**Trademark** A **trademark** is a distinctive name, symbol, or slogan that distinguishes a product or service from similar products or services. Well-known examples include Coke®, Windows®, Yahoo!®, and the Nike Swoosh®. As shown in Exhibit 10-10 later in the chapter, the value of the Coca-Cola trademark was estimated in 2009 to be in excess of \$68 billion. Because the Coca-Cola trademark is an internally generated intangible asset, it is not reported in **The Coca-Cola Company’s** balance sheet. However, the company has purchased other trademarks (such as Minute Maid®), with a total cost of \$6.2 billion; these are reported in The Coca-Cola Company’s balance sheet, as shown in Chapter 3.

FYI

The original Coca-Cola bottling franchise sold for \$1.

**Franchises** Franchise operations have become so common in everyday life that we often don’t realize we are dealing with them. In fact, these days it is difficult to find a nonfranchise business in a typical shopping mall. When a business obtains a franchise, the recorded cost of the franchise includes any sum paid specifically for the franchise right as well as legal fees and other costs incurred in obtaining it. Although the value of a franchise at the time of its acquisition may be substantially in excess of its cost, the amount recorded should be limited to actual outlays. For example, approximately 81% of **McDonald’s** locations are operated under franchise agreements. A McDonald’s

General Electric . . . . .	83,928
Bank of America . . . . .	78,129

---

<sup>6</sup>FASB ASC paragraph 350-20-25-3.

franchisee must contribute an initial cash amount of around \$500,000, which is used to buy some of the equipment and signs and to pay the initial franchise fee. The value of a McDonald's franchise alone is much more than \$500,000, but the franchisee would only record a franchise asset in his or her financial statements equal to the cost (not value) of the franchise. However, if a franchise right is included when one company purchases another company, presumably the entire value is included in the purchase price, and the fair value attributable to the franchise right is recorded as an intangible asset in the acquirer's books.

**Order Backlog** To some companies, especially capital equipment manufacturers, the order backlog is a key economic asset. The *order backlog* is the amount of orders the company has received for equipment that has not yet been produced or delivered. Note that these orders do not constitute sales because they do not satisfy the revenue recognition requirement that the product be completed and shipped. However, this order backlog does represent future valuable economic activity, and the contractual right to these backlogged orders constitutes an important intangible asset. In its 2009 10-K filing, **Boeing** reported the following about its order backlog:

<b>Contractual Backlog (unaudited, in millions)</b> Years ended December 31,	<b>2009</b>	<b>2008</b>	<b>2007</b>
Contractual backlog:			
Commercial Airplanes . . . . .	\$250,476	\$278,575	\$255,176
Boeing Defense, Space & Security:			
Boeing Military Aircraft . . . . .	\$ 26,311	\$ 25,710	\$ 22,974
Network & Space Systems . . . . .	7,746	8,868	9,207
Global Services & Support . . . . .	11,967	10,707	9,607
Total Boeing Defense, Space & Security . . . . .	\$ 46,024	\$ 45,285	\$ 41,788
Total contractual backlog . . . . .	\$296,500	\$323,860	\$296,964

As with other intangible assets, this internally generated order backlog would not be recognized as an intangible asset on Boeing's balance sheet. However, if another company were to buy Boeing, part of the purchase price would be identified with the economic value of the order backlog, and a corresponding intangible asset would be recognized in the books of the acquiring company.

**Goodwill** Goodwill represents the business contacts, reputation, functioning systems, staff camaraderie, and industry experience that make a business much more than just a collection of assets. As mentioned earlier, if these factors are the result of a contractual right or are associated with intangibles that can be bought and sold separately, the value of the factor should be reported as a separate intangible asset. In essence, goodwill is a residual number, the value of all of the synergies of a functioning business that cannot be specifically identified with any other intangible factor. Goodwill is recognized only when it is purchased

## FYI

The most important recent development in accounting for intangibles is the FASB's emphasis on companies reporting separate amounts for all of the individual intangible assets that can be identified. Previously, these assets were typically tossed in with goodwill.

as part of the acquisition of another company. In other words, a company's own goodwill, its homegrown goodwill, is not recognized. Goodwill will be defined and discussed more in depth later in the chapter.

## Acquisitions Other Than Simple Cash Transactions

**2** Properly account for noncurrent operating asset acquisitions using various special arrangements, including deferred payment, self-construction, and acquisition of an entire company.

**WHY** All subsequent accounting for a noncurrent operating asset depends on the amount initially recorded as the cost of that asset. Measuring that initial cost can be difficult when an acquisition involves more than a simple cash purchase.

**HOW** Conceptually, the acquisition cost of a noncurrent operating asset should reflect the cash equivalent of whatever consideration is given in exchange for the asset. Measurement of this cash equivalent sometimes involves present value calculations, estimates of fair values, and/or estimates of total self-construction cost.

When an asset is purchased for cash, the acquisition is simply recorded at the amount of cash paid, including all outlays relating to its purchase and preparation for intended use. Assets can be acquired under a number of other arrangements, however, some of which present special problems relating to the cost to be recorded. The acquisition of assets is discussed under the following headings:

1. Basket purchase
2. Deferred payment
3. Leasing
4. Exchange of nonmonetary assets
5. Acquisition by issuing securities
6. Self-construction
7. Acquisition by donation or discovery
8. Acquisition of an asset with significant restoration costs at retirement
9. Acquisition of an entire company

### Basket Purchase

In some purchases, a number of assets may be acquired in a **basket purchase** for one lump sum. For example, the opening scenario of this chapter described how Jerry Jones acquired football equipment, cable TV rights, player contracts, and the Cowboys' NFL franchise rights when he purchased the Dallas Cowboys. To account for the assets on an individual basis, the total purchase price must be allocated among the individual assets. When part of a purchase price can be clearly identified with specific assets, such a cost assignment should be made and the balance of the purchase price allocated among the remaining assets. When no part of the purchase price can be related to specific assets, the entire amount must be allocated among the different assets acquired. Appraisal values or similar evidence provided by a competent independent authority should be sought to support the allocation.

To illustrate the allocation of a joint asset cost, assume that land, buildings, and equipment are acquired for \$160,000. Assume further that a professional appraiser valued each of the assets at the acquisition date. The cost allocation is made as follows.

Assigned to	Appraised Values	Cost Allocation According to Relative Appraised Values	Cost Assigned to Individual Assets
Land	\$ 56,000	$56,000/200,000 \times \$160,000$	\$ 44,800
Buildings	120,000	$120,000/200,000 \times \$160,000$	96,000
Equipment	24,000	$24,000/200,000 \times \$160,000$	19,200
	<u>\$200,000</u>		<u>\$160,000</u>

The entry to record this acquisition, assuming a cash purchase, is as follows.

Land	44,800
Buildings	96,000
Equipment	19,200
Cash	160,000

This cost allocation of a basket purchase price is not merely a theoretical exercise. Some assets in the group may be depreciable, others nondepreciable. Depreciable assets may have different useful lives. Periodic depreciation expense can be significantly impacted by the proportion of the purchase price that is allocated to assets with relatively long useful lives.

## CAUTION

In this example, each semiannual payment declines since the interest is calculated on a declining balance in Notes Payable. For example, on January 1, 2014, the total payment would be just \$8,000 (\$5,000 + \$3,000 interest). Alternatively, a contract can provide for a constant payment, or annuity. With an annuity, the amount applied to the note principal increases (and the Interest Expense decreases) each period as the liability decreases

## Deferred Payment

The acquisition of real estate or other property frequently involves deferred payment of all or part of the purchase price. The buyer signs a note or a mortgage that specifies the terms of settlement of the obligation. The debt contract may call for one payment at a given future date or a series of

payments at specified intervals. Interest charged on the unpaid balance of the contract should be recognized as an expense.

To illustrate the accounting for a deferred payment purchase contract, assume that land is acquired on January 2, 2013, for \$100,000; \$35,000 is paid at the time of purchase, and the balance is to be paid in semiannual installments of \$5,000 plus interest on the unpaid principal at an annual rate of 10%. Entries for the purchase and for the first payment on the contract follow.

Transaction	Entry
January 2, 2013	Land ..... 100,000
Purchased land for \$100,000, paying \$35,000 down, the balance to be paid in semiannual payments of \$5,000 plus interest at 10%.	Cash ..... 35,000
	Notes Payable ..... 65,000
June 30, 2013	Interest Expense ..... 3,250
Made first payment.	Notes Payable ..... 5,000
Amount of payment: \$5,000 + \$3,250 (5% of \$65,000) = \$8,250	Cash ..... 8,250

In the preceding example, the contract specified both a purchase price and interest at a stated rate on the unpaid balance. Sometimes, however, a contract may simply provide for a payment or series of payments without reference to interest or may provide for a stated interest rate that is unreasonable in relation to the market. In these circumstances, the note, sales price, and cost of the property, goods, or services exchanged for the note should be recorded at the fair value of the property, goods, or services or at the current market value of the note, whichever value is more clearly determinable.<sup>7</sup> The following example illustrates the accounting by the purchaser in this circumstance.

Assume that certain equipment, which has a cash price of \$50,000, is acquired under a deferred payment contract. The contract specifies a down payment of \$15,000 plus seven annual payments of \$7,189 each, or a total price, including interest, of \$65,323. Although not stated, the effective interest rate implicit in this contract is 10%, the rate that discounts the annual payments of \$7,189 to a present value of \$35,000, the cash price less the down payment.<sup>8</sup> If the fair value of the asset varies from the contract price because of delayed payments, the difference should be recorded as a discount (contra liability) and amortized over the life of the contract using the implicit or effective interest rate. Using the earlier example, the entries to record the purchase, the amortization of the discount for the first two years, and the first two payments would be as follows.

Transaction	Entry		
January 2, 2013	Equipment . . . . .	50,000	
Purchased equipment with a cash price of \$50,000 for \$15,000 down plus seven annual payments of \$7,189 each, or a total contract price of \$65,323.	Discount on Notes Payable . . . . .	15,323	
	Notes Payable . . . . .		50,323
	Cash . . . . .		15,000
December 31, 2013	Notes Payable . . . . .	7,189	
Made first payment of \$7,189.	Cash . . . . .		7,189
Amortization of debt discount: \$50,323 – \$15,323 = \$35,000 10% x \$35,000 = \$3,500	Interest Expense . . . . .	3,500	
	Discount on Notes Payable . . . . .		3,500
December 31, 2014	Notes Payable . . . . .	7,189	
Made second payment of \$7,189.	Cash . . . . .		7,189
Amortization of debt discount: 10% x \$31,311* = \$3,131	Interest Expense . . . . .	3,131	
	Discount on Notes Payable . . . . .		3,131
*\$50,323 – \$7,189 = \$43,134	Notes payable		
\$15,323 – \$3,500 = 11,823	Discount on notes payable		
	<u>\$31,311</u>	Present value of notes payable at end of first year	

<sup>7</sup> FASB ASC paragraph 835-30-25-10.

<sup>8</sup> As illustrated in the Time Value of Money Review Module, the effective or implicit interest rate may be computed as follows:

Business calculator keystrokes:

First toggle to make sure that the payments are assumed to occur at the end (END) of the period.

The difference between the cash price and the down payment is \$35,000.

PV = (\$35,000); N = 7; PMT = \$7,189 → I = 10.00%

Additional examples of computing an implicit rate of interest are presented in the Module.

## CAUTION

The account Discount on Notes Payable is a contra liability account and is reported as an offset to Notes Payable. It represents that portion of the remaining payments on the note that will be for interest.

When there is no established cash price for the property, goods, or services and there is no stated rate of interest on the contract, or the stated rate is unreasonable under the circumstances, an imputed interest rate must be used. The imputed

interest rate is an estimate of what interest rate the borrowing company would have to pay on a loan given its creditworthiness and current market interest rates.

### Leasing

A lease is a contract whereby one party (the lessee) is granted a right to use property owned by another party (the lessor) for a specified period of time for a specified periodic cost. Most leases are similar in nature to rentals. These leases are called **operating leases**. However, other leases, referred to as **capital leases**, are economically equivalent to a sale of the leased asset with the lessor allowing the lessee to pay for the asset over time with a series of “lease” payments. In these circumstances, the lease payments are exactly

equivalent to mortgage payments. In such cases, the leased property should be recorded as an asset on the books of the company using the asset (the lessee), not on the books of the company that legally owns the asset (the lessor). The capital lease asset is

recorded at the present value of the future lease payments. Because lease accounting is a complex area, an entire chapter (Chapter 15) is devoted to accounting for leases.

Even when a lease is not considered to be the same as a purchase and the periodic payments are recorded as rental expense, certain lease prepayments or improvements to the property by the lessee may be treated as capital expenditures. Because leasehold improvements such as partitions in a building, additions, and attached equipment revert to the owner at the expiration of the lease, they are properly capitalized on the books of the lessee and amortized over the remaining life of the lease. Some lease costs are really expenses of the period and should not be capitalized. These include improvements that are made in lieu of rent; for example, a lessee builds partitions in a leased warehouse for storage of its product, and the lessor allows the lessee to offset the cost against rental expense for the period. These costs should be expensed by the lessee.

### Exchange of Nonmonetary Assets

In some cases, an enterprise acquires a new asset by exchanging or trading existing nonmonetary assets.<sup>9</sup> Generally, the new asset should be valued at its fair value or at the fair value of the asset given up, whichever is more clearly determinable.<sup>10</sup> If the nonmonetary asset is used equipment, the fair value of the new asset is generally more clearly determinable and therefore used to record the exchange. If one of the parties in the exchange could have

<sup>9</sup> Monetary assets are those assets whose amounts are fixed in terms of currency, by contract, or otherwise. Examples include cash and accounts receivable. Nonmonetary assets include all other assets, such as inventories, land, buildings, and equipment.

<sup>10</sup> FASB ASC paragraph 845-10-30-1.

chosen to receive cash instead of the nonmonetary asset, that amount of cash is a good reflection of the fair value of the assets exchanged.

It should be observed that determining the fair value of a new asset can sometimes be difficult. The quoted or list price for an asset is not always a good indicator of the market value and is often higher than the actual cash price for the asset. An inflated list price permits the seller to increase the indicated trade-in allowance for a used asset. The price for which the asset could be sold in a cash transaction is the fair value that should be used to record the acquisition.

To illustrate, assume the sticker on the window of a new car sitting in a dealer's showroom lists a total selling price of \$33,500. The sticker includes a base price plus an itemized listing of all the options that have been added. If you, as a buyer, approached the dealer with your old clunker as a trade-in, you might be surprised to be offered \$3,000 for a car you know is worth no more than \$1,000. If you offered to pay cash for the new car with no trade-in, however, you could probably buy it for approximately \$31,500 or the list price reduced by the inflated amount of allowance offered for the trade-in. The fair value of the new asset is thus not the list price of \$33,500 but the true cash price of \$31,500.

If the nonmonetary asset given up to acquire the new asset is also property or equipment, a sale of property occurs simultaneously with the acquisition. When an exchange of a nonmonetary asset takes place, the use of fair value results in a gain or loss on the disposal of the nonmonetary asset. Under some limited circumstances, a gain may be deferred and recognized (through lower depreciation expense) over the life of the newly acquired asset.<sup>11</sup> Because of the need to first discuss depreciation methods before explaining the accounting for the sale of assets, the full discussion of acquisition and disposal by exchange is covered in Chapter 11.

### Acquisition by Issuing Securities

A company may acquire certain property by issuing its own bonds or stocks. When a fair value for the securities can be determined, that value is assigned to the asset; in the absence of a fair value for the securities, the fair value of the asset acquired would be used. To illustrate, assume that a company issues 1,000 shares of \$1 par common stock in acquiring land; the stock has a current market price of \$45 per share. An entry should be made as follows:

Land .....	45,000	
Common Stock .....		1,000
Paid-In Capital in Excess of Par .....		44,000

When securities do not have an established market value, appraisal of the acquired assets by an independent authority may be required to arrive at an objective determination of their fair value.

As discussed in Chapter 5, purchasing noncurrent assets in exchange for long-term debt and/or stock is an example of a significant noncash transaction. This kind of noncash transaction is not included in the body of the statement of cash flows as an investing or a financing activity. Instead, the transaction, if material, is disclosed separately.

### Self-Construction

Sometimes buildings or equipment are constructed by a company for its own use. This may be done to save on construction costs, to utilize idle facilities, or to achieve a higher quality of construction.

<sup>11</sup> FASB ASC paragraph 845-10-30-3.

**Self-Constructed Assets** Like purchased assets, these are recorded at cost, including all expenditures incurred to build the asset and make it ready for its intended use. Some considerations in determining the cost of self-constructed assets are discussed in the following sections.

**Overhead Chargeable to Self-Construction** All costs that can be related to construction should be charged to the assets under construction. There is no question about the inclusion of charges for material and labor directly attributable to the new construction. However, there is a difference of opinion regarding the amount of overhead properly assignable to the construction activity. Some accountants take the position that assets under construction should be charged with no more than the incremental overhead, the increase in a company's total overhead resulting from the special construction activity. Others maintain that overhead should be assigned to construction just as it is assigned to normal operations. This would call for the inclusion of not only the increase in overhead resulting from construction activities but also a pro rata share of the company's fixed overhead. Common practice is to allocate both variable overhead and a pro rata share of fixed overhead to self-construction projects. An illustration of the capitalization of overhead costs is given in the December 31, 2009, 10-K filing of **Gyrodyne Company of America**. The company began in 1946 as a producer of helicopters and has since transitioned to managing real estate operations. Gyrodyne reports, "In addition to land, land development, and construction costs, real estate held for development includes legal, engineering and other related soft development costs, interest, real estate taxes, and related development and construction overhead costs which are capitalized during the development and construction period."

**Savings or Loss on Self-Construction** When the cost of self-construction of an asset is less than the cost to acquire it through purchase or construction by outsiders, the difference for accounting purposes is not a profit but a savings. The construction is properly reported at its actual cost. The savings will emerge as an increase in net income over the life of the asset as lower depreciation is charged against periodic revenue. Assume, on the other hand, the cost of self-construction is greater than bids originally received for the construction. There is generally no assurance that the asset under alternative arrangements might have been equal in quality to that which was self-constructed. In recording this transaction, just as in recording others, accounts should reflect those courses of action taken, not the alternatives that might have been selected. However, if there is evidence indicating cost has been materially excessive because of construction inefficiencies or failures, the asset should be evaluated for possible recording of an impairment loss. Recognition of impairment losses is discussed in Chapter 11.

**Interest During Period of Construction** When a construction company bids on a job, the bid includes a charge for interest that will be incurred on funds borrowed to finance the construction. The interest cost is viewed as being an integral part of the cost of construction, just like materials, labor, and equipment rental costs. In a similar way, when a company constructs an asset for its own use, long-standing accounting practice is for the company to capitalize the interest costs incurred to finance the construction.

Capitalization of interest first began with public utilities. Public utilities self-construct a large portion of their assets, so the capitalized interest amount can be very material. More importantly, public utility rates are frequently set by government bodies and are tied to the utility's rate base, which is the utility's book value of assets. The higher the

rate base, the higher the utility rates. Accordingly, public utilities have a great incentive to include all possible costs, including **capitalized interest**, in the reported cost of their self-constructed assets.

Although capitalization of interest began with public utilities, it is now generally accepted accounting practice for all firms that construct assets for their own use. Remember that interest capitalization is not merely a ploy used by utilities to get higher rates; interest is a legitimate cost of construction, and the proper matching of revenues and expenses suggests that interest be deferred and charged over the life of the constructed asset. If buildings or equipment were acquired by purchase rather than by self-construction, a charge for interest during the construction period would be implicit in the purchase price.

Capitalization of interest is required for assets, such as buildings and equipment, that are being self-constructed for an enterprise's own use and assets that are intended to be leased or sold to others that can be identified as discrete projects. These are projects that can be clearly identified as to the assets involved. Interest should not be capitalized for inventories manufactured or produced on a repetitive basis, for assets that are currently being used, or for assets that are idle and are not undergoing activities to prepare them for use. Thus, land that is being held for future development does not qualify for interest capitalization.<sup>12</sup>

Once it is determined that the construction project qualifies for interest capitalization, the amount of interest to be capitalized must be determined. The following basic guidelines govern the computation of capitalized interest:

1. Interest charges begin when the first expenditures are made on the project and continue as long as work continues and until the asset is completed and actually ready for use.
2. The amount of interest to be capitalized is computed using the accumulated expenditures for the project, weighted based on when the expenditures were made during the year. *Expenditures* mean cash disbursements, not accruals.
3. The interest rates to be used in calculating the amount of interest to capitalize are, in the following order:
  - (a) Interest rate incurred for any debt specifically incurred for funds used on the project.
  - (b) Weighted-average interest rate from all other enterprise borrowings regardless of the use of funds.
4. If the construction period covers more than one fiscal period, accumulated expenditures include prior years' capitalized interest.

The maximum interest that can be capitalized is the total interest accrued for the year.

The following illustration demonstrates the application of these guidelines. Cutler Industries, Inc., has decided to construct a new computerized assembly plant. It is estimated that the construction period will be about 18 months and that the cost of construction will be approximately \$6.4 million (excluding capitalized interest). A 12% construction loan for \$2 million is obtained on January 1, 2013, at the beginning of construction.

In addition to the construction loan, Cutler has the following outstanding debt during the construction period:

5-year notes payable, 11% interest . . . . .	\$3,000,000
Mortgage on other plant, 9% interest . . . . .	4,800,000

<sup>12</sup> FASB ASC paragraph 835-20-15-6.

The weighted-average interest rate on this general nonconstruction debt is computed as follows.

Nonconstruction Debt	Principal	Rate	Interest Cost
Notes payable.....	\$3,000,000	11%	\$330,000
Mortgage.....	4,800,000	9	432,000
	<u>\$7,800,000</u>	9.8*	<u>\$762,000</u>

\*Weighted-average rate = \$762,000 ÷ \$7,800,000 = 9.8% (rounded)

The following expenditures were incurred on the project during 2013.

January 1, 2013.....	\$1,200,000
October 1, 2013.....	1,800,000

Computation of the amount of interest to be capitalized for 2013 is as follows:

Expenditure Date	Amount	Interest Capitalization Rate	Fraction of the Year Outstanding	Capitalized Interest
January 1, 2013.....	\$1,200,000	12%	12/12	\$144,000
October 1, 2013.....	800,000	12	3/12	24,000
	1,000,000	9.8	3/12	24,500
Total capitalized interest for 2013				<u>\$192,500</u>

Notice first that capitalized interest is computed only for the amount of time the expenditures were outstanding. The January 1 expenditures caused increased borrowing costs for the entire year, but the October 1 expenditures were outstanding for only the final three months of the year. This approach results in an approximation of the amount of interest that could have been avoided if the expenditures had been used to repay debt instead of being used for the construction project.

This approach also assumes that the most avoidable interest is the interest on the borrowing specifically

for the construction project. Accordingly, the interest rate of 12% on the specific construction borrowing is used. However, the amount of that loan is only \$2,000,000; expenditures above this \$2,000,000 amount could have been used to repay general company debt. Therefore, the October 1 expenditure of \$1,800,000 has been split into two pieces—the first \$800,000 could have been used to repay the balance of the construction loan (\$800,000 = \$2,000,000 – \$1,200,000), so the amount of avoidable interest is computed using the 12% rate. The remaining \$1,000,000 could have been used to repay general company debt, so the weighted-average rate of 9.8% on general borrowing is used.

Finally, recall that the amount of interest capitalized cannot exceed total interest incurred for the year. Total interest incurred during 2013 was as follows.

## STOP&THINK

Which ONE of the following describes the financial statement impact of a company neglecting to capitalize interest that should be capitalized?

- a) Net income overstated and total assets overstated
- b) Net income understated and total assets overstated
- c) Net income overstated and total assets understated
- d) Net income understated and total assets understated

Debt	Amount	Interest Rate	Annual Interest
Construction loan . . . . .	\$2,000,000	12%	\$ 240,000
Notes payable . . . . .	3,000,000	11%	330,000
Mortgage payable . . . . .	4,800,000	9%	432,000
Total interest incurred . . . . .			<u>\$1,002,000</u>

Because total interest incurred exceeds the computed amount of interest to be capitalized, the entire indicated amount of \$192,500 is capitalized. The journal entry to record total interest incurred by Cutler Industries during 2013 (assuming that all interest was paid in cash) is as follows.

Construction in Progress . . . . .	192,500	
Interest Expense (\$1,002,000 – \$192,500) . . . . .	809,500	
Cash . . . . .		1,002,000

Assume that additional construction expenditures of \$3,200,000 were made on February 1, 2014, and the project was completed on May 31, 2014.

The amount of interest to be capitalized for the year 2014 follows.

Expenditure Date	Amount	Interest Capitalization Rate	Fraction Outstanding of the Year	Capitalized Interest
Accumulated in 2013 . . . . .	\$2,000,000	12%	5/12	\$100,000
	1,192,500	9.8	5/12	48,694
February 1, 2014 . . . . .	3,200,000	9.8	4/12	104,533
Total capitalized interest for 2014 . . . . .				<u>\$253,227</u>

Avoidable interest in 2014 includes interest on all the loans that could have been repaid with the construction expenditures made in 2013. These expenditures total \$3,192,500 (\$1,200,000 + \$1,800,000 + \$192,500) and include interest capitalized in 2013. Interest is capitalized only until May 31 (five months) when construction is completed and the building is ready for use. Because \$253,227 is less than the actual annual interest of \$1,002,000, the entire indicated amount of \$253,227 is capitalized in 2014.

Total recorded cost of the building on May 31, 2014, when it is put into service, is \$6,645,727, computed as follows.

Expenditures incurred in 2013 . . . . .	\$3,000,000
Interest capitalized in 2013 . . . . .	192,500
Expenditures incurred in 2014 . . . . .	3,200,000
Interest capitalized in 2014 . . . . .	253,227
Total building cost, May 31, 2014 . . . . .	<u>\$6,645,727</u>

**FYI**

This is an unusual project indeed! It finished ahead of schedule (in only 17 months), and the actual total cost of construction (excluding capitalized interest) is only \$6.2 million, \$200,000 less than forecasted.

FASB ASC Subtopic 835-20 (Interest—Capitalization of Interest) requires disclosure of the total interest expense for the year and the amount capitalized. This disclosure can be made either in the body of the income statement or in a note to the statements.

To illustrate these two methods, assume that Cutler Industries reported the 2013 interest information on the income statement and the 2014 interest information in a note.

<b>Cutler Industries, Inc.</b>		
<b>Income Statement</b>		
<b>For the Year Ended December 31, 2013</b>		
Operating income .....		\$XXX,XXX
Other expenses and losses:		
Total interest incurred .....	\$1,002,000	
Less: Capitalized interest .....	<u>192,500</u>	<u>809,500</u>
Income before income taxes .....		\$XXX,XXX
Income taxes .....		<u>XXX,XXX</u>
Net income .....		<u>\$XXX,XXX</u>

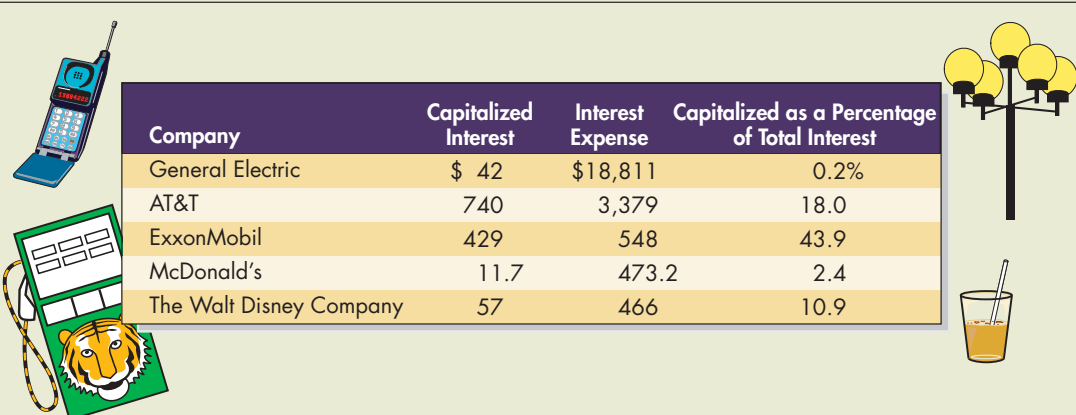

**Cutler Industries, Inc.**  
**Financial Statement Notes**  
**For the Year Ended December 31, 2014**

Note X—Interest expense. Interest of \$253,227 was capitalized in 2014 as part of the cost of construction for the computerized assembly plant in accordance with the requirements of FASB ASC Subtopic 835-20.

The amount of capitalized interest reported for 2009 by several large U.S. companies and its percentage of total interest reported by those companies are displayed in Exhibit 10-5. As you can see, **General Electric** capitalized only an insignificant amount of its \$18,769 million in interest during 2009. On the other hand, **ExxonMobil** capitalized almost as much interest as it expensed in 2009.

EX

10-5 CAPITALIZED INTEREST FOR SEVERAL LARGE U.S. COMPANIES IN 2009 (IN MILLIONS OF U.S. DOLLARS)

Company	Capitalized Interest	Interest Expense	Capitalized as a Percentage of Total Interest
General Electric	\$ 42	\$18,811	0.2%
AT&T	740	3,379	18.0
ExxonMobil	429	548	43.9
McDonald's	11.7	473.2	2.4
The Walt Disney Company	57	466	10.9

Complexities arise in computing the amount of interest to capitalize when a company secures new loans in the middle of the year. These complexities and an alternate approach to computing capitalized interest are explained in the Web Material associated with this chapter ([www.cengage.com/accounting/stice](http://www.cengage.com/accounting/stice)).

Not everyone agrees that interest on funds used to finance the self-construction of assets should be capitalized. In fact, the original FASB vote was only four to three in favor of pre-Codification *SFAS No. 34*, which mandated the capitalization of interest in the United States back in 1979. The changing stance of the IASB and its predecessor, the IASC, perfectly illustrates the split view on interest capitalization. In the original international standard on interest capitalization (*IAS 23*), companies were allowed to either capitalize (or *capitalise*, to use the international spelling) interest or not, but the company should be consistent in its practice. In a 1989 exposure draft, the IASC then proposed establishing a benchmark treatment requiring interest capitalization. But the revised version of *IAS 23* issued in 1993 said that all interest should be expensed, regardless of how the funds are used, with interest capitalization as an allowable alternative. Finally, in 2007 the IASB revised *IAS 23* again to require, starting on January 1, 2009, that all companies capitalize “borrowing costs” incurred in the construction of a long-term asset. An important difference between this revised version of *IAS 23* and the U.S. standard is that the international standard requires that companies capitalize the *net* amount of interest incurred rather than the *gross* amount. This means that under *IAS 23* a company capitalizes the amount of interest, computed as shown above under the explanation of the U.S. standard, *less* the amount of investment income generated by borrowed construction funds that are temporarily invested before they are needed to pay for construction expenditures. Accordingly, the amount of interest capitalized under the international standard is generally less than the amount that would be capitalized under the U.S. standard.

### Acquisition by Donation or Discovery

When property is received through **donation**, there is no cost that can be used as a basis for its valuation. Even though certain expenditures may have to be made incidental to the gift, these expenditures are generally considerably less than the value of the property. Here cost obviously fails to provide a satisfactory basis for asset valuation.

Property acquired through donation should be appraised and recorded at its fair value. A donation is recognized as a revenue or gain in the period in which it is received.<sup>13</sup> To illustrate, Netty’s Ice Cream Parlor is given a donation of land and a building by an eccentric ice cream lover. The entry on Netty’s books, using the appraised values of the land and the building, is as follows:

Land .....	400,000	
Buildings .....	1,500,000	
Revenue or Gain .....		1,900,000

Depreciation of an asset acquired by gift should be recorded in the usual manner, the value assigned to the asset providing the basis for the depreciation charge.

If a gift is contingent upon some act to be performed by the recipient, no asset should be reported until the conditions of the gift have been met. At that time, both the increase in

<sup>13</sup> FASB ASC paragraph 958-310-25-1.

Dave Thompson/Life File/Photodisc/Getty Images

Publicly traded oil and gas firms are required to disclose the quantity of their proved oil and gas reserves, as well as a forecast of the discounted value of future net cash flows expected to be generated by the reserves.

i

FYI

Valuation issues in transactions that are not arm's length can be very difficult. FASB ASC paragraph 845-10-S99-1 requires that when a corporation receives nonmonetary assets as an investment by a shareholder, the assets are recorded by the company at the shareholder's historical cost.

assets and the revenue or gain should be recognized in the accounts and in the financial statements.<sup>14</sup>

Occasionally, valuable resources are discovered on land already owned. The **discovery** greatly increases the value of the property. However, because the cost of the land is not affected by the discovery, it is common practice in the United States to ignore this increase in value. Similarly, the increase in value for assets that change over time, such as growing timber or aging wine, is ignored in common practice in the United States. Failure to recognize these discovery or accretion values ignores the economic reality of the situation and tends to materially understate the assets of the entity. Nevertheless, asset write-ups are generally not allowable under U.S. accounting standards, although they are routine in some other countries. More information on asset write-ups is given later in the chapter.

One exception to the practice of ignoring the value of assets discovered is the supplemental disclosure required regarding oil and gas reserves. Publicly traded oil and gas firms are required to disclose the amount of their proved oil and gas reserves, along with summary

data on why the amount of proved reserves changed during the period. In addition, the oil and gas firms are required to disclose a forecast of the discounted value of future net cash flows expected to be generated by the reserves.<sup>15</sup> The oil and gas firms are skeptical about the usefulness of this disclosure as illustrated by this quote from **Chevron's** 2009 annual report:

The information provided does not represent management's estimate of the company's expected future cash flows or value of proved oil and gas reserves. Estimates of proved-reserve quantities are imprecise and change over time as new information becomes available. Moreover, probable and possible reserves, which may become proved in the future, are excluded from the calculations. . . . The calculations . . . should not be relied upon as an indication of the company's future cash flows or value of its oil and gas reserves.

The international standard for recognizing increases in the value of property from growth or discovery is substantially different from U.S. practice. Under *IAS 41*, biological

<sup>14</sup> FASB ASC paragraph 958-605-25-11.

<sup>15</sup> FASB ASC paragraph 932-235-50-2.

assets, such as cattle, fruit trees, and lumber forests, are recorded in the balance sheet at their fair value (less estimating selling costs) as of the balance sheet date. Increases in this fair value are recognized as gains, and decreases are recognized as losses. Accordingly, under international accounting standards, a lumber company would report the timber in its forests at fair value (less selling cost) in each balance sheet during, say, the 30-year period the timber is growing. The yearly increases or decreases in fair value would be reported in the income statement as gains or losses. In summary, international financial reporting standards allow, and sometimes require, the recognition of changes in long-term asset values in many more cases than do U.S. standards.

FYI

In 2004, Royal Dutch/Shell Group was fined a total of \$150 million by U.S. and British authorities for deceptive reporting of its proved oil and gas reserves. The company was forced to reduce its reported oil reserves by 4.47 billion barrels, a reduction of 23%. This reserve restatement knocked about 10% off the market value of the company.

### Acquisition of an Asset with Significant Restoration Costs at Retirement

Sometimes, the act of acquiring a long-term operating asset legally obligates a company to incur restoration costs in the future when the asset is retired. For example, when an oil exploration firm erects an oil platform to support drilling operations, it becomes legally obligated to dismantle and remove the platform when the drilling is done.<sup>16</sup> Proper accounting for this obligation requires that it be recognized, at its estimated fair value, at the time that it is incurred and that the fair value of the obligation be added to the cost of acquiring the long-term operating asset.

To illustrate the initial recognition of an [asset retirement obligation](#), assume that Bryan Beach Company purchases and erects an oil platform at a total cost of \$750,000. The oil platform will be in use for 10 years, at which time Bryan Beach is legally obligated to ensure that the platform is dismantled and removed from the site. Bryan Beach can estimate the fair value of this asset retirement obligation by referring to market prices for the settlement of these obligations or by using present value techniques. If, for example, there are firms that will contract in advance to dismantle and remove an oil platform 10 years from now, Bryan Beach can use the price of those contracts to estimate the fair value of its asset retirement obligation. In this case, assume that no such market exists. However, Bryan Beach estimates that it will have to pay \$100,000 to have the platform dismantled and removed from the site in 10 years. If the appropriate interest rate to use

FYI

Adding the fair value of asset retirement obligations to the cost of the associated long-term operating asset applies only to normal restoration costs that are unavoidable in the routine use of the asset. Unforeseen restoration costs, such as from a catastrophic toxic waste spill, are accounted for differently. The present value of these catastrophic cleanup costs is expensed in the period in which the unforeseen cost is incurred and the related liability is recognized.

<sup>16</sup> This oil platform illustration and the nuclear plant illustration used later are adapted from FASB ASC Section 410-20-55 (Asset Retirement and Environmental Obligations—Asset Retirement Obligations—Implementation Guidance and Illustration).

in computing the present value is 8%,<sup>17</sup> the present value of the \$100,000 obligation is computed as follows:

$$FV = \$100,000; I = 8\%; N = 10 \text{ years} \rightarrow \$46,319$$

The journal entries to record the purchase of the oil platform and the recognition of the asset retirement obligation are as follows:

Oil Platform .....	750,000	
Cash .....		750,000
Oil Platform .....	46,319	
Asset Retirement Obligation .....		46,319

In this oil platform example, the entire asset retirement obligation was created by the initial acquisition and deployment of the long-term operating asset. In other situations, additional asset retirement obligation is created over time. For example, assume that Homer Company constructs and commences operation of a nuclear power plant. Total construction cost is \$400,000. The cost of cleaning up the routine contamination caused by the initial stockpile of nuclear material is estimated to be \$500,000; this cost will be incurred in 30 years when the plant is decommissioned. Additional contamination will occur each year that the plant is in operation. In its first year of operation, that additional contamination adds \$40,000 to the estimated cleanup cost, which will occur after 29 years (because one year has elapsed). The journal entries to record the purchase of the nuclear plant and the recognition of the initial asset retirement obligation (assuming that the appropriate interest rate is 9%) and the additional obligation created after one year are as follows:

*Initial Acquisition*

Nuclear Plant .....	400,000	
Cash .....		400,000
Nuclear Plant .....	37,686	
Asset Retirement Obligation .....		37,686

$$FV = \$500,000; I = 9\%; N = 30 \text{ years} \rightarrow \$37,686$$

*After One Year*

Nuclear Plant .....	3,286	
Asset Retirement Obligation .....		3,286

$$FV = \$40,000; I = 9\%; N = 29 \text{ years} \rightarrow \$3,286$$

The asset retirement cost added to the basis of the nuclear plant would be depreciated over the useful life of the plant. In addition, the amount of the asset retirement obligation would increase each year through the passage of time (because the time until the payment of the restoration costs would be shorter). Accounting for depreciation and the systematic increase in the recorded amount of the asset retirement obligation will be discussed in Chapter 11.

<sup>17</sup> In FASB ASC paragraphs 410-20-55-13 through 17, the FASB states that the appropriate interest rate to use is the credit-adjusted risk-free rate, meaning the rate on U.S. Treasury securities (typically 5% or less), plus premiums to reflect both the credit standing of the company doing the calculation as well as a “market-risk premium” that a third party would demand for accepting the uncertainties associated with taking on the asset retirement obligation. See the Time Value of Money Review Module of this text for more discussion on present-value calculations.

## Acquisition of an Entire Company

Instead of buying selected assets from another firm, as in a basket purchase, sometimes a company will buy the entire firm. This is called a *business combination*. The procedures for accounting for a business combination are similar to those used for a basket purchase. The primary difference is that in a business combination the sum of the fair values of the identifiable assets is usually less than the total amount paid to buy the company. As discussed earlier, this excess is called *goodwill* and reflects the value of the synergy of having all of the productive assets together as a functioning unit. The accounting for business combinations and goodwill is discussed in detail later in the chapter when the acquisition of intangible assets is covered.

## Capitalize or Expense?

**3** Separate costs into those that should be expensed immediately and those that should be capitalized, and understand the accounting standards for research and development and oil and gas exploration costs.

**WHY** The definition of an asset in the Conceptual Framework includes the phrase “probable future economic benefit.” In practice, there has been some difficulty in using this definition to identify a cost as an asset or an expense. The FASB has created a number of more specific rules for particular types of costs.

**HOW** Postacquisition costs that increase an asset’s capacity or extend its life are capitalized; routine maintenances costs are expensed. Research and development costs are always expensed except for software development costs incurred after technological feasibility has been established. Firms have the choice of either capitalizing or expensing some oil and gas exploration costs.

The decision as to whether a given expenditure is an asset or an expense is one of the many areas in which an accountant must exercise judgment. Conceptually, the issue is straightforward: If an expenditure is expected to benefit future periods, it is an asset; otherwise, it is an expense.

In practice, the capitalize-or-expense question is much more difficult. To illustrate, look at the continuum in Exhibit 10-6.

Few people would disagree with the claim that the cost of office supplies used is an expense. Once the supplies are used, they offer no more future benefit. Similarly, the cost of a building clearly should be capitalized

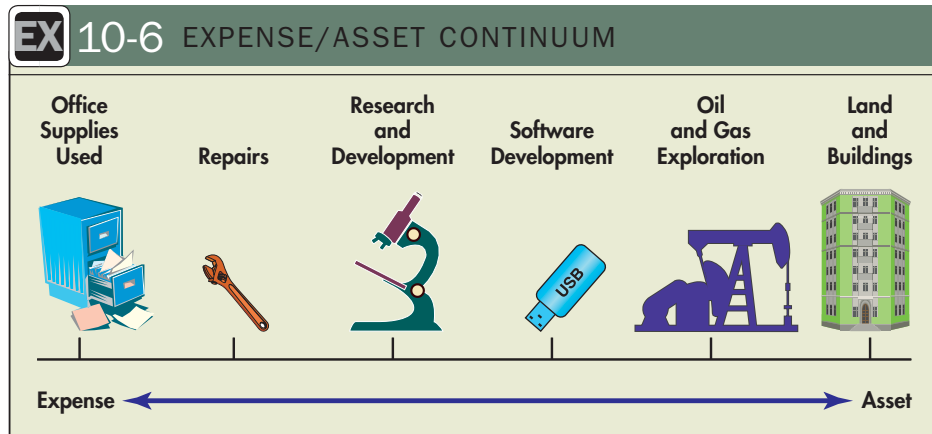

because the building will provide economic benefit in future periods. The endpoints of the continuum are easy, but it is the vast middle ground where accountants must exercise their judgment.

The difficulty with making capitalize-or-expense decisions is that many expenditures have some probability of generating future economic benefit, but uncertainty surrounds that benefit. Research and development expenditures are a good example. Companies spend money on research and development because they expect to reap future benefits. However, there is no guarantee that the benefits will materialize. The following sections

**FYI**

This seemingly simple capitalize-or-expense issue blew up in the face of **WorldCom** in 2002 when it was revealed that the company had capitalized \$3.8 billion in expenditures that it should have expensed. Uproar over this accounting abuse harmed the company’s public image and hastened its bankruptcy, the largest in U.S. history to that time.

© 2012 Cengage Learning.

examine several categories of expenditures to give you practice in analyzing the issues relevant to a capitalize-or-expense decision.

Before examining the conceptual issues, here is one practical note. Many companies establish a lower limit on amounts that will be considered for capitalization to avoid wasting time agonizing about the proper accounting for trivial amounts. Thus, any expenditure under the established limit is always expensed currently even though future benefits are expected from that expenditure. This practice is justified on the grounds of expediency and materiality. Of course, the amount of the limit varies with the size of the company. In the published financial statements of large corporations, for example, amounts are rounded to the nearest million. Detailed accounting for amounts smaller than this will have no impact on the reported numbers. This treatment is acceptable as long as it is consistently applied and no material misstatements arise due to unusual expenditure patterns or other causes.

### Postacquisition Expenditures

Over the useful lives of plant assets, regular as well as special expenditures are incurred. Certain expenditures are required to maintain and repair assets; others are incurred to increase their capacity or efficiency or to extend their useful lives. Each expenditure requires careful analysis to determine whether it should be expensed or capitalized.

The words *maintenance*, *repairs*, *renewals*, *replacements*, *additions*, *betterments*, *improvements*, and *rearrangements* are often used in describing expenditures made in the course of asset use. A more systematic way to view these postacquisition expenditures is how they relate to the components of a recorded piece of property, plant, or equipment.<sup>18</sup> A **component** is a portion of a property, plant, or equipment item that is separately identifiable and for which a separate useful life can be estimated. An example of a component is

<sup>18</sup> AcSEC Exposure Draft, Proposed Statement of Position, "Accounting for Certain Costs and Activities Related to Property, Plant, and Equipment" (New York: American Institute of Certified Public Accountants, June 29, 2001). On April 14, 2004, the FASB met to consider the AcSEC's final proposed Statement of Position (SOP). The Board objected to the release of the SOP, so it was withheld. Among other things, the Board members thought that intercompany differences in defining "components" would result in a lack of comparability of financial statements. The FASB may undertake a review of the accounting for property, plant, and equipment in conjunction with its general effort to increase international convergence. Ultimately, the concept of a "component" of a certain item of property, plant, or equipment may not be retained by the FASB. However, the "component" approach is part of International Financial Reporting Standards; see IAS 16, par. 43.

## EX 10-7 SUMMARY OF EXPENDITURES SUBSEQUENT TO ACQUISITION

Type of Expenditure	Definition	Accounting Treatment
Maintenance and repairs	Normal cost of keeping property in operating condition.	Expense as incurred because the cost is intended to keep an existing component in working order.
Renewals and replacements:		
1. No extension of useful life or increase in future cash flows.	Unplanned replacement. Expenditure needed to fulfill original plans.	Expense as incurred; no new component acquired.
2. Extends useful life or increases future cash flows.	Improvement resulting from replacement with better component.	Replacement of a component. Capitalize the cost of the new component. The remaining book value of the replaced component is added to depreciation expense for the period.
Additions and betterments	Expenditures that add to asset usefulness by either extending life or increasing future cash flows.	Account for as a separate component of the asset with a separate estimated useful life.

© 2012 Cengage Learning.

the heating and cooling system of a building. The acquisition cost of this system can be separately identified, and typically the heating and cooling system has a different life than the building itself. In accounting for postacquisition expenditures, the important consideration is whether the expenditure results in the replacement of an existing component, the addition of a component, or is merely intended to maintain an existing component in working order. Exhibit 10-7 summarizes the accounting for these postacquisition expenditures.

**Maintenance and Repairs** Expenditures to maintain plant assets in good operating condition are referred to as **maintenance**. Among these are expenditures for painting, lubricating, and adjusting equipment. Maintenance expenditures are ordinary, recurring, and do not improve the asset or add to its life; therefore, they are recorded as expenses when they are incurred.

Expenditures to restore assets to good operating condition upon their breakdown or to restore and replace broken parts are referred to as **repairs**. These are ordinary and recurring expenditures that benefit only current operations; thus, they also are charged to expense immediately.

**Renewals and Replacements** Expenditures for overhauling plant assets are frequently referred to as **renewals**. These amounts should be expensed as incurred. Substitutions of parts or entire units are referred to as **replacements**. If a part is removed and replaced with a different part, the cost and accumulated depreciation related to the replaced part should be removed from the accounts, and the remaining book value of the replaced part is added to depreciation expense for the period. If the replacement component has a useful life different from the remaining useful life of the large plant asset of which it is a component, its cost should be accounted for as a separate depreciable asset. To illustrate replacements, assume that Mendon Fireworks Company replaces the roof of its manufacturing plant for \$40,000. Assume that the original cost of the building was \$1,600,000 and it is three-fourths depreciated. If the original roof cost \$20,000, this roof was recorded as part of the building cost, and the new roof is recorded as a separate component. The following entry could be made to remove the undepreciated book value of the old roof and record the expenditure for the new one.

Roof.....	40,000	
Accumulated Depreciation—Buildings (old roof).....	15,000	
Depreciation Expense.....	5,000	
Buildings (old roof).....		20,000
Cash.....		40,000

**Additions and Betterments** Enlargements and extensions of existing facilities are referred to as **additions**. Changes in assets designed to provide increased or improved services are referred to as **betterments**. If the addition or betterment does not involve a replacement of component parts of an existing asset, the expenditure should be capitalized by adding it to the cost of the asset, or, if the new component has a useful life different from the larger asset of which it is a component, establishing a separate asset account for the component. If a replacement is involved, it is accounted for as discussed in the Mendon roof example.

### Research and Development Expenditures

Historically, expenditures for **research and development (R&D)** purposes were reported sometimes as assets and sometimes as expenses. The FASB inherited this problem from the Accounting Principles Board and made this area the subject of its first definitive standard.<sup>19</sup> The Board defined **research** activities as those undertaken to discover new knowledge that will be useful in developing new products, services, or processes or that will result in significant improvements of existing products or processes. Development activities involve the application of research findings to develop a plan or design for new or improved products and processes. **Development** activities include the formulation, design, and testing of products; construction of prototypes; and operation of pilot plants.

Because of the uncertainty surrounding the future economic benefit of R&D activities, the FASB concluded that research and development expenditures should be expensed in the period incurred. Among the arguments for expensing R&D costs is the frequent inability to find a definite causal relationship between the expenditures and future revenues. Sometimes very large expenditures do not generate any future revenue, but relatively small expenditures lead to significant discoveries that generate large revenues. The Board found it difficult to establish criteria that would distinguish between those research and development expenditures that would most likely benefit future periods and those that would not.<sup>20</sup>

Research and development costs include those costs of materials, equipment, facilities, personnel, purchased intangibles, contract services, and a reasonable allocation of indirect costs that are related specifically to research and development activities and that have no alternative future uses. Such activities include the following:

- Research aimed at discovery of new knowledge
- Search for applications of research findings
- Search for possible product or process alternatives
- Design, construction, and testing of preproduction prototypes
- Design, construction, and operation of a pilot plant

Expenditures for certain items having alternative future uses, either in additional research projects or for productive purposes, can be recorded as assets and allocated against future

<sup>19</sup> *Pre-Codification Statement of Financial Accounting Standards No. 2, "Accounting for Research and Development Costs"* (Stamford, CT: Financial Accounting Standards Board, 1974).

<sup>20</sup> FASB ASC paragraphs 730-10-05-1 through 3

projects or periods as research and development expenses. This exception permits the deferral of costs incurred for materials, equipment, facilities, and purchased intangibles, but only if an alternative use can be identified.

### Computer Software Development Expenditures

The FASB's requirement that all R&D costs be expensed seemed particularly ill-suited for the many software developers that sprang up in the early 1980s. The only economic assets owned by these firms were the software they developed, and strict application of pre-Codification *Statement No. 2* dictated that all development costs be expensed. The FASB, with strong support from the SEC, reexamined the R&D issue in the context of software developers and in 1985 issued pre-Codification *Statement No. 86*, "Accounting for the Costs of Computer Software to Be Sold, Leased, or Otherwise Marketed."

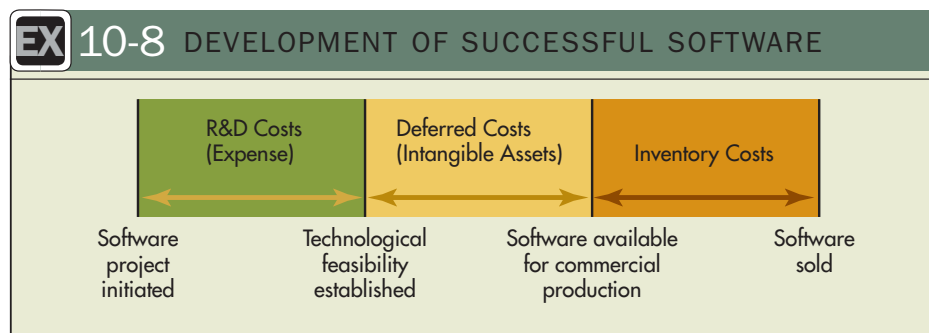

The Board's conclusions concerning computer **software development costs** are summarized in Exhibit 10-8.

As demonstrated by Exhibit 10-8, all costs incurred up to the point where **technological feasibility** is established are to be expensed as research and development. These include costs incurred for planning, designing, and testing activities. In essence, the uncertainty surrounding the future benefits of these costs is so great that they should be expensed. After technological feasibility has been established, uncertainty about future benefits is decreased to the extent that costs incurred after this point can be capitalized. Capitalizable software development costs include the costs of coding and testing done after the establishment of technological feasibility and the cost to produce masters. Additional costs to actually produce software from the masters and package the software for distribution are inventoriable costs and will be expensed as part of cost of goods sold.

Considerable judgment is required to determine when technological feasibility has been established. At a minimum, technological feasibility is attained when an enterprise has produced either of the following:<sup>21</sup>

- A detailed program design of the software, or
- A working model of the software

**International Accounting for Research and Development: IAS 38** The IASB has established an R&D accounting rule that many think is superior to the FASB rule. *IAS 38* requires research costs to be expensed and development costs to be capitalized. *Research costs*, as defined in this standard, are those R&D costs incurred before technical and commercial feasibility has been established, and development costs are those incurred after technical and commercial

© 2012 Cengage Learning.

<sup>21</sup> FASB ASC paragraph 985-20-25-2.

feasibility. As you can see, the FASB rule for the accounting for software development costs is quite similar to the IASB standard for all research and development costs.

**The Future of R&D Accounting in the United States** On April 22, 2004, the FASB and the IASB held a joint meeting to discuss the convergence of their respective sets of accounting standards. One area identified as a candidate for convergence in the short term is the accounting for research and development. To date, the staffs of the FASB and the IASB are still studying this issue. Preliminary indications are that the general approach to R&D accounting in *IAS 38* will be adopted by the FASB, with the IASB borrowing some of the criteria included in pre-Codification FASB *Statement No. 86* (on computer software R&D) in order to make *IAS 38* easier to implement. However, remember that, until the FASB and the IASB come to an agreement on a joint R&D accounting standard, U.S. GAAP requires that all R&D costs be expensed except for post-feasibility computer software development costs.

### Oil and Gas Exploration Costs

The nature of oil exploration is that several dry wells are drilled for each “gusher” that is discovered. The accounting question is whether the cost of the dry holes should be expensed as incurred or whether the costs should be capitalized. Two methods of accounting have been developed to account for oil and gas exploratory costs. Under the **full cost method**, all exploratory costs are capitalized, the reasoning being that the cost of drilling dry

wells is part of the cost of locating productive wells. Under the **successful efforts method**, exploratory costs for dry holes are expensed, and only exploratory costs for successful wells are capitalized. Most large, successful oil companies use the successful efforts method. Exhibit 10-9 contains a description of the successful efforts method given by ExxonMobil in the notes to its 2007 financial statements.

FYI

In 1979, the SEC proposed a new method of accounting for oil and gas exploration called *reserve recognition accounting (RRA)*. RRA was a form of discovery accounting that would have recognized as an asset the value of the oil and gas discovered rather than the cost of the exploration efforts. A form of RRA lives on in the supplemental disclosures required of oil and gas firms.

For smaller companies, the full cost method has been more popular. The claim is that the full cost method encourages small companies to continue exploration by not imposing the severe penalty of recognizing all costs of unsuccessful projects as immediate expenses. Exhibit 10-9 also contains an excerpt from the 2009 financial statements of **Glen Rose Petroleum Corporation**, a small company based in Texas, which drills for oil and gas and accounts for its oil and gas operations using the full cost method.

The issue of how to account for exploratory costs in the oil and gas industry has attracted the attention of the FASB, the SEC, and even the U.S. Congress. When an apparent oil shortage developed in the 1970s, strong pressure was placed on oil companies to expand their exploration to discover new sources of oil and gas. One provision of the Energy Policy and Conservation Act of 1975 was that the SEC establish accounting rules for U.S. firms engaged in the production of oil and gas. The SEC allowed the FASB to take the lead. In 1977, the FASB decided that the successful efforts method (i.e., expense the cost of dry holes) was the appropriate accounting treatment and issued pre-Codification FASB *Statement No. 19*, “Financial Accounting and Reporting by Oil and Gas Producing Companies.”

The uproar over *SFAS No. 19* was immediate and loud. Small independent oil exploration firms argued that using the successful efforts method would require them to

## EX 10-9 EXXONMOBIL AND GLEN ROSE PETROLEUM— EXPLORATION COSTS

### ExxonMobil

The Corporation uses the “successful efforts” method to account for its exploration and production activities. Under this method, costs are accumulated on a field-by-field basis with certain exploratory expenditures and exploratory dry holes being expensed as incurred. Costs of productive wells and development dry holes are capitalized and amortized on the unit-of-production method. The Corporation uses this accounting policy instead of the “full cost” method because it provides a more timely accounting of the success or failure of the Corporation’s exploration and production activities. If the full cost method were used, all costs would be capitalized and depreciated on a country-by-country basis. The capitalized costs would be subject to an impairment test by country. The full cost method would tend to delay the expense recognition of unsuccessful projects.

### Glen Rose Petroleum

We employ the full cost method of accounting for our oil and gas production assets, which are located in the southwestern United States. Under the full cost method, all costs associated with the acquisition, exploration and development of oil and gas properties are capitalized and accumulated in cost centers on a country-by-country basis. The sum of net capitalized costs and estimated future development and dismantlement costs for each cost center is depleted on the equivalent unit-of-production basis using proved oil and gas reserves as determined by independent petroleum engineers.

© 2012 Cengage Learning.

expense costs that they had been capitalizing, resulting in lower profits, depressed stock prices, and more difficulty in getting loans. The Department of Energy held hearings, and the Justice Department’s antitrust division expressed concern. A bill was introduced in the Senate that would have made it *illegal* for the FASB to eliminate the full cost method. The SEC ran for cover and declared that in spite of the FASB standard, financial statements prepared using the full cost method would be acceptable to the SEC. In February 1979, the FASB succumbed to the pressure and issued pre-Codification *SFAS No. 25*, reinstating the full cost method.

The oil and gas controversy is a perfect illustration of the difficulties surrounding the capitalize-or-expense decision. Conceptual arguments can usually be made on both sides of the issue. Some expenditures, such as research and development and oil and gas exploration costs, are covered by specific authoritative pronouncements. Other expenditures, such as repairs or renewals, require accounting judgment. Material in the cases at the end of the chapter allows you to test your judgment on such issues as the accounting for advertising and asbestos removal.

## Accounting for the Acquisition of Intangible Assets

4

Recognize intangible assets acquired separately, as part of a basket purchase, and as part of a business acquisition.

**WHY** Intangible assets comprise an increasing portion of company assets. Because of the very nature of intangible assets, accounting for intangibles requires different rules for valuation and impairment than the rules that apply to tangible noncurrent assets.

**HOW** Internally generated intangible assets are not recognized on the balance sheet. Acquired intangible assets are valued at the amount paid to acquire them. Intangible assets are often acquired in a basket purchase, so the total purchase price is allocated on the basis of the estimated fair values of all of the assets purchased. The fair value of an intangible asset can be estimated by using market prices, by the traditional present value approach, or by the expected cash flow approach.

One of the most striking trends in business in the past 20 years is the increasing importance of intangible assets. This trend has proved to be a difficult challenge for financial reporting. The classic financial reporting model is based on manufacturing and retail companies with a focus on inventory, accounts receivable, buildings, equipment, and so forth. In a world driven by information technology, global brand names, and human capital, this accounting model often excludes the most important economic assets of a business. For example, in 2006, it was estimated that an average of 213 gigabytes of digital information was generated for each man, woman, and child in North America.<sup>22</sup> In 2001, Federal Reserve economist Leonard Nakamura estimated that U.S. companies invest approximately \$1 trillion per year in intangible assets and that the value of the existing stock of intangibles is \$5 trillion.<sup>23</sup> Finally, in 2001, Professor Erik Brynjolfsson of MIT's Sloan School estimated that U.S. companies had invested \$1.3 trillion over the preceding 10 years in their "organization capital," or their processes and ways of doing things effectively and efficiently; this is comparable to the amount those same companies had invested in new equipment and factories over the same period.<sup>24</sup>

In August 1996, the FASB began a project on the accounting for intangibles. The FASB noted, "Intangible assets make up an increasing proportion of the assets of many (if not most) entities, but despite their importance, those assets often are not recognized as such." The result of the FASB's project was a requirement that companies make greater efforts to identify and separately recognize more intangible assets. Theoretically, this requirement has existed since 1970; pre-Codification *APB Opinion No. 17* (paragraphs 24 through 26) stipulated that the cost of identifiable intangible assets should be separately recognized in the financial statements. However, in practice most companies had reported intangibles as an ill-defined conglomeration, with little detail about separate intangibles. The revised standards are contained in FASB ASC 350 (Intangibles—Goodwill and Other).

These revised standards also substantially change the practice of amortizing the cost of intangible assets. Under these standards, many intangible assets are assumed to have indefinite useful lives and thus are not systematically amortized. The amortization (and nonamortization) of intangible assets is discussed in Chapter 11. The different types of intangible assets and the process through which they are recognized are discussed below.

### Internally Generated Intangibles

One thing the new FASB standards do *not* attempt is to require companies to identify and value internally generated, or homegrown, intangibles. In most cases, these are the most valuable intangible assets that a company has. As an illustration, consider Exhibit 10-10, which lists the 10 most valuable brands in the world in 2009. Each of these brands represents a valuable economic asset that was internally generated. For example, the \$68.73 billion Coca-Cola brand name has been created over the years by The Coca-Cola Company through successful business operations and relentless marketing. Because the valuation of this asset is not deemed sufficiently reliable to meet the standard for financial statement recognition, it is not included in The Coca-Cola Company's balance sheet. However, as explained later, if another company were to buy The Coca-Cola Company, an important part of recording the transaction would be allocating the total purchase price to the various economic assets acquired, including previously unrecorded intangible assets.

<sup>23</sup> Leonard I. Nakamura, "What Is the U.S. Gross Investment in Intangibles? (At Least) One Trillion Dollars a Year!" Federal Reserve Bank of Philadelphia, Working Paper No. 01-15, October 2001.

<sup>24</sup> Mark Kindley, "Hidden Assets," *CIO Insight*, October 1, 2001.

**EX 10-10** TEN MOST VALUABLE BRANDS IN THE WORLD FOR 2009

Brand	Brand Value (in billions)
1 Coca-Cola	\$68.73
2 IBM	60.21
3 Microsoft	56.65
4 General Electric	47.78
5 Nokia	34.86
6 McDonald's	32.28
7 Google	31.98
8 Toyota	31.33
9 Intel	30.64
10 Disney	28.45

Source: Interbrand at <http://www.interbrand.com>.

In the future, financial reporting will move toward providing more information about internally generated intangibles. Whether this will involve actual valuation and recognition of these intangibles in the financial statements or simply more extensive note disclosure remains to be seen.

### Intangibles Acquired in a Basket Purchase

A common method of acquiring intangible assets is in conjunction with a collection of associated assets. For example, a company might pay \$700,000 to purchase a patent along with a functioning factory and special equipment used in producing the patented product. Helpful information is lost if the entire \$700,000 purchase price is merely recorded as a generic “asset.” Accordingly, as demonstrated earlier in the chapter with a basket purchase involving only tangible assets, the total purchase price of \$700,000 is allocated among all of the assets, tangible and intangible, according to the relative fair values of the assets. If the fair values of the patent, factory, and equipment are estimated to be \$200,000, \$450,000, and \$100,000, respectively, the \$700,000 cost would be allocated as follows:

	Estimated Fair Values	Cost Allocation According to Relative Estimated Values	Cost Assigned to Individual Assets
Patent	\$200,000	$200,000/750,000 \times \$700,000$	\$186,667
Factory	450,000	$450,000/750,000 \times \$700,000$	420,000
Equipment	100,000	$100,000/750,000 \times \$700,000$	93,333
	<u>\$750,000</u>		<u>\$700,000</u>

**Five General Categories of Intangible Assets** To aid companies in identifying different types of intangible assets that should be recognized separately, in FASB ASC Section 805-20-55, the FASB includes a description of five general categories of intangible assets. Those five general categories are:

1. *Marketing-related* intangible assets such as trademarks, brand names, and Internet domain names.
2. *Customer-related* intangible assets such as customer lists, order backlogs, and customer relationships.
3. *Artistic-related* intangible assets such as items protected by copyright.

## CAUTION

Of course, an intangible can be acquired by itself. If a company buys a single intangible asset, the purchase price allocation is simple: The entire purchase price is recorded as the cost of the single intangible asset.

4. *Contract-based* intangible assets such as licenses, franchises, and broadcast rights.
5. *Technology-based* intangible assets including both patented and unpatented technologies as well as trade secrets.

These five categories do not comprise a comprehensive catalogue of all possible intangible assets. In addition, the identification of intangibles should not be viewed as merely matching up an acquired basket of assets with items from the FASB's list. As with all other assets, intangible assets must meet specific criteria to be recognized. The conceptual background for those criteria is laid out in *Concepts Statement No. 5* (paragraph 63), which indicates that to be recognized as an asset, an item must have probable future economic benefit, must be relevant to decision makers, and must be reliably measurable. In addition, intangible assets must be identifiable in order to be separately recognized in the financial statements. The criterion of identifiability is presumed to be satisfied with intangibles that are based on contracts or that are separately traded.

**Contract-Based Intangibles** Most of the intangible assets briefly described at the beginning of this chapter arise from contracts or other legal rights. Examples are trademarks, patents, copyrights, and franchise agreements. An intangible asset that is based on contractual or legal rights should be recognized as a separate asset, even if the right is inseparably connected with another asset. For example, the legal right to operate a specific nuclear power plant would often be sold with the nuclear power plant itself. Although these assets are not practically separable, the right to operate the factory is established by a specific legal permit and should be valued and reported separately in the books of the company that acquires the plant.

**Separately Tradable Intangibles** Some intangible assets arise as companies establish and maintain relationships of trust with their customers. These relationships are not imposed by legal right or contract but are voluntary and are based on past positive experiences. Companies are increasingly recognizing the value in these relationships and are even learning how to sell or rent these relationships. One example is the sale (exclusive use) or rental (nonexclusive use) of a customer database to another company. The fact that there is a market for these databases is taken as evidence that intangibles of this sort are reliably measurable assets that should be recognized as a separate asset when acquired by a company. Another example is the relationship a bank has with its depositors. Although these relationships themselves are not typically traded in separate transactions, they are inherent

in the trading of portfolios of customer deposits. When a bank acquires a set of depositor liabilities from another bank, included in that transaction is the transfer of the depositor relationships to the acquiring bank. In such a transaction, a fair value should be estimated for the depositor relationships and a separate intangible asset recognized.

## FYI

One of the dangers in these tradable intangibles is that the very relationship of trust that created the valuable intangible in the first place may be impaired when it is sold. For example, subscribers to a magazine may cancel their subscription when they learn that the magazine publisher has sold their subscriber database to a telemarketing firm or a political fund-raising organization.

### Estimating the Fair Value of an Intangible

The most difficult part of recording an amount for an intangible asset is not in identifying the asset but in estimating its fair value. The objective in estimating the fair value is to duplicate the price at which the intangible asset would change hands in an arm's-length market transaction. If there is a market for similar intangible assets, the best estimate of fair value

is made with reference to these observable market prices. In the absence of such a market, present value techniques should be used to estimate the fair value. As described in *Concepts Statement No. 7*, the present value of future cash flows can be used to estimate fair value in one of two ways. In the traditional approach, which is often used in situations in which the amount and timing of the future cash flows are determined by contract, the present value is computed using a risk-adjusted interest rate that incorporates expectations about the uncertainty of receipt of the future contractual cash flows. In the expected cash flow approach, a range of possible outcomes is identified, the present value of the cash flows in each possible outcome is computed (using the risk-free interest rate), and a weighted-average present value is computed by summing the present value of the cash flows in each outcome, multiplied by the estimated probability of that outcome. To illustrate the traditional and the expected cash flow approaches, consider the following two examples.

**Traditional approach:** Intangible Asset A is the right to receive royalty payments in the future. The future royalty cash flows are \$1,000 at the end of each year for the next five years. The risk-free interest rate is 5%; the receipt of these royalty cash flows is not certain, so a risk-adjusted interest rate of 12% is used in computing their present value. The fair value of Intangible Asset A is estimated as follows:

Business calculator keystrokes  
 $N = 5$  years  
 $I = 12\%$   
 $PMT = \$1,000$   
 $FV = \$0$  (there is no additional payment at the end of five years)  
 $PV = \$3,605$

If Intangible Asset A is acquired as part of a basket purchase with other assets, this \$3,605 amount would be used as the estimated fair value of the intangible asset in the allocation of the total purchase price.

**Expected cash flow approach:** Intangible Asset B is a secret formula to produce a fast-food cheeseburger that contains 25 essential vitamins and minerals, reduces cholesterol levels, and replenishes the ozone

layer. Future cash flows from the secret formula are uncertain; the following estimates have been generated, with the associated probabilities:

- Outcome 1 10% probability of cash flows of \$5,000 at the end of each year for 10 years
- Outcome 2 30% probability of cash flows of \$1,000 at the end of each year for 4 years
- Outcome 3 60% probability of cash flows of \$100 at the end of each year for 3 years

i

FYI

In forming a corporation, certain organization costs are incurred, including legal fees, promotional costs, stock certificate costs, underwriting costs, and state incorporation fees. It can be argued that the benefits to be derived from these expenditures extend beyond the first fiscal period. However, the AICPA, with the approval of the FASB, has decided that organization costs (and the costs associated with other types of start-up activities) should be expensed as they are incurred. See FASB ASC paragraph 720-15-25-1.

i

FYI

In the traditional approach to computing present values, all of the “art” goes into determining the appropriate risk-adjusted interest rate.

In the expected cash flow approach, the uncertainty of the future cash flows is not reflected in a risk-adjusted interest rate but is incorporated through the assessment of the various possible outcomes and the probabilities of each. Thus, the risk-free interest rate (5% in this case) is used in computing the present value of the cash flows in each outcome:<sup>25</sup>

	Present Value	Probability	Probability Weighted Present Value
Outcome 1 . . . . .	\$38,609	0.10	\$3,861
Outcome 2 . . . . .	3,546	0.30	1,064
Outcome 3 . . . . .	272	0.60	163
Total estimated fair value . . . . .			<u>\$5,088</u>

To summarize, the fair value of an intangible can be determined by referring to market prices, by computing present value using the traditional approach, or by computing present value using the expected cash flow approach. Again, these present value computation procedures are reviewed in the Time Value of Money Module of this text.

**Acquired In-Process Research and Development** One valuable intangible sometimes involved when one company purchases a collection of assets from another is existing research and development projects, often called *acquired in-process R&D*. For example, on October 1, 2001, **Bristol-Myers Squibb**, a large pharmaceuticals company, acquired the pharmaceuticals division of **DuPont** for \$7.8 billion. Of this amount, \$2.009 billion was associated with five ongoing research projects, as described in the following financial statement note:

The [\$2.009 billion] charge was associated with five research projects in the Cardiovascular, Central Nervous System, Oncology, and Anti-Infective therapeutic areas ranging from the preclinical to the phase II development stage. The amount was determined by identifying research projects for which technological feasibility has not been established and for which there is no alternative future use. The projected FDA approval dates are years 2005 through 2008, at which time the Company expects these projects to begin to generate cash flows. The cost to complete these research projects is estimated at \$1.2 billion.

Acquired in-process R&D creates a somewhat embarrassing situation for financial accountants in the United States. As mentioned earlier in the chapter, under U.S. GAAP normal R&D costs are expensed as incurred. The rationale behind this treatment is that there is too much uncertainty over the future economic value of research and development. However, as demonstrated in the Bristol-Myers Squibb case, the value of ongoing R&D can be verified in a market transaction. On this issue, the FASB has provided inconsistent answers. In summary, in-process R&D is to be recognized as an intangible asset if it is acquired as part of a business combination but is to be expensed if acquired as part of a basket purchase outside of a business combination.<sup>26</sup>

<sup>25</sup> In applying the expected cash flow approach, we really should take the analysis one step further and convert the expected cash flows into “certainty equivalents.” The basic idea is that there is a lower amount of cash that you would accept for sure in exchange for a higher, uncertain amount. We will leave this more complete “certainty equivalent” analysis to a more detailed course in valuation.

This patchwork approach is a perfect illustration of two general forces operating in the development of U.S. GAAP: (1) the steady influence of the desire for the FASB and the IASB to converge on a common set of high-quality international accounting standards and (2) the great caution of accountants in general and the FASB in particular when considering any change to long-standing practice. The FASB has stated that it intends to revisit this inconsistency in the future.

To summarize this section on the acquisition of intangibles as part of a basket purchase, the key point is that it is important to itemize and recognize intangible assets separately as much as possible. The total purchase price is allocated to the intangible assets according to their relative fair values. As discussed in Chapter 11, some of these intangibles will be amortized and some will not.

### Intangibles Acquired in the Acquisition of a Business

In the previous section, we discussed the acquisition of intangible assets as part of a basket purchase. In this section we cover the acquisition of an entire company. When one company acquires another, the acquiring company pays for an assorted collection of tangible assets, liabilities, identifiable intangible assets, and usually an additional intangible asset, goodwill, that is essentially the synergistic value of the acquired business that can't be associated with any specific tangible or intangible asset.

One objective of the FASB standards on accounting for a business acquisition (also called a business combination) is to curtail the use of the goodwill asset account as a “kitchen sink” containing a hodgepodge of costs that would more appropriately be allocated to individual intangible assets. **Goodwill** is best thought of as a residual amount, the amount of the purchase price of a business that is left over after all other tangible and intangible assets have been identified. As such, goodwill is that intangible something that makes the whole company worth more than its individual parts. In general, goodwill represents all of the special advantages, not otherwise separately identifiable, enjoyed by an enterprise, such as a high credit standing, reputation for superior products and services, experience with development and distribution processes, favorable government relations, and so forth. These factors allow a business to earn above normal income with the identifiable assets, tangible and intangible, employed in the business.

The accounting for the acquisition of an entire company is very similar to the accounting for a basket purchase; the total purchase price is allocated to all of the acquired items in accordance with their estimated fair values. A key difference in the accounting for acquisition of a basket of assets and acquisition of an entire business is as follows:

- The acquisition cost is not allocated in proportion to the fair values of the identifiable assets. Instead, each identifiable asset is recorded at an amount equal to its estimated fair value; any residual is reported as goodwill.

In determining fair values of assets and liabilities for the purpose of allocating the overall acquisition price, current market values should be sought rather than the values reported in the accounts of the acquired company. Receivables should be stated at amounts expected to be realized. Inventories and securities should be restated in terms of current market values. Land, buildings, and equipment may require special appraisals in arriving at their fair values. Intangible assets, such as patents and franchises, should be included at their estimated fair values whether or not they were recorded as assets on the books of the acquired company. Care should be taken to determine that liabilities are fully recognized.

<sup>26</sup> See FASB ASC paragraphs 350-30-35-17A, 805-20-35-5, and 730-10-25-1 and 2.

To the extent possible, the amount paid for any existing company should be related to identifiable assets. If an excess does exist, it is recognized as an asset and called *goodwill* or “cost in excess of fair value of net assets acquired.”

To illustrate the recording of the purchase of an ongoing business, assume that Airnational Corporation purchases the net assets of Speedy Freight Airlines for \$1,500,000 in cash. A schedule of net assets for Speedy Freight, as recorded on Speedy Freight’s books at the time of acquisition, follows.

<b>Assets</b>			
Cash .....		\$ 37,500	
Receivables .....		246,000	
Inventory .....		392,000	
Land, buildings, and equipment (net) .....		<u>361,200</u>	
			\$1,036,700
<b>Liabilities</b>			
Current liabilities .....		\$ 86,000	
Long-term debt .....		<u>183,500</u>	269,500
Book value of net assets .....			<u>\$ 767,200</u>

Analysis of the \$732,800 difference between the purchase price of \$1,500,000 and the net asset book value of \$767,200 ( $\$1,036,700 - \$269,500$ ) reveals the following differences between the recorded costs and market values of the assets:

	<b>Cost</b>	<b>Market</b>
Inventory .....	\$392,000	\$ 427,000
Land, buildings, and equipment .....	361,200	389,500
Patents .....	0	50,000
Purchased in-process R&D .....	0	400,000
Totals .....	<u>\$753,200</u>	<u>\$1,266,500</u>

The identifiable portion of the \$732,800 difference amounts to \$513,300 ( $\$1,266,500 - \$753,200$ ) and is allocated to the respective items. The remaining difference of \$219,500 ( $\$732,800 - \$513,300$ ) is recorded as goodwill.

The entry to record the purchase is shown below. The estimated fair value associated with purchased in-process research and development projects is recognized as a separate intangible asset, consistent with the treatment of other research and development expenditures.

Cash .....	37,500	
Receivables .....	246,000	
Inventory .....	427,000	
Land, Buildings, and Equipment .....	389,500	
Patents .....	50,000	
In-Process R&D Asset .....	400,000	
Goodwill .....	219,500	
Current Liabilities .....		86,000
Long-Term Debt .....		183,500
Cash .....		1,500,000

After it is recognized, goodwill is left on the books at its originally recorded amount unless there is evidence that its value has been impaired. As mentioned earlier, this treatment is viewed by some as a compromise by the FASB. Whether goodwill should be amortized is an interesting theoretical discussion, but the existing standard says that goodwill is not to be amortized. Goodwill impairment is discussed in Chapter 11.

Notice that the patent asset was not recorded on the books of Speedy Freight before the acquisition. This could be because the patent cost had been fully amortized or because the patent had been developed through in-house research and development and all of those costs had been immediately expensed. However, when Speedy Freight is acquired, the patent is recognized as an identifiable economic asset.

The Speedy Freight example was simplified because Airnational purchased 100% of Speedy Freight. The accounting is changed a little if Airnational were to purchase, say, only 80% of Speedy Freight. All of the acquired assets, including goodwill, are still recognized at 100% of their fair values, but an additional item, called *noncontrolling interest*, is recognized to represent the outside ownership of the nonpurchased 20% of Speedy Freight. Noncontrolling interest is reported in the Equity section of the acquiring company's balance sheet; this topic is covered in Chapter 13.

Because goodwill is recorded on the books only when another company is acquired, one must be careful in interpreting a company's reported goodwill balance. The reported goodwill balance does not reflect the company's own goodwill but the goodwill of other companies it has acquired. So, **Microsoft's** goodwill is not recognized on Microsoft's balance sheet, nor is **PepsiCo's** goodwill shown on the balance sheet of PepsiCo. There is substantial goodwill on Pepsi's balance sheet, but that has arisen from the acquisitions of other companies, such as **Frito Lay**. Thus, companies with sizable economic goodwill may have no recorded goodwill at all, and the goodwill that a company does report was developed by someone else. Current accounting principles may result in misleading users of financial statements as far as goodwill is concerned. On the other hand, to allow companies to place a value on their own goodwill and record this amount on the balance sheet would introduce a significant amount of added subjectivity to the financial statements.

**Bargain Purchase** Occasionally, the amount paid for another company is less than the fair value of the net identifiable items of the acquired company. This condition can arise when the existing management of a company is using the assets in a suboptimal fashion. When this **bargain purchase** exists, the acquiring company should first review all of the fair value estimates to make sure that they are reliable. If after doing this there is still an excess of identifiable net fair value over the purchase price, any remaining excess is recognized as a gain.

To illustrate, assume that the Speedy Freight acquisition described earlier was for \$1,000,000 instead of \$1,500,000. The acquisition is recorded as follows:

Cash .....	37,500	
Receivables .....	246,000	
Inventory .....	427,000	
Land, Buildings, and Equipment .....	389,500	
Patents .....	50,000	
In-Process R&D Asset .....	400,000	
Gain .....		280,500
Current Liabilities .....		86,000
Long-Term Debt .....		183,500
Cash .....		1,000,000

**International Accounting for Intangibles: IAS 38 and IFRS 3** The IASB's standard for the accounting for intangible assets is *IAS 38*. This IASB standard is very much compatible with U.S. GAAP. The international accounting standard for business combinations, *IFRS 3*, is also quite similar to the U.S. standard. This similarity in the accounting for intangibles is not accidental; the FASB and IASB worked jointly on their business combinations standards in order to eliminate almost all differences in accounting for the related intangible assets. In addition, the FASB worked with several non-U.S. standard setters in developing its standards on goodwill and intangibles. The most significant differences between U.S. GAAP and IASB standards in the accounting for intangible assets are in the testing of these assets for impairment. This topic is covered in Chapter 11.

## FASB CODIFICATION

**The Issue:** You are the accountant for a company in the carpet cleaning business. Because of your company's innovative cleaning system (no harsh detergents, no damaging brushes, and extremely small carbon footprint), you have been very successful and have begun to drive your competitors out of business. In fact, just today your company's CEO has decided to start buying a number of your competitors. As you walked out the door at the end of the day, she said: "You had better learn how to account for a bargain purchase."

**The Question:** What is a bargain purchase, and why is a bargain purchase likely to arise in this situation?

**Searching the Codification:** Bargain purchases are covered in this chapter, but you would like to show your boss that you can find accounting standards for yourself in the authoritative literature. The best place to start is in Topic 805 (Business Combinations), which is in the "Broad Transactions" collection of topics.

**The Answer:** The authoritative accounting standards relative to bargain purchases are described on page 10-43.

## Valuation of Assets at Fair Values

5

Discuss the pros and cons of recording noncurrent operating assets at their fair values.

**WHY** IASB standards allow the upward revaluation of noncurrent operating assets. In a choice of reliability over relevance, U.S. accounting standards do not allow such upward revaluation.

**HOW** In those international standards allowing upward revaluation of noncurrent operating assets, the asset account is increased based on an assessment of the asset's fair value with the corresponding credit being made to a special equity account.

Throughout this chapter, the valuation of assets has been based on historical costs. As discussed in Chapter 1, asset measurement is frequently a trade-off between relevance and reliability. Historical cost is a reliable number, but the fair value of noncurrent assets can be more relevant.

The reduction in the recorded amount of noncurrent operating assets that have declined in value has long been part of generally accepted accounting principles. Writing down assets to recognize market value declines is a reflection of the conservative bias

that is a fundamental part of accounting practice. The rules governing these impairment write-downs are discussed in Chapter 11. On the other hand, asset write-ups have not been generally accepted in recent times. Before the formation of the SEC in 1934, it was common for U.S. companies to report the upward revaluation of property and equipment. However, by 1940 the SEC had effectively eliminated this practice, not by explicitly banning it but through informal administrative pressure. Much of the suspicion about asset revaluations stemmed from a Federal Trade Commission investigation, completed in 1935, that uncovered a number of cases in the public utility industry in which a utility had improperly revalued assets upward to boost its rate base. In the late 1980s, the absence of advance warning of the \$500 billion collapse of the savings and loan (S&L) industry was blamed in part on the failure of S&Ls to report current market values of their loan portfolios. Reexamination of the accounting for financial institutions led to pre-Codification FASB *Statement No. 115*, which required most investment securities to be reported at their current market values; this provision continues in FASB ASC Topic 320. It is likely that the continuing call by financial statement users for current value information will result in a reconsideration of the appropriateness of historical cost accounting for noncurrent operating assets. In fact, between 1980 and 1986 the FASB required large companies to report the current value of noncurrent operating assets in a note to the statements.

In *IAS 16*, the IASB permits the inclusion of upward revaluations of noncurrent operating assets in the financial statements as an allowable alternative to reporting the historical cost of those assets. Because fair values are often based on subjective appraisals rather than objective historical cost, accountants and auditors have traditionally been concerned that companies might use upward asset revaluations to artificially boost reported balance sheet and income statement values. This concern is reflected in the careful rules laid out in *IAS 16*, some of which are summarized here.

- If a company revalues its noncurrent operating assets to fair value, it must do so on a regular basis (not as a one-time event) and must revalue entire classes of assets rather than just picking and choosing certain assets in an effort to report the fair values of only those assets that have increased in value.
- Downward revaluations are recorded as a loss.
- Upward revaluations are recorded as a debit to the asset and a credit to a special “revaluation” equity account. This practice means that upward revaluations cannot be used to boost reported income. In addition, when an asset that has been revalued upward is subsequently sold, any associated balance in the special revaluation equity account is credited directly to retained earnings and is not reported as an income statement gain. The implication of this accounting treatment is that the choice to recognize the increase in the value of a noncurrent operating asset through an asset revaluation means that the increase will never be reported in the income statement as a gain, even when the asset is sold.

## STOP & THINK

Which ONE of the following statements is true regarding the fair value of noncurrent operating assets?

- a) International standards prohibit companies from recognizing the fair value of noncurrent operating assets.
- b) The fair value of noncurrent operating assets can be estimated by professional appraisers, just as the pension liability is currently estimated by actuaries.
- c) The fair value of noncurrent operating assets is not relevant information to most financial statement users.

One example of a company that revalues its assets on an annual basis is **Bank of China (Hong Kong) Limited** (BOC). The company indicates in the notes to its financial statements that valuations are done at least annually by external independent appraisers. As of December 31, 2009, the reported net amount of land and buildings (“premises”) for BOC was HK\$23.7 billion. This number is a mix of historical cost numbers and amounts obtained from professional revaluations. Without the revaluations, the net amount of land and buildings would have been HK\$12.1 billion. Further explanation of the accounting for upward asset revaluations is given in Chapter 11.

IASB standards also allow investment property to be reported at fair value in the balance sheet. According to the provisions of *IAS 40*, investment property is land or a building that is held in order to earn rentals or for price appreciation, or both. This investment property can be accounted for using the traditional cost method. Alternatively, under *IAS 40*, a company can elect to use a fair value approach in which the investment property is reported in the balance sheet at its fair value, and any resulting gains or losses are reported in the income statement. This option is very important to real estate companies which are in business to make money through price appreciation; requiring these companies to report investment property at cost in the balance sheet conceals key operating information.

## Measuring Property, Plant, and Equipment Efficiency

**6** Use the fixed asset turnover ratio as a general measure of how efficiently a company is using its property, plant, and equipment.

**WHY** Financial ratios allow comparisons to be made across companies and for the same company over time. Information relating to property, plant, and equipment usage allows users to determine how efficiently a company uses its noncurrent operating assets.

**HOW** A common measure of long-term asset efficiency is to determine how many sales dollars are generated by each dollar of property, plant, and equipment (also called fixed assets). When using this ratio, caution must be exercised to ensure that the resulting number is useful for comparison purposes because reported property, plant, and equipment values are sometimes substantially less than the fair values of the assets.

The result of proper capital budgeting analysis should be a level of property, plant, and equipment that is appropriate to the amount of sales a company is doing. As with any other asset, excess funds tied up in the form of property, plant, and equipment reduce a company’s efficiency, increase financing costs, and lower return on equity.

In this section, we discuss the **fixed asset turnover ratio**, which uses financial statement data to roughly indicate how efficiently a company is utilizing its property, plant, and equipment to generate sales. We also illustrate that careful interpretation of the fixed asset turnover ratio is necessary because the recorded book value of long-term operating assets can differ significantly from the actual value of those assets.

### Evaluating the Level of Property, Plant, and Equipment

Fixed asset turnover ratio is computed as sales divided by average property, plant, and equipment (fixed assets) and is interpreted as the number of dollars in sales generated by each dollar of fixed assets. This ratio is also called *PP&E turnover*. The computation of

the fixed asset turnover ratio for General Electric is given below. (All financial statement numbers are in millions.)

The fixed asset turnover ratios suggest that General Electric was more efficient at using its fixed assets to generate sales in 2008 than it was in 2009. In 2009, each dollar of fixed assets generated \$2.12 in sales, down from \$2.33 in 2008.

	2009	2008
Sales .....	\$156,783	\$182,515
Property, plant, and equipment:		
Beginning of year .....	\$78,530	\$77,888
End of year .....	\$69,212	\$78,530
Average fixed assets [(beginning balance + ending balance) ÷ 2] .....	\$73,871	\$78,209
Fixed asset turnover ratio .....	2.12	2.33

### Dangers in Using the Fixed Asset Turnover Ratio

As with all ratios, the fixed asset turnover ratio must be used carefully to ensure that erroneous conclusions are not made. For example, fixed asset turnover ratio values for two companies in different industries cannot be meaningfully compared. This point can be illustrated using the fact that General Electric is composed of two primary parts: General Electric, the manufacturing company, and **GE Capital Services**, the financial services firm. The fixed asset turnover ratio computed earlier was for both parts. Because GE Capital Services does not use property, plant, and equipment for manufacturing but leases assets to other companies to earn financial revenue, one would expect GE Capital Services' fixed asset turnover ratio to be quite unlike that for a manufacturing firm. In fact, as shown next, the fixed asset turnover ratio for the manufacturing segments of General Electric was 7.89 times in 2009, more than triple the ratio value for the entire company.

Fixed Asset Turnover Ratio General Electric—Manufacturing Segments Only		
	2009	2008
Sales .....	\$106,226	\$121,753
Property, plant, and equipment:		
Beginning of year .....	\$14,433	\$14,142
End of year .....	\$12,495	\$14,433
Average fixed assets [(beginning balance + ending balance) ÷ 2] .....	\$13,464	\$14,288
Fixed asset turnover ratio .....	7.89	8.52

Another difficulty in comparing values for the fixed asset turnover ratio among different companies is that the reported amount for property, plant, and equipment can be a poor indicator of the actual fair value of the fixed assets being used by a company. As discussed earlier, the accounting rules in the United States require fixed assets to be written down when their value is impaired but do not allow the writing up of fixed asset amounts to reflect increases in fair value. This creates a comparability problem

## STOP & THINK

Why did Safeway's accumulated depreciation decrease so dramatically from 1985 to 1986?

- The accumulated depreciation balance fluctuates depending on the current values of property, plant, and equipment.
- The accumulated depreciation balance represented a large cash amount that was used to finance the leveraged buyout.
- When company ownership changes, as in a leveraged buyout, the existing assets are recorded as if they had just been purchased at their fair values (as in a business combination).
- According to the U.S. tax code, accumulated depreciation is a deferred tax item that must be reduced when a company experiences a leveraged buyout.

when one company has relatively new fixed assets, which are recorded at close to market value, and another company has older fixed assets, which are recorded at depreciated historical cost values that may significantly understate the real value of the assets.

A graphic illustration of this comparability problem is provided by **Safeway**, the supermarket chain. Safeway was taken private in a leveraged buyout near the end of 1986. When the leveraged buyout occurred, Safeway became a new company, for accounting purposes at least, and Safeway's assets were

restated to their current market values as of the leveraged buyout date. This provides a rare opportunity to see how significantly the fixed asset turnover ratio is impacted by whether a company has its fixed assets recorded at market values or at depreciated historical cost. Listed below are the cost, accumulated depreciation, and fixed asset turnover ratios for Safeway for 1985, just before the leveraged buyout, and 1986, just after the leveraged buyout.

Safeway had almost the same fixed assets in place at the end of 1986 as it had at the end of 1985; the difference in the reported numbers is due almost entirely to the revaluation that took place as part of the leveraged buyout. Notice that the book value of Safeway's fixed assets increased by more than \$1 billion from 1985 to 1986. This increase reflects the impact of reporting the fixed assets at market value rather than at depreciated historical cost. Also, note the significant decline in the computed fixed asset turnover ratio: from 7.45 in 1985 to 5.44 in 1986. Actually, Safeway's use of its fixed assets was almost exactly the same in 1986 as it had been in 1985; the difference in the ratio is caused by the use of the artificially low depreciated cost numbers in 1985 to compute the ratio. In summary, the fixed asset turnover ratio can be significantly impacted by the difference between the market value of fixed assets and their reported depreciated cost. For some companies, this difference can be very large indeed.

	1986	1985
Cost . . . . .	\$3,854	\$4,641
Less: Accumulated depreciation . . . . .	120	2,004
Book value . . . . .	<u>\$3,734</u>	<u>\$2,637</u>
Fixed asset turnover ratio . . . . .	5.44	7.45

Another complication with analysis using the fixed asset turnover ratio is caused by leasing. As will be discussed in Chapter 15, many companies lease the bulk of their fixed assets, and, as a result, many of these assets are not included in their balance sheets. This biases the fixed asset turnover ratio for these companies upward because the sales generated by the leased assets are included in the numerator of the ratio but the leased assets generating the sales are not included in the denominator.

## SOLUTIONS TO OPENING SCENARIO QUESTIONS

1. When Jerry Jones purchased the Dallas Cowboys for \$150 million, his accountants were then faced with the problem of allocating this \$150 million purchase price among the many and varied assets of the Cowboys such as miscellaneous football equipment, stadium leases, radio and TV broadcast rights, cable TV rights, luxury stadium suites, player contracts, a lease on the Cowboys' luxurious Valley Ranch training facility, and the Cowboys' NFL franchise rights.
2. The desire to allocate as much of the purchase price as possible to the asset "players' contracts" is motivated by tax considerations. The asset players' contracts can be written off over four years for tax purposes, thus accelerating the tax break associated with depreciation of some or all of the original purchase price.

## SOLUTIONS TO STOP & THINK

1. (Page 10-16) The answer is D. Capitalized interest is not extra interest. If a company were to forget to capitalize interest that should be capitalized, interest expense would be overstated and long-term assets would be understated. Total cash flow would be unaffected, but cash from operations would be understated and cash from investing activities would be overstated.
2. (Page 10-39) The answer is B. It is unlikely that within the next 10 years U.S. companies will be required to recognize the current value of property, plant, and equipment, although such revaluation is allowable under international accounting standards. The historical cost tradition is strong in the United States, and the FASB is having enough trouble getting the business community to accept the recognition of the fair value of financial instruments and derivatives. But fair value recognition of property, plant, and equipment is only a matter of time—the information is very relevant and can be estimated by professional appraisers, just as the pension liability is currently estimated by actuaries.
3. (Page 10-42) The answer is C. One event that reduces accumulated depreciation is the disposal of old assets. This is not what happened to Safeway between 1985 and 1986. Instead, when Safeway's assets were revalued in late 1986, the accumulated depreciation account was set to zero. It was as if Safeway had disposed of all of its old assets and then repurchased them at their current market values.

## SOLUTION TO USING THE FASB'S CODIFICATION

Under Topic 805 (Business Combinations), you should have seen Subtopic 805-30 (Goodwill or Gain from Bargain Purchase, Including Consideration Transferred). Section 805-30-25 includes material on "Gain from Bargain Purchase." With respect to the circumstances under which a bargain purchase might occur, the following is contained in FASB ASC paragraph 805-30-25-3: "A bargain purchase might happen, for example, in a business combination that is a forced sale in which the seller is acting under compulsion." In this particular case, your CEO

expects to be able to buy her struggling competitors for a low price.

As explained in the textbook, if the purchase price is less than the fair value of the net assets of the acquired company, the difference is recognized as a "gain in earnings on the acquisition date" [FASB ASC paragraph 805-30-25-2]. In past years, this gain has sometimes been called "negative goodwill," representing the negative value associated with the acquired company created by poor management, poor reputation, and poor operating circumstances.

# REVIEW CHAPTER 10

## LEARNING OBJECTIVES

- 1** Identify those costs to be included in the acquisition cost of different types of noncurrent operating assets.

The cost of tangible noncurrent operating assets includes not only the original purchase price or equivalent value but also any other expenditures required in obtaining and preparing the asset for its intended use. For example, land cost includes surveying fees and the cost of removing old buildings. Equipment cost includes the costs of testing and installation.

Intangible noncurrent operating assets are also generally recorded at cost. The cost is the purchase price if copyrights, patents, or trademarks are purchased from another company. For internally generated intangibles, the cost often includes only the actual legal and filing costs, as well as any cost to successfully defend the rights in court.

- 2** Properly account for noncurrent operating asset acquisitions using various special arrangements, including deferred payment, self-construction, and acquisition of an entire company.

- *Basket purchase.* Acquisition cost is allocated to the various assets based on the relative fair values of the assets.
- *Deferred payment.* The acquisition is recorded at the discounted present value of the payments.
- *Leasing.* Property leased under a capital lease is recognized as an asset; property leased under an operating lease is not included in the balance sheet.
- *Exchange of nonmonetary assets.* The transaction is recorded at the fair value of the asset received or the asset given, whichever is more clearly determinable.
- *Acquisition by issuing securities.* The transaction is recorded at the fair value of the asset acquired or the securities issued, whichever is more clearly determinable.

- *Self-construction.* The cost of self-constructed assets includes an allocation of overhead and the cost of interest incurred to finance the construction. The amount of capitalized interest is an estimate of interest that could have been avoided if the construction expenditures had been used to repay loans instead.
- *Acquisition by donation or discovery.* Assets received as donations are recorded as revenue in an amount equal to the fair value of the assets. Discovered assets are not recognized.
- *Acquisition and an associated asset retirement obligation.* The estimated fair value of the asset retirement obligation is recognized as a liability and added to the cost of the asset acquired.
- *Acquisition of an entire company.* In a business combination accounted for as a purchase, acquired assets are recorded at their fair values, and any excess is recognized as goodwill.

- 3** Separate costs into those that should be expensed immediately and those that should be capitalized, and understand the accounting standards for research and development and oil and gas exploration costs.

- *Postacquisition costs.* Repair and maintenance costs are expensed. Expenditures for new components, either as replacements or as additional components, are capitalized.
- *Research and development costs.* In the United States, all general research and development expenditures are expensed as incurred. The FASB may reconsider this rule some time soon.
- *Software development costs.* In the United States, software development expenditures incurred before technological feasibility has been established are expensed; expenditures after technological feasibility has been established are capitalized.

- *Oil and gas exploration costs.* With the successful efforts method, costs of drilling dry wells are expensed immediately; with the full cost method, these costs are capitalized.

**4 Recognize intangible assets acquired separately, as part of a basket purchase, and as part of a business acquisition.**

In a basket purchase including intangibles, the total purchase price is allocated in proportion to the estimated fair values of all of the acquired assets, including the intangibles. Recorded intangibles can be either contract based, separately tradable, or relevant items that have probable future economic benefit and are reliably measurable. Fair values of intangibles are estimated by reference to market prices, by the traditional present value approach (using a risk-adjusted interest rate), or by the expected cash flow approach. Amounts allocated to acquired in-process research and development should be expensed immediately.

In a business acquisition, only those intangibles that are contract based or separately tradable are recognized; other intangible items are included in the recorded amount of goodwill. In the case of a bargain purchase, the fair value estimates should be carefully reviewed. If the purchase price is still less than the fair value of the net assets acquired, a gain is recognized for the difference.

**5 Discuss the pros and cons of recording noncurrent operating assets at their fair values.**

Recording noncurrent operating assets at their fair values represents a trade-off between relevance and reliability. In the United States, reliability concerns have resulted in the prohibition of asset write-ups. Under *IAS 16*, upward asset revaluations are an allowable alternative to reporting the historical cost of those assets.

**6 Use the fixed asset turnover ratio as a general measure of how efficiently a company is using its property, plant, and equipment.**

The fixed asset turnover ratio is computed as sales divided by average property, plant, and equipment (fixed assets) and is interpreted as the number of dollars in sales generated by each dollar of fixed assets. Meaningful comparison of fixed asset turnover ratios can only be done between firms in similar industries. Another difficulty in comparing values for the fixed asset turnover ratio among different companies is that the reported amount for property, plant, and equipment can be a poor indicator of the actual fair value of the fixed assets being used by a company. This is true when fixed assets have increased in value, relative to their depreciated cost, and when a significant number of assets have been leased and are not reported in the balance sheet.

### FASB-IASB CODIFICATION SUMMARY

Topic	FASB Accounting Standards Codification	Original FASB Standard	Corresponding IASB Standard	Differences between U.S. GAAP and IFRS
Interest capitalization	Subtopic 835-20	SFAS No. 34	IAS 23	Under IFRS, net "borrowing costs" are capitalized. The net amount is the gross interest paid less interest received on investment of idle funds.
Asset retirement obligation	Subtopic 410-20	SFAS No. 143	IAS 16 and IAS 37	No substantial differences

(continued)

Business combinations	Topic 805	SFAS No. 141R	IFRS 3	No substantial differences
Intangible assets	Topic 350	SFAS No. 142	IAS 38	No substantial differences
Research and development	Topic 730	SFAS No.2 SFAS No.86	IAS 38	Under IFRS, development costs, which are costs incurred after technological feasibility, are capitalized. This matches U.S. GAAP for software development costs, but not for ordinary R&D.

## KEY TERMS

Additions 10-26	Component 10-24	Maintenance 10-25	Research and development (R&D) 10-26
Asset retirement obligation 10-21	Development 10-26	Noncurrent operating assets 10-4	Software development costs 10-27
Bargain purchase 10-37	Discovery 10-20	Operating leases 10-12	Successful efforts method 10-28
Basket purchase 10-9	Donation 10-19	Renewals 10-25	Technological feasibility 10-27
Betterments 10-26	Fixed asset turnover ratio 10-40	Repairs 10-25	Trademark 10-7
Capital leases 10-12	Full cost method 10-28	Replacements 10-25	
Capitalized interest 10-15	Goodwill 10-35	Research 10-26	
	Intangible assets 10-6		

## QUESTIONS

- On the balance sheets of many companies, the largest classification of assets in amount is noncurrent operating assets. Name the items, other than the amount paid to the former owner or contractor, that may be properly included as part of the acquisition cost of the following property items: (a) land, (b) buildings, and (c) equipment.
- What acquisition costs are included in (a) copyrights, (b) franchises, and (c) trademarks?
- What procedure should be followed to allocate the cost of a basket purchase of assets among specific accounts?
- What special accounting problems are introduced when a company purchases equipment on a deferred payment contract rather than with cash?
- (a) Why is the "list price" of an asset often not representative of its fair market value? (b) Under these conditions, how should a fair value be determined?
- Gaylen Corp. decides to construct a building for itself and plans to use existing plant facilities to assist with such construction. (a) What costs will enter into the cost of construction? (b) What two positions can the company take with respect to general overhead allocation during the period of construction? Evaluate each position and indicate your preference.
- What characteristics must a construction project have before interest can be capitalized as part of the project cost?
- What amount of interest is capitalized under IAS 23?
- Parkhurst Corporation acquires land and buildings valued at \$250,000 as a gift from a local philanthropist. The president of the company maintains that because there was no cost for the acquisition, neither the cost of the facilities nor depreciation needs to be recognized for financial statement purposes. Evaluate the president's position assuming (a) the donation is unconditional and (b) the donation is contingent upon the employment by the company of a certain number of employees for a 10-year period.
- What type of asset value increases are recognized under IAS 41?

11. What is an asset retirement obligation? What is the proper accounting for an asset retirement obligation?
12. Why do some companies expense asset expenditures that are less than an established monetary amount?
13. Indicate the effects of the following errors on the balance sheet and the income statement in the current year and succeeding years.
  - (a) The cost of a depreciable asset is incorrectly recorded as an expense.
  - (b) An expense expenditure is incorrectly recorded as an addition to the cost of a depreciable asset.
14. Which of the following items would be recorded as expenses and which would be recorded as assets?
  - (a) Cost of installing machinery
  - (b) Cost of unsuccessful litigation to protect patent
  - (c) Extensive repairs as a result of a fire
  - (d) Cost of grading land
  - (e) Insurance on machinery in transit
  - (f) Interest incurred during construction period
  - (g) Cost of replacing a major machinery component
  - (h) New safety guards on machinery
  - (i) Commission on purchase of real estate
  - (j) Special tax assessment for street improvements
  - (k) Cost of repainting offices
15. What happens to the remaining net book value of a component that is replaced?
16. (a) What type of activities are considered to be research and development activities?
  - (b) Under what conditions, if any, are research and development costs capitalized?
17. Distinguish between the full cost and successful efforts methods of recording exploratory costs for oil and gas properties.
18. In general, how is the cost of internally generated intangibles accounted for?
19. What are the five general categories of intangible assets?
20. What two approaches are used in estimating fair values using present value computations? Briefly explain the difference between the two approaches.
21. (a) Under what conditions may goodwill be reported as an asset? (b) Roper Company engages in a widespread advertising campaign on behalf of new products, charging above normal expenditures to goodwill. Do you approve of this practice? Why or why not?
22. How is acquired in-process research and development accounted for under U.S. GAAP?
23. What argument is given for reporting noncurrent operating assets at their historical costs instead of at current values?
24. Under the provisions of IAS 16, what is the credit entry when noncurrent operating assets are written up to reflect an increase in market value?
25. Describe the fair value option that is available under IAS 40 to companies that own investment property.
26. How is the fixed asset turnover ratio calculated, and what does the resulting ratio measure?
27. Briefly describe the dangers to financial statement users inherent in the use of the fixed asset turnover ratio.

## PRACTICE EXERCISES

### Practice 10-1

#### L01

#### Categories of Tangible Noncurrent Operating Assets

The following costs were incurred in the most recent year:

- (a) Paid \$30,000 to purchase a piece of equipment. In addition, paid \$1,000 to have the equipment shipped to and installed in its final location. Spent \$1,750 to have the equipment tested before beginning its production use. Paid \$2,000 for lubrication and normal maintenance during the first year of operation of the equipment.
- (b) Paid \$85,000 to buy a piece of land. Also paid \$10,000 to construct a parking lot and sidewalks.
- (c) Paid \$50,000 to buy another piece of land. Then paid \$10,000 to have an old building demolished and have the land cleared. Paid \$132,000 to have a building constructed.

Compute the total cost that should be reported in each of the following categories:

1. Land
2. Buildings
3. Equipment
4. Land Improvements

**Practice 10-2**  
**L02**

**Basket Purchase**

The company paid \$750,000 to buy a collection of assets. The assets had the following appraised values:

Equipment .....	\$250,000
Building .....	425,000
Land .....	125,000

Compute the cost to be allocated to each asset.

**Practice 10-3**  
**L02**

**Deferred Payment**

The company purchased a piece of equipment. Terms of the purchase were as follows: \$10,000 in cash immediately, followed by note payments of \$20,000 at the end of each year for the next eight years. The market rate of interest is 9%. Make the journal entries necessary to record (1) the initial purchase and (2) the first cash payment of \$20,000 at the end of the first year.

**Practice 10-4**  
**L02**

**Exchange of Nonmonetary Assets**

The company exchanged a piece of land for a new piece of equipment. The equipment has a list price of \$100,000, and the land has a historical cost of \$35,000. The land has a current market value of \$97,300. Make the journal entry necessary to record the exchange.

**Practice 10-5**  
**L02**

**Cost of a Self-Constructed Asset**

The company constructed its own building. The cost of materials was \$400,000. Labor cost incurred on the construction project was \$600,000. Total overhead cost for the company for the year was \$8,000,000; total labor cost (including the cost of construction) was \$4,000,000. Interest incurred to finance the construction cost was \$140,000. Compute the total cost of the building.

**Practice 10-6**  
**L02**

**Capitalized Interest: Single-Year Computation**

The company had the following loans outstanding for the entire year:

	Amount	Interest Rate
Specific construction loan .....	\$ 100,000	10%
General loan .....	2,000,000	13

The company began the self-construction of a building on January 1. The following expenditures were made during the year:

January 1 .....	\$100,000
May 1 .....	200,000
November 1 .....	300,000
Total .....	<u>\$600,000</u>

Construction was completed on December 31. Compute (1) the amount of interest capitalized during the year and (2) the recorded cost of the building at the end of the year.

**Practice 10-7**  
**L02**

**Capitalized Interest: Journal Entry**

Refer to Practice 10-6. Make the journal entry necessary to record *total* interest paid for the year. Assume that all of the interest was paid in cash on December 31.

**Practice 10-8**

**Capitalized Interest: Multiple-Year Computation**

**L02**

Refer to Practice 10-6. Assume that construction was *not* completed on December 31 of Year 1. Also assume that the same loans were outstanding for all of Year 2. The following expenditure was made during Year 2:

July 1 ..... \$500,000

Final construction was completed on December 31 of Year 2. Compute (1) the amount of interest capitalized during Year 2 and (2) the recorded cost of the building at the end of Year 2.

**Practice 10-9**

**Acquisition by Donation**

**L02**

The company has received a donation of land from a rich local philanthropist. The land originally cost the philanthropist \$48,000. On the date of the donation, it had a market value of \$111,000. Make the journal entry necessary on the books of the company to record the receipt of the land.

**Practice 10-10**

**Accounting for an Asset Retirement Obligation**

**L02**

The company purchased a mining site that will have to be restored to certain specifications when the mining production ceases. The cost of the mining site is \$800,000, and the restoration cost is expected to be \$200,000. It is estimated that the mine will continue in operation for 15 years. The appropriate interest rate is 7%. Make the appropriate journal entries to record the purchase of the mining site and the recognition of the obligation to restore the mining site.

**Practice 10-11**

**Renewals and Replacements**

**L03**

The company recently replaced the heating/cooling system for its building. The old system cost \$160,000, and was 80% depreciated. The new system cost \$210,000, which was paid in cash. The new system will extend the economic useful life of the building by five years. Make the journal entry necessary to record the removal of the old system and the installation of the new system, assuming that the separate cost of the old system is identifiable and has been accounted as part of the building cost.

**Practice 10-12**

**Research and Development**

**L03**

During the year, the company made the following research and development expenditures:

Date	Amount	Comment
July 23 .....	\$120,000	Before technological feasibility established.
December 31 .....	100,000	After technological feasibility established.

Compute the total research and development (R&D) expense for the year assuming (1) the expenditures were for normal R&D, (2) the expenditures were for software R&D, and (3) the expenditures were for normal R&D and the company does its accounting according to international financial reporting standards.

**Practice 10-13**

**Oil and Gas Exploration Costs**

**L03**

The company started business on January 1 and during the year had oil and gas exploration costs of \$500,000. Of these costs, \$100,000 was associated with successful wells and \$400,000 with so-called dry holes. For simplicity, assume that all of the costs were incurred on December 31. Compute the total oil and gas exploration expense to be reported for the year, assuming that (1) the company uses the successful efforts method and (2) the company uses the full cost method.

**Practice 10-14****L04****Accounting for the Acquisition of an Entire Company**

Stafford Company purchased Deaver Manufacturing for \$1,400,000 cash on January 1. The book value and fair value of the assets of Deaver as of the date of the acquisition follow:

	Book Value	Fair Value
Cash .....	\$ 20,000	\$ 20,000
Accounts receivable .....	190,000	190,000
Inventory .....	260,000	320,000
Patent .....	0	80,000
Property, plant, and equipment .....	600,000	750,000
Totals .....	<u>\$1,070,000</u>	<u>\$1,360,000</u>

In addition, Deaver had liabilities totaling \$500,000 at the time of the acquisition. Deaver has no other separately identifiable intangible assets. Make the journal entry necessary on the books of Stafford Company to record the acquisition.

**Practice 10-15****L04****Accounting for a Bargain Purchase**

Refer to Practice 10-14. Assume that the cash acquisition price is \$720,000 instead of \$1,400,000. Make the journal entry necessary on the books of Stafford Company to record the acquisition.

**Practice 10-16****L04****Intangibles and a Basket Purchase**

The company paid \$500,000 to purchase the following: a building with an appraised value of \$200,000, an operating permit valued at \$100,000, and ongoing research and development projects valued at \$150,000. In addition, it is estimated that the fair value of the order backlog associated with the products manufactured in the building is \$120,000; this order backlog is included as part of the purchase. Make the journal entry necessary to record this cash purchase.

**Practice 10-17****L04****Intangibles and a Business Acquisition**

Buyer Company purchased Target Company for \$800,000 cash. Target Company had total liabilities of \$300,000. Buyer Company's assessment of the fair values it obtained when it purchased Target Company is as follows:

Cash .....	\$100,000
Inventory .....	50,000
In-process R&D .....	500,000

Make the journal entry necessary to record this business acquisition.

**Practice 10-18****L06****Fixed Asset Turnover Ratio**

Company A had sales for the year totaling \$480,000. The net property, plant, and equipment balance at the beginning of the year was \$160,000; the ending balance was \$200,000. Compute the fixed asset turnover ratio.

**Practice 10-19****L06****Danger in Using Fixed Asset Turnover Ratio**

Refer to Practice 10-18. Company A's competitor, Company B, had sales for the year totaling \$360,000. The net property, plant, and equipment balance at the beginning of the year was \$200,000; the ending balance was \$220,000. Company B is a very young company; all of its fixed assets have been purchased in the past two years. In contrast, Company A's assets are 10 years old, on average. It is estimated that Company A's fixed assets had a market value of \$290,000 at the beginning of the year and \$310,000 at the end of the year. Which company is more efficient at using its fixed assets to generate sales, Company A or Company B? Explain.

## EXERCISES

## Exercise 10-20

**Cost of Specific Plant Items**

L01

The following expenditures were incurred by Peterson Enterprises Co. in 2013:

Purchase of land .....	\$ 282,000
Land survey .....	4,800
Fees for search of title for land .....	500
Building permit .....	4,000
Temporary quarters for construction crews .....	11,200
Payment to tenants of old building for vacating premises .....	4,450
Razing old building .....	41,000
Excavating basement .....	13,000
Special assessment tax for street project .....	2,400
Dividends .....	4,000
Damages awarded for injuries sustained in construction (no insurance was carried) .....	8,750
Costs of construction .....	2,395,000
Cost of paving parking lot adjoining building .....	55,000
Cost of shrubs, trees, and other landscaping .....	36,000

What is the cost of the land, land improvements, and building?

## Exercise 10-21

**Determining Cost of Patent**

L01

Dean Lang Enterprises Inc. developed a new machine that reduces the time required to insert the fortunes into its fortune cookies. Because the process is considered very valuable to the fortune cookie industry, Dean Lang patented the machine. The following expenses were incurred in developing and patenting the machine:

Research and development laboratory expenses .....	\$34,000
Metal used in the construction of the machine .....	6,000
Blueprints used to design the machine .....	2,600
Legal expenses to obtain patent .....	13,400
Wages paid for the employees' work on the research, development, and building of the machine (60% of the time was spent in actually building the machine) .....	42,000
Expense of drawing required by the patent office to be submitted with the patent application .....	2,500
Fee paid to government patent office to process application .....	3,200

One year later, Dean Lang Enterprises Inc. paid \$19,300 in legal fees to successfully defend the patent against an infringement suit by Chinese Cookie Co.

Give the entries on Dean Lang's books indicated by the preceding events. Ignore any amortization of the patent or depreciation of the machine.

## Exercise 10-22

**Basket Purchase**

L02

Allred Shipping Co. acquired land, buildings, and equipment at a lump-sum price of \$920,000. An appraisal of the assets at the time of acquisition disclosed the following values.

Land .....	\$250,000
Buildings .....	600,000
Equipment .....	200,000

What cost should be assigned to each asset?

**Exercise 10-23**

**Basket Purchase**

**L02**

Ratcliff Corporation purchased land, a building, a patent, and a franchise for the lump sum of \$1,450,000. A real estate appraiser estimated the building to have a resale value of \$600,000 (2/3 of the total worth of land and building). The franchise had no established resale value. The patent was valued by management at \$337,000. Give the journal entry to record the acquisition of the assets.

**Exercise 10-24**

**Equipment Purchase on Deferred Payment Contract**

**L02**

Custom Industries purchases new specialized manufacturing equipment on July 1, 2013. The equipment cash price is \$96,000. Custom signs a deferred payment contract that provides for a down payment of \$10,000 and a 10-year note for \$112,420. The note is to be paid in 10 equal annual payments of \$11,242. The payments include 5.193% interest and are made on June 30 of each year, beginning June 30, 2014. Prepare the journal entries for 2013, 2014, and 2015 related to the equipment purchase and the contract. Custom's fiscal year ends on June 30.

**Exercise 10-25**

**Purchase on Deferred Payment Contract**

**L02**

HiTech Industries purchases new electronic equipment for its telecommunication system. The contractual arrangement specifies 10 payments of \$8,600 each to be made over a 10-year period. If HiTech had borrowed money to buy the equipment, it would have paid interest at 9%. HiTech's accountant recorded the purchase as follows:

Equipment .....	86,000
Notes Payable .....	86,000

Prepare the correcting acquisition entry, considering the implicit interest in the purchase.

**Exercise 10-26**

**Basket Purchase in Exchange for Stock**

**L02**

On May 31, 2013, Julienne Corp. exchanged 20,000 shares of its \$1 par common stock for the following assets:

- (a) A trademark valued at \$183,000.
- (b) A building, including land, valued at \$732,000 (20% of the value is for the land).
- (c) A franchise right. No estimate of the value is available at time of exchange.

Julienne Corp. stock is selling at \$53 per share on the date of the exchange. Give the entries to record the exchange on Julienne's books.

**Exercise 10-27**

**Purchase of Building with Bonds and Stock**

**L02**

Sayer Co. enters into a contract with Bradford Construction Co. for construction of an office building at a cost of \$680,000. Upon completion of construction, Bradford agrees to accept in full payment of the contract price Sayer Co.'s 10% bonds with a face value of \$350,000 and common stock with a par value of \$90,000 and no established fair market value. Sayer Co.'s bonds are selling in the market at this time at 106. How would you recommend the building acquisition be recorded?

**Exercise 10-28**

**Acquisition of Land and Building for Stock and Cash**

**L02**

Valdilla's Music Store acquired land and an old building in exchange for 50,000 shares of its common stock, par \$0.50, and cash of \$80,000. The auditor ascertains that the company's stock was selling for \$15 per share when the purchase was made. The following additional costs were incurred to complete the transaction:

Legal cost to complete transaction .....	\$10,000
Property tax for previous year .....	30,000
Cost of building demolition .....	21,000
Salvage value of demolished building .....	(6,000)

What entry should be made to record the acquisition of the property?

**Exercise 10-29****L02****Cost of Self-Constructed Asset**

Brodhead Manufacturing Company has constructed its own special equipment to produce a newly developed product. A bid to construct the equipment by an outside company was received for \$1,200,000. The actual costs incurred by Brodhead to construct the equipment were as follows:

Direct material .....	\$320,000
Direct labor .....	200,000

It is estimated that incremental overhead costs for construction amount to 140% of direct labor costs. In addition, fixed costs (exclusive of interest) of \$700,000 were incurred during the construction period and allocated to production on the basis of total prime costs (direct labor plus direct material). The prime costs incurred to build the new equipment amounted to 35% of the total prime costs incurred for the period. The company follows the policy of capitalizing all possible costs on self-construction projects.

To assist in financing the construction of the equipment, a \$500,000, 10% loan was acquired at the beginning of the 6-month construction period. The company carries no other debt except for trade accounts payable. For simplicity, assume that all construction expenditures took place exactly midway through the project: That is, all expenditures took place with three months remaining in the construction period. Compute the cost to be assigned to the new equipment.

**Exercise 10-30****L02****SPREADSHEET****Capitalization of Interest**

Carver Department Stores, Inc., constructs its own stores. In the past, no cost has been added to the asset value for interest on funds borrowed for construction. Management has decided to correct its policy and desires to include interest as part of the cost of a new store just being completed. Based on the following information, how much interest would be added to the cost of the store (1) in 2013 and (2) in 2014?

Total construction expenditures:

January 2, 2013 .....	\$ 500,000
May 1, 2013 .....	450,000
November 1, 2013 .....	700,000
March 1, 2014 .....	950,000
September 1, 2014 .....	800,000
November 30, 2014 .....	600,000
	<u>\$4,000,000</u>

Outstanding company debt:

Mortgage related directly to new store; interest rate, 10%; term,

5 years from beginning of construction ..... \$1,500,000

General bond liability:

Bonds issued just prior to construction of store; interest rate,

13% for 10 years ..... \$ 500,000

Bonds issued prior to construction; interest rate, 12%, mature in 5 years ..... \$ 800,000

Estimated cost of equity capital ..... 14%

**Exercise 10-31****L02****Interest Capitalization Decision**

For each of the situations described here, indicate when interest should be capitalized (C) and when it should not be capitalized (NC).

- Queen Company is constructing a piece of equipment for its own use. Total construction costs are expected to be \$4 million, and the construction period will be one month.
- Ferney Company is constructing a piece of equipment for sale. Total construction costs are expected to exceed \$10 million, and the construction period will be

about 15 months. This is a special order. Ferney has never produced a piece of equipment like this before.

- (c) Patterson Company is constructing a piece of equipment for its own use. Total construction costs are expected to be \$15 million, and the construction period will be about two years. The forecasted total construction cost is only a very rough estimate because Patterson has no system in place to accumulate separately the costs associated with this project.
- (d) Savis Company is constructing a piece of equipment for its own use. Total construction costs are expected to be \$350, and the construction period will be nine months.
- (e) Platt Company is constructing a piece of equipment for sale. Total construction costs are expected to exceed \$10 million, and the construction period will be about 15 months. This particular piece of equipment is Platt's best seller.
- (f) Stowell Company is in the process of renovating its corporate office building. The project will cost \$7.5 million and will take about 15 months. The building will remain in use throughout the project.
- (g) Jackson Company owns a piece of undeveloped land. The land originally cost \$21 million. Jackson plans to hold onto the land for three to four years and then develop it into a vacation resort.

**Exercise 10-32**

**Asset Retirement Obligation**

**L02**

Simpson Company purchased a nerve gas detoxification facility. The facility cost \$900,000. The cost of cleaning up the routine contamination caused by the initial location of nerve gas on the property is estimated to be \$1,300,000; this cost will be incurred in 20 years when all of the existing stockpile of nerve gas is detoxified and the facility is decommissioned. Additional contamination will occur each year that the facility is in operation. In its first year of operation, that additional contamination adds \$100,000 to the estimated cleanup cost, which will occur after 19 years (because one year has elapsed). Make the journal entries necessary to record the purchase of the detoxification facility and the recognition of the initial asset retirement obligation (assuming that the appropriate interest rate is 7%). Also make the journal entry to recognize the additional obligation created after one year.

**Exercise 10-33**

**Postacquisition Expenditures**

**L02**

GoodeHill Company replaced some parts of its factory building during 2013:

- (a) The outside corrugated covering on the factory walls was removed and replaced. The job was done by an expert crew from Hollister Construction Company and will extend the life of the building by six years. The cost of the new wall was \$84,000. The cost of the old wall is estimated to be \$60,000. The building is 30% depreciated.
- (b) Dust filters in the interior of the factory were replaced at a cost of \$20,000. The new filters are expected to reduce employee health hazards and thus reduce wage and fringe benefit costs. The original filters cost \$11,000. The old filters are one-fourth depreciated.

Prepare journal entries for the preceding information.

**Exercise 10-34**

**Research and Development Costs**

**L03**

In 2013, the Slidell Corporation incurred research and development costs as follows:

Materials and equipment . . . . .	\$160,000
Personnel . . . . .	105,000
Indirect costs . . . . .	60,000
	<u>\$325,000</u>

These costs relate to a product that will be marketed in 2014. It is estimated that these costs will be recouped by December 31, 2017.

1. What is the amount of research and development costs that should be expensed in 2013?
2. Assume that of these costs, equipment of \$80,000 can be used on other research projects. Estimated useful life of the equipment is five years with no salvage value, and it was acquired at the beginning of 2013. What is the amount of research and development costs that should be expensed in 2013 under these conditions? Assume that depreciation on all equipment is computed on a straight-line basis.

**Exercise 10-35****L03****What Are the R&D Costs?**

Pringle Company has a substantial research department. Following are listed, in chronological order, some of the major activities associated with one of Pringle's research projects.

*Project Started*

- (a) Purchased special equipment to be used solely for this project.
- (b) Purchased general equipment that will be usable in Pringle's normal operations.
- (c) Allocated overhead to the project.

*Technological Feasibility Established*

- (d) Purchased more special equipment to be used solely for this project.
- (e) Performed tests on an early model of the product.
- (f) Allocated overhead to the project.

*Product Becomes Ready for Production*

- (g) Incurred direct production costs.
- (h) Allocated overhead to the products.

1. For each activity (a) through (h), indicate whether the cost should be capitalized (C), expensed (E), or included in cost of inventory (I).
2. Repeat (1), assuming that Pringle is a computer software development company.

**Exercise 10-36****L03****Full Cost and Successful Efforts**

Exploratory Company is an oil and gas exploration firm. During 2013, Exploratory engaged in 86 different exploratory projects, only 20 of which were successful. The total cost of this exploration effort was \$24 million, \$5.6 million of which was associated with the successful projects. As of the end of 2013, production had not yet begun at the successful sites.

1. Using the successful efforts method of accounting for oil and gas exploration costs, how much exploration expense would be shown in Exploratory's income statement for 2013? How much of the exploration cost will be capitalized and shown as an asset on the company's balance sheet as of December 31, 2013?
2. Repeat (1) using the full cost method.

**Exercise 10-37****L03****Classifying Expenditures as Assets or Expenses**

One of the most difficult problems facing an accountant is the determination of which expenditures should be capitalized and which should be immediately expensed. What position would you take in each of the following instances?

- (a) Painting partitions in a large room recently divided into four sections.
- (b) Labor cost of tearing down a wall to permit extension of assembly line.
- (c) Replacement of motor on a machine. Life used to depreciate the machine is eight years. The machine is four years old. Replacement of the motor was anticipated when the machine was purchased.

- (d) Cost of grading land prior to construction.
- (e) Assessment for street paving.
- (f) Cost of tearing down a previously occupied old building in preparation for new construction; old building is fully depreciated.

**Exercise 10-38**

**L04**

**Purchase of a Company**

Conglomerate Company purchased Individual Company for \$935,000 cash. A schedule of the fair values of Individual’s assets and liabilities as of the purchase date follows.

Individual Company Schedule of Asset and Liability Fair Values			
Assets			
Cash .....		\$ 12,000	
Receivables .....		96,000	
Inventory .....		145,000	
Land, buildings, and equipment .....		<u>519,000</u>	\$772,000
Liabilities			
Current liabilities .....		\$ 75,000	
Long-term debt .....		<u>116,000</u>	<u>191,000</u>
Net asset fair value .....			<u>\$581,000</u>

1. Make the journal entry necessary for Conglomerate Company to record the purchase.
2. Assume that the purchase price is \$445,000 cash. Make the journal entry necessary to record the purchase.

**Exercise 10-39**

**L04**

**SPREADSHEET**

**Purchase of a Company**

Landers Inc. is considering purchasing J&B Properties, which has the following assets and liabilities.

	Cost	Fair Value
Accounts receivable .....	\$ 210,000	\$ 200,000
Inventory .....	250,000	260,000
Prepaid insurance .....	12,000	12,000
Buildings and equipment (net) .....	88,000	168,000
Accounts payable .....	<u>(130,000)</u>	<u>(130,000)</u>
Net assets .....	<u>\$ 430,000</u>	<u>\$ 510,000</u>

1. Make the journal entry necessary for Landers Inc. to record the purchase if the purchase price is \$650,000 cash.
2. Assume that the purchase price is \$320,000 cash. Make the journal entry necessary to record the purchase.

**Exercise 10-40**

**L04**

**Basket Purchase of Intangible Assets**

Taraz Company paid \$500,000 to purchase the following portfolio of intangibles with estimated fair values as indicated:

	Estimated Fair Value
Internet domain name . . . . .	\$150,000
Order backlog . . . . .	100,000
In-process research and development. . . . .	200,000
Operating permit . . . . .	80,000

In addition, Taraz spent \$300,000 to run an advertising campaign to boost its image in the local community.

Make the journal entries necessary to record the purchase of the intangibles and the payment for the advertising.

**Exercise 10-41****L04****Purchase of Intangible Assets in a Business Acquisition**

Omniportal Company purchased Network Enterprises. The following fair values were associated with the items acquired in this business acquisition:

	Cost	Fair Value
Accounts receivable . . . . .	\$ 180,000	\$ 180,000
Inventory . . . . .	120,000	75,000
Government contacts . . . . .	0	92,000
Equipment (net) . . . . .	68,000	84,000
Short-term loan payable. . . . .	(160,000)	(160,000)
Net assets . . . . .	<u>\$ 208,000</u>	<u>\$ 271,000</u>

The fair value associated with Network Enterprises' government contacts is not based on any legal or contractual relationship. In addition, for obvious reasons, there is no open market trading for intangibles of this sort.

1. Make the journal entry necessary for Omniportal Company to record the purchase if the purchase price is \$805,000 cash.
2. Assume that the purchase price is \$24,300 cash. Make the journal entry necessary to record the purchase.

**Exercise 10-42****L06****Fixed Asset Turnover**

Dandy Hardware Stores reported the following asset values in 2012 and 2013:

	2013	2012
Cash . . . . .	\$ 40,000	\$ 25,000
Accounts receivable . . . . .	380,000	330,000
Inventory . . . . .	590,000	410,000
Land . . . . .	150,000	125,000
Buildings . . . . .	500,000	450,000
Equipment . . . . .	260,000	250,000

In addition, Dandy Hardware had sales of \$3,500,000 in 2013. Cost of goods sold for the year was \$2,200,000.

Compute Dandy Hardware's fixed asset turnover ratio for 2013.

## PROBLEMS

## Problem 10-43

## L01

**Correcting Noncurrent Operating Asset Valuation**

On December 31, 2013, Bridgeport Co. shows the following account for machinery it had assembled for its own use during 2013:

**Account:** MACHINERY (Job Order #1329)

Item	Debit	Credit	Balance	
			Debit	Credit
Cost of dismantling old machine	18,760		18,760	
Cash proceeds from sale of old machine		13,900	4,860	
Raw materials used in construction of new machine	83,400		88,260	
Labor in construction of new machine	55,000		143,260	
Cost of installation	13,600		156,860	
Materials spoiled in machine trial runs	3,100		159,960	
Profit on construction	22,500		182,460	
Purchase of machine tools	15,200		197,660	

An analysis of the details in the account disclosed the following:

- The old machine, which was removed before the installation of the new one, had been fully depreciated.
- Cash discounts received on the payments for materials used in construction totaled \$4,500, and these were reported in the purchase discounts account.
- The factory overhead account shows a balance of \$351,000 for the year ended December 31, 2013; this balance exceeds normal overhead on regular plant activities by approximately \$22,700 and is attributable to machine construction.
- A profit was recognized on construction for the difference between costs incurred and the price at which the machine could have been purchased.

**Instructions:**

- Determine the machinery and machine tools balances as of December 31, 2013.
- Give individual journal entries necessary to correct the accounts as of December 31, 2013, assuming that the nominal accounts are still open.

## Problem 10-44

## L01

**Cost Classification for a Golf Course**

The accountant for Stansbury Development Company is uncertain how to record the following costs associated with the construction of a golf course.

- Building artificial lakes.
- Moving earth around to enhance the "hilliness" of the course.
- Planting fairway grass.
- Planting trees and shrubs.
- Installing an automatic sprinkler system.
- Installing golf cart paths.
- Purchasing 50 wooden sand trap rakes (at \$1 each).
- Paying attorneys' fees to prepare and file the land title.
- Demolishing an old house situated on the site planned for the clubhouse.

**Instructions:** Indicate which costs should be expensed (E), which should be capitalized and considered to be nondepreciable (CN), and which should be capitalized and depreciated (CD). Include explanations for each classification.

**Problem 10-45****L02****Acquisition of Land and Buildings**

Skyline Corporation has decided to expand its operations and has purchased land in Salina for construction of a new manufacturing plant. The following costs were incurred in purchasing the property and constructing the building:

Land purchase price . . . . .	\$ 140,000
Payment of delinquent property taxes . . . . .	22,000
Title search and insurance . . . . .	7,000
City improvements for water and sewer . . . . .	19,500
Building permit . . . . .	6,000
Cost to destroy existing building on land (\$5,000 worth of salvaged material used in new building) . . . . .	24,000
Contract cost of new building . . . . .	1,800,000
Land improvements—landscaping . . . . .	81,600
Sidewalks and parking lot . . . . .	41,000
Fire insurance on building—1 year . . . . .	20,000

The depreciated value of the old building on the books of the company from which the land was purchased was \$29,000. The old building was never used by Skyline.

**Instructions:**

1. Determine the costs of the land and land improvements. Show clearly the elements included in the totals.
2. Determine the cost of the new building. Show clearly the elements included in the total.

**Problem 10-46****L01**

SPREADSHEET

**Transactions Involving Property**

The following transactions were completed by Millennial Toy Co. during 2013:

Mar.	1	Purchased real property for \$829,700, which included a charge of \$29,700 representing property tax for March 1–June 30 that had been prepaid by the vendor; 25% of the purchase price is deemed applicable to land and the balance to buildings. A mortgage of \$460,000 was assumed by Millennial Toy Co. on the purchase. Cash was paid for the balance.
	30	Previous owners had failed to take care of normal maintenance and repair requirements on the building, necessitating current reconditioning at a cost of \$34,200.
May	15	Demolished garages in the rear of the building, \$6,600 being recovered on the lumber salvage. The company proceeded to construct a warehouse. The cost of such construction was \$101,300, which was almost exactly the same as bids made on the construction by independent contractors. Upon completion of construction, city inspectors ordered extensive modifications to the building as a result of failure on the part of the company to comply with the building safety code. Such modifications, which could have been avoided, cost \$12,400.
June	1	The company exchanged its own stock with a market value of \$64,000 (par \$4,000) for a patent and a new toy-making machine. The machine has a market value of \$31,000.
July	1	The new machinery for the new building arrived. In addition to the machinery, a new franchise was acquired from the manufacturer of the machinery to produce toy robots. Payment was made by issuing bonds with a face value of \$100,000 and by paying cash of \$15,000. The value of the franchise is set at \$50,000, while the machine's fair value is \$61,000.
Nov.	20	The company contracted for parking lots and landscaping at a cost of \$42,000 and \$8,900, respectively. The work was completed and paid for on November 20.
Dec.	31	The business was closed to permit taking the year-end inventory. During this time, required redecorating and repairs were completed at a cost of \$6,400.

**Instructions:** Give the journal entries to record each of the preceding transactions. (Disregard depreciation.)

## Problem 10-47

L02

**Acquisition of Land and Construction of Plant**

Bylund Corporation was organized in June 2013. In auditing its books, you find the following land, buildings, and equipment account:

Account: LAND, BUILDINGS, AND EQUIPMENT

Date	Item	Debit	Credit	Balance	
				Debit	Credit
2013					
June 8	Organization fees paid to the state	21,000		21,000	
16	Land site and old building	325,000		346,000	
30	Corporate organization costs	40,000		386,000	
July 2	Title clearance fees	15,300		401,300	
Aug. 28	Cost of razing old building	15,000		416,300	
Sept. 1	Salaries of Bylund Corporation executives	100,000		516,300	
1	Cost to acquire patent for special equipment	54,000		570,300	
Dec. 12	Stock bonus to corporate promoters, 3,000 shares of common stock, \$50/share market value	150,000		720,300	
15	County real estate tax	13,200		733,500	
15	Cost of new building completed and occupied on this date	1,450,000		2,183,500	

An analysis of this account and of other accounts disclosed the following additional information:

- The building acquired on June 16, 2013, was valued at \$41,000.
- The corporation paid \$15,000 for the demolition of the old building and then sold the scrap for \$7,000 and credited the proceeds to Miscellaneous Revenue.
- The corporation executives did not participate in the construction of the new building.
- The county real estate tax was for the 6-month period ended December 31, 2013, and was assessed by the county on the land.

**Instructions:** Prepare journal entries to correct Bylund Corporation's books.

## Problem 10-48

L02

**Acquisition of Intangible Assets**

In your audit of the books of Dyer Corporation for the year ended September 30, 2013, you found the following items in connection with the company's patents account:

- The company had spent \$120,000 during its fiscal year ended September 30, 2012, for research and development costs and debited this amount to its patents account. Your review of the company's cost records indicated the company had spent a total of \$141,500 for the research and development of its patents, of which \$21,500 spent in its fiscal year ended September 30, 2012, had been debited to Research and Development Expense.
- The patents were issued on April 1, 2012. Legal expenses in connection with the issuance of the patents of \$14,280 were debited to Legal and Professional Fees Expense.
- The company paid a retainer of \$15,000 on October 5, 2012, for legal services in connection with a patent infringement suit brought against it. This amount was debited to Deferred Costs.
- A letter dated October 15, 2013, from the company's attorneys in reply to your inquiry as to liabilities of the company existing at September 30, 2013, indicated that a settlement of the patent infringement suit had been arranged. The other party had agreed to drop the suit and to release the company from all future liabilities in exchange for \$23,000. Additional fees due to the attorneys amounted to \$1,260.

**Instructions:** From the information given, prepare correcting journal entries as of September 30, 2013.

**Problem 10-49****L04****Acquisition of Intangible Assets**

Transactions during 2013 of the newly organized Menlove Corporation included the following:

Jan.	2	Paid legal fees of \$15,000 and stock certificate costs of \$8,300 to complete organization of the corporation.	
	15	Hired a clown to stand in front of the corporate office for two weeks and hand out pamphlets and candy to create goodwill for the new enterprise. Clown cost, \$1,000; pamphlets and candy, \$500.	
Apr.	1	Patented a newly developed process with costs as follows:	
		Legal fees to obtain patent . . . . .	\$42,900
		Patent application and licensing fees . . . . .	6,350
		Total . . . . .	<u>\$49,250</u>

It is estimated that in six years other companies will have developed improved processes, making the Menlove Corporation process obsolete.

May	1	Acquired both a license to use a special type of container and a distinctive trademark to be printed on the container in exchange for 600 shares of Menlove Corporation no-par common stock selling for \$50 per share. The license is worth twice as much as the trademark, both of which may be used for six years.
July	1	Constructed a shed for \$131,000 to house prototypes of experimental models to be developed in future research projects.
Dec.	31	Incurred salaries for an engineer and chemist involved in product development totaling \$175,000 in 2013.

**Instructions:**

1. Give journal entries to record the preceding transactions. (Ignore amortization of intangible assets.)
2. Present the Intangible Assets section of Menlove Corporation's balance sheet at December 31, 2013.

**Problem 10-50****L02**

SPREADSHEET

**Basket Purchase of Noncurrent Operating Assets**

Bridges Wholesale Company incurred the following costs in 2013 for a warehouse acquired on July 1, 2013, the beginning of its fiscal year:

Cost of land . . . . .	\$132,000
Cost of building . . . . .	528,000
Remodeling and repairs prior to occupancy . . . . .	58,200
Escrow fee . . . . .	12,000
Landscaping . . . . .	31,000
Property tax for period prior to acquisition . . . . .	10,000
Real estate commission . . . . .	40,000

The company signed a non-interest-bearing note for \$600,000 ( $20 \times \$30,000$ ) on July 1, 2013. The implicit interest rate is 12% compounded semiannually. Payments of \$30,000 are to be made semiannually beginning December 31, 2013, for 10 years.

**Instructions:** Give the required journal entries to record (1) the acquisition of the land and building (assume that cash is paid to equalize the cost of the assets and the present value of the note) and (2) the first two semiannual payments, including amortization of note discount.

**Problem 10-51****L03****Income Statement for Computer Software Company**

Powersoft Company is engaged in developing computer software for the small business and home computer market. Most of the computer programmers are involved in developmental work designed to produce software that will perform fairly specific tasks in a user-friendly manner. Extensive testing of the working model is

performed before it is released to production for preparation of masters and further testing. As a result of careful preparation, Powersoft has produced several products that have been very successful in the marketplace. The following costs were incurred during 2013:

Salaries and wages of programmers doing research .....	\$265,000
Expenses related to projects prior to establishment of technological feasibility .....	82,200
Expenses related to projects after technological feasibility has been established but before software is available for production .....	53,800
Amortization of capitalized software development costs from current and prior years .....	32,150
Costs to produce and prepare software for sale .....	49,800
<i>Additional data for 2013:</i>	
Sales of products for the year .....	\$675,000
Beginning inventory .....	155,000
Portion of goods available for sale sold during year .....	60%

**Instructions:** Prepare an income statement for Powersoft for the year 2013. Income tax rate is 30%.

**Problem 10-52**

**L03**

**Valuation of Property**

At December 31, 2012, certain accounts included in the Noncurrent Operating Assets section of Salvino Company's balance sheet had the following balances:

Land .....	\$150,000
Buildings .....	910,000
Leasehold improvements .....	500,000
Machinery and equipment .....	600,000

During 2013, the following transactions occurred.

- (a) Land site 653 was acquired for \$1,600,000. Additionally, to acquire the land, Salvino paid a \$90,000 commission fee to a real estate agent. Costs of \$25,000 were incurred to clear the land. During the course of clearing the land, timber and gravel were recovered and sold for \$20,000.
- (b) A second tract of land (site 654) with a building was acquired for \$700,000. The closing statement indicated that the land value was \$510,000 and the building value was \$215,000. Shortly after acquisition, the building was demolished at a cost of \$30,000. A new building was constructed for \$600,000 plus the following costs.

Excavation fees .....	\$35,000
Architectural design fees .....	19,000
Building permit fee .....	15,000
Imputed interest on funds used during construction .....	60,000

(Salvino had no interest-bearing debt outstanding during the construction period.)

The building was completed and occupied on September 30, 2013.

- (c) A third tract of land (site 655) was acquired for \$600,000 and was put on the market for resale.
- (d) Extensive work was done to a building occupied by Salvino under a lease agreement that expires on December 31, 2019. The total cost of work was \$150,000, which consisted of the following.

Painting ceilings . . . . .	\$ 10,000	(estimated useful life is 1 year)
Performing electrical work . . . . .	60,000	(estimated useful life is 10 years)
Constructing extension to current working area . . . . .	80,000	(estimated useful life is 30 years)
	<u>\$150,000</u>	

The lessor paid half of the costs incurred in connection with the extension to the current working area.

- (e) During December 2013, costs of \$70,000 were incurred to improve leased office space. The related lease will terminate on December 31, 2015, and is not expected to be renewed.
- (f) A group of new machines was purchased under a royalty agreement that provides for payment of royalties based on units of production for the machines. The invoice price of the machines was \$90,000, freight costs were \$2,000, unloading charges were \$2,500, and royalty payments for 2013 were \$13,000.

**Instructions:**

- Prepare an analysis of the changes in each of the following balance sheet accounts for 2013. (Disregard the related accumulated depreciation accounts.)
  - Land
  - Buildings
  - Leasehold improvements
  - Machinery and equipment
- List the items in the preceding information that were not used to determine the answer to (1), and indicate where, if at all, these items should be included in Salvino's financial statements.

**Problem 10-53**

**L02**

**Acquisition of Noncurrent Operating Assets**

At December 31, 2012, Davis Company's noncurrent operating asset accounts had the following balances:

	Category
Land . . . . .	\$ 280,000
Buildings . . . . .	1,150,000
Machinery and equipment . . . . .	924,000
Automobiles . . . . .	113,000
Leasehold improvements . . . . .	277,000
Land improvements . . . . .	0

Transactions for 2013 included the following:

- Jan. 6 A plant facility consisting of land and a building was acquired from Matthews Corp. in exchange for 10,000 shares of Davis' common stock. On this date, Davis' stock had a market price of \$73 a share. Current assessed values of land and building for property tax purposes are \$195,000 and \$405,000, respectively.
- Mar. 25 New parking lots, streets, and sidewalks at the acquired plant facility were completed at a total cost of \$141,000.
- July 1 Machinery and equipment were purchased at a total invoice cost of \$187,000, which included \$12,000 of sales tax. Additional costs of \$14,000 for delivery and \$22,000 for installation were incurred.
- Aug. 30 Davis purchased a new automobile for \$26,400.
- Nov. 4 Davis purchased for \$370,000 a tract of land as a potential future building site.

Dec. 20 A machine with a cost of \$22,000 and a remaining book value of \$3,100 at date of disposition was scrapped without cash recovery.

**Instructions:** Prepare a schedule analyzing the changes in each of the noncurrent operating asset accounts during 2013. This schedule should include columns for beginning balance, increase, decrease, and ending balance for each of the noncurrent operating asset accounts.

**Problem 10-54**

**L02**

**Capitalization of Interest**

Oceanwide Enterprises, Inc., is involved in building and operating cruise ships. Each ship is identified as a separate discrete job in the accounting records. At the end of 2012, Oceanwide correctly reported \$5,400,000 as Construction in Progress on the following jobs.

Ship	Completion Date (end of month)	Accumulated Costs (including 2012 interest) December 31, 2012
340 .....	October 31, 2012*	\$2,300,000
341 .....	June 30, 2013	1,150,000
342 .....	September 30, 2013	1,200,000
343 .....	January 31, 2014	750,000

\*Ship 340 was completed and ready for use in October 2012 and will be placed in service May 1, 2013.

Construction costs for 2013, and the dates the expenditures were made, were as follows:

Ship	Date	Costs
341 .....	April 1, 2013	\$1,200,000
342 .....	May 1, 2013	1,600,000
343 .....	July 1, 2013	2,200,000
344 .....	September 1, 2013	810,000
345 .....	November 1, 2013	360,000

Oceanwide had the following general liabilities at December 31, 2013:

12%, 5-year note (maturity date—2015) .....	\$2,000,000
10%, 10-year bonds (maturity date—2018) .....	8,000,000

On January 1, 2013, Oceanwide borrowed \$2,000,000 specifically for the construction of ship 343. The loan was for three years with interest at 13%.

**Instructions:**

1. Compute the maximum interest that can be capitalized in 2013.
2. Compute the weighted-average interest rate for the general liabilities for 2013.
3. Compute the interest that Oceanwide should capitalize during 2013.

**Problem 10-55**

**L02**

**Self-Construction of Equipment**

American Corporation received a \$400,000 low bid from a reputable manufacturer for the construction of special production equipment needed by American in an expansion program. Because its own plant was not operating at capacity, American decided to

construct the equipment itself and recorded the following production costs related to the construction:

Services of consulting engineer . . . . .	\$ 10,000
Work subcontracted. . . . .	20,000
Materials . . . . .	200,000
Plant labor normally assigned to production . . . . .	65,000
Plant labor normally assigned to maintenance . . . . .	100,000
Total . . . . .	<u>\$395,000</u>

Management prefers to record the cost of the equipment under the incremental cost method. Approximately 40% of the corporation's production is devoted to government supply contracts, which are all based in some way on cost. The contracts require that any self-constructed equipment be allocated its full share of all costs related to the construction.

The following information also is available.

- (a) The preceding production labor was for partial fabrication of the equipment in the plant. Skilled personnel were required and were assigned from other projects. The maintenance labor amount (\$100,000) represents the cost of nonproduction plant employees assigned to the construction project. Had these workers not been assigned to construction, the \$100,000 cost would still have been incurred for their idle time.
- (b) Payroll taxes and employee fringe benefits are approximately 30% of labor cost and are included in manufacturing overhead cost. Total manufacturing overhead for the year was \$5,630,000, including the \$100,000 maintenance labor used to construct the equipment.
- (c) Manufacturing overhead is approximately 50% variable and is applied on the basis of production labor cost. Production labor cost for the year for the corporation's normal products totaled \$6,810,000.
- (d) General and administrative expenses include \$22,500 of executive salary cost and \$10,500 of postage, telephone, supplies, and miscellaneous expenses identifiable with this equipment construction.

#### Instructions:

1. Compute the amount that should be reported as the full cost of the constructed equipment to meet the requirements of the government contracts.
2. Compute the incremental cost of the constructed equipment.
3. What is the greatest amount that should be capitalized as the cost of the equipment? Why?

#### Problem 10-56

#### L02

#### Asset Retirement Obligation

Madison Company has purchased land that will serve as a temporary repository for nuclear waste. The site will function for 20 years, at which time Madison will be required to completely decontaminate the land. The purchase price for the land is \$700,000. Madison knows that the land will have to be decontaminated but isn't sure which of several possible approaches will be sufficient to reach the level of decontamination necessary by law. The costs of each approach, and the estimated probability that the approach will be the one used, follow:

- |            |                                                                                      |
|------------|--------------------------------------------------------------------------------------|
| Approach 1 | 15% probability of total decontamination cost of \$10,000 at the end of 20 years.    |
| Approach 2 | 25% probability of total decontamination cost of \$250,000 at the end of 20 years.   |
| Approach 3 | 60% probability of total decontamination cost of \$1,200,000 at the end of 20 years. |

The appropriate interest rate is 6%.

**Instructions:** Make the journal entries necessary to record the purchase of the land and the recognition of the asset retirement obligation.

**Problem 10-57**

**L04**

**Recording Goodwill**

Aurora Corp. acquired Payette Company on December 31, 2013. The following information concerning Payette's assets and liabilities was assembled on the acquisition date:

	Per Company's Books	As Adjusted by Appraisal and Audit
<b>Assets</b>		
Current assets . . . . .	\$ 307,000	\$ 340,000
Land, buildings, and equipment (net) . . . . .	179,200	260,000
	<u>\$ 486,200</u>	<u>\$ 600,000</u>
<b>Liabilities</b>		
Current liabilities . . . . .	(25,000)	(25,000)
Long-term liabilities . . . . .	(160,000)	(160,000)
Net assets . . . . .	<u>\$ 301,200</u>	<u>\$ 415,000</u>

**Instructions:**

1. Make the journal entry necessary for Aurora Corp. to record the purchase, assuming the purchase price was \$1,500,000 in cash.
2. Why might Aurora be willing to pay such a high price for Payette?
3. Repeat (1), assuming the purchase price is \$350,000.
4. Repeat (1), assuming the purchase price is \$150,000.

**Problem 10-58**

**L04**

**Summary Entries for Interest Payments**

Santa Clarita Company reported interest expense in 2013 and 2012 of \$470,000 and \$410,000, respectively. The balance in Accrued Interest Payable at the end of 2013, 2012, and 2011 was \$51,000, \$59,000, and \$46,000, respectively. In addition, a note to Santa Clarita's 2013 financial statements included the following:

Interest costs related to construction in progress are capitalized as incurred. The Company capitalized \$350,000 and \$260,000 of interest costs during the years 2013 and 2012, respectively.

**Instructions:**

1. What summary journal entries would be needed to record all information related to interest in 2013 and 2012?
2. How would interest paid be disclosed in Santa Clarita's statement of cash flows for 2013 and 2012? Santa Clarita uses the indirect method in reporting cash flow from operating activities.

**Problem 10-59**

**L03**

**Classifying Expenditures as Assets or Expenses**

As of December 31, 2013, W. W. Cole Company's total assets were \$325 million and total liabilities were \$180 million. Net income for 2013 was \$38 million. During 2013, W. W. Cole's chief executive officer had put extreme pressure on employees to meet the profitability goal the CEO had set for them. The goal was to achieve a return on stockholders' equity in 2013 of 25% (net income/stockholders' equity). The rumor among Cole's employees is that to meet this goal, the accounting for some items may have been overly "aggressive." The following items are of concern:

- (a) Research and development costs totaling \$18 million were capitalized. None of these costs related to items with alternative uses. The capitalized R&D was assigned a useful life of six years; \$3 million was written off during 2013.

- (b) During the year, a building was acquired in exchange for 5 million shares of Cole common stock. The building was assigned a value of \$27 million by the board of directors. At the time of the exchange, Cole common stock was trading on the New York Stock Exchange for \$3 per share.
- (c) On December 31, equipment was purchased for \$1 million in cash and an agreement to pay \$3 million per year for the next eight years, the first payment to be made in one year. The cost of the equipment was recorded at \$25 million. The interest rate implicit in the contract was 12%.
- (d) Interest of \$7 million was capitalized during the year. The only items produced during the year by Cole were routine inventory items.

**Instructions:**

1. Ignoring any concerns raised by items (a) through (d), did W. W. Cole Company meet its profitability goal for the year?
2. After making any adjustments suggested by items (a) through (d), did W. W. Cole meet its profitability goal? (Ignore income taxes.)
3. What should prevent accounting abuses like those described above?

**Problem 10-60****L03****Classifying Expenditures as Assets or Expenses**

Trevor Company completed a program of expansion and improvement of its plant during 2013. You are provided with the following information concerning its buildings account:

- (a) On October 31, 2013, a 50-foot extension to the present factory building was completed at a contract cost of \$462,000.
- (b) During the course of construction, the following costs were incurred for the removal of the end wall of the building where the extension was to be constructed.
  - (1) Payroll costs during the month of March arising from employees' time spent in removing the wall, \$23,410.
  - (2) Payments to a salvage company for removing unusual debris, \$2,610.
- (c) The cost of the original structure allocable to the end wall was estimated to be \$33,900 with accumulated depreciation thereon of \$17,300. Trevor Company received \$6,570 from the construction company for windows and other assorted materials salvaged from the old wall.
- (d) The old floor covering was replaced with a new type of long-lasting floor covering at a cost of \$9,190. The cost of the old floor covering was \$13,000 and accumulated depreciation was \$6,250. The cost of the old floor covering had been included with the overall building cost even though the floor covering has a different useful life than the building.
- (e) The interior of the plant was repainted in new bright colors for a contract price of \$12,420.
- (f) New and improved shelving was installed at a cost of \$4,180. The cost of the old shelving was \$2,200 and accumulated depreciation was \$990. The cost of the old shelving had been included with the overall building cost even though the shelving has a different useful life than the building.
- (g) Old electrical wiring was replaced at a cost of \$13,440. Cost of the old wiring was determined to be \$5,110 with accumulated depreciation to date of \$1,900. Assume that the new wiring has a remaining useful life that is the same as the building.
- (h) New electrical fixtures using fluorescent bulbs were installed. The new fixtures were purchased on the installment plan; the schedule of monthly payments showed total payments of \$10,240, which included interest and carrying charges of \$800. The old fixtures were carried at a cost of \$3,300 with accumulated depreciation to date of \$1,410. The old fixtures have no scrap value. Assume that the new fixtures have the same remaining useful life as the building.

**Instructions:** Prepare journal entries for the preceding information. Briefly justify the capitalize-or-expense decision for each item.

**Problem 10-61**

**L04**

**Acquisition and Valuation of Intangibles**

Beecher's Boston Barbeque Company purchased a customer list and an ongoing research project for a total of \$300,000. Beecher uses the expected cash flow approach for estimating the fair value of these two intangibles. The appropriate interest rate is 7%. The potential future cash flows from the two intangibles, and their associated probabilities, are as follows:

*Customer List*

- Outcome 1 20% probability of cash flows of \$40,000 at the end of each year for five years.
- Outcome 2 30% probability of cash flows of \$18,000 at the end of each year for four years.
- Outcome 3 50% probability of cash flows of \$9,000 at the end of each year for three years.

*Ongoing Research Project*

- Outcome 1 10% probability of cash flows of \$450,000 at the end of each year for 10 years.
- Outcome 2 20% probability of cash flows of \$12,000 at the end of each year for 4 years.
- Outcome 3 70% probability of cash flows of \$500 at the end of each year for 3 years.

**Instructions:** Prepare the journal entry necessary to record the purchase of the two intangibles.

**Problem 10-62**

**L06**

**Limitations of the Fixed Asset Turnover Ratio**

Progressive Company reported the following asset values in 2012 and 2013:

	2013	2012
Cash .....	\$ 50,000	\$ 45,000
Accounts receivable .....	300,000	220,000
Inventory .....	650,000	510,000
Land .....	600,000	400,000
Buildings .....	900,000	800,000
Equipment .....	350,000	250,000

In addition, in 2013, Progressive had sales of \$4,800,000; cost of goods sold for the year was \$2,900,000.

As of the end of 2012, the fair value of Progressive's total assets was \$3,000,000. Of the excess of fair value over book value, \$100,000 resulted from the fact that Progressive uses LIFO for inventory valuation. As of the end of 2013, the fair value of Progressive's total assets was \$3,800,000, and Progressive's LIFO reserve was \$150,000.

**Instructions:**

1. Compute Progressive's fixed asset turnover ratio for 2013.
2. Using the fair value of fixed assets instead of their book values, recompute Progressive's fixed asset turnover ratio for 2013. State any assumptions that you make.
3. Progressive's primary competitor is Steady State. Steady State's fixed asset turnover ratio for 2013, based on publicly available information, is 2.5. Is Progressive more or less efficient at using its fixed assets than Steady State? Explain your answer.

## Problem 10-63

## Sample CPA Exam Questions

## L02, L04

- Cole Co. began constructing a building for its own use in January 2013. During 2013, Cole incurred interest of \$50,000 on specific construction debt and \$20,000 on other borrowings. The amount of interest that could have been avoided if the building construction expenditures had been used to pay off debt during 2013 was \$40,000. What amount of interest cost should Cole capitalize?
  - \$20,000
  - \$40,000
  - \$50,000
  - \$70,000
- Which of the following costs of goodwill should be capitalized?

	Maintaining Goodwill	Developing Goodwill
(a)	Yes	No
(b)	No	No
(c)	Yes	Yes
(d)	No	Yes

## CASES

Discussion  
Case 10-64

## Is There Any Goodwill?

Fugate Energy Corp. has recently purchased a small local company, Gleave Inc., for \$556,950 cash. Fugate's chief accountant has been given the assignment of preparing the journal entry to record the purchase. An investigation disclosed the following information about the assets of Gleave Inc.:

- Gleave owned land and a small manufacturing building. The book value of the property on Gleave's records was \$115,000. An appraisal for fire insurance purposes had been made during the year. The building was appraised by the insurance company at \$175,000. Property tax assessment notices showed that the building's worth was five times the worth of the land.
- Gleave's equipment had a book value of \$75,000. It is estimated by Gleave that it would take six times the amount of book value to replace the old equipment with new equipment. The old equipment is, on average, 50% depreciated.
- Gleave had a franchise to produce and sell solar energy units from another company in a set geographic area. The franchise was transferred to Fugate as part of the purchase. Gleave carried the asset on its books at \$40,000, the unamortized balance of the original cost of \$90,000. The franchise is for an unlimited time. Similar franchises are now being sold by the company for \$120,000 per geographic area.
- Gleave had two excellent research scientists who were responsible for much of the company's innovation in product development. Each is paid \$150,000 per year by Gleave. They have agreed to work for Fugate Energy at the same salary.
- Gleave held two patents on its products. Both had been fully amortized and were not carried as assets on Gleave's books. Gleave believes they could have been sold separately for \$75,000 each.

Evaluate each of these items and prepare the journal entry that should be made to record the purchase on Fugate's books. (Note: Gleave has no liabilities.)

Discussion  
Case 10-65

## But Research Is Our Only Asset!

Strategy, Inc., was organized by Elizabeth Durrant and Ramona Morales, two students working their way through college. Both Elizabeth and Ramona had used the Internet extensively while in high school and had become very proficient Web surfers. Elizabeth

had a special ability for designing Web-based games that challenged the reasoning power of players. Ramona could see great potential in marketing Elizabeth's products to other Web users, and so the two began Strategy. Sales have exceeded expectations, and they have added 10 employees to their company to design additional products, debug new programs, and produce and distribute the final software products.

Because of its growing size, increased capital is needed for the company. The partners decide to apply for a \$100,000 loan to support the growing cost of research. As part of the documentation to obtain the loan, the bank asks for audited financial statements for the past year. After some negotiation, Mark Dawson, CPA, is hired. Strategy had produced a preliminary income statement that reported net income of \$35,000. After reviewing the statements, Dawson indicates that the company actually had a \$10,000 loss for the year. The major difference relates to \$45,000 of wage and material costs that Strategy had capitalized as an intangible asset but that Dawson determined should be expensed.

"It's all research and development," Dawson insisted.

"We'll easily recoup it in sales next year," countered Ramona. "I thought you accountants believed in the matching principle. Why do you permit us to capitalize the equipment we're using, but not our Web development costs? We'll never look profitable under your requirements!"

What major issues are involved in this case? Which position best reflects generally accepted accounting principles?

#### Discussion Case 10-66

#### Why Is My ROA Lower than Yours?

Terri Morton has been recently hired as a financial analyst. Her first assignment is to analyze why the reported return on assets (ROA) for Arnold Company is so much different from that of Baker Company. Arnold Company develops and markets innovative consumer products. Baker Company is a fabricator of heavy steel products. Both companies have net incomes of \$1 million, but Arnold has reported total assets of only \$3 million compared to \$6 million for Baker. Terri suspects her new boss is using this assignment to test her understanding of financial statements. Terri's boss did give her one cryptic clue: unrecorded assets. Prepare Terri's analysis.

#### Discussion Case 10-67

#### Expensing R&D: Will It Kill Me?

In 1974, as the FASB considered requiring the expensing of all in-house research and development expenditures, the Board received many comments predicting that if firms were required to expense R&D, they would significantly cut back on research expenditures to avoid hurting reported earnings. Subsequent to the adoption of pre-Codification FASB *Statement No. 2*, such an impact proved to be difficult to document. Elliott et al. summarized and extended conflicting prior research and concluded that R&D expenditures did decrease after the adoption of FASB *Statement No. 2* but that the decrease may have been a function of the generally unfavorable economic conditions in the United States in the mid-1970s.

Would you expect that a rule requiring all firms to expense R&D outlays would cause R&D expenditures to decrease? Why or why not?

SOURCE: John Elliott, Gordon Richardson, Thomas Dyckman, and Roland Dukes, "The Impact of SFAS No. 2 on Firm Expenditures on Research and Development: Replications and Extensions," *Journal of Accounting Research*, Spring 1984, pp. 85–102.

#### Discussion Case 10-68

#### Brand Values on the Balance Sheet?

In 1996, *Financial World* magazine estimated and ranked the most valuable brand names in the world. Number 11 in the ranking was **Gillette** with an estimated value of \$10.3 billion. *Financial World* explained its brand value estimation process for Gillette as follows:

- *Estimate the amount of assets used in generating the brand sales.* This estimation involves using industry sales-to-asset ratios. For Gillette, *Financial World* estimated that 1995 sales of \$2.6 billion required the use of \$988 million in assets.
- *Compute excess return on assets.* *Financial World* assumes that a generic brand name will generate a return on assets of 5%. Gillette's 1995 operating profit of

\$961 million exceeds this 5% return by \$912 million [ $\$961 \text{ million} - (\$988 \text{ million assets} \times 0.05)$ ].

- *Estimate after-tax return.* *Financial World* puts Gillette's tax rate at 37%, yielding an after-tax excess return of \$575 million [ $\$912 \text{ million} \times (1 - 0.37)$ ].
- *Multiply the after-tax excess return by the brand's strength multiple.* The strength multiple takes into account the brand's leadership, stability, market size, internationality, trend, and legal protection. *Financial World* placed Gillette's strength multiple at 17.9 (quite high). This yields the final estimate of the brand value: \$10.3 billion ( $\$575 \text{ million excess after-tax return} \times 17.9$ ).

Comment on the relevance and reliability of the \$10.3 billion Gillette brand value calculated by *Financial World*. Under what circumstances would you be willing to recognize this value in the financial statements?

SOURCE: See "Behind the Numbers," *Financial World*, July 8, 1996, p. 54.

### Discussion Case 10-69

#### Asset Write-Ups

**Rouse Company**, a real estate developer, is well known as one of the few U.S. companies to have reported the current value of property and equipment in its financial statements. As mentioned in the text of the chapter, *IAS 16* permits the inclusion of upward asset revaluations, based on appraisals, in the financial statements. And *IAS 40* allows real estate companies to both record investment property in the balance sheet at its fair value and include the associated unrealized gains in the income statement.

In Germany, as in the United States, upward revaluations are not allowed. In fact, before being replaced by IASB standards, German rules were seen as encouraging write-downs, resulting in the creation of so-called hidden reserves, which constitute a systematic understatement of assets. In March 1993, **Daimler-Benz** disclosed that it had hidden reserves of \$2.45 billion.

1. Why might real estate companies be among the leaders in encouraging the disclosure of the current value of property and equipment?
2. If German companies have "hidden reserves," why do you think Daimler-Benz chose to reveal the magnitude of its hidden reserves in March 1993? What is the advantage of having hidden reserves?
3. As an auditor, how would you feel about auditing the financial statements of a company that uses appraisal values instead of historical costs?

### Case 10-70

#### Deciphering Financial Statements (The Walt Disney Company)

Locate the 2009 financial statements for **The Walt Disney Company** on the Internet.

Use those financial statements and consider the following questions.

1. As illustrated in Exhibit 10-10, **Interbrand** estimates the value of the Disney brand name in 2009 at \$28.45 billion. Search Disney's financial statements and notes—what is Disney's estimate of the value of the Disney name?
2. What summary journal entry did Disney make to record interest incurred during fiscal 2009? (*Hint:* Don't forget to distinguish between interest incurred and cash paid for interest.)
3. Find Disney's note about intangible assets. What is Disney's amortization policy for intangible assets? How often does Disney review its intangible assets to determine if their carrying values are recorded accurately?
4. According to the statement of cash flows, in 2009 Disney spent \$1,753 million on investments in parks, resorts, and other property. Use the notes to the financial statements to determine how much of this total related to each of Disney's operating segments.

### Case 10-71

#### Writing Assignment (Is It an Asset or Not?)

Hunter Company has developed a computerized machine to assist in the production of appliances. It is anticipated that the machine will do well in the marketplace; however, the company lacks the necessary capital to produce the machine. Rosalyn Finch,

secretary-treasurer of Hunter Company, has offered to transfer land to the company to be used as collateral for a bank loan. In exchange for the land transfer, Rosalyn will receive a 5-year employment contract and a percentage of any profits earned from sales of the new machine. The title to the land is to be transferred unconditionally. If Hunter defaults on the employment contract, a lump-sum cash settlement for lost wages will be paid to Rosalyn.

The land transfer may be a good business move, but it raises a number of sticky accounting issues. Hunter's controller has given you the task of writing a memo that summarizes the options available in accounting for the land transfer. Your memo should outline the arguments both for and against recording the land as an asset on Hunter's books. Also discuss how the land should be valued if it is recorded as an asset.

### Case 10-72

#### Ethical Dilemma (Dumping Costs into a Landfill)

On St. Patrick's Day 1992, **Chambers Development Company**, one of the largest landfill and waste management firms in the United States, announced that it had been improperly capitalizing costs associated with landfill development. Chambers announced that it was immediately expensing over \$40 million in executive salaries, travel expenses, and public relations costs that had been capitalized as part of the cost of landfills. Wall Street fear over what this move meant for Chambers' track record of steady earnings growth sent Chambers' stock price plunging 62% in one day—total market value declined by \$1.4 billion.

Imagine that it is early 1992 and you have just been assigned to work on the Chambers Development audit. In the course of your audit, you find a number of irregular transactions, including the questionable capitalization of costs as described above. Chambers' accounting staff tells you that the company has always capitalized these costs. You do a little historical investigation and find that if all the questionable costs had been expensed as you think they should have been, the \$362 million expense would completely wipe out all the profit reported by Chambers since it first went public in 1985. You are reluctant to approach your superior, the audit partner on the job, because you know that a large number of the financial staff working for Chambers are former partners in the audit firm you work for. However, you know that ignoring something like this can lead to a catastrophic audit failure.

Draft a memo to the audit partner summarizing your findings.

### Case 10-73

#### Cumulative Spreadsheet Analysis

This spreadsheet assignment is a continuation of the spreadsheet assignments given in earlier chapters. If you completed those assignments, you have a head start on this one.

Refer back to the instructions for preparing the revised financial statements for 2013 as given in (1) of the Cumulative Spreadsheet Analysis assignment in Chapter 3.

1. Skywalker wishes to prepare a *forecasted* balance sheet, a *forecasted* income statement, and a *forecasted* statement of cash flows for 2014. Use the financial statement numbers for 2013 as the basis for the forecast, along with the following additional information.
  - (a) Sales in 2014 are expected to increase by 40% over 2013 sales of \$2,100.
  - (b) In 2014, new property, plant, and equipment acquisitions will be in accordance with the information in (q).
  - (c) The \$480 in operating expenses reported in 2013 breaks down as follows: \$15 in depreciation expense and \$465 in other operating expenses.
  - (d) No new long-term debt will be acquired in 2014.
  - (e) No cash dividends will be paid in 2014.
  - (f) New short-term loans payable will be acquired in an amount sufficient to make Skywalker's current ratio in 2014 exactly equal to 2.0.
  - (g) Skywalker does not anticipate repurchasing any additional shares of stock during 2014.
  - (h) Because changes in future prices and exchange rates are impossible to predict, Skywalker's best estimate is that the balance in accumulated other comprehensive income will remain unchanged in 2014.

- (i) In the absence of more detailed information, assume that the balances in Investment Securities, Long-Term Investments, and Other Long-Term Assets will all increase at the same rate as sales (40%) in 2014. The balance in Intangible Assets will change in accordance with item (r).
- (j) In the absence of more detailed information, assume that the balance in the other long-term liabilities account will increase at the same rate as sales (40%) in 2014.
- (k) The investment securities are classified as available-for-sale securities. Accordingly, cash from the purchase and sale of these securities is classified as an investing activity.
- (l) Assume that transactions impacting other long-term assets and other long-term liabilities accounts are operating activities.
- (m) Cash and investment securities accounts will increase at the same rate as sales.
- (n) The forecasted amount of accounts receivable in 2014 is determined using the forecasted value for the average collection period. The average collection period for 2014 is expected to be 14.08 days. To make the calculations less complex, this value of 14.08 days is based on forecasted end-of-year accounts receivable rather than on average accounts receivable.
- (o) The forecasted amount of inventory in 2014 is determined using the forecasted value for the number of days' sales in inventory. The number of days' sales in inventory for 2014 is expected to be 107.6 days. To make the calculations simpler, this value of 107.6 days is based on forecasted end-of-year inventory rather than on average inventory.
- (p) The forecasted amount of accounts payable in 2014 is determined using the forecasted value for the number of days' purchases in accounts payable. The number of days' purchases in accounts payable for 2014 is expected to be 48.34 days. To make the calculations simpler, this value of 48.34 days is based on forecasted end-of-year accounts payable rather than on average accounts payable.

(Note: These forecasted statements were constructed as part of the spreadsheet assignment in Chapter 9; you can use that spreadsheet as a starting point if you have completed that assignment.)

For this exercise, make the following additional assumptions:

- (q) The forecasted amount of property, plant, and equipment (PP&E) in 2014 is determined using the forecasted value for the fixed asset turnover ratio. The fixed asset turnover ratio for 2014 is expected to be 3.518 times. To make the calculations simpler, this ratio of 3.518 is based on forecasted end-of-year gross property, plant, and equipment balance rather than on the average balance. (Note: For simplicity, ignore accumulated depreciation in making this calculation.)
- (r) Skywalker has determined that no new intangible assets will be acquired in 2014. For this assignment, ignore amortization of the existing intangible asset account balance.

Clearly state any additional assumptions that you make.

2. Assume the same scenario as (1), and show the impact on the financial statements with the following changes in assumptions:
  - (a) Fixed asset turnover ratio is expected to be 4.500.
  - (b) Fixed asset turnover ratio is expected to be 2.500.
3. Comment on the differences in the forecasted values of cash provided by operating activities in 2014 under each of the following assumptions about the fixed asset turnover ratio: 3.518 times, 4.500 times, and 2.500 times. Explain how a change in the fixed asset turnover ratio impacts cash provided by operations.

# CHAPTER 11 Investments in Noncurrent Operating Assets—Utilization and Retirement

## LEARNING OBJECTIVES

- 1 Use straight-line, accelerated, use-factor, and group depreciation methods to compute annual depreciation expense.
- 2 Apply the productive-output method to the depletion of natural resources.
- 3 Incorporate changes in estimates and methods into the computation of depreciation for current and future periods.
- 4 Identify whether an asset is impaired, and measure the amount of the impairment loss using both U.S. GAAP and IASB standards.
- 5 Discuss the issues impacting proper recognition of amortization or impairment for intangible assets.
- 6 Account for the sale of depreciable assets in exchange for cash and in exchange for other depreciable assets.

### EM EXPANDED MATERIAL

- 7 Compute depreciation for partial periods, using both straight-line and accelerated methods.
- 8 Understand the depreciation methods underlying the MACRS income tax depreciation system.

Garbage—that’s how H. Wayne Huizenga made his first splash on the national scene. In the early 1960s, he started with one garbage truck in southern Florida. Huizenga went on to buy up hundreds of local garbage companies across the country, combining them into **Waste Management Inc.** (which later merged with USA Waste Services but kept the Waste Management name), the largest trash hauler in the world.

After his retirement from the trash business in 1984, Huizenga’s eye fell on a small, 20-store, video chain in Dallas called **Blockbuster Video.**<sup>1</sup> By the end of 1987, Huizenga had acquired control of Blockbuster and had increased the number of stores to 130. Through a combination of aggressive expansion and the acquisition of existing video chains, Blockbuster soon became the nation’s largest video chain. By the end of 2007, there were 7,830 Blockbuster Video stores, primarily located in the United States, Great Britain, and Canada.

<sup>1</sup> Eric Calonius, “Meet the King of Video,” *Fortune*, June 4, 1990, p. 208.

On May 8, 1989, a **Bear Stearns** investment report was released that was critical of some of Blockbuster's accounting practices, particularly its depreciation policies. The report suggested that the 40-year life Blockbuster used for amortizing goodwill was much too long; to quote from the report: "Have you ever seen a 40-year-old videotape store?" Five years was suggested as a more reasonable amortization period. The report also criticized Blockbuster for increasing the depreciation period for videotapes from 9 months to 36 months.<sup>2</sup> Revising both these items to use the shorter amortization periods would have cut Blockbuster's 1988 net income almost in half—from \$0.57 per share to \$0.32 per share.

Release of the Bear Stearns report caused Blockbuster's stock price to drop from \$33.50 to \$26.25 in two days, a 22% drop. (See Exhibit 11-1.) This represented a total decline in market value of approximately \$200 million. Wayne Huizenga was livid. In a meeting with stock analysts, he showed a letter from the SEC ordering Blockbuster to use the longer videotape amortization period. He criticized the Bear Stearns researchers for not understanding his business and said that their report wasn't "worth the powder to blow it to hell."<sup>3</sup> Huizenga was vindicated when within

two weeks of the release of the report, Blockbuster's stock had regained most of the 22% loss.

In 1994, Wayne Huizenga left Blockbuster after presiding over its acquisition by **Viacom** in a deal valued at over \$8 billion. This completed an incredible run by Huizenga: He had entered, dominated, and successfully exited two very different industries, garbage and video rentals. So, what was next? Selected as America's number 1 entrepreneur by *Success* magazine in 1995, it was certain that Wayne Huizenga would not just sit around and count his money (about \$1.4 billion). At one time he owned three professional sports teams in southern Florida: the Miami Dolphins (football), the Florida Marlins (baseball), and the Florida Panthers (hockey). His new company, **AutoNation**, is busy doing for auto dealerships what Huizenga already did for garbage hauling and video stores: taking fragmented businesses across the country and consolidating them into a nationwide network. Currently, AutoNation is the largest automotive retailer in the United States with 246 new vehicle franchises as of December 31, 2009. At age 66, after creating three Fortune 1000 companies from scratch, Mr. Huizenga announced that he was stepping down from the board of AutoNation in April 2004.

© 2012 Cengage Learning.

<sup>2</sup> Dana Weschsler, "Earnings Helper," *Forbes*, June 12, 1989, p. 15. As explained later in the chapter, GAAP has been changed, and goodwill is no longer amortized but is instead tested for impairment on a regular basis.

<sup>3</sup> Duncan Maxwell Anderson and Michael Warshaw, "The #1 Entrepreneur in America," *Success*, March 1995, p. 32.

## QUESTIONS

1. Why would the Bear Stearns report cause Blockbuster's stock price to decline by 22%?
2. Look carefully at Exhibit 11-1 to see the behavior of Blockbuster's stock price around the release of the Bear Stearns report. When did "the market" better understand Blockbuster's accounting for depreciation—on May 7, just before the release of the Bear Stearns report, or on May 10, two days after the release of the report? Explain your answer.

*Answers to these questions can be found on page 11-41.*

## A

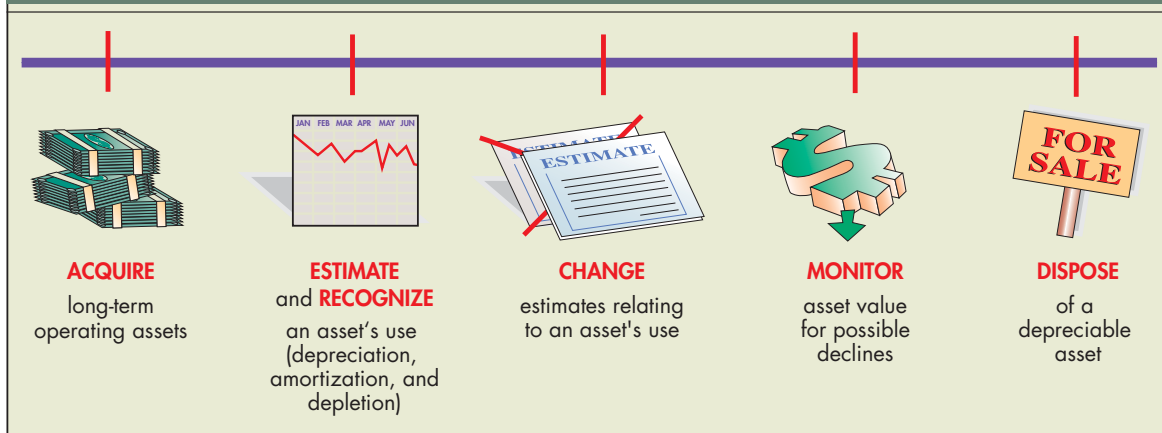

A fundamental task of accrual accounting is appropriately allocating the cost of long-lived assets to expense. If you are a Venetian shipmaster setting the price that you will charge for the use of your ship on a spice-trading voyage to the Orient, you must somehow allocate the cost of the ship over the expected number of voyages the ship can complete. If you are a Silicon Valley research firm, proper measurement of annual income requires you to allocate the cost of your research patents over their expected economic life. Computing asset depreciation is an exercise in accounting judgment, and, as illustrated in the Blockbuster/Bear Stearns example, reasonable people can disagree, with huge implications for reported profits.

Three different terms are used to describe the process of allocating the cost of long-lived assets to periodic expense. The allocation of tangible property costs is referred to as **depreciation**. For minerals and other natural resources, the cost allocation process is called **depletion**. For intangible assets, such as patents and copyrights, the process is referred to as **amortization**. Sometimes amortization is used generically to encompass all three terms.

This chapter discusses what happens to a long-lived asset after acquisition. The first decision facing management relates to estimating and recognizing the expense associated with a long-lived asset's use. We will cover the common depreciation methods and the depletion of natural resources. We will also address the issues associated with the proper treatment of changes in depreciation estimates. The chapter also describes when an impairment loss should be recognized and the proper accounting for the retirement of depreciable assets. The chapter includes discussion of three types of intangibles: those that are amortized, those that are not amortized but are tested for impairment, and goodwill, which is not amortized and is tested for impairment using a special test. The time line in Exhibit 11-2 illustrates the issues to be discussed. The Expanded Material at the end of the chapter offers more detail on depreciating assets acquired and retired in midyear and on the modified accelerated cost recovery system (MACRS), a depreciation system used for income tax purposes.

## EX 11-2 TIME LINE OF BUSINESS ISSUES INVOLVED WITH LONG-TERM OPERATING ASSETS

© 2012 Cengage Learning.

## Depreciation

1

Use straight-line, accelerated, use-factor, and group depreciation methods to compute annual depreciation expense.

**WHY** The conduct of business operations involves the use, and eventual wearing out, of plant and equipment, as well as some intangible assets. Conceptually, the amount of these assets consumed in doing business during a period should be reported as an expense of that period. In practice, accountants estimate this cost by using a systematic method to allocate the recorded cost of these assets to expense over the life of the asset.

**HOW** Four factors are used to compute depreciation expense: asset cost, salvage value, useful life, and pattern of use. The amount of depreciation expense recognized for a particular period depends on the depreciation method used.

i

FYI

Depreciation expense was not widely reported in income statements until the early 1900s. The passage of the Sixteenth Amendment in 1913, allowing the taxation of income, spurred companies to demand some depreciation deduction for the use of long-term assets.

Depreciation is *not* a process through which a company accumulates a cash fund to replace its long-lived assets. Depreciation is also *not* a way to compute the current value of long-lived assets. Instead, depreciation is the systematic allocation of the cost of an asset over the different periods benefited by the use of the asset.

Accumulated depreciation is not an asset replacement fund but is the sum of all the asset cost that has been expensed in prior periods. Similarly, the **book value** of an asset (historical cost less accumulated depreciation) is the asset cost remaining to be allocated to future periods but is not an estimate of the asset's current value.

Depreciation expense is the recognition of the using up of the service potential of an asset. The nature of depreciation expense is conceptually no different from the expenses that recognize the expiration of insurance premiums or prepaid rent; the practical

difference is that noncurrent assets are depreciated over several years, whereas prepaid rent is usually expensed over a period of months.

### Factors Affecting the Periodic Depreciation Charge

Four factors are taken into consideration in determining the appropriate amount of annual depreciation expense.

- Asset cost
- Residual or salvage value
- Useful life
- Pattern of use

**Asset Cost** The cost of an asset includes all the expenditures relating to its acquisition and preparation for use as described in Chapter 10. The cost of property less the expected residual value, if any, is the depreciable cost or depreciation base, that is, the portion of asset cost to be expensed in future periods.

**Residual or Salvage Value** The **residual (salvage) value** of property is an estimate of the amount for which the asset can be sold when it is retired. The residual value depends on the retirement policy of the company as well as market conditions and other factors. If, for example, the company normally uses equipment until it is physically exhausted and no longer serviceable, the residual value, represented by the scrap or junk value that can be salvaged, may be quite small. If, however, the company normally replaces its equipment after a short period of use, the residual value, represented by the selling price or trade-in value, may be relatively high.

From a theoretical point of view, any estimated residual value should be subtracted from cost in arriving at the portion of asset cost to be charged to depreciation. In practice, however, residual values are frequently ignored in determining periodic depreciation charges. This practice is acceptable when residual values are relatively small or are not subject to reasonable estimation.

## CAUTION

Ignoring small residual values bothers some students who want to compute depreciation correctly to the penny. Remember that depreciation is an *estimate*—forget the pennies.

**Useful Life** Noncurrent operating assets other than land have a limited **useful life** as a result of certain physical and functional factors. The physical factors that limit the service life of an asset are (1) wear and tear, (2) deterioration and decay, and (3) damage or destruction. Everyone is familiar with the processes of wear and tear that render an automobile, a building, or furniture no longer usable. A tangible asset, whether used or not, also is subject to deterioration and decay through aging. Finally, fire, flood, earthquake, or accident may reduce or terminate the useful life of an asset.

The primary functional factor limiting the useful lives of assets is obsolescence. An asset may lose its usefulness when as a result of altered business requirements or technological progress, it no longer can produce sufficient revenue to justify its continued use. Although the asset is still physically usable, its inability to produce sufficient revenue has cut short its economic life. Look around: How many old personal computers are stored in corners, still perfectly operational, but unable to run the software that is currently being used?

Amos Morgan/Digital Vision/Getty Images

Computers have short useful lives due to the quick progress of technology.

Both physical and functional factors must be considered in estimating the useful life of a depreciable asset. This recognition requires estimating what events will take place in the future and requires careful judgment on the part of the accountant. Physical factors are more readily apparent than functional factors in predicting asset life. When functional factors are expected to hasten the retirement of an asset, these also must be considered.

In practice, many companies as a matter of policy dispose of certain classes of assets after a predetermined period without regard to the serviceability of individual assets within a class.

Company automobiles, for example, may be replaced routinely every two or three years.

The useful life of a depreciable plant asset may be expressed in terms of either an estimated time factor or an estimated use factor. The time factor may be a period of months or years; the use factor may be a number of hours of service or a number of units of output. The cost of the asset is allocated in accordance with the lapse of time or extent of use. The rate of cost allocation may be modified by other factors, but basically depreciation must be recognized on a time or use basis.

**Pattern of Use** To match asset cost against revenues, periodic depreciation charges should reflect as closely as possible the pattern of use. If the asset produces a varying revenue pattern, the depreciation charges should vary in a corresponding manner. When depreciation is measured in terms of a time factor, the pattern of use must be estimated. Because of the difficulty in identifying a pattern of use, several somewhat arbitrary methods have come into common practice. Each method represents a different pattern and is designed to make the time basis approximate the use basis. The time factor is employed in two general classes of methods: straight-line depreciation and accelerated depreciation. When depreciation is measured in terms of a use factor, the units of use must be estimated. The depreciation charge varies periodically in accordance with the services provided by the asset. As illustrated later, the use factor is employed in service-hours depreciation and in productive-output depreciation.

**Recording Periodic Depreciation**

The general form of the journal entry used to recognize depreciation is as follows:

Depreciation Expense .....	xx
Accumulated Depreciation .....	xx

In manufacturing operations, depreciation is sometimes charged to a production overhead account and then allocated to the cost of inventory. This merely extends the period of deferral; instead of going straight to an expense account, depreciation goes to inventory and then to expense (Cost of Sales).

The allowance account that is credited in recording periodic depreciation is commonly titled *Accumulated Depreciation*. The accumulation of expired cost in a separate account

rather than crediting the asset account directly permits identification of the original cost of the asset and the accumulated depreciation. Companies are required to disclose both cost and accumulated depreciation for plant assets on the balance sheet or in the notes to the financial statements. This enables the user to estimate the relative age of plant assets and provides some basis for predicting future cash outflows for the replacement of plant assets.

## Methods of Depreciation

There are a number of different methods for computing depreciation expense. The depreciation method used in any specific instance is a matter of judgment and, conceptually, should be selected to most closely approximate the actual pattern of use expected from the asset. In practice, most firms select one depreciation method, such as straight-line, and use it for substantially all their depreciable assets. The following methods are described in this section.

### Time-Factor Methods

- Straight-line depreciation
- Accelerated methods
  - Sum-of-the-years'-digits depreciation
  - Declining-balance depreciation

### Use-Factor Methods

- Service-hours depreciation
- Productive-output depreciation

### Group and Composite Methods

The examples that follow assume the acquisition of a polyurethane plastic-molding machine at the beginning of 2013 by Schuss Boom Ski Manufacturing, Inc., at a cost of \$100,000 with an estimated residual value of \$5,000. The following symbols are used in the formulas for the development of depreciation rates and charges:

$C$  = Asset cost

$R$  = Estimated residual value

$n$  = Estimated life in years, hours of service, or units of output

$r$  = Depreciation rate per period, per hour of service, or per unit of output

$D$  = Periodic depreciation charge

**Time-Factor Methods** The most common methods of cost allocation are related to the passage of time. A productive asset is used up over time, and possible obsolescence due to technological changes is also a function of time. Of the **time-factor depreciation** methods, straight-line depreciation is by far the most popular.

The use of **accelerated depreciation** methods is based largely on the assumption that there will be rapid reductions in a depreciable asset's efficiency, output, or other benefits in the early years of that asset's life. As assets age, they often require increased charges for maintenance and repairs. Charges for depreciation decline, then, as the economic advantages afforded through ownership of the asset decline. The most commonly used accelerated method is the declining-balance method; the sum-of-the-years'-digits method is also sometimes used.

**Straight-line depreciation.** **Straight-line depreciation** relates depreciation to the passage of time and recognizes equal depreciation in each year of the life of the asset. The simple assumption behind the straight-line method is that the asset is equally useful during each time period, and depreciation is not affected by asset productivity or efficiency variations.

In applying the straight-line method, an estimate is made of the useful life of the asset, and the depreciable asset cost (the difference between the asset cost and residual value) is divided by the useful life of the asset in arriving at the periodic depreciation amount.

Using data for the machine acquired by Schuss Boom Ski Manufacturing and assuming a 5-year life, annual depreciation is computed as follows:

$$D = \frac{C - R}{N}, \text{ or } \frac{\$100,000 - \$5,000}{5 \text{ years}} = \$19,000 \text{ per year}$$

A table summarizing annual depreciation for the entire life of the asset, using the straight-line method, follows.

End of Year	Computation	Depreciation Amount	Accumulated Depreciation	Asset Book Value
				\$100,000
2013	\$95,000/5 =	\$19,000	\$19,000	81,000
2014	95,000/5 =	19,000	38,000	62,000
2015	95,000/5 =	19,000	57,000	43,000
2016	95,000/5 =	19,000	76,000	24,000
2017	95,000/5 =	<u>19,000</u>	95,000	5,000
		<u>\$95,000</u>		

It was indicated earlier that residual value is frequently ignored when it is a relatively minor amount. If this were done in the preceding example, depreciation would be \$20,000 per year instead of \$19,000.

When assets are acquired or disposed of in the middle of a year, depreciation for the partial year should be recognized. The examples in this chapter assume that partial-year depreciation is recognized for the number of months an asset was held during the year. A variety of other approaches to computing partial-year depreciation are covered in the Expanded Material at the end of the chapter.

**Sum-of-the-years'-digits depreciation.** The [sum-of-the-years'-digits depreciation](#) method yields decreasing depreciation in each successive year. The computations are done by applying a series of fractions, each of a smaller value, to depreciable asset cost. The numerator of the fraction is the number of years remaining in the asset life as of the beginning of the year. The denominator of the fraction is the sum of all the digits from one to the original useful life. There is no great conceptual insight behind this method; it is merely a clever arithmetic scheme that gives decreasing depreciation each year and results in the entire depreciable cost being allocated over the asset's useful life.

In the Schuss Boom example, the useful life is five years, so the denominator of the fraction is 15(1 + 2 + 3 + 4 + 5). Annual depreciation is computed as follows:

End of Year	Computation	Depreciation Amount	Accumulated Depreciation	Asset Book Value
				\$100,000
2013	\$95,000 × 5/15 =	\$31,667	\$31,667	68,333
2014	95,000 × 4/15 =	25,333	57,000	43,000
2015	95,000 × 3/15 =	19,000	76,000	24,000
2016	95,000 × 2/15 =	12,667	88,667	11,333
2017	95,000 × 1/15 =	<u>6,333</u>	95,000	5,000
		<u>\$95,000</u>		

Note that under this method, annual depreciation expense declines by 1/15 of the depreciation asset base each year, or by \$6,333 (by \$6,334 in 2014 and 2017 due to effects of rounding).

When an asset has a long useful life, such as 20 years, computing the sum of the years' digits can be cumbersome. The following formula is a shortcut to computing the sum of the years' digits:

$$\frac{[n(n + 1)]}{2} = (1 + 2 + 3 + \cdots + n)$$

With a useful life of 20 years, the sum-of-the-years'-digits denominator determined by the formula is  $[20(20 + 1)]/2 = 210$ . The fraction applied to depreciable cost in the first year would be 20/210, in the second year, 19/210, and so forth.

**Declining-balance depreciation.** The **declining-balance depreciation** methods provide decreasing charges by applying a constant percentage rate to a declining asset book value. The most popular rate is two times the straight-line rate, and this method is often called **double-declining-balance depreciation**. The percentage to be used is double the straight-line rate, calculated for various useful lives as follows:

Estimated Useful Life in Years	Straight-Line Rate	2 Times Straight-Line Rate
3	33 1/3%	66 2/3%
5	20	40
7	14 2/7	28 4/7
8	12 1/2	25
10	10	20
20	5	10

Residual value is not used in the computations under this method; however, it is generally recognized that depreciation should not continue once the book value is equal to the residual value. Depreciation using the double-declining-balance method for the Schuss Boom asset described earlier is summarized in the following table:

End of Year	Computation	Depreciation Amount	Accumulated Depreciation	Asset Book Value
				\$100,000
2013	$\$100,000 \times 40\% =$	\$40,000	\$40,000	60,000
2014	$60,000 \times 40\% =$	24,000	64,000	36,000
2015	$36,000 \times 40\% =$	14,400	78,400	21,600
2016	$21,600 \times 40\% =$	8,640	87,040	12,960
2017	$12,960 \times 40\% =$	5,184	92,224	7,776
		<u>\$92,224</u>		

It should be noted that the rate of 40% is applied to the decreasing book value of the asset each year. This results in a declining amount of depreciation expense. In applying this rate, the book value after five years exceeds the residual value by \$2,776 ( $\$7,776 - \$5,000$ ). This condition arises whenever residual values are relatively low in amount. Companies

**FYI**

The famous mathematician Carl Friedrich Gauss deduced this formula in 1878 during a test in school when he was 10 years old.

## CAUTION

With both the straight-line and sum-of-the-years'-digits methods, the residual value is subtracted from the asset cost before calculating depreciation. Residual value is not subtracted when using the double-declining-balance method.

## STOP&THINK

Imagine that at the beginning of 2013, Schuss Boom had five different machines: one brand new, and the others one year, two years, three years, and four years old. Which depreciation method—straight-line, sum-of-the-years'-digits, or double-declining-balance—would give the highest total depreciation expense in 2013?

- Straight-line gives the highest total depreciation expense in 2013.
- Sum-of-the-years'-digits gives the highest total depreciation expense in 2013.
- Double-declining-balance gives the highest total depreciation expense in 2013.
- All three depreciation methods give the same total depreciation expense in 2013.

usually switch to the straight-line method when the remaining annual depreciation computed using straight line exceeds the depreciation computed by continuing to apply the declining-balance rate. In the Schuss Boom example, the depreciation expense for the year 2017 would be \$7,960 if a switch was made from the double-declining-balance to the straight-line method. This would reduce the book value of the asset to its \$5,000 residual value. In this example, the switch would be made in the last year of the asset's life, and the final year's depreciation expense is simply the amount necessary to reduce the asset's book value to its residual value. However, if the asset in the example had a lower residual value, the switch could have been made in the fourth year. For example, assume the asset is expected to have no residual value. The book value under the double-

declining-balance method at the end of the third year as shown previously is \$21,600; thus, the straight-line depreciation for the fourth and fifth years would be \$10,800 ( $\$21,600/2$ ); because the straight-line depreciation of \$10,800 exceeds the double-declining depreciation of \$8,640, the straight-line amount would be used.

**Evaluation of time-factor methods.** Exhibit 11-3 illustrates the pattern of depreciation expense for the time-factor methods discussed in the preceding sections. Note that when the straight-line method is used, depreciation is a constant or fixed charge each period. When the life of an asset is affected primarily by the lapse of time rather than by the degree of use, recognition of depreciation as a constant charge is generally appropriate. However, when the straight-line method is used, net income measurements become particularly sensitive to changes in the volume of business activity. With above normal activity, there is no increase in the depreciation charge; with below normal activity, there is no decrease in the depreciation charge.

As mentioned, straight-line depreciation is the most widely used procedure for financial reporting purposes. It is readily understood and frequently parallels asset use. It has the advantage of simplicity and under normal conditions offers a satisfactory means of cost allocation. Normal asset conditions exist when (1) assets have been accumulated over a period of years so that the total of depreciation plus maintenance is comparatively even from period to period and (2) service potentials of assets are being steadily reduced by functional as well as physical factors. The absence of either of these conditions may suggest the use of some depreciation method other than straight line.

## EX 11-3 TIME-FACTOR METHODS: DEPRECIATION PATTERNS COMPARED

© 2012 Cengage Learning.

Accelerated methods can be supported as reasonable approaches to cost allocation when the annual benefits provided by an asset decline as it grows older. These methods, too, are suggested when an asset requires increasing maintenance and repairs over its useful life.<sup>4</sup> When straight-line depreciation is employed, the combined charges for depreciation, maintenance, and repairs will increase over the life of the asset; when an accelerated method is used, the combined charges will tend to be equalized. Exhibit 11-4 illustrates this relationship.

Other factors suggesting the use of an accelerated method include (1) the anticipation of a significant contribution in early periods with the extent of the contribution to be realized in later periods being less definite and (2) the possibility that inadequacy or obsolescence may result in premature retirement of the asset.

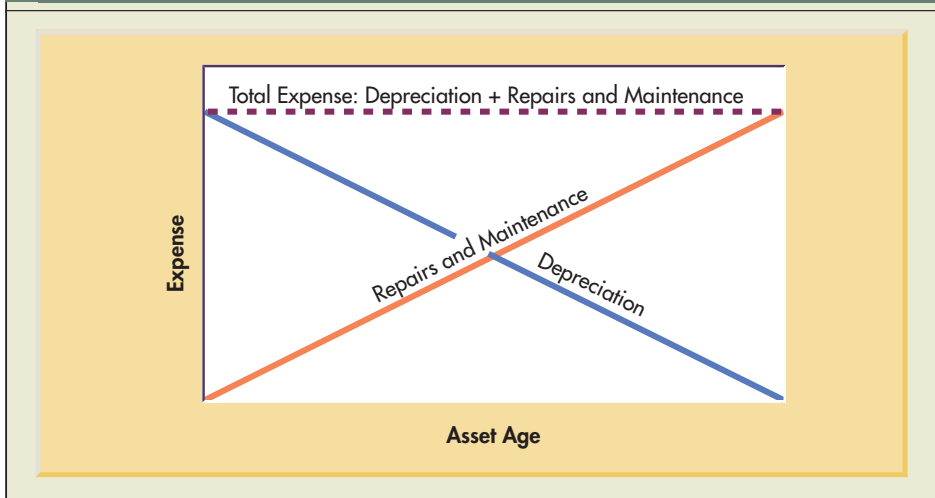

**Use-Factor Methods** Use-factor depreciation methods view asset exhaustion as related primarily to asset use or output and provide periodic charges varying with the degree of such service. Service life for certain assets can best be expressed in terms of hours of service but for others in terms of units of production.

**Service-hours depreciation.** Service-hours depreciation is based on the theory that the purchase of an asset represents the purchase of a number of hours of direct service. This method requires an estimate of the life of the asset in terms of service hours. Depreciable

<sup>4</sup> The following is found in FASB ASC paragraph 360-10-35-7: "The declining-balance method is an example of one of the methods that meet the requirements of being systematic and rational. If the expected productivity or revenue-earning power of the asset is relatively greater during the earlier years of its life, or maintenance charges tend to increase during later years, the declining-balance method may provide the most satisfactory allocation of cost. That conclusion also applies to other methods, including the sum-of-the-years'-digits method, that produce substantially similar results."

**EX 11-4 ACCELERATED DEPRECIATION AND REPAIRS AND MAINTENANCE EXPENSE**

© 2012 Cengage Learning.

cost is divided by total service hours in arriving at the depreciation rate to be assigned for each hour of asset use. The use of the asset during the period is measured, and the number of service hours is multiplied by the depreciation rate in arriving at the periodic depreciation charge. Depreciation charges against revenue fluctuate periodically according to how much the asset is used.

Using the Schuss Boom asset data previously given and an estimated service life of 20,000 hours, the rate to be applied for each service hour is determined as follows:

$$r \text{ (per hour)} = \frac{C - R}{n}, \text{ or } \frac{\$100,000 - \$5,000}{20,000 \text{ hours}} = \$4.75 \text{ per hour}$$

Computation of annual depreciation is summarized in the following table.

End of Year	Service Hours	Computation	Depreciation Amount	Accumulated Depreciation	Asset Book Value
					\$100,000
2013 .....	3,000	3,000 × \$4.75 =	\$14,250	\$14,250	85,750
2014 .....	5,000	5,000 × 4.75 =	23,750	38,000	62,000
2015 .....	5,000	5,000 × 4.75 =	23,750	61,750	38,250
2016 .....	4,000	4,000 × 4.75 =	19,000	80,750	19,250
2017 .....	<u>3,000</u>	3,000 × 4.75 =	<u>14,250</u>	95,000	5,000
	<u>20,000</u>		<u>\$95,000</u>		

In this illustration, the original estimate of service hours is correct, and the asset is retired after 20,000 hours are reached in the fifth year. Such precise estimation would seldom be found in practice. Procedures for handling changes in estimates are discussed later in the chapter.

Recall that straight-line depreciation resulted in annual depreciation of \$19,000 regardless of fluctuations in how much the asset was used. When asset life is affected

directly by the degree of use and when there are significant fluctuations in such use, the service-hours method, which recognizes hours used instead of hours available for use, normally provides the more appropriate charge to operations.

FYI

The productive-output method approximates the technique used to depreciate the cost of producing a motion picture. This technique is discussed in Discussion Case 11-74.

**Productive-output depreciation.** Productive-output depreciation is based on the theory that an asset is acquired for the service it can provide in the form of production output. This method requires an estimate of the total unit output of the asset. Depreciable cost divided by the total estimated output gives the equal charge to be assigned for each unit of output. The measured production for a period multiplied by the charge per unit gives the charge to be made against revenue. Depreciation charges fluctuate periodically according to the contribution the asset makes in unit output.

Using the Schuss Boom asset data and an estimated productive life of 25,000 units, the rate to be applied for each unit produced is determined as follows:

$$r \text{ (per hour)} = \frac{C - R}{n}, \text{ or } \frac{\$100,000 - \$5,000}{25,000 \text{ units}} = \$3.80 \text{ per unit}$$

A table for the productive-output method would be similar to that prepared for the service-hours method.

**Evaluation of use-factor methods.** When quantitative measures of asset use can be reasonably estimated, the use-factor methods provide highly satisfactory approaches to asset cost allocation. Depreciation as a fluctuating charge tends to follow the revenue curve: High depreciation charges are assigned to periods of high activity; low charges are assigned to periods of low activity. When the useful life of an asset is affected primarily by the degree of its use, recognition of depreciation as a variable charge is particularly appropriate.

However, certain limitations in applying the use-factor methods need to be noted. Asset performance in terms of service hours or productive output is often difficult to estimate. Measurement solely in terms of these factors could fail to recognize special conditions, such as increasing maintenance and repair costs, as well as possible inadequacy and obsolescence. Furthermore, when service life expires even in the absence of use, a use-factor method may conceal actual fluctuations in earnings; by relating periodic depreciation charges to the volume of operations, periodic operating results may be smoothed out, thus creating a false appearance of stability.

**Group and Composite Methods** It was assumed in preceding discussions that depreciation expense is associated with individual assets and is applied to each separate unit. This practice is called **unit depreciation**. From a practical standpoint, it often makes sense to compute depreciation for an entire group of assets as if the group were one asset. Group cost allocation procedures are referred to as **group depreciation** when the assets in the group are similar (e.g., all of a company's delivery vans) and **composite depreciation** when the assets in the group are related but dissimilar (e.g., all of a company's desks, chairs, and computers). In the following discussion, the term *group depreciation* will be used generically to refer to both methods.

The group depreciation procedure treats a collection of assets as a single group. Depreciation is accumulated in a single account, and the depreciation rate is based on the average life of assets in the group. Group depreciation is generally computed as an adaptation of the straight-line method, and the illustrations in this chapter assume this approach. A group rate is established by initially analyzing the various assets or classes of assets in use and computing the depreciation as an average of the straight-line annual depreciation as follows:

Asset	Cost	Residual Value	Depreciable Cost	Estimated Life in Years	Annual Depreciation Expense (Straight-Line)
A . . . . .	\$ 2,000	\$ 120	\$ 1,880	4	\$ 470
B . . . . .	6,000	300	5,700	6	950
C . . . . .	12,000	1,200	10,800	10	1,080
	<u>\$20,000</u>	<u>\$1,620</u>	<u>\$18,380</u>		<u>\$2,500</u>

Group depreciation rate to be applied to cost:  $\$2,500/\$20,000 = 12.5\%$

Average life of assets:  $\$18,380/\$2,500 = 7.352$  years

The rate of 12.5% applied to the cost of the existing assets, \$20,000, results in annual depreciation of \$2,500. Annual depreciation of \$2,500 will accumulate to a total of \$18,380 in 7.352 years; hence, 7.352 years is the average life of the assets.

After the group rate of 12.5% has been set, it is used to compute annual depreciation for all assets subsequently included in the group. For example, if Asset D is acquired for \$5,000, the total cost of the assets in the group becomes \$25,000 (\$2,000 + \$6,000 + \$12,000 + \$5,000), and annual depreciation expense is \$3,125 ( $\$25,000 \times 0.125$ ). The group rate is ordinarily left the same in subsequent years in the absence of significant changes in the lives of assets included in the group. It is assumed that the assets are replaced with similar assets when retired. The group rate should be reviewed periodically to confirm that it is still appropriate for the assets in the group.

Because the accumulated depreciation account under the group procedure applies to the entire group of assets, it is not related to any specific asset. Thus, no book value can be calculated for any specific asset, and there are no fully depreciated assets. No gains or losses are recognized at the time individual assets are retired. For example, if asset B is sold for \$3,500 after two years of use, the entry to record the sale using the group depreciation method would be as follows:

Cash . . . . .	3,500	
Accumulated Depreciation . . . . .	2,500	
Equipment . . . . .		6,000

Because no gain or loss is recognized, the debit to Accumulated Depreciation is the difference between the cost of the asset and the cash received. Gains and losses due solely to normal variations in asset lives are not recognized.

In instances when assets in a group are continued in use after their cost has been assigned to operations, no further depreciation charges are recognized. On the other hand, when all the assets in a group are retired before their costs have been assigned to

## FASB CODIFICATION

**The Issue:** You are interviewing for a job with a mid-size accounting firm. Just before lunch you had a fairly unpleasant interview with a person who has been with the firm for six years. He decided to test your knowledge of depreciation methods, so he asked you to list all of the depreciation methods you know. When you mentioned “group depreciation,” he stopped you and challenged you to name one industry that uses group depreciation. He said that in his long experience in the “real world,” he has never seen a company using group depreciation. You can hear this person down the hall boasting to his colleagues about how he “stumped” the job applicant with a simple question about depreciation.

You feel that your credibility is at stake. You have just 30 minutes until your afternoon set of interviews begins.

**The Question:** According to the authoritative accounting literature, what industry uses group depreciation?

**Searching the Codification:** You have found that with respect to questions about accounting standards and practices, your best online friend is the FASB’s Codification. You know that depreciation expense relates to property, plant, and equipment, which is discussed in Topic 360 of the Codification. You also know that depreciation expense is an issue of “subsequent measurement,” which is found in Section 35 of whatever subtopic it is under. So, start with Topic 360 and start looking for some descriptions of depreciation standards in specific industries.

**The Answer:** The use of group depreciation in a specific industry is described on page 11–42.

operations, a special charge related to such retirement would be recognized, either as a loss or as an addition to depreciation expense.

### Depreciation and IAS 16

Some items of property, plant, and equipment are composed of identifiable subitems. A perfect example is a building which has a roof, a heating/cooling system, windows, a general supporting structure, and so forth. Those subitems almost certainly do not depreciate over the same life. However, standard U.S. practice has been to treat the building as one composite asset depreciated as a group. An alternate approach is to depreciate each subitem, or component, separately. This component approach was mentioned briefly in Chapter 10. Mandatory use of the component approach was proposed by the AICPA in 2001 but rejected by the FASB in 2004; under current U.S. GAAP companies are allowed, but not required, to use the component approach.

In contrast, the component approach is required under IASB standards. The following requirement is contained in *IAS 16*:

Each part of an item of property, plant and equipment with a cost that is significant in relation to the total cost of the item shall be depreciated separately.<sup>5</sup>

<sup>5</sup> *International Accounting Standard 16*, “Property, Plant and Equipment” (London: International Accounting Standards Board, December 9, 2004), par. 43.

Conceptually, the component approach presents no great difficulty because it merely requires that the standard depreciation calculations be applied separately to each significant component of a larger asset, such as a building. In practice, there is a slight increase in bookkeeping effort to keep track of the separate components.

### Depreciation and Accretion of an Asset Retirement Obligation

As discussed in Chapter 10, the act of acquiring a long-term operating asset sometimes legally obligates a company to incur restoration costs in the future when the asset is retired. The fair value of this obligation is estimated when the asset is acquired; the fair value of the obligation is recognized as a liability and is added to the cost of the acquired asset. To continue the example introduced in Chapter 10, assume that Bryan Beach Company purchases and erects an oil platform at a total cost of \$750,000. The oil platform will be in use for 10 years, at which time Bryan Beach is legally obligated to ensure that the platform is dismantled and removed from the site. Bryan Beach estimates that it will have to pay \$100,000 to have the platform dismantled and removed from the site in 10 years. If the appropriate interest rate to use in computing the present value of the restoration obligation is 8%, the present value of the \$100,000 obligation is computed as follows:

$$FV = \$100,000; I = 8\%; N = 10 \text{ years} \rightarrow \$46,319$$

The journal entries to record the purchase of the oil platform and the recognition of the asset retirement obligation are as follows:

Oil Platform .....	750,000	
Cash .....		750,000
Oil Platform .....	46,319	
Asset Retirement Obligation .....		46,319

The cost of the oil platform asset, including the estimated retirement obligation, is depreciated just like any other long-term asset. If straight-line depreciation is used and a zero residual value is assumed, the depreciation entry each year is as follows:

Depreciation Expense [(\$750,000 + \$46,319)/10] .....	79,632	
Accumulated Depreciation—Oil Platform .....		79,632

In addition to this entry, each year an entry must be made to recognize the increase in the present value of the asset retirement obligation as the time until the obligation must be satisfied grows closer. This increase is similar to interest expense, but the FASB ruled that it should not be classified as interest expense.<sup>6</sup> Instead, the expense is called *accretion expense* and is recognized through the following journal entry:

Accretion Expense (\$46,319 × 0.08) .....	3,706	
Asset Retirement Obligation .....		3,706

<sup>6</sup> FASB ASC paragraph 410-20-35-5.

## Depletion of Natural Resources

**2** Apply the productive-output method to the depletion of natural resources.

**WHY** The cost associated with the use of a natural resource should be reported as an expense in the period in which the resource is used. As with depreciation, accountants estimate this cost by using a systematic method to allocate the recorded cost of these assets to expense over the life of the asset.

**HOW** Depletion expense (the term used to represent the using up of a natural resource) is computed by estimating the amount of natural resource consumed during the period in relation to the amount of natural resource that existed as of the beginning of the period. This proportion of the cost of the resource (as of the beginning of the period) is expensed.

Natural resources, also called *wasting assets*, are consumed as the physical units representing these resources are removed and sold. The withdrawal of oil or gas, the cutting of timber, and the mining of coal, sulfur, iron, copper, or silver ore are examples of processes leading to the exhaustion of natural resources. Depletion expense is a charge for the “using up” of the resources.

The computation of depletion expense is an adaptation of the productive-output method of depreciation. Perhaps the most difficult problem in computing depletion expense is estimating the amount of resources available for economical removal from the land. Generally, a geologist, mining engineer, or other expert is called upon to make the estimate, and it is subject to continual revision as the resource is extracted or removed.

Developmental costs, such as costs of drilling, sinking mine shafts, and constructing roads, should be capitalized and added to the original cost of the property in arriving at the total cost subject to depletion. These costs are often incurred before normal activities begin.

To illustrate the computation of depletion expense, assume the following facts: Land containing mineral deposits is purchased at a cost of \$5,500,000. After all of the mineral deposits have been extracted, it is expected that the land will have a residual value of \$250,000. The natural resource supply is estimated at 1,000,000 tons. The unit-depletion charge and the total depletion charge for the first year, assuming the withdrawal of 80,000 tons, are calculated as follows:

$$\text{Depletion charge per ton: } (\$5,500,000 - \$250,000) \div 1,000,000 = \$5.25$$

$$\text{Depletion charge for the first year: } 80,000 \text{ tons} \times \$5.25 = \$420,000$$

The following entries should be made to record these events:

Mineral Deposits . . . . .	5,500,000	
Cash . . . . .		5,500,000
Depletion Expense . . . . .	420,000	
Accumulated Depletion (or Mineral Deposits) . . . . .		420,000

If the 80,000 tons are sold in the current year, the entire \$420,000 would be included as part of the cost of goods sold. If only 60,000 tons are sold, \$105,000 is reported as part of ending inventory on the balance sheet.

When buildings and improvements are constructed in connection with the removal of natural resources and their usefulness is limited to the duration of the project, it is

reasonable to recognize depreciation on such properties on an output basis consistent with the charges to be recognized for the natural resources themselves. For example, assume that buildings are constructed at a cost of \$250,000; the useful lives of the buildings are expected to terminate upon exhaustion of the natural resource consisting of 1,000,000 units. Under these circumstances, a depreciation charge of \$0.25 ( $\$250,000/1,000,000$ ) should accompany the depletion charge recognized for each unit. When improvements provide benefits expected to terminate prior to the exhaustion of the natural resource, the cost of such improvements should be allocated on the basis of the units to be removed during the life of the improvements or on a time basis, whichever is considered more appropriate.

## Changes in Estimates of Cost Allocation Variables

3

Incorporate changes in estimates and methods into the computation of depreciation for current and future periods.

**WHY** Depreciation expense involves making estimates relating to pattern of use, estimated useful life, and salvage value. Almost inevitably, actual experience will indicate that one or more of these estimates is incorrect. This does NOT suggest a past error that must be fixed, but it does suggest the need for a revised depreciation estimate for the current and future periods to reflect the updated information.

**HOW** Changes in estimated salvage value or useful life and changes in depreciation method are reflected in the computation of depreciation expense for the current and future periods. The undepreciated book value is allocated over the remaining life based on the revised estimates or method.

The allocation of asset costs benefiting more than one period cannot be precisely determined at acquisition because so many of the variables must be estimated. Only one factor in determining the periodic charge for depreciation, amortization, or depletion is based on historical information: asset cost. Other factors—residual value, useful life or output, and the pattern of use or benefit—must be estimated. The question frequently facing accountants is how adjustments to these estimates, which arise as time passes, should be reflected in the accounts. A change in estimate is reported in the current and future periods rather than as an adjustment of prior periods. This type of adjustment is made for residual value and useful-life changes. A change in depreciation method (e.g., from double-declining-balance to straight-line) based on a revised expected pattern of use is also reported in the current and future periods rather than as an adjustment of prior periods.<sup>7</sup>

### Change in Estimated Life

To illustrate the procedure for a change in estimated life affecting allocation of asset cost, assume that a company purchased \$50,000 of equipment and estimated a 10-year life. Using the straight-line method with no residual value, the annual depreciation would be \$5,000. After four years, accumulated depreciation would amount to \$20,000, and the remaining undepreciated book value would be \$30,000. Early in the fifth year, a reevaluation of the life indicates only four more years of service can be expected from the asset. An adjustment must therefore be made for the fifth and subsequent years to reflect the change. A new annual depreciation charge is calculated by dividing the remaining book

<sup>7</sup> FASB ASC paragraph 250-10-45-19.

value by the remaining life of four years. This would result in an annual charge of \$7,500 for the fifth through eighth years ( $\$30,000/4 = \$7,500$ ).

Year	Computation		Depreciation Amount	Accumulated Depreciation
1	$\$50,000/10$	=	\$ 5,000	\$ 5,000
2	$\$50,000/10$	=	5,000	10,000
3	$\$50,000/10$	=	5,000	15,000
4	$\$50,000/10$	=	5,000	20,000
5	$(\$50,000 - \$20,000)/4$	=	7,500	27,500
6	$(\$50,000 - \$20,000)/4$	=	7,500	35,000
7	$(\$50,000 - \$20,000)/4$	=	7,500	42,500
8	$(\$50,000 - \$20,000)/4$	=	7,500	50,000
			<u>7,500</u>	
			<u>\$50,000</u>	

Note that no attempt is made to go back and “fix” the first four years. The \$5,000 depreciation charge recognized in those years was computed using the best information available. When revised information becomes available in the fifth year, the impact is reflected in the current and future periods.

### Change in Estimated Units of Production

Another change in estimate occurs in accounting for natural resources when the estimate of the recoverable units changes as a result of further discoveries, improved extraction processes, or changes in sales prices that indicate changes in the number of units that can be extracted profitably. A revised depletion rate is established by dividing the remaining resource cost balance by the estimated remaining recoverable units.

To illustrate, assume the facts used in the earlier depletion example. Land is purchased at a cost of \$5,500,000 with estimated net residual value of \$250,000. The original estimated supply of natural resources in the land is 1,000,000 tons. As indicated previously, the depletion rate under these conditions would be \$5.25 per ton, and the depletion charge for the first year when 80,000 tons were mined would be \$420,000. Assume that in the second year of operation, 100,000 tons of ore are withdrawn, but before the books are closed at the end of the second year, appraisal of the expected recoverable tons indicates a remaining tonnage of 950,000. The new depletion rate and the depletion charge for the second year would be computed as follows:

Cost assignable to recoverable tons as of the beginning of the second year:

Original costs applicable to depletable resources	\$5,250,000
Deduct: Depletion charge for the first year	<u>420,000</u>
Balance of cost subject to depletion	<u>\$4,830,000</u>

Estimated recoverable tons as of the beginning of the second year:

Number of tons withdrawn in the second year	100,000
Estimated recoverable tons as of the end of the second year	<u>950,000</u>
Total recoverable tons as of the beginning of the second year	<u>1,050,000</u>

Depletion charge per ton for the second year:  $\$4,830,000/1,050,000 = \$4.60$

Depletion charge for the second year:  $100,000 \times \$4.60 = \$460,000$

Sometimes an increase in estimated recoverable units arises from additional expenditures for capital developments. When this occurs, the additional costs should be added to the

remaining recoverable cost and divided by the number of tons remaining to be extracted. To illustrate this situation, assume in the preceding example that \$525,000 of additional costs had been incurred at the beginning of the second year. The preceding computation of depletion rate and depletion expense would be changed as follows:

Cost assignable to recoverable tons as of the beginning of the second year:	
Original costs applicable to depletable resources. . . . .	\$5,250,000
Add: Additional costs incurred in the second year . . . . .	<u>525,000</u>
	\$5,775,000
Deduct: Depletion charge for the first year . . . . .	<u>420,000</u>
Balance of cost subject to depletion. . . . .	<u><u>\$5,355,000</u></u>
Estimated recoverable tons as of the beginning of the second year	
(as stated previously). . . . .	1,050,000
Depletion charge per ton for the second year: $\$5,355,000/1,050,000 = \$5.10$	
Depletion charge for the second year: $100,000 \times \$5.10 = \$510,000$	

Accounting is made up of many estimates. The procedures outlined in this section are designed to prevent the continual restating of reported income from prior years. Adjustments to prior-period income figures are made only if actual errors have occurred, not when reasonable estimates have been made that later prove inaccurate.

### Change in Depreciation Method

Another change in estimate occurs when the actual pattern of consumption of an asset doesn't match the pattern of consumption implicit in the depreciation method used. For example, an asset for which straight-line depreciation has been used might be observed to be wearing out in an accelerated fashion. Accordingly, a change in depreciation method is indicated.

To illustrate, assume that an asset is purchased for \$120,000 with a 12-year expected useful life and zero expected salvage value. Straight-line depreciation is used with the asset resulting in annual depreciation expense of \$10,000 [ $(\$120,000 - \$0)/12$  years]. After two years of use, the asset has a remaining book value of \$100,000 ( $\$120,000 - \$10,000$  depreciation for Year 1 –  $\$10,000$  depreciation for Year 2) and a remaining useful life of 10 years. Observation of the pattern of consumption of this asset for these two years indicates that the double-declining-balance method of depreciation would yield a better estimate of periodic depreciation. This change in estimate related to the pattern of asset consumption is reflected in the year in which the change is implemented (Year 3 in this example) and the subsequent years. Depreciation expense for Year 3 is computed as follows:

- Straight-line rate =  $100\%/Remaining\ life = 100\%/10\ years = 10\%$
- Double the straight-line rate =  $10\% \times 2 = 20\%$
- Remaining book value = \$100,000 (computation shown above)
- Year 3 depreciation expense =  $\$100,000 \times 0.20 = \$20,000$

When a change in estimate impacting the computation of depreciation expense is made, the current-year impact of the change on net income must be disclosed in the notes to the financial statements. When the change is implemented through a change in depreciation method, the note disclosure must also include an explanation of the change. Further discussion of accounting changes is contained in Chapter 20.

## Impairment of Tangible Assets

**4** Identify whether an asset is impaired, and measure the amount of the impairment loss using both U.S. GAAP and IASB standards.

**WHY** To avoid misleading financial statement users with overly optimistic data, noncurrent operating assets should not be reported in the balance sheet at an amount substantially in excess of their current value. Under U.S. GAAP, noncurrent operating assets are reviewed for possible substantial declines in value (called impairment) whenever there is a significant change in operations or in the way an asset is used.

**HOW** An asset is impaired when the undiscounted sum of future cash flows from the asset is less than the reported book value. An impaired asset is written down to its fair value.

Events sometimes occur after the purchase of an asset and before the end of its estimated life that impair its value and require an immediate write-down of the asset rather than making a normal allocation of cost over a period of time. Until 1995, the authoritative accounting literature did not include a clear statement of accounting standards governing the recognition of asset impairment.

As an example, in 1994, **Eli Lilly**, a large pharmaceutical company, paid \$4.1 billion to acquire **PCS Health Systems**, a company that helps insurance companies and HMOs manage their prescription drug benefit plans. By the second quarter of 1997, it had become apparent that the PCS acquisition was not turning out as planned. The movement toward managed health care had not been as fast as Lilly had expected, and the ominous possibility of increased government regulation of prescription drug benefit plans had tempered enthusiasm about PCS's prospects. In reviewing the acquisition, Eli Lilly decided that it should recognize a loss and reduce the recorded value of PCS's assets by \$2.4 billion.

As illustrated by the Eli Lilly/PCS Health Systems case, whether to recognize the impairment of operating assets is not a simple decision. In addition, once the decision to recognize the impairment has been made, one is still faced with the question of the amount of the write-down. This section discusses the concepts and procedures associated with the recognition of an asset impairment.

**FYI**

In a final act of surrender, Eli Lilly sold its PCS division to Rite Aid on January 22, 1999, for just \$1.6 billion.

### Accounting for Asset Impairment

Guidance on the accounting for asset impairment addresses the following four questions:<sup>8</sup>

1. When should an asset be reviewed for possible impairment?
2. When is an asset impaired?
3. How should an impairment loss be measured?
4. What information should be disclosed about an impairment?

<sup>8</sup> FASB ASC Subtopic 360-10 (Property, Plant, and Equipment—Overall), various subsections on “Impairment.”

**1. When Should an Asset Be Reviewed for Possible Impairment?** Conducting an impairment review of every asset at the end of every year would be unlikely to provide sufficiently improved financial information to justify the cost of the reviews. Instead, companies are required to conduct impairment tests whenever there has been a material change in the way an asset is used or in the business environment. In addition, if management obtains information suggesting that the market value of an asset has declined, an impairment review should be conducted.

**2. When Is an Asset Impaired?** According to the FASB, an entity should recognize an impairment loss only when the undiscounted sum of estimated future cash flows from an asset is less than the book value of the asset. As illustrated in the following example, this is rather a strange impairment threshold; a more intuitive test would be to compare the book value to the fair value of the asset. Because the undiscounted cash flows do not incorporate the time value of money, the sum of undiscounted future cash flows will always be greater than the fair value of the asset.

**3. How Should an Impairment Loss Be Measured?** The impairment loss is the difference between the book value of the asset and the fair value. The fair value can be approximated using the present value of estimated future cash flows from the asset.

**4. What Information Should Be Disclosed about an Impairment?** Disclosure should include a description of the impaired asset, reasons for the impairment, a description of the measurement assumptions, and the business segment or segments affected. An impairment loss should be included as part of income from continuing operations, and note disclosure of the amount should be made if the impairment loss is not shown as a separate income statement item.

CAUTION

The existence of an impairment loss is determined using undiscounted future cash flows. The amount of the impairment loss is measured using fair value, or *discounted*, future cash flows.

Application of the impairment rules is illustrated with the following example. Guangzhou Company purchased a building five years ago for \$600,000. The building has been depreciated using the straight-line method with a 20-year useful life and no residual value. Several other buildings in the immediate area have recently been abandoned, and Guangzhou has decided that the building should be evaluated for possible impairment. Guangzhou estimates that the building has a remaining useful life of 15 years, that net cash inflow from the building will be \$25,000 per year, and that the fair value of the building is \$230,000.

Annual depreciation for the building has been \$30,000 ( $\$600,000/20$  years). The current book value of the building is computed as follows:

Annual depreciation for the building has been \$30,000 ( $\$600,000/20$  years). The current book value of the building is computed as follows:

Original cost . . . . .	\$600,000
Accumulated depreciation ( $\$30,000 \times 5$ years) . . . . .	150,000
Book value . . . . .	<u>\$450,000</u>

The book value of \$450,000 is compared to the \$375,000 ( $\$25,000 \times 15$  years) undiscounted sum of future cash flows to determine whether the building is impaired. The sum of future cash flows is less, so an impairment loss should be recognized. The loss is equal to the \$220,000 ( $\$450,000 - \$230,000$ ) difference between the book value of the building and its fair value. The impairment loss would be recorded as on page 11-23.

Accumulated Depreciation—Building . . . . .	150,000	
Loss on Impairment of Building . . . . .	220,000	
Building (\$600,000 – \$230,000) . . . . .		370,000

The new recorded value of \$230,000 (\$600,000 – \$370,000) is considered to be the cost of the asset. After an impairment loss is recognized, no restoration of the loss is allowed even if the fair value of the asset recovers.

The odd nature of the undiscounted cash flow threshold can be seen if the facts in the Guangzhou example are changed slightly. Assume that net cash inflow from the building will be \$35,000 per year and that the fair value of the building is \$330,000.

With these numbers, no impairment loss is recognized, even though the fair value of \$330,000 is less than the book value of \$450,000 because the undiscounted sum of future cash flows of \$525,000 ( $\$35,000 \times 15$  years) exceeds the book value.

In many cases, it is more appropriate to estimate a range of possible future cash flows rather than to make a specific point estimate. In the preceding example, assume that instead of estimating future cash flows of \$25,000 per year, it is estimated that the following two cash flow scenarios are possible, with the indicated probabilities:

## STOP & THINK

Which ONE of the following statements best describes the effect of the undiscounted cash flow threshold used in the impairment test?

- a) Use of the undiscounted cash flow threshold means that an asset must suffer a significant drop in fair value before an impairment loss is recognized.
- b) Use of the undiscounted cash flow threshold means that any drop in fair value, no matter how small, will result in the recognition of an impairment loss.
- c) Use of the undiscounted cash flow threshold means that impairment losses will occasionally be recognized even when assets have increased in value.
- d) Use of the undiscounted cash flow threshold means that it is unlikely that any company will ever recognize an impairment loss.

	Future Cash Inflows	Probability
Scenario 1 . . . . .	\$20,000 per year for 15 years	85%
Scenario 2 . . . . .	50,000 per year for 15 years	15%

In applying the impairment test, the weighted-average undiscounted cash flows are computed as follows:

	Undiscounted Future Cash Inflows	Probability	Probability-Weighted Future Cash Flows
Scenario 1 . . . . .	$\$20,000 \times 15 \text{ years} = \$300,000$	85%	\$255,000
Scenario 2 . . . . .	$50,000 \times 15 \text{ years} = 750,000$	15%	112,500
Total . . . . .			\$367,500

The \$367,500 probability-weighted sum of undiscounted future cash flows is compared to the \$450,000 book value of the building, indicating that the asset is impaired ( $\$367,500 < \$450,000$ ). Assume that in this case there is no observable market value of the building and that the market value must be estimated using present value techniques. If the risk-free interest rate is 6.0%, the expected present value is computed as shown on page 11-24.

	Future Cash Inflows	Present Value (6.0% discount rate)	Probability	Probability-Weighted Present Value
Scenario 1 . . . . .	\$20,000 × 15 years	\$194,245	85%	\$165,108
Scenario 2 . . . . .	50,000 × 15 years	485,612	15%	72,842
Estimated fair value				<u>\$237,950</u>

The impairment loss would be recorded as follows:

Accumulated Depreciation—Building . . . . .	150,000
Loss on Impairment of Building (\$450,000 – \$237,950) . . . . .	212,050
Building (\$600,000 – \$237,950) . . . . .	362,050

**International Accounting for Asset Impairment: IAS 36**

The IASB’s standard for impairment is *IAS 36*, “Impairment of Assets.” This international standard is, from a conceptual standpoint, superior to the impairment standard embodied in U.S. GAAP. The IASB standard requires that a company recognize an impairment loss whenever the “recoverable amount” of an asset is less than its book value. *Recoverable amount* is defined as the higher of the selling price of the asset or the discounted future cash flows associated with the asset’s use. Both of these measures are based on the discounted value of the future cash flows from the asset, which means that the IASB has completely rejected the conceptually unappealing undiscounted cash flow threshold adopted by the FASB.

*IAS 36* also differs from U.S. GAAP in that the international standard allows for the reversal of an impairment loss if events in subsequent years suggest the asset is no longer impaired. Therefore, if an asset has increased in value and is no longer deemed to be impaired, the portion of the impairment loss that has been recovered should be reversed and recognized as a gain. Under the FASB standard, no subsequent recovery of an impairment loss is allowed.

**Accounting for Upward Asset Revaluations: IAS 16**

As mentioned in Chapter 10, an allowable alternative under *IAS 16* is to recognize increases in the value of long-term operating assets. Because the accounting procedures associated with asset revaluation are similar to those used to recognize an asset impairment, they are illustrated in this section.

**Recognizing an Upward Asset Revaluation** Earlier, we used an example of a building purchased by Guangzhou Company to illustrate the accounting for an asset impairment. Recall that after five years, the book value of that building was as follows:

Original cost . . . . .	\$600,000
Accumulated depreciation (\$30,000 × 5 years) . . . . .	150,000
Book value . . . . .	<u>\$450,000</u>

Now assume that Guangzhou Company uses international accounting standards, the building’s fair value is \$540,000, and Guangzhou employs the allowable alternative under international standards, electing to recognize this increase in asset value. The journal entry to recognize the asset revaluation is as follows:

Accumulated Depreciation—Building . . . . .	150,000	
Revaluation Equity Reserve . . . . .		90,000
Building (\$600,000 – \$540,000) . . . . .		60,000

After the entry is posted, the balance in the accumulated depreciation account is \$0, and the balance in the building account is \$540,000 (\$600,000 – \$60,000), resulting in a net recorded amount of \$540,000. As discussed in Chapter 13, the revaluation equity reserve is a separate category of equity and reflects the increase in the reported value of the total assets of the company stemming from increases in the market value of long-term operating assets. After the revaluation, annual depreciation expense is computed based on the revalued amount; the revalued amount is depreciated over the remaining estimated life of the asset.

## CAUTION

Remember that the upward revaluation of long-term operating assets is an allowable alternative under international accounting standards but is *not* allowable under U.S. GAAP.

**Recording the Disposal of a Revalued Asset** An interesting twist in the provisions of *IAS 16* makes it somewhat costly for a company to revalue its assets upward. To illustrate, assume that, immediately after revaluing its building to \$540,000, Guangzhou Company sells the building for \$540,000 in cash. This disposal would be recorded as follows:

Cash .....	540,000	
Building .....		540,000
Revaluation Equity Reserve .....	90,000	
Retained Earnings .....		90,000

Note that because Guangzhou chose to revalue the asset, the \$90,000 “gain” from the increase in the value of the asset is never reported as a gain in Guangzhou’s income statement. The “gain” is initially reflected as an increase in the equity reserve; on disposal, the “gain” is transferred directly to Retained Earnings, bypassing the income statement completely. Thus, although *IAS 16* gives companies the benefit of recognizing increases in the value of long-term operating assets, the provisions of *IAS 16* also impose a cost in the sense that these increases are then never reflected as increases in earnings in the income statement.

## Amortization and Impairment of Intangibles

5

Discuss the issues impacting proper recognition of amortization or impairment for intangible assets.

**WHY** Because intangible assets do not necessarily wear out as do physical assets, their periodic amortization and tests for impairment must be handled more delicately than the corresponding tests for tangible assets. In particular, careful consideration must be given to whether an intangible asset has a finite or an infinite life.

**HOW** An intangible asset with a finite life is amortized over its estimated useful life, usually with zero residual value and using the straight-line method. These intangibles are tested for impairment using the standard 2-step impairment test. An intangible asset with an indefinite life is not amortized. These intangibles are tested for impairment simply by comparing their carrying value to their estimated fair value. Goodwill is tested for impairment using a special fair value test tied to the reporting unit to which the goodwill is assigned.

For accounting purposes, recorded intangible assets come in three varieties:

- *Intangible assets that are amortized.* The impairment test for these intangibles is the same as the 2-step test described earlier in the chapter for tangible long-term operating assets.
- *Intangible assets that are not amortized.* The impairment test for these intangibles involves a simple 1-step comparison of the book value to the fair value.
- *Goodwill, which according to FASB ASC Topic 350 (Intangibles—Goodwill and Other) is not amortized.* The goodwill impairment test is a process that first involves estimating the fair value of the entire reporting unit to which the goodwill is allocated.

In accounting for an intangible asset after its acquisition, a determination first must be made as to whether the intangible asset has a finite life. If no economic, legal, or contractual factors cause the intangible to have a finite life, then its life is said to be indefinite, and the asset is not to be amortized until its life is determined to be finite. An indefinite life is one that extends beyond the foreseeable horizon.<sup>9</sup> An example of an intangible asset that has an indefinite life is a broadcast license that includes an extension option that can be renewed indefinitely. If an intangible asset is determined to have a finite life, the asset is to be amortized over its estimated life; the useful life estimate should be reviewed periodically.<sup>10</sup>

### Amortization and Impairment of Intangible Assets Subject to Amortization

The very nature of intangible assets makes estimating their useful lives a difficult problem. The useful life of an intangible asset may be affected by a variety of economic, legal, regulatory, and contractual factors. These factors, including options for renewal or extension, should be evaluated in determining the appropriate period over which the cost of the intangible asset should be allocated. A patent, for example, has a legal life of 20 years from the date of application in the United States; but if the competitive advantages afforded by the patent are expected to terminate after five years, the patent cost should be amortized over the shorter period.

Intangible assets are to be amortized by the straight-line method unless there is strong justification for using another method. Amortization, like depreciation, may be charged as an operating expense of the period or allocated to production overhead if the asset is related directly to the manufacture of goods. Because companies must disclose both the original cost and the accumulated amortization for amortizable intangibles, the credit entry should be made to a separate accumulated amortization account.

To illustrate the accounting for amortizable intangibles, consider the following example. Ethereal Company markets products to real-estate agents and to new homeowners. Ethereal purchased a customer list for \$30,000 on January 1, 2013. Because of turnover among real-estate agents and because new homeowners gradually become established homeowners, the list is expected to have economic value for only four years. As with all amortizable intangibles, the presumption is that the residual value of the customer list is zero; in this case there is no evidence to rebut this presumption. Similarly,

<sup>9</sup> FASB ASC paragraph 350-30-35-4.

<sup>10</sup> Before the adoption of pre-Codification SFAS No. 142 in 2001 (which is the basis for FASB ASC Topic 350), intangible assets were amortizable over a maximum period of 40 years. The FASB considered imposing a maximum amortization period of 20 years on intangibles. However, the final standard does not include any arbitrary cap on the useful life of amortizable intangible assets.

there is no evidence to justify the use of any amortization method other than straight line. On December 31, 2013, the following journal entry is made to recognize amortization expense:

Amortization Expense (\$30,000/4 years) .....	7,500	
Accumulated Amortization—Customer List .....		7,500

During 2014, before amortization expense for the year is recognized, the customer list intangible asset is tested for impairment. The impairment test is the same as that explained previously for tangible long-term operating assets. The impairment test for the real-estate customer list was prompted by a substantial downturn in the real-estate market in the area. At the time of the impairment test, the book value of the intangible asset is \$22,500 (\$30,000 – \$7,500). It is estimated that the customer list will generate future cash flows of \$5,000 per year for the next three years and that the fair value of the customer list on December 31, 2014, is \$12,000. The customer list intangible asset is impaired because the \$15,000 (\$5,000 × 3 years) sum of the future undiscounted cash flows is less than the book value of \$22,500. The amount of the impairment loss is the \$10,500 (\$22,500 – \$12,000) difference between the book value and the fair value and is recorded as follows:

Impairment Loss (\$22,500 – \$12,000) .....	10,500	
Accumulated Amortization—Customer List .....	7,500	
Customer List (\$30,000 – \$12,000) .....		18,000

The \$12,000 fair value is the new basis for the intangible asset; no entry is made to recognize any subsequent recovery in the value of the intangible. Amortization in subsequent years will be based on the new book value of \$12,000 and the estimated remaining useful life of three years. In the notes to the financial statements for 2014, Ethereal Company would be required to disclose the amount of amortization expense it expects to recognize for all of its intangibles in each year for the next five years.

### Impairment of Intangible Assets Not Subject to Amortization

Some intangibles are identified as having indefinite lives and are not amortized. The FASB described the following examples of intangibles with indefinite lives:

- *Broadcast license.* Broadcast licenses often have a renewal period of 10 years. Renewal is virtually automatic if the license holder maintains an acceptable level of service to the public. Accordingly, there is no foreseeable end to the useful life of the broadcast license; it has an indefinite life.
- *Trademark.* A trademark right is granted for a limited time, but trademarks can be renewed almost routinely. If economic factors suggest that the trademark will continue to have value in the foreseeable future, then its useful life is indefinite.<sup>11</sup>

Intangibles with indefinite lives are not amortized. However, an intangible with an indefinite life is evaluated at least annually to determine (1) whether the end of the useful life is now foreseeable and amortization should begin and/or (2) whether the intangible is impaired. The impairment test is a very simple one: The fair value of the intangible is compared to its book value, and if the fair value is less than the book value, an impairment loss is recognized for the difference.

<sup>11</sup> FASB ASC paragraphs 350-30-55-11 through 13 and 20 through 22.

## STOP & THINK

Why wouldn't the regular 2-step impairment test (using the undiscounted sum of future cash flows) work for intangible assets that are not amortized?

- a) The undiscounted sum of future cash flows is zero.
- b) The undiscounted sum of future cash flows is always equal to the book value of the intangible asset, by definition.
- c) The undiscounted sum of future cash flows is infinite.
- d) The undiscounted sum of future cash flows is always less than the fair value of the asset.

To illustrate, assume that Impalpable Company has a broadcast license that has no foreseeable end to its useful life. The broadcast license is recorded at its original acquisition cost of \$60,000. In the past, it was estimated that the broadcast license would generate cash flows of \$7,000 per year. Recent changes in the broadcast environment have reduced the cash flows expected to be generated by the license. The data gathered by Impalpable Company

suggest that, although the useful life of the license is still indefinite, the possible future cash flows will be reduced to either \$2,000 per year (with 70% probability) or to \$4,000 per year (with 30% probability). The risk-free interest rate to be used in the probability-weighted present value calculation is 5%. The estimate of the fair value of the intangible is computed as follows:

	Future Cash Inflows	Present Value* of Indefinite Annual Cash Flows	Probability	Probability- Weighted Present Value
Scenario 1 . . . . .	\$2,000 per year	\$40,000	70%	\$28,000
Scenario 2 . . . . .	\$4,000 per year	80,000	30%	24,000
Total estimated fair value				<u>\$52,000</u>

\*The present value of a stream of indefinite, or infinite, annual cash flows is simply (Annual cash flow/Discount rate).

Because the estimated fair value of the broadcast license is less than its book value (\$52,000 < \$60,000), the intangible asset is impaired. The impairment loss is recognized with the following journal entry:

Impairment Loss (\$60,000 – \$52,000) . . . . .	8,000
Broadcast License . . . . .	8,000

As with the recognition of other impairment losses, the \$52,000 fair value is the new basis for the intangible asset; no entry is made to recognize any subsequent recovery in the value of the intangible.

### Impairment of Goodwill

When goodwill is recognized in conjunction with the acquisition of a business, that goodwill is assigned to an existing “reporting unit” of that business. For example, if **Disney** were to acquire another TV network in addition to its existing ABC network, any goodwill associated with the acquisition would be assigned to Disney’s Media Networks segment. If necessary, goodwill created in an acquisition can be split up and assigned to several different existing operating segments.

As discussed in Chapter 10, for accounting purposes goodwill is computed as the residual amount left over after the purchase price of a business has been allocated to all of the identifiable tangible and intangible assets. This residual nature of goodwill is the key to testing whether goodwill is impaired after its acquisition. Clearly, by definition goodwill

cannot be valued by itself but is instead the remaining value not explained by the fair values of all of the identifiable assets. The procedures in testing goodwill for impairment stem from this idea and are outlined as follows:

### Procedures in Testing Goodwill for Impairment

1. Compute the fair value of each reporting unit to which goodwill has been assigned. This can be done by using the present value of expected future cash flows or earnings or revenue multiples.
2. If the fair value of the reporting unit exceeds the net book value of the assets (including goodwill) and liabilities of the reporting unit, the goodwill is assumed to *not* be impaired and no impairment loss is recognized.
3. If the fair value of the reporting unit is less than the net book value of the assets and liabilities of the reporting unit, then a new fair value of goodwill is computed. The value of goodwill cannot be measured directly. Instead, goodwill value is always a residual amount; it is the amount of fair value of a reporting unit that is left over after the values of all identifiable assets and liabilities of the reporting unit have been considered. Accordingly, the fair values of all assets and liabilities of the reporting unit are estimated, these amounts are compared to the overall fair value of the reporting unit, and the implied amount of goodwill is computed.
4. If the implied amount of goodwill computed in (3) is less than the amount initially recorded, a goodwill impairment loss is recognized for the difference.

To illustrate the goodwill impairment test, assume that Buyer Company acquired Target Company on January 1, 2013. As part of the acquisition, \$1,000 in goodwill was recognized; this goodwill was assigned to Buyer's Manufacturing reporting unit. For 2013, earnings from the Manufacturing reporting unit were \$350. Separately traded companies with operations similar to the Manufacturing reporting unit have market values approximately equal to six times earnings (i.e., their price-earnings ratios are 6.0). As of December 31, 2013, book and fair values of assets and liabilities of the Manufacturing reporting unit are as follows:

	Book Values	Fair Values
Identifiable assets . . . . .	\$3,500	\$4,000
Goodwill . . . . .	1,000	?
Liabilities . . . . .	2,000	2,000

**Procedure 1** Using the earnings multiple, the fair value of the Manufacturing reporting unit is estimated to be \$2,100 ( $\$350 \times 6$ ). This fair value estimation could also be done using cash flow estimates and present value techniques.

**Procedure 2** The net book value of the assets and liabilities of the Manufacturing reporting unit is computed as follows:

$$\text{Assets } (\$3,500 + \$1,000) - \text{Liabilities } (\$2,000) = \$2,500$$

Because the estimated fair value of the reporting unit (\$2,100) is less than the net book value of the reporting unit (\$2,500), further computations are needed to determine the amount of a goodwill impairment loss, if any.

## STOP & THINK

It has been suggested that the goodwill impairment test is a costly one to apply in practice. Which one of the four procedures of the goodwill impairment test do you think is the most costly to perform?

- Compute the fair value of each reporting unit to which goodwill has been assigned.
- Compare the fair value of the reporting unit to the net book value of the assets (including goodwill) and liabilities of the reporting unit.
- Estimate the fair value of all assets and liabilities of the reporting unit and use these amounts to compute the implied amount of goodwill.
- Compare the newly computed estimate of goodwill to the recorded amount of goodwill.

**Procedure 3** Using the \$2,100 estimated fair value of the Manufacturing reporting unit, along with the estimated fair values of the identifiable assets and liabilities, the implied fair value of goodwill is computed as follows:

Estimated fair value of	
Manufacturing reporting unit . . . . .	\$2,100
Fair value of identifiable assets – fair	
value of liabilities (\$4,000 – \$2,000) . . . . .	<u>2,000</u>
Implied fair value of goodwill . . . . .	<u>\$ 100</u>

**Procedure 4** The implied fair value of goodwill is less than the recorded amount of goodwill (\$100 < \$1,000). Accordingly, the goodwill is impaired. The journal entry necessary to recognize the goodwill impairment loss is as follows:

Goodwill Impairment Loss . . . . .	900	
Goodwill (\$1,000 – \$100) . . . . .		900

## FYI

During 2002, **Time Warner** (formerly known as AOL Time Warner) recognized goodwill impairment losses totaling \$98.884 billion. The goodwill initially arose as part of the ill-fated acquisition of Time Warner by AOL.

The total amount of goodwill impairment losses should be reported as a separate line item in the income statement.

### International Accounting for Intangible Impairment: IAS 36

As explained in the preceding section, U.S. GAAP contains three different impairment tests for intangible assets—one for intangibles with finite lives, a different one for intangible assets with indefinite lives, and a third test for goodwill. Well, the good news with respect to international financial reporting standards is that there is basically just one impairment test for intangibles, explained in IAS 36, and this is the same impairment test used with tangible assets: the recorded amount of the intangible asset is compared to its “recoverable amount.” As explained earlier, the recoverable amount is the higher of the fair value of the intangible (less the cost to sell the intangible) and the value of the intangible in use.<sup>12</sup> If the recoverable amount is less than the recorded amount, the intangible is impaired, and an impairment loss is recognized. When testing goodwill for impairment, the test is applied to the business unit to which the goodwill has been assigned. Goodwill is impaired if the recoverable amount of the entire business unit is less than the recorded amount of the net assets of the unit (including goodwill); this test is similar to the goodwill impairment test under U.S. GAAP.

<sup>12</sup> The difference between “fair value” and “value in use” is that “fair value” is a market-based quantity reflecting what market participants outside a company would pay to buy the intangible. In contrast, “value in use” is a company-specific quantity based on the present value of the discounted cash flows expected to be generated by the intangible given how the company plans to use that intangible internally. “Value in use” is usually greater than “fair value” because if the internal value of an asset is less than its value in the external market, the company would likely have already sold the asset.

## Asset Retirements

6

Account for the sale of depreciable assets in exchange for cash and in exchange for other depreciable assets.

**WHY** Depreciation expense is not expected to perfectly reflect declines in an asset's market value. A gain or loss on disposal (or exchange) reflects the difference between an asset's book value and its fair value on the date it is sold or exchanged.

**HOW** When a noncurrent operating asset is disposed or exchanged, it is removed from the books and replaced with the assets received in exchange, which are recorded at their fair values. If the fair value of the assets received exceeds the book value of the assets given, then a gain is recognized; if the reverse is true, a loss is recognized. In some special cases, assets received are recorded at the **BOOK** value of the assets given in exchange.

Assets may be retired by sale, exchange, or abandonment. Generally, when an asset is disposed of, any unrecorded depreciation or amortization for the period is recorded at the date of disposition. A book value as of the date of disposition can then be computed as the difference between the cost of the asset and its accumulated depreciation. If the disposition price exceeds the book value, a **gain** is recognized. If the disposition price is less than the book value, a **loss** is recorded. As part of the disposition entry, the balances in the asset and accumulated depreciation accounts for the asset are canceled. The following sections illustrate the asset retirement process under varying conditions.

### Asset Retirement by Sale

If the proceeds from the sale of an asset are in the form of cash or a receivable, the recording of the transaction follows the order outlined in the previous paragraph. For example, assume that on July 1, 2013, Landon Supply Co. sells for \$43,600 machinery that is recorded on the books at cost of \$83,600 with accumulated depreciation as of January 1, 2013, of \$50,600. The company depreciates its machinery using a straight-line, 10% rate. Before recording the asset sale, a half-year of depreciation is recognized representing use of the asset for the first six months of the year.

The following entries would be made to record this transaction:

Depreciation Expense—Machinery . . . . .	4,180	
Accumulated Depreciation—Machinery . . . . .		4,180
<i>To record depreciation for six months in 2013 (<math>\\$83,600 \times 0.10 \times 6/12</math>).</i>		
Cash . . . . .	43,600	
Accumulated Depreciation—Machinery . . . . .	54,780	
Machinery . . . . .		83,600
Gain on Sale of Machinery . . . . .		14,780*
<i>To record sale of machinery at a gain.</i>		

*Sales price	\$43,600
Book value ( $\$83,600 - \$54,780$ )	28,820
Gain on sale	<u>\$14,780</u>

### Asset Classification as Held for Sale

Often a plan is made to dispose of an asset before the actual sale takes place. Special accounting is required if the following conditions are satisfied:

- Management commits to a plan to sell a long-term operating asset.
- The asset is available for immediate sale.
- An active effort to locate a buyer is underway.
- It is probable that the sale will be completed within one year.

If these criteria are satisfied, two uncommon accounting actions are required. During the interval between being classified as held for sale and actually being sold

1. No depreciation is to be recognized, and
2. The asset is to be reported at the lower of its book value or its fair value (less the estimated cost to sell).<sup>13</sup>

To illustrate the accounting for a long-term asset that is classified as held for sale, assume that as of July 1, 2013, Haan Company has a building with a cost of \$100,000 and accumulated depreciation of \$35,000. Haan commits to a plan to sell the building by March 1, 2014. On July 1, 2013, the building has an estimated fair value of \$40,000, and it is estimated that selling costs associated with the disposal of the building will be \$3,000. On July 1, 2013, Haan must make the following journal entry:

Building—Held for Sale .....	37,000	
Loss on Held-for-Sale Classification .....	28,000	
Accumulated Depreciation—Building .....	35,000	
Building .....		100,000

After this journal entry is made, the building is recorded at its net realizable value of \$37,000 (\$40,000 selling price – \$3,000 selling costs). If the net realizable value had been greater than the book value of \$65,000 (\$100,000 – \$35,000), no journal entry would have been made. This measurement approach is exactly the same as that used to record inventory at the lower of cost or market, as illustrated in Chapter 9.

## CAUTION

Recognition of this loss did *not* involve use of the 2-step impairment test explained earlier. Instead, the net selling price of the asset held for sale is compared directly to the book value; no comparison is made to the sum of future undiscounted cash flows.

On December 31, 2013, no adjusting entry is made for depreciation of the building. As mentioned, no depreciation expense is recognized on a long-term asset classified as held for sale. The rationale behind this approach is that because the asset is now designated for disposal, the key accounting point is no longer long-

term cost allocation using depreciation but is instead proper current valuation of the asset. Accordingly, in the Haan Company example, the \$37,000 carrying value of the building on December 31, 2013, would be compared to a revised estimate of the selling price (less selling cost) on that date. If this revised estimate is even lower than \$37,000, an additional loss would be recognized. If the estimated net selling price had increased since the initial loss was recognized, a gain would be recognized to the extent of the \$28,000 loss initially recognized.

<sup>13</sup> FASB ASC paragraph 360-10-35-43.

For example, if the estimated selling price as of December 31, 2013, was \$58,000 (with \$3,000 estimated selling costs), the following journal entry would be necessary:

Building Held for Sale .....	18,000	
Gain on Recovery of Value—Held for Sale .....		18,000

Computation of gain:  $(\$58,000 - \$3,000) - \$37,000 = \$18,000$

A gain is recognized only to the extent that it offsets a previously recognized loss. For example, if the net selling price of the building on December 31, 2013, was estimated to be \$80,000, a gain of only \$28,000 would be recognized instead of the entire indicated gain of \$43,000  $(\$80,000 - \$37,000)$ .

## CAUTION

This partial recovery of the loss recognized on the held-for-sale classification is not the usual practice with impairment losses. For regular long-term assets (not being held for sale), no recovery of impairment losses is allowed.

### Asset Retirement by Exchange for Other Nonmonetary Assets

As indicated in Chapter 10, when operating assets are acquired in exchange for other nonmonetary assets, the new asset acquired is generally recorded at its fair value or the fair value of the nonmonetary asset given in exchange, whichever is more clearly determinable. However, if the exchange has no real commercial substance, the asset received is sometimes recorded at the BOOK value (not fair value) of the asset given.

The entries required to record the exchange of most nonmonetary assets are identical to those illustrated in the previous section except that a nonmonetary asset is received in exchange rather than cash or receivables. Gains and losses arising from these exchanges are recognized when the exchange takes place.

To illustrate, assume in the earlier example that the retirement of the described asset was done by exchanging it for delivery equipment that had a market value of \$43,600. The entries would be the same as illustrated except that instead of a debit to Cash, Delivery Equipment would be debited for \$43,600. The gain would still be computed by comparing the book value of the machine and the market value of the asset acquired in the exchange. (*Note:* In the examples in this section, the entry to record depreciation expense for the first six months of the year will not be shown.)

Delivery Equipment .....	43,600	
Accumulated Depreciation—Machinery .....	54,780	
Machinery .....		83,600
Gain on Exchange of Machinery .....		14,780

If the machinery's market value were more clearly determinable than the value of the delivery equipment, the value of the machinery would be used to compute the gain or loss and to determine the value for the delivery equipment. Assume that the delivery equipment is used and has no readily available market price, but the machinery had a market value of \$25,000. Under these circumstances, a loss of \$3,820  $(\$28,820 - \$25,000)$  would be indicated, and the entry to record the exchange would be as follows:

Delivery Equipment .....	25,000	
Accumulated Depreciation—Machinery .....	54,780	
Loss on Exchange of Machinery .....	3,820	
Machinery .....		83,600

Often the exchange of nonmonetary assets includes a transfer of cash because the nonmonetary assets in most exchange transactions do not have identical market values. The cash part of the transaction adjusts the market values of the assets received to those of the assets given up. Thus, if in the previous example the machinery (with a market value of \$25,000) were given in exchange for the delivery equipment and \$3,000 cash, the entry would be as follows:

Cash .....	3,000	
Delivery Equipment (\$25,000 – \$3,000 cash received) .....	22,000	
Accumulated Depreciation—Machinery .....	54,780	
Loss on Exchange of Machinery .....	3,820	
Machinery .....		83,600

Remember that for most exchanges of nonmonetary assets, the asset received is recorded on the books at its fair value on the date of exchange. An exception to this general rule is explained in the next section.

### Nonmonetary Exchange without Commercial Substance

Not all exchanges of nonmonetary assets involve substantive business transactions. For example, the Tri-City Cadillac dealership has a blue DeVille in its inventory but really wishes that it had a red one in stock. Another dealership in a nearby town has a red DeVille and is willing to exchange its car for Tri-City’s blue one. This exchange of nonmonetary assets is not intended to be an earnings transaction for either party. Using the FASB’s terminology, this exchange has no “commercial substance” because it does nothing to affect the risk, timing, or amount of Tri-City’s cash flows.<sup>14</sup> Another example of such an exchange without commercial substance would occur if two manufacturing companies exchanged similar equipment that both companies used in similar ways in their production processes.

To illustrate the application of the notion of “commercial substance” to the accounting for nonmonetary exchanges, three examples follow. In the first example, no cash is involved in the exchange. In the second example, the exchange includes a “small” transfer of cash. In the third example, cash makes up a “large” part of the value of the transaction.

**Example 1—No Cash Involved** Republic Manufacturing Company owns a molding machine which it has decided to exchange for a similar machine owned by Logan Square Company. The following cost and market data relate to the two machines:

	Republic	Logan
Costs of machines to be exchanged .....	\$46,000	\$54,000
Accumulated depreciation on machines to be exchanged .....	32,000	37,700
Book values of machines to be exchanged .....	14,000	16,300
Fair values of machines to be exchanged .....	16,000	16,000

This exchange does not have commercial substance because the machines are essentially the same, will be used in the same way, and have the same fair values. In short, this exchange will not affect the risk, timing, or amount of either company’s cash flows. In such a case, both companies will record the asset received at the book value of the asset or assets given up. The entry on Republic’s books to record the exchange is on page 11-35.

<sup>14</sup> FASB ASC Section 845-10-30 (Nonmonetary Transactions—Overall—Initial Measurement).

Machinery (new) .....	14,000	
Accumulated Depreciation—Machinery (old) .....	32,000	
Machinery (old) .....		46,000

The entry on Logan's books to record the exchange is as follows:

Machinery .....	16,000	
Accumulated Depreciation—Machinery (old) .....	37,700	
Loss on Exchange of Machinery .....	300	
Machinery (old) .....		54,000

Note that in Republic's entry, no gain is recognized even though there is an **indicated gain** because the fair value of the asset received is \$2,000 more than the book value of the asset given. The exchange does not have commercial substance, so no gain is recognized and the new asset is slotted into Republic's accounting records at the same book value as the old asset.

## CAUTION

Indicated losses are *always* recognized. Indicated gains are sometimes recognized and sometimes not.

For Logan's entry, the fair value of the asset exchanged is less than its book value, so there is an **indicated loss**. The loss is recognized, and the newly acquired molding machine is recorded on Logan's books at its fair value. This is a good example of conservatism in accounting: Losses are recognized as soon as they are objectively determinable; gains are not recognized until realized. Another way to view the recognition of this loss is that the exchange prompted a reevaluation of the recorded amount of the machine, suggesting that Logan should recognize a loss similar to an impairment loss.

**Example 2—Transfer of a “Small” Amount of Cash in the Exchange** Assume the same facts as in Example 1, except that it is agreed that Republic's machine has a fair value of \$16,000 and Logan's machine is worth \$17,000. To make the exchange equal, Republic agrees to pay Logan \$1,000 cash. The entry on Republic's books for Example 2 is as follows:

Machinery (new) .....	15,000	
Accumulated Depreciation—Machinery (old) .....	32,000	
Machinery (old) .....		46,000
Cash .....		1,000

As was true for Example 1, Republic does not recognize any of the indicated gain. The fair value of the assets surrendered (\$16,000 + \$1,000) exceeds their book values (\$14,000 + \$1,000), indicating a \$2,000 gain. The exchange does not have commercial substance because the machines are essentially the same except for a minor difference (\$1,000) in fair value. Technically, the immediate payment of the \$1,000 in cash impacts the risk, timing, and amount of both companies' cash flows, but the impact is not significant. The indicated gain, therefore, is not recognized. The new machine is recorded at \$15,000, equal to the book value of the assets given in the exchange.

In example 2, the book value of Logan's machine is less than the fair value, indicating a \$700 gain (\$17,000 – \$16,300). Because Logan received cash as part of the transaction, a portion of the \$700 indicated gain should be recognized as having been earned.<sup>15</sup>

<sup>15</sup> FASB ASC paragraph 845-10-30-6.

The amount to be recognized is computed using the following formula:

$$\text{Recognized gain} = \frac{\text{Cash received}}{\text{Cash received} + \text{Fair value of acquired asset}} \times \text{Total indicated gain}$$

Using the figures from example 2, Logan would recognize \$41 of the indicated gain, computed as follows:

$$\frac{\$1,000}{\$1,000 + \$16,000} \times \$700 = \$41$$

The recorded value of the molding machine on Logan’s books is \$15,341, the book value of the packaging machine exchanged less the cash received plus the gain recognized (\$16,300 – \$1,000 + \$41). Another way of computing the recorded value is by deducting the deferred gain from the fair value of the asset received (\$16,000 – \$659, or \$15,341).

The entry on Logan’s books to record the exchange is as follows:

Cash .....	1,000
Machinery (new) .....	15,341
Accumulated Depreciation—Machinery (old) .....	37,700
Machinery (old) .....	54,000
Gain on Exchange of Machinery .....	41

The effect of this treatment is to defer a portion of the indicated gain and reduce the recorded book value of the new machinery. In essence, the deferred gain will be recognized over time through lower depreciation charges.

**Example 3—Transfer of a “Large” Amount of Cash in the Exchange** Assume the same facts as in Example 2 except that it is agreed that Republic’s machine has a fair value of \$12,750 and that Republic must pay \$4,250 cash to make the exchange equal; remember that in Example 2 the fair value of Logan’s machine was \$17,000. In this case, the cash comprises a “large” part of the fair value of the exchange. When cash comprises a large part of the transaction, the exchange has commercial substance, all gains and losses are recognized, and assets received are recorded at their fair values. The entry on Republic’s books for Example 3 is as follows:

Machinery (new) .....	17,000
Accumulated Depreciation—Machinery (old) .....	32,000
Loss on Exchange of Machinery .....	1,250
Machinery (old) .....	46,000
Cash .....	4,250

The entry on Logan’s books for the exchange is as follows:

Cash .....	4,250
Machinery (new) .....	12,750
Accumulated Depreciation—Machinery (old) .....	37,700
Machinery (old) .....	54,000
Gain on Exchange of Machinery .....	700

The question that remains is how much cash constitutes an amount large enough to have a significant impact on the risk, amount, or timing of the cash flows of the companies involved in the exchange. In Example 3, the \$4,250 in cash comprises 25% (\$4,250/\$17,000) of the transaction. A 25% threshold is used by the FASB to distinguish a small amount of cash from a large amount of cash. So, if the amount of cash is 25% or more of the fair value of the transaction, then the transaction is accounted for as a monetary transaction.<sup>16</sup>

<sup>16</sup> FASB ASC paragraph 845-10-25-6.

**EM EXPANDED MATERIAL**

The kind of depreciation that businesspeople are most interested in is income tax depreciation. By lowering taxable income, tax depreciation reduces the payments for income taxes. The Expanded Material for this chapter shows how the MACRS income tax depreciation system is derived from the financial reporting depreciation methods illustrated earlier. An important part of MACRS is the depreciation computation for assets acquired or disposed of in the middle of the year. Accordingly, computation of depreciation for partial periods is also explained in more detail.

## Depreciation for Partial Periods

**7** Compute depreciation for partial periods, using both straight-line and accelerated methods.

**WHY** To simplify depreciation computations, reasonable assumptions may be made regarding how much depreciation to recognize in the year an asset is purchased or sold rather than tracking exact purchase and sales dates.

**HOW** A common simplifying assumption is the half-year convention: One-half of a year's depreciation is recognized on all assets purchased or sold during the year. Alternatively, fractional calculations can be made using any one of the time-factor depreciation methods covered in the chapter.

Most of the illustrations in this chapter have assumed that assets were purchased on the first day of a company's fiscal period. In reality, of course, asset transactions occur throughout the year. When a time-factor method is used, depreciation on assets acquired or disposed of during the year may be based on the number of days the asset was held during the period. When the level of acquisitions and retirements is significant, however, companies often adopt a less burdensome policy for recognizing depreciation for partial periods. Some alternatives found in practice include the following:

1. Depreciation is recognized to the nearest whole month. Assets acquired on or before the 15th of the month are considered owned for the entire month; assets acquired after the 15th are not considered owned for any part of the month; assets sold after the 15th are considered owned for the entire month.
2. Depreciation is recognized to the nearest whole year. Assets acquired during the first six months are considered held for the entire year; assets acquired during the last six months are not considered in the depreciation computation. Conversely, no depreciation is recorded on assets sold during the first six months, and a full year's depreciation is recorded on assets sold during the last six months.
3. One-half year's depreciation is recognized on all assets purchased or sold during the year. A full year's depreciation is taken on all other assets. This approach is required for income tax purposes and is illustrated in the next section.
4. No depreciation is recognized on acquisitions during the year, but depreciation for a full year is recognized on retirements.
5. Depreciation is recognized for a full year on acquisitions during the year, but no depreciation is recognized on retirements.

### CAUTION

Remember that depreciation is an estimate, and computing depreciation for the exact number of days or months gives only an illusion of precision.

Alternatives 2 through 5 are attractive because of their simplicity. Alternative 1 makes the most intuitive sense, and its use is assumed in the examples and problems in the text unless otherwise noted.

If a company uses the sum-of-the-years'-digits method of depreciation and recognizes a partial year's depreciation on assets in the year purchased, the depreciation expense for the second year must be determined by the following allocation procedure. To illustrate, the example used earlier in the chapter of the asset acquired by Schuss Boom Ski Manufacturing will be used. To repeat, the asset cost \$100,000 and has an estimated residual value of \$5,000 and an estimated useful life of five years. Assume that the asset was purchased three-fourths of the way through the fiscal year. The computation of depreciation expense for the first two years, using sum-of-the-years'-digits depreciation, is as follows:

First year:		
Depreciation for full year ( $\$95,000 \times 5/15$ ) . . . . .	\$31,667	
One-fourth year's depreciation ( $\$31,667/4$ ) . . . . .		<u>\$ 7,917</u>
Second year:		
Depreciation for balance of first year ( $\$31,667 - \$7,917$ ) . . . . .		\$23,750
Depreciation for second full year ( $\$95,000 \times 4/15$ ) . . . . .	\$25,333	
One-fourth year's depreciation ( $\$25,333/4$ ) . . . . .		<u>6,333</u>
Total depreciation—second year. . . . .		<u>\$30,083</u>

From this point, each year's depreciation will be \$6,333 less than the previous year's depreciation. This difference equals 1/15 of the original depreciable asset base of \$95,000. A summary of the depreciation charges for the 5-year period is as follows:

	Depreciation	Asset Book Value (Cost Less Accumulated Depreciation)
Year 1 . . . . .	\$ 7,917	\$92,083
Year 2 . . . . .	30,083	62,000
Year 3 . . . . .	23,750	38,250
Year 4 . . . . .	17,417	20,833
Year 5 . . . . .	11,083	9,750
Year 6 . . . . .	<u>4,750</u>	5,000
Total . . . . .	<u>\$95,000</u>	

Year 5 depreciation is \$6,334 less than the previous year due to effects of rounding.

Alternatively, depreciation for Years 2 through 6 can be computed using the standard sum-of-the-years'-digits computation with the numerator being the number of years remaining in the asset's useful life as of the beginning of the year. For Year 2, the number of years remaining in the asset's useful life at the beginning of the year is 4.75. The depreciation for Year 2 is  $\$95,000 \times 4.75/15 = \$30,083$ .

If a company uses a declining-balance method of depreciation, the computation of depreciation when partial years are involved is relatively straightforward. After Year 1's depreciation is computed, the remaining years are calculated in the same manner as illustrated earlier in the chapter; a constant percentage is multiplied by a declining book value. Again assuming a purchase three-fourths of the way through the fiscal year and the use of alternative 1, the double-declining-balance depreciation expense for the Schuss Boom asset would be as shown on page 11-39, assuming a switch to straight-line depreciation in Year 5.

Year	Computation	Depreciation Amount	Asset Book Value
1	$\$100,000 \times 0.40 \times 1/4 =$	\$10,000	\$90,000
2	$\$90,000 \times 0.40 =$	36,000	54,000
3	$\$54,000 \times 0.40 =$	21,600	32,400
4	$\$32,400 \times 0.40 =$	12,960	19,440
5	$(\$19,440 - \$5,000)/1.75 =$	8,251*	11,189
6	$\$11,189 - \$5,000 =$	6,189	5,000
		<u>\$95,000</u>	

\*Rounded.

## Income Tax Depreciation

**8** Understand the depreciation methods underlying the MACRS income tax depreciation system.

**WHY** The depreciation tax rules are designed to simplify the depreciation calculations and to accelerate depreciation enabling companies to get their depreciation tax deductions sooner.

**HOW** Depreciation for tax purposes is based on the 200% declining-balance depreciation method with no residual value and a half-year convention. The Internal Revenue Service has established different classes of assets with varying depreciation lives.

The Economic Recovery Tax Act (ERTA) of 1981 introduced an adaptation of the declining-balance depreciation method to be used for income tax purposes. It is referred to as the **accelerated cost recovery system (ACRS)**. Subsequent revisions to the income tax laws have altered the original provisions. Because the Tax Reform Act of 1986 made several significant changes to ACRS, the new system is now referred to as the **modified accelerated cost recovery system (MACRS)**.

The term *cost recovery* was used in the tax regulations to emphasize that ACRS is not a standard depreciation method because the system is not based strictly on asset life or pattern of use. ACRS has largely replaced traditional depreciation accounting for income tax purposes. Its original purpose was to both simplify the computation of tax depreciation and provide for a more rapid write-off of asset cost to reduce income taxes and thus stimulate investment in noncurrent operating assets. Simplification was to be achieved by using one of three cost recovery periods for all assets rather than a specific useful life for each class of asset as previously prescribed by the income tax regulations. In addition, salvage values were to be ignored. A more rapid write-off was achieved by allowing companies to write off most machinery and equipment over three to five years, and all real estate over 15 years, even though previously prescribed income tax class lives were for much longer periods.

### FYI

Firms can choose MACRS for tax purposes and another method for financial reporting. Unlike LIFO elections, there is no necessary connection between income tax depreciation and depreciation for financial reporting.

The subsequent modifications to ACRS by Congress have tended to dampen both of its original objectives, primarily because tightening tax depreciation rules is a way to increase

tax revenues without increasing income tax rates.<sup>17</sup> The original three recovery periods have been replaced with six recovery periods for personal property, such as equipment, automobiles, and furniture, and two periods for real property or land and buildings.<sup>18</sup> At the same time, the recovery periods for most assets have been extended so that less rapid write-off of asset cost is permitted.

Exhibit 11-5 illustrates the cost recovery periods and depreciation methods under MACRS. For personal property, the appropriate cost recovery period is determined by reference to the IRS class lives defined in the tax regulations. The real property recovery periods relate to the type of real property involved rather than class lives. ACRS initially provided for 150% declining-balance depreciation. The 1986 Reform Act increased the number of asset recovery periods and extended the recovery periods for most assets. The effects of these changes were partially offset by changing the method of depreciation for most personal property to the 200% (or double-) declining-balance method.

The MACRS method for personal property also incorporates a **half-year convention**, meaning that one-half of a year's depreciation is recognized on all assets purchased or sold during the year. To illustrate, assume that office equipment is purchased for \$100,000 on October 1, 2013. The office equipment has a \$5,000 estimated residual value. The equipment is 5-year property according to the IRS classification. Using the half-year convention, the double-declining-balance method, and ignoring the residual value, the MACRS depreciation for the equipment would be computed as follows:

Year	Computation	MACRS Depreciation Amount	Asset Book Value
1	$\$100,000 \times 0.40 \times 1/2 =$	\$ 20,000	\$80,000
2	$80,000 \times 0.40 =$	32,000	48,000
3	$48,000 \times 0.40 =$	19,200	28,800
4	$28,800 \times 0.40 =$	11,520	17,280
5	$17,280/1.5 =$	11,520	5,760
6	Remaining book value =	5,760	0
		<u>\$100,000</u>	

**FYI**

Of course, regular taxpayers aren't prepared to do these calculations. The IRS has summarized the MACRS method in a series of tables listing the percentage of the original asset cost that should be depreciated each year.

Even though the asset was purchased three-fourths of the way through the year, for tax purposes \$20,000 is reported as the cost recovery in the first year rather than \$10,000 determined by computing depreciation to the nearest month. Note that a switch to the straight-line method was made in Year 5. If the double-

declining-balance method had been applied to this year, only \$6,912 ( $\$17,280 \times 0.40$ ) would have been reported rather than \$11,520 using straight-line for the remaining one and one-half years.

<sup>17</sup> For example, the Revenue Reconciliation Act of 1993 increased the recovery period for nonresidential real property from 31.5 years to 39 years. *RIA United States Tax Reporter, Tax Bulletin*, No. 33, August 12, 1993.

<sup>18</sup> *Personal property* is a general term that encompasses all property other than real property (land and buildings).

**EX 11-5** MACRS COST RECOVERY PERIODS AND DEPRECIATION METHODS

IRS-Defined Class Lives	MACRS Cost Recovery Period	Depreciation Method	Examples of Assets
<b>Personal Property:</b>			
4 years or less	3.0 years	200% declining balance	Race horses
4 to < 10 years	5.0	200 declining balance	Cars, trucks, office machinery
10 to < 16 years	7.0	200 declining balance	Office furniture, most factory machinery
16 to < 20 years	10.0	200 declining balance	Ships
20 to < 25 years	15.0	150 declining balance	Service station
More than 25 years	25.0	150 declining balance	Water treatment facilities
<b>Real Property—Buildings:</b>			
Residential rental	27.5	Straight line	
Nonresidential	39.0	Straight line

**? SOLUTIONS TO OPENING SCENARIO QUESTIONS**

1. The stock price decline was likely caused by a number of factors. First, if investors were convinced that they had previously been valuing Blockbuster’s stock based on artificially inflated earnings, the stock price would drop upon realization of that fact. In addition, if this announcement caused investors to doubt the integrity of Blockbuster’s management, the stock price would drop in anticipation of the uncovering of even more bad news.
2. Interpretation of daily stock price movements is a very uncertain business in spite of the impression you might get from Wall Street analysts every evening on the news. With that

said, here is one explanation for the pattern in Blockbuster’s stock price movement around the release of the Bear Stearns report. First, investors understood the valuation implications of Blockbuster’s depreciation practices before the release of the report on May 8. In response to the report, investors panicked and drove the price down. Over the course of the next two weeks, investors re-evaluated their valuation of Blockbuster and decided that they had been correct in the first place. The fact that the stock price ended up a little below where it had stood before the report indicates, perhaps, a little lingering uncertainty about Blockbuster.

**STOP & THINK SOLUTIONS TO STOP & THINK**

1. (Page 11-10) The correct answer is D. Total depreciation expense for the five assets is computed below. (Note: With double-declining-balance, the depreciation for the 4-year-old asset is the amount that reduces the book

value to the residual value of \$5,000.) For each depreciation method, total annual depreciation expense for the five assets is the same—\$95,000. For a company with a stable base of assets, all depreciation methods yield the same

Age of Asset	Straight-Line	Sum-of-the-Years'-Digits	Double-Declining-Balance
Brand new . . . . .	\$19,000	\$31,667	\$40,000
One year old . . . . .	19,000	25,333	24,000
Two years old . . . . .	19,000	19,000	14,400
Three years old . . . . .	19,000	12,667	8,640
Four years old . . . . .	19,000	6,333	7,960
Total depreciation . . . . .	<u>\$95,000</u>	<u>\$95,000</u>	<u>\$95,000</u>

- total depreciation expense. If a company is growing, and thus has more new assets than old assets, the accelerated methods yield higher total depreciation expense than does straight-line.
- (Page 11-23) The correct answer is A. The undiscounted sum of future cash flows is always greater than an asset's fair value because the undiscounted amount does not reflect the time value of money. Accordingly, in order for the undiscounted sum of future cash flows to be less than an asset's book value, the fair value of the asset must be substantially less than the book value.
  - (Page 11-28) The correct answer is C. For an intangible asset with an indefinite life, there is no foreseeable end to the future cash flows to be generated by the asset. Accordingly, the undiscounted sum of future cash flows will always be infinite, and, using the 2-step impairment test, no impairment loss would ever be recognized. This is an unreasonable outcome, so a separate impairment test, using the discounted present value of the future cash flows, is used.
  - (Page 11-30) The correct answer is C. Procedure 3 is the most costly to perform. In many cases, Procedure 1 can be done using simple earnings or revenue multiples to estimate the fair value of the reporting unit. Procedure 2 is a simple calculation using the estimated fair value and the reported amounts of assets and liabilities for the reporting unit. Once Procedure 3 is completed, Procedure 4 simply involves the comparison of two numbers. However, Procedure 3 requires the estimation of the fair value of ALL the assets and liabilities of the reporting unit. Because of the difficulty of performing Procedure 3, Topic 350 allows a company to use the same detailed asset and liability valuations from one year to the next if the economic situation of the reporting unit has not changed much, if the composition of the assets and liabilities has not changed much, and if the previous impairment test threshold was exceeded by a substantial margin.

**SOLUTION TO USING THE FASB'S CODIFICATION**

Under Topic 360 (Property, Plant, and Equipment), you see a number of industries listed—agriculture, airlines, contractors, and so forth. Let's start with agriculture. In Section 35 (Subsequent Measurement) under Subtopic 905-360, you see subsections on topics such as breeding animals, production animals, and trees and vines. This doesn't look like the right place.

The next industry listed is airlines covered in Subtopic 908-360. In Section 35 on subsequent measurement, you see a subsection on "Depreciation Methods." There you find the following: "A depreciation method may be applied to a single asset (unit depreciation) or to a group or pool of assets

that are similar in nature (group depreciation). An air carrier can use unit or group depreciation methods on different groups of assets . . . Under the group method, the airline depreciates the aggregate cost of a group of equipment that is fairly homogeneous, despite differences in the service lives of individual items. Group depreciation usually is applied to groups of assets that are significant in number but have relatively small unit values, such as rotatable parts and assemblies."

So, here is one example, the airline industry, where group depreciation is so routine that it is mentioned in the authoritative accounting standards.

# REVIEW CHAPTER 11

## LEARNING OBJECTIVES

- 1** Use straight-line, accelerated, use-factor, and group depreciation methods to compute annual depreciation expense.

The four factors that are considered in computing annual depreciation are asset cost, residual (or salvage) value, useful life, and pattern of use. The most common methods for computing annual depreciation are as follows:

### Time-Factor Methods

- *Straight-line depreciation.* The difference between asset cost and residual value is divided by the useful life of the asset.
- *Accelerated methods*
  - *Sum-of-the-years'-digits depreciation.* The depreciable asset cost is multiplied by a fraction; the numerator is the number of years remaining in the asset life as of the beginning of the year, and the denominator is the sum of all the digits from 1 to the original useful life.
  - *Declining-balance depreciation.* The asset book value is multiplied by a constant percentage rate derived from the useful life. The most commonly used percentage is double the straight-line rate.

### Use-Factor Methods

- *Service-hours depreciation.* Depreciable cost is divided by total expected lifetime service hours to compute a per-hour depreciation rate. The number of service hours in a period multiplied by the rate yields the periodic depreciation charge.
- *Productive-output depreciation.* This is similar to service-hours depreciation except the rate is based on expected number of output units during the life of the asset.

### Group and Composite Methods

A collection of assets is depreciated as one group. A group rate, derived from an initial analysis of the type of assets in the group, is multiplied by the total cost of group assets to compute periodic depreciation expense. Gains

and losses resulting from normal variations in asset lives are not recognized.

- 2** Apply the productive-output method to the depletion of natural resources.

The depletion rate is based on total development cost of the natural resource divided by the estimated amount of resource units to be removed. Periodic depletion expense is the depletion rate multiplied by the number of units removed during the period. Structures and improvements related specifically to removal of the natural resource should be depreciated based on the fraction of natural resources extracted during the period.

- 3** Incorporate changes in estimates and methods into the computation of depreciation for current and future periods.

A change in estimate impacts the current and future periods and is not used to adjust amounts reported in prior periods. The undepreciated book value is allocated over the remaining life based on the revised estimates. Changes in depreciation method are accounted for as changes in estimates and are reflected in the current and future periods.

- 4** Identify whether an asset is impaired, and measure the amount of the impairment loss using both U.S. GAAP and IASB standards.

Under U.S. GAAP, assets are reviewed for possible impairment whenever there is a significant change in operations or in the way an asset is used. An asset is impaired when the undiscounted sum of future cash flows from the asset is less than the reported book value. An impaired asset is written down to its fair value. IASB standards differ from U.S. GAAP in that the discounted sum of future cash flows—rather than the undiscounted sum—is used to determine whether an impairment loss exists. International standards also allow for the upward revaluation of long-term operating assets that have increased in value.

**5** Discuss the issues impacting proper recognition of amortization or impairment for intangible assets.

An intangible asset with a finite life is amortized over its estimated useful life, usually with zero residual value and using the straight-line method. These intangibles are tested for impairment using the standard 2-step impairment test. An intangible asset with an indefinite life is not amortized. Instead, these intangibles are tested for impairment simply by comparing their carrying value to their estimated fair value. Goodwill is not amortized. Goodwill is tested for impairment each year using a process that starts with an estimate of the fair value of the entire reporting unit to which the goodwill was assigned when it was acquired.

**6** Account for the sale of depreciable assets in exchange for cash and in exchange for other depreciable assets.

Indicated losses are always recognized. In cash transactions and in other exchanges involving commercial substance, indicated gains are recognized and all assets exchanged are recorded on the books of the company receiving them at their fair

values. Some nonmonetary exchanges do not have commercial substance, meaning that they do not impact the risk, timing, or amount of the cash flows of the parties in the exchange. In this case, the assets received are recorded at the book value of the assets given up in the exchange.

**EM EXPANDED MATERIAL**

**7** Compute depreciation for partial periods, using both straight-line and accelerated methods.

Depreciation is not always computed for the exact number of days or months an asset is owned. One common simplifying assumption is the half-year convention: One-half of a year's depreciation is recognized on all assets purchased or sold during the year.

**8** Understand the depreciation methods underlying the MACRS income tax depreciation system.

MACRS is based on the 200% declining-balance depreciation method with no residual value and a half-year convention. To streamline the system, the IRS has established eight classes of assets with set depreciation lives.

**FASB-IASB CODIFICATION SUMMARY**

Topic	FASB Accounting Standards Codification	Original FASB Standard	Corresponding IASB Standard	Differences between U.S. GAAP and IFRS
Impairment of tangible assets	Subtopic 360-10 various subsections on "Impairment"	SFAS No. 144	IAS 36	Under U.S. GAAP the impairment test is a 2-step test. Under IFRS, the impairment test involves just one step, a comparison of the book value to the "recoverable amount" of the asset.
Impairment of intangible assets	Topic 350	SFAS No. 142	IAS 36	U.S. GAAP includes three different impairment tests for intangibles. Under IFRS, there is just one test, which is the same as is used for tangible assets.
Upward revaluation	Not part of U.S. GAAP	Not part of U.S. GAAP	IAS 16	Upward revaluations of property, plant, and equipment are generally not allowable under U.S. GAAP
Asset retirement obligations	Subtopic 410-20	SFAS No. 143	IAS 16 and IAS 37	No substantial differences
Assets classified as held for sale	Section 360-10-45	SFAS No. 144	IFRS 5	No substantial differences

## KEY TERMS

Accelerated depreciation 11-7	Double-declining-balance depreciation 11-9	Productive-output depreciation 11-13	Use-factor depreciation 11-11
Amortization 11-3	Gain 11-31	Residual (salvage) value 11-5	Useful life 11-5
Book value 11-4	Group depreciation 11-13	Service-hours depreciation 11-11	<b>EM</b> EXPANDED MATERIAL
Composite depreciation 11-13	Impairment 11-21	Straight-line depreciation 11-7	
Declining-balance depreciation 11-9	Indicated gain 11-35	Sum-of-the-years'-digits depreciation 11-8	Accelerated cost recovery system (ACRS) 11-39
Depletion 11-3	Indicated loss 11-35	Time-factor depreciation 11-7	Half-year convention 11-40
Depreciation 11-3	Loss 11-31	Unit depreciation 11-13	Modified accelerated cost recovery system (MACRS) 11-39
	Natural resources 11-17		

## QUESTIONS

- Distinguish among depreciation, depletion, and amortization expenses.
- What factors must be considered in determining the periodic depreciation charges that should be made for a company's depreciable assets?
- What role does residual, or salvage, value play in the various methods of time-factor depreciation?
- Distinguish between the functional and physical factors affecting the useful life of a tangible noncurrent operating asset.
- Distinguish between time-factor and use-factor methods of depreciation.
- Briefly describe group depreciation, and describe how asset retirements are recorded under this method.
- Describe the component approach to computing depreciation.
- How does the recognition of an asset retirement obligation impact periodic depreciation expense? Interest expense?
- Describe the proper accounting treatment for a change in estimated useful life.
- What procedures must be followed when the estimate of recoverable natural resources is changed due to subsequent development work?
- Under U.S. GAAP what test is used to determine whether a long-term tangible asset is impaired? How is an impairment loss measured?
- How does the international accounting standard for asset impairment differ from the standard used in the United States?
- If a non-U.S. company chooses to revalue a long-term operating asset upward in accordance with IAS 16, how is the unrealized "gain" on the revaluation recognized in the financial statements?
- Briefly describe the three types of intangible assets in terms of amortization and impairment.
- Briefly describe the four procedures followed in testing goodwill for impairment.
- Under IAS 36, there is basically one impairment test for intangible assets. Briefly describe the structure of that test.
- What two unusual accounting actions are taken when a long-term operating asset is classified as held for sale?
- Under what circumstances is a gain recognized when a productive asset is exchanged for a similar productive asset? A loss?

**EM** EXPANDED MATERIAL

- Why isn't depreciation expense always computed for the exact number of days an asset is owned?
- What were the original reasons for the development of the ACRS income tax depreciation method?

## PRACTICE EXERCISES

**Practice 11-1****L08****Recording Depreciation Expense**

Depreciation expense for the year was \$1,000. Make the necessary journal entry.

**Practice 11-2****L01****Computing Straight-Line Depreciation**

The company acquired a machine on January 1 at an original cost of \$108,000. The machine's estimated residual value is \$20,000, and its estimated life is five years.

(1) Compute the annual straight-line depreciation amount, (2) make the journal entry necessary to record depreciation expense for the first year, and (3) compute the machine's book value at the end of the first year.

**Practice 11-3**

**Computing Sum-of-the-Years'-Digits Depreciation**

**L01**

The company acquired a machine on January 1 at an original cost of \$115,000. The machine's estimated residual value is \$20,000, and its estimated life is five years. Assume that the company uses sum-of-the-years'-digits depreciation. Compute (1) depreciation expense for each year of the machine's 5-year life and (2) book value at the end of each year of the machine's 5-year life.

**Practice 11-4**

**Computing Double-Declining-Balance Depreciation**

**L01**

The company acquired a machine on January 1 at an original cost of \$100,000. The machine's estimated residual value is \$10,000, and its estimated life is four years. The company uses double-declining-balance depreciation and switches to straight-line in the final year of the machine's life. Compute (1) depreciation expense for each year of the machine's 4-year life and (2) book value at the end of each year of the machine's 4-year life.

**Practice 11-5**

**Computing Service-Hours Depreciation**

**L01**

The company acquired a machine on January 1 at an original cost of \$81,000. The machine's estimated residual value is \$15,000, and its estimated life is 20,000 service hours. The actual usage of the machine was as follows: Year 1, 9,000 hours; Year 2, 5,000 hours; Year 3, 4,000 hours; Year 4, 2,000 hours. Compute (1) depreciation expense for each year of the machine's life and (2) book value at the end of each year of the machine's life.

**Practice 11-6**

**Computing Productive-Output Depreciation**

**L01**

The company acquired a machine on January 1 at an original cost of \$70,000. The machine's estimated residual value is \$5,000, and its estimated lifetime output is 13,000 units. The actual output of the machine was as follows: Year 1, 3,000 units; Year 2, 5,000 units; Year 3, 2,000 units; Year 4, 3,000 units. Compute (1) depreciation expense for each year of the machine's life and (2) book value at the end of each year of the machine's life.

**Practice 11-7**

**Computing Group Depreciation**

**L01**

The company has decided to use group depreciation based on the straight-line depreciation method. The initial pool of assets on which the group depreciation rate is based is as follows:

	Acquisition Cost	Salvage Value	Useful Life
Asset 1 .....	\$64,000	\$ 4,000	6 years
Asset 2 .....	90,000	10,000	10
Asset 3 .....	42,000	6,000	9
Asset 4 .....	30,000	0	5

Compute the group depreciation rate.

**Practice 11-8**

**Group Depreciation: Recording Asset Sales**

**L01, L06**

Refer to Practice 11-7. (1) Make the journal entry to record the sale of Asset 3 after two years for \$22,000 cash. (2) Compute depreciation expense in the third year if Asset 5 is purchased at the beginning of the year for \$50,000. This purchase is made at the same time that Asset 3 is sold.

**Practice 11-9**

**Asset Retirement Obligation**

**L01**

On January 1, Lewis Company purchased land it will use as a landfill for the next 12 years. The cost of the land was \$525,000. At the end of 12 years, Lewis Company will be required to spend \$250,000 to landscape and reforest the landfill site. The appropriate discount rate is 6%. Because the useful life of the land is limited in this

case, the cost of the land is depreciated. Lewis uses the straight-line method. Compute the amount of depreciation expense and accretion expense in Year 1.

**Practice 11-10****Computing Depletion Expense****L02**

On January 1, the company purchased a mine for \$100,000. At that time, it was estimated that the mine contained 5,000 tons of ore. It is also estimated that the mine will have a residual value of \$20,000 when all of the ore is extracted. During the year, the company extracted 900 tons of ore from the mine. (1) Compute depletion expense for the year and (2) make the journal entry necessary to record the depletion expense.

**Practice 11-11****Change in Estimated Life****L03**

The company purchased a machine for \$40,000. The machine had an estimated residual value of \$4,000 and an estimated useful life of nine years. After three full years of experience with the machine, it was determined that its total useful life would be only seven years instead of nine. In addition, a revised estimate of \$8,000 was made for the residual value, instead of the original \$4,000. Compute depreciation expense for the fourth year. The company uses straight-line depreciation.

**Practice 11-12****Change in Estimated Units of Production****L03**

On January 1 of Year 1, the company purchased a mine for \$300,000. At that time, it was estimated that the mine contained 2,000 tons of ore. During Year 1, the company extracted 900 tons of ore from the mine. On January 1 of Year 2, the company spent \$120,000 on mine improvements. During Year 2, the company extracted 600 tons of ore. On December 31 of Year 2, it was estimated that the mine contained 700 tons of ore. Compute depletion expense for (1) Year 1 and (2) Year 2.

**Practice 11-13****Change in Depreciation Method****L03**

On January 1, the company purchased a machine for \$80,000. The machine had an estimated useful life of eight years and an estimated salvage value of \$8,000. After three full years of using the machine, the company changed its depreciation method from straight-line to double-declining-balance. Compute depreciation expense for the fourth year.

**Practice 11-14****Determining Whether a Tangible Asset Is Impaired****L04**

The cost and the accumulated depreciation for a piece of equipment are \$1,500,000 and \$600,000, respectively. Management is concerned that the equipment has become impaired. Management hired several independent appraisers who agreed that the current value of the equipment is \$500,000. Management also estimates that the equipment will generate cash inflows of \$65,000 per year for the next 14 years. Is the equipment impaired? Explain.

**Practice 11-15****Recording a Tangible Asset Impairment****L04**

A building has a cost of \$1,500,000 and accumulated depreciation of \$250,000. The fair value of the building is estimated to be \$600,000. The building is expected to generate net cash inflows of \$40,000 per year for the next 30 years. (1) Determine whether the building is impaired and (2) if it is impaired, make the journal entry necessary to record the impairment loss.

**Practice 11-16****Recording Upward Asset Revaluations****L04**

A building has a cost of \$500,000 and accumulated depreciation of \$40,000. The current value of the building is estimated to be \$730,000. The company that owns the building is based in Genovia and uses international financial reporting standards. The company has chosen to recognize increases in the value of long-term operating assets. Make the necessary journal entry.

**Practice 11-17****Recording Amortization Expense****L05**

On January 1, the company purchased the rights to a valuable Internet domain name for \$250,000. Given current market conditions, the company estimates that these rights have an economic life of four years at which time they will have no residual value. Make the journal entry necessary to recognize amortization expense for the year.

**Practice 11-18**

**L05**

**Goodwill Impairment**

Buyer Company acquired Target Company on January 1. As part of the acquisition, \$2,000 in goodwill was recognized; this goodwill was assigned to Buyer's Manufacturing reporting unit. On December 31, it was estimated that the future cash flows expected to be generated by the Manufacturing reporting unit are \$700 at the end of each year for the next 10 years. The appropriate interest rate is 10%. The fair values and book values of the assets and liabilities of the Manufacturing reporting unit are as follows:

	Book Values	Fair Values
Identifiable assets . . . . .	\$7,000	\$8,000
Goodwill . . . . .	2,000	?
Liabilities . . . . .	4,000	4,000

Make the journal entry necessary to recognize any goodwill impairment loss.

**Practice 11-19**

**L06**

**Exchange of Assets**

A building has a cost of \$700,000 and accumulated depreciation of \$340,000. The building is exchanged for land. Make the necessary journal entry if (1) the land has a market value of \$400,000 and (2) the land has a market value of \$200,000.

**Practice 11-20**

**L06**

**Classifying an Asset as Held for Sale**

On October 1, 2013, the company has a building with a cost of \$375,000 and accumulated depreciation of \$225,000. The company commits to a plan to sell the building by February 1, 2014. On October 1, 2013, the building has an estimated selling price of \$145,000, and it is estimated that selling costs associated with the disposal of the building will be \$9,000. On December 31, 2013, the estimated selling price of the building has increased to \$170,000, with estimated selling costs remaining at \$9,000. Make the journal entries necessary to record (1) the initial classification of the building as held for sale on October 1, 2013, and (2) any adjustment necessary on December 31, 2013. Remember that no depreciation expense is recognized once an asset is classified as held for sale.

**Practice 11-21**

**L06**

**Exchange of Assets**

The company exchanged an asset for a similar asset. The exchange was with another company in the same line of business. The old asset had a cost of \$1,000 and accumulated depreciation of \$850. The old asset had a market value of \$400 on the date of the exchange. Make the journal entry necessary to record the exchange assuming that (1) the company received the new machine and no cash, (2) the company received the new machine and a "large" amount of cash of \$300, and (3) the company received the new machine and a "small" amount of cash of \$80. [*Hint:* In all three cases, the total market value of assets received (cash plus new asset) is the same as the market value of the asset given up (\$400).]

**EM** EXPANDED MATERIAL

**Practice 11-22**

**L07**

**Depreciation for Partial Periods**

The company purchased a machine on April 1 for \$100,000. The machine has an estimated useful life of five years and an estimated salvage value of \$15,000. The company computes partial-year depreciation to the nearest whole month. Compute the amount of depreciation expense for this year *and* next year using (1) sum-of-the-years'-digits depreciation and (2) double-declining-balance depreciation.

**Practice 11-23**

**L08**

**Income Tax Depreciation**

The company purchased a ship for \$850,000. The ship has an estimated residual value of \$100,000. Compute the amount of MACRS depreciation deduction for the first two years of the life of the ship.

## EXERCISES

## Exercise 11-24

**Computation of Asset Cost and Depreciation Expense**

L01

A machine is purchased at the beginning of 2013 for \$38,400. Its estimated life is eight years. Freight costs on the machine are \$3,000. Installation costs are \$1,600. The machine is estimated to have a residual value of \$600 and a useful life of 32,000 hours. It was used 3,000 hours in 2013.

1. What is the cost of the machine for accounting purposes?
2. Compute the depreciation charge for 2013 using (a) the straight-line method and (b) the service-hours method.

## Exercise 11-25

**Service-Hours Depreciation**

L01

Jen and Barry's Ice Milk Company used cash to purchase a new ice milk mixer on January 1, 2013. The new mixer is estimated to have a 20,000-hour service life. Jen and Barry's depreciates equipment on the service-hours method. The total price paid for the machine was \$57,000. This price included \$2,000 freight in, \$1,800 installation costs, and \$3,000 for a 2-year maintenance contract.

During 2013, Jen and Barry's used the machine for 2,500 hours; in 2014, 3,000 hours. Prepare all related journal entries for the purchase of equipment, annual depreciation, and maintenance expense for 2013 and 2014.

## Exercise 11-26

**Inferring Useful Lives**

L01

The information that follows is from the balance sheet of Hampton Company for December 31, 2013, and December 31, 2012.

	Dec. 31, 2013	Dec. 31, 2012
Equipment—cost . . . . .	\$ 680,000	\$ 680,000
Accumulated depreciation—equipment . . . . .	(250,000)	(160,000)
Buildings—cost . . . . .	2,450,000	2,450,000
Accumulated depreciation—buildings . . . . .	(340,000)	(230,000)

Hampton did not acquire or dispose of any buildings or equipment during 2013. Hampton uses the straight-line method of depreciation. If residual values are assumed to be 10% of asset cost, what is the average useful life of Hampton's (1) equipment and (2) buildings?

## Exercise 11-27

**Computation of Depreciation Expense**

L01

Limestone Construction purchased a concrete mixer on July 15, 2013. Company officials revealed the following information regarding this asset and its acquisition:

Purchase price . . . . .	\$196,000
Residual value . . . . .	\$20,000
Estimated useful life . . . . .	9 years
Estimated service hours . . . . .	50,000
Estimated production in units . . . . .	375,000 yards

The concrete mixer was operated by construction crews in 2013 for a total of 6,500 hours, and it produced 49,500 yards of concrete.

It is company policy to take a half-year's depreciation on all assets for which it used the straight-line or double-declining-balance depreciation method in the year of purchase.

Calculate the resulting depreciation expense for 2013 under each of the following methods, and specify which method allows the greatest depreciation expense.

1. Double-declining-balance
2. Productive-output
3. Service-hours
4. Straight-line

**Exercise 11-28**

**Productive-Output Depreciation and Asset Retirement**

**L01**

Equipment was purchased at the beginning of 2011 for \$100,000 with an estimated product life of 300,000 units. The estimated salvage value was \$4,000. During 2011, 2012, and 2013, the equipment produced 80,000 units, 120,000 units, and 40,000 units, respectively. The machine was damaged at the beginning of 2014, and the equipment was scrapped with no salvage value.

1. Determine depreciation using the productive-output method for 2011, 2012, and 2013.
2. Give the entry to write off the equipment at the beginning of 2014.

**Exercise 11-29**

**Group Depreciation**

**L01**

Allwood, Inc., a small furniture manufacturer, purchased the following assets at the end of 2012.

Description	Cost	Salvage	Life
Delivery truck . . . . .	\$37,000	\$8,000	7 years
Circular saws . . . . .	725	180	5 years
Workbench . . . . .	460	—	10 years
Forklift . . . . .	11,000	950	6 years

Compute the following amounts for 2013 using group depreciation on a straight-line basis:

1. Depreciation expense
2. Group depreciation rate
3. Average life of the assets

**Exercise 11-30**

**Group Depreciation Entries**

**L01**

Lundquist, Inc., uses the group depreciation method for its furniture account. The depreciation rate used for furniture is 21%. The balance in the furniture account on December 31, 2012, was \$125,000, and the balance in Accumulated Depreciation—Furniture was \$61,000. The following purchases and dispositions of furniture occurred in the years 2013–2015 (assume that all purchases and disposals occurred at the beginning of each year).

Year	Assets Purchased—Cost (Cash)	Assets Sold	
		Cost	Selling Price (Cash)
2013 . . . . .	\$35,000	\$27,000	\$8,000
2014 . . . . .	27,600	15,000	6,000
2015 . . . . .	24,500	32,000	8,000

1. Prepare the summary journal entries Lundquist should make each year (2013–2015) for the purchase, disposition, and depreciation of the furniture.
2. Prepare a summary of the furniture and accumulated depreciation accounts for the years 2013–2015.

**Exercise 11-31**

**Depreciation of Special Components**

**L01**

Jackson Manufacturing acquired a new milling machine on April 1, 2008. The machine has a special component that requires replacement before the end of the useful life. The asset was originally recorded in two accounts, one representing the main unit and

the other for the special component. Depreciation is recorded by the straight-line method to the nearest month, residual values being disregarded. On April 1, 2014, the special component is scrapped and is replaced with a similar component. This component is expected to have a residual value of approximately 25% of cost at the end of the useful life of the main unit, and because of its materiality, the residual value will be considered in calculating depreciation. Specific asset information is as follows:

Main milling machine:	
Purchase price in 2008 .....	\$71,200
Residual value .....	\$6,200
Estimated useful life .....	10 years
First special component:	
Purchase price .....	\$12,000
Residual value .....	\$500
Estimated useful life .....	6 years
Second special component:	
Purchase price .....	\$16,500

What are the depreciation charges to be recognized for the years (1) 2008, (2) 2014, and (3) 2015?

**Exercise 11-32****L01, L02****Asset Retirement Obligation**

On January 1, 2013, Major Company purchased a uranium mine for \$800,000. On that date, Major estimated that the mine contained 1,000 tons of ore. At the end of the productive years of the mine, Major Company will be required to spend \$4,200,000 to clean up the mine site. The appropriate discount rate is 8%, and it is estimated that it will take approximately 14 years to mine all of the ore. Major uses the productive-output method of depreciation. During 2013, Major extracted 100 tons of ore from the mine.

1. Compute the amount of depreciation (or depletion) expense for 2013.
2. Compute the amount of accretion expense for 2013.

**Exercise 11-33****L02****Depletion Expense**

On January 2, 2012, Adelaide Rose purchased land with valuable natural ore deposits for \$13 million. The estimated residual value of the land was \$4 million. At the time of purchase, a geological survey estimated 3 million tons of removable ore were under the ground. Early in 2012, roads were constructed on the land to aid in the extraction and transportation of the mined ore at a cost of \$975,000. In 2012, 75,000 tons were mined. In 2013, Adelaide fired her mining engineer and hired a new expert. A new survey made at the end of 2013 estimated 4.5 million tons of ore were available for mining. In 2013, 265,000 tons were mined. Assuming that all the ore mined was sold, how much was the depletion expense for 2012 and 2013?

**Exercise 11-34****L03****Change in Estimated Useful Life**

Goff Corporation purchased a machine on January 1, 2008, for \$250,000. At the date of acquisition, the machine had an estimated useful life of 20 years with no salvage value. The machine is being depreciated on a straight-line basis. On January 1, 2013, as a result of Goff's experience with the machine, it was decided that the machine had an estimated useful life of 15 years from the date of acquisition. What is the amount of depreciation expense on this machine in 2013 using a new annual depreciation charge for the remaining 10 years?

**Exercise 11-35****L03****Change in Estimated Useful Life**

Finn Corporation purchased a machine on July 1, 2010, for \$225,000. The machine was estimated to have a useful life of 12 years with an estimated salvage value of \$15,000.

During 2013, it became apparent that the machine would become uneconomical after December 31, 2017, and that the machine would have no scrap value. Finn uses the straight-line method of depreciation for all machinery. What should be the charge for depreciation in 2013 using the new estimates for useful life and salvage value?

**Exercise 11-36****Change in Depreciation Method****L03**

Franklin Company purchased a machine on January 1, 2010, paying \$150,000. The machine was estimated to have a useful life of eight years and an estimated salvage value of \$30,000. In early 2012, the company elected to change its depreciation method from straight-line to sum-of-the-years'-digits for future periods. What should be the charge for depreciation for 2012?

**Exercise 11-37****Recording an Impairment Loss****L04**

Della Bee Company purchased a manufacturing plant building 10 years ago for \$2,600,000. The building has been depreciated using the straight-line method with a 30-year useful life and 10% residual value. Della Bee's manufacturing operations have experienced significant losses for the past two years, so Della Bee has decided that the manufacturing building should be evaluated for possible impairment. Della Bee estimates that the building has a remaining useful life of 15 years, that net cash inflow from the building will be \$100,000 per year, and that the fair value of the building is \$760,000.

1. Determine whether an impairment loss should be recognized.
2. If an impairment loss should be recognized, make the appropriate journal entry.
3. How would your answer to (1) change if the fair value of the building was \$1,120,000?

**Exercise 11-38****Impairment and Revaluation Under International Accounting Standards****L04**

Use the information given in Exercise 11-37 and assume that Della Bee Company is located in Hong Kong and uses International Financial Reporting Standards. Della Bee also has chosen to recognize increases in the value of long-term operating assets in accordance with the allowable alternative under IAS 16.

1. Determine whether an impairment loss should be recognized.
2. If an impairment loss should be recognized, make the appropriate journal entry.
3. What journal entry would Della Bee make if the fair value of the building was \$2,500,000?

**Exercise 11-39****Accounting for Patents****L05**

The Rockington Co. applied for and received numerous patents at a total cost of \$31,195 at the beginning of 2008. It is assumed the patents will have economic value for their remaining legal life of 16 years. At the beginning of 2010, the company paid \$9,350 in successfully prosecuting an attempted infringement of these patent rights. At the beginning of 2013, \$32,400 was paid to acquire patents that could make its own patents worthless; the patents acquired have a remaining life of 15 years but will not be used.

1. Give the entries to record the expenditures relative to patents.
2. Give the entries to record patent amortization for the years 2008, 2010, and 2013.

**Exercise 11-40****Impairment of Intangibles****L05**

An intangible asset cost \$300,000 on January 1, 2013. On January 1, 2014, the asset was evaluated to determine whether it was impaired. As of January 1, 2014, the asset was expected to generate future cash flows of \$25,000 per year (at the end of the year). The appropriate discount rate is 5%.

1. Give the entries to record amortization in 2013 and any impairment loss in 2014 assuming that as of January 1, 2013, the asset was assumed to have a total

useful life of 10 years and that as of January 1, 2014, there were nine years remaining.

2. Give the entries to record amortization in 2013 and any impairment loss in 2014 assuming that as of January 1, 2013, the asset was assumed to have an indefinite useful life and that as of January 1, 2014, the remaining life was still indefinite.

**Exercise 11-41****Impairment of Goodwill****L05**

Largest Company acquired Large Company on January 1. As part of the acquisition, \$10,000 in goodwill was recognized; this goodwill was assigned to Largest's Production reporting unit. During the year, the Production reporting unit reported revenues of \$13,000. Publicly traded companies with operations similar to those of the Production unit had price-to-revenue ratios averaging 1.60. The fair values and book values of the assets and liabilities of the Production reporting unit are as follows:

	Book Values	Fair Values
Identifiable assets .....	\$21,300	\$20,500
Goodwill .....	10,000	?
Liabilities .....	7,600	7,600

Make the journal entry necessary to recognize any goodwill impairment loss.

**Exercise 11-42****Recording the Sale of Equipment with Note****L06**

On December 31, 2013, Debenham Corporation sold an old machine for \$15,000, having an original cost of \$84,000 and a book value of \$9,000. The terms of the sale were as follows: \$3,000 down payment, \$6,000 payable on December 31 of the next two years. The sales agreement made no mention of interest; however, 8% would be a fair rate for this type of transaction. Give the journal entries on Debenham's books to record the sale of the machine and receipt of the two subsequent payments. (Note: Round to the nearest dollar.)

**Exercise 11-43****Long-Term Operating Asset Held for Sale****L06**

On April 1, 2013, Brandoni Company has a piece of machinery with a cost of \$100,000 and accumulated depreciation of \$75,000. On April 1, Brandoni decided to sell the machine within one year. As of April 1, 2013, the machine had an estimated selling price of \$10,000 and a remaining useful life of two years. It is estimated that selling costs associated with the disposal of the machine will be \$1,000. On December 31, 2013, the estimated selling price of the machine had increased to \$15,000, with estimated selling costs increasing to \$1,600.

1. Make the entry to record the initial classification of the machine as held for sale on April 1, 2013.
2. Make the entry to record depreciation expense on the machine for the period April 1 through December 31, 2013.
3. Make the entry, if any, needed on December 31, 2013, to reflect the change in the expected selling price.

**Exercise 11-44****Exchange of Machinery****L06**

Assume that Coaltown Corporation has a machine that cost \$52,000, has a book value of \$35,000, and has a fair value of \$40,000. The machine is used in Coaltown's manufacturing process. For each of the following situations, indicate the value at which the company should record the new asset and why it should be recorded at that value.

- (a) Coaltown exchanged the machine for a truck with a list price of \$43,000.
- (b) Coaltown exchanged the machine with another manufacturing company for a similar machine with a list price of \$41,000.

- (c) Coaltown exchanged the machine for a newer model machine from another manufacturing company. The new machine had a list price of \$62,000, and Coaltown paid a “large” amount of cash of \$15,000.
- (d) Coaltown exchanged the machine plus a “small” amount of cash of \$3,000 for a similar machine from Newton Inc., a manufacturing company. The newly acquired machine is carried on Newton’s books at its cost of \$55,000 with accumulated depreciation of \$42,000; its fair value is \$43,000. In addition to determining the value, give the journal entries for both companies to record the exchange.

**Exercise 11-45**

**Exchange of Truck**

**L06**

On January 2, 2013, Joshon Hardware Company traded with a dealer an old delivery truck for a newer model. Data relative to the old and new trucks follow:

Old truck:

Original cost .....	\$22,750
Accumulated depreciation as of January 2, 2013 .....	19,000

New truck:

List price .....	\$24,000
Cash price without trade-in .....	23,100
Cash paid with trade-in .....	20,900

1. Give the journal entries on Joshon’s books to record the purchase of the new truck.
2. Give the journal entries on Joshon’s books if the cash paid was \$18,000 and that amount is considered “large.”

**EM** EXPANDED MATERIAL

**Exercise 11-46**

**Computation of Depreciation Expense**

**L07**

Feng Company purchased a machine for \$180,000 on September 1, 2013. It is estimated that the machine will have a 10-year life and a salvage value of \$18,000. Its working hours and production in units are estimated at 36,000 and 750,000, respectively. It is the company’s policy to depreciate assets for the number of months they are held during a year. During 2013, the machine was operated 1,500 hours and produced 21,000 units. Which of the following methods will give the greatest depreciation expense for 2013: (1) double-declining-balance (2) sum-of-the-years’-digits, (3) productive-output, or (4) service-hours? (Show computations for all four methods.)

**Exercise 11-47**

**Computation of Book and Tax Depreciation**

**L08**

Rocky Point Foundry purchased factory equipment on March 15, 2012. The equipment will be depreciated for financial purposes over its estimated useful life, counting the year of acquisition as a half-year. The company accountant revealed the following information regarding this machine:

Purchase price .....	\$110,000
Residual value .....	\$17,000
Estimated useful life .....	12 years

1. What amount should Rocky Point Foundry record for depreciation expense for 2013 using the (a) double-declining-balance method and (b) sum-of-the-years’-digits method?
2. Assuming the equipment is classified as 8-year property under the modified accelerated cost recovery system (MACRS), what amount should Rocky Point Foundry deduct for depreciation on its tax return in 2013?

**Exercise 11-48****L08****MACRS Computation**

Olympus Equipment Company purchased a new piece of factory equipment on May 1, 2013, for \$29,200. For income tax purposes, the equipment is classified as a 7-year asset. Because this is similar to the economic life expected for the asset, Olympus decides to use the tax depreciation for financial reporting purposes. The equipment is not expected to have any residual value at the end of the seven years. Prepare a depreciation schedule for the life of the asset using the MACRS method of cost recovery.

**PROBLEMS****Problem 11-49****L01****SPREADSHEET****Time-Factor Methods of Depreciation**

A delivery truck was acquired by Navarro Inc. for \$80,000 on January 1, 2013. The truck was estimated to have a 3-year life and a trade-in value at the end of that time of \$20,000. The following depreciation methods are being considered:

- Depreciation is to be calculated by the straight-line method.
- Depreciation is to be calculated by the sum-of-the-years'-digits method.
- Depreciation is to be calculated by the double-declining-balance method.

**Instructions:** Prepare tables reporting periodic depreciation and asset book value over a 3-year period for each method listed.

**Problem 11-50****L01****Depreciation Under Different Methods**

On January 1, 2010, Ron Shelley purchased a new tractor to use on his farm. The tractor cost \$100,000. Ron also had the dealer install a front-end loader on the tractor. The cost of the front-end loader was \$7,000. The shipping charges were \$600, and the cost to install the loader was \$800. The estimated life of the tractor was eight years, and the estimated service-hour life of the tractor was 12,500 hours. Ron estimated that he could sell the tractor for \$15,000 at the end of eight years or 12,500 hours. The tractor was used for 1,725 hours in 2013. A full year's depreciation was taken in 2010, the year of acquisition.

**Instructions:** Compute depreciation expense for 2013 under each of the following methods:

- Straight-line
- Double-declining-balance
- Sum-of-the-years'-digits
- Service-hours

**Problem 11-51****L01****Maintenance Charges and Depreciation of Components**

A company buys a machine for \$61,700 on January 1, 2010. The maintenance costs for the years 2010–2013 are as follows: 2010, \$4,900; 2011, \$4,700; 2012, \$12,400 (includes \$7,800 for cost of a new motor installed in December 2012); 2013, \$4,800.

**Instructions:**

- Assume the machine is recorded in a single account at a cost of \$61,700. Although it was not accounted for separately, the old motor (replaced at the end of 2012) had a cost of \$7,100. Straight-line depreciation is used, and the asset is estimated to have a useful life of 11 years. It is assumed there will be no residual value at the end of the useful life. What are the total expenses related to the machine for each of the first four years?
- Assume the cost of the frame of the machine was recorded in one account at a cost of \$54,600 and the motor was recorded in a second account at a cost of \$7,100. Straight-line depreciation is used with a useful life of 13 years for the frame and four years for the motor. Neither item is assumed to have any residual

- value at the end of its useful life. What are the total expenses related to the machine?
- Evaluate the two methods.

**Problem 11-52**

**L01**

**Depreciation and the Steady State**

Lyell Company started a newspaper delivery business on January 1, 2010. On that date, the company purchased a small pickup truck for \$14,000. Lyell planned to depreciate the truck over three years and assumed an \$800 residual value. During 2010 and 2011, Lyell's business expanded. On January 1, 2011, Lyell purchased a second truck, identical to the first. On January 1, 2012, Lyell purchased a third truck, again identical to the first two. During 2012, Lyell's growth leveled off. However, on January 1, 2013, Lyell bought another truck to replace the one (purchased in 2010) that had just worn out. All trucks purchased cost the same amount as the first truck.

**Instructions:**

- Compute depreciation expense for 2010, 2011, 2012, and 2013 using the following:
  - Straight-line method
  - Sum-of-the-years'-digits method
- What general conclusions can be drawn from your calculations in (1)?

**Problem 11-53**

**L01**

**Group Depreciation and Asset Retirement**

Wright Manufacturing Co. acquired 20 similar machines at the beginning of 2008 for a total cost of \$150,000. The machines have an average life of five years and no residual value. The group depreciation method is employed in writing off the cost of the machines. They were retired as follows:

- 2 machines at the end of 2010
- 4 machines at the end of 2011
- 8 machines at the end of 2012
- 6 machines at the end of 2013

Assume the machines were not replaced.

**Instructions:** Give the entries to record the retirement of the machines and the periodic depreciation for the years 2008–2013 inclusive.

**Problem 11-54**

**L01**

**Group Depreciation**

Machines are acquired by Milestone Corporation on April 1, 2013, as follows:

Machine	Cost	Estimated Residual Value	Estimated Life in Years
511 .....	\$27,000	\$ 5,000	11
512 .....	31,000	7,000	6
513 .....	52,000	10,000	7
514 .....	38,000	None	8
515 .....	23,000	4,000	5

**Instructions:**

- Calculate the group depreciation rate for this group.
- Calculate the average life in years for the group.
- Give the entry to record the group depreciation for the year ended December 31, 2013.

**Problem 11-55****L03****Changes in Estimates**

The following independent cases describe facts concerning the ownership of racing bicycles.

- (a) Piero Niccolo, winner of the 2011 Milan–San Remo cycling classic, purchased a new Fierro bicycle for \$6,500 at the beginning of 2011. The bicycle was being depreciated using the straight-line method over an estimated useful life of four years, with a \$1,500 salvage value. At the beginning of 2013, the Italian superstar paid \$900 to upgrade the bicycle. As a result, the useful life of the bicycle was extended by one year. The salvage value remained \$1,500.
- (b) Bart Gysel, winner of his country's own Tour of Flanders cycling classic in 2011, purchased a new Lampacht bicycle for \$7,400 at the beginning of 2010. The bicycle was being depreciated using the double-declining-balance method over an estimated useful life of seven years, with a \$2,000 salvage value. At the beginning of 2011, when the Belgian superstar won at Flanders, the salvage value of his Lampacht (eventual selling price) jumped to \$3,000.
- (c) Jacques Arouet, winner of the 2010 and 2011 Paris–Roubaix cycling classics, purchased a new Tonnerre bicycle for \$8,000 in 2009. The French superstar did not use his new bicycle during the 2009 season. However, in 2010 and 2011, Arouet used his bicycle to win Paris–Roubaix and logged 7,500 and 9,000 kilometers, respectively, each year. Arouet estimated that the bicycle had a productive life of 25,000 kilometers. He did not use the bike in 2012, but in 2013 he decided to upgrade the bike with \$1,750 of new components, giving the bicycle an additional 11,000 kilometers of productive use. During the 2013 season, he logged 11,500 kilometers on the bike. The estimated salvage value of the bicycle is \$1,500.

**Instructions:** In each case, compute the depreciation for 2013.

**Problem 11-56****L01, L02****Financial Statements for Mining Company**

Roscoe Corp. was organized on January 2, 2013. It was authorized to issue 74,000 shares of common stock. On the date of organization, it sold 20,000 shares at \$50 per share and gave the remaining shares in exchange for certain land-bearing recoverable ore deposits estimated by geologists at 900,000 tons. The property is deemed to have a value of \$2,700,000 with no residual value.

During 2013, purchases of mine buildings and equipment totaled \$350,000. During the year, 75,000 tons were mined; 8,000 tons of this amount were unsold on December 31, the balance of the tonnage being sold for cash at \$17 per ton. Expenses incurred and paid for during the year, exclusive of depletion and depreciation, were as follows:

Mining .....	\$173,500
Delivery .....	20,000
General and administrative .....	19,500

Cash dividends of \$2 per share were declared on December 31, payable January 15, 2014.

It is believed that buildings and sheds will be useful only over the life of the mine; hence, depreciation is to be recognized in terms of mine output.

**Instructions:** Prepare an income statement and a balance sheet for 2013. Ignore income taxes.

**Problem 11-57****L01, L02****Depletion Expense**

In 2009, Heslop Mining Company purchased property with natural resources for \$5,400,000. The property was relatively close to a large city and had an expected residual value of \$700,000.

The following information relates to the use of the property:

- (a) In 2009, Heslop spent \$300,000 in development costs and \$500,000 in buildings on the property. Heslop does not anticipate that the buildings will have any utility after the natural resources are depleted.
- (b) In 2010 and 2012, \$200,000 and \$700,000, respectively, were spent for additional developments on the mine.
- (c) The tonnage mined and estimated remaining tons for years 2009–2013 are as follows:

Year	Tons Extracted	Estimated Tons Remaining
2009	0	4,000,000
2010	1,200,000	2,800,000
2011	1,100,000	1,800,000
2012	800,000	900,000
2013	900,000	0

**Instructions:** Compute the depletion and depreciation expense for the years 2009–2013.

**Problem 11-58**

**L01, L02**

**Depletion and Depreciation**

In 2008, Sunbeam Corporation acquired a silver mine in eastern Alaska. Because the mine is located deep in the Alaskan frontier, Sunbeam was able to acquire the mine for the low price of \$50,000. In 2009, Sunbeam constructed a road to the silver mine costing \$5,000,000. Improvements to the mine made in 2009 cost \$750,000. Because of the improvements to the mine and to the surrounding land, it is estimated that the mine can be sold for \$600,000 when mining activities are complete.

During 2010, five buildings were constructed near the mine site to house the mine workers and their families. The total cost of the five buildings was \$1,500,000. Estimated residual value is \$250,000. In 2008, geologists estimated 4 million tons of silver ore could be removed from the mine for refining. During 2011, the first year of operations, only 5,000 tons of silver ore were removed from the mine. However, in 2012, workers mined 1 million tons of silver. During that same year, geologists discovered that the mine contained 3 million tons of silver ore in addition to the original 4 million tons. Improvements of \$275,000 were made to the mine early in 2012 to facilitate the removal of the additional silver. Early in 2012, an additional building was constructed at a cost of \$225,000 to house the additional workers needed to excavate the added silver. This building is not expected to have any residual value.

In 2013, 2.5 million tons of silver were mined and costs of \$1,100,000 were incurred at the beginning of the year for improvements to the mine.

**Instructions:**

- 1. Compute the depreciation and depletion charges for 2011, 2012, and 2013.
- 2. Give the journal entries to record the depreciation and depletion charges for 2013.

**Problem 11-59**

**L01, L02**

**Computation of Depreciation and Depletion**

The following independent situations describe facts concerning the ownership of various assets.

- (a) Dickenton Company purchased a tooling machine in 1998 for \$85,000. The machine was being depreciated on the straight-line method over an estimated useful life of 30 years with no salvage value. At the beginning of 2013, when the

machine had been in use for 15 years, Dickenton paid \$17,000 to overhaul the machine. As a result of this improvement, Dickenton estimated that the useful life of the machine would be extended an additional five years.

- (b) Andresen Manufacturing Co., a calendar-year company, purchased a machine for \$50,000 on January 1, 2011. At the date of purchase, Andresen incurred the following additional costs:

Loss on sale of old machinery . . . . .	\$3,000
Freight cost . . . . .	900
Installation cost . . . . .	1,900
Testing costs prior to regular operation . . . . .	800

The estimated salvage value of the machine was \$8,000, and Andresen estimated that the machine would have a useful life of 15 years, with depreciation being computed using the straight-line method. In January 2013, accessories costing \$2,925 were added to the machine to reduce its operating costs. These accessories neither prolonged the machine’s life nor did they provide any additional salvage value.

- (c) On July 1, 2013, Schiff Corporation purchased equipment at a cost of \$48,000. The equipment has an estimated salvage value of \$6,000 and is being depreciated over an estimated life of five years under the double-declining-balance method of depreciation. For the six months ended December 31, 2013, Schiff recorded a half-year’s depreciation.
- (d) Quinn Company acquired a tract of land containing an extractable natural resource. Geological surveys estimate that the recoverable reserves will be 4,000,000 tons and that the land will have a value of \$800,000 after restoration. Relevant cost information follows:

Land . . . . .	\$14,000,000
Tons mined and sold in 2013 . . . . .	950,000

- (e) In January 2013, Bradley Corporation entered into a contract to acquire a new machine for its factory. The machine, which had a cash price of \$150,000, was paid for as follows:

Down payment . . . . .	\$ 40,000
400 shares of Bradley common stock with an agreed-upon value of \$325 per share . . . . .	130,000
	<u>\$170,000</u>

Prior to the machine’s use, installation costs of \$10,000 were incurred. The machine has an estimated useful life of 16 years and an estimated salvage value of \$20,000. The straight-line method of depreciation is used.

**Instructions:** In each case, compute the amount of depreciation or depletion for 2013.

**Problem 11-60**  
**L01**

**Depreciation and the Cash Flow Statement**

Oakeson Company is a manufacturing firm. Work-in-process and finished goods inventories for December 31, 2013, and December 31, 2012, follow:

	Dec. 31, 2013	Dec. 31, 2012
Work-in-process inventory (including depreciation) . . . . .	\$ 70,000	\$ 75,000
Finished goods inventory (including depreciation) . . . . .	123,000	110,000

Depreciation is a major portion of Oakeson’s overhead, and the inventories listed above include depreciation in the amounts shown on page 11-60.

	Dec. 31, 2013	Dec. 31, 2012
Depreciation included in work-in-process inventory . . . . .	\$15,000	\$12,500
Depreciation included in finished goods inventory . . . . .	26,000	29,000

Oakeson's net income for 2013 was \$90,000. Cost of goods sold for the year included \$22,000 in depreciation.

**Instructions:** Compute net cash flow from operating activities for Oakeson Company for 2013. Assume that the levels of all current assets (except for inventories) and all current liabilities were unchanged from beginning of year to end of year.

### Problem 11-61

L04

#### Impairment

Deedle Company purchased four convenience store buildings on January 1, 2007, for a total of \$13,000,000. The buildings have been depreciated using the straight-line method with a 20-year useful life and 5% residual value. As of January 1, 2013, Deedle has converted the buildings into Internet Learning Centers where classes on Internet usage will be conducted six days a week. Because of the change in the use of the buildings, Deedle is evaluating the buildings for possible impairment. Deedle estimates that the buildings have a remaining useful life of 10 years, that their residual value will be zero, that net cash inflow from the buildings will total \$800,000 per year, and that the current fair value of the four buildings totals \$5,000,000.

#### Instructions:

1. Make the appropriate journal entry, if any, to record an impairment loss as of January 1, 2013.
2. Compute total depreciation expense for 2013.
3. Repeat (1) and (2) assuming that the net cash inflow from the buildings totals \$1,100,000 per year. The fair value of the four buildings totals \$6,000,000.

### Problem 11-62

L04

#### Impairment: U.S. GAAP and IASB Standards

JJS Corporation purchased a building on January 1, 2009, for a total of \$12,000,000. The building has been depreciated using the straight-line method with a 20-year useful life and no residual value. As of January 1, 2013, JJS is evaluating the building for possible impairment. The building has a remaining useful life of 12 years and is expected to generate cash inflows of \$850,000 per year. The estimated fair value of the building on January 1, 2013, is \$6,800,000.

#### Instructions:

1. Determine whether the building is impaired as of January 1, 2013. Make your determination using the provisions of both U.S. GAAP and IAS 36. Compare your answers.
2. Assume that JJS uses U.S. GAAP. Compute depreciation expense for 2013. (Note: Don't forget the new information on the expected useful life of the building.)
3. Assume that JJS is a non-U.S. company and uses international accounting standards. Compute depreciation expense for 2013.
4. Assume that JJS is a non-U.S. company and uses international accounting standards. Further assume that the building has a fair value of \$14,000,000 on January 1, 2013, and that JJS chooses to upwardly revalue its long-term operating assets when they increase in value. Compute depreciation expense for 2013.

### Problem 11-63

L05

#### Accounting for Patents

On January 3, 2005, Merris Company spent \$89,000 to apply for and obtain a patent on a newly developed product. The patent had an estimated useful life of 10 years.

At the beginning of 2009, the company spent \$16,000 in successfully prosecuting an attempted infringement of the patent. At the beginning of 2010, the company purchased for \$37,000 a patent that was expected to prolong the life of its original patent by five years. On July 1, 2013, a competitor obtained rights to a patent that made the company's patent obsolete.

**Instructions:** Give all the entries that would be made relative to the patent for the period 2005–2013, including entries to record the purchase of the patent, annual patent amortization, and ultimate patent obsolescence. (Assume the company's accounting period is the calendar year.)

**Problem 11-64**

**L05**

**Intangible Impairment**

On December 31, 2012, Magily Company acquired the following three intangible assets:

- (a) *A trademark for \$30,000.* The trademark has seven years remaining in its legal life. It is anticipated that the trademark will be renewed in the future, indefinitely, without problem.
- (b) *Goodwill for \$150,000.* The goodwill is associated with Magily's Abacus Manufacturing reporting unit.
- (c) *A customer list for \$22,000.* By contract, Magily has exclusive use of the list for five years. Because of market conditions, it is expected that the list will have economic value for just three years.

On December 31, 2013, before any adjusting entries for the year were made, the following information was assembled about each of the intangible assets:

- (a) Because of a decline in the economy, the trademark is now expected to generate cash flows of just \$1,000 per year. The useful life of the trademark still extends beyond the foreseeable horizon.
- (b) The cash flow expected to be generated by the Abacus Manufacturing reporting unit is \$25,000 per year for the next 22 years. Book values and fair values of the assets and liabilities of the Abacus Manufacturing reporting unit are as follows:

	Book Values	Fair Values
Identifiable assets .....	\$270,000	\$300,000
Goodwill .....	150,000	?
Liabilities .....	180,000	180,000

- (c) The cash flows expected to be generated by the customer list are \$12,000 in 2014 and \$8,000 in 2015.

**Instructions:** The appropriate discount rate for all items is 6%. Make all journal entries necessary on December 31, 2013, in connection with these three intangible assets.

**Problem 11-65**

**L06**

**Exchange of Assets**

A review of the books of Lakeshore Electric Co. disclosed that there were five transactions involving gains and losses on the exchange of fixed assets. The transactions were recorded as indicated in the following ledger accounts:

Cash		Buildings and Equipment			
	5,000	(e)	1,000	(a)	10,000
(b)	6,000	(c)	118,000	(b)	25,000
(c)		(d)	850,000	(d)	550,000

Acum. Depr.—Buildings and Equipment		Intangible Assets	
(c)	110,000	(e)	1,000
(d)	390,000		

Gain on Exchange of Buildings and Equipment		Loss on Exchange of Buildings and Equipment	
	(a) 10,000	(c)	2,000
	(b) 30,000		
	(d) 90,000		

Investigation disclosed the following facts concerning these dealer-to-dealer transactions:

- (a) Exchanged a piece of equipment with a \$50,000 original cost, \$20,000 book value, and \$30,000 fair value for a piece of similar equipment owned by Highlite Electric, which had a \$60,000 original cost, \$10,000 book value, and a \$30,000 fair value.
- (b) Exchanged a machine—cost, \$70,000; book value, \$10,000; fair value, \$40,000—for a similar machine—fair value, \$35,000—and a “small” amount in cash, \$5,000.
- (c) Exchanged a building—cost, \$150,000; book value, \$40,000; fair value, \$30,000—for a building with fair value of \$24,000 plus cash of \$6,000.
- (d) Exchanged a factory building—cost, \$850,000; book value, \$460,000; fair value, \$550,000—for equipment owned by Romeo Inc. That had an original cost of \$900,000, accumulated depreciation of \$325,000, and fair value of \$550,000. The transaction is deemed to have commercial substance.
- (e) Exchanged a patent—cost, \$12,000; book value, \$6,000; fair value, \$3,000—and cash of \$1,000 for another patent with fair value of \$4,000.

**Instructions:** Analyze each recorded transaction as to its compliance with generally accepted accounting principles. Prepare adjusting journal entries where required.

**Problem 11-66**

**L06**

**Exchange of Assets**

Wild Expansion Co. acquired the following assets in exchange for various nonmonetary assets.

2013

- Mar. 15 Acquired from another company a large lathe in exchange for three small lathes. The small lathes had a total cost of \$28,000 and a remaining book value of \$15,000. The new lathe had a market value of \$23,000, approximately the same value as the three small lathes. This transaction is deemed NOT to have commercial substance.
- June 1 Acquired 175 acres of land by issuing 3,200 shares of common stock with par value of \$1 and market value of \$75. Market analysis reveals that the market value of the stock was a reasonable value for the land.
- July 15 Acquired a used piece of heavy, earth-moving equipment, market value, \$120,000, by exchanging a used molding machine with a market value of \$20,000 (book value, \$12,000; cost, \$50,000) and land with a market value of \$135,000 (cost, \$110,000). Cash of \$35,000 was received by Wild Expansion Co. as part of the transaction.
- Aug. 15 Acquired a patent, franchise, and copyright for two used milling machines. The book value of each milling machine was \$4,000, and each originally cost \$8,500. The market value of each machine is \$9,000. It is estimated that the patent and franchise have about the same market values, and the market value of the copyright is 50% of the market value of the patent.
- Nov. 1 Acquired a new packaging machine for four old packaging machines. The old machines had a total cost of \$72,000 and a total remaining book value of \$20,000. The new packaging machine has an indicated market value of \$60,000, approximately the same value as the four machines. This transaction is deemed to have commercial substance.

**Instructions:** Prepare the journal entries required on Wild Expansion Co.’s books to record the exchanges.

**Problem 11-67**  
**L01, L06****Computation of Depreciation and Amortization**

Information pertaining to Hedlund Corporation's property, plant, and equipment for 2013 follows.

<i>Account balances at January 1, 2013:</i>	<b>Debit</b>	<b>Credit</b>
Land .....	\$ 150,000	
Buildings .....	1,200,000	
Accumulated Depreciation—Buildings .....		\$263,100
Machinery and Equipment .....	900,000	
Accumulated Depreciation—Machinery and Equipment .....		250,000
Automotive Equipment .....	115,000	
Accumulated Depreciation—Automotive Equipment .....		84,600

<i>Depreciation data:</i>	<b>Depreciation Method</b>	<b>Useful Life</b>
Buildings .....	150% declining-balance	25 years
Machinery and Equipment .....	Straight-line	10 years
Automotive Equipment .....	Sum-of-the-years'-digits	4 years
Leasehold Improvements .....	Straight-line	—

The salvage values of the depreciable assets are immaterial. Depreciation is computed to the nearest month.

Transactions during 2013 and other information are as follows:

- (a) On January 2, 2013, Hedlund purchased a new car for \$20,000 cash and trade-in of a 2-year-old car with a cost of \$18,000 and a book value of \$5,400. The new car has a cash price of \$24,000; the market value of the trade-in is not known.
- (b) On April 1, 2013, a machine purchased for \$23,000 on April 1, 2008, was destroyed by fire. Hedlund recovered \$15,500 from its insurance company.
- (c) On May 1, 2013, costs of \$168,000 were incurred to improve leased office premises. The leasehold improvements have a useful life of eight years. The related lease terminates on December 31, 2019.
- (d) On July 1, 2013, machinery and equipment were purchased at a total invoice cost of \$280,000; additional costs of \$5,000 for freight and \$25,000 for installation were incurred.
- (e) Hedlund determined that the automotive equipment comprising the \$115,000 balance at January 1, 2013, would have been depreciated at a total amount of \$18,000 for the year ended December 31, 2013.

**Instructions:**

1. Compute the total depreciation and amortization expense that would appear on Hedlund's income statement for the year ended December 31, 2013. Also compute the accumulated depreciation and amortization that would appear on the balance sheet at December 31, 2013.
2. Compute the total gain or loss from disposal of assets that would appear in Hedlund's income statement for the year ended December 31, 2013.
3. Prepare the Noncurrent Operating Assets section of Hedlund's December 31, 2013, balance sheet.

**Problem 11-68**  
**L01, L06****Comprehensive Depreciation and Amortization**

At December 31, 2012, Oteron Company's noncurrent operating asset and accumulated depreciation and amortization accounts had balances as follows:

Category	Cost of Asset	Accumulated Depreciation and Amortization
Land	\$ 430,000	
Buildings	1,500,000	\$320,500
Machinery and equipment	825,000	174,300
Automobiles and trucks	146,000	94,600
Leasehold improvements	205,000	102,500

Category	Depreciation Method	Useful Life
Land improvements	Straight-line	15 years
Buildings	150% declining-balance	30 years
Machinery and equipment	Straight-line	12 years
Automobiles and trucks	150% declining-balance	6 years
Leasehold improvements	Straight-line	8 years

Depreciation is computed to the nearest month. The salvage values of the depreciable assets are immaterial.

Transactions during 2013 and other information are as follows:

- On January 6, 2013, a plant facility consisting of land and a building was acquired from Windop Corp. for \$800,000. Of this amount, 25% was allocated to land.
- On April 6, 2013, new parking lots, streets, and sidewalks at the acquired plant facility were completed at a total cost of \$210,000. These expenditures had an estimated useful life of 15 years.
- The leasehold improvements were completed on December 31, 2009, and had an estimated useful life of eight years. The related lease, which would have terminated on December 31, 2015, was renewable for an additional 4-year term. On April 29, 2013, Oteron exercised the renewal option.
- On July 1, 2013, machinery and equipment were purchased at a total invoice cost of \$275,000. Additional costs of \$15,000 for delivery and \$25,000 for installation were incurred.
- On August 30, 2013, Oteron purchased a new automobile for \$18,000.
- On September 30, 2013, a truck with a cost of \$21,000 and a carrying amount of \$10,841 on the date of sale was sold for \$12,500. Depreciation for the nine months ended September 30, 2013, was \$2,502.
- On December 20, 2013, a machine with a cost of \$19,000 and a carrying amount of \$3,275 at date of disposition was scrapped without cash recovery.

**Instructions:** Compute total depreciation and amortization expense for the year ended December 31, 2013.

### Problem 11-69

#### L02, L03

### Sample CPA Exam Questions

- In January 2013, Vorst Co. purchased a mineral mine for \$2,820,000 with removable ore estimated at 1,200,000 tons. After it has extracted all the ore, Vorst believes it will be able to sell the property for \$300,000. During 2013, Vorst incurred \$360,000 of development costs preparing the mine for production and removed and sold 60,000 tons of ore. In its 2013 income statement, what amount should Vorst report as depletion?
  - \$135,000
  - \$144,000

- (c) \$150,000  
 (d) \$159,000
2. Turtle Co. purchased equipment on January 2, 2011, for \$50,000. The equipment had an estimated 5-year service life with an expected salvage value of \$0. Turtle's policy for 5-year assets is to use the double-declining-balance depreciation method for the first two years of the asset's life and then switch to the straight-line depreciation method. In its December 31, 2013, balance sheet, what amount should Turtle report as accumulated depreciation for equipment?
- (a) \$30,000  
 (b) \$38,000  
 (c) \$39,200  
 (d) \$42,000

**EM** EXPANDED MATERIAL

**Problem 11-70**

**LO8**

**Tax Depreciation Methods and the Time Value of Money**

The following two depreciation methods are acceptable for tax purposes:

- (a) *Straight line with a half-year convention.* The half-year convention is the assumption that all assets are acquired in the middle of the year. Therefore, a half-year's depreciation is allowed in the first year.
- (b) *200% declining balance with a half-year convention.* There is a switch to straight-line depreciation on the remaining cost when straight line yields a larger amount than does 200% declining balance.

On January 1, 2013, Stratford Company purchased a piece of equipment for \$425,000. The equipment has an estimated useful life of five years and no estimated residual value.

**Instructions:**

- For tax purposes, depreciation reduces taxes payable by reducing taxable income. If the tax rate is 40%, for example, a \$100 depreciation deduction will reduce taxes by \$40. Ignoring the time value of money, calculate the total reduction in taxes Stratford will realize through the recovery of the asset cost over the life of the equipment. Assume that the tax rate is 40%. Is the answer the same for each of the two acceptable depreciation methods?
- For each of the acceptable methods, compute the present value (as of January 1, 2013) of the depreciation tax savings. Assume that the appropriate interest rate is 10% and that the tax savings occur at the end of the year.
- Should a company be required to use the same depreciation method in its financial statements as it uses for tax purposes?

**CASES**

**Discussion  
 Case 11-71**

**We Don't Need No Depreciation!**

The managements of two different companies argue that because of specific conditions in their companies, recording depreciation expense should be suspended for 2013. Evaluate carefully their arguments.

- (a) The president of Guzman Co. recommends that no depreciation be recorded for 2013 because the depreciation rate is 5% per year, and price indexes show that prices during the year have risen by more than this figure.
- (b) The policy of Liebnitz Co. is to recondition its building and equipment each year so that they are maintained in perfect repair. In view of the extensive periodic costs incurred in 2013, officials of the company believe that the need for recognizing depreciation is eliminated.

**Discussion  
Case 11-72****Is It Really Worth that Much?**

Ferris Bueller, Inc., owns a building in Des Moines, Iowa, that was built at a cost of \$5,000,000 in 2000. The building was used as a manufacturing facility from 2003 to 2012. However, economic conditions have made it necessary to consolidate Ferris Bueller's operations, and the building has been leased as of January 1, 2013, as a warehouse for 10 years at an annual rental of \$240,000. Taxes, insurance, and normal maintenance costs are to be paid by the lessee. At the end of the 10-year period, Ferris Bueller may offer the lessee a renewal of the lease or again use the building in its operations. The building is being depreciated on a straight-line basis over a 40-year life.

In early 2013, Julie Ramos, a new staff accountant for Ferris Bueller, was assigned to review the building accounts and raised a question to Alison Crowther, her supervisor, concerning the carrying value of the Des Moines building. As of January 1, 2013, Julie feels the Des Moines building was impaired and should be written down in value. Alison is unsure about the current position of the FASB on this issue and invites Julie to prepare a memorandum recommending a specific write-down amount, with supporting justification. Prepare the memorandum, assuming current interest rates are 10%.

**Discussion  
Case 11-73****Which Depreciation Method Should We Use?**

Atwater Manufacturing Company purchased a new machine especially built to perform one particular function on the assembly line. A difference of opinion has arisen as to the method of depreciation to be used in connection with this machine. Three methods are now being considered:

- (a) The straight-line method
- (b) The productive-output method
- (c) The sum-of-the-years'-digits method

List separately the arguments for and against each of the proposed methods from both the theoretical and practical viewpoints.

**Discussion  
Case 11-74****How Do We Charge that Motion Picture Cost to Revenue?**

In today's high-tech, high-cost entertainment industry, motion pictures often have costs in the tens of millions of dollars. Of course, it is hoped that these movies will be box office winners and that the revenues will exceed the cost outlay. With first runs, reruns, DVD sales and rentals, and so forth, it has become increasingly difficult to determine how the initial cost should be amortized against the revenue. Considering this industry and its characteristics, what amortization method would you suggest for these movie production costs?

**Discussion  
Case 11-75****Let's Take a Bath!**

Professor Linda DeAngelo found evidence suggesting that when the management of a company is ousted under fire, the new management tends to take an earnings "bath" after gaining control. A "bath" is a large reduction in earnings due to asset write-downs, reorganization charges, discontinuance of segments, and other extraordinary charges.

As an example, **Circle K Corporation** declared Chapter 11 bankruptcy and changed management during fiscal 1990. For the year, Circle K reported a reorganization and restructuring charge of \$639 million, consisting primarily of write-downs of long-term assets. This contributed to a net loss for the year of \$773 million, compared to average net income for the previous four years of about \$40 million per year. Why might the new management of a company want to "take a bath" in its first year?

**SOURCES:** Linda DeAngelo, "Managerial Compensation, Information Costs, and Corporate Governance," *Journal of Accounting and Economics* 10, January 1988, pp. 3–36.

The Circle K Corporation, 1990 Annual Report.

**Discussion**  
**Case 11-76**

**But What Is a Reasonable Life for My Airplane?**

Different airlines depreciate the same airplanes but using different useful-life and residual value assumptions. For example, airlines have depreciated the same **Boeing** aircraft over lives ranging from 14 years to 28 years. What might cause a firm to decide to increase the estimated useful life of a depreciable asset?

**Case 11-77**

**Deciphering Financial Statements (The Walt Disney Company)**

Locate the 2009 financial statements for **The Walt Disney Company** on the Internet and consider the following questions:

1. What depreciation method does Disney use for its parks, resorts, and other property? For its film and television costs?
2. Where do you have to look to find out that Disney's 2009 total depreciation and amortization expense was \$1,631 million?
3. As of October 3, 2009, what percentage of film and television production costs was expected to be amortized within the next three years?
4. In 2006, Disney acquired **Pixar**. The following information concerning the acquisition is summarized from Disney's 2006 annual report:

On May 5, 2006, the Company completed an all stock acquisition of Pixar, a digital animation studio. The acquisition price was \$7.5 billion, and the Company allocated the purchase price to the tangible and identifiable assets acquired and liabilities assumed based on their fair values, which were determined primarily through third-party appraisals. The following table summarizes the allocation of the purchase price (in millions):

Cash and cash equivalents . . . . .	\$ 11
Investments . . . . .	1,073
Prepaid and other assets. . . . .	45
Film costs . . . . .	538
Buildings and equipment . . . . .	225
Intangibles . . . . .	233
Goodwill . . . . .	<u>5,557</u>
Total assets acquired . . . . .	<u>\$7,682</u>
Liabilities . . . . .	\$ 64
Deferred income taxes . . . . .	<u>123</u>
Total liabilities assumed . . . . .	<u>\$ 187</u>
Net assets acquired . . . . .	<u>\$7,495</u>

The goodwill on Disney's 2005 consolidated balance sheet was \$16.974 billion, and, as seen in the table above, \$5.557 billion of goodwill was associated with the Pixar purchase in 2006. In the consolidated balance sheet of Disney's 2009 financial statements, the original cost associated with total goodwill was \$21.683 billion. If \$5.557 billion of goodwill from the Pixar purchase was added to Disney's 2005 total goodwill (giving a total of \$22.531 billion), why you think Disney's 2009 total goodwill was only \$21.683 billion?

**Case 11-78**

**Deciphering Financial Statements (Delta Air Lines)**

The following information is from the June 30, 1998, balance sheet for **Delta Air Lines** (all dollar amounts are in millions):

	1998	1997
Flight equipment . . . . .	\$11,180	\$9,619
Less: Accumulated depreciation . . . . .	3,895	3,510

Delta also included this note to its financial statements:

Depreciation and Amortization—Effective July 1, 1998, the Company increased the depreciable life of certain new generation aircraft types from 20 to 25 years. Owned flight equipment is depreciated on a straight-line basis to a residual value equal to 5% of cost.

1. Assume that all flight equipment will be affected by this policy change. The new policy will not be reflected in the 1998 financial statements, as the policy was changed on July 1, 1998. Estimate the total depreciation expense recognized by Delta on flight equipment for the year ended June 30, 1998, using the old 20-year life and the new 25-year life. Assume there were no flight equipment retirements during the year and new acquisitions are depreciated for half the year.
2. How reasonable is the assumption that there were no flight equipment retirements in 1998?

#### Case 11-79

#### Writing Assignment (One depreciation method, please!)

The FASB frequently receives recommendations about areas it should consider for study. Depreciation accounting has not been addressed as a separate topic by the FASB, and several alternative methods are used for recording this expense on the books. Assume that a group of financial analysts recommends to the FASB that a study be made of depreciation accounting with the objective of selecting one method as the only acceptable one. The analysts reason that only then will comparability in financial statements be achieved. You have recently been hired as a member of the FASB's research staff. Write a summary memo presenting the arguments for and against the FASB following the recommendation by the analysts.

#### Case 11-80

#### Ethical Dilemma (Profit manipulation during labor negotiations)

You and your partner own a small data-entry company. You contract with businesses to manually enter data, such as library card catalogs and medical records, into a computer database. Your most significant physical assets are a large office building you own, along with the computer hardware and software necessary for operations. Your business has been running for five years, and you now have 100 employees. Operating cash flow has always been healthy, and you and your partner have been able to withdraw significant amounts of cash from the business. Recently, you have seen growing discontent among your employees because of their low wages and lack of fringe benefits. You and your partner are preparing for the first meeting with an employee grievance committee.

Your partner has taken responsibility for preparing the company's financial statements. You are embarrassed to admit that this is the first set of financial statements you have ever examined—you have never sought bank financing and all equity funding has come from you and your partner. You are surprised when you first review the statements because they reveal that the company has experienced significant losses in each of its five years of operation.

A closer look at the statements reveals that your partner has used the double-declining-balance method of depreciation for your office building and computer equipment. He has also assumed very short useful lives and zero residual values. Your calculations indicate that using the straight-line method with more realistic useful life and residual value assumptions would increase profits dramatically, even to the extent that substantial profits would be reported in each of the first five years of operation.

The meeting with the employee grievance committee is tomorrow. Your partner has been your friend since first grade. What, if anything, should you do?

#### Case 11-81

#### Cumulative Spreadsheet Analysis

This spreadsheet assignment is a continuation of the spreadsheet assignments given in earlier chapters. If you completed those assignments, you have a head start on this one.

Refer back to the instructions for preparing the revised financial statements for 2013 as given in (1) the Cumulative Spreadsheet Analysis assignment in Chapter 3.

1. Skywalker wishes to prepare a *forecasted* balance sheet, a *forecasted* income statement, and a *forecasted* statement of cash flows for 2014. Use the financial statement numbers for 2013 as the basis for the forecast, along with the following additional information.
  - (a) Sales in 2014 are expected to increase by 40% over 2013 sales of \$2,100.
  - (b) In 2014, new property, plant, and equipment acquisitions will be in accordance with the information in (q).
  - (c) The \$480 in operating expenses reported in 2013 breaks down as follows: \$15 in depreciation expense and \$465 in other operating expenses.
  - (d) No new long-term debt will be acquired in 2014.
  - (e) No cash dividends will be paid in 2014.
  - (f) New short-term loans payable will be acquired in an amount sufficient to make Skywalker's current ratio in 2014 exactly equal to 2.0.
  - (g) Skywalker does not expect to repurchase additional shares of stock in 2014.
  - (h) Because changes in future prices and exchange rates are impossible to predict, Skywalker's best estimate is that the balance in accumulated other comprehensive income will remain unchanged in 2014.
  - (i) Assume that the balances in Investment Securities, Long-Term Investments, and Other Long-Term Assets will increase at the same rate as sales (40%) in 2014. The balance in Intangible Assets will change in accordance with item (r).
  - (j) Assume that the balance in the other long-term liabilities account will increase at the same rate as sales (40%) in 2014.
  - (k) The investment securities are classified as available-for-sale securities. Accordingly, cash from the purchase and sale of these securities is classified as an investing activity.
  - (l) Assume that transactions impacting other long-term assets and other long-term liabilities accounts are operating activities.
  - (m) Cash and investment securities accounts will increase at the same rate as sales.
  - (n) The forecasted amount of accounts receivable in 2014 is determined using the forecasted value for the average collection period. The average collection period for 2014 is expected to be 14.08 days. To make the calculations less complex, this value of 14.08 days is based on forecasted end-of-year accounts receivable rather than on average accounts receivable.
  - (o) The forecasted amount of inventory in 2014 is determined using the forecasted value for the number of days' sales in inventory. The number of days' sales in inventory for 2014 is expected to be 107.6 days. To make the calculations simpler, this value of 107.6 days is based on forecasted end-of-year inventory rather than on average inventory.
  - (p) The forecasted amount of accounts payable in 2014 is determined using the forecasted value for the number of days' purchases in accounts payable, which is expected to be 48.34 days. To make the calculations simpler, this value of 48.34 days is based on forecasted end-of-year accounts payable rather than on average accounts payable.
  - (q) The forecasted amount of property, plant, and equipment (PP&E) in 2014 is determined using the forecasted value for the fixed asset turnover ratio, which is expected to be 3.518 times. To make the calculations simpler, this ratio of 3.518 is based on forecasted end-of-year gross property, plant, and equipment rather than on the average balance. (Note: For simplicity, ignore accumulated depreciation in making this calculation.)
  - (r) Skywalker has determined that no new intangible assets will be acquired in 2014. Intangible assets are amortized according to the information in (t).

(Note: These forecasted statements were constructed as part of the spreadsheet assignment in Chapter 10; you can use that spreadsheet as a starting point.)

For this exercise, make the following additional assumptions:

- (s) In computing depreciation expense for 2014, use straight-line depreciation and assume a 30-year useful life with no residual value. Gross PP&E acquired during the year is only depreciated for half the year. In other words, depreciation expense for 2014 is the sum of two parts: (1) a full year of depreciation on the beginning balance in PP&E, assuming a 30-year life and no residual value, and (2) a half-year of depreciation on any new PP&E acquired during the year, based on the change in the gross PP&E balance.
- (t) Skywalker assumes a 20-year useful life for its intangible assets. Assume that the \$100 in intangible assets reported in 2013 is the original cost of the intangibles. Include the amortization expense with the depreciation expense in the income statement.

Clearly state any additional assumptions that you make.

- 2. Assume the same scenario as (1), and show the impact on the financial statements with the following changes in assumptions:
  - (a) Estimated useful life of property, plant, and equipment is 15 years.
  - (b) Estimated useful life of property, plant, and equipment is 60 years.
- 3. Comment on the differences in the forecasted values of cash from operating activities in 2014 under each of the following assumptions about the estimated useful life of PP&E: 15 years, 30 years, and 60 years. Explain exactly why a change in depreciation life has an impact on cash from operating activities.

ACTIVITIES OF  
A BUSINESS

# CHAPTER 12

## Debt Financing

### LEARNING OBJECTIVES

- 1 Understand the various classification and measurement issues associated with debt.
- 2 Account for short-term debt obligations, including those expected to be refinanced, and describe the purpose of lines of credit.
- 3 Apply present value concepts to the accounting for long-term debts such as mortgages.
- 4 Understand the various types of bonds; compute the price of a bond issue; and account for the issuance, interest, and redemption of bonds.
- 5 Discuss the use of the fair value option for financial assets and liabilities.
- 6 Explain various types of off-balance-sheet financing, and understand the reasons for this type of financing.
- 7 Analyze a firm's debt position using ratios.
- 8 Review the notes to financial statements, and understand the disclosure associated with debt financing.

### EM EXPANDED MATERIAL

- 9 Understand the conditions under which troubled debt restructuring occurs, and be able to account for troubled debt restructuring.

Analysis of the data gathered in the U.S. census of 1880 took almost 10 years. For the census of 1890, the U.S. government commissioned Herman Hollerith to provide data tabulation machines to speed up the process. This system of mechanized data handling saved the Census Bureau \$5 million and slashed the data analysis time by two years. In 1924, Hollerith's company adopted the name **International Business Machines Corporation (IBM)**. IBM became the largest office machine producer in the United States with sales of more than \$180 million in 1949.

In 1950, there was great resistance to the idea of electronic computers at IBM. IBM's engineers were specialists in electromechanical devices and were uncomfortable working with vacuum tubes, diodes, and magnetic recording tapes. In addition, there were many questions about the customer demand for electronic computers. One IBM executive forecast that the size of the total

worldwide market for computers was no more than five. However, following significant internal debate, IBM pressed forward with the production of its first electronic computer, the 701. Through the 1960s and 70s, with its aggressive leasing program, emphasis on sales and service, and continued investment in research and development, IBM established a dominant (some claimed a monopolistic) position in the mainframe computer market.

When the IBM personal computer was released in 1981, it quickly became the industry standard for PCs. By 1986, IBM held 40% of the PC market. Amid this success, IBM made what, in retrospect, was a crucial error—it chose to focus on producing and selling hardware and to leave software development, by and large, to others. In fact, IBM did not develop the operating system for its first PC, instead electing to use a system called DOS, licensed from a 32-person company named **Microsoft**. In the early 1990s, as profits of software developers such as Microsoft exploded, the profits of IBM slumped badly. In 1990, IBM reported an operating profit of \$11 billion. Operating profit in 1991 fell to \$942 million, and operations showed a loss of \$45 million in 1992, which was IBM's first operating loss ever. As of December 31, 1992, the total market value of IBM stock was \$29 billion, down from \$106 billion in 1987 when IBM was the most valuable company in the world.

Interestingly, in the midst of these problems—decreasing market share, lower profit margins, and record losses—IBM found high demand for its record-setting bond issue. In 1993, IBM issued \$1.25 billion of 7-year notes and \$550 million of 20-year debentures. At the time, this was the largest U.S. bond issue in history. The stated interest rates were 6.375% for the notes and 7.50% for the bonds. On their issue date, these two bond issues provided investors with a yield just 0.7% above that provided by U.S. Treasury instruments with comparable maturity periods. Because of IBM's financial woes and increased risk at the time, many thought that the difference would be much higher. Nonetheless, investors' concerns about IBM's future did increase the perceived risk associated with loaning money to the

company. In January 1993, **Standard & Poor's** downgraded IBM's credit rating from the highest rating, AAA, to AA-. In March 1993, **Moody's Investor's Service** also lowered IBM's rating from A-1 to AA-2.<sup>1</sup> Prior to these downgrades, IBM was able to finance debt in the market at approximately 0.5% above the U.S. Treasury yield.<sup>2</sup>

In a bid to turn IBM around, the board of directors looked outside the company for a new CEO in 1993. They picked Louis V. Gerstner, Jr., who had been the CEO at **RJR Nabisco** for four years. In his 1997 address to IBM's shareholders, Mr. Gerstner looked back on the task that had faced him when he took the reins in 1993. When he came aboard, he reported, IBM's board was considering dismantling the company, thinking that a collection of smaller, more nimble businesses would hopefully be worth more to IBM's shareholders than the lumbering, inefficient parent company. Mr. Gerstner changed the direction of the company, deciding to keep the company together and to rely on IBM's unique market position in terms of product breadth and strong customer ties.

Under Mr. Gerstner's leadership, IBM recovered. Mr. Gerstner led the company, as the chairman of the board of directors, through 2002. Exhibit 12-1 shows the relationship between IBM's total short- and long-term debt, its total assets, and its market value from 1992 through 2007. Note that IBM's total short- and long-term debt and total market value were almost equal in 1992. Although the company's assets and debt have remained relatively constant over the 16-year period, the firm's market value increased significantly peaking at \$208 billion on December 31, 2001, before easing in the wake of the burst of the dot.com bubble.

An examination of IBM's 2009 liabilities reveals the following (in millions):

Current liabilities:	
Taxes .....	\$ 3,826
Short-term debt .....	4,168
Accounts payable .....	7,436
Compensation and benefits .....	4,505
Deferred income .....	10,845
Other accrued expenses and liabilities .....	5,223

<sup>1</sup> These bond rating scales have since been modified.

<sup>2</sup> Thomas T. Vogel, Jr., and Leslie Scism, "Investors Snap Up \$1.8 Billion of IBM Securities as Corporations Scramble to Best Higher Interest Rates," *The Wall Street Journal*, June 9, 1993, p. C16.

## 12-1 IBM'S TOTAL DEBT, TOTAL ASSETS, AND TOTAL MARKET VALUE OF EQUITY

© 2012 Cengage Learning.

Long-term:

Long-term debt .....	21,932
Retirement and nonpension postretirement benefit obligations .....	15,953
Deferred income .....	3,562
Other liabilities .....	8,819

IBM's largest liability is its long-term debt. A review of this debt reveals debentures, some of which will

mature as far out as 2096. In addition, the long-term debt includes notes and foreign currency debt denominated in euros, Japanese yen, and Swiss francs.

In this chapter, we will discuss many of these liabilities. A discussion of the liabilities relating to compensation (compensation and benefits and retirement and nonpension postretirement benefits) will be saved for Chapter 17.

### QUESTIONS

1. What was the interest rate impact of the downgrading of IBM's debt by the bond rating agencies?
2. Why is the market interest rate on corporate bonds ALWAYS higher than the market interest rate associated with comparable U.S. Treasury bonds?
3. In 2009, IBM's long-term debt and its long-term retirement obligation were the two largest liabilities on the balance sheet. However, the financial characteristics of these two obligations are dramatically different. On what important dimension do these two long-term obligations differ?

*Answers to these questions can be found on page 12-54.*

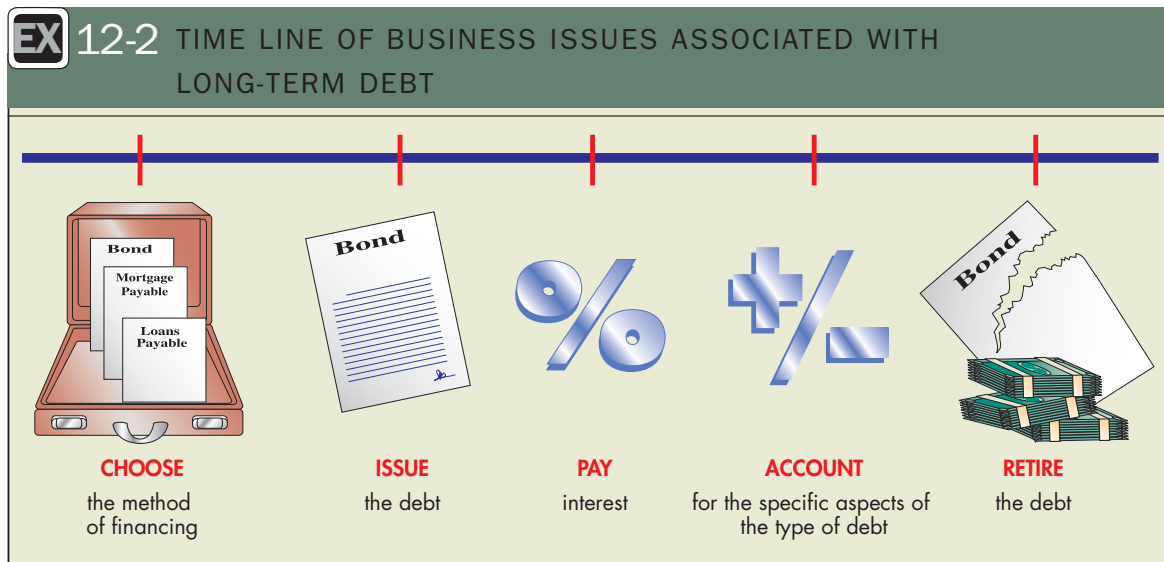

In addition to the routine notes and debentures issued by IBM, a long list of more creative types of debt-financing instruments has been created by the U.S. financial industry. For years, we've had convertible bonds, junk bonds, zero-interest bonds, and commodity-backed bonds, to name a few. The objective of each of these debt instruments is to assist a company in raising needed funds for its business. In this chapter, we will discuss various methods available to companies for borrowing

money. We begin with a quick review of liabilities: what they are and how they are measured. Then we will discuss short-term obligations and lines of credit. We then review the concept of present value and examine a mortgage to illustrate how present values apply to the accounting for long-term debt obligations. We then focus on the accounting for various types of bonds, including the option to report these bonds in the balance sheet at their fair value. Following our discussion of bonds, we will introduce some common methods that companies use to avoid disclosing debt on the financial statements. These methods are collectively referred to as *off-balance-sheet financing*. Once you have been exposed to various types of debt financing available to a company, we will talk about how one can analyze a firm's debt position as well as common note disclosures associated with debt.

In the Expanded Material section of the chapter, we discuss troubled debt restructuring. The topic of troubled debt restructuring covers those instances when a company is in poor financial condition and is in danger of defaulting on its debt payments. The negotiations between the bond issuer and the holders of the bonds (or troubled debt) often require journal entries to account for the concessions made on the part of the bondholders.

A time line illustrating the business issues associated with long-term financing is given in Exhibit 12-2. The first action is to choose the appropriate form of financing. For example, a company must decide whether to negotiate a private loan with a bank or to seek public financing through the issuance of bonds. After the debt is issued, it is usually serviced through periodic interest payments, although some forms of long-term debt defer payment of all interest until the end of the loan period. An important part of issuing and monitoring long-term debt is the accounting for the specific features of the debt. As discussed in this chapter, bonds require specialized accounting procedures to ensure that the proper amount of interest expense is reported in the income statement and that the long-term debt obligation is reported at the appropriate amount in the balance sheet. Finally, the long-term debt is repaid, either as originally scheduled or, sometimes, in advance.

# Classification and Measurement Issues Associated with Debt

1

Understand the various classification and measurement issues associated with debt.

**WHY** To effectively evaluate a firm's liquidity and solvency positions, all current and future obligations must be identified and quantified. Obligations due in the future must be measured in present value terms.

**HOW** Theoretically, all debt should be recorded at its present value. However, most current obligations arising in the normal course of business are not discounted. Obligations that cannot be measured with certainty are estimated and recorded at an approximate amount.

Before we get into the specifics of debt, let's first take a moment and review just what liabilities are and how they are classified and measured.

## Definition of Liabilities

The FASB has defined **liabilities** as “probable future sacrifices of economic benefits arising from present obligations of a particular entity to transfer assets or provide services to other entities in the future as a result of past transactions or events.”<sup>3</sup> This definition contains significant components that need to be explained before individual liability accounts are discussed.

A liability is a result of *past transactions or events*. Thus, a liability is not recognized until incurred. This part of the definition excludes contractual obligations from an exchange of promises if performance by both parties is still in the future. Such contracts are referred to as *executory contracts*. Determining when an executory contract qualifies as a liability is not always easy. For example, the signing of a labor contract that obligates both the employer and the employee does not give rise to a liability in current accounting practice, nor does the placing of an order for the purchase of merchandise. However, under some conditions, the signing of a lease is recognized as an event that requires the current recognition of a liability even though a lease is essentially an executory contract.

A liability must involve a *probable future transfer of assets or services*. Although liabilities result from past transactions or events, an obligation may be contingent upon the occurrence of another event sometime in the future. When occurrence of the future event seems probable, the obligation is defined as a *liability*. Although the majority of liabilities are satisfied by payment of cash, some obligations are satisfied by transferring other types of assets or by providing services. For example, revenue received in advance requires recognition of an obligation to provide goods or services in the future. Usually, the time of payment is specified by a debt instrument, for example, a note requiring payment of interest and principal on a given date or series of dates. Some obligations, however, require the transfer

**FYI**

The FASB is considering a change in the conceptual framework definition of a liability. The change intends to extend the definition of a liability beyond obligations to transfer assets or services to also include obligations to deliver a certain dollar value of equity shares.

<sup>3</sup> *Statement of Financial Accounting Concepts No. 6, “Elements of Financial Statements”* (Stamford, CT: Financial Accounting Standards Board, December 1985), par. 35. As discussed in this chapter and in Chapter 13 on equity financing, the FASB is currently considering a revision of this liability definition.

Keith Brasky/Photodisc/Getty Images

A liability, such as a bank loan, has the following characteristics: (1) is a result of past transactions or events, (2) involves a probable future transfer of assets or services, and (3) is the obligation of a particular entity.

of assets or services over a period of time, but the exact dates cannot be determined when the liability is incurred, for example, obligations to provide parts or service under a warranty agreement.

A liability is the *obligation of a particular entity*, that is, the entity that has the responsibility to transfer assets or provide services. As long as the payment or transfer is probable, it is not necessary that the entity to whom the obligation is owed be identified. Thus, a warranty to make any repairs necessary to an item sold by an entity is an obligation of that entity even though it is not certain which customers will receive benefits. Generally, the obligation rests on a foundation of legal rights and duties. However, obligations created, inferred, or construed from the facts of a particular situation may also be recognized as liabilities. For example, if a company regularly pays vacation pay or year-end bonuses, accrual of these items as a liability is warranted even though no legal agreement exists to make these payments.

Although the FASB's definition is helpful, the question of when a liability exists is not always easy to answer. Examples of areas in which there are continuing controversies include the problems associated with off-balance-sheet financing, deferred income taxes, leases, pensions, and even some equity securities, such as redeemable preferred stock. Once an item is accepted as having met the definition of a liability, there is still the need to appropriately classify, measure, and report the liability.

### Classification of Liabilities

For reporting purposes, liabilities are usually classified as current or noncurrent. The distinction between current and noncurrent liabilities was introduced and explained in Chapter 3, where it was pointed out that the computation of working capital is considered by many to be a useful measure of the liquidity of an enterprise.

As noted in Chapter 3, the same rules generally apply for the classification of liabilities as for assets. If a liability arises in the course of an entity's normal operating cycle, it is considered current if current assets will be used to satisfy the obligation within one year or one operating cycle, whichever period is longer. On the other hand, bank borrowings, notes, mortgages, and similar obligations are related to the general financial condition of the entity, rather than directly to the operating cycle, and are classified as current only if they are to be paid with current assets within one year.

When debt that has been classified as noncurrent will mature within the next year, the liability should be reported as a current liability in order

**i**

**EYI**

The classification of a liability as current or noncurrent can impact significantly a company's ability to raise additional funds. Most lending institutions and investors look carefully at the current ratio—current assets divided by current liabilities—as a measure of liquidity.

to reflect the expected drain on current assets. However, if the liability is to be paid by transfer of noncurrent assets that have been accumulated for the purpose of liquidating the liability, the obligation continues to be classified as noncurrent.

The distinction between current and noncurrent liabilities is important because of the impact on a company's current ratio. This fundamental measurement of a company's liquidity is computed by dividing total current assets by total current liabilities.

The current ratio is a measure of an entity's ability to meet current obligations. Care must be taken to determine that proper items have been included in the current asset and current liability categories. Historically, the rule of thumb has been that a current ratio below 2.0 suggests the possibility of liquidity problems. However, advances in information technology have enabled companies to be much more effective in minimizing the need to hold cash, inventories, and other current assets. As a result, current ratios for successful companies these days are frequently less than 1.0. Current ratios for selected U.S. companies are given in Exhibit 12-3. Note that ALL of the companies have current ratios substantially below the 2.0 historical benchmark, and the current ratio of **Delta Air Lines** is only 0.79.

A reasonable margin of current assets over current liabilities suggests that a company will be able to meet maturing obligations even in the event of unfavorable business conditions or losses on such assets as securities, receivables, and inventories. A current ratio of 1.4 means, for example, that a company could liquidate its total current liabilities 1.4 times using only its current assets.

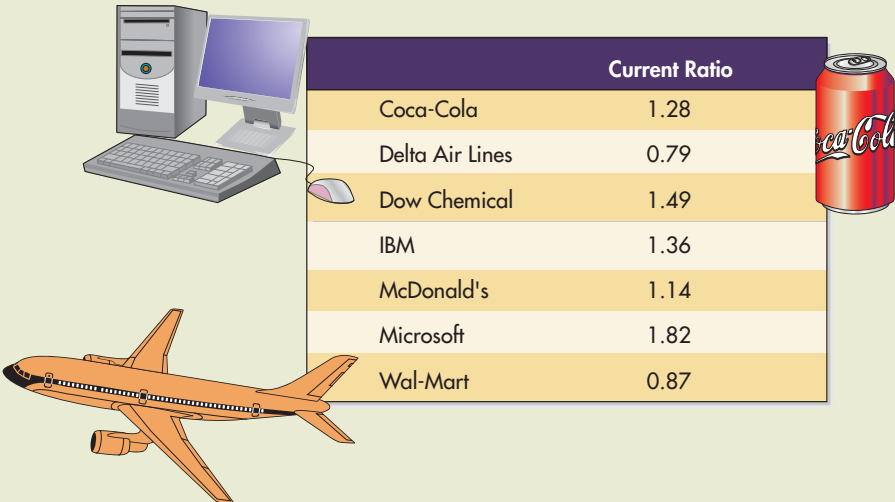

## STOP & THINK

Look at Exhibit 12-3. The 2009 current ratio of **Wal-Mart** is only 0.87. How will Wal-Mart most likely meet its current obligations as they come due?

- By the issuance of new shares of common stock
- By liquidating long-term assets such as land or buildings
- Wal-Mart will probably not be able to meet its current obligations as they come due.
- Through the generation of operating cash flow in the normal course of business

### EX 12-3 CURRENT RATIOS FOR SELECTED U.S. COMPANIES FOR FISCAL 2009

	Current Ratio
Coca-Cola	1.28
Delta Air Lines	0.79
Dow Chemical	1.49
IBM	1.36
McDonald's	1.14
Microsoft	1.82
Wal-Mart	0.87

## Measurement of Liabilities

The distinction between current and noncurrent liabilities is also an important consideration in the measurement of liabilities. Obviously, before liabilities can be reported on the financial statements, they must be stated in monetary terms. The fair value measurement used for liabilities is typically the present value of the future cash outflows to settle the obligation. Generally, this is the amount of cash required to pay someone else to accept responsibility for the obligation today.

If a claim isn't to be paid until sometime in the future, as is the case with noncurrent liabilities, either the claim should provide for interest to be paid on the debt or the obligation should be reported at the discounted value of its maturity amount. Current obligations that arise in the course of normal business operations are generally due within a short period, for example, 30 to 60 days, and normally are not discounted.<sup>4</sup> Thus, trade accounts payable are not reported at their present value even though they carry no interest provision. However, this is an exception to the general rule; most nonoperating business transactions, such as the borrowing of money, purchasing of assets over time, and long-term leases, do involve the computation of present values. The obligation in these instances is the present value of the future resource outflows. The use of present value concepts with long-term debt obligations is illustrated in detail later in the chapter.

For measurement purposes, liabilities can be divided into three categories:

1. Liabilities that are definite in amount
2. Estimated liabilities
3. Contingent liabilities

The measurement of liabilities always involves some uncertainty because a liability, by definition, involves a future outflow of resources. However, for the first category, both the existence of the liability and the amount to be paid are determinable because of a contract, trade agreement, or general business practice. An example of a liability that is definite in amount is the principal payment on a note.

The second category includes items that are definitely liabilities; that is, they involve a definite future resource outflow, but the actual amount of the obligation cannot be established currently. In this situation, the amount of the liability is estimated so that the obligation is reflected in the current period, even though at an approximated value. A warranty obligation that is recorded on an accrual basis is an example of an estimated liability.

Generally, liabilities from both of the first two categories are reported on the balance sheet, either as current or noncurrent liabilities, whichever is appropriate. However, items that resemble liabilities but are contingent upon the occurrence of some future event are

not recorded until it is probable that the event will occur. Even though the amount of the potential obligation may be known, the actual existence of a liability is questionable because it is contingent upon a future event for which there is considerable uncertainty. An example of a contingent liability is a pending lawsuit. Only if the lawsuit is lost or is settled out of court

### CAUTION

A contingent liability results only when there is a significant degree of uncertainty as to the outcome of the event associated with the potential liability. Recall from its definition that a liability involves a "probable future sacrifice. . . ." If the contingent event is probable, it meets the definition of a liability and should be recorded as such.

<sup>4</sup> FASB ASC paragraph 835-30-15-3a.

will a sacrifice of economic benefits be necessary. Although not recorded in the accounts, some contingent liabilities should be disclosed in the notes to the financial statements as discussed and illustrated in Chapter 19.

## Accounting for Short-Term Debt Obligations

**2** Account for short-term debt obligations, including those expected to be refinanced, and describe the purpose of lines of credit.

**WHY** Obligations due within one year or within the company's operating cycle are classified as current. This classification allows financial statement users to assess the company's liquidity position.

**HOW** The most common current liabilities include accounts payable, wages payable, interest payable, taxes payable, and other short-term operating accruals. Short-term obligations expected to be refinanced on a long-term basis should be classified as noncurrent if certain criteria are met.

As noted in the previous section, liabilities that have been classified as current are typically not discounted, that is, they are not reported at their present value. Instead, they are reported on the balance sheet at their face value. Representative of this type of debt are accounts payable, notes payable, and miscellaneous operating payables including salaries, payroll taxes, property and sales taxes, and income taxes. Short-term obligations that are expected to be refinanced require special consideration. Problems that can arise in determining the balances to be reported for these various types of debt are described in the following sections.

### Short-Term Operating Liabilities

Businesses with good internal processes purchase most goods and services on credit. The term **account payable** usually refers to the amount due for the purchase of materials by a manufacturing company or merchandise by a wholesaler or retailer. Other obligations, such as salaries and wages, rent, interest, and utilities, are reported as separate liabilities in accounts descriptive of the nature of the obligation. Accounts payable are not recorded when purchase orders are placed but instead when legal title to the goods passes to the buyer. The rules for the customary recognition of legal passage of title were presented in Chapter 9. If goods are in transit at year-end, the purchase should be recorded if the shipment terms indicate that title has passed. This means that care must be exercised to review the purchase of goods and services near the end of an accounting period to ensure a proper cutoff and reporting of liabilities and inventory. It is customary to report accounts payable at the expected amount of the payment. Because the payment period is normally short, no recognition of interest is required.

### Short-Term Debt

Companies often borrow money on a short-term basis for operating purposes other than for the purchase of materials or merchandise involving accounts payable. Collectively, these obligations may be referred to as *short-term debt*. In most cases, such debt is evidenced by a **promissory note**, a formal written promise to pay a sum of money in the future, and is usually reflected on the debtor's books as **Notes payable**.

Notes issued to trade creditors for the purchase of goods or services are called **trade notes payable**. **Nontrade notes payable** are notes issued to banks or to officers and

stockholders for loans to the company and those issued to others for the purchase of non-current operating assets. It is normally desirable to classify current notes payable on the balance sheet as trade or nontrade because such information would reveal to statement users the sources of indebtedness and the extent to which the company has relied on each source in financing its activities.

The problems encountered in the valuation of notes payable are the same as those discussed in Chapter 7 with respect to notes receivable. Thus, a short-term note payable is recorded and reported at its present value, which is normally the face value of the note. This presumes that the note bears a reasonable stated rate of interest. However, if a note has no stated rate of interest, or if the stated rate is unreasonable, then the face value of the note would need to be discounted to its present value to reflect the effective rate of interest implicit in the note. This is accomplished by debiting Discount on Notes Payable when the note is issued and by writing off the discount to Interest Expense over the life of the note in the same manner as was illustrated for the discount on notes receivable in Chapter 7.

Discount on Notes Payable is a contra account to Notes Payable and would be reported on the balance sheet as follows; the \$90,000 net amount represents the present value of the note.

Current liabilities:

Notes payable . . . . .	\$100,000	
Less: Discount on notes payable . . . . .	<u>10,000</u>	\$90,000

### Short-Term Obligations Expected to Be Refinanced

Misclassification of debt can create serious problems for users of financial statements. Because the “current” classification is reserved for those obligations that will be satisfied with current assets within a year, a short-term obligation that is expected to be refinanced on a long-term basis should not be reported as a current liability. This applies to the currently maturing portion of a long-term debt and to all other short-term obligations except those arising in the normal course of operations that are due in customary terms. Similarly, it should not be assumed that a short-term obligation will be refinanced and therefore classified as a noncurrent liability unless the refinancing arrangements are secure. Thus, to avoid potential manipulation, the refinancing expectation must be realistic, not just a mere possibility.

An example will illustrate this last point and show the importance of proper classification. Assume that a company borrows a substantial amount of money that it expects to pay back at the end of five years. The president of the company signs a 6-month note, which the loan officer at the bank verbally agrees will be renewed “automatically” until the actual maturity date in five years. The only current obligation expected is payment of the accrued interest each renewal period. Under these circumstances, the company reports the obligation as noncurrent, except for the accrued interest obligation. Assume further that the loan officer leaves the bank and that the new bank official will not allow the short-term note to be refinanced. The financial picture of the company is now dramatically changed. What was considered a long-term obligation because of refinancing expectations is suddenly a current liability requiring settlement with liquid assets in the near future.

The authoritative guideline for classifying short-term obligations expected to be refinanced is contained in FASB ASC Topic 470 (Debt). According to the FASB, both of the following conditions must be met before a short-term obligation may be properly excluded from the current liability classification.<sup>5</sup>

<sup>5</sup> FASB ASC paragraph 470-10-45-14.

1. Management must *intend to refinance* the obligation on a long-term basis.
2. Management must *demonstrate an ability to refinance* the obligation.

Concerning the second point, an ability to refinance may be demonstrated by either of the following:

- (a) Actually refinancing the obligation during the period between the balance sheet date and the date the statements are issued.
- (b) Reaching a firm agreement that clearly provides for refinancing on a long-term basis.

The terms of the refinancing agreement should be noncancelable as to all parties and extend beyond the current year. In addition, the company should not be in violation of the agreement at the balance sheet date or the date of issuance, and the lender or investor should be financially capable of meeting the refinancing requirements.

If an actual refinancing does occur before the balance sheet is issued, the portion of the short-term obligation that is to be excluded from current liabilities cannot exceed the proceeds from the new debt or equity securities issued to retire the old debt. For example, if a \$400,000 long-term note is issued to partially refinance \$750,000 of short-term obligations, only \$400,000 of the short-term debt can be excluded from current liabilities.

An additional question relates to the timing of the refinancing. If the obligation is paid prior to the actual refinancing but before the issuance of the financial statements, the obligation should be included in current liabilities on the balance sheet.<sup>6</sup> To illustrate, assume that the liabilities of CareFree Inc. at December 31, 2012, include a note payable for \$200,000, due January 15, 2013. The management of CareFree intends to refinance the note by issuing 10-year bonds. The bonds are actually issued before the issuance of the December 31, 2012, balance sheet on February 15, 2013. If the bonds are issued prior to payment of the note, the note should be classified as noncurrent on the December 31, 2012, balance sheet. If payment of the note precedes the issuance of the bonds, however, the note should be included in current liabilities as of December 31, 2012.

The international standard for classification of short-term obligations to be refinanced is slightly different. According to *IAS 1*, for the obligation to be classified as long term the refinancing must take place by the balance sheet date, not the later date when the financial statements are finalized. In other words, under the international standard post-balance-sheet-date events are NOT considered when determining whether a refinancable obligation is reported as current or noncurrent. The FASB is considering adopting this more stringent condition.

Normally, classified balance sheets are presented showing a total for Current Liabilities. If a short-term obligation is excluded from that category due to refinancing expectations, disclosure should be made in the notes to the financial statements. The note should include a general description of the refinancing agreement.

### Lines of Credit

Some companies have temporary borrowing needs necessitated by the seasonal nature of their business. **Toys “R” Us** is an example of this type of business. Even nonseasonal companies have predictable short-term funding needs that they prefer to arrange for in advance. A way to handle these temporary funding needs is to arrange lines of credit with banks. The lines of credit can be used for automatic borrowing as cash is needed, and then the loans can be repaid when cash is plentiful. For example, in 2009, Toys “R” Us had a

<sup>6</sup> FASB ASC paragraph 470-10-45-15.

\$2 billion line of credit to finance seasonal inventory buildup and store construction costs. IBM also has lines of credit established with numerous banks that allow it to quickly borrow money. A **line of credit** is a negotiated arrangement with a lender in which the terms are agreed to prior to the need for borrowing. When a company finds itself in need of money, an established line of credit allows the company access to funds immediately without having to go through the credit approval process. IBM disclosed the following in the notes to its 2009 financial statements:

## LINES OF CREDIT

The company maintains a five-year, \$10 billion Credit Agreement (the “Credit Agreement”), which expires on June 28, 2012. The total expense recorded by the company related to this facility was \$6.3 million in 2009, \$6.2 million in 2008 and \$6.2 million in 2007. The amended Credit Agreement permits the company and its Subsidiary Borrowers to borrow up to \$10 billion on a revolving basis. Borrowings of the Subsidiary Borrowers will be unconditionally backed by the company. The company may also, upon the agreement of either existing lenders, or of the additional banks not currently party to the Credit Agreement, increase the commitments under the Credit Agreement up to an additional \$2.0 billion. Subject to certain terms of the Credit Agreement, the company and Subsidiary Borrowers may borrow, prepay and reborrow amounts under the Credit

Agreement at any time during the Credit Agreement. Interest rates on borrowings under the Credit Agreement will be based on prevailing market interest rates, as further described in the Credit Agreement. The Credit Agreement contains customary representations and warranties, covenants, events of default, and indemnification provisions. The company believes that circumstances that might give rise to breach of these covenants or an event of default, as specified in the Credit Agreement are remote. The company’s other lines of credit, most of which are uncommitted, totaled approximately \$9,790 million and \$11,031 million at December 31, 2009 and 2008, respectively. Interest rates and other terms of borrowing under these lines of credit vary from country to country, depending on local market conditions.

(\$ in millions) At December 31:	2009	2008
Unused lines:		
From the committed global credit facility . . . . .	\$ 9,910	\$ 9,888
From other committed and uncommitted lines . . . . .	7,405	8,376
Total unused lines of credit . . . . .	<u>\$17,314</u>	<u>\$18,264</u>

The line of credit itself is *not* a liability. However, once the line of credit is used to borrow money, the company has a formal liability that will be reported as either a current or long-term liability, depending on the repayment terms of the agreement. A sample of U.S. companies with large unused lines of credit is given in Exhibit 12-4. Note especially that the lines of credit are quite large relative to the amount of outstanding debt; in the case of **Sears**, use of the full amount of credit would increase its amount of outstanding debt by 75%. Details regarding the terms of the line of credit, for example, the used and unused portions and the applicable interest rates, are disclosed in the financial statement notes.

## EX 12-4 UNUSED LINES OF CREDIT—2009

(numbers in billions of dollars)

Company	Unused Line of Credit	Outstanding Short-Term and Long-Term Debt
IBM	\$17.3	\$ 26.1
ExxonMobil	4.8	9.6
General Electric	9.0	12.2
General Electric Capital Services	51.7	461.4
Sears	2.5	3.3

© 2012 Cengage Learning.

Maintaining a line of credit is not costless. Banks typically charge a small amount, a fraction of 1% per year, in exchange for the commitment to provide a company with guaranteed credit. For example, on December 31, 2009, **McDonald's** had a \$1.3 billion line of credit (expiring in 2012) that had a fee of 0.05% per year. Of course, if McDonald's uses the line of credit, interest on the borrowed amount would have to be paid in addition to this fee. The fee is the cost that McDonald's pays in order to have guaranteed access to credit. The cost of maintaining this \$1.3 billion credit line for one year is \$650,000 ( $\$1.3 \text{ billion} \times 0.0005$ ).

PhotoLink/Photodisc/Getty Images

Seasonal businesses often use lines of credit to handle temporary borrowing needs.

## Present Value of Long-Term Debt

3

Apply present value concepts to the accounting for long-term debts such as mortgages.

**WHY** Conceptually, a liability should be reported at the amount that would satisfy the obligation on the balance sheet date. For a long-term obligation, this amount is the present value of the future payments to be made.

**HOW** When a payment is made on a long-term debt, present value calculations are used to determine the portion of the payment that is applied to reduce the liability and the amount that is included as interest expense on the income statement.

The reporting of long-term debt obligations is more complex than for short-term obligations because the sum of the future cash payments to be made on a long-term debt is not a good measure of the actual economic obligation. For example, repaying a 30-year, \$200,000 mortgage with a 7% interest rate will require monthly payments totaling \$479,018 over the 30-year life of the mortgage. However, the entire obligation could be settled with one payment of \$200,000 today. In reporting long-term debt obligations, the emphasis is on reporting what the real economic value of the obligation is today, not what the total debt payments will be in the future.

To illustrate the application of present value concepts to the accounting for long-term debt, a simple mortgage example will be used. A **mortgage** is a loan backed by an asset that serves as collateral for the loan. If the borrower cannot repay the loan, the lender has the legal right to claim the mortgaged asset and sell it in order to recover the loan amount. Mortgages are generally payable in equal installments; a portion of each payment represents interest on the unpaid mortgage balance, and the remainder of the payment is designated as repayment of part of the principal of the loan. As an example, assume that on January 1, 2013, Crystal Michae purchases a house for \$250,000 and makes a down payment of \$50,000. The remaining \$200,000 of the purchase price is financed through a mortgage on the house. The mortgage is payable over 30 years at a rate of \$2,057 monthly. The interest rate is 12% compounded monthly, and the first payment is due on February 1, 2013. An interest rate of 12% compounded monthly is the same as 1% per month (12%/12 months). (See the Time Value of Money Review module for a review of present value concepts.)

As the mortgage payments are made, each monthly payment of \$2,057 must be divided between principal and interest. The interest is based on 1% of the mortgage balance at the beginning of the month. On February 1, the interest is \$2,000 ( $\$200,000 \times 0.01$ ), and the principal portion of the payment is \$57 (or  $\$2,057 - \$2,000$ ). In March, the interest is \$1,999, 1% of \$199,943 ( $\$200,000 - \$57$ ), and this pattern continues monthly. The division of these payments into interest and principal components for the first five monthly payments is shown in Exhibit 12-5. This process is called **loan** (or **mortgage**) **amortization**.

If Crystal were to maintain a set of personal financial records, she would make the following journal entry on February 1:

Interest Expense .....	2,000	
Mortgage Payable .....	57	
Cash .....		2,057

As with other forms of long-term financing, a mortgage obligation is reported in a company's balance sheet at its present value, which approximates the cash amount that would fully satisfy the obligation today. So, for example, if Crystal were to prepare a quarterly balance sheet as of April 1, 2013 (after the third payment was made), she would show a mortgage liability of \$199,827 (see Exhibit 12-5). Because most mortgages are payable in monthly installments, the principal payments for the next 12 months following the balance sheet date must be shown in the Current Liability section as the current portion of a long-term debt. The remaining portion is classified as a long-term liability.

A **secured loan** is similar to a mortgage in that it is a loan backed by certain assets as collateral. If the borrower cannot repay the loan, the lender can claim the securing assets. Secured loans are more common among firms experiencing financial difficulties. The fact

## EX 12-5 LOAN (MORTGAGE) AMORTIZATION SCHEDULE

Date	(1)	(2)	(3)	(4)
	Payment Amount	Interest Expense (4) × 0.01	Amount Applied to Reduce Principal (1) – (2)	Balance
January 1, 2013 . . . . .	—	—	—	\$200,000
February 1, 2013 . . . . .	\$2,057	\$2,000	\$57	199,943
March 1, 2013 . . . . .	2,057	1,999	58	199,885
April 1, 2013 . . . . .	2,057	1,999	58	199,827
May 1, 2013 . . . . .	2,057	1,998	59	199,768
June 1, 2013 . . . . .	2,057	1,998	59	199,709

© 2012 Cengage Learning.

that the loan is secured reduces the risk to the lender and therefore reduces the interest cost for the borrower. For example, in its 2009 annual report, Delta Air Lines disclosed the following regarding its secured loans:

In December 2009, we entered into a \$100 million first-lien revolving credit facility, which is guaranteed by the Guarantors and is secured by a first lien on certain aircraft, engines and related assets owned by Mesaba and us . . . In December 2009, we also entered into a \$150 million first-lien revolving credit facility, which is guaranteed by the Guarantors and is secured by a first lien on certain aircraft, engines and related assets owned by Delta and Comair.

## Financing with Bonds

**4** Understand the various types of bonds; compute the price of a bond issue; and account for the issuance, interest, and redemption of bonds.

**WHY** Bonds come in a variety of shapes and sizes, but all bonds share one feature—the borrowing of money now with some form of repayment in the future. Because bonds represent long-term obligations, bond accounting involves extensive use of present value calculations.

**HOW** Bonds typically involve interest-only payments during the bond life with a lump-sum payment at maturity for the face amount of the bond. Present value techniques are used to determine the present value of the bond issue as well as the amount to be recorded as periodic interest expense.

The long-term financing of a corporation is accomplished either through the issuance of long-term debt instruments, usually bonds or notes, or through the sale of additional stock. The issuance of bonds or notes instead of stock may be preferred by management and stockholders for the following reasons:

1. Present owners remain in control of the corporation.
2. Interest is a deductible expense in arriving at taxable income; dividends are not.
3. Current market rates of interest may be favorable relative to stock market prices.
4. The charge against earnings for interest may be less than the amount of dividends that might be expected by shareholders.

There are, however, certain limitations and disadvantages of financing with long-term debt securities. Debt financing is possible only when a company is in satisfactory financial condition and can offer adequate security to creditors. Furthermore, interest obligations must be paid regardless of the company's earnings and financial position. If a company has operating losses and is unable to raise sufficient cash to meet periodic interest payments, secured debt holders may take legal action to assume control of company assets.

A complicating factor is that the distinction between debt and equity securities may become fuzzy. Usually, a debt instrument has a fixed interest rate and a definite maturity date when the principal must be repaid. Also, holders of debt instruments generally have

no voting privileges. A traditional equity security, on the other hand, has no fixed repayment obligation or maturity date, and dividends on stock become obligations only after being formally declared by the board of directors of a corporation. In addition, common stockholders generally have voting and other ownership privileges.

The problem is that certain convertible debt securities have many equity characteristics, and some preferred stocks have many of the characteristics of debt. This makes it important to recognize the distinction between debt and equity and to provide the accounting treatment that is most appropriate under the specific circumstances.

### Accounting for Bonds

Conceptually, bonds and long-term notes are similar types of debt instruments. There are some technical differences, however. For example, the **trust indenture**, (i.e., the bond contract) associated with bonds generally provides more extensive detail than the contract terms of a note, often including restrictions on the payment of dividends or incurrence of additional debt. The length of time to maturity is also generally longer for bonds than for notes. Some bonds do not mature for 20 years or longer, while most notes mature in one to five years. Other characteristics of bonds and notes are similar. Therefore, although the discussion that follows deals specifically with bonds, the accounting principles and reporting practices related to bonds can also be applied to long-term notes.

There are three main considerations in accounting for bonds:

1. Recording the issuance or purchase
2. Recognizing the applicable interest during the life of the bonds
3. Accounting for the retirement of bonds either at maturity or prior to the maturity date

Before these considerations are discussed, the nature of bonds and the determination of bond market prices will be reviewed.

### Nature of Bonds

The power of a corporation to create bond indebtedness is found in the corporation laws of a state and may be specifically granted by charter. In some cases, formal authorization by a majority of stockholders is required before a board of directors can approve a bond issue.

Borrowing by means of bonds involves the issuance of certificates of indebtedness. **Bond certificates**, commonly referred to simply as *bonds*, are frequently issued in

**FYI**

Often, companies in poor financial condition can still obtain financing. However, the terms of the debt are typically very restrictive and the interest rate is very high. Bonds issued by high-risk companies are often classified as **junk bonds**. Junk bonds are discussed later in this chapter.

denominations of \$1,000, referred to as the **face value**, **par value**, or **maturity value** of the bond, although in some cases bonds are issued in varying denominations.

The group contract between the corporation and the bondholders is known as the **bond indenture**. The indenture details the rights and obligations of the contracting parties, indicates the property pledged as well as the protection offered on the loan, and names the bank or trust company that is to represent the bondholders.

Bonds may be sold by the company directly to investors, or they may be underwritten by investment bankers or a syndicate. The underwriters may agree to purchase the entire bond issue or that part of the issue not sold by the company, or they may agree simply to manage the sale of the security on a commission basis, often referred to as a “*best efforts*” basis.

Most companies attempt to sell their bonds to underwriters to avoid incurring a loss after the bonds are placed on the market. An interesting example of this occurred when IBM went to the bond market for the first time and issued a record \$1 billion worth of bonds and long-term notes. After the issue was released by IBM to the underwriters, interest rates soared as the Federal Reserve Bank sharply increased its discount rate. The market price of the IBM securities fell, and the brokerage houses and investment bankers participating in the underwriting incurred a loss in excess of \$50 million on the sale of the securities to investors.

**Issuers of Bonds** Bonds and similar debt instruments are issued by private corporations; the U.S. government; state, county, and local governments; school districts; and government-sponsored organizations, such as the Federal Home Loan Bank and the Federal National Mortgage Association. As of December 2009, the Securities Industry and Financial Markets Association estimated that the amount of outstanding bonds for corporations was \$6.9 trillion.

The U.S. government’s debt includes not only U.S. Treasury bonds but also U.S. Treasury bills, which are notes with less than one year to maturity date, and U.S. Treasury notes, which mature in one to seven years. Outstanding U.S. government debt securities as of December 2009 totaled \$9.2 trillion.

Debt securities issued by state, county, and local governments and their agencies are collectively referred to as **municipal debt**. A unique feature of municipal debt is that the interest received by investors from such securities is exempt from federal income tax. Because of this tax advantage, “municipals” generally carry lower interest rates than debt securities of other issuers, enabling these governmental units to borrow at favorable interest rates. The tax exemption is in reality a subsidy granted by the federal government to encourage capital investment in state and local governments. Municipal bonds outstanding as of December 2009 were \$2.8 trillion.

**Types of Bonds** Bonds may be categorized in many different ways, depending on the characteristics of a particular bond issue. The major distinguishing features of bonds are identified and discussed in the following sections.

**Term versus serial bonds.** Bonds that mature on a single date are called **term bonds**. When bonds mature in installments, they are referred to as **serial bonds**. Serial bonds are much less common than term bonds.

**Secured versus unsecured bonds.** Bonds issued by private corporations may be either secured or unsecured. **Secured bonds** offer protection to investors by providing some form of security, such as a mortgage on real estate or a pledge of other collateral. A first-mortgage

bond represents a first claim against the property of a corporation in the event of the company's inability to meet bond interest and principal payments. A second-mortgage bond is a secondary claim ranking only after the claim of the first-mortgage bond or senior issue has been completely satisfied. A **collateral trust bond** is usually secured by stocks and bonds of other corporations owned by the issuing company. Such securities are generally transferred to a trustee, who holds them as collateral on behalf of the bondholders and, if necessary, will sell them to satisfy the bondholders' claim.

**Unsecured bonds** are not protected by the pledge of any specific assets and are frequently termed **debenture bonds**, or **debentures**. Holders of debenture bonds simply rank as general creditors along with other unsecured parties. The risk involved in these securities varies with the financial strength of the debtor. Debentures issued by a strong company may involve little risk; debentures issued by a weak company whose properties are already heavily mortgaged may involve considerable risk. Quality ratings for bonds are published by both Moody's and Standard & Poor's investor service companies. For example, Moody's bond ratings range from (Aaa), for prime or high-quality bonds to (C), for very high-risk bonds. Standard & Poor's range is from AAA, AA, A, BBB, and so forth, to D.

**Registered versus bearer (coupon) bonds.** **Registered bonds** call for the registry of the owner's name on the corporation books. Transfer of bond ownership is similar to that for stock. When a bond is sold, the corporate transfer agent cancels the bond certificate surrendered by the seller and issues a new certificate to the buyer. Interest checks are mailed periodically to the bondholders of record. **Bearer bonds**, or **coupon bonds**, are not recorded in the name of the owner; title to these bonds passes with delivery. Each bond is accompanied by coupons for individual interest payments covering the life of the issue. Coupons are clipped by the owner of the bond and presented to a bank for deposit or collection. The issue of bearer bonds eliminates the need for recording bond ownership changes and preparing and mailing periodic interest checks. Coupon bonds fail to offer the bondholder the protection found in registered bonds in the event the bonds are lost or stolen. In some cases, bonds provide interest coupons but require registry as to principal. Here, ownership safeguards are provided while the time-consuming routines involved in making interest payments are avoided. Bonds of recent issue are registered rather than coupon bonds.

**Zero-interest bonds and bonds with variable interest rates.** In recent years, some companies have issued long-term debt securities that do not bear interest. Instead, these securities sell at a significant discount that provides an investor with a total interest payoff at maturity. These bonds are known as **zero-interest bonds** or **deep-discount bonds**. Another type of zero-interest bond delays interest payments for a period of time.

Because of potentially wide fluctuations in interest rates, some bonds and long-term notes are issued with variable (or floating) interest rates. Over the life of these obligations, the interest rate changes as prevailing market interest rates increase or decrease. A variable interest rate security benefits the investor when interest rates are rising and the issuer when interest rates are falling.

**Junk bonds.** High-risk, high-yield bonds issued by companies that are heavily in debt or otherwise in weak financial condition are often referred to as **junk bonds**. These bonds are rated Ba2 or lower by Moody's and BB or lower by Standard & Poor's. Junk bonds typically yield higher interest rates, some yielding in excess of 20%.

Junk bonds are issued in at least three types of circumstances. First, they are issued by companies that once had high credit ratings but have fallen on hard times. As an example,

Standard & Poor's issued a rating of B for debt issued by **Little Traverse Bay Band of Odawa Indians**, owners of a hotel and casino resort in Michigan, and provided the following information:

Standard & Poor's Ratings Services assigned its 'B' rating to Harbor Springs, Mich.-based Little Traverse Bay Band of Odawa Indians' \$195 million senior notes due 2013. At the same time, Standard & Poor's assigned its 'B' issuer credit rating to the Tribe. The outlook is negative.

The ratings on the Tribe reflect very high leverage during the construction period of the Tribe's expansion project, a narrow gaming operation, a competitive marketplace that is facing additional intermediate-term gaming supply, and challenges managing a larger gaming facility. These are only partially tempered by the escrowing of the first four interest payments on the notes, totaling \$33 million, and stable cash flow from the existing gaming facility.

Second, junk bonds are issued by emerging growth companies, such as **Amazon.com's** issue of junk bonds priced at \$275 million in 1998, that lack adequate cash flow, credit history, or diversification to permit them to issue higher grade (i.e., lower risk) bonds (Amazon's fortunes have since changed with the company reporting its first positive cash flow from operations in 2002 and its first positive net income in 2003). The third circumstance is that junk bonds are issued by companies undergoing restructuring, often in conjunction with a leveraged buyout (LBO).

**Convertible and commodity-backed bonds.** Bonds may provide for their conversion into some other security at the option of the bondholder. Such bonds are known as **convertible bonds**. The conversion feature generally permits the owner of bonds to exchange them for common stock. The bondholder is thus able to convert the claim into an ownership interest if corporate operations prove successful and conversion becomes attractive; in the meantime, the special rights of a creditor are maintained. Bonds may also be redeemable in terms of commodities, such as oil or precious metals. These types of bonds are referred to as **commodity-backed bonds**.

**Callable bonds.** Bond indentures frequently give the issuing company the right to call and retire the bonds prior to their maturity. Such bonds are termed **callable bonds**. When a corporation wishes to reduce its outstanding indebtedness, bondholders are notified of the portion of the issue to be surrendered, and they are paid in accordance with call provisions. Interest does not accrue after the call date.

**Mortgage-backed securities.** One of the culprits of the 2008 worldwide financial crises was mortgage-backed securities. In many cases, these securities are just a special form of secured bonds. The underlying collateral for these bonds is the collection of mortgages owned by the issuing entity (either a private company or, more often, a U.S. government sponsored entity such as the Federal National Mortgage Association, or Fannie Mae). Problems with this type of secured bond arise when the people who own the mortgaged homes can no longer make their payments. These defaults cause the portfolio of mortgage loans to have decreased value as collateral for the mortgage-backed bonds.

## FASB CODIFICATION

**The Issue:** You are in charge of preparing the financial statements for the start-up company for which you work. The CEO has just come to your office to criticize your liability classification of the subordinated debentures that the company has issued. These debentures are “subordinated” to the company’s other loans, meaning that those other loans must be repaid first before the subordinated debentures are repaid. As a result, from an economic standpoint, the holders of the subordinated debentures are close to being common stockholders. Your CEO thinks that these debentures should be reported in the equity section of your company’s balance sheet. She points out, correctly, that banks often classify subordinated debentures as “equity” in the definition of debt covenant calculations for borrowers. Your accounting instinct tells you that subordinated debentures must be classified as liabilities, but you don’t have any authoritative support for your position.

**The Question:** Where can one find the authoritative statement requiring subordinated debt to be classified as a liability in the balance sheet?

**Searching the Codification:** Of course, we are going to start by looking in FASB ASC Topic 470 (Debt). Here is a hint—the classification of subordinated debt was addressed by the SEC in a Staff Accounting Bulletin.

**The Answer:** The authoritative guidance for the balance sheet classification of subordinated debt is given on page 12-55.

### Market Price of Bonds

The market price of bonds varies with the safety of the investment and the current market interest rate for similar instruments. When the financial condition and earnings of a corporation are such that payment of interest and principal on bond indebtedness is virtually ensured, the interest rate a company must offer to sell a bond issue is relatively low. As the risk factor increases, a higher interest return is necessary to attract investors. The amount of interest paid on bonds is a specified percentage of the face value. This percentage is termed the **stated rate**, or **contract rate**. This rate, however, may not be the same as the prevailing or market rate for bonds of similar quality and length of time to maturity at the time the issue is sold. Furthermore, the market rate fluctuates constantly. These factors often result in a difference between bond face values and the prices at which the bonds actually sell in the market.

The purchase of bonds at face value implies agreement between the bond’s stated rate of interest and the prevailing market rate of interest. If the stated rate exceeds the market rate, the bonds will sell at a premium; if the stated rate is less than the market rate, the

bonds will sell at a discount. The **bond premium** or the **bond discount** is the amount needed to adjust the stated rate of interest to the actual market rate of interest or yield for that particular bond. Thus, the stated rate adjusted for the premium or the discount gives the actual rate of return on the bonds, known as the

### CAUTION

When the stated interest rate on a company’s bonds is less than the market rate for similar bonds, investors will pay less than the face value of the bond because they are going to receive a lower interest payment. The amount paid below the face value is termed a *discount*. The reverse is true for a premium.

market, yield, or effective interest rate. A declining market rate of interest subsequent to issuance of the bonds results in an increase in the market value of the bonds; a rising market rate of interest results in a decrease in their market value.

Bond prices are quoted in the market as a percentage of face value. For example, a bond quotation of 96.5 means the market price is 96.5% of face value; thus, the bond is trading at a discount. A bond quotation of 104 means the market price is 104% of face value; thus, the bond is trading at a premium. U.S. government note and bond quotations are made in 32s rather than 100s. This means that a government bond selling at 98.16 (sometimes written 98:16) is selling at 98  $\frac{16}{32}$ , or in terms of decimal equivalents, 98.5%.

The market price of a bond at any date can be determined by discounting the maturity value of the bond and each remaining interest payment at the market rate of interest for similar debt on that date. The present value calculations explained in the Time Value of Money Review module can be used for computing bond market prices.

To illustrate the computation of a bond market price, assume 10-year, 8% bonds of \$100,000 are to be sold on the bond issue date. Further assume that the effective interest rate for bonds of similar quality and maturity is 10%, compounded semiannually.

The computation of the market price of the bonds may be divided into two parts:

*Part 1 Present value of principal (maturity value):*

Maturity value of bonds after 10 years, or 20 semiannual periods	\$100,000
Effective interest rate = 10% per year, or 5% per semiannual period; FV = \$100,000; N = 20; I = 5%	\$37,689

*Part 2 Present value of 20 interest payments:*

Semiannual payment, 4% of \$100,000	\$ 4,000
Effective interest rate, 10% per year, or 5% per semiannual period; PMT = \$4,000; N = 20; I = 5%	49,849
Total present value (market price) of bond	<u>\$87,538</u>

The market price for the bonds would be \$87,538, the sum of the present values of the two parts. Because the effective interest rate is higher than the stated interest rate, the bonds would sell at a \$12,462 discount at the issuance date. It should be noted that if the effective rate on these bonds were 8% instead of 10%, the sum of the present values of the two parts would be \$100,000, meaning that the bonds would sell at their face value, or at par. If the effective interest rate were less than 8%, the market price of the bonds would be more than \$100,000, and the bonds would sell at a premium.

The bonds of public corporations are traded on various bond exchanges, which are similar to stock exchanges. Exhibit 12-6 presents a selection of bond listings as of July 12, 2010.

<b>EX 12-6 BOND LISTING</b>						
	<b>Price</b>	<b>Coupon %</b>	<b>Maturity Date</b>	<b>Yield to Maturity %</b>	<b>Current Yield%</b>	<b>Rating</b>
Hewlett-Packard	116.26	5.400	1-Mar-2017	2.703	4.645	A
Hewlett-Packard	116.71	5.500	1-Mar-2018	3.029	4.712	A
Delta Airlines	103.50	6.417	2-Jul-2012	4.533	6.200	BB
Atlantic Richfield	118.55	8.750	1-Mar-2032	7.063	7.381	A

## STOP & THINK

In computing the market price for bonds, what is the only thing for which the stated rate of interest is used?

- Computing the amount of the periodic interest payments
- Computing the amount of the maturity value
- Computing the present value of the periodic interest payments
- Computing the present value of the maturity value

Notice that **Hewlett-Packard** has more than one bond issue listed; the first listing is for bonds that mature in 2017, and the second listing is for bonds that mature in 2018. The current yield for the first Hewlett-Packard bond listing is 4.645, which means that if the bonds were purchased at their closing price of 116.26, the interest payments would give the investor a

4.645% annual return. These Hewlett-Packard bonds were trading at a premium, which means that the coupon rate on these bonds of 5.400% is higher than was the market rate required on bonds of similar riskiness. The yield to maturity percentage is the overall rate of return that would be earned by an investor (through receipt of periodic interest payments as well as the maturity amount) who purchases the bonds today and holds them until their maturity. The yield to maturity percentage can be thought of as the rate of return necessary to induce an investor to buy the bonds, given the riskiness of the bond issuer.

### Issuance of Bonds

Bonds may be sold directly to investors by the issuer or they may be sold in the open market through securities exchanges or through investment bankers. Regardless of how they are placed, when bonds are issued (sold), the issuer must record the receipt of cash and

recognize the long-term liability. The purchaser must record the payment of cash and the bond investment.

An issuer normally records the bond obligation at its face value—the amount that the company must pay at maturity. Hence, when bonds are issued at an amount other than face

value, a bond discount or premium account is established for the difference between the cash received and the bond face value. The premium is added to or the discount is subtracted from the bond face value to report the bonds at their present value. Although an investor could also record the investment in bonds at their face value by using a premium or discount account, traditionally investors record their bond investments at cost, that is, the face value net of any premium or discount.

Bonds issued or acquired in exchange for noncash assets or services are recorded at the fair value of the bonds unless the value of the exchanged assets or services is more clearly determinable. A difference between the face value of the bonds and the cash value of the bonds or the value of the property acquired is recognized as bond discount or bond premium. When bonds and other securities are acquired for a lump sum, an apportionment of such cost among the securities is required.

As indicated earlier, bonds may be issued at par, at a discount, or at a premium. They may be issued on an interest payment date or between interest dates, which calls for the recognition of accrued interest. Each of these situations will be illustrated using the following data: \$100,000, 8%, 10-year bonds are issued; semiannual interest of \$4,000 ( $\$100,000 \times 0.08 \times 6/12$ ) is payable on January 1 and July 1.

## FYI

Where capital markets are less well developed, banks are the major source of debt financing of companies. As economies develop, such as in China, the relative amount of bond financing increases.

**Bonds Issued at Par on Interest Date** When bonds are issued at par, or face value, on an interest date, there is no premium or discount to be recognized nor any accrued interest at the date of issuance. The appropriate entries for the first year on the issuer's books and on the investor's books, assuming the data in the preceding paragraph and issuance on January 1 at par value, are as follows.

Issuer's Books				Investor's Books			
Jan. 1	Cash	100,000		Bond Investment	100,000		
	Bonds Payable		100,000	Cash		100,000	
July 1	Interest Expense	4,000		Cash	4,000		
	Cash		4,000	Interest Revenue		4,000	
Dec. 31	Interest Expense	4,000		Interest Receivable	4,000		
	Interest Payable		4,000	Interest Revenue		4,000	

**Bonds Issued at Discount on Interest Date** Now assume that the bonds were issued on January 1 but that the effective rate of interest was 10%, requiring recognition of a discount of \$12,462 (\$100,000 - \$87,538; see computations on page 12-21). The appropriate entries on January 1 follow. The interest entries on July 1 and December 31 are illustrated in a later section of this chapter that discusses the amortization of discounts and premiums.

Issuer's Books				Investor's Books			
Jan. 1	Cash	87,538		Bond Investment	87,538		
	Discount on Bonds Payable	12,462		Cash		87,538	
	Bonds Payable		100,000				

**Bonds Issued at Premium on Interest Date** Again using the preceding data, assume that the bonds were sold at an effective interest rate of 7%. Using present value techniques, it can be computed that the bond will sell for a premium of \$7,106. In this case, the entries on January 1 are as follows:

Issuer's Books				Investor's Books			
Jan. 1	Cash	107,106		Bond Investment	107,106		
	Premium on Bonds Payable		7,106	Cash		107,106	
	Bonds Payable		100,000				

**Bonds Issued at Par between Interest Dates** When bonds are issued between interest dates, an adjustment is made for the interest accrued between the last interest payment date and the date of the transaction. A buyer of the bonds pays the amount of accrued interest along with the purchase price and then receives the accrued interest plus interest earned subsequent to the purchase date when the next interest payment is made. This practice avoids the problem an issuer of bonds would have in trying to split interest payments for a given period between two or more owners of the securities. To illustrate, if

the bonds in the previous example were issued at par on March 1, the appropriate entries are as follows.<sup>7</sup>

Issuer's Books			Investor's Books		
Mar. 1	Cash .....	101,333	Bond Investment .....	100,000	
	Bonds Payable .....	100,000	Interest Receivable .....	1,333	
	Interest Payable .....	1,333*	Cash .....		101,333
	*(\$100,000 × 0.08 × 2/12)				
July 1	Interest Expense .....	2,667†	Cash .....	4,000	
	Interest Payable .....	1,333	Interest Receivable .....		1,333
	Cash .....	4,000	Interest Revenue .....		2,667
	†(\$100,000 × 0.08 × 4/12)				

**Bond Issuance Costs** The issuance of bonds normally involves costs to the issuer for legal services, printing and engraving, taxes, and underwriting. Traditionally, these costs have been offset against any premium or added to any discount arising on the issuance and thus netted against the face value of the bonds. In *Statement of Financial Accounting Concepts No. 3* (paragraph 161), the FASB stated that “deferred charges” such as **bond issuance costs** fail to meet the definition of assets. In its recent consideration of the accounting for the issuance of debt and equity financing, the FASB has made a preliminary determination that all issuance costs, for both debt and equity financing, should be expensed as incurred. However, this decision has not yet been formalized into an official standard. Accordingly, until such time as the FASB releases a formal standard, these bond issuance costs will still be reported as assets by some companies.<sup>8</sup>

### Accounting for Bond Interest

With coupon bonds, cash is paid by the issuing company in exchange for interest coupons on the interest dates. Payments on coupons may be made by the company directly to bondholders, or payments may be cleared through a bank or other disbursing agent. Subsidiary records with bondholders are not maintained because coupons are redeemable by bearers. In the case of registered bonds, interest checks are mailed either by the company or its agent. When bonds are registered, the bonds account requires subsidiary ledger support. The subsidiary ledger shows holdings by individuals and changes in such holdings. Checks are sent to bondholders of record as of the interest payment dates.

When bonds are issued at a premium or discount, the market acts to adjust the stated interest rate to a market or effective interest rate. Because of the initial premium or discount, the periodic interest payments made over the bond’s life by the issuer do not represent the total interest expense for the periods involved. An adjustment to the interest

<sup>7</sup> As an alternative, the accrued interest could be initially credited to Interest Expense by the issuer and debited to Interest Revenue by the investor. When the first interest payment is made, the debit to Interest Expense for the issuer, when combined with the initial entry, would result in the proper amount of interest expense being recognized. A similar procedure can be applied by the investor in determining interest revenue.

<sup>8</sup> FASB ASC paragraph 835-30-45-3. In some cases, these bond issuance costs, or “deferred charges,” can be thought of as “points,” or interest paid in advance, that are then capitalized and expensed over the life of the bond. The FASB also states that debt issuance costs for financial liabilities that are reported at fair value should be expensed as incurred. This “fair value option” is discussed in more detail later in the chapter.

expense associated with the cash payment is necessary to reflect the effective interest being incurred on the bonds. This adjustment is referred to as bond premium or discount **amortization**. This periodic adjustment results in a gradual adjustment of the bond's carrying value toward the bond's face value.

A premium on issued bonds recognizes that the stated interest rate is higher than the market interest rate. Amortization of the premium reduces the interest expense below the amount of cash paid. A discount on issued bonds recognizes that the stated interest rate is lower than the market interest rate. Amortization of the discount increases the amount of interest expense above the amount of cash paid. In summary, the amortization of a discount or premium on bonds accomplishes two things: The bond's carrying value is gradually adjusted to be equal to the maturity value, and the periodic interest expense is adjusted to reflect the fact that the effective interest rate on the bonds is either higher (with a discount) or lower (with a premium) than the actual amount of cash paid each period.

Two main methods are used to amortize the premium or discount: (1) the straight-line method and (2) the effective-interest method. The straight-line method is explained first because the computations are simpler. This method is acceptable, however, only when its application results in periodic interest expense that does not differ materially from the amounts that would be reported using the effective-interest method.<sup>9</sup>

**Straight-Line Method** The **straight-line method** provides for the recognition of an equal amount of premium or discount amortization each period. The amount of monthly amortization is determined by dividing the premium or discount at purchase or issuance date by the number of months remaining to the bond maturity date. For example, if a 10-year, 10% bond issue with a maturity value of \$200,000 was sold on the issuance date at 103, the \$6,000 premium would be amortized evenly over the 120 months until maturity, or at a rate of \$50 per month (\$6,000/120). If the bonds were sold three months after the issuance date, the \$6,000 premium would be amortized evenly over 117 months, or at a rate of \$51.28 per month (\$6,000/117). The amortization period is always the time from original sale to maturity. The premium amortization would reduce both interest expense on the issuer's books and interest revenue on the investor's books. A discount amortization would have the opposite results: Both accounts would be increased.

To illustrate the accounting for bond interest using straight-line amortization, consider again the earlier example of the \$100,000, 8%, 10-year bonds issued on January 1. When sold at a \$12,462 discount, the appropriate entries to record interest on July 1 and December 31 would be as follows:

		Issuer's Books		Investor's Books	
July	1	Interest Expense . . . . .	4,623	Cash . . . . .	4,000
		Discount on Bonds Payable . . . . .	623*	Bond Investment . . . . .	623
		Cash . . . . .	4,000†	Interest Revenue . . . . .	4,623
* $\$12,462/120 \times 6 \text{ months} = \$623$ (rounded) discount amortization for 6-month period					
† $\$100,000 \times 0.08 \times 6/12 = \$4,000$ cash					
Dec.	31	Interest Expense . . . . .	4,623	Interest Receivable . . . . .	4,000
		Discount on Bonds Payable . . . . .	623	Bond Investment . . . . .	623
		Interest Payable . . . . .	4,000	Interest Revenue . . . . .	4,623

<sup>9</sup> FASB ASC paragraphs 835-30-35-2 through 4.

**FYI**

As explained in Chapter 14, this amortization of bond premiums and discounts on the books of the investor is most important when the bond investment is classified as held to maturity. For trading and available-for-sale securities, the bond investment is revalued at the end of each period and reported at its fair value.

Note that the discount amortization has the effect of increasing the effective interest rate over the life of the bond from the 8% stated rate to the 10% market rate of interest that the bonds were sold to yield. Over the life of the bond, the \$12,462 discount will be charged to interest expense for the issuer and recognized as interest revenue by the investor.

To illustrate the entries that would be required to amortize a bond premium, consider again the situation in which the 8% bonds were sold to yield 7%, or \$107,106. The \$7,106 premium would be amortized on a straight-line basis as follows:

		Issuer's Books		Investor's Books	
July 1	Interest Expense . . . . .	3,645		Cash . . . . .	4,000
	Premium on Bonds Payable . . . . .	355*		Bond Investment . . . . .	355
	Cash . . . . .		4,000	Interest Revenue . . . . .	3,645
Dec. 31	Interest Expense . . . . .	3,645		Interest Receivable . . . . .	4,000
	Premium on Bonds Payable . . . . .	355		Bond Investment . . . . .	355
	Interest Payable . . . . .		4,000	Interest Revenue . . . . .	3,645

\*\$7,106/120 × 6 months = \$355 (rounded) premium amortization for 6-month period

The amortization of the premium has the effect of reducing the amount of interest expense or interest revenue over the life of the bond to the actual yield or market rate of the bonds, 7%.

**Effective-Interest Method** The **effective-interest method** of amortization uses a uniform interest rate based on a changing loan balance and provides for an increasing premium or discount amortization each period. The mortgage (or loan) amortization schedule in Exhibit 12-5 on page 12-15 employs the effective-interest method. In order to use this method, the effective-interest rate for the bonds must be known. This is the rate of interest at bond issuance that discounts the maturity value of the bonds and the periodic interest payments to the market price of the bonds. This rate is used to determine the amount of revenue or expense to be recorded on the books.

To illustrate the amortization of a bond discount using the effective-interest method, consider once again the \$100,000, 8%, 10-year bonds sold for \$87,538, based on an effective interest rate of 10%. The discount amortization for the first six months using the effective-interest method is computed as follows:

Bond balance (carrying value) at beginning of first period . . . . .	\$87,538
Effective rate per semiannual period . . . . .	5%
Stated rate per semiannual period . . . . .	4%
Interest amount based on carrying value and effective rate (\$87,538 × 0.05) . . . . .	\$ 4,377
Interest payment based on face value and stated rate (\$100,000 × 0.04) . . . . .	4,000
Discount amortization—difference in interest based on effective rate and stated rate . . . . .	<u>\$ 377</u>

This difference between the amount paid (received) and the compound interest expense (revenue) is the discount amortization for the first period using the effective-interest method. For the second semiannual period, the bond carrying value increases by the amount of discount amortized. The amortization for the second semiannual period would be computed as follows:

Bond balance (carrying value) at beginning of second period ( $\$87,538 + \$377$ )	\$87,915
Interest amount based on carrying value and effective rate ( $\$87,915 \times 0.05$ )	\$ 4,396
Interest payment based on face value and stated rate ( $\$100,000 \times 0.04$ )	4,000
Discount amortization—difference in interest based on effective rate and stated rate	<u>\$ 396</u>

The amount of interest to be recognized each period is computed at a uniform rate on an increasing balance. This results in an increasing discount amortization over the life of the bonds, which is graphically demonstrated and compared with straight-line amortization in Exhibit 12-7.

The entries for amortizing the discount would be the same as those shown for straight-line amortization; only the amounts would be different.

Premium amortization would be computed in a similar way except that the interest payment based on the stated interest rate would be higher than the interest amount based on the effective rate. For example, assume that the \$100,000, 8%, 10-year bonds were sold on the issuance date for \$107,106, thus providing an effective interest rate of 7%. The premium amortization for the first and second 6-month periods would be computed as follows (amounts are rounded to the nearest dollar):

Bond balance (carrying value) at beginning of first period	\$107,106
Effective rate per semiannual period	3.5%
Stated rate per semiannual period	4.0%
Interest payment based on face value and stated rate ( $\$100,000 \times 0.04$ )	\$ 4,000
Interest amount based on carrying value and effective rate ( $\$107,106 \times 0.035$ )	3,749
Premium amortization—difference in interest based on stated rate and effective rate	<u>\$ 251</u>
Bond balance (carrying value) at beginning of second period ( $\$107,106 - \$251$ )	<u>\$106,855</u>
Interest payment based on face value and stated rate ( $\$100,000 \times 0.04$ )	\$ 4,000
Interest amount based on carrying value and effective rate ( $\$106,855 \times 0.035$ )	3,740
Premium amortization—difference in interest based on stated rate and effective rate	<u>\$ 260</u>

As illustrated, as the investment or liability balance is reduced by the premium amortization, the interest, based on the effective rate, also decreases. The difference between the interest payment and the effective interest amount increases in a manner similar to

## CAUTION

Students often interchange the stated and market interest rates when computing interest expense for the period. Remember that the stated rate is used only once—to determine the amount of cash paid or received as interest. The market, or effective, rate is used to calculate the amount of interest expense or interest revenue.

## STOP&THINK

When preparing a bond amortization schedule like the one that follows, there are certain numbers within that schedule that you know without having to do any elaborate computations. Which ONE of the following numbers can be determined using a very simple computation?

- The periodic interest expense
- The periodic interest payment
- The periodic premium (or discount) amortization
- The carrying value of the bond

**EX 12-7** COMPARISON OF STRAIGHT-LINE AND EFFECTIVE-INTEREST AMORTIZATION METHODS

© 2012 Cengage Learning.

discount amortization. Bond amortization tables may be prepared to determine the periodic adjustments to the bond carrying value, that is, the present value of the bond. A partial bond amortization table follows.

Because the effective-interest method adjusts the stated interest rate to an effective interest rate, it is theoretically more accurate as an amortization method than is the straight-line method. Note that the total amortization over the life of the bond is the same under either method; only the interim amounts differ. The effective-interest method is the recommended amortization method. However, as stated previously, the straight-line method may be used by a company if the interim results of using it do not differ materially from the amortization using the effective-interest method.

**Amortization of Bond Premium—Effective-Interest Method \$100,000, 10-Year Bonds, Interest at 8% Payable Semiannually, Sold at \$107,106 to Yield 7%**

Interest Payment	A Interest Paid (0.04 × \$100,000)	B Interest Expense (0.035 × Bond Carrying Value)	C Premium Amortization (A – B)	D Unamortized Premium (D – C)	E Bond Carrying Value (\$100,000 + D)
				\$7,106	\$107,106
1	\$4,000	\$3,749 (0.035 × \$107,106)	\$251	6,855	106,855
2	4,000	3,740 (0.035 × \$106,855)	260	6,595	106,595
3	4,000	3,731 (0.035 × \$106,595)	269	6,326	106,326
4	4,000	3,721 (0.035 × \$106,326)	279	6,047	106,047
5	4,000	3,712 (0.035 × \$106,047)	288	5,759	105,759

## Cash Flow Effects of Amortizing Bond Premiums and Discounts

The amortization of a bond discount or premium does not involve the receipt or payment of cash and, like other noncash items, must be considered in preparing a statement of cash flows. Recall that when the indirect method is used to report cash flows from operating activities, net income is adjusted for noncash items. When a bond discount is amortized, interest expense reported on the income statement is higher than interest paid, and net income, on a cash basis, is understated. The appropriate adjustment is to add the amount of discount amortization back to net income. The reverse is true in the case of a bond premium. That is, the amount of bond premium amortization is subtracted from net income to arrive at cash flow from operations.

Using the direct method requires conversion of individual accrual-basis revenue and expense items to a cash basis. Thus, to convert interest expense to cash paid for interest, the expense reported on the income statement is decreased by the amount of discount amortization for the period or increased by the amount of premium amortization.

The following example illustrates the adjustments necessary when preparing a statement of cash flows. Consider the information used in the previous examples related to a bond discount: The company issues \$100,000, 8%, 10-year bonds when the effective rate of interest is 10%. The bonds are issued at a price of \$87,538. The calculations for the discount amortization during the first year are on page 12-26. The amount of discount amortized during the first year is \$773 (\$377 + \$396). The amount of interest expense disclosed on the income statement for the year is \$8,773 (\$4,377 + \$4,396), and the amount of cash paid to bondholders is \$8,000 (if, for simplicity, we assume that the second payment of \$4,000 is made on December 31). To keep the example simple, assume that the company reported net income of \$90,000 for the year and that sales for the year (all cash) were \$98,773, meaning that the \$8,773 in interest expense was the only expense. An analysis of the cash flow impact of the discount amortization is included in the following matrix:

Income Statement		Adjustments	Cash Flows from Operations	
Sales	\$98,773	None	\$98,773	Cash collected from customers
Interest expense	(8,773)	+ \$773 (bond discount amortization; not a cash item)	(8,000)	Cash paid for interest
Net income	<u>\$90,000</u>	+ \$773 net adjustment	<u>\$90,773</u>	Cash flow from operations

Reporting using the indirect method, the amount of discount amortized (\$773) is added back to net income. Reporting using the direct method, the amount of the discount is subtracted from reported interest expense to convert that amount to a cash basis as follows: \$8,773 interest expense – \$773 discount amortization = \$8,000 cash paid for interest. In this case, in which only one bond issue is involved, cash paid for interest could instead be computed by multiplying the stated interest rate by the face value of the bonds ( $\$100,000 \times 0.08$ ).

## Retirement of Bonds at Maturity

In most cases, bonds include a specified termination or maturity date. At that time, the issuer must pay the current investors the maturity, or face, value of the bonds. When bond discount or premium and issuance costs have been properly amortized over the life of

the bonds, bond retirement at maturity simply calls for elimination of the liability or the investment by a cash transaction, illustrated as follows assuming a \$100,000 bond:

Issuer's Books		Investor's Books	
Bonds Payable .....	100,000	Cash .....	100,000
Cash .....	100,000	Bond Investment .....	100,000

**i FYI**

In 1975, high interest rates had caused a decline in the market value of bonds issued during the 1960s. Many companies were retiring these bonds early in order to be able to report accounting gains on the retirement. In order to stop companies from including these gains as part of ordinary income from continuing operations, the FASB decreed that they be classified as extraordinary. In 2002, the FASB rescinded this special accounting for gains and losses on early extinguishment of debt.

There is no recognition of any gain or loss on retirement because the carrying value is equal to the maturity value, which is also equal to the market value of the bonds at that point in time.

Any bonds not presented for payment at their maturity date should be removed from the Bonds Payable balance on the issuer's books and reported separately as Matures Bonds Payable; these are reported as a current liability except when they are to be paid out of a bond retirement fund. Interest does not accrue on matured bonds not presented for payment. If a bond retirement fund is used to pay off a bond issue, any cash remaining in the fund may be returned to the cash account.

**! CAUTION**

Note that a gain or loss is determined by comparing the carrying value of the bond to its fair value. If a company can retire a bond for less than its carrying value, a gain results. If the company must pay more than the carrying value, the result is a loss.

**Extinguishment of Debt Prior to Maturity**

When debt is retired, or "extinguished," prior to the maturity date, a gain or loss must be recognized for the difference between the carrying value of the debt security and the amount paid to satisfy the obligation.

The problems that arise in retiring bonds or other forms of long-term debt prior to maturity are described in the following sections. Bonds may be retired prior to maturity in one of the following ways.

1. Bonds may be *redeemed* by the issuer by purchasing the bonds on the open market or by exercising the call provision that is frequently included in bond indentures.
2. Bonds may be *converted*, that is, exchanged for other securities.
3. Bonds may be *refinanced* (sometimes called *refunded*) by using the proceeds from the sale of a new bond issue to retire outstanding bonds.

**Redemption by Purchase of Bonds in the Market** Corporations frequently purchase their own bonds in the market when prices or other factors make such actions desirable. When bonds are purchased, amortization of bond premium or discount and issue costs should be brought up to date. Purchase by the issuer calls for the cancellation of the bond's face value together with any related premium, discount, or issue costs as of the purchase date.

To illustrate a bond redemption prior to maturity, assume that \$100,000, 8% bonds of Triad Inc. are not held until maturity but are redeemed by the issuer on February 1, 2013, at 97. The carrying value of the bonds on both the issuer's and investor's books is \$97,700 as of February 1. Interest payment dates on the bonds are January 31 and July 31. Entries on both the issuer's and investor's books at the time of redemption are as follows:

Issuer's Books		Investor's Books		
Feb. 1	Bonds Payable . . . . .	100,000	Cash . . . . .	97,000
	Discount on Bonds Payable . . . . .	2,300	Loss on Sale of Bonds . . . . .	700
	Cash . . . . .	97,000	Bond Investment—Triad Inc. . . . .	97,700
	Gain on Bond Redemption . . . . .	700*		
Computation:				
	*Carrying value of bonds, February 1, 2013 . . . . .	\$97,700		
	Purchase (redemption) price . . . . .	97,000		
	Gain on bond redemption . . . . .	<u>\$ 700</u>		

If the redemption had occurred between interest payment dates, adjusting entries would have to be made to recognize the accrued interest and to amortize the bond discount or premium.

**Redemption by Exercise of Call Provision** A call provision gives the issuer the option of retiring bonds prior to maturity. Frequently, the call must be made on an interest payment date, and no further interest accrues on the bonds not presented at this time. When only a part of an issue is to be redeemed, the bonds called may be determined by lot.

The inclusion of call provisions in a bond agreement is a feature favoring the issuer. The company is in a position to terminate the bond agreement and eliminate future interest charges whenever its financial position makes such action feasible. Furthermore, the company is protected in the event of a fall in the market interest rate by being able to retire the old issue from proceeds of a new issue paying a lower rate of interest. A bond contract normally requires payment of a premium if bonds are called. A bondholder is thus offered special compensation if the investment is terminated early.

## FYI

Until the issuance of pre-Codification FASB *Statement No. 125* in 1996, early extinguishment of debt could also be accomplished through *in-substance defeasance*. This process involved transferring assets into an irrevocable trust, using those assets to satisfy the cash flow requirements of a certain debt obligation, and removing both the assets and the associated debt from the balance sheet. The requirement now is that the assets and debt in an in-substance defeasance arrangement still be reported in the balance sheet.

When bonds are called, the difference between the amount paid and the bond carrying value is reported as a gain or a loss on both the issuer's and investor's books. Any interest paid at the time of the call is recorded as a debit to Interest Expense on the issuer's books and a credit to Interest Revenue on the investor's books. The entries to be made are the same as illustrated previously for the purchase (redemption) of bonds by the issuer.

**Convertible Bonds** Convertible debt securities raise specific questions as to the nature of the securities, that is, whether they should be considered debt or equity securities, the valuation of the conversion feature, and the treatment of any gain or loss on conversion.

Convertible debt securities usually have the following features:<sup>10</sup>

1. An interest rate lower than the issuer could establish for nonconvertible debt
2. An initial conversion price higher than the market value of the common stock at time of issuance
3. A call option retained by the issuer

The popularity of these securities may be attributed to the advantages to both an issuer and a holder. An issuer is able to obtain financing at a lower interest rate because of the value of the conversion feature to the holder. Because of the call provision, an issuer is in a position to exert influence on the holders to exchange the debt for equity securities if stock values increase; the issuer has had the use of relatively low interest rate financing if stock values do not increase. On the other hand, the holder has a debt instrument that, barring default, ensures the return of investment plus a fixed return and, at the same time, offers an option to transfer his or her interest to equity capital should such transfer become attractive.

**Accounting for convertible debt issuance when the conversion feature is nondetachable.**

Differences of opinion exist as to whether convertible debt securities should be treated by an issuer solely as debt or whether part of the proceeds received from the issuance of debt should be recognized as equity capital. One view holds that the debt and the conversion privilege are inseparably connected, and, therefore, the debt and equity portions of a security should not be separately valued. A holder cannot sell part of the instrument and retain the other. An alternate view holds that there are two distinct elements in these securities and that each should be recognized in the accounts: The portion of the issuance price attributable to the conversion privilege should be recorded as a credit to Paid-In Capital; the balance of the issuance price should be assigned to the debt. This would decrease the premium otherwise recognized in the debt or perhaps result in a discount.

These views are compared in the example that follows. Assume that 500 ten-year bonds, face value \$1,000, are sold at 105, or a total issue price of \$525,000 ( $500 \times \$1,000 \times 1.05$ ). The bonds contain a conversion privilege that provides for exchange of a \$1,000 bond for 20 shares of stock, par value \$1. The interest rate on the bonds is 8%. It is estimated that without the conversion privilege, the bonds would sell at 96. Assume that a separate value of the conversion feature cannot be determined. The journal entries to record the issuance on the issuer's books under the two approaches are as follows:

Debt and Equity Not Separated		Debt and Equity Separated	
Cash .....	525,000	Cash .....	525,000
Bonds Payable .....	500,000	Discount on Bonds Payable .....	20,000*
Premium on Bonds Payable .....	25,000	Bonds Payable .....	500,000
		Paid-In Capital Arising from Bond Conversion Feature .....	45,000†
Computations:			
*Par value of bonds ( $500 \times \$1,000$ ) .....	\$500,000	†Total cash received on sale of bonds .....	\$525,000
Selling price of bonds without conversion feature ( $\$500,000 \times 0.96$ ) .....	480,000	Selling price without conversion feature .....	480,000
Discount on bonds without conversion feature .....	<u>\$ 20,000</u>	Amount applicable to conversion feature (equity portion) .....	<u>\$ 45,000</u>

<sup>10</sup> FASB ASC paragraph 470-20-25-11.

The periodic charge for interest will differ, depending on which method is employed. To illustrate the computation of interest charges, assume that the straight-line method is used to amortize bond premium or discount. Under the first approach, the annual interest charge would be \$37,500 (\$40,000 paid less \$2,500 premium amortization). Under the second approach, the annual interest charge would be \$42,000 (\$40,000 paid plus \$2,000 discount amortization).

The provisions of FASB ASC Section 470-20-25 (Debt—Debt with Conversion and Other Options—Recognition) state that when convertible debt is sold at a price or with a value at issuance not significantly in excess of the face value, “no portion of the proceeds from the issuance . . . should be accounted for as attributable to the conversion feature.”<sup>11</sup> On the other hand, there would seem to be strong theoretical support for separating the debt and equity portions of the proceeds from the issuance of convertible debt on the issuer’s books. Despite these theoretical arguments, current practice follows the provisions in Topic 470, and no separation is usually made between debt and equity when the conversion feature of the debt is not detachable, or separately tradable, from the debt instrument itself. This is true even when separate values are determinable.<sup>12</sup>

**Accounting for convertible debt issuance when the conversion feature is detachable.** Sometimes, bonds are issued in conjunction with stock warrants. The warrants allow the holder to buy shares of stock at a set price. The bonds and the warrants are issued as elements of a single security; in essence, the combination of the bonds and the stock warrants is economically equivalent to a convertible debt security. The practical difference is that investors can trade the stock warrants separately from the bonds themselves. In this case, the issuer of the bonds and the stock warrants is required to allocate the joint issuance price between the two instruments; the bonds are accounted for as debt, and the stock warrants are accounted for as part of paid-in capital as illustrated in the “Debt and Equity Separated” journal entry shown previously. The FASB has expressed a preliminary preference for ultimately requiring the proceeds of *all* convertible debt issues to be separated into their debt and equity components. If the value of the convertibility feature cannot be separately determined, as in the preceding example, the “with-and-without” method of allocating the bond proceeds between the debt and the equity components can be used. This is the method illustrated earlier in the “Debt and Equity Separated” example. An alternative method of separating the proceeds, the “relative-fair-value” method, is recommended by the FASB when reliable fair values of both the bond and the conversion feature can be determined.<sup>13</sup> This relative-fair-value method is illustrated in the section on accounting for stock warrants in Chapter 13. The Board has not yet produced a formal standard on this issue.

**Accounting for convertible debt issuance according to IAS 32.** IAS 32, “Financial Instruments: Disclosure and Presentation,” does not differentiate between convertible debt with nondetachable and detachable conversion features. Instead, IAS 32 states that for all convertible debt issues, the issuance proceeds should be allocated between the debt and equity. Accordingly, the international standard mandates that in all cases, the “Debt and Equity Separated” journal entry illustrated previously should be used.

<sup>11</sup> FASB ASC paragraphs 470-20-25-10 and 12.

<sup>12</sup> Separation is required when the initial conversion price is *lower* than the market value of the common stock at the time of issuance. These convertible bonds are said to be “in the money” at the date of issuance, and the accounting standards refer to this as a “beneficial conversion feature.” According to FASB ASC paragraph 470-20-25-5, the magnitude of the excess of the market value over the conversion price at issuance is to be recognized as additional paid-in capital.

<sup>13</sup> FASB ASC paragraph 470-20-30-1.

**Accounting for conversion.** When conversion takes place, a special valuation question must be answered: Should the issuer of the convertible bonds use the fair value of the securities to compute a gain or loss on the date of the conversion? This question has two answers, and the correct answer depends on the nature of the conversion feature as of the issuance date of the convertible bonds. If, as of the issuance date, the probability of eventual conversion of the convertible bonds was deemed to be “at least reasonably possible,” then the conversion is really just a routine transition in the life of the convertible bonds, and no gain or loss is recognized upon conversion.<sup>14</sup> For example, consider a convertible bond for which, as of the issuance date, the fair value of the common stock into which the bond can be converted is close to the fair value of the convertible bond itself. In such a case, it is “at least reasonably possible” that at some time during the life of the convertible bond, the fair value of the common stock will increase and create conditions favorable to the conversion of the bonds by the bondholder. Upon conversion of these bonds, no gain or loss would be recognized on the books of the bond issuer. Instead, the carrying value of the bonds is simply transferred from the bond-related accounts to the common stock accounts.

To illustrate bond issuer accounting for a conversion when no gain or loss is recognized, assume HiTec Co. offers bondholders 40 shares of HiTec Co. common stock, \$1 par, in exchange for each \$1,000, 8% bond held. An investor exchanges bonds with a face value of \$10,000 (carrying value as of the conversion date, \$9,850) for 400 shares of common stock having a market price at the time of the exchange of \$26 per share. To keep things simple, assume that the exchange is completed at an interest payment date AFTER interest has been paid and properly recorded, including bond discount amortization. Also assume that, as of the issuance date, the fair value of 40 shares of HiTec Co. common stock was close to the issuance price of the convertible bonds. In this case, no gain or loss is recognized on the conversion date. The bond’s carrying value is transferred to the common stock accounts on the theory that the company, upon issuing the bonds, is aware of the fact that bond proceeds are at least reasonably likely to ultimately represent the consideration identified with stock. Thus, when bondholders exercise their conversion privileges, the value identified with the obligation is transferred to the common stock that replaces it. The conversion is recorded as follows:

Bonds Payable .....	10,000
Common Stock, \$1 par .....	400
Paid-In Capital in Excess of Par. ....	9,450
Discount on Bonds Payable .....	150

The accounting for the conversion is different if, as of the issuance date, there is not a reasonable possibility that the convertible bonds will eventually be converted. This occurs if, for example, the fair value of the common stock into which the bond can be converted is substantially lower than the fair value of the convertible bond itself on the issuance date. In this case, the most likely future for the convertible bonds is that they will never be converted into common stock. Thus, it is a significant event if and when they are converted. Refer again to the HiTec example, but now assume that, as of the issuance date, the fair value of 40 shares of HiTec Co. common stock was substantially below the issuance price of the convertible bonds. The subsequent “unexpected” conversion is recorded as shown on page 12-35.

<sup>14</sup> FASB ASC paragraphs 470-20-40-4 and 5.

Bonds Payable .....	10,000	
Loss on Conversion of Bonds .....	550*	
Common Stock, \$1 par .....		400
Paid-In Capital in Excess of Par .....		10,000
Discount on Bonds Payable .....		150
Computation:		
*Market value of stock issued (400 shares at \$26) .....		\$10,400
Face value of bonds payable .....	\$10,000	
Less unamortized discount .....	150	9,850
Loss to company on conversion of bonds .....		<u>\$ 550</u>

In summary, if subsequent conversion is at least reasonably possible as of the issuance date, then no gain or loss is recognized upon that subsequent conversion. If subsequent conversion was unexpected as of the issuance date, the fair value of the shares issued on conversion is used to compute a gain or loss on the conversion date.

From the standpoint of the bondholder, or investor, the exchange of the bonds for common stock of HiTec Co. represents a nonmonetary exchange of one asset for another. Nonmonetary exchanges were discussed in Chapter 10. The general rule is that an asset received in a nonmonetary exchange is to be recorded on the books at its fair value on the exchange date, and any gain or loss arising from a difference between this fair value and the carrying value of the exchanged asset is to be recognized. An exception to this rule occurs when the exchange lacks “commercial substance” meaning that the cash flows expected to come from the newly received asset have the same risk, timing, and amount as the cash flows that had been expected from the exchanged asset.<sup>15</sup> In the case of a bond conversion into common stock, cash flows from a bond investment have substantially different risk, timing, and amount compared to cash flows from a common stock investment, so the exchange does have commercial substance.

Refer again to the HiTec example. Assume that the bond investment carrying value is the same on the books of the investor as it is on the books of the issuer. The exchange is recorded on the books of the investor as follows:

Investment in HiTec Co. Common Stock .....	10,400	
Bond Investment—HiTec Co. ....		9,850
Gain on Conversion of HiTec Co. Bonds .....		550

**Bond Refinancing** Cash for the retirement of a bond issue is frequently raised through the sale of a new issue and is referred to as **bond refinancing**, or refunding. Bond refinancing may take place when an issue matures, or bonds may be refinanced prior to their maturity when the interest rate has dropped and the interest savings on a new issue will more than offset the cost of retiring the old issue. To illustrate, assume that a corporation has outstanding \$1,000,000 of 12% bonds callable at 102 and with a remaining 10-year term, and similar 10-year bonds can be marketed currently at an interest rate of only 10%. Under these circumstances it would be advantageous to retire the old issue with the proceeds from a new 10% issue because the future savings in interest will exceed by a considerable amount the premium to be paid on the call of the old issue.

The desirability of refinancing may not be so obvious as in the preceding example. In determining whether refinancing is warranted in marginal cases, careful consideration must be given to factors such as the different maturity dates of the two issues, possible

<sup>15</sup> FASB ASC paragraphs 845-10-301 through 4.

future changes in interest rates, changed loan requirements, different indenture provisions, income tax effects of refinancing, and legal fees, printing costs, and marketing costs involved in refinancing.

When refinancing takes place before the maturity date of the old issue, the call premium and unamortized discount and issue costs of the original bonds are considered in computing the gain or loss on bond retirement.<sup>16</sup>

### Reporting Some Equity-Related Items as Liabilities

As discussed more fully in Chapter 13, the FASB has decided that certain equity-related items should actually be reported in the balance sheet as liabilities.<sup>17</sup> These items are as follows:

- Mandatorily redeemable preferred shares
- Financial instruments (such as written put options) that obligate a company to repurchase its own shares
- Financial instruments that obligate a company to issue a certain dollar value of its own shares

These items share the characteristic that, although related to equity shares, they each obligate the company to deliver items of a set value (either cash or equity shares) some time in the future. Again, each of these items will be illustrated in detail in Chapter 13.

## Fair Value Option

5

Discuss the use of the fair value option for financial assets and liabilities.

**WHY** To allow companies to reflect in the financial statements the offsetting economic effects of hedging activities, the FASB permits companies to report financial assets and financial liabilities in the balance sheet at their fair value rather than their historical cost.

**HOW** Fluctuations in fair values create unrealized economic gains and losses. When financial assets and liabilities are reported in the balance sheet at their fair value, the associated unrealized economic gains and losses are reported in the income statement.

For many assets and liabilities, the FASB and IASB have determined that fair value is the most relevant measurement attribute. Recall that fair value is defined as “the price that would be received to sell an asset or paid to transfer a liability in an orderly transaction between market participants at the measurement date.”<sup>18</sup> Because accounting has long been founded on a backbone of historical cost, the FASB and IASB are transitioning cautiously, item by item, to fair value.

In 2007, with pre-Codification *SFAS No. 159*, the FASB took a bold step toward increased use of fair value by allowing companies a fair value option for the reporting of financial assets and liabilities.<sup>19</sup> Under the fair value option, a company has the option to report, at each balance sheet date, any or all of its financial assets and liabilities at their

<sup>16</sup> FASB ASC paragraph 470-50-40-2.

<sup>17</sup> FASB ASC Topic 480 (Distinguishing Liabilities from Equity).

<sup>18</sup> FASB ASC Master Glossary, “Fair Value.”

<sup>19</sup> Pre-Codification *Statement of Financial Accounting Standards No. 159*, “The Fair Value Option for Financial Assets and Financial Liabilities—Including an amendment of FASB Statement No. 115” (Norwalk, CT: Financial Accounting Standards Board, February 2007). This guidance is now found in the “Fair Value Option” subsections of FASB ASC Topic 825 (Financial Instruments).

fair values on the balance sheet date. This is a very interesting accounting rule because a company can choose to report some financial assets and liabilities of a certain type at fair value while at the same time continuing to use another basis, such as historical cost, for other financial assets and liabilities of exactly the same type.

You should be asking yourself: Why did the FASB give companies this financial reporting flexibility? The FASB stated its reason as follows: “The objective is to improve financial reporting by providing entities with the opportunity to mitigate volatility in reported earnings caused by measuring related assets and liabilities differently without having to apply complex hedge accounting provisions.” The best way to understand this rationale is through a simple example as given below.

Lily Kay Company has a very simple structure—the company has one asset, a Lusvardi Company bond that it purchased (on the day it was issued) as an investment, and one liability, one of its own bonds that Lily Kay issued to finance the purchase of the Lusvardi bond investment. Both bonds have the same terms: \$1,000 face value, 20-year life, 10% coupon rate, and single interest payments made at the end of each year. Given the general level of interest rates in the economy and the riskiness of both Lily Kay Company and Lusvardi Company, both bonds were associated with a market interest rate of 10% when they were issued. Accordingly, both bonds were issued at par of \$1,000. Lily Kay Company’s balance sheet on the day it purchased the Lusvardi bond with the \$1,000 cash raised by issuing its own bond is as follows:

Assets		Liabilities and Equity	
Lusvardi bond .....	\$1,000	Bonds payable .....	\$1,000
		Equity .....	0

As seen earlier, a risk associated with bonds is that their value fluctuates when market interest rates fluctuate. If, for example, the market interest rate associated with the Lusvardi bond asset were to increase to 12%, the value of the bond would decrease by \$149 to \$851.<sup>20</sup> This would represent an economic loss to Lily Kay Company. However, in the same way that the fair value of the bond asset is impacted by market interest rates, the fair value of the bond liability is also impacted by market interest rates. If the market interest rate associated with the Lily Kay Company bond were to also increase to 12%, the fair value of the bond would decrease to \$851. This \$149 decrease represents an economic gain because Lily Kay Company could pay a third party just \$851 to take over its bond obligation, which is currently reported in its balance sheet at \$1,000. The \$149 loss on the bond asset is exactly offset by the \$149 gain on the bond liability. Lily Kay Company’s balance sheet would then appear as follows:

Assets		Liabilities and Equity	
Lusvardi bond .....	\$851	Bonds payable .....	\$851
		Equity .....	0

Under the FASB’s fair value option, both the \$149 loss and the \$149 gain from the fair value fluctuations would be reported in Lily Kay Company’s income statement. The net impact on income is \$0, so retained earnings (and total equity in this case because there was no initial shareholder investment) stays at its initial balance of \$0.

<sup>20</sup>  $N = 20, I = 12\%, PMT = \$100, FV = \$1,000 \rightarrow PV = \$851.$

In this case, the bond liability serves as a **hedge** for fluctuations in the value of the bond asset. A hedge is an action taken to reduce the risk associated with a related investment or action. For example, if an airline company is worried about future fluctuations in the price of aviation fuel, the airline can enter into hedging arrangements whereby it enters into contracts to buy its fuel in the future at a price that is set now. Hedging is discussed in more detail in Chapter 19.

Now, assume that Lily Kay Company were required to report the Lusvardi bond asset at its fair value of \$851 but were also required to report the bond liability at its historical issuance amount of \$1,000. The resulting balance sheet would appear as follows:

Assets		Liabilities and Equity	
Lusvardi bond	\$851	Bonds payable	\$1,000
		Equity	(149)

The negative equity of \$149 represents the recognized loss associated with the decline in fair value of the bond asset. And because the accounting requirement is that the bond liability be reported at its historical issuance amount of \$1,000, the corresponding, and offsetting, economic gain is not recognized. Requiring one side of the balance sheet to include fair values but the other side to report historical amounts results in misleading reporting because the hedging effect of the related asset and liability is not reflected in the financial statements.

As explained more fully in Chapter 19, accounting rules and procedures exist which allow for the impact of hedging activities to be reflected in the financial statements. These accounting rules are found in FASB ASC Topic 815 (Derivatives and Hedging). However, the bookkeeping requirements underlying the accounting for hedges often prove to be extremely onerous. As shown in the simple Lily Kay example, for some cases the economic effect of hedging can be reflected quite nicely and simply in the financial statements by allowing companies the option of fair value reporting for both financial assets and financial liabilities. Thus, the intent of the fair value option is to simplify the accounting for economic hedges.

Please note that hedging reduces risk, it doesn't guarantee profits. In the example given above when the market interest rate increased to 12% for both the Lusvardi bond asset and the Lily Kay bond liability, the economic loss on the asset was offset by an economic gain on the liability. However, it could just as easily have been the case that the market interest rate decreased for both the bond asset and the bond liability. For example, assume that the market interest rate on both the Lusvardi bond asset and the Lily Kay bond liability decreased to 8%. The fair value of both the asset and the liability would then be \$1,196.<sup>21</sup> In this case, an economic gain of \$196 on the bond asset would be offset by an economic loss of \$196 because of an increase in the fair value of the bond liability. The resulting balance sheet would appear as follows:

Assets		Liabilities and Equity	
Lusvardi bond	\$1,196	Bonds payable	\$1,196
		Equity	0

In retrospect, from a reporting standpoint, Lily Kay might wish it had not elected the fair value option for the bonds payable. Then the economic gain of \$196 from the increase

<sup>21</sup>  $N = 20, I = 8\%, PMT = \$100, FV = \$1,000 \rightarrow PV = \$1,196.$

in the value of the asset would have been reported but the offsetting loss would not have been reported. To prevent companies from using hindsight to selectively enhance reported results using the fair value option, a company must designate whether it is using the fair value option with respect to a financial asset or financial liability when the initial transaction to create the item occurs.<sup>22</sup> A company can't wait to see which way interest rates go and then cherry pick the economic gains while ignoring the economic losses.

In the examples given in this section, the gains and losses on the Lusvardi and Lily Kay bonds were exactly offsetting, meaning that the market interest rates for the two bonds moved together. This might be the case if the change in interest rates were caused by general economic factors that affected both companies equally. However, if the change in market interest rates is caused by firm-specific factors, there is no reason to think that they would move together. For example, assume that the financial condition of Lusvardi Company weakened, resulting in an increase in the market interest rate associated with the company's bonds from 10% to 12%. At the same time, assume that the financial condition of Lily Kay Company strengthened, resulting in a decrease in the market interest rate from 10% to 8%. The resulting balance sheet would appear as follows:

Assets		Liabilities and Equity	
Lusvardi bond .....	\$851	Bonds payable .....	\$1,196
		Equity .....	(345)

The \$345 economic loss is a combination of the \$149 loss from the weakening of Lusvardi Company and a \$196 economic loss from the strengthening of Lily Kay Company as evidenced by the drop in the market interest rate from 10% to 8%. The \$149 loss is easy to understand, but the \$196 loss requires further explanation. How can an improvement in a company's economic circumstances result in a loss? Remember that losses and gains are reported from the standpoint of the shareholders. In this example, the shareholders of Lily Kay are now obligated to make 10% interest payments on the Lily Kay bonds for the next 20 years when in fact the circumstances of the company suggest that it need pay only 8%. In other words, Lily Kay Company is obligated to make above-market interest payments for the next 20 years. This represents a transfer of wealth from the shareholders, who are paying too much interest, to the bondholders, who are collecting too much interest. From an accounting standpoint, the important thing to note here is that use of the fair value option results in all of these interesting and relevant economic facts being reflected immediately in the financial statements.

## Off-Balance-Sheet Financing

6

Explain various types of off-balance-sheet financing, and understand the reasons for this type of financing.

**WHY** Off-balance-sheet financing is a set of accounting techniques companies employ to avoid recognizing economic obligations as liabilities in the balance sheet.

**HOW** By carefully structuring transactions, companies can comply with accounting rules while at the same time avoiding the balance sheet recognition of economic obligations. However, a careful review of note disclosure will often allow financial statement users to assess the potential financial statement impact of these off-balance-sheet transactions.

<sup>22</sup> FASB ASC paragraph 825-10-25-4.

A major issue facing the accounting profession today is how to deal with companies that do not disclose all their debt in order to make their financial position look stronger. This is often referred to as **off-balance-sheet financing**. Traditionally, leasing has been one of the most common forms of off-balance-sheet financing. The primary techniques that have been used to borrow money while keeping the debt off the balance sheet are

1. Leases
2. Unconsolidated subsidiaries
3. Variable interest entities (VIEs)
4. Joint ventures
5. Research and development arrangements
6. Project financing arrangements

### Leases

A lease is merely a seller-sponsored technique through which a buyer can finance the use of an asset. For accounting purposes, leases are considered to be either rentals (called *operating leases*) or asset purchases with borrowed money (called *capital leases*). A company using a leased asset tries to have the lease classified as an operating lease in order to keep the lease obligation off the balance sheet. The proper accounting treatment depends on whether the lease contract transfers effective ownership of the leased asset. Capital leases are accounted for as if the lease agreement transfers ownership of the leased asset from the lessor (the owner of a leased asset) to the lessee (the user of the leased asset). Operating leases are accounted for as rental agreements.

The four lease classification criteria are as follows:

1. Lease transfers ownership
2. Lease includes a bargain purchase option
3. Lease covers 75% or more of the economic life of the asset
4. Present value of lease payments is 90% or more of the asset value

If any one of these criteria is met, the lease is classified as a capital lease by the lessee; if none of the criteria are met, the lease is accounted for as an operating lease. An operating lease is accounted for as a rental, with neither the leased asset nor (more importantly to the lessee) the lease liability appearing on the lessee's balance sheet. The vast majority of leases, probably in excess of 90%, are accounted for as operating leases, with the obligation to make the future lease payments excluded from balance sheet recognition. Accounting for leases is discussed in great detail in Chapter 15.

### Unconsolidated Subsidiaries

In 1987, the FASB issued pre-Codification *Statement No. 94* requiring all majority-owned subsidiaries to be consolidated.<sup>23</sup> Prior to the issuance of FASB *Statement No. 94*, subsidiaries involved in operations unrelated to the parent company's primary focus were not required to be consolidated. For example, **IBM Credit LLC** and **GE Capital Services** are each financing subsidiaries of their respective parent companies. The tremendous debt associated with these financing subsidiaries was not recognized on the balance sheets of their parent companies prior to 1987 because the subsidiaries were involved in nonhomogeneous operations. However, with the issuance of *Statement No. 94*, even these subsidiaries

<sup>23</sup> Pre-Codification *Statement of Financial Accounting Standards No. 94*, "Consolidation of All Majority-Owned Subsidiaries" (Stamford, CT: Financial Accounting Standards Board, 1987).

are now consolidated. Thus, the FASB eliminated one opportunity that companies have used for off-balance-sheet financing.

The objective of consolidated financial statements is to show the net assets that are owned *or* controlled by a company and its subsidiaries. For accounting purposes, a controlling interest in a subsidiary's net assets is presumed to exist when ownership by the parent company exceeds 50%. Of course, there are some instances when control can be achieved with less than 50% ownership, such as when a parent owns a large portion of a subsidiary, say 40%, and also controls access to important inputs to and outputs from the subsidiary's production process. This difficult issue of defining "control" is something that the FASB, now in conjunction with the IASB, continues to re-evaluate from time to time.

Under current accounting rules, companies are able to avoid recognizing debt associated with subsidiaries that are less than 50% owned by the company. As described in Chapter 14, unconsolidated subsidiaries using the equity method are those subsidiaries for which the parent company owns between 20% and 50% of the outstanding shares. With this level of ownership, the presumption is that the parent influences but does not control the subsidiary. The equity method of accounting dictated for these subsidiaries provides that the parent reports, as an asset, its share of the net assets (assets minus liabilities) of the subsidiary; none of the individual liabilities of the subsidiary are reported in the parent company's balance sheet. Even with less than 50% ownership, a parent can often effectively control a subsidiary. For example, **Coca-Cola** owns just 34% of its major U.S. bottler but still effectively controls the operations of this bottler. Because Coca-Cola owns less than 50%, however, the parent company is not required to report the liabilities of the bottler in its balance sheet. To illustrate the potential impact of unconsolidated subsidiaries on the reported amount of a company's debt, consider that Coca-Cola's reported liabilities as of December 31, 2009, were \$23.325 billion, whereas the actual liabilities of Coca-Cola and its unconsolidated bottlers totaled \$58.382 billion.<sup>24</sup> The topic of consolidation is briefly introduced in Chapter 14 and is covered extensively in advanced accounting courses.

### Variable Interest Entities (VIEs)

An important category of unconsolidated subsidiaries is **variable interest entities (VIEs)**. Much of the dissatisfaction about Enron's accounting leading up to its 2001 accounting scandal and bankruptcy centered around its use of so-called "special-purpose entities" (SPEs). A post-Enron revision of the accounting rules has changed the practice and terminology associated with these entities; they are now called *variable interest entities*. However, the fundamental concept of a variable interest entity is the same as a special-purpose entity. To illustrate how a VIE can serve as a form of off-balance-sheet financing, consider the following example. Sponsor Company requires the use of a building costing \$100,000. Rather than buy the building (with borrowed money), Sponsor facilitates the establishment of VIE Company. VIE Company is started with a \$10,000 investment from a private investor (who is not associated with Sponsor Company), along with a \$90,000 bank loan. VIE now has \$100,000 in cash with which it purchases the \$100,000 building needed by Sponsor. VIE then leases the building to Sponsor, with the lease terms carefully crafted to allow for the lease to be accounted for as an operating lease. After this series of

<sup>24</sup> In February 2010, Coca-Cola announced that it intended to purchase the North American operations of its largest bottler. Apart from the operational reasons for making this acquisition, this transaction will bring over \$10 billion of liabilities onto Coca-Cola's balance sheet that had previously been hidden in its unconsolidated subsidiary.

transactions, the building-related and lease-related items on the balance sheets of Sponsor and VIE are as follows:

Sponsor		VIE	
Assets:		Assets:	
.....	\$0	Building .....	\$100,000
Liabilities:		Liabilities:	
.....	0	Bank loan .....	90,000
		Equity:	
		Paid-in capital .....	10,000

As you can see, with the help of VIE, Sponsor now has use of the building but without any debt on its balance sheet. If VIE were classified as being “controlled” by Sponsor, then VIE’s books would be consolidated with those of Sponsor, and both the building and the bank loan would appear on Sponsor’s consolidated balance sheet. Thus, the creation of an “independent” VIE is another way to engage in off-balance-sheet financing.

From this simple example, you can see that the following issues are crucial in the accounting for a VIE:

- How much outside equity financing of the VIE is necessary for the VIE to be considered an independent entity? The 10% financing in this case (\$10,000/\$100,000) coincides with the general guideline contained in FASB ASC Topic 810 (Consolidation).<sup>25</sup>
- If the sponsor is contingently liable for the VIE’s debt, is the VIE an independent entity? When the sponsor guarantees, or cosigns, the debt of the VIE, the VIE certainly is less like an entity independent of the sponsor. According to FASB rules, loan cosigning by the sponsor can be evidence that the risks of ownership are actually borne by the sponsor and not the VIE equity investor. If the risks of ownership are borne by the sponsor, then the sponsor would be required to report in its balance sheet both the assets and liabilities of the VIE.

**FYI**

Enron also used its SPEs to engage in strategically timed purchases of assets so that Enron could avoid reporting losses on declines in the values of the assets. Also, Enron used SPEs to take the other side of a number of hedging transactions, as discussed in Chapter 19. The provisions of FASB ASC Subtopic 810-10 are now designed to prevent, or at least reduce, all of these abuses.

The accounting rules that existed for special-purposes entities allowed sponsor companies to carefully design their SPEs so that they could be accounted for as separate companies. In the wake of the Enron scandal and the unwelcome focus on SPEs as a tool for financial statement manipulation, the FASB has not only changed the terminology (from SPE to VIE) but has

also substantially tightened the accounting rules to prevent variable interest entities from serving as forms of off-balance-sheet financing. The focus of the current FASB rules is on the expected profits and losses of the special entity; the entity expected to bear the majority of the expected losses or reap the majority of the expected gains should include the assets and liabilities of the VIE in its balance sheet, independent of technical voting control.

*SIC 12 Consolidation—Special Purpose Entities* was issued internationally in December 1998. *SIC 12* is a good example of a principles-based standard. The gist of *SIC 12* is contained in its paragraph 8, reproduced here in its entirety: “An SPE [special-purpose

<sup>25</sup> FASB ASC paragraph 810-10-25-45.

entity] shall be consolidated when the substance of the relationship between an entity and the SPE indicates that the SPE is controlled by that entity.” If, in the judgment of the accountant, an entity “controls” an SPE, then the entity is required to consolidate the SPE, meaning that all of its assets and liabilities are included in the balance sheet of the controlling entity. In this context, “control” is not limited to voting control. For example, if a special-purpose entity has been set up with all of its operating decisions determined in advance by rigid policies, then the company that established the special-purpose entity and the “autopilot” operating policies effectively controls the SPE no matter what its ownership percentage is. This concept of “control” is an essential one, but further discussion is outside the scope of this text.

## Joint Ventures

Companies will, on occasion, join forces with other companies to share the costs and benefits associated with specifically defined projects. These **joint ventures** are often developed to share the risks associated with high-risk projects. For example, following the identification of the human genome’s complete structure, pharmaceutical companies have been forming joint ventures. These joint ventures are intended to perform research to identify the exact structure of proteins manufactured by specific genes associated with specific diseases. The ultimate objective is to use this detailed understanding of the biochemistry underlying specific diseases to be able to design chemical treatments, or, even better, cures. Start-up costs for this type of joint venture can easily exceed \$100 million. By involving several pharmaceutical companies, the costs, risks, and results can be shared.

Because the benefits of these joint ventures are uncertain, companies could incur substantial liabilities with few, if any, assets resulting from their efforts. As a result (as is sometimes the case with unconsolidated subsidiaries), a joint venture is sometimes carefully structured to ensure that its liabilities are not disclosed in the balance sheets of the companies that are partners.

A common form of a joint venture is a 50/50 partnership between two companies. For example, before its merger with **Chevron** in 2001, **Texaco** had two 50/50 joint venture partnerships: one with Chevron and one with **Saudi Refining, Inc.** The Chevron joint venture was called **Caltex** and engaged in oil exploration, refining, and marketing in Africa, Asia, the Middle East, Australia, and New Zealand. The joint venture with Saudi Refining was called **Star** and marketed gasoline in the eastern United States. The advantage of a 50/50 joint venture is that both companies can account for their investment using the equity method. Thus, joint ventures are often just a special type of unconsolidated subsidiary. For example, the Caltex and Star joint ventures had total long-term liabilities in excess of \$3 billion, none of which were reported in Texaco’s balance sheet. The accounting for joint ventures is discussed in more detail in Chapter 14.

### FYI

Many U.S. automobile companies have formed joint ventures with foreign car companies to develop and manufacture cars. For example, **Ford Motor Co.** has teamed up with **Mazda** in joint ventures in both North America and Asia.

## Research and Development Arrangements

Another way a company may obtain off-balance-sheet financing is with research and development arrangements. These involve situations in which an enterprise obtains the results of research and development activities funded partially or entirely by others. The

main accounting issue is whether the arrangement is, in essence, a means of borrowing to fund research and development or if it is simply a contract to do research for others.<sup>26</sup> In deciding on the appropriate accounting treatment, a major consideration is whether the enterprise is obligated to repay the funds provided by the other parties regardless of the outcome of the research and development activities. If there is an obligation to repay, the enterprise should estimate and recognize that liability and record the research and development expenses in the current year in accordance with FASB ASC Topic 730 (Research and Development). If the financial risk associated with the research and development is transferred from the enterprise to other parties and there is no obligation to them, then a liability need not be reported by the enterprise.

Research and development arrangements may take a variety of forms, including a limited partnership. For example, assume that Kincher Company formed a limited partnership for the purpose of conducting research and development. Kincher is the general partner and manages the activities of the partnership. The limited partners are strictly investors. The question is this: Should Kincher record the research and development expenses and the obligation to the investors on its books? The answer depends on an assessment of who is at risk and whether Kincher is obligated to repay the limited partners regardless of the results of the research and development. If the limited partners are at risk and have no guarantee or claim against Kincher Company for any of the funds contributed, the debt and related expenses need not be reported on Kincher's books.

### Project Financing Arrangements

At times, companies become involved in long-term commitments that are related to project financing arrangements. As an example, assume that Striker Corporation, a large construction company, has decided to establish a separate company, Paveway, in order to undertake a highway construction project. Paveway is to be organized as a separate legal entity, and all loans acquired by Paveway will specifically state that they are to be repaid from the cash flows of Paveway itself, with the assets of Paveway serving as collateral for the loans. It is likely that Striker would have a contingent obligation to satisfy the debt of Paveway even though the debt itself is intended to be repaid from Paveway cash flows. In this case, Striker would disclose this commitment in a note to the financial statements. This type of arrangement is another form of off-balance-sheet financing.<sup>27</sup>

### Reasons for Off-Balance-Sheet Financing

Companies might use one of the preceding or other techniques to avoid including debt on the balance sheet for several reasons. It may allow a company to borrow more than it otherwise could due to debt-limit restrictions. Also, if a company's financial position looks stronger, it will usually be able to borrow at a lower cost.

Whatever the reasons, the problems of off-balance-sheet financing are serious. Many investors and lenders aren't sophisticated enough to see through the off-balance-sheet borrowing tactics and therefore make ill-informed decisions. For example, in periods of economic downturn, a company with hidden debt may find it is not able to meet its obligations and, as a result, may suffer severe financial distress or, in extreme cases, business failure. In turn, unsuspecting creditors and investors may sustain substantial losses that could have been avoided had they known the true extent of the company's debt.

<sup>26</sup> FASB ASC Subtopic 730-20 (Research and Development—Research and Development Arrangements).

<sup>27</sup> FASB ASC Topic 440 (Commitments).

## Analyzing a Firm's Debt Position

**7** Analyze a firm's debt position using ratios.

**WHY** Assessing a firm's liquidity and solvency allows investors and creditors to evaluate the potential return on their investment.

**HOW** The results of debt-related ratio analysis allow users to compare a firm's debt position over time or at the same time across companies.

Those parties considering investing in, or lending money to, a firm are particularly interested in that firm's obligations and capital structure. The term *leverage* refers to the relationship between a firm's debt and assets or its debt and stockholders' equity. A firm that is highly leveraged has a large amount of debt relative to its assets or equity. A common measure of a firm's leverage is the **debt-to-equity ratio**, calculated by dividing total liabilities by total stockholders' equity. As an example, consider the following information from the 2009 annual report of IBM.

(In millions)	2009	2008
Long-term debt . . . . .	\$21,932	\$22,689
Total liabilities . . . . .	86,267	95,939
Total stockholders' equity . . . . .	22,755	13,584
Income before income taxes . . . . .	18,138	16,715
Interest expense . . . . .	402	673

IBM's debt-to-equity ratios for 2009 and 2008 are as follows:

$$2009: \$82,267/\$22,755 = 3.62$$

$$2008: \$95,939/\$13,584 = 7.06$$

A debt-to-equity ratio exceeding 1.0 indicates that the firm has more liabilities than stockholders' equity. For IBM, the debt-to-equity ratio has decreased substantially from 2008 to 2009. Investors generally prefer a higher debt-to-equity ratio to obtain the advantages of financial leverage, while creditors favor a lower ratio to increase the safety of their debt. Debt-to-equity ratios for a number of U.S. companies are presented in Exhibit 12-8.

As these data illustrate, what constitutes an acceptable debt-to-equity ratio depends to a great extent on the industry in which a company operates. For example, financial institutions, such as **Bank of America**, typically have very high debt-to-equity ratios because the financial assets held by such institutions provide very good collateral for loans. Note that **General Electric**, which has a large amount of financial assets and liabilities in its GE Capital Services subsidiary, has a debt-to-equity ratio indicative of a financial institution. At the other end of the spectrum, companies with few tangible assets to offer as loan collateral typically have lower debt-to-equity ratios. The extreme example of this is **Yahoo!** with a debt-to-equity ratio of just 0.19.

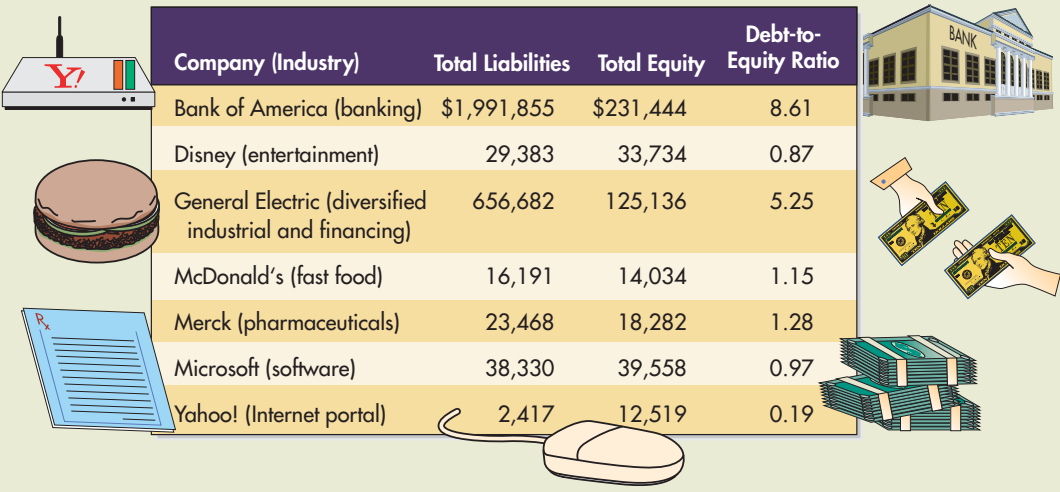

Because there is no hard and fast rule for what is included in the word *debt*, alternative definitions and interpretations of the debt-to-equity ratio have developed. For example, the ratio is often varied to include only long-term debt. If this definition were used for IBM, the debt-to-equity ratio for the 2-year period would be:

$$2009: \$21,932/\$22,755 = 0.96$$

$$2008: \$22,689/\$13,584 = 1.67$$

## EX 12-8 DEBT-TO-EQUITY RATIOS FOR SELECTED U.S. COMPANIES FOR FISCAL 2009 (\$ IN MILLIONS)

Company (Industry)	Total Liabilities	Total Equity	Debt-to-Equity Ratio
Bank of America (banking)	\$1,991,855	\$231,444	8.61
Disney (entertainment)	29,383	33,734	0.87
General Electric (diversified industrial and financing)	656,682	125,136	5.25
McDonald's (fast food)	16,191	14,034	1.15
Merck (pharmaceuticals)	23,468	18,282	1.28
Microsoft (software)	38,330	39,558	0.97
Yahoo! (Internet portal)	2,417	12,519	0.19

© 2012 Cengage Learning.

Note that the debt-to-equity ratios differ dramatically depending on how “debt” is defined: The debt-to-equity ratio is 3.62 if debt is defined to include all liabilities but is only 0.96 if debt is defined to include just long-term debt. Because there is no requirement for companies or analysts to compute ratios in particular ways, you are certain to encounter various different measures of the debt-to-equity ratio. The point to be remembered is this: Make sure you understand the inputs to a ratio before you try to interpret the output. Debt to one person may not mean the same thing to another. Another common variation of the leverage measure is to compare total liabilities to total assets. This measure, frequently called the *debt ratio*, was introduced in Chapter 3.

### FYI

The sum of a company's income before income taxes and interest expense is often called *EBIT* (*earnings before interest and taxes*).

Another measure of a company's performance relating to debt is the number of times interest is earned. This measure compares a company's interest obligations with its earnings ability. **Times interest earned** is calculated by adding a company's income

before income taxes and interest expense and then dividing by the interest expense for the period. In the case of IBM, times interest earned for 2009 and 2008 is computed as follows:

$$2009: (\$18,138 + \$402)/\$402 = 46.1$$

$$2008: (\$16,715 + \$673)/\$673 = 25.8$$

The number of times interest is earned reflects the company's ability to meet interest payments and the degree of safety afforded the creditors. Note that in 2009, IBM offered creditors a much larger margin of safety than in 2008. In 2009, IBM's operations generated 46.1 times the amount needed to be able to pay the company's interest obligation for the year, while in 2008, IBM generated “only” 25.8 times the needed amount (still a healthy cushion).

## Disclosing Debt in the Financial Statements

8

Review the notes to financial statements, and understand the disclosure associated with debt financing.

**WHY** Disclosures in the notes to the financial statements relating to debt financing provide additional details that may not be captured in the recognized numbers in the financial statements.

**HOW** Common disclosure associated with long-term debt includes information relating to maturities, interest rates, conversion privileges, and debt covenants.

In disclosing details about long-term debt in the notes to the financial statements, the nature of the liabilities, maturity dates, interest rates, methods of liquidation, conversion privileges, sinking fund requirements, borrowing restrictions, assets pledged, dividend limitations, and other significant matters should be indicated. The portion of long-term debt coming due in the current period should also be disclosed.

Bond liabilities are often combined with other long-term debt for balance sheet presentation, with supporting details disclosed in a note. An example of such a note

### EX 12-9 IBM—DISCLOSURE OF LONG-TERM DEBT

IBM—Disclosure of Long-Term Debt

Total . . . . .		<u>\$21,932</u>	<u>\$22,689</u>
* \$1.6 billion in debt securities issued by IBM International Group Capital LLC, which is an indirect, 100 percent owned finance subsidiary of the company, is included in 2010–2012. Debt securities issued by IBM International Group Capital LLC are fully and unconditionally guaranteed by the company.			
** The portion of the fixed-rate debt obligations that is hedged is reflected in the Consolidated Statement of Financial Position as an amount equal to the sum of the debt's carrying value plus a fair value adjustment representing changes in the fair value of the hedged debt obligations attributable to movements in benchmark interest rates.			

© 2012 Cengage Learning.

taken from the 2009 annual report of IBM is presented in Exhibit 12-9. Note that IBM enters into long-term borrowing arrangements using a variety of different instruments and in a variety of different currencies. In U.S. dollars, IBM has both long-term debentures (unsecured bonds) and notes. The 7.125% debenture issue is interesting because it doesn't mature until 2096. IBM obtains loans denominated in foreign currencies for a variety of reasons. First, some countries are reluctant to allow large multinational corporations such as IBM to do business in their countries without using local financing. It helps IBM establish good local relations if it uses local financial institutions as much as possible. Also, some of IBM's foreign subsidiaries are relatively self-contained, meaning that almost all operating, investing, and financing activities are handled locally. Sometimes IBM gets foreign currency financing because the interest rate is low. (Look at the 1.5% average rate on the Japanese yen loans.) Finally, foreign currency financing is a way for IBM to hedge, or protect itself, against fluctuations in the value of foreign currencies. For example, if IBM has assets denominated in Thai baht and the baht decreases in value, IBM will have lost money. However, if IBM has an equal amount of loans denominated in Thai baht, the loss from the decrease in the value of the Thai baht assets will be offset by the gain from the decrease in value of the Thai baht liabilities. This is called a *hedge* and results in IBM being immune from the effects of exchange rate changes, up or down.

**EM EXPANDED MATERIAL**

To this point in the chapter, we have covered the most common issues associated with debt: issuance, the payment of interest, and its retirement. In this Expanded Material, we will introduce and discuss an issue that does not occur frequently but, when it does occur, has a significant impact. The issue to be discussed is troubled debt restructuring: how to account for concessions made on the debt of firms in poor financial condition.

## Accounting for Troubled Debt Restructuring

**9** Understand the conditions under which troubled debt restructuring occurs, and be able to account for troubled debt restructuring.

**WHY** When a firm finds itself in financial trouble, actions taken to alleviate some of the distress are to retire some of the firm's debt at a reduced amount or to restructure the terms of the debt.

**HOW** When debt is restructured, the terms of the debt are modified. These modifications might include forgoing interest payments, reducing the interest rate on the debt, reducing the amount of the principal, or a combination of these options. This restructuring provides an economic benefit to the firm, and that benefit must be carefully reflected in either an immediate or a gradual future increase in reported income.

A significant accounting problem is created when economic conditions make it difficult for an issuer of long-term debt to make the cash payments required under the terms of the debt instrument. These payments include interest payments, principal payments on installment obligations, periodic payments to bond retirement funds, or even payments to retire debt at maturity. To avoid bankruptcy proceedings or foreclosure on the debt, investors may

agree to make concessions and revise the original terms of the debt to permit the issuer to recover from financial problems. The revision of debt terms in such situations, referred to as **troubled debt restructuring**, can take many different forms. For example, there may be a suspension of interest payments for a period of time, a reduction in the interest rate, an extension of the maturity date of the debt, or even an exchange of assets or equity securities for the debt. The primary accounting question in these cases, on both the books of the issuer and the investor, is whether a gain or loss should be recognized upon the restructuring of the debt.

In FASB ASC Subtopic 470-60 (Debt—Troubled Debt Restructurings by Debtors), the FASB defined *troubled debt restructuring* as a situation in which “the creditor for economic or legal reasons related to the debtor’s financial difficulties grants a concession to the debtor that it would not otherwise consider . . . That concession either stems from an agreement between the creditor and the debtor or is imposed by law or a court.”<sup>28</sup> The key word in this definition is *concession*. If a concession is not made by creditors, accounting for the restructuring follows the procedures discussed for extinguishment of debt prior to maturity.

The major issue addressed by the FASB in Subtopic 470-60 is whether a troubled debt restructuring agreement should be viewed as a significant economic transaction. It was decided that if it is considered to be a significant economic transaction, entries should be made on the issuer’s books to reflect any gain or loss. If the restructuring is not considered to be a significant economic transaction, no entries are required. The accounting treatment thus depends on the nature of the restructuring. The FASB conclusions are summarized in the table below.

For the issuer, each type of restructuring is discussed and illustrated in the following sections. For the investor, the procedures associated with an asset swap and an equity swap are discussed in this chapter. The complexities associated with a modification of terms from the point of view of the investor (or creditor) are discussed in Chapter 14 where we discuss the accounting for the impairment of a loan, which is addressed in FASB ASC Subtopic 310-40 (Receivables—Troubled Debt Restructurings by Creditors).

Type	Restructuring Considered Significant Economic Transaction: Gain or Loss Recognized	Restructuring Not Considered Significant Economic Transaction: No Gain or Loss Recognized
Transfer of assets in full settlement (asset swap) . . . . .	XXX	
Grant of equity interest in full settlement (equity swap) . . . . .	XXX	
Modification of terms: Total payment under new structure exceeds debt carrying value . . . . .		XXX
Modification of terms: Total payment under new structure is less than debt carrying value . . . . .	XXX	

<sup>28</sup> FASB ASC paragraphs 470-60-15-5 and 6.

### Transfer of Assets in Full Settlement (Asset Swap)

A debtor that transfers assets, such as real estate, inventories, receivables, or investments, to a creditor to fully settle a payable usually will recognize two types of gains or losses: (1) a gain or loss on disposal of the asset and (2) a gain arising from the concession granted in the restructuring of the debt. The computation of these gains and/or losses is made as follows:

The gain or loss on disposal of an asset is usually reported as an ordinary income item unless it meets criteria for reporting it as an unusual or irregular item. Similarly, the gain on restructuring is typically considered to be part of ordinary income.

An investor always recognizes a loss on the restructuring due to the concession granted unless the investment has already been written down in anticipation of the loss. The computation of the loss is made as follows:

The classification of this loss depends on the criteria being used to recognize irregular or extraordinary items. However, usually the loss is anticipated as market values of the investment decline, and it is recognized as an ordinary loss, either prior to the restructuring or as part of the restructuring.

## STOP & THINK

From the standpoint of the debtor, which ONE of the following is NOT possible on an asset swap done as part of a debt restructuring?

- Loss on disposal of the asset and loss on the debt restructuring
- Gain on disposal of the asset and gain on the debt restructuring
- Loss on disposal of the asset and gain on the debt restructuring

To illustrate these points, assume that Stanton Industries is behind in its interest payments on outstanding bonds of \$500,000 and is threatened with bankruptcy proceedings. The carrying value of the bonds on Stanton's books is \$545,000 after deducting the unamortized discount of \$5,000 and adding unpaid interest of \$50,000. To settle the debt, Stanton transfers long-term investments it holds in Worth common stock with a

carrying value of \$350,000 and a fair value of \$400,000 to all investors on a pro rata basis.

Assume that Realty Inc. holds \$40,000 face value of Stanton's bonds. Because of the troubled financial condition of Stanton Industries, Realty Inc. has previously recognized as a loss a \$5,000 decline in the value of the debt and is carrying the investment at \$35,000 on its books plus interest receivable of \$4,000. The entry on Stanton's books to record the asset transfer would be as follows:

Stanton Industries (Issuer)		Realty Inc. (Investor)	
Interest Payable . . . . .	50,000	Long-Term Investments—	
Bonds Payable . . . . .	500,000	Worth Common Stock . . . . .	32,000 <sup>†</sup>
Discount on Bonds Payable . . . . .	5,000	Loss on Restructuring of Debt . . . . .	7,000
Long-Term Investments—		Bond Investment—Stanton Industries . . . . .	35,000
Worth Common Stock . . . . .	350,000	Interest Receivable . . . . .	4,000
Gain on Disposal of Worth			
Common Stock . . . . .	50,000*		
Gain on Restructuring of Debt . . . . .	145,000*		
*Carrying value of Worth common . . . . .	\$350,000		
Market value of Worth common . . . . .	\$400,000	\$50,000 gain on disposal	
Carrying value of debt liquidated . . . . .	\$545,000	\$145,000 gain from restructuring	
		<sup>†</sup> Percentage of debt held by Realty Inc.: \$40,000/\$500,000 = 8%	
		Market value of long-term investment received in settlement of debt:	
		0.08 × \$400,000 = \$32,000	

### Grant of Equity Interest (Equity Swap)

A debtor that grants an equity interest to the investor as a substitute for a liability must recognize a gain equal to the difference between the fair value of the equity interest and the carrying value of the liquidated liability. A creditor (investor) must recognize a loss equal to the difference between the same fair value of the equity interest and the carrying value of the debt as an investment. For example, assume that Stanton Industries transferred 20,000 shares of common stock to satisfy the \$500,000 face value of bonds. The par value of the common stock per share is \$1, and the market value at the date of the restructuring is \$20 per share. Assume that the other facts described in the preceding illustration of an asset swap are unchanged. The entry on Stanton's books to record the grant of the equity interest is as follows:

Stanton Industries (Issuer)		Realty Inc. (Investor)	
Interest Payable . . . . .	50,000	Long-Term Investments—Stanton	
Bonds Payable . . . . .	500,000	Common Stock . . . . .	32,000
Discount on Bonds Payable . . . . .	5,000	Loss on Restructuring of Debt . . . . .	7,000
Common Stock . . . . .	20,000	Bond Investment—Stanton Industries . . . . .	35,000
Paid-In Capital in Excess of Par . . . . .	380,000	Interest Receivable . . . . .	4,000
Gain on Restructuring of Debt . . . . .	145,000*		
*Market value of common stock . . . . .	\$400,000		
Carrying value of debt liquidated . . . . .	\$545,000	\$145,000 gain from restructuring	

The entry on Stanton's books for an equity swap differs from that made for the asset swap because there can be no gain or loss on exchange of a company's own stock.

### Modification of Debt Terms

There are many ways debt terms may be modified to aid a troubled debtor. Modification may involve either the interest or the maturity value or both. Interest concessions may involve a reduction of the interest rate, forgiveness of unpaid interest, or a moratorium on interest payments for a period of time. Maturity value concessions may involve an extension of the maturity date or a reduction in the amount to be repaid at maturity. Basically, the FASB decided that most modifications of debt did not result in a significant economic transaction for the issuer of the debt and thus did not give rise to a gain or loss at the date of restructuring. It argued that the new terms were merely an extension of an existing debt and that the modifications should be reflected in future periods through modified interest charges based on computed implicit interest rates. The only exception to this general rule occurs if the total payments to be made under the new structure, including all future interest payments, are less than the carrying value of the debt at the time of restructuring. Under this exception, the difference between the total future cash payments required and the carrying value of the debt is recognized immediately as a gain on the debtor's books. These provisions are summarized here:

Description of the Restructuring	Accounting Treatment
<b>Substantially</b> modify the loan terms. The sum of the future payments (undiscounted) does <b>not</b> exceed the carrying value of the loan.	Make a journal entry. New carrying value of the loan equals the undiscounted future payments. <b>No</b> interest expense in subsequent periods.
<b>Slightly</b> modify the loan terms. The sum of the future payments (undiscounted) still exceeds the carrying value of the loan.	<b>No</b> journal entry. However, a new "implicit" interest rate is computed and used to compute interest expense in subsequent periods.

To illustrate the accounting for a "substantial" restructuring, assume the interest rate on the Stanton Industries bonds (see page 12-51) is reduced from 10% to 7%, the maturity date is extended from three to five years from the restructuring date, and the past interest due of \$50,000 is forgiven. The total future payments to be made after this restructuring are as follows:

Maturity value of bonds . . . . .	\$500,000
Interest— $0.07 \times \$500,000 \times 5$ years . . . . .	175,000
Total payments to be made after restructuring . . . . .	<u>\$675,000</u>

Because the \$675,000 exceeds the carrying value of \$545,000 [ $(\$500,000 - \$5,000) + \$50,000$ ], no gain is recognized on the books of Stanton Industries at the time of restructuring.

However, if, in addition to the preceding changes, \$200,000 of maturity value is forgiven, the future payments would be reduced as follows:

Maturity value of bonds ( $\$500,000 - \$200,000$ ) . . . . .	\$300,000
Interest— $0.07 \times \$300,000 \times 5$ years . . . . .	105,000
Total payments to be made after restructuring . . . . .	<u>\$405,000</u>

Now the carrying value exceeds the future payments by \$140,000, and this gain would be recognized by Stanton as follows:

Interest Payable .....	50,000	
Bonds Payable .....	500,000	
Discount on Bonds Payable .....		5,000
Restructured Debt .....		405,000
Gain on Restructuring of Debt .....		140,000

In this case, the total future cash flows to be repaid are less than the amount that is owed, meaning that the implicit interest rate is negative. In order to raise the rate to zero, the carrying value must be reduced to the cash to be realized and a gain recognized for the difference. All interest payments in the future are offset directly to the debt account. No interest expense will be recognized in the future because of the extreme concessions made in the restructuring. By charging all interest payments to the debt account, the balance remaining at the maturity date will be the maturity value of the debt.

When terms are modified just “slightly,” the total carrying value of the restructured debt is not changed, and no gain is recognized. The amount recognized as interest expense in the remaining periods of the debt instrument’s life is based on a computed implicit interest rate. The implicit interest rate is the rate that equates the present value of all future debt payments to the present carrying value of the debt. The interest expense for each period is equal to the carrying value of the debt for the period involved times the implicit interest rate. The computation of the implicit interest rate can be complex and usually requires the use of a business calculator. Computing implicit interest rates (internal rates of return) is explained in the Time Value of Money Review module.

To illustrate the computation of an implicit interest rate, the initial restructuring of Stanton Industries described above will be used. The question to be answered is what rate of interest will equate the total future payments of \$675,000 to the present carrying value of \$545,000. Interest is paid and compounded semiannually.

#### Business Calculator Keystrokes

PV = - \$545,000 (this is the carrying value of the loan; enter as a negative number)

PMT = \$17,500 ( $\$500,000 \times 0.07 \times 6/12$ )

FV = \$500,000 (amount to be paid in a lump sum at the loan maturity date)

N = 10 (the total loan term is 5 years; interest payments are semiannual)

I = ???

The solution returned by the calculator is 2.47% for each 6-month period.

#### Using the Excel RATE Function

Excel Label	Your Input
Nper	10
Pmt	17,500
Pv	-545,000
Fv	500,000
Type	0

Press “Enter” to see the answer of 2.47%.

Using this rate, the recorded interest expense for the first six months would be \$13,462, or 2.47% of \$545,000. Because the actual cash payment for interest is \$17,500, the carrying value of the debt will decline by \$4,038 ( $\$17,500 - \$13,462$ ). The interest expense for the second semiannual period will be less than for the first period because of

the decrease in the carrying value of the debt  $[(\$545,000 - \$4,038) \times 0.0247 = \$13,362$  interest expense]. These computations are the same as those required in applying the effective-interest method of amortization described earlier. Continuation of the procedure for the 10 periods would leave a balance of \$500,000, the maturity value, in the liability account of Stanton Industries. The entries to record the restructuring on Stanton's books and the first two interest payments would be as follows:

Bonds Payable .....	500,000	
Interest Payable .....	50,000	
Discount on Bonds Payable .....		5,000
Restructured Debt .....		545,000
Interest Expense .....	13,462	
Restructured Debt .....	4,038	
Cash .....		17,500
Interest Expense .....	13,362	
Restructured Debt .....	4,138	
Cash .....		17,500

Any combination of these methods of bond restructuring may be employed. Accounting for these multiple restructurings can become very complex and must be carefully evaluated. As stated previously, the accounting for a modification of terms by the creditor is discussed in Chapter 14.

### SOLUTIONS TO OPENING SCENARIO QUESTIONS

1. A bond rating downgrade indicates that a company's riskiness has increased. Accordingly, the downgrades increased the market interest rate on IBM's debt. Prior to the downgrades, the market interest rate on IBM's debt was approximately 0.5% above the interest rate on comparable U.S. Treasury bonds. After the downgrades, this spread grew to 0.7%.
2. The interest rate that investors must be paid to get them to purchase a bond is related to the riskiness of the bond issuer. Historically, investors have viewed U.S. Treasury bonds as being essentially riskless. As a result, the market interest rate on U.S. Treasury bonds is some-
- times called the "risk-free rate." Because there is some risk associated with the bonds of all issuing corporations, the market interest rate associated with corporate bonds is higher than the rate on comparable U.S. Treasury bonds.
3. The long-term debt obligation is fixed, in monetary terms, by a variety of contracts. IBM has virtually no uncertainty about the amounts it owes under these contracts. In contrast, the retirement obligation is an estimate based on expected employee life spans, future health care cost trends, and so forth. IBM has great uncertainty about the amounts it will ultimately pay for these retirement obligations.

### SOLUTIONS TO STOP & THINK

1. (Page 12-7) The correct answer is D. The current ratio is just one indicator of a company's ability to meet its current obligations. Another indicator is the ability of the company to generate operating cash flow. In fact, from a practical standpoint, current obligations are satisfied with normal ongoing operating cash flow rather than through the liquidation of a company's existing current assets. Because Wal-Mart has the ability to generate a stable stream of operating cash flow, the company is still able to meet its current obligations even though its current ratio is just 0.87.

2. (Page 12-22) The correct answer is A. Do not confuse the market and the stated rates. The stated rate is only used for computing the amount of the interest payments. The market rate is used for computing the present value amounts of the principal and interest payments.
3. (Page 12-27) The correct answer is B. The periodic interest payment is the same each period and is equal to the bond maturity value multiplied by the coupon rate.
4. (Page 12-50) The correct answer is A. The gain or loss on disposal of an asset is computed by comparing the carrying value with its market value. The market value could be greater than or less than book value. Regarding the restructuring, there can only be a gain for the debtor. Remember what we are doing here—getting the creditor to forgive the debt. That means the debtor will be able to retire debt at less than its carrying value. The debtor is getting a good deal—and this good deal is classified as a gain.

### SOLUTION TO USING THE FASB'S CODIFICATION

The “Debt—Overall” subtopic (470-10) includes a section (S99) on SEC material. Under the heading “SEC Staff Guidance” you can see a reference to “Staff Accounting Bulletins.” One of the topics under that heading is “SAB Topic 4.A, Subordinated Debt.” The authoritative GAAP reference is FASB ASC paragraph 470-10-S99-2, and the guidance is as follows: “Subordinated debt may not be included in the stockholders’ equity section of the balance sheet. Any presentation describing such debt as a component of stockholders’ equity must be eliminated. Furthermore, any caption representing

the combination of stockholders’ equity and only subordinated debts must be deleted.”

Note that this classification restriction is imposed on those who prepare financial statements. In contrast, users of financial statements, such as banks and financial analysts, are free to reclassify balance sheet items in any way they choose. Thus, for purposes of debt covenant calculations, banks often exclude goodwill from the balance sheet assets and reclassify subordinated debt from a liability to equity.

## REVIEW CHAPTER 12

### LEARNING OBJECTIVES

- 1 Understand the various classification and measurement issues associated with debt.

Debt can be classified as either current or noncurrent. Debt is considered current if it will be paid within one year or the current operating cycle, whichever period is longer. Theoretically, all debt should be recorded at its present value. However, most current obligations arising in the normal course of business are not discounted. Some obligations cannot be measured with certainty. These obligations are estimated and recorded at an approximate amount.

- 2 Account for short-term debt obligations, including those expected to be refinanced, and describe the purpose of lines of credit.

Short-term debt obligations can result from operations or from nonoperating activities. The most common example of a short-term obligation resulting from operations is accounts payable. Other short-term operating liabilities include wages payable, interest payable, and taxes payable. Notes payable involve a more formal credit arrangement. These notes typically specify an interest rate and a payment date. Notes payable can be classified as

trade or nontrade. Short-term obligations expected to be refinanced on a long-term basis should be classified as noncurrent if certain criteria are met.

Negotiating a line of credit allows a company to arrange the source of its financing in advance of the time that the funds are actually needed.

**3** Apply present value concepts to the accounting for long-term debts such as mortgages.

The present value of a long-term obligation is the amount of cash it would take today to completely satisfy the obligation. Mortgages and secured loans are loans that are backed by specific assets as collateral. These types of loans reduce the risk to the lender because the securing assets can be seized if the loan payments are not made. In accounting for the repayment of a mortgage obligation, each payment amount must be divided between the amount paid for interest and the amount paid for principal.

**4** Understand the various types of bonds; compute the price of a bond issue; and account for the issuance, interest, and redemption of bonds.

Bonds come in various shapes and sizes. They are issued by governments and corporations; they can be secured or unsecured, term or serial, registered or coupon—to name a few of the variations. All bonds share one feature: the borrowing of money now with some form of repayment in the future.

Most bonds also involve periodic interest payments. The market price of a bond is determined using present value techniques that incorporate the market rate of interest and the stated rate of the bond. The difference between the market and stated rates will result in a premium or discount. This premium or discount is amortized over time.

When bonds are retired, the debt is removed from the books of the debtor when cash is paid. Bonds can be refinanced at or prior to maturity. Any gain on the early retirement of debt is reported as an ordinary item on the income statement.

**5** Discuss the use of the fair value option for financial assets and liabilities.

Under the fair value option, a company has the option to report, at each balance sheet date, any or all of its financial assets and liabilities at their fair values on the balance sheet date. The resulting unrealized gains and losses are reported in the income statement. This simple procedure allows companies to include the economic effects of hedging activities in the financial statements.

**6** Explain various types of off-balance-sheet financing, and understand the reasons for this type of financing.

Off-balance-sheet financing is a method companies employ to avoid disclosing obligations in the financial statements. Common examples of off-balance-sheet financing include leasing, unconsolidated subsidiaries, variable interest entities, joint ventures, research and development arrangements, and project financing arrangements. Most areas involving off-balance-sheet financing have been addressed by the FASB, and disclosure associated with the financing arrangement is often required in the notes to the financial statements.

**7** Analyze a firm's debt position using ratios.

Ratios can be used to compare a firm's debt position over time or at the same time across companies. The most common measure of a firm's debt position is the debt-to-equity ratio. This ratio compares a firm's liabilities and its stockholders' equity. A common variation on this ratio is to include only long-term debt in the numerator. Times interest earned is another ratio often used to evaluate a company's debt position. This ratio is computed by dividing a firm's income before interest expense and taxes by interest expense for the period.

**8** Review the notes to financial statements, and understand the disclosure associated with debt financing.

Common disclosure associated with long-term debt includes information relating to maturities, interest rates, conversion privileges, and debt covenants. The portion of

long-term debt coming due in the current period is also disclosed.

**EM EXPANDED MATERIAL**

**9** Understand the conditions under which troubled debt restructuring occurs, and be able to account for troubled debt restructuring.

When a firm finds itself in financial trouble, options used to alleviate some of the distress are to retire the debt at a reduced amount or to restructure the terms of its debt. Debt can be retired immediately at

a reduced value with assets or by trading the debt for stock ownership. Another option for restructuring debt is to modify the terms of the debt. These modifications might include forgoing interest payments, reducing the interest rate on the debt, reducing the amount of the principal, or a combination of these options. If these modifications result in the total payments under the new structure being greater than the carrying value of the debt, no gain is recognized. A gain is recognized, however, if the total payments are less than the debt's current carrying value.

**FASB-IASB CODIFICATION SUMMARY**

Topic	FASB Accounting Standards Codification	Original FASB Standard	Corresponding IASB Standard	Differences between U.S. GAAP and IFRS
Short-term obligations expected to be refinanced	Section 470-10-45 par. 14	SFAS No. 6 par. 10-11	IAS 1 par. 72	Under IFRS, for a short-term obligation to be classified as long term, the refinancing must take place by the balance sheet date.
Splitting convertible debt proceeds into debt and equity	Subtopic 470-20	APB Opinion No. 14	IAS 32 par. 28-32	Under IFRS, ALL convertible debt issues are divided into their debt and equity components. This separation is only done under certain circumstances under U.S. GAAP.
Consolidation of variable interest entities (VIE)	Section 810-10-25 par. 20 through 59	FIN 46R	SIC 12	Under IFRS, a VIE is consolidated when the economic substance of the relationship indicates that the VIE is controlled. Compared to U.S. GAAP, this is very much a principles-based approach.
Fair value option	Topic 825, "Fair Value Option" subsections	SFAS No. 159	IFRS 9	There is a fair value option for financial assets under IFRS, but as of 2010 there was not yet a fair value option for financial liabilities.
Troubled debt restructuring	Subtopic 470-60	SFAS No. 15	IAS 39 par. 39 through 41	No substantial differences

## KEY TERMS

Account payable 12-9	Debenture bonds, or debentures 12-18	Market, yield, or effective interest rate 12-21	Term bonds 12-17
Amortization 12-25	Debt-to-equity ratio 12-45	Mortgage 12-14	Times interest earned 12-46
Bearer (coupon) bonds 12-18	Effective-interest method 12-26	Municipal debt 12-17	Trade notes payable 12-9
Bond certificates 12-16	Face value, par value, or maturity value 12-17	Nontrade notes payable 12-9	Trust indenture 12-16
Bond discount 12-20	Hedge 12-38	Notes payable 12-9	Unsecured bonds 12-18
Bond indenture 12-17	Joint venture 12-43	Off-balance-sheet financing 12-40	Variable interest entity (VIE) 12-41
Bond issuance costs 12-24	Junk bonds 12-18	Promissory note 12-9	Zero-interest (deep-discount) bonds 12-18
Bond premium 12-20	Liabilities 12-5	Registered bonds 12-18	<b>EM</b> EXPANDED MATERIAL
Bond refinancing 12-35	Line of credit 12-12	Secured bonds 12-17	Troubled debt restructuring 12-49
Callable bonds 12-19	Loan (mortgage) amortization 12-14	Secured loan 12-14	
Collateral trust bond 12-18	Long-term debt 12-15	Serial bonds 12-17	
Commodity-backed bonds 12-19		Stated (contract) rate 12-20	
Convertible bonds 12-19		Straight-line method 12-25	
Convertible debt securities 12-31			

## QUESTIONS

- Identify the major components included in the definition of *liabilities* established by the FASB.
- (a) What is meant by *executory contract*?  
(b) Do these contracts fit the definition of liabilities included in this chapter?
- Distinguish between current and noncurrent liabilities.
- At what amount should liabilities generally be reported?
- Under what circumstances is a short-term loan classified among the long-term liabilities on the balance sheet?
- How does the international standard for classification of short-term obligations to be refinanced differ from U.S. GAAP?
- What is a line of credit?
- Why is it important to use present value concepts in properly valuing long-term liabilities?
- When money is borrowed and monthly payments are made, how does one determine the portion of the payment that is interest and the portion that is principal?
- Distinguish between (a) secured and unsecured bonds, (b) collateral trust and debenture bonds, (c) convertible and callable bonds, (d) coupon and registered bonds, (e) municipal and corporate bonds, and (f) term and serial bonds.
- What is meant by *market rate of interest*, *stated or contract rate*, and *effective rate*? Which of these rates changes during the lifetime of the bond issue?
- What amortization method for premiums and discounts on bonds is recommended in FASB ASC Section 835-30-35 (Interest—Imputation of Interest—Subsequent Measurement)? Why? When can the alternative method be used?
- List three ways that bonds are commonly retired prior to maturity. How should the early extinguishment of debt be presented on the income statement?
- What purpose is served by issuing callable bonds?
- What are the distinguishing features of convertible debt securities? What questions relate to the nature of this type of security?
- How does the accounting for convertible debt under IAS 32 differ from the accounting prescribed by U.S. GAAP?
- The conversion of convertible bonds to common stock may be viewed as an exchange involving no gain or loss or as a transaction for which market values should be recognized and a gain or loss reported. What arguments support each of these views for the issuer?
- What is meant by *refinancing* or *refunding* a bond issue? When may refinancing be advisable?
- Briefly explain the “fair value option.”
- Why did the FASB decide to allow the fair value option?

21. What provision of the fair value option prevents companies from using hindsight to selectively enhance reported results using the fair value option?
22. Why is off-balance-sheet financing popular with many companies? What problems are associated with the use of this method of financing?
23. How can a variable interest entity (VIE) be used as a vehicle for off-balance-sheet financing?
24. What is a joint venture, and how can a joint venture be a form of off-balance-sheet financing?

EM

EXPANDED MATERIAL

25. What distinguishes a troubled debt restructuring from other debt restructurings?
26. What is the recommended accounting treatment for bond restructurings effected as
- An asset swap?
  - An equity swap?
  - A modification of terms?

## PRACTICE EXERCISES

### Practice 12-1

#### Working Capital and Current Ratio

L01

Using the following information, compute (1) working capital and (2) current ratio.

Deferred sales revenue	\$ 900
Accounts payable	1,100
Accounts receivable	1,750
Cash	400
Sales	10,000
Accrued wages payable	375
Sales returns and allowances	700
Bonds payable (to be repaid in 6 months)	1,000
Bonds payable (to be repaid in 5 years)	4,000

### Practice 12-2

#### Short-Term Obligations Expected to Be Refinanced

L02

The company has the following three loans payable scheduled to be repaid in February of next year. As of December 31 of this year, compute (1) total current liabilities and (2) total noncurrent liabilities.

- The company intends to repay Loan A, for \$10,000, when it comes due in February. In the following September, the company intends to get a new loan for \$8,000 from the same bank.
- The company intends to refinance Loan B for \$15,000 when it comes due in February. The refinancing contract, for \$18,000, will be signed in May, *after* the financial statements for this year have been released.
- The company intends to refinance Loan C for \$20,000 before it comes due in February. The actual refinancing, for \$17,500, took place in January, *before* the financial statements for this year have been released.

### Practice 12-3

#### Total Cost of Line of Credit

L02

The company arranged a line of credit for \$500,000 on January 1. The commitment fee is 0.05% (five one-hundredths of 1%) of the total credit line. In addition, the company must pay interest of 5.9% (compounded annually) on any actual loans acquired under the credit line arrangement. This year, the company borrowed \$260,000 under the agreement on May 1; this loan was still outstanding at the end of the year. Compute the total cost of the credit line (including interest) for the year.

### Practice 12-4

#### Computation of Monthly Payments

L03

Florence Clark purchased a house for \$300,000. She paid cash of 10% of the purchase price and signed a mortgage for the remainder. She will repay the mortgage in monthly

payments for 30 years, with the first payment to occur in one month. The interest rate is 5.4% compounded monthly. What is the amount of her monthly payment?

**Practice 12-5****Present Value of Future Payments**

L03

Refer to Practice 12-4. What is the present value of Florence's monthly mortgage payments after 12 payments have been made?

**Practice 12-6****Market Price of a Bond**

L04

The company intends to issue 20-year bonds with a face value of \$1,000. The bonds carry a coupon rate of 9%, and interest is paid semiannually. On the issue date, the market interest rate for bonds issued by companies with similar risk is 12% compounded semiannually. Compute the market price of one bond on the date of issue.

**Practice 12-7****Market Price of a Bond**

L04

The company intends to issue 10-year bonds with a face value of \$1,000. The bonds carry a coupon rate of 13%, and interest is paid semiannually. On the issue date, the market interest rate for bonds issued by companies with similar risk is 8% compounded semiannually. Compute the market price of one bond on the date of issue.

**Practice 12-8****Accounting for Issuance of Bonds**

L04

Bonds with a face value of \$1,000 were issued for \$1,083. Make the necessary journal entry on the books of the issuer.

**Practice 12-9****Accounting for Issuance of Bonds**

L04

Bonds with a face value of \$1,000 were issued for \$920. Make the necessary journal entry on the books of the issuer.

**Practice 12-10****Bond Issuance between Interest Dates**

L04

The company had planned to issue bonds with a face value of \$100,000 on January 1. Because of regulatory delays, the bonds were not issued until February 1. The bonds have a coupon rate of 9%, which is equal to the market rate of interest (for companies of similar risk) on the issue date of February 1. Interest is to be paid semiannually; the first interest payment of \$4,500 [ $\$100,000 \times 0.09 \times 6/12$ ] will be made on July 1, as originally scheduled. Make the journal entry necessary on the books of the issuer on February 1 to record the issuance of these bonds.

**Practice 12-11****Straight-Line Amortization**

L04

On January 1, the company issued 10-year bonds with a face value of \$400,000. The bonds carry a coupon rate of 10%, and interest is paid semiannually. On the issue date, the market interest rate for bonds issued by companies with similar risk was 12% compounded semiannually. The issuance price of the bonds was \$354,120. Make the journal entries needed on the books of the issuer to record the first two interest payments on June 30 and December 31. Use straight-line amortization of the bond discount.

**Practice 12-12****Effective-Interest Amortization**

L04

On January 1, the company issued 10-year bonds with a face value of \$400,000. The bonds carry a coupon rate of 10%, and interest is paid semiannually. On the issue date, the market interest rate for bonds issued by companies with similar risk was 12% compounded semiannually. The issuance price of the bonds was \$354,120. Make the journal entries needed on the books of the issuer to record the first two interest payments on June 30 and December 31. Use effective-interest amortization of the bond discount.

**Practice 12-13****Bond Premiums and Discounts on the Cash Flow Statement**

L04

The company has bonds outstanding with a face value of \$50,000 and an unamortized premium of \$2,350 at the beginning of the year and \$2,000 as of the end of the year.

Sales (all for cash) were \$42,000 for the year. Total interest expense of \$4,650 was reported for the year. Because interest expense is the only expense for this company, net income for the year was \$37,350 (\$42,000 – \$4,650). Prepare the Operating Activities section of the cash flow statement using both (1) the direct method and (2) the indirect method.

**Practice 12-14****Market Redemption of Bonds****L04**

The company has outstanding bonds payable with a total face value of \$100,000. On July 1, the company redeemed the bonds by purchasing them on the open market for a total of \$102,700. Make the necessary journal entry on the issuer's books to record the redemption of the bonds assuming that (1) the bonds have an unamortized discount of \$1,800 and (2) the bonds have an unamortized premium of \$1,800.

**Practice 12-15****Accounting for Issuance of Convertible Bonds****L04**

The company issued convertible bonds with a total face value of \$100,000 for \$111,000. If the bonds had been issued without the conversion feature, their issuance price would have been \$101,000. Make the journal entry necessary to record the issuance of the bonds.

**Practice 12-16****Accounting for Conversion of Convertible Bonds****L04**

The company has convertible bonds with a total face amount of \$100,000 and a carrying value of \$98,500. The bonds are converted into 2,000 shares of \$1 par common stock. Each share of stock had a market value of \$55 on the date of conversion. Make the journal entry to record the conversion. (Note: On the bond issuance date, it had been less than reasonably possible that the bonds would eventually be converted. In other words, ultimate conversion had been viewed as an unlikely event.)

**Practice 12-17****Fair Value Option****L05**

The company has one asset, a bond (called Bond B) that it purchased (on the day it was issued) as an investment, and one liability, one of its own bonds (called Bond X) that the company issued to finance the purchase of the Bond B investment. The company had no initial shareholder investment. Both bonds have the same terms: \$1,000 face value, 30-year life, 8% coupon rate, and single interest payments made at the end of each year. On their issuance dates, both bonds were associated with a market interest rate of 8%. The company has determined to account for both the bond asset and the bond liability using the fair value option. (1) Prepare a balance sheet for the company as of the issuance date of investment Bond B and the company's own Bond Payable X. (2) On the very next day, the market interest rate with respect to Bond B had risen to 13% and the market interest rate with respect to Bond Payable X had risen to 11%. Prepare the company's balance sheet.

**Practice 12-18****Debt-to-Equity Ratio****L07**

Consider the following information:

Short-term debt .....	\$ 17,300
Interest expense .....	8,200
Total current liabilities .....	27,000
Long-term debt .....	93,000
Cash .....	6,200
Total liabilities .....	130,000
Total stockholders' equity .....	85,000
Income before income taxes .....	17,500

Compute the debt-to-equity ratio assuming that (1) *debt* is defined to include all liabilities, (2) *debt* is defined to include just interest-bearing debt, and (3) *debt* is defined to include just long-term, interest-bearing debt.

**Practice 12-19****L07****Times Interest Earned Ratio**

Refer to Practice 12-18. Compute the times interest earned ratio.

**EM** EXPANDED MATERIAL

**Practice 12-20****L09****Debt Restructuring: Asset Swap**

The company has bonds payable with a total face value of \$100,000 and a carrying value of \$103,000. In addition, unpaid interest on the bonds has been accrued in the amount of \$6,000. The lender has agreed to the settlement of the bonds in exchange for land worth \$90,000. The land has a historical cost of \$64,000. Make the journal entry necessary on the books of the borrower to record this settlement of the bonds payable.

**Practice 12-21****L09****Debt Restructuring: Equity Swap**

The company has bonds payable with a total face value of \$150,000 and a carrying value of \$142,000. In addition, unpaid interest on the bonds has been accrued in the amount of \$8,000. The lender has agreed to the settlement of the bonds in exchange for 20,000 shares of \$1 par common stock. The shares have a current market value of \$140,000. Make the journal entry necessary on the books of the borrower to record this settlement of the bonds payable.

**Practice 12-22****L09****Debt Restructuring: Substantial Modification**

On January 1, the company obtained a \$10,000, 8% loan. The \$800 interest is payable at the end of each year, with the principal amount to be repaid in five years. As of the end of the year, the first year's interest of \$800 is not yet paid because the company is experiencing financial difficulties. The company negotiated a restructuring of the loan. The payment of all of the interest ( $\$4,000 = \$800 \times 5$  years) will be delayed until the end of the loan term. In addition, the amount of principal repayment will be dropped from \$10,000 to \$5,000. (1) Make the journal entry necessary on the company's books to record this debt restructuring. (2) Compute the amount of interest expense that will be recognized *next* year.

**Practice 12-23****L09****Debt Restructuring: Slight Modification**

Refer to Practice 12-22. Assume all of the same facts except that the principal repayment amount will be dropped to \$8,000 (from \$10,000) instead of to \$5,000. (1) Make the journal entry necessary on the company's books to record this debt restructuring. (2) Compute the amount of interest expense that will be recognized *next* year.

**EXERCISES****Exercise 12-24****L03****Accounting for Mortgages**

On January 1, 2013, Lily Company purchased a building for \$2,000,000. The company made a 25% down payment and took out a mortgage payable over 30 years with monthly payments of \$11,006.47. The first payment is due February 1, 2013. The mortgage interest rate is 8%.

1. Determine how much of the first two mortgage payments would be applied to interest expense and how much would be applied to reducing the principal. (Note: The 8% interest rate is compounded monthly.)
2. Make the journal entry necessary to record the first mortgage payment on February 1, 2013.

**Exercise 12-25****L03****Mortgage Amortization Schedule**

On July 1, 2013, Ketchikan Inc. borrowed \$90,000 to finance the purchase of machinery. The terms of the mortgage require payments to be made at the end of every month with

the first payment of \$1,589 being due on July 31, 2013. The length of the mortgage is seven years, and the mortgage carries an interest rate of 12% compounded monthly.

1. Prepare a mortgage amortization schedule for the last six months of 2013.
2. How much interest expense will be reported in 2013 in connection with this mortgage?
3. What amount will be reported in Ketchikan's balance sheet as mortgage liability at the end of 2013?

**Exercise 12-26****Computation of Market Values of Bond Issues****L04**

What is the market value of each of the following bond issues? (Note: Round to the nearest dollar.)

- (a) 10% bonds of \$1,000,000 sold on bond issue date; 10-year life; interest payable semiannually; effective rate, 12%.
- (b) 9% bonds of \$200,000 sold on bond issue date; 5-year life; interest payable semiannually; effective rate, 8%.
- (c) 8% bonds of \$150,000 sold 30 months after bond issue date; 15-year life; interest payable semiannually; effective rate, 10%.

**Exercise 12-27****Selling Bonds at Par, Premium, or Discount****L04**

In each of the following independent cases, state whether the bonds were issued at par, a premium, or a discount. Explain your answers.

- (a) Pop-up Manufacturing sold 1,500 of its \$1,000, 8% stated-rate bonds when the market rate was 7%.
- (b) Splendor, Inc., sold 500 of its \$2,000, 8 3/4% bonds to yield 9%.
- (c) Cards Corporation issued 1,000 of its 9%, \$100 face value bonds at an effective rate of 9 1/2%.
- (d) Floppy, Inc., sold 3,000 of its 10% bonds with a face value of \$2,500 at a time when the market rate was 9%.
- (e) Cintron Co. sold 5,000 of its 12% contract-rate bonds with a stated value of \$1,000 at an effective rate of 12%.

**Exercise 12-28****Zero-Coupon Bonds****L04**

George's Inc. is considering issuing bonds to finance the acquisition of a nationwide chain of distributors of George's products. George's is contemplating two different types of bonds to raise the required \$180 million purchase price. The first is a traditional 10-year, 14% bond with semiannual interest payments. The second is a 10-year, zero-coupon bond.

Assuming the market rate of interest is 14%, compute the face value of the bond issuance and make the journal entries necessary to record the issuance if (a) a traditional bond is issued and (b) a zero-coupon bond is issued.

**Exercise 12-29****Issuance and Reacquisition of Bonds****L04**

On January 1, 2012, Housen Company issued 10-year bonds of \$500,000 at 102. Interest is payable on January 1 and July 1 at 10%. On April 1, 2013, Housen Company reacquires and retires 50 of its own \$1,000 bonds at 98 plus accrued interest. The fiscal period for Housen Company is the calendar year.

Prepare entries to record (1) the issuance of the bonds, (2) the interest payments and adjustments relating to the debt in 2012, (3) the reacquisition and retirement of bonds in 2013, and (4) the interest payments and adjustments relating to the debt in 2013. Assume the premium or discount is amortized on a straight-line basis. (Note: Round to the nearest dollar.)

**Exercise 12-30****Amortization of Bond Premium or Discount****L04**

On January 1, 2012, Terrel Company sold \$100,000 of 10-year, 8% bonds at 93.5, an effective rate of 9%. Interest is to be paid on July 1 and December 31. Compute the

amount of premium or discount amortization in 2012 and 2013 using (1) the straight-line method and (2) the effective-interest method. Make the journal entries to record the amortization when the effective-interest method is used.

**Exercise 12-31**

L04

SPREADSHEET

**Bond Interest and Premium or Discount Amortization**

Assume that \$280,000 of Denham Springs School District 8% bonds are sold on the bond issue date for \$257,196. Interest is payable semiannually, and the bonds mature in 15 years. The purchase price provides a return of 9% on the investment.

1. What entries would be made on the investor's books for the receipt of the first two interest payments, assuming premium or discount amortization on each interest date by (a) the straight-line method and (b) the effective-interest method? (*Note:* Round to the nearest dollar.)
2. What entries would be made on Denham Springs School District's books to record the first two interest payments, assuming premium or discount amortization on each interest date by (a) the straight-line method and (b) the effective-interest method? (*Note:* Round to the nearest dollar.)

**Exercise 12-32**

L04

**Discount and Premium Amortization**

Tanzanite Corporation issued \$500,000 of 7% debentures to yield 11%, receiving \$424,624. Interest is payable semiannually, and the bonds mature in five years.

1. What entries would be made by Tanzanite for the first two interest payments, assuming premium or discount amortization on interest dates by (a) the straight-line method and (b) the effective-interest method? (*Note:* Round to the nearest dollar.)
2. What entries would be made on the books of the investor for the first two interest receipts, assuming premium or discount amortization on interest dates and that one party obtained all the bonds and used the straight-line method of amortization? (*Note:* Round to the nearest dollar.)
3. If the sale is made to yield 5%, \$543,760 being received, what entries would be made by Tanzanite for the first two interest payments, assuming premium or discount amortization on interest dates by (a) the straight-line method and (b) the effective-interest method? (*Note:* Round to the nearest dollar.)

**Exercise 12-33**

L04

**Sale of Bond Investment**

Jennifer Stack acquired \$50,000 of Oldtown Corp. 9% bonds on July 1, 2010. The bonds were acquired at 92; interest is paid semiannually on March 1 and September 1. The bonds mature September 1, 2017. Stack's books are kept on a calendar-year basis. On February 1, 2013, Stack sold the bonds for 97 plus accrued interest. Assuming straight-line amortization and no reversing entry at January 1, 2013, give the entry to record the sale of the bonds on February 1. (*Note:* Round to the nearest dollar.)

**Exercise 12-34**

L04

**Retirement of Debt before Maturity**

The Long-Term Debt section of Rodman Company's balance sheet as of December 31, 2012, included 8% bonds payable of \$600,000 less unamortized discount of \$44,000. Further examination revealed that these bonds were issued to yield 11%. The amortization of the bond discount was recorded using the effective-interest method. Interest was paid on January 1 and July 1 of each year. On July 1, 2013, Rodman retired the bonds at 104 before maturity.

Prepare the journal entries to record the July 1, 2013, payment of interest, including the amortization of the discount since December 31, 2012, and the early retirement on the books of Rodman Company.

**Exercise 12-35**

L04

**Retirement of Bonds**

The December 31, 2012, balance sheet of Spring Company includes the following items:

8% bonds payable due December 31, 2019 .....	\$200,000
Premium on bonds payable .....	8,750

The bonds were issued on December 31, 2011, at 105, with interest payable on June 30 and December 31 of each year. The straight-line method is used for premium amortization.

On April 1, 2013, Spring retired \$100,000 of these bonds at 99 plus accrued interest. Prepare the journal entries to record retirement of the bonds, including accrual of interest since the last payment and amortization of the premium.

**Exercise 12-36****L04****Retirement and Refinancing of Bonds**

Chiam Corporation has \$300,000 of 12% bonds, callable at 102, with a remaining 10-year term, and interest payable semiannually. The bonds are currently valued on the books at \$290,000, and the company has just made the interest payment and adjustments for amortization of any premium or discount. Similar bonds can be marketed currently at 10% and would sell at par.

1. Give the journal entries to retire the old debt and issue \$300,000 of new 10% bonds at par.
2. In what year will the reduction in interest offset the cost of refinancing the bond issue?

**Exercise 12-37****L04****Issuance of Convertible Bonds**

Joy Insurance decides to finance expansion of its physical facilities by issuing convertible debenture bonds. The terms of the bonds follow: maturity date 10 years after May 1, 2012, the date of issuance; conversion at option of holder after two years; 20 shares of \$1 par value stock for each \$1,000 bond held; interest rate of 12% and call provision on the bonds of 102. The bonds were sold at 101.

1. Give the entry on Joy's books to record the sale of \$1,800,000 of bonds on July 1, 2012; interest payment dates are May 1 and November 1.
2. Assume the same condition as in (1) except that the sale of the bonds is to be recorded in a manner that will recognize a value related to the conversion feature. The estimated sales price of the bonds without the conversion feature is 98.

**Exercise 12-38****L04****Convertible Bonds**

Clarkston Inc. issued \$1,000,000 of convertible 10-year, 11% bonds on July 1, 2012. The interest is payable semiannually on January 1 and July 1. The discount in connection with the issue was \$9,500, which is amortized monthly using the straight-line basis. The debentures are convertible after one year into five shares of the company's \$1 par common stock for each \$1,000 of bonds.

On August 1, 2013, \$100,000 of the bonds were converted. Interest has been accrued monthly and paid as due. Any interest accrued at the time of conversion of the bonds is paid in cash.

Prepare the journal entries on Clarkston's books to record the conversion, amortization, and interest on the bonds as of August 1 and August 31, 2013. (*Note:* Round to the nearest dollar.) (*Note:* On the bond issuance date, it had been at least reasonably possible that the bonds would eventually be converted.)

**Exercise 12-39****L05****Fair Value Option**

Ryan Marie Company has one asset, a bond issued by Miles Company that Ryan Marie purchased (on the day it was issued) as an investment. Ryan Marie also has only one liability, one of its own bonds that was to finance the purchase of the Miles bond investment. The company had no initial shareholder investment. Both bonds have the same terms: \$1,000 face value, 10-year life, 11% coupon rate, and single interest payments made at the end of each year. On their issuance dates, both bonds were associated with a market interest rate of 8%. The company has determined to account for both the bond asset and the bond liability using the fair value option.

1. Prepare a balance sheet for Ryan Marie Company as of the date it both purchased the Miles bond investment and issued its own bonds payable.

2. On the very next day, the market interest rate with respect to the Miles bond investment had risen to 13%, and the market interest rate with respect to Ryan Marie's bond had risen to 11%. Prepare the company's balance sheet.
3. Repeat (2) but this time assume that the market interest rate for the Miles bond had gone down to 6%, and the market interest rate of the Ryan Marie bond had increased to 14%.
4. Repeat (2) but this time assume that the market interest rate for the Miles bond had increased to 14%, and the market interest rate of the Ryan Marie bond had gone down to 6%.

EM	EXPANDED MATERIAL
----	-------------------

**Exercise 12-40****L09****Troubled Debt Restructuring—Asset Swap**

McKeon Machine Company has outstanding a \$210,000 note payable to Tejon Investment Corporation. Because of financial difficulties, McKeon negotiates with Tejon to exchange inventory of machine parts to satisfy the debt. The cost of the inventory transferred is carried on McKeon's books at \$160,000. The estimated retail value of the inventory is \$195,000. McKeon uses a perpetual inventory system. Prepare journal entries for the exchange on the books of McKeon Machine Company according to the requirements of FASB *Statement No. 15*.

**Exercise 12-41****L09****Troubled Debt Restructuring—Equity Swap**

MedQuest Enterprises is threatened with bankruptcy due to its inability to meet interest payments and fund requirements to retire \$5,000,000 of long-term notes. The notes are all held by Dynasty Insurance Company. In order to prevent bankruptcy, MedQuest has entered into an agreement with Dynasty to exchange equity securities for the debt. The terms of the exchange are as follows: 300,000 shares of \$1 par common stock, current market value \$10 per share, and 24,000 shares of \$10 par preferred stock, current market value \$65 per share. Prepare journal entries for the exchange on the books of MedQuest Enterprises according to the requirements of ASC Subtopic 470-60.

**Exercise 12-42****L09****Modification of Debt Terms**

Moriarty Co. is experiencing financial difficulties. Income has exhibited a downward trend, and the company reported its first loss in company history this past year. The firm has been unable to service its debt and, as a result, has missed two semiannual interest payments. In an attempt to turn the company around, management has negotiated a modification of its debt terms with bondholders. These modified terms are effective January 1, 2013. The bonds are \$10,000,000, 10-year, 10% bonds that were issued on January 2, 2008, and currently have an unamortized premium of \$210,000. Prepare the necessary journal entries on Moriarty's books for each of the following independent situations.

- (a) Bondholders agree to forgive past-due interest and reduce the interest rate on the debt from 10% to 5%.
- (b) Bondholders agree to forgive past-due interest and forgive \$3,000,000 of the face amount of the debt.
- (c) Bondholders agree to forgive past-due interest, reduce the interest rate on the debt from 10% to 6%, and forgive \$2,000,000 of the face value of the debt.

**PROBLEMS****Problem 12-43****L02, L07****Short-Term Loans Expected to Be Refinanced**

The following information comes from the financial statements of Randall Stewart Company.

Current assets .....	\$ 80,000
Accounts payable .....	55,000
Short-term loan payable* .....	65,000
Long-term debt .....	110,000
Other long-term liabilities .....	10,000
Total stockholders' equity .....	180,000

\*Randall Stewart has arranged with its bank to refinance its short-term loan when it becomes due in three months. The new loan will have a term of five years.

**Instructions:**

1. Compute the following ratio values.
  - (a) Current ratio
  - (b) Debt-to-equity ratio
  - (c) Debt ratio
2. If you were the auditor of Randall Stewart's financial statements, how would you convince yourself of the validity of the refinancing agreement?

**Problem 12-44**

**L03**

**Amortizing a Mortgage and the Effect on the Financial Statements**

On January 1, 2013, Picard Inc. purchased a new piece of equipment from LaForge Engineering to expand its production facilities. The equipment was purchased at a cost of \$800,000. Picard financed the purchase with an \$800,000 mortgage to be repaid in annual payments over five years at a rate of 10%. The mortgage was arranged through Pulaski Bank. The annual payments of \$211,038 are to be made on December 31 of each year.

**Instructions:**

1. Prepare a mortgage amortization schedule for the 5-year life of the mortgage.
2. Assuming the equipment is expected to last for five years (with zero salvage value), determine the net amount at which the equipment will be reported on the balance sheet at the end of each year for its 5-year life using straight-line depreciation.
3. Compare the liability amount to be disclosed on the balance sheet at the end of each year for the 5-year mortgage term with the asset amount to be disclosed at the end of the same years. Identify the primary reasons for the differences each year.

**Problem 12-45**

**L04**

**Bond Issuance and Adjusting Entries**

On January 1, 2013, Encino Company issued bonds with a face value of \$1,000,000 and a maturity date of December 31, 2022. The bonds have a stated interest rate of 8%, payable on January 1 and July 1. They were sold to SeaRay Company for \$820,744, a yield of 11%. It cost Encino \$40,000 to issue the bonds. This amount was deferred and amortized over the life of the issue using the straight-line method. Assume that both companies have December 31 year-ends and that Encino uses the effective-interest method to amortize any premium or discount and SeaRay uses the straight-line method.

**Instructions:**

1. Make all entries necessary to record the sale and purchase of the bonds on each company's books.
2. Prepare the adjusting entries as of December 31, 2013, for both companies. Assume SeaRay is carrying the bonds as a long-term held-to-maturity security.

**Problem 12-46**

**L04**

**Computation of Bond Market Price and Amortization of Premium or Discount**

Lighthouse Enterprises decided to issue \$1,400,000 of 10-year bonds. The interest rate on the bonds is stated at 10%, payable semiannually. At the time the bonds were sold, the market rate had increased to 12%.

**Instructions:**

1. Determine the maximum amount an investor should pay for these bonds. (Note: Round to the nearest dollar.)
2. Assuming that the amount in (1) is paid, compute the amount at which the bonds would be reported by the investor after being held for one year. Use two recognized methods of handling amortization of the difference in cost and maturity value of the bonds and give support to the method you prefer. (Note: Round to the nearest dollar.)

**Problem 12-47**

**L04**

**SPREADSHEET**

**Premium or Discount Amortization Table**

Bray Co. acquired \$30,000 of Honey Sales Co.'s 7% bonds, interest payable semiannually, bonds maturing in five years. The bonds were acquired at \$32,626, a price to return approximately 5%.

**Instructions:**

1. Prepare tables to show the periodic adjustments to the investment account and the annual bond earnings, assuming adjustment by each of the following methods: (a) the straight-line method and (b) the effective-interest method. (Note: Round to the nearest dollar.)
2. Assuming the use of the effective-interest method, prepare journal entries for each company for the first year.

**Problem 12-48**

**L04**

**Amortizing Deferred Interest Bonds**

R. J. Winter Co. recently issued \$100,000, 10-year deferred interest bonds. The bonds have a stated rate of 10%, and interest is to be paid in 10 semiannual payments beginning in Year 6. The market rate of interest on the date of issuance was 8%.

**Instructions:**

1. Compute the maximum amount an investor should pay for these bonds. (Note: Round to the nearest dollar.)
2. Prepare a bond amortization schedule for R. J. Winter, assuming the effective-interest method is used. (Note: Round to the nearest dollar.)

**Problem 12-49**

**L04**

**SPREADSHEET**

**Cash Flow Effects of a Bond Premium**

On January 1, 2013, Datalink Inc. issued \$100,000, 10%, 10-year bonds when the market rate of interest was 8%. Interest is payable on June 30 and December 31. The following financial information is available:

Sales .....	\$300,000
Cost of sales .....	180,000
Gross profit .....	120,000
Interest expense .....	?
Depreciation expense .....	(14,500)
Other expenses .....	(82,000)
Net income .....	?

	Dec. 31, 2013	Jan. 1, 2013
Accounts receivable .....	\$55,000	\$48,000
Inventory .....	87,000	93,000
Accounts payable .....	60,000	58,000

All purchases of inventory are on account. Other expenses are paid for in cash.

**Instructions:**

1. Prepare the journal entry to record the issuance of the bonds on January 1, 2013.
2. Compute (a) the amount of cash paid to bondholders for interest during 2013, (b) the amount of premium amortized during 2013, assuming Datalink uses the straight-line method for amortizing bond premiums and discounts, and (c) the amount of interest expense for 2013.
3. Prepare the Cash Flows from Operating Activities section of Datalink's statement of cash flows using (a) the direct method and (b) the indirect method.

**Problem 12-50****L04****Bond Entries—Issuer**

On April 1, 2003, Rowe Tool Company authorized the sale of \$5,000,000 of 6% convertible bonds with interest payment dates of April 1 and October 1. The bonds were sold on July 1, 2003, and mature on April 1, 2023. The bond discount totaled \$398,200. The bond contract entitles the bondholders to receive 20 shares of \$1 par value common stock in exchange for each \$1,000 bond. On April 1, 2013, the holders of bonds with total face value of \$700,000 exercised their conversion feature. On July 1, 2013, Rowe Tool Company reacquired bonds, face value \$600,000, on the open market. The balances in the equity accounts as of December 31, 2012, were

Common stock, \$1 par, authorized 3 million shares, issued and outstanding, 300,000 shares . . . . .	\$ 300,000
Paid-in capital in excess of par . . . . .	6,400,000

Market values of the common stock and bonds were as follows:

Date	Bonds (per \$1,000)	Common Stock (per share)
April 1, 2013 . . . . .	\$1,120	\$52
July 1, 2013 . . . . .	1,200	61

**Instructions:** Prepare journal entries on the issuer's books for each of the following transactions. (Use the straight-line amortization method for the bond discount.)

1. Sale of the bonds on July 1, 2003.
2. Interest payment on October 1, 2003.
3. Interest accrual on December 31, 2003, including bond discount amortization for the six months since the bond issuance.
4. Conversion of bonds on April 1, 2013. (Assume that interest and discount amortization are correctly shown as of April 1, 2013. No gain or loss on conversion is recognized.)
5. Reacquisition and retirement of bonds on July 1, 2013. (Assume that interest and discount amortization are correctly reported as of July 1, 2013.)

**Problem 12-51****L04****Bond Entries—Issuer**

Greenwood Company sold \$4,000,000 of 7% first-mortgage bonds on October 1, 2005, at \$3,479,683 plus accrued interest. The bonds were dated July 1, 2005; interest payable semiannually on January 1 and July 1; redeemable after June 30, 2010, to June 30, 2013, at 101, and thereafter until maturity at 100; and convertible into \$1 par value common stock as follows:

- Until June 30, 2010, at the rate of five shares for each \$1,000 bond.
- From July 1, 2010, to June 30, 2013, at the rate of four shares for each \$1,000 bond.
- After June 30, 2013, at the rate of three shares for each \$1,000 bond.

The bonds mature 10 years from their issue date. The company adjusts its books monthly and closes its books as of December 31 each year.

The following transactions occur in connection with the bonds.

2011

July 1 Converted \$1,500,000 of bonds into stock with no gain or loss recognized.

2012

Dec. 31 Reacquired \$1,000,000 face value of bonds at 99.75 plus accrued interest. These were immediately retired.

2013

July 1 Called the remaining bonds for redemptions and paid accrued interest. For purposes of obtaining funds for redemption and business expansion, a \$3,000,000 issue of 9% bonds was sold at 97. These bonds are dated July 1, 2013, and are due in 20 years.

**Instructions:** Prepare journal entries necessary for Greenwood Company in connection with the preceding transactions, including monthly adjustments, where appropriate, as of the following dates. Assume bond discount amortization is made using the straight-line method. (Note: Round to the nearest dollar.)

- |                      |                      |
|----------------------|----------------------|
| 1. October 1, 2005   | 4. December 31, 2012 |
| 2. December 31, 2005 | 5. July 1, 2013      |
| 3. July 1, 2011      |                      |

#### Problem 12-52

L04

#### Bond Entries—Investor

On June 1, 2012, Chloe Inc. purchased as a long-term investment 800 of the \$1,000 face value, 9% bonds of Logan Corporation for \$731,052. The bonds were purchased to yield 11% interest. Interest is payable semiannually on December 1 and June 1. The bonds mature on June 1, 2018. Chloe uses the effective-interest method of amortization. On November 1, 2013, Chloe sold the bonds for \$756,400. This amount includes the appropriate accrued interest. Chloe intended to hold these bonds until they matured, so year-to-year market value fluctuations were ignored in accounting for the bonds.

**Instructions:** Prepare a schedule showing the income or loss before income taxes from the bond investment that Chloe should record for the years ended December 31, 2012, and 2013.

#### Problem 12-53

L04

#### Bond Entries—Investor

On May 1, 2010, Glacier Bay Co. acquired \$30,000 of Horizon Corp. 8% bonds at 97 plus accrued interest. Interest on bonds is payable semiannually on March 1 and September 1, and bonds mature on September 1, 2013.

On May 1, 2011, Glacier Bay Co. sold bonds of \$10,000 for 103 plus accrued interest. On July 1, 2012, bonds of \$15,000 were exchanged for 2,000 shares of Horizon Corp. common, no par value, quoted on the market on this date at \$9. Interest was received on bonds to date of exchange.

On September 1, 2013, remaining bonds were redeemed and accrued interest was received.

**Instructions:** Give journal entries for 2010–2013 to record the preceding transactions on the books for Glacier Bay Co., including any adjustments that are required at the end of each fiscal year ending on December 31. Assume bond premium or discount amortization is by the straight-line method. Ignore any potential impact of year-to-year market value changes on the accounting for the bonds.

#### Problem 12-54

L04

#### Note Payable Entries—Investor and Issuer

Fitzgerald Inc. issued \$750,000 of 8-year, 11% notes payable dated April 1, 2009. Interest on the notes is payable semiannually on April 1 and October 1. The notes were sold on April 1, 2009, to an underwriter for \$720,000 net of issuance costs. The notes were then offered for sale by the underwriter, and on July 1, 2009, L. Baum purchased the entire issue as a long-term investment. Baum paid 101 plus accrued interest for

the notes. On June 1, 2012, Baum sold the investment in Fitzgerald notes to J. Gott as a short-term investment. Gott paid 96 plus accrued interest for the notes as well as \$1,500 for brokerage fees. Baum paid \$1,000 brokerage fees to sell the notes. Gott held the investment until April 1, 2013, when the notes were called at 104 by Fitzgerald.

**Instructions:** Prepare all journal entries required on the books of Fitzgerald Inc. for 2009 and 2013, on the books of Baum for 2009 and 2012, and on the books of Gott for 2012 and 2013. Assume that each entity uses the calendar year for reporting purposes and that issue costs are netted against the note proceeds by Fitzgerald. Any required amortization is made using the straight-line method. Ignore any potential impact of year-to-year market value changes on the accounting for the notes by the investors.

### Problem 12-55

#### L04

### Adjustment of Bond Investment Account

In auditing the books for Stiller Corporation as of December 31, 2013, before the accounts are closed, you find the following long-term investment account balance:

**Account:** INVESTMENT IN WILSON CHEMICAL 9% BONDS (MATURITY DATE, JUNE 1, 2017)

Date	Item	Debit	Credit	Balance	
				Debit	Credit
2013					
Jan. 21	Bonds, \$300,000 par, acquired at 103 plus accrued interest	312,773		312,773	
Mar. 1	Proceeds from sale of bonds, \$150,000 par and accrued interest		159,000	153,773	
June 1	Interest received		6,750	147,023	
Nov. 1	Amount received on call of bonds, \$80,000 par, at 102 plus accrued interest		84,600	62,423	
Dec. 1	Interest received		3,150	59,273	

### Instructions:

1. Give the entries that should have been made relative to the investment in bonds, including any adjusting entries that would be made on December 31, the end of the fiscal year. (Assume that bond premium or discount amortization is by the straight-line method and ignore any potential impact of year-to-year market value changes on the accounting for the bonds.)
2. Give the journal entries required at the end of 2013 to correct and bring the accounts up to date in view of the entries actually made.

### Problem 12-56

#### L04

### Reacquisition of Bonds

Gerona Company authorized the sale of \$300,000 of 10%, 10-year debentures on January 1, 2008. Interest is payable on January 1 and July 1. The entire issue was sold on April 1, 2008, at 103 plus accrued interest. On April 1, 2013, \$100,000 of the bond issue was reacquired and retired at 99 plus accrued interest. On June 30, 2013, the remaining bonds were reacquired at 98 plus accrued interest and refunded with an issue of \$200,000 of 9% bonds which were sold at 100.

**Instructions:** Give the journal entries for 2008 and 2013 (through June 30) on Gerona Company's books. The company's books are kept on a calendar-year basis. (Note: Round to the nearest dollar. Assume straight-line amortization of the premium or discount. Ignore any potential impact of year-to-year market value changes on the accounting for the bonds.)

### Problem 12-57

#### L04

### Deferred Interest Bonds and the Selling of Assets

At the beginning of 2011, Wheel R. Dealer purchased the net assets of Consolidated Corp. by issuing 10-year, 10% bonds with a face value of \$100,000,000, with semiannual

interest payments made on June 30 and December 31 and no interest payments made until 2016. Dealer hopes to sell off assets of Consolidated and realize enough cash to buy back the bonds on the open market prior to interest payments becoming due in 2016. At the end of 2013, Dealer sold net assets with a carrying value of \$85,000,000 for \$70,000,000 and used the proceeds to retire the bond issue.

**Instructions:**

1. Prepare the journal entry to record the issuance of the bonds on January 2, 2011, assuming a market rate of 8%.
2. Prepare the journal entry to record the sale of the net assets.
3. Compute the market value of the bonds on January 3, 2014, the day of retirement, assuming a market rate of 14%.
4. Prepare the journal entry to record the retirement of the bond issue on January 3, 2014, assuming a carrying value of \$96,000,000 and the market value as computed in (3).
5. Explain how Mr. Dealer can buy his bonds back three years after their initial sale for less than he originally sold them for and without ever having made an interest payment.
6. Should Mr. Dealer be able to reduce the liability to market value even if he does not retire the bonds?

**Problem 12-58**

**L04**

**Convertible Bonds**

Von Surf Co. issued \$1,200,000 of convertible 10-year debentures on July 1, 2012. The debentures provide for 8% interest payable semiannually on January 1 and July 1. The discount in connection with the issue was \$18,000, which is being amortized monthly on a straight-line basis.

The debentures are convertible after one year into nine shares of the Von Surf Co.'s \$1 par value common stock for each \$1,000 of debentures.

On August 1, 2013, \$200,000 of debentures were turned in for conversion into common stock. Interest has been accrued monthly and paid as due. Accrued interest on debentures is paid in cash upon conversion.

**Instructions:** Prepare the journal entries to record the conversion, amortization, and interest in connection with the debentures as of August 1, 2013, August 31, 2013, and December 31, 2013, including closing entries for year-end. Note: On the bond issuance date, it had been at least reasonably possible that the bonds would eventually be converted. (Note: Round to the nearest dollar.)

**Problem 12-59**

**L04**

**Early Extinguishment and Conversion of Bonds**

On January 1, 2012, Brewster Company issued 2,000 of its 5-year, \$1,000 face value, 11% bonds dated January 1 at an effective annual interest rate (yield) of 9%. Interest is payable each December 31. Brewster uses the effective-interest method of amortization. On December 31, 2013, the 2,000 bonds were extinguished early through acquisition in the open market by Brewster for \$1,980,000 plus accrued interest.

On July 1, 2012, Brewster issued 5,000 of its 6-year, \$1,000 face value, 10% convertible bonds dated July 1 at an effective annual interest rate (yield) of 12%. Interest is payable every June 30 and December 31. The bonds are convertible at the investor's option into Brewster's common stock at a ratio of 10 shares of common stock for each bond. On July 1, 2013, an investor in Brewster's convertible bonds tendered 1,500 bonds for conversion into 15,000 shares of Brewster's common stock, which had a fair market value of \$105 and a par value of \$1 at the date of conversion.

**Instructions:**

1. Make all necessary journal entries for the issuer and the investor to record the issuance of both the 11% and the 10% bonds. Ignore any potential impact of year-to-year market value changes on the investor accounting for the bonds.

2. Make all necessary journal entries on the issuer's books to record the early extinguishment of both debt instruments assuming:
  - (a) On the bond issuance date, it had been less than reasonably possible that the bonds would eventually be converted. In other words, ultimate conversion had been viewed as an unlikely event.
  - (b) On the bond issuance date, it had been at least reasonably possible that the bonds would eventually be converted.

**Problem 12-60****L04****Sample CPA Exam Questions**

1. On December 31, 2014, Moss Co. issued \$1,000,000 of 11% bonds at 109. Each \$1,000 bond was issued with 50 detachable stock warrants, each of which entitled the bondholder to purchase one share of \$5 par common stock for \$25. Immediately after issuance, the market value of each warrant was \$4. On December 31, 2014, what amount should Moss record as discount or premium on issuance of bonds?
  - (a) \$40,000 premium
  - (b) \$90,000 premium
  - (c) \$110,000 discount
  - (d) \$200,000 discount
2. On July 31, 2014, Dome Co. issued \$1,000,000 of 10%, 15-year bonds at par and used a portion of the proceeds to call its 600 outstanding 11%, \$1,000 face value bonds, due on July 31, 2022, at 102. On that date, unamortized bond premium relating to the 11% bonds was \$65,000. In its 2014 income statement, what amount should Dome report as gain or loss, before income taxes, from retirement of bonds?
  - (a) \$53,000 gain
  - (b) \$0
  - (c) (\$65,000) loss
  - (d) (\$75,000) loss

<b>EM</b>	<b>EXPANDED MATERIAL</b>
-----------	--------------------------

**Problem 12-61****L09****Troubled Debt Restructuring—Modification of Terms**

Volatile Company, after having experienced financial difficulties in 2011, negotiated with two major creditors and arrived at an agreement to restructure its debts on December 31, 2011. The two creditors were M. Voisin and G. Stock. Voisin was owed principal of \$325,000 and interest of \$40,000 but agreed to accept equipment worth \$70,000 and notes receivable from Volatile Company's customers worth \$275,000. The equipment had an original cost of \$95,000 and accumulated depreciation of \$35,000. Stock was owed \$650,000 and agreed to extend the terms and to accept immediate payment of \$200,000 and the remaining agreed-upon balance of \$477,403 to be paid on December 31, 2013. All payments were made according to schedule.

**Instructions:** Prepare Volatile's journal entries to record the restructuring on December 31, 2011, and the entries necessary to make the adjustments and record payments on December 31, 2012, and 2013.

**Problem 12-62****L09****Troubled Debt Restructuring—Modification of Terms**

In the latter part of 2012, New Iberia Company experienced severe financial pressure and was in default of meeting interest payments on long-term notes of \$4,500,000 due on December 31, 2017. The interest rate on the debt was 10%, payable semiannually on June 30 and December 31. In an agreement with Loans-R-Us Corporation, New Iberia obtained acceptance of a change in principal and interest terms for the remaining 5-year life of the notes. The changes in terms are as follows:

- (a) A reduction of principal of \$500,000.
- (b) A reduction in the interest rate to 7%.
- (c) New Iberia agreed to pay on December 31, 2012, both the \$450,000 of interest in arrears and the normal interest payment under the old terms.

**Instructions:**

1. Compute the total dollar difference in cash payments by New Iberia over the 5-year period as a result of the restatement of terms.
2. Prepare the journal entries for the restructuring of the debt, payment of interest under the old terms, and the first two interest payments under the new terms that New Iberia would make. (Note: The implicit interest rate is 4.2% compounded semiannually.)

**CASES****Discussion  
Case 12-63****What Is a Liability?**

Professional athletes regularly sign long-term multimillion-dollar contracts in which they promise to play for a particular team for a specified time period. Owners of these teams often sign long-term leases for the use of playing facilities for a specified time period. GAAP often requires the leases to be booked as liabilities but does not require the obligations associated with pro athletes' contracts to be recorded.

Discuss the reasons for the differing treatment of these two seemingly similar events. Do you think the accounting treatment currently required by GAAP in these instances satisfies the needs of investors and creditors?

**Discussion  
Case 12-64****Leave My Current Ratio Alone!**

Soto Inc., a closely held corporation, has never been audited and is seeking a large bank loan for plant expansion. The bank has requested audited financial statements. In conference with the president and majority stockholder of Soto, the auditor is informed that the bank looks very closely at the current ratio. The auditor's proposed reclassifications and adjustments include the following:

- (a) A note payable issued 4 1/2 years ago matures in six months from the balance sheet date. The auditor wants to reclassify it as a current liability. The controller says no because "we are probably going to refinance this note with other long-term debt."
- (b) An accrual for compensated absences. Again the controller objects because the amount of the pay for these absences cannot be estimated. "Some employees quit in the first year and don't get vacation, and it is impossible to predict which employees will be absent for illness or other causes. Without being able to identify the employees, we can't determine the rate of compensation."

If you were the auditor, how would you respond to the controller?

**Discussion  
Case 12-65****What Is Meant by Valuing Liabilities at Fair Value?**

John Jex, CPA, had just delivered a keynote address to a banker's organization on the merits of valuing loan portfolio assets at fair values that reflected changing interest rates. During the question-and-answer period, he was asked why bank liabilities should not be valued using current interest rates if assets are to be revalued for interest rate changes. His answer did not seem to satisfy the banker, and the meeting soon adjourned. After the meeting, John was asked by a listener to explain the impact that changing interest rates would have on liabilities if a revaluation were to occur. How would you respond to such a request?

## EM EXPANDED MATERIAL

**Discussion  
Case 12-66****Do We Really Have Income?**

Jefferson Corporation has \$20,000,000 of 10% bonds outstanding. Because of cash flow problems, the company is behind in interest payments and in contributions to its bonds retirement fund. The market value of the bonds has declined until it is currently only 50% of the face value of the bonds. After lengthy negotiations, the principal bondholders have agreed to exchange their bonds for preferred stock that has a current market value of \$10,000,000. The accountant for Jefferson Corporation recorded the transaction by charging Bond Liability for the entire \$20,000,000 and crediting Preferred Stock for the same amount. This entry thus transfers the amount received by the company from debt to equity.

The CPA firm performing the annual audit, however, does not agree with this treatment. The auditors argue that this transfer represents a troubled debt restructuring due to the significant concessions made by the bondholders, and under these conditions, the FASB requires Jefferson to use the market value of the preferred stock as its recorded value. The difference between the \$20,000,000 face value of the bonds and the \$10,000,000 market value of the preferred stock is a reportable gain.

The controller of Jefferson, L. Rogers, is flabbergasted. "Here we are, almost bankrupt, and you tell us we must report the \$10,000,000 as a gain. I don't care what the FASB says; that's a ridiculous situation. You can't be serious."

The auditor in charge of the engagement is adamant. "We really have no choice. You have had a forgiveness of debt for \$10,000,000. You had use of the money, and based on current conditions, you won't have to pay it back. That situation looks like a gain to me."

What position do you think should be taken? Consider the external users of the financial statements and their needs in your discussion.

**Case 12-67****Deciphering Financial Statements (The Walt Disney Company)**

Locate **The Walt Disney Company's** 2009 annual report on the Internet and answer the following questions.

1. What is the largest liability listed in Disney's 2009 balance sheet?
2. By what percentage did Disney change its total borrowings (current and long-term) in 2009?
3. In the notes to the financial statements, Disney outlines how the company has borrowed money. What form of borrowing constitutes the greatest portion of Disney's total borrowing?

**Case 12-68****Deciphering Financial Statements (Boston Celtics)**

In December of 2002, the Boston Celtics were purchased by a private investment group. Now that the Celtics are owned by a private group, their financial statements are not publicly available. However, prior to their going private, their financial statements were publicly available. A portion of those financial statements (the Liabilities and Equity section of the balance sheet) is shown below. **Celtics Basketball Holdings Limited Partnership** was the name of the entity under which the results of the Boston Celtics were reported prior to their going private.

Review the Liabilities and Equity section of the balance sheet and answer the following questions.

1. What is Deferred Game Revenues? How would that liability have arisen?
2. What does the account Deferred Compensation represent? Note that this account has both a current and noncurrent portion.
3. As of June 30, 2001, what did the Celtics report as total assets?
4. Consider your answer to part (3) in light of the \$50,000,000 amount of outstanding notes payable. If you were a creditor of the Celtics, would you be concerned? How is it possible for the organization to continue to function with such a large partners' deficit?

<b>Celtics Basketball Holdings, LP Liabilities and Partners' Capital (Deficit)</b>

**Case 12-69****Deciphering Financial Statements (Hewlett-Packard & Dell)**

Review the 2009 balance sheet data for **Hewlett-Packard (HP)** and **Dell** shown below.

<b>(in millions)</b>	<b>Hewlett-Packard</b>	<b>Dell</b>
Current assets.....	\$52,539	\$24,245
Current liabilities.....	43,003	18,960
Total liabilities.....	74,282	28,011
Total stockholders' equity.....	40,517	5,641
Retained earnings.....	29,936	22,110

1. Compute each company's current ratio for 2009. Based on the result, which company appears to be more liquid?
2. Compute each company's debt-to-equity ratio for 2009. Which company appears to have the most debt in relation to stockholders' equity?
3. Which company has a larger amount of long-term debt in its financing mix?
4. Why would HP have a larger amount in retained earnings at the end of 2009 relative to Dell?
5. How can Dell have \$22,110 million in retained earnings and only \$5,641 million of total stockholders' equity?

**Case 12-70****Deciphering Financial Statements (Altria Group)**

Examine the partial balance sheet of **Altria Group** shown below and answer the following questions.

1. Current assets for Altria Group (parent company of **Philip Morris**) totaled \$5,773 (in millions) at the end of 2009. Compute the company's current ratio.
2. Why would Altria classify its liabilities into two different categories?
3. Compute Altria's debt-to-equity ratio for 2009 using (a) only long-term debt and (b) all liabilities in your computations. Why the huge difference in your answers?

When interpreting a debt-to-equity ratio computed by someone else, what should be your first question?

### Case 12-71

#### Writing Assignment (I like these “no interest” bonds)

J. R. Chump, president of ProKeeper Industries, is contemplating the issuance of long-term debt to finance plant expansion and renovation. In the past, his company has issued traditional debt instruments that require regular interest payments and a retirement of the principal on the maturity date. However, he has noticed that several competitors have recently issued bonds that either do not require interest payments or

defer interest payments for several years. He has asked you, his chief financial officer, to prepare a short memo addressing the following questions.

1. Why would a company issue bonds that require interest payments if bonds that do not require interest payments are being sold in the open market?
2. If the company were to issue 10-year bonds with a face value of \$100,000 and the market rate of interest is 10%, what would be the proceeds from the sale if the bonds were zero-interest bonds? What would be the proceeds if the annual interest payments did not begin for five years and the stated rate of interest were 10%? What would be the proceeds if the bonds paid interest annually for 10 years at 10%?
3. What factors must a business consider when determining the interest terms associated with long-term debt?

### Case 12-72

#### Ethical Dilemma (Keeping our debt covenants)

You are the chief financial officer of a local manufacturing company, Larsen Enterprises. This company is run by two brothers, Steve and John Larsen. The Larsen brothers have built this company up from a small 5-man shop to a company now employing over 200 people. The national economy has recently taken a turn for the worse, which has affected the Larsens' business. In fact, the company's performance of late has been such that it is in jeopardy of violating several of its debt covenants (promises made to the lending institution). If the company violates these covenants, the bank has the option of calling the debt due immediately. If the debt is called, Larsen is not sure what will happen, but it will certainly not be good.

The covenant that is in jeopardy relates to the current ratio. If the current ratio drops below 2, Larsen Enterprises is considered in technical default on its debt. Steve and John have come to you and asked you to suggest ways in which the current ratio, which currently stands at 1.9, could be increased.

Take a moment and think of ways in which the current ratio might be manipulated. Identify specific actions that the Larsen brothers might take to increase the current ratio. Is it in the best interests of shareholders and lending institutions for Steve and John to make business decisions that have cosmetic effects on the financial statements?

### Case 12-73

#### Cumulative Spreadsheet Analysis

This spreadsheet assignment is a continuation of the spreadsheet assignments given in earlier chapters. If you completed those assignments, you have a head start on this one.

Refer back to the instructions for preparing the revised financial statements for 2013 as given in (1) of the Cumulative Spreadsheet Analysis assignment in Chapter 3.

1. Skywalker wishes to prepare a *forecasted* balance sheet, a *forecasted* income statement, and a *forecasted* statement of cash flows for 2014. Use the financial statement numbers for 2013 as the basis for the forecast, along with the following additional information.
  - (a) Sales in 2014 are expected to increase by 40% over 2013 sales of \$2,100.
  - (b) In 2014, new property, plant, and equipment acquisitions will be in accordance with the information in (q).
  - (c) The \$480 in operating expenses reported in 2013 breaks down as follows: \$15 in depreciation expense and \$465 in other operating expenses.
  - (d) New long-term debt will be acquired in 2014 in accordance with (u).
  - (e) No cash dividends will be paid in 2014.
  - (f) New short-term loans payable will be acquired in an amount sufficient to make Skywalker's current ratio in 2014 exactly equal to 2.0.
  - (g) Skywalker does not anticipate repurchasing any additional shares of stock during 2014.
  - (h) Because changes in future prices and exchange rates are impossible to predict, Skywalker's best estimate is that the balance in accumulated other comprehensive income will remain unchanged in 2014.

- (i) In the absence of more detailed information, assume that the balances in Investment Securities, Long-Term Investments, and Other Long-Term Assets will all increase at the same rate as sales (40%) in 2014. The balance in Intangible Assets will change in accordance with item (r).
- (j) In the absence of more detailed information, assume that the balance in the other long-term liabilities account will increase at the same rate as sales (40%) in 2014.
- (k) The investment securities are classified as available-for-sale securities. Accordingly, cash from the purchase and sale of these securities is classified as an investing activity.
- (l) Assume that transactions impacting other long-term assets and other long-term liabilities accounts are operating activities.
- (m) Cash and investment securities accounts will increase at the same rate as sales.
- (n) The forecasted amount of accounts receivable in 2014 is determined using the forecasted value for the average collection period. The average collection period for 2014 is expected to be 14.08 days. To make the calculations less complex, this value of 14.08 days is based on forecasted end-of-year accounts receivable rather than on average accounts receivable.
- (o) The forecasted amount of inventory in 2014 is determined using the forecasted value for the number of days' sales in inventory. The number of days' sales in inventory for 2014 is expected to be 107.6 days. To make the calculations simpler, this value of 107.6 days is based on forecasted end-of-year inventory rather than on average inventory.
- (p) The forecasted amount of accounts payable in 2014 is determined using the forecasted value for the number of days' purchases in accounts payable. The number of days' purchases in accounts payable for 2014 is expected to be 48.34 days. To make the calculations simpler, this value of 48.34 days is based on forecasted end-of-year accounts payable rather than on average accounts payable.
- (q) The forecasted amount of property, plant, and equipment (PP&E) in 2014 is determined using the forecasted value for the fixed asset turnover ratio. The fixed asset turnover ratio for 2014 is expected to be 3.518 times. To make the calculations simpler, this ratio of 3.518 is based on forecasted end-of-year gross property, plant, and equipment balance rather than on the average balance. (Note: For simplicity, ignore accumulated depreciation in making this calculation.)
- (r) Skywalker has determined that no new intangible assets will be acquired in 2014. Intangible assets are amortized according to the information in (t).
- (s) In computing depreciation expense for 2014, use straight-line depreciation and assume a 30-year useful life with no residual value. Gross PP&E acquired during the year is only depreciated for half the year. In other words, depreciation expense for 2014 is the sum of two parts: (1) a full year of depreciation on the beginning balance in PP&E, assuming a 30-year life and no residual value, and (2) a half-year of depreciation on any new PP&E acquired during the year, based on the change in the gross PP&E balance.
- (t) Skywalker assumes a 20-year useful life for its intangible assets. Assume that the \$100 in intangible assets reported in 2013 is the original cost of the intangibles. Include the amortization expense with the depreciation expense in the income statement.

(Note: These forecasted statements were constructed as part of the spreadsheet assignment in Chapter 11; you can use that spreadsheet as a starting point if you have completed that assignment.)

For this exercise, make the following additional assumptions:

- (u) New long-term debt will be acquired (or repaid) in an amount sufficient to make Skywalker's debt ratio (total liabilities divided by total assets) in 2014 exactly equal to 0.80.
- (v) Assume an interest rate on short-term loans payable of 6.0% and on long-term debt of 8.0%. Only a half-year's interest is charged on loans taken out during the year. For example, if short-term loans payable at the end of 2014 is \$15 and given that short-term loans payable at the end of 2013 were \$10, total short-term interest expense for 2014 would be \$0.75 [ $(\$10 \times 0.06) + (\$5 \times 0.06 \times 1/2)$ ].

Clearly state any additional assumptions that you make.

2. Repeat (1) with the following changes in assumptions.
  - (a) The debt ratio in 2014 is exactly equal to 0.70.
  - (b) The debt ratio in 2014 is exactly equal to 0.90.
3. Comment on the differences in the forecasted values of cash from operating activities in 2014 under each of the following assumptions about the debt ratio: 0.70, 0.80, and 0.90. Explain exactly why a change in debt ratio has an impact on cash from operating activities.

# CHAPTER 13

## Equity Financing

### LEARNING OBJECTIVES

- 1 Identify the rights associated with ownership of common and preferred stock.
- 2 Record the issuance of stock for cash, on a subscription basis, and in exchange for noncash assets or for services.
- 3 Use both the cost and par value methods to account for stock repurchases.
- 4 Account for the issuance of stock rights and stock warrants.
- 5 Compute the compensation expense associated with the granting of employee stock options.
- 6 Determine which equity-related items should be reported in the balance sheet as liabilities.
- 7 Distinguish between stock conversions that require a reduction in retained earnings and those that do not.
- 8 List the factors that impact the Retained Earnings balance.
- 9 Properly record cash dividends, property dividends, small and large stock dividends, and stock splits.
- 10 Explain the background of unrealized gains and losses recorded as part of accumulated other comprehensive income, and list the major types of equity reserves found in foreign balance sheets.
- 11 Prepare a statement of changes in stockholders' equity.

Bill Gates is one of the two richest people in the United States. (The other one is mentioned further down—keep reading.) **Microsoft**, the company Bill Gates founded with partner Paul Allen in 1975, was originally best known for developing the first-generation DOS operating system used with **IBM** personal computers and their clones. Microsoft subsequently came to dominate (some would say monopolize) the software market with popular software packages such as Word®, Excel®, and PowerPoint®, based on its Windows® operating system.

In 1985, Microsoft decided to issue its stock publicly for the first time. Before this time, Microsoft had stock outstanding, but the stock was held by company officials and employees and was not publicly traded. A key consideration, of course, was what price to charge when issuing the shares.

## 13-1 MICROSOFT'S PRICE PER SHARE OF STOCK

© 2012 Cengage Learning.

An initial price range of \$16 to \$19 per share was set, based on Microsoft's earnings per share and the price-earnings (P/E) ratios for similar firms that already had publicly traded stock. The large amount of interest in the Microsoft stock issue resulted in the final offering price being raised to \$21 per share. On March 13, 1986, Microsoft shares were first publicly traded, and by the end of the first day of trading, the shares were at \$27.75.<sup>1</sup> If you had purchased one of those initial shares for \$21 in 1986, by December 1999 it would have been worth almost \$15,000. (See Exhibit 13-1.) By December 2000, that same share of stock would have declined in value to \$5,489 as a result of both the bursting of the dot.com bubble and the continued uncertainty about Microsoft's future caused by the antitrust lawsuits against the company. In May 2010, Microsoft had recovered some of its lost value, with one of the initial shares being worth \$8,320.

A share of Microsoft stock does not trade for \$8,320 because, since 1986, Microsoft has split its stock several times. A split is like cutting a pie into more pieces—the number of shares is increased and the price of each share is reduced proportionately. Most firms use stock splits to maintain their per-share price in the range that is considered normal, usually between \$20 and \$80 per share in the United States.

A glaring exception to this price-per-share range is stock of **Berkshire Hathaway**, which is headed by Warren Buffett, who annually vies with Bill Gates for the title of richest person in the United States. Buffett's company is involved in a number of diverse lines of business. Its largest operations are in property and casualty insurance; **Geico** is owned by Berkshire Hathaway. However, it also produces and sells **Kirby** vacuums, **See's Candies**, and **World Book** encyclopedias. In addition, Berkshire Hathaway has a substantial investment portfolio: It owns 12.7% of **American Express**, 9.9% of **BYD Company**, 8.6% of **Coca-Cola**, 8.8% of **Kraft Foods**, 6.5% of **Wells Fargo**, and 19% of the **Washington Post**.<sup>2</sup> In fact, a whole industry has built up around financial analysts who interpret the investment choices made by Warren Buffett.

Because Berkshire Hathaway has been very profitable and has never split its stock, its price per share has risen higher than any other stock on the New York Stock Exchange. On May 14, 2010, Berkshire Hathaway shares closed at \$114,150 each.<sup>3</sup>

By the way, in the 2009 annual *Forbes* survey of America's richest people, Bill Gates (\$50.0 billion) beat out Warren Buffett (\$40.0 billion) as the richest person in the United States for the 16th straight year.<sup>4</sup>

## QUESTIONS

1. If you had purchased Microsoft stock in December 1999 and sold it in May 2010, what percentage return on your investment would you have earned during that time interval?
2. What is Berkshire Hathaway's relationship with the *Washington Post*?
3. In the year 2010, Microsoft's price per share was around \$29, whereas the price per share for Berkshire Hathaway was about \$114,150. What additional information would you need to determine which company had a higher total market value?

*Answers to these questions can be found on page 13-54.*

<sup>1</sup> Bro Uttal, "Inside the Deal That Made Bill Gates \$350,000,000," *Fortune*, July 21, 1986, p. 23.

<sup>2</sup> From the 2009 Annual Report of Berkshire Hathaway.

<sup>3</sup> In May 1996, the shareholders of Berkshire Hathaway approved the creation of a new class of shares, called *Class B shares*. Originally, each of these shares had 1/30 the value of the original Class A shares. A 50-for-1 stock split of these shares in January 2010 now makes each B share worth 1/1,500 the value of the A shares. These actions were taken to head off some investment companies that had started buying Berkshire Hathaway shares, carving them up, and selling shares of the shares.

<sup>4</sup> In the 2009 *Forbes* survey, Warren Buffett was ahead of Paul Allen (\$11.5 billion), who was Bill Gates' partner in the founding of Microsoft. Also, the six heirs to Sam Walton's Wal-Mart fortune had a combined net worth of \$90 billion, making them the wealthiest family in America.

Owner investments are reported in the Equity section of the balance sheet. For example, when a corporation issues new shares of stock to the public, the proceeds are recorded in the Equity section. These invested funds are called *contributed*, or *paid-in, capital*. Owners also contribute funds to a company by allowing profits to be reinvested. In a corporation, these reinvested profits are called *retained earnings*. In sole proprietorships and partnerships, paid-in capital and retained earnings are lumped together into a single capital account. This chapter emphasizes the accounting for equity of corporations.

In a simple world, the Equity section of a corporation's balance sheet would include only the two sections just mentioned, paid-in capital and retained earnings. However, the increasing complexity of worldwide business necessitates a number of other equity items. For example, some equity-related items must be reported as liabilities in the balance sheet. In addition, unrealized gains or losses on some investment securities are shown in a separate equity category, as is the impact of foreign currency fluctuations on the equity of foreign subsidiaries. The items that can appear in the Equity section are summarized in Exhibit 13-2 and are discussed in the remainder of the chapter.

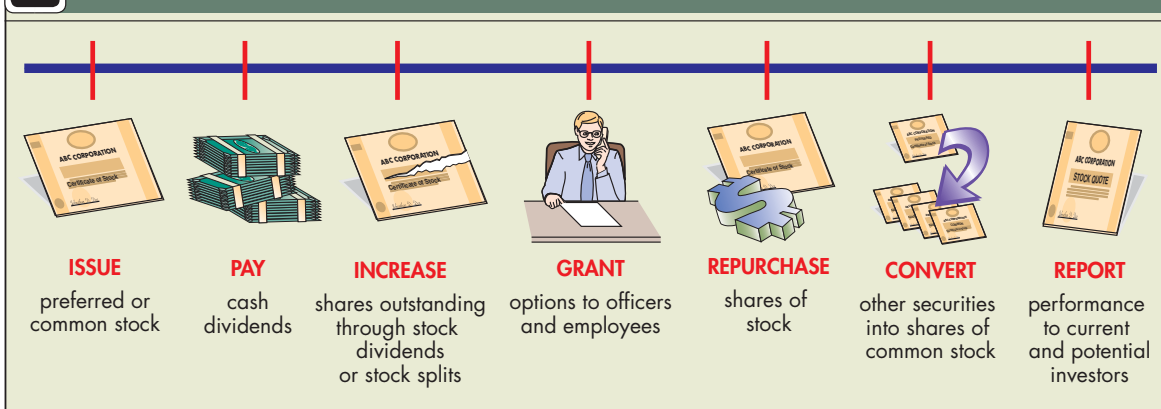

Although many items affect owners' equity, the major decisions associated with owner investment are illustrated in the time line in Exhibit 13-3. Note that many of the issues associated with transactions involving owners may or may not occur during any given period. Dividends may or may not be paid, and options may or may not be granted. This chapter discusses many of the possible actions that may be taken by management that will affect owners' equity.

## EX 13-2 EQUITY ITEMS

Stockholders' Equity
Contributed capital:
Preferred stock
Common stock
Additional paid-in capital
Retained earnings
Less: Treasury stock
Accumulated other comprehensive income:
Foreign currency translation adjustment
Unrealized gains and losses on available-for-sale securities
Unrealized gains and losses on some derivatives
Noncontrolling interest
Total stockholders' equity

## EX 13-3 TIME LINE OF ISSUES ASSOCIATED WITH OWNERS' EQUITY

© 2012 Cengage Learning.

## Nature and Classifications of Paid-In Capital

**1** Identify the rights associated with ownership of common and preferred stock.

**WHY** The providers of a company's financing (both debt and equity) need to know who else has provided financing to the company and in what amount. This information, coupled with knowledge of the rights held by each class of capital provider, allows any given capital provider to assess the risks and potential returns associated with the investment.

**HOW** Holders of common stock are the true owners of the business and have voting rights in corporate matters. Preferred shareholders do not typically possess voting rights but do have preference when it comes to the receipt of dividends.

A corporation is a legal, artificial entity that has an existence separate from its owners and may engage in business within prescribed limits just as if it were a real person. The modern corporation makes it possible for large amounts of resources to be assembled under one management. These resources are transferred to the corporation by individual owners, and in exchange for these resources, the corporation issues stock certificates evidencing ownership interests.<sup>5</sup> Stockholders elect a [board of directors](#) whose members oversee the strategic and long-run planning for the corporation. The directors select managers who supervise the day-to-day operations of the corporation.

Corporations are typically created under the incorporating laws of one of the 50 states. Because the states do not follow a uniform incorporating act, the conditions under which corporations may be created and under which they may operate are somewhat varied. Many businesses are incorporated in Delaware because constraints on cash dividends are loose, and Delaware laws governing corporations are generally seen as being “pro business.” In fact, of the 1,471 publicly traded companies in the United States with market values greater than \$1 billion as of the end of the first quarter of 2004, more than 50% (752 of 1,471) were incorporated in Delaware.

In theory, regulation of corporations is strictly a state matter falling outside the jurisdiction of federal authorities. However, in practice almost all issues of stock to the public fall under the jurisdiction of the federal Securities and Exchange Commission (SEC). Exceptions are made when an issue is small (less than \$1 million in any 12-month period), is made only to “accredited” investors (informed investors such as banks, investment companies, issuing company officers, and individuals with net worth exceeding \$1 million), or is made only to residents of a single state.

When a corporation is formed, a single class of stock, known as *common stock*, is usually issued. Corporations may later find that there are advantages to issuing one or more

### FYI

Boards of directors are composed of top managers of the company, top executives from other companies, prominent civic officials, and major shareholders. For example, the 2010 board of The Coca-Cola Company included Peter Ueberroth, former head of the Los Angeles Olympics Committee (1984) and former commissioner of Major League Baseball, and Alexis Herman, former U.S. Secretary of Labor and former director of Public Liaison for the White House.

<sup>5</sup> Briefly, the advantages of organizing a business as a corporation instead of as a sole proprietorship or partnership are that the investors in a corporation have limited liability (they can lose only what they put in; their other personal assets are safe), and ownership interest is easily transferable (there is no need to get approval from the other shareholders before selling your shares). The primary disadvantage is that corporate income is taxed twice: once at the corporate level and again at the individual level when shareholders receive cash dividends.

additional classes of stock with varying rights and priorities. Stock with certain preferences (rights) over common stock is called *preferred stock*.

### Common Stock

The owners of the common stock of a corporation can be thought of as the true owners of the business. If the corporation does poorly, the common stockholders are likely to lose some or all of their investment because they can receive cash from the corporation only after the claims of all other parties (i.e., lenders, employees, government, preferred stockholders) are satisfied. On the other hand, if the corporation does well, the common stockholders reap the benefit because they own all assets in excess of those needed to satisfy the fixed claims of others. In summary, the common stockholders bear the greatest risk, but they also stand to receive the highest return on their investment.

Unless restricted by terms of the articles of incorporation, certain basic rights are held by each common stockholder. These rights are as follows:

1. To vote in the election of directors and in the determination of certain corporate policies such as the management compensation plan or major corporate acquisitions.
2. To maintain one's proportional interest in the corporation through purchase of additional common stock if and when it is issued. This right is known as the *preemptive right* and ensures that a common stockholder's ownership percentage cannot be diluted against his or her will. In recent years, some states have eliminated the preemptive right.

**FYI**

Outside the United States, corporations sometimes have different classes of shares for local investors and for foreign investors. For example, Chinese corporations can have two classes of shares that trade on the Shanghai and Shenzhen stock exchanges: A shares, which only Chinese citizens (and selected foreign institutional investors) can own, and B shares, which can be purchased by foreigners. In February 2001, regulations were loosened, allowing Chinese citizens with approved foreign currency accounts to trade in B shares. Chinese B shares traded on The Stock Exchange of Hong Kong are called *H shares*. Shares of Chinese companies that trade on a U.S. exchange are called *N shares* (for "New York").

Usually, each corporation has only one class of common stock. However, a recent phenomenon is the creation of multiple classes of common stock, each with slightly different ownership privileges. For example, **Google** has two classes of common stock. Google Class B common is held almost exclusively by insiders and is not publicly traded. Each share of Class B common has 10 votes in board elections, compared to one vote for each share of the publicly traded Class A common. With this share structure, Google is able to raise

equity funding through issuance of Class A shares without seriously diluting voting control. Berkshire Hathaway, discussed in the opening scenario of this chapter, has created some Class B common shares that have 1/1,500 the value of the Class A shares—for those investors (such as you and the authors) who might not have the \$114,150 necessary to buy one share of Berkshire's Class A shares. However, to repeat, most corporations have only one class of common stock.

### Par or Stated Value of Stock

The journal entry to record the issuance of common stock in exchange for cash frequently looks something like this:

Cash .....	XXX
Common Stock (at par value) .....	XXX
Additional Paid-In Capital .....	XXX

Historically, **par value** was equal to the market value of the shares at issuance. Par value was also sometimes viewed by the courts as the minimum contribution by investors.<sup>6</sup> Accordingly, when corporate assets were insufficient to cover corporate liabilities, investors who had contributed less than par value were required to cover the shortfall. As a consequence, corporations began to issue shares with lower par values in order to protect investors. In addition, state incorporation laws were written to prevent payment of cash dividends whenever operating losses reduced corporate equity below total par value of shares issued. Lower par values allowed corporations more flexibility in their cash dividend policy.

Today, most stocks have either a nominal par value or no par value at all. No-par stock sometimes has a **stated value** that, for financial reporting purposes, functions exactly like a par value. As can be seen from Exhibit 13-4, 84.6% of publicly traded stocks in the United States have par values of \$1 or less.

FYI

Legal capital constraints are not usually a limiting factor for payment of cash dividends. More frequently, payment of dividends is restricted by debt covenants imposed by lenders. A typical debt covenant might require maintenance of a debt-to-equity ratio below a certain amount.

## Preferred Stock

The term *preferred stock* is somewhat misleading because it gives the impression that preferred stock is better than common stock. Preferred stock isn't better—it's different. In fact, a useful way to think of preferred stock is that preferred stockholders give up many of the rights of ownership in exchange for some of the protection enjoyed by creditors.

The rights of ownership given up by preferred stockholders are:

- **Voting.** In most cases, preferred stockholders are not allowed to vote for the board of directors. Voting rights can exist under circumstances specific to each preferred stock issue. For example, some preferred stockholders are granted corporate voting rights if the company fails to pay them cash dividends for, say, two consecutive quarters. When a company fails to pay preferred dividends, those dividends are said to have been “passed.”
- **Sharing in success.** The cash dividends received by preferred stockholders are usually fixed in amount. Therefore, if the company does exceptionally well, preferred stockholders do not get to share in the success. As a result of this cap on dividends, the market value of preferred stock does not typically vary with the success of the company as does the price of common stock. Instead, the market value of preferred stock varies with changes in interest rates, in much the same way as bond prices change.

The protections enjoyed by preferred stockholders, relative to common stockholders, are:

- **Cash dividend preference.** Preferred stockholders are entitled to receive their full cash dividend before any cash dividends are paid to common stockholders.
- **Liquidation preference.** If the company goes bankrupt, preferred stockholders are entitled to have their investment repaid, in full, before common stockholders receive anything.

<sup>6</sup> For a more complete discussion of the legal significance of par value, see Philip McGough, “The Legal Significance of the Par Value of Common Stock: What Accounting Educators Should Know,” *Issues in Accounting Education*, Fall 1988, pp. 330–350.

## EX 13-4 PAR VALUES OF PUBLICLY TRADED STOCKS

Par or Stated Values Publicly Traded Stocks in the United States For the Year 2003		
	All Firms	Only Firms with Market Value Greater Than \$1 Billion
Less than \$0.01 . . . . .	24.4%	9.9%
Exactly \$0.01 . . . . .	36.7	38.0
Between \$0.01 and \$1.00 . . . . .	15.3	18.8
Exactly \$1.00 . . . . .	8.2	13.2
Greater than \$1.00 . . . . .	15.4	20.1

**Source:** Standard & Poor's *COMPUSTAT*.

A later section in the chapter discusses in more detail the securities, such as preferred stock, that share the characteristics of both debt and equity. As financial markets become more sophisticated, the line between debt and equity continues to blur and disclosure issues associated with these hybrid securities become even more important.

Preferred stock is generally issued with a par value. When preferred stock has a par value, the dividend is stated in terms of a percentage of par value. When preferred stock is no par, the dividend must be stated in terms of dollars and cents. Thus, holders of 5% preferred stock with a \$50 par value are entitled to an annual dividend of \$2.50 per share before any distribution is made to common stockholders; holders of \$5 no-par preferred stock are entitled to an annual dividend of \$5 per share before dividends are paid to common stockholders.

A corporation may issue more than one class of preferred stock. For example, **Citigroup** described 14 classes of preferred stock in the notes to its 2008 financial statements; only four classes remained outstanding at the end of 2009. The classes vary in terms of dividend rates, redemption requirements, convertibility, and other features.

**Cumulative and Noncumulative Preferred Stock** When a corporation fails to declare dividends on **cumulative preferred stock**, such dividends accumulate and require payment in the future before any dividends may be paid to common stockholders.

For example, assume that Good Time Corporation has outstanding 100,000 shares of 9% cumulative preferred stock, \$10 par. Dividends were last paid in 2010. Total dividends of \$300,000 are declared in 2013 by the board of directors. The majority of this amount will be paid to the preferred shareholders as follows:

	Dividends to Preferred Shareholders	Dividends to Common Shareholders	Total Dividends
Cumulative dividend for 2011 . . . . .	\$ 90,000	—	\$ 90,000
Cumulative dividend for 2012 . . . . .	90,000	—	90,000
Dividends for 2013 . . . . .	90,000	\$30,000	120,000
Total . . . . .	<u>\$270,000</u>	<u>\$30,000</u>	<u>\$300,000</u>

Dividends on cumulative preferred stock that are passed are referred to as **dividends in arrears**. Although these dividends are not a liability until declared by the board of directors,

this information is important to stockholders and other users of the financial statements. The amount of dividends in arrears is disclosed in the notes to the financial statements. For example, **Harrah's Entertainment, Inc.**, a large U.S. corporation that owns several casinos, hotels, and golf courses, disclosed in the notes to its 2009 financial statements that it had \$652.6 million of dividends in arrears..

With **noncumulative preferred stock**, it is not necessary to provide for passed dividends. A dividend omission on preferred stock in any one year means it is irretrievably lost. Dividends may be declared on common stock as long as the preferred stock receives the preferred rate for the current period. Thus, in the previous example, if the preferred stock were noncumulative, the 2013 dividends would be distributed as follows:

	Dividends to Preferred Shareholders	Dividends to Common Shareholders	Total Dividends
Dividend passed in 2011 .....	—	—	—
Dividend passed in 2012 .....	—	—	—
Dividends for 2013 .....	\$90,000	\$210,000	\$300,000
Total .....	<u>\$90,000</u>	<u>\$210,000</u>	<u>\$300,000</u>

Preferred stock contracts normally provide for cumulative dividends. Also, courts have generally held that dividend rights on preferred stock are cumulative in the absence of specific provisions to the contrary.

**Participating Preferred Stock** Dividends on preferred stock are generally of a fixed amount. However, **participating preferred stock** issues provide for additional dividends to be paid to preferred stockholders after dividends of a specified amount are paid to the common stockholders. A participative provision makes preferred stock more like common stock. Although once quite common, participating preferred stocks are now relatively rare.

**Convertible Preferred Stock** Preferred stock is **convertible** when it can be exchanged by its owner for some other security of the issuing corporation. Conversion rights generally provide for the exchange of preferred stock into common stock. Conversion of preferred stock into common stock would be attractive when the company has done well, allowing the preferred shareholders to escape from the preferred dividend limits. In some instances, preferred stock may be convertible into bonds, thus allowing investors the option of changing their positions from stockholders to creditors. The journal entries required for stock conversions are illustrated later in the chapter. Consideration of convertible preferred stock is important in the calculation of diluted earnings per share; this is discussed in Chapter 18.

**Callable Preferred Stock** Many preferred issues are **callable**, meaning they may be called and canceled at the option of the corporation. The call price is usually specified in the original agreement and provides for payment of dividends in arrears as part of the repurchase price.

**Redeemable Preferred Stock** **Redeemable preferred stock** is preferred stock that is redeemable at the option of the stockholder or upon other conditions not within the control of the issuer (e.g., redemption on a specific date or upon reaching a certain level of earnings). This feature makes redeemable preferred stock somewhat like a loan in that

the issuing corporation may be forced to repay the stock proceeds. The FASB currently requires disclosure of the extent of redemption requirements for all issues of preferred stock that are callable or redeemable.<sup>7</sup> As described in a later section in this chapter, preferred stock that *must* be redeemed, called mandatorily redeemable preferred stock, is reported as a liability in the balance sheet instead of as equity.

**Current Developments in the Accounting for Preferred Stock** Since 1990 the FASB has been wrestling with the sticky issue of separating debt financing from equity financing. Their most current attempt is a *Preliminary Views* document, “Financial Instruments with Characteristics of Equity,” released on November 30, 2007. This document explains that many provisions of existing U.S. GAAP conflict with the Conceptual Framework definition of a liability, so a substantial reworking of the liability/equity distinction, with perhaps an accompanying change in the Conceptual Framework, is necessary.

In the *Preliminary Views* document, the FASB recommended the “basic ownership approach” to identifying equity. This approach hinges on the idea that equity claims are those that remain when all other claims have been satisfied. Thus, the only elements of financing that should be identified as “equity” are the most basic elements which are left when all claims with a higher priority have been satisfied.<sup>8</sup>

Application of this basic ownership approach would result in a very restrictive definition of equity. In fact, *all* preferred stock, whether redeemable or not, would be reported as a liability under this approach. User comments to both the FASB and the IASB have been overwhelmingly against this “basic ownership approach.” Instead, users prefer a “perpetual approach,” which describes an equity instrument as one for which there is no requirement to repay the invested funds, and the holder of the instrument is entitled to some assets if the company is liquidated. Preferred shares would be classified as equity under this “perpetual approach.” Both the FASB and the IASB are leaning toward the “perpetual approach.” However, remember that no final decision has been made, so stay tuned. For the time being, most preferred stock is classified as equity.

## Issuance of Capital Stock

2

Record the issuance of stock for cash, on a subscription basis, and in exchange for noncash assets or for services.

**WHY** To avoid misstating the amount of financing provided by the shareholders in a corporation, issued shares must be carefully valued whenever anything other than cash is received in exchange for the shares. In addition, to avoid inflating the apparent amount of equity funds received by a corporation, stock subscriptions receivable (but not yet received) do not result in a net increase in equity.

**HOW** Issued stock is recorded using the fair value of the assets or services received in exchange for the shares or the fair market value of the shares issued, whichever is more objectively determinable. Stock subscriptions receivable are *not* reported as an asset.

Stock can be issued in exchange for cash, on a subscription basis, in exchange for noncash consideration, or as part of a business combination. The accounting for each of these possibilities is described on the following pages.

<sup>7</sup> FASB ASC paragraphs 505-10-50-4 and 5.

<sup>8</sup> *Preliminary Views*, “Financial Instruments with Characteristics of Equity” (Norwalk, CT: Financial Accounting Standards Board, November 2007), par. D11.

## Capital Stock Issued for Cash

The issuance of stock for cash is recorded by a debit to Cash and a credit to Capital Stock for the par or stated value.<sup>9</sup> When the amount of cash received from the sale of stock is more than the par or stated value, the excess is recorded separately as a credit to an **additional paid-in capital** account. This account is carried on the books as long as the stock to which it relates is outstanding. When stock is retired, the Capital Stock balance as well as any related Additional Paid-In Capital balance is generally canceled.

To illustrate, assume that Goode Corporation issued 4,000 shares of \$1 par common stock on April 1, 2011, for \$45,000 cash. The entry to record the transaction is as follows:

2011		
Apr. 1	Cash .....	45,000
	Common Stock .....	4,000
	Paid-In Capital in Excess of Par .....	41,000

If, in the example, the common stock were no-par stock but with a \$1 stated value, the entry would be the same except that the \$41,000 would be designated Paid-In Capital in Excess of Stated Value. Generally, stock is assigned a par or a stated value. However, if there is no such value assigned, the entire amount of cash received on the sale of stock is credited to the capital stock account, and no additional paid-in capital account is associated with the stock. Assuming Goode Corporation's stock was no-par common without a stated value, the entry to record the sale of 4,000 shares for \$45,000 would be as follows:

2011		
Apr. 1	Cash .....	45,000
	Common Stock .....	45,000

## Capital Stock Sold on Subscription

Capital stock may be issued on a subscription basis. A **subscription** is a legally binding contract between the subscriber (purchaser of stock) and the corporation (issuer of stock). The contract states the number of shares subscribed, the subscription price, the terms of payment, and other conditions of the transaction. A subscription gives the corporation a legal claim for the contract price and gives the subscriber the legal status of a stockholder unless certain rights as a stockholder are specifically withheld by law or by terms of the contract. Ordinarily, stock certificates evidencing share ownership are not issued until the full subscription price has been received by the corporation.

The following entries illustrate the recording and issuance of capital stock sold on subscription.

*November 1–30: Received subscriptions for 5,000 shares of \$1 par common at \$12.50 per share with 50% down, balance due in 60 days.*

Common Stock Subscriptions Receivable .....	62,500	
Common Stock Subscribed .....		5,000
Paid-In Capital in Excess of Par .....		57,500
Cash .....	31,250	
Common Stock Subscriptions Receivable .....	31,250	

<sup>9</sup> *Capital stock* is a general term; when it is used in account titles in the text, it represents either preferred stock or common stock. When an illustration is meant to apply specifically to preferred or common stock, the appropriate term is used in the account title.

December 1–31: Received balance due on one-half of subscriptions and issued stock to the fully paid subscribers, 2,500 shares.

Cash . . . . .	15,625	
Common Stock Subscriptions Receivable . . . . .		15,625
Common Stock Subscribed . . . . .	2,500	
Common Stock . . . . .		2,500

Contributed capital would be reported in the Stockholders' Equity section of the December 31 balance sheet as follows:

<b>Stockholders' Equity</b>	
Contributed capital:	
Common stock, \$1 par, 2,500 shares issued and outstanding . . . . .	\$ 2,500
Common stock subscribed, 2,500 shares . . . . .	2,500
Paid-in capital in excess of par . . . . .	57,500
	<u>\$62,500</u>
Less: Common stock subscriptions receivable . . . . .	15,625
Total contributed capital . . . . .	<u>\$46,875</u>

Capital Stock Subscriptions Receivable should normally not be shown as an asset but as an offset to equity.<sup>10</sup> This treatment is deemed appropriate because the legal penalty against subscribers who don't fully pay the contract price is often minimal, increasing the probability that the issuer of the stock may not fully collect on the subscriptions receivable. SEC rules allow subscription amounts receivable as of the balance sheet date to be shown as a current asset if the full contract price is collected prior to the date the financial statements are actually issued. For example, **Nebo Products**, a Draper, Utah-based importer of hand tools and camping gear (manufactured in Taiwan, China, and India), reported stock subscriptions receivable totaling \$1,302,586 in its December 31, 2001, balance sheet. Of this amount, \$201,664 was reported as a current asset, and \$1,100,922 was reported as a subtraction from stockholders' equity. By way of explanation, Nebo reported the following in its 2001 annual report: "From January 2002 to March 25, 2002 [the date on the audit opinion], the company collected a total of \$201,664 of stock subscriptions receivable."

**Subscription Defaults** If a subscriber defaults on a subscription by failing to make a payment when it is due, a corporation may (1) return to the subscriber the amount paid, (2) return to the subscriber the amount paid less any reduction in price or expense incurred on the resale of the stock, (3) declare the amount paid by the subscriber as forfeited, or (4) issue to the subscriber shares equal to the number paid for in full. The practice followed will depend on the policy adopted by the corporation within the legal limitations set by the state in which it is incorporated.

### Capital Stock Issued for Consideration Other Than Cash

When capital stock is issued for consideration in the form of property other than cash or for services received, the fair market value of the stock or the fair market value of the property or services, whichever is more objectively determinable, is used to record

<sup>10</sup> FASB ASC paragraph 505-10-45-2.

the transaction. If a quoted market price for the stock is available, that amount should be used as a basis for recording the exchange. Otherwise, it may be possible to determine the fair market value of the property or services received, for example, through appraisal by a competent outside party.

To illustrate, assume that AC Company issues 200 shares of \$0.50 par value common stock in return for land. The company's stock is currently selling for \$50 per share. The entry on AC Company's books would be as follows:

Land .....	10,000	
Common Stock .....		100
Paid-In Capital in Excess of Par .....		9,900

If, on the other hand, the land has a readily determinable market price of \$12,000 but AC Company's common stock has no established fair market value, the transaction would be recorded as follows:

Land .....	12,000	
Common Stock .....		100
Paid-In Capital in Excess of Par .....		11,900

If no readily determinable value is available for either the stock or the property or services received, the accepted procedure is to have the value of the property or services independently appraised. If the transaction is material, the source of the appraisal should be disclosed in the financial statements.

When stock is issued in exchange for services, the journal entry is similar to that just illustrated. Assume that AC Company decides not to pay a key employee in cash but instead grants the employee 100 shares of \$0.50 par common stock, with a market value of \$50 per share, as payment of salary. The transaction would be recorded as follows:

Salary Expense .....	5,000	
Common Stock .....		50
Paid-In Capital in Excess of Par .....		4,950

This entry is interesting because it is so noncontroversial. However, if AC Company were to pay the employee with stock options instead of with actual shares of stock, the accounting would be highly controversial. Accounting for stock options given as employee compensation is discussed later in the chapter.

### Issuance of Capital Stock in a Business Combination

Corporations often merge; the combination of **Mars** and **Wrigley** in a \$22 billion deal in 2008 is one recent example. The union of two corporations is called a **business combination**. The combination can be accomplished by one corporation paying cash to buy out the shareholders of the other, by an exchange of stock whereby all the shareholders of the two separate corporations become joint shareholders of the new combined company, or by a mixture of a cash buyout and a stock swap.

The accounting for a business combination assumes that one of the companies is dominant and is acquiring the other company. The assets of the company being acquired are revalued to their fair value. In addition, the acquiring company records goodwill if the value of the cash and stock given in the acquisition exceeds the fair value of the net assets acquired. Accounting for business combinations is discussed in detail in advanced accounting texts. Accounting for the acquisition of a business and any resulting goodwill was covered in Chapters 10 and 11.

## Stock Repurchases

3

Use both the cost and par value methods to account for stock repurchases.

**WHY** There is really no good reason to have two different methods for accounting for stock repurchases. However, given that the two exist, it is important to understand the differences between them. For example, use of the par value method can have a significant impact on the reported amount of a company's retained earnings.

**HOW** The cost method is quite simple with the amount paid to repurchase the shares recorded in a contra-equity account. The par value method treats a stock repurchase similar to the retirement of stock, and Paid-In Capital in Excess of Par and (sometimes) Retained Earnings are debited.

For a variety of reasons, a company may find it desirable to reacquire shares of its own stock. **ExxonMobil**, for example, has been the most aggressive company in buying back its own stock. As of December 31, 2009, Exxon Mobil had spent a cumulative net amount of \$166.4 billion in buying back its own shares. Coca-Cola, another company well known for stock repurchasing, had spent more than \$25.4 billion as of December 31, 2009, in buying back its own stock. In general, companies acquire their own stock to:

1. Provide shares for incentive compensation and employee savings plans.
2. Obtain shares needed to satisfy requests by holders of convertible securities (bonds and preferred stock).
3. Reduce the amount of equity relative to the amount of debt.
4. Invest excess cash temporarily.
5. Remove some shares from the open market in order to protect against a hostile takeover.
6. Improve per-share earnings by reducing the number of shares outstanding and returning inefficiently used assets to shareholders.
7. Display confidence that the stock is currently undervalued by the market.

Whatever the reason, a company's stock may be reacquired by exercise of call or redemption provisions or by repurchase of the stock in the open market. State laws normally prohibit the repurchase of stock if the repurchase would impair the ability of creditors to be repaid. In many states, the total amount spent to repurchase shares cannot exceed the sum of additional paid-in capital and retained earnings. In addition, share repurchases at exorbitant prices are banned because they dilute the stock value for the remaining shareholders.

In accounting for the reacquisition of stock, remember that reacquisitions do not give rise to income or loss. A company issues stock to raise capital. In reacquiring shares of its stock, the company is merely reducing its invested capital. Gains or losses arise from the operating and investing activities of the business, not from transactions with shareholders.

A company's stock may be reacquired for immediate retirement or be reacquired and held as treasury stock for subsequent disposition, either eventual retirement or reissuance. There are two methods of accounting for treasury stock transactions: the cost method and the par value method. After a short discussion of treasury stock, these methods will be discussed in detail.

### Treasury Stock

When a company's own stock is reacquired and held in the name of the company, it is referred to as **treasury stock**. Treasury shares may subsequently be reissued or formally

retired. Before discussing how to account for treasury stock, three important features should be noted:

- Treasury stock should not be viewed as an asset; instead, it should be reported as a reduction in total owners' equity.
- There is no income or loss on the reacquisition, reissuance, or retirement of treasury stock.
- Retained earnings can be decreased by treasury stock transactions but is never increased by such transactions.

Two methods for recording treasury stock transactions are generally accepted: (1) the **cost method**, which records the treasury stock in a special equity account until the shares are reissued or retired; and (2) the **par (or stated) value method**, which accounts for the purchase of treasury stock as if the shares were being retired.

## CAUTION

Reacquisition of shares may reduce retained earnings, but it can *never* increase retained earnings.

**Cost Method of Accounting for Treasury Stock** Under the cost method, the purchase of treasury stock is recorded by debiting a treasury stock account for the total amount paid to repurchase the shares. The treasury stock account is reported as a deduction from total stockholders' equity on the balance sheet.

The cost method of accounting for treasury stock transactions is illustrated in the following example:

**2012**—Newly organized corporation issued 10,000 shares of common stock, \$1 par, at \$15:

Cash . . . . .	150,000	
Common Stock . . . . .		10,000
Paid-In Capital in Excess of Par . . . . .		140,000

Net income for the first year of business was \$30,000.

**2013**—Reacquired 1,000 shares of common stock at \$40 per share:

Treasury Stock . . . . .	40,000	
Cash . . . . .		40,000

**2013**—Sold 200 shares of treasury stock at \$50 per share:

Cash . . . . .	10,000	
Treasury Stock (200 × \$40) . . . . .		8,000
Paid-In Capital from Treasury Stock . . . . .		2,000

Because the treasury stock is reissued at a price greater than the \$40 repurchase price, the excess is recorded in an additional paid-in capital account. (*Note:* No gain is recorded.)

**2013**—Sold 500 shares of treasury stock at \$34 per share:

Cash . . . . .	17,000	
Paid-In Capital from Treasury Stock . . . . .		2,000
Retained Earnings . . . . .		1,000
Treasury Stock (500 × \$40) . . . . .		20,000

Because the treasury stock is reissued at a price less than the \$40 repurchase price, Retained Earnings is debited for the difference, or as in this example, any paid-in capital from prior treasury stock reissuances may first be debited.

**2013**—Retired remaining 300 shares of treasury stock (3% of original issue of 10,000 shares):

Common Stock .....	300
Paid-In Capital in Excess of Par .....	4,200
Retained Earnings [300 × (\$40 - \$15)] .....	7,500
Treasury Stock (300 × \$40) .....	12,000

**FYI**

In the 1980s, a large number of “greenmail” treasury stock transactions occurred. A firm repurchased its shares from a troublesome shareholder at a price significantly greater than the market value. In many cases, the “greenmail” in excess of the market value of the repurchased shares had to be expensed.

Alternatively, the entire \$11,700 difference between Common Stock and the cost to acquire the treasury stock may be debited to Retained Earnings.

It should be noted that in the example, all treasury stock was acquired at \$40 per share. If several acquisitions of treasury stock are made at different prices, the resale or retirement of

treasury shares must be recorded using the actual cost to reacquire the shares being sold or retired (specific identification) or using the basis of a cost flow assumption, such as FIFO or average cost.

**Par (or Stated) Value Method of Accounting for Treasury Stock** If the par (or stated) value method is used, the purchase of treasury stock is regarded as a withdrawal of a group of stockholders. Similarly, the sale or reissuance of treasury stock, under this approach, is viewed as the admission of a new group of stockholders, requiring entries giving effect to the investment by this group. Thus, the purchase and sale are viewed as two separate and unrelated transactions.

Using the data given for the cost method illustration, the following entries would be made for 2013 under the par value method:

**2013**—Reacquired 1,000 shares of common stock at \$40 per share:

Treasury Stock .....	1,000
Paid-In Capital in Excess of Par .....	14,000
Retained Earnings [1,000 × (\$40 - \$15)] .....	25,000
Cash .....	40,000

Sold 200 shares of treasury stock at \$50 per share:

Cash .....	10,000
Treasury Stock .....	200
Paid-In Capital in Excess of Par .....	9,800

Sold 500 shares of treasury stock at \$34 per share:

Cash .....	17,000
Treasury Stock .....	500
Paid-In Capital in Excess of Par .....	16,500

Retired remaining 300 shares of treasury stock:

Common Stock .....	300
Treasury Stock .....	300

**Evaluating the Cost and Par Value Methods** Less than 10% of large U.S. companies use the par value method. Using the numbers from the example just given, the following comparison shows the impact on stockholders’ equity of the two approaches after the original stock repurchases have occurred but prior to the reissuance or retirement of the treasury shares.

### Comparison of Stockholders' Equity

	Cost Method	Par Value Method
Contributed capital:		
Common stock .....	\$ 10,000	\$ 10,000
Paid-in capital in excess of par .....	<u>140,000</u>	<u>126,000</u>
Total contributed capital .....	\$150,000	\$136,000
Retained earnings .....	<u>30,000</u>	<u>5,000</u>
Total contributed capital and retained earnings .....	\$180,000	\$141,000
Less: Treasury stock .....	<u>40,000</u>	<u>1,000</u>
Total stockholders' equity .....	<u>\$140,000</u>	<u>\$140,000</u>

Note that total stockholders' equity is the same regardless of which method is used. As the example shows, however, there may be differences in the relative amounts of contributed capital and retained earnings reported. Note again that retained earnings may be decreased by treasury stock transactions but can never be increased by buying or selling treasury stock. Exhibit 13-5 lists the 10 largest companies in the United States (in terms of their April 2010 market value) and their stock repurchases, according to reported information. It is interesting to note that three of these 10 companies—Microsoft, **Wal-Mart**, and **Bank of America**—use the par value method of accounting for their treasury stock purchases. Note also that Berkshire Hathaway, **Apple**, and Google do not repurchase shares of their own stock. Because of poor operating performance associated with the 2008 worldwide financial meltdown, Bank of America did not buy back shares in 2008 or 2009, but did engage in stock buybacks in the years before 2008.

## STOP & THINK

After looking at this comparison, why do you think so few companies use the par value method?

- Use of the cost method usually increases reported earnings.
- Use of the par value method usually involves reducing retained earnings.
- Use of the par value method requires the company to pay more for the repurchased shares.
- Use of the par value method increases long-term debt.

### EX 13-5 TREASURY STOCK PURCHASES FOR THE 10 LARGEST U.S. COMPANIES

Rank	Market Value (in \$billions)	Repurchases During the Year	Balance Sheet Amount	Accounting Method
1. ExxonMobil	\$308.77	\$19,703	\$166,410	Cost
2. Microsoft	254.52	2,611	0	Par Value
3. Wal-Mart	205.37	7,397	0	Par Value
4. Berkshire Hathaway	190.86	0	0	?
5. Apple	189.51	0	0	?
6. Procter & Gamble	184.47	6,370	55,961	Cost
7. Johnson & Johnson	174.90	2,130	19,780	Cost
8. General Electric	169.65	214	32,238	Cost
9. Google	169.38	0	0	?
10. Bank of America	167.63	0	0	Par Value

© 2012 Cengage Learning.

**Retirement of Repurchased Shares** If shares of stock are reacquired at par (or stated) value and then retired, the capital stock account is debited and the cash account is credited. However, if the purchase price of the stock exceeds the par value, the excess amount may be (1) charged to any paid-in capital balances applicable to that class of stock, (2) allocated between Paid-In Capital and Retained Earnings, or (3) charged entirely to Retained Earnings.<sup>11</sup> The alternative used depends on the existence of previously established paid-in capital amounts and on management's preference.

## Stock Rights, Warrants, and Options

4

Account for the issuance of stock rights and stock warrants.

**WHY** Stock rights, warrants, and options are separate equity instruments with unique characteristics. Accordingly, for a financial statement user to understand the potential impact of these items on the issuing company's financial structure, these items must be recognized or disclosed separately.

**HOW** When stock warrants are issued in connection with debt or preferred stock, a portion of the total issuance proceeds should be allocated to the stock warrants based on the relative fair value of the warrants.

A corporation may issue rights, warrants, or options that permit the purchase of the company's stock for a specified period (the exercise period) at a certain price (the exercise price). Although the terms *rights*, *warrants*, and *options* are sometimes used interchangeably, a distinction may be made as follows:

- **Stock rights**—issued to existing shareholders to permit them to maintain their proportionate ownership interests when new shares are to be issued. (Some state laws require this preemptive right.)
- **Stock warrants**—sold by the corporation for cash, generally in conjunction with the issuance of another security.
- **Stock options**—granted to officers or employees, usually as part of a compensation plan.

A company may offer rights, warrants, or options to raise additional capital, to encourage the sale of a particular class of securities, or as compensation for services received. The exercise period is generally longer for warrants and options than for rights. Warrants and rights may be traded independently among investors, whereas options generally are restricted to a particular person or specified group to whom the options are granted. The accounting considerations relating to stock rights, warrants, and options are described in the following sections.

### Stock Rights

When announcing rights to purchase additional shares of stock, the directors of a corporation specify a date on which the rights will be issued. All stockholders of record on the issue date are entitled to receive the rights. Thus, between the announcement date and the issue date, the stock is said to sell *rights-on*. After the rights are issued, the stock sells *ex-rights*, and the rights may be sold separately by those receiving them from the corporation. An expiration date is also designated when the rights are announced, and rights not exercised by this date are worthless.

<sup>11</sup> FASB ASC paragraph 505-30-30-8.

When rights are issued to stockholders, only a memorandum entry is made on the issuing company's books stating the number of shares that may be claimed under the outstanding rights. This information is required so the corporation may retain sufficient unissued or reacquired stock to meet the exercise of the rights. Upon surrender of the rights and the receipt of payments as specified by the rights, the stock is issued. At this time, a memorandum entry is made to record the decrease in the number of rights outstanding accompanied by an entry to record the stock sale. The entry for the sale is recorded the same as any other issue of stock, with appropriate recognition of the cash received, the par, or stated, value of the stock issued, and any additional paid-in capital. Information concerning outstanding rights should be reported with the corporation's balance sheet so that the effects of the future exercise of remaining rights may be determined.

FYI

A company would include warrants to encourage investors to purchase the company's bonds. Of course, another way to encourage investors to purchase the bonds is to increase the interest rate paid on the bonds. Therefore, warrants can be viewed as decreasing the interest rate that must be paid.

### Stock Warrants

Warrants may be sold in conjunction with other securities as a “sweetener” to make the purchase of the securities more attractive. For example, warrants to purchase shares of a corporation's common stock may be issued with bonds to encourage investors to purchase the bonds. A warrant has value when the exercise price is less than the market value, either present or potential, of the security that can be purchased with the warrants. Warrants issued with other securities may be detachable or nondetachable. **Detachable warrants** are similar to stock rights because they can be traded separately from the security with which they were originally issued. **Nondetachable warrants** cannot be separated from the security with which they were issued.

Part of the issuance price of debt securities is assigned to any detachable stock warrants and classified as part of owners' equity.<sup>12</sup> The value assigned to the warrants is determined by the relative fair value method which is illustrated in the following equation:

$$\text{Value assigned to warrants} = \frac{\text{Total issue price}}{\text{Market value of security without warrants} + \text{Market value of warrants}} \times \text{Market value of warrants}$$

Although the FASB's standards are directed only to warrants attached to debt, it appears logical to extend the conclusions of that opinion to warrants attached to preferred stock. Thus, if a market value exists for the warrants at the issuance date, a separate equity account is credited with that portion of the issuance price assigned to the warrants. If the warrants are exercised, the value assigned to the common stock is the value allocated to the warrants plus the cash proceeds from the issuance of the common stock. If the warrants are allowed to expire, the value assigned to the warrants may be transferred to a permanent paid-in capital account.

FYI

From an investor standpoint, both the preferred shares and the detachable warrants are recorded at their fair values.

<sup>12</sup> FASB ASC paragraph 470-20-25-2.

Accounting for detachable warrants attached to a preferred stock issue is illustrated as follows. Assume that Stewart Co. sells 1,000 shares of \$50 par preferred stock for \$58 per share. As an incentive to purchase the stock, Stewart Co. gives the purchaser detachable warrants enabling holders to subscribe to 1,000 shares of \$2 par common stock for \$25 per share. The warrants expire after one year. Immediately following the issuance of the preferred stock, the warrants are selling at \$3, and the fair market value of the preferred stock without the warrant attached is \$57. The proceeds of \$58,000 should be allocated by Stewart Co. as follows:

$$\text{Value assigned to the warrants} = \$58,000 \times \frac{\$3}{\$57 + \$3} = \$2,900$$

The entry on Stewart's books to record the sale of the preferred stock with detachable warrants is as follows:

Cash .....	58,000	
Preferred Stock, \$50 par .....		50,000
Paid-In Capital in Excess of Par—Preferred Stock .....		5,100
Common Stock Warrants .....		2,900

If the warrants are exercised, the entry to record the issuance of common stock would be as follows:

Common Stock Warrants .....	2,900	
Cash .....	25,000	
Common Stock, \$2 par .....		2,000
Paid-In Capital in Excess of Par—Common Stock .....		25,900

This entry would be the same regardless of the market price of the common stock at the issuance date.

If the warrants in the example were allowed to expire, the following entry would be made:

Common Stock Warrants .....	2,900	
Paid-In Capital from Expired Warrants .....		2,900

Under current U.S. GAAP, if warrants are nondetachable, the securities are considered inseparable, and no allocation is made to recognize the value of the warrant. The entire proceeds are assigned to the security to which the warrant is attached. Thus, for nondetachable warrants, the accounting treatment is similar to that for convertible securities, such as convertible bonds. Clearly, from a conceptual standpoint this inconsistency is not justified because the economic value of a warrant exists, even if the warrant cannot be traded separately or “detached.” This is essentially the same argument made for recognizing the conversion feature of a convertible security. Notwithstanding this argument, a separate instrument does not exist for a nondetachable warrant, and current practice in the United States does not require a separate value to be assigned to these warrants. In its October 2000 *Exposure Draft*, “Accounting for Financial Instruments with Characteristics of Liabilities, Equity, or Both,” the FASB recommended the relative fair value method for allocating the proceeds for all securities that combine different elements of debt, preferred stock, and common stock. But so far no such comprehensive standard has been adopted in the United States. In contrast, *IAS 32* requires all compound financial instruments to be recorded as separate debt and equity components.

# Accounting for Share-Based Compensation

5

Compute the compensation expense associated with the granting of employee stock options.

**WHY** Share-based compensation comprises an important component of the compensation packages of many employees in the United States, especially for upper-level management of large corporations and for employees at all levels in technology-based startup companies. Fair and accurate reporting of the total compensation expense for these companies requires that share-based compensation be reported as an expense in the income statement.

**HOW** The fair value of share-based compensation is estimated as of the date the compensation is granted. This fair value is then expensed over the service period required of the employee to earn the compensation.

During 1994, debate over the proper accounting for employee stock options escalated into a full-scale war, with the FASB pitted against the business community and, ultimately, the Congress of the United States. The subject of all the controversy was this: Should the fair value of stock options granted to employees be estimated and recognized as part of compensation expense? In his letter to the shareholders in Berkshire Hathaway's 1993 annual report, Warren Buffett approvingly summarized the position of the FASB:

If options aren't a form of compensation, what are they? If compensation isn't an expense, what is it? And if expenses shouldn't go into the calculation of earnings, where in the world should they go?<sup>13</sup>

In spite of this logic, the FASB surrendered to the pressure and did not require the recognition of a stock option expense because "the debate threatened the future of accounting standard-setting in the private sector,"<sup>14</sup> meaning that Congress had suggested the possibility of abolishing the FASB if it didn't toe the line on stock option accounting. The FASB's compromise was to encourage companies to recognize a stock option expense or, if they didn't, then to disclose an estimate of this expense in the notes to the financial statements. Almost all companies chose the disclosure route.

In 2002, stock option accounting again became a hot issue in the wake of the financial accounting scandals that began to bubble to the surface in 2001. Many financial statement users pointed to stock option accounting as another example of poor accounting rules that allowed companies to hide their activities from investors and creditors. In this case, the activity being hidden was the granting of stock options to top corporate executives.

So, in 2003 the FASB again added stock option accounting to its agenda but quickly found that the strong feelings against expensing the cost of stock options had not died down. When the FASB issued an Exposure Draft in March 2004 that basically repeated its position

i

FYI

Employee stock options are *not* the same as the call and put stock options traded on major exchanges. Traded option contracts can exist between any two parties. Call options entitle the owner to buy shares of a certain stock at a set "exercise" price. Put options entitle the owner to sell shares at a set price.

<sup>13</sup> Berkshire Hathaway Annual Report—1993.

<sup>14</sup> Pre-Codification *Statement of Financial Accounting Standards No. 123*, "Accounting for Stock-Based Compensation" (Norwalk, CT: Financial Accounting Standards Board, 1995), par. 60.

from back in 1994, yet another firestorm of protest arose. The FASB received 14,239 comment letters in response to this Exposure Draft; by comparison, issuance of a typical Exposure Draft rarely elicits more than 100 comment letters, and usually the FASB receives just 20 or 30 comment letters. Business lobbying of Congress against the FASB's Exposure Draft prompted passage of a House Resolution mandating alternative accounting that would have greatly reduced companies' reported stock option compensation expense; mercifully, this bill died in the Senate.

In opposing the FASB's proposal to require expensing the fair value of stock options granted to employees, businesses concocted a marvelous array of pseudo-theoretical arguments that we, the authors, would rather not repeat here. Theoretical arguments aside, the vast majority of corporations in the United States opposed the FASB's attempt to require recognition of a stock option compensation expense for a simple reason: Recognition of a stock option compensation expense would reduce reported earnings. The area of stock option accounting is a perfect illustration of why we need an independent financial accounting standard setter such as the FASB—financial statement users need informative and unbiased information about companies, which those companies would sometimes prefer not to include in the financial statements. In December 2004, the FASB adopted pre-Codification *Statement No. 123* (revised 2004), "Share-Based Payment," which requires the expensing of the fair value of stock options granted as compensation. This standard is now found in FASB ASC Topic 718 (Compensation—Stock Compensation).

The recognition and disclosure requirements for stock option compensation plans are illustrated in the following example. A simple plan is illustrated first, followed by some exposure to the accounting for more complex plans.

### Basic Stock Option Compensation Plan

On January 1, 2011, the board of directors of Neff Company authorized the grant of 10,000 stock options to supplement the salaries of certain employees. Each stock option permits the purchase of one share of Neff common stock at a price of \$50 per share; the market price of the stock on January 1, 2011, is also \$50 per share. (This is typical of many actual stock option plans for real companies. For example, in its 2009 annual report, **Toys "R" Us** states that options granted under its Management Equity Plan have an exercise price equal to the stock's fair market value on the grant date.) The options vest, or become exercisable, beginning on January 1, 2014, and only if the employees stay with the company for the entire 3-year vesting period. The options expire on December 31, 2014.

Neff is required to estimate the fair value of the options as of the grant date. Clearly, each option has value because the stock price could increase above \$50 during the 3-year period and the options give the employees the right to buy the stock at the fixed exercise price of \$50. Computation of the fair value of the options involves consideration of factors such as the expected volatility of the stock price and the length of time the options are valid. For example, the higher the volatility of the stock price, the higher the value of the option, because there is a better chance that the stock price will increase significantly. Of course, increased volatility also means that there is an increased probability that the stock price will decrease. However, this doesn't negatively impact the option value, because the employees can choose not to exercise the option if the share price drops below the option price of \$50. Also, an option with a longer

term has increased value because there is a better chance of a significant stock price increase over a long time period than there is over a short one. Exact computation of option values involves formulas derived using stochastic calculus (the famous Black-Scholes model) or discrete probability lattice models (such as the binomial model).

Unfortunately, we don't have time to cover stochastic calculus in this text. However, commercially available software packages make option valuation no more difficult than using a spreadsheet.

For the Neff Company example, assume that an option-pricing formula is used to estimate a grant date value of \$10 for each of the employee stock options. Thus, the total fair value of the options granted is \$100,000 ( $10,000 \times \$10$ ) as of the grant date. Once the options granted have been valued, the remaining accounting problem is determining when the compensation expense should be recognized. The compensation should be charged to the periods in which the employees perform the services for which the options are granted. In the Neff example, no specific service period is mentioned, so compensation cost is allocated over the 3-year period between the January 1, 2011, grant date and the January 1, 2014, vesting date. The journal entry to record the recognition of compensation expense for 2011 is as follows:

2011

Dec.	31	Compensation Expense (\$100,000/3 years) . . . . .	33,333	
		Paid-In Capital from Stock Options . . . . .		33,333

Note that this paid-in capital is *not* from the investment of cash in the business but instead represents an investment of work by the employees covered under the stock option plan.

Similar entries would be made in 2012 and 2013. At the end of the 3-year service period, the balance in the additional paid-in capital from stock options account is \$100,000, which is equal to the grant date value of the options.

The journal entry to record the exercise of all 10,000 of the options on December 31, 2014, to purchase shares of Neff's no-par common stock would be as follows:

2014

Dec.	31	Cash ( $10,000 \times \$50$ ) . . . . .	500,000	
		Paid-In Capital from Stock Options . . . . .	100,000	
		Common Stock (no par) . . . . .		600,000

If the options had been allowed to expire unexercised, the following journal entry could be made on December 31, 2014, the end of the exercise period, to reclassify the paid-in capital from the stock options:

2014

Dec.	31	Paid-In Capital from Stock Options . . . . .	100,000	
		Paid-In Capital from Expired Options . . . . .		100,000

FYI

In general, an employee has taxable income in the amount of the difference between the option exercise price and the stock price on the date the options are exercised. The worst-case scenario occurs when an employee exercises options, holds the stock, and the stock subsequently declines drastically in value. If the stock price has declined enough, selling the stock might not generate enough cash even to pay the tax.

**Required Disclosure** The following note disclosure (illustrated for 2011) is required each year:

<b>Employee Stock Options</b>		
	<b>Shares</b>	<b>Exercise Price</b>
Outstanding at January 1, 2011 . . . . .	0	—
Granted during 2011 . . . . .	10,000	\$50
Exercised during 2011 . . . . .	0	—
Forfeited during 2011 . . . . .	0	—
Outstanding at December 31, 2011 . . . . .	<u>10,000</u>	<u>\$50</u>
Options exercisable at December 31, 2011 . . . . .	0	
Weighted-average fair value of options granted during 2011 . . . . .	\$10	
Compensation expense associated with the stock option plan in 2011 . . . . .	\$33,333	

The note should also include a general description of the employee stock option plan as well as a description of the techniques used in estimating the fair value of the options.

**IASB Standard** The release of pre-Codification FASB *Statement No. 123* (revised 2004) is an excellent example of how the convergence between FASB and IASB standards is improving the quality of both sets of standards. In February 2004, the IASB adopted *International Financial Reporting Standard (IFRS) 2*, “Share-Based Payment.” This standard requires essentially the same expensing of stock options as initially proposed by the FASB back in 1994. Because the granting of employee stock options is much less common outside the United States, the IASB did not experience nearly as much opposition to its stock option expensing proposal as did the FASB. And once the IASB had adopted its standard, the FASB could wave the flag of “international harmonization” to aid in promulgating the U.S. stock option expensing standard over the protests of the U.S. business community and Congress.

### Accounting for Performance-Based Plans

The simple example above is based on a simple stock option plan. In such a plan, the plan terms (i.e., the option exercise price and the number of options granted) are fixed as of the date the options are granted. In a **performance-based stock option plan**, the plan terms are dependent on how well the individual or company performs after the date the options are granted. In the simple stock option plan of Neff Company that is illustrated above, Neff’s employees needed only to stay with the company for the entire 3-year vesting period in order to receive the full value of the options. With a performance-based plan, the terms of the option depend on how well an employee performs or how well the company performs during the vesting period. To illustrate, assume that the terms of the Neff Company stock-based compensation plan are as follows:

- On January 1, 2011, the board of directors of Neff Company authorized the grant of stock options to supplement the salaries of certain employees.
- Each stock option permits the purchase of one share of Neff common stock at a price of \$50 per share; the market price of the stock on January 1, 2011, is also \$50 per share.
- The options vest, or become exercisable, beginning on January 1, 2014, and only if the employees stay with the company for the entire 3-year vesting period. The options expire on December 31, 2014.

- The number of options granted, instead of being fixed at 10,000 as in the earlier example, is contingent on Neff's level of sales for 2013. If Neff's sales for 2013 are less than \$50 million, only the 10,000 options will vest. If Neff's 2013 sales are between \$50 million and \$80 million, an additional 2,000 options will vest, making a total of 12,000. Finally, if Neff's 2013 sales exceed \$80 million, a total of 15,000 options will vest.

## CAUTION

Stock price and option fair value changes after the grant date do not impact compensation expense.

For the Neff performance-based stock option plan, the computation of compensation expense is done by combining the value of the options on the grant date with the number of options that are probable to vest. As in the earlier example, application of an option valuation method results in a computed value for each option of \$10 as of the grant date. The number of options probable to vest depends, of course, on the probable level of 2013 sales. As of December 31, 2011, when compensation expense for the first year must be recorded, Neff forecasts that 2013 sales will be around \$60 million, indicating that 12,000 options will vest. Recognition of compensation expense for 2011 involves recognizing one-third of the \$120,000 ( $12,000 \times \$10$ ) total estimated expense for the 3-year service period. Note that the change in Neff's stock price during the year (from \$50 to \$56) does not affect the calculation. The options are valued once, at the grant date, and that value is used for the life of the options. The journal entry to recognize compensation expense is as follows:

2011

Dec.	31	Compensation Expense (\$120,000/3 years) . . . . .	40,000	
		Paid-In Capital from Stock Options . . . . .		40,000

Events in 2012 lead Neff to lower its forecast of 2013 sales. As of December 31, 2012, Neff expects 2013 sales to be only \$40 million. Accordingly, it is probable that only 10,000 options will vest on January 1, 2014. The new estimate for total compensation expense for the 3-year service period is \$100,000 ( $10,000 \times \$10$ ). Because two-thirds of the service period has elapsed, aggregate compensation expense recognized should be \$66,667 ( $\$100,000 \times 2/3$ ). Because compensation expense of \$40,000 was recognized in 2011, the necessary journal entry in 2012 is as follows:

2012

Dec.	31	Compensation Expense (\$66,667 – \$40,000) . . . . .	26,667	
		Paid-In Capital from Stock Options . . . . .		26,667

Upon close examination, it can be seen that this computation of compensation expense differs from that typically encountered in situations with changing accounting estimates. Usually, the effects of changes in estimates are spread over current and future periods. In this case, such a procedure would result in 2012 compensation expense of \$30,000, an allocation of the remaining compensation expense of \$60,000 ( $\$100,000 - \$40,000$ ) evenly over the remaining two years of the service period, 2012 and 2013. However, a so-called “catch-up adjustment” is required when recognizing compensation expense related to performance-based option plans. The catch-up adjustment makes the cumulative expense recognized equal to the amount it would have been had the updated estimate for 2013 sales been used all along.

Actual sales for 2013 are \$85 million (Neff had a pretty good year). As a result, according to the terms of the performance-based plan, 15,000 options will vest as of

January 1, 2014. Because the entire service period has elapsed, aggregate compensation expense recognized should be \$150,000 ( $15,000 \times \$10$ ). Because compensation expense of \$66,667 ( $\$40,000 + \$26,667$ ) has already been recognized in 2011 and 2012, the necessary journal entry in 2013 is as follows:

2013			
Dec.	31	Compensation Expense ( $\$150,000 - \$66,667$ )	83,333
		Paid-In Capital from Stock Options	83,333

The journal entry to record the exercise of all 15,000 of the options on December 31, 2014, to purchase shares of Neff's no-par common stock would be as follows:

2014			
Dec.	31	Cash ( $15,000 \times \$50$ )	750,000
		Paid-In Capital from Stock Options	150,000
		Common Stock (no par)	900,000

### Accounting for Awards That Call for Cash Settlement

Neff Company's stock-based compensation plans discussed above stipulated that the compensation would be paid in the form of stock options. Because settlement of these stock options requires Neff to issue its own stock and does not require any transfer of assets, the stock options are considered to be equity instruments. When a stock-based compensation plan calls for a cash settlement or gives the employee the option of choosing a cash settlement instead of receiving stock options, work by employees during the service period creates a liability for the firm because the firm is obligated to transfer assets (cash) in the future.

To illustrate the accounting for share-based compensation plans that call for settlement in cash, assume that Neff Company, the company used in the earlier example on stock option plans, has decided that instead of granting its employees 10,000 stock options, it will grant an equal number of cash **stock appreciation rights (SARs)**. A cash SAR awards an employee a cash amount equal to the market value of the issuing firm's shares

above a specified threshold price. Neff Company promises that after January 1, 2014, it will pay the exerciser of each cash SAR an amount equal to the excess of the share price on the exercise date over the \$50 threshold price. The cash SARs vest beginning on January 1, 2014, only for the employees who stay with the company for the entire 3-year vesting period. The cash SARs expire on December 31, 2014. From an employee's standpoint, this cash SAR plan is economically equivalent to the basic stock option plan illustrated earlier in the chapter.

## STOP&THINK

Assume that Neff's managers are greedy, unscrupulous scoundrels. Which ONE of the following might Neff's performance-based stock option plan cause Neff's management (the ones who are receiving the stock options) to do?

- Delay the recognition of 2012 sales into 2013, and accelerate the recognition of 2014 sales into 2013.
- Accelerate the recognition of 2013 sales into 2012, and delay the recognition of 2013 sales into 2014.
- Accelerate the recognition of 2013 sales into 2012, and delay the recognition of 2011 sales into 2012.
- Accelerate the recognition of 2012 sales into 2011, and delay the recognition of 2010 sales into 2011.

From the standpoint of Neff's accounting treatment, the cash SAR plan is different from the stock option plan discussed previously because the cash SAR plan creates a liability to transfer cash. All journal entries to record compensation expense for 2011, 2012, and 2013 and for the redemption of the cash SARs on December 31, 2014, are given on the next page.

Assume the following information:

*Fair value of one SAR:*

January 1, 2011 .....	\$10
December 31, 2011 .....	6
December 31, 2012 .....	7
December 31, 2013 .....	9

The forecast of the cash settlement amount is updated at the end of each period using current data to estimate the fair value of each SAR. This fair value is impacted by the existing stock price, the amount of time remaining until the award settlement date, and the volatility of the underlying stock price. As of December 31, 2011, because the estimated fair value of each SAR is \$6, the best estimate of the amount of cash that will be transferred when the cash SARs are exercised is \$60,000 ( $10,000 \times \$6$ ). The journal entry to recognize 2011 compensation expense is as follows:

2011

Dec. 31	Compensation Expense (\$60,000/3 years) .....	20,000	
	Share-Based Compensation Liability .....		20,000

As of December 31, 2012, the estimated fair value of each SAR is \$7. The new estimate for total compensation expense for the 3-year service period is \$70,000 ( $10,000 \times \$7$ ). Because two-thirds of the service period has elapsed, aggregate compensation expense recognized should be \$46,667 ( $\$70,000 \times 2/3$ ). Because compensation expense of \$20,000 was recognized in 2011, the necessary journal entry in 2012 is as follows:

2012

Dec. 31	Compensation Expense (\$46,667 – \$20,000) .....	26,667	
	Share-Based Compensation Liability .....		26,667

Except for the account titles, this catch-up adjustment is exactly like those illustrated previously.

The estimated fair value of each SAR is \$9 on December 31, 2013. Aggregate compensation expense for the 3-year service period is \$90,000 ( $10,000 \times \$9$ ). Because compensation expense of \$46,667 ( $\$20,000 + \$26,667$ ) has already been recognized in 2011 and 2012, the necessary journal entry in 2013 is as follows:

2013

Dec. 31	Compensation Expense (\$90,000 – \$46,667) .....	43,333	
	Share-Based Compensation Liability .....		43,333

Between the time the cash SARs vest and the time they are exercised, the company's stock price can still move, affecting the ultimate amount of cash paid out for the cash SARs. The impact of these post-vesting price movements on the cash SAR payable account are recognized as compensation expense in the year the price movements occur. The share price on December 31, 2014 is \$61, meaning that Neff will pay \$11 ( $\$61 - \$50$ ) for each SAR. The required entry in 2014, to reflect this information is:

2014

Dec. 31	Compensation Expense $\{[10,000 \times (\$61 - \$50)] - \$90,000\}$ .....	20,000	
	Share-Based Compensation Liability .....		20,000

The entry to record the cash payments made to holders of the 10,000 cash SARs that vested on January 1, 2014, and were exercised on December 31, 2014, is shown on p. 13-28.

2014			
Dec.	31	Share-Based Compensation Liability .....	110,000
		Cash [10,000 × (\$61 - \$50)] .....	110,000

If the exercise period extended beyond 2014 and if cash SARs remained outstanding, an entry would be made at the end of each year to revise the estimated amount of the cash SAR liability. These revisions are recognized as part of compensation expense for the period.

### Broad-Based Plans

Some employers grant employee stock options and employee stock purchase rights to substantially all employees. Under FASB ASC Topic 718 (Compensation—Stock Compensation), compensation expense is recognized if employees are allowed to purchase shares for more than a 5% discount from the market price.<sup>15</sup> The rationale is that allowing employees to purchase stock for an excessive discount is just an alternative way to grant compensation.

## Reporting Some Equity-Related Items as Liabilities

6

Determine which equity-related items should be reported in the balance sheet as liabilities.

**WHY** In the increasingly complex world of corporate finance, companies are using their own equity shares in many different ways. Accordingly, accountants must carefully examine the economic nature of financing arrangements, rather than just the labels placed on the arrangements, in order to decide whether an item should be reported as a liability or as equity in the balance sheet.

**HOW** Obligations that require a company to deliver financial instruments or cash of a fixed monetary value in the future should be reported in the balance sheet as liabilities. In addition, a company obligation to repurchase its own shares should be reported as a liability.

In the field of finance, a *debt claim* is one that entitles the debt holders to a fixed payment when company assets are sufficient to meet that payment; if company assets are below that amount, the debt holders get all of the assets. An *equity claim* is one that entitles the equity holders to all company assets in excess of the debt holders' portion. The definitions of liabilities and equities given by the FASB in its *Statement of Accounting Concepts No. 6* embody similar notions: Equity is defined as the residual amount of assets left after deducting the liability claims.

Although examples of pure equity (common stock) and pure debt (a bank loan) are easy to distinguish, many securities are in a middle ground and have characteristics of both debt and equity. For example, preferred stock is like debt in that the payments (both dividend and liquidation amounts) are capped, but it is also like equity because the payments aren't guaranteed and have lower priority than debt claims. As another example, convertible debt may be exchanged for equity if the issuing firm performs well; as the performance of the issuing firm improves, the convertible debt gradually changes in nature from debt to equity.

These examples illustrate that the line between a liability and an equity can be very unclear. As mentioned several times earlier in the chapter, for several years the FASB has

<sup>15</sup> FASB ASC paragraph 718-50-25-1a(2).

been performing a fundamental review of the accounting distinction between debt and equity. As a result of this review, the FASB has decided that certain equity-related items should actually be reported in the balance sheet as liabilities.<sup>16</sup> These items are as follows.

- Mandatorily redeemable preferred shares
- Financial instruments (such as written put options) that obligate a company to repurchase its own shares
- Financial instruments that obligate a company to issue a certain dollar value of its own shares

These items share the characteristic that, although related to equity shares, they each obligate the company to deliver items of a set value (either cash or equity shares) some time in the future. Each of these items is illustrated below.

In addition, this section includes a brief description of noncontrolling interest which has historically been called *minority interest*. Noncontrolling interest is an item that has often in the past been classified as a liability but that should now be classified as equity.

### Mandatorily Redeemable Preferred Shares

As mentioned above, preferred stock embodies some of the characteristics of a debt instrument because preferred shareholders are typically not entitled to additional payments based on the success of the issuing company. In some cases, the ownership contract associated with preferred shares stipulates that those shares must be redeemed by the issuing company at a specified future date. For example, consider preferred shares that are issued now in exchange for \$1,000 cash but the issuing company agrees that in 10 years it will redeem those shares for, say, \$1,100 cash. In this case, you can call these financial instruments “shares” if you like, but the more you consider them, the more they resemble a liability. In fact, mandatorily redeemable preferred shares are a textbook example of a financial instrument that fits the Conceptual Framework definition of a liability: “. . . present obligation to transfer assets . . . in the future as a result of past transactions or events.”

Historically, the SEC required that firms not include mandatorily redeemable preferred stock under the Stockholders’ Equity heading. Instead, mandatorily redeemable preferred stock was listed above the Equity section in a gray area between the liabilities and equities; this reporting of mandatorily redeemable preferred stock as neither debt nor equity was referred to as “mezzanine” treatment. The FASB now requires mandatorily redeemable preferred shares to be reported as liabilities in the balance sheet. For example, in 2004, **Critical Path**, a seller of messaging technology, reported the following in its balance sheet (in thousands of U.S. dollars):

Total liabilities . . . . .	\$ 59,011
Mandatorily redeemable preferred stock . . . . .	122,377
Total shareholders’ deficit . . . . .	(112,189)
Total liabilities, mandatorily redeemable preferred stock and shareholders’ deficit . . . . .	<u>\$ 69,199</u>

Under FASB ASC Topic 480, Critical Path, and all other U.S. companies, are now required to include mandatorily redeemable preferred stock in the computation of total liabilities.

An example of the new presentation required under FASB ASC Topic 480 (pre-Codification *Statement No. 150*) can be found in the financial statements of **American**

<sup>16</sup> FASB ASC Topic 480 (Distinguishing Liabilities from Equity).

**Physicians Service Group**, an insurance and financial services company. The Liabilities section of the company's 2009 balance sheet is as follows (in thousands of U.S. dollars):

Reserve for loss and loss adjustment expense .....	\$ 88,668
Unearned premiums .....	36,341
Reinsurance premiums payable .....	30
Funds held under reinsurance treaties .....	2,379
Accrued expenses and other liabilities .....	6,465
Mandatorily redeemable preferred stock .....	6,679
Total liabilities .....	<u>\$140,562</u>

To understand the journal entries associated with mandatorily redeemable preferred shares, consider the following simple example. On January 1, 2011, Tarazi Company issued mandatorily redeemable preferred shares in exchange for \$100 cash. No dividends are to be paid on these shares, and they must be redeemed in exactly one year, on January 1, 2012, for \$110. You can see that the interest rate implicit in this agreement is 10%; Tarazi is agreeing to pay \$10 in interest in order to use the \$100 issuance proceeds for one year. The journal entries to record the issuance, accrual of interest, and redemption of these preferred shares are as follows:

2011			
Jan.	1	Cash .....	100
		Mandatorily Redeemable Preferred Shares (liability) .....	100
Dec.	31	Interest Expense (\$100 × 0.10) .....	10
		Mandatorily Redeemable Preferred Shares (liability) .....	10
2012			
Jan.	1	Mandatorily Redeemable Preferred Shares (liability) .....	110
		Cash .....	110

A related class of shares is called “temporary equity.” Shares classified as “temporary equity” are shares, either common or preferred, that can be redeemed at the option of the shareholders. According to SEC *Accounting Series Release (ASR) No. 268*, “Presentation in Financial Statements of ‘Redeemable Preferred Stocks,’” such securities are to be reported in the balance sheet outside of the Stockholders’ Equity section, similar to the “mezzanine” treatment described above.<sup>17</sup>

### Written Put Options

As discussed in a previous section, most successful companies have approved extensive programs of share repurchases. One such company is **Dell Computer**. In the past, as part of this effort Dell wrote put options allowing other parties to sell Dell’s shares back to Dell at set prices on specific dates. For example, on February 2, 2001, Dell had obligated itself to repurchase 122 million shares of its own stock at an average repurchase price of \$44 per share. Because this obligation was in the form of a put option, Dell was not certain that it would have to repurchase the shares. In fact, Dell was hoping that its share price would stay above \$44 per share so that the options would never be exercised. In the extreme, if Dell’s share price were to drop to \$0, the company would have had to buy back 122 million worthless shares for a total of \$5.4 billion (\$44 per share × 122 million shares). Of course, it was unlikely that Dell’s share price would drop all the way to \$0, and if that

<sup>17</sup> This standard can be found in FASB ASC paragraph 480-10-S99-1.

were to actually happen, the company would have more pressing things to worry about than honoring its obligation under these put contracts. Accordingly, the fair value of Dell's obligation was somewhere between \$0 (if the share price stayed above \$44) and \$5.4 billion (if the share price dropped all the way to \$0). Precise estimation of the fair value of the put options involves the use of option-pricing formulas, as discussed earlier.

Why would Dell write these put options in the first place? The reason is that when Dell writes the put options, the party buying the options (usually a large financial institution) pays Dell some cash up front (equal to the fair value of the options on that date) for the right to be able to sell Dell shares to Dell at a set price in the future. Dell takes the cash and hopes that its share price stays high. The financial institution pays the cash and hopes that Dell's share price will go down.

Historically, companies have often recorded these put options as part of equity. However, the FASB now instructs companies to record the fair value of the obligation under written put options on a company's own shares as a liability.<sup>18</sup>

To understand the journal entries associated with written put options, consider the following simple example. On January 1, 2011, Kamili Company wrote a put option agreeing to purchase one share of its own stock for \$100 on December 31, 2012, at the option of the purchaser of the put option. The market price of Kamili's shares on January 1, 2011, was \$100. Given the past volatility in Kamili's share price and the 2-year period until the option expiration date, there is some chance that Kamili's shares will actually be trading for less than \$100 on December 31, 2012. If this is the case, the put option holder will exercise the option to sell a share of Kamili stock to Kamili for \$100 at a time when the shares are worth less than \$100. Assume that the use of an option-pricing formula indicates that, as of January 1, 2011, this put option has a fair value of \$20. The journal entry that Kamili would make to record the writing of the put option is as follows:

2011			
Jan.	1	Cash .....	20
		Put Option (liability) .....	20

By December 31, 2011, Kamili's share price has declined to \$88 per share. Accordingly, the odds that the share price will be less than \$100 on December 31, 2012, have increased, making it more likely that the put option holder will find it attractive to exercise the option and require Kamili to repurchase one of its own shares at an amount greater than its market value. Assume that an option-pricing formula suggests that the fair value of the put option on December 31, 2011, is \$30, up from \$20 at the beginning of the year. The necessary adjusting entry is as follows:

2011			
Dec.	31	Loss on Put Option .....	10
		Put Option (liability) (\$30 - \$20 already recognized) .....	10

On December 31, 2012, the put option expiration date, the market price of Kamili stock is \$82 per share. At this price, the put option holder of course decides to exercise the option and sell one share of Kamili stock to Kamili for \$100. One way to think of this transaction is that the put option holder can go out into the market, buy a share of Kamili stock for \$82, and then exercise the put option to require Kamili to buy that same share of stock for \$100. Accordingly, the option holder will net a gain of \$18 on the option exercise

<sup>18</sup> FASB ASC paragraph 480-10-25-8.

date. In this case, this is less than the option holder expected to gain, as evidenced by the fact that the option holder paid \$20 to purchase this option back on January 1, 2011.

The journal entry that Kamili would make to record the purchase of one share of its stock in conjunction with the exercise of the put option is as follows:

2012			
Dec.	31	Treasury Stock (the fair value of the share repurchased) . . . . .	82
		Put Option (liability) . . . . .	30
		Gain on Put Option . . . . .	12
		Cash . . . . .	100

The \$12 gain on the put option reflects the fact that Kamili's estimated obligation under the put option decreased from \$30 at the beginning of the year to just \$18 (\$100 – \$82) at the option exercise date.

### Obligation to Issue Shares of a Certain Dollar Value

Companies occasionally agree to satisfy their obligations by delivering shares of their own stock rather than by paying cash. This is especially true for startup companies that are trying to conserve their limited cash supply. Depending on how the contract is written, this promise to deliver shares of one's stock to satisfy an obligation can be recorded as equity or as a liability. The two following examples illustrate this distinction.

**Example 1:** On October 1, 2011, Lily Company, a software startup firm, experienced trouble with its office air conditioning system. The repair bill is \$5,000. Rather than pay this amount in cash, Lily has agreed to deliver 200 shares of its no-par common stock to the repairperson on February 1, 2012. On October 1, 2011, Lily's shares have a market value of \$25 per share. The journal entries that Lily would make to record the repairs and the delivery of the shares are as follows:

2011			
Oct.	1	Maintenance Expense (200 shares × \$25) . . . . .	5,000
		Common Stock Issuance Obligation (equity) . . . . .	5,000
2012			
Feb.	1	Common Stock Issuance Obligation (equity) . . . . .	5,000
		Common Stock . . . . .	5,000

The account “Common Stock Issuance Obligation (equity)” is similar to the common stock subscribed account introduced earlier in the chapter; both are included in the Equity section of the balance sheet. An obligation that requires a company to deliver a fixed number of its shares should be classified as equity because the party to whom the shares must be delivered is at risk to the same extent as are the existing shareholders. If Lily's shares go down in value between October 1, 2011, and February 1, 2012, the repairperson suffers in that the value of the shares received will be less than \$5,000. Similarly, if Lily's shares go up in value, the repairperson benefits. In short, once Lily has made the promise to deliver a fixed number of shares to the repairperson, he or she experiences the same ups and downs in economic circumstances as do the existing shareholders of Lily Company. Accordingly, on the December 31, 2011, balance sheet, Lily Company will report this obligation to deliver a fixed number of its shares as part of equity.

**Example 2:** As in Example 1, on October 1, 2011, Lily Company received air conditioning repair services costing \$5,000. Again, the company, wishing to conserve cash, promises to pay the repair bill with shares of its own stock on February 1, 2012. However, in this example, Lily doesn't fix the number of shares to be handed over on February 1

but instead promises to deliver shares with a market value of \$5,000 on February 1. On October 1, 2011, Lily's shares have a market value of \$25 per share, and on February 1, 2012, the shares have a market value of \$20 per share. The journal entries that Lily would make to record the repairs and the delivery of the shares are as follows:

2011			
Oct.	1	Maintenance Expense .....	5,000
		Common Stock Issuance Obligation (liability) .....	5,000
2012			
Feb.	1	Common Stock Issuance Obligation (liability) .....	5,000
		Common Stock (250 shares × \$20) .....	5,000

The account “Common Stock Issuance Obligation (liability)” would be reported as a liability on Lily’s December 31, 2011, balance sheet. Because Lily has an obligation to deliver shares with a fixed monetary amount, the repairperson really doesn’t care whether Lily’s shares increase or decrease in value between October 1, 2011, and February 1, 2012. No matter what happens to the value of Lily’s shares, the repairperson gets \$5,000 worth of shares. Between October 1, 2011, and February 1, 2012, the repairperson does not share in the risks and rewards of ownership in Lily Company, so the obligation to deliver the shares is reported as a liability rather than as equity.

By the way, this provision will ultimately require a change in the Conceptual Framework. Currently, the Conceptual Framework definition of a liability includes only obligations to “transfer assets or provide services.” The FASB may revise this definition to include obligations to transfer shares without transferring the risks and rewards of ownership. However, as mentioned several times earlier in the chapter, the FASB is currently undertaking a comprehensive review of the definitions of liability and equity items which probably will require more extensive changes in the conceptual definitions of those items.

### Noncontrolling Interest

A consolidated balance sheet is the combined balance sheet for both a parent company and all of the subsidiaries that it controls. A consolidated balance sheet includes *all* assets and liabilities of the parent and the subsidiaries it controls. Thus, even though the parent owns only, say, 80% of a subsidiary, *all* of that subsidiary’s assets and liabilities are included in the consolidated total. The intuition here is that the parent, with its 80% ownership, completely controls the assets of the subsidiary even though it doesn’t own them completely.

The fact that all of the assets and liabilities of a subsidiary owned less than 100% by the parent are in the consolidated total means that the consolidated balance sheet includes assets for which the acquisition was financed by funds coming not from consolidated liabilities and not from parent equity but instead from the shareholders who, in the example given above, own the other 20% of the subsidiary. These are called minority shareholders, and the financing provided by them is called **minority interest**. Minority interest is the amount of equity investment made by outside shareholders to consolidated subsidiaries that are not 100% owned by the parent.

The FASB uses the term **noncontrolling interest** to replace “minority interest” and directs that this item be classified in the consolidated balance sheet as part of equity.<sup>19</sup> This treatment brings U.S. GAAP in line with International Financial Reporting Standards contained in *IAS 27*.

<sup>19</sup> FASB ASC paragraph 810-10-45-16.

Other than bringing consistent treatment within the set of U.S. companies and consistency with international standards, no one is really pleased with the classification of noncontrolling interest as part of equity. Everyone realizes that the claims of the noncontrolling, or minority, shareholders are fundamentally different from the claims of the shareholders who directly control the parent and indirectly control the subsidiaries in the consolidated group. However, the claim of the noncontrolling shareholders also isn't a liability. If it isn't equity and it isn't a liability, what is it? Historically, noncontrolling, or minority, interest has been reported as a liability, an equity, and as an in-between item in the "mezzanine" that was mentioned earlier. Given the existing Conceptual Framework, classifying noncontrolling interest as equity is the best the FASB can do. As part of the FASB's general reexamination of the difference between liability and equity items, the Conceptual Framework definitions may be revised to clarify the status of noncontrolling interest.

## Stock Conversions

7

Distinguish between stock conversions that require a reduction in retained earnings and those that do not.

**WHY** When stock is converted from one class or type to another, contributed capital accounts will be affected as par values are transferred.

**HOW** In most instances, contributed capital amounts are simply reclassified. When total paid-in capital associated with stock that is to be converted is less than the total par value of the post-conversion shares, the retained earnings account is debited for the difference.

As noted earlier, stockholders may be permitted by the terms of their stock agreement or by special action of the corporation to exchange their holdings for stock of other classes. No gain or loss is recognized by the issuer on these conversions, because it is an exchange of one form of equity for another. In certain instances, the exchanges may affect only corporate contributed capital accounts; in other instances, the exchanges may affect both capital and retained earnings accounts.

To illustrate the different conditions, assume that the capital of Sorensen Corporation on December 31, 2013, is as follows:

Preferred stock, \$50 par, 10,000 shares	\$ 500,000
Paid-in capital in excess of par—preferred	100,000
Common stock, \$1 par, 100,000 shares	100,000
Paid-in capital in excess of par—common	2,900,000
Retained earnings	1,000,000

Each preferred share is convertible into four common shares at any time at the option of the shareholder.

### Case 1: One Preferred Share for Four Common Shares (\$1 par)

On December 31, 2013, 1,000 shares of preferred stock are exchanged for 4,000 shares of common. The amount originally paid for the 1,000 preferred shares, \$60,000, is now the consideration identified with 4,000 shares of common stock with a total par value of \$4,000. The conversion is recorded as shown on page 13-35.

Preferred Stock, \$50 par . . . . .	50,000
Paid-In Capital in Excess of Par—Preferred . . . . .	10,000
Common Stock, \$1 par . . . . .	4,000
Paid-In Capital in Excess of Par—Common . . . . .	56,000

Case 1 is the usual case because par values for preferred stocks are typically high relative to par values of common stocks. This is so because preferred stock par values are still approximately equal to the market value of the preferred stock at the issue date, whereas the par value of common stocks is usually set at some very low value (as discussed earlier in the chapter).

### Case 2: One Preferred Share for Four Common Shares (\$20 par)

In Case 2, assume that the par value of the common shares is \$20. In converting 1,000 shares of preferred for 4,000 shares of common, an increase in common stock at par of \$80,000 ( $4,000 \times \$20$ ) must be recognized, although it is accompanied by a decrease in the preferred equity of only \$60,000. This type of conversion is generally recorded as follows:

Preferred Stock, \$50 par . . . . .	50,000
Paid-In Capital in Excess of Par—Preferred . . . . .	10,000
Retained Earnings . . . . .	20,000
Common Stock, \$20 par . . . . .	80,000

The problems relating to the conversion of bonds for capital stock were described in Chapter 12.

For an investor, conversion of preferred stock for common stock often requires only retitling the investment account because both types of investment are carried at fair market value in the books of the investor. A special journal entry may be required if the conversion is also associated with a change in the investor's classification of the investment (e.g., from trading security to available-for-sale security). Investment reclassification is discussed in Chapter 14.

## Factors Affecting Retained Earnings

8

List the factors that impact the Retained Earnings balance.

**WHY** In a simple case, the retained earnings account is exactly what the name implies: the cumulative amount of a company's earnings that have been retained in the business instead of being paid out as cash dividends. However, because many other transactions can impact retained earnings, and sometimes in very significant ways, it is important to understand all factors affecting retained earnings.

**HOW** All income-related effects on a company's equity are reflected in retained earnings. In addition, certain other equity impacts, such as treasury stock transactions and stock conversions, can reduce, but *never* increase, retained earnings.

The retained earnings account is essentially the meeting place of balance sheet and income statement accounts. In successive periods, retained earnings are increased by income and decreased by losses and dividends. As a result, the Retained Earnings balance represents the net accumulated earnings of a corporation.

A number of other factors can affect retained earnings in addition to net income, losses, and dividends. These factors include prior-period adjustments for corrections of errors,

quasi-reorganizations, stock dividends, and treasury stock transactions. The transactions and events that increase or decrease retained earnings may be summarized as follows:

Retained Earnings	
Decreases	Increases
Error corrections	Error corrections
Some changes in accounting principle	Some changes in accounting principle
Net loss	Net income
Cash dividends	Quasi-reorganizations
Stock dividends	
Treasury stock transactions	
Stock conversions	

### Net Income and Dividends

The primary source of retained earnings is the net income generated by a business. The retained earnings account is increased by net income and is reduced by net losses from business activities. When operating losses or other debits to Retained Earnings produce a debit balance in this account, the debit balance is referred to as a *deficit*.

Dividends are distributions to the stockholders of a corporation in proportion to the number of shares held by the respective owners. Distributions may take the form of cash, other assets, notes (in essence, these are deferred cash dividends), and stock dividends. Most dividends involve reductions in retained earnings. Exceptions include some large stock dividends, which involve a reduction in additional paid-in capital, and liquidating dividends, which represent a return of invested capital to stockholders and call for reductions in contributed capital.

Use of the term *dividend* without qualification normally implies the distribution of cash. Dividends in a form other than cash, such as property or stock dividends, should be designated by their special form. Distributions from a capital source other than retained earnings should carry a description of their special origin, for example, liquidating dividend or dividend distribution of paid-in capital.

### Prior-Period Adjustments

In some situations, errors made in past years are discovered and corrected in the current year by an adjustment to the retained earnings account, referred to as a *prior-period adjustment*. Several types of errors can occur in measuring the results of operations and the financial status of an enterprise. Accounting errors can result from mathematical mistakes, a failure to apply appropriate accounting procedures, or a misstatement or omission of certain information. In addition, a change from an accounting principle that is not generally accepted to one that is accepted is considered a correction of an error.<sup>20</sup>

Fortunately, most errors are discovered during the accounting period, prior to closing the books. When this is the case, corrections can be made by making correcting entries directly to the accounts. This is much better than error correction by prior-period adjustment, because the error is fixed immediately and it isn't advertised to the world through disclosure of a retained earnings adjustment.

Sometimes errors go undetected during the current period, but they are offset by an equal misstatement in the subsequent period. When this happens, the under- or overstatement of income in one period is counterbalanced by an equal over- or understatement of

<sup>20</sup> FASB ASC Topic 250 (Accounting Changes and Error Corrections).

income in the next period. After the closing process is completed for the second year, the retained earnings account is correctly stated. If a counterbalancing error is discovered during the second year, however, it should be corrected at that time.

When errors of past periods are not counterbalancing, retained earnings will be misstated until a correction is made in the accounting records. If the error is material, a prior-period adjustment should be made directly to the retained earnings account. If an error resulted in an understatement of income in previous periods, a correcting entry would be needed to increase Retained Earnings; if an error overstated income in prior periods, then Retained Earnings would have to be decreased. These adjustments for corrections in net income of prior periods typically would be shown as a part of the total change in retained earnings as follows:

Retained earnings, unadjusted beginning balance . . . . .	\$XXX
Add or deduct prior-period adjustments . . . . .	XX
Retained earnings, adjusted beginning balance . . . . .	\$XXX
Add current year's net income or deduct current year's net loss . . . . .	XX
	<u>XXX</u>
Deduct dividends . . . . .	XX
Retained earnings, ending balance . . . . .	<u>XXX</u>

An example of a prior-period adjustment made to correct an error is in the August 2006 financial statements of **Apollo Group**, an education provider and parent company of the University of Phoenix. In 2006, Apollo made prior-period adjustments to reflect errors in the accounting for share-based compensation and the allowance for doubtful accounts. The adjustment also reflected corrections needed to change the accounting for cash, revenue, property and equipment, leases, and other investments to be in accordance with GAAP. The company corrected these errors by reducing its beginning Retained Earnings balance by \$72.7 million.

Another type of prior-period adjustment occurs when a company changes an accounting method or principle. When there is a change in accounting principle or method, a company is required to determine how the income statement would have been different in past years if the new accounting method had been used all along. To improve comparability, income statements for all years presented (for example, for all three years if three years of comparative data are provided) must be restated using the new accounting method. The beginning balance of Retained Earnings for the oldest year presented reflects an adjustment for the cumulative income effect of the accounting change on the net incomes of all preceding years for which a detailed income statement is not presented.

Techniques for analyzing and correcting errors are covered in detail in Chapter 20. Chapter 20 also covers prior-period adjustments associated with changes in accounting principle.

### Other Changes in Retained Earnings

The most common changes in retained earnings result from earnings (or losses) and dividends. Other changes may result from treasury stock transactions (explained earlier in the chapter) or from a quasi-reorganization, which is performed only under special circumstances in which a business seeks a “fresh start.” Quasi-reorganizations are covered in the Web Material (see [www.cengage.com/accounting/stice](http://www.cengage.com/accounting/stice)) associated with this chapter.

**FYI**

The provisions of IAS 8 regarding prior-period adjustments are the same as those under U.S. GAAP.

### Retained Earnings Restrictions

A company's Retained Earnings balance has historically served as a constraint on the payment of cash dividends and on the repurchase of treasury shares. For example, the General Corporation Law of the state of California states that

Neither a corporation nor any of its subsidiaries shall make any distribution to the corporation's shareholders [unless] . . . the amount of the retained earnings of the corporation immediately prior thereto equals or exceeds the amount of the proposed distribution. (Division 1, Chapter 5, Section 500)

However, in most states this constraint is no longer absolute. California law allows the payment of cash dividends even if the preceding retained earnings provision is not satisfied, as long as the total equity and working capital of the corporation are at specified levels. Other states, with Delaware often being viewed as the leader, have even less restrictive laws.

This flexibility in state laws doesn't mean that the level of retained earnings is not important. Banks and other lenders often place retained earnings restrictions in their loan contracts. For example, **Coinmach Service Corp.**, a Plainview, New York-based company that provides outsourced laundry equipment services for multi-family housing properties, disclosed the following in its 2007 financial statements:

The covenant described above in the indenture governing the 11% Senior Secured Notes relating to restrictions on our ability to pay dividends permits quarterly dividend payments for the life of the notes in an amount equal to the difference between our distributable cash flow and our consolidated interest expense, so long as we satisfy an interest coverage test for the preceding fiscal quarter and no default is continuing.

In addition, industry regulations, such as banking codes, can also restrict the amount of retained earnings that can be used to support dividend payments. This is illustrated in a note from the 2009 financial statements of **Dimeco Inc.**, a bank that has been based in Pennsylvania since 1905.

The Pennsylvania Banking Code restricts the availability of capital funds for payment of dividends by all state-chartered banks to the surplus of the Bank. Accordingly, at December 31, 2009, the balance in the capital surplus account totaling approximately \$1,756,000 is unavailable for dividends.

Retained earnings may also be restricted at the discretion of the board of directors. For example, the board may designate a portion of retained earnings as restricted for a particular purpose, such as expansion of plant facilities.

If restrictions on retained earnings are material, they are generally disclosed in a note to the financial statements. Occasionally, the restricted portion of retained earnings is reported on the balance sheet separately from the unrestricted amount that is available for dividends. The restricted portion may be designated as **appropriated retained earnings** and the unrestricted portion as unappropriated (or free) retained earnings. Whatever the form of disclosure, the main idea behind restrictions on retained earnings is to notify stockholders that some of the assets that might otherwise be available for dividend distribution are being retained within the business for specific purposes.

## FASB CODIFICATION

**The Issue:** You have been working as a part-time accountant for a small electronics company. Your company makes remote control devices for home entertainment systems. The company has suffered five very tough years and has a large negative retained earnings balance to show for it. However, recent successes suggest that profits will be substantially improved in the future.

Unfortunately, the large negative retained earnings balance makes your company's reported financial statements look terrible. The company's CEO has come to you to see if you have any ideas about removing this accumulated deficit from the company's books. The CEO knows that the company's financial statements can be "refreshed" by going through a formal legal reorganization, but she is hoping that you can come up with a less costly process that will directly address the accumulated deficit on the balance sheet.

**The Question:** Is there a way to eliminate a negative retained earnings balance without going through a formal legal reorganization of the company?

**Searching the Codification:** Here are two hints. First, you are looking for "reorganizations," which are transactions that have a broad impact on the financial statements. Hence, you should look under the collection of topics labeled "Broad Transactions." Second, you don't want a "real" reorganization. You are looking for an imitation or informal reorganization. Another way to say this is "quasi-reorganization."

**The Answer:** The accounting technique for eliminating a large negative retained earnings balance is described on pages 13-54–13-55.

## Accounting for Dividends

9

Properly record cash dividends, property dividends, small and large stock dividends, and stock splits.

**WHY** Dividends are a return on investment to the owners of shares of stock. This return on investment is accounted for differently depending on the type of dividend being given.

**HOW** The declaration of a dividend results in a reduction in the retained earnings account balance. The amount of the reduction depends on the type of dividend. In most instances, retained earnings is reduced for the fair value of the dividend.

Among the powers delegated by the stockholders to the board of directors is the power to control the dividend policy. Whether dividends will or will not be paid, as well as the nature and the amount of dividends, are matters that the board determines. In setting dividend policy, the board of directors must answer two questions:

1. Do we have the legal right to declare a dividend?
2. Is a dividend distribution financially advisable?

In answering the first question, the board of directors must observe the state incorporation laws governing the payment of dividends. The availability of capital as a basis for dividends is a determination to be made by the legal counsel, not by the accountant. The accountant must report accurately the sources of each capital increase or decrease; the legal counsel investigates the availability of such sources as bases for dividend distributions.

**FYI**

It has been recommended that the format of the Stockholders' Equity section in the balance sheet be changed to give emphasis to the specific legal restrictions on cash distributions to shareholders. See Michael L. Roberts, William D. Samson, and Michael T. Dugan, "The Stockholders' Equity Section: Form without Substance?" *Accounting Horizons*, December 1990, p. 35.

The board of directors must also consider the second question (i.e., does the payment of a dividend make financial sense?). Literally thousands of research papers by finance professors have examined the issue of the "best" corporate dividend policy. Full discussion of this issue is a topic for a corporate finance class. Three general observations are made here:

- Old stable companies pay out a large portion of their income as cash dividends.
- Young growing companies pay out a small portion of their income as cash dividends. They keep the funds inside the company for expansion.
- Once a company has established a certain level of cash dividends, any subsequent reduction is seen as very bad news by investors. Accordingly, companies are quite cautious about raising their dividends, waiting until they are sure they can maintain the increased level permanently.

When a dividend is legally declared and announced, it cannot be revoked. The amount of the dividend is thereafter reported as a dividends payable liability until it is paid to the shareholders.

**Recognition and Payment of Dividends**

Three dates are essential in the recognition and payment of dividends: (1) date of declaration, (2) date of record, and (3) date of payment. Dividends are made payable to stockholders of record as of a date following the date of declaration and preceding the date of payment.

The liability for dividends payable is recorded on the declaration date and is canceled on the payment date. No entry is required on the record date, but a list of the stockholders is made as of the close of business on this date. These are the persons who receive dividends on the payment date. For example, on May 10, 2010, American

Express paid a quarterly cash dividend of \$0.18, or 18 cents, per share to shareholders of record as of April 1, 2010. These dividends were declared on March 22, 2010.

**Cash Dividends**

The most common type of dividend is a **cash dividend**. For the corporation, these dividends involve a reduction in Retained Earnings and in Cash. For the investor, a cash dividend generates cash and is recognized as dividend revenue. Entries to record the declaration and payment of a \$100,000 cash dividend by a corporation follow:

*Declaration of Dividend:*

Dividends (or Retained Earnings) .....	100,000	
Dividends Payable .....		100,000

*Payment of Dividend:*

Dividends Payable .....	100,000	
Cash .....		100,000

**FYI**

After the record date, stock no longer carries a right to dividends and it sells at a lower price. Stock on the New York Stock Exchange is normally quoted ex-dividend several trading days prior to the record date because of the time required to deliver the stock and to record the stock transfers.

In most circumstances, the declaration of a dividend is viewed as a noncancelable, legal obligation to pay the dividend to the shareholders. However, this is not always true, as demonstrated by this December 11, 2001, press release from **Enron**:

HOUSTON—Enron Corp. (NYSE: ENE) announced today that previously declared dividends will not be paid on the corporation's common stock, the Cumulative Second Preferred Convertible Stock, the Enron Capital LLC 8% Cumulative Guaranteed Monthly Income Preferred Shares, and the Enron Capital Resources, L.P. 9% Cumulative Preferred Securities, Series A.

This press release was made about a week after Enron filed for Chapter 11 bankruptcy, probably to head off an additional landslide of lawsuits. Obviously, if the dividends had been paid to the shareholders, the creditors, who were resigned to recovering just pennies on the dollar for the amounts owed to them, would have sued to reclaim the assets paid out as dividends.

### Property Dividends

A distribution to stockholders that is payable in some asset other than cash is generally referred to as a **property dividend**. Frequently, the assets to be distributed are securities of other companies owned by the corporation. The corporation thus transfers to its stockholders the ownership interest in such securities. Property dividends occur most frequently in closely held corporations.

This type of transfer is sometimes referred to as a **nonreciprocal transfer to owners** inasmuch as nothing is received by the company in return for its distribution to the stockholders. These transfers should be recorded using the fair value (as of the day of declaration) of the assets distributed and a gain or loss recognized for the difference between the carrying value on the books of the issuing company and the fair value of the assets.<sup>21</sup> Property dividends are valued at carrying value if the fair value is not determinable.

To illustrate the entries for a property dividend, assume that Bigler Corporation owns 100,000 shares in Tri-State Oil Co., carrying value \$2,700,000, current fair market value \$3,000,000, or \$30 per share, which it wishes to distribute to its stockholders. There are 1,000,000 shares of Bigler Corporation stock outstanding. Accordingly, a dividend of 1/10 of a share of Tri-State Oil Co. stock is declared on each share of Bigler Corporation stock outstanding. The entries for Bigler for the dividend declaration and payment are as follows:

*Declaration of Dividend:*

Dividends (or Retained Earnings) .....	3,000,000	
Property Dividends Payable .....		2,700,000
Gain on Distribution of Property Dividends .....		300,000

*Payment of Dividend:*

Property Dividends Payable .....	2,700,000	
Investment in Tri-State Oil Co. Stock .....		2,700,000

<sup>21</sup> FASB ASC paragraph 845-10-30-1.

## Stock Dividends

A corporation may distribute to stockholders additional shares of the company's own stock as a stock dividend. A stock dividend involves no transfer of cash or any other asset to shareholders. In essence, a stock dividend results in the same pie (the company) being cut up into more pieces (shares outstanding), with each shareholder owning the same proportion of the pieces as before the stock dividend. From a shareholder's standpoint, receipt of a stock dividend is an economic nonevent.

Fear that investors were being deceived into thinking that receipt of a stock dividend actually represented income led to development of the rules governing how the issuing company must account for stock dividends. As described by Professor James Tucker, stock dividends acquired a shady reputation in the late 1800s because they were viewed as being similar to "stock watering."<sup>22</sup> *Stock watering* is the practice of issuing stock without receiving adequate compensation in return, thus diluting the value of the shares. In addition, in the 1920s and 1930s, accountants and regulatory authorities became concerned that companies issuing stock dividends were wrongly leading investors to believe that receiving a stock dividend was equivalent to receiving a cash dividend. This impression was particularly easy to convey when a company had a practice of issuing small, regular stock dividends (e.g., a 2.5% annual stock dividend). Also, from the issuing company's standpoint, a stock dividend involved no cash outlay, and the standard accounting treatment required only a small reduction in Retained Earnings equal to the par value of the newly issued shares.

The Committee on Accounting Procedure (CAP) issued *Accounting Research Bulletin (ARB) No. 11* in September 1941, which made it considerably more difficult for firms to issue small stock dividends by requiring a reduction in Retained Earnings equal to the market value of the newly issued shares. To see what a difference this makes, recall that par values are typically around \$1 per share, whereas market values usually range between \$20 and \$80 per share. Professor Stephen Zeff cites *ARB No. 11* as one of the earliest examples of the economic consequences of accounting standards, in this case, the use of an accounting standard to reduce the incidence of small, regular stock dividends.<sup>23</sup>

**Small versus Large Stock Dividends** In accounting for stock dividends, a distinction is made between a small and a large stock dividend.<sup>24</sup> Recall that the specific objective of the Committee on Accounting Procedures was to discourage regularly recurring small stock dividends. As a general guideline, a stock dividend of less than 20%–25% of the number of shares previously outstanding is considered a **small stock dividend**. Stock dividends involving the issuance of more than 20%–25% are considered **large stock dividends**.<sup>25</sup>

With a small stock dividend, companies must transfer from Retained Earnings to Capital Stock and Additional Paid-In Capital an amount equal to the fair market value of the additional shares issued. Such a transfer is consistent with the general public's view of a stock dividend as a distribution of corporate earnings at an amount equivalent to the fair

<sup>24</sup> FASB ASC paragraph 505-20-25-3.

<sup>25</sup> In *Accounting Series Release No. 124*, the SEC specified that for publicly traded companies, stock dividends of 25% or more should be accounted for as large stock dividends and those of less than 25% as small stock dividends.

market value of the shares received. The following example illustrates the entries for the declaration and issuance of a small stock dividend.

Assume that stockholders' equity for the Fuji Company on July 1 is as follows:

Common stock, \$1 par, 100,000 shares outstanding .....	\$ 100,000
Paid-in capital in excess of par .....	1,100,000
Retained earnings .....	750,000

The company declares a 10% stock dividend, or a dividend of 1 share of common for every 10 shares held. Before the stock dividend, the stock is selling for \$22 per share. After the 10% stock dividend, each original share worth \$22 will become 1.1 shares, each with a value of \$20 ( $\$22/1.1$ ). The stock dividend is to be recorded at the market value of the new shares issued, or \$200,000 (10,000 new shares at the postdividend price of \$20). The entries to record the declaration of the dividend and the issuance of stock by Fuji Company are as follows:

*Declaration of Dividend:*

Retained Earnings .....	200,000	
Stock Dividends Distributable .....		10,000
Paid-In Capital in Excess of Par .....		190,000

*Issuance of Dividend:*

Stock Dividends Distributable .....	10,000	
Common Stock, \$1 par .....		10,000

If a balance sheet is prepared after the declaration of a stock dividend but before issue of the shares, Stock Dividends Distributable is reported in the Stockholders' Equity section as an addition to capital stock outstanding.

Because the focus of the CAP was on reducing the number of small stock dividends, the accounting requirements governing large stock dividends are less specific than those for small stock dividends. Accordingly, the existing standard is quite general, as follows:

... there is no need to capitalize retained earnings, other than to the extent occasioned by legal requirements. (FASB ASC 505-20-30-6)

In practice, this standard results in the par or stated value of the newly issued shares being transferred to the capital stock account from either the retained earnings or paid-in capital in excess of par accounts.<sup>26</sup> To illustrate, assume that Fuji Company declares a large stock dividend of 50%, or a dividend of one share for every two held. Legal requirements call for the transfer to Capital Stock of an amount equal to the par value of the shares issued. Entries for the declaration of the dividend and the issuance of the 50,000 new shares ( $100,000 \times 0.50$ ) are as follows:

*Declaration of Dividend:*

Retained Earnings .....	50,000	
Stock Dividends Distributable .....		50,000

**OR**

Paid-In Capital in Excess of Par .....	50,000	
Stock Dividends Distributable .....		50,000

*Issuance of Dividend:*

Stock Dividends Distributable .....	50,000	
Common Stock, \$1 par .....		50,000

<sup>26</sup> Some large stock dividends are effected by reducing both paid-in capital in excess of par and retained earnings by a total of the par value of the newly issued shares.

**Stock Dividends versus Stock Splits** A corporation may effect a **stock split** by reducing the par or stated value of each share of capital stock and proportionately increasing the number of shares outstanding. For example, a corporation with 1,000,000 shares of \$3 par stock outstanding may split the stock on a 3-for-1 basis. After the split, the corporation will have 3,000,000 shares of \$1 par stock outstanding, and each stockholder will have three shares for every one previously held. However, each share now represents

only one-third of the capital interest it previously represented; furthermore, each share of stock can be expected to sell for approximately one-third of its previous market price. From an investor's perspective, therefore, a stock split can be viewed the same as a stock dividend.

Although a stock dividend can be compared to a stock split from the investor's point of view, its effects on corporate capital differ from those of a stock split. A stock dividend results in an increase in the number of shares outstanding, and because the par or stated value of each share is unchanged, the Capital Stock balance also increases. In contrast, a stock split merely divides the existing Capital Stock balance into more parts, with a reduction in the par or stated value

of each share. Because a stock split does not involve any transfers among the capital accounts, no journal entry is necessary. Instead, the change in the number of shares outstanding, as well as the change in the par or stated value, may be recorded by means of a memorandum entry.

Exhibit 13-6 provides a comparative example of the effects of a 100% stock dividend and a 2-for-1 stock split.

The simple example in Exhibit 13-6 illustrates that, from an accounting perspective, the effects of a large stock dividend can be very different from the effects of a stock split even though both result in the creation of the same number of new shares. The required transfer from Retained Earnings (or Paid-In Capital in Excess of Par) can significantly impact the Stockholders'

Equity section of the balance sheet. For example, in the illustration in Exhibit 13-6, the 100% stock dividend may hinder the issuing firm's ability to pay future cash dividends because the Retained Earnings balance is so drastically reduced; no such constraint arises when the issuance of the new shares is accounted for as a 2-for-1 stock split.

Although stock splits and stock dividends are distinctly different in an accounting sense, the terms "stock split" and "stock dividend" are used interchangeably in the

## STOP&THINK

You are hired as an accounting consultant by a company that is considering issuing either a 20% stock dividend or a 25% stock dividend. From an accounting standpoint, which would you recommend?

- If the company wishes to minimize the impact of the stock dividend on reported profits for the current year, declare a 20% stock dividend.
- If the company wishes to minimize the impact of the stock dividend on reported profits for the current year, declare a 25% stock dividend.
- If the company is confident about its future ability to generate profits and pay cash dividends, declare a 20% stock dividend as a way to proclaim this confidence in a public way.
- If the company is confident about its future ability to generate profits and pay cash dividends, declare a 25% stock dividend as a way to proclaim this confidence in a public way.

## FYI

A *reverse stock split* is the consolidation of shares outstanding into a smaller number of shares. Conventional wisdom is that shares trading for less than \$10 are viewed with some skepticism, and a reverse split can make the stock look more respectable. Whatever the conventional wisdom, a reverse stock split is almost always viewed as bad news by investors.

## EX 13-6 COMPARATIVE EXAMPLE—STOCK DIVIDEND VERSUS STOCK SPLIT

Stockholders' Equity*	
Common stock, \$5 par, 50,000 shares outstanding . . . . .	\$250,000
Paid-in capital in excess of par. . . . .	400,000
Retained earnings . . . . .	300,000
Total stockholders' equity . . . . .	<u>\$950,000</u>
*Prior to stock dividend or stock split.	
Stockholders' Equity After 100% Stock Dividend	Stockholders' Equity After 2-for-1 Stock Split
Common stock, \$5 par, 100,000 shares outstanding . . . . .	Common stock, \$2.50 par, 100,000 shares outstanding . . . . .
\$500,000	\$250,000
Paid-in capital in excess of par* . . . . .	Paid-in capital in excess of par. . . . .
400,000	400,000
Retained earnings . . . . .	Retained earnings . . . . .
50,000	300,000
Total stockholders' equity . . . . .	Total stockholders' equity . . . . .
<u>\$950,000</u>	<u>\$950,000</u>
*Some or all of the \$250,000 transfer to common stock at par could have been made from paid-in capital in excess of par.	

© 2012 Cengage Learning.

financial press and sometimes even in the issuing company's annual report. For example, *The Wall Street Journal's* description of a distribution as a split or dividend agrees with the actual accounting for the distribution only about 25% of the time.<sup>27</sup>

### Liquidating Dividends

A **liquidating dividend** is a distribution representing a return to stockholders of a portion of contributed capital. Whereas a normal cash dividend provides a return on investment and is accounted for by reducing Retained Earnings, a liquidating dividend provides a return of investment. A liquidating dividend is accounted for by reducing Paid-In Capital.

To illustrate, assume that Stubbs Corporation declared and paid a cash dividend and a partial liquidating dividend amounting to \$150,000. Of this amount, \$100,000 represents a regular \$10 cash dividend on 10,000 shares of common stock. The remaining \$50,000 represents a \$5-per-share liquidating dividend, which is recorded as a reduction to Paid-In Capital in Excess of Par. The entries would be as follows:

#### Declaration of Dividend:

Dividends (or Retained Earnings) . . . . .	100,000	
Paid-In Capital in Excess of Par. . . . .	50,000	
Dividends Payable. . . . .		150,000

#### Payment of Dividend:

Dividends Payable . . . . .	150,000	
Cash . . . . .		150,000

<sup>27</sup> See Graeme Rankine and Earl K. Stice, "The Market Reaction to the Choice of Accounting Method for Stock Splits and Large Stock Dividends," *Journal of Financial and Quantitative Analysis*, 1997.

## USING STOCK DIVIDENDS AS SIGNALS

The accounting treatment of stock dividends makes their declaration an interesting way to send a good news signal to the market. The reasoning goes like this: Because cash dividend payments are often restricted to the amount of retained earnings, the reduction in Retained Earnings required in accounting for a stock dividend might make it more difficult to declare cash dividends in the future. Accordingly, only firms with favorable future prospects would be likely to declare stock dividends. These firms would be confident that future earnings would bolster the Retained Earnings balance, making up for the reduction required by the stock dividend declaration.

So, according to this reasoning, if you see a firm declaring a stock dividend, you can conclude that the management of that firm must be confident that

future earnings will be adequate to cover future cash dividends. This signaling view of stock dividends is supported by the fact that stock prices of companies instantly go up when they announce plans to issue a stock dividend. The accompanying graph shows the size of the positive market reaction to a stock dividend announcement, based on the size of the stock dividend.

### Questions:

1. Assume that there is validity to this signaling theory of stock dividends. Which would be a stronger signal, a 20% stock dividend or a 25% stock dividend?
2. Again, assuming validity to the signaling theory, which would be a stronger signal, a 100% stock dividend or a 2-for-1 stock split?

**Sources:** Graeme Rankine and Earl K. Stice, "Accounting Rules and the Signaling Properties of 20% Stock Dividends," *The Accounting Review*, January 1997; Graeme Rankine and Earl K. Stice, "The Market Reaction to the Choice of Accounting Method for Stock Splits and Large Stock Dividends," *Journal of Financial and Quantitative Analysis*, 1997.

Stockholders should be notified as to the allocation of the total dividend payment, so they can determine the amount that represents revenue and the amount that represents a return of investment.

In addition to the two major categories of contributed capital and retained earnings, the Equity section of a U.S. balance sheet often includes a number of miscellaneous items. These items are gains or losses that bypass the income statement when they are recognized

## Other Equity Items

10

Explain the background of unrealized gains and losses recorded as part of accumulated other comprehensive income, and list the major types of equity reserves found in foreign balance sheets.

**WHY** Some economic gains and losses that are reflected in the balance sheet (with changes in recorded asset values) are not included in the computation of net income and thus are not recorded in the Retained Earnings section of stockholders' equity. Instead, the equity impact of those economic gains and losses is shown in the equity account, Accumulated Other Comprehensive Income.

**HOW** Unrealized economic gains and losses stemming from the impact of foreign currency exchange rate changes on the value of foreign subsidiaries, from changes in the market value of an available-for-sale investment portfolio, and from fluctuations in the value of some derivatives, are not recorded in the income statement but do impact the accumulated other comprehensive income equity account directly.

and are reported as part of accumulated other comprehensive income. A further discussion of these items follows. In addition, the following section includes a discussion of equity reserves, which are common in the balance sheets of foreign companies that do not use U.S. accounting principles.

FASB ASC Topic 220 requires that all companies provide a statement of comprehensive income. An example of Microsoft's 2009 statement of comprehensive income is included in Exhibit 13-7. A discussion of the most common elements affecting comprehensive income follows.

### Equity Items That Bypass the Income Statement and Are Reported as Part of Accumulated Other Comprehensive Income

Since 1980, the Equity sections of U.S. balance sheets have begun to fill up with a strange collection of items, each the result of an accounting controversy. These items are summarized in the following sections.

**Foreign Currency Translation Adjustment** The foreign currency translation adjustment arises from the change in the equity of foreign subsidiaries (as measured in terms of U.S.

### EX 13-7 MICROSOFT'S STATEMENT OF COMPREHENSIVE INCOME

© 2012 Cengage Learning.

dollars) that occurs as a result of changes in foreign currency exchange rates. For example, if the Japanese yen weakens relative to the U.S. dollar, the equity of Japanese subsidiaries of U.S. firms will decrease, in dollar terms. Before 1981, these changes were recognized as losses or gains in the income statement. Multinational firms disliked this treatment because it added volatility to reported earnings. The FASB changed the accounting rule, and now these changes are reported as direct adjustments to equity, insulating the income statement from this aspect of foreign currency fluctuations.<sup>28</sup> Computation of this foreign currency translation adjustment is explained in Chapter 22.

**Unrealized Gains and Losses on Available-for-Sale Securities** Available-for-sale securities are those that were not purchased with the immediate intention to resell but that a company also doesn't necessarily plan to hold forever. These securities, along with trading securities (those purchased as part of an active buying and selling program), are reported on the balance sheet at their current market values. The unrealized gains and losses from market value fluctuations in trading securities are included in the income statement, but the unrealized gains and losses from market value fluctuations in available-for-sale securities are shown as a direct adjustment to equity. When the FASB was considering requiring securities to be reported at their market values, companies complained about the income volatility that would be caused by recognition of changes in the market value of securities. The FASB made the standard more acceptable to businesses by allowing unrealized gains and losses on available-for-sale securities to bypass the income statement and go straight to the Equity section.<sup>29</sup> Accounting for securities is covered in Chapter 14.

**Unrealized Gains and Losses on Derivatives** A derivative is a financial instrument, such as an option or a future, that derives its value from the movement of a price, an exchange rate, or an interest rate associated with some other item. For example, as discussed earlier in the chapter, an option to purchase a stock becomes more valuable as the price of the stock increases. Similarly, the right to purchase foreign currency at a fixed exchange rate becomes more valuable as that foreign currency becomes more expensive. As will be discussed in Chapter 19, companies often use derivatives to manage their exposure to risk stemming from changes in prices and rates. Frequently, derivatives are used to manage risk associated with sales or purchases that will not occur until a future period. In these cases, in order to ensure proper matching of gains and losses, derivative gains and losses are sometimes deferred and reported as part of accumulated other comprehensive income.

To illustrate the computation and reporting of comprehensive income, consider the following example. The last few lines of Kendall Company's income statement were as follows:

Income before income taxes .....	\$2,000
Income tax expense .....	(800)
Income from continuing operations.....	<u>\$1,200</u>
Income from discontinued operations:	
Income from operations (including loss on disposal of \$200) .....	\$ 250
Income tax expense .....	(100)
Income from discontinued operations .....	<u>150</u>
Net income .....	<u><u>\$1,350</u></u>

<sup>28</sup> FASB ASC Subtopic 830-30 (Foreign Currency Matters-Translation of Financial Statements).

<sup>29</sup> FASB ASC paragraph 320-10-35-1b.

In addition, Kendall had the following items impacting comprehensive income:

	<b>Amount This Year (Before Taxes)</b>
Unrealized gain (loss) on available-for-sale securities .....	\$100
Unrealized gain (loss) on derivative instruments .....	(20)
Foreign currency translation adjustment, increase (decrease) in stockholders' equity .....	300

Assume that the income tax rate for all items is 40%. Kendall Company would report its comprehensive income for the year as follows.

Net income .....	\$1,350
Other comprehensive income:	
Unrealized gain on available-for-sale securities [ $\$100 \times (1 - 0.40)$ ] .....	60
Unrealized loss on derivative instruments [ $\$20 \times (1 - 0.40)$ ] .....	(12)
Foreign currency translation adjustment [ $\$300 \times (1 - 0.40)$ ] .....	180
Comprehensive income .....	<u>\$1,578</u>

In this illustration, each of the other comprehensive income items is shown net of income taxes. An alternative approach is to report all of the items before tax and then show the total income tax effect of the other comprehensive income items as a single separate line in the computation of comprehensive income.

In this case, comprehensive income is composed of three primary components:

- Income from continuing operations
- Income from discontinued operations
- Other comprehensive income

The most important source of income is income from continuing operations because this income not only arises from the core business of the company but also represents the potential for a continuing stream of income in the future. Other comprehensive income arises from events (such as changes in security values, changes in foreign exchange rates, and so forth) that are not part of a company's core operations and that also fluctuate, almost randomly, from positive to negative from year to year. The reporting of comprehensive income allows the financial statement user to see all of the wealth changes that impacted the company during the year but to also distinguish between those wealth changes that are expected to persist in the future and those that are transitory, 1-year items.

**FYI**

The income tax effects of other comprehensive income items are usually deferred and don't impact the amount of current income taxes payable. Deferred income taxes are discussed in Chapter 16.

**Balance Sheet Reporting** The accumulated amount of comprehensive income is reflected in the Equity section of the balance sheet in two ways:

- Net income (less dividends) is cumulated in retained earnings.
- Other comprehensive income is cumulated in accumulated other comprehensive income.

In essence, you can think of the accumulated other comprehensive income account as the “retained earnings” of other comprehensive income items. To illustrate, refer back to the Kendall Company example. Assume that the beginning balance in Retained Earnings was \$5,000, the beginning balance in Accumulated Other Comprehensive Income was an equity reduction of \$500, and the dividends paid for the year were \$400. The Equity section of Kendall’s balance sheet at the end of the year would include the following two items:

Retained earnings (\$5,000 + \$1,350 – \$400) .....	\$5,950
Accumulated other comprehensive income [–\$500 + \$60 – \$12 + \$180]. .....	(272)

**International Accounting: Equity Reserves**

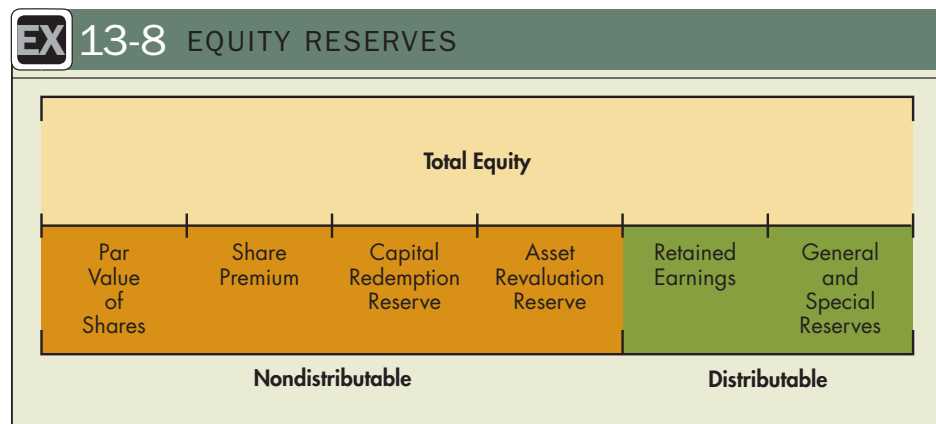

As discussed earlier in this chapter, state incorporation laws link the ability of a firm to pay cash dividends to the Retained Earnings balance. In other words, total equity is divided into two parts: the equity that is available to be distributed to shareholders and the equity that is not available for distribution. Restriction of the distribution of equity ensures that an equity “cushion” exists for the absorption of operating losses, thus increasing the chances of creditors to be fully repaid.

Laws in foreign countries are often more explicit than U.S. state incorporation laws in linking the payment of cash dividends to the amount of distributable equity. Equity is divided among various equity reserve accounts, each with legal restrictions dictating whether it can be distributed to shareholders. In that type of legal environment, the accounting for equity accounts directly influences a firm’s ability to pay dividends and thus becomes an important part of corporate financing policy.

A brief summary of accounting for equity reserves is given in the following sections. The discussion is based on equity accounting practice in the United Kingdom. Because of the worldwide British influence left from the days of the British Empire, the U.K. model is widely used.

The major types of equity reserve accounts are illustrated in Exhibit 13-8. Remember that the most important distinction is whether the reserve is part of distributable or non-distributable equity.

**Par Value and Share Premium** These accounts correspond closely with U.S. practice, with the share premium account being the same as the paid-in capital in excess of par account. Usually, a country’s laws restrict the ability of a firm to “refund” any of this paid-in capital, so these two accounts are part of nondistributable equity.

© 2012 Cengage Learning.

**Capital Redemption Reserve** When shares are reacquired, total equity is reduced. To protect the ability of creditors to be fully repaid, these reductions are usually considered to be reductions in distributable equity. To reflect this fact in the accounts, an amount equal to the par value of the shares reacquired is transferred from Retained Earnings (part of distributable equity) to Capital Redemption Reserve (part of nondistributable equity).

**Asset Revaluation Reserve** In many countries, property, plant, and equipment can be written up to its current market value. The recognition of this unrealized gain increases equity. The question is whether the additional equity can be used to support additional cash dividend payments. The answer is no. A revaluation reserve is established as part of nondistributable equity, and unrealized gains from increases in fixed asset market values are credited to the revaluation reserve.

**General and Special Reserves** As discussed earlier, the board of directors can voluntarily restrict the use of retained earnings for the payment of cash dividends. These restrictions can later be rescinded. In the United States, these restrictions can be disclosed in a financial statement note or recognized as a formal appropriation of a portion of retained earnings. In many foreign countries, these restrictions are acknowledged by transferring part of retained earnings to a general or a special reserve account. Note that these reserves are still part of distributable equity; the board of directors can remove the restrictions at any time.

Some of the reserves mentioned are illustrated with the accounts of **Swire Pacific Limited** shown in Exhibit 13-9. Swire Pacific Limited is based in Hong Kong and is one of the largest companies in the world. The primary operations of the company are in the regions of Hong Kong, China, and Taiwan, where it has operated for more than 125 years. Swire operates **Cathay Pacific Airways** and has extensive real estate holdings in Hong Kong.

As you can see from the amounts included in its calculation, the “revenue reserve” is generally equivalent to what we call “retained earnings.” The “investment revaluation reserve” is equivalent to the accumulated unrealized gain or loss on available-for-sale securities. Thus, the legal limit on dividend payments by Swire Pacific is HK\$14.151 billion.

## Disclosures Related to the Equity Section

### 11 Prepare a statement of changes in stockholders' equity.

**WHY** The statement of stockholders' equity provides users with a summary of changes in the equity accounts of a company.

**HOW** This statement allows users to determine whether or not changes in equity were as a result of contributed capital transactions, transactions affecting retained earnings, or events affecting accumulated other comprehensive income.

In accounting for capital stock, it should be recognized that stock may be

- Authorized but unissued
- Subscribed for and held for issuance pending receipt of cash for the full amount of the subscription price
- Outstanding in the hands of stockholders
- Reacquired and held by the corporation for subsequent reissuance
- Canceled by appropriate corporation action

Thus, a corporation must maintain an accurate record of all transactions involving capital stock. Separate general ledger accounts are required for each source of capital including each class of stock. In addition, subsidiary records are needed to keep track of individual stockholders and stock certificates.

Contributed capital and its components should be disclosed separately from retained earnings on the balance sheet. Within the Contributed Capital section, it is important to identify the major classes of stock and the additional paid-in capital. Although it is common practice to report a single amount for additional paid-in capital, separate accounts should be provided in the ledger to identify the individual sources of additional paid-in capital, for example, Paid-In Capital in Excess of Par or Stated Value, Paid-In Capital from Treasury Stock, or Paid-In Capital from Stock Options.

For each class of stock, a description of the major features should be disclosed, such as par or stated value, dividend preference, or conversion terms. The number of shares authorized, issued, and outstanding should also be disclosed.

As an illustration, the Stockholders' Equity section from the balance sheet of IBM as of December 31, 2009, is presented in Exhibit 13-10. Many companies do not provide as much detail on the balance sheet as is illustrated for IBM.

### EX 13-10 IBM'S STOCKHOLDERS' EQUITY SECTION

(Dollars in millions)	2009	2008
Stockholders' equity		
Common stock, par value \$0.20 per share and additional paid-in capital . . . . .	41,810	39,129
Shares authorized: 4,687,500,000		
Shares issued (2009—2,127,016,668; 2008—2,096,981,860)		
Retained earnings . . . . .	80,900	70,353
Treasury stock, at cost (shares: 2009—821,679,245; 2008—757,885,937) . . . . .	(81,243)	(74,171)
Accumulated other comprehensive income/(loss) . . . . .	(18,830)	(21,845)
Total IBM Stockholders' equity . . . . .	22,637	13,465
Noncontrolling interests (Note N) . . . . .	118	119
Total equity . . . . .	<u>22,755</u>	<u>13,584</u>

Readers of financial statements should be provided with an explanation of the changes in individual equity balances during the period. When stockholders' equity is composed of numerous accounts, as in the following example, a [statement of changes in stockholders' equity](#) is usually presented. The statement of changes in stockholders' equity for IBM for 2009 is illustrated in Exhibit 13-11.

(Dollars in millions)	Common Stock and Additional	Retained Earnings	Treasury Stock	Accumulated other (Losses)	Total IBM Stockholders' Equity	Non- controlling Interests	Total Equity

## SOLUTIONS TO OPENING SCENARIO QUESTIONS

1. Your return would have been a negative  
 $44.5\% = (\$8,320 - \$15,000)/\$15,000$ .
2. In 2009, Berkshire Hathaway owned 19% of the shares of the company that publishes the *Washington Post*.
3. You would also need to know how many shares of stock of each company were outstanding.

In May 2010, Microsoft had about 8.76 billion shares outstanding and the total market value of the company was \$254 billion. Also in May 2010, Berkshire Hathaway had just 1.6 million shares outstanding, and the total market value of the company was \$189 billion.

## SOLUTIONS TO STOP &amp; THINK QUESTIONS

1. (Page 13-17) The answer is B. When a company's stock price has increased since the time the stock was originally issued (as is true for most companies), the par value method reduces retained earnings when shares are repurchased. Reduced retained earnings can hinder a firm's ability to pay cash dividends. The cost method does not involve a reduction in retained earnings until the repurchased shares are actually retired.
2. (Page 13-26) The answer is A. Because the number of options granted depends on reported sales in 2013, the greedy, unscrupulous managers of Neff will do their best to boost the reported sales for 2013. They can do this by delaying the recognition of some 2012 sales and reporting them in 2013, and by accelerating the recognition of some 2014 sales and reporting them in 2013.
3. (Page 13-44) The answer is C. The surprising answer to this question is discussed in the boxed item "Using Stock Dividends as Signals" in this chapter. A 20% stock dividend, because it requires the transfer of the market value of the new shares from retained earnings, causes a much larger decrease in retained earnings than does a 25% stock dividend that only requires the transfer of the par value. If a firm is nervous about the size of its dividend pool, it should not declare a 20% stock dividend, as this could drastically reduce retained earnings. However, if a company is confident about its future ability to generate profits and pay cash dividends and it wants to proclaim this confidence in a public way, then it should declare a 20% stock dividend. This blatant reduction in the retained earnings safety net shows management's optimism about the future.

## SOLUTION TO USING THE FASB'S CODIFICATION

Under Topic 852 (Reorganizations), you should have seen Subtopic 852-20 (Quasi-Reorganizations). Section 852-20-05 contains the following: "This Subtopic addresses the accounting applicable to a corporate readjustment procedure in which, without the creation of a new corporate entity and without the intervention of formal court proceedings, an entity restates its balance sheet to fair value. This corporate readjustment procedure may eliminate an accumulated deficit." Well, this sounds like what we are looking for.

The quasi-reorganization process is described in Section 852-20-25 as follows: "If a corporation

elects to restate its assets, capital stock, additional paid-in capital, and retained earnings or accumulated deficit through a readjustment and therefore avail itself of permission to relieve its future income account or retained earnings account of charges that would otherwise be made against it, it shall make a clear report to its shareholders of the restatements proposed to be made, and obtain their formal consent. It shall present a fair balance sheet as at the date of the readjustment, in which the adjustment of carrying amounts is reasonably complete, in order that there may be no continuation of the circumstances that justify

charges to additional paid-in capital. When the amounts to be written off in a readjustment have been determined, they shall be charged first against retained earnings to the full extent of such retained earnings; any balance may then be charged against additional paid-in capital." In other words, in a quasi-reorganization, assets are revalued to reflect their fair values. This may require significant write-

downs of assets against retained earnings, thus initially increasing the accumulated deficit. The total deficit is then written off (retained earnings is adjusted to a zero balance) against paid-in capital balances, giving the company's balance sheet a substantially restructured equity section with, as of the quasi-reorganization date, a fresh start with respect to retained earnings.

## REVIEW CHAPTER 13

### LEARNING OBJECTIVES

- 1** Identify the rights associated with ownership of common and preferred stock.

Common stockholders are the true owners of the business. They are the first to lose their investment when a business does poorly, and they are the ones who get rich when a business does well. Common stockholders vote in the election of members of the board of directors.

Preferred stockholders usually cannot vote in director elections. Preferred stock dividends must be paid in full before any common stock dividends can be paid. Preferred stock can be cumulative, participating, convertible, callable, redeemable, or some combination of these.

Par values of common stocks are usually very low (less than \$1). Par values of preferred stocks often approximate the issuance price.

- 2** Record the issuance of stock for cash, on a subscription basis, and in exchange for noncash assets or for services.

When stock is sold for cash, the amount of the proceeds is usually divided between par value (or stated value) and additional paid-in capital.

When stock is sold on a subscription basis, any unpaid subscription amount (Stock Subscriptions Receivable) is reported as a subtraction from stockholders' equity.

When stock is issued in exchange for non-cash assets or for services, the transaction is recorded using the fair market value of the assets or

services or the fair market value of the stock, whichever is more objectively determinable.

- 3** Use both the cost and par value methods to account for stock repurchases.

When capital stock is acquired and retired, the capital stock account is reduced, and Retained Earnings can be reduced for all or part of the excess over par value paid to reacquire the stock. Additional paid-in capital created at the issuance of the stock can also be reduced or eliminated when the stock is reacquired.

Treasury stock is stock reacquired but not immediately retired. When the par value method is used, the treasury shares are accounted for in a manner similar to a stock retirement. When the cost method is used, the entire cost to reacquire the treasury shares is shown in a contra equity account until the shares are reissued or retired.

- 4** Account for the issuance of stock rights and stock warrants.

Stock rights are issued to existing shareholders to allow them to purchase sufficient shares to maintain their proportionate interest when new shares are issued. Only memorandum entries are needed to record the issuance of stock rights.

Stock warrants are issued in conjunction with other securities to make those other securities more attractive to investors. The proceeds of the security issuance are allocated between the security and a detachable stock warrant.

No allocation is done for nondetachable warrants.

**5** Compute the compensation expense associated with the granting of employee stock options.

With a simple stock-based compensation plan, total compensation expense is the number of options granted multiplied by the fair value of each option as of the grant date. This expense is allocated over the service period.

With a performance-based stock option plan, total compensation expense is equal to the fair value of each option as of the grant date multiplied by the number of options that are probable to be awarded. This amount is reevaluated at the end of each year, and a catch-up adjustment is made to compensation expense.

Some stock-based compensation plans call for payment in cash such as with cash stock appreciation rights (SARs). These obligations are remeasured at the end of each year, and a catch-up adjustment is made to compensation expense.

**6** Determine which equity-related items should be reported in the balance sheet as liabilities.

Certain equity-related items are reported in the balance sheet as liabilities. These items are as follows.

- Mandatorily redeemable preferred shares
- Financial instruments (such as written put options) that obligate a company to repurchase its own shares
- Financial instruments that obligate a company to issue a certain dollar value of its own shares

In addition, the FASB has clarified that noncontrolling interest should be classified as equity in the consolidated balance sheet.

**7** Distinguish between stock conversions that require a reduction in retained earnings and those that do not.

When total paid-in capital (par value plus additional paid-in capital) associated with stock that is to be converted is less than the total par value of the postconversion

shares, the retained earnings account is debited for the difference.

**8** List the factors that impact the Retained Earnings balance.

Retained earnings is reduced by the following:

- Some error corrections
- Some changes in accounting principle
- Net losses
- Cash dividends
- Stock dividends
- Treasury stock transactions
- Preferred stock conversions

Retained earnings is increased by the following:

- Some error corrections
- Some changes in accounting principle
- Net income
- Quasi-reorganizations

The Retained Earnings balance is often a constraint on the amount of cash dividends a firm can pay because of state incorporation law restrictions. In addition, a firm may voluntarily restrict the use of retained earnings.

**9** Properly record cash dividends, property dividends, small and large stock dividends, and stock splits.

A dividend payable is recorded on the dividend declaration date and is removed from the books when the dividend is distributed. When a property dividend is paid, a gain or loss is recorded on the declaration date to recognize the difference between the book value and fair value of the asset to be distributed as the property dividend.

A stock dividend is a distribution of additional shares to stockholders without receiving any cash in return. In essence, a stock dividend results in company ownership being divided into more pieces, with each stockholder owning a proportionately increased number of shares.

Stock dividends and stock splits are accounted for as follows:

- *Small stock dividend (less than 20%–25%):* Retained Earnings is reduced by the market value of the new shares created.
- *Large stock dividend (more than 20%–25%):* Retained Earnings and/or Additional Paid-In Capital is reduced by the par value of the new shares created.
- *Stock split:* No journal entry is made. A memorandum entry records the facts that the par value of each share is reduced and the number of outstanding shares is increased.

**10** Explain the background of unrealized gains and losses recorded as part of accumulated other comprehensive income, and list the major types of equity reserves found in foreign balance sheets.

Unrealized gains and losses that bypass the income statement and are recognized as direct equity adjustments as part of accumulated other comprehensive income are as follows:

- *Foreign currency translation adjustment.* Changes in the equity of foreign subsidiaries resulting from foreign currency exchange rate fluctuations.

- *Unrealized gains and losses on available-for-sale securities.* Unrealized gains and losses from market value fluctuations of available-for-sale securities.
- *Unrealized gains and losses on derivatives.* Unrealized gains and losses from market value fluctuations of derivative instruments that are intended to manage risks associated with future sales or purchases.

The Equity sections of foreign balance sheets often include a number of equity reserves. These reserves are designed to carefully divide equity into the portion that is available for distribution to shareholders and the portion that is nondistributable. Some of these equity reserves are the capital redemption reserve, the asset revaluation reserve, and general and special reserves.

**11** Prepare a statement of changes in stockholders' equity.

A statement of changes in stockholders' equity outlines the changes during a given period in the different equity categories.

## FASB-IASB CODIFICATION SUMMARY

Topic	FASB Accounting Standards Codification	Original FASB Standard	Corresponding IASB Standard	Differences between U.S. GAAP and IFRS
Stock warrants	Section 470-20-25 par. 2	APB Opinion No. 14 par. 16	IAS 32 par. 28	Under IFRS, all compound financial instruments, such as stock warrants, are to be separated into separate debt and equity components. Under U.S. GAAP, this is required only if the stock warrants are "detachable."
Stock-based compensation	Topic 718	SFAS No. 123R	IFRS 2	No substantial differences
Reporting equity-related items as liabilities	Topic 480	SFAS No. 150	IAS 32	No substantial differences
Noncontrolling interest	Section 810-10-45 par. 16	SFAS No. 160 par. 5	IAS 27 par. 27	No substantial differences

## KEY TERMS

Additional paid-in capital 13-11	Derivative 13-48	Nonreciprocal transfer to owners 13-41	Stated value 13-7
Appropriated retained earnings 13-38	Detachable warrants 13-19	Par value 13-7	Statement of changes in stockholders' equity 13-53
Available-for-sale securities 13-48	Dividends in arrears 13-8	Par (or stated) value method 13-15	Stock appreciation rights (SARs) 13-26
Board of directors 13-5	Equity reserve 13-50	Participating preferred stock 13-9	Stock options 13-18
Business combination 13-13	Foreign currency translation adjustment 13-47	Performance-based stock option plan 13-24	Stock rights 13-18
Callable 13-9	Large stock dividend 13-42	Property dividend 13-41	Stock split 13-44
Cash dividend 13-40	Liquidating dividend 13-45	Redeemable preferred stock 13-9	Stock warrants 13-18
Convertible 13-9	Minority interest 13-33	Small stock dividend 13-42	Subscription 13-11
Cost method 13-15	Noncontrolling interest 13-33		Treasury stock 13-14
Cumulative preferred stock 13-8	Noncumulative preferred stock 13-9		
	Nondetachable warrants 13-19		

## QUESTIONS

- What basic rights are held by each common stockholder?
- What is the historical significance of par value?
- What rights of ownership are given up by preferred shareholders? What additional protections are enjoyed by preferred shareholders?
- What was the user response to the FASB proposal, in its November 2007 *Preliminary Views* document, that preferred stock be classified in the balance sheet as a liability?
- How is stock valued when it is issued in exchange for noncash assets or for services?
- Why might a company repurchase its own stock?
- (a) What is the basic difference between the cost method and the par value method of accounting for treasury stock? (b) How will total stockholders' equity differ, if at all, under the two methods?
- There is frequently a difference between the purchase price and the selling price of treasury stock. Why isn't this difference shown as a gain or a loss on the income statement?
- Explain the difference in the accounting for detachable and nondetachable warrants.
- What option value is used in the computation of compensation expense associated with a basic stock-based compensation plan?
- With a performance-based stock option plan, a catch-up adjustment is necessary when the probable number of options that will vest changes from one year to the next. Describe this catch-up adjustment.
- When a stock-based award calls for settlement in cash, how is the obligation accounted for?
- How should mandatorily redeemable preferred shares be reported in the balance sheet?
- When a corporation writes a put option on its own shares, what does the corporation receive? What does the corporation agree to do?
- What distinguishes a situation in which an obligation to issue shares is recorded as equity from a situation in which an obligation to issue shares is recorded as a liability?
- What is noncontrolling interest?
- How are errors corrected when they are discovered in the current year? in a subsequent year?
- How can retained earnings be restricted by law? In what other ways can retained earnings be restricted?
- The following announcement appeared on the financial page of a newspaper: The board of directors of Benton Co., at its meeting on June 15, 2013, declared the regular quarterly dividend on outstanding common stock of \$1.40 per share, payable on July 10, 2013, to the stockholders of record at the close of business June 30, 2013.
  - What is the purpose of each of the three dates given in the announcement?
  - When would the common stock of Benton Co. normally trade "ex-dividend"?
- The directors of The Dress Shoppe are considering declaring either a stock dividend or a stock split. They have asked you to explain the difference between a stock dividend and a stock split and the accounting for a small stock dividend versus a large stock dividend.

21. (a) What is a liquidating dividend? (b) Under what circumstances are such distributions made?
22. What three types of unrealized gains and losses are shown as direct equity adjustments (part of accumulated other comprehensive income), bypassing the income statement? Briefly explain each.
23. In accounting for the equity of foreign companies, what is the primary purpose of equity reserves?

## PRACTICE EXERCISES

### Practice 13-1

L01

#### Computation of Dividends, Common and Preferred

The company has 10,000 shares of 6%, \$100 par preferred stock outstanding. In addition, the company has 100,000 shares of common stock outstanding. The company started business on January 1, 2012. Total cash dividends paid during 2012 and 2013 were \$55,000 and \$107,000, respectively. Compute the total dividends paid to preferred shareholders and to common shareholders in both years, assuming that (1) the preferred stock is noncumulative and (2) the preferred stock is cumulative.

### Practice 13-2

L02

#### Issuance of Common Stock

The company issued 10,000 shares of \$1 par common stock for cash of \$40 per share. Make the necessary journal entry.

### Practice 13-3

L02

#### Accounting for Stock Subscriptions

The company received subscriptions for 20,000 shares of \$1 par common stock for \$25 per share. The company received 40% of the subscription amount immediately and the remainder two months later. Make the journal entries necessary to record the initial subscriptions (and cash receipt) and the subsequent receipt of the remaining cash.

### Practice 13-4

L02

#### Issuing Stock in Exchange for Services

The company is experiencing a cash flow shortfall and has asked certain key employees to accept shares of common stock (instead of cash) in payment of salaries. The employees accepted 35,000 shares of \$0.50 par common stock in place of salaries of \$623,000. Make the necessary journal entry.

### Practice 13-5

L03

#### Accounting for Treasury Stock: Cost Method

The company repurchased 10,000 shares of \$1 par common stock for a total of \$300,000. None of the shares were retired. A month later, the company sold 4,000 of these shares for \$144,000. The shares were initially issued for \$20 per share. Make the necessary journal entries to record the repurchase of the 10,000 shares and the subsequent sale of the 4,000 shares.

### Practice 13-6

L03

#### Accounting for Treasury Stock: Par Value Method

Refer to Practice 13-5. Make the necessary journal entries using the par value method.

### Practice 13-7

L04

#### Accounting for Stock Warrants

The company issued 40,000 shares of 7%, \$50 par preferred stock. Associated with each share of stock was a detachable common stock warrant. Each warrant entitles the holder to purchase one share of the company's \$1 par common stock for \$20 per share. Each unit (one share of preferred stock and one warrant) was issued for \$55. It is estimated that each warrant could have been issued for \$3 if issued alone, and the preferred stock could have been issued for \$52 if issued alone. Some time after the issuance, all of the warrants were exercised. Make the journal entries necessary to record both the issuance of the preferred stock-warrant units and the subsequent exercise of the warrants.

**Practice 13-8****L05****Accounting for a Basic Stock-Based Compensation Plan**

On January 1, the company granted 150,000 stock options to key employees. Each option allows an employee to buy one share of \$1 par common stock for \$25, which was the market price of the shares on the grant date of January 1. In order to be able to exercise the options, the employees must remain with the company for three entire years. It is estimated that the fair value of each option on the date of grant was \$4. At the end of three years, all of the options were exercised when the market price of the shares was \$38 per share. Make all of the journal entries necessary with respect to these options in the first year. Also make the journal entry that would be made at the end of three years to record the exercise of the options.

**Practice 13-9****L05****Accounting for a Performance-Based Stock Option Plan**

Refer to Practice 13-8. Assume that the stock-based compensation plan is performance based. As of the end of the first year, the number of options that are probable to vest is 150,000. At the end of the second year, the number of options that are probable to vest is 120,000. As in Practice 13-8, the options have a 3-year service period. Make the journal entries necessary at the end of the first year and the second year to recognize the compensation expense associated with this performance-based plan.

**Practice 13-10****L05****Accounting for Cash Stock Appreciation Rights**

Refer to Practice 13-8. Assume that the stock-based compensation plan involves stock appreciation rights (SARs). At the end of three years, the employees are given a cash award equal to the excess of the fair value at that time of 150,000 shares of stock above the threshold price of \$25. The estimated fair value of each SAR is \$8 at the end of the first year and \$5 at the end of the second year. The service period is three years. Make the journal entries necessary at the end of the first year and the second year to recognize the compensation expense associated with these stock appreciation rights.

**Practice 13-11****L06****Accounting for Mandatorily Redeemable Preferred Shares**

On January 1, Year 1, the company issued mandatorily redeemable preferred shares in exchange for \$2,000 cash. No dividends are to be paid on these shares, and they must be redeemed in exactly two years, on January 1, Year 3, for \$2,332.80. The interest rate implicit in this agreement is 8%. Make the journal entries to record the issuance, accrual of interest in Year 1 and Year 2, and redemption of these preferred shares on January 1, Year 3.

**Practice 13-12****L06****Accounting for a Written Put Option**

On January 1, Year 1, the company wrote a put option agreeing to purchase 100 shares of its own stock for \$50 per share on December 31, Year 2, at the option of the purchaser of the put option. The market price of the company's shares on January 1, Year 1, was \$50 per share. As of January 1, Year 1, this put option has a fair value of \$1,200. Because the company's shares increased in value during Year 1, the put option has a fair value of just \$350 on December 31, Year 1. On December 31, Year 2, the company's shares have a market price of \$46 per share, so the purchaser of the put option exercised the option on that date. Make the journal entries necessary on January 1, Year 1, on December 31, Year 1, and on December 31, Year 2 on the books of the company that wrote the put option.

**Practice 13-13****L07****Accounting for Stock Conversion**

Stockholders of the company converted 12,000 shares of \$40 par preferred stock into 60,000 shares of \$1 par common stock. The preferred shares were originally issued for \$44 per share. Make the journal entry necessary to record the conversion.

**Practice 13-14****L08****Prior-Period Adjustments**

The Retained Earnings balance at the end of last year was \$42,000. In June of this year, well after last year's books were closed, it was found that a mistake had been made in

computing depreciation expense last year. The mistake resulted in reported depreciation expense that was \$4,000 too high last year. Net income for this year was \$12,000; cash dividends declared and paid this year totaled \$4,500. Show the computation of the correct ending balance in Retained Earnings for this year. Ignore income taxes.

**Practice 13-15****L09****Accounting for Declaration and Payment of Dividends**

On August 17, the company declared cash dividends of \$35,000. The dividends were paid on September 16. Make the journal entries necessary to record both events.

**Practice 13-16****L09****Accounting for Property Dividends**

On January 1, the company purchased 10,000 shares of Wilsonville Company stock for \$20 per share as an available-for-sale investment. In March, the company decided to distribute the Wilsonville shares as a property dividend to its stockholders. The Wilsonville shares had a market price of \$27 per share on the date the property dividend was declared on March 23. The Wilsonville property dividend was distributed on April 15. Make the journal entries necessary to record the declaration and distribution of this property dividend.

**Practice 13-17****L09****Accounting for Small Stock Dividends**

The company had 40,000 shares of \$1 par common stock outstanding. When each share of stock had a market value of \$44, the company declared and distributed a 10% stock dividend. After the distribution of the dividend shares, each share of stock had a market value of \$40. Make the journal entries necessary to record the declaration and distribution of this stock dividend.

**Practice 13-18****L09****Large Stock Dividends and Stock Splits**

The company had 10,000 shares of \$1 par common stock outstanding. When each share of stock had a market value of \$130, the company decided to reduce the price per share of stock to \$65 by doubling the number of shares outstanding. Make the journal entries necessary to record the declaration of the decision to double the number of shares and to distribute the shares assuming that (1) the distribution is accounted for as a large stock dividend and (2) the distribution is accounted for as a stock split.

**Practice 13-19****L09****Accounting for Liquidating Dividends**

The board of directors of the company has decided that the interests of the shareholders will be best served if the company is liquidated in an orderly fashion, with the proceeds to be distributed to the shareholders. As the first installment in this liquidation, a total dividend of \$500,000 was distributed to the shareholders. Of this amount, \$30,000 is a regular dividend, and \$470,000 is a liquidating dividend. Make the journal entries necessary to record the declaration and payment of this combined dividend.

**Practice 13-20****L010****Comprehensive Income**

The company started business on January 1, 2011. Net income and dividends for the first three years of the company's existence are as follows:

	Net Income (Loss)	Dividends
2011 .....	\$(1,500)	\$ 0
2012 .....	600	150
2013 .....	2,100	550

The company has some foreign subsidiaries and also maintains a portfolio of available-for-sale securities. During 2011, 2012, and 2013, the U.S. dollar value of the equity of the foreign subsidiaries and the market value of the securities in the available-for-sale portfolio fluctuated as shown on p. 13-62.

	Change in U.S. Dollar Value	Change in Value of Portfolio
2011 .....	Increase of \$320	Decrease of \$900
2012 .....	Decrease of \$680	Decrease of \$400
2013 .....	Decrease of \$170	Increase of \$560

Compute comprehensive income for each of the three years: 2011, 2012, and 2013.

**Practice 13-21****L010****Accumulated Other Comprehensive Income**

Refer to Practice 13-20. Compute the balance in (1) Retained Earnings and (2) Accumulated Other Comprehensive Income as of the end of each year: 2011, 2012, 2013.

**Practice 13-22****L010****International Equity Reserves**

The company, based in the United Kingdom, has the following equity accounts:

Retained earnings .....	\$1,000
Asset revaluation reserve .....	3,200
Par value of shares .....	100
Special reserve .....	400
Share premium .....	<u>1,700</u>
Total equity .....	<u>\$6,400</u>

Compute the amount of (1) nondistributable and (2) distributable equity.

**Practice 13-23****L011****Statement of Changes in Stockholders' Equity**

Beginning balances in the equity accounts were as follows:

Common stock, at par .....	\$ 2,000
Paid-in capital in excess of par .....	14,000
Accumulated other comprehensive income .....	(3,500)
Retained earnings .....	18,000
Treasury stock .....	<u>(6,000)</u>
Total stockholders' equity .....	<u>\$24,500</u>

The following is true for the year:

- Net income was \$6,300.
- Equity increased \$200 from an increase in value of available-for-sale securities.
- Dividends were \$2,000.
- Treasury stock of \$1,600 was purchased. Assume the cost method.
- Shares of stock for \$800 were issued. Par value was \$50.

Prepare a statement of changes in stockholders' equity for the year.

**EXERCISES****Exercise 13-24****L02****Issuance of Common Stock**

Verdero Company is authorized to issue 100,000 shares of \$2 par value common stock. Verdero has the following transactions:

- Issued 20,000 shares at \$30 per share; received cash.
- Issued 250 shares to attorneys for services in securing the corporate charter and for preliminary legal costs of organizing the corporation. The value of the services was \$9,000.

- (c) Issued 300 shares, valued objectively at \$10,000, to the employees instead of paying them cash wages.
- (d) Issued 12,500 shares of stock in exchange for a building valued at \$295,000 and land valued at \$80,000. (The building was originally acquired by the investor for \$250,000 and has \$100,000 of accumulated depreciation; the land was originally acquired for \$30,000.)
- (e) Received cash for 6,500 shares of stock sold at \$38 per share.
- (f) Issued 4,000 shares at \$45 per share; received cash.

Make the journal entries necessary for Verdero Company to record each transaction.

### Exercise 13-25

#### Dividends—Different Classes of Stock

L01

Solar Storm Inc. began operations on June 30, 2011, and issued 60,000 shares of \$1 par common stock on that date. On December 31, 2011, Solar Storm declared and paid \$24,200 in dividends. After a vote of the board of directors, Solar Storm issued 25,000 shares of 7% cumulative, \$10 par, preferred stock on January 1, 2013. On December 31, 2013, Solar Storm declared and paid \$16,500 in dividends, and on December 31, 2014, Solar Storm declared and paid \$41,300 in dividends. Determine the amount of dividends to be distributed to each class of stock for each of Solar Storm's dividend payments.

### Exercise 13-26

#### Preferred Stock—Cumulative and Noncumulative

L01

Anderson Company paid dividends at the end of each year as follows: 2011, \$150,000; 2012, \$240,000; and 2013, \$560,000. Determine the amount of dividends per share paid on common and preferred stock for each year, assuming independent capital structures as follows:

- (a) 300,000 shares of no-par common; 10,000 shares of \$100 par, 9% noncumulative preferred.
- (b) 250,000 shares of no-par common; 20,000 shares of \$100 par, 9% noncumulative preferred.
- (c) 250,000 shares of no-par common; 20,000 shares of \$100 par, 9% cumulative preferred.
- (d) 250,000 shares of \$1 par common; 30,000 shares of \$100 par, 9% cumulative preferred.

### Exercise 13-27

#### Issuance of Capital Stock with Subscriptions

L02

Palo Verde Company was incorporated on January 1, 2013, with the following authorized capitalization:

- 25,000 shares of common stock, stated value \$6 per share
- 8,000 shares of 8% cumulative preferred stock, par value \$20 per share

Make the entries required for each of the following transactions:

- (a) Issued 14,000 shares of common stock for a total of \$518,000 and 5,000 shares of preferred stock at \$25 per share.
- (b) Subscriptions were received for 3,000 shares of common stock at a price of \$41. A 25% down payment is received.
- (c) Collected the remaining amount owed on the stock subscriptions and issued the stock.
- (d) Sold the remaining authorized shares of common stock at \$53 per share.

### Exercise 13-28

#### Acquisition and Retirement of Stock

L03

Holanna Company reported the following balances related to common stock as of December 31, 2012:

Common stock, \$1 par, 200,000 shares issued and outstanding	\$ 200,000
Paid-in capital in excess of par	2,400,000

The company purchased and immediately retired 21,000 shares at \$19 on August 1, 2013, and 34,000 shares at \$9 on December 31, 2013. Make the entries to record the acquisition and retirement of the common stock. (Assume all shares were originally sold at the same price.)

**Exercise 13-29****L03****Treasury Stock: Par Value and Cost Methods**

The stockholders' equity of Thomas Company as of December 31, 2012, was as follows:

Common stock, \$1 par, authorized 275,000 shares; 240,000 shares issued and outstanding. . . . .	\$ 240,000
Paid-in capital in excess of par. . . . .	3,840,000
Retained earnings . . . . .	900,000

On June 1, 2013, Thomas reacquired 15,000 shares of its common stock at \$16. The following transactions occurred in 2013 with regard to these shares.

July	1	Sold 5,000 shares at \$20.
Aug.	1	Sold 7,000 shares at \$14.
Sept.	1	Retired 1,000 shares.

1. Using the cost method to account for treasury stock:
  - (a) Prepare the journal entries to record all treasury stock transactions in 2013.
  - (b) Prepare the Stockholders' Equity section of the balance sheet at December 31, 2013, assuming Retained Earnings of \$1,005,000 (before the effects of treasury stock transactions).
2. Using the par value method to account for treasury stock:
  - (a) Prepare the journal entries to record all treasury stock transactions in 2013.
  - (b) Prepare the Stockholders' Equity section of the balance sheet at December 31, 2013, assuming Retained Earnings of \$1,005,000 (before the effects of treasury stock transactions).

**Exercise 13-30****L04****Stock Rights**

In 2013, Calton Inc. had 100,000 shares of \$1.50 par value common stock outstanding. Calton issued 100,000 stock rights. Five rights, plus \$50 in cash, are required to purchase one new share of Calton common stock. On the date the rights were issued, Calton common stock was selling for \$55 per share.

What entries must Calton make to record the issuance of the stock rights?

**Exercise 13-31****L04****Accounting for Stock Warrants**

Western Company wants to raise additional equity capital. After analysis of the available options, the company decides to issue 1,500 shares of \$20 par preferred stock with detachable warrants. The package of the stock and warrants sells for \$90. The warrants enable the holder to purchase 1,500 shares of \$2 par common stock at \$30 per share. Immediately following the issuance of the stock, the stock warrants are selling at \$9 per share. The market value of the preferred stock without the warrants is \$85.

1. Prepare a journal entry for Western Company to record the issuance of the preferred stock and the attached warrants.
2. Assuming that all the warrants are exercised, prepare a journal entry for Western to record the exercise of the warrants.
3. Assuming that only 70% of the warrants are exercised (and the remaining 30% lapse), prepare the journal entries for Western to record the exercise and expiration of the warrants.

**Exercise 13-32****L05****Accounting for a Basic Stock-Based Compensation Plan**

On January 1, 2012, Obregon Supply Company established a stock-based compensation plan for its senior employees. A total of 45,000 options was granted that permit

employees to purchase 45,000 shares of \$2 par common stock at \$29 per share. Each option had a fair value of \$7 on the grant date. Options are exercisable beginning on January 1, 2015, and can be exercised anytime during 2015. The market price for Obregon common stock on January 1, 2012, was \$32.

Assume that all options were exercised on December 31, 2015. Prepare all entries required for the years 2012–2015.

**Exercise 13-33****L05****Accounting for a Performance-Based Stock Option Plan**

Rhiener Corporation initiated a performance-based employee stock option plan on January 1, 2012. The performance base for the plan is net sales in the year 2014. The plan provides for stock options to be awarded to the employees as a group on the following basis:

Level	Net Sales Range	Options Granted
1	<\$250,000	10,000
2	\$250,000–\$499,999	20,000
3	\$500,000–\$1,000,000	30,000
4	>\$1,000,000	40,000

The options become exercisable on January 1, 2015. The option exercise price is \$20 per share. On January 1, 2012, each option had a fair value of \$9. The market prices of Rhiener stock on selected dates in 2012–2014 were as follows:

January 1, 2012	\$25
December 31, 2012	30
December 31, 2013	35
December 31, 2014	32

Year 2014 sales estimates as of selected dates were as follows:

January 1, 2012	\$400,000
December 31, 2012	450,000
December 31, 2013	550,000

Actual sales for 2014 were \$700,000. Calculate the compensation expense Rhiener should report for the years 2012, 2013, and 2014 related to this performance-based stock option plan.

**Exercise 13-34****L05****Stock Appreciation Rights**

San Juan Corporation established a stock option plan that provides for cash payments to employees based on the appreciation of stock prices from an established threshold price. The plan was instituted on January 1, 2013, and provides benefits to employees who work for the succeeding three years. Cash payments to employees will be made on January 1, 2016, and will equal the excess of the stock price over the threshold price on that date. In total, 15,000 of these cash stock appreciation rights (SARs) were granted to employees.

The threshold price established for the SARs is \$10 per share. The estimated fair value of each SAR on selected dates in 2013–2015 was as follows:

December 31, 2013	\$ 6
December 31, 2014	10
December 31, 2015	8

Prepare the journal entries on San Juan's books for the years 2013, 2014, 2015, and 2016 related to this plan.

**Exercise 13-35****L07****Convertible Preferred Stock**

Stockholders' equity for Channa Co. on December 31 was as follows:

Preferred stock, \$14 par, 25,000 shares issued and outstanding	\$ 350,000
Paid-in capital in excess of par—preferred stock	100,000
Common stock, \$9 par, 125,000 shares issued and outstanding	1,125,000
Paid-in capital in excess of par—common stock	875,000
Retained earnings	1,600,000

Preferred stock is convertible into common stock.

Provide the entry made on Channa Co.'s books assuming that 6,000 shares of preferred are converted under each assumption listed:

1. Preferred shares are convertible into common on a share-for-share basis.
2. Each share of preferred stock is convertible into 4.0 shares of common.
3. Each share of preferred stock is convertible into 1.5 shares of common.

**Exercise 13-36****L08****Reporting Errors from Previous Periods**

Endicott Company's December 31, 2012, balance sheet reported retained earnings of \$86,500, and net income of \$124,000 was reported in the 2012 income statement. While preparing financial statements for the year ended December 31, 2013, Tom Dryden, accountant for Endicott Company, discovered that net income for 2012 had been overstated by \$36,000 due to an error in recording depreciation expense for 2012. Net income for 2013 was \$106,000, and dividends of \$30,000 were declared and paid in 2013.

1. What effect, if any, would the \$36,000 error made in 2012 have on the company's 2013 financial statements?
2. Compute the amount of retained earnings to be reported in Endicott Company's December 31, 2013, balance sheet.

**Exercise 13-37****L09****Cash Dividend Computations**

Consistent Company has been paying regular quarterly dividends of \$2.00 and wants to pay the same amount in the third quarter of 2013. Given the following information, (1) what is the total amount that Consistent will have to pay in dividends in the third quarter in order to pay \$2.00 per share, and (2) what is the total amount of dividends to be distributed during the year assuming no equity transactions occur after June 30?

2013

Jan.	1	Shares outstanding, 800,000; \$2 par (1,500,000 shares authorized).
Feb.	15	Issued 50,000 new shares at \$10.50.
Mar.	31	Paid quarterly dividends of \$2.00 per share.
May	12	Converted \$1,000,000 of \$1,000 bonds to common stock at the rate of 100 shares of stock per \$1,000 bond.
June	15	Issued an 11% stock dividend.
	30	Paid quarterly dividends of \$2.00 per share.

**Exercise 13-38****L09****Property Dividends**

Phelps Company distributed the following dividends to its stockholders:

- (a) 450,000 shares of Bedrock Corporation stock, carrying value of investment, \$975,000; fair market value, \$1,350,000.
- (b) 220,000 shares of Great Basin Company stock, a closely held corporation. The shares were purchased by Phelps three years ago at \$6.25 per share, but no current market price is available.

Indicate the journal entries to account for the declaration and the payment of the dividends.

**Exercise 13-39****L09****Stock Dividends**

The balance sheet of Carmen Corporation shows the following:

Common stock, \$1 stated value, 80,000 shares issued and outstanding . . . . .	\$ 80,000
Paid-in capital in excess of stated value . . . . .	1,120,000
Retained earnings . . . . .	350,000

A 25% stock dividend is declared, with the board of directors authorizing a transfer from Retained Earnings to Common Stock at the stated value of the shares.

1. Provide entries to record the declaration and issuance of the stock dividend.
2. What was the effect of the issuance of the stock dividend on the ownership equity of each stockholder in the corporation?
3. Provide entries to record the declaration and issuance of the dividend if the board of directors had elected to declare a 15% stock dividend instead of 25%. The market value of the stock is \$10 per share after the 15% stock dividend is issued.

**Exercise 13-40****L09****SPREADSHEET****Stock Dividends and Stock Splits**

The capital accounts for Alston Market on June 30, 2013, are as follows:

Common stock, \$6 par, 50,000 shares issued and outstanding . . . . .	\$ 300,000
Paid-in capital in excess of par . . . . .	600,000
Retained earnings . . . . .	1,840,000

Shares of the company's stock are selling at this time at \$66. What entries would you make in each of the following cases?

- (a) A 10% stock dividend is declared and issued.
- (b) A 50% stock dividend is declared and issued.
- (c) A 2-for-1 stock split is declared and issued.

**Exercise 13-41****L09****Small Stock Dividend**

Zenon Company has 450,000 shares of \$1 par value common stock outstanding. In declaring and distributing a 10% stock dividend, Zenon initially issued only 40,000 new shares; the other stock dividend shares have not yet been issued as of the end of the year. Prepare all journal entries necessary to record the declaration and distribution of the stock dividend. The market price of the shares is \$21 per share after the 10% stock dividend is issued.

**Exercise 13-42****L09****Liquidating Dividend**

Van Etten Company declared and paid a cash dividend of \$3.25 per share on its \$1 par common stock. Van Etten has 100,000 shares of common stock outstanding and total paid-in capital from common stock of \$800,000. As part of the dividend announcement, Van Etten stated that retained earnings served as the basis for only \$0.50 per share of the dividend; investors should consider the remainder to be a return of investment. Prepare the journal entries necessary on Van Etten's books to record the declaration and distribution of this dividend.

**Exercise 13-43****L08****Correcting the Retained Earnings Account**

The retained earnings account for Carlitos Inc. shows the following debits and credits. Indicate all entries required to correct the account. What is the corrected amount of retained earnings?

**Account:** Retained Earnings

Date	Item	Debit	Credit	Balance	
				Debit	Credit
Jan. 1	Balance				291,700
(a)	Loss from fire	3,175			288,525
(b)	Goodwill impairment	32,200			256,325
(c)	Stock dividend	50,000			206,325
(d)	Loss on sale of equipment	17,550			188,775
(e)	Officers' compensation related to income of prior periods— accrual overlooked	210,400		21,625	
(f)	Loss on retirement of preferred shares at more than issuance price	28,000		49,625	
(g)	Paid-in capital in excess of par		79,500		29,875
(h)	Stock subscription defaults		3,725		33,600
(i)	Gain on retirement of preferred stock at less than issuance price		14,700		48,300
(j)	Gain on early retirement of bonds at less than book value		8,100		56,400
(k)	Gain on life insurance policy settlement		7,800		64,200
(l)	Correction of prior-period error		31,050		95,250

**Exercise 13-44****Equity Adjustments****L010, L011**

The following data are for Radial Company:

Contributed capital and retained earnings . . . . .	\$417,000
Foreign currency translation adjustment . . . . .	72,000
Unrealized gain on available-for-sale securities . . . . .	95,000

(Note: The currencies in the countries where Radial has foreign subsidiaries have strengthened relative to the U.S. dollar.)

Compute total stockholders' equity for Radial Company.

**Exercise 13-45****Analysis of Owners' Equity****L011**

From the following information, reconstruct the journal entries that were made by Rivers Corporation during 2013.

	Dec. 31, 2013		Dec. 31, 2012	
	Amount	Shares	Amount	Shares
Common stock . . . . .	\$175,000	7,000	\$150,000	6,000
Paid-in capital in excess of par . . . . .	54,250	—	36,000	—
Paid-in capital from treasury stock . . . . .	1,000	200	—	—
Retained earnings . . . . .	76,500*	—	49,000	—
Treasury stock . . . . .	15,000	300	—	—

\*Includes net income of \$40,000 for 2013. There were no dividends. Assume that revenues and expenses were closed to a temporary account, Income Summary. Use this account to complete the closing process. At the beginning of 2013, 2,500 shares of common stock (issued when the company was formed) were purchased for \$90,000; these were retired later in the year. The cost method is used to record treasury stock transactions. Treasury stock purchased during the year was purchased at a cost of \$50 per share.

**Exercise 13-46****Reporting Stockholders' Equity****L011**

Kenny Co. began operations on January 1, 2012, by issuing at \$15 per share one-half of the 950,000 shares of \$1 par value common stock that had been authorized for sale. In addition, Kenny has 500,000 shares of \$5 par value, 6% preferred shares authorized. During 2012, Kenny had \$1,025,000 of net income and declared \$237,500 of dividends.

During 2013, Kenny had the following transactions:

Jan.	10	Issued an additional 100,000 shares of common stock for \$17 per share.
Apr.	1	Issued 150,000 shares of the preferred stock for \$8 per share.
July	19	Authorized the purchase of a custom-made machine to be delivered in January 2014. Kenny restricted \$295,000 of retained earnings for the purchase of the machine.
Oct.	23	Sold an additional 50,000 shares of the preferred stock for \$9 per share.
Dec.	31	Reported \$1,215,000 of net income and declared a dividend of \$635,000 to stockholders of record on January 15, 2014, to be paid on February 1, 2014.

1. Prepare the Stockholders' Equity section of Kenny's balance sheet for December 31, 2012.
2. Prepare a statement of changes in stockholders' equity for 2013.
3. Prepare the Stockholders' Equity section of Kenny's balance sheet for December 31, 2013.

## PROBLEMS

### Problem 13-47

L02, L09, L011

SPREADSHEET

### Journalizing Stock Transactions

Lighthouse Company began operations on January 1. Authorized were 25,000 shares of \$1 par value common stock and 5,000 shares of 10%, \$100 par value convertible preferred stock. The following transactions involving stockholders' equity occurred during the first year of operations:

Jan.	1	Issued 1,000 shares of common stock to the corporation promoters in exchange for property valued at \$23,000 and services valued at \$5,000. The property had cost the promoters \$18,000 three years before and was carried on the promoters' books at \$15,000.
Feb.	23	Issued 1,500 shares of convertible preferred stock with a par value of \$100 per share. Each share can be converted to five shares of common stock. The stock was issued at a price of \$120 per share, and the company paid \$6,000 to an agent for selling the shares.
Mar.	10	Sold 2,500 shares of the common stock for \$26 per share. Issue costs were \$2,000.
Apr.	10	Sold 5,000 shares of common stock under stock subscriptions at \$37 per share. No shares are issued until a subscription contract is paid in full. No cash was received.
July	14	Exchanged 1,200 shares of common stock and 190 shares of preferred stock for a building with a fair market value of \$72,000. The building was originally purchased for \$65,000 by the investors and has a book value of \$48,000. In addition, 900 shares of common stock were sold for \$27,000 in cash.
Aug.	3	Received payments in full for half of the stock subscriptions and payments on account on the rest of the subscriptions. Total cash received was \$138,000. Shares of stock were issued for the subscriptions paid in full.
Dec.	1	Declared a cash dividend of \$10 per share on preferred stock, payable on December 31 to stockholders of record on December 15, and a \$1.20-per-share cash dividend on common stock, payable on January 5 of the following year to stockholders of record on December 15. (No dividends are paid on unissued subscribed stock.)
	31	Paid the preferred stock dividend.
	31	Received notice from holders of stock subscriptions for 1,000 shares that they would not pay further on the subscriptions because the price of the stock had fallen to \$19 per share. The amount still due on those contracts was \$35,000. Amounts previously paid on the contracts are forfeited according to the agreements.

Net income for the first year of operations was \$80,000. Assume that revenues and expenses were closed to a temporary account, Income Summary. Use this account to complete the closing process.

### Instructions:

1. Prepare journal entries to record the preceding transactions on Lighthouse's books.
2. Prepare the Stockholders' Equity section of the balance sheet at December 31 for Lighthouse.

**Problem 13-48**  
**L02, L011****Stockholders' Equity Transactions and Balance Sheet Presentation**

Atlantic Pacific Corporation was organized on September 1, 2013, with authorized capital stock of 150,000 shares of 7% cumulative preferred stock with a \$40 par value and 1,000,000 shares of no-par common stock with a \$2 stated value. During the balance of the year, the following transactions relating to capital stock were completed:

- Oct. 1 Received subscriptions for 200,000 shares of common stock at \$39, payable \$20 down and the balance in two equal installments due November 1 and December 1. On the same date, 17,800 shares of common stock were issued to Alan Williams in exchange for his business. Assets transferred to the corporation were valued as follows: land, \$195,000; buildings, \$216,000; equipment, \$62,000; merchandise, \$105,000. Liabilities of the business assumed by the corporation were mortgage payable, \$46,000; accounts payable, \$14,000; accrued interest on mortgage, \$900. The fair value of the net assets is considered to be a reliable reflection of the value of the business; no goodwill is recognized.
- 3 Received subscriptions for 110,000 shares of preferred stock at \$51, payable \$21 down and the balance in two equal installments due November 1 and December 1.
- Nov. 1 Collected amounts due on this date from all common and preferred stock subscribers.
- 12 Received subscriptions for 390,000 shares of common stock at \$42, payable \$20 down and the balance in two equal installments due December 1 and January 1.
- Dec. 1 Collected amounts due on this date from all common stock and preferred stock subscribers and issued stock fully paid for.

**Instructions:**

1. Prepare journal entries to record these transactions.
2. Prepare the Contributed Capital section of stockholders' equity for the corporation as of December 31, including any equity offsets.

**Problem 13-49**  
**L02, L08,**  
**L09, L011****Reconstruction of Equity Transactions**

Manti Company had the following account balances on its balance sheet at December 31, 2013, the end of its first year of operations. All stock was issued on a subscription basis.

Common stock subscriptions receivable	\$150,000
Common stock, \$1 par	3,000
Common stock subscribed	9,000
Paid-in capital in excess of par—common	348,000
8% preferred stock, \$100 par	120,000
Paid-in capital in excess of par—8% preferred	60,000
10% preferred stock, \$50 par	25,000
Retained earnings	10,000

The reported net income for 2013 was \$55,000. Assume that revenues and expenses were closed to a temporary account, Income Summary. Use this account to complete the closing process.

**Instructions:** From the data given, reconstruct in summary form the journal entries to record all transactions involving the company's stockholders. Indicate the amount of dividends distributed on each class of stock.

**Problem 13-50**  
**L02, L03,**  
**L09, L011****Comprehensive Analysis and Reporting of Stockholders' Equity**

Keystone Company has two classes of capital stock outstanding: 10%, \$40 par preferred and \$1 par common. During the fiscal year ended November 30, 2013, the company was active in transactions affecting the stockholders' equity. Page 13-71 summarizes these transactions.

Type of Transaction	Number of Shares	Price per Share
(a) Issue of preferred stock . . . . .	6,000	\$47
(b) Issue of common stock . . . . .	40,000	76
(c) Reacquisition and retirement of preferred stock . . . . .	3,000	50
(d) Purchase of treasury stock—common (reported at cost) . . . . .	15,000	80
(e) Stock split—common (par value reduced to \$0.50) . . . . .	2 for 1	
(f) Reissuance of treasury stock—common (after stock split) . . . . .	15,000	56

Balances of the accounts in the Stockholders' Equity section of the November 30, 2012, balance sheet were

Preferred stock, 40,000 shares . . . . .	\$ 1,600,000
Common stock, 250,000 shares . . . . .	250,000
Paid-in capital in excess of par—preferred . . . . .	200,000
Paid-in capital in excess of par—common . . . . .	18,250,000
Retained earnings . . . . .	960,000

Dividends were paid at the end of the fiscal year on the common stock at \$1.20 per share and on the preferred stock at the preferred rate. Net income for the year was \$800,000.

**Instructions:** Based on the preceding data, prepare the Stockholders' Equity section of the balance sheet as of November 30, 2013. For shares retired, assume that the most recently issued shares are retired first. (Note: A work sheet beginning with November 30, 2012, balances showing transactions for the current year will facilitate the preparation of this section of the balance sheet.)

### Problem 13-51

#### L04, L05, L011

### Accounting for Various Capital Stock Transactions

The Stockholders' Equity section of Webster Inc. showed the following data on December 31, 2012: common stock, \$3 par, 300,000 shares authorized, 250,000 shares issued and outstanding, \$750,000; paid-in capital in excess of par, \$7,050,000; additional paid-in capital from stock options, \$150,000; retained earnings, \$480,000. The stock options were granted to key executives and provided them the right to acquire 30,000 shares of common stock at \$35 per share. The options had a value of \$5 each on the grant date.

The following transactions occurred during 2013.

Mar.	31	Key executives exercised 4,500 options outstanding at December 31, 2012. The market price per share was \$44 at this time.
Apr.	1	The company issued bonds of \$2,000,000 at par, giving each \$1,000 bond a detachable warrant enabling the holder to purchase two shares of stock at \$40 each for a 1-year period. Market values immediately following issuance of the bonds were \$4 per warrant and \$998 per \$1,000 bond without the warrant.
June	30	The company issued rights to stockholders (one right on each share, exercisable within a 30-day period) permitting holders to acquire one share at \$40 with every 10 rights submitted. Shares were selling for \$43 at this time. All but 6,000 rights were exercised on July 31, and the additional stock was issued.
Sept.	30	All warrants issued with the bonds on April 1 were exercised.
Nov.	30	The market price per share dropped to \$33, and options came due. Because the market price was below the option price, no remaining options were exercised.

### Instructions:

1. Provide entries to record these transactions.
2. Prepare the Stockholders' Equity section of the balance sheet as of December 31, 2013 (assume net income of \$210,000 and no dividend declarations for 2013).

**Problem 13-52****L02, L03, L07,  
L08, L09, L011****Accounting for Various Capital Stock Transactions**

Pineview Co., organized on June 1, 2012, was authorized to issue stock as follows:

- 80,000 shares of preferred 9% stock, convertible, \$100 par
- 500,000 shares of common stock, \$2.50 stated value

During the remainder of Pineview Co.'s fiscal year ended May 31, 2013, the following transactions were completed in the order given:

- (a) 30,000 shares of preferred stock were subscribed for at \$105, and 90,000 shares of common stock were subscribed for at \$26. Both subscriptions were payable 30% upon subscription, the balance in one payment.
- (b) The second subscription payment was received, except one subscriber for 6,000 shares of common stock defaulted on payment. The full amount paid by this subscriber was returned, and all of the fully paid stock was issued.
- (c) 15,000 shares of common stock were reacquired by purchase at \$28. (Treasury stock is recorded at cost.)
- (d) Each share of preferred stock was converted into four shares of common stock.
- (e) The treasury stock was exchanged for machinery with a fair market value of \$430,000.
- (f) There was a 2-for-1 stock split, and the stated value of the new common stock is \$1.25.
- (g) Net income was \$83,000. Assume that revenues and expenses have been closed to a temporary account, Income Summary.

**Instructions:**

1. Give the journal entries to record these transactions. (For net income, give the entry to close the income summary account to Retained Earnings.)
2. Prepare the Stockholders' Equity section as of May 31, 2013.

**Problem 13-53****L02, L03****Issuance, Repurchase, and Resale of Capital Stock**

Lupito Company had the following transactions occur during 2013:

- (a) Issued 8,000 shares of common stock to the founders for land valued at \$275,000. Par value of the common stock is \$1 per share.
- (b) Issued 4,000 shares of \$100 par preferred stock for cash at \$120.
- (c) Sold 2,500 shares of common stock to the company president for \$45 per share.
- (d) Purchased 750 shares of outstanding preferred stock issued in (b) for cash at par.
- (e) Purchased 2,000 shares of the outstanding common stock issued in (a) for \$39 per share.
- (f) Reissued 400 shares of repurchased preferred stock at \$112.
- (g) Reissued 500 shares of reacquired common stock for \$45 per share.
- (h) Repurchased 200 shares of the common stock sold in (g) for \$43 per share. These same 200 shares were later reissued for \$35 per share.

**Instructions:**

1. Prepare the necessary entries to record the preceding transactions involving Lupito's preferred stock. Assume that the par value method is used for recording treasury stock.
2. Prepare the necessary entries for the common stock transactions assuming that the cost method is used for recording treasury stock.

**Problem 13-54****L02, L03, L011****Treasury Stock Transactions**

Transactions that affected Barter Company's stockholders' equity during 2013, the first year of operations, follow.

- (a) Issued 30,000 shares of 9% preferred stock, \$20 par, at \$26.
- (b) Issued 50,000 shares of \$3 par common stock at \$33.

- (c) Purchased and immediately retired 4,000 shares of preferred stock at \$28.
- (d) Purchased 6,000 shares of its own common stock at \$35.
- (e) Reissued 1,000 shares of treasury stock at \$37.

No dividends were declared in 2013, and net income for 2013 was \$185,000.

**Instructions:**

1. Record each of the transactions. Assume that treasury stock acquisitions are recorded at cost.
2. Prepare the Stockholders' Equity section of the balance sheet at December 31, 2013.

**Problem 13-55**

**L05**

**Accounting for Stock Options**

The board of directors of Muir Company adopted a fixed stock option plan to supplement the salaries of certain executives of the company. Options to buy common stock were granted as follows:

Date	Employee	Number of Shares	Exercise Price	Price of Shares at Date of Grant	Option Value at Date of Grant
Jan. 1, 2010	D. R. Call	80,000	\$30	\$32	\$ 9
Jan. 1, 2011	J. K. Neilson	45,000	38	41	10
Jan. 1, 2012	B. D. Gwynn	25,000	43	47	11

Options are nontransferable and can be exercised beginning three years after date of grant, provided the executive is still employed by the company. Stock options were exercised as follows:

Date	Employee	Number of Shares	Price of Shares at Date of Exercise
Dec. 31, 2013	D. R. Call	80,000	\$48
Dec. 31, 2014	J. K. Neilson	45,000	43
Dec. 31, 2015	B. D. Gwynn	25,000	49

Stock of the company has a \$1 par value. The accounting period for the company is the calendar year.

**Instructions:**

1. Provide all entries that would be made on the books of Muir relative to the stock option plan for the period 2010 to 2015 inclusive.
2. Prepare the required note disclosure relative to the stock option plan for the year 2012 and for the year 2014.

**Problem 13-56**

**L05**

**Performance-Based Stock Options**

Globe Corporation, a new environmental control company, initiated a performance-based stock option plan for its management on January 1, 2012. The plan provided for the granting of a variable number of stock options to management personnel who worked for the entire 4-year period ending December 31, 2015, depending on the net income earned by the company in 2015. No options were granted for the first \$50,000 of net income. Thereafter, the following options were available based on the level of net income in 2015.

\$50,000–\$99,999	12,000 stock options
\$100,000–\$124,999	24,000 stock options
\$125,000–\$149,999	36,000 stock options
\$150,000 or more	60,000 stock options

The exercise price for the \$5 par common stock was \$20 per share. The fair value of the options on the grant date was \$9.

Assume the market price for the Globe stock and Globe's forecasted 2015 net income were as follows at each of the following dates:

	Stock Price	Forecasted 2015 Income
January 1, 2012 . . . . .	\$24	\$120,000
December 31, 2012 . . . . .	31	140,000
December 31, 2013 . . . . .	26	170,000
December 31, 2014 . . . . .	32	135,000
December 31, 2015 . . . . .	33	145,000 (actual)

**Instructions:** Prepare journal entries related to the stock options of Globe for the period 2012–2015 assuming that all available options are exercised on December 31, 2015.

**Problem 13-57**

**L02, L09**

**Analysis of Stock Transactions**

You have been asked to audit Greystone Company. During the course of your audit, you are asked to prepare comparative data from the company's inception to the present. You have determined the following:

- (a) Greystone Company's charter became effective on January 2, 2009, when 2,000 shares of no-par common and 1,000 shares of 7% cumulative, nonparticipating, preferred stock were issued. The no-par common stock had no stated value and was sold at \$120 per share, and the preferred stock was sold at its par value of \$100 per share.
- (b) Greystone was unable to pay preferred dividends at the end of its first year. The owners of the preferred stock agreed to accept two shares of common stock for every 50 shares of preferred stock owned in discharge of the preferred dividends due on December 31, 2009. The shares were issued on January 2, 2010. The fair market value was \$100 per share for common on the date of issue.
- (c) Greystone Company acquired all of the outstanding stock of Booth Corporation on May 1, 2011, in exchange for 1,000 shares of Greystone common stock.
- (d) Greystone split its common stock 3 for 2 on January 1, 2012, and 2 for 1 on January 1, 2013.
- (e) Greystone offered to convert 20% of the preferred stock to common stock on the basis of two shares of common for one share of preferred. The offer was accepted, and the conversion was made on July 1, 2013.
- (f) No cash dividends were declared on common stock until December 31, 2011. Cash dividends per share of common stock were declared as follows:

	June 30	Dec. 31
2011 . . . . .	—	\$3.19
2012 . . . . .	\$1.75	2.75
2013 . . . . .	1.25	1.25

**Instructions:** Compute the following:

- 1. The number of shares of each class of stock outstanding on the last day of each year from 2009 through 2013.
- 2. Total cash dividends applicable to common stock for each year from 2011 through 2013.

**Problem 13-58****L02, L03,  
L09, L011****SPREADSHEET****Accounting for Stock Transactions**

Morris Corporation is publicly owned, and its shares are traded on a national stock exchange. Morris has 16,000 shares of \$2 stated value common stock authorized. Only 75% of these shares have been issued, and of the shares issued, only 11,000 are outstanding. On December 31, 2012, the Stockholders' Equity section revealed that the balance in Paid-In Capital in Excess of Stated Value was \$416,000, and the Retained Earnings balance was \$110,000. Treasury stock was purchased at an average cost of \$37.50 per share.

During 2013, Morris had the following transactions:

Jan.	15	Morris issued, at \$55 per share, 800 shares of \$50 par, 5% cumulative preferred stock; 2,000 shares are authorized.
Feb.	1	Morris sold 1,500 shares of newly issued \$2 stated value common stock at \$42 per share.
Mar.	15	Morris declared a cash dividend on common stock of \$0.15 per share, payable on April 30 to all stockholders of record on April 1.
Apr.	15	Morris reacquired 200 shares of its common stock for \$43 per share. Morris uses the cost method to account for treasury stock.
	30	Morris paid dividends.
	30	Employees exercised 1,000 options granted in 2008 under a fixed stock option plan. When the options were granted, each option entitled the employee to purchase one share of common stock for \$50 per share. The share price on the grant date was \$51 per share. On April 30, when the market price was \$55 per share, Morris issued new shares to the employees. The fair value of the options at the grant date was \$6.
May	1	Morris declared a 10% stock dividend to be distributed on June 1 to stockholders of record on May 7. The market price of the common stock was \$55 per share on May 1 (before the stock dividend). (Assume that treasury shares do not participate in stock dividends.)
	31	Morris sold 150 treasury shares reacquired on April 15 and an additional 200 shares costing \$7,500 that had been on hand since the beginning of the year. The selling price was \$57 per share.
June	1	Morris distributed the stock dividend.
Sept.	15	The semiannual cash dividend on common stock was declared, amounting to \$0.15 per share. Morris also declared the yearly dividend on preferred stock. Both are payable on October 15 to stockholders of record on October 1.
Oct.	15	Morris paid dividends.

Net income for 2013 was \$50,000. Assume that revenues and expenses were closed to a temporary account, Income Summary. Use this account to complete the closing process.

**Instructions:**

1. Compute the number of shares and dollar amount of treasury stock at the beginning of 2013.
2. Make the necessary journal entries to record the transactions in 2013 relating to stockholders' equity.
3. Prepare the Stockholders' Equity section of Morris Corporation's December 31, 2013, balance sheet.

**Problem 13-59****L02, L03, L09****Accounting for Stock Transactions**

Valentine Corporation was organized on June 30, 2010. After 2 1/2 years of profitable operations, the Equity section of Valentine's balance sheet was as follows:

Contributed capital:

Common stock, \$5 par, 500,000 shares authorized, 300,000 shares issued and outstanding	\$ 1,500,000
Paid-in capital in excess of par	11,000,000
Retained earnings	3,600,000
Total stockholders' equity	<u>\$16,100,000</u>

During 2013, the following transactions affected stockholders' equity:

Jan.	31	Reacquired 20,000 shares of common stock at \$41; treasury stock is recorded at cost.
Apr.	1	Declared a 30% stock dividend. (Applies to all issued stock.)
	30	Declared an \$0.80 cash dividend. (Applies only to outstanding stock.)
June	1	Issued the stock dividend and paid the cash dividend.
Aug.	31	Sold all treasury stock at \$49.

**Instructions:** Provide the journal entries to record the stock transactions.

### Problem 13-60

L09

#### Stock Dividend and Cash Dividend

On January 1, 2013, Cozumel Company had 100,000 shares of \$0.50 par value common stock outstanding. The market value of Cozumel's common stock was \$18 per share. Cozumel's Retained Earnings balance on January 1 was \$460,000. During 2012, Cozumel had declared and paid cash dividends of \$0.75 per share. Net income for 2013 is expected to be \$130,000. Cozumel has a large loan from McGraw Bank; part of the loan agreement stipulates that Cozumel must maintain a minimum Retained Earnings balance of \$350,000.

Cozumel's board of directors is debating whether to declare a stock dividend in addition to its \$0.75 per share annual cash dividend. Three proposals have been presented: (1) no stock dividend, (2) a 10% stock dividend, and (3) a 25% stock dividend.

**Instructions:** As a shareholder in Cozumel Company, which of the three proposals do you favor? Support your answer.

#### Stockholders' Equity Transactions

Squires Inc. was organized on January 2, 2012, with authorized capital stock consisting of 40,000 shares of 10%, \$200 par value preferred, and 300,000 shares of no-par, no stated value common. During the first two years of the company's existence, the following selected transactions took place:

2012		
Jan.	2	Sold 15,000 shares of common stock at \$14.
	2	Sold 4,000 shares of preferred stock at \$211.
Mar.	2	Sold common stock as follows: 11,300 shares at \$19; 3,900 shares at \$24.
July	10	Acquired a nearby piece of land, appraised at \$500,000, for 800 shares of preferred stock and 34,000 shares of common. (Preferred stock was recorded at \$211, the balance being assigned to common.)
Dec.	16	Declared the regular preferred dividend and a \$1.75 common dividend.
	28	Paid dividends declared on December 16.
	31	Assume that revenues and expenses were closed to a temporary account, Income Summary. The income summary account showed a credit balance of \$600,000, which was transferred to Retained Earnings.
2013		
Feb.	27	Reacquired 11,000 shares of common stock at \$18. The treasury stock is carried at cost. (State law requires that an appropriation of Retained Earnings be made for the purchase price of treasury stock. Appropriations are to be returned to Retained Earnings upon resale of the stock.)
June	17	Resold 8,000 shares of the treasury stock at \$21.
July	31	Resold all of the remaining treasury stock at \$16.
Sept.	30	Sold 17,000 additional shares of common stock at \$22.
Dec.	16	Declared the regular preferred dividend and a \$0.70 common dividend.
	28	Dividends declared on December 16 were paid.
	31	The income summary account showed a credit balance of \$550,000, which was transferred to Retained Earnings.

**Instructions:**

1. Give the journal entries to record these transactions.
2. Prepare the Stockholders' Equity section of the balance sheet as of December 31, 2013.

**Problem 13-62****L03, L07, L08,  
L09, L011****Accounting for Stockholders' Equity**

A condensed balance sheet for Sharp Tax Inc. as of December 31, 2010, follows. Capital stock authorized consists of 750 shares of 8%, \$100 par, cumulative preferred stock and 15,000 shares of \$50 par common stock.

Information relating to operations of the succeeding three years follows the condensed balance sheet.

<b>Sharp Tax Inc.</b>			
<b>Condensed Balance Sheet</b>			
<b>December 31, 2010</b>			
<b>Assets</b>		<b>Liabilities and Stockholders' Equity</b>	
Assets .....	\$525,000	Liabilities .....	\$120,000
		8% preferred stock, \$100 par .....	75,000
		Common stock, \$50 par .....	150,000
		Paid-in capital in excess of par—common .....	30,000
		Retained earnings .....	150,000
Total assets .....	<u>\$525,000</u>	Total liabilities and stockholders' equity .....	<u>\$525,000</u>

	<b>2011</b>	<b>2012</b>	<b>2013</b>
Dividends declared on December 20, payable on January 10 of the following year:			
Preferred stock .....	8% cash	8% cash	8% cash
Common stock .....	\$1.00 cash	\$1.25 cash	\$1.00 cash
	50% stock		
Net income for year .....	\$67,500	\$39,000	\$51,000

**2012**

Feb. 12 Accumulated depreciation was reduced by \$72,000 following an income tax investigation. (Assume that this was an error that qualified as a prior-period adjustment.) Additional income tax of \$22,500 for prior years was paid.

Mar. 3 Purchased 300 shares of common stock at \$54 per share; treasury stock is recorded at cost, and retained earnings are appropriated equal to such costs.

**2013**

Aug. 10 All the treasury stock was resold at \$59 per share, and the retained earnings appropriation was canceled.

Sept. 12 By vote of the stockholders, each share of the common stock was exchanged by the corporation for four shares of no-par common stock with a stated value of \$15.

**Instructions:**

1. Make the journal entries to record these transactions for the 3-year period ended December 31, 2013. (Assume that revenues and expenses were closed to a temporary account, Income Summary, at the end of each year. Use this account to complete the closing process.)
2. Prepare the Stockholders' Equity section of the balance sheet as it would appear at the end of 2011, 2012, and 2013.

**Problem 13-63****L08, L09****Retained Earnings and the Statement of Cash Flows**

The following items relate to the activities of Schmidt Company for 2013:

- (a) Cash dividends declared and paid on common stock during the year totaled \$90,000. In addition, on January 15, 2013, dividends of \$25,000 that were declared in 2012 were paid.

- (b) Retained earnings of \$145,000 were appropriated during the year in anticipation of a major capital expansion in future years.
- (c) Depreciation expense was \$59,000.
- (d) Equipment was purchased for \$215,000 in cash.
- (e) Early in the year, a 10% stock dividend was declared and distributed. This stock dividend resulted in the distribution of 40,000 new shares of \$1 par common stock. The market value per share immediately after the stock dividend was \$55.
- (f) Cash revenues for the year totaled \$582,000.
- (g) Cash expenses for the year totaled \$305,000.
- (h) Old machinery was sold for its book value of \$20,000.
- (i) Near the end of the year, a 2-for-1 stock split was declared. The 440,000 shares of \$1 par common stock outstanding at the time were exchanged for 880,000 shares with a par value of \$0.50.
- (j) Cash dividends totaling \$27,000 were declared and paid on preferred stock.
- (k) Land was acquired in exchange for 5,000 shares of \$0.50 par value common stock. The land had a fair market value of \$170,000.
- (l) Assume no changes in current operating receivable and payable balances during the year.

**Instructions:** Prepare a statement of cash flows for Schmidt Company for the year ended December 31, 2013. Use the indirect method for reporting cash flows from operating activities.

**Problem 13-64**

**L02, L08,  
L09, L011**

**Reporting Stockholders' Equity**

The Stockholders' Equity section of Nilsson Corporation's balance sheet as of December 31, 2012, is as follows:

Common stock (\$5 par, 500,000 shares authorized, 275,000 issued and outstanding) . . . . .	\$1,375,000	
Paid-in capital in excess of par . . . . .	550,000	
Total paid-in capital . . . . .		\$1,925,000
Unappropriated retained earnings . . . . .	\$1,335,000	
Appropriated retained earnings . . . . .	500,000	
Total retained earnings . . . . .		1,835,000
Total stockholders' equity . . . . .		<u>\$3,760,000</u>

Nilsson Corporation had the following stockholders' equity transactions during 2013:

- Jan. 15 Completed the building renovation, for which \$500,000 of retained earnings had been restricted. Paid the contractor \$485,000, all of which is capitalized.
- Mar. 3 Issued 100,000 additional shares of the common stock for \$8 per share.
- May 18 Declared a dividend of \$1.50 per share to be paid on July 31, 2013, to stockholders of record on June 30, 2013.
- June 19 Approved additional building renovation to be funded internally. The estimated cost of the project is \$400,000, and retained earnings are to be restricted for that amount.
- July 31 Paid the dividend.
- Nov. 12 Declared a property dividend to be paid on December 31, 2013, to stockholders of record on November 30, 2013. The dividend is to consist of 35,000 shares of Hampton Inc. stock that are currently recorded in Nilsson's books at \$9 per share. The fair market value of the stock on November 12 is \$13 per share.
- Dec. 31 Reported \$885,000 of net income on the December 31, 2013, income statement. (Assume that revenues and expenses were closed to a temporary account, Income Summary. Use this account to complete the closing process.) In addition, the stock was distributed in satisfaction of the property dividend. The Hampton stock closed at \$14 per share at the end of the day's trading.

**Instructions:**

1. Make all necessary journal entries for Nilsson to account for the transactions affecting stockholders' equity.
2. Prepare the December 31, 2013, Stockholders' Equity section of the balance sheet for Nilsson.

**Problem 13-65**  
**L02, L03, L04**

**Auditing Stockholders' Equity**

You have been assigned to the audit of Packer Inc., a manufacturing company. You have been asked to summarize the transactions for the year ended December 31, 2013, affecting stockholders' equity and other related accounts. The Stockholders' Equity section of Packer's December 31, 2012, balance sheet follows:

<b>Stockholders' Equity</b>	
Contributed capital:	
Common stock, \$2 par value, 300,000 shares authorized, 75,000 shares issued, 73,850 shares outstanding	\$ 150,000
Paid-in capital in excess of par	1,800,000
Paid-in capital from treasury stock	25,000
Total contributed capital	<u>\$1,975,000</u>
Retained earnings	295,741
Total contributed capital and retained earnings	<u>\$2,270,741</u>
Less: Cost of 1,150 shares of treasury stock	74,750
Total stockholders' equity	<u>\$2,195,991</u>

You have extracted the following information from the accounting records and audit working papers.

2013

- Jan. 15 Packer reissued 850 shares of treasury stock for \$50 per share. The 1,150 shares of treasury stock on hand at December 31, 2012, were purchased in one block in 2012. Packer used the cost method for recording the treasury shares purchased.
- Feb. 2 Sold 80, \$1,500, 9% bonds due February 1, 2016, at 103 with one detachable stock warrant attached to each bond. Interest is payable annually on February 1. The fair market value of the bonds without the stock warrants is 97. The detachable warrants have a fair value of \$90 each and expire on February 1, 2014. Each warrant entitles the holder to purchase 15 shares of common stock at \$50 per share.
- Mar. 6 Subscriptions for 1,800 shares of common stock were issued at \$53 per share, payable 45% down and the balance by March 20.
- 20 The balance due on 1,500 shares was received and those shares were issued. The subscriber who defaulted on the 300 remaining shares forfeited the down payment in accordance with the subscription agreement.
- Nov. 1 There were 65 stock warrants detached from the bonds and exercised.

**Instructions:** Provide journal entries required to summarize the preceding transactions.

**Problem 13-66**  
**L03, L04,**  
**L05, L010**

**Sample CPA Exam Questions**

- On January 2, 2014, Kine Co. granted Morgan, its president, compensatory stock options to buy 1,000 shares of Kine's \$10 par common stock. The options call for a price of \$20 per share and are exercisable beginning on December 31, 2014. The options can be exercised any time during the three years beginning with this date. Morgan exercised the options on December 31, 2014. The market price of the stock was \$40 on January 2, 2014, and \$70 on December 31, 2014. The fair value of the options was \$25. By what net amount should stockholders' equity increase as a result of the grant and exercise of the options?
  - \$20,000
  - \$25,000
  - \$30,000
  - \$50,000
- A company issued rights to its existing shareholders without consideration. The rights allowed the recipients to purchase unissued common stock for an amount

in excess of par value. When the rights are issued, which of the following accounts will be increased?

	Common Stock	Additional Paid-In Capital
(a)	Yes	Yes
(b)	Yes	No
(c)	No	No
(d)	No	Yes

- |     | Common Stock | Additional Paid-In Capital |
|-----|--------------|----------------------------|
| (a) | Yes          | Yes                        |
| (b) | Yes          | No                         |
| (c) | No           | No                         |
| (d) | No           | Yes                        |
- If a corporation sells some of its treasury stock at a price that exceeds its cost, this excess should be
    - reported as a gain in the income statement.
    - treated as a reduction in the carrying amount of remaining treasury stock.
    - credited to Additional Paid-In Capital.
    - credited to Retained Earnings
  - Which of the following should be reported as a stockholders' equity contra account?
    - Discount on convertible bonds
    - Premium on convertible bonds
    - Cumulative foreign exchange translation loss
    - Organization costs

## CASES

### Discussion Case 13-67

#### Should I Throw the Stock Warrants Away?

A stock warrant entitles the owner to buy a specified number of shares of stock at a specified price. Landon Davis owns 1,000 stock warrants. Each warrant entitles him to buy one share of Plum Street Company common stock for \$50. The current market price of a share of Plum Street common is \$40. Because the warrant price is higher than the current market price, Landon has decided that his warrants are worthless and is going to throw them away. Do the warrants have any value? How would you explain to Landon the factors that influence the value of a stock warrant?

### Discussion Case 13-68

#### Treasury Stock Transactions—You Can't Lose!

The following is adapted from an article appearing in *Forbes*:

The board of **Hospital Corporation of America (HCA)** authorized the buyback of 12 million of the firm's own shares at a total cost of \$564 million. However, after the stock market crash of 1987, HCA's shares were trading at only 31 1/8. So, HCA was now out \$190.5 million on its investment—right? Common sense would answer yes, but beyond common sense lurks the logic of accounting. According to generally accepted accounting principles, HCA didn't lose a penny on the buyback. Call it a no-risk investment. In this era of stock market volatility, stock buybacks offer firms the opportunity to tell shareholders that they have a terrific investment—without ever having to own up to the bad news if it turns sour.

Consider the criticism in the preceding paragraph and evaluate the reasonableness of the accounting for treasury stock transactions.

**SOURCE:** Penelope Wang, "Losses? What Losses?" *Forbes*, February 8, 1988, p. 118.

### Discussion Case 13-69

#### Who Gets the Cash Dividend?

On March 23, 2013, the board of directors of Mycroft Company declared a quarterly cash dividend on its \$1 par common stock of \$0.50 per share, payable on May 10, 2013, to the shareholders of record on April 14, 2013. Before April 9, Mycroft's shares traded in

the stock market “with dividend,” meaning that the quoted stock price included the right to receive the dividend. After April 9, the shares traded “ex-dividend,” meaning that the quoted price did not include the right to receive the dividend. Before April 9, Mycroft’s shares were selling for \$30 per share. What should happen to Mycroft’s stock price on April 9, the ex-dividend date? What should happen to Mycroft’s stock price on March 23, the dividend declaration date?

**Discussion**  
**Case 13-70**

**Stock Split or Stock Dividend?**

In early 2013, the \$20 par common stock of Driftwood Construction Company was selling in the range of \$100 to \$130 per share, with 146,000 shares outstanding. On May 1, 2013, Driftwood’s board of directors decided that, effective May 10, 2013, Driftwood stock would be split 2 for 1. Before making the public announcement, the board had to decide whether to do the split as a “true” stock split and reduce the par value per share to \$10 or to accomplish the split through a 100% stock dividend.

Why does Driftwood’s board of directors want to double the number of shares outstanding? What factors should Driftwood’s board consider in deciding between a true 2-for-1 split and a 100% stock dividend?

**Discussion**  
**Case 13-71**

**Out of Sight, Out of Mind**

Historically, in some countries payments of bonuses to directors were deducted directly from Retained Earnings rather than being charged to income of the year. Does this treatment make it more or less likely that bonuses will be paid to directors? Can accounting standards be neutral in their impact on economic decision making by companies? Should they be neutral?

**Case 13-72**

**Deciphering Financial Statements (The Walt Disney Company)**

The 2009 financial statements for **The Walt Disney Company** can be found on the Internet. Locate those financial statements and consider the following questions.

1. What is the par value of Disney’s common stock? What was the average issuance price of Disney’s common stock?
2. Does Disney use the cost method or the par value method of accounting for treasury stock? As of October 3, 2009, what was the average cost of the repurchased shares held in treasury?
3. Combining information from questions (1) and (2), estimate the decrease in Disney’s retained earnings if all of the treasury shares were retired.
4. From Disney’s foreign currency translation adjustment, deduce whether the foreign currencies got stronger or weaker in 2009 (relative to the U.S. dollar) in the countries where Disney has subsidiaries. (*Hint:* Find the detail about accumulated other comprehensive income that is included at the bottom of the statement of stockholders’ equity.)

**Case 13-73**

**Deciphering Financial Statements (Swire Pacific Limited)**

The equity categories for **Swire Pacific Limited** are illustrated in Exhibit 13-9, on page 13-51. Using the information in the exhibit, answer the following questions:

1. Recall that the primary purpose of defining different reserve categories is to distinguish between distributable and nondistributable equity. As of December 31, 2009, how much of Swire Pacific’s equity is distributable?
2. What is the U.S. equivalent of Swire Pacific’s revenue reserve?
3. What do you think is the purpose of the capital redemption reserve?

**Case 13-74**

**Writing Assignment (Strategic accounting: par value or cost method?)**

J. D. Michael Company has been very successful in recent years. Cash flow from operations is more than sufficient to cover the cost of all capital expenditures as well as regular cash dividends. J. D. Michael has decided to use some of its extra cash to

begin a program of repurchasing its own shares in the open market. The shares will not be retired but will be held for potential reissue. Because J. D. Michael has never repurchased its own shares before, it has not had to make a choice between the par value and cost methods of accounting for treasury stock.

As the resident expert on accounting in the company, you have been asked to draft a 1-page memo to the board of directors recommending either the cost method or the par value method of accounting for treasury stock. Your memo should address issues like the prevailing practice, the likely effect on the financial statements (particularly the Equity section), and the potential impact of the treasury stock accounting treatment on the ability to maintain steady cash dividend payments in the future.

#### Case 13-75

##### **Ethical Dilemma (Stock dividend instead of cash: The investors will never know!)**

Best Ski Manufacturer usually pays a cash dividend sufficient to give investors a dividend yield (annual dividend divided by stock price) of around 6%. Last quarter, Best Ski Manufacturer paid a quarterly cash dividend of \$1 per share. Its stock price is currently at \$65 per share.

In the current quarter, Best Ski has suddenly experienced a big slowdown in ski equipment orders. The vice president of finance unequivocally stated that Best Ski just didn't have the cash to pay another cash dividend of \$1 per share. She suggested that Best Ski make a public announcement explaining the situation to shareholders. This suggestion infuriated the chief executive officer, who subsequently insisted that nothing be done to make the shareholders nervous or pessimistic about Best Ski's future prospects.

The controller (your boss) came to the rescue with an accounting solution to the problem. He proposed that Best Ski declare a 10% stock dividend in place of the regular quarterly cash dividend. He said that a stock dividend is merely a cosmetic increase in the number of shares, with no associated cash flow, either into or out of the company. However, he claimed that investors would never know the difference between a cash dividend and a stock dividend. The controller's suggestion was met with enthusiasm by the board of directors.

The shareholder relations department is drafting a press release to announce the 10% stock dividend. Because of your accounting expertise, you have been asked to help with the wording of the memo. What wording would you suggest?

#### Case 13-76

##### **Cumulative Spreadsheet Analysis**

This spreadsheet assignment is a continuation of the spreadsheet assignments given in earlier chapters. If you completed those assignments, you have a head start on this one.

Refer back to the instructions for preparing the revised financial statements for 2013 as given in (1) of the Cumulative Spreadsheet Analysis assignment in Chapter 3.

1. Skywalker wishes to prepare a *forecasted* balance sheet, a *forecasted* income statement, and a *forecasted* statement of cash flows for 2014. Use the financial statement numbers for 2013 as the basis for the forecast, along with the following additional information.
  - (a) Sales in 2014 are expected to increase by 40% over 2013 sales of \$2,100.
  - (b) In 2014, new property, plant, and equipment acquisitions will be in accordance with the information in (q).
  - (c) The \$480 in operating expenses reported in 2013 breaks down as follows: \$15 in depreciation expense and \$465 in other operating expenses.
  - (d) New long-term debt will be acquired in 2014 in accordance with (u).
  - (e) Cash dividends will be paid in 2014 in accordance with (w).
  - (f) New short-term loans payable will be acquired in an amount sufficient to make Skywalker's current ratio in 2014 exactly equal to 2.0.
  - (g) Skywalker anticipates repurchasing additional shares of stock during 2014 in accordance with (x).

- (h) Because changes in future prices and exchange rates are impossible to predict, Skywalker's best estimate is that the balance in accumulated other comprehensive income will remain unchanged in 2014.
- (i) In the absence of more detailed information, assume that the balances in Investment Securities, Long-Term Investments, and Other Long-Term Assets will all increase at the same rate as sales (40%) in 2014. The balance in Intangible Assets will change in accordance with item (r).
- (j) In the absence of more detailed information, assume that the balance in the other long-term liabilities account will increase at the same rate as sales (40%) in 2014.
- (k) The investment securities are classified as available-for-sale securities. Accordingly, cash from the purchase and sale of these securities is classified as an investing activity.
- (l) Assume that transactions impacting other long-term assets and other long-term liabilities accounts are operating activities.
- (m) Cash and investment securities will increase at the same rate as sales.
- (n) The forecasted amount of accounts receivable in 2014 is determined using the forecasted value for the average collection period. The average collection period for 2014 is expected to be 14.08 days. To make the calculations less complex, this value of 14.08 days is based on forecasted end-of-year accounts receivable rather than on average accounts receivable.
- (o) The forecasted amount of inventory in 2014 is determined using the forecasted value for the number of days' sales in inventory. The number of days' sales in inventory for 2014 is expected to be 107.6 days. To make the calculations simpler, this value of 107.6 days is based on forecasted end-of-year inventory rather than on average inventory.
- (p) The forecasted amount of accounts payable in 2014 is determined using the forecasted value for the number of days' purchases in accounts payable. The number of days' purchases in accounts payable for 2014 is expected to be 48.34 days. To make the calculations simpler, this value of 48.34 days is based on forecasted end-of-year accounts payable rather than on average accounts payable.
- (q) The forecasted amount of property, plant, and equipment (PP&E) in 2014 is determined using the forecasted value for the fixed asset turnover ratio. The fixed asset turnover ratio for 2014 is expected to be 3.518 times. To make the calculations simpler, this ratio of 3.518 is based on forecasted end-of-year gross property, plant, and equipment balance rather than on the average balance. (Note: For simplicity, ignore accumulated depreciation in making this calculation.)
- (r) Skywalker has determined that no new intangible assets will be acquired in 2014. Intangible assets are amortized according to the information in (t).
- (s) In computing depreciation expense for 2014, use straight-line depreciation and assume a 30-year useful life with no residual value. Gross PP&E acquired during the year is only depreciated for half the year. In other words, depreciation expense for 2014 is the sum of two parts: (1) a full year of depreciation on the beginning balance in PP&E, assuming a 30-year life and no residual value, and (2) a half-year of depreciation on any new PP&E acquired during the year, based on the change in the gross PP&E balance.
- (t) Skywalker assumes a 20-year useful life for its intangible assets. Assume that the \$100 in intangible assets reported in 2013 is the original cost of the intangibles. Include the amortization expense with the depreciation expense in the income statement.
- (u) New long-term debt will be acquired (or repaid) in an amount sufficient to make Skywalker's debt ratio (total liabilities divided by total assets) in 2014 exactly equal to 0.80.

- (v) Assume an interest rate on short-term loans payable of 6.0% and on long-term debt of 8.0%. Only a half-year's interest is charged on loans taken out during the year. For example, if short-term loans payable at the end of 2014 is \$15 and given that short-term loans payable at the end of 2013 were \$10, total short-term interest expense for 2014 would be \$0.75  $[(\$10 \times 0.06) + (\$5 \times 0.06 \times 1/2)]$ .

(Note: These forecasted statements were constructed as part of the spreadsheet assignment in Chapter 12; you can use that spreadsheet as a starting point if you have completed that assignment.)

For this exercise, make the following additional assumptions:

- (w) Skywalker has decided to begin paying cash dividends in 2014. Skywalker intends to maintain a dividend payout ratio (cash dividends divided by net income) of 40%. (Note: Make sure you adjust your spreadsheet formula so that if net income happens to be negative, cash dividends are no lower than \$0.)
- (x) Skywalker has decided to continue its stock repurchase program in 2014. Skywalker intends to spend \$50 repurchasing shares during the year. Skywalker accounts for treasury stock purchases using the cost method.

Clearly state any additional assumptions that you make.

2. According to the forecast for 2014, state whether Skywalker is expected to issue new shares of stock. Would your answer change if Skywalker were not to repurchase the shares as described in (x)?
3. Repeat (2), with the following changes in assumptions:
  - (a) The debt ratio in 2014 is exactly equal to 0.70.
  - (b) The debt ratio in 2014 is exactly equal to 0.95.
4. Comment on how it is possible for a company to have negative net paid-in capital when net paid-in capital is equal to paid-in capital minus treasury stock.

ADDITIONAL  
ACTIVITIES OF  
A BUSINESS

## CHAPTER 14 Investments in Debt and Equity Securities

### LEARNING OBJECTIVES

- 1 Determine why companies invest in other companies.
- 2 Understand the varying classifications associated with investment securities.
- 3 Account for the purchase of debt and equity securities.
- 4 Account for the recognition of revenue from investment securities.
- 5 Account for the change in fair value of investment securities.
- 6 Account for the sale of investment securities.
- 7 Record the transfer of investment securities between categories.
- 8 Properly report purchases, sales, and changes in fair value of investment securities in the statement of cash flows.
- 9 Explain the proper classification and disclosure of investments in securities.

### EM EXPANDED MATERIAL

- 10 Account for the impairment of a loan receivable.

Many companies invest in other companies. In some cases, the investor may own another company in its entirety; for example, **The Walt Disney Company** owns 100% of the **American Broadcasting Company (ABC)**. In other cases, the investor may own just a portion of another company as is the case with **Berkshire Hathaway**, which owns more than 8% of **The Coca-Cola Company**, 13% of **American Express**, and more than 6% of **Wells Fargo**. In other instances, investors may purchase debt rather than equity interests. Exhibit 14-1 lists selected U.S. companies with investment account balances.

FYI

**Citigroup** is the first company in history to exceed \$1 trillion in total assets. As of December 31, 2009, the company reported total assets of \$1.857 trillion and total liabilities of \$1.702 trillion.

## 14-1 INVESTMENT IN DEBT AND EQUITY SECURITIES—2009

© 2012 Cengage Learning.

As the exhibit illustrates, company investment in other companies can be quite substantial. Berkshire Hathaway, a company whose major stockholder, Warren Buffett, is the second richest person in America, is a holding company that basically buys ownership in other companies. **Microsoft**, whose major stockholder, Bill Gates, is the richest person in America, makes more money than it can reinvest in its own company. As a result, it invests in other companies, sometimes in order to exercise strategic influence on companies that are developing new technologies. **College Retirement Equities Fund (CREF)** is a company established to assist in the

retirement plans for employees of nonprofit educational and research organizations. College professors and others have money withheld from their salaries and forwarded to CREF, which invests that money. As of December 31, 2009, CREF had more than \$100 billion, or 99.7% of the company's total assets, invested in the debt and equity securities of other companies. Exhibit 14-2 displays the asset portion of CREF's balance sheet as of December 31, 2009. How do companies like CREF, Berkshire Hathaway, and Microsoft account for their huge investments in securities? That topic is the focus of this chapter.

## QUESTIONS

1. What is the important difference between Disney's investment in ABC and Berkshire Hathaway's investment in Coca-Cola?
2. What is the important difference between the investing operations of Berkshire Hathaway and the investing operations of Microsoft?
3. Whose money does CREF invest?

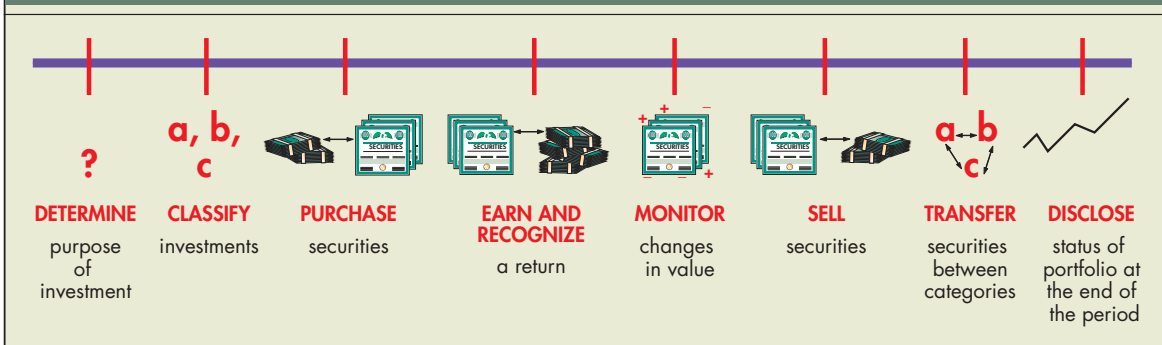

Answers to these questions can be found on pages 14-48-14-49.

## A

Accounting for investments in debt and equity securities has generated a great deal of interest for many years. The primary area of concern is the recognition and disclosure of changes in fair value. Because the value of investment securities can change dramatically in a short period of time, accounting information that reflects this change in value is useful to businesses and financial statement users. To address the issue of valuation, the FASB issued pre-Codification *Statement of Financial Accounting Standards No. 115*, "Accounting for Certain Investments in Debt and Equity Securities." The major effect of this standard, issued in 1993, was to require businesses to record many of their investment securities at fair value. This position differs from previous standards in that increases, as well as decreases, in the value of certain securities are reported in the financial statements. The fair value requirements of pre-Codification *SFAS No. 115* were augmented in 2006 by the refined definition of fair value and the increased disclosure requirements included in pre-Codification *Statement of Financial Accounting Standards No. 157*, "Fair Value Measurements." The provisions of both of these standards are now contained in FASB ASC Topic 320 (Investments—Debt and Equity Securities).

In this chapter, we discuss why and how companies invest in other companies. We will also address the accounting issues associated with investments in both debt and equity securities. Accounting for these investments involves several activities. These activities are summarized in Exhibit 14-3. Each of the issues presented in Exhibit 14-3 will be addressed in turn. Following the discussion of these issues, the Expanded Material section of the chapter discusses the accounting for the impairment of a loan receivable.

# Why Companies Invest in Other Companies

**1** Determine why companies invest in other companies.

**WHY** Proper accounting treatment must incorporate the idea of management intent. In the area of accounting for investments in other companies, management's objective in making an investment impacts how the investment itself and the economic gains and losses from the investment are reported in the financial statements.

**HOW** Sometimes management intent with respect to an investment can be determined through explicit statements by management. In other cases, the nature and size of the investment give an indication of management intent.

Companies invest in the debt and equity securities of other companies for a host of reasons. Five of the more common reasons are discussed in this section.

## Safety Cushion

Microsoft holds more cash and short-term investments than just about any company. As of June 30, 2009, Microsoft reported holding \$31.4 billion in cash and short-term investments. Of this amount, only \$2.064 billion was actually composed of cash; the remainder was a mixture of certificates of deposit, U.S. Treasury securities, corporate notes and bonds, and other short-term interest-earning securities. In essence, Microsoft has stored a substantial amount of cash in the form of interest-earning loans to banks, governments, and other corporations. In *Time* magazine (January 13, 1997), it was reported that Bill Gates has a rule that Microsoft must always have a large enough liquid investment balance to operate for a year without any revenue. Thus, this large investment balance is a safety cushion to ensure that Microsoft can continue to operate even in the face of extreme adversity. Other companies have much smaller safety cushions, but the general principle is that investments are sometimes made to give a company a ready source of funds on which it can draw when needed.

## Cyclical Cash Needs

Some companies operate in seasonal business environments that need cyclical inventory buildups requiring large amounts of cash, followed by lots of sales and cash collections. For example, the following is an excerpt from the January 30, 2010, 10-K filing of **Toys “R” Us**, the large retail toy chain:

In general, our primary uses of cash are providing for working capital, which principally represents the purchase of inventory, servicing debt, financing construction of new stores, remodeling existing stores, and paying expenses, such as payroll costs, to operate our stores. Our working capital needs follow a seasonal pattern, peaking in the third quarter of the year when inventory is purchased for the fourth quarter holiday selling season. Peak borrowings under our revolving credit facilities and credit lines amounted to \$784 million and have been repaid as of January 30, 2010. Our largest source of operating cash flows is cash collections from our customers. We have been able to meet our cash needs principally by using cash on hand, cash flows from operations and borrowings under our revolving credit facilities and credit lines.

The fluctuation in the cash balance for Toys “R” Us from 2007 through 2010 is shown in Exhibit 14-4. During those periods of time when excess cash exists for a company such

as Toys “R” Us, the company can invest that money and earn a return. Of course, most companies are not satisfied with the low interest rates offered by bank deposits and turn to other investment alternatives. Investing in the stocks (equity) and bonds (debt) of other companies allows a firm to store its cyclical cash surplus and earn a higher rate of return by accepting a higher degree of risk.

### Investment for a Return

Another reason that companies invest in the stocks and bonds of other companies is simply to earn money. Although companies owned by Berkshire Hathaway at the end of 2009 employed 257,000 employees who provide a variety of products and services, Berkshire Hathaway is still commonly viewed as making its money through investments. This is because, as of December 31, 2009, Berkshire Hathaway had invested an average of \$63,641 in stocks and bonds for each ownership share outstanding. In other words, with a share of Berkshire Hathaway stock selling for around \$120,000, more than half of the amount required to buy a share of Berkshire Hathaway stock represents an indirect investment, through Berkshire Hathaway, in the stocks and bonds that Warren

Buffett and Charlie Munger (Buffett’s partner) have decided are good investments. Berkshire Hathaway’s investment criteria, reprinted from the 2009 annual report, are listed in Exhibit 14-5.

Berkshire Hathaway is the exception; most U.S. corporations engage in only a small amount of investment

solely for the purpose of earning a return. This is so because those companies, such as Microsoft, **Intel**, and **McDonald’s**, are not experts in investing. Instead, they are good at creating software, developing computer chips, and selling hamburgers. Thus, it makes sense for those companies to concentrate on operating decisions relative to their respective businesses rather than to spend management’s valuable time trying to figure out the stock and bond markets.

**FYI**

Warren Buffett is proud that although the Berkshire Hathaway headquarters staff must oversee an empire that employs 257,000 people, only about 20 people work in the corporate offices.

### EX 14-5 BERKSHIRE HATHAWAY INC. ACQUISITION CRITERIA

1. Large purchases (at least \$75 million of pre-tax earnings unless the business will fit into one of our existing units),
2. Demonstrated consistent earning power (future projections are of *no* interest to us, nor are “turnaround” situations),
3. Businesses earning good returns on equity while employing little or no debt,
4. Management in place (we can’t supply it),
5. Simple businesses (if there’s lots of technology, we won’t understand it),
6. An offering price (we don’t want to waste our time or that of the seller by talking, even preliminarily, about a transaction when price is unknown).

© 2012 Cengage Learning.

### Investment for Influence

For companies in which Berkshire Hathaway is a large shareholder, Warren Buffett is not content to be a passive investor. For example, he has been on the board of directors of The Coca-Cola Company, **The Gillette Company**, and **The Washington Post Company**. In general,

## EX 14-6 THE COCA-COLA COMPANY'S OWNERSHIP PERCENTAGE OF MAJOR BOTTLERS OF ITS PRODUCTS

Bottler	Location	Coca-Cola's Ownership Percentage
Coca-Cola Enterprises	United States, Canada, and Great Britain (largest bottler of Coca-Cola products in the world)	34%
Coca-Cola Amatil	Australia, New Zealand, and Pacific Islands	30
Coca-Cola FEMSA	Mexico, Central and South America	32
Coca-Cola Hellenic Bottling Company	Europe (primarily eastern)	23

© 2012 Cengage Learning.

companies can invest in other companies for many reasons other than to earn a return. Some reasons are to ensure a supply of raw materials, to influence the board of directors, or to diversify product offerings. For example, Coca-Cola historically has not bottled its own soft drinks; those bottling franchises are owned by independent bottlers all over the world. However, to ensure that the bottling segment of the soft drink supply chain remains predictably open to Coca-Cola, Coca-Cola owns sizable portions of a number of the major bottlers of its soft drinks. Some of these bottlers, their location, and Coca-Cola's ownership percentage are listed in Exhibit 14-6.<sup>1</sup>

To summarize, large investments in other companies are often made for business reasons such as to be able to exercise influence over the conduct of that company's operations.

### Purchase for Control

Warren Buffett first invested in **GEICO** insurance in 1951, soon after graduating from Columbia. He describes the company as his "first business love," partly stemming from his admiration of its basic strategy of being the low-cost provider of a necessary product. In 1976, Buffett decided that Berkshire Hathaway should buy a large number of GEICO shares. At the beginning of 1995, Berkshire Hathaway owned almost 50% of GEICO and obviously exercised significant influence over the operation of the company. In 1995, Buffett decided to buy the remaining shares of GEICO, making GEICO a wholly owned subsidiary of Berkshire Hathaway.

## STOP&THINK

As of December 31, 2009, **Ford Motor** owned 11% of **Mazda**. Which ONE of the following possible motivations do you think is the primary motivation for this investment by Ford?

- Safety cushion
- Cyclical cash needs
- Investment for a return
- Investment for influence

When a company purchases enough of another company to be able to control operating, investing, and financing decisions, different accounting treatment is required for that acquisition. For accounting purposes, a parent company is required to report the results

<sup>1</sup> In February 2010, Coca-Cola announced that it intended to purchase the North American operations of its largest bottler, Coca-Cola Enterprises. Coca-Cola's announced intention for the acquisition is to create operational efficiencies and to increase its control of its product's bottling in the key North American market.

of all of its subsidiaries of which it owns more than 50% as if the parent and subsidiaries were one company. For example, Berkshire Hathaway has a controlling interest in a host of different subsidiaries incorporated in many different states and countries scattered from Omaha, Nebraska, to Cologne, Germany. The financial performances of these subsidiaries are included in the financial statements of Berkshire Hathaway. This is the reason the financial statements of most large corporations are called *consolidated financial statements*: They include aggregated, or consolidated, results for both the parent and all of its majority-owned subsidiaries.

## Classification of Investment Securities

**2** Understand the varying classifications associated with investment securities.

**WHY** Investment securities are classified based on management's intent in holding the securities. How the securities are classified will influence how the securities are accounted for, the resulting financial statement numbers, and the financial ratios computed using those numbers.

**HOW** Based on management intent, investment securities are classified as either equity method, trading, available-for-sale, or held-to-maturity securities.

As mentioned previously, FASB ASC Topic 320 addresses the valuation of securities. The statement applies to all debt securities and to equity securities for which a readily determinable fair value is available.<sup>2</sup> If, however, the investment in equity securities of a company is large enough, a different method of accounting (called the "equity method") for equity securities is applied.

Before we discuss the various classifications of securities under the provisions of Topic 320, let's first review what debt and equity securities are.

### Debt Securities

From Chapter 12 you will recall that **debt securities** are financial instruments issued by a company that typically have the following characteristics: (1) a maturity value representing the amount to be repaid to the debt holder at maturity, (2) an interest rate (either fixed or variable) that specifies the periodic interest payments, and (3) a maturity date indicating when the debt obligation will be redeemed.

### Equity Securities

**Equity securities** represent ownership in a company. These shares of stock typically carry with them the right to collect dividends and to vote on corporate matters. In addition, equity securities are an attractive investment because of the potential for significant increases in the price of the security. Features of equity securities were covered in detail in Chapter 13.

Sophisticated trading markets for both debt and equity securities have developed over time, with the New York Stock Exchange, the New York Bond Exchange, and NASDAQ being the premier trading exchanges for stocks and bonds.

<sup>2</sup> FASB ASC paragraph 320-10-15-5.

## EX 14-7 CLASSIFICATIONS OF DEBT AND EQUITY SECURITIES

© 2012 Cengage Learning.

For accounting purposes, debt and equity securities falling under the scope of FASB ASC Topic 320 can be classified into one of four categories: held to maturity, available for sale, trading, and equity method. Exhibit 14-7 illustrates the major classifications of debt and equity securities.

### Held-to-Maturity Securities

**Held-to-maturity securities** are debt securities purchased by a company with the intent and ability to hold those securities until they mature.<sup>3</sup> Note that this category includes only debt securities because equity securities typically do not mature. Note also that the company must have the intention of holding the security until it matures. Simply intending to hold a security for a long period of time does not qualify for inclusion in this category.

### Available-for-Sale Securities

Debt securities that are not being held until maturity and are not classified as trading securities are considered, by default, to be “available-for-sale” securities.<sup>4</sup> **Available-for-sale securities** are also equity securities that are not considered trading securities and are not accounted for using the equity method. Most of the typical company’s investment securities are classified as available for sale. This is because the typical company uses its investment securities as a store of excess cash and is not actively managing the investment portfolio to make profits on stock trading.

### Trading Securities

Trading securities are debt and equity securities purchased with the intent of selling them in the near future. Trading involves frequent buying and selling of securities, generally for the purpose of “generating profits on short-term differences in price.”<sup>5</sup>

### Equity Method Securities

**Equity method securities** are equity securities purchased with the intent of being able to control or significantly influence the operations of the investee. As a result, a large block of stock (presumed to be at least 20% of the outstanding stock unless there exists evidence to the contrary) must be owned to be classified as an equity method security.<sup>6</sup> Because the

<sup>3</sup> FASB ASC paragraph 320-10-25-1c.

<sup>4</sup> FASB ASC paragraph 320-10-25-1b.

<sup>5</sup> FASB ASC paragraph 320-10-25-1a.

<sup>6</sup> FASB ASC paragraph 323-10-15-8.

intent associated with these securities is not simply to earn a return on an investment but includes being able to affect the operations of the investee, a different method of accounting has been developed for these securities.

The reason for these four distinct categories is that the FASB requires different accounting and disclosure, depending on the classification of the securities. Securities classified as trading securities are reported at their fair value on the balance sheet with any unrealized holding gains or losses being reported on the income statement as part of net income. Securities classified as available-for-sale securities are also reported on the balance sheet at fair value. However, any unrealized holding gains and losses associated with these securities are reported as other comprehensive income and are accumulated as a separate component of stockholders' equity; these unrealized gains and losses do not affect reported net income for the period. Held-to-maturity securities are reported on the balance sheet at their amortized cost and are not reported at fair value. The accounting for held-to-maturity securities is generally the mirror image of the accounting by an issuer of long-term debt as discussed in Chapter 12. Equity method securities are not reported at their fair value on the balance sheet. Instead, the investment account is increased or decreased as the net assets of the investee increase and decrease. Exhibit 14-8 summarizes the accounting treatment for debt and equity securities.

### Why the Different Categories?

Why does the FASB have these different categories for classifying securities? Why didn't they just make the rule that all increases and decreases in fair value go on the income statement? If you think about the classification scheme, it makes a lot of sense. Take, for example, held-to-maturity securities. Companies plan on holding these securities until they mature (hence the name). The company has no intention of realizing any changes in fair value on these securities between the purchase date and the maturity date, so there is no reason to recognize any changes in fair value prior to the maturity date. Similarly, companies hold equity method securities not to realize changes in the fair value of those securities but to maintain some level of influence over the investee. Thus, the fair value of the investment is not of primary importance to the investor. In summary, because appreciation in price is not a major reason for holding held-to-maturity and equity method securities, adjustments for temporary changes in fair value are not required.

Trading securities are purchased with the intent of realizing profits in the short term. Thus, changes in fair value are recorded in the period in which they occur, whether that change has been realized through an arm's-length transaction or not. Because an unrealized gain (or loss) can be turned into a realized gain (or loss) with a simple phone call to a

## EX 14-8 THE DIFFERENT ACCOUNTING TREATMENTS FOR DEBT AND EQUITY SECURITIES

Classification of Securities	Types of Securities	Disclosure on the Balance Sheet	Treatment of Temporary Changes in Fair Value
Held to maturity	Debt	Amortized cost	Not recognized
Available for sale	Debt and equity	Fair value	Reported in stockholders' equity
Trading	Debt and equity	Fair value	Reported on the income statement
Equity method	Equity	Historical cost adjusted for changes in the net assets of the investee	Not recognized

© 2012 Cengage Learning.

portfolio manager, it makes sense to include the change in fair value on the income statement of the period in which the change occurs.

What about available-for-sale securities? Why not treat increases and decreases in fair value on this type of security similar to the treatment for trading securities? The

answer lies in the probability of realizing those changes in fair value. With trading securities, it is likely that those changes in fair value will be realized sooner rather than later; that is the reason they are called *trading securities*. The same likelihood of realization is not as certain with available-for-sale securities. Because it is less certain that the changes in fair value of available-for-sale securities will actually be realized in the current period, the FASB elected to bypass the income statement and require these increases in value to be reported directly in the Stockholders' Equity section of the balance sheet as part of Accumulated Other Comprehensive Income. In addition, although these unrealized gains and losses are excluded from net income, they are included in the computation of comprehensive income. Because available-for-sale securities are not purchased with the primary intent of making money on short-term price fluctuations, it seems reasonable to exclude unrealized gains and losses on these securities from the computation of the periodic net income.

### The Fair Value Option

As explained in Chapter 12, in 2007 the FASB took a bold step toward increased use of fair value by allowing companies a fair value option for the reporting of financial assets and liabilities.<sup>7</sup> Under the fair value option, a company has the option to report, at each balance sheet date, any or all of its financial assets and liabilities at their fair values on the balance sheet date. The unrealized gains and losses from changes in the fair values of financial assets and liabilities accounted for using the fair value option are reported in the income statement. As illustrated in Chapter 12, this fair value option allows companies to reflect in the income statement, without complicated hedge accounting procedures, the offsetting economic effects of the hedging of corresponding financial assets and liabilities.

The election of this fair value option for an investment security trumps the classification of the security as described above (trading, available for sale, held to maturity, and equity method). Accordingly, even though a security is classified as available for sale, if the company elects the fair value option for that security then the unrealized gains and losses are included in earnings in the income statement rather than in other comprehensive income as is typically required for available-for-sale securities. Similarly, equity method or held-to-maturity securities, which typically are NOT reported in the balance sheet at fair value, are reported at fair value if the company has elected the fair value option with respect to those particular securities. In essence, all investment securities for which the fair value option is elected are accounted for in the same way as the trading security accounting illustrated later in the chapter.

**FYI**

Who decides how a security is to be classified? Management does. Management's intent is the key factor in determining the reasons for holding certain securities. As you can guess, judgment plays a significant role in this classification.

<sup>7</sup> Pre-Codification Statement of Financial Accounting Standards No. 159, "The Fair Value Option for Financial Assets and Financial Liabilities—Including an Amendment of FASB Statement No. 115" (Norwalk, CT: Financial Accounting Standards Board, February 2007). This guidance is now found in the "Fair Value Option" subsections of FASB ASC Topic 825 (Financial Instruments).

### Classification of Investment Securities According to IFRS

The classification of investment securities under International Financial Reporting Standards, specifically *IFRS 9*, is very similar to the classification categories under U.S. GAAP. In fact, it is apparent that *IFRS* has been heavily influenced by pre-Codification *SFAS No. 115* (adopted in 1993 and now included in Topic 320). The same categories of trading, available-for-sale, and held-to-maturity investments exist. Under IFRS, the available-for-sale category exists but is typically referred to by a description rather than a label.

The fair value option for financial assets, as described above, also exists in IFRS under the provisions of *IFRS 9*.<sup>8</sup> In fact, Sir David Tweedie, the chairman of the IASB, has stated several times that he thinks that the perfect accounting standard for the accounting for all investment securities would consist of just two paragraphs. The first paragraph would say that *all* investment securities should be reported on the balance sheet at fair value, with unrealized gains and losses from changes in fair value to be reported through “profit and loss” (the income statement); this is the fair value option comprehensively applied to all investment securities. The second paragraph of this perfect accounting standard would say: “Reread Paragraph 1.”

## Purchase of Securities

### 3 Account for the purchase of debt and equity securities.

**WHY** As with any other asset, the original cost of investment securities must be recognized when the securities are acquired.

**HOW** Debt and equity securities are accounted for at acquisition cost. For debt securities, this cost must be adjusted for accrued interest imbedded in the purchase price.

The purchase of debt and equity securities is recorded at cost just like the purchase of any other asset. But because debt securities are bought and sold between interest payment dates, accounting for the amount of accrued interest since the last payment date adds a minor complexity.

### Purchase of Debt Securities

The purchase of debt securities is recorded at cost, which includes brokerage fees, taxes, and other charges incurred in their acquisition. When debt securities are acquired between interest payment dates, the amount paid for the securities is increased by a charge for accrued interest to the date of purchase. This charge should not be reported as part of the investment cost. Two assets have been acquired—the security and the accrued interest receivable—and should be reported in two separate asset accounts. Upon receipt of the interest, Interest Receivable is closed and Interest Revenue is credited for the amount of interest earned since the purchase date. Instead of recording the interest as a receivable (asset approach), Interest Revenue may be debited for the accrued interest paid at the time of purchase. The subsequent collection of interest would then be credited in full to Interest Revenue. The latter procedure (revenue approach) is usually more convenient.

<sup>8</sup> Initially, the fair value option under IFRS has applied only to financial assets. In May 2010, the IASB released an exposure draft proposing extension of the fair value option to financial liabilities.

To illustrate the entries for the acquisition of debt securities, assume that \$100,000 in U.S. Treasury notes are purchased at 104¼ (debt securities are normally quoted at a price per \$100 face value) on May 1. Interest is 9% payable semiannually on January 1 and July 1. Accrued interest of \$3,000 would thus be added to the purchase price. The debt securities are classified by the purchaser as trading securities because management will sell the securities if a change in the price will result in a profit. The entries to record the purchase of the notes and the subsequent collection of interest under the alternate procedures would be as follows:

*Asset Approach*

May 1	Investment in Trading Securities .....	104,250	
	Interest Receivable .....	3,000	
	Cash .....		107,250
July 1	Cash .....	4,500	
	Interest Receivable .....		3,000
	Interest Revenue .....		1,500

*Revenue Approach*

May 1	Investment in Trading Securities .....	104,250	
	Interest Revenue .....	3,000	
	Cash .....		107,250
July 1	Cash .....	4,500	
	Interest Revenue .....		4,500

The important point is that under either approach, the interest revenue recognized for the period is equal to the interest earned, not the amount received. In this case, the company earned \$1,500, representing interest for the period May 1 to June 30.

### Purchase of Equity Securities

Shares of stock are usually purchased for cash through stock exchanges (e.g., New York, NASDAQ, or regional exchanges) and from individuals and institutional investors rather than from the corporations themselves. The investment is recorded at the amount paid, including brokers' commissions, taxes, and other fees incidental to the purchase price. Even when part of the purchase price is deferred, the full cost should be recorded as the investment in stock, with a liability account established for the amount yet to be paid. If stock is acquired in exchange for properties or services instead of cash, the fair value of the consideration given or the value at which the stock is currently selling, whichever is more clearly determinable, should be used as the basis for recording the investment. If two or more securities are acquired for a lump-sum price, the cost should be allocated to each security in an equitable manner, as illustrated in Chapter 10 with the basket purchase of long-term operating assets.

To illustrate the accounting for the purchase of equity securities, assume that Gondor Enterprises purchased 300 shares of Boromir Co. stock at \$75 per share and 500 shares of Faramir Inc. stock at \$50 per share. Gondor

Ryan McVay/Photodisc/Getty Images

Stock purchased for cash through stock exchanges is recorded at the amount paid, including brokers' commissions, taxes, and other fees at the amount paid.

classifies the Boromir stock as a trading security because management has no intention of holding these securities for a long period of time and will sell them as soon as it is economically advantageous for the company. The Faramir stock is classified as available for sale.<sup>9</sup> The journal entry to record the purchases would be as follows:

Investment in Trading Securities—Boromir Co. ....	22,500*	
Investment in Available-for-Sale Securities—Faramir Inc. ....	25,000†	
Cash. ....		47,500
Computations:		
*300 × \$75 = \$22,500		
†500 × \$50 = \$25,000		

## Recognition of Revenue from Investment Securities

### 4 Account for the recognition of revenue from investment securities.

**WHY** In order to properly characterize the performance of different types of investment securities, revenue from investment securities must be carefully computed and labeled.

**HOW** For trading and available-for-sale debt securities, the amount of interest revenue is a function of the stated rate of interest on those debt securities. In the case of held-to-maturity securities, any premium or discount associated with the initial purchase must be amortized and included in the computation of interest revenue. For equity securities classified as trading or available for sale, dividends declared by the investee are recorded as revenue. If an investment is accounted for using the equity method, the amount of revenue recognized by the investor is a function of the income earned by the investee and the percentage of ownership of the investor.

A primary reason that companies invest in the debt or equity securities of other companies is to earn a return in the form of either interest or dividends. In the case of debt securities, the computation of that return is complicated because a difference often exists between the purchase price and the maturity value of the debt instrument. The resulting premium or discount can affect the amount of interest revenue recognized in each future period—depending on how the securities are classified when purchased. For equity securities, the recognition of revenue from an investment depends on the level of ownership in the investee. Each of these issues is discussed in the following sections.

### Recognition of Revenue from Debt Securities

Recall from Chapter 12 that debt securities carry with them a stated rate of interest that when multiplied by the maturity value of the securities indicates the amount of cash to be received in interest each year. Often, interest is received on a semiannual basis. When interest is received, Cash is debited and Interest Revenue is credited. However, when debt securities are acquired at a higher or lower price than their maturity value and the debt securities are classified as held to maturity, periodic amortization of the premium or accumulation

<sup>9</sup> Historically, brokerage fees and other costs involved with purchasing investment securities have been included in the initial recorded cost of the securities. However, for securities accounted for using the fair value option, brokerage fees and other upfront costs are to be expensed when incurred; see FASB ASC paragraph 825-10-25-3. This immediate expensing of upfront fees also applies to trading securities. The historical approach of including upfront fees as part of the initial recorded amount for the securities still applies to available-for-sale and held-to-maturity securities; see FASB ASC paragraphs 310-20-15-2 through 4.

of the discount with corresponding adjustments to interest revenue is required. One could amortize a premium or discount associated with trading or available-for-sale securities. But recall that one of the primary reasons for this amortization process is to ensure that the carrying value of held-to-maturity securities is equal to its maturity value on the maturity date. If securities are not classified as being held to maturity, the amortization process becomes less relevant.<sup>10</sup>

As explained in Chapter 12, a premium or discount results when the stated rate of interest and the market rate of interest on the date of acquisition of the debt security are different. If the stated rate of interest is higher than the prevailing market rate, investors will pay a higher price for the debt security (a premium) to receive the higher interest payments. When the market rate of interest is higher than the stated rate, investors will pay less than the face amount of the debt security, resulting in a discount.

The present value computations associated with computing the value of a debt security were illustrated in Chapter 12 and an example is included here. Assume that on January 1, 2012, Silmaril Technologies purchased 5-year, 10% bonds with a face value of \$100,000 and interest payable semiannually on January 1 and July 1. The market rate on bonds of similar quality and maturity is 8%. Silmaril computes the market price of the bonds as follows:

**FYI**

You will need to be comfortable with present value computations if you are to understand the calculations that follow. The Time Value of Money Review module contains an overview of the time value of money.

Present value of principal:

Maturity value of bonds after 5 years .....	\$100,000	
Present value of \$100,000: $FV = \$100,000; N = 10; I = 4\%$ .....		\$ 67,556

Present value of interest payments:

Semiannual payment, 5% of \$100,000 .....	\$ 5,000	
Present value of 10 payments of \$5,000: $PMT = \$5,000; N = 10; I = 4\%$ .....		40,554
Total present value (market price) of the bonds (rounded) .....		<u>\$108,110</u>

We will use two examples to illustrate the accounting for interest revenue. First, we will assume that Silmaril intends to take advantage of short-term price fluctuations (thereby making them trading securities), and second, we will assume that Silmaril intends, and has the ability, to hold the bonds until they mature (making them held-to-maturity securities).

**Interest Revenue for Debt Securities Classified as Trading** Recall from Chapter 12 that the investor typically does not use a premium or discount account but instead records the investment at cost and nets the face value and any premium or discount. Silmaril would make the following journal entry to record the initial purchase of the bonds:<sup>11</sup>

Investment in Trading Securities .....	108,110	
Cash .....		108,110

When interest payments are received, the journal entry to record their receipt would be

Cash .....	5,000	
Interest Revenue .....		5,000

<sup>10</sup> In all examples that follow as well as in the end-of-chapter material, we will assume that premiums and discounts associated only with held-to-maturity securities are amortized.

<sup>11</sup> The journal entries would be similar had the security been classified as available for sale. The only difference would be in the account title.

**Interest Revenue for Debt Securities Classified as Held to Maturity** The entry to record the initial purchase of the bonds had they been originally classified as held to maturity would be

Investment in Held-to-Maturity Securities . . . . .	108,110	
Cash . . . . .		108,110

To determine the amount of premium to amortize each period, Silmaril would prepare an amortization table, as illustrated. This table is based on the effective-interest method of amortization.<sup>12</sup>

<b>Amortization of Bond Premium—Effective-Interest Method</b> <b>\$100,000, 5-Year Bonds, Interest at 10% Payable Semiannually,</b> <b>Sold at \$108,110 to Yield 8% Compounded Semiannually</b>					
Interest Payment	A Interest Received (0.05 × \$100,000)	B Interest Revenue (0.04 × Bond Carrying Value)	C Premium Amortization (A – B)	D Unamortized Premium (D – C)	Bond Carrying Value (\$100,000 + D)
				\$8,110	\$108,110
1	\$5,000	\$4,324	\$676	7,434	107,434
2	5,000	4,297	703	6,731	106,731
3	5,000	4,269	731	6,000	106,000
4	5,000	4,240	760	5,240	105,240
5	5,000	4,210	790	4,450	104,450
6	5,000	4,178	822	3,628	103,628
7	5,000	4,145	855	2,773	102,773
8	5,000	4,111	889	1,884	101,884
9	5,000	4,075	925	959	100,959
10	5,000	4,041*	959	0	100,000

\*Rounding differences are adjusted with last entry.

## STOP&THINK

Theoretically, we should amortize the discount or premium associated with trading and available-for-sale debt securities just as we do with held-to-maturity securities. In this simple example, why don't we?

- Both trading and available-for-sale debt securities are adjusted to fair value at the end of each reporting period.
- Most U.S. companies don't hold any trading or available-for-sale debt securities.
- Neither trading nor available-for-sale debt securities are ever sold at premiums or discounts to face value.
- Companies avoid amortizing discounts and premiums on trading and available-for-sale debt securities for income tax reasons.

When the first interest payment of \$5,000 is received from the bond issuer, Silmaril would make the following journal entry:

Cash . . . . .	5,000	
Interest Revenue . . . . .		4,324
Investment in Held-to-Maturity Securities . . . . .		676

Subsequent receipts of interest would be recorded with a similar journal entry, the only difference being that the amount amortized would differ, depending on which interest payment was received.

<sup>12</sup> As explained in Chapter 12, the straight-line method of interest amortization can be used when the results do not differ materially from effective-interest amortization. However, in all the examples that follow as well as in the end-of-chapter material, we will use the effective-interest method.

## Recognition of Revenue from Equity Securities

Once an equity security is purchased, one of two basic methods must be used to account for the revenue earned on that investment depending on the control or degree of influence exercised by the acquiring company (investor) over the acquired company (investee). In those instances where the level of ownership in the investee is such that the investor is able to control or significantly influence decisions made by the investee, the use of the **equity method** is appropriate. The accounting procedures associated with the equity method are outlined in FASB ASC Topic 323 (Investments—Equity Method and Joint Ventures). When the acquiring company does not exercise significant influence over the investee, the equity securities are classified as trading or available-for-sale securities.

The ability of the investor to exercise **significant influence** over such decisions as dividend distribution and operational and financial administration may be indicated in several ways: representation on the investee's board of directors, participation in policy-making processes, material intercompany transactions, interchange of managerial personnel, or technological dependency of investee on investor. Another important consideration is the extent of ownership by an investor in relation to the concentration of other stockholdings. While it is clear that ownership of more than 50% of common stock virtually assures **control** by the acquiring company, ownership of 50% or less may give effective control if the remaining shares of the stock are widely held and no significant blocks of stockholders are consistently united in their ownership. The FASB recognizes that the degree of influence and control will not always be clear and that judgment will be required in assessing the status of each investment. To achieve a reasonable degree of uniformity in the application of its position, the FASB has set 20% as an ownership standard; the ownership of 20% or more of the voting stock of the company carries the presumption, in the absence of evidence to the contrary, that an investor has the ability to exercise significant influence over that company. Conversely, ownership of less than 20% leads to the presumption that the investor does not have the ability to exercise significant influence unless such ability can be demonstrated.<sup>13</sup> Again, the 20% criterion is only a guideline, and judgment is required in determining the appropriate accounting method in cases where ownership is 50% or less.<sup>14</sup>

Both the FASB and the IASB are currently deliberating the issue of control in the context of whether a sizeable equity investment should be accounted for using the equity method (which is illustrated in this chapter) or consolidation (which is outside the scope of this book). In their discussions of control, the FASB and IASB have described control as the power to direct the affairs of another company to the extent that profits or returns of that company are significantly affected. The current thinking of the FASB and the IASB is that one company has control over another when it has more than half of the voting rights, when it possesses substantive contractual control of key activities, or when it has a large minority voting interest in the election of the Board of Directors and no other party or organized group of parties has a significant voting interest. Thus, one company could be classified as "controlling" another with less than 50% ownership. For example, Coca-Cola might be classified as controlling the bottling subsidiaries listed in Exhibit 14-6. As of 2010, the FASB and IASB were still considering this area. The existing standard is that control exists when one company owns more than 50% of another.

<sup>13</sup> FASB ASC paragraphs 322-10-15-6 through 8.

<sup>14</sup> FASB ASC paragraph 323-10-15-10.

Until the FASB provides a definitive standard addressing the issue of control, the percentage-of-ownership criterion is widely accepted as the basis for determining the appropriate method of accounting for long-term investments in equity securities when the investor does not possess absolute voting control. If it is determined that control exists, the combined financial results are reported in consolidated financial statements. If significant influence exists, the equity method of accounting is applied to the investment. If not, then the securities are classified as either trading or available for sale. Note that because preferred stock is generally nonvoting stock and does not provide for significant influence, it is always classified as either trading or available for sale.

In the case of consolidation, the investor and investee are referred to respectively as the **parent company** and the **subsidiary company**. Where control exists, preparation of consolidated financial statements is required. This means that the financial statement balances of the parent and subsidiary companies are combined, or consolidated, for financial reporting

purposes even though the companies continue to operate as separate entities. In the consolidation process, any intercompany transactions are eliminated, for example, any sales and purchases between the parent and subsidiary companies. By eliminating all intercompany transactions, the

combined balances or consolidated totals appropriately reflect the financial position and results of operation of the total economic unit. This treatment reflects the fact that majority ownership of common stock assures control by the parent over the decision-making processes of the subsidiary. The important point is this: The process of consolidation builds on the journal entries made when the equity method is applied. In fact, the equity method of accounting is often referred to as a “one-line consolidation.” Coca-Cola provides an example of an instance where the company owned a greater than 50% interest in a subsidiary and yet did not prepare consolidated financial statements for the subsidiary. Recall from our previous discussion of acquiring companies for influence that Coca-Cola owned 30% of Coca-Cola Amatil, an Australian-based bottler. In past years, Coca-Cola’s ownership interest in Coca-Cola Amatil exceeded 50%, yet the company did not consolidate. The reason Coca-Cola did not consolidate was that, as the company indicated in the notes to its financial statements, its control was considered temporary.

Previous accounting standards allowed separate reporting for certain majority-owned subsidiaries if those subsidiaries had “nonhomogeneous” operations, a large minority interest, or a foreign location. Separate reporting by subsidiaries occurred most often when the operations of the subsidiary and parent were significantly different (i.e., nonhomogeneous). Typically, the subsidiary was engaged in finance, insurance, leasing, or real estate, while the parent company was a manufacturer or merchandiser. Examples include **General Electric Capital Services (GECS)** and **IBM Credit Corporation**, which are finance companies that are wholly owned by **General Electric** and **IBM**, respectively. Traditionally, the financial statements of these subsidiaries were not consolidated with those of their respective parent companies.

Since the issuance of pre-Codification *Statement of Financial Accounting Standards No. 94*, the FASB has required the consolidation of all majority-owned subsidiaries unless control is temporary or does not rest with the majority owner (as, for instance, when the subsidiary is in legal reorganization or in bankruptcy) and is considering expanding the concept of control to encourage the consolidation of subsidiaries for which a parent

**FYI**

Remember, consolidation is not an alternative to the equity method. It constitutes procedures employed in addition to those used with the equity method.

## EX 14-9 EFFECT OF OWNERSHIP INTEREST AND CONTROL OR INFLUENCE ON ACCOUNTING FOR LONG-TERM INVESTMENTS IN COMMON STOCKS

Ownership Interest	Control or Degree of Influence	Accounting Method	Applicable Standard
More than 50%	Control	Equity method and consolidation procedures	FASB ASC <i>Topic 810</i>
20 to 50%	Significant influence	Equity method	FASB ASC <i>Topic 323</i>
Less than 20%	No significant influence	Account for as trading or available for sale	FASB ASC <i>Topic 320</i>

© 2012 Cengage Learning.

company has control even with a less-than-majority ownership interest.<sup>15</sup> Thus, even though a subsidiary has nonhomogeneous operations, a large minority interest, or a foreign location, it should be consolidated. The reporting entity is to be the total economic unit consisting of the parent and all of its subsidiaries.

To summarize, in the absence of persuasive evidence to the contrary, equity securities are classified as trading or available for sale when ownership is less than 20%; the equity method is used when ownership is such that the investor has the ability to significantly influence or control the investee's operations; in those instances where control is deemed to exist, the equity method, along with additional consolidation procedures, is used. These relationships dealing with the effect of ownership interest and control or influence and the proper accounting method to be used are summarized in Exhibit 14-9. Note that the percentages are given only as guidelines. Subjective assessment of the ability of an investor to influence or control an investee should also be considered when determining the appropriate accounting for the investment.

We will first discuss and illustrate the accounting and reporting issues associated with the recognition of revenue on trading and available-for-sale equity securities. The more complex equity method will then be discussed.

**Revenue for Equity Securities Classified as Trading and Available for Sale** When an investment in another company's stock does not involve either a controlling interest or significant influence, it is classified as either trading or available for sale. Recall that equity securities cannot be classified as held to maturity. Revenue is recognized when dividends are declared (if the investor knows about the declaration) or when the dividends are received from the investee. Continuing a previous example, assume that Gondor Enterprises receives the following dividends from its investees:

Company	Classification	Number of Shares Held	Dividends Received per Share
Boromir Co. . . . .	Trading securities	300	\$2.00
Faramir Inc. . . . .	Available-for-sale securities	500	3.75

The journal entry to record receipt of the dividends would be:

Cash . . . . .	2,475*	
Dividend Revenue . . . . .		2,475

\*[(300 × \$2.00) + (500 × \$3.75) = \$2,475]

<sup>15</sup> Pre-Codification *Statement of Financial Accounting Standards No. 94*, "Consolidation of All Majority-Owned Subsidiaries" (Stamford, CT: Financial Accounting Standards Board, 1987).

**Revenue for Securities Classified as Equity Method Securities** The equity method of accounting for long-term investments in common stock reflects the economic substance of the relationship between the investor and investee rather than the legal distinction of the separate entities. The objective of this method is to reflect the underlying claim by the investor on the net assets of the investee company.

Under the equity method, the investment is initially recorded at cost, just as any other investment. However, with the equity method, the investment account is periodically adjusted to reflect changes in the underlying net assets of the investee. The investment balance is increased to reflect a proportionate share of the earnings of the investee company or decreased to reflect a share of any losses reported. If preferred stock dividends have been declared by the investee, they must be deducted from income reported by the investee before computing the investor's share of investee earnings or losses. When dividends are received by the investor, the investment account is reduced. Thus, the equity method results in an increase in the investment account when the investee's net assets increase; similarly, the investment account decreases when the investee records a loss or pays out dividends.

We will illustrate the equity method with a simple example. Assume that BioTech Inc. purchased 40% of the outstanding stock of Medco Enterprises on January 1 of the current year by paying \$200,000. During the year, Medco reported net income of \$50,000 and paid dividends of \$10,000. BioTech would make the following journal entries during the year:

Investment in Medco Enterprises Stock . . . . .	200,000	
Cash . . . . .		200,000
<i>To record the purchase of 40% of Medco stock.</i>		
Investment in Medco Enterprises Stock . . . . .	20,000	
Income from Investment in Medco Enterprises Stock (\$50,000 × 0.40) . . . . .		20,000
<i>To record the recognition of revenue from investment in Medco.</i>		
Cash (\$10,000 × 0.40) . . . . .	4,000	
Investment in Medco Enterprises Stock . . . . .		4,000
<i>To record the receipt of a dividend on Medco stock.</i>		

Notice that Medco Enterprises' book value increased by \$40,000 during the year (\$50,000 in income less \$10,000 dividend). BioTech's investment in Medco increased by 40% of this amount (\$16,000 = \$20,000 – \$4,000). The equity method of accounting maintains a relationship between the book value of the investee and the investment account on the books of the investor. As the subsidiary's book value changes, so does the investment account on the books of the parent company.

**Comparing the Provisions of FASB ASC Topics 320 and 323** To contrast and illustrate the accounting entries under various methods, assume that Powell Corporation purchases 5,000 shares of San Juan Company common stock on January 2 at \$20 per share, including commissions and other costs. San Juan has a total of 25,000 shares outstanding; thus, the 5,000 shares represent a 20% ownership interest. We will illustrate the accounting differences in revenue recognition for equity securities by assuming that (1) the securities are classified as available for sale and (2) the securities are classified as equity method securities and accounted for using the equity method. The appropriate entries under both assumptions are shown in Exhibit 14-10. The actual method used would depend on the degree of influence exercised by the investor as indicated by a consideration of all relevant factors, as well as the percentage owned. Exhibit 14-10 highlights the basic differences in accounting for investments using FASB ASC Topics 320 (on standard investments in debt and equity securities) and 323 (on the equity method used when an investment is made in order to create significant influence). Under both methods, the investment is originally

## EX 14-10 JOURNAL ENTRIES TO RECORD REVENUE RECOGNITION USING FASB ASC TOPICS 320 AND 323

Available for Sale (Topic 320)		Equity Method (Topic 323)	
<i>Jan. 2 Purchased 5,000 shares of San Juan Company common stock at \$20 per share:</i>			
Investment in Available-for-Sale		Investment in San Juan	
Securities . . . . .	100,000	Company Stock . . . . .	100,000
Cash . . . . .	100,000	Cash . . . . .	100,000
<i>Oct. 31 Received dividend of \$0.80 per share from San Juan Company (\$0.80 × 5,000 shares):</i>			
Cash . . . . .	4,000	Cash . . . . .	4,000
Dividend Revenue . . . . .	4,000	Investment in San Juan	
		Company Stock . . . . .	4,000
<i>Dec. 31 San Juan Company announced earnings for the year of \$60,000:</i>			
No entry		Investment in San Juan	
		Company Stock . . . . .	12,000
		Income from Investment	
		in San Juan Company Stock	
		(0.20 × \$60,000) . . . . .	12,000

© 2012 Cengage Learning.

recorded at cost. Dividends received are recognized as dividend revenue for the available-for-sale securities and as a reduction in the investment account under the equity method.

The investor's percentage of the earnings of the investee company are recorded as income and as an increase to the investment account under the equity method, whereas no entry is required for this event when the securities are classified as available for sale. If the securities had been classified as trading, the journal entries to recognize revenue would have been identical to those made for the available-for-sale securities.

**Equity Method: Purchase for More than Book Value** When a company is purchased by another company, the purchase price usually differs from the recorded book value of the underlying net assets of the acquired company. For example, assume that Snowbird Company purchased 100% of the common stock of Ski Resorts International for \$8 million, although the book value of Ski Resorts' net assets is only \$6.5 million. In effect, Snowbird is purchasing some undervalued assets, above-normal earnings potential, or both.

As explained in Chapter 10, if the purchase price of an ongoing business exceeds the recorded value, the acquiring company must allocate this purchase price among the assets acquired using their current market values as opposed to the amounts carried on the books of the acquired company. If part of the purchase price cannot be allocated to specific assets, either tangible or intangible, that amount is recorded as goodwill. If the fair values of the acquired assets have decreased, the assets acquired might be recorded at an amount less than their carrying value on the books of the acquired company. Whether assets are increased or decreased as a result of the purchase, future income determination will use the new (adjusted) values to determine the depreciation and amortization charges.

When only a portion of a company's stock is purchased and the equity method is used to reflect the income of the partially owned company, an adjustment to the investee's reported income, similar to that just described, may be required. To determine whether such an adjustment is necessary, the acquiring company must compare the purchase price of the common stock with the recorded net asset value of the acquired company at the date of purchase. If the purchase price exceeds the investor's share of book value, the computed excess must be analyzed in the same way as described above for a 100% purchase. Although no entries to adjust asset values are made on the books of either company, an

adjustment to the investee’s reported income is required under the equity method for the investor to reflect the economic reality of paying more for the investment than the underlying net book value. If depreciable assets had been adjusted to higher market values on the books of the investee to reflect the price paid by the investor, additional depreciation would have been taken by the investee company. Similarly, if the purchase price reflected amortizable intangibles, additional amortization would have been required. These adjustments would have reduced the reported income of the investee. To reflect this condition, an adjustment is made by the investor to the income reported by the investee in applying the equity method. This adjustment serves to meet the objective of computing the income reported using the equity method in the same manner as would be done if the company were 100% purchased and consolidated financial statements were prepared.

To illustrate, assume that the book value of common stockholders’ equity (net assets) of Stewart Inc. was \$500,000 at the time Phillips Manufacturing Co. purchased 40% of its common shares for \$250,000. Based on a 40% ownership interest, the market value of the net assets of Stewart Inc. would be \$625,000 ( $\$250,000/0.40$ ), or \$125,000 more than the book value. Assume that a review of the asset values discloses that the market value of depreciable properties exceeds the carrying value of these assets by \$50,000. The remaining \$75,000 difference ( $\$125,000 - \$50,000$ ) is attributed to a special operating license. Assume further that the average remaining life of the depreciable assets is 10 years and that the license is to be amortized over 20 years. Phillips Manufacturing Co. would adjust its share of the annual income reported by Stewart Inc. to reflect the additional depreciation and the amortization of the license as follows:

Additional depreciation ( $\$50,000 \times 0.40$ )/10 years .....	\$2,000
License amortization ( $\$75,000 \times 0.40$ )/20 years .....	1,500
	<u>\$3,500</u>

Each year for the first 10 years, Phillips would make the following entry in addition to entries made to recognize its share of Stewart Inc.’s income and dividends:

Income from Investment in Stewart Inc. Stock .....	3,500
Investment in Stewart Inc. Stock .....	3,500
<i>To adjust share of income on Stewart Inc. common stock for proportionate depreciation on excess market value of depreciable property, \$2,000, and for amortization of the unrecorded license, \$1,500.</i>	

After the 10th year, the adjustment would be for \$1,500 until the license amount is fully amortized.

To complete the illustration, assume that the purchase was made on January 2, 2013; Stewart Inc. declared and paid dividends of \$70,000 to common stockholders during 2013, and it reported net income of \$150,000 for the year ended December 31, 2013. At the end of 2013, the investment in Stewart Inc. common stock would be reported on the balance sheet of Phillips Manufacturing Co. at \$278,500, computed as follows:

Investment in Stewart Inc. Common Stock		
Acquisition cost .....	\$250,000	
Add: Share of 2013 earnings of investee company ( $\$150,000 \times 0.40$ ) .....	60,000	\$310,000
Less: Dividends received from investee ( $\$70,000 \times 0.40$ ) .....	\$ 28,000	
Additional depreciation of undervalued assets .....	2,000	
Amortization of unrecorded license .....	1,500	31,500
Year-end carrying value of investment (equity in investee company) .....		<u>\$278,500</u>

This illustration assumes that the fiscal years of the two companies coincide and that the purchase of the stock is made at the beginning of the year. If a purchase is made at a time other than the beginning of the year, the income earned up to the date of the purchase is assumed to be included in the cost of purchase. Only income earned by the investee subsequent to acquisition should be recognized by the investor.

The adjustments for additional depreciation and intangible asset amortization are needed only when the purchase price is greater than the underlying book value at the date of acquisition. If the purchase price is less than the underlying book value at the time of acquisition, it is assumed that specific assets of the investee are overvalued. An adjustment is necessary to reduce the depreciation included in the reported income of the investee. The journal entry to reflect this adjustment is the reverse of the one illustrated previously. The computations would also be similar except that the adjustments for overvalued assets would be added to (instead of subtracted from) the carrying value of the investment.

FYI

Goodwill associated with an equity method investment is not tested for impairment using the techniques described in Chapter 11. Instead, as described later in the chapter, the entire equity method investment is considered to see whether any declines in value are permanent.

If the excess of the investment cost over the share of the book value of the net assets of the investee is attributable to goodwill, the computation of investment income is simplified. This is so because this goodwill, just like goodwill recorded in connection with the acquisition of an entire business, is not amortized. Accordingly, in the Phillips Manufacturing example if the \$75,000 excess had been attributed to goodwill instead of to the operating license, income for the investment in the first year would have been \$58,000 (\$60,000 – \$2,000) rather than \$56,500 (\$60,000 – \$2,000 – \$1,500).

**Equity Method: Joint Ventures** As explained in Chapter 12, a *joint venture* is a form of off-balance-sheet financing. What was not mentioned in Chapter 12 is that joint ventures are accounted for using the equity method. The manner in which joint ventures serve as a form of off-balance-sheet financing is illustrated in the following example. Owner A Company and Owner B Company each own 50% of Ryan Julius Company, which does research and marketing for the products of both Owner A and Owner B. Ryan Julius has assets of \$10,000 and liabilities of \$9,000. Because neither Owner A nor Owner B owns more than 50% of Ryan Julius, both companies would account for their investment using the equity method. The balance sheets of both companies would include the following with respect to their investment in Ryan Julius:

**Owner A Balance Sheet**

Investment in Ryan Julius $[(\$10,000 - \$9,000) \times 0.50]$	\$500
----------------------------------------------------------------	-------

**Owner B Balance Sheet**

Investment in Ryan Julius $[(\$10,000 - \$9,000) \times 0.50]$	\$500
----------------------------------------------------------------	-------

The off-balance-sheet financing aspect of joint ventures can be seen in that the \$9,000 in liabilities of Ryan Julius are not reported in the balance sheet of either of the companies that own Ryan Julius. In this way, Owner A and Owner B have used the Ryan Julius joint venture to jointly borrow \$9,000 without either one of them being required to report the liability in its balance sheet. As mentioned in Chapter 12, before their merger, **Chevron** and **Texaco** had a 50-50 joint venture partnership, **Caltex**. The Caltex joint venture had total liabilities in excess of \$6 billion, none of which were reported in either Chevron's or Texaco's balance sheet.

Not all joint ventures have the 50-50 ownership structure illustrated here. If the owner of a joint venture is, say, 70-30, the minority owner will still account for the joint venture using the equity method, but the majority owner will be required to consolidate the joint venture and list all of the assets and liabilities of the joint venture in its (the majority owner's) balance sheet.

### Equity Method Accounting According to IFRS

Equity method accounting under IFRS is the same, in all important respects, as under U.S. GAAP. The relevant standard is *IAS 28*. Under IFRS, the term “associate” is used for what is called an “equity method investee” under U.S. GAAP. If this were an advanced accounting text, we would probably discuss the proportionate consolidation for joint ventures that is allowed under *IAS 31*; proportionate consolidation is allowed only in specialized industries under U.S. GAAP. However, because this is not an advanced accounting text, we will leave the very interesting proportionate consolidation discussion to another day.

## Accounting for the Change in Value of Securities

### 5 Account for the change in fair value of investment securities.

**WHY** For most investment securities, the most relevant measure of value is fair value. In addition, for those investment securities tradeable in public markets, fair value is also a reliable measure of value. Accordingly, most investment securities are reported in the balance sheet at fair value, with unrealized economic gains and losses being reported either in the income statement or as other comprehensive income.

**HOW** Temporary changes in the value of debt and equity securities classified as trading or available for sale are accounted for through the use of a market adjustment account. The use of this account results in these securities being reported at fair value on the balance sheet. For trading securities, the increase or decrease in fair value is reported as a gain or loss on the income statement. In the case of available-for-sale securities, the change in fair value is recognized as other comprehensive income, which is then accumulated as part of stockholders' equity. Temporary changes in fair value for held-to-maturity securities and equity method securities are not recognized.

The fair value of debt and equity securities can rise and fall on a daily basis. Some of these changes in fair value can be considered temporary while others might be of a more permanent nature. Prior to 1993, when pre-Codification FASB *Statement No. 115* was issued, if temporary price changes occurred, only declines (and their subsequent recovery) in value of securities were recognized in the financial statements. The existing standard requires, for many types of debt and equity securities, both increases and decreases in fair value to be reflected in the financial statements. This section of the chapter deals with accounting for temporary changes in a security's fair value. We also briefly discuss the accounting for permanent declines in fair value.

### Accounting for Temporary Changes in the Fair Value of Securities

Recall from our previous discussion that all publicly traded debt securities and those publicly traded equity securities not being held with the intent to influence the investee are to

be classified into one of three categories. Those categories and their required disclosures were summarized in Exhibit 14-8.

The following example will be used throughout this section to illustrate accounting for changes in fair value. Eastwood Incorporated purchased five different securities on March 23, 2013. A schedule showing the type and cost of each security, along with its fair value on December 31, 2013, is as follows:

Security	Classification	Cost	Fair Value, Dec. 31, 2013
1 .....	Trading	\$ 8,000	\$ 7,000
2 .....	Trading	3,000	3,500
3 .....	Available for sale	5,000	6,100
4 .....	Available for sale	12,000	11,500
5 .....	Held to maturity	20,000*	19,000

\*Security 5 was purchased at face value. If the security were purchased at a price other than face value, the amortization procedures described previously would be employed.

The entry to record the initial purchase would be as follows:

Investment in Trading Securities .....	11,000
Investment in Available-for-Sale Securities .....	17,000
Investment in Held-to-Maturity Securities .....	20,000
Cash .....	48,000

Securities 1 and 2 are classified by management as trading securities because management has no intention of holding these securities for a long period of time and will sell them as soon as it is economically advantageous for the company. Securities 3 and 4 are deemed by management to be available-for-sale securities. Management purchased security 5 at face value and intends to hold it until it matures.

During an accounting period, the fair value of securities will rise and fall. Only at the end of the period, when financial statements are prepared, is a company required to account for any change in fair value. At the end of the accounting period, the fair value of the portfolio of securities for certain categories is compared with the historical cost and an adjustment is made for the difference.

**Trading Securities** At the end of 2013, the fair value of the trading securities portfolio has decreased by \$500 (\$11,000 cost less \$10,500 fair value). As a result, the following journal entry would be made:

Unrealized Loss on Trading Securities .....	500
Market Adjustment—Trading Securities .....	500

The loss of \$500 reflects the fact that the fair value of the trading securities portfolio has declined during the period. The loss is classified as unrealized because these securities have not been sold. This entry introduces a valuation account, *Market Adjustment—Trading Securities*. This account is

**FYI**

Once the adjusting entry is made, the trading securities account and the market adjustment account should always sum to the fair value of the trading securities. The same is true for available-for-sale securities.

combined with Investment in Trading Securities and is reported on the balance sheet. The use of a valuation account allows the company to maintain a record of historical cost. To determine realized and unrealized holding gains and losses, a record of historical cost is necessary. The unrealized loss on the trading securities account would be reported on the income statement under Other Expenses and Losses or would be combined with dividend and interest revenue in one item called Net Investment Income.

**Available-for-Sale Securities** For available-for-sale securities, adjustments similar to those illustrated for trading securities would be made; the only difference would be that instead of any unrealized gain or loss being disclosed on the income statement, it would be reported as part of other comprehensive income and then accumulated directly in stockholders' equity as part of Accumulated Other Comprehensive Income. Continuing the Eastwood example, at the end of 2013, its available-for-sale portfolio had increased from \$17,000 to \$17,600. This \$600 increase in fair value of the securities above their cost would be recorded with the following journal entry:

Market Adjustment—Available-for-Sale Securities . . . . .	600
Unrealized Increase/Decrease in Value of Available-for-Sale Securities . . . . .	600

Note that the unrealized increase/decrease in value of the available-for-sale securities account would serve to increase the amount of stockholders' equity, which is consistent with the fact that an asset has increased in value. The \$600 increase would *not* be included in the computation of net income, but it would be in Other Comprehensive Income and added to net income when computing comprehensive income for the year.

**Held-to-Maturity Securities** Security 5 has decreased in value from \$20,000 to \$19,000. However, because this security is classified as held to maturity, no adjustment is made for the difference between carrying value and fair value. Exhibit 14-11 summarizes how the securities and the resulting increases and decreases in fair value would be reported in the financial statements of Eastwood Inc. for 2013.

At the end of 2014, similar adjustments must be made to reflect changes in fair value. Assume the following fair values at the end of 2014:

Security	Classification	Cost	Fair Value, Dec. 31, 2014
1 . . . . .	Trading	\$ 8,000	\$ 7,700
2 . . . . .	Trading	3,000	3,600
3 . . . . .	Available for sale	5,000	6,500
4 . . . . .	Available for sale	12,000	10,700
5 . . . . .	Held to maturity	20,000	20,700

By the end of 2014, the trading securities portfolio had increased to a fair value of \$11,300 (\$7,700 + \$3,600). Comparing this amount to the historical cost of \$11,000 indicates that Market Adjustment—Trading Securities should have a debit balance of \$300. Because its current balance is a \$500 credit (carried over from 2013), an adjusting entry must be made. The adjusting entry is as follows:

Market Adjustment—Trading Securities . . . . .	800
Unrealized Gain on Trading Securities . . . . .	800

**EX 14-11 FINANCIAL STATEMENT DISCLOSURE OF SECURITIES**

<b>Eastwood Inc.</b>			
<b>Balance Sheet (Partial)</b>			
<b>December 31, 2013</b>			
<b>Assets:</b>			
Investment in trading securities, at cost	\$11,000		
Less: Market adjustment—trading securities	(500)	\$10,500	
Investment in available-for-sale securities, at cost	\$17,000		
Add: Market adjustment—available-for-sale securities	600	17,600	
Investment in held-to-maturity securities, at amortized cost		20,000	\$48,100
<b>Stockholders' Equity:</b>			
Add: Unrealized increase in fair value of available-for-sale securities		\$ 600	
<b>Eastwood Inc.</b>			
<b>Income Statement (Partial)</b>			
<b>For the Year Ended December 31, 2013</b>			
<b>Other expenses and losses:</b>			
Unrealized loss on trading securities			\$ 500

© 2012 Cengage Learning.

The balance in Market Adjustment—Trading Securities, which appears here in T-account form, would be added to Investment in Trading Securities and reported on the balance sheet. The \$800 unrealized gain would be included in the computation of net income for 2014.

**Market Adjustment—Trading Securities**

		12/31/2013 Balance	500
12/31/2014 Adjustment	800		
12/31/2014 Balance	300		

At the end of 2014, the fair value of the available-for-sale securities has decreased from \$17,600 to \$17,200. Because fair value now exceeds historical cost by \$200, the market adjustment account should have a \$200 debit balance. Its current balance, carried over from 2013, is \$600 (debit). The journal entry made at the end of 2014 to adjust the account is as follows:

Unrealized Increase/Decrease in Value of Available-for-Sale Securities	400
Market Adjustment—Available-for-Sale Securities	400

The effect on the market adjustment—available-for-sale securities account is reflected in the following T-account. Again, no adjustment is made for changes in the fair value of held-to-maturity securities. The \$400 unrealized decrease would be subtracted from net income in computing comprehensive income for 2014.

**Market Adjustment—Available-for-Sale Securities**

12/31/2013 Balance	600		
		12/31/2014 Adjustment	400
12/31/2014 Balance	200		

The financial statements for Eastwood Inc. at the end of 2014 would include the effects of each of the above adjusting entries as shown in Exhibit 14-12.

**EX 14-12 FINANCIAL STATEMENT DISCLOSURE OF SECURITIES**

**Equity Method Securities** Assume that security 5 is an equity method security rather than a held-to-maturity security. As with held-to-maturity securities, no journal entries are made to reflect changes in fair value of equity method securities. Thus, the \$20,700 fair value of the securities on December 31, 2014, would not be used to adjust the reported balance sheet amount of the equity method securities. However, the \$20,700 fair value would be disclosed in the notes to the financial statements. For example, in the notes to its 2009 financial statements, Coca-Cola disclosed that its investment in its bottler **Coca-Cola Enterprises** was recorded in the Coca-Cola balance sheet at just \$25 million but that the current market value of the investment was \$3.4 billion.

### Accounting for “Other-Than-Temporary” Declines in the Fair Value of Securities

Sometimes the fair value of investments declines due to economic circumstances that are unlikely to improve. For example, in 2001 the value of numerous Internet stocks decreased significantly without much expectation that they would ever recover. If a decline in the fair value of an individual security is judged to be other than temporary, regardless of whether the security is debt or equity and regardless of whether it is being accounted for as a trading, available-for-sale, held-to-maturity, or equity method security, the cost basis of that security should be reduced by crediting the investment account rather than a market adjustment account. In addition, the write-down should be recognized as a loss and charged against current income. The new cost basis for the security may not be adjusted upward to its original cost for any subsequent increases in fair value. If, however, the security is classified as a trading security or an available-for-sale security, a market adjustment account may be used to record future increases and decreases in fair value.

Determining whether a decline in fair value is other than temporary may sound like an impossible task because no one can predict which way market prices will move in the

future. Also, investors are always confident that their carefully chosen investments that have declined in value will recover soon. In *Staff Accounting Bulletin (SAB) No. 59*,<sup>16</sup> the SEC staff suggests that one consider the following in determining whether a decline in fair value is other than temporary:

- How long has the fair value of the security been below its original cost? A rule of thumb (not in the official GAAP provisions) is that securities that have had fair values less than their costs for over six months have probably experienced an “other-than-temporary” decline in fair value.
- What is the current financial condition of the investee and its industry? If the investee has experienced losses for several years, and if the investee’s entire industry has performed poorly, the decline in fair value is probably other than temporary.
- Will the investor’s plans involve holding the security long enough for it to recover its value? For example, if a security has declined in fair value by 40% and the investor plans to sell the security in five months, it is unlikely that the security will recover its fair value in that time.

## FYI

Because of the permanent change in the operations of some industries (e.g., travel and tourism-related industries) in the wake of the September 11, 2001, attack on the World Trade Center, accountants and auditors were particularly careful in determining whether investments in companies in these industries had suffered “other-than-temporary” declines in value.

## FASB CODIFICATION

**The Issue:** You are the accounting expert in a mid-sized technology company that has a substantial investment portfolio. The company maintains this portfolio in order to have sufficient liquidity to take advantage of any favorable acquisition opportunities in your volatile industry. In recent years, the balance sheet value of your portfolio has fluctuated substantially because of the ups and downs in the market. Your CEO hates this “mark-to-market” accounting. She has heard that if you were to classify your debt securities as held to maturity, you wouldn’t be required to report these balance sheet fluctuations.

You have been trying to convince the CEO that the held-to-maturity classification is extremely restrictive, but she has not been persuaded by your arguments. What you need is some authoritative support showing that very few debt security investments can be classified as held to maturity.

**The Question:** Under what circumstances can debt securities NOT be classified as held to maturity?

**Searching the Codification:** The location of the authoritative guidance on the accounting for investment securities is Topic 320 (Investments—Debt and Equity Securities). The relevant section is 320-10-25 on “Recognition.”

**The Answer:** The authoritative guidance for classifying debt securities as held to maturity is given on page 14-49.

<sup>16</sup>This SEC guidance is contained in the formal U.S. GAAP provisions in FASB ASC paragraph 320-10-299-1.

## Sale of Securities

### 6 Account for the sale of investment securities.

**WHY** Careful accounting for the sale of investment securities, coupled with careful accounting for changes in fair value of investment securities, allow the financial statement user to compute the total economic return on an investment security portfolio for the reporting period.

**HOW** When an investment security is sold, its carrying value is removed from the books, and the difference between carrying value and the cash received is recorded as a realized gain or loss.

When securities are sold, an entry must be made to remove the carrying value of the security from the investor's books and to record the receipt of cash. The difference between the carrying value and the cash received is a realized gain or loss. For trading and available-for-sale securities, the carrying value will be equal to the security's original cost. The carrying value of held-to-maturity and equity method securities will change as any premium or discount is amortized (in the case of held-to-maturity securities) or when the book value of the investee changes (in the case of equity method securities).

How does the market adjustment account come into play when a security is sold? Simply put, it does not. The market adjustment account is adjusted only at the end of each accounting period prior to the issuance of financial statements. The market adjustment account is used to reflect the fair value of the securities portfolio as of the end of the period; it is not to be associated with transactions that are measuring the amount of realized gains or losses. This approach makes practical sense if you think of a large company with an investment portfolio containing several hundred different securities. The significant effort required to associate a specific portion of the market adjustment account with each individual security (and to maintain this identification as hundreds or even thousands of securities are traded during the year) would not result in any improvement in the reported financial result.

At this point, it is important to distinguish between a realized and an unrealized gain or loss. A realized gain or loss occurs when an arm's-length transaction has occurred and a security has actually been sold. When the sale occurs, any difference between the carrying value of the security and the selling price is recognized on the income statement. An unrealized gain or loss arises when the fair value of a security changes, yet the security

is still being held by the investor. As discussed previously, these unrealized gains and losses may or may not be recognized, depending upon the security's classification or whether the company has elected the fair value option with respect to that security.

In the case of a debt security, an entry must be made prior to recording the sale to record any interest earned to the date of the sale and to amortize any premium or discount. For example, continuing the Silmaril

### STOP & THINK

What is the difference between *realized* and *recognized*?

- Realized* relates to the past, whereas *recognized* relates to the future.
- Realized* relates to trading securities, whereas *recognized* relates to available-for-sale securities.
- Realized* relates to the collection of cash, whereas *recognized* relates to the recording of an accounting journal entry.
- Realized* relates to financial statements, whereas *recognized* relates to income taxes.

Technologies example from page 14-15, assume that the debt securities are sold on April 1, 2014, for \$103,000, which includes accrued interest of \$2,500. The carrying value of the debt securities on January 1, 2014, is \$105,240. Interest revenue of \$2,105 ( $\$105,240 \times 0.08 \times 3/12$ ) would be recorded, and a receivable relating to interest of \$2,500 would be established. The investment account would be reduced by \$395 to reflect the amortization of the premium for the 3-month period between January 1 and April 1.

Interest Receivable .....	2,500
Investment in Held-to-Maturity Securities .....	395
Interest Revenue .....	2,105

A second entry would remove the book value of the investment from Silmaril's books, record the receipt of cash of \$103,000, eliminate the Interest Receivable balance, and record a loss equal to the difference between the investment's carrying value and the amount of cash received (net of interest).

Cash .....	103,000
Realized Loss on Sale of Securities .....	4,345
Interest Receivable .....	2,500
Investment in Held-to-Maturity Securities .....	104,845

These two entries could easily be combined into a single journal entry:

Cash .....	103,000
Realized Loss on Sale of Securities .....	4,345
Investment in Held-to-Maturity Securities .....	105,240
Interest Revenue .....	2,105

### Impact of Sale of Securities on Unrealized Gains and Losses

The sale of a portion of an investment securities portfolio during the year complicates the computation and interpretation of the unrealized increases and decreases in the fair value of trading and available-for-sale securities. To illustrate, consider the following simple example. At the beginning of Year 1, Levi Company purchased a portfolio of trading securities for \$10. At the end of Year 1, the portfolio had a value of \$12. At the end of Year 2, the entire portfolio is sold for \$9. The surprisingly difficult question is this: What is the amount of the unrealized gain or loss on the portfolio for Year 2? If you quickly answered "\$3 unrealized loss," you need to read the following discussion carefully.

At the end of Year 1, the market adjustment account has a \$2 debit balance to reflect the \$2 increase ( $\$10 \uparrow$  to  $\$12$ ) in the fair value of the trading portfolio during Year 1. In addition, at the end of Year 2, the market adjustment account must have a \$0 balance because the cost of the remaining trading securities (\$0) is exactly equal to the fair value of those securities (\$0). The necessary adjustment to the market adjustment account during Year 2 can be identified using the following T-account:

Market Adjustment—Trading	
End of Year 1	2
	Necessary Adjustment
	2 in Year 2
End of Year 2	0

The required journal entry is as follows:

Unrealized Loss—Trading	2
Market Adjustment—Trading	2

The reason that the unrealized loss for Year 2 is not equal to the \$3 decline (\$12 – \$9) in the portfolio for the year is that a portion of that decline is included in the *realized* loss recorded when the trading securities are sold. The realized loss is the \$1 difference between the original cost of the securities (\$10) and their selling price (\$9). The realized loss is recorded with the following entry:

Cash	9
Realized Loss—Trading	1
Investment Securities—Trading	10

The realized and unrealized losses in Year 2 in this case can be thought of as follows:

- *Realized loss* is the difference between the selling price and the original cost of the securities.
- *Unrealized loss* is the amount needed to adjust the end-of-year market adjustment account to its appropriate balance. More intuitively, in this simple example, it represents the reversal of the cumulative unrealized gains and losses recognized in past years on securities that were sold during this year. This reversal is needed to avoid double counting because those cumulative unrealized gains and losses from past years will impact the computation of the gain or loss realized this year.

As you can see, the interpretation of the unrealized loss is quite difficult. In a more complicated example, in which only a portion of the securities portfolio is sold, the unrealized gain or loss becomes a mixture of unrealized gains and losses for the year for securities still held at the end of this year and a reversal of unrealized gains and losses from past years for securities sold this year. What you should remember is that with an active securities portfolio, for which many purchases and sales of securities occur throughout the year, the computed amount of unrealized gain or loss for the year has no easy interpretation.

Lest you be discouraged by the unwelcome news contained in the previous paragraph, rest assured that the accounting system for investment securities actually does yield meaningful information. This can be seen by computing the total of the realized and unrealized gains and losses for the year. In this case, the sum of the \$1 realized loss and the \$2 unrealized loss is a total loss of \$3 for the year. This total is exactly equal to the economic performance of the portfolio during the year; the portfolio decreased from a fair value of \$12 at the beginning of the year to \$9 at the end of the year. So, even though the interpretation of the unrealized gain or loss by itself is somewhat difficult, the sum of the realized and unrealized gains and losses is always easy to interpret in that the sum is equal to the total economic return on the portfolio for the year.

The preceding discussion dealt with trading securities. The concept is exactly the same for available-for-sale securities. The only difference is that the unrealized “gains” and “losses” are not included in the income statement. However, it is still true that the sum of the realized gains and losses and the unrealized increases and decreases for an available-for-sale portfolio is equal to the economic return on the portfolio during the

year. For example, in 2007 Berkshire Hathaway reported a net realized gain of \$5,598 million and a net unrealized loss of \$2,981 million on its available-for-sale portfolio. The combination of these two numbers reveals that the total economic return for the portfolio during 2007 was a gain of \$2,617 million (\$5,598 million gain – \$2,981 million loss).

### Derecognition

On July 17, 2008, two large financial industry trade groups implored the FASB to rethink an accounting rule change that would hurt the financial ratios of financial institutions, cause some of them to violate loan covenants, “force some banks to tighten their lending requirements,” and “make it more cumbersome for [the financial institutions] to raise capital.”<sup>17</sup> These consequences would arise, it was claimed, from an FASB rule that would require financial institutions to change the accounting for \$10.5 trillion in asset-backed securities. The financial institutions had accounted for the transfer of these securities as sales, removing them from their books as illustrated in the previous section. The new FASB rule would require that these transfers instead be accounted for as loans (with the securities serving as collateral), with the security assets returned to the balance sheets of the financial institutions, balanced by a \$10.5 trillion liability for the loans. There is a HUGE difference between accounting for a security transfer as a sale and accounting for it as a collateralized loan. This is another example of the practice of off-balance-sheet financing that was introduced in Chapter 12. By the way, on July 30, 2008, the FASB decided to delay the rule change until 2010, giving the financial institutions some time to figure out how to explain to the users of their financial statements what had been going on with the missing \$10.5 trillion.

As explained in Chapter 7 and according to FASB ASC Topic 860 (Transfers and Servicing), a transfer of a financial asset is accounted for as a sale (resulting in [derecognition](#)) when the transfer satisfies each of the following three conditions.<sup>18</sup>

- Legal control—The transferor has given up legal claim to the assets, meaning that even if it declares bankruptcy its creditors cannot go after the transferred assets.
- Actual control—The transferor cannot prevent the transferee from using the transferred assets however desired, such as selling them or pledging them as collateral for a loan.
- Effective control—The transferor does not have the right to force the transferee to return the assets, such as with a repurchase agreement.

The international standard governing derecognition is in *IAS 39*. Whereas Topic 860 focuses on the transfer of control, *IAS 39* focuses on the transfer of risks and rewards. Under the provisions of *IAS 39*, the transfer of a financial asset is recorded as a sale “if the entity transfers substantially all the risks and rewards of ownership of the financial asset.”<sup>19</sup>

<sup>17</sup> Marine Cole, “Securities Groups to FASB: Push Back Deadline for FAS 140,” *Financial Week*, July 17, 2008.

<sup>18</sup> FASB ASC paragraph 860-10-40-5.

<sup>19</sup> *International Accounting Standard 39*, “Financial Instruments: Recognition and Measurement” (London: International Accounting Standards Board, August 18, 2005), par. 20.

## Transferring Securities between Categories

**7** Record the transfer of investment securities between categories.

**WHY** When securities are reclassified, recognition of previously unrecognized changes in fair value must be made to ensure that securities are recorded at fair value on the date of the reclassification. This procedure also ensures that category changes cannot be used to hide unrealized losses.

**HOW** If the reclassification involves a movement to or from the trading classification, any change in fair value not previously recognized in income is recognized in the current period. If the reclassification is from held to maturity to available for sale, changes in fair value since the investment's acquisition are recorded as a separate component of stockholders' equity. If an available-for-sale security is reclassified as a held-to-maturity security, all previously recorded changes in fair value are amortized over the remaining life of the investment.

On occasion, management will change its intentions with respect to holding certain securities. For example, a company may originally purchase securities for the purpose of making effective use of excess cash; subsequently, the company may decide to pursue a long-term business relationship with the investee. As a result, the company may reclassify the security from a trading security to an available-for-sale security. In addition, a company may initially purchase an equity security as a short-term investment and subsequently elect to increase its ownership interest to the point where the equity method is appropriate. This section of the chapter discusses the procedures employed when a security is transferred between investment security categories. Transitions to and from the equity method are covered in the Web Material (see [www.cengage.com/accounting/stice](http://www.cengage.com/accounting/stice)) associated with this chapter. By the way, investment securities for which the fair value option has been elected must always be accounted for according to that choice; the fair value election is irrevocable.

### Transferring Debt and Equity Securities between Categories

If a company reclassifies a security, the security is accounted for at the fair value at the time of the transfer.<sup>20</sup> Because these securities are maintained on the books at their historical cost, the historical cost of the securities must be removed from the “old” category, and the securities are recorded in the “new” category at their current fair value. The change in value that has occurred is accounted for differently, depending on the category being transferred to and the category being transferred from. Exhibit 14-13 summarizes how these unrealized gains and losses are accounted for in each category.

To illustrate each type of transfer, we will use the data from the Eastwood Inc. example as of December 31, 2014 (page 14-28). Recall that on that date Eastwood Inc. had the following securities:

Security	Classification	Cost	Fair Value, Dec. 31, 2014
1 .....	Trading	\$ 8,000	\$ 7,700
2 .....	Trading	3,000	3,600
3 .....	Available for sale	5,000	6,500
4 .....	Available for sale	12,000	10,700
5 .....	Held to maturity	20,000	20,700

<sup>20</sup> FASB ASC paragraph 320-10-35-10.

## EX 14-13 ACCOUNTING FOR TRANSFERS OF SECURITIES BETWEEN CATEGORIES

Transferred	Treatment of the Change in Value
From trading	Any unrealized change in value not previously recognized will be recognized in net income in the current period. Previously recognized changes in value are not to be reversed.
To trading	Any unrealized change in value not previously recognized will be recognized in net income in the current period.
From held to maturity to available for sale	Recognize any unrealized change in value in a stockholders' equity account.
From available for sale to held to maturity	Any unrealized change in value recorded in a stockholders' equity account is to be amortized over the security's remaining life using the effective-interest method.*

\* FASB ASC paragraph 320-10-35-10d.

© 2012 Cengage Learning.

During 2015, Eastwood Inc. elects to reclassify certain of its securities. The category being transferred from and to along with the fair value for each security on the date of the transfer is as follows:

Security	Transferring from	Transferring to	Fair Value, Date of Transfer
2	Trading	Available for sale	\$ 3,800
3	Available for sale	Held to maturity	5,900
4	Available for sale	Trading	10,300
5	Held to maturity	Available for sale	20,400

The different types of reclassifications are illustrated in the following sections.

**From the Trading Security Category** Assume that Eastwood elects to reclassify security 2 from a trading security to an available-for-sale security. The security's historical cost is removed from the trading security classification, along with the associated \$600 market adjustment (as of December 31, 2014), and the security is recorded at its current fair value as an available-for-sale security. The \$200 difference between the fair value as of December 31, 2014, and the fair value at the date of transfer is recorded as an unrealized gain. The following journal entry illustrates this procedure:

Investment in Available-for-Sale Securities	3,800
Market Adjustment—Trading Securities	600
Unrealized Gain on Transfer of Securities	200
Investment in Trading Securities	3,000

Alternatively, Eastwood could have recognized the \$800 difference between fair value and historical cost as an unrealized gain at the time of the transfer and made an adjustment to the market adjustment—trading securities account at the end of the period. The net result of either approach would be the same. In the remainder of the examples that follow, we will adjust the market adjustment account on the date of the transfer.

**Into the Trading Security Category** Suppose Eastwood Inc. elects to reclassify security 4 from an available-for-sale security to a trading security. Recall that unrealized holding gains and losses associated with available-for-sale securities are recorded in the stockholders' equity account, Unrealized Increase/Decrease in Value of Available-for-Sale Securities. The

amount in this account associated with security 4 is removed, and the security is recorded as a trading security at its current fair value.

Investment in Trading Securities . . . . .	10,300
Market Adjustment—Available-for-Sale Securities . . . . .	1,300
Unrealized Loss on Transfer of Securities . . . . .	1,700
Unrealized Increase/Decrease in Value of Available-for-Sale Securities . . . . .	1,300
Investment in Available-for-Sale Securities . . . . .	12,000

With this journal entry, security 4 is recorded as a trading security at its current fair value of \$10,300. The carrying value of security 4 (historical cost less market adjustment) as an available-for-sale security is eliminated from the company's books. Because the security is now classified as a trading security, all changes in fair value should be reflected in the income statement. Thus, this journal entry transfers the unrealized changes in value from the stockholders' equity account to the income statement and recognizes the additional \$400 decline in value since the last balance sheet date. The amount of the unrealized increase/decrease is determined by comparing the security's historical cost, obtained from subsidiary records, with its carrying value as of December 31, 2014. In this example, the unrealized decrease is \$1,300 (\$12,000 less \$10,700). The final result of this journal entry is to reclassify the security and to record on the income statement the decline in fair value since the purchase of the security.

**From the Held-to-Maturity to the Available-for-Sale Category** Although transfers of debt securities from the held-to-maturity category should not occur often, they will happen on occasion. FASB ASC Topic 320 lists a number of circumstances that might lead a firm to reclassify a held-to-maturity security.<sup>21</sup> In this instance, Eastwood Inc. has elected to reclassify security 5 from a security being held until maturity to one that is available to be sold. Recall that security 5's fair value on the date of the transfer is \$20,400. The security is recorded as an available-for-sale security at its current fair value with any difference between its carrying cost and its fair value being recorded as an unrealized increase/decrease in value of available-for-sale securities. The following journal entry will accomplish these objectives:

Investment in Available-for-Sale Securities . . . . .	20,400
Unrealized Increase/Decrease in Value of Available-for-Sale Securities . . . . .	400
Investment in Held-to-Maturity Securities . . . . .	20,000

Because security 5 was originally classified as held to maturity, no adjustment has been made in prior periods to record any changes in value. Thus, there is no market adjustment account related to this transfer.

**From the Available-for-Sale to the Held-to-Maturity Category** Eastwood Inc. elects to reclassify security 3 from one that is available to be sold to a security that will be held until maturity. Recall that security 3 was originally purchased for \$5,000, had a fair value on December 31, 2014, of \$6,500, and has a fair value on the date of the transfer of \$5,900. The following entry should be made:

Investment in Held-to-Maturity Securities . . . . .	5,900
Unrealized Increase/Decrease in Value of Available-for-Sale Securities . . . . .	600
Investment in Available-for-Sale Securities . . . . .	5,000
Market Adjustment—Available-for-Sale Securities . . . . .	1,500

The debit to Unrealized Increase/Decrease in Value of Available-for-Sale Securities reflects the fact that the security has declined in value by \$600 since the last balance sheet date. The \$1,500 credit to the market adjustment account removes the previously

<sup>21</sup> FASB ASC paragraph 320-10-25-6.

recorded increase in value for this security (\$6,500 – \$5,000) while it was classified as available for sale. The combination of these amounts illustrates that security 3 has increased in value by \$900 (\$5,900 – \$5,000) since its acquisition.

Once the security is classified as held to maturity, increases and decreases in its value will not be reflected in the financial statements. The treatment of the \$900 unrealized increase in value (gain) existing

at the transfer date is a bit of a problem because, on the one hand, the gain can't be ignored because it occurred while the security was classified as available for sale, but, on the other hand, the gain would never have been recognized if the security had always been classified as held to maturity. Any unrealized increases and decreases in value that have been recorded to date (while the security has been available to be sold) must be amortized over the remaining life of the security using the effective-interest method and offset against (or added to) any interest revenue received on the debt security. The unamortized balance of an unrealized gain or loss continues to be reported as part of Accumulated Other Comprehensive Income in the Equity section of the balance sheet.<sup>22</sup> In addition, because the security is now classified as held to maturity, the company must also begin amortizing it down to its eventual maturity value. For example, if security 3 has a maturity value of \$4,500, Eastwood Inc. must amortize, as a premium, the \$1,400 difference between the security's carrying value and its maturity value (\$5,900 less \$4,500), as discussed previously. Thus, the interest revenue from security 3 will be adjusted for two types of amortization: the unrealized gain (increasing interest revenue) that existed at the transfer date and the carrying value to the maturity value (reducing interest revenue).

## STOP & THINK

Which ONE of the following statements is correct with respect to ALL transfers of investment securities from one category to another?

- All unrealized losses as of the date of transfer are recognized immediately as part of income.
- All unrealized gains as of the date of transfer are recognized immediately as part of income.
- All unrealized losses as of the date of transfer are recognized immediately as part of other comprehensive income.
- All transferred securities are recorded at their fair value on the date of transfer.

## Investment Securities and the Statement of Cash Flows

8

Properly report purchases, sales, and changes in fair value of investment securities in the statement of cash flows.

**WHY** The classification of a security indicates how management is using the investment in that security as part of the company's business strategy and therefore determines where the cash flows associated with that security are reported in the statement of cash flows.

**HOW** The purchase and sale of available-for-sale, held-to-maturity, and equity method securities are reported in the Investing Activities section of the statement of cash flows. The cash flows associated with the purchase and sale of trading securities and securities for which the fair value option has been elected are shown in the Operating or Investing Activities section depending on the reason the securities were acquired. If the cash flows are classified as operating activities, adjustments must be made for unrealized gains and losses when the indirect method is used to compute operating cash flow.

The purchase and sale of available-for-sale, held-to-maturity, and equity method securities are reported in the Investing Activities section of the statement of cash flows. In contrast, the cash flows associated with the purchase and sale of trading securities (and fair value

<sup>22</sup> FASB ASC paragraph 320-10-35-10d.

option securities) are shown in the Operating or Investing Activities depending on the reason the securities were acquired.<sup>23</sup> This difference stems from the fact that a company that maintains a trading securities portfolio or that chooses to account for certain investment securities using the fair value option often considers as part of its business operations the attempt to make money through the correct timing of purchases and sales of these securities.

The difficulties in reporting the cash flows associated with investment securities are associated with the proper treatment of both realized and unrealized gains and losses. In addition, a special adjustment must be made to operating cash flow associated with equity method securities because the cash received in the form of dividends is not equal to the income reported from the investment. These issues are discussed in the following sections.

### Cash Flows from Gains and Losses on Available-for-Sale Securities

Caesh Company came into existence with a \$1,000 cash investment by owners on January 1, 2013, and entered into the following transactions during 2013:

Cash sales	\$ 1,700
Cash expenses	(1,400)
Purchase of investment securities	(600)
Sale of investment securities (costing \$200)	170

The investment securities are classified as available for sale. In addition, the market value of the remaining securities was \$500 on December 31, 2013. Given these transactions, Caesh Company's net income for 2013 can be computed as follows:

Sales	\$ 1,700
Expenses	(1,400)
Operating income	\$ 300
Realized loss on sale of securities (\$200 – \$170)	(30)
Net income	<u>\$ 270</u>

In addition, Caesh Company will report a \$100 unrealized increase in the fair value of its available-for-sale portfolio. This \$100 increase is the difference between the \$500 ending fair value of the portfolio and the \$400 cost (\$600 – \$200 sold) of the portfolio. This \$100 unrealized increase is not included in the computation of net income but is reported as an increase in the Accumulated Other Comprehensive Income portion of equity.

Recall from Chapter 5 that the general treatment of gains and losses in the Operating Activities section of the statement of cash flows is that gains are subtracted and losses are added when the indirect method is used. This approach stems from the fact that the cash flow effects of the transactions creating the gains and losses will be reported in the Investing Activities section, so the impact of those gains and losses must be removed from the Operating Activities section. With this in mind, the statement of cash flows for Caesh Company for 2013 can be prepared as follows:

Operating activities:		
Net income	\$ 270	
Plus: Realized loss on sale of securities	<u>30</u>	\$ 300
Investing activities:		
Purchase of investment securities	\$(600)	
Sale of investment securities	<u>170</u>	(430)
Financing activities:		
Initial investment by owners		<u>1,000</u>
Net increase in cash		<u>\$ 870</u>

<sup>23</sup> FASB ASC paragraph 320-10-45-11.

As you can see, the realized gains and losses from the sale of available-for-sale securities are treated in exactly the same way, and for exactly the same reasons, as the gains and losses from the sale of property, plant, and equipment that were discussed in Chapter 5.

### Cash Flows from Gains and Losses on Trading Securities

If the investment securities purchased by Caesh Company are classified as trading securities and are deemed to have been acquired for operating purposes, the cash flows associated with the purchase and sale of the securities are reported in the Operating Activities section of the statement of cash flows. In addition, net income is \$370 instead of \$270 because the \$100 unrealized increase in the fair value of the portfolio is reported as an unrealized gain in the income statement. The statement of cash flows appears as follows:

Operating activities:		
Net income	\$ 370	
Purchase of investment securities	(600)	
Sale of investment securities	170	
Plus: Realized loss on sale of securities	30	
Less: Unrealized gain on trading securities	(100)	\$ (130)
Investing activities		0
Financing activities:		
Initial investment by owners		1,000
Net increase in cash		<u>\$ 870</u>

The realized loss on the sale of the securities is added back because all of the cash flow effects of the sale are reflected in the \$170 cash proceeds, which are reported separately; to fail to adjust for the realized loss, which is included in net income, would double count this \$30. The unrealized gain is subtracted in the computation of operating cash flow, but the subtraction occurs for a different reason than to avoid double counting.

Instead, the \$100 unrealized gain is subtracted in the computation of operating cash flow because the gain increases income but does not result in any cash flow this period. The increased cash flow will come in the future when the securities are sold for a higher price, at which time the cash proceeds will be reported as a separate item. Similarly, the amount of an unrealized loss on trading securities would be added back in the computation of cash from operating activities.

### FYI

Alternatively, the \$600 cash outflow for the purchase of investment securities, the \$170 cash inflow from the sale of trading securities, and the \$30 realized loss can all be netted together and reported as a net cash outflow from the \$400 increase in the cost of the trading securities portfolio. If this is done, the fact that securities are sold for more or less than their cost is reflected in the amount of the realized gain or loss, which is already imbedded in net income.

### Equity Method Securities and Operating Cash Flow

When a company owns equity method securities, an adjustment to operating cash flow must be made to reflect the fact that the cash received from the securities in the form of dividends is not equal to the income from the securities included in the computation of net income. To illustrate, assume that Daltone Company owns 30% of the outstanding shares of Chase Company. Chase Company's net income for the year was \$100,000, and

cash dividends paid were \$40,000. Daltone would include \$30,000 ( $\$100,000 \times 0.30$ ) in its income statement as income from the investment. However, Daltone received only \$12,000 ( $\$40,000 \times 0.30$ ) in cash dividends from its investment in Chase. Accordingly, Daltone would report a subtraction in the Operating Activities section of its statement of cash flows for the \$18,000 ( $\$30,000 - \$12,000$ ) difference between the income reported and the cash dividends received.

## Classification and Disclosure

9

Explain the proper classification and disclosure of investments in securities.

**WHY** Companies that have investment securities typically have not just one or two investments but instead have complicated portfolios of investments. Note disclosure is necessary to give financial statement users a sufficient understanding of the performance and status of these portfolios. In addition, because the fair values of investment securities are determined in a variety of ways, financial statement users need disclosure to help them determine the reliability of the reported numbers.

**HOW** Realized gains and losses on the sale of investment securities are reported in the income statement in the period of the sale. Unrealized gains and losses on trading securities are also reported in the income statement. Unrealized increases and decreases on securities classified as available for sale are reported as other comprehensive income and are accumulated in the Stockholders' Equity section of the balance sheet. Companies are also required to give additional note disclosure regarding their investment portfolios, including details on Level 1, Level 2, and Level 3 fair values.

We have discussed the treatment of the gains and losses (both realized and unrealized) associated with selling, valuing, and/or reclassifying securities. Gains and losses from the sale of securities and unrealized gains and losses from changes in fair value while holding trading securities are reported in the income statement as Other Revenues and Expenses, or are combined with dividend and interest revenue and reported as Net Investment Income. Unrealized gains and losses on available-for-sale securities are reported in the Accumulated Other Comprehensive Income section of stockholders' equity and are included as Other Comprehensive Income in the computation of comprehensive income. As with any asset, significant permanent declines in the value of investments are recognized as a loss in the year they occur. Berkshire Hathaway, for example, includes a one-line summary of all of its realized gains and losses for the year in its income statement and discloses further details in the notes. The relevant note disclosure for Berkshire Hathaway for 2009 is included in Exhibit 14-14. Note that Berkshire Hathaway has cumulative unrealized gains on its debt and equity investments totaling almost \$36 billion. How is it possible that none of this unrealized amount shows up on Berkshire Hathaway's income statement? The company classifies its securities as either held to maturity (for some debt securities), available for sale (for most debt and equity securities), or equity method (for some large investments).

Although the unrealized increases associated with the available-for-sale securities are not reported on the income statement, they are included in the computation of comprehensive income. Berkshire Hathaway's statement of comprehensive income is included in Exhibit 14-15.

The total unrealized increase reported for the available-for-sale portfolio is \$20,375 million ( $\$17,607 \text{ million} + \$2,768 \text{ million}$ ). The "reclassification" item reported in the

## EX 14-14 BERKSHIRE HATHAWAY—NOTE DISCLOSURE RELATING TO INVESTMENTS (PARTIAL)

### 4) Investments in fixed maturity securities

Investments in securities with fixed maturities as of December 31, 2009 are summarized below (in millions).

	Amortized Cost	Unrealized Gains	Unrealized Losses*	Fair Value
<i>December 31, 2009</i>				
U.S. Treasury, U.S. government corporations and agencies . . . . .	\$ 2,362	\$ 46	\$ (1)	\$ 2,407
States, municipalities and political subdivisions . . . . .	3,689	275	(1)	3,963
Foreign governments . . . . .	11,518	368	(42)	11,844
Corporate bonds . . . . .	13,094	2,080	(502)	14,672
Mortgage-backed securities . . . . .	3,961	310	(26)	4,245
	<u>\$34,624</u>	<u>\$ 3,079</u>	<u>\$ (572)</u>	<u>\$37,131</u>

\*Includes \$471 million at December 31, 2009 related to securities that have been in an unrealized loss position for 12 months or more.

### 5) Investments in equity securities

Investments in equity securities as of December 31, 2009 are summarized below (in millions).

	Cost Basis	Unrealized Gains	Unrealized Losses	Fair Value
<i>December 31, 2009</i>				
American Express Company . . . . .	\$ 1,287	\$ 4,856	\$ —	\$ 6,143
The Coca-Cola Company . . . . .	1,299	10,101	—	11,400
Kraft Foods Inc. . . . .	4,330	—	(789)	3,541
The Procter & Gamble Company . . . . .	4,962	78	—	5,040
Wells Fargo & Company . . . . .	7,394	2,721	(1,094)	9,021
Other . . . . .	17,935	7,118	(1,164)	23,889
	<u>\$37,207</u>	<u>\$24,874</u>	<u>\$(3,047)</u>	<u>\$59,034</u>

\*Included in Other assets.

Unrealized losses at December 31, 2009 included \$1,864 million related to securities that have been in an unrealized loss position for 12 months or more. Approximately 90% of the gross unrealized losses at December 31, 2009 were concentrated in four issuers. We use no bright-line test in determining whether impairments are temporary or other than temporary. We consider several factors in determining other-than-temporary impairment losses including the current and expected long-term business prospects of the issuer, the length of time and relative magnitude of the price decline and our ability and intent to hold the investment until the price recovers. In our judgment, the future earnings potential and underlying business economics of these companies are favorable and we possess the ability and intent to hold these securities until their prices recover. Changing market conditions and other facts and circumstances may change the business prospects of these issuers as well as our ability and intent to hold these securities until the prices recover. Accordingly, other-than-temporary impairment charges may be recorded in future periods with respect to one or more of these securities.

### (6) Other Investments

A summary of other investments follows (in millions).

	Cost	Unrealized Gains/Losses	Fair Value	Carrying Value
<i>December 31, 2009</i>				
Fixed maturity and equity . . . . .	\$21,089	\$ 5,879	\$26,968	\$26,014
Equity method . . . . .	5,851	1,721	7,572	6,586
	<u>\$26,940</u>	<u>\$ 7,600</u>	<u>\$34,540</u>	<u>\$32,600</u>

Fixed maturity and equity investments in the preceding table include our investments in The Goldman Sachs Group, Inc. ("GS") and The General Electric Company ("GE"), which were acquired in 2008 and investments in Swiss Reinsurance Company Ltd. ("Swiss Re") and The Dow Chemical Company ("Dow") that were made in 2009. In addition, fixed maturity and equity investments include investments in Wm. Wrigley Jr. Company ("Wrigley") that we acquired in both 2008 and 2009.

Finance and financial products . . . . .	67	7	193
	<u>\$318</u>	<u>\$1,173</u>	<u>\$5,598</u>

© 2012 Cengage Learning.

statement of comprehensive income includes the reversal of prior-year unrealized losses on securities that were sold during the year.

Appropriate presentation of individual securities on the balance sheet depends on the intent of management. If management intends or is willing to sell the securities within one year or the current operating cycle, whichever is longer, the security is classified as a current asset. Because trading securities are short term by definition, they are always classified as current. Held-to-maturity securities are always classified as noncurrent unless they mature within a year. Available-for-sale securities are classified as current or noncurrent, depending on the intentions of management.

**EX 14-15 BERKSHIRE HATHAWAY—STATEMENT OF COMPREHENSIVE INCOME FOR 2009**

In addition to the reporting required in the income statement, balance sheet, and statement of cash flows, the following additional disclosures are required in the financial statement notes:

1. Trading securities:
  - The change in net unrealized holding gain or loss that is included in the income statement.
2. Available-for-sale securities:
  - Aggregate fair value, gross unrealized holding gains and gross unrealized holding losses, and amortized cost basis by major security type. For debt securities, the company should disclose information about contractual maturities.
  - The proceeds from sales of available-for-sale securities and the gross realized gains and losses on those sales and the basis on which cost was determined in computing realized gains and losses.
  - The change in net unrealized holding gain or loss on available-for-sale securities that has been included in stockholders' equity during the period.
3. Held-to-maturity securities:
  - Aggregate fair value, gross unrealized holding gains and gross unrealized holding losses, and amortized cost basis by major security type. In addition, the company should disclose information about contractual maturities.
4. Transfers of securities between categories:
  - Gross gains and losses included in earnings from transfers of securities from available-for-sale into the trading category.
  - For securities transferred from held-to-maturity, the company should disclose the amortized cost amount transferred, the related realized or unrealized gain or loss, and the reason for transferring the security.

In Exhibit 14-16, an excerpt from the note on the fair value of investment securities is taken from the 2009 annual report of Wells Fargo & Company, a major company in the banking industry. In particular, note the extended disclosure regarding the Level 3 items, as described more fully in the Fair Value Module in this textbook.

The IASB does not currently have a fair value measurement and disclosure standard comparable to U.S. GAAP. International Financial Reporting Standards do, of course, include many fair value measurements, including those associated with investment securities as explained earlier in this chapter. However, the IASB has not yet adopted a single, comprehensive fair value measurement and disclosure standard. In particular, the IASB does not currently have any disclosure requirement comparable to the Level 1, Level 2, and Level 3 disclosures illustrated in Exhibit 14-16. As of July 2010, the IASB was considering this issue. Of course, the provisions outlying the disclosures required under U.S. GAAP are an important springboard in those considerations.

## EX 14-16 WELLS FARGO—NOTE DISCLOSURE FOR INVESTMENT SECURITIES (PARTIAL)

### Assets and Liabilities Recorded at Fair Value on a Recurring Basis

The table below presents the balances of assets and liabilities measured at fair value on a recurring basis.

(in millions)	Level 1	Level 2	Level 3	Netting <sup>(4)</sup>	Total
Balance at December 31, 2009					
Trading assets (excluding derivatives) <sup>(2)</sup>	\$ 2,386	20,497	2,311	—	25,194
Derivatives (trading assets)	340	70,938	5,682	(59,115)	17,845
Securities of U.S. Treasury and federal agencies	1,094	1,186	—	—	2,280
Securities of U.S. states and political subdivisions	4	12,708	818	—	13,530

Other liabilities (excluding derivatives)	(638)	(630)	—	168	(10)	(1,110)	(606)

(1) The amounts presented as transfers into and out of Level 3 represent fair value as of the beginning of the quarter in which each transfer occurred.

(2) Represents only net gains (losses) that are due to changes in economic conditions and management's estimates of fair value and excludes changes due to the collection/ realization of cash flows over time.

(3) Included in other noninterest income in the income statement.

(4) Included in mortgage banking in the income statement.

(5) Represents total unrealized losses of \$3.3 billion and \$571 million, net of losses of \$8 million and gains of \$23 million related to sales, in 2008 and 2007, respectively.

© 2012 Cengage Learning.

**EM** EXPANDED MATERIAL

To this point in the chapter, we have talked about securities for which there is a tradeable market. In some instances, a company may invest in another firm in the form of a nonmarketable security. The most common example of this type of security would be a loan. In this Expanded Material, we deal with the most complex issue associated with these nonmarketable securities: impairment.

## Accounting for the Impairment of a Loan

### 10 Account for the impairment of a loan receivable.

**WHY** On some occasions, particularly in the case of loans made to other companies, a market value may not exist for the investment. In these instances, the investor must assess the collectibility of the investment, and if it is determined that an “impairment” exists, an adjustment to the value of the receivable must be made.

**HOW** Impairment is measured by comparing the present value of expected future cash flows with the carrying value of the investment.

A common example of an investment for which there might be no market value would be a loan receivable. Accounting for loans receivable is straightforward except for impairment.<sup>24</sup> Loans may arise by a company lending money to a borrower or by selling inventory and assets in return for a receivable. An entry to Loans Receivable is thus offset by a credit to Sales, Cash, or a surrendered asset. Financial institutions engage in such loans on a regular basis. A critical issue with these loans is when cost should be abandoned as the valuation basis. In other words, when should the loan be written down, or written off?

Because it is assumed that no ready market exists for these loans, the market valuations prescribed by FASB ASC Topic 320 cannot apply.

Loans receivable are thus carried at a cost valuation unless evidence exists of a probable impairment. FASB ASC Topic 310 (Receivables) defines impairment as follows:

A loan is impaired when, based on current information and events, it is probable that a creditor will be unable to collect all amounts due according to the contractual terms of the loan agreement.<sup>25</sup>

All amounts due according to contractual terms include both interest and principal payments. Troubled debt restructuring is direct evidence of impairment; however, impairment may occur even though a formal restructuring has not occurred. If sufficient write-down has not previously been made, the restructuring will give rise to an additional decrease in the value of the loan receivable.

### Measurement of Impairment

A creditor shall measure impairment for loans with no market value at the present value of expected future cash flows discounted at the loan’s effective interest rate, that is, the rate implicit in the original loan contract. The impairment is recorded by creating a valuation allowance account and charging the estimated loss to Bad Debt Expense. Thus, accounting for loans receivable is similar to accounting for accounts receivable except that the measurement method is more specifically defined by the FASB.

If a loan agreement is restructured in a troubled debt restructuring, the interest rate to be used to discount the new modified contract terms is based on the original contract rate, not the rate specified in the restructuring agreement. The selection of the discount rate to use was one of the difficult issues addressed by the FASB. The continued use of the original loan rate is consistent with the historic cost principle. The estimate of future cash

<sup>24</sup> See Chapter 7 for discussion of notes receivable.

<sup>25</sup> FASB ASC paragraph 310-10-35-16.

flows is based on the creditor's best estimate based on reasonable and supportable assumptions and projections. Any future changes in the estimates or timing of future cash flows result in a recalculation of the impairment and an adjustment of the receivable and valuation allowance accounts with a charge or credit to Bad Debt Expense. Income arising from the passage of time will be recognized as part of interest revenue in each respective reporting period.

FYI

Again, you will need to be comfortable with present values if you are to understand the computations in this section. See the Time Value of Money Review module if you need a review.

### Example of Accounting for Loan Impairment

Assume that Malone Enterprises reports a loan receivable from Stockton Co. in the amount of \$500,000. The initial loan's repayment terms include a 10% interest rate plus annual principal payments of \$100,000 on January 1 each year. The loan was made on January 1, 2011. Stockton made the \$50,000 interest payment in 2011 but did not make the \$100,000 principal payment nor the \$50,000 interest payment for 2012. Malone is preparing its annual financial statements on December 31, 2012. The loan receivable has a carrying value of \$550,000 including the \$50,000 interest receivable for 2012. Stockton is having financial difficulty, and Malone has concluded that the loan is impaired. Analysis of Stockton's financial conditions indicates the principal and interest currently due can probably be collected, but it is probable that no further interest can be collected. The probable amount and timing of the collections is determined to be as follows:

December 31, 2013 .....	\$175,000
December 31, 2014 .....	200,000
December 31, 2015 .....	175,000
	<u>\$550,000</u>

The present value at December 31, 2012, of the expected future cash flows discounted at 10% is \$455,860, calculated as follows:

Date	Payment	Time of Discount	Present Value @ 10%
Dec. 31, 2013 .....	\$175,000	1 year	\$159,091
Dec. 31, 2014 .....	200,000	2 years	165,289
Dec. 31, 2015 .....	175,000	3 years	131,480
Present value at December 31, 2012 .....			<u>\$455,860</u>

The impairment loss to be reported for 2012 is \$94,140, or the \$550,000 carrying value less the present value of \$455,860. The journal entry to record the impairment is as follows:

2012

Dec. 31 Bad Debt Expense .....	94,140
Allowance for Loan Impairment .....	94,140

The allowance would be reported as an offset to the loan receivable account.

FYI

If you look closely, you will realize that the computations being made in this table are conceptually identical to those done in the bond amortization table on page 14-16.

If Stockton makes the payments as projected, the accounting for the cash received and the recognition of interest revenue is computed by constructing an amortization schedule similar to that illustrated here.

Interest Revenue from Loan Impairment					
Date	(1) Loan Receivable before Current Payment	(2) Allowance for Loan Impairment	(3) Net Receivable (1) – (2)	(4) Interest Revenue 10% × (3)	(5) Payment Received
Dec. 31, 2013 . . . . .	\$550,000	\$94,140	\$455,860	\$45,586	\$175,000
Dec. 31, 2014 . . . . .	375,000	48,554*	326,446	32,645	200,000
Dec. 31, 2015 . . . . .	175,000	15,909†	159,091	15,909	175,000
				<u>\$94,140</u>	<u>\$550,000</u>

\*\$94,140 – \$45,586 = \$48,554

†\$48,554 – \$32,645 = \$15,909

The entries on December 31, 2013, to record the receipt of the 2013 loan payment and to recognize interest revenue for the year are as follows:

2013

Dec. 31	Cash . . . . .	175,000	
	Loan Receivable . . . . .		175,000
	Allowance for Loan Impairment . . . . .	45,586	
	Interest Revenue* . . . . .		45,586

\*Alternatively, a company may show all changes in present value as an adjustment to Bad Debt Expense in the same manner in which impairment initially was recognized.<sup>26</sup>

The T-accounts for the loan receivable and allowance accounts for 2012 and 2013 are as follows:

Loan Receivable				Allowance for Loan Impairment			
Beg. Bal.	550,000					12/31/2012	94,140
		12/31/2013	175,000	12/31/2013	45,586		
Bal.	375,000					Bal.	48,554

Similar entries would be made at the end of 2014 and 2015 using the amounts included in the preceding amortization schedule. Note that computation of the amortization of the allowance for loan impairment account is identical to the computation for the amortization of Discount on Notes Receivable used in Chapter 7. If all payments are made as scheduled, the loan receivable and allowance accounts will both be closed out as of December 31, 2015.

<sup>26</sup> FASB ASC paragraph 310-10-35-40.

**SOLUTIONS TO OPENING SCENARIO QUESTIONS**

1. Disney owns 100% of ABC. As a result, the shareholders of Disney, through their board of directors, control the strategic decisions of ABC. In contrast, Berkshire Hathaway owns just over 8% of Coca-Cola. Berkshire Hathaway may be able to influence the actions of Coca-Cola but certainly not control them.
2. The primary business activity of Berkshire Hathaway is to invest in other companies and earn a return from those investments.

In contrast, Microsoft's primary business activity is the development and sale of software. Microsoft's investments serve as both a temporary storage place for excess cash as well as strategic investments in order to

exercise influence on the operations of other companies.

3. CREF invests the retirement funds of educators. Many college professors have their retirement funds invested through CREF.

## SOLUTIONS TO STOP & THINK

1. (Page 14-7) The correct answer is D. The investment by Ford in Mazda is part of a broader strategic alliance. Ford and Mazda are partners in a joint venture in Thailand, have joint plans for production and sales in China, and are partners in production facilities in the United States. In addition, this investment by Ford gives the company a presence in Japan, the homeland of the company's primary foreign competitors, Toyota and Honda. Before the fourth quarter of 2008, Ford's ownership of Mazda was 33%. As discussed in this chapter, for accounting purposes the ownership threshold for "significant influence" is assumed to be 20%. However, it is clear that Ford's 11% ownership of Mazda exists to give Ford significant influence.
2. (Page 14-16) The correct answer is A. Recall that both trading and available-for-sale debt securities are reported in the balance sheet at fair value. Accordingly, after carefully amortizing a discount or premium on these debt securities, the securities would then just be adjusted to current fair value anyway. However, in a more comprehensive example, achieving a proper split between interest revenue and unrealized holding gains and losses would require that the discount or premium first be amortized before adjusting the security to fair value.
3. (Page 14-30) The correct answer is C. Recognized is an accounting term, which indicates that a transaction has been recorded using a journal entry. In the context of investment securities, realized means that a gain or loss amount has actually been confirmed through the sale of the securities.
4. (Page 14-37) The correct answer is D. As seen in the examples, all transferred securities are recorded at their fair value on the date of transfer. Depending on the type of transfer, unrealized gains and losses will be treated in a variety of ways.

## SOLUTION TO USING THE FASB'S CODIFICATION

Under FASB ASC Section 320-10-25 you can see material labeled "Restrictions on Classification of a Debt Security as Held-to-Maturity." Paragraph 320-10-25-3 confirms what you have been telling your CEO: "Use of the held-to-maturity category is restrictive because the use of amortized cost must be justified for each investment in a debt security."

This section also lists circumstances when the held-to-maturity classification is definitely NOT

appropriate. For example, paragraph 320-10-25-4b identifies potential "needs for liquidity" as a circumstance in which a debt security must NOT be classified as held to maturity. Because the securities in your company's investment portfolio are held to provide liquidity for potential business acquisitions, the held-to-maturity classification is NOT appropriate.

# REVIEW CHAPTER 14

## LEARNING OBJECTIVES

- 1** Determine why companies invest in other companies.

Companies invest in the debt and equity securities of other businesses for a variety of reasons. The most common reason is to earn a return on idle cash. Other reasons for investing in other companies include establishing a business relationship through ownership, diversifying seasonal or industry risk, and gaining access to a company's research or technology. The intended outcome of investing in other companies is to enhance the overall return to shareholders.

- 2** Understand the varying classifications associated with investment securities.

Securities are classified based on management's intent in holding the securities. If a firm invests in the equity securities of another company with the intent of influencing or controlling the decisions and activities of that company, the investment is accounted for using the equity method. Investments in debt and equity securities where the intent is to sell those securities should the need for cash arise or to take advantage of increases in value are classified as trading securities. Debt securities that are intended to be held until they mature are classified as held-to-maturity securities. All remaining investment securities are classified as available for sale.

- 3** Account for the purchase of debt and equity securities.

Debt and equity securities are accounted for at cost, which includes brokerage fees, taxes, and other charges incurred at acquisition. In the case of debt securities, accrued interest presents an additional complexity. The amount of interest accrued prior to the purchase date must be accounted for separately from the cost of the investment.

- 4** Account for the recognition of revenue from investment securities.

The method for recognizing revenue from investments depends on how the investment was originally classified. For debt securities, the revenue recognized is termed *interest revenue*. For trading and available-for-sale debt securities, the amount of interest revenue is a function of the stated rate of interest associated with the debt interest. In the case of held-to-maturity securities, any premium or discount associated with the initial purchase must be amortized and offset against interest revenue. For equity securities classified as trading or available for sale, dividends declared by the investee are recorded as revenue. If an investment is accounted for using the equity method, then the amount of revenue recognized is a function of the percentage of ownership. The net income of the investee is multiplied by the ownership interest and recorded as revenue.

- 5** Account for the change in fair value of investment securities.

Temporary changes in the fair value of debt and equity securities classified as trading or available for sale are accounted for through the use of a market adjustment account. The use of this account results in securities being valued at fair value on the balance sheet. For trading securities, the increase or decrease in fair value is reported on the income statement. In the case of available-for-sale securities, the change in fair value is disclosed as a separate component of stockholders' equity. Temporary changes in fair value for held-to-maturity securities and equity method securities are not recognized. If a decline in the fair value of an investment is judged to be permanent, the amount of the decline is recorded in the current period's income, and the investment's cost basis is adjusted.

**6 Account for the sale of investment securities.**

When an investment is sold, its carrying value is removed from the books, and the difference between carrying value and the cash received is recorded as a realized gain or loss. In the case of debt securities, an adjustment may be required to record interest revenue earned but not received prior to the sale and to amortize any premium or discount.

**7 Record the transfer of investment securities between categories.**

On occasion, management may elect to reclassify certain of its investment securities. If the reclassification involves a movement to or from the trading classification, any change in fair value not previously recognized in income is recorded in the current period. If the reclassification is from held to maturity to available for sale, changes in fair value since the investment's acquisition are recorded as a separate component of stockholders' equity. If an available-for-sale security is reclassified as a held-to-maturity security, all previously recorded changes in fair value are amortized over the remaining life of the investment.

**8 Properly report purchases, sales, and changes in fair value of investment securities in the statement of cash flows.**

The purchase and sale of available-for-sale, held-to-maturity, and equity method securities are reported in the Investing Activities section of the statement of cash flows. The cash flows associated with the purchase and sale of trading securities and securities accounted for using the fair value options are shown in the Operating or Investing Activities section depending on the reason the securities were acquired. For available-for-sale securities, realized losses are added and realized gains are subtracted when computing cash from operating activities. With trading securities, unrealized gains are also subtracted,

and unrealized losses are also added if those trading securities are considered to be part of operating activities. With equity method securities, an adjustment to operating cash flow must be made to reflect the fact that the cash received from the securities in the form of dividends is not equal to the income from the securities included in the computation of net income.

**9 Explain the proper classification and disclosure of investments in securities.**

Realized gains and losses on the sale of investment securities are disclosed on the income statement in the period of the sale. Unrealized gains and losses on trading securities are also disclosed on the income statement. Unrealized increases and decreases on securities being classified as available for sale are disclosed in the Stockholders' Equity section of the balance sheet. Additional note disclosure relating to investment securities is required, and the appropriate disclosure varies, depending on the classification of the security. For investment securities reported at fair value, the magnitude of the fair values determined using Level 1, Level 2, and Level 3 inputs is disclosed.

**EM EXPANDED MATERIAL****10 Account for the impairment of a loan receivable.**

On some occasions, particularly in the case of loans made to other companies, a market value may not exist for the investment. In these instances, the investor must regularly assess the collectibility of the investment, and if it is determined that an "impairment" exists, an adjustment to the value of the receivable must be made. Impairment is measured by comparing the present value of expected future cash flows with the carrying value of the investment.

## FASB-IASB CODIFICATION SUMMARY

Topic	FASB Accounting Standards Codification	Original FASB Standard	Corresponding IASB Standard	Differences between U.S. GAAP and IFRS
Classification as trading, available for sale, or held to maturity	Section 320-10-25 par. 1	SFAS No. 115 par. 6-12	IFRS 9 par 4.1, 5.4.4	No substantial differences
Equity method	Topic 323	APB Opinion No. 18	IAS 28	No substantial differences
Fair value option	Topic 825, "Fair Value Option" subsections	SFAS No. 159	IFRS 9	There is a fair value option for financial assets under IFRS, but as of 2010 there was not yet a fair value option for financial liabilities.
Derecognition of investment securities	Topic 860	SFAS No. 140	IAS 39 par. 20	Under U.S. GAAP, the transfer of a financial asset is recorded as a sale if control of the asset passes from the transferor to the transferee. Under IFRS, the transfer is recorded as a sale if the risks and rewards associated with the cash flows from the financial assets pass from the transferor to the transferee.
Classification of cash flows from the purchase and sale of investment securities	Section 320-10-45 par. 11	SFAS No. 115 par. 18	IAS 7 par. 15-16	Under IFRS, cash flows from the purchase and sale of trading securities are classified under operating activities; for other security categories, the cash flows are investing activities. Under U.S. GAAP, trading security cash flows may be operating or investing, depending on management intent.
Loan impairment	Section 310-10-35	SFAS No. 114	IAS 39 par. 58 through 65	No substantial differences

## KEY TERMS

Available-for-sale securities 14-9  
Control 14-17  
Debt securities 14-8

Derecognition 14-33  
Equity method 14-17  
Equity method securities 14-9

Equity securities 14-8  
Held-to-maturity securities 14-9  
Parent company 14-18

Significant influence 14-17  
Subsidiary company 14-18

## QUESTIONS

- Why might a company invest in the securities of another company?
- What securities fall under the scope of FASB ASC Topic 320?
- What criteria must be met for a security to be classified as held to maturity?
- What criteria must be met for a security to be classified as a trading security?
- What is "the fair value option"?
- How does the classification of investment securities under International Financial Reporting Standards (trading, available for

- sale, and held to maturity) differ from the classification under U.S. GAAP?
7. (a) When computing the price to be paid for a debt security, the stated rate of interest is used to determine what value? (b) How does the market or effective rate affect a debt security's value?
  8. How does one compute the interest revenue to be recognized on a debt security if the effective-interest method is being used?
  9. What other factors are considered when determining whether effective control exists when the investor does not possess absolute voting control?
  10. (a) What factors may indicate the ability of an investor owning less than a majority voting interest to exercise significant influence on the investee's operating and financial policies? (b) What factors may indicate the investor's inability to exercise significant influence?
  11. How is a joint venture a form of off-balance-sheet financing?
  12. In the United States, we use the term "equity method investee" to describe a company in which another company has purchased between 20 and 50% of the shares and is thus able to exert significant influence. What term is used for an "equity method investee" in International Financial Reporting Standards?
  13. How are changes in value reported in the financial statements for trading securities? Available-for-sale securities? Held-to-maturity securities?
  14. What type of account is Market Adjustment? How is it disclosed on the financial statements?
  15. How is an "other-than-temporary" decline in the value of investments recorded?
  16. What impact does the sale of investment securities during the year have on the computation of unrealized gains and losses on trading securities? On unrealized increases and decreases on available-for-sale securities?
  17. When transferring securities between categories, how is the transfer accounted for? At what value are the securities recorded?
  18. How are realized gains and losses on trading securities handled in the statement of cash flows? How are unrealized gains and losses on trading securities handled?
  19. Are trading, available-for-sale, and held-to-maturity securities disclosed on the balance sheet as current or long-term assets?
  20. Where are the cash flow effects of purchases and sales of equity securities reported?
  21. What additional disclosures are recommended under FASB *Statement No. 115* for trading, available-for-sale, and held-to-maturity securities?
  22. Why is the impairment of a loan accounted for differently from the decline in value of a debt security?

EXPANDED MATERIAL

## PRACTICE EXERCISES

### Practice 14-1

L03

#### Purchasing Debt Securities

On January 1, Issuing Company issued \$100,000 in debt securities. The stated interest rate on the debt securities is 8%, with interest payable semiannually, on June 30 and December 31. On February 1, Purchasing Company purchased the bonds from the private investor who acquired them when they were originally issued. Purchasing Company paid the private investor an amount equal to the face value of the securities plus accrued interest. The securities were purchased as trading securities. Make the journal entries necessary on Purchasing Company's books to record the security purchase and the receipt of interest on June 30 using (1) the asset approach and (2) the revenue approach.

### Practice 14-2

L03

#### Purchasing Equity Securities

The company purchased 2,000 shares of equity securities for \$27 per share. The shares were purchased as an available-for-sale investment. Make the journal entry necessary to record the purchase.

### Practice 14-3

L03

#### Computing the Value of Debt Securities

On January 1, the company purchased debt securities with a face value of \$100,000. The securities mature in seven years. The securities have a stated interest rate of 8%,

and interest is paid semiannually. The prevailing market interest rate on these debt securities is 12% compounded semiannually. Compute the fair value of the securities.

**Practice 14-4**

**L04**

**Interest Revenue for Held-to-Maturity Securities**

On January 1, the company purchased debt securities for cash of \$25,518. The securities have a face value of \$20,000, and they mature in 15 years. The securities have a stated interest rate of 10%, and interest is paid semiannually, on June 30 and December 31. The prevailing market interest rate on these debt securities is 7% compounded semiannually. The securities were purchased as a held-to-maturity investment. Make the journal entries to record (1) the purchase of the securities, (2) the June 30 receipt of interest, and (3) the December 31 receipt of interest.

**Practice 14-5**

**L02, L04**

**Cost Method, Equity Method, and Consolidation**

Identify how each of the following investments in equity securities should be classified by the investor company:

	Number of Shares Owned by Investor Company	Total Shares of Investee Company Outstanding
1 .....	1,200	10,000
2 .....	6,000	8,000
3 .....	20,000	55,000

**Practice 14-6**

**L04**

**Revenue for Trading and Available-for-Sale Securities**

The company owns 2,000 shares of Stock A and 6,000 shares of Stock B. The company received dividends of \$1.75 per share from Stock A and \$0.97 per share from Stock B. The company classifies Stock A as a trading security and Stock B as an available-for-sale security. Make the journal entry or entries necessary to record the receipt of the cash dividends.

**Practice 14-7**

**L04**

**Revenue for Equity Method Securities**

On January 1 of Year 1, Burton Company purchased 2,000 shares of the 8,000 outstanding shares of Company A for a total of \$54,000. The purchase price was equal to 25% of the book value of Company A's equity. Company A's net income in Year 1 was \$40,000; net income in Year 2 was \$50,000. Dividends per share paid by Company A were \$1.60 in Year 1 and \$2.00 in Year 2. Make all journal entries necessary on Burton's book to record its investment in Company A in Year 1 and Year 2.

**Practice 14-8**

**L04**

**Equity Method: Excess Depreciation**

On January 1 of Year 1, Stratton Company purchased 5,000 shares of the 15,000 outstanding shares of Company B for a total of \$82,000. At the time of the purchase, the book value of Company B's equity was \$202,000. Any excess of investment purchase price over the book value of Company B's equity is attributable to a building owned by Company B. The building has a remaining useful life of 11 years. Company B's net income in Year 1 was \$72,000. Dividends per share paid by Company B were \$1.65 in Year 1. (1) Make all journal entries necessary on Stratton's books to record its investment in Company B in Year 1. (2) Compute the Year 1 ending balance in Stratton Company's investment in Company B account.

**Practice 14-9**

**L04**

**Equity Method: Cost Greater than Book Value**

On January 1 of Year 1, Dridge Company purchased 2,500 shares of the 10,000 outstanding shares of Company C for a total of \$100,000. At the time of the purchase, the

book value of Company C's equity was \$300,000. Company C assets having a fair value greater than book value at the time of the acquisition were as follows:

Asset	Book Value	Fair Value	Remaining Life
Inventory	\$ 40,000	\$ 50,000	less than 1 year
Building	200,000	250,000	10 years
Goodwill	0	40,000	indefinite

Company C's net income in Year 1 was \$70,000. Dividends per share paid by Company C were \$2.00 in Year 1. (1) Make all journal entries necessary on Dridge's books to record its investment in Company C in Year 1. Assume that the goodwill is not impaired. (2) Compute the Year 1 ending balance in Dridge Company's investment in Company C account.

**Practice 14-10****L05****Changes in Value: Trading Securities**

On December 1, the company purchased securities for \$3,850. On December 31, the company still held the securities. Make the necessary adjusting journal entry to record a change in value of the securities assuming that their December 31 fair value was (a) \$5,200 and (b) \$2,600. In addition, before considering the impact of the change in value of the securities, the net income for the company was \$3,000. Compute net income assuming that the December 31 fair value of the securities was (c) \$5,200 and (d) \$2,600. Ignore income taxes. Assume that the securities are classified as trading.

**Practice 14-11****L05****Changes in Value: Available-for-Sale Securities**

Refer to Practice 14-10. Make the adjusting journal entries for (a) and (b) and the computations for (c) and (d), assuming that the securities are classified as available for sale.

**Practice 14-12****L05****Changes in Value: Held-to-Maturity Securities**

Refer to Practice 14-10. Make the adjusting journal entries for (a) and (b) and the computations for (c) and (d), assuming that the securities are classified as held to maturity. The changes in value are not deemed to be "other than temporary."

**Practice 14-13****L05****Changes in Value: Equity Method**

Refer to Practice 14-10. Make the adjusting journal entries for (a) and (b) and the computations for (c) and (d), assuming that the securities are accounted for using the equity method. Ignore the impact of the investee company income and dividends. The changes in value are not deemed to be "other than temporary."

**Practice 14-14****L06****Sale of Securities**

During Year 1, the company purchased 1,000 shares of stock for \$24 per share. Near the end of Year 1, the company sold 400 shares. Make the journal entry to record the sale, assuming that the shares were sold for (1) \$27 per share and (2) \$20 per share. The shares were classified as trading securities.

**Practice 14-15****L06****Sale of Securities and the Market Adjustment Account**

The company purchased the following securities during Year 1:

Security	Classification	Cost	Fair Value (Dec. 31, Year 1)
A	Trading	\$ 9,000	\$10,000
B	Trading	10,000	16,000

On July 23, Year 2, the company sold all of the shares of security B for a total of \$9,500. As of December 31, Year 2, the shares of security A had a fair value of \$5,800. No other activity occurred during Year 2 in relation to the trading security portfolio. (1) What amount should the company report as *realized gain or loss* in the Year 2 income statement? Clearly indicate whether the amount is a gain or a loss. (2) What amount should the company report as *unrealized gain or loss* in the Year 2 income statement? Clearly indicate whether the amount is a gain or a loss.

**Practice 14-16**

**L07**

**Transfer between Categories: To and from Trading**

The company purchased the following securities during Year 1:

Security	Classification	Cost	Fair Value (Dec. 31, Year 1)
A .....	Trading	\$5,000	\$4,000
B .....	Available for sale	6,000	8,000

In Year 2, the company reclassified both of these securities. Security A was reclassified as available for sale; the fair value of security A at the time of the reclassification was \$5,500. Security B was reclassified as trading; the fair value of security B at the time of the reclassification was \$4,100. Make the journal entries necessary to record both of these reclassifications.

**Practice 14-17**

**L07**

**Transfer between Categories: Available for Sale**

The company purchased the following securities during Year 1:

Security	Classification	Cost	Fair Value (Dec. 31, Year 1)
A .....	Available for sale	\$ 8,200	\$ 7,100
B .....	Held to maturity	10,000	13,500

In Year 2, the company reclassified both of these securities. Security A was reclassified as held to maturity; the fair value of security A at the time of the reclassification was \$8,850. Security B was reclassified as available for sale; the fair value of security B at the time of the reclassification was \$9,450. Make the journal entries necessary to record both of these reclassifications. (Note: The held-to-maturity securities were acquired at their face value, so there has been no amortization.)

**Practice 14-18**

**L08**

**Cash Flow and Available-for-Sale Securities**

The company entered into the following transactions during the year:

Purchase of investment securities .....	\$400
Sale of investment securities .....	470

The company had no investment securities at the beginning of the year. The cost of the investment securities sold was \$350. The fair value of the remaining securities was \$65 on December 31. The net income for the year was \$880. Assume that net income does not include any noncash items and does not reflect gains or losses related to investment securities.

Assume that the securities are classified as available for sale. Compute (1) cash flow from operating activities and (2) cash flow from investing activities.

**Practice 14-19**

**L08**

**Cash Flow and Trading Securities**

Refer to Practice 14-18. Assume that the securities are classified as trading and that they were purchased for operating purposes. Compute (1) cash flow from operating activities and (2) cash flow from investing activities.

**Practice 14-20**

**L09**

**Disclosure: Computation of Total Economic Gain**

During Year 1, Walters Company purchased 6,000 shares of Company A common stock for \$25 per share and 10,000 shares of Company B common stock for \$32 per share.

These investments are classified as available-for-sale securities. At December 31, Year 1, Walters Company appropriately recorded a \$95,000 debit to Market Adjustment—Available-for-Sale Securities. On March 23, Year 2, the 6,000 shares of Company A common stock were sold for \$41 per share. The fair value of the Company B shares on December 31, Year 2, was \$38 per share. (1) Prepare *all* journal entries *needed in Year 2* related to these securities. (2) Compute the total increase in economic value generated by Walters' stock portfolio during Year 2.

**EM** EXPANDED MATERIAL

**Practice 14-21**

**L010**

**Loan Impairment: Initial Measurement**

On January 1 of Year 1, the lending company made a \$10,000, 8% loan. The \$800 interest is receivable at the end of each year, with the principal amount to be received at the end of five years. As of the end of Year 1, the first year's interest of \$800 has not yet been received because the borrower is experiencing financial difficulties. The lending company negotiated a restructuring of the loan. The payment of all of the interest (\$4,000 = \$800 × 5 years) will be delayed until the end of the 5-year loan term. In addition, the amount of principal repayment will be dropped from \$10,000 to \$5,000. Make the journal entry necessary on the lending company's books to record this loan impairment on December 31 of Year 1. (*Note: No interest revenue has been recognized in Year 1 in connection with the loan.*)

**Practice 14-22**

**L010**

**Loan Impairment: Subsequent Interest Revenue**

Refer to Practice 14-21. Make all journal entries necessary on the lending company's books in connection with the loan during Year 2, Year 3, Year 4, and Year 5. Assume that all cash payments are received according to the renegotiated schedule.

**EXERCISES**

**Exercise 14-23**

**L03, L04, L06**

**Recording Securities Transactions**

The following transactions of Kelsey, Inc., occurred within the same accounting period:

- (a) Purchased \$55,000 U.S. Treasury 6% bonds, paying 102 plus accrued interest of \$1,400. Kelsey uses the revenue approach to record accrued interest on purchased bonds. Kelsey classified this security as a trading security.
- (b) Purchased 2,100 shares of Dulce Co. common stock at \$67 per share. Kelsey classifies this stock as an available-for-sale security.
- (c) Received semiannual interest on the U.S. Treasury bonds.
- (d) Sold 400 shares of Dulce at \$81 per share.
- (e) Sold \$20,000 of U.S. Treasury 6% bonds at 101 plus accrued interest of \$180.
- (f) Purchased an \$18,000, 6-month certificate of deposit. The certificate is classified as a trading security.

Prepare the entries necessary to record these transactions.

**Exercise 14-24**

**L03, L04, L06**

**Accounting for the Purchase and Sale of Securities**

During January 2013, Aragorn Inc. purchased the following securities:

Security	Classification	No. of Shares	Total Cost
Gimli Corporation stock . . . . .	Trading	500	\$ 9,000
Legolas International Inc. stock . . . . .	Available for sale	1,000	22,000
Glorfindel Enterprises stock . . . . .	Available for sale	2,500	42,500
Mirkwood Co. bonds . . . . .	Held to maturity	—	24,000
U.S. Treasury bonds . . . . .	Trading	—	11,000

During 2013, Aragorn received interest from Mirkwood and the U.S. Treasury totaling \$3,630. Dividends received on the stock held amounted to \$1,760. During November 2013, Aragorn sold 200 shares of the Gimli stock at \$17 per share and 250 shares of the Glorfindel stock at \$19 per share.

Give the journal entries required by Aragorn to record the (1) purchase of the debt and equity securities; (2) receipt of interest and dividends during 2013; and (3) sale of the equity securities during November.

**Exercise 14-25****L04****Accounting Methods for Equity Securities**

For each of the following independent situations, determine the appropriate accounting method to be used: cost or equity. For cost method situations, determine whether the security should be classified as trading or available for sale. For equity method situations, determine whether consolidated financial statements would be required. Explain the rationale for your decision.

- ATV Company manufactures and sells 4-wheel recreational vehicles. It also provides insurance on its products through its wholly owned subsidiary, RV Insurance Company.
- Buy Right Inc. purchased 20,000 shares of Big Supply Company common stock to be held as a long-term investment. Big Supply has 200,000 shares of common stock outstanding.
- Super Tire Manufacturing Co. holds 5,000 shares of the 10,000 outstanding shares of nonvoting preferred stock of Valley Corporation. Super Tire considers the investment as being long-term in nature.
- Takeover Company owns 15,000 of the 50,000 shares of common stock of Western Supply Company. Takeover has tried and failed to obtain representation on Western's board of directors. Takeover intends to sell the securities if it cannot obtain board representation at the next stockholders' meeting, scheduled in three weeks.
- Espino Inc. purchased 50,000 shares of Independent Mining Company common stock. Independent has a total of 125,000 common shares outstanding. Espino has no intention to sell the securities in the foreseeable future.

**Exercise 14-26****L04****Investment in Equity Securities**

On January 10, 2013, Delta Corporation acquired 12,000 shares of the outstanding common stock of Kennedy Company for \$600,000. At the time of purchase, Kennedy Company had outstanding 48,000 shares with a book value of \$2.4 million. On December 31, 2013, the following events took place:

- Kennedy reported net income of \$180,000 for the calendar year 2013.
- Delta received from Kennedy a dividend of \$0.55 per share of common stock.
- The fair value of Kennedy Company stock had temporarily declined to \$41 per share.

Give the entries that would be required to reflect the purchase and subsequent events on the books of Delta Corporation, assuming that (1) the security is classified as available for sale and (2) the equity method is appropriate.

**Exercise 14-27****L04****Investment in Equity Securities—Unrecorded Intangible**

Alpha Co. acquired 20,000 shares of Beta Co. on January 1, 2012, at \$12 per share. Beta Co. had 80,000 shares outstanding with a book value of \$800,000. The difference between the book value and fair value of Beta Co. on January 1, 2012, is attributable to a broadcast license intangible asset. Beta Co. recorded earnings of \$360,000 and \$390,000 for 2012 and 2013, respectively, and paid per-share dividends of \$1.60 in 2012 and \$2.00 in 2013. Assuming a 20-year straight-line amortization policy for the broadcast license, give the entries to record the purchase in 2012 and to reflect Alpha's share of Beta's earnings and the receipt of the dividends for 2012 and 2013.

**Exercise 14-28**

**L04**

**Investment in Equity Securities—Fair Value Different from Book Value**

On January 3, 2013, McDonald Inc. purchased 40% of the outstanding common stock of Old Farms Co., paying \$128,000 when the book value of the net assets of Old Farms equaled \$250,000. The difference was attributed to equipment, which had a book value of \$60,000 and a fair value of \$100,000, and to buildings, with a book value of \$50,000 and a fair value of \$80,000. The remaining useful life of the equipment and buildings was 4 years and 12 years, respectively. During 2013, Old Farms reported net income of \$80,000 and paid dividends of \$50,000.

Prepare the journal entries made by McDonald Inc. during 2013 related to its investment in Old Farms.

**Exercise 14-29**

**L04**

**Amortization of a Premium on a Debt Security**

On January 1, 2013, Randy Incorporated purchased \$600,000 of 20-year, 10% bonds when the market rate of interest was 8%. Interest is to be paid on June 30 and December 31 of each year.

1. Prepare the journal entry to record the purchase of the debt security classified as held to maturity.
2. Prepare the journal entry to record the receipt of the first two interest payments, assuming that Randy accounts for the debt security as held to maturity and uses the effective-interest method.

**Exercise 14-30**

**L04**

**Amortization of a Discount on a Debt Security**

On January 1, 2013, Cougar Creations Inc. purchased \$100,000 of 5-year, 8% bonds when the effective rate of interest was 10%, paying \$92,277. Interest is to be paid on July 1 and December 31.

1. Prepare an interest amortization schedule for the bonds.
2. Prepare the journal entries made by Cougar Creations on July 1 and December 31 of 2013 to recognize the receipt of interest and to amortize the discount.

**Exercise 14-31**

**L05**

**Valuation of a Debt Security**

Using the information from Exercise 14-30, provide the journal entry that would be necessary to properly value the debt security if, on December 31, 2013, the bond's fair value was \$96,500. Assume the security was initially classified as follows:

1. A trading security
2. An available-for-sale security
3. A held-to-maturity security

**Exercise 14-32**

**L03, L05**

**Trading Securities**

During 2013, Litten Company purchased trading securities as a short-term investment. The costs of the securities and their fair values on December 31, 2013, follow:

Security	Cost	Fair Value, Dec. 31, 2013
A .....	\$ 65,000	\$ 75,000
B .....	100,000	54,000
C .....	220,000	226,000

At the beginning of 2013, Litten had a zero balance in the market adjustment—trading securities account. Before any adjustments related to these trading securities, Litten had net income of \$287,000.

1. What is net income after making any necessary trading security adjustments? (Ignore income taxes.)
2. What would net income be if the fair value of security B were \$95,000?

**Exercise 14-33**  
**L03, L05, L06**

**Accounting for Trading Securities**

During 2012, Spelling Inc. purchased the following trading securities:

Security	Cost	Fair Value, Dec. 31, 2012
Bizarre Corp. common .....	\$31,000	\$33,000
8% U.S. Treasury notes .....	16,000	9,000
PhalCo bonds .....	22,000	25,000

At the beginning of 2012, Spelling had a zero balance in Market Adjustment—Trading Securities.

1. What entry would be made at year-end, assuming the preceding values?
2. What entry would be made during 2013, assuming one-half of the Bizarre Corp. common stock is sold for \$17,000?
3. Give the entry that would be made at the end of 2013, assuming the following situations:
  - (a) The fair value of remaining securities is \$50,000.
  - (b) The fair value of remaining securities is \$52,500.
  - (c) The fair value of remaining securities is \$56,000.

**Exercise 14-34**  
**L05**

**Debt and Equity Securities**

American Steel Corp. acquired the following securities in 2013:

Security	Classification	Cost	Fair Value, Dec. 31, 2013
A .....	Trading	\$10,000	\$12,000
B .....	Trading	16,000	10,000
C .....	Available for sale	12,000	15,000
D .....	Available for sale	20,000	15,000
E .....	Held to maturity	20,000	22,000

At the beginning of 2013, American Steel had a zero balance in each of its market adjustment accounts.

1. What entry or entries would be made at the end of 2013, assuming the preceding fair values?
2. If net income before any adjustments related to investment securities was \$100,000, what would reported income be after adjustments? (Ignore income taxes.)

**Exercise 14-35**  
**L05**

**Temporary and “Other-Than-Temporary” Changes in Value**

The securities portfolio for Malibu Industries contained the following trading securities:

Securities (common stock)	Initial Cost	Fair Value, Dec. 31, 2012	Fair Value, Dec. 31, 2013
Brooks Co. ....	\$15,000	\$18,000	\$22,300
Sonoma Co. ....	12,000	8,000	5,300
Taylor Co. ....	24,000	20,000	25,700

1. Assuming that all changes in fair value are considered temporary, what is the effect of the changes in value on the 2012 and 2013 financial statements? Give the valuation entries for these years, assuming that the market adjustment account has a \$0 balance at the beginning of 2012.

- Assume that at December 31, 2013, management believed that the fair value of the Sonoma Co. common stock reflected an “other-than-temporary” decline in the value of that stock. Give the entries to be made on December 31, 2013, under this assumption.

**Exercise 14-36**

**L05, L07**

**Reclassification of Securities**

Kyoto Inc. had the following portfolio of securities at the end of its first year of operations:

Security	Classification	Cost	Year-End Fair Value
A .....	Trading	\$ 8,000	\$13,000
B .....	Trading	15,000	18,000

- Provide the entry necessary to adjust the portfolio of securities to its fair value.
- In the following year, Kyoto elects to reclassify security B as an available-for-sale security. On the date of the transfer, security B's fair value is \$16,500. Provide the journal entry to reclassify security B.

**Exercise 14-37**

**L05, L06**

**Reclassification of Securities**

Bicknel Technologies Inc. purchased the following securities during 2012:

Security	Classification	Cost	Fair Value, Dec. 31, 2012
A .....	Trading	\$ 2,000	\$ 4,000
B .....	Trading	7,000	6,000
C .....	Available for sale	18,000	16,000
D .....	Available for sale	5,000	4,000
E .....	Held to maturity	14,000	15,000

At the beginning of 2012, Bicknel Technologies had a zero balance in each of its market adjustment accounts. During 2013, after the 2012 financial statements had been issued, Bicknel determined that security B should be reclassified as an available-for-sale security and security C should be reclassified as a trading security. The fair values on the date of the transfer are \$5,500 for security B and \$17,000 for security C.

Prepare the journal entries to do the following:

- Adjust the portfolio of securities to its fair value at December 31, 2012.
- Reclassify security B as an available-for-sale security in 2013.
- Reclassify security C as a trading security in 2013.

**Exercise 14-38**

**L05**

**Valuation of Securities**

Truss Builders Co. reported the following selected balances on its financial statements for each of the four years 2011–2014:

	2011	2012	2013	2014
Market adjustment—Available-for-sale securities .....	\$0	\$ 6,200	\$4,600	\$(800)
Market adjustment—Trading securities .....	0	(1,800)	300	1,550

Based on these balances, reconstruct the valuation entries that must have been made each year.

**Exercise 14-39**  
**L05, L06**

**Accounting for Securities**

During 2012, the first year of its operations, Profit Industries purchased the following securities:

Security	Classification	Cost	Fair Value, Dec. 31, 2012	Fair Value, Dec. 31, 2013
A .....	Trading	\$18,000	\$13,000	\$ 9,000
B .....	Trading	8,000	9,000	10,000
C .....	Available for sale	17,000	15,000	17,000
D .....	Available for sale	24,000	28,000	13,000

During 2013, Profit sold one-half of security A for \$8,000 and one-half of security D for \$15,000.

Provide the journal entries required to do the following:

1. Adjust the portfolio of securities to its fair value at the end of 2012.
2. Record the sale of security A and security D.
3. Adjust the portfolio of securities to its fair value at the end of 2013.

**Exercise 14-40**  
**L08**

**Investment Securities and the Statement of Cash Flows**

Indicate how each of the following transactions or events would be reflected in a statement of cash flows prepared using the indirect method. Each transaction or event is independent of the others. For items (a) and (d), assume that the balance in the market adjustment account was zero at the beginning of the year. In all cases, assume that trading securities were acquired for operating purposes.

- (a) At year-end, the trading securities portfolio has an aggregate cost of \$185,000 and an aggregate fair value of \$150,000.
- (b) During the year, trading securities and available-for-sale securities were purchased for \$50,000 and \$70,000, respectively. The securities were paid for in cash.
- (c) Trading securities on hand at the beginning of the period (cost \$40,000) were sold for \$62,000 cash.
- (d) At year-end, the trading securities portfolio has an aggregate cost of \$170,000 and an aggregate fair value of \$190,000.

**Exercise 14-41**  
**L08**

**Gain and Losses and the Statement of Cash Flows**

Miss Maggie Company entered into the following transactions during the year:

Purchase of trading securities .....	\$500
Sale of trading securities .....	220
Purchase of available-for-sale securities .....	900
Sale of available-for-sale securities .....	470

Miss Maggie had no investment securities at the beginning of the year. The cost of the trading securities sold was \$300; the cost of the available-for-sale securities sold was \$150. The fair value of the remaining securities on December 31 was as follows: trading securities, \$310; available-for-sale securities, \$460. The net income for the year was \$985. Assume that net income does not include any noncash items except for those related to investment securities. In all cases, assume that trading securities were acquired for operating purposes.

Compute (1) cash flow from operating activities and (2) cash flow from investing activities.

SPREADSHEET

**Accounting for the Impairment of a Loan**

Tortuga Enterprises loaned \$350,000 to Turner Inc. on January 1, 2012. The terms of the loan require principal payments of \$70,000 each year for five years plus interest at the market rate of interest of 6%. The first principal and interest payment is due on January 1, 2013. Turner made the required payments during 2013 and 2014. However, during 2014 Turner began to experience financial difficulties, requiring Tortuga to reassess the collectibility of the loan. On December 31, 2014, Tortuga determines that the remaining principal payments will be collected, but the collection of interest is unlikely.

1. Compute the present value of the expected future cash flows as of December 31, 2014.
2. Provide the journal entry to record the loan impairment as of December 31, 2014.
3. Provide the journal entries for 2015 to record the receipt of the principal payment on January 1 and the recognition of interest revenue as of December 31, assuming that Tortuga's assessment of the collectibility of the loan has not changed.

## PROBLEMS

## Problem 14-43

## L03, L05, L06

**Accounting for Trading Securities**

Fox Company made the following transactions in the common stock of NOP Company:

July 10, 2011	Purchased 10,000 shares at \$45 per share.
Sept. 29, 2012	Sold 2,000 shares for \$51 per share.
Aug. 17, 2013	Sold 2,500 shares for \$33 per share.

The end-of-year market prices for the shares were as follows:

December 31, 2011	\$47 per share
December 31, 2012	39 per share
December 31, 2013	31 per share

**Instructions:** Prepare the necessary entries for 2011, 2012, and 2013, assuming the NOP stock is classified as a trading security.

## Problem 14-44

## L03, L04, L05, L06

SPREADSHEET

**Recording and Valuing Trading Securities**

Myers & Associates reports the following information on its December 31, 2011, balance sheet:

Trading securities (at cost) .....	\$225,850	
Less: Market adjustment—trading securities .....	2,260	<u>\$223,590</u>

Supporting records of Myers' trading securities portfolio show the following debt and equity securities:

Security	Cost	Fair Value
200 shares Conway Co. common .....	\$ 25,450	\$ 24,300
\$80,000 U.S. Treasury 7% bonds .....	79,650	77,400
\$120,000 U.S. Treasury 7 1/2% bonds .....	120,750	121,890
Total .....	<u>\$225,850</u>	<u>\$223,590</u>

Interest dates on the treasury bonds are January 1 and July 1. Myers & Associates uses the revenue approach to record the purchase of bonds with accrued interest.

During 2012 and 2013, Myers & Associates completed the following transactions related to trading securities:

**2012**

Jan.	1	Received semiannual interest on U.S. Treasury bonds. Assume that the appropriate adjusting entry was made on December 31, 2011.
Apr.	1	Sold \$60,000 of the 7 1/2% U.S. Treasury bonds at 102 plus accrued interest. Brokerage fees paid were \$200.
May	21	Received dividend of \$0.25 per share on the Conway Co. common stock. The dividend had not been recorded on the declaration date.
July	1	Received semiannual interest on U.S. Treasury bonds and then sold the 7% bonds at 97 1/2. Brokerage fees paid were \$250.
Aug.	15	Purchased 100 shares of Nieman Inc. common stock at \$116 per share.
Nov.	1	Purchased \$50,000 of 8% U.S. Treasury bonds at 101 plus accrued interest. Interest dates are January 1 and July 1.
Dec.	31	Market prices of securities were Conway Co. common, \$110; 7 1/2% U.S. Treasury bonds, 101 3/4; 8% U.S. Treasury bonds, 101; Nieman Inc. common, \$116.75.

**2013**

Jan.	2	Recorded the receipt of semiannual interest on the U.S. Treasury bonds.
Feb.	1	Sold the remaining 7 1/2% U.S. Treasury bonds at 101 plus accrued interest. Brokerage fees paid were \$300.

**Instructions:**

1. Prepare journal entries for the preceding transactions and to accrue interest on December 31, 2012. Ignore any amortization of premium or discount on U.S. Treasury bonds. Give computations in support of your entries.
2. Show how trading securities would be presented on the December 31, 2012, balance sheet.

**Problem 14-45****L03, L04, L05, L06****Accounting for Debt and Equity Securities**

During 2013, Rooster Company purchased 5,000 shares of Hen Company common stock for \$18 per share and 3,200 shares of Egg Company common stock for \$21 per share. These investments are intended to be held as ready sources of cash and are classified as trading securities.

Also in 2013, Rooster purchased 6,400 shares of Chicken Company common stock for \$27 per share and \$80,000 of treasury notes at 103. These securities are classified as available for sale.

During 2013, Rooster received the following interest and dividend payments on its investments:

Hen Company	\$2.50 per share dividend
Egg Company	\$1.25 per share dividend
Chicken Company	\$1.00 per share dividend
Treasury notes	8% annual interest earned for 6 months

Fair values of the securities at December 31, 2013, were as follows:

Hen Company	\$21 per share
Egg Company	\$16 per share
Chicken Company	\$24 per share
Treasury notes	104

On March 23, 2014, the 3,200 shares of Egg common stock were sold for \$16 per share. On June 30, 2014, the treasury notes were sold at 102 plus accrued interest.

Fair values of remaining securities at December 31, 2014, were as follows:

Hen Company	\$20 per share
Chicken Company	\$30 per share

**Instructions:**

1. Prepare all 2013 and 2014 journal entries related to these securities.
2. Describe how the following items would be treated on Rooster Company's statement of cash flows for the year ended December 31, 2014. Rooster uses the indirect method of reporting cash flows from operating activities. In all cases, assume that trading securities were acquired for operating purposes.
  - (a) Proceeds from the sale of Egg shares and any realized gain or loss from the sale.
  - (b) Proceeds from the sale of the treasury securities and any realized gain or loss from the sale.
  - (c) Any unrealized gain or loss on the remaining securities.

**Problem 14-46****L03, L04, L05,  
L06, L09****Journal Entries and Balance Sheet Presentation for Investments in Securities**

On December 31, 2011, Durst Company's balance sheet showed the following balances related to its securities accounts:

Trading securities . . . . .	\$155,000	
Less: Market adjustment—trading securities . . . . .	(7,250)	\$147,750
Available-for-sale securities . . . . .	\$108,000	
Add: Market adjustment—available-for-sale securities . . . . .	10,000	118,000
Interest receivable—NYC water bonds . . . . .		1,250

Durst's securities portfolio on December 31, 2011, was made up of the following securities:

Security	Classification	Cost	Market
1,000 shares Herzog Corp. stock . . . . .	Trading	\$75,000	\$76,250
800 shares Taylor Inc. stock . . . . .	Trading	55,000	52,825
10% New York City water bonds (interest payable semiannually on January 1 and July 1) . . . . .	Trading	25,000	18,675
1,000 shares Martin Inc. stock . . . . .	Available for sale	59,000	65,000
2,000 shares Outdoors Unlimited Inc. stock . . . . .	Available for sale	49,000	53,000

During 2012, the following transactions took place:

Jan.	3	Received interest on the New York City water bonds.
Mar.	1	Purchased 300 additional shares of Herzog Corp. stock for \$22,950, classified as a trading security.
Apr.	15	Sold 400 shares of the Taylor Inc. stock for \$69 per share.
May	4	Sold 400 shares of the Martin Inc. stock for \$62 per share.
July	1	Received interest on the New York City water bonds.
Oct.	30	Purchased 1,500 shares of Cook Co. stock for \$83,250, classified as a trading security.

The fair values of the stocks and bonds on December 31, 2012, are as follows:

Herzog Corp. stock	\$76.60 per share
Taylor Inc. stock	\$68.50 per share
Cook Co. stock	\$55.25 per share
New York City water bonds	\$20,555
Martin Inc. stock	\$61.00 per share
Outdoors Unlimited Inc. stock	\$27.00 per share

**Instructions:**

1. Make all necessary journal entries for 2012, including any year-end accrual or adjusting entries.
2. Show how the investment securities would be presented on the balance sheet at December 31, 2012. Assume that the available-for-sale securities are classified as current assets.

**Problem 14-47**

**L03, L04, L05, L07**

**Journal Entries for Trading Securities**

During 2013 and 2014, Foley Co. made the following journal entries to account for transactions involving trading securities:

2013

- (a) Nov. 1 Investment in Trading Securities—7% U.S. Treasury Bonds ..... 52,417  
 Cash ..... 52,417  
*To record the purchase of \$50,000 of U.S. Treasury bonds at 102.50. Interest is payable semiannually on January 1 and July 1.*
  
- (b) Dec. 31 Unrealized Increase/Decrease in Value of  
 Available-for-Sale Securities ..... 2,227  
 Market Adjustment—Trading Securities ..... 2,227  
*To record the decrease in fair value of the current investment securities based on the following data.*

	Cost	Market	Market Adjustment
Lawlor Co. stock .....	\$ 26,420	\$ 25,260	\$1,160 Cr.
Hurst Co. stock .....	34,850	36,200	1,350 Dr.
7% U.S. Treasury bonds .....	52,417	50,000	2,417 Cr.
Total .....	<u>\$113,687</u>	<u>\$111,460</u>	<u>\$2,227 Cr.</u>

The beginning balance in Market Adjustment—Trading Securities was a \$900 credit. There were no other entries in 2013.

2014

- (c) Jan. 1 Cash ..... 1,750  
 Interest Revenue ..... 1,750  
*To record interest revenue for 6 months.*
  
- (d) July 1 Cash ..... 1,750  
 Interest Revenue ..... 1,750  
*To record interest revenue for 6 months.*
  
- (e) Dec. 6 Investment in Available-for-Sale Securities—Lawlor Co. .... 26,420  
 Investment in Trading Securities—Lawlor Co. .... 26,420  
*To reclassify Lawlor Co. stock from trading securities to available-for-sale securities. Market price was \$26,100 at the date of reclassification.*
  
- (f) Dec. 31 Unrealized Increase/Decrease in Value of  
 Available-for-Sale Securities ..... 937  
 Market Adjustment—Available-for-Sale Securities ..... 220  
 Market Adjustment—Trading Securities ..... 717  
*To record the decrease in fair value of available-for-sale securities based on the following data.*

	Cost	Market	Market Adjustment
Hurst Co. stock .....	\$ 34,850	\$ 35,350	\$ 500 Dr.
7% U.S. Treasury bonds .....	52,417	51,200	1,217 Cr.
Lawlor Co. stock .....	26,420	26,200	220 Cr.
Total .....	<u>\$113,687</u>	<u>\$112,750</u>	<u>\$ 937 Cr.</u>

There were no other entries in 2014.

**Instructions:** For each incorrect entry, give the entry that should have been made. Assume the revenue approach is used. Ignore any premium or discount amortization on U.S. Treasury bonds.

**Problem 14-48****L05****Valuation of Equity Securities**

The investment portfolio of Morris Inc. on December 31, 2012, contains the following securities:

- Opus Co. common, 3% ownership, 5,000 shares; cost, \$100,000; fair value, \$95,000; classified as a trading security.
- Garrod Inc. preferred, 2,000 shares; cost, \$40,000; fair value, \$43,000; classified as a trading security.
- Sherrill Inc. common, 30% ownership, 20,000 shares; cost, \$1,140,000; fair value, \$1,130,000; classified as an influencing investment.
- Jennings Co. common, 15% ownership, 25,000 shares; cost, \$67,500; fair value, \$50,000; classified as an available-for-sale security.

**Instructions:**

1. Give the valuation adjustment required at December 31, 2012, assuming that all investments were purchased in 2012 and none of the indicated declines in fair value are considered other than temporary.
2. Assume that the Jennings Co.'s common stock market decline is considered other than temporary. Give the valuation entry required at December 31, 2012, under this change in assumption.
3. Assume that the fair values for the long-term investment portfolio at December 31, 2013, were as follows:

Opus Co. common	\$ 102,000
Garrod Inc. preferred	43,000
Sherrill Inc. common	1,115,000
Jennings Co. common	45,000

Give the valuation entries at December 31, 2013, assuming that the investment categories remain the same and that all declines in 2012 and 2013 are temporary except for the 2012 decline in Jennings Co. stock.

**Problem 14-49****L04, L05****Investments in Common Stock**

Both Seco Inc. and Hillsborough Corp. have 100,000 shares of no-par common stock outstanding. World Inc. acquired 10,000 shares of Seco stock for \$6 per share and 30,000 shares of Hillsborough stock for \$12 per share in 2012. Both securities are being held as long-term investments. Changes in retained earnings for Seco and Hillsborough for 2012 and 2013 are as follows:

	Seco Inc.	Hillsborough Corp.
Retained earnings (deficit), January 1, 2012	\$175,000	\$ (45,000)
Net income, 2012	40,000	70,000
Cash dividends, 2012	(37,500)	—
Retained earnings, December 31, 2012	\$177,500	\$ 25,000
Net income, 2013	70,000	40,000
Cash dividends, 2013	(45,000)	(20,000)
Retained earnings, December 31, 2013	\$202,500	\$ 45,000
Fair value of stock: December 31, 2012	\$ 7.50	\$ 13.00
December 31, 2013	6.50	15.00

**Instructions:** Give the entries required on the books of World Inc. for 2012 and 2013 to account for its investments.

**Problem 14-50**

**L03, L04, L05**

**Long-Term Investments in Stock—Equity Method**

On January 1, 2013, Standard Co. bought 40% of the outstanding common stock of Exchange Corp. for \$380,000 cash. Standard Co. accounts for this investment by the equity method. At the date of acquisition of the stock, Exchange Corp.'s net assets had a carrying value of \$630,000. Assets with an average remaining life of five years have a current fair value that is \$160,000 in excess of their carrying values. The remaining difference between the purchase price and the value of the underlying stockholders' equity cannot be attributed to any identifiable tangible or intangible asset. Accordingly, the remaining difference is allocated to goodwill. At the end of 2013, Exchange Corp. reports net income of \$210,000. During 2013, Exchange Corp. declared and paid cash dividends of \$30,000.

**Instructions:** Give the entries necessary to reflect Standard Co.'s investment in Exchange Corp. for 2013.

**Problem 14-51**

**L04, L05**

**Investment in Common Stock**

On July 1 of the current year, Melissa Co. acquired 25% of the outstanding shares of common stock of International Co. at a total cost of \$700,000. At the time, the equity (net assets) of Melissa totaled \$2,400,000, meaning that the \$700,000 purchase price was greater than 25% of Melissa's net assets. Melissa was willing to pay more than book value for the International Co. stock for the following reasons:

- (a) International owned depreciable plant assets (10-year remaining economic life) with a current fair value of \$60,000 more than their carrying amount.
- (b) International owned land with a current fair value of \$300,000 more than its carrying amount.
- (c) There are no other identifiable tangible or intangible assets with fair value in excess of book value. Accordingly, the remaining excess, if any, is to be allocated to goodwill.

International Co. earned net income of \$527,000 evenly over the current year ended December 31. On December 31, International declared and paid a cash dividend of \$105,000 to common stockholders. Fair value of Melissa's share of the stock at December 31 is \$761,000. Both companies close their accounting records on December 31.

**Instructions:**

1. Compute the total amount of goodwill of International Co. based on the price paid by Melissa Co.
2. Prepare all journal entries in Melissa's accounting records relating to the investment for the year ended December 31 under the cost method of accounting, classifying the securities as available for sale.
3. Prepare all journal entries in Melissa's accounting records relating to the investment for the year ended December 31 under the equity method of accounting.

**Problem 14-52**

**L03, L04**

**Investment in Common Stock—Fair Value Less than Book Value**

JJJ Inc. purchased 35% of ABC Co. on January 4, 2013, for \$280,000 when ABC's book value was \$810,000. On that day, the fair value of the net assets of ABC equaled their book values with the following exceptions:

	Book	Fair Value
Equipment . . . . .	\$175,000	\$140,000
Buildings . . . . .	40,000	65,000

The equipment has a remaining useful life of 10 years, and the building has a remaining useful life of 20 years. ABC reported the following related to operations for 2013 and 2014:

	Net Income (Loss)	Dividends
2013.....	\$ 80,000	\$15,000
2014.....	(10,000)	8,000

**Instructions:** Provide the entries made by JJJ Inc. relating to its investment in ABC for the years 2013 and 2014.

**Problem 14-53**  
**L05, L07**

**Reclassification of Securities**

Willow Creek Incorporated had the following portfolio of securities on December 31, 2012:

Security	Classification	Cost	Fair Value, Dec. 31, 2012
A .....	Trading	\$18,000	\$23,000
B .....	Trading	31,000	37,000
C .....	Available for sale	3,000	6,000
D .....	Available for sale	12,000	14,000
E .....	Available for sale	34,000	28,000
F .....	Held to maturity	65,000	67,000

The balances in the market adjustment accounts as of January 1, 2012, were as follows:

Market Adjustment—Trading Securities .....	\$9,000 Dr.
Market Adjustment—Available-for-Sale Securities .....	3,600 Cr.

During 2013, Willow Creek determined that certain securities should be reclassified. Those reclassifications are as follows:

Security	Old Classification	New Classification	Fair Value at Date of Reclassification
A .....	Trading	Available for sale	\$24,400
C .....	Available for sale	Trading	5,200
D .....	Available for sale	Held to maturity	15,000
F .....	Held to maturity	Trading	63,500

**Instructions:**

1. Make the necessary journal entries to adjust Willow Creek’s portfolio of securities to fair value as of December 31, 2012.
2. Make the necessary journal entries to reclassify the securities in 2013.

**Problem 14-54**  
**L05, L06, L07**

**Accounting for Marketable Equity Securities**

Trans America Trust Co. owns both trading and available-for-sale securities. The securities shown on page 14-70 were owned on December 31, 2012.

*Trading Securities:*

Security	Shares	Total Cost	Fair Value, Dec. 31, 2012	Market Adjustment
Albert Groceries, Inc. . . . .	600	\$ 9,000	\$11,500	\$2,500 Dr.
West Data, Inc. . . . .	1,000	27,000	18,000	9,000 Cr.
Steel Co. . . . .	450	9,900	10,215	315 Dr.
Total . . . . .		<u>\$45,900</u>	<u>\$39,715</u>	<u>\$6,185 Cr.</u>

*Available-for-Sale Securities:*

Security	Shares	Total Cost	Fair Value, Dec. 31, 2012	Market Adjustment
Dairy Products . . . . .	2,000	\$ 86,000	\$ 90,000	\$ 4,000 Dr.
Vern Movies, Inc. . . . .	15,000	390,000	365,000	25,000 Cr.
Disks, Inc. . . . .	5,000	60,000	80,000	20,000 Dr.
Total . . . . .		<u>\$536,000</u>	<u>\$535,000</u>	<u>\$ 1,000 Cr.</u>

The following transactions occurred during 2013:

- (a) Sold 500 shares of West Data, Inc., for \$9,500.
- (b) Sold 200 shares of Disks, Inc., for \$3,000.
- (c) Transferred all shares of Albert Groceries, Inc., to the available-for-sale portfolio when the total fair value was \$12,900.
- (d) Transferred the remaining shares of Disks, Inc., to the trading securities portfolio when the market price was \$20 per share. These shares were subsequently sold for \$18 per share.

At December 31, 2013, market prices for the remaining securities were as follows:

Security	Market Price per Share
Albert Groceries, Inc. . . . .	\$22
West Data, Inc. . . . .	15
Steel Co. . . . .	21
Dairy Products . . . . .	46
Vern Movies, Inc. . . . .	31

**Instructions:** Prepare all journal entries necessary to record Trans America Trust Co.'s marketable equity securities transactions and year-end adjustments for 2013. Assume that all declines in fair value are temporary.

**Problem 14-55**  
**L04, L05**

**Accounting for Long-Term Investments**

On January 2, 2011, Weston Company acquired 20% of the 200,000 shares of outstanding common stock of Startile Corp. for \$18 per share. The purchase price was equal to Startile's underlying book value. Weston plans to hold this stock to influence the activities of Startile.

The following data are applicable for 2011 and 2012:

	2011	2012
Startile dividends (paid Oct. 31) . . . . .	\$28,000	\$ 29,000
Startile earnings . . . . .	93,000	105,000
Startile stock market price at year-end . . . . .	21	20

On January 2, 2013, Weston Company sold 12,000 shares of Startile stock for \$23 per share. During 2013, Startile reported net income of \$80,000, and on October 31, 2013, Startile paid dividends of \$22,000. At December 31, 2013, after a significant stock market decline, which is expected to be temporary, Startile's stock was selling for \$14 per share. After selling the 12,000 shares, Weston does not expect to exercise significant influence over Startile, and the shares are classified as available for sale.

**Instructions:**

1. Make all journal entries for Weston Company for 2011, 2012, and 2013, assuming the 20% original ownership interest allowed significant influence over Startile.
2. Make the year-end valuation adjusting entries for Weston Company for 2011, 2012, and 2013, assuming the 20% original ownership interest did not allow significant influence over Startile.

**Problem 14-56****L08, L09****Investment Securities and the Statement of Cash Flows**

Julie Company came into existence with a \$2,000 cash investment by owners on January 1, 2013, and entered into the following transactions during 2013:

Sales .....	\$ 3,200
Cash expenses .....	(2,700)
Purchase of building on January 1 .....	550
Purchase of trading securities .....	500
Sale of trading securities (cost, \$200) .....	340
Purchase of available-for-sale securities .....	300
Sale of available-for-sale securities (cost, \$100) .....	60

The following additional information is available:

Balance in accounts receivable on December 31 .....	\$190
Depreciation expense recognized for the year .....	50
Fair value of remaining trading securities on December 31 .....	210
Fair value of remaining available-for-sale securities on December 31 .....	270

**Instructions:**

1. Prepare an income statement for 2013.
2. Prepare a complete statement of cash flows for 2013. Use the indirect method of reporting cash from operating activities. In all cases, assume that trading securities were acquired for operating purposes.
3. Prepare a balance sheet as of December 31, 2013.

**Problem 14-57****L02****Sample CPA Exam Questions**

1. A company should report the marketable equity securities that it has classified as trading at:
  - (a) Lower of cost or market, with holding gains and losses included in earnings.
  - (b) Lower of cost or market, with holding gains included in earnings only to the extent of previously recognized holding losses.
  - (c) Fair value, with holding gains included in earnings only to the extent of previously recognized holding losses.
  - (d) Fair value, with holding gains and losses included in earnings.
2. Nola Co. has a portfolio of marketable equity securities which it does not intend to sell in the near term. How should Nola classify these securities, and how should it report unrealized gains and losses from these securities?

Classify as	Report as
(a) Trading securities	Component of income from continuing operations
(b) Available-for-sale securities	Separate component of stockholders' equity
(c) Trading securities	Separate component of stockholders' equity
(d) Available-for-sale securities	Component of income from continuing operations

3. Kale Co. purchased bonds at a discount on the open market as an investment and intends to hold these bonds to maturity. Kale should account for these bonds at:
  - (a) Cost.
  - (b) Amortized cost.
  - (c) Fair value.
  - (d) Lower of cost or market.

**EM** EXPANDED MATERIAL

**Problem 14-58**  
**LO10**

**Accounting for the Impairment of a Loan**

Halstead Associates loaned Stevens Company \$600,000 on January 1, 2011. The terms of the loan were payment in full on January 1, 2016, plus annual interest payments at 10%. The interest payment was made as scheduled on January 1, 2012; however, due to financial setbacks, Stevens was unable to make its 2013 interest payment. Halstead considers the loan impaired and projects the following cash flows from the loan as of December 31, 2013, and 2014. Assume that Halstead accrued the interest at December 31, 2012, but did not continue to accrue interest due to the impairment of the loan.

*Projected Cash Flows:*

Date of Flow	Amount Projected as of Dec. 31, 2013	Amount Projected as of Dec. 31, 2014
Dec. 31, 2014 .....	\$ 40,000	\$ 40,000
Dec. 31, 2015 .....	120,000	140,000
Dec. 31, 2016 .....	150,000	220,000
Dec. 31, 2017 .....	200,000	200,000
Dec. 31, 2018 .....	90,000	

**Instructions:**

1. Prepare the valuation adjusting entry at December 31, 2013.
2. Prepare the journal entry to record the \$40,000 receipt on December 31, 2014.
3. Prepare the valuation adjusting entry at December 31, 2014.
4. Prepare the 2015 journal entries, assuming the receipt of \$140,000 as scheduled; also assume that estimates for future cash flows remain the same as they were at the end of 2014.

**CASES**

**Discussion**  
**Case 14-59**

**But Do We Really Have “Mark to Market” Accounting Now?**

The movement toward the use of fair value for investments has been given the label “mark to market.” Previously, marketable equity securities were valued at the lower of

cost or market. The shift to fair value, whether higher or lower than cost, is a significant departure from the past. Even though all investments classified as trading or available for sale are now valued at fair values, only market changes for trading securities affect the income statement. To many accounting theorists, this is indeed a cop-out on the part of the FASB. These accountants reason that if market changes are going to be recognized on the balance sheet, they should be recognized on the income statement as well. This position was held by the two FASB members who voted against the issuance of pre-Codification *Statement No. 115*. This is also the approach taken in the “fair value option” and, as noted in the chapter, is the common-sense approach advocated by Sir David Tweedie, chairman of the IASB.

Evaluate the rationale for this compromise position. What arguments for the two different approaches (income and equity) do you think are most persuasive and why? What future events could cause standard setters to revise this approach?

**Discussion  
Case 14-60**

**Why Is 49% Ownership Enough?**

In 1986, **The Coca-Cola Company** borrowed \$2.4 billion to purchase several large soft drink bottling operations. Then a separate company, **Coca-Cola Enterprises**, was formed to bottle and distribute Coke throughout the country. The Coca-Cola Company sold 51% of Coca-Cola Enterprises to the public and retained a 49% ownership. The \$2.4 billion debt incurred to finance the purchase was transferred to the balance sheet of Coca-Cola Enterprises.

While 49% ownership did not guarantee control, it did give The Coca-Cola Company significant influence over the bottling company. For example, The Coca-Cola Company determines the price at which it will sell concentrate to Coca-Cola Enterprises and reviews Coca-Cola Enterprises’ marketing plan. In addition, The Coca-Cola Company’s chief operating officer initially was chairman of Coca-Cola Enterprises, and many current or former Coca-Cola Company officials have served on Coca-Cola Enterprises’ board of directors.

**SOURCE:** *The Wall Street Journal*, October 15, 1986, pp. A1 and A12.

1. From an accounting standpoint, what is the significance of owning more than 50% of a company’s stock?
2. Why would The Coca-Cola Company elect to own less than 50% of its distribution network?
3. In the consolidation process, the parent’s and the subsidiary’s individual asset and liability account balances are added together and reported on the consolidated financial statements, whereas with the equity method, the net investment is reported as an asset on the investor company’s balance sheet. Why would The Coca-Cola Company want to avoid consolidation?

**Discussion  
Case 14-61**

**Which Method of Accounting for Investments Is Appropriate?**

International Inc. owns companies or the stock of companies in countries all over the world. International is reviewing its methods of accounting for those companies and has asked you to provide input as to whether the cost method, the equity method, or consolidation is appropriate for each of the following subsidiaries. Provide justification for your suggestions.

1. **Subsidiary 1:** This subsidiary, MEOil, is an oil company located in the Middle East. A growing anti-American sentiment in the country in which the company is located has led International to remove all non-native employees. There is a growing fear that the government may nationalize MEOil. International Inc. owns 75% of the oil company.
2. **Subsidiary 2:** Ecological Inc., a company that produces environmentally safe products, has production facilities in more than 10 states. The ownership of the company is widely held, with International Inc. holding the largest block of stock. International has succeeded in placing its president and vice president in two of the five board of directors’ seats of Ecological Inc. International owns 15% of Ecological Inc.’s outstanding stock.

3. Subsidiary 3: International Inc. recently purchased 100% of the outstanding stock of Harmon National Bank. This subsidiary represents International's first purchase of a nonmanufacturing facility, and management has expressed concern about the comparability of the different accounting methods used by financial institutions.
4. Subsidiary 4: International has been involved in a takeover battle with Beatrix Inc. involving Campton Soups. Beatrix recently purchased 50% of the stock of Campton. International has owned 30% of Campton's stock for five years.

**Discussion**  
**Case 14-62**

**What Is the Difference in Accounting between the Cost and Equity Methods?**

Logical Corporation, a producer of medical products, disclosed the following investments in affiliates in the notes to its July 31, 2013, financial statements:

	2013	2012
Investments (if classified as available for sale) . . . . .	\$ 822,188	\$ 50,000
Investments (if using the equity method) . . . . .	1,677,181	2,009,647

Discuss the factors that determine whether Logical uses the cost or the equity method in accounting for its investment in affiliates. What events are recorded when the security is accounted for as an available-for-sale security? What events are recorded when the equity method is used? What does the investment account represent when the security is classified as available for sale? What does it represent using the equity method?

**Discussion**  
**Case 14-63**

**How Different Are International Standards?**

You have been approached about doing a consulting job for Choi Hung Company, which is based in southern China. Choi Hung reports its financial results using International Financial Reporting Standards. The consulting job involves sorting through Choi Hung's purchases and sales of investment securities for the past three years to make sure that the reported results are in conformity with international standards. An acquaintance has advised you not to take this consulting job because "you are trained in U.S. GAAP and don't know anything about international standards." How might you respond?

**Case 14-64**

**Deciphering Financial Statements (The Walt Disney Company)**

Locate **Disney's** 2009 financial statements and related notes on the Internet and answer the following questions:

1. Locate Disney's note that discusses investments. What amount of the investment portfolio is classified as available for sale? Now look at Disney's balance sheet. What percentage of the total investment account is classified as available-for-sale securities? What types of securities constitute the balance in that account?
2. Locate Disney's note that discusses what types of securities are included in "Investments" on the balance sheet. Also examine the note that defines cash and cash equivalents. Are all of Disney's investment securities listed under Investments in the balance sheet?
3. Review the note on "Fair Value Measurement" to determine the fair value of investments on October 3, 2009. Why is this number so much less than that reported as Investments on the balance sheet?

**Case 14-65**

**Deciphering Financial Statements (Intel)**

The note shown on page 14-75 is taken from **Intel's** 2009 annual report.

**Note 7: Available-for-Sale Investments**

Available-for-sale investments as of December 26, 2009 and December 27, 2008 were as follows:

(In Millions)	2009				2008			
	Adjusted Cost	Gross Unrealized Gains	Gross Unrealized Losses <sup>1</sup>	Fair Value	Adjusted Cost	Gross Unrealized Gains	Gross Unrealized Losses	Fair Value
Commercial paper	\$ 5,444	\$ —	\$ —	\$ 5,444	\$ 3,244	\$ 4	\$ —	\$ 3,248
Corporate bonds	3,688	38	(14)	3,712	6,323	5	(139)	6,189
Government bonds <sup>2</sup>	2,205	11	(1)	2,215	546	2	—	548
Bank time deposits <sup>3</sup>	1,317	1	—	1,318	606	2	—	608
Marketable equity securities	387	386	—	773	393	2	(43)	352
Asset-backed securities	154	—	(18)	136	374	—	(43)	331
Money market fund deposits	65	—	—	65	419	—	—	419
Total available-for-sale investments	<u>\$13,260</u>	<u>\$436</u>	<u>\$(33)</u>	<u>\$13,663</u>	<u>\$11,905</u>	<u>\$15</u>	<u>\$(225)</u>	<u>\$11,695</u>

<sup>1</sup> As of December 26, 2009, unrealized non-credit components of other-than-temporary impairments recognized on available-for-sale investments were insignificant.

<sup>2</sup> Includes bonds issued or deemed to be guaranteed by non-U.S. governments, FDIC-insured corporate bonds, U.S. agency securities, and U.S. Treasury securities.

<sup>3</sup> Bank time deposits were primarily issued by institutions outside the U.S. as of December 26, 2009 and December 27, 2008.

As of December 26, 2009, we had \$33 million of gross unrealized losses on available-for-sale investments, which included \$26 million of gross unrealized losses related to individual securities that had been in a continuous loss position for 12 months or more.

As of December 26, 2009, a majority of our available-for-sale investments in an unrealized loss position were rated AA-/Aa3 or better. With the exception of a limited number of investments for which we have recognized other-than-temporary impairments, we have not seen significant liquidation delays, and for those that have matured we have received the full par value of our original debt investments.

We sold available-for-sale investments, primarily marketable equity securities, for proceeds of \$192 million in 2009 (\$1.2 billion in 2008 and \$1.7 billion in 2007, primarily marketable debt instruments). The gross realized gains on sales of available-for-sale investments totaled \$43 million in 2009 (\$38 million in 2008 and \$138 million in 2007) and were primarily related to our sales of marketable equity securities.

1. What amount of gains and losses on available-for-sale securities is reported in Intel's 2009 income statement? How much is realized? How much is unrealized?
2. Judging from the comparison of book values to fair values, what portion of Intel's available-for-sale portfolio performed the best in 2009?

**Case 14-66****Writing Assignment (Going around the income statement)**

The accounting provisions in FASB ASC Topic 320 outline two different treatments for unrealized gains and losses depending on whether the security is classified as trading or available for sale. Unrealized gains and losses for trading securities are reported on the income statement, while unrealized gains and losses for available-for-sale securities are reported as other comprehensive income and then become part of accumulated other comprehensive income in stockholders' equity.

Your assignment is to develop an argument, in writing, for including unrealized gains and losses for available-for-sale securities on the income statement. Include in your 1-page paper reasons as to why the FASB might have chosen the reporting rules that it did and be able to refute the Board's reasoning.

**Case 14-67****Ethical Dilemma (Reclassifying securities for gain)**

You are the chief financial officer of a large manufacturing company. As CFO, you are responsible for investing excess cash in marketable securities and then handling the accounting for those securities. Your firm has a policy of classifying all securities as being available for sale. At the end of the year, preliminary financial results indicate that your company will be slightly below targeted net income. The board of directors has

given you the task of determining how income might be increased without (and the board emphasized this point) going outside of the rules.

You determine that one method of increasing net income would be to reclassify all available-for-sale securities that have experienced an increase in fair value as if they were purchased as trading securities.

1. Would this reclassification achieve the desired results?
2. Is this reclassification within the rules?
3. Is this reclassification consistent with the intent of FASB *Statement No. 115*?
4. If you were the company's external auditor, what questions might you have regarding this reclassification?

**Case 14-68**

**Cumulative Spreadsheet Analysis**

This assignment is based on the spreadsheet prepared in (1) of the cumulative spreadsheet assignment for Chapter 13. Review that assignment for a summary of the assumptions made in preparing a forecasted balance sheet, income statement, and statement of cash flows for 2014 for Skywalker Company. This assignment involves changing assumption (h) in the Chapter 13 assignment.

	Original Cost	Fair Value, 12/31/2013
Security A .....	\$10	\$22
Security B .....	25	18
Security C .....	5	8
Security D .....	40	15
Total .....	<u>1</u>	<u>7</u>
	<u>\$81</u>	<u>\$70</u>

[Note: These numbers imply that the accumulated other comprehensive income balance of \$132 (credit) as of December 31, 2013, includes a debit amount of \$11(\$81 – \$70) from available-for-sale securities.]

As mentioned in the Chapter 13 assignment, Skywalker intends to invest another \$28 in available-for-sale securities (security F) in 2014 in order to increase the total value of the portfolio by 40% to \$98 (\$70 + \$28).

Because Skywalker cannot predict future stock prices, the best forecast is that the fair values of Securities A through E will remain the same during 2014 and that the fair value of security F, to be acquired in 2014 for \$28, will remain at \$28.

Revise the spreadsheet made in (1) of the Chapter 13 assignment in accordance with the above and following assumptions. In each case, any gains or losses expected to be realized in 2014 should be reported in a separate income statement line, "Investment income, net."

1. Skywalker intends to sell security A in 2014 at an anticipated price of \$22. That \$22 will be used to buy security G. Skywalker's best forecast is that the fair value of security G will remain at \$22 through the end of 2014.
2. How does the sale of security A in (1) impact expected cash from operating activities in 2014? Explain.
3. Repeat (1) and (2) assuming that, instead of selling security A, Skywalker intends to sell security D in 2014 at an anticipated price of \$15, which will be used to buy security G. Skywalker's best forecast is that the fair value of security G will remain at \$15 through the end of 2014.

ADDITIONAL  
ACTIVITIES OF  
A BUSINESS

# CHAPTER 15 Leases

## LEARNING OBJECTIVES

- 1** Describe the circumstances in which leasing makes more business sense than does an outright sale and purchase.
- 2** Understand the accounting issues faced by the asset owner (lessor) and the asset user (lessee) in recording a lease transaction.
- 3** Outline the types of contractual provisions typically included in lease agreements.
- 4** Apply the lease classification criteria in order to distinguish between capital and operating leases.
- 5** Properly account for both capital and operating leases from the standpoint of the lessee (asset user).
- 6** Properly account for both capital and operating leases from the standpoint of the lessor (asset owner).
- 7** Prepare and interpret the lease disclosures required of both lessors and lessees.
- 8** Compare the treatment of accounting for leases in the United States with the requirements of international accounting standards.

## EM EXPANDED MATERIAL

- 9** Record a sale-leaseback transaction for both a seller-lessee and a purchaser-lessor.

Which company owns the largest number of commercial jets in the world? Did you guess **Delta**, **United**, or **American**? Those are good guesses. As of December 31, 2009, those three airlines, which are the three largest in the United States, owned the following number of aircraft:

	Number of Aircraft Owned on December 31, 2009
Delta .....	677
American .....	590
United .....	209

Werner Bachmeier/Imagebroker/Alamy

The company that owns the most commercial jets, however, is **General Electric**. Through its GE Capital Aviation Services subsidiary, General Electric owns over 1,800 aircraft that it leases to more than 225 customer airlines in over 70 countries. Aircraft leasing companies own about 40% of the passenger jets flying today. The leasing companies buy the jets from **Boeing** or **Airbus** and in turn lease them to an airline. Not one to let a good business opportunity slip away, Boeing is also in the leasing business. In a move that was seen by many as putting itself in close competition with companies that already buy its planes and lease them to airlines, Boeing restructured Boeing Capital Corporation in 1999 in an effort to become a major player in the airplane financing business.<sup>1</sup>

Airlines use these leasing arrangements as an alternative to obtaining loans to buy the planes themselves. Large stable airlines typically sign long-term leases of 15 to 20 years. Smaller airlines trying to establish a market toehold are likely to sign more expensive short-term leases of four to eight years.<sup>2</sup> The flexibility that lease financing gives to airlines was illustrated in the wake of the September 11, 2001, World Trade Center attack when the business of most airlines suffered substantially. Airlines were able to cancel or renegotiate their leases to adapt to this lower passenger traffic. Of course, the leasing companies were also impacted; they began

to scrutinize the financial condition of their potential customer airlines more carefully. In fact, in October 2001, **International Lease Finance Corporation (ILFC)** (which leases 985 aircraft worldwide, mostly outside the United States) shipped 30 pilots to Zurich to snatch 19 of ILFC's planes that had been leased to **Swissair**. Like auto repossession specialists, the pilots boarded the planes and flew them to France. The reason for the repossession was that ILFC's planes appeared to be in danger of being dragged into the bankruptcy proceedings of Swissair.<sup>3</sup>

As an accountant, a question you might ask yourself while flying at 35,000 feet is whether your airline reports its leased planes as assets on its balance sheet. The answer is sometimes yes but often no. In the case of Delta, a company that leased 306 airplanes (or 31% of its fleet) as of December 31, 2009, only 93 of those leased aircraft were reported on the company's balance sheet. The remaining 213 planes, for which Delta had made contractual promises to pay billions of dollars in the future, were not reported on the balance sheet as assets, nor were the future lease payments reported as a liability. The only financial statement indication that these planes even exist is buried in the lease note to Delta's financial statements.

So, when is a leased airplane an asset? Keep reading; that question is what this chapter is all about.

## QUESTIONS

1. How is it that General Electric owns so many more airplanes than does American Airlines?
2. Why do airlines find it attractive to lease rather than buy their airplanes?
3. Do leased airplanes appear as assets in the balance sheets of the airlines that are using the planes? Explain.

*Answers to these questions can be found on page 15-42.*

<sup>2</sup> John H. Taylor, "Fasten Seat Belts, Please," *Forbes*, April 2, 1990, p. 84.

<sup>3</sup> J. Lynn Lunsford, "With Airlines in a Dive, Secretive Leasing Firm Plays a Crucial Role," *The Wall Street Journal*, February 12, 2002, p. A1.

**A** lease is a contract specifying the terms under which the owner of property, the **lessor**, transfers the right to use the property to a **lessee**. In this chapter, we will focus on how leases are accounted for from both the lessor's and the lessee's perspectives. We will discuss the issues associated with classifying a lease as a debt-financed purchase of property (capital lease) or as a rental (operating lease) and the disclosure issues associated with that classification. In addition, we will illustrate how businesses can have definite obligations to pay significant amounts of money in the future relating to operating lease obligations yet not recognize those obligations as liabilities on the balance sheet.

Historically, a major challenge for the accounting profession has been to establish accounting standards that prevent companies from using the legal form of a lease to avoid recognizing future payment obligations as a liability. "Off-balance-sheet financing" continues to be a perplexing problem for the accounting profession, and leasing is probably the oldest and most widely used means of keeping debt off the balance sheet. This chapter will discuss in detail and analyze the criteria established by the FASB in an attempt to bring more long-term leases onto the balance sheet as well as specific accounting procedures used for leased assets. In addition, we will discuss how international financial reporting standards differ from those in the United States.

FYI

The Committee on Accounting Procedure (CAP) addressed the issue of leasing in 1949 with ARB No. 38. The APB, formed in 1959, issued four opinions on the subject. The FASB issued pre-codification *Statement No. 13* on leases in 1976 and has subsequently issued over a dozen amendments and interpretations of the lease accounting rules.

## Economic Advantages of Leasing

1

Describe the circumstances in which leasing makes more business sense than does an outright sale and purchase.

**WHY** Accountants get very excited about the interesting accounting issues surrounding leases. But we should remember that leases actually serve very important business purposes that have nothing to do with accounting.

**HOW** The lessee (the party using the leased asset) enjoys flexibility and reduced risk through leasing rather than buying. The lessor (the party that owns the leased asset) uses the attractiveness of leasing to increase sales and establish long-term relationships with customers.

Before discussing the accounting treatment of leases, it is important first to consider the valid business reasons for entering into a lease agreement. It would be unfair and incorrect to imply that the only reason companies lease property is to avoid reporting the lease obligation in the financial statements. Although the accounting ramifications are an important consideration in structuring a deal as a lease, other financial and tax considerations also play an important role in the leasing decision.

Every situation is different, but there are three primary advantages to the lessee of leasing over purchasing.

1. *No down payment.* Most debt-financed purchases of property require a portion of the purchase price to be paid immediately by the borrower. This provides

Skip Nahl/Photodisc/Getty Images

Car leasing provides increased sales for automakers while making payments more affordable for car owners.

added protection to the lender in the event of default and repossession. Lease agreements, in contrast, frequently are structured so that 100% of the value of the property is financed through the lease. This aspect of leasing makes it an attractive alternative to a company that does not have sufficient cash for a down payment or wishes to use available capital for other operating or investing purposes. Of course, many leases also require a down payment; as an example, look carefully at the fine print the next time you see a car lease advertisement on television.

2. *Avoid risks of ownership.* There are many risks accompanying the ownership of property. These risks include casualty loss, obsolescence, changing economic conditions, and physical deterioration. If the market value of a leased asset decreases dramatically, the lessee may terminate the lease, although usually with some penalty. On the other hand, if you own the asset, you are stuck with it when the market value declines.
3. *Flexibility.* Business conditions and requirements change over time. If assets are leased, a company can more easily replace assets in response to these changes. This flexibility is especially important in businesses where innovation and technological change make the future usefulness of particular equipment or facilities highly uncertain. A prime example of this condition in recent years has been in high-tech industries with rapid change in areas such as computer technology, robotics, and telecommunications. Flexibility is a primary reason for the popularity of automobile leasing. Car buyers like the flexibility of choosing a brand-new car every two or three years as their leases run out.

The lessor also may find benefits to leasing its property rather than selling it. Advantages of the lease to the lessor include the following:

1. *Increased sales.* For the reasons suggested in the preceding paragraphs, customers may be unwilling or unable to purchase property. By offering potential customers the option of leasing its products, a manufacturer or dealer may significantly increase its sales volume.
2. *Ongoing business relationship with lessee.* When property is sold, the purchaser frequently has no more dealings with the seller of the property. In leasing situations, however, the lessor and lessee maintain contact over a period of time, and long-term business relationships often can be established through leasing.
3. *Residual value retained.* In many lease arrangements, title to the leased property never passes to the lessee. The lessor benefits from economic conditions that may result in a significant residual value at the end of the lease term. The lessor may lease the asset to another lessee or sell the property and realize an immediate gain. For example,

new car leasing provides auto dealers with a supply of 2- to 3-year-old used cars, which can then be sold or leased again.

In summary, a leasing arrangement is often a sound business practice for both the lessee and the lessor. The remainder of the chapter discusses the intricate and interesting accounting implications of leases.

## CAUTION

The sooner you get comfortable with the terms *lessee* and *lessor*, the better. The *lessor* is the legal owner of the leased asset; the *lessee* is the party that will use the leased asset.

## Simple Example

2

Understand the accounting issues faced by the asset owner (lessor) and the asset user (lessee) in recording a lease transaction.

**WHY** For the lessor, the key accounting issue is whether or not a sale should be recognized on the date the lease is signed. For the lessee, the key accounting issue is whether the leased asset and the lease payment obligation should be recognized on the balance sheet.

**HOW** Capital leases are accounted for as if the lease agreement transfers ownership of the leased asset from the lessor to the lessee. Operating leases are accounted for as rental agreements.

A simple example will be used to introduce the accounting issues associated with leases. Owner Company owns a piece of equipment with a market value of \$10,000 and an estimated useful life of five years. User Company wishes to acquire the equipment for use in its operations. One option for User Company is to purchase the equipment from Owner by borrowing \$10,000 from a bank at an interest rate of 10%. User can use the \$10,000 to buy the equipment from Owner and can repay the principal and interest on the bank loan in five equal annual installments of \$2,638.

Alternatively, User Company can lease the asset from Owner for five years, making five annual “rental” payments of \$2,638. From User’s standpoint, the lease is equivalent to purchasing the asset, the only difference being the legal form of the transaction. User will still use the equipment for five years and will still make payments of \$2,638 per year. From Owner’s standpoint, the primary difference in the transaction is that now Owner is not just selling the equipment but is also substituting for the bank in providing financing.

With this lease arrangement, the key accounting issue for Owner Company is as follows:

- On the date the lease is signed, should Owner Company recognize an equipment sale?
- The correct answer to this question hinges on factors that have been discussed in previous chapters in connection with inventory sales and revenue recognition.
- Has effective ownership of the equipment been passed from Owner to User?
  - Is the transaction complete, meaning does Owner have any significant responsibilities remaining in regard to the equipment?
  - Is Owner reasonably certain that the five annual payments of \$2,638 can be collected from User?

The key accounting issue for User Company is as follows:

- On the date the lease is signed, should User recognize the leased equipment as an asset and the obligation to make the lease payments as a liability?

The correct answer to this question also hinges on whether effective ownership, as opposed to legal ownership, of the equipment changes hands when Owner and User sign the lease agreement.

Accounting for leases is a classic illustration of the accounting aphorism “substance over form.” The legal form of the lease is that Owner Company maintains ownership of the equipment, but whether the lease transfers economic ownership of the asset from Owner to User depends on the specifics of the lease agreement. Consider the following four independent scenarios:

- The lease agreement stipulates that Owner is to maintain legal title to the equipment for the 5-year lease period, but title is to pass to User at the end of the lease.
- The lease agreement stipulates that Owner is to maintain legal title to the equipment for the 5-year lease period, but at the end of the lease period User has the option to buy the equipment for \$1.
- The useful life of the equipment is just five years. Accordingly, when the lease term is over, the equipment can no longer be used by anyone else.
- Present value calculations suggest that payment of the five annual \$2,638 lease payments is equivalent to paying \$10,000 for the equipment on the lease-signing date.

In each of these four scenarios, the economic substance of the lease is that the lease signing is equivalent to the transfer of effective ownership, and the fact that Owner retains legal title of the equipment during the lease period is a mere technicality. On the other hand, if the lease agreement does not provide for the transfer of the legal title at the end of the lease, if the lease covers only a fraction of the useful life of the equipment, and if the lease payments are not large enough to “pay” for the equipment, then economically the lease is just a rental, not a transfer of ownership.

For accounting purposes, leases are separated into two groups, capital leases and operating leases. Capital leases are accounted for as if the lease agreement transfers ownership of the asset from the lessor to the lessee. In the preceding example, if the lease is accounted for as a capital lease, Owner Company would recognize the sale of the equipment on the lease-signing date and would recognize earned interest revenue as the five annual lease payments are collected. On the lease-signing date, User Company would recognize the leased asset, as well as the liability for the future lease payments, on its balance sheet.

Operating leases are accounted for as rental agreements, with no transfer of effective ownership associated with the lease. In the foregoing example, if the lease is accounted for as an operating lease, Owner Company recognizes no sale on the lease-signing date. Instead, lease rental revenue is recognized each year when the lease payment is collected. User Company recognizes no leased asset and no lease liability but reports only a periodic lease rental expense equal to the annual lease payments.

From this simple introduction, you may receive the misleading impression that accounting for leases is straightforward and noncontroversial. In fact, most companies using assets under lease agreements go to great lengths to ensure that they can account for the bulk of their leases as operating leases because it allows them to keep both the asset

and the associated liability off the balance sheet. Keeping the asset off the balance sheet improves financial ratio measures of efficiency, and keeping the liability off the balance sheet improves measures of leverage. For companies that lease a large portion of the assets that they use, the accounting standards associated with leasing are the most critical accounting standards that they apply.

The following sections contain a more detailed description of the kinds of provisions found in lease agreements. In addition, the specific accounting rules used to distinguish between operating leases and capital leases will be explained.

## Nature of Leases

**3** Outline the types of contractual provisions typically included in lease agreements.

**WHY** The specific contractual provisions in a lease determine whether or not the lease involves a transfer of economic ownership.

**HOW** The key contractual provisions of a lease are cancellation provisions, bargain purchase option (if any), lease term, residual value (and whether it is guaranteed or unguaranteed), and the minimum lease payments.

Leases vary widely in their contractual provisions. Reasons for this variability include cancellation provisions and penalties, bargain renewal and purchase options, lease term, economic life of assets, residual asset values, minimum lease payments, interest rates implicit in the lease agreement, and the degree of risk assumed by the lessee, including payments of certain costs such as maintenance, insurance, and taxes. These and other relevant facts must be considered in determining the appropriate accounting treatment of a lease.

The many variables affecting lease capitalization have been given precise definitions that must be understood in order to account for the various types of leases found in practice. Each of these variables is defined and briefly discussed in the following sections.

### Cancellation Provisions

Some leases are **noncancelable**, meaning that these lease contracts are cancelable only on the outcome of some remote contingency or that the cancellation provisions and penalties of these leases are so costly to the lessee that, in all likelihood, cancellation will not occur. All cancelable leases are accounted for as operating leases; some, but not all, noncancelable leases are accounted for as capital leases.

## CAUTION

To determine whether a bargain purchase option exists, the parties to the lease must be able to make a reasonable estimate as to what the fair value of the leased asset will be at the end of the lease.

### Bargain Purchase Option

Leases often include a provision giving the lessee the right to purchase leased property at some future date. If the specified purchase option price is expected to be considerably less than the fair value at the date the purchase option may be exercised, the option is called a **bargain purchase option**. By definition, a bargain purchase option is one that is expected to be exercised. Accordingly, a lease agreement including a bargain

FYI

The lease term is an important concept in capital lease accounting for lessees because it can determine the period over which the leased asset is depreciated.

purchase option is likely to result in the transfer of asset ownership from the lessor to the lessee. Noncancelable leases with bargain purchase options are accounted for as capital leases.

### Lease Term

An important variable in lease agreements is the **lease term**, that is, the time period from the beginning to the end of the lease. The beginning of the lease term occurs when the leased property is transferred to the lessee. The end of the lease term is more flexible because many leases include provisions allowing the lessee to extend the lease period. For accounting purposes, the end of the lease term is defined as the end of the fixed noncancelable lease period plus all renewal option periods that are likely to be exercised. A **bargain renewal option** is one with such an attractive lease rate, or other favorable provision, that at the inception of the lease, it is likely that the lease will be renewed beyond the fixed lease period. If a bargain purchase option is included in the lease contract, the lease term includes any renewal periods preceding the date of the bargain purchase option but does not extend beyond the date of the bargain purchase option.

### Residual Value

The market value of the leased property at the end of the lease term is referred to as its *residual value*. In some leases, the lease term extends over the entire economic life of the asset or the period in which the asset continues to be productive, and there is little, if any, residual value. In other leases, the lease term is shorter, and a significant residual value does exist. If the lessee can purchase the asset at the end of the lease term at a materially reduced price from its residual value, a bargain purchase option is present, and it can be

assumed that the lessee would exercise the option and purchase the asset.

Some lease contracts require the lessee to guarantee a minimum residual value. If the market value at the end of the lease term falls below the **guaranteed residual value**, the lessee must pay the

difference. This provision protects the lessor from loss due to unexpected declines in the market value of the asset. For example, assume that the car you lease is expected to have a \$15,000 residual value at the end of the lease term and that you guarantee that amount to the car dealership. However, at the end of the lease term, the residual value of the car is only \$10,000. You are then obligated to pay the dealership the \$5,000 difference because the dealership is, in effect, guaranteed the full amount of the residual value that was estimated at the beginning of the lease. You may buy the car for the \$15,000 guaranteed amount, but the lease terms do not require the purchase.

If there is no bargain purchase option or guarantee of the residual value, the lessor reacquires the property at the end of the lease term and may offer to renew the lease, lease the asset to another lessee, or sell the property. The actual amount of the residual value is unknown until the end of the lease term; however, it must be estimated at the inception of the lease. The residual value under these circumstances is referred to as the **unguaranteed residual value**.

CAUTION

The residual value risk for unguaranteed residual values is borne by the lessor; the residual value risk for guaranteed residual values is borne by the lessee.

## Minimum Lease Payments

The rental payments required over the lease term plus any amount to be paid for the residual value either through a bargain purchase option or a guarantee of the residual value are referred to as the **minimum lease payments**. Lease payments sometimes include charges for items such as insurance, maintenance, and taxes incurred for the leased property. These are referred to as **executory costs**, and they are not included as part of the minimum lease payments. In addition, building lease payments are often composed of a fixed minimum amount with additional payments made based on sales by the lessee. The additional payments are not considered part of the minimum lease payment.

To illustrate the computation of minimum lease payments, assume that Dorney Leasing Co. owns and leases road equipment for three years at \$3,000 per month. Included in the lease payment is \$500 per month for executory costs to insure and maintain the equipment. At the end of the 3-year period, Dorney is guaranteed a residual value of \$10,000 by the lessee.

Minimum lease payments:

Rental payments exclusive of executory costs ( $\$2,500 \times 36$ )	\$ 90,000
Guaranteed residual value	<u>10,000</u>
Total minimum lease payments	<u>\$100,000</u>

How did Dorney decide that a \$2,500 monthly lease payment would be sufficient? Calculation of the appropriate lease payment involves consideration of the fair value of the leased equipment, the guaranteed residual value, the lease term, and the appropriate interest rate. Dorney computed the \$2,500 monthly lease payment by using an interest rate of 12% compounded monthly (1% per month) and a fair value of the road equipment of \$82,258. The computation is as follows:

Present value of 36 monthly payments of \$2,500 (\$3,000 less executory costs of \$500) at 1% interest (12% compounded monthly) paid at the end of each month:

$$PMT = \$2,500, N = 36, I = 1\%, PV \dots\dots\dots \$75,269$$

Present value of \$10,000 guaranteed residual value at the end of three years at 12% compounded monthly:

$$FV = \$10,000, N = 36, I = 1\%, PV \dots\dots\dots 6,989$$

$$\text{Present value of minimum lease payments} \dots\dots\dots \underline{\underline{\$82,258}}$$

Of course, this computation is backwards; in actuality, Dorney would use the \$82,258 fair value and the interest rate of 12% compounded monthly to compute the desired monthly lease payment of \$2,500. The interest rate used is called the **implicit interest rate**: the rate used by the lessor in calculating the desired lease payment.

**FYI**

If the lessee cannot ascertain the lessor's implicit rate, the incremental borrowing rate is used in the lessee's present value calculations. Two reasons the lessee would not be able to compute the implicit rate are if the asset being leased does not have a readily determinable fair value or if a reliable estimate of residual value cannot be obtained.

As discussed later in the chapter, the present value of the minimum lease payments is also an important quantity for the lessee. A complication arises because the implicit interest rate used by the lessor in calculating the lease payments may not be the appropriate discount rate for the lessee. For purposes of computing the present value of the minimum lease payments, the lessee uses the *lower* of the implicit interest rate used by the lessor

and the lessee’s own **incremental borrowing rate**. The lessee’s incremental borrowing rate is the rate at which the lessee could borrow the amount of money necessary to purchase the leased asset, taking into consideration the lessee’s financial situation and the current conditions in the marketplace.

The use of present value formulas and tables in discounting minimum lease payments is illustrated later in the chapter.

## Lease Classification Criteria

**4** Apply the lease classification criteria in order to distinguish between capital and operating leases.

**WHY** The lease classification criteria were designed by the FASB to capture the idea of the transfer of economic ownership. In practice, these criteria are often used by companies in designing leases to make sure that they get the accounting treatment (either capital or operating) that they desire.

**HOW** If a lease involves a transfer of ownership, a bargain purchase option, a lease term greater than or equal to 75% of the economic life of the leased asset, or minimum payments with a present value of at least 90% of the fair value of the leased asset, then the lease is accounted for as a capital lease. Otherwise, the lease is accounted for as an operating lease.

Leasing was one of the topics on the original agenda of the FASB, and in 1976 the Board issued pre-codification *Statement No. 13*, “Accounting for Leases.” The objective of the FASB in issuing *Statement No. 13* was to reflect the economic reality of leasing by requiring that some long-term leases be accounted for as capital acquisitions by the lessee and sales by the lessor. To accomplish this objective, the FASB identified criteria to determine whether a lease is merely a rental contract (an operating lease) or is, in substance, a purchase of property (a capital lease). The lease classification criteria and their applicability to lessees and lessors are summarized in Exhibit 15-1. These criteria are now found in FASB ASC Topic 840.

**EX 15-1 LEASE CLASSIFICATION CRITERIA**

Capital Lease		Operating Lease
Yes ←	Title Transfer?	→ No
Yes ←	Bargain Purchase Option?	→ No
Yes ←	Lease Term ≥ 75% of Life?	→ No
Yes ←	Present Value of Payments ≥ 90% of Fair Value?	→ No

Additional *revenue recognition* criteria applicable to lessors:

1. Collectibility of the minimum lease payments is reasonably predictable.
2. No important uncertainties surround the amount of unreimbursable costs yet to be incurred by the lessor.

- **Lessee:** Capital lease if any one of general criteria is met.
- **Lessor:** Capital lease if any one of general criteria is met and both revenue recognition criteria are met.

© 2012 Cengage Learning.

## General Classification Criteria—Lessee and Lessor

The four general criteria that apply to all leases for both the lessee and lessor relate to transfer of ownership, bargain purchase options, economic life, and fair value. The transfer of ownership criterion is met if the lease agreement includes a clause that transfers full ownership of the property to the lessee by the end of the lease term. Of all the classification criteria, transfer of ownership is the most objective and therefore the easiest to apply.

The second general criterion is met if the lease contains a bargain purchase option that makes it reasonably assured that the property will be purchased by the lessee at some future date. This criterion is more difficult to apply than the first criterion because the future fair value of the leased property must be estimated at the inception of the lease and compared with the purchase option price to determine whether a bargain purchase is indeed indicated.

The third criterion relates to the economic life of the asset. This criterion is met if the lease term is equal to 75% or more of the estimated economic life of the leased property. As defined earlier, the lease term includes renewal periods if renewal seems assured. The economic life criterion is somewhat subjective because of the uncertainty

of an asset's economic life. This criterion does not apply to land leases because land has an unlimited life.

The fourth general criterion focuses on the fair value of the property in relation to the provisions of the lease. This criterion is met if, at the beginning of the lease term, the present value of the minimum lease payments equals or exceeds 90% of the fair value of the leased asset. If the lessee is obligated to pay, in present value terms, almost all the fair value of the leased property, the lease is in substance a purchase of the property. The key variable in this criterion is the discounted minimum lease payments.

The rate used to discount the future minimum lease payments is critical in determining whether the fair value criterion is met. The lower the discount rate used, the higher the present value of the minimum lease payments and the greater the

likelihood that the fair value criterion of 90% will be met. As explained earlier, the FASB specified that the lessor should use the implicit interest rate of the lease agreement. The lessee also uses the lessor's implicit interest rate if it is known and if it is lower than the lessee's incremental borrowing rate. If the lessee cannot determine the lessor's implicit interest rate, the lessee must use its incremental borrowing rate.

Because incremental borrowing rates are often higher than the implicit interest rates and because lessees generally do not want to capitalize leases, many lessees use the borrowing rate and do not attempt to estimate the implicit rate. In the 1980s, the FASB

### FYI

The FASB's intent was that these general criteria would require most long-term leases to be accounted for as capital leases. However, companies have been clever in how they construct lease agreements, so most leases are accounted for as operating leases.

### STOP & THINK

How exactly does using a higher incremental borrowing rate reduce the likelihood that a lessee will be required to account for a lease as a capital lease?

- A higher incremental borrowing rate increases the incidence of bargain purchase options.
- A higher incremental borrowing rate increases the expected useful life of the leased asset.
- The use of a higher discount rate increases the likelihood that the lease will be canceled.
- The use of a higher discount rate lowers the computed present value of the minimum payments.

FYI

During World War II, the United Kingdom was in dire need of warships. The problem was that the United Kingdom had no money, and U.S. law prohibited the United States from loaning money to another country for purchasing ships. The solution: An 1892 statute that allowed the secretary of war to lease U.S. military property. Thus was born the famous Lend-Lease Bill, which allowed the United States to provide warships to the United Kingdom.

proposed tightening the capital lease criteria by requiring lessees to estimate the implicit interest rate in all cases. The FASB dropped the proposal when criticism of this proposed provision became widespread.

The four criteria outlined represent the FASB's attempt to precisely delineate the difference between operating and capital leases. In practice, companies have become very skilled at structuring

lease agreements according to whether they want to account for the lease as an operating or a capital lease. In essence, the precise nature of the FASB's four criteria provides a legalistic framework that firms easily circumvent through clever structuring of the lease. As a result, the goal of lease accounting that represents substance over form is not entirely met.

An alternative to the FASB's precise framework is the IASB approach, which relies more on accounting judgment. The international accounting standard on leases (*IAS 17*, "Accounting for Leases") states simply: "A lease is classified as a finance (i.e., capital) lease if it transfers substantially all the risks and rewards incident to ownership."<sup>4</sup> This type of standard places the responsibility of distinguishing between operating and capital/finance leases on the accountant. Paragraph 10 in *IAS 17* does provide some guidance on distinguishing between operating and finance leases. The paragraph gives the following examples of situations that "would normally lead to a lease being classified as a finance lease."

- (a) the lease transfers ownership of the asset to the lessee by the end of the lease term;
- (b) the lessee has the option to purchase the asset at a price that is expected to be sufficiently lower than the fair value at the date the option becomes exercisable for it to be reasonably certain, at the inception of the lease, that the option will be exercised;
- (c) the lease term is for the major part of the economic life of the asset even if title is not transferred;
- (d) at the inception of the lease the present value of the minimum lease payments amounts to at least substantially all of the fair value of the leased asset

As you can recognize as you read the *IAS 17* list, the IASB guidance is exactly the same, in spirit, to the FASB guidance. However, the "75% of economic life" criterion of the FASB becomes a "major part of the economic life" in IFRS. Similarly, the "90% of fair value" criterion of the FASB becomes "substantially all of the fair value" under IFRS. The international standard on lease accounting is a classic example of the principles-based approach in IFRS compared to the rules-based approach in U.S. GAAP.

### Revenue Recognition Criteria—Lessor

In addition to meeting one of the four general criteria, a lease must meet two additional revenue recognition criteria to be classified by the lessor as a capital lease.<sup>5</sup> As indicated in Exhibit 15-1, the first of the two revenue recognition criteria relates to collectibility. Collection of the minimum lease payments must be reasonably predictable.

<sup>4</sup> *International Accounting Standard No. 17, "Accounting for Leases"* (London: International Accounting Standards Board, revised December 2003).

<sup>5</sup> FASB ASC paragraph 840-10-25-42. If the lease involves real estate, these revenue recognition criteria are more complex and depend on whether the lease involves just land, land and buildings, or just part of a building. See FASB ASC paragraphs 840-10-25-54 through 69.

The second additional criterion requires substantial completion of performance by the lessor. This means that any unreimbursable costs yet to be incurred by the lessor under the terms of the lease are known or can be reasonably estimated at the lease inception date. If the leased asset is constructed by the lessor, this criterion is applied at the later of the lease inception date or the date construction is completed.

**Application of General Lease Classification Criteria**

To illustrate the application of the lease classification criteria, four different leasing situations are presented in Exhibit 15-2. A summary analysis of each lease also is presented in the exhibit. Following is a brief explanation of the analysis for each of the four leases.

Lease 1 will be treated as an operating lease by the lessee but as a capital lease by the lessor. The lease does not meet any of the first three general criteria. Because the lessee does not know the implicit interest rate of the lessor, the incremental borrowing rate is used to test for the present value criterion. The present value of the minimum lease payments using the incremental borrowing rate is less than 90% of the fair value of the property; thus, the present value criterion is not met for the lessee. Because the lessor uses the implicit interest rate, the present value criterion is met. The two additional criteria applicable to the lessor are also met.

Lease 2 will be treated as a capital lease by both the lessee and the lessor because title passes to the lessee at the end of the lease term and the additional lessor criteria are both met. Because of the difference in the present value calculations, if the title had not passed, Lease 2 would be treated as an operating lease by the lessee but as a capital lease by the lessor.

Lease 3 will be treated as a capital lease by the lessee but as an operating lease by the lessor. The bargain purchase option criterion is met as is the present value criterion.

EX 15-2 APPLICATION OF LEASE CLASSIFICATION CRITERIA TO LEASE SITUATIONS				
Lease Provisions	Lease 1	Lease 2	Lease 3	Lease 4
Cancelable . . . . .	No	No	No	Yes
Title passes to lessee . . . . .	No	Yes	No	Yes
Bargain purchase option . . . . .	No	No	Yes	No
Lease term . . . . .	10 years	10 years	8 years	10 years
Economic life of asset . . . . .	14 years	15 years	13 years	12 years
Present value of minimum lease payments as a percentage . . . . .				
of fair value—incremental borrowing rate . . . . .	80%	79%	95%	76%
Present value of minimum lease payments as a percentage . . . . .				
of fair value—implicit interest rate . . . . .	92%	91%	92%	82%
Lessee knows implicit interest rate . . . . .	No	No	Yes	Yes
Rental payments collectible and lessor costs certain . . . . .	Yes	Yes	No	Yes
Analysis of Leases:				
Lessee . . . . .				
Treat as capital lease . . . . .	No	Yes	Yes	No
Criteria met . . . . .	None	Title	Bargain purchase, present value	Must be noncancelable
Lessor . . . . .				
Treat as capital lease . . . . .	Yes	Yes	No	No
First four criteria met . . . . .	Present value	Title, present value	Bargain purchase, present value	Must be noncancelable
Lessor criteria met . . . . .	Yes	Yes	No	n/a

However, because there is some uncertainty as to the collectibility of the rental payments and the amount of lessor costs to be incurred, the lease fails to meet the revenue recognition criteria applicable to the lessor.

Lease 4 will be treated as an operating lease by both the lessee and the lessor. The lease is a cancelable lease, and even though title passes to the lessee at the end of the lease, it would be classified as a rental agreement.

## Accounting for Leases—Lessee

5

Properly account for both capital and operating leases from the standpoint of the lessee (asset user).

**WHY** Operating lease accounting is by far the biggest form of off-balance-sheet financing. It is important to understand both why lessees desire operating lease accounting and how leases can be carefully constructed to allow for operating lease accounting.

**HOW** For a lessee, an operating lease is accounted for as a rental, with the lease payment amount being recognized as rent expense. With a capital lease, an asset and a liability are recognized on the lease-signing date.

All leases as viewed by the lessee may be divided into two types: operating leases and capital leases. If a lease meets any one of the four general classification criteria discussed previously, it is treated as a capital lease. Otherwise, it is accounted for as an operating lease.

Accounting for operating leases involves the recognition of rent expense over the term of the lease. The leased property is not reported as an asset on the lessee's balancesheet, nor is a liability recognized for the obligation to make future payments for use of the property. Information concerning the lease is limited to disclosure in notes to the financial statements. Accounting for a capital lease essentially requires the lessee to report on the balance sheet the present value of the future lease payments, both as an asset and a liability. The asset is amortized as though it had been purchased by the lessee. The liability is accounted for in the same manner as would be a mortgage on the property. The difference in the impact of these two treatments on the financial statements of the lessee often can be significant, as illustrated here.

### Accounting for Operating Leases—Lessee

Operating leases are considered to be simple rental agreements with debits being made to an expense account as the payments are made. For example, assume the lease terms for manufacturing equipment are \$40,000 a year on a year-to-year basis. The entry to record the lease payment for a year would be as follows:

Rent Expense .....	40,000
Cash .....	40,000

Lease payments frequently are made in advance. If the lease period does not coincide with the lessee's fiscal year or if the lessee prepares interim reports, a prepaid rent account would be required to record the unexpired portion of the lease payment at the end of the accounting period involved. The prepaid rent account would be adjusted at the end of each period.

**Operating Leases with Varying Lease Payments** Some operating leases specify lease terms that provide for varying lease payments over the lease term. Most commonly, these types

of agreements call for lower initial payments and scheduled increases later in the life of the lease. They may even provide an inducement to prospective lessees in the form of a “rent holiday” (free rent). In some cases, however, the lease may provide for higher initial payments. In cases with varying lease payments, periodic expense should be recognized on a straight-line basis.<sup>6</sup>

When recording lease payments under these agreements, differences between the actual payments and the debit to expense would be reported as Rent Payable or Prepaid Rent, depending on whether the payments were accelerating or declining. For example, assume the terms of the lease for an aircraft by International Airlines provide for payments of \$150,000 a year for the first two years of the lease and \$250,000 for each of the next three years. The total lease payments for the five years would be \$1,050,000, or \$210,000 a year on a straight-line basis. The required entries in the first two years would be as follows:

Rent Expense .....	210,000	
Cash .....		150,000
Rent Payable .....		60,000

The entries for each of the last three years are as follows:

Rent Expense .....	210,000	
Rent Payable .....	40,000	
Cash .....		250,000

The portion of Rent Payable due in the subsequent year would be classified as a current liability.

This process of making appropriate accrual adjustments to report rent expense of an equal amount each period seems simple. However, in February 2005 the chief accountant of the SEC wrote a letter to the AICPA explaining that many U.S. companies had been improperly reporting lease-related rent expense because of a failure to make these simple accrual adjustments.<sup>7</sup>

As explained later in the chapter, a large amount of detail concerning operating leases is disclosed in the notes to the financial statements. This disclosure includes summary information about lease provisions and a schedule of future minimum lease payments associated with operating leases.

### Accounting for Capital Leases—Lessee

Capital leases are considered to be more like a purchase of property than a rental. Consequently, accounting for capital leases by lessees requires entries similar to those required for the purchase of an asset with long-term credit terms. The amounts to be recorded as an asset and as a liability are the present values of the future minimum lease payments as previously defined. The discount rates used by lessees to record capital leases are the same as those used to apply the classification criteria previously discussed, that is, the lower of the implicit interest rate (if known) and the incremental borrowing rate. The

<sup>6</sup> Periodic lease expense is recognized on a straight-line basis “unless another systematic and rational basis is more representative of the time pattern in which use benefit is derived from the leased property, in which case that basis shall be used.” FASB ASC paragraph 840-20-25-1.

<sup>7</sup> Letter from Donald T. Nicolaisen, chief accountant of the SEC, to Robert J. Kueppers, chairman of the Center for Public Company Audit Firms at the American Institute of Certified Public Accountants, February 7, 2005, available at <http://www.sec.gov/info/accountants/staffletters/cpcf020705.htm>.

## FASB CODIFICATION

**The Issue:** You are part of the management team of a start-up company. Your company has outgrown its existing facility and has decided to move to a larger building. You have agreed with a real estate management company to lease a building that the real estate management company will build to your specifications. This is called a “build-to-suit” lease. You personally have carefully negotiated the lease terms so that your company will account for the lease as an operating lease.

During the 3-month construction period, and before you have moved in and started using the building, the lease contract requires you to make monthly lease payments. Note that these payments are made BEFORE you start using the building.

**The Question:** What is the proper accounting treatment for these lease payments made BEFORE you start using the building under the operating lease agreement?

**Searching the Codification:** This is a question we would love to address using the “Search” box in the top right corner of the FASB ASC home page. However, the search facility doesn’t work when you are using the “Basic View” version; this is one of the things you get when you pay your \$800+ to upgrade to the “Professional View.” But we can still answer this question using the menus and our knowledge of the transaction. Let’s proceed step by step.

- Of course, we’ll start by going to Topic 840, Leases.
- Because the lease we are talking about is an operating lease, let’s choose Subtopic 840-20, Operating Leases.
- Now things get tough. However, we can narrow our search by realizing that we are talking about how to account for something that happens at the beginning of the lease agreement. So, we want to look in either Recognition or Initial Measurement.
- Under both of the options, we have to remember that we are talking about the accounting rules from the standpoint of the lessee.
- You are close—go ahead and find out how the lessee in an operating lease arrangement is to account for early lease payments made under a build-to-suit lease.

**The Answer:** The correct treatment is described on page 15-42.

minimum lease payments consist of the total rental payments, bargain purchase options, and lessee-guaranteed residual values.<sup>8</sup>

**Illustrative Entries for Capital Leases** Assume that Marshall Corporation leases equipment from Universal Leasing Company with the following terms:

- Lease period: 5 years, beginning January 1, 2013. Noncancelable.
- Rental amount: \$65,000 per year payable annually in advance; includes \$5,000 to cover executory costs.
- Estimated economic life of equipment: 5 years.
- Expected residual value of equipment at end of lease period: None.

<sup>8</sup> An important exception to the use of the present value of future minimum lease payments as a basis for recording a capital lease is included in FASB ASC paragraph 840-30-30-3, as follows: “If the present value of the minimum lease payments exceeds the fair value of the leased property at lease inception, the amount measured initially as the asset and obligation shall be the fair value.” In this case, an implicit interest rate would have to be computed using the fair value of the asset.

Because the lease payments are payable in advance, one way to compute the present value of the lease is to add the amount of the first payment (made on the lease-signing date) to the present value of the annuity of the four remaining payments.<sup>9</sup> Assuming that Marshall Corporation's incremental borrowing rate and the implicit interest rate on the lease are both 10%, the present value for the lease would be \$250,192 computed as follows using a business calculator:

Toggle so that the payments are assumed to occur at the beginning (BEG) of the period.

$$PMT = \$60,000; N = 5; I = 10\% \rightarrow PV = \$250,192$$

The journal entries to record the lease at the beginning of the lease term would be

2013

Jan. 1	Leased Equipment .....	250,192	
	Obligations under Capital Leases .....		250,192
	<i>To record the lease.</i>		
1	Lease Expense .....	5,000	
	Obligations under Capital Leases .....	60,000	
	Cash .....		65,000
	<i>To record the first lease payment (including executory costs of \$5,000).</i>		

The term *lease expense* is used to record the executory costs related to the leased equipment, such as insurance and taxes. It is possible to record the lease liability at the gross amount of the payments ( $\$300,000 = 5 \times \$60,000$ ) and offset it with a discount account—Discount on Lease Contract. The net method is more common in accounting for leases by the lessee and will be used in this chapter.

**FYI**

When a lease is capitalized, the asset is included on the balance sheet and written off over time. The word *amortization*, instead of *depreciation*, is typically used when describing the systematic expensing of the cost of a leased asset.

Once the leased asset and the lease liability are recorded, periodic entries must be made to recognize the gradual depreciation of the leased asset and the payment (with interest) of the lease liability. The asset value is amortized in accordance with the lessee's normal method of depreciation for owned assets. The amortization period to be used depends on which of the criteria is used to qualify the lease as a capital lease. If the lease qualifies under the ownership transfer or bargain purchase option criteria, the economic life of the asset should be used because it is assumed that the lessee will take ownership of the asset for the remainder of its useful life at the end of the lease term. If the lease fails to satisfy the ownership transfer or bargain purchase option criteria but does qualify under either the lease term or present value of minimum lease payments criteria, the length of the lease term should be used for amortization purposes. In the Marshall Corporation example, the equipment lease qualifies for capitalization under the lease term criterion because the lease period is equal to the economic life of the equipment. Accordingly, the equipment is amortized over the economic life of five years.

<sup>9</sup> The annuity present value tables assume that the payments occur at the end of the period. To compute the present value of an annuity when the payments occur at the beginning of the period, split the annuity into a payment now plus the remaining payments. For example:

$$PVn = \$60,000 + [\$60,000 PVA_{\overline{4}|10\%}]$$

$$PVn = \$60,000 + [\$60,000(3.1699)]$$

$$PVn = \$250,194 \text{ (differs from } \$250,192 \text{ because of rounding in the tables)}$$

<b>EX 15-3 SCHEDULE OF LEASE PAYMENTS</b> <b>[5-YEAR LEASE, \$60,000 ANNUAL PAYMENTS</b> <b>(NET OF EXECUTORY COSTS), 10% INTEREST]</b>					
Date	Description	Amount	Interest Expense*	Principal	Lease Obligation
1/1/2013	Initial balance				\$250,192
1/1/2013	Payment	\$ 60,000		\$ 60,000	190,192
12/31/2013	Payment	60,000	\$19,019	40,981	149,211
12/31/2014	Payment	60,000	14,921	45,079	104,132
12/31/2015	Payment	60,000	10,413	49,587	54,545
12/31/2016	Payment	60,000	5,455	54,545	0
		<u>\$300,000</u>	<u>\$49,808</u>	<u>\$250,192</u>	

\*Preceding lease obligation × 10%.

© 2012 Cengage Learning.

The recorded amount of the lease liability should be reduced each period as the lease payments are made. Interest expense on the unpaid balance is computed and recognized. The lessee’s incremental borrowing rate, or the lessor’s implicit interest rate if lower, is the interest rate that should be used in computing interest expense. Exhibit 15-3 shows how the \$60,000 payments (excluding executory costs) would be allocated between payment on the obligation and interest expense. To simplify the schedule, it is assumed that all lease payments after the first payment are made on December 31 of each year. If the payments were made in January, an accrual of interest at December 31 would be required.

If the normal company depreciation policy for this type of equipment is straight line, the required entry at December 31, 2013, for amortization of the leased asset would be as shown below.

2013		
Dec. 31	Amortization Expense on Leased Equipment . . . . .	50,038*
	Accumulated Amortization on Leased Equipment . . . . .	50,038

\*Computation: \$250,192/5 = \$50,038

Similar entries would be made for each of the remaining four years. Although the credit could be made directly to the asset account, the use of a contra asset account provides the necessary disclosure information about the original lease value and accumulated amortization to date.

In addition to the entry recording amortization, another entry is required at December 31, 2013, to record the second lease payment, including a prepayment of 2014’s executory costs. As indicated in Exhibit 15-3, the interest expense for 2013 would be computed by multiplying the incremental borrowing rate of 10% by the initial present value of the obligation less the immediate \$60,000 first payment, or  $(\$250,192 - \$60,000) \times 0.10 = \$19,019$ .

2013		
Dec. 31	Prepaid Executory Costs . . . . .	5,000
	Obligations under Capital Leases . . . . .	40,981
	Interest Expense . . . . .	19,019
	Cash . . . . .	65,000

Because of the assumption that all lease payments after the first payment are made on December 31, the portion of each payment that represents executory costs must be recorded as a prepayment and charged to lease expense in the following year.

Based on the preceding journal entries and using information contained in Exhibit 15-3, the December 31, 2013, balance sheet of Marshall Corporation would include information concerning the leased equipment and related obligation as illustrated here:

<b>Marshall Corporation</b>			
<b>Balance Sheet (Partial)</b>			
<b>December 31, 2013</b>			
<b>Assets</b>		<b>Liabilities</b>	
Current assets:		Current liabilities:	
Prepaid executory costs—		Obligations under capital	
leased equipment . . . . .	\$ 5,000	leases, current portion . . . . .	\$ 45,079
Land, buildings, and equipment:		Noncurrent liabilities:	
Leased equipment . . . . .	\$250,192	Obligations under capital	
Less: Accumulated amortization . . . .	50,038	leases, exclusive of \$45,079	
Net value . . . . .	<u>\$200,154</u>	Included in current liabilities . . . . .	<u>\$104,132</u>

Note that the principal portion of the payment due December 31, 2014, is reported as a current liability on the December 31, 2013, balance sheet.<sup>10</sup>

The income statement would include the amortization on leased property of \$50,038, interest expense of \$19,019, and executory costs of \$5,000 as expenses for the period. The total expense of \$74,057 exceeds the \$65,000 rental payment made in the first year. As the amount of interest expense declines each period, the total expense will be reduced and, for the last two years, will be less than the \$65,000 payments (Exhibit 15-4). The total amount debited to expense over the life of the lease will be the same regardless of whether the lease is accounted for as an operating lease or as a capital lease. If an accelerated depreciation method of amortization is used, the difference in the early years between the expense and the payment would be even larger.

In addition to the amounts recognized in the capital lease journal entries previously given, a note to the financial statements would be necessary to explain the terms of the lease and future minimum lease payments in more detail.

**Accounting for Leases with a Bargain Purchase Option** Frequently, the lessee is given the option of purchasing the property at some future date at a bargain price. As discussed previously, the present value of the bargain purchase option is part of the minimum lease payments and should be included in the capitalized value of the lease. Assume in the preceding example that there is a bargain purchase option of \$75,000 exercisable after

<sup>10</sup> There have been some theoretical arguments advanced against this method of allocating lease obligations between current and noncurrent liabilities. See Robert J. Swieringa, "When Current Is Noncurrent and Vice Versa," *The Accounting Review*, January 1984, pp. 123–130. Professor Swieringa identifies two methods of making the allocation: the "change in present value" (CPV) approach that is used in the example and the "present value of the next year's payment" (PVNYP) approach that allocates a larger portion of the liability to the current category. A later study shows that the CPV method is followed almost universally in practice. See A. W. Richardson, "The Measurement of the Current Portion of Long-Term Lease Obligations—Some Evidence from Practice," *The Accounting Review*, October 1985, pp. 744–752. While there is theoretical support for both positions, this text uses the CPV method in chapter examples and problem materials.

**EX 15-4** SCHEDULE OF EXPENSES RECOGNIZED—CAPITAL AND OPERATING LEASES COMPARED

Year	Expenses Recognized—Capital Lease				Expenses Recognized—Operating Lease	Difference
	Interest	Executory Costs	Amortization	Total		
2013	\$19,019	\$ 5,000	\$ 50,038	\$ 74,057	\$ 65,000	\$ 9,057
2014	14,921	5,000	50,038	69,959	65,000	4,959
2015	10,413	5,000	50,038	65,451	65,000	451
2016	5,455	5,000	50,038	60,493	65,000	(4,507)
2017	0	5,000	50,040*	55,040	65,000	(9,960)
	<u>\$49,808</u>	<u>\$25,000</u>	<u>\$250,192</u>	<u>\$325,000</u>	<u>\$325,000</u>	<u>\$ 0</u>

\*Rounded.

© 2012 Cengage Learning.

5 years, and the economic life of the equipment is expected to be 10 years. The other lease terms remain the same. The present value of the minimum lease payments would be increased by the present value of the bargain purchase amount of \$75,000, or \$46,569, computed as follows:

Toggle back so that the payments are assumed to occur at the end (END) of the period.

$$FV = \$75,000; N = 5; I = 10\% \rightarrow PV = \$46,569$$

In FASB ASC paragraph 840-30-35-14, the FASB states that no gain or loss should be recognized when a leased asset is purchased. As with the exchange of similar assets, the fair value of the equipment on the purchase date is ignored unless evidence of significant impairment exists. See Chapter 11.

The total present value of the future minimum lease payments is \$296,761 (\$250,192 + \$46,569). This amount will be used to record the initial asset and liability. The asset balance of \$296,761 will be amortized over the asset life of 10 years because of the existence of the bargain purchase option; this makes

the transaction, in reality, a sale. The liability balance will be reduced as shown in Exhibit 15-5.

At the date of exercising the option, the net balance in the leased equipment asset account and its related accumulated amortization account would be transferred to the regular equipment account. The entries at the exercise of the option would be as follows:

2017		
Dec. 31	Obligations under Capital Leases . . . . .	68,182
	Interest Expense . . . . .	6,818
	Cash . . . . .	75,000
	<i>To record exercise of bargain purchase option.</i>	
	Equipment . . . . .	148,381
	Accumulated Amortization on Leased Equipment . . . . .	148,380*
	Leased Equipment . . . . .	296,761
	<i>To transfer remaining balance in leased asset account to equipment account.</i>	

\*Computation:  
 Accumulated amortization: \$296,761/10 years = \$29,676 per year;  
 5 years × \$29,676 per year = \$148,380.

**EX 15-5 SCHEDULE OF LEASE PAYMENTS [5-YEAR LEASE WITH BARGAIN PURCHASE OPTION OF \$75,000 AFTER FIVE YEARS, \$60,000 ANNUAL PAYMENTS (NET OF EXECUTORY COSTS), 10% INTEREST]**

Date	Description	Amount	Interest Expense	Principal	Lease Obligation
1/1/2013	Initial balance				\$296,761
1/1/2013	Payment	\$ 60,000		\$ 60,000	236,761
12/31/2013	Payment	60,000	\$23,676	36,324	200,437
12/31/2014	Payment	60,000	20,044	39,956	160,481
12/31/2015	Payment	60,000	16,048	43,952	116,529
12/31/2016	Payment	60,000	11,653	48,347	68,182
12/31/2017	Payment	75,000	6,818	68,182	0
		<u>\$375,000</u>	<u>\$78,239</u>	<u>\$296,761</u>	

© 2012 Cengage Learning.

If the equipment is not purchased and the lease is permitted to lapse, a loss equal to the \$73,381 difference (\$148,381 – \$75,000) between the equipment's remaining book value and the remaining balance in the lease liability account (including accrued interest) would have to be recognized by the following entry:

2017

Dec. 31	Loss from Failure to Exercise Bargain Purchase Option . . . . .	73,381
	Obligations under Capital Leases . . . . .	68,182
	Interest Expense . . . . .	6,818
	Accumulated Amortization on Leased Equipment. . . . .	148,380
	Leased Equipment . . . . .	296,761

**Accounting for Leases with a Lessee-Guaranteed Residual Value** If the lease agreement requires the lessee to guarantee a residual value, the lessee treats the guarantee similar to a bargain purchase option and includes the present value of the guarantee as part of the capitalized value of the lease. At the expiration of the lease term, the amount of the guarantee will be reported as a liability under the lease. In addition, the remaining book value of the leased asset will be equal to the guaranteed residual value. If the fair value of the leased asset is less than the guaranteed residual value, a loss is reported for the difference, and the lessee must make up the difference with a cash payment.

**Accounting for Purchase of Asset During Lease Term** When a lease does not provide for a transfer of ownership or a purchase option, it is still possible that the lessee may purchase leased property during the term of the lease. Usually the purchase price will differ from the recorded lease obligation at the purchase date. No gain or loss should be recorded on the purchase, but the difference between the purchase price and the obligation still on the books should be charged or credited to the acquired asset's carrying value.<sup>11</sup>

To illustrate, assume that on December 31, 2015, rather than making the lease payment due, the lessee purchased the leased property in the Marshall Corporation example described on page 15-16 for \$120,000. At that date, the remaining liability recorded on the

<sup>11</sup> FASB ASC paragraph 840-30-35-15.

lessee's books is \$114,545 (lease obligation of \$104,132 + interest payable of \$10,413; see Exhibit 15-3) and the net book value of the recorded leased asset is \$100,078, the original capitalized value of \$250,192 less \$150,114 amortization ( $\$50,038 \times 3$ ). The entry to record the purchase on the lessee's books would be as follows:

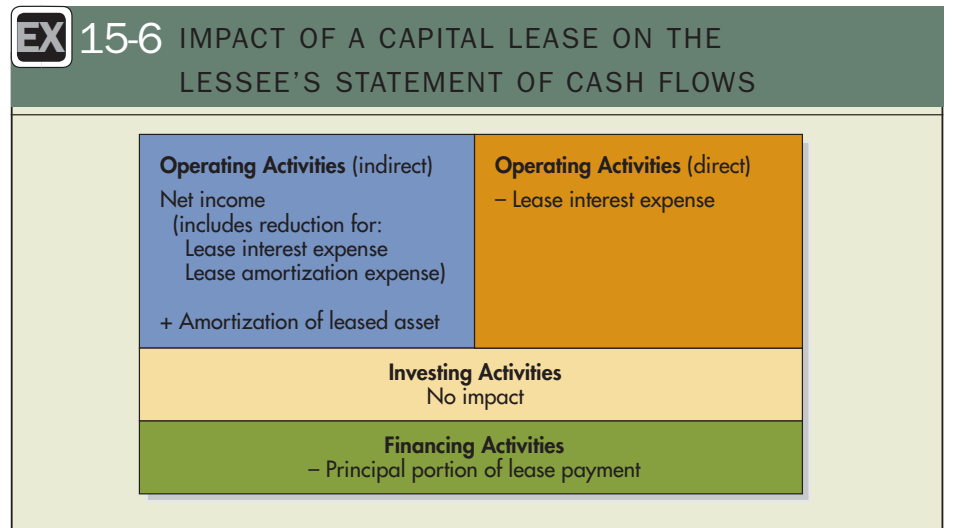

2015			
Dec. 31	Interest Expense . . . . .	10,413	
	Obligations under Capital Leases . . . . .	104,132	
	Equipment . . . . .	105,533	
	Accumulated Amortization on Leased Equipment . . . . .	150,114	
	Leased Equipment . . . . .		250,192
	Cash . . . . .		120,000

The purchased equipment is capitalized at \$105,533, which is the book value of the leased asset, \$100,078, plus \$5,455, the excess of the purchase price over the carrying value of the lease obligation ( $\$120,000 - \$114,545$ ).

**Treatment of Leases on Lessee's Statement of Cash Flows**

Operating leases present no special problems to the lessee in preparing a statement of cash flows. The lease payments reduce, and thus require no adjustment to, net income under the indirect method except for accrued or prepaid rent expense. The cash payments would be reported as operating expense outlays under the direct method.

Adjustments for capital leases by the lessee, however, are more complex. The amortization of leased assets would be treated the same as depreciation, that is, added to net income under the indirect method and ignored under the direct method. The portion of the cash payment allocated to interest expense would require no adjustment under the indirect method and would be reported as part of the cash payment for interest expense under the direct method. The portion of the cash payment allocated to the lease liability would be reported as a financing outflow under either method. The signing of a capital lease would not be reported as either an investing or financing activity because it is a noncash transaction. The impact of a capital lease on the lessee's statement of cash flows is summarized in Exhibit 15-6.

© 2012 Cengage Learning.

To illustrate the impact of a capital lease on the lessee's statement of cash flows, refer back to the Marshall Corporation example starting on page 15-16. Assume that in 2013, Marshall Corporation's income before any lease-related expenses is \$200,000. For simplicity, ignore income taxes and executory costs. Net income for the year can be computed as follows:

Income before lease-related expenses .....	\$200,000
Lease-related interest expense .....	(19,019)
Lease-related amortization expense .....	(50,038)
Net income .....	<u>\$130,943</u>

The statement of cash flows for Marshall Corporation for 2013, displaying only the lease-related items and using the indirect method to report cash flow from operating activities, would appear as follows:

<i>Operating activities:</i>	
Net income .....	\$ 130,943
Add: Amortization of asset leased under capital lease .....	50,038
Net cash flow from operating activities .....	<u>\$ 180,981</u>
<i>Investing activities:</i>	
No lease-related items	
<i>Financing activities:</i>	
Repayment of lease liability (\$60,000 + \$40,981) .....	\$(100,981)

In addition, the supplemental disclosure to the statement of cash flows would include the following two lease-related items:

- Significant noncash transaction: During 2013 the company leased equipment under a capital lease arrangement. The present value of the minimum future payments under the lease was \$250,192 on the lease-signing date.
- Cash paid for interest was \$19,019.

## Accounting for Leases—Lessor

6

Properly account for both capital and operating leases from the standpoint of the lessor (asset owner).

**WHY** Just as lessees often desire operating lease treatment as a form of off-balance-sheet financing, lessors often desire capital lease treatment in order to be able to recognize a sale immediately. An interesting twist in the accounting rules allows a lessor to treat a lease as a capital lease while at the same time the lessee treats the same lease as an operating lease.

**HOW** For a lessor, an operating lease is accounted for as a rental, with the lease payment amount being recognized as rent revenue. The lessor continues to depreciate the leased asset. For a lessor, there are two types of capital leases: direct financing leases and sales-type leases. With a direct financing lease, a lease receivable is recognized on the lease-signing date. Interest revenue on the receivable balance is recognized during the lease term. With a sales-type lease, in addition to interest revenue over the life of the lease, a profit is recognized on the lease-signing date equal to the difference between the fair value of the leased asset and its cost.

The lessor in a lease transaction gives up the physical possession of the property to the lessee. If the transfer of the property is considered temporary in nature, the lessor will continue to carry the leased asset as an owned asset on the balance sheet; the revenue from the lease will be reported as it is earned; and depreciation of the leased asset will be matched against the revenue. This type of lease is described as an *operating lease*, and cash receipts from the lessee are treated similar to the operating lease procedures described for the lessee. However, if a lease has terms that make the transaction similar in substance to a sale or a permanent transfer of the asset to the lessee, the lessor should no longer report the asset as though it were owned but should reflect the transfer to the lessee.

As indicated earlier, if a lease meets one of the four general lease classification criteria that apply to both lessees and lessors plus both of the revenue recognition criteria that apply to the lessor only (i.e., collectibility and substantial completion), it is classified by the lessor as a capital lease and recorded as either a direct financing lease or a sales-type lease.

**Direct financing leases** involve a lessor who is primarily engaged in financing activities, such as a bank or finance company. The lessor views the lease as an investment. The revenue generated by this type of lease is interest revenue. **Sales-type leases**, on the other hand, involve manufacturers or dealers who use leases as a means of facilitating the marketing of their products. Thus, there are two different types of revenue generated

by this type of lease: (1) an immediate profit or loss, which is the difference between the cost of the property being leased and its sales price, or fair value, at the inception of the lease and (2) interest revenue earned over time as the lessee makes the lease payments that pay off the lease obligation plus interest.

For either an operating, direct financing, or sales-type lease, a lessor may incur certain costs, referred to as **initial direct costs**, in connection with obtaining the lease. These costs include the costs to negotiate the lease, perform the credit check on the lessee, and prepare the lease documents.<sup>12</sup>

Initial direct costs are accounted for differently, depending on which of the three types of leases is involved. Exhibit 15-7 summarizes the accounting treatment for initial direct costs. These costs will be discussed further as each type of lease is presented.

### Accounting for Operating Leases—Lessor

Accounting for operating leases for the lessor is very similar to that described for the lessee. The lessor recognizes revenue as the payments are received. If there are significant variations in the payment terms, entries will be necessary to reflect a straight-line pattern of revenue recognition. Initial direct costs incurred in connection with an operating lease are deferred and amortized on a straight-line basis over the term of the lease, thus matching them against rent revenue.

To illustrate accounting for an operating lease on the lessor's books, assume that the equipment leased for five years by Universal Leasing Company to Marshall Corporation (page 15-16) on January 1, 2013, for \$65,000 a year, including executory costs of \$5,000 per year, had a cost of \$400,000 to the lessor, Universal Leasing. Initial direct costs of \$15,000 were incurred to obtain and finalize the lease. The equipment has an estimated life of 10 years, with no residual value. Assuming no purchase or renewal options or guarantees

<sup>12</sup> FASB ASC paragraph 840-20-25-17.

FYI

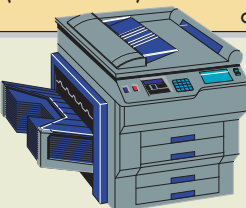

The sale of new cars provides a good example of a sales-type lease. **Ford Motor** has a financing subsidiary to handle leasing. When a car is leased from a dealership, the auto company earns a profit on the lease as well as interest from the lease contract.

EX

## 15-7 ACCOUNTING FOR INITIAL DIRECT COSTS

Type of Lease	Accounting Treatment of Initial Direct Costs
Operating (840-20-35-2)	Recorded as an asset and amortized over lease term.
Direct financing (840-30-35-23)	Recorded as an asset and amortized over lease term, reducing interest revenue.
Sales-type (840-30-25-6)	Immediately recognized as a reduction in manufacturer's or dealer's profit.

© 2012 Cengage Learning.

by the lessee, the lease does not meet any of the four general classification criteria and would be treated as an operating lease. The entries to record the payment of the initial direct costs and the receipt of the lease payments by Universal Leasing would be as follows:

2013

Jan.	1	Deferred Initial Direct Costs .....	15,000
		Cash .....	15,000
	1	Cash .....	65,000
		Rent Revenue .....	60,000
		Executory Costs .....	5,000

The \$5,000 payment received from the lessee to reimburse the executory costs may be reflected as a credit (reduction) to the executory costs account, as shown here, or as a credit to a separate revenue account against which the executory costs can be matched.

Assuming the lessor depreciates the equipment on a straight-line basis over its expected life of 10 years and amortizes the initial direct costs on a straight-line basis over the 5-year lease term, the depreciation and amortization entries at the end of the first year would be as follows:

2013

Dec.	31	Amortization of Initial Direct Costs .....	3,000
		Deferred Initial Direct Costs .....	3,000
	31	Depreciation Expense on Leased Equipment .....	40,000
		Accumulated Depreciation on Leased Equipment .....	40,000

If the rental period and the lessor's fiscal year do not coincide or if the lessor prepares interim reports, an adjustment would be required to record the unearned rent revenue at the end of the accounting period. Amortization of the initial direct costs would be adjusted to reflect a partial year.

### Accounting for Direct Financing Leases

Accounting for direct financing leases for lessors is very similar to that used for capital leases by lessees but with the entries reversed to provide for interest revenue rather than interest expense and reduction of a lease payment receivable rather than a lease liability. The lease payment receivable is reported at its present value; this is the standard practice followed with all long-term receivables, as explained in Chapter 7. The lease payment receivable is sometimes recorded by the lessor at the gross amount of the lease payments with an offsetting valuation account for the unearned interest, or aggregate amount of interest that will be earned by the lessor over the course of the lease. Unearned interest revenue is computed as the difference between the total expected lease payments and the fair value, or cost, of the leased asset. This approach is illustrated for the first year in the following example. Although the remainder of the journal entries in the chapter report the lease payment receivable at its net present value, note that in each case the receivable could be shown at its gross amount less an adjustment for unearned interest revenue.

**Illustrative Entries for Direct Financing Leases** Referring to the lessee example on page 15-16, assume that the cost of the equipment to the Universal Leasing Company was the same as its fair value, \$250,192, and that the purchase by the lessor had been entered into Equipment Purchased for Lease. The entry to record the initial lease would be this:

2013

Jan. 1	Lease Payments Receivable . . . . .	250,192	
	Equipment Purchased for Lease . . . . .		250,192

or, if the lease payment receivable is recorded at its gross amount:

Jan. 1	Lease Payments Receivable . . . . .	300,000	
	Equipment Purchased for Lease . . . . .		250,192
	Unearned Interest Revenue . . . . .		49,808

The first payment would be recorded as follows:

Jan. 1	Cash . . . . .	65,000	
	Lease Payments Receivable . . . . .		60,000
	Executory Costs . . . . .		5,000

The lessor is paying the executory costs but charging them to the lessee. The lessor can record the receipt of the executory costs by debiting Cash and crediting the Executory Costs Expense account. As the lessor pays the costs, the expense account is debited. The lessor is serving as a conduit for these costs to the lessee and will have an expense only if the lessee fails to make the payments. Interest revenue will be recognized over the lease term as shown in Exhibit 15-8.

At the end of the first year, the following entries would be made to record the receipt of the second lease payment, to recognize the interest revenue for 2013, and to recognize the advance payment for next year's executory costs as a deferred credit.

2013

Dec. 31	Cash . . . . .	65,000	
	Lease Payments Receivable . . . . .		40,981
	Interest Revenue . . . . .		19,019
	Deferred Executory Costs (a liability) . . . . .		5,000

**EX 15-8 SCHEDULE OF LEASE RECEIPTS AND INTEREST REVENUE [5-YEAR LEASE, \$60,000 ANNUAL PAYMENTS (EXCLUSIVE OF EXECUTORY COSTS), 10% INTEREST]**

Date	Description	Interest Revenue*	Payment Receipt	Reduction in Receivable	Lease Payments Receivable
1/1/2013	Initial balance				\$250,192
1/1/2013	Receipt		\$ 60,000	\$ 60,000	190,192
12/31/2013	Receipt	\$19,019	60,000	40,981	149,211
12/31/2014	Receipt	14,921	60,000	45,079	104,132
12/31/2015	Receipt	10,413	60,000	49,587	54,545
12/31/2016	Receipt	5,455	60,000	54,545	0
		<u>\$49,808</u>	<u>\$300,000</u>	<u>\$250,192</u>	

\*Preceding lease payment receivable × 10%.

© 2012 Cengage Learning.

or, if the lease payment receivable is recorded at its gross amount:

Dec. 31	Cash	65,000	
	Lease Payments Receivable		60,000
	Deferred Executory Costs (a liability)		5,000
31	Unearned Interest Revenue	19,019	
	Interest Revenue		19,019

Notice that unlike the operating lease example, no annual depreciation expense is recorded by the lessor in association with an asset leased under a capital lease agreement. This is because the asset has been “sold” to the lessee and removed from the lessor’s books.

Based on the journal entries, the asset portion of the balance sheet of the lessor at December 31, 2013, will report the lease receivable as follows:

<b>Universal Leasing Company</b>	
<b>Balance Sheet (Partial)</b>	
<b>December 31, 2013</b>	
<b>Assets</b>	
Current assets:	
Lease payments receivable	\$ 45,079
Noncurrent assets:	
Lease payments receivable (exclusive of \$45,079 included in current assets)	\$104,132

If a direct financing lease contains a bargain purchase option, the present value of the option is added to the receivable. The periodic entries and computations are made as though the bargain purchase amount was an additional rental payment.

**Lessor Accounting for Direct Financing Leases with Residual Value** If leased property is expected to have residual value, the present value of the expected residual value is added to the receivable account. It does not matter whether the residual value is guaranteed or unguaranteed. If guaranteed, it is treated in the accounts exactly like a bargain purchase option. If unguaranteed, the lessor is expected to have an asset equal in value to the residual amount at the end of the lease term.

## CAUTION

The fair value in this example (\$296,761) is different from the fair value in the previous example (\$250,192) because, in the previous example, the asset was assumed to be worthless at the end of the lease term. In this example, the asset is estimated to have a residual value of \$75,000. The present value of that \$75,000 (i.e., \$46,569) accounts for the difference.

To illustrate the recording of residual values, assume the same facts for the Universal Leasing Company as the example on pages 15-20–15-21 except that the asset has a residual value at the end of the 5-year lease term of \$75,000 (either guaranteed or unguaranteed) rather than a bargain purchase option. Assume the cost of the equipment to the Universal

Leasing Company was again the same as its fair value, \$296,761.

The entries to record this lease and the first payment follow:

2013			
Jan.	1	Lease Payments Receivable .....	296,761
		Equipment Purchased for Lease .....	296,761
	1	Cash .....	65,000
		Lease Payments Receivable .....	60,000
		Executory Costs .....	5,000

The computation of interest revenue would be identical to the interest expense computation illustrated in Exhibit 15-5 for the lessee.

At the end of the first year, the lessor would make the following entries:

2013			
Dec.	31	Cash .....	65,000
		Lease Payments Receivable .....	36,324
		Deferred Executory Cost .....	5,000
		Interest Revenue .....	23,676

At the end of the lease term, the lessor would make the following entry to record the recovery of the leased asset, assuming the residual value was the same as originally estimated:

2017			
Dec.	31	Equipment .....	75,000
		Lease Payments Receivable .....	68,182
		Interest Revenue .....	6,818

**Initial Direct Costs Related to Direct Financing Leases** If the lessor incurs any initial direct costs in conjunction with a direct financing lease, those costs are recorded as a separate asset, increasing the net lease investment. Because the initial net lease investment is increased but the lease payments remain the same, the existence of initial direct costs results in a lower implicit interest rate earned by the lessor. Including initial direct costs as part of the initial net lease investment effectively spreads the initial costs over the lease term and reduces the amount of interest revenue that would otherwise be recognized.

### Accounting for Sales-Type Leases—Lessor

Accounting for sales-type leases adds one more dimension to the lessor’s revenue, an immediate profit or loss arising from the difference between the sales price of the leased property and the lessor’s cost to manufacture or purchase the asset. If there is no difference

between the sales price and the lessor's cost, the lease is not a sales-type lease. The lessor also will recognize interest revenue over the lease term for the difference between the sales price and the gross amount of the minimum lease payments. The three values that must be identified to determine these income elements, therefore, can be summarized as follows:

1. The minimum lease payments as defined previously for the lessee, that is, rental payments over the lease term net of any executory costs plus the amount to be paid under a bargain purchase option or guarantee of the residual value.
2. The fair value of the asset.
3. The cost or carrying value of the asset to the lessor increased by any initial direct costs to lease the asset.

The manufacturer's or dealer's profit is the difference between the fair value of the asset and the cost or carrying value of the asset to the lessor. If cost exceeds the fair value, a loss will be reported. The difference between the gross rentals and the fair value of the asset is interest revenue and arises because of the time delay in paying for the asset as described by the lease terms. The relationship between these three values can be demonstrated as follows:

To illustrate this type of lease, assume that the lessor for the equipment described on page 15-16 is American Manufacturing Company rather than Universal Leasing. The fair value of the equipment is equal to its present value (the future lease payments discounted at 10%), or \$250,192. This computation is reversed from what would happen in practice; normally, the fair value is known, and the minimum lease payments are set at an amount that will yield the desired rate of return to the lessor.

Assume that the equipment cost American Manufacturing \$160,000 and initial direct costs of \$15,000 were incurred. The three values and the related revenue amounts would be as follows:

(1) Minimum lease payments: $(\$65,000 - \$5,000) \times 5$	\$300,000	\$49,808 (Interest Revenue)
(2) Fair value of equipment	\$250,192	
(3) Cost of leased equipment to lessor, plus initial direct costs	\$175,000	\$75,192 (Manufacturer's Profit)

**Illustrative Entries for Sales-Type Leases** The interest revenue (\$49,808) is the same as that illustrated for a direct financing lease on page 15-25, and it is recognized over the lease term by the same entries and according to Exhibit 15-8. The manufacturer's profit is recognized as revenue immediately in the current period by including the fair value of the asset as a sale and debiting the cost of the equipment carried in Finished Goods Inventory to Cost of Goods Sold. The initial direct costs previously deferred are recognized as an expense immediately by increasing Cost of Goods Sold by the amount expended for these costs. This reduces the amount of immediate profit to be recognized. The reimbursement of executory costs is treated in the same way as illustrated for direct financing leases.

The entries to record this information on American Manufacturing Company’s books at the beginning of the lease term would be as follows:

2013			
Jan. 1	Lease Payments Receivable . . . . .	250,192	
	Sales . . . . .		250,192
1	Cost of Goods Sold . . . . .	175,000	
	Finished Goods Inventory . . . . .		160,000
	Deferred Initial Direct Costs . . . . .		15,000
1	Cash . . . . .	65,000	
	Lease Payments Receivable . . . . .		60,000
	Executory Costs . . . . .		5,000

The first journal entry records the sale and recognizes a receivable, reported at its present value. The second journal entry simply removes the inventory and deferred direct costs from the books of the lessor and recognizes the cost of goods sold. The final

entry records the first payment. The example does not show the payment for the initial direct costs. The deferred initial direct costs account would have been charged at the time these costs were paid.

The 2013 income statement would include the sales and cost of goods sold amounts yielding the manufacturer’s profit of \$75,192 and interest revenue of \$19,019. A note to the statements would describe in more detail the nature of the lease and its terms.

## CAUTION

The sales account is always credited for the present value of the minimum lease payments.

## FYI

These journal entries to record a sales-type lease may seem complex, but look more carefully—these are exactly the entries one makes when reporting a credit sale and a subsequent partial payment.

**Accounting for Sales-Type Leases with a Bargain Purchase Option or Guarantee of Residual Value** If the lease agreement provides for the lessor to receive a lump-sum payment at the end of the lease term in the form of a bargain purchase option or a guarantee of residual value, the minimum lease payments include these amounts. The receivable is thus increased by the present value of the future payment, and sales are increased by the present value of the additional amount.

To illustrate a sales-type lease with a bargain purchase option, assume that American Manufacturing was the lessor on the lease described on page 15-16 and in Exhibit 15-5.

The initial entries when either a bargain purchase option or a guarantee of residual value of \$75,000 is payable at the end of the 5-year lease term would be as follows:

2013			
Jan. 1	Lease Payments Receivable . . . . .	296,761	
	Sales . . . . .		296,761
1	Cost of Goods Sold . . . . .	175,000	
	Finished Goods Inventory . . . . .		160,000
	Deferred Initial Direct Costs . . . . .		15,000
1	Cash . . . . .	65,000	
	Lease Payments Receivable . . . . .		60,000
	Executory Costs . . . . .		5,000

Because the lease now includes a bargain purchase option, Sales increases by \$46,569 (present value of the bargain purchase amount) over the amount recognized in the previous example. The manufacturer's profit is also increased by this amount.

**Accounting for Sales-Type Leases with Unguaranteed Residual Value** When a sales-type lease does not contain a bargain purchase option or a guaranteed residual value but the economic life of the leased asset exceeds the lease term, the residual value of the property will remain with the lessor. As indicated earlier, this is called an *unguaranteed residual value*. Because the sales amount reflects the present value of the minimum lease payments, an unguaranteed residual value would not be included in the sales amount. However, the cost of goods sold would be reduced by the present value of the unguaranteed residual value to recognize the fact that the lessor will be receiving back the \$75,000 leased asset (worth a present value of \$46,569) at the end of the lease term. In essence, this \$46,569 residual value is not “sold” but is merely loaned to the lessee for the period of the lease, after which it will be returned to the lessor. The entry to record the initial lease described earlier with an unguaranteed residual value follows:

2013

Jan. 1	Lease Payments Receivable .....	250,192	
	Sales .....		250,192
1	Cost of Goods Sold (\$175,000 – \$46,569) .....	128,431	
	Finished Goods Inventory (\$160,000 – \$46,569) .....		113,431
	Deferred Initial Direct Costs .....		15,000
1	Lease Payment Receivable .....	46,569	
	Finished Goods Inventory .....		46,569

The only difference between accounting for an unguaranteed residual value and a guaranteed residual value or bargain purchase option is that rather than increasing Sales by the present value of the residual value, the present value of the unguaranteed residual value is deducted from the cost of the leased equipment sold. This reduction occurs because the portion of the leased asset represented by the unguaranteed residual value will be returned at the end of the lease term and therefore is not “sold” on the lease-signing date. The \$46,569 in inventory represented by the present value of the unguaranteed residual value has not been sold but has been exchanged for a receivable of equal amount.

Note that the gross profit on the transaction is the same regardless of whether the residual value is guaranteed or unguaranteed, as follows:

	<b>Guaranteed Residual Value</b>	<b>Unguaranteed Residual Value</b>
Sales .....	\$296,761	\$250,192
Cost of goods sold .....	175,000	128,431
Gross profit .....	<u>\$121,761</u>	<u>\$121,761</u>

**Third-Party Guarantees of Residual Value** When a lease is used by the seller as a means to provide financing to the buyer and to increase sales, the seller wants to account for the lease as a sales-type lease, not as an operating lease, so that the revenue from the sale can be recognized immediately. On the other hand, the buyer would prefer to account for the lease as an operating lease to keep the lease obligation off the balance sheet. A third-party guarantee of residual value is a clever trick that companies have devised to get around

the accounting rules and allow the desires of both the seller-lessor and the buyer-lessee to be satisfied.

Consider the example just given in which the guaranteed residual value is \$75,000. In this case, the fair value of the equipment on the lease-signing date is \$296,761. From the lessor's standpoint, the present value of the minimum lease payments, including the guaranteed residual value, is also \$296,761. Accordingly, the lease meets the 90% of fair value criterion, and the lease is accounted for as a sales-type lease.

Here is where the fun begins. The lessee, instead of guaranteeing the residual value itself, can pay an insurance company or investment firm to guarantee the residual value. For a fee, the insurance company bears the risk that the residual value of the leased asset might fall below the guaranteed residual value. If this happens, the insurance company, not the lessee, will make up the difference. By the purchase of this "insurance policy," the lessee removes the guaranteed residual value from its calculation of the present value of the minimum lease payments. Without the guaranteed residual value, the present value of the minimum lease payments is only \$250,192, just 84% ( $\$250,192/\$296,761$ ) of the fair value of the leased asset. As a result, the lessee accounts for the lease as an operating lease.

In summary, a third-party guarantee of residual value allows the seller-lessor to recognize the entire profit from the lease transaction immediately but also permits the buyer-lessee to treat the lease as an operating lease and keep the lease liability off the balance sheet.

Obviously these "insurance policies" are designed to take advantage of the precision of the FASB 90% criterion. As U.S. companies transition to IFRS, it is likely that the number of these third-party guarantee arrangements will decrease because the principles-based nature of the IASB's lease classification standard will require accountants to be very skeptical of transactions designed to mask the economic substance of a lease.

### Sale of Asset During Lease Term

If the lessor sells an asset to the lessee during the lease term, a gain or loss is recognized on the difference between the receivable balance and the selling price of the asset. Thus, if the leased asset described in Exhibit 15-8 is sold on December 31, 2015, for \$140,000 before the \$60,000 rental payment is made, a gain of \$25,455 would be reported. The following journal entry would be made to record the sale:

2015			
Dec. 31	Cash	.....	140,000
	Interest Revenue	.....	10,413
	Lease Payments Receivable	.....	104,132
	Gain on Sale of Leased Asset	.....	25,455

Although the lessor does recognize a gain or loss on the sale, as mentioned earlier, the lessee accounts for the transaction as an exchange of similar assets and defers any gain or loss through an adjustment in the value placed on the purchased asset.

### Treatment of Leases on Lessor's Statement of Cash Flows

Operating leases present no special problems to the lessor in preparing a statement of cash flows except for initial direct costs. Because initial direct costs are recognized as an asset when the lease is an operating lease, the payment of these costs would be reported as an investing cash outflow. Under the indirect method, the amortization of initial direct costs would be added to net income in the same way income is adjusted for depreciation. Under

the direct method, the amortization would be ignored. The lease payment receipts would be reported as part of net income and would require no adjustment under the indirect method and would be reported as part of the revenue receipts under the direct method.

Capital leases must be analyzed carefully to determine their impact on the statement of cash flows. Direct financing leases would require adjustments similar to those made by the lessee for capital leases except that for the lender (lessor), the transaction is viewed as an investing activity rather than a financing activity as was the case for the borrower (lessee). The portion of the receipt that represents interest will be included in net income and requires no adjustment under the indirect method. It would be part of cash inflows from interest under the direct method. The portion of the lease payment representing the principal would be reported as a cash inflow from investing activities.

Under sales-type leases, the manufacturer's profit, net of initial direct costs, is reported in net income, but the cash inflow comes as the lease payments are received. Under the indirect method, this requires a deduction from net income for the manufacturer's profit at the inception of the lease. This would automatically occur as the changes in inventory, deferred initial costs, and net lease payments receivable are reflected in the Operating section of the statement of cash flows. Because the transaction is being accounted for as a sale, all further receipts under the indirect method are reported as operating inflows either as interest revenue or as reductions in the net lease payments receivable. Under the direct method, the entire lease receipt would be included in cash flows from operating activities. A summary of the treatment of lease impact on the statement of cash flows is included in Exhibit 15-9.

To illustrate the impact of a lease on the lessor's statement of cash flows, refer back to the American Manufacturing Company sales-type lease example starting on page 15-20. Assume that in 2013, American Manufacturing's income before any lease-related items is \$200,000. For simplicity, ignore income taxes and executory costs and assume that all of the nonlease items included in income are cash items. Net income for the year can be computed as follows:

Income before lease-related items . . . . .	\$ 200,000
Lease-related sales . . . . .	250,192
Lease-related cost of goods sold . . . . .	(175,000)
Lease-related interest revenue . . . . .	19,019
Net income . . . . .	<u>\$ 294,211</u>

The computation of cash from operating activities for American Manufacturing Company for 2013, using the indirect method to report cash flow from operating activities, would appear as follows:

<i>Operating activities:</i>	
Net income . . . . .	\$ 294,211
Less: Increase in lease payments receivable (\$250,192 – \$60,000 – \$40,981) . . . . .	(149,211)
Plus: Decrease in finished goods inventory . . . . .	175,000
Net cash flow from operating activities . . . . .	<u>\$ 320,000</u>

Note that the total operating cash flow of \$320,000 is equal to the \$200,000 income before lease-related items (which were assumed to be all cash items) plus the two \$60,000 lease payments received during the year. This illustrates again that a sales-type lease impacts the lessor's financial statements in the same way as any other long-term credit sale.

## EX 15-9 SUMMARY OF LEASE IMPACT ON STATEMENT OF CASH FLOWS

	Operating Activities		Investing Activities	Financing Activities
	Indirect Method	Direct Method		
<b>Lessee:</b>				
Operating lease payments	NI	– Cash		
Capital lease:				
Lease payments—interest	NI	– Cash		
Lease payments—principal				– Cash
Amortization of asset	+ NI	No impact		
<b>Lessor:</b>				
Operating lease:				
Initial direct costs (IDC)			– Cash	
Amortization of IDC	+ NI	No impact		
Lease receipts	NI	+ Cash		
Direct financing lease:				
Initial direct costs			– Cash	
Amortization of IDC	+ NI	No impact		
Lease receipts—interest	NI	+ Cash		
Lease receipts—principal			+ Cash	
Sales-type lease:				
Initial direct costs			– Cash	
Manufacturer's or dealer's profit (net of IDC)	– NI	No impact		
Lease receipts—interest	NI	+ Cash		
Lease receipts—principal	+ NI	+ Cash		
Key:				
	NI = Included in net income			
	+ NI = Added as an adjustment to net income			
	– NI = Deducted as an adjustment to net income			
	+ Cash = Reported as a receipt of cash			
	– Cash = Reported as a payment of cash

## Disclosure Requirements for Leases

7

Prepare and interpret the lease disclosures required of both lessors and lessees.

**WHY** Because a key characteristic of an operating lease, from the standpoint of the lessee, is that the lease-related asset and liability are off the balance sheet, it is important for the financial statement user to be able to interpret the associated note disclosure to detect the existence of these off-balance-sheet items.

**HOW** The lessee is required to provide enough note disclosure to allow the financial statement users to quantify the magnitude of the off-balance-sheet operating leases. The lessor is also required to provide enough disclosure to allow the financial statement user to figure out the extent to which lease-related sales and rentals have impacted the lessor's financial statements.

The FASB has established specific disclosure requirements for all leases, regardless of whether they are classified as operating or capital leases. The required information supplements the amounts recognized in the financial statements and usually is included in a single note to the financial statements.

The following information is required for all leases that have initial or remaining noncancelable lease terms in excess of one year:

#### Lessee

1. Gross amount of assets recorded as capital leases, along with related accumulated amortization.
2. Future minimum rental payments required as of the date of the latest balance sheet presented in the aggregate and for each of the five succeeding fiscal years. These payments should be separated between operating and capital leases. For capital leases, executory costs should be excluded.
3. Rental expense for each period for which an income statement is presented. Additional information concerning minimum rentals, contingent rentals, and sublease rentals is required for the same periods.
4. A general description of the lease contracts, including information about restrictions on such items as dividends, additional debt, and further leasing.
5. For capital leases, the amount of imputed interest necessary to reduce the lease payments to present value.

Exhibit 15-10 presents a note accompanying the 2009 financial statements of Delta Air Lines, illustrating the required lessee disclosures for both operating and capital leases.

Several points should be highlighted relating to Delta's lease disclosure. First, compare the minimum lease payments for Delta's capital leases to the payments to be made for its operating leases. The expected payments for operating leases exceed those for capital leases by a factor of more than 13. Note also that Delta discloses the portion of the minimum lease payments on its capital leases that represents interest. With the information in this note, we can approximate the impact that the obligations related to Delta's operating leases would have on its balance sheet if those leases were capitalized.

To approximate the present value of these future operating lease payments, we can make some simplifying assumptions:

- The appropriate interest rate for discounting future cash flows is 10%.
- The uneven stream of future operating lease payments by Delta is roughly equivalent to \$1,310 million per year for nine years. This rough approximation stems from the fact that the payments in the first five years average \$1,310 million per year and the total of the payments is \$11,790 million, which is roughly equal to \$1,310 million a year for nine years.

Given these simplifying assumptions, it is easy to compute that the present value of an annuity of \$1,310 million per year for nine years is \$7.5 billion if the interest rate is 10%. This \$7.5 billion approximates the economic value of Delta's obligations under its operating leases.

If Delta were required to report these future obligations as liabilities, there would be a noticeable impact on the company's reported liabilities—long-term debt would increase from \$17.2 billion to \$24.7 billion. For this reason, companies go to great lengths to structure leases so that the leases can be classified as operating leases and the lease obligation can be excluded from the balance sheet.

#### Lessor

1. The following components of the net investment in sales-type and direct financing leases as of the date of each balance sheet presented:
  - (a) Future minimum lease payments receivable with separate deductions for amounts representing executory costs and the accumulated allowance for uncollectible minimum lease payments receivable

**EX 15-10 DELTA AIR LINES—LESSEE DISCLOSURE**

**NOTE 7. LEASE OBLIGATIONS**

We lease aircraft, airport terminals and maintenance facilities, ticket offices and other property and equipment from third parties. Rental expense for operating leases, which is recorded on a straight-line basis over the life of the lease term, totaled \$1.3 billion and \$798 million for the years ended December 31, 2009 and 2008, respectively, \$470 million for the eight months ended December 31, 2007 and \$261 million for the four months ended April 30, 2007. Amounts due under capital leases are recorded as liabilities on our Consolidated Balance Sheets. Assets acquired under capital leases are recorded as property and equipment on our Consolidated Balance Sheets. Amortization of assets recorded under capital leases is included in depreciation and amortization expense on our Consolidated Statements of Operations. Many of our facility, aircraft and equipment leases include rental escalation clauses and/or renewal options. Our leases do not include residual value guarantees.

The following tables summarize, as of December 31, 2009, our minimum rental commitments under capital leases and noncancelable operating leases (including certain aircraft under Contract Carrier agreements) with initial or remaining terms in excess of one year:

<b>Capital Leases</b>	
<b>Years Ending December 31, (in millions)</b>	<b>Capital Leases</b>
2010 . . . . .	\$148
2011 . . . . .	146
2012 . . . . .	119
2013 . . . . .	87
2014 . . . . .	67
Thereafter . . . . .	<u>337</u>
Total minimum lease payments . . . . .	904
Less: amount of lease payments representing interest . . . . .	<u>(396)</u>
Present value of future minimum capital lease payments . . . . .	508
Plus: unamortized premium, net. . . . .	25
Less: current obligations under capital leases . . . . .	<u>(88)</u>
Long-term capital lease obligations . . . . .	<u>\$445</u>

<b>Years Ending December 31, (in millions)</b>	<b>Operating Leases</b>		
	<b>Delta Lease Payments</b>	<b>Contract Carrier Aircraft Lease Payments<sup>(1)</sup></b>	<b>Total</b>
2010 . . . . .	\$1,082	\$ 507	\$ 1,589
2011 . . . . .	910	497	1,407
2012 . . . . .	806	490	1,296
2013 . . . . .	711	460	1,171
2014 . . . . .	634	451	1,085
Thereafter . . . . .	<u>3,700</u>	<u>1,542</u>	<u>5,242</u>
Total minimum lease payments . . . . .	<u>\$7,843</u>	<u>\$3,947</u>	<u>\$11,790</u>

<sup>(1)</sup> These amounts represent the minimum lease obligations under our Contract Carrier agreements with Atlantic Southeast Airlines, Inc. ("ASA"), Chautauqua Airlines, Inc. ("Chautauqua"), Freedom Airlines, Inc. ("Freedom"), Pinnacle Airlines, Inc. ("Pinnacle"), Shuttle America Corporation ("Shuttle America") and SkyWest Airlines, Inc. ("SkyWest Airlines").

At December 31, 2009, we operated 213 aircraft under operating leases and 93 aircraft under capital leases. Our Contract Carriers under capacity purchase agreements operated 450 aircraft under operating leases. Leases for aircraft operated by us and our Contract Carriers have expiration dates ranging from 2010 to 2025. During the four months ended April 30, 2007, we recorded estimated claims relating to the restructuring of the financing arrangements for many of our aircraft and the rejection of certain of our leases in connection with our bankruptcy proceedings.

- (b) Unguaranteed residual values accruing to the benefit of the lessor
  - (c) Unearned revenue (the difference between the gross lease payments and the present value of the lease payments)
  - (d) For direct financing leases only, initial direct costs
2. Future minimum lease payments to be received for each of the five succeeding fiscal years as of the date of the latest balance sheet presented, including information on contingent rentals
  3. The amount of unearned revenue included in income to offset initial direct costs for each year for which an income statement is prepared
  4. For operating leases, the cost of assets leased to others and the accumulated depreciation related to these assets
  5. A general description of the lessor’s leasing arrangements

An example of lessor disclosure of sales-type and direct financing leases for International Lease Finance Corporation, one of the major lessors of airplanes mentioned at the beginning of this chapter, is shown in Exhibit 15-11.

EX 15-11 INTERNATIONAL LEASE FINANCE CORPORATION—LESSOR DISCLOSURE

**Note E — Net Investment in Finance and Sales-type Leases**  
 The following lists the components of the net investment in finance and sales-type leases:

	<b>December 31, 2009</b>	<b>December 31, 2008</b>
Total lease payments to be received . . . . .	\$171,549	\$165,503
Estimated residual values of leased flight equipment (unguaranteed) . . . . .	138,665	195,737
Less: Unearned income . . . . .	<u>(49,133)</u>	<u>(59,481)</u>
Net investment in finance and sales-type leases . . . . .	<u>\$261,081</u>	<u>\$301,759</u>

At December 31, 2009, minimum future lease payments on finance and sales-type leases are as follows:

2010 . . . . .	\$ 39,323	
2011 . . . . .	32,333	
2012 . . . . .	32,040	
2013 . . . . .	24,526	
2014 . . . . .	21,596	
Thereafter . . . . .	<u>21,731</u>	
Total minimum lease payments to be received . . . . .	<u>\$ 171,549</u>

## International Accounting of Leases

**8** Compare the treatment of accounting for leases in the United States with the requirements of international accounting standards.

**WHY** The IASB’s lease accounting standard is very similar, in concept, to the U.S. standard. However, a big practical difference is that the U.S. standard provides precise guidelines and thresholds in the four lease criteria described earlier. In contrast, the international standard is an example of a “principles-based” standard.

**HOW** In practice, international lease accounting is the same as lease accounting in the United States with the one noticeable difference being that, internationally, capital leases are called *finance leases*.

As mentioned earlier in the chapter, the international accounting standard on leases (*IAS 17*) relies on the exercise of accounting judgment to distinguish between operating and capital leases. *IAS 17* states that a finance lease, which is the same as our capital lease, is “a lease that transfers substantially all the risks and rewards incident to ownership of an asset.” This standard has been criticized because it leaves the classification of a lease as either operating or capital almost exclusively up to the accountant (subject to the approval of an external auditor). However, before finding fault with *IAS 17*, remember that the four lease classification criteria adopted as part of pre-codification *Statement No. 13* have not been successful in preventing U.S. companies from cleverly constructing most leases to be classified as operating.

In October 2002, the FASB circulated a proposal regarding principles-based accounting standards. As envisioned by their proponents, principles-based standards would involve fewer rigid thresholds and rules (such as the four lease classification criteria) and would rely more on accountants exercising professional judgment in the interpretation and execution of the standards.<sup>13</sup> *IAS 17* is just such a principles-based standard. The entire idea of principles-based standards is still being debated, but the area of lease accounting provides a good illustration of the limitation of principles-based standards. Although *IAS 17* is indeed a principles-based standard, when the rule is actually applied in practice around the world, accountants often sneak a peek at the four lease classification criteria included in FASB ASC paragraph 840-10-25-1 in order to be able to use the *IAS 17* “principle” in the context of an actual lease contract. As U.S. companies switch to IFRS, it is likely that accountants and auditors will continue to reference the FASB’s four lease classification criteria for help in applying the principles of *IAS 17*.

A very interesting lease accounting proposal has been circulating for a number of years among accounting standard setters around the world. The standard setters of the United States, the United Kingdom, Canada, Australia, and New Zealand sponsored a research project that resulted in a new lease accounting proposal in 1996. This proposal, titled “Accounting for Leases: A New Approach,” notes that current lease accounting standards fail in their objective of requiring companies to recognize significant rights and obligations as assets and liabilities in the balance sheet. The proposal also suggests that the lease accounting rules be simplified as follows: All lease contracts are to be accounted for as capital leases.

To illustrate the dramatic impact that this “new approach” would have on the reporting of leases for lessees, consider the following table:

<b>Fair value of leased asset = \$10,000</b>	<b>Present value of minimum lease payments = \$8,999</b>	<b>Present value of minimum lease payments = \$9,001</b>
Lease obligation reported under current U.S. GAAP	\$ 0	\$9,001
Lease obligation that would be reported under the New Approach for lease accounting	\$8,999	\$9,001

In each of the two cases, the fair value of the leased asset is \$10,000. In the first case, the present value of the minimum lease payments is \$8,999, which is 89.9% of the fair value of the leased asset. The present value of the minimum payments is less than 90% of the fair value of the leased asset, and, assuming that none of the other capital lease criteria are

<sup>13</sup> Proposal—“Principles-Based Approach to U.S. Standard Setting” (Norwalk, CT: Financial Accounting Standards Board, October 21, 2002).

satisfied, the lease would be accounted for as an operating lease under U.S. GAAP. With the lease classified as an operating lease, the lessee would not report any obligation for the future lease payments. Under the new approach, an \$8,999 obligation would be reported for the present value of the future minimum lease payments. In the second case, the present value of the lease payments is \$9,001, which is more than 90% of the fair value of the leased asset. This lease would be classified as a capital lease under existing U.S. GAAP, and the \$9,001 obligation would be reported under both U.S. GAAP and the new approach. Note that under the new approach, the small \$2 change in the present value of the lease payments, from \$8,999 to \$9,001, is reflected in the correspondingly small increase in the recorded amount of the lease obligation. However, under U.S. GAAP, this small change in the present value of the payments results in a huge change in the reported liability. Whenever there is a knife-edge accounting rule such as this, one can be sure that companies will be very careful, and inventive, in making certain that the present value of their lease payments is just below the 90% threshold.

More recently, the FASB and IASB have both endorsed the idea that all leases should be capitalized. The terminology currently being used by the FASB is that the signing of a lease creates a “right-of-use asset” and a “lease obligation.” The FASB and IASB expect to circulate an exposure draft along these lines in 2010 and hope to adopt final standards in 2011.

This proposal to capitalize all leases is still in the discussion stage. Given the great efforts that U.S. companies now expend to keep leases off the balance sheet, a proposal to capitalize all leases is sure to touch off one of the largest accounting debates in the past 30 years.

#### EXPANDED MATERIAL

Lease agreements can be very complicated. Some of these complications have been specifically designed to circumvent the accounting rules and allow for favorable classification of leases. One example is the third-party guarantee of residual values mentioned earlier in the chapter. Another example is the sale-leaseback transaction described in this section. It is a transaction that usually has the effect of sweeping assets and liabilities right off a company's balance sheet even as those assets continue to be used exactly as they were before.

## Sale-Leaseback Transactions

9

Record a sale-leaseback transaction for both a seller-lessee and a purchaser-lessor.

**WHY** Sale-leaseback transactions are common because they can serve both a valid business purpose and an attractive accounting purpose.

**HOW** A sale-leaseback is a transaction in which one party sells an asset to another, and then the first party immediately leases the asset back and continues to use it. Any gain realized on a sale-leaseback by the seller-lessee is deferred and amortized over the life of the lease. A loss on the sale is recognized immediately. If the lease is structured appropriately, the seller-lessee can account for the lease as an operating lease; in this case, the sale-leaseback serves to remove the asset and any associated liability from the balance sheet without impacting the continued use of the asset.

A common type of lease arrangement is referred to as a **sale-leaseback** transaction. Typical of this type of lease is an arrangement whereby one party sells the property to a second party, and then the first party leases the property back. Thus, the seller becomes a seller-lessee and the purchaser a purchaser-lessor.

The accounting problem raised by this transaction is whether the seller-lessee should recognize the profit from the original sale immediately or defer it over the lease term. The FASB rule is that if the initial sale produces a profit, it should be deferred and amortized in proportion to the amortization of the leased asset if it is a capital lease or in proportion to the rental payments if it is an operating lease. If the transaction produces a loss because the fair value of the asset is less than its carrying value, an immediate loss should be recognized.<sup>14</sup>

There are two exceptions to the profit deferral rule. First, if the seller-lessee's remaining ownership rights are "minor" after the sale-leaseback transaction, then the sale and leaseback are separate transactions, and any profit on the sale is recognized immediately. Second, if the profit on the sale is "large," defined as larger than the present value of the minimum payments on the leaseback, then the "excess" profit (the amount greater than the present value of the minimum leaseback payments) is recognized at the time of the sale with the remainder of the profit deferred and recognized according to the normal process.

## STOP & THINK

Why would a company sell an asset and then turn right around and lease that same asset back?

- To increase the reported amount of total liabilities.
- To decrease the reported amount of total liabilities.
- To increase the reported amount of total assets.
- To increase the reported amount of current liabilities.

To illustrate the accounting treatment for a sale at a gain, assume that on January 1, 2013, Hopkins Inc. sells equipment having a carrying value of \$750,000 on its books to Ashcroft Co. for \$950,000 and immediately leases back the equipment. The following conditions are established to govern the transaction:

- The term of the lease is 10 years, noncancelable. A down payment of \$200,000 is required plus equal lease payments of \$107,107 at the beginning of each year. The implicit interest rate is 10%.
- The equipment has a fair value of \$950,000 on January 1, 2013, and an estimated economic life of 20 years. Straight-line depreciation is used on all owned assets.
- Hopkins has an option to renew the lease for \$10,000 per year for 10 years, the rest of its economic life. Title passes at the end of the lease term.

Analysis of this lease shows that it qualifies as a capital lease under both the lease term and present value of payments criteria. It meets the 75% of economic life criterion because of the bargain renewal option, which makes both the lease term and the economic life of the equipment 20 years. It meets the 90% of fair value criterion because the present value of the lease payments is equal to the fair value of the equipment (\$950,000).<sup>15</sup> The

<sup>14</sup> FASB ASC paragraph 840-40-25-3 and paragraph 840-40-35-1.

<sup>15</sup> Computation of present value of lease:

(a) Present value of 10 years' rentals:

Payments at the beginning of the period (BEG):  $PMT = \$107,107, N = 10, I = 10\% \rightarrow \$723,939$ .

(b) Present value of second 10 years' rentals:

Payments at the beginning of the period (BEG):  $PMT = \$10,000, N = 10, I = 10\% \rightarrow \$67,590$ , present value at beginning of second 10 years' lease period. Present value at beginning of lease, 10 years earlier:  $FV = \$67,590, N = 10, I = 10\% \rightarrow \$26,059$ .

(c) Total present value,  $\$723,939 + \$26,059 + \$200,000$  down payment = \$950,000 (rounded).

journal entries for the first year of the lease for Hopkins, the seller-lessee, and Ashcroft, the purchaser-lessor, follow:

<b>Hopkins Inc. (Seller-Lessee)</b>		
2013		
Jan. 1	Cash .....	950,000
	Equipment .....	750,000
	Unearned Profit on Sale-Leaseback .....	200,000
	<i>To record original sale of equipment.</i>	
1	Leased Equipment .....	950,000
	Obligations under Capital Lease .....	642,893
	Cash (\$200,000 + \$107,107) .....	307,107
	<i>To record lease of equipment, including down payment and first payment.</i>	
Dec. 31	Amortization Expense on Leased Equipment .....	47,500
	Accumulated Amortization on Leased Equipment .....	47,500
	<i>To record amortization of equipment over 20-year period (\$950,000/20).</i>	
31	Interest Expense .....	64,289
	Obligations under Capital Lease .....	42,818
	Cash .....	107,107
	<i>To record second lease payment (interest expense: \$642,893 × 0.10 = \$64,289).</i>	
31	Unearned Profit on Sale-Leaseback .....	10,000
	Revenue Earned on Sale-Leaseback .....	10,000
	<i>To record recognition of revenue over 20-year life in proportion to the amortization of the leased asset.</i>	
<b>Ashcroft Co. (Purchaser-Lessor)</b>		
Jan. 1	Equipment .....	950,000
	Cash .....	950,000
	<i>To record purchase of equipment.</i>	
1	Cash .....	307,107
	Lease Payments Receivable .....	642,893
	Equipment .....	950,000
	<i>To record direct financing sale-leaseback to Hopkins Inc. Gross receivable = (10 × \$107,107) + (10 × \$10,000) = \$1,171,070</i>	
Dec. 31	Cash .....	107,107
	Lease Payments Receivable .....	42,818
	Interest Revenue .....	64,289
	<i>To record receipt of second lease payment (see computations for Hopkins Inc.).</i>	

The amortization entries and recognition of the deferred gain on the sale for Hopkins Inc. would be the same each year for the 20-year lease term. The interest expense and interest revenue amounts would decline each year using the effective interest method of computation.

If the lease had not met the criteria, it would have been recorded as an operating lease. The gain on the sale would have been deferred and recognized in proportion to the lease payments. The yearly gain recognition amounts would closely parallel that just illustrated

because both the amortization of a leased asset and the pattern of lease payments typically follow a straight-line process.

If the initial sale had been at a loss, an immediate recognition of the loss would have been recorded.

The provisions of *IAS 17* regarding the deferral of sale profits on a sale-leaseback are essentially the same as under U.S. GAAP. The wording in *IAS 17* is somewhat different (and, frankly, a bit more clear) than in FASB ASC Subtopic 840-40, but the international accounting is basically the same as that required under U.S. GAAP.

### SOLUTIONS TO OPENING SCENARIO QUESTIONS

1. American Airlines leases many of the airplanes that it uses. It leases these planes from financing companies, such as GE Capital Aviation Services, that buy the airplanes from the manufacturer and then make money by leasing the planes to airlines.
2. By leasing many of their airplanes, the airlines give themselves financing flexibility. If they experience a decline in the need for aircraft, it is much easier to get out of a lease than it is to sell an unneeded plane in order to pay off the loan used to buy the plane in the first place.
3. As illustrated with data from Delta Air Lines, some leased airplanes are reported as an asset in the leasing airline's balance sheet and some are not. This chapter explains the accounting rules that determine when a leased asset is reported on the leasing company's balance sheet as an asset.

### SOLUTIONS TO STOP & THINK

1. (Page 15-11) The correct answer is D. The use of a higher discount rate results in a lower computed present value. A lower present value reduces the probability that a lease will satisfy the 90% of market value criterion and thus reduces the likelihood that the lease will be classified as a capital lease.
  2. (Page 15-40) The correct answer is B. One reason for a firm to do a sale-leaseback is to remove an asset (and the associated payment obligation) from the balance sheet. A carefully constructed sale-leaseback deal results in the lease being classified as an operating lease—with the leased asset and the lease liability disclosed only in the financial statement notes.
- Another reason to do a sale-leaseback is to put the property in the hands of a professional property management firm, allowing the company to concentrate on its core business. For example, imagine a large engineering consulting firm with an office building located on a prime piece of land in a large city. What does an engineering consulting firm know about maximizing the use of the property? Nothing. But it needs the office building. So, the firm sells the building and property to a property management firm and then leases them back. The engineering consulting firm is now concentrating on what it does best—engineering—and the property is being managed by a firm of professionals.

### SOLUTION TO USING THE FASB'S CODIFICATION

You should have found the following in FASB ASC paragraph 840-20-25-8: "If a build-to-suit lease is classified as an operating lease, the lessee shall consider construction period lease payments made before the beginning of the lease term to be prepaid rent."

So, if these payments are prepaid rent, they should then be added in with all of the other lease/rent payments so that the total amount is recognized as expense in a straight-line fashion over the lease term.

# REVIEW CHAPTER 15

## LEARNING OBJECTIVES

- 1** Describe the circumstances in which leasing makes more business sense than does an outright sale and purchase.

The three primary advantages to a lessee of leasing over purchasing are that a lease often involves no down payment, leasing avoids the risks of ownership, and leasing gives the lessee flexibility to change assets when technology or preferences change.

The economic advantages to a lessor include an increase in sales by providing financing to customers who might not otherwise be able to buy, establishment of an ongoing relationship with customers, and retention of the residual value of the leased asset after the lease term is over.

- 2** Understand the accounting issues faced by the asset owner (lessor) and the asset user (lessee) in recording a lease transaction.

For the lessor, the key accounting issue is whether or not a sale should be recognized on the date the lease is signed. The proper accounting hinges on whether the lease signing transfers effective ownership of the leased asset, whether the lessor has any significant additional responsibilities remaining after the lease is signed, and whether payment collectibility is reasonably assured.

For the lessee, the key accounting issue is whether the leased asset and the lease payment obligation should be recognized on the balance sheet. Again, the proper accounting treatment depends on whether the lease signing transfers effective ownership of the leased asset.

Capital leases are accounted for as if the lease agreement transfers ownership of the leased asset from the lessor to the lessee. Operating leases are accounted for as rental agreements.

- 3** Outline the types of contractual provisions typically included in lease agreements.

- *Cancellation provisions.* A noncancelable lease agreement is one that can be canceled by the lessee only under very

unusual circumstances. Only noncancelable leases can be classified as capital leases.

- *Bargain purchase option.* If the lessee has the option to purchase the leased asset in the future at an amount low enough such that exercise of the option is likely, a bargain purchase option exists.
- *Lease term.* The lease term includes the noncancelable lease period plus any periods covered by bargain renewal options that include favorable lease terms (e.g., low lease payments) that make it likely that the lessee will renew the lease.
- *Residual value.* The residual value is the value of the leased asset at the end of the lease term. Sometimes, the lease agreement requires that the lessee guarantee the residual value; if the residual value falls below the guaranteed amount, the lessee must pay the lessor the difference.
- *Minimum lease payments.* The minimum lease payments include the periodic lease payments plus any bargain purchase option amount or the amount of any guaranteed residual value. The lessor computes the present value of the minimum lease payments using the implicit interest rate. The lessee computes the present value using the lower of the implicit interest rate and the lessee's own incremental borrowing rate.

- 4** Apply the lease classification criteria in order to distinguish between capital and operating leases.

The four general lease classification criteria, applicable to both lessors and lessees, are as follows:

- *Transfer of ownership.* The lease includes a provision that title to the leased asset passes to the lessee by the end of the lease term.
- *Bargain purchase option.* A bargain purchase option exists that makes it reasonably assured that the lessee will acquire the asset.

- *75% of economic life.* The lease term is equal to 75% or more of the economic life of the leased asset.
- *90% of asset value.* The present value of the minimum lease payments is greater than or equal to 90% of the fair value of the leased asset on the lease-signing date.

If any one of these criteria is met, the lease is classified as a capital lease by the lessee. For the lessor, the lease is a capital lease if, in addition to one of the general criteria, both of the revenue recognition criteria are met:

- *Collection* of the minimum lease payments is reasonably assured.
- The lessor has substantially completed its obligations to the lessee as of the date of the lease signing; no significant work remains to be done.

**5** Properly account for both capital and operating leases from the standpoint of the lessee (asset user).

An operating lease is accounted for as a rental, with the lease payment amount being recognized as rent expense. With a capital lease, an asset and a liability are recognized on the lease-signing date. The asset is subsequently amortized over the lease term or, if the ownership transfer or bargain purchase option criteria are met, over the economic life of the asset. The lease payments are recorded as reductions in the balance of the lease liability, with a part of the payment being classified as interest expense.

**6** Properly account for both capital and operating leases from the standpoint of the lessor (asset owner).

An operating lease is accounted for as a rental, with the lease payment amount being recognized as rent revenue. The lessor continues to depreciate the leased asset.

For a lessor, there are two types of capital leases: direct financing leases and sales-type leases. With a direct financing

lease, a lease receivable is recognized on the lease-signing date. Interest revenue on the receivable balance is recognized during the lease term. With a sales-type lease, in addition to interest revenue over the life of the lease, a profit is recognized on the lease-signing date equal to the difference between the fair value of the leased asset and its cost.

With operating leases and direct financing leases, initial direct costs are capitalized and amortized over the lease term. With a sales-type lease, initial direct costs are immediately recognized as a reduction in the sale profit.

**7** Prepare and interpret the lease disclosures required of both lessors and lessees.

Required disclosures for lessees include the following:

- Gross amount and accumulated amortization associated with assets leased under capital leases
- Rental expense associated with operating leases
- Schedule of future minimum lease payments for both capital and operating leases

Required disclosures for lessors include the following:

- Schedule of future minimum lease payments to be received for both capital and operating leases
- Cost and accumulated depreciation of assets leased to others under operating leases

**8** Compare the treatment of accounting for leases in the United States with the requirements of international accounting standards.

IAS 17 does not include specific lease classification criteria; instead, it states that a capital lease is “a lease that transfers substantially all the risks and rewards incident to ownership of an asset.” A proposal is now circulating internationally that suggests that all leases longer than one year should be capitalized.

EM

**EXPANDED MATERIAL****9 Record a sale-leaseback transaction for both a seller-lessee and a purchaser-lessor.**

A sale-leaseback is a transaction in which one party sells an asset to another, and

then the first party immediately leases the asset back and continues to use it. Apart from a couple of exceptions, any gain realized on a sale-leaseback by the seller-lessee is deferred and amortized over the life of the lease. A loss on the sale is recognized immediately.

**FASB-IASB CODIFICATION SUMMARY**

Topic	FASB Accounting Standards Codification	Original FASB Standard	Corresponding IASB Standard	Differences between U.S. GAAP and IFRS
Lease classification criteria	Section 840-10-25 par. 1	SFAS No. 13 par. 7	IAS 17 par. 8-10	In substance, the standards are the same. IFRS provides less detail.
Lease discount rate (for lessees)	Section 840-10-25 par. 31	SFAS No. 13 par. 7	IAS 17 par. 20	In IFRS, no explicit mention is made of using the lower of the implicit rate or the incremental borrowing rate. Instead, the implicit rate is to be used if known.
Revenue recognition criteria (for lessor)	Section 840-10-25 par. 42	SFAS No. 13 par. 8	IAS 17 par. 42	Substantially the same. Rather than the two explicit criteria, IFRS merely says that a sale in a sales-type lease is recognized "in accordance with the policy followed by the entity for outright sales."
Initial direct costs (for lessors)	Section 840-20-35 par. 2 Section 840-30-35 par. 23 Section 840-30-25 par. 6	SFAS No. 13 par. 19 SFAS No. 13 par. 18 SFAS No. 13 par. 17	IAS 17 par. 38, 42	No substantial differences
Sale-leaseback accounting	Section 840-40-25 par. 3 Section 840-40-35 par. 1	SFAS No. 13 par. 7	IAS 17 par. 58-63	No substantial differences

## QUESTIONS

1. What are the principal advantages to a lessee in leasing rather than purchasing property?
2. What are the principal advantages to a lessor in leasing rather than selling property?
3. Conceptually, what is the difference between a capital lease and an operating lease?
4. What is a bargain purchase option?
5. How is the lease term measured?
6. (a) What discount rate is used to determine the present value of a lease by the lessee?  
(b) by the lessor?
7. What criteria must be met before a lease can be properly accounted for as a capital lease on the books of the lessee?
8. In determining the classification of a lease, a lessor uses the criteria of the lessee plus two additional criteria. What are these additional criteria, and why are they included in the classification of leases by lessors?
9. What is the basic difference between an operating lease and a capital lease from the viewpoint of the lessee?
10. If an operating lease requires the payment of uneven rental amounts over its life, how should the lessee recognize rental expense?
11. What amount should be recorded as an asset and a liability for capital leases on the books of the lessee?
12. Why do asset and liability balances for capital leases usually differ after the first year?
13. A capitalized lease should be amortized in accordance with the lessee's normal depreciation policy. What time period should be used for lease amortization?
14. The use of the capital lease method for a given lease will always result in a lower net income than the operating lease method. Do you agree? Explain fully.
15. (a) How does a capital lease for equipment affect the lessee's statement of cash flows?  
(b) How would the treatment on the statement of cash flows differ if the contract was identified as a purchase of equipment with a down payment and a long-term note payable for the balance?
16. Distinguish a sales-type lease from a direct financing lease.
17. Unguaranteed residual values accrue to the lessor at the expiration of the lease. How are these values treated in a sales-type lease?
18. Under what circumstances are the minimum lease payments for the lessee different from those of the lessor?
19. Why is the principal portion of a lease receipt of a financing lease treated as an investment inflow on the lessor's books while the principal portion of a lease payment is treated as a financial cash outflow on the lessee's books?
20. Describe the specific lease disclosure requirements for lessees.
21. What disclosures are required by the FASB for lessors under sales-type and direct financing leases?
22. How does the lease classification standard in IAS 17 differ from that in FASB ASC Topic 840?
23. What lease accounting proposal has been circulating among the members of the international accounting community?
24. When should the profit or loss be recognized by the seller-lessee in a sale-leaseback arrangement?

EXPANDED MATERIAL

## PRACTICE EXERCISES

### Practice 15-1

L03

#### Present Value of Minimum Payments

A lease involves payments of \$2,000 per month for two years. The payments are made at the end of each month. The lease also involves a guaranteed residual value of \$20,000 to be paid at the end of the 2-year period. The appropriate interest rate is 12% compounded monthly. Compute the present value of the minimum payments.

### Practice 15-2

L03

#### Computation of Payments

The lessor is computing the appropriate monthly lease payment. The fair value of the leased asset is \$75,000. The guaranteed residual value at the end of the lease term is \$12,000. The appropriate interest rate is 12% compounded monthly. The lease term is 36 months, and the lease payments occur at the end of each month. What is the appropriate amount of the monthly payment?

**Practice 15-3****L03****Computation of Implicit Interest Rate**

A lease involves payments of \$1,000 per month for five years. The payments are made at the end of each month. The lease also involves a guaranteed residual value of \$10,000 to be paid at the end of the 5-year period. The fair value of the leased asset is \$35,000. Compute the interest rate implicit in the lease.

**Practice 15-4****L03****Incremental Borrowing Rate and Implicit Interest Rate**

A lease involves payments of \$16,000 per month for four years. The payments are made at the end of each month. The lease also involves a guaranteed residual value of \$50,000 to be paid at the end of the 4-year period. Compute the present value of the minimum payments (1) using the rate implicit in the lease of 9% compounded monthly and (2) the lessee's incremental borrowing rate of 12% compounded monthly.

**Practice 15-5****L04****Lease Criteria**

The lessor leased equipment to the lessee. The fair value of the equipment is \$246,000. Lease payments are \$35,000 per year, payable at the end of the year, for 10 years. The interest rate implicit in the lease is 9%. At the end of 10 years, the lessor will repossess the equipment. The lease does *not* include a bargain purchase option, and the equipment has a total estimated useful life of 15 years. Is the lease an operating lease or a capital lease? Explain.

**Practice 15-6****L05****Journal Entries for an Operating Lease—Lessee**

On January 1, the lessee company signed an operating lease contract. The lease contract calls for \$3,000 payments at the end of each year for 10 years. The rate implicit in the lease is 10%. Make the journal entries necessary on the books of the lessee company (1) on the lease-signing date and (2) to record the first lease payment.

**Practice 15-7****L05****Operating Lease with Varying Payments—Lessee**

The company is a lessee and signed a 3-year operating lease that calls for a payment of \$20,000 at the end of the first year and payments of \$80,000 at the end of each year for the second and third years. Make the journal entries necessary to record the lease payments at the end of each of the three years.

**Practice 15-8****L05****Journal Entries for a Capital Lease—Lessee**

Refer to Practice 15-6. Assume that the lease is to be accounted for as a capital lease. Also assume that the leased asset is to be amortized over the 12-year asset life rather than the 10-year lease term. Make the journal entries necessary on the books of the lessee company (1) on the lease-signing date and (2) at the end of the first year, including the recording of the first lease payment.

**Practice 15-9****L05****Accounting for a Bargain Purchase Option—Lessee**

A lease involves payments of \$10,000 per year for six years. The payments are made at the end of each year. The lease involves a bargain purchase option of \$6,000 to be exercised at the end of the 6-year period. The total economic life of the leased asset is nine years. The interest rate implicit in the lease is 12% compounded annually. Make the journal entries necessary on the books of the lessee company (1) on the lease-signing date and (2) at the end of the first year, including the recording of the first lease payment.

**Practice 15-10****L05****Purchasing a Leased Asset During the Lease Term—Lessee**

On December 31, the company, a lessee, purchased some machinery that it had been leasing under a capital lease arrangement. The leased asset and lease liability were originally recorded at \$1,000,000. At the time of the purchase, the accumulated amortization on the leased asset was \$400,000, and the remaining balance of the lease liability was \$650,000. The leased asset was purchased for \$720,000 cash. Make the necessary journal entry on the books of the lessee.

**Practice 15-11****L05****Leases on a Statement of Cash Flows—Lessee**

Refer to Practice 15-6. Net income for the year was \$10,000. Except for lease-related items, there were no changes in current operating assets or liabilities during the year, no purchases or sales of property, plant, or equipment, and no dividends paid, stock issued, or loans obtained or repaid. Prepare a complete statement of cash flows using the indirect method of reporting operating cash flow assuming that the lease is accounted for as (1) an operating lease (net income was \$10,000) and (2) a capital lease (net income was \$9,621). (Note: The capital lease entries for the year are made in Practice 15-8.)

**Practice 15-12****L06****Journal Entries for an Operating Lease—Lessor**

On January 1, the lessor company purchased a piece of equipment for \$24,000. The equipment has an expected life of four years with zero salvage value. The lessor company immediately leased the equipment under an operating lease agreement. The lease calls for the lessor company to receive lease payments of \$6,800 per year to be received at the beginning of the year. Make the journal entries necessary on the books of the lessor company to record (1) the purchase of the equipment for cash, (2) the lease signing (including receipt of the first lease payment), and (3) depreciation of the leased equipment.

**Practice 15-13****L06****Journal Entries for a Direct Financing Lease—Lessor**

Refer to Practice 15-12. Assume that the lease is accounted for as a direct financing lease instead of as an operating lease. The interest rate implicit in the lease is 9%. Make the journal entries necessary on the lessor's books to record (1) the signing of the lease, (2) the receipt of the initial \$6,800 lease payment on the lease-signing date, and (3) the recognition of interest revenue at the end of the first year.

**Practice 15-14****L06****Direct Financing Lease with a Residual Value**

On January 1, the lessor company purchased a piece of equipment for \$100,000. The equipment has an expected salvage value of \$3,974; this amount is *not* guaranteed. The lessor company immediately leased the equipment under a direct financing lease agreement. The lease calls for the lessor company to receive annual lease payments of \$15,600 per year for 10 years, to be received at the beginning of the year; at the end of 10 years, the equipment is returned to the lessor company. The interest rate implicit in the lease is 12%. Make the journal entries necessary on the lessor's books to record (1) the signing of the lease, (2) the receipt of the initial \$15,600 lease payment on the lease-signing date, (3) the recognition of interest revenue at the end of the first year, and (4) the journal entry at the end of 10 years to record the final interest revenue accrual and the recovery of the equipment, assuming that the salvage value was equal to its estimated amount. (Hint: Interest revenue in the 10th year is \$426.)

**Practice 15-15****L06****Journal Entries for a Sales-Type Lease—Lessor**

On January 1, the lessor company purchased a piece of equipment for \$7,000 as inventory. The lessor company immediately leased the equipment under a sales-type lease agreement; the cash selling price of the equipment is \$10,000. The lease calls for the lessor company to receive five annual lease payments of \$2,600 per year, to be received at the beginning of the year. The interest rate implicit in the lease is 15%. Make the journal entries necessary on the books of the lessor company to record (1) the lease signing (including receipt of the first lease payment) and (2) the recognition of interest revenue at the end of the first year.

**Practice 15-16****L06****Sales-Type Lease with a Bargain Purchase Option**

On January 1, the lessor company purchased a piece of equipment for \$6,000 as inventory. The lessor company immediately leased the equipment under a sales-type lease agreement. The lease calls for the lessor company to receive five annual lease

payments of \$2,500 per year, to be received at the beginning of the year. In addition to the five annual payments of \$2,500 at the beginning of each year, the lessor is to receive a bargain purchase option amount of \$500 at the end of five years. The interest rate implicit in the lease is 12%. Make the journal entries necessary on the books of the lessor company to record (1) the lease signing (including receipt of the first lease payment) and (2) the recognition of interest revenue at the end of the first year.

**Practice 15-17****L06****Sales-Type Lease with an Unguaranteed Residual Value**

Refer to Practice 15-16. Assume the same facts except that the \$500 bargain purchase option is instead a \$500 *unguaranteed* residual value. Make the journal entries necessary on the books of the lessor company to record (1) the lease signing (including receipt of the first lease payment) and (2) the recognition of interest revenue at the end of the first year.

**Practice 15-18****L05, L06****Third-Party Guarantees of Residual Value**

On January 1, the lessor company purchased a piece of equipment for \$9,000 as inventory. The lessor company immediately leased the equipment under a sales-type lease agreement. The lease calls for the lessor company to receive six annual lease payments of \$3,000 per year, to be received at the beginning of the year. In addition to the six annual payments of \$3,000 at the beginning of each year, the lessor is to receive a *guaranteed* residual value of \$4,000 at the end of six years. The fair value on the date of the lease signing is equal to the present value of the lessor's minimum payments; the interest rate implicit in the lease is 11%. The equipment has a useful life of 10 years, there is no bargain purchase option, and the title does not transfer at the end of the lease term. Also, the residual value is guaranteed by a third-party insurance company, not by the lessee company. Make the journal entries necessary to record the lease signing, including the first lease payment, (1) on the books of the *lessor* company and (2) on the books of the *lessee* company.

**Practice 15-19****L06****Selling a Leased Asset During the Lease Term—Lessor**

On December 31 of Year 1, the company, a lessor, sold some machinery that it had been leasing under a direct financing lease arrangement. On January 1 of Year 1 (after receipt of the lease payment for the year), the following account balances were associated with the lease:

Gross Lease Payments Receivable . . . . .	\$234,000
Unearned Interest Revenue . . . . .	40,000
Present Value of Lease Payments Receivable . . . . .	<u>\$194,000</u>

The interest rate implicit in the lease is 10%. The leased machinery is sold for \$130,000 cash. Make the journal entry or entries necessary on the books of the lessor to record this sale. (*Note:* Don't forget any necessary year-end adjustment.)

**Practice 15-20****L06****Leases on a Statement of Cash Flows—Lessor**

On January 1, the lessor company purchased some equipment (for cash) that the company then immediately leased. The lease contract calls for the receipt of \$5,000 payments at the end of each year for eight years. The residual value of the equipment at the end of the 8-year lease term is expected to be \$6,500. The rate implicit in the lease is 13%. Except for lease-related items, there were no changes in current operating assets or liabilities during the year; no purchases or sales of property, plant, or equipment; and no dividends paid, stock issued, or loans obtained or repaid. The equipment has a total useful life of 12 years with no salvage value. Prepare a complete statement of cash flows for the lessor using the indirect method of reporting operating cash flow assuming that the lease is accounted for as (1) an operating lease (net income was \$30,000) and (2) a direct financing lease (net income was \$30,640).

**Practice 15-21****L05, L07****Debt-to-Equity Ratio Adjusted for Operating Leases**

As of December 31, the company has total assets of \$10,000 and total liabilities of \$4,000. Future minimum payments on operating leases for which the company is the lessee are \$600 per year for the next 15 years. Assume that the lease payments occur at the end of the year. The appropriate discount rate is 8%. Calculate (1) the company's debt-to-equity ratio using its reported numbers and (2) the company's debt-to-equity ratio assuming that the operating leases were accounted for as capital leases.

EM	EXPANDED MATERIAL
----	-------------------

**Practice 15-22****L09****Sale-Leaseback Transactions—Lessor and Lessee**

On January 1, Seller-Lessee sold a building to Buyer-Lessor for \$200,000. The building had originally cost Seller-Lessee \$230,000 and had accumulated depreciation of \$70,000 on the date of the sale. On the day of the sale, Seller-Lessee leased the building back from Buyer-Lessor. The lease calls for annual lease payments of \$23,750 at the end of each year for the next 25 years. The interest rate implicit in the lease is 11%. On January 1, the building had a fair value of \$200,000 and a remaining useful life of 25 years (with zero expected salvage value). Make all lease-related journal entries necessary for the year on the books of (1) Seller-Lessee and (2) Buyer-Lessor.

**EXERCISES****Exercise 15-23****L04****Criteria for Capitalizing Leases**

Atwater Manufacturing Co. leases its equipment from Westside Leasing Company. In each of the following cases, assuming none of the other criteria for capitalizing leases are met, determine whether the lease would be a capital lease or an operating lease under FASB ASC Topic 840. Your decision is to be based only on the terms presented, considering each case independently of the others.

- (a) At the end of the lease term, the market value of the equipment is expected to be \$20,000. Atwater has the option of purchasing it for \$5,000.
- (b) The fair value of the equipment is \$75,000. The present value of the lease payments is \$67,000 (excluding any executory costs).
- (c) Ownership of the property automatically passes to Atwater at the end of the lease term.
- (d) The economic life of the equipment is 12 years. The lease term is 8 years.
- (e) The lease requires payments of \$9,000 per year in advance plus executory costs of \$500 per year. The lease period is three years, and Atwater's incremental borrowing rate is 12%. The fair value of the equipment is \$28,000.
- (f) The lease requires payments of \$6,000 per year in advance, which includes executory costs of \$500 per year. The lease period is three years, and Atwater's incremental borrowing rate is 10%. The fair value of the equipment is \$16,650.

**Exercise 15-24****L05, L06****Entries for Lease—Lessor and Lessee**

Doxey Company purchased a machine on January 1, 2013, for \$2,500,000 for the express purpose of leasing it. The machine was expected to have a 9-year life from January 1, 2013, no salvage value, and to be depreciated on a straight-line basis. On March 1, 2013, Doxey leased the machine to Mondale Company for \$600,000 a year for a 4-year period ending February 28, 2017. The appropriate interest rate is 12% compounded annually. Doxey paid a total of \$30,000 for maintenance, insurance, and property taxes on the machine for the year ended December 31, 2013. Mondale paid \$600,000 to Doxey on March 1, 2013. Doxey retains title to the property and plans to lease it to someone else after the 4-year lease period. Give all the 2013 entries relating to the lease on (1) Doxey Company's books and (2) Mondale Company's books. Assume both sets of books are maintained on the calendar-year basis.

**Exercise 15-25****L05****SPREADSHEET****Entries for Operating Lease—Lessee**

Mighty Inc. leases some of the equipment it uses. The lease term is five years, and the lease payments are to be made in advance as shown in the following schedule.

January 1, 2013 .....	\$ 60,000
January 1, 2014 .....	60,000
January 1, 2015 .....	90,000
January 1, 2016 .....	110,000
January 1, 2017 .....	140,000
Total .....	<u>\$460,000</u>

The equipment is to be used evenly over the 5-year period. For each of the five years, give the entry that should be made at the time the lease payment is made to allocate the proper share of rent expense to each period. The lease is classified as an operating lease by Mighty Inc.

**Exercise 15-26****L05****Entries for Lease—Lessee**

Bingham Smelting Company entered into a 15-year noncancelable lease beginning January 1, 2013, for equipment to use in its smelting operations. The term of the lease is the same as the expected economic life of the equipment. Bingham uses straight-line depreciation for all plant assets. The provisions of the lease call for annual payments of \$290,000 in advance plus \$20,000 per year to cover executory costs, such as taxes and insurance, for the 15-year period of the lease. At the end of the 15 years, the equipment is expected to be scrapped. The incremental borrowing rate of Bingham is 10%. The lessor's computed implicit interest rate is unknown to Bingham.

Record the lease on the books of Bingham and give all the entries necessary to record the lease for its first year plus the entry to record the second lease payment on December 31, 2013. (Note: Round to the nearest dollar.)

**Exercise 15-27****L05****Entries for Lease—Lessee**

On January 2, 2013, Jacques Company entered into a noncancelable lease for new equipment. The equipment was built to Jacques Company's specifications and is in an area in which rental to another lessee would be difficult. Rental payments are \$600,000 a year for 10 years, payable in advance. The equipment has an estimated economic life of 20 years. The taxes, maintenance, and insurance are to be paid directly by Jacques Company, and the title to the equipment is to be transferred to Jacques at the end of the lease term. Assume the cost of borrowing funds for this type of an asset by Jacques Company is 12%.

1. Give the entry on Jacques' books that should be made at the inception of the lease.
2. Give the entries for 2013 and 2014, assuming the second payment and subsequent payments are made on December 31 and assuming double-declining-balance amortization.

**Exercise 15-28****L05, L07****SPREADSHEET****Schedule of Lease Payments**

Stagg Construction Co. is leasing equipment from Cloud Inc. The lease calls for payments of \$50,000 a year plus \$3,000 a year executory costs for five years. The first payment is due on January 1, 2013, when the lease is signed, with the other four payments coming due on December 31 of each year. Stagg has also been given the option of purchasing the equipment at the end of the lease at a bargain price of \$95,000. Stagg has an incremental borrowing rate of 9%, the same as the implicit interest rate of Cloud. Stagg has hired you as an accountant and asks you to prepare a schedule showing how the lease payments will be split between principal and interest and the outstanding lease liability balance over the life of the lease.

**Exercise 15-29****L05****Entry for Purchase by Lessee**

Cordon Enterprise Company leases many of its assets and capitalizes most of the leased assets. At December 31, the company had the following balances on its books in relation to a piece of specialized equipment:

Leased Equipment .....	\$80,000
Accumulated Amortization—Leased Equipment .....	49,300
Obligations under Capital Leases .....	26,000

Amortization has been recorded up to the end of the year, and no accrued interest is involved. At December 31, Cordon decided to purchase the equipment for \$32,000 and paid cash to complete the purchase. Give the entry required on Cordon's books to record the purchase.

**Exercise 15-30****L06****Entry for Sale by Lessor**

Smithston Corporation leased equipment to Dayplanner Co. on January 1, 2013. The terms of the lease called for annual lease payments to be made at the first of each year. Smithston's implicit interest rate for the transaction is 12%. On July 1, 2015, Dayplanner purchased the equipment and paid \$116,000 to complete the transaction. After the 2015 payment was made, the following balance relating to the leased equipment was on the books of Smithston as of January 1, 2015:

Lease Payments Receivable (net) .....	\$151,500
---------------------------------------	-----------

Prepare the journal entry that should be made by Smithston to record the sale, including the accrual of interest through July 1.

**Exercise 15-31****L03, L06****Computation of Implicit Interest Rate**

Moor Leasing leases equipment to Wong Manufacturing. The fair value of the equipment is \$527,169. Lease payments, excluding executory costs, are \$60,000 per year, payable in advance, for 15 years. What is the implicit rate of interest Moor Leasing should use to record this capital lease on its books?

**Exercise 15-32****L06****Direct Financing Lease—Lessor**

Deseret Finance Company purchased a printing press to lease to Quality Printing Company. The lease was structured so that at the end of the lease period of 15 years, Quality would own the printing press. Lease payments required in this lease were \$190,000 (excluding executory costs) per year, payable in advance. The cost of the press to Deseret was \$1,589,673, which is also its fair value at the time of the lease.

1. Why is this a direct financing lease?
2. Give the entry to record the lease transaction on the books of Deseret Finance Company.
3. Give the entry at the end of the first year on Deseret Finance Company's books to recognize interest revenue.

**Exercise 15-33****L06****SPREADSHEET****Direct Financing Lease with Residual Value**

Massachusetts Casualty Insurance Company decides to enter the leasing business. It acquires a specialized packaging machine for \$600,000 cash and leases it for a period of six years, after which the machine is to be returned to the insurance company for disposition. The expected unguaranteed residual value of the machine is \$40,000. The lease terms are arranged so that a return of 12% is earned by the insurance company.

1. Calculate the annual lease payment, payable in advance, required to yield the desired return.
2. Prepare entries for the lessor for the first year of the lease, assuming the machine is acquired and the lease is recorded on January 1, 2013. The first

lease payment is made on January 1, 2013, and subsequent payments are made each December 31.

3. Assuming that the packaging machine is sold by Massachusetts to the lessee at the end of the six years for \$58,000, give the required entry to record the sale.

**Exercise 15-34****L06****Table for Direct Financing Lease—Lessor**

Wenville Savings and Loan Company acquires a piece of specialized manufacturing equipment for \$2,000,000 that it leases on January 1, 2013, to a local factory for \$466,646 per year, payable in advance. Because of rapid technological developments, the equipment is expected to be replaced after four years. It is expected that the machine will have a residual value of \$450,000 to Wenville Savings at the end of the lease term. The implicit rate of interest in the lease is 8%.

1. Prepare a 4-year table for Wenville Savings and Loan similar to Exhibit 15-8.
2. How would the table differ if the local factory guaranteed the residual value to Wenville?

**Exercise 15-35****L05****Capital Lease with Guaranteed Residual Value—Lessee**

Mario Automobile Company leases automobiles under the following terms. A 3-year lease agreement is signed in which the lessor receives annual rental of \$4,000 (in advance). At the end of the three years, the lessee agrees to make up any deficiency in residual value below \$3,500. The cash price of the automobile is \$13,251. The implicit interest rate is 12%, which is known to the lessee, and the lessee's incremental borrowing rate is 14%. The lessee estimates the residual value at the end of three years to be \$4,200 and depreciates its automobiles on a straight-line basis.

1. Give the entries on the lessee's books required in the first year of the lease, including the second payment on April 30, 2014. Assume the lease begins May 1, 2013, the beginning of the lessee's fiscal year.
2. What balances relative to the lease would appear on the lessee's balance sheet at the end of Year 3?
3. Assume that at the end of the three years, the automobile is sold by the lessee (with the permission of the lessor) for \$3,800. Prepare the entries to record the sale and settlement with the lessor.

**Exercise 15-36****L06****Sales-Type Lease—Lessor**

Salcedo Co. leased equipment to Erickson Inc. on April 1, 2013. The lease, appropriately recorded as a sale by Salcedo, is for an 8-year period ending March 31, 2019. The first of eight equal annual payments of \$350,000 (excluding executory costs) was made on April 1, 2013. The cost of the equipment to Salcedo is \$1,880,000. The equipment has an estimated useful life of eight years with no residual value expected. Salcedo uses straight-line depreciation and takes a full year's depreciation in the year of purchase. The cash selling price of the equipment is \$2,053,800.

1. Give the entry required to record the lease on Salcedo's books.
2. How much interest revenue will Salcedo recognize in 2013?

**Exercise 15-37****L06****Sales-Type Lease—Lessor**

Loco Leasing and Manufacturing Company uses leases as a means of financing sales of its equipment. Loco leased a machine to Potomac Construction for \$15,000 per year, payable in advance, for a 10-year period. The cost of the machine to Loco was \$86,000. The fair value at the date of the lease was \$100,000. Assume a residual value of \$0 at the end of the lease.

1. Give the entry required to record the lease on Loco's books.
2. How much profit will Loco recognize initially on the lease, excluding any interest revenue?
3. How much interest revenue would be recognized in the first year?

**Exercise 15-38****L05, L06****Effect of Lease on Reported Income—Lessee and Lessor**

On February 20, 2013, Hudson Inc. purchased a machine for \$2,100,000 for the purpose of leasing it. The machine is expected to have a 12-year life, has no residual value, and is depreciated on the straight-line basis to the nearest month. The machine was leased to Donah Company on March 1, 2013, for a 5-year period at a monthly rental of \$34,000. Assume that the lease payments are made at the end of the month and that the appropriate interest rate is 11% compounded monthly. There is no provision for the renewal of the lease or purchase of the machine by the lessee at the expiration of the lease term. Hudson paid \$72,000 of commissions associated with negotiating the lease in February 2013.

1. What expense should Donah record as a result of the lease transaction for the year ended December 31, 2013?
2. What income or loss before income taxes should Hudson record as a result of the lease transaction for the year ended December 31, 2013?

**Exercise 15-39****L05, L07****Cash Flow Treatment of Capital Leases—Lessee**

The following information relates to a capital lease between Glass Electric Co. (lessee) and Williams Manufacturing Inc. (lessor). The lease term began on January 1, 2013. Glass capitalized the 10-year lease and recorded \$150,000 as an asset. The annual lease payment, made at the beginning of each year, is \$22,193 at 10% interest. Glass uses the straight-line method to depreciate its owned assets. How will this lease be reported on Glass' statement of cash flows for 2013 if the second lease payment is made on December 31, 2013, and Glass uses the indirect method?

**Exercise 15-40****L06****Cash Flow Treatment of Capital Leases—Lessor**

On January 1, 2013, Warr Delivery Company purchased some equipment for \$64,768 in cash. Warr Delivery immediately leased the equipment; Warr Delivery is the lessor. The lease contract calls for the receipt of \$14,000 payments at the end of each year for five years. The residual value of the equipment at the end of the 5-year lease term is expected to be \$15,868. The rate implicit in the lease is 9%. Except for lease-related items, there were no changes in current operating assets or liabilities during the year; no purchases or sales of property, plant, or equipment; and no dividends paid, stock issued, or loans obtained or repaid. The equipment has a total useful life of eight years with no salvage value. Prepare a complete statement of cash flows for Warr Delivery for 2013 using the indirect method of reporting operating cash flow assuming that the lease is accounted for as (1) an operating lease (net income was \$70,000), (2) a direct financing lease (net income was \$69,925), and (3) a sales-type lease (net income was \$69,925; for comparability, make the unreasonable assumption that sales and cost of good sold are the same amount).

**Exercise 15-41****L05, L07****Lease Disclosures—Lessee**

The following lease information was obtained by a staff auditor for a client, Kroller Inc., at December 31, 2013. Indicate how this information should be presented in Kroller's 2-year comparative financial statements. Include any notes to the statements required to meet generally accepted accounting principles. Lease payments are made on December 31 of each year.

Leased building; minimum lease payments per year; 10 years remaining life on December 31, 2012 .....	\$ 45,000
Executory costs per year .....	2,000
Capitalized lease value, 12% interest .....	343,269
Accumulated amortization of leased building at December 31, 2013 .....	114,423
Amortization expense for 2013 .....	22,885
Obligations under capital leases; balance at December 31, 2013 .....	239,770
Obligations under capital leases; balance at December 31, 2012 .....	254,259

**Exercise 15-42****L05, L07**

SPREADSHEET

**Lease Disclosure on the Financial Statements**

Acme Enterprises leased equipment from Monument Equipment Co. on January 1, 2013. The terms of the lease agreement require five annual payments of \$20,000 with the first payment being made on January 1, 2013, and each subsequent payment being made on December 31 of each year. Because the equipment has an expected useful life of five years, the lease qualifies as a capital lease for Acme. Acme does not know Monument's implicit interest rate and therefore uses its own incremental borrowing rate of 12% to calculate the present value of the lease payments. Acme uses the sum-of-the-years'-digits method for amortizing leased assets. The expected salvage value of the leased asset is \$0.

1. Prepare a schedule that shows the lease obligation balance in each year of the lease.
2. Prepare an asset amortization schedule for the leased asset.
3. Compare the amount shown on the year-end balance sheet for the leased asset with that of the lease obligation for the years 2013 through 2017 and explain why the amounts differ.

**Exercise 15-43****L05, L07****Impact of Capitalizing the Value of Operating Leases**

The following information comes from the 2013 financial statements of Jessica Hatch Company:

Total liabilities . . . . .	\$250,000
Total stockholders' equity . . . . .	110,000

In addition, Jessica Hatch has a large number of operating leases. The future payments on these operating leases are disclosed in the notes to the financial statements as follows:

Year	Payment
2014 . . . . .	\$ 30,000
2015 . . . . .	30,000
2016 . . . . .	30,000
2017 . . . . .	30,000
2018 . . . . .	30,000
Thereafter . . . . .	330,000

All of these lease payments occur at the end of the year. The incremental borrowing rate of Jessica Hatch Company is 10%. This is also the implicit rate in all of the leases that Jessica Hatch signs.

1. Compute the debt-to-equity ratio (total liabilities/total equity).
2. Compute the debt ratio (total liabilities/total assets).
3. Assuming that Jessica Hatch's operating leases are accounted for as capital leases, compute the debt-to-equity ratio.
4. Assuming that Jessica Hatch's operating leases are accounted for as capital leases, compute the debt ratio.

<b>EM</b>	<b>EXPANDED MATERIAL</b>
-----------	--------------------------

**Exercise 15-44****L09****Sale-Leaseback Accounting**

On July 1, 2013, Flashlight Corporation sold equipment it had recently purchased to an unaffiliated company for \$480,000. The equipment had a book value on Flashlight's books of \$390,000 and a remaining life of six years. On that same day, Flashlight leased back the equipment at \$95,000 per year, payable in advance, for a

6-year period. Flashlight's incremental borrowing rate is 11%, and it does not know the lessor's implicit interest rate. What entries are required for Flashlight to record the transactions involving the equipment during the first full year, assuming the second lease payment is made on June 30, 2014? Ignore consideration of the lessee's fiscal year. The lessee uses the double-declining-balance method of depreciation for similar assets it owns outright.

**Exercise 15-45****Sale-Leaseback Transaction****L09**

Smalltown Grocers sold its plant facilities to United Grocers, Inc., for \$813,487. United immediately leased the building back to Smalltown for 20 annual payments of \$96,000 with the first payment due immediately. The terms of the lease agreement provide a bargain purchase option wherein Smalltown has the option of purchasing the building at the end of the lease term for \$100,000. If United's implicit interest rate is 12% (lower than Smalltown's incremental borrowing rate), prepare the entries that should be made by United to record the purchase of the building and the receipt of the first two payments from Smalltown Grocers, assuming this leasing arrangement qualifies as a capital lease for United.

**PROBLEMS****Problem 15-46****Entries for Capital Lease—Lessee; Lease Criteria****L04, L05**

Extractor Company leased a machine on July 1, 2013, under a 10-year lease. The economic life of the machine is estimated to be 15 years. Title to the machine passes to Extractor Company at the expiration of the lease, and thus, the lease is a capital lease. The lease payments total \$194,000 per year (which includes executory costs of \$6,000 per year), all payable in advance annually. The incremental borrowing rate of the company is 9%, and the lessor's implicit interest rate is unknown. Extractor Company uses the straight-line method of amortization and the calendar year for reporting purposes.

**Instructions:**

1. Give all entries on the books of the lessee relating to the lease for 2013.
2. Assume that the lessor retains title to the machine at the expiration of the lease, that there is no bargain renewal or purchase option, and that the fair value of the equipment is \$1,420,000 as of the lease date. Using the criteria for distinguishing between operating and capital leases according to FASB ASC Topic 840, what would be the amortization expense for 2013?

**Problem 15-47****Operating Lease—Lessee and Lessor****L05, L06**

York Industries leases a large specialized machine to Echo Company at a total rental of \$1,400,000, payable in five annual installments in the following declining pattern: 24% in the first two years, 20% in the third and fourth years, and 12% in the last year. The lease begins January 1, 2013. In addition to the rent, Echo is required to pay annual executory costs of \$18,000 to cover unusual repairs and insurance. The lease does not qualify as a capital lease for reporting purposes. York incurred initial direct costs of \$18,000 in obtaining the lease. The machine cost York \$1,900,000 to construct and has an estimated life of eight years with an estimated residual value of \$120,000. York uses the straight-line depreciation method on its equipment. Both companies report on a calendar-year basis.

**Instructions:**

1. Prepare the journal entries on York's books for 2013 and 2017 related to the lease.
2. Prepare the journal entries on Echo's books for 2013 and 2017 related to the lease.

**Problem 15-48****L05****Entries for Capital Lease—Lessee**

Aldridge Enterprises has a long-standing policy of acquiring company equipment by leasing. Early in 2013, the company entered into a lease for a new milling machine. The lease stipulates that annual payments will be made for five years. The payments are to be made in advance on December 31 of each year. At the end of the 5-year period, Aldridge may purchase the machine. Company financial records show the incremental borrowing rate to be less than the implicit interest rate. The estimated economic life of the equipment is 12 years. Aldridge uses the calendar year for reporting purposes and straight-line depreciation for other equipment. In addition, the following information about the lease is also available:

Annual lease payments . . . . .	\$55,000
Purchase option price . . . . .	\$25,000
Estimated fair value of machine after five years . . . . .	\$75,000
Incremental borrowing rate . . . . .	10%
Date of first lease payment . . . . .	Jan. 1, 2013

**Instructions:**

1. Compute the amount to be capitalized as an asset for the lease of the milling machine.
2. Prepare a schedule that shows the computation of the interest expense for each period.
3. Give the journal entries that would be made on Aldridge's books for the first two years of the lease.
4. Assume that the purchase option is exercised at the end of the lease. Give the Aldridge journal entry necessary to record the exercise of the option. The actual fair value of the milling machine at the end of the lease is \$95,000. On the date the purchase option is exercised, the undiscounted sum of future cash flows expected from the machine is \$125,000.

**Problem 15-49****L05****Entries for Capital Lease—Lessee; Guaranteed Residual Value**

For some time, Ulrich Inc. has maintained a policy of acquiring company equipment by leasing. On January 1, 2013, Ulrich entered into a lease with Riverbottoms Fabricators for a new concrete truck that had a selling price of \$315,000. The lease stipulates that annual payments of \$61,800 will be made for six years. The first lease payment is made on January 1, 2013, and subsequent payments are made on December 31 of each year. Ulrich guarantees a residual value of \$33,535 at the end of the 6-year period. Ulrich has an incremental borrowing rate of 11%, and the implicit interest rate to Riverbottoms is 10% after considering the guaranteed residual value. The economic life of the truck is eight years. Ulrich uses the calendar year for reporting purposes and straight-line depreciation to depreciate other equipment.

**Instructions:**

1. Compute the amount to be capitalized as an asset on the lessee's books for the concrete truck. Ulrich knows that Riverbottoms' implicit interest rate is 10%.
2. Prepare a schedule showing the reduction of the liability by the annual payments after considering the interest charges.
3. Give the journal entries that would be made on Ulrich's books for the first two years of the lease.
4. Assume that the lessor sells the truck for \$24,000 at the end of the 6-year period to a third party. Give the Ulrich journal entries necessary to record the payment to satisfy the residual guarantee and to write off the leased equipment accounts.

**Problem 15-50****L05, L06****Accounting for Direct Financing Lease—Lessee and Lessor**

Trost Leasing Company buys equipment for leasing to various manufacturing companies. On October 1, 2012, Trost leases a press to Shumway Shoe Company. The cost of the machine to Trost was \$392,220, which approximated its fair value on the lease date. The lease payments stipulated in the lease are \$66,000 per year in advance for the 10-year period of the lease. The payments include executory costs of \$6,000 per year. The expected economic life of the equipment is also 10 years. The title to the equipment remains in the hands of Trost Leasing Company at the end of the lease term, although only nominal residual value is expected at that time. Shumway's incremental borrowing rate is 10%, and it uses the straight-line method of depreciation on all owned equipment. Both Shumway and Trost have fiscal years ending September 30, and lease payments are made on this date.

**Instructions:**

1. Prepare the entries to record the lease and the first lease payment on the books of the lessor and lessee, assuming the lease meets the criteria of a direct financing lease for the lessor and a capital lease for the lessee.
2. Compute the implicit rate of interest of the lessor.
3. Give all entries required to account for the lease on both the lessee's and lessor's books for the fiscal years 2013, 2014, and 2015.

**Problem 15-51****L05, L06****Lease Computations—Lessee and Lessor**

Enco Tech Corporation is in the business of leasing new sophisticated satellite systems. As a lessor of satellites, Enco Tech purchased a new system on December 31, 2013. The system was delivered the same day (by prior arrangement) to Ocular Investment Company, a lessee. The corporation accountant revealed the following information relating to the lease transaction:

Cost of system to Enco Tech . . . . .	\$840,000
Estimated useful life and lease term . . . . .	6 years
Expected residual value (unguaranteed) . . . . .	\$60,000
Enco Tech's implicit rate of interest . . . . .	12%
Ocular's incremental borrowing rate . . . . .	14%
Date of first lease payment . . . . .	Dec. 31, 2013

Additional information is as follows:

- (a) At the end of the lease, the system will revert to Enco Tech.
- (b) Ocular is aware of Enco Tech's rate of implicit interest.
- (c) The lease rental consists of equal annual payments.
- (d) Enco Tech accounts for leases using the direct financing method. Ocular intends to record the lease as a capital lease. Both the lessee and the lessor report on a calendar-year basis and elect to depreciate all assets on the straight-line basis.

**Instructions:**

1. Compute the annual lease payment under the lease. (Note: Round to the nearest dollar.)
2. Compute the amounts of the lease payments receivable that Enco Tech should recognize at the inception of the lease.
3. What are the total expenses related to the lease that Ocular should record for the year ended December 31, 2014?

**Problem 15-52****L06****Sales-Type Lease—Lessor**

Aquatran Incorporated uses leases as a method of selling its products. In early 2013, Aquatran completed construction of a passenger ferry for use between Manhattan and Staten Island. On April 1, 2013, the ferry was leased to the Manhattan Ferry Line on a

contract specifying that ownership of the ferry will transfer to the lessee at the end of the lease period. Annual lease payments do not include executory costs. Other terms of the agreement are as follows:

Original cost of the ferry . . . . .	\$1,500,000
Fair value of ferry at lease date . . . . .	\$2,107,102
Lease payments (paid in advance) . . . . .	\$225,000
Estimated residual value . . . . .	\$78,000
Incremental borrowing rate—lessee . . . . .	10%
Date of first lease payment . . . . .	April 1, 2013
Lease period . . . . .	20 years

**Instructions:**

1. Compute the amount of financial revenue that will be earned over the lease term and the manufacturer's profit that will be earned immediately by Aquatran.
2. Give the entry to record the signing of the lease on Aquatran's books. Compute the implicit rate of interest on the lease.
3. Give the journal entries necessary on Aquatran's books to record the lease for the first three years, exclusive of the initial entry. Aquatran's accounting period is the calendar year.
4. Indicate the balance of Lease Payments Receivable at December 31, 2015.

**Problem 15-53**

**L06**

**Sales-Type Lease—Lessor**

New World Enterprises adopted the policy of leasing as the primary method of selling its products. The company's main product is a small jet airplane that is very popular among corporate executives. New World constructed such a jet for Corporate Air Company (CAC) at a cost of \$6,456,239. Financing of the construction was at a 12% rate. The terms of the lease provided for annual advance payments of \$985,630 to be paid over 15 years with the ownership of the airplane transferring to CAC at the end of the lease period. It is estimated that the plane will have a residual value of \$950,000 at that date. The lease payments began on October 1, 2013. New World incurred initial direct costs of \$100,000 in finalizing the lease agreement with CAC. The sales price of similar airplanes is \$7,867,200.

**Instructions:**

1. Compute the amount of manufacturer's profit that will be earned immediately by New World.
2. Prepare the journal entry to record the lease on New World's books at October 1, 2013.
3. Prepare the journal entries to record the lease on New World's books for the years 2013–2015 exclusive of the initial entry. New World's accounting period is the calendar year.
4. How much revenue did New World earn from this lease for each of the first three years of the lease?

**Problem 15-54**

**L05, L06**

**Entries for Capital Lease—Lessee and Lessor**

Alta Corporation entered into an agreement with Snowfire Company to lease equipment for use in its ski manufacturing facility. The lease is appropriately recorded as a purchase by Alta and as a sale by Snowfire. The agreement specifies that lease payments will be made on an annual basis. The cost of the machine is reported as inventory on Snowfire's accounting records. Because of extensive changes in ski manufacturing technology, the machine is not expected to have any residual value. Alta uses straight-line depreciation and computes depreciation to the nearest month. After three years, Alta purchases the machine from Snowfire.

Annual lease payments do not include executory costs. Other terms of the agreement are as follows:

Machine cost recorded in inventory . . . . .	\$3,700,000
Price at purchase option date . . . . .	\$3,250,000
Lease payments (paid in advance) . . . . .	\$710,000
Contract interest rate . . . . .	10%
Contract date/first lease payment . . . . .	Oct. 1, 2013
Date of Alta purchase . . . . .	Oct. 1, 2016
Lease period. . . . .	8 years

**Instructions:** Prepare journal entries on the books of both the lessee and the lessor as follows:

1. Make entries in 2013 to record the first lease payment, and make adjustments necessary at December 31, the end of each company's fiscal year.
2. Record all entries required in 2014.
3. Prepare the entries in 2016 to record the sale (on Snowfire's books) and purchase (on Alta's books), assuming that no previous entries have been made during the year in connection with the lease.

#### Problem 15-55

L05, L06

#### Accounting for Capital Lease—Lessee and Lessor

Mullen Equipment Company both leases and sells its equipment to its customers. The most popular line of equipment includes a machine that costs \$280,000 to manufacture. The standard lease terms provide for five annual payments of \$110,000 each (excluding executory costs), with the first payment due when the lease is signed and subsequent payments due on December 31 of each year. The implicit rate of interest in the contract is 10% per year. Walton Tool Co. leases one of these machines on January 2, 2013. Initial direct costs of \$20,000 are incurred by Mullen on January 2, 2013, to obtain the lease. Walton's incremental borrowing rate is determined to be 12%. The equipment is very specialized, and it is assumed it will have no salvage value after five years. Assume that the lease qualifies as a capital lease and a sales-type lease for lessee and lessor, respectively. Also assume that both the lessee and the lessor are on a calendar-year basis and that the lessee is aware of the lessor's implicit interest rate.

**Instructions:**

1. Give all entries required on Walton's books to record the lease of equipment from Mullen for the year 2013. The depreciation on owned equipment is computed once a year on the straight-line basis.
2. Give entries required on Mullen's books to record the lease of equipment to Walton for the year 2013.
3. Prepare the balance sheet section involving lease balances for both the lessee's and lessor's financial statements at December 31, 2013.
4. Determine the amount of expense Walton will report relative to the lease for 2013 and the amount of revenue Mullen will report for the same period.

#### Problem 15-56

L05, L06, L07

#### Accounting for Leases—Lessee and Lessor with Third-Party Guarantee

Atwater Equipment Co. manufactures, sells, and leases heavy construction equipment. England Construction Company, a regular customer, leased equipment on July 1, 2013, that had cost Atwater \$252,000 to manufacture. The lease payments are \$63,161, beginning on July 1, 2013, and continuing annually with the last payment being made on July 1, 2017. If England were to purchase the equipment outright, the fair value would be \$291,881. Because of the heavy wear expected on construction equipment, the lease contains a guaranteed residual value clause wherein the lessee guarantees a residual value on June 30, 2018, of \$65,000. England contracted with Weathertop Financial Services to serve as a third-party guarantor of the residual value. Atwater's implicit interest rate is 12%, which is lower than England's incremental borrowing rate of 14%.

**Instructions:**

1. Assuming that the equipment reverts to Atwater upon completion of the lease term and that the equipment has an expected useful life of 10 years, prepare the entries that should be made on the books of both Atwater and England in recording the lease on July 1, 2013. (Note: England knows the implicit interest rate for the lease.)
2. Prepare the journal entries that should be made by Atwater and England on July 1, 2014. Ignore fiscal year considerations.
3. What financial statement disclosure should be made by Weathertop in its role as a third-party guarantor?

**Problem 15-57****L05, L06****Accounting for Lease—Lessee and Lessor**

Gryphon Manufacturing Company manufactures and leases a variety of items. On January 2, 2013, Gryphon leased a piece of equipment to Scissor Industries Co. The lease is for seven years for an annual amount of \$43,500, payable in advance. The lease payment includes executory costs of \$2,500 per year. The equipment has an estimated useful life of 12 years, and it was manufactured by Gryphon at a cost of \$180,000. It is estimated that the equipment will have a residual value of \$90,000 at the end of the 7-year lease term. There is no provision for purchase or renewal by Scissor at the end of the lease term. However, a third party has guaranteed the residual value of \$90,000. The equipment has a fair value at the lease inception of \$250,274. The implicit rate of interest in the contract is 12%, the same rate at which Scissor can borrow money at its bank. All lease payments after the first one are made on December 31 of each year. Both companies use the straight-line method of depreciation.

**Instructions:**

1. Give all the entries relating to the lease on the books of the lessor and lessee for 2013.
2. Show how the lease would appear on the balance sheet of Gryphon Manufacturing Company and Scissor Industries Co. (if applicable) as of December 31, 2013.
3. Assume that Gryphon sold the equipment at the end of the 7-year lease for \$110,000. Give the entry to record the sale, assuming that all lease entries have been properly made.

**Problem 15-58****L06****Cash Flow Treatment of Capital Lease—Lessor**

The following information relates to a capital lease between Bradford Electric Co. (lessee) and Widstoe Manufacturing Inc. (lessor). The lease term began on January 1, 2013. Widstoe recorded the lease as a sale and made the following entries related to the lease during 2013. Assume this was the only lease Widstoe had during the year.

Jan. 1	Deferred Initial Direct Costs . . . . .	6,000	
	Cash . . . . .		6,000
1	Lease Payments Receivable . . . . .	88,000	
	Sales . . . . .		88,000
1	Cost of Goods Sold . . . . .	70,000	
	Inventory . . . . .		64,000
	Deferred Initial Direct Costs . . . . .		6,000
1	Cash . . . . .	11,132	
	Lease Payments Receivable . . . . .		11,132
Dec. 31	Cash . . . . .	11,132	
	Lease Payments Receivable . . . . .		11,132
31	Lease Payments Receivable . . . . .	6,242	
	Interest Revenue . . . . .		6,242

**Instructions:**

1. Prepare the partial Operating Activities section of the statement of cash flows for 2013 for Widstoe Manufacturing Inc. under the indirect method. Widstoe reported net income of \$148,504 inclusive of the lease revenue in the preceding entries.
2. Prepare the partial Operating Activities section of the statement of cash flows for 2013 for Widstoe Manufacturing Inc. under the direct method. Assume that cash provided by operating activities exclusive of the lease transactions is \$124,262.

**Problem 15-59**

**L07**

**Disclosure Requirements—Operating Leases**

Jaquar Mining and Manufacturing Company leases from Emory Leasing Company three machines under the following terms.

- Machine 1: Lease period—10 years, beginning April 1, 2007; lease payment—\$18,000 per year, payable in advance.
- Machine 2: Lease period—10 years, beginning July 1, 2011; lease payment—\$30,000 per year, payable in advance.
- Machine 3: Lease period—15 years, beginning January 1, 2012; lease payment—\$12,500 per year, payable in advance.

All of the leases are classified as operating leases.

**Instructions:** Prepare the note to the 2013 financial statements that would be required to disclose the lease commitments of Jaquar Mining and Manufacturing Company. Jaquar uses the calendar year as its accounting period.

**Problem 15-60**

**L05, L07**

**Capitalizing the Value of Operating Leases**

The following information comes from the financial statements of Marci Sinclair Company.

Total liabilities . . . . .	\$ 300,000
Total stockholders' equity . . . . .	220,000
Property, plant, and equipment . . . . .	290,000
Sales . . . . .	1,400,000

In addition, Marci Sinclair has a large number of operating leases. The payments on these operating leases total \$55,000 per year for the next 10 years. All of these lease payments occur at the end of the year. The incremental borrowing rate of Marci Sinclair Company is 11%. This is also the rate implicit in all of the leases that Marci Sinclair signs.

**Instructions:**

1. Compute the following ratio values:
  - (a) Debt ratio (total liabilities/total assets).
  - (b) Debt ratio, assuming that Marci Sinclair's operating leases are accounted for as capital leases.
  - (c) Asset turnover (sales/total assets).
  - (d) Asset turnover, assuming that Marci Sinclair's operating leases are accounted for as capital leases.
2. Briefly describe how the accounting for assets used under operating leases distorts the values of financial ratios.

**EM** EXPANDED MATERIAL

**Problem 15-61**

**L09**

**Sale-Leaseback of a Building**

On January 3, 2013, Wayside Inc. sold a building with a book value of \$1,800,000 to Birchman Industries for \$1,735,500. Wayside immediately entered into a leasing agreement wherein Wayside would lease the building back for an annual payment of \$320,049. The

term of the lease is eight years, the expected remaining useful life of the building. The first annual lease payment is to be made immediately, and future payments will be made on January 1 of each succeeding year. Birchman's implicit interest rate is 13%.

**Instructions:**

1. Prepare the journal entries that both Wayside and Birchman should make on January 3, 2013, relating to this sale-leaseback transaction.
2. Prepare the journal entries that both parties should make at the end of 2013 to accrue interest and to amortize the leased building. (Assume a salvage value of \$0 and use of the straight-line method.)

**Problem 15-62**

**L03, L09**

**Sample CPA Exam Questions**

1. In a sale-leaseback transaction, a gain resulting from the sale should be deferred at the time of the sale-leaseback and subsequently amortized when:
  - I. The seller-lessee has transferred substantially all the risks of ownership.
  - II. The seller-lessee retains the right to substantially all of the remaining use of the property.
  - (a) I only.
  - (b) II only.
  - (c) Both I and II.
  - (d) Neither I nor II.
2. At the inception of a capital lease, the guaranteed residual value should be:
  - (a) Included as part of minimum lease payments at present value.
  - (b) Included as part of minimum lease payments at future value.
  - (c) Included as part of minimum lease payments only to the extent that guaranteed residual value is expected to exceed estimated residual value.
  - (d) Excluded from minimum lease payments.

**CASES**

**Discussion**

**Case 15-63**

**How Should the Lease Be Recorded?**

Louise Corporation entered into a leasing arrangement with Wilder Leasing Corporation for a certain machine. Wilder's primary business is leasing; it is not a manufacturer or dealer. Louise will lease the machine for a period of three years, which is 50% of the machine's economic life. Wilder will take possession of the machine at the end of the initial 3-year lease. Louise does not guarantee any residual value for the machine.

Louise's incremental borrowing rate is 10%, and the implicit rate in the lease is 8½%. Louise has no way of knowing the implicit rate used by Wilder. Using either rate, the present value of the minimum lease payments is between 90% and 100% of the fair value of the machine at the date of the lease agreement.

Louise has agreed to pay all executory costs directly, and no allowance for these costs is included in the lease payments.

Wilder is reasonably certain that Louise will pay all lease payments, and because Louise has agreed to pay all executory costs, there are no important uncertainties regarding costs to be incurred by Wilder.

1. With respect to Louise (the lessee), answer the following:
  - (a) What type of lease has been entered into? Explain the reason for your answer. How should Louise compute the appropriate amount to be recorded for the lease or asset acquired?
  - (c) What accounts will be created or affected by this transaction, and how will the lease or asset and other costs related to the transaction be matched with earnings?
  - (d) What disclosures must Louise make regarding this lease or asset?

2. With respect to Wilder (the lessor), answer the following:
  - (a) What type of leasing arrangement has been entered into? Explain the reason for your answer.
  - (b) How should this lease be recorded by Wilder, and how are the appropriate amounts determined?
  - (c) How should Wilder determine the appropriate amount of earnings to be recognized from each lease payment?
  - (d) What disclosures must Wilder make regarding this lease?

**Discussion**  
**Case 15-64**

**Should We Buy or Lease?**

Meeker Machine and Die Company has learned that a sophisticated piece of computer-operated machinery is available to either buy or rent. The machinery will result in three employees being replaced, and quality of the output has been tested to be superior in every demonstration. There is no doubt that this machinery represents the latest in technology; however, new inventions and research make it difficult to estimate when the machinery will be made obsolete by new technology. The physical life expectancy of the machine is 10 years; however, the estimated economic life is between two and five years.

Meeker has a debt-to-equity ratio of 0.75. If the machine is purchased and the minimum down payment is made, the outstanding loan balance on the machine will cause the debt-to-equity ratio to increase to 1.1. The monthly payments if the machine is purchased are 20% lower than the lease payments if it is leased. The incremental borrowing rate for Meeker is 11%. The rate implicit in the lease is 12%. What factors should Meeker consider in deciding how to finance the acquisition of the machine?

**Discussion**  
**Case 15-65**

**More Leases Mean Lower Profits**

Digital X-Ray, Inc., has introduced a new line of equipment that may revolutionize the medical profession. Because of the new technology involved, potential users of the equipment are reluctant to purchase the equipment, but they are willing to enter into a lease arrangement as long as they can classify the lease as an operating lease. The new equipment will replace equipment that Digital X-Ray, Inc., has been selling in the past. It is estimated that a 25% loss of actual equipment sales will occur as a result of the leasing policy for the new equipment.

Management must decide how to structure the leases so that they can treat them as operating leases. Some members of management want to structure the leases so that Digital X-Ray, Inc., as lessor, can classify the lease as a sales-type lease and thus avoid a further reduction of income. Others believe that they should treat the leases as operating leases and minimize the income tax liability in the short term. They are uncertain, however, as to how the financial statements would be affected under these two different approaches. They also are uncertain as to how leases could be structured to permit the lessee to treat the lease as an operating lease and the lessor to treat it as a sales-type lease. You are asked to respond to their questions.

**Discussion**  
**Case 15-66**

**Structuring a Lease to Avoid Liability Recognition**

Johnson Pharmaceuticals needs cash. One option being considered by the board of directors is to sell the plant facilities to a group of venture capitalists and then lease the facilities back for a long-term period with the option of repurchasing the plant facilities at the end of the lease.

The chairman has commented that this option will provide Johnson Pharmaceuticals the needed cash but will result in a large lease liability on the balance sheet. As the chief financial officer, you comment that if the company carefully structures the terms of the lease agreement, it may be able to avoid recognizing the lease liability.

The chairman has asked you to prepare a memo discussing the specific ways in which a lease agreement can be structured to avoid recognizing the liability on the balance sheet.

**Discussion  
Case 15-67**

**The Risks of Leasing: The Case of SUVs**

On January 1, 2013, Skull Valley Motors leased a Lincoln Navigator to T. K. “Pusan Boots” Denny. The lease is a 3-year lease requiring a payment of \$695 at the end of each month for 36 months. The cash price of the Navigator was \$46,000. Skull Valley Motors expects to be able to sell the Navigator for \$30,652 when it is returned at the end of the 3-year lease term.

1. What interest rate (compounded monthly) was used in the computation of the \$695 monthly payment amount?
2. On December 31, 2015, Skull Valley Motors learned that the Navigator could be sold for only \$25,000 at auction instead of the anticipated \$30,652. With this actual residual value, what rate of return (compounded monthly) did Skull Valley earn on this 3-year Navigator lease?
3. Assume that Skull Valley did not know about the decline in residual value until the Navigator was sold at auction for \$25,000 in 2015. How much net profit, in total, was recognized during the 3-year life of the lease, excluding the final sale of the Navigator at auction? How much gain or loss was recognized when the Navigator was sold for \$25,000 at auction?
4. Refer to (2). If the rate of return on the lease is so low, why would Skull Valley Motors continue in the leasing business at all?

Case 15-68**

**Recognizing Profits on a Sale-Leaseback Transaction**

John Carson, president of Carson Enterprises, recently arranged a financing deal with a group of foreign investors whereby he sold his movie company for \$13,000,000 and immediately leased the company back, recognizing a \$4,000,000 profit on the sale. Mr. Carson has just entered your office to tell you, his accountant, the good news.

After hearing the details of the transaction, you tell Mr. Carson that he must defer recognizing the gain immediately and instead recognize it piecemeal over the term of the lease agreement. Mr. Carson counters that if he had simply sold the company to the investors, he would be able to book the profits. He asks you: “What difference does it make if I lease the company back or not? Shouldn’t the sale and the lease be treated as two separate transactions?” How do you respond?

**Case 15-69**

**Deciphering Financial Statements (The Walt Disney Company)**

Look in the historical archives of the SEC’s EDGAR online database of financial statements and locate the 2004 financial statements for **The Walt Disney Company**. In Note 4 to the financial statements, Disney briefly outlines a rather complicated lease it arranged in regard to the Disneyland Paris theme park assets of **Euro Disney**. To summarize:

- The theme park assets are owned by an unnamed financing company.
  - A wholly owned subsidiary of Disney, called Disney SCA, has leased the theme park assets from the owner under a 12-year, noncancelable lease.
  - Euro Disney has subleased the theme park assets from Disney SCA.
1. With this leasing and subleasing, who will actually use the theme park assets?
  2. Regarding the lease agreement between the owner of the assets and Disney SCA, does it appear that the lease includes a bargain purchase option?
  3. Why do you think Euro Disney just didn’t lease the theme park assets directly from the owner?

**Case 15-70**

**Deciphering Financial Statements (International Lease Finance Corporation)**

As mentioned in the chapter, **International Lease Finance Corporation** leases airplanes to airlines. Disclosure regarding International's leases is reproduced in Exhibit 15-11 in the text.

1. By examining the stream of expected future lease payments as of the end of 2008 and 2009, estimate how much business in new capital leases the company generated during 2009.
2. Comment on the relationship between the amount of total lease payments to be received and the estimated residual values as of the end of 2008 and 2009.

**Case 15-71**

**Deciphering Financial Statements (FedEx)**

The following summary data are from the May 31, 2009, balance sheet of **FedEx**. All numbers are in millions.

Total current assets .....	\$ 7,116
Property, plant, and equipment (net) .....	13,417
Other long-term assets .....	3,711
Total assets .....	<u>\$24,244</u>
Current liabilities .....	\$ 4,524
Long-term debt .....	1,930
Other long-term liabilities .....	4,164
Total liabilities .....	<u>\$10,618</u>
Stockholders' equity .....	<u>\$13,626</u>
Total sales .....	<u>\$35,497</u>

A summary of future minimum lease payments under capital leases and noncancelable operating leases with an initial or remaining term in excess of one year at May 31, 2009 is as follows (in millions):

	Operating Leases			
	Capital Leases	Aircraft and Related Equipment	Facilities and Other	Total Operating Leases
2010 .....	\$164	\$ 512	\$1,247	\$ 1,759

2012 .....	8	504	947	1,451
2013 .....	119	499	817	1,316
2014 .....	2	472	694	1,166
Thereafter .....	15	2,458	4,894	7,352
Total .....	328	<u>\$4,971</u>	<u>\$9,685</u>	<u>\$14,656</u>
Less amount representing interest .....	34			
Present value of net minimum lease payments .....	<u>\$294</u>			

**Instructions:** Compute the following ratio values.

1. Debt ratio (total liabilities/total assets).
2. Debt ratio assuming that FedEx's operating leases are accounted for as capital leases.
3. Asset turnover (sales/total assets).
4. Asset turnover assuming that FedEx's operating leases are accounted for as capital leases.

**Case 15-72**

**Deciphering Financial Statements (McDonald's Corporation)**

The franchise arrangement between **McDonald's** and its franchisees is summarized in the following note from McDonald's 2009 annual report.

Conventional franchise arrangements generally include a lease and a license and provide for payment of initial fees, as well as continuing rent and royalties to the Company based upon a percent of sales with minimum rent payments that parallel the Company's underlying leases and escalations (on properties that are leased). Under this arrangement, franchisees are granted the right to operate a restaurant using the McDonald's System and, in most cases, the use of a restaurant facility, generally for a period of 20 years. These franchisees pay related occupancy costs including property taxes, insurance and maintenance. Affiliates and developmental licensees operating under license agreements pay a royalty to the Company based upon a percent of sales, and may pay initial fees.

The results of operations of restaurant businesses purchased and sold in transactions with franchisees were not material to the consolidated financial statements for periods prior to purchase and sale. Revenues from franchised restaurants consisted of:

In millions	2009	2008	2007
Rents . . . . .	\$4,841.0	\$4,612.8	\$4,177.2
Royalties . . . . .	2,379.8	2,275.7	1,941.1
Initial fees . . . . .	65.4	73.0	57.3
Revenues from franchised restaurants . . . . .	<u>\$7,286.2</u>	<u>\$6,961.5</u>	<u>\$6,175.6</u>

Future minimum rent payments due to the Company under existing franchise arrangements are:

In millions	Owned sites	Leased sites	Total
2010 . . . . .	\$ 1,218.1	\$ 1,076.0	\$ 2,294.1
2011 . . . . .	1,177.3	1,042.9	2,220.2
2012 . . . . .	1,144.5	1,011.5	2,156.0
2013 . . . . .	1,105.1	972.4	2,077.5
2014 . . . . .	1,062.1	924.8	1,986.9
Thereafter . . . . .	8,495.8	6,782.5	15,278.3
Total minimum payments . . . . .	<u>\$14,202.9</u>	<u>\$11,810.1</u>	<u>\$26,013.0</u>

At December 31, 2009, net property and equipment under franchise arrangements totaled \$13.1 billion (including land of \$3.8 billion) after deducting accumulated depreciation and amortization of \$6.5 billion.

**Instructions:** From this information, answer the following questions.

- McDonald's arrangement with its franchisees is that the franchisees agree to pay a minimum rent plus additional amounts if sales are above a certain level. Compare the minimum amount to be received from rent payments in 2010 with the total amount received from franchised and affiliated restaurants in 2009. How significant are these additional amounts?
- As indicated in the franchise note, McDonald's owns some of its sites and leases others. An important comparison is the relationship between future minimum lease payments McDonald's must make and future minimum payments to be received from franchisees. The future payments (in millions of dollars) McDonald's must make on its leased restaurant sites are summarized as follows.

In millions	Restaurant
2010 . . . . .	\$ 1,064.7
2011 . . . . .	1,002.4
2012 . . . . .	928.1
2013 . . . . .	859.8
2014 . . . . .	783.9
Thereafter . . . . .	5,794.5
Total minimum payments . . . . .	<u>\$10,433.4</u>

Comparing the payments to be made for leased sites and the minimum payments (plus the additional percentage from royalties) to be collected from franchisees for leased sites, it looks as if McDonald's is guaranteed to make money every year on its leased sites. What would have to happen for McDonald's to *lose* money on these leased sites?

**Case 15-73**

**Writing Assignment (All leases are sales-type leases!)**

You are the accountant for Clear Water Bay Company, an equipment manufacturer. In order to help customers finance their purchases, Clear Water Bay often leases, rather than sells, the equipment. Clear Water Bay structures the lease agreements so that most of its equipment leases are classified as operating leases. This is because customers strongly prefer this treatment in order to keep the lease obligations off their balance sheets. This treatment does result in a delay in Clear Water Bay's ability to report profits from the sales, but this delay has been viewed as part of the cost of keeping customers happy.

The president of Clear Water Bay just returned from a weeklong accounting and finance seminar at a prominent university. She is excited about the session she attended on the accounting for leases. She was told, or thinks she was told, that there is no need for Clear Water Bay to report its leasing arrangements as operating leases—according to U.S. GAAP, lessors can always classify a lease as a sales-type lease even when the lessee classifies the same lease as an operating lease. The president tells you to get to work restating Clear Water Bay's most recent financial statements to reflect reclassification of all Clear Water Bay's leases from operating leases to sales-type leases.

Write a memo to the president clarifying the accounting rules governing sales-type and operating leases. Carefully explain the circumstances in which the same lease can be classified as a sales-type lease by the lessor and an operating lease by the lessee.

**Case 15-74**

**Ethical Dilemma (Using operating leases to fool the bank)**

You are the chief financial officer for RAM Solutions, a small but rapidly growing retail computer hardware chain. You are trying to figure out how to finance the new buildings that are scheduled to be purchased this year. The difficulty is that RAM has an existing loan with Commercial Security Bank (CSB) that requires RAM to maintain an interest coverage ratio (Operating income/Interest expense) of 2.0 or greater. Forecasts for next year are as follows:

Forecasted operating income . . . . .	\$15,000,000
Forecasted interest expense (assuming no new borrowing) . . . . .	7,000,000
Cost of purchasing new buildings . . . . .	50,000,000

If you borrow the \$50 million needed to finance the new buildings, the increased interest expense will cause you to be in violation of the interest coverage constraint.

The controller has suggested an accounting solution to this dilemma: lease the new buildings, carefully constructing the lease agreements so that the leases will be accounted for as operating leases. The leasing arrangements will be economically similar to purchase of the buildings with borrowed money, but the annual payments will be reported as rent expense instead of interest expense. Accordingly, the interest coverage loan covenant will be completely sidestepped.

You personally negotiated the loan with Commercial Security Bank, and you know that the intent of the loan covenant was to prevent RAM from incurring large fixed obligations that might endanger the repayment of the CSB loan. Operating lease payments are fixed obligations, just like interest payments, and you are uneasy about using this accounting trick to get around the loan covenant. However, there does not seem to be any other solution. What should you do?

## Case 15-75

**Cumulative Spreadsheet Analysis**

This assignment is based on the spreadsheet prepared in (1) of the cumulative spreadsheet assignment for Chapter 13. Review that assignment for a summary of the assumptions made in preparing a forecasted balance sheet, income statement, and statement of cash flows for 2014 for Skywalker Company. This assignment involves revisiting assumptions (q) and (u) in the Chapter 13 assignment.

Skywalker would like to know how its forecasted financial statements would look if it decided to lease all new property, plant, and equipment under operating leases. Before 2014, all of Skywalker's property, plant, and equipment purchases had been 100% financed using long-term debt. This same assumption underlies the forecast prepared in (1) of the Chapter 13 assignment.

1. Using the same instructions given in (1) of the Chapter 13 spreadsheet assignment, forecast the following values for 2014:

Forecasted balance sheet for 2014:

- (a) Property, plant, and equipment
- (b) Accumulated depreciation
- (c) Long-term debt

Forecasted income statement for 2014:

- (d) Depreciation and amortization expense
- (e) Other operating expenses
- (f) Interest expense
- (g) Income tax expense
- (h) Net income

Forecasted statement of cash flows for 2014:

- (i) Cash from operating activities
- (j) Cash from investing activities
- (k) Cash from financing activities

Financial ratios for 2014:

- (l) Debt ratio (Total liabilities/Total assets)
- (m) Asset turnover (Sales/Total assets)

2. Repeat (1), but now assume that all new property, plant, and equipment expected to be acquired during 2014 will be acquired under an operating lease arrangement. Assume that the annual operating lease payment for property, plant, and equipment is 15% of the purchase price of the asset and that the new property, plant, and equipment that Skywalker will lease in 2014 will not all be leased at the start of the year but will be added evenly throughout the year. Mathematically, this is the same as assuming that new assets leased during the year are leased, on average, for half the year. (Note: Operating lease payments are classified in the income statement as "Other operating expenses.") Under this leasing arrangement, the forecasted balance in long-term debt at the end of 2014 should be the amount forecasted previously (assuming an 80% debt ratio), less the amount of recognized long-term debt that can be avoided through the leasing arrangement.
3. Comment on the differences between the numbers in (1) and (2).

A BUSINESS

## CHAPTER 16

### Income Taxes

#### LEARNING OBJECTIVES

- 1 Understand the concept of deferred taxes and the distinction between permanent and temporary differences.
- 2 Compute the amount of deferred tax liabilities and assets including the use of a valuation allowance and the uncertainty of tax positions.
- 3 Explain the provisions of tax loss carrybacks and carryforwards, and be able to account for these provisions.
- 4 Schedule future tax rates, and determine the effect on deferred tax assets and liabilities.
- 5 Determine appropriate financial statement presentation and disclosure associated with deferred tax assets and liabilities.
- 6 Comply with income tax disclosure requirements associated with the statement of cash flows.
- 7 Describe how, with respect to deferred income taxes, international accounting standards have converged toward the U.S. treatment.

Accounting for deferred taxes is both complicated and controversial. You will learn about a few of the complications in this chapter. The controversy has stemmed from the FASB's attempts to use accounting theory to define exactly what the phrase "income tax expense" means. Because of the idiosyncrasies of the income tax code, there are many cases in which income is earned this year but is not taxed until a future year; this gives rise to a deferred income tax liability equal to the amount of additional tax expected to be paid in the future based on business activities completed this year. Similarly, there are many cases in which a company can create a business expense this year but the tax code does not allow for the deduction of that expense until a future year; this gives rise to a deferred income tax asset equal to the expected future tax savings from business activities completed this year. "Income tax expense" for this year must reflect ALL of the tax consequences, both current and deferred, of business activities undertaken this year.

In February 1992, the FASB issued pre-Codification *Statement No. 109*, “Accounting for Income Taxes,” in response to five years of complaints and controversy surrounding the standard it superseded, pre-Codification FASB *Statement No. 96*. *Statement No. 96* was so unpopular that some observers predicted it would result in an unraveling of public confidence in the FASB, with the possibility that the FASB would be replaced just as its two predecessor bodies, the Committee on Accounting Procedure (CAP) and the Accounting Principles Board (APB), had been. The two primary complaints against *Statement No. 96* were that it was overly complicated and that it severely restricted the recognition of deferred tax assets.

Issued in 1987, *Statement No. 96* mandated that the deferred tax amounts reported on the balance sheet should be valued using expected future tax rates. Previously, deferred tax items had been valued using tax rates in effect when the deferred taxes arose in past years. This accounting change, coupled with the fact that the Tax Reform Act of 1986 had lowered the maximum corporate tax rate from 46% to 34%, caused significant downward revisions in the reported amounts of deferred taxes. For a firm with a deferred tax liability, the combined result was a decrease in the reported liability (a debit) and

the recognition of a corresponding one-time gain (a credit). The business press of the period was full of articles warning investors of the large cosmetic accounting gains that companies were expected to report.<sup>1</sup> **General Electric** adopted *Statement No. 96* in 1987; as a result, General Electric’s finance subsidiary showed a gain of \$518 million, increasing the subsidiary’s net income by 106%. **IBM** adopted *Statement No. 96* in 1988 and showed a gain of \$315 million. **Exxon** made the adoption in 1989 and increased net income by 18% with a \$535 million gain.

In response to one of the major criticisms of *Statement No. 96*, *Statement No. 109*, as explained more fully in this chapter, allows the recognition of most deferred tax assets. Once again, the business press warned investors to beware of firms reporting one-time accounting gains because of the change in accounting for deferred taxes.<sup>2</sup> These gains come about because previously unrecorded deferred tax assets are recognized (a debit), along with a corresponding gain (a credit). For example, on September 30, 1992, IBM announced that it would report a \$1.9 billion gain as a result of adopting *Statement No. 109*. Interestingly, this gain was used to partially offset a \$2.1 billion write-off of buildings and equipment.<sup>3</sup>

## QUESTIONS

1. Why was the release of pre-Codification FASB *Statement No. 96* in 1987 a dangerous event for the FASB?
2. Adoption of FASB *Statement No. 96* resulted in big one-time gains for many firms. What external event resulted in these gains?
3. How did adoption of pre-Codification FASB *Statement No. 109* result in big one-time gains for many firms?

*Answers to these questions can be found on page 16-35.*

<sup>1</sup> For an example, see Lee Berton, “FASB Is Expected to Issue Rule Allowing Many Firms to Post Big, One-Time Gains,” *The Wall Street Journal*, November 4, 1987, p. 4.

<sup>2</sup> See Mary Beth Grover, “Cosmetics,” *Forbes*, March 30, 1992, p. 78.

<sup>3</sup> See Michael W. Miller and Laurence Hooper, “IBM Announces Write-Off for Total of \$2.1 Billion,” *The Wall Street Journal*, September 30, 1992, p. A3.

This chapter begins with a discussion of the reasons for differences between financial reporting income and taxable income. This discussion leads into the topic of deferred taxes and how differences in the timing of the recognition of revenues and expenses for tax and financial reporting purposes cause differences between income tax payable and income tax expense for a period. Accounting for these deferred tax assets and liabilities comprises the bulk of this chapter. Additional topics covered include net operating loss carrybacks and carryforwards and their relationship to deferred taxes, the effect of deferred taxes on the statement of cash flows, common deferred tax items for large corporations, the accounting for uncertain tax positions, and the disclosure requirements associated with deferred taxes. We will also discuss how the international standards for deferred tax accounting have become more similar to U.S. GAAP over the past few years.

## Deferred Income Taxes: An Overview

1

Understand the concept of deferred taxes and the distinction between permanent and temporary differences.

**WHY** In order to properly inform financial statement users about all of the income tax consequences associated with operations during the current period, the delayed, or deferred, income tax consequences must be reflected in the balance sheet and the income statement.

**HOW** Permanent differences between financial income and tax income provide no difficult accounting issues; income tax expense is based strictly on taxable income. Temporary differences can create the need to recognize additional income tax expense, with an associated deferred tax liability, or to recognize a reduction in income tax expense, with an associated deferred tax asset.

When taking introductory financial accounting courses, many students are surprised to learn that corporations in the United States compute two different income numbers: **financial income** for reporting to stockholders and **taxable income** for reporting to the Internal Revenue Service (IRS). The existence of these two “sets of books” seems unethical to some, illegal to others. However, the difference between the information needs of the stockholders and the efficient revenue collection needs of the government makes the computation of the two different income numbers essential. The different purposes of these reporting systems were summarized by the U.S. Supreme Court in the **Thor Power Tool** case (1979):

The primary goal of financial accounting is to provide useful information to management, shareholders, creditors, and others properly interested; the major responsibility of the accountant is to protect these parties from being misled. The primary goal of the income tax system, in contrast, is the equitable collection of revenue.

In summary, U.S. corporations compute income in two different ways, and rightly so. The existence of these two different numbers that can each be called “income before taxes” makes it surprisingly difficult to define what is meant by “income tax

### CAUTION

Although the emphasis in this chapter is on accounting for federal income taxes, most states also assess a tax on income. The conceptual issues are applicable to both federal and state taxes. Often, state income tax laws are patterned after the federal law. Multinational companies are also often subject to foreign income taxation. Having multiple taxing jurisdictions complicates the establishment of income tax accounting standards and increases the materiality of income tax payments.

## STOP & THINK

This discussion mentions two sets of books, the financial accounting and the income tax records. Which ONE of the following is the most important third set of accounting records in a well-run business?

- Managerial accounting records
- State sales tax records
- CEO astrological chart records
- Corporate property tax records

expense” and to compute an appropriate balance sheet value for income tax liabilities and prepaid income tax assets. This accounting difficulty stems from two basic considerations:

- How to account for revenues and expenses that have already been recognized and reported to shareholders in a company’s financial statements but will not affect taxable income until subsequent years.
- How to account for revenues and expenses that have already been reported to the IRS but will not be recognized in the financial statements until subsequent years.

Accounting for deferred income taxes focuses on temporary differences between financial accounting income and taxable income. For example, the income tax rules allow companies to deduct depreciation faster than is typically done for the financial accounting books. Over the life of the asset, the amount of depreciation is the same for both sets of books, but *temporarily*, there is a difference between the cumulative depreciation deduction reported in the tax books and the amount of cumulative depreciation expense recognized in the financial accounting books. It is this temporary difference that results in deferred income taxes. The accounting for deferred taxes is summarized in Exhibit 16-1.

Two simple examples will be used to illustrate the accounting issues resulting from this difference between financial accounting income and taxable income.

### Example 1. Simple Deferred Income Tax Liability

In 2013, Ibanez Company earned revenues of \$30,000. Ibanez has no expenses other than income taxes. Assume that in this case, the income tax law specifies that income is taxed when received in cash and that Ibanez received \$10,000 cash in 2013 and expects to receive \$20,000 in 2014. The income tax rate is 40%, and we will assume for the moment that the tax rate is expected to remain the same into the foreseeable future.

## EX 16-1 A SUMMARY OF TEMPORARY DIFFERENCES AND DEFERRED INCOME TAXES

Event occurs that creates a temporary difference between financial accounting income and taxable income.

If, in the initial year, taxable income is less than financial accounting income, then taxable income will be greater in subsequent years. The income tax expected to be paid on this future additional taxable income is recognized now as a deferred tax liability.

If, in the initial year, taxable income is greater than financial accounting income, then taxable income will be less in subsequent years. This expected income tax reduction is recognized now as a deferred tax asset. (Note: As explained later, realization of this deferred tax asset depends on the existence of taxable income in future years.)

The two amounts to be determined are total income tax liability at the end of the year and total income tax expense for the year. Obviously, the income tax liability is at least \$4,000 because that is how much the IRS is expecting based on Ibanez’s reported taxable income of \$10,000. In addition, it would be misleading to the shareholders not to tell them of the expected tax to be paid on the additional \$20,000 to be received in cash in 2014. Remember, this \$20,000 in income has been reported to the shareholders because it was earned in 2013, but it has not yet been reported to the IRS. The expected tax on the \$20,000 is \$8,000 ( $\$20,000 \times 0.40$ ) and is called a *deferred tax liability*. It is a liability because it requires a payment in the future (hence the word *deferred*) as a result of a past transaction (the past transaction is the earning of the income). This liability can be thought of as the expected income tax on income earned but not yet taxed. The journal entry to record all the tax-related information for Ibanez for 2013 is as follows:

C. Sherburne/PhotoLink/Photodisc/Getty Images

Corporations keep two “sets of books” to compute income—one for reporting financial income and the other for reporting taxable income to the IRS.

Income Tax Expense (\$4,000 current year + \$8,000 deferred) .....	12,000
Income Taxes Payable .....	4,000
Deferred Tax Liability .....	8,000

It is important to recognize the difference between the two recorded liabilities. Income taxes payable is an existing legal liability that the IRS fully expects to collect by March 15, 2014 (corporations pay taxes at different times than do individuals). Deferred tax liability is not an existing legal liability; as far as the IRS is concerned, it doesn’t exist. However, because Ibanez knows that \$20,000 of the revenues earned in 2013 will be taxed in 2014, recognition of the deferred tax liability is necessary to ensure that all expenses associated with 2013 revenues are reported in the 2013 income statement and that all obligations are reported on the December 31, 2013, balance sheet.

i

FYI

Although accounting standard-setting bodies have not expressed interest in abandoning deferred income tax accounting, many writers through the years have suggested that basing income tax expense on the actual tax payments is the most practical way of reporting income taxes. If this solution were to become the standard, there would be no need for a chapter on income taxes in an intermediate accounting text. This would undoubtedly please authors, faculty, and students alike.

As can be seen from the income tax journal entries for 2013, total income tax expense of \$12,000 is the sum of the current and deferred tax expenses. The 2013 income statement for Ibanez Company is as follows:

Revenues .....	\$30,000	
Income tax expense:		
Current .....	\$4,000	
Deferred .....	8,000	12,000
Net income .....		\$18,000

Some have argued that reported income tax expense should just be the amount currently payable according to IRS rules. This type of disclosure would lead to a rude surprise in 2014 for the Ibanez shareholders: Ibanez will owe \$8,000 in income tax in 2014 even if no new revenues are generated in 2014.

### Example 2. Simple Deferred Tax Asset

In 2013, its first year of operations, Gupta Company generated service revenues totaling \$60,000, all taxable in 2013. Gupta Company offers a warranty on its service. No warranty claims were made in 2013, but Gupta estimates that in 2014 warranty costs of \$10,000 will be incurred for claims relating to 2013 service revenues. The \$10,000 estimated warranty expense is reported in the 2013 financial statements as required by GAAP. For tax purposes, however, assume that the IRS does not allow any tax deduction until the actual warranty services are performed. Also assume that the income tax rate is 40% and that Gupta Company had no expenses in 2013 other than warranty costs and income taxes.

Income taxes payable as of the end of 2013 is \$24,000 ( $\$60,000 \times 0.40$ ) because Gupta is required to report \$60,000 in revenues to the IRS but is not allowed to take any warranty deduction until 2014. What about the \$10,000 warranty deduction Gupta expects to take in 2014? Gupta can expect this deduction to lower the 2014 tax bill by \$4,000 ( $\$10,000 \times 0.40$ ). This \$4,000 is called a *deferred tax asset* and represents the expected benefit of a tax deduction for an expense item that has already been incurred and reported to the shareholders but is not yet deductible according to IRS rules. In effect, Gupta is paying taxes this year in anticipation of lower taxes next year—a prepayment of taxes. The journal entry to record all the tax-related information for Gupta for 2013 is as follows:

Income Tax Expense (\$24,000 current – \$4,000 deferred benefit) . . . . .	20,000	
Deferred Tax Asset . . . . .	4,000	
Income Taxes Payable . . . . .		24,000

Total income tax expense of \$20,000 is the difference between the current tax expense and the deferred tax benefit. The 2013 income statement for Gupta Company is as follows:

Revenues . . . . .		\$60,000
Warranty expense . . . . .		<u>10,000</u>
Income before taxes . . . . .		\$50,000
Income tax expense:		
Current . . . . .	\$24,000	
Deferred benefit . . . . .	<u>(4,000)</u>	<u>20,000</u>
Net income . . . . .		<u>\$30,000</u>

As explained in detail later in the chapter, deferred tax assets can be much more complicated than this simple example indicates. The two most common complications revolve around (1) the likelihood that a company will be able to realize the deferred tax asset in the future (a company that experiences repeated operating losses, for example, may not be able to take full advantage of the deferred tax asset) and (2) changing tax rates (a change in future tax rates affects the amount of deferred tax assets and liabilities). As mentioned at the start of this chapter, dissatisfaction over the FASB's handling of these issues related to the accounting for deferred income tax assets contributed to the acrimonious demise of pre-Codification *Statement No. 96* in 1992.

## Permanent and Temporary Differences

Before more detailed deferred tax examples are presented, some of the specific differences between financial accounting standards and tax rules will be described.

Some differences between financial and taxable income are **permanent differences**. These differences are caused by specific provisions of the tax law that exempt certain types of revenues from taxation and prohibit the deduction of certain types of expenses. Nontaxable revenues and nondeductible expenses are never included in determining taxable income, but they are included in determining financial income under GAAP. Permanent differences are created by political and social pressures to favor certain segments of society or to promote certain industries or economic activities. Examples of nontaxable revenues include proceeds from life insurance policies, interest received on municipal bonds, and a portion of the dividend revenue received by one corporation from its investments in other corporations. Examples of nondeductible expenses include fines for violation of laws and payment of life insurance premiums. Permanent differences also arise because income tax rates are different in different jurisdictions. For example, the state of Texas has no state income tax while the corporate income tax rate for income generated in New York is 7.1%. Permanent differences do not create accounting problems. Because they are never included in the computation of taxable income, they have no impact on either current or future (deferred) tax obligations.

**FYI**

Although permanent differences do not create financial accounting problems, that doesn't mean that they aren't important. The dream of a tax accountant is to be able to structure a company's transactions so that all of the revenue differences are permanent ones, meaning that the revenue is never taxed.

More commonly, differences between pretax financial income and taxable income arise from business events that are recognized for both financial reporting and tax purposes but in different time periods. In some cases, income tax payments are deferred to a period later than when the effect of the event on financial income is recognized. In other cases, income tax payments are required before the effect of the event on financial income is recognized. These differences are referred to as **temporary differences** because, over time, their impact on financial income and taxable income will be the same.

A common example of a temporary difference, and one that historically has been the most significant for U.S. companies, is the computation of depreciation. As indicated in Chapter 11, depreciation for federal income tax purposes is referred to as *cost recovery* and has varied over time as to the degree of acceleration in the recovery of asset costs. On the other hand, the most common depreciation method used to determine financial income is the straight-line method, which recognizes an even amount of depreciation expense each year the asset is in service. In the early years of an asset's life, straight-line depreciation reported on the income statement usually is less than the cost recovery deduction on the income tax return. In the latter portion of an asset's life, however, this pattern reverses; that is, the depreciation expense on the income statement exceeds the cost recovery deduction on the tax return.

There are many other temporary differences in addition to depreciation, and new income tax laws continue to create new ones as income taxes are used to meet changing economic and policy objectives. Some examples of temporary differences are given in Exhibit 16-2. This list is just a sample of the differences between financial accounting standards and income tax laws that can create temporary differences between financial and taxable income.

## EX 16-2 EXAMPLES OF TEMPORARY DIFFERENCES

1. Differences That Create Deferred Tax Liabilities for Future Taxable Amounts
  - (a) Revenues or gains are taxable *after* they are recognized for financial reporting purposes.
    - Installment sales method or cash basis used for tax purposes but accrual method of recognizing sales revenue used for financial reporting purposes.
    - Unrealized gain on trading securities recognized as a gain in the period in which the value increases for financial reporting purposes but becomes a taxable gain only when the securities are sold.
  - (b) Expenses or losses are deductible for tax purposes *before* they are recognized for financial reporting purposes.
    - MACRS used for tax purposes but straight-line method of depreciation used for financial reporting purposes.
    - Intangible drilling costs for extractive industry written off as incurred for tax purposes but capitalized for financial reporting purposes.
2. Differences That Create Deferred Tax Assets for Future Deductible Amounts
  - (a) Revenues or gains are taxable *before* they are recognized for financial reporting purposes.
    - Rent revenue received in advance of period earned recognized as revenue for tax purposes but deferred to be recognized in future periods for financial reporting purposes.
    - Subscription revenue received in advance of period earned recognized as revenue for tax purposes but deferred to be recognized in future periods for financial reporting purposes.
  - (b) Expenses or losses are deductible for tax purposes *after* they are recognized for financial reporting purposes.
    - Warranty expense or bad debt expense deductible for tax purposes only when actually incurred but accrued in the year of sale for financial reporting purposes.
    - Restructuring charge deductible for tax purposes only when expenses actually incurred or losses actually realized but accrued in the year of the restructuring for financial reporting purposes.
    - Unrealized loss on trading securities recognized as a loss in the period in which the value decreases for financial reporting purposes but becomes a tax deductible loss only when the securities are sold.

### STOP & THINK

How can a company have both deferred tax assets and deferred tax liabilities at the same time?

- a) A company can have both deferred tax assets and deferred tax liabilities at the same time only if it has negative retained earnings.
- b) A company can have both deferred tax assets and deferred tax liabilities at the same time only if the effective income tax rate is greater than 50%.
- c) Deferred tax assets and deferred tax liabilities result from different transactions, so a company can have both at the same time.
- d) Actually, a company *cannot* have both deferred tax assets and deferred tax liabilities at the same time.

The examples in Exhibit 16-2 are presented in two major categories. The first category includes differences, called **taxable temporary differences**, that will result in taxable amounts in future years. Income taxes expected to be paid on future taxable amounts are reported on the balance sheet as a deferred tax liability. The second category includes differences, called **deductible temporary differences**, that will result in deductible amounts in future years. Income tax benefits (savings) expected to be realized from future deductible amounts are reported

on the balance sheet as a deferred tax asset. Exhibit 16-3 provides examples of deferred tax assets and deferred tax liabilities taken from the 2009 financial statements of several large U.S. companies. The large deferred tax liabilities of the capital-intensive companies listed in Exhibit 16-3 highlight the importance of deferred tax liabilities arising from depreciation. The \$25,636 million deferred tax liability recognized by **Berkshire Hathaway** stems from its large investment portfolio. Increases in the value of investments are recognized for financial reporting purposes as they occur but are not taxed until the investments are sold; this gives rise to deferred tax liabilities.

## EX 16-3 SELECTED DEFERRED TAX ASSETS AND DEFERRED TAX LIABILITIES FOR 2009

(Numbers in millions)

Company	Deferred Tax Assets*	Deferred Tax Liabilities
Berkshire Hathaway	\$ 6,941	\$25,636
ExxonMobil	16,318	34,033
Ford Motor	9,636	8,571
General Electric	26,052	28,225
Union Pacific	339	11,130

\*Where applicable, deferred tax assets are reported net of any associated valuation allowance. Valuation allowances are discussed later in the chapter.

### Illustration of Permanent and Temporary Differences

To illustrate the effect of permanent and temporary differences on the computation of income taxes, assume that for the year ended December 31, 2013, Monroe Corporation reported income before taxes of \$420,000. Assume that this amount includes \$20,000 of nontaxable revenues and \$5,000 of nondeductible expenses, both permanent differences. In addition, assume that Monroe has one temporary difference: The depreciation (cost recovery) deduction on the 2013 income tax return exceeds depreciation expense on the income statement by \$30,000. Assuming a corporate income tax rate of 35% for 2013, income taxes payable for the year would be computed as follows:

Pretax financial income (from income statement) .....	\$420,000
Add (deduct) permanent differences:	
Nontaxable revenues .....	\$(20,000)
Nondeductible expenses .....	5,000
Financial income subject to tax .....	\$405,000
Add (deduct) temporary differences:	
Excess of tax depreciation over book depreciation .....	(30,000)
Taxable income .....	\$375,000
Tax on taxable income (income taxes payable): $\$375,000 \times 0.35$ .....	\$131,250

As illustrated, the permanent differences are not included in either the financial income subject to tax or the taxable income. In addition, because these permanent differences never reverse, they have no impact on income taxes payable in subsequent periods and are thus not associated with any deferred tax consequences. Temporary differences are the cause

## CAUTION

It is important that you be able to distinguish among the terms *pretax financial income*, *pretax financial income subject to tax*, and *taxable income*. This simple illustration highlights these terms and will make the later discussion clearer. Where there are no permanent differences, pretax financial income and pretax financial income subject to tax are the same. Unless otherwise noted, the shorter term is used in the remainder of the chapter.

of the complexity and controversy in accounting for income taxes because they impact financial income and taxable income in different periods. In general, the accounting for temporary differences is referred to as [interperiod tax allocation](#).

## Annual Computation of Deferred Tax Liabilities and Assets

**2** Compute the amount of deferred tax liabilities and assets including the use of a valuation allowance and the uncertainty of tax positions.

**WHY** Although they are not perfectly measured, deferred tax assets and liabilities fit the conceptual framework definitions of assets and liabilities and should therefore be included in the balance sheet.

**HOW** Computing the amount of deferred tax assets and liabilities involves identifying the temporary differences, computing the amounts of any deferred tax liability and deferred tax asset, and reducing the amount of the deferred tax asset using a valuation allowance account, if necessary.

As illustrated with the earlier examples, the basic concepts underlying deferred tax accounting are fairly simple. The examples that follow introduce some of the complexities associated with the specific provisions of FASB ASC Topic 740 (Income Taxes). Before launching into these examples, take a moment to reflect on how lucky you are not to have taken this class a few years ago. At that time, this chapter was based on pre-Codification *Statement No. 96*, which was much more difficult to understand and to implement and was hated by practitioners, financial statement users, students, and professors alike.

Topic 740 reflects the Board's preference for the [asset and liability method of interperiod tax allocation](#), which emphasizes the measurement and reporting of balance sheet amounts. The major advantages of the asset and liability method of accounting for deferred taxes are as follows:

1. Because the assets and liabilities recorded under this method are in agreement with the FASB definitions of financial statement elements, the method is conceptually consistent with other standards.
2. The asset and liability method is a flexible method that recognizes changes in circumstances and adjusts the reported amounts accordingly. This flexibility may improve the predictive value of the financial statements.

One drawback of the asset and liability method is that in some ways, it is still too complicated (even after the significant simplification implemented in the wake of pre-Codification *Statement No. 96*). Many financial statement users claim that they ignore deferred tax assets and liabilities anyway, and thus, efforts devoted to deferred tax accounting are just a waste of time. For example, one financial statement analysis textbook reports that "because of the uncertainty over whether (and when) a deferred tax liability will be paid, some individuals elect to exclude deferred tax liabilities from liabilities when performing analysis."<sup>4</sup> On the other hand, research using stock market data suggests that investors compute values of companies as if the reported deferred tax liabilities are bona fide liabilities.<sup>5</sup>

<sup>4</sup> Charles H. Gibson, *Financial Statement Analysis: Using Financial Accounting Information*, 6th ed. (Cincinnati, OH: South-Western Publishing Co., 1995), p. 321.

<sup>5</sup> Dan Givoly and Carla Hayn, "The Valuation of the Deferred Tax Liability: Evidence from the Stock Market," *The Accounting Review*, April 1992, pp. 394–410.

The following list summarizes the procedure to be followed each year to compute the amount of deferred tax liabilities and assets to be included in the financial statements.<sup>6</sup>

1. Identify the types and amounts of existing temporary differences.
2. Measure the deferred tax liability for taxable temporary differences using applicable current and future tax rates.
3. Measure the deferred tax asset for deductible temporary differences using applicable current and future tax rates.
4. Reduce deferred tax assets by a valuation allowance if it is more likely than not (a likelihood of more than 50%) that some portion or all of the deferred tax assets will not be realized. The valuation allowance should reduce the deferred tax asset to the amount that is more likely than not to be realized.

Several examples will illustrate the computation of deferred tax assets and liabilities.

### Example 3. Deferred Tax Liability

If a company has only deferred tax liabilities to consider, the accounting for deferred taxes is relatively straightforward. To illustrate, assume that Roland Inc. begins operations in 2013. For 2013, Roland computes pretax financial income of \$75,000. The only difference between financial accounting income and taxable income is depreciation. Roland uses the straight-line method of depreciation for financial reporting purposes and an accelerated cost recovery method on its tax return. The depreciation amounts for existing plant assets for the years 2013 through 2016 are as follows:

Year	Financial Reporting	Income Tax Reporting
2013	\$ 25,000	\$ 40,000
2014	25,000	30,000
2015	25,000	25,000
2016	25,000	5,000
	<u>\$100,000</u>	<u>\$100,000</u>

The enacted tax rate for 2013 and future years is 40%. Roland's taxable income for 2013 is \$60,000, computed as follows:

Financial income subject to tax	\$ 75,000
Deduct temporary difference:	
Excess of tax depreciation over book depreciation	<u>(15,000)</u>
Taxable income	<u>\$ 60,000</u>
Tax ( $\$60,000 \times 0.40$ )	<u>\$ 24,000</u>

Thus, Roland records a current liability of \$24,000. At the end of 2013, aggregate tax depreciation exceeds aggregate book depreciation by \$15,000 (\$40,000 – \$25,000). This taxable temporary difference will result in a taxable amount of \$15,000 in future years as the difference reverses. With the currently enacted 40% tax rate, income tax on this future taxable amount will total \$6,000 (\$15,000 × 0.40). Accordingly, a deferred tax liability of \$6,000 will be reported on the December 31, 2013, balance sheet. Because the depreciable

<sup>6</sup> FASB ASC paragraph 740-10-30-5.

asset is a noncurrent operating asset, the associated deferred tax liability is also classified as noncurrent.

The journal entry to record Roland's income taxes for 2013 would be as follows:

Income Tax Expense (\$24,000 current + \$6,000 deferred) . . . . .	30,000	
Income Taxes Payable . . . . .		24,000
Deferred Tax Liability—Noncurrent . . . . .		6,000

Income taxes would be shown on Roland's 2013 income statement as follows:

Income before income taxes . . . . .		\$75,000
Current . . . . .	\$24,000	
Deferred . . . . .	<u>6,000</u>	<u>30,000</u>
Net income . . . . .		<u>\$45,000</u>

## STOP & THINK

How might the current and deferred income tax numbers for 2013 change if the 2013 income tax rate were 40% but Roland expected tax rates in future periods to be 30% instead of 40%?

- a) The numbers would be the same.
- b) Both the current and deferred amounts would be multiplied by 30% instead of 40%.
- c) The current amount would be multiplied by 30% instead of 40%.
- d) The deferred amount would be multiplied by 30% instead of 40%.

The December 31, 2013, balance sheet would report a current liability of \$24,000 for income taxes payable and, as noted above, a noncurrent deferred tax liability of \$6,000.

So as to not unnecessarily complicate this example, we will assume that Roland earns financial income subject to tax of \$75,000 in each of the years 2014 through 2016. In 2014, Roland reports taxable income of \$70,000, computed as follows:

Financial income subject to tax . . . . .		\$75,000
Deduct temporary difference:		
Excess of tax depreciation over book depreciation . . . . .		<u>(5,000)</u>
Taxable income . . . . .		<u>\$70,000</u>
Tax (\$70,000 × 0.40) . . . . .		<u>\$28,000</u>

Roland's current taxes payable are \$28,000. In each subsequent year following the initial deferral, the ending deferred tax liability is determined and compared with the beginning balance. The difference between the beginning and ending balances is recorded as an adjustment to the deferred tax liability account. At the end of 2014, aggregate tax depreciation exceeds aggregate book depreciation by \$20,000 (\$70,000 – \$50,000). The deferred tax liability account, therefore, must be adjusted to a balance of \$8,000 (\$20,000 × 0.40). The amount of the adjustment is \$2,000 (\$8,000 less the beginning balance of \$6,000). The following journal entry records the current payable and the adjustment to the deferred tax liability account:

Income Tax Expense (\$28,000 current + \$2,000 deferred) . . . . .	30,000	
Income Taxes Payable . . . . .		28,000
Deferred Tax Liability—Noncurrent . . . . .		2,000

Because the depreciation expense for tax and financial reporting purposes is the same for 2015, no adjustment to the deferred tax liability account would be necessary for that year. Income for tax purposes would be equal to financial accounting income, and tax expense and taxes payable would be recorded with the journal entry shown on page 16-13.

Income Tax Expense . . . . .	30,000
Income Taxes Payable ( $\$75,000 \times 0.40$ ) . . . . .	30,000

For 2016, income for tax purposes would be equal to \$95,000, computed as follows:

Financial income subject to tax . . . . .	\$75,000
Add reversal of temporary difference:	
Excess of book depreciation over tax depreciation . . . . .	<u>20,000</u>
Taxable income . . . . .	<u>\$95,000</u>
Tax ( $\$95,000 \times 0.40$ ) . . . . .	<u>\$38,000</u>

Therefore, current taxes payable would be \$38,000. The accumulated difference of \$20,000 in the deferred tax account reverses, and aggregate tax depreciation and aggregate book depreciation are the same (\$100,000). Thus, the journal entry to record the current year's payable as well as to reduce the deferred tax liability to zero would be as shown:

Income Tax Expense ( $\$38,000$ current – $\$8,000$ deferred benefit) . . . . .	30,000
Deferred Tax Liability—Noncurrent . . . . .	8,000
Income Taxes Payable . . . . .	38,000

The income tax benefit reduces the current income tax expense for 2016. The T-account summarizing the changes in the deferred tax liability account from 2013 to 2016 is as follows:

	6,000	for 2013
	6,000	balance, end of 2013
	2,000	for 2014
	8,000	balance, end of 2014
	0	for 2015
	8,000	balance, end of 2015
for 2016	8,000	
	0	balance, end of 2016

**Effect of Currently Enacted Changes in Future Tax Rates** The example assumed a constant future tax rate of 40%. If changes in future tax rates have been enacted, the deferred tax liability (or asset) is measured using the enacted tax rate for the future years when the temporary difference is expected to reverse. To illustrate, assume that in 2013, Congress enacts legislation that reduces corporate tax rates for 2014 and subsequent years. In the Roland Inc. example, all of the temporary difference reverses in 2016, and the deferred tax liability should be measured using the tax rate enacted for that year. If the enacted tax rate for 2016 is 35%, the deferred tax liability at the end of 2013 would be \$5,250 ( $\$15,000 \times 0.35$ ), rather than \$6,000 as computed earlier. At the end of 2014, the deferred tax liability would be \$7,000 ( $\$20,000 \times 0.35$ ), and the required adjustment would be \$1,750 ( $\$7,000 - \$5,250$ ).

IAS 12 is very similar to, but not exactly the same as, U.S. GAAP regarding the use of future tax rates. Under U.S. GAAP, as described in the previous paragraph, measurement of deferred tax liabilities and assets is done using the income tax rates that had been enacted as of the measurement date. This provision has the objective of measuring the deferred tax items at the tax rates that are expected to be in effect when the temporary items reverse, which will not be the same as the income tax rate for the current year if future tax rate changes have already been enacted into law. IFRS carries this concept one step further. Under IAS 12, deferred tax items are to be measured at income tax rates “that

CAUTION

The entire effect of a change in rates is reflected in tax expense on income from continuing operations even if some of the deferred tax balances relate to “below-the-line” or accumulated other comprehensive income items. See FASB ASC paragraph 740-10-45-17.

have been enacted or substantively enacted by the end of the reporting period.” The “substantively enacted” part of this IFRS provision refers to cases in which governments in some jurisdictions announce an income tax rate change but the formal legal enactment of the change does not occur for

several months. This is an example of the international standard taking a step back from legal literalism in order to capture the economic essence of a transaction or an event.

**Subsequent Changes in Enacted Tax Rates** When rate changes are enacted after a deferred tax liability or asset has been recorded, Topic 740 requires that the beginning deferred account balance be adjusted to reflect the new tax rate. Again using the Roland Inc. example, assume that the enacted tax rate for 2016 changed from 40% to 35% during 2014. The balance in the deferred tax liability at the beginning of 2014 is \$6,000 ( $\$15,000 \times 0.40$ ). The following adjusting entry would be made to reflect the newly enacted 35% tax rate for 2016:

Deferred Tax Liability—Noncurrent .....	750
Income Tax Benefit—Rate Change	
(reduction in income tax expense) .....	750
( $\$15,000 \times 0.05$ )	

The income effect of the change is reflected in income tax expense. In this case, the effect is a tax benefit resulting from a lower tax rate and would be shown as a reduction in income tax expense on the 2014 income statement.

**Example 4. Deferred Tax Asset**

Assume that Sandusky Inc. begins operations in 2013. For 2013, Sandusky computes pre-tax financial income of \$22,000. The only difference between financial and taxable income is the recognition of warranty expense. Sandusky accrues estimated warranty expense in the year of sale for financial reporting purposes but deducts only actual warranty expenditures for tax purposes. Accrued warranty expense for 2013 was \$18,000; no actual warranty expenditures were made in 2013. Therefore, taxable income in 2013 is \$40,000, computed as follows:

Financial income subject to tax .....	\$22,000
Add temporary difference:	
Excess of warranty expense over warranty deductions .....	<u>18,000</u>
Taxable income .....	<u>\$40,000</u>
Tax ( $\$40,000 \times 0.40$ ) .....	<u>\$16,000</u>

The difference in 2013 between warranty expense for financial reporting and tax purposes is a deductible temporary difference because it will result in future tax deductions of \$18,000. The deferred tax asset implied by this difference is \$7,200 ( $\$18,000 \times 0.40$ ). Warranty expenditures for 2013 sales are expected to be \$6,000 in each of the years 2014 through 2016. Because the underlying warranty obligation is assumed to be one-third current and two-thirds noncurrent, the associated deferred tax asset would be classified in the same ratio.

The future tax deduction of \$18,000 will provide a tax benefit only if Sandusky has taxable income in future periods against which the deduction can be offset. Accordingly, to record a deferred tax asset, one must assume that sufficient taxable income will exist in future years. Conditions under which this assumption may or may not be reasonable are described later in the chapter in the section entitled “Valuation Allowance for Deferred Tax Assets.”

Assuming that future taxable income will be sufficient to allow for full realization of the tax benefits of the \$18,000 future tax deduction (and let’s assume, just to keep things simple, that financial income subject to tax is \$22,000 in each of the next three years), the journal entry to record Sandusky’s income taxes for 2013 would be as follows:

Income Tax Expense (\$16,000 current – \$7,200 deferred benefit) . . . . .	8,800	
Deferred Tax Asset—Current . . . . .	2,400*	
Deferred Tax Asset—Noncurrent . . . . .	4,800†	
Income Taxes Payable . . . . .		16,000

\*One-third of underlying warranty obligation is current ( $1/3 \times \$7,200$ ).

†Two-thirds of underlying warranty obligation is noncurrent ( $2/3 \times \$7,200$ ).

Sandusky’s 2013 income statement would present income tax expense as follows:

Income before income taxes . . . . .		\$22,000
Income tax expense:		
Current . . . . .	\$16,000	
Deferred (benefit) . . . . .	(7,200)	8,800
Net income . . . . .		<u>\$13,200</u>

Sandusky’s December 31, 2013, balance sheet would report deferred tax assets of \$2,400 under current assets and \$4,800 under noncurrent assets. Income taxes payable for 2013 would be shown with current liabilities.

In subsequent periods, Sandusky’s taxable income would be less than reported pretax financial income because the deductible temporary differences would begin to reverse. In the years 2014 through 2016, taxable income would be equal to \$16,000, computed as follows:

Income subject to tax . . . . .	\$22,000
Reversal of temporary difference:	
Excess of warranty deductions over warranty expense . . . . .	(6,000)
Taxable income . . . . .	<u>\$16,000</u>
Tax ( $\$16,000 \times 0.40$ ) . . . . .	<u>\$ 6,400</u>

The amount of the deductible temporary difference would decline each year, affecting first the amount classified as noncurrent and finally eliminating the current portion of the deferred tax asset account. The following table illustrates the journal entries that would be made each year:

	2014	2015	2016
Income Tax Expense . . . . .	6,400	6,400	6,400
Income Taxes Payable . . . . .		6,400	6,400
Income Tax Expense . . . . .	2,400	2,400	2,400
Deferred Tax Asset—Current . . . . .	2,400	2,400	2,400
Deferred Tax Asset—Current . . . . .	2,400	2,400	
Deferred Tax Asset—Noncurrent . . . . .	2,400	2,400	

The first journal entry records the current period's tax liability. The second journal entry recognizes that the current portion of the deferred tax asset has expired. The final journal entry simply reclassifies the deferred tax asset from noncurrent to current, indicating that a portion of the deductible temporary difference will reverse in the upcoming period.

### Example 5. Deferred Tax Liabilities and Assets

Hsieh Company began operation on January 1, 2013. For 2013, Hsieh reported pretax financial income of \$38,000. As of December 31, 2013, the actual differences between Hsieh Company's financial accounting and income tax records for 2013 and the estimated differences for 2014 through 2016 are summarized as follows:

	Financial Reporting		Income Tax Reporting	
	Depreciation Expense	Warranty Expense	Depreciation Deduction	Warranty Deduction
2013 (actual)	\$25,000	\$18,000	\$40,000	\$ 0
2014 (estimated)	25,000	0	30,000	6,000
2015 (estimated)	25,000	0	25,000	6,000
2016 (estimated)	25,000	0	5,000	6,000

The enacted income tax rate for all years is 40% (note that Example 5 simply combines Examples 3 and 4). For 2013, taxable income would be computed as follows:

Financial income subject to tax	\$ 38,000
Add (deduct) temporary differences:	
Excess of warranty expense over warranty deductions	18,000
Excess of tax depreciation over book depreciation	(15,000)
Taxable income	<u>\$ 41,000</u>
Tax (\$41,000 × 0.40)	<u>\$ 16,400</u>

As of December 31, 2013, aggregate tax depreciation exceeds aggregate book depreciation by \$15,000 (\$40,000 – \$25,000). As explained previously, this represents a future taxable amount. The income tax expected to be paid on this amount is \$6,000 (\$15,000 × 0.40). This \$6,000 is a deferred tax liability as of December 31, 2013. Because the difference relates to a noncurrent item, the deferred tax liability is a noncurrent liability.

As of December 31, 2013, Hsieh has recognized an \$18,000 warranty expense for financial accounting purposes, which it plans to deduct for tax purposes over the next three years. Assuming that future taxable income will be sufficient to allow the tax benefit of this deduction to be fully realized, this future deductible amount creates a deferred tax asset of \$7,200 (\$18,000 × 0.40). Because the underlying warranty liability is part current (\$6,000) and part noncurrent (\$12,000), the deferred tax asset would also be classified as part current (\$2,400 = \$6,000 × 0.40) and part noncurrent (\$4,800 = \$12,000 × 0.40). The journal entries to record Hsieh's current taxes payable as well as the deferred portion of its 2013 income tax expense are as follows:

Income Tax Expense	16,400	
Income Taxes Payable		16,400
Deferred Tax Asset—Current	2,400	
Deferred Tax Asset—Noncurrent	4,800	
Income Tax Benefit (a subtraction from income tax expense)		1,200
Deferred Tax Liability—Noncurrent		6,000

Note that this journal entry is a combination of the journal entries associated with the deferred taxes from Examples 3 and 4. For reporting purposes, current deferred tax assets and current deferred tax liabilities are netted against one another and reported as a single amount. Similarly, noncurrent deferred tax assets and liabilities are netted and reported as a single amount.<sup>7</sup> In this example, the amounts to be reported on Hsieh's December 31, 2013, balance sheet are a \$2,400 current deferred tax asset and a \$1,200 noncurrent deferred tax liability (\$6,000 liability – \$4,800 asset). The income tax benefit would be shown as a \$1,200 reduction of current income tax expense in the 2013 income statement.

**Deferred Tax Classification under IFRS** Under IFRS, deferred tax assets and liabilities are to be classified as noncurrent assets and liabilities. As seen in the examples explained earlier, under U.S. GAAP, the deferred tax items are classified as current or noncurrent based on the classification of the underlying item that gives rise to the deferred income tax asset or liability. The IFRS classification provision is contained in *IAS 1*, which outlines, among other things, the basic structure of the financial statements.

### Valuation Allowance for Deferred Tax Assets

A deferred tax asset represents future income tax benefits. But the tax benefits will be realized only if there is sufficient taxable income from which the deductible amount can be deducted. Topic 740 requires that the deferred tax asset be reduced by a valuation allowance if, based on all available evidence, it is “more likely than not” that some portion or all the deferred tax asset will not be realized. As applied to deferred tax assets, “more likely than not” means a likelihood of more than 50%.<sup>8</sup> The **valuation allowance** is a contra asset account that reduces the asset to its expected realizable value. Before we get into the details of the valuation allowance, it is important for you to realize that for most companies, and for profitable companies in particular, the valuation allowance is not an issue. The valuation allowance becomes an issue when future profitability is in doubt.

In the Hsieh Company example (Example 5 on page 16-16), it was assumed that there would be sufficient taxable income to allow for the full realization of the benefits from the \$18,000 warranty deduction, and thus, no valuation allowance was established. Some possible sources of taxable income to be considered in evaluating the realizable value of a deferred tax asset are as follows:<sup>9</sup>

1. Future reversals of existing taxable temporary differences
2. Future taxable income exclusive of reversing temporary differences
3. Taxable income in prior (carryback) years

The first source of future taxable income, reversals of taxable temporary differences, can be identified without making assumptions about the profitability of future operations. In 2013, Hsieh Company has a \$15,000 excess of aggregate tax depreciation over aggregate book depreciation, which will result in a future taxable amount. The reversal of this temporary difference will provide taxable income in the future against which the \$18,000 warranty deduction can be offset. If it appears more likely than not that no other income will be available, then only \$15,000 of the \$18,000 warranty deduction is expected to be realized. Accordingly, the total deferred tax asset is \$7,200 ( $\$18,000 \times 0.40$ ), but the realizable amount is only \$6,000 ( $\$15,000 \times 0.40$ ). The \$1,200 difference would be recorded as a valuation allowance, an offset to the reported deferred tax asset. Two journal entries

<sup>7</sup> FASB ASC paragraph 740-10-45-6.

<sup>8</sup> FASB ASC paragraph 740-10-30-5e.

<sup>9</sup> FASB ASC paragraph 740-10-30-18.

can be used to record this deferred tax information. First, the deferred tax asset and liability are recognized, as follows.

Deferred Tax Asset—Current	2,400	
Deferred Tax Asset—Noncurrent	4,800	
Income Tax Benefit (a subtraction from income tax expense)		1,200
Deferred Tax Liability—Noncurrent		6,000

Note that this is the same as the deferred tax journal entry shown earlier. The second journal entry represents the fact that it is more likely than not that \$1,200 of the deferred tax asset will not be realized.

Income Tax Expense	1,200	
Allowance to Reduce Deferred Tax Asset to Realizable Value—Current		400
Allowance to Reduce Deferred Tax Asset to Realizable Value—Noncurrent		800

For classification purposes, the valuation allowance is allocated proportionately between the current and noncurrent portions of the deferred tax asset.<sup>10</sup> In this example, because one-third of the deferred tax asset is current (\$6,000/\$18,000), one-third, or \$400 ( $\$1,200 \times 1/3$ ), of the valuation allowance is classified as current. Of course, these two journal entries can be combined into one. The net effect of the two entries is that there is

no deferred tax component of income tax expense—the \$6,000 income tax expense associated with the deferred tax liability is exactly offset by the \$6,000 ( $\$7,200 - \$1,200$ ) income tax benefit (net) associated with the realizable portion of the deferred tax asset.

In 2014 and subsequent years, the company should reconsider available evidence to determine whether the valuation account should be adjusted.

The other two sources through which the benefit of a deferred tax asset can be realized include taxable income expected from profitable operations in future years and taxable income in

prior carryback years. This latter source relates to specific carryback provisions of the tax law, which are explained later in the chapter.

Topic 740 stipulates that both positive and negative evidence be considered when determining whether deferred tax assets will be fully realized.<sup>11</sup> Examples of negative evidence include cumulative losses in recent years, a history of the expiration of unused tax loss carryforwards, and unsettled circumstances that might cause a currently profitable company to report losses in future years. Positive evidence includes the existence of an order backlog sufficient to yield enough taxable income for the deferred tax asset to be realized, the existence of appreciated assets, and a strong earnings history.

## STOP & THINK

In what way do the data regarding deferred tax assets and liabilities provide valuable information to current and potential investors and creditors?

- Data regarding deferred tax assets and liabilities allow investors and creditors to better compute cost of goods sold.
- Data regarding deferred tax assets and liabilities allow investors and creditors to better estimate bad debt expense.
- Data regarding deferred tax assets and liabilities allow investors and creditors to better estimate future tax-related cash flows.
- Data regarding deferred tax assets and liabilities allow investors and creditors to better compute earnings before interest and taxes.

<sup>10</sup> FASB ASC paragraph 740-10-45-5.

<sup>11</sup> FASB ASC paragraph 740-10-30-17.

The FASB was very reluctant to allow firms to consider possible future taxable income when evaluating the realizability of deferred tax assets because, as stated in pre-Codification FASB *Statement No. 96*:

Incurring losses or generating profits in future years are future events that are not recognized in financial statements for the current year. Those future events shall not be anticipated, regardless of probability, for purposes of recognizing and measuring a deferred tax liability or asset in the current year. The tax consequences of those future events shall be recognized and reported in the financial statements in future years when the events occur.<sup>12</sup>

However, because many firms complained that it was unfair to require them to report deferred tax liabilities but not allow them to report deferred tax assets, the FASB reconsidered and revised its position. Topic 740 explicitly allows a firm to consider potential future income in evaluating the realizability of deferred tax assets.

**Valuation Allowance under IAS 12** Simply stated, under the provisions of *IAS 12*, there is no valuation allowance. Instead, deferred tax assets are recognized only “to the extent that it is probable that taxable profit will be available against which the deductible temporary difference can be utilised.” Thus, under U.S. GAAP, all deferred tax assets are initially recognized and then are reduced by a valuation allowance if it is more likely than not that there will not be sufficient future taxable income to allow for the realization of the deferred tax asset. Under IFRS, deferred tax assets are only recognized in the first place if their realization is probable; there is no need for a valuation allowance. However, much more important than the procedural difference between U.S. GAAP and IFRS is the difference in probability thresholds for ultimate deferred tax asset recognition. Under U.S. GAAP, the realizability of the deferred tax asset must be more likely than not, interpreted as a probability of 50%. Under IFRS, the realizability must be “probable.” Although no one has put a definitive probability percentage on “probable,” everyone agrees that probable is more than 50%, usually substantially more. Thus, the international standard is stricter than is U.S. GAAP with respect to the recognition of deferred tax assets.

**Accounting for Uncertain Tax Positions** In spite of the voluminous nature of the tax code, there are still many areas in which the deductibility of certain expenses or losses and the claiming of some tax credits are in question. Professional tax preparers are constantly giving advice to clients regarding aggressive tax positions that may, upon close scrutiny, be rejected by the Internal Revenue Service. Tax preparers are not required to be absolutely certain that a position will be sustained by the IRS in order to be justified in recommending that tax position to a client. According to U.S. Treasury Department regulations, a tax preparer or a taxpayer can justifiably advocate an aggressive tax position, without fear of legal or professional censure, if there is “substantial authority” to support a position.<sup>13</sup> “Substantial authority” is generally defined in practice as being a greater than 40% probability of having the tax position sustained.

The existence of aggressive tax positions that are not certain to be sustained upon IRS scrutiny raises the financial accounting question of whether the tax benefit associated with

<sup>12</sup> Pre-Codification FASB *Statement No. 96*, “Accounting for Income Taxes” (Stamford, CT: Financial Accounting Standards Board, 1987), par. 15.

<sup>13</sup> *IRC Section 6662(d)*.

these tax positions should be recognized as a reduction in income tax expense. Topic 740 states that the tax benefit associated with an uncertain tax benefit can be recognized only if it is *more likely than not* that the position will be sustained upon audit by the IRS. You can see that, under this interpretation, there will be some **uncertain tax positions** that might be taken by taxpayers but the tax benefits are not immediately recognized for financial accounting purposes because those benefits are not yet more likely than not.

Some examples of areas where tax benefits might be considered uncertain include the following:

- Classifying a revenue transaction as tax exempt (when it may not be)
- Electing not to file a tax return in a certain jurisdiction (when filing might be appropriate)
- Establishing a capitalization threshold for routine property and equipment purchases (when the tax law does not prescribe a threshold)

Topic 740 requires the use of a 2-step process to determine the recognition of any tax benefit associated with an uncertain tax position. The two steps relating to recognition and measurement are as follows:

1. Step 1—Determine if it is more likely than not that a tax position would be sustained if it were examined, and it must be assumed that the tax position will be examined. Remember, more likely than not means a likelihood of greater than 50%. If a tax position meets this criterion, then the analysis moves to Step 2.
2. Step 2—The measurement of the tax benefit is based on a probability assessment of the likelihood of specific outcomes and the amounts associated with those outcomes. The amount of the benefit is measured by taking the largest amount of tax benefit that is greater than 50% likely of being realized upon settlement.

An example is used to illustrate this 2-step process. Company A has taken a tax position on an issue for which the tax law is subject to interpretation. For tax purposes, Company A has claimed a deduction in the current period that results in a \$100 reduction in taxes to be paid this period. If this expenditure is reviewed, it is possible that the IRS may disallow all or part of the deduction. Company A must now determine how much should be reported as Income Tax Expense on the income statement and as Income Taxes Payable on the balance sheet.

**Case 1: Highly certain tax position.** In this example, if the probability that the tax benefit of \$100 would be achieved were greater than 50%, this would be deemed a “highly certain” tax position. A “highly certain” tax position is one in which the position is based on clear and unambiguous tax law and where it is more likely than not that (that is, a greater than 50% probability) the position taken and the amount in question would be upheld if reviewed. In this instance, there would be no additional tax liability recognized because the amount of tax benefit claimed on the tax return and the amount of benefit expected to be received based on the tax position analysis are the same.

**Case 2: Uncertain tax position—more likely than not.** Suppose instead that there is a range of possible outcomes associated with this tax position. The company is required to provide an assessment of both the probability of an outcome as well as the amount of allowable reduction in taxes associated with that probability. Assume the assessment of probabilities as shown on page 16-21.

There is a xx% probability that	The allowable reduction in taxes payable will be	The cumulative probability of occurrence is
10%	\$100	10%
20	80	30
25	60	55
20	40	75
15	20	90
10	0	100

If Company A determines that the technical merits of its position exceed the more-likely-than-not threshold (Step 1), the amount of tax benefit to be recognized for financial statement purposes in this example is \$60, the amount at which the cumulative probability exceeds 50% (Step 2). What this means is that Company A would now need to record an additional tax liability, called an *unrecognized tax benefit*, for the \$40 difference—the difference between the actual reduction in taxes (or tax benefit) on the income tax return filed this period and the expected amount of benefit based on this tax position analysis.<sup>14</sup>

The required journal entry is as follows:

Income Tax Expense . . . . .	40	
Unrecognized Tax Benefit . . . . .		40

The account, Unrecognized Tax Benefit, is a liability and would be classified as current if payment is anticipated within one year. It is important to note that liabilities relating to uncertain tax positions are not to be combined with deferred tax assets or liabilities for disclosure purposes.

**Case 3: Uncertain tax position—NOT more likely than not.** If the company completes Step 1 of the analysis and determines that it is NOT more likely than not that the tax position will be sustained (that is, there is a less than 50% chance the position will be supported upon review), then the entire amount of the position must be recognized as a liability with the following journal entry:

Income Tax Expense . . . . .	100	
Unrecognized Tax Benefit . . . . .		100

Topic 740 also requires note disclosure relating to the beginning balance of unrecognized tax benefits, additions based on tax positions related to the current year, additions related to tax positions for prior years, reductions for tax positions of prior years, and adjustments related to any settlements made during the year.

Exhibit 16-4 includes a portion of the financial statement note disclosure about uncertain tax positions made by **General Mills** in its May 30, 2010, financial statements. Note that a \$30.7 million tax benefit, and then a \$52.6 million tax expense, were recorded in consecutive years with respect to the same uncertain tax position. Clearly, a substantial amount of complex judgment must be used in assessing the probabilities and amounts associated with these uncertain tax positions.

<sup>14</sup> FASB ASC paragraph 740-10-25-16.

**EX 16-4** GENERAL MILLS DISCLOSURE ABOUT UNCERTAIN TAX POSITIONS—2010

NOTE 14. INCOME TAXES (in part)  
 The IRS has concluded its field examination of our 2006 and prior federal tax years, which resulted in payments of \$17.6 million in fiscal 2009 and \$56.5 million in fiscal 2008 to cover the additional U.S. income tax liability plus interest related to adjustments during these audit cycles. The IRS also proposed additional adjustments for the fiscal 2002 to 2006 audit cycles related to the amount of capital loss and depreciation and amortization we reported as a result of our sale of noncontrolling interest in our GMC subsidiary. The IRS has proposed adjustments that effectively eliminate most of the tax benefits associated with this transaction. We believe our positions are supported by substantial technical authority and are vigorously defending our positions. We are currently in negotiations with the IRS Appeals Division for fiscal 2002

to 2006. We have determined that a portion of this matter should be included as a tax liability and have accordingly included it in our total liabilities for uncertain tax positions. The IRS initiated its audit of our fiscal 2007 and 2008 tax years during fiscal 2009.

In the third quarter of fiscal 2008, we recorded an income tax benefit of \$30.7 million as a result of a favorable U.S. district court decision on an uncertain tax matter. In the third quarter of fiscal 2009, the U.S. Court of Appeals for the Eighth Circuit issued an opinion reversing the district court decision. As a result, we recorded \$52.6 million (including interest) of income tax expense related to the reversal of cumulative income tax benefits from this uncertain tax matter recognized in fiscal years 1992 through 2008. We expect to make cash tax and interest payments of approximately \$31.7 million in connection with this matter . . .

# FASB CODIFICATION

**The Issue:** Your brother-in-law is a bit of a know-it-all. He has heard that you are taking an accounting class. He thinks he is an accounting expert because he took, and passed (barely), an intermediate financial accounting class several years ago. He is now trying to embarrass you at a family gathering by showing how much more he knows about accounting than you do.

He has just thrown the following question at you: “What is INTRAperiod tax allocation?” Fortunately, he has been called away to a phone call. You have five minutes to go online and use the FASB’s Codification to avoid the humiliation of being bested by your obnoxious brother-in-law.

**The Question:** What is INTRAperiod tax allocation?

**Searching the Codification:** Your initial thought is that your brother-in-law has made a mistake. The accounting for temporary differences and deferred income taxes is called INTERperiod tax allocation. But because of the wicked smile he gave you when he asked the question, you know there is a trick here. The best place to start your search is FASB ASC Topic 740. Good luck!

**The Answer:** A discussion of INTRAperiod tax allocation is given on page 16-36.

## Carryback and Carryforward of Operating Losses

**3** Explain the provisions of tax loss carrybacks and carryforwards, and be able to account for these provisions.

**WHY** For some startup businesses, and even for some established businesses experiencing difficult economic conditions, the cash flow savings associated with the deduction of tax losses comprise an extremely important portion of the business's total economic value.

**HOW** If a business reports a tax loss, the U.S. tax code allows the business to carry back this loss up to two years to obtain a refund of taxes previously paid or to carry forward the loss up to 20 years in order to reduce the tax payments to be made in future periods. A tax carryforward results in a reduction in the current period's income tax expense and the recognition of a deferred tax asset.

Because income tax is based on the amount of taxable income reported, no tax is payable if a company experiences an operating loss. As an incentive to those businesses that experience alternate periods of income and losses, U.S. tax laws provide a way to ease the risk of loss years. This is done through a carryback and carryforward provision that permits a company to apply a net operating loss occurring in one year against income of other years. Specifically, the Internal Revenue Code provides for a 2-year carryback and a 20-year carryforward.<sup>15</sup>

### Net Operating Loss (NOL) Carryback

If you were profitable in prior periods and, as a result, paid taxes, you can get a refund of some or all those tax payments in the period in which you incur an operating loss. A **net operating loss (NOL) carryback** is applied to the income of the two preceding years in reverse order, beginning with the second year and moving to the first year. If unused net operating losses are still available, they may be carried forward up to 20 years to offset any future income. Amended income tax returns must be filed for each year to which the carryback is applied to receive refunds of previously paid income taxes. Net operating loss carrybacks result in a journal entry establishing a current receivable for the tax refund claim. The benefit that arises from such refunds is used to reduce the loss in the current period. This treatment is supported in theory because it is the current year's operating loss that results in the tax refund.

To illustrate, assume that Prairie Company had the following pattern of income and losses for the years 2012 through 2014:

Year	Income (Loss)	Income Tax Rate	Income Tax
2012	\$ 10,000	35%	\$3,500
2013	14,000	30	4,200
2014	(19,000)	30	0

<sup>15</sup> Before 1997, the carryback period was 3 years and the carryforward period was 15 years. Also, as an alternative, a taxpayer can elect to forgo the carryback and carry the entire loss forward for up to 20 years. This election is seldom made because carrybacks result in current refunds of taxes. In recognition of the economic damage caused by the September 11, 2001, World Trade Center attack, the Job Creation and Worker Assistance Act of 2002 extended the carryback period for NOLs created in 2001 or 2002 from two years to five years.

The \$19,000 net operating loss in 2014 would be carried back to 2012 first and then to 2013. An income tax refund claim of \$6,200 would be filed for the two years [ $\$3,500 + 0.30(\$9,000)$ ]. The entry to record the income tax receivable in 2014 would be as follows:

Income Tax Refund Receivable . . . . .	6,200
Income Tax Benefit from NOL Carryback . . . . .	6,200

The refund will be reflected on the income statement as a reduction of the operating loss as follows:

Net operating loss before income tax benefit . . . . .	\$(19,000)
Income tax benefit from NOL carryback . . . . .	<u>6,200</u>
Net loss . . . . .	<u><u>\$(12,800)</u></u>

The 2014 net operating loss reduces the 2012 taxable income to zero and the 2013 taxable income to \$5,000 ( $\$14,000 - \$9,000$ ). If another net operating loss occurs next year (in 2015), it may be carried back to the remaining \$5,000 from 2013.

### Net Operating Loss (NOL) Carryforward

If an operating loss exceeds income for the two preceding years, the remaining unused loss may be applied against income earned over the next 20 years as a **net operating loss (NOL) carryforward**. Under the provisions of Topic 740, a deferred tax asset is recognized for the potential future tax benefit from a loss carryforward. Full realization of the benefit, however, depends on the company having income equal to the carryforward

in the next 20 years. As is true for other deferred tax assets, a valuation allowance is used to reduce the asset if it is more likely than not that some or all of the future benefit will not be realized.

To illustrate the carryforward provisions, let's continue the previous example and assume that in 2015 Prairie Company incurred an operating loss of \$35,000. This loss would

be carried back to the years 2013 and 2014 in that order. However, the only income remaining against which operating losses can be applied is \$5,000 from 2013. After applying \$5,000 to the 2013 income, \$30,000 is left to carry forward against future income. The tax benefit from the carryback is \$1,500 ( $\$5,000 \times 0.30$ ). Assuming the enacted tax rate for future years is 30%, the potential tax benefit from the carryforward is \$9,000 ( $\$30,000 \times 0.30$ ). The entry in 2015 to record the tax benefits would be as follows:

Income Tax Refund Receivable . . . . .	1,500
Deferred Tax Asset—NOL Carryforward . . . . .	9,000
Income Tax Benefit from NOL Carryback . . . . .	1,500
Income Tax Benefit from NOL Carryforward . . . . .	9,000

The deferred tax asset of \$9,000 would be reported on the balance sheet as a current asset if it is expected to be realized in 2016. Any portion that is expected to be realized after 2016 would be classified as noncurrent. The \$10,500 in tax benefits would be shown on

## STOP & THINK

These net operating loss carrybacks sound like a great feature of the tax law. However, what did the company have to do to take advantage of this aspect of the law?

- a) Experience a tax loss
- b) Experience substantial taxable income
- c) Experience a financial accounting loss
- d) Experience substantial financial accounting income

the 2015 income statement as a reduction of the operating loss.

Assuming that Prairie becomes profitable in future periods, the deferred tax asset associated with the NOL carryforward would be used to offset any taxes payable resulting from profitable operations. As an example, assume that Prairie reports taxable income of \$50,000 in 2016. Rather than pay \$15,000 ( $\$50,000 \times 0.30$ ) in taxes, Prairie would be allowed to offset the deferred tax asset against the liability. The journal entry made by Prairie associated with its tax liability would then be as follows:

C. Sherburne/PhotoLink/Photodisc/Getty Images

The IRS provides a 2-year carryback and a 20-year carryforward provision that allows a company to apply a net operating loss occurring in one year against income of other years.

Income Tax Expense . . . . .	15,000	
Income Taxes Payable . . . . .		6,000
Deferred Tax Asset—NOL Carryforward . . . . .		9,000

The journal entry recorded at the end of 2015 indicates that it is more likely than not that the carryforward benefit will be realized in full. If, however, it is more likely than not that some portion or all of the deferred tax asset will not be realized, a valuation allowance account is needed to reduce the asset to its estimated realizable value. For example, assume that Prairie Company's recent losses resulted from a declining market for its products and that the weight of available evidence indicates continuing losses in subsequent years. As a result, management believes it is more likely than not that none of the asset will be realized. In this case, the journal entry to record the carryback and carryforward would be as follows:

Income Tax Refund Receivable . . . . .	1,500	
Deferred Tax Asset—NOL Carryforward . . . . .	9,000	
Income Tax Benefit from NOL Carryback . . . . .		1,500
Allowance to Reduce Deferred Tax Asset to Realizable Value—NOL Carryforward . . . . .		9,000

As a result of this entry, the net deferred tax asset is zero—the expected realizable value. If market conditions improve and the company does have taxable income in subsequent years, the valuation allowance account would be decreased (debited) and an income tax benefit account would be credited.

**FYI**

Under certain conditions, a company may acquire another company's NOL carryforwards as part of an acquisition or a merger. In some situations, these unused carryforwards are a company's most valuable "asset" to another company.

Under pre-Codification *APB Opinion No. 11*, future tax benefits from an NOL carryforward could be reported as an asset only if future income were "assured beyond reasonable doubt." Although such a criterion is not easily met, there were cases in which NOL carryforward benefits were reported as an asset. In pre-Codification *Statement No. 96*, the FASB was even more restrictive and prohibited reporting income tax benefits from

carryforwards as an asset under any circumstances. The adoption of the more-likely-than-not approach for deferred tax assets in pre-Codification *Statement No. 109* in 1992 led the Board to conclude that a similar approach should be used for net operating loss carryforwards. That is, NOL carryforwards are reported as assets if it is more likely than not that future income will be sufficient to allow for the realization of the tax benefit. This is a significant change in accounting for NOL carryforwards. Under *Statement No. 109*, millions of dollars of previously unreported income tax carryforwards are now included in the assets of companies. For example, IBM indicated in the notes to its 1990 financial statements that in addition to \$110 million of unrecognized deferred tax assets under FASB *Statement No. 96*, it had \$700 million of unrecognized tax credit carryforwards. As reported at the beginning of the chapter, IBM announced in September 1992 that it would recognize a gain of \$1.9 billion as a result of the deferred tax assets it would be able to recognize because of its adoption of *Statement No. 109*.

Deferred tax asset valuation allowances were discussed in the preceding section. Four U.S. companies with deferred tax asset valuation allowances are given in Exhibit 16-5. As the exhibit indicates, a very common reason for a company to have a deferred tax asset valuation allowance is that it has state, federal, or foreign NOL carryforwards that it doesn't think it will be able to use before they expire.

### EX 16-5 EXAMPLE OF DEFERRED TAX ASSET VALUATION ALLOWANCES 2009

For the Year 2009 (in millions)	Deferred Tax Assets	Valuation Allowance	Reason Given for Need for Valuation Allowance
AT&T Inc.	\$18,085	\$1,182	Certain state NOL carryforwards may expire unused.
Verizon	17,562	2,942	Certain state and foreign NOL carryforwards may expire unused.
ExxonMobil	17,813	1,495	No reason given
IBM	11,788	812	Certain state and foreign NOL carryforwards may expire unused.

## Scheduling for Enacted Future Tax Rates

4

Schedule future tax rates, and determine the effect on deferred tax assets and liabilities.

**WHY** When future tax rates are expected to be different from current tax rates, proper recognition of deferred tax assets and liabilities requires careful determination of when the temporary differences will reverse and what the tax rates will be in those periods.

**HOW** Deferred tax assets and liabilities are recorded at the tax rates expected to be in effect in the future when the temporary differences reverse. With varying future tax rates, the scheduled timing of the reversal of temporary differences must be determined in order to match the appropriate tax rate with the deferred tax assets and liabilities.

Recall that the two major complaints about FASB *Statement No. 96* were that it did not allow for the recognition of most deferred tax assets and that it was too complicated. The complaints about nonrecognition of deferred tax assets came primarily from companies

and users of financial statements who thought the inconsistent treatment of deferred tax assets and liabilities was misleading and unfair. Complaints about the complexities of pre-Codification *Statement No. 96* came primarily from preparers of financial statements. Those complaints focused on one topic: scheduling of the periods in which temporary differences are expected to reverse. Under the provisions of *Statement No. 96*, scheduling was required each year to determine which deferred tax assets could be realized because no future income could be assumed, and these assets were realizable only through the carryback and carryforward provisions of the tax law. In addition, under the provisions of *Statement No. 96*, scheduling was necessary to determine how deferred tax assets and liabilities should be classified based on the expected period of their reversal.

In 1992, the FASB eliminated much of the need for scheduling through the “more-likely-than-not” criterion for future income and because deferred tax assets and liabilities are classified according to the classification of the underlying items instead of according to the expected reversal period. However, scheduling is still required in a limited number of cases. One such case arises when differences in enacted future tax rates make it necessary to schedule the timing of a reversal in order to match that reversal with the tax rate expected to be in effect when it occurs.

Consider again the Hsieh Company example introduced on page 16-17. When that example was covered before, it was assumed that the enacted income tax rate was 40% for all periods. Assume now that the enacted tax rates are as follows: 2013, 40%; 2014, 35%; 2015, 30%; and 2016, 25%. As of December 31, 2013, using the 40% rate to value the deferred tax asset stemming from the future deductible amount of \$18,000 and the deferred tax liability resulting from the future taxable amount of \$15,000 would be misleading because it is known that the tax rate will not be 40% when those temporary differences reverse. A more accurate valuation can be obtained by applying tax rates expected to be in effect when the differences reverse, as follows:

	Enacted Tax Rate	Deductible Amount	Asset Valuation	Taxable Amount	Liability Valuation
2014 .....	35%	\$ 6,000	\$2,100	\$ 0	\$ 0
2015 .....	30	6,000	1,800	0	0
2016 .....	25	<u>6,000</u>	<u>1,500</u>	<u>15,000</u>	<u>3,750</u>
Total .....		<u>\$18,000</u>	<u>\$5,400</u>	<u>\$15,000</u>	<u>\$3,750</u>

The noncurrent deferred tax liability is \$3,750 ( $\$15,000 \times 0.25$ ), which is the expected tax to be paid on the taxable amount when it is taxed in 2016. The current deferred tax asset is \$2,100 ( $\$6,000 \times 0.35$ ), and the noncurrent deferred tax asset is \$3,300 [ $(\$6,000 \times 0.30) + (\$6,000 \times 0.25)$ ]. The journal entry to record the deferred portion of income tax expense for 2013 would be as follows:

Deferred Tax Asset—Current .....	2,100
Deferred Tax Asset—Noncurrent .....	3,300
Income Tax Benefit (a subtraction from income tax expense) .....	1,650
Deferred Tax Liability—Noncurrent .....	3,750

In this example, it was assumed that future income is more likely than not to be sufficient to allow for full deductibility of the \$6,000 deductible amount each year. Accordingly, the tax benefit is computed as the deductible amount times the tax rate for that year. However, if the future income was not deemed sufficient to allow for offset of the

deductible amounts and if the deferred tax asset could be realized only through the carryback provision of the tax law, the deferred tax asset would be valued using the tax rate in the carryback year. For example, if future income is unlikely but 2013 taxable income exceeds \$18,000, then the deductible amounts will be realized only through carryback and offset against 2013 taxable income. If this is the case, the deferred tax asset would be valued using the tax rate in effect for 2013, the carryback year.

## Financial Statement Presentation and Disclosure

5

Determine appropriate financial statement presentation and disclosure associated with deferred tax assets and liabilities.

**WHY** Accounting for income taxes is a complex area with current and deferred tax effects as well as state, federal, and international income tax obligations. Significant supplemental disclosure is necessary to allow a financial statement user to understand the impact of income taxes on a company's financial position and performance.

**HOW** Deferred tax assets and liabilities are reported on the balance sheet as either current or noncurrent, based on the classification of the underlying asset or obligation. Additional disclosure is required relating to the tax expense for the period, deferred tax expense, benefits associated with tax loss carryforwards, the effect of changes in tax rates, and adjustments associated with the valuation allowance account.

On classified balance sheets, deferred tax assets and liabilities must be reported as either current or noncurrent. As discussed previously, FASB ASC Topic 740 provides for some offsetting of deferred assets and liabilities. For offsetting to be acceptable, the asset and liability must both be current or both be noncurrent. A current asset cannot be offset against a noncurrent liability. Most companies are subject to state and municipal income taxes as well as federal income taxes. If a business enterprise pays income taxes in more than one tax jurisdiction, no offsetting is permitted across jurisdictions.

The income statement must show, either in the body of the statement or in a note, the following selected components of income taxes related to continuing operations:<sup>16</sup>

1. Current tax expense or benefit
2. Deferred tax expense or benefit
3. Investment tax credits
4. Government grants recognized as tax reductions
5. Benefits of operating loss carryforwards
6. Adjustments of a deferred tax liability or asset for enacted changes in tax laws or rates or a change in the tax status of an enterprise
7. Adjustments in the beginning-of-the-year valuation allowance because of a change in circumstances

The kind of disclosure typically made for income taxes is illustrated by an excerpt from the notes to the 2009 financial statements of ExxonMobil, presented in Exhibit 16-6.

The current portion of income tax expense (with an \$838 million tax benefit for U.S. federal and \$15.830 billion tax expense for non-U.S. income taxes in the ExxonMobil example) can be viewed as the one place in the financial statements where the financial accounting records and the tax records coincide. Roughly speaking, the \$838 million tax benefit that ExxonMobil reports as the consolidated current portion of U.S. federal income

<sup>16</sup> FASB ASC paragraph 740-10-50-9.

## EX 16-6 EXXONMOBIL—DISCLOSURE FOR PROVISION FOR INCOME TAXES

(Millions of dollars)	2009			2008			2007		
	U.S.	Non-U.S.	Total	U.S.	Non-U.S.	Total	U.S.	Non-U.S.	Total

© 2012 Cengage Learning.

tax for 2009 is the same number that would appear on a hypothetical ExxonMobil 2009 consolidated tax return for the U.S. federal jurisdiction under the heading of “Total Tax Refund” for the year. A careful look at Exhibit 16-6 reveals that this isn’t all of the tax ExxonMobil paid during the year. First, additional income taxes of \$32 million (extra income tax that must be paid to the U.S. government for income earned in a foreign country) and \$110 million (state income taxes) were also payable for 2009. Also, note that because of the existence of deferred taxes, the amount of reported income tax expense (related to U.S. federal income taxes) is \$650 million more than the amount of income tax actually owed for the year. In addition, to highlight the large taxes associated with its industry, ExxonMobil reports that in 2009 it owed a total of \$63.507 billion (\$25.936 + \$37.571) worldwide for sales-based taxes, other taxes, and duties.

As another example of disclosure, see Exhibit 16-7, which is a portion of IBM’s 2009 financial statement note related to income taxes. IBM reported in the notes to its 2009 financial statements that it had a valuation allowance for its deferred tax assets of \$812 million on December 31, 2009. The note also indicates that the valuation allowance is principally associated with foreign and state loss carryforwards and state credit carryforwards that IBM believes it is more likely than not that it won’t be able to use.

Firms also disclose the specific accounting differences between the financial statements and the tax return that give rise to deferred tax assets and deferred tax liabilities. The most common source of deferred tax items is depreciation. As an illustration, IBM provides significant disclosure as to the specific makeup of its deferred tax assets and liabilities. This disclosure is reproduced in Exhibit 16-7. Overall, as of December 31, 2009, IBM had \$10.976 billion in deferred tax assets (net of a \$812 million valuation allowance) and \$5.578 billion in deferred tax liabilities. In contrast, for ExxonMobil, the total deferred tax

## EX 16-7 IBM—DISCLOSURE FOR DEFERRED TAX ASSETS AND LIABILITIES

The significant components of deferred tax assets and liabilities that are recorded in the Consolidated Statement of Financial Position were as follows:

### Deferred Tax Assets

(\$ in millions)

At December 31:	2009	2008
Retirement benefits . . . . .	\$ 3,921	\$ 5,215
Share-based and other compensation . . . . .	1,853	2,579
Domestic tax loss/credit carryforwards . . . . .	859	862
Deferred income . . . . .	847	739
Foreign tax loss/credit carryforwards . . . . .	680	642
Bad debt, inventory and warranty reserves . . . . .	605	561
Capitalized research and development . . . . .	539	795
Depreciation . . . . .	485	388
Other . . . . .	1,999	1,863
Gross deferred tax assets . . . . .	11,788	13,644
Less: valuation allowance . . . . .	812	720
Net deferred tax assets . . . . .	<u>\$10,976</u>	<u>\$12,924</u>

### Deferred Tax Liabilities

(\$ in millions)

At December 31:	2009	2008
Leases . . . . .	\$2,129	\$1,913
Depreciation . . . . .	1,138	941
Goodwill and intangible assets . . . . .	639	552
Software development costs . . . . .	409	449
Retirement benefits . . . . .	389	104
Other . . . . .	874	697
Gross deferred tax liabilities . . . . .	<u>\$5,578</u>	<u>\$4,656</u>

The valuation allowance at December 31, 2009, principally applies to certain foreign, state and local loss carryforwards that, in the opinion of management, are more likely than not to expire unutilized. However, to the extent that tax benefits related to these carryforwards are realized in the future, the reduction in the valuation allowance will reduce income tax expense. The year-to-year change in the allowance balance was an increase of \$92 million.

© 2012 Cengage Learning.

liability as of December 31, 2009 (not shown in Exhibit 16-6), was \$34.033 billion; of this amount, 59.4%, or \$20.210 billion, arose from accelerated tax depreciation.

In addition to the disclosures already described, the reported amount of income tax expense related to continuing operations must be reconciled with the amount of income tax expense that would result from applying federal tax rates to pretax financial income from continuing operations. This reconciliation provides information to readers of the financial statements regarding how the entity has been affected by special provisions of the tax code such as permanent differences, tax credits, and so forth. To illustrate, Exhibit 16-8 is the income tax rate reconciliation for Berkshire Hathaway for 2009. The company begins by reporting that its 2009 income tax expense would have been \$4,043 million (\$11,552 million  $\times$  0.35) if the federal tax rate of 35.0% had been applied to all of its earnings before income taxes. Berkshire Hathaway's **effective tax rate** for the

year of 30.6% is computed by dividing reported income tax expense by earnings before income taxes (\$3,538 million/\$11,552 million). By looking at Exhibit 16-8, you can see that this difference between the 35.0% statutory rate and the 30.6% effective rate is *not* caused by temporary differences (except for the tax rate changes affecting these temporary differences as noted in the footnote to the exhibit). As illustrated in this chapter, temporary differences affect whether income tax is payable this year but do not affect whether the income tax expense is accrued this year. The items included in Exhibit 16-8 reflect permanent differences between the tax that Berkshire Hathaway must pay and the tax the company would pay if all income were taxed at the 35.0% rate. For example, Berkshire Hathaway owed an extra \$81 million in income taxes for the year because state income taxes must be paid on top of the 35.0% federal income tax. In addition, lower income tax rates in foreign countries resulted in Berkshire

Hathaway's saving \$92 million in income tax for the year. Offsetting these extra taxes is the fact that some of Berkshire Hathaway's 2009 income will never be taxed. Berkshire Hathaway saved \$33 million in income taxes because some of its interest income (on municipal securities) is not taxable. Also, dividends paid by one corporation to another are partially excluded from tax; this tax provision yielded a permanent \$479 million tax savings to Berkshire Hathaway in 2009.

## STOP & THINK

What is the rationale behind excluding from a corporation's taxable income dividends received from another corporation?

- The dividend exclusion increases the progressive nature of income tax rates.
- The dividend exclusion is necessary to avoid the recognition of unrealizable deferred tax assets.
- Without the exclusion, corporate income would be subject to triple taxation.
- It is futile to search for any underlying rationale in income tax rules.

### EX 16-8 BERKSHIRE HATHAWAY—RECONCILIATION OF EFFECTIVE TAX RATE TO FEDERAL STATUTORY RATE

Charges for income taxes are reconciled to hypothetical amounts computed at the U.S. federal statutory rate in the table shown below (in millions).

	2009	2008	2007
Earnings before income taxes . . . . .	\$11,552	\$7,574	\$20,161
Hypothetical amounts applicable to above computed at the federal statutory rate . . . . .	\$ 4,043	\$2,651	\$ 7,056
Tax-exempt interest income . . . . .	(33)	(88)	(33)
Dividends received deduction . . . . .	(479)	(415)	(306)
State income taxes, less federal income tax benefit . . . . .	81	162	152
Foreign tax rate differences . . . . .	(92)	(59)	(36)
Effect of income tax rate changes on deferred income taxes* . . . . .	—	—	(90)
Non-taxable exchange of investment . . . . .	—	(154)	—
Other differences, net . . . . .	18	(119)	(149)
Total income taxes . . . . .	<u>\$ 3,538</u>	<u>\$1,978</u>	<u>\$ 6,594</u>

\* Relates to adjustments made to deferred income tax assets and liabilities in 2007 upon the enactment of reductions to corporate income tax rates in the United Kingdom and Germany.

## Deferred Taxes and the Statement of Cash Flows

6

Comply with income tax disclosure requirements associated with the statement of cash flows.

**WHY** The FASB decided that all cash flows associated with income statement expenses were to be reported in the statement of cash flows as operating activities. Because many financial statement users view income taxes as a nonoperating item, it is useful to these users to have separate disclosure of the amount of cash paid for income taxes.

**HOW** The amount of cash paid for income taxes must be disclosed in the financial statements. With the direct method, the amount of cash paid for income taxes is disclosed in the body of the statement of cash flows. With the indirect method, disclosure of cash paid for income taxes is typically made in the notes to the financial statements.

FASB ASC Topic 230 (Statement of Cash Flows) requires separate disclosure of the amount of cash paid for income taxes during a period. This separate disclosure is required for just two items: cash paid for income taxes and cash paid for interest. Financial statements are used to assess the amount and timing of future cash flows, and in the case of interest and income taxes, the FASB argued that this specific cash flow information should be readily available and easily disclosed by most firms.<sup>17</sup> As an example, **Disney** discloses in its financial statements that for the year ended October 3, 2009, it reported income tax expense of \$2,049 million (on the income statement) and cash paid during the year for income taxes of \$1,609 million (on the statement of cash flows).

Income taxes affect the Operating Activities section of the statement of cash flows.<sup>18</sup> When the direct method is used, cash paid for income taxes is shown as a separate line item. When the indirect method is used, the treatment of income taxes is a bit more complicated. Adjustments to convert net income into cash from operations are needed for changes in income taxes payable and receivable accounts and for changes in deferred tax asset and liability accounts. In addition, supplemental disclosure of the amount of cash paid for income taxes is required.

As an illustration of how income taxes are handled in the statement of cash flows, consider the following information for Collazo Company for 2013:

Revenue (all cash) . . . . .		\$30,000
Income tax expense:		
Current . . . . .	\$10,300	
Deferred . . . . .	<u>1,700</u>	<u>12,000</u>
Net income . . . . .		<u>\$18,000</u>

In addition, Collazo had the balance sheet amounts shown on page 16-33 at the beginning and end of the year.

<sup>17</sup> FASB ASC paragraph 230-10-50-2.

<sup>18</sup> The FASB considered allocating income taxes paid among the Operating, Investing, and Financing Activities sections of the statement of cash flows. For example, any income tax effects from the disposal of equipment could be disclosed in the Investing Activities section. However, it was concluded that this allocation would be unnecessarily complex, with the cost of doing it outweighing the benefit. See pre-Codification FASB *Statement No. 95*, par. 92.

	December 31, 2013	December 31, 2012
Income tax refund receivable . . . . .	\$2,000	\$ 0
Income taxes payable . . . . .	0	1,000
Deferred tax liability . . . . .	9,700	8,000

Using the format developed in Chapter 5, we will analyze the income statement and convert the accrual basis number to the cash basis, as demonstrated in the following table:

Income Statement		Adjustments	Statement of Cash Flows	
Revenue (all cash)	\$ 30,000	—	\$ 30,000	Cash collected from customers
Income tax expense—current	(10,300)	– \$2,000—Increase in tax receivable	(13,300)	Cash paid for taxes
Income tax expense—deferred	(1,700)	– 1,000—Decrease in taxes payable + 1,700—Increase in deferred tax liability	0	
Net income	<u>\$ 18,000</u>	– \$1,300—Total adjustments	<u>\$ 16,700</u>	Cash flow from operations

Using the resulting information, the Operating Activities section of Collazo's statement of cash flows is as follows if the direct method is used:

Cash collected from customers . . . . .	\$ 30,000
Income taxes paid . . . . .	<u>(13,300)</u>
Cash provided by operating activities . . . . .	<u>\$ 16,700</u>

If the indirect method is used, the Operating Activities section is as follows:

Net income . . . . .	\$18,000
(Increase) decrease in income tax refund receivable . . . . .	(2,000)
Increase (decrease) in income taxes payable . . . . .	(1,000)
Increase (decrease) in deferred tax liability . . . . .	1,700
Cash provided by operating activities . . . . .	<u>\$16,700</u>

In addition, if the indirect method is used, the amount of cash paid for income taxes, \$13,300, must be separately disclosed either in the statement of cash flows or in the notes to the financial statements.

## International Accounting for Deferred Taxes

7

Describe how, with respect to deferred income taxes, international accounting standards have converged toward the U.S. treatment.

**WHY** Accounting for income taxes is an area where there have historically been large differences in standards around the world. In this particular area, the U.S. approach has gradually become the worldwide standard.

**HOW** Historically, companies around the world have used the no-deferral, the partial recognition, and the comprehensive recognition approaches to deferred tax accounting. Since the substantial revision of IAS 12 in 1996, deferred tax accounting around the world has converged toward the comprehensive recognition approach employed in the United States.

In the past, accounting standards around the world have differed substantially in the area of deferred taxes. However, over the past 15 years, the U.S. approach to deferred tax accounting has become used almost everywhere. This section discusses the different approaches that have been used around the world and recent developments in the international harmonization of deferred tax accounting.

The approach to deferred tax accounting used in the United States (and discussed in this chapter) is sometimes called the *comprehensive recognition approach* because it requires recognition of all temporary differences between financial accounting income and taxable income. At the other extreme, the *no-deferral approach* recognizes none of the differences. These two approaches are described in this section.

### No-Deferral Approach

The simplest approach to accounting for differences between financial accounting and taxable income is just to ignore the differences and report income tax expense equal to the amount of tax payable for the year. Historically, this no-deferral approach was quite common around the world. In countries where there is a close correspondence between financial accounting standards and tax rules, the no-deferral approach yields financial statement numbers that are not that much different from what would be generated using the full-blown deferred tax accounting practices used in the United States. The no-deferral approach has become almost extinct now (except in smaller, privately held companies) as companies seek to converge to the prevailing international practice; the no-deferral approach has been formally frowned upon since the original issuance of *IAS 12* in 1979.

### Comprehensive Recognition Approach

The IASB has embraced the comprehensive recognition approach to deferred tax accounting that underlies FASB ASC Topic 740 in the United States. The original version of *IAS 12* required that deferred taxes be included in the computation of income tax expense and that deferred taxes be reported on the balance sheet, but it left open the method used to compute the deferred taxes. In 1996, the IASB (predecessor to the IASB) revised *IAS 12*; the accounting required in the revised version is very similar to the deferred tax accounting practices that have been described throughout this chapter. The good news for U.S. accountants and accounting students is that the world appears to have come around to the U.S. way of accounting for deferred taxes, so we don't have to learn very much in order to understand international accounting for deferred taxes.

### Partial Recognition Approach

Historically, the United Kingdom employed an innovative technique for accounting for deferred taxes that results in a deferred tax liability being recorded only to the extent that the deferred taxes are actually expected to be paid in the future. To use the U.K. terminology, deferred income taxes are recognized only if they are expected to “crystallise.” An equivalent concept in the United States might be “realized.” For example, if a company is growing and continually purchasing new assets, as deferred taxes on the older assets reverse, they will be offset by taxes being deferred on the new assets. In such cases, if the firm is assumed to be a going concern, the tax deferral may continue indefinitely as new assets replace old ones. In the United Kingdom, it is said that this type of deferred tax liability will not crystallise, and so historically it was not recognized. Only if it is expected that deferrals on new assets will not offset older assets will crystallisation occur—and then a deferred tax liability would be recognized. The reasoning behind the U.K. approach to deferred tax liabilities is actually quite interesting: If a liability is deferred indefinitely, the

present value of that liability is zero. This concept highlights a common criticism of U.S. deferred tax accounting—no accounting recognition is given to the fact that by deferring income tax payments, firms are decreasing the present value of their tax obligation. Despite its conceptual attractiveness, the U.K. partial recognition approach was dropped in the interest of international harmonization. In its description of its new standard (*FRS 19*), the Accounting Standards Board (ASB) of the United Kingdom gives this lukewarm evaluation of the comprehensive recognition approach:

In recent years, the partial provision method of accounting for deferred tax . . . has lost favour internationally, primarily because it is subjective (relying heavily on management expectations about future events) and inconsistent with other areas of accounting. Other major standard-setters and *IAS 12* (revised 1996) now require deferred tax to be provided for in full. Whilst the ASB could see the merits of the partial provision method, it accepted some of the arguments against it and concluded that deferred tax was not an area where a good case could be made for taking a stand against the direction of international opinion.<sup>19</sup>

In summary, both the no-deferral and partial recognition approaches have been used around the world in the past, but *IAS 12* now requires the comprehensive recognition approach that is employed in the United States. It appears that the international differences in accounting for deferred income taxes will be relatively small in future years.

### SOLUTIONS TO OPENING SCENARIO QUESTIONS

1. Financial statement users and preparers complained about pre-Codification *Statement No. 96* on both practical and conceptual grounds. These complaints were so heated that the FASB's credibility was damaged. For a time, there were suggestions that, because of its "mishandling" of the accounting for deferred taxes, the FASB should be replaced with a different standard setter.
2. Pre-Codification *Statement No. 96* required that deferred tax liabilities be valued using current income tax rates instead of the tax rates that existed when the deferred tax liability was first recognized. Because the Tax Reform Act of 1986 had lowered corporate income tax rates, *Statement No. 96* resulted in recognition of a reduction in the recorded amount of deferred tax liabilities and a corresponding gain.
3. Under FASB Pre-Codification *Statement No. 96*, deferred tax assets were generally not recognized; in fact, this was one of the complaints about *Statement No. 96*. With the adoption of pre-Codification FASB *Statement No. 109*, these deferred tax assets were recognized on the balance sheet along with the recognition of a corresponding gain.

### SOLUTIONS TO STOP & THINK

1. (Page 16-4) The correct answer is A. An obvious third set of books for a well-run company, arguably the most important, is the managerial accounting system. Of course, the managerial records would be tailored to the needs of each company. Different aspects of the managerial records would emphasize CONTROL, EVALUATION, and PLANNING. A small business would combine the functions of all three sets of books—financial, tax, and managerial—into one set of reports. As a company's information needs become more sophisticated, there is increased divergence among these three sets of books.
2. (Page 16-8) The correct answer is C. Deferred tax assets and deferred tax liabilities result from different types of transactions. For example, a deferred tax asset can result from warranties, while a deferred tax liability can result from

<sup>19</sup> <http://www.asb.org.uk>. *FRS 19*, "Deferred Tax," background to FRS requirements.

- accelerated depreciation of a depreciable asset. The differences between GAAP and tax law provide numerous instances that can result in either deferred tax assets or deferred tax liabilities.
3. (Page 16-12) The correct answer is D. As will be pointed out in an upcoming section of the text, deferred tax assets and deferred tax liabilities are to be measured using tax rates expected to be applicable in the period of the reversal. Thus, if rates in the future are expected to be 30%, then the deferred amount would be multiplied by 30% instead of 40%.
  4. (Page 16-18) The correct answer is C. One of the key purposes of financial statements, according to the Conceptual Framework, is to aid investors and creditors in assessing the amounts, timing, and uncertainty of future cash flows. By reporting to financial statement users the existence of additional future cash flows (deferred tax liabilities) and additional future cash savings (deferred tax assets), deferred tax accounting helps users assess future cash flows.
  5. (Page 16-24) The correct answer is A. Although carrybacks and carryforwards work to the benefit of the company in that it is able to either receive a refund of taxes previously paid or to reduce the amount of taxes to be paid in the future, one must remember that the company had to report a net operating loss in order to take advantage of this feature of the tax law. The carryback and carryforward provisions ease the pain of an operating loss.
  6. (Page 16-31) The correct answer is C. Dividends paid to shareholders are already double taxed. The corporation must pay tax on the income, leaving less income to pay to shareholders as dividends. Then the shareholders must pay income tax when they receive the dividends. When a corporation is a shareholder and receives dividends, then that dividend income would be taxed for a third time without the special tax provision excluding the dividends from income taxation for the receiving corporation.

### SOLUTION TO USING THE FASB'S CODIFICATION

You should have found Topic 740 in the “Expenses” collection of topics. And right there in the topic table of contents is Subtopic 740-20 (Income Taxes—Intraperiod Tax Allocation). A quick look at the “Overview and Background” section reveals the following in FASB ASC paragraph 740-20-05-2: “This Subtopic addresses the process of intraperiod tax allocation that allocates total income tax expense or benefit of an entity for a period to different components of comprehensive income and shareholders’ equity. This includes allocating income tax expense or benefit for the year to: (a) continuing operations,

(b) discontinued operations, (c) extraordinary items, (d) other comprehensive income, and (e) items charged or credited directly to shareholders’ equity.”

Ahh, this makes sense. The IRS doesn’t care whether you classify a certain income-generating event as an extraordinary item or a discontinued operation—you still have to pay tax on any income generated. Intraperiod tax allocation is the process of assigning your total tax bill to the different categories of income. So, when your brother-in-law comes back in the room, try to be gracious in victory.

## REVIEW CHAPTER 16

### LEARNING OBJECTIVES

- 1 Understand the concept of deferred taxes and the distinction between permanent and temporary differences.

Deferred taxes result from the different objectives being used and applied for computing taxable income and income

for financial reporting purposes. Because of differences between the tax code and GAAP, the accounting treatment for certain issues will differ. These differences can result in temporary timing differences that will eventually reverse or permanent differences that will not reverse. Temporary

timing differences that result in taxable income in the future are termed *taxable temporary differences* and result in deferred tax liabilities. Those differences that result in expected deductible amounts in the future are termed *deductible temporary differences* and result in deferred tax assets.

**2** Compute the amount of deferred tax liabilities and assets including the use of a valuation allowance and the uncertainty of tax positions.

Computing the amount of deferred tax assets and liabilities involves four steps: (1) identify the types and amounts of temporary timing differences, (2) compute the deferred tax liability associated with taxable temporary differences using current and future tax rates, (3) compute the amount of deferred tax asset associated with deductible temporary differences using current and future tax rates, and (4) reduce the amount of deferred tax asset if it is more likely than not that some or all of the asset may not be realized, using a valuation allowance account. The claiming of uncertain tax deductions may require the recognition of an unrecognized tax benefit liability to the extent that the claimed deduction is in excess of the deduction that is more likely than not to be sustained upon taxing authority review.

**3** Explain the provisions of tax loss carrybacks and carryforwards, and be able to account for these provisions.

Tax law requires corporations to pay taxes if they report taxable income. If a business reports a loss, the tax code allows that business to offset the loss against income in other years. The business is allowed to carry back its net operating losses up to 2 years to obtain a refund of taxes previously paid or to carry forward an operating loss up to 20 years in order to reduce the tax liability associated with future periods. A carryforward results in a deferred tax asset and may require the use of a valuation allowance account if it is more likely than not that the deferred asset may not be realized.

**4** Schedule future tax rates, and determine the effect on deferred tax assets and liabilities.

Deferred tax assets and liabilities are recorded at the tax rates expected to be

in effect in the periods of reversal. Thus, if Congress enacts rate changes or the corporation's taxable income level results in different expected future tax rates, these differing rates must be reflected in the valuation of deferred tax assets and liabilities.

**5** Determine appropriate financial statement presentation and disclosure associated with deferred tax assets and liabilities.

Deferred tax assets and liabilities are disclosed on the balance sheet as either current or noncurrent, based on the classification of the underlying asset or obligation. Additional disclosure is required relating to the tax expense (or benefit) for the period, deferred tax expense (or benefit), benefits associated with tax loss carryforwards, the effect of changes in tax rates, and adjustments associated with the valuation allowance account.

**6** Comply with income tax disclosure requirements associated with the statement of cash flows.

The amount of cash paid for income taxes must be disclosed using either the direct or indirect methods. With the direct method, the amount of cash paid for income taxes would be disclosed directly on the statement of cash flows. Under the indirect method, adjustments are made to net income for changes in receivable and payable balances associated with current and deferred tax assets and liabilities. Thus, with this method, the actual amount paid for taxes may not be disclosed in the body of the statement of cash flows. If this is the case, disclosure of cash paid for taxes is required in the notes to the financial statements or at the bottom of the statement of cash flows.

**7** Describe how, with respect to deferred income taxes, international accounting standards have converged toward the U.S. treatment.

Historically, companies around the world have used the no-deferral, the partial recognition, and the comprehensive recognition approaches to deferred tax accounting. With the revision of *IAS 12* in 1996, it now appears that deferred tax accounting around the world is converging toward the comprehensive recognition approach employed in the United States.

## FASB-IASB CODIFICATION SUMMARY

Topic	FASB Accounting Standards Codification	Original FASB Standard	Corresponding IASB Standard	Differences between U.S. GAAP and IFRS
Use of currently enacted tax rates	Section 740-10-10 par. 3	SFAS No. 109 par. 18	IAS 12 par. 46	Under U.S. GAAP, currently enacted tax rates for future years are used in valuing deferred tax assets and liabilities. Under IFRS, tax rates that have been "substantively enacted" are also used. Substantively enacted tax rates are future tax rates that have been announced by the government but that have not yet been formally enacted into law.
Current/noncurrent classification of deferred tax assets and liabilities	Section 740-10-45 par. 4	SFAS No. 109 par. 41	IAS 1 par. 56	Under U.S. GAAP, deferred tax assets and liabilities are classified current or noncurrent based on the classification of the associated asset or liability. Under IFRS, all deferred tax items are classified as noncurrent.
Recognition of deferred tax assets	Section 740-10-30 par. 5e	SFAS No. 109 par. 17e	IAS 12 par. 24	Under U.S. GAAP, deferred tax assets are recognized if it is "more likely than not" (50%+ probability) that the future tax benefits will be realized. Under IFRS, the probability threshold is "probable," which is generally seen to be higher than "more likely than not."
Uncertain tax positions	Topic 740	FASB FIN No. 48	No specific accounting standard in IAS	Under IFRS, there is no standard regarding the recognition of a tax liability related to an uncertain tax position.
Cash paid for income taxes	Section 230-10-50 par. 2	SFAS No. 95 par. 121	IFRS 7 par. 35	Both U.S. GAAP and IFRS require separate disclosure of the amount of cash paid for income taxes. Under IFRS, this amount may be allocated among operating, investing, and financing activities.

## KEY TERMS

Asset and liability method of interperiod tax allocation 16-10	Effective tax rate 16-31 Financial income 16-3 Interperiod tax allocation 16-10	Net operating loss (NOL) carryforward 16-24 Permanent differences 16-7 Taxable income 16-3	Taxable temporary differences 16-8 Temporary differences 16-7 Uncertain tax position 16-20 Valuation allowance 16-17
Deductible temporary differences 16-8	Net operating loss (NOL) carryback 16-23		

## QUESTIONS

- Accounting methods used by a company to determine income for financial reporting purposes frequently differ from those used to determine taxable income. What is the justification for these differences?
- Distinguish between a nondeductible expense and a temporary difference that results in a taxable income greater than pretax financial income reported in the income statement.
- Distinguish between taxable temporary differences and deductible temporary differences, and give at least two examples of each type.
- One possibility for reporting income tax expense in the income statement for a given year is to merely report the amount of income tax payable in that year. What is wrong with this approach?
- What are the major advantages of the asset and liability method?
- What is a drawback of the asset and liability method?
- Describe how a change in enacted future tax rates is accounted for under the asset and liability method.
- When is a valuation allowance necessary?
- How does the FASB define the probability term “more likely than not” in Topic 740?
- What are the sources of income through which the tax benefit of a deferred tax asset can be realized?
- In applying the net operating loss carryback and carryforward provisions, what order of application is followed for federal tax purposes?
- How is the classification of assets (current or noncurrent) arising from NOL carryforwards determined under FASB ASC Topic 740?
- Under what conditions would scheduling the temporary difference reversals be required under Topic 740?
- How would you define “uncertain” tax position?
- What are the two steps that are required in determining the amount of tax benefit to be recognized in association with an uncertain tax position?
- “In practice, the provisions for accounting for uncertain tax positions are relatively easy to apply.” Do you agree or disagree? Explain.
- What was the most significant change in accounting for income tax carryforwards between pre-Codification *Statement No. 96* and pre-Codification *Statement No. 109*? (Note: Pre-Codification *Statement No. 109* is the source for most of the existing provisions in FASB ASC Topic 740.)
- How do changes in the balances of deferred income taxes affect the amount of cash paid for income taxes?
- If a company experiences a current operating loss, it may carry the loss backward and forward. What impact do these carrybacks and carryforwards have on the reported operating loss? on the statement of cash flows?
- What rules govern the netting of deferred tax assets and deferred tax liabilities?
- In the past, why was accounting for income taxes not as significant an issue in some foreign countries as it is in the United States?
- In 1996, the IASB revised *IAS 12*. Did that revision make the international standard for deferred tax accounting more or less similar to the U.S. standard?
- Briefly describe the partial recognition approach to accounting for deferred income taxes.

## PRACTICE EXERCISES

## Practice 16-1

## L01

## Simple Deferred Tax Liability

The company had sales for the year of \$100,000. Of these sales, only \$70,000 was collected in cash. The other \$30,000 is expected to be collected in cash next year. For this business, the tax rules stipulate that income is not taxed until it is collected in cash. The only expense is income tax expense, and the tax rate is 35% this year and

in all future years. Make all journal entries necessary to record income tax expense for the year.

**Practice 16-2****Simple Deferred Tax Asset****L01**

The company had sales for the year of \$200,000. Expenses (except for income taxes) for the year totaled \$170,000. Of this \$170,000 in expenses, \$12,000 is bad debt expense. The tax rules applicable to this company stipulate that bad debts are not tax deductible until the accounts are actually written off. None of the accounts were written off this year but are expected to be written off next year or the following year. The tax rate is 30% this year and in all future years. Make all journal entries necessary to record income tax expense for the year. Assume that the company has been profitable and is expected to be profitable in the future.

**Practice 16-3****Permanent and Temporary Differences****L01**

The company reported pretax financial income in its income statement of \$50,000. Among the items included in the computation of pretax financial income were the following:

Interest revenue from municipal bonds . . . . .	\$10,000
Nondeductible expenses . . . . .	17,000
Warranty expenses (not deductible until actually provided; none provided this year) . . . . .	8,000

The income tax rate is 30%. Compute the following: (1) financial income subject to tax, (2) taxable income, (3) income tax expense, and (4) net income.

**Practice 16-4****Deferred Tax Liability****L02**

On January 1, the company purchased investment securities for \$1,000. The securities are classified as trading. By December 31, the securities had a fair value of \$1,800 but had not yet been sold. Excluding the trading securities, income before taxes for the year was \$10,000. Assume that there are no other book-tax differences. The income tax rate is 40% for the current year and all future years. Prepare the journal entry or entries necessary to record income tax expense for the year.

**Practice 16-5****Deferred Tax Liability****L02**

On January 1, 2013, the company purchased a piece of equipment for \$75,000. The equipment has a 5-year useful life and \$0 residual value. The company uses straight-line depreciation for financial accounting purposes. Assume that the depreciation deduction for income tax purposes is as follows: 2013 = \$25,000; 2014 = \$20,000; 2015 = \$15,000; 2016 = \$10,000; and 2017 = \$5,000. Assume that revenue in each year 2013–2017 is \$50,000, that the revenue is the same for both tax and financial reporting purposes, and that the only expenses are depreciation and income taxes. The income tax rate is 40% in all years. Prepare the journal entry or entries to record income tax expense in each year 2013–2017.

**Practice 16-6****Variable Future Tax Rates****L02**

Refer to Practice 16-4. Assume that the income tax rate is 40% for the current year but that the enacted tax rate for all future years is 46%. Prepare the journal entry or entries necessary to record income tax expense for the year.

**Practice 16-7****Change in Enacted Tax Rates****L02**

Refer to Practice 16-5. Assume that on January 1, 2015, Congress changes the enacted tax rate. Make the journal entry necessary to record this tax rate change on January 1, 2015, assuming that (1) the new tax rate is 30% and (2) the new tax rate is 43%.

**Practice 16-8****Deferred Tax Asset****L02**

On January 1, the company purchased investment securities for \$1,000. The securities are classified as trading. By December 31, the securities had a fair value of \$100 but

had not yet been sold. Excluding the trading securities, income before taxes for the year was \$5,000. Assume that there are no other book-tax differences. The income tax rate is 45% for the current year and all future years. Assume that the company has been profitable in past years and is more likely than not to be profitable in future years. Prepare the journal entry or entries necessary to record income tax expense for the year.

**Practice 16-9****Deferred Tax Asset****L02**

The company started business on January 1 and had revenues of \$60,000 for the year. In addition to income tax expense, the company's only other expenses are as follows:

- *Bad debt expense of \$10,000.* Tax rules do not allow any deduction until the bad debts are actually written off. During the year, bad debts totaling \$2,000 were written off.
- *Postretirement health care benefit expense of \$15,000.* Tax rules do not allow any deduction until the actual retiree health care expenditures are made. No expenditures were made during the year.

The income tax rate is 41% for the current year and all future years. Assume that the company is more likely than not to be profitable in future years. Prepare the journal entry or entries necessary to record income tax expense for the year.

**Practice 16-10****Deferred Tax Liabilities and Assets****L02**

On January 1, the company purchased investment securities for \$2,000. The securities are classified as trading. By December 31, the securities had a fair value of \$4,200 but had not yet been sold. The company also recognized a \$7,000 restructuring charge during the year. The restructuring charge is composed of an impairment write-down on a manufacturing facility. Tax rules do not allow a deduction for the write-down unless the facility is actually sold; the facility was not sold by the end of the year. Excluding the trading securities and the restructuring charge, income before taxes for the year was \$25,000. Assume that there are no other book-tax differences. The income tax rate is 40% for the current year and all future years. Prepare the journal entry or entries necessary to record income tax expense for the year. State any assumptions you must make.

**Practice 16-11****Deferred Tax Liabilities and Assets****L02**

On January 1, the company purchased investment securities for \$1,000. The securities are classified as trading. By December 31, the securities had a fair value of \$700 but had not yet been sold. On January 1, the company also purchased a piece of equipment for \$10,000. The equipment has a 4-year useful life and \$0 residual value. The company uses straight-line depreciation for financial accounting purposes. Assume that the depreciation deduction for income tax purposes is \$3,300 in the first year of the life of the equipment. Excluding the trading securities and the depreciation, income before taxes for the year was \$4,000. Assume that there are no other book-tax differences. The income tax rate is 40% for the current year and all future years. Prepare the journal entry or entries necessary to record income tax expense for the year. State any assumptions you must make.

**Practice 16-12****Valuation Allowance****L02**

Refer to Practice 16-8. The company had no taxable income in past years. Analysis of prospects for the future indicates that it is more likely than not that total taxable income in the foreseeable future will be no more than \$400. Assume that the income tax expense journal entry required in Practice 16-8 has already been made. Make any necessary adjusting entry.

**Practice 16-13****Valuation Allowance****L02**

Refer to Practice 16-9. The company had no taxable income in past years. Analysis of prospects for the future indicates that it is more likely than not that total taxable income in the foreseeable future will be no more than \$20,000. Assume that the income tax expense journal entry required in Practice 16-9 has already been made. Make any necessary adjusting entry.

**Practice 16-14**

**L02**

**Uncertain Tax Positions**

The company has taken a tax position that is subject to review by the Internal Revenue Service. The company determines that there is a 40% probability that the position will not be sustained upon review. Is this a “highly certain” tax position? Why or why not?

**Practice 16-15**

**L02**

**Uncertain Tax Position**

The company has determined that there is an 80% likelihood that its position on a tax issue will be upheld upon review by taxing authorities and that the entire amount of the position, \$100,000, will be allowed. Is this a “highly certain” tax position? Why or why not?

**Practice 16-16**

**L02**

**Uncertain Tax Position**

The company is evaluating its tax position on a certain issue and has determined that although it is more likely than not that its position will be sustained, it is less certain about the amount that will be sustained. It has provided the following probability estimates and amounts:

There is a xx% probability that	The allowable reduction in taxes payable will be	The cumulative probability of occurrence is
15%	\$100	15%
20	80	35
10	60	45
15	40	60
20	20	80
20	0	100

Determine the amount of the unrecognized tax benefit liability and provide the journal entry required to recognize the liability associated with the unrecognized tax benefit.

**Practice 16-17**

**L03**

**Net Operating Loss Carryback**

Taxable income and income tax rates for 2011–2013 for the company have been as follows:

Year	Taxable Income	Income Tax Rate	Total Tax Paid
2011	\$ 75,000	25%	\$18,750
2012	50,000	30	15,000
2013	(93,000)	35	0

Make the journal entry necessary to record any net operating loss (NOL) carryback in 2013.

**Practice 16-18**

**L03**

**Net Operating Loss Carryforward**

Refer to Practice 16-17. Assume that the net operating loss in 2013 was \$150,000 instead of \$93,000. Make the journal entry necessary to record (1) any net operating loss (NOL) carryback in 2013 and (2) any net operating loss (NOL) carryforward created in 2013. The enacted tax rate for future years is 35%. State any assumptions you must make.

**Practice 16-19**

**L03**

**Net Operating Loss Carryforward**

Taxable income and income tax rates for 2011–2016 for the company have been as seen on page 16-43.

Year	Taxable Income	Income Tax Rate	Total Tax Paid
2011	\$ 30,000	30%	\$9,000
2012	15,000	35	5,250
2013	20,000	35	7,000
2014	(100,000)	40	?
2015	50,000	35	?
2016	(200,000)	30	?

Make the journal entry necessary to record any net operating loss (NOL) carryforward created in 2016. The enacted tax rate for future years is 40%.

**Practice 16-20****Scheduling for Enacted Future Tax Rates****L04**

Refer to Practice 16-5. Assume that the enacted tax rates are as follows:

2013	40%
2014	37
2015	37
2016	37
2017	31

For simplicity, assume that temporary differences reverse in a FIFO pattern; that is, assume that the first temporary difference created is the first to reverse. Prepare the journal entry or entries to record income tax expense in 2013.

**Practice 16-21****Reporting Deferred Tax Assets and Liabilities****L05**

Refer to Practice 16-11. (1) What deferred tax amount or amounts would appear on the balance sheet? (2) Prepare the financial statement note disclosure needed to identify the sources of the deferred tax amounts. Refer to Exhibit 16-7.

**Practice 16-22****Computation of Effective Tax Rate****L05**

Refer to Practice 16-3. Compute the effective tax rate.

**Practice 16-23****Reconciliation of Statutory Rate and Effective Rate****L05**

The company reported sales of \$60,000. Other income statement items for the year were as follows:

Interest revenue from municipal bonds	\$ 7,000
Depreciation expense (tax depreciation was \$36,000)	25,000
Expenses not deductible for tax purposes	18,000
Warranty expenses (not deductible until actually provided; \$2,000 provided this year)	10,000

The income tax rate is 35%. (1) Compute the effective tax rate and (2) provide a reconciliation of the statutory tax rate of 35% to the effective tax rate.

**Practice 16-24****Deferred Taxes and Operating Cash Flow****L06**

The company assembled the following information with respect to operating cash flow for the year:

Net income	\$10,000
Depreciation	2,000
Increase in accounts receivable	1,200
Decrease in inventory	850

Decrease in accounts payable . . . . .	\$ 300
Increase in income taxes payable. . . . .	40
Increase in deferred tax liability . . . . .	1,430

Compute cash flow from operating activities.

**Practice 16-25****L06****Cash Paid for Income Taxes**

The company reported the following balance sheet information:

	2013	2012
Income taxes payable . . . . .	\$ 17,000	\$22,000
Deferred income tax liability. . . . .	130,000	90,000

Total income tax expense for 2013 was \$60,000. Compute the amount of cash paid for income taxes in 2013.

**EXERCISES****Exercise 16-26****L01****Identification of Temporary Differences**

Indicate which of the following items are temporary differences and which are nontaxable or nondeductible. For each temporary difference, indicate whether the item considered alone would create a deferred tax asset or a deferred tax liability.

- Tax depreciation in excess of book depreciation, \$150,000.
- Excess of income on installment sales over income reportable for tax purposes, \$130,000.
- Premium payment for life insurance policy on president, \$95,000.
- Rent collected in advance of period earned, \$75,000.
- Warranty provision accrued in advance of period paid, \$40,000.
- Interest revenue received on municipal bonds, \$30,000.

**Exercise 16-27****L01****Calculation of Taxable Income**

Using the information given in Exercise 16-26 and assuming pretax financial income of \$2,900,000, calculate taxable income.

**Exercise 16-28****L02****Deferred Tax Liability**

Faro Inc. began operating on January 1, 2013. At the end of the first year of operations, Faro reported \$400,000 income before income taxes on its income statement but only \$320,000 taxable income on its tax return. Analysis of the \$80,000 difference revealed that \$45,000 was a permanent difference and \$35,000 was a temporary tax liability difference related to a current asset. The enacted tax rate for 2013 and future years is 35%.

- Prepare the journal entries to record income taxes for 2013.
- Assume that at the end of 2014, the accumulated temporary tax liability difference related to future years is \$70,000. Prepare the journal entry to record any adjustment to deferred tax liabilities at the end of 2014.

**Exercise 16-29****L02****Deferred Tax Asset**

Lofthouse Machinery Co. includes a 2-year warranty on its machinery sales. At the end of 2013, an analysis of the warranty records reveals an accumulated temporary difference of \$120,000 for warranty expenses; book expenses related to warranties have exceeded tax deductions allowed. The enacted income tax rate for 2013 and future years is 40%. Management concludes that it is more likely than not that Lofthouse will have future income to realize the future tax benefit from this temporary difference. They also conclude that 20% of the warranty liability is current and 80% is noncurrent.

1. How would the deferred tax information be reported on the Lofthouse balance sheet at December 31, 2013?
2. If management assumed that only 70% of the tax benefit from the temporary difference could be realized, how would the deferred tax information be reported on the balance sheet at December 31, 2013? (Recall that the valuation allowance is allocated proportionately between the current and noncurrent portions of the deferred tax asset.)

**Exercise 16-30****L02****Determinants of “More Likely than Not”**

Fulton Company computed a pretax financial loss of \$18,000 for the first year of its operations ended December 31, 2013. This loss did not include \$25,000 in unearned rent revenue that was recognized as taxable income in 2013 when the cash was received.

1. Prepare the journal entries necessary to record income tax for the year. The income tax rate is 40%. Assume it is more likely than not that future taxable income will be sufficient to allow for the full realization of any deferred tax assets and that unearned rent revenue is a current liability.
2. If future taxable income from operations was not expected to be sufficient to allow for the full realization of any deferred tax assets, what other sources of income may be considered to determine the need for a valuation allowance?

**Exercise 16-31****L02****SPREADSHEET****Deferred Tax Asset Valuation Allowance**

Relevan Company computed a pretax financial loss of \$15,000 for the first year of its operations ended December 31, 2013. Included in the loss was \$42,000 in uncollectible accounts expense that was accrued on the books in 2013 using an allowance system based on a percentage of sales. For income tax purposes, deductions for uncollectible accounts are allowed when specific accounts receivable are determined to be uncollectible and written off. No accounts receivable have been written off as uncollectible in 2013.

1. Prepare the journal entries necessary to record income taxes for the year. The enacted income tax rate is 35% for 2013 and all future years. Assume that it is more likely than not that future taxable income will be sufficient to allow for the full realization of any deferred tax assets. Accounts Receivable and the related allowance account are reported under current assets on the balance sheet.
2. Repeat (1), assuming that it is more likely than not that future taxable income will be zero before considering the actual bad debt losses in future years.

**Exercise 16-32****L02****Changing Tax Rates**

Goshute Company computed pretax financial income of \$50,000 for the year ended December 31, 2013. Taxable income for the year was \$15,000. Accumulated temporary differences as of December 31, 2012, were \$120,000. A deferred tax liability of \$48,000 was included on the December 31, 2012, balance sheet. Accumulated temporary differences as of December 31, 2013, are \$155,000. The differences are related to noncurrent items.

1. Prepare the journal entries necessary to record income tax for 2013. The enacted income tax rate is assumed to be 40% for 2013 and future years.
2. On January 1, 2014, the income tax rate is changed to 32% for 2014 and all future years. Prepare the necessary journal entry, if any.

**Exercise 16-33****L02****Deferred Tax Liability**

Hinton Exploration Company reported pretax financial income of \$637,000 for the calendar year 2013. Included in the Other Income section of the income statement was \$98,000 of interest revenue from municipal bonds held by the company. The income statement also included depreciation expense of \$580,000 for a machine that cost \$3,250,000. The income tax return reported \$650,000 as MACRS depreciation on the machine.

The enacted tax rate is 40% for 2013 and future years. Prepare the journal entry or entries necessary to record income taxes for 2013.

**Exercise 16-34**

**L02**

**Deferred Tax Asset**

Pro-Tech-Tronics Company computed pretax financial income of \$35,000 for the first year of its operations ended December 31, 2013. Unearned rent revenue of \$55,000 had been recognized as taxable income in 2013 when the cash was received but had not yet been recognized in the financial accounting records.

The unearned rent is expected to be recognized on the books in the following pattern.

2014 .....	\$15,000
2015 .....	20,000
2016 .....	12,000
2017 .....	8,000
Total .....	<u>\$55,000</u>

The enacted tax rates for this year and the next four years are as follows:

2013 .....	34%
2014 .....	34
2015 .....	30
2016 .....	30
2017 .....	37

Prepare the journal entries necessary to record income taxes for 2013. Assume that there will be sufficient income in each future year to realize any deductible amounts.

**Exercise 16-35**

**L02**

**Deferred Tax Assets and Liabilities**

Fibertek, Inc., computed a pretax financial income of \$40,000 for the first year of its operations ended December 31, 2013. Included in financial income was \$25,000 of nondeductible expenses, \$22,000 gross profit on installment sales that was deferred for tax purposes until the installments were collected, and \$18,000 in bad debt expense that had been accrued on the books in 2013.

The temporary differences are expected to reverse in the following patterns:

Year	Gross Profit on Collections	Bad Debt Write-Offs
2014 .....	\$ 5,000	\$ 6,000
2015 .....	7,000	12,000
2016 .....	4,000	
2017 .....	6,000	
Totals .....	<u>\$22,000</u>	<u>\$18,000</u>

The enacted tax rates for this year and the next four years are as follows:

2013 .....	40%
2014 .....	35
2015 .....	32
2016 .....	30
2017 .....	32

Prepare the journal entries necessary to record income taxes for 2013. Assume that there will be sufficient income in each future year to realize any deductible amounts. For classification purposes, the bad debt write-offs are considered to be associated with a current asset, and the receivable for installment sales is classified as both current and noncurrent, depending on the expected timing of the receipt.

**Exercise 16-36****L02****Deferred Tax Assets and Liabilities**

Flatworld Shipping Company reports taxable income of \$912,000 on its income tax return for the year ended December 31, 2013, its first year of operations. Temporary differences between financial income and taxable income for the year are as follows:

Tax depreciation in excess of book depreciation . . . . .	\$ 95,000
Accrual for product liability claims in excess of actual claims (estimated product claims payable is a current liability) . . . . .	180,000
Reported installment sales income in excess of taxable installment sales income (installments receivable is a current asset). . . . .	315,000

The enacted income tax rate is 35% for 2013 and all future years. Prepare the journal entries necessary to record income taxes for 2013.

**Exercise 16-37****L02, L04****Computation of Deferred Asset and Liability Balances**

Friedman Construction reported taxable income of \$50,000 for 2013, its first fiscal year. The enacted tax rate for 2013 is 40%. Enacted tax rates and deductible amounts for 2014–2016 are as follows:

	Enacted Tax Rate	Deductible Amount
2014 . . . . .	38%	\$12,000
2015 . . . . .	35	15,000
2016 . . . . .	36	18,000

1. Prepare the journal entries necessary to record income taxes for 2013. Assume that there will be sufficient income in each future year to realize any deductible amounts. For classification purposes, assume that all deductible amounts relate to noncurrent items.
2. Repeat (1), assuming that it is more likely than not that taxable income for all future periods will be zero or less.

**Exercise 16-38****L02, L04****Computation of Deferred Asset and Liability Balances**

Dixon Type and Supply Company reported taxable income of \$75,000 for 2013, its first fiscal year. The enacted tax rate for 2013 is 40%. Enacted tax rates and deductible amounts for 2014–2017 are as follows:

	Enacted Tax Rate	Deductible Amount
2014 . . . . .	35%	\$14,000
2015 . . . . .	32	24,000
2016 . . . . .	30	16,000
2017 . . . . .	32	40,000

1. Prepare the journal entries necessary to record income taxes for 2013. Assume that there will be sufficient income in each future year to realize any deductible amounts. For classification purposes, assume that all deductible amounts relate to noncurrent items.
2. Repeat (1), assuming it is more likely than not that taxable income for all future periods will be zero or less.

**Exercise 16-39****L03, L04****Net Operating Loss (NOL) Carryback and Carryforward**

The historical financial data shown on page 16-48 are available for the Bradshaw Manufacturing Company.

Year	Income	Tax Rate	Tax Paid
2010	\$175,000	40%	\$70,000
2011	230,000	42	96,600
2012	310,000	30	93,000

In 2013, Bradshaw suffered an \$820,000 net operating loss due to an economic recession. The company elects to use the carryback provision in the tax law.

- Using the information given, calculate the refund due arising from the loss carryback and the amount of the loss available to carry forward to future periods. Assume that the enacted tax rate is 34% for 2013 and all future years.
- Prepare the entry necessary to record the loss carryback and carryforward. Assume that there will be sufficient taxable income in the carryforward period to realize all benefits from NOL carryforwards.
- Using the answers from (1) and (2), prepare the bottom portion of the 2013 income statement reflecting the effect of the loss carryback and carryforward.

**Exercise 16-40**

**L03, L04**

**Net Operating Loss (NOL) Carryback and Carryforward**

The following historical financial data are available for Lexis Company.

Year	Income	Tax Rate	Tax Paid
2010	\$500,000	35%	\$175,000
2011	150,000	30	45,000
2012	30,000	30	9,000

In 2013, Lexis Company suffered a \$1 million net operating loss. The company will use the carryback provision of the tax law.

- Using the information given, calculate the refund due for the loss carryback and the amount of the loss available to carry forward to future periods. Assume that the enacted tax rate for 2013 and all future years is 40%.
- Prepare journal entries to record the loss carryback and carryforward. Assume that it is more likely than not that future taxable income will be sufficient to allow for the full realization of any deferred tax assets.
- Evaluate the reasonableness of the assumption in (2).

**Exercise 16-41**

**L06**

**Cash Flow and Income Taxes**

Joyce Smithers Inc. reported the following amounts related to income taxes on its 2013 income statement.

Income tax expense—current	\$32,000
Income tax expense—deferred	(8,000)

Smithers also reported the following amounts on its December 31, 2012 and 2013, balance sheets:

	2013	2012
Deferred tax liability	\$26,000	\$34,000
Income taxes payable	10,000	4,000

If Smithers uses the indirect method of reporting cash flows, what information concerning income taxes would it include in its statement of cash flows and related disclosure?

**Exercise 16-42****L06****Cash Flow and Income Taxes**

Victoria Clothing reported the following amounts related to income taxes on its 2013 income statement.

Income tax benefit from NOL carryback .....	\$12,000
Income tax benefit from NOL carryforward .....	28,000

Victoria also reported the following on its December 31, 2012 and 2013, balance sheets.

	2013	2012
Deferred tax asset—NOL carryforward .....	\$28,000	\$ 0
Income tax refund receivable .....	12,000	4,000

1. If Victoria uses the indirect method of reporting cash flows, what information concerning income taxes would Victoria include in its statement of cash flows and related disclosure?
2. If Victoria uses the direct method of reporting cash flows, what information concerning income taxes would Victoria include in its statement of cash flows and related disclosure?

**PROBLEMS****Problem 16-43****L01, L02****SPREADSHEET****Life Cycle of a Temporary Difference**

A. J. Johnson & Co. recorded certain revenues on its books in 2013 and 2014 of \$15,400 and \$16,600, respectively. However, such revenues were not subject to income taxation until 2015. The company records reveal pretax financial income and taxable income for the 3-year period as follows:

	Financial Income	Taxable Income
2013 .....	\$44,200	\$28,800
2014 .....	38,200	21,600
2015 .....	21,100	53,100

Assume that Johnson's tax rate is 35% for all periods.

**Instructions:** Prepare the journal entries necessary at the end of each year to record income taxes.

**Problem 16-44****L02****Deferred Tax Liability**

Polytechnic Corporation reported taxable income of \$2,340,000 for the year ended December 31, 2013. The controller is unfamiliar with the required treatment of temporary and permanent differences in reconciling taxable income to pretax financial income and has contacted your firm for advice. You are given company records that list the following differences.

Tax depreciation in excess of book depreciation .....	\$310,000
Proceeds from life insurance policy upon death of officer .....	145,000
Interest revenue on municipal bonds .....	107,000

**Instructions:**

1. Compute pretax financial income.

2. Given an income tax rate of 35%, prepare the journal entry or entries to record income taxes for the year.
3. Prepare a partial income statement beginning with Income from continuing operations before income taxes.

**Problem 16-45**

**L02, L04**

**Deferred Tax Liability**

Olympus Motors, Inc., computed a pretax financial income of \$90,000 for its first year of operations ended December 31, 2013. In preparing the income tax return for the year, the tax accountant determined the following differences between 2013 financial income and taxable income.

Nondeductible expenses . . . . .	\$25,000
Nontaxable revenues . . . . .	15,500
Temporary difference—installment sales reported in financial income but not in taxable income. . . . .	32,000

The temporary difference is expected to reverse in the following pattern as the cash is collected:

2014 . . . . .	\$ 7,000
2015 . . . . .	16,500
2016 . . . . .	8,500
Total . . . . .	\$32,000

The enacted tax rates for this year and the next three years are as follows:

2013 . . . . .	40%
2014 . . . . .	35
2015 . . . . .	33
2016 . . . . .	30

**Instructions:**

1. Prepare journal entries to record income taxes payable and deferred income taxes.
2. Prepare a partial income statement for Olympus Motors beginning with Income from continuing operations before income taxes for the year ended December 31, 2013.

**Problem 16-46**

**L02, L04**

**Deferred Tax Asset**

Davidson Gasket Inc. computed a pretax financial loss of \$25,000 for the first year of its operations, ended December 31, 2013. Analysis of the tax and book bases of its liabilities disclosed \$55,000 in unearned rent revenue on the books that had been recognized as taxable income in 2013 when the cash was received. Also disclosed was \$20,000 in warranties payable that had been recognized as expense on the books in 2013 when product sales were made but that are not deductible on the tax return until paid.

These temporary differences are expected to reverse in the following pattern.

Year	Rent Earned on Books	Warranty Payments
2014 . . . . .	\$13,000	\$ 5,000
2015 . . . . .	25,000	8,000
2016 . . . . .	12,000	7,000
2017 . . . . .	5,000	
Totals . . . . .	\$55,000	\$20,000

The enacted tax rates for this year and the next four years are as follows:

2013 .....	38%
2014 .....	36
2015 .....	32
2016 .....	30
2017 .....	30

**Instructions:**

1. Prepare journal entries to record income taxes payable and deferred income taxes. Assume there will be sufficient income in each future year to realize any deductible amount.
2. Prepare the income statement for Davidson Gasket Inc. beginning with Loss from continuing operations before income taxes for the year ended December 31, 2013.
3. If future taxable income from operations was not expected to be sufficient to allow for the full realization of any deferred tax assets, what other sources of income may be used to avoid establishing a valuation allowance?

**Problem 16-47**

**L02**

**Deferred Tax Assets and Liabilities**

As of December 31, 2013, its first year in business, Kukui Company had taxable temporary differences totaling \$110,000. Of this total, \$45,000 relates to current items. Kukui also had deductible temporary differences totaling \$42,000, \$14,000 of which relates to current items. Pretax financial income for the year was \$200,000. The enacted tax rate for 2013 and all future years is 35%.

**Instructions:**

1. Prepare the journal entries to record income taxes for 2013.
2. Repeat (1), but assume that all the taxable temporary differences are noncurrent and that all the deductible temporary differences are current.

**Problem 16-48**

**L02, L04**

**SPREADSHEET**

**Netting of Deferred Tax Assets and Liabilities**

Stratco Corporation computed a pretax financial income of \$40,000 for the first year of its operations ended December 31, 2013. Included in financial income was \$50,000 of nontaxable revenue, \$20,000 gross profit on installment sales that was deferred for tax purposes until the installments were collected, and \$50,000 in warranties payable that had been recognized as expense on the books in 2013 when product sales were made.

The temporary differences are expected to reverse in the following pattern:

Year	Gross Profit on Collections	Warranty Payments
2014 .....	\$ 5,000	\$ 9,000
2015 .....	7,000	16,500
2016 .....	2,000	20,500
2017 .....	6,000	4,000
Totals .....	<u>\$20,000</u>	<u>\$50,000</u>

The enacted tax rates for this year and the next four years are as follows:

2013 .....	40%
2014 .....	35
2015 .....	32
2016 .....	30
2017 .....	30

**Instructions:**

1. Prepare journal entries to record income taxes payable and deferred income taxes. Assume that there will be sufficient income in each future year to realize any deductible amount.
2. Prepare the income statement for Stratco beginning with Income from continuing operations before income taxes for the year ended December 31, 2013.

**Problem 16-49**

**L02**

**Valuation Allowance**

Cheng Company computed taxable income of \$8,000 for the first year of its operations ended December 31, 2013. Tax depreciation exceeded depreciation for financial reporting purposes by \$24,000. Receipt of \$13,000 cash was reported as revenue for tax purposes but is reported as a current liability, Unearned Revenue, for financial reporting. The enacted tax rate for 2013 and all future years is 35%.

**Instructions:**

1. Prepare the journal entries to record income taxes for 2013. Assume that it is more likely than not that future taxable income will be sufficient to allow for the full realization of any deferred tax assets.
2. Repeat (1), assuming that it is more likely than not that future taxable income will be zero, exclusive of the expected reversal of the depreciation temporary difference.

**Problem 16-50**

**L04**

**SPREADSHEET**

**Adjustment for Changing Tax Rates**

Hermann Company analyzed its temporary differences as of December 31, 2013. The enacted tax rate was 35% for 2013 and all future tax years.

The total amount of taxable temporary differences as of the end of 2013 was \$540,000. All the temporary differences relate to noncurrent items.

**Instructions:**

1. Assume that in early 2014 the taxing authority changed the rates for 2014 and beyond to 30%. Prepare the 2014 journal entry to record the tax rate decrease.
2. Assume that instead of being decreased, the tax rate was increased to 40% in early 2014. Prepare the 2014 journal entry to record the tax rate increase.

**Problem 16-51**

**L03, L04**

**Operating Loss Carryback and Carryforward**

The following information is taken from the financial statements of Aruban Enterprises.

Year	Taxable and Pretax Financial Income	Income Tax Rate	Income Tax Paid
2009	\$ 32,000	40%	\$12,800
2010	29,300	35	10,255
2011	33,100	40	13,240
2012	22,500	34	7,650
2013	(94,300)	35	0

The company elects to use the carryback provisions of the tax law.

**Instructions:**

1. Given the information from the financial statements, compute the amount of income tax refund due as a result of the operating loss in 2013.
2. What is the amount, if any, of the operating loss carryforward? How would the operating loss carryforward be reflected in the financial statements?

3. Assume the foregoing information except as follows:
  - (a) The loss in 2013 was \$39,000. Calculate the refund due and prepare the journal entry to record the claim for income tax refund.
  - (b) In addition to (a), there was a loss of \$28,000 in 2014. How much could be carried back, and how much could be carried forward?

**Problem 16-52****L03, L04****NOL Carryback and Carryforward**

The financial history below shows the income and losses for Irontree Company for the 10-year period 2004–2013.

Assume that no adjustments to taxable income are necessary for purposes of the NOL carryback and that the company elects to use the carryback provisions of the tax code.

Year	Taxable and Pretax Financial Income (before NOL)	Income Tax Rate	Income Tax Paid
2004	\$ 14,200	48%	\$ 6,816
2005	17,600	48	8,448
2006	20,500	42	8,610
2007	(29,300)	42	0
2008	13,900	42	5,838
2009	(25,100)	44	0
2010	23,500	44	?
2011	40,650	38	15,447
2012	(64,400)	38	0
2013	72,000	38	?

**Instructions:**

1. Given the foregoing information, compute the amount of income tax refund for each year as a result of each NOL carryback and the amount of the carryforward (if any).
2. How would the NOL carryforward as of December 31, 2012, be reflected in the 2012 financial statements?
3. Calculate the amount of income tax paid, showing the benefit of the NOL carryforward, for the years 2010 and 2013.
4. For 2013, give the entry (or entries) to record income taxes, assuming that the deferred tax asset stemming from the 2012 NOL carryforward was fully recognized in 2012.

**Problem 16-53****L01, L05****Sample CPA Exam Questions**

1. At December 31, 2013, Bren Co. had the following deferred income tax items:
  - A deferred income tax liability of \$15,000 related to a noncurrent asset
  - A deferred income tax asset of \$3,000 related to a noncurrent liability
  - A deferred income tax asset of \$8,000 related to a current liability
 Which of the following should Bren report in the noncurrent section of its December 31, 2013, balance sheet?
  - (a) A noncurrent asset of \$3,000 and a noncurrent liability of \$15,000.
  - (b) A noncurrent liability of \$12,000.
  - (c) A noncurrent asset of \$11,000 and a noncurrent liability of \$15,000.
  - (d) A noncurrent liability of \$4,000.

2. For the year ended December 31, 2013, Grim Co.'s pretax financial statement income was \$200,000 and its taxable income was \$150,000. The difference is due to the following:

Interest on municipal bonds .....	\$ 70,000
Premium expense on keyman life insurance .....	(20,000)
Total .....	<u>\$ 50,000</u>

Grim's enacted income tax is 30%. In its 2013 income statement, what amount should Grim report as current provision for income tax expense?

- |              |              |
|--------------|--------------|
| (a) \$45,000 | (c) \$60,000 |
| (b) \$51,000 | (d) \$66,000 |

## CASES

### Discussion Case 16-54

#### What Are Deferred Income Taxes?

Hurst Inc. is a new corporation that has just completed a highly successful first year of operations. Hurst is a privately held corporation, but its president, Byron Hurst, has indicated that if the company continues to do as well for the next four or five years, it will go public. By all indications, the company should continue to be highly profitable on both a short-term and a long-term basis.

The controller of the new company, Lori James, plans on using the MACRS method of depreciating Hurst's assets and using the installment sales method of recognizing income for tax purposes. For financial statement presentation, straight-line depreciation will be used, and all sales will be fully recognized in the year of sale. There are no other differences between book and taxable income.

Hurst has hired your firm to prepare its financial statements. You are now preparing the income statement. The controller wants to show, as income tax expense, the amount of the tax liability actually due. "After all," James reasons, "that's the amount we'll actually pay, and in light of our plans for continued expansion, it's highly unlikely that the temporary differences will ever reverse."

Draft a memo to the controller outlining your reaction to the plan. Give reasons in support of your decision.

### Discussion Case 16-55

#### Why Aren't Deferred Taxes Discounted?

Tyler Dee is the controller for Martinez Company, a major employer in the area. Tyler has just come from a meeting of a local civic group. The meeting was an opportunity for Tyler to present and explain Martinez's financial statements for the fiscal year recently ended. A significant amount of time was spent discussing the large deferred tax liability reported by Martinez. Several members of the civic group questioned Tyler about the nature of this liability. In particular, Tyler was asked why the liability wasn't discounted to reflect the time value of money. Tyler had no real answer, except to mumble something like, "That's just the way the standard is written."

How might Tyler have better explained the lack of discounting of deferred taxes?

### Discussion Case 16-56

#### Raising Tax Rates: Does It Help Me or Hurt Me?

When the corporate tax rate was lowered from 46% to 34% in 1986, most firms that had adopted the asset and liability method of deferred tax accounting reported one-time gains as a result of the revaluation of their deferred tax items. In fact, one writer claimed that this lowering of income tax rates "freed a large chunk of money that had been accumulated to pay deferred taxes at the former higher rate."

In early 1993, Congress was considering raising the corporate income tax rate. One proposal was to raise the top corporate rate from 34% to 36%. Accounting experts pointed out that the increase in the tax rate would cause some firms to report one-time losses and other firms to report one-time gains.

1. Why did the lowering of tax rates in 1986 result in most firms reporting gains, whereas an increase in tax rates in 1993 would cause some firms to report gains and some firms to report losses?
2. Comment on the writer's statement that the lowering of income tax rates "freed a large chunk of money."

**SOURCES:** Rick Wartzman, "Rise in Corporate Taxes Would Force Many Big Companies to Take Charges," *The Wall Street Journal*, February 11, 1993, p. A2; Lee Berton, "FASB Is Expected to Issue Rule Allowing Firms to Post Big, One-Time Gains," *The Wall Street Journal*, November 4, 1987, p. 4.

**Discussion  
Case 16-57**

**Is a Valuation Allowance Needed?**

Assume that you go to work for one of the large accounting firms upon your graduation from college and that for your first assignment, you are asked to review the deferred income tax asset account to determine whether a valuation allowance seems to be warranted. You remember talking about deferred income taxes in your intermediate accounting class, but the problems always told you whether an allowance was required or not. Now you must examine the facts to help determine the need for an allowance. What factors would you consider in making your recommendation?

**Case 16-58**

**Deciphering Financial Statements (The Walt Disney Company)**

The 2009 financial statements for **The Walt Disney Company** can be found on the Internet.

1. Using the financial statements and information contained in the notes, determine how much income tax expense Disney reported for the fiscal year ended October 3, 2009.
2. Referring to the note on income taxes, how much of the tax expense relates to current items, and how much relates to deferred items?
3. Disney notes that its effective income tax rate for 2009 was 36.2%. Using information from the income statement, determine how that number was computed.
4. Note that Disney has a valuation allowance of \$388 million. In the journal entry establishing this allowance account, what would have been the debit and the credit?
5. Why was Disney's effective income tax rate higher than the U.S. federal income tax rate of 35.0% in 2009? [*Hint:* Look at Note 10 (Income Taxes).]
6. Explain why the effective income tax rate differs from company to company.
7. Do differences in effective tax rates reflect the impact of *temporary* book-tax differences or *permanent* book-tax differences? Explain.
8. How much cash did Disney pay for income taxes during 2009?

**Case 16-59**

**Deciphering Financial Statements (Sara Lee Corporation)**

**Sara Lee Corporation** owns the following brands: Ball Park franks, Sara Lee bakery goods, Hillshire Farm, Jimmy Dean, Kiwi shoe care products, and many other products. The following information relates to the company's deferred taxes.

**Sara Lee Corporation and Subsidiaries  
Income Taxes**

Current and deferred tax provisions (benefits) were (in millions):

	2009		2008		2007	
	Current	Deferred	Current	Deferred	Current	Deferred
U.S.	\$ 89	\$(61)	\$310	\$(247)	\$ 18	\$(144)
Foreign	214	(22)	168	(32)	123	4
State	4	0	(10)	12	(4)	(8)
	<u>\$307</u>	<u>\$(83)</u>	<u>\$468</u>	<u>\$(267)</u>	<u>\$137</u>	<u>\$(148)</u>

Cash payments for income taxes from continuing operations were \$273 in 2009, \$459 in 2008, and \$378 in 2007.

Based on this information, answer the following questions:

1. Provide the journal entry(ies) made by Sara Lee to record the 2009 income tax expense (net) of \$224 million. Remember to allocate the expense and benefit between current and deferred.
2. Provide the journal entry made by Sara Lee to record the payment of income taxes during the year 2009.

**Case 16-60****Writing Assignment (Uncertain Tax Positions)**

FASB ASC Topic 740 discusses uncertain tax positions and highly certain tax positions. In one page or less, discuss the difference between an uncertain tax position and a highly certain tax position.

**Case 16-61****Writing Assignment (Crystallisation)**

As discussed in the chapter, deferred taxes in the United Kingdom have historically been computed in a slightly different manner than in the United States. The concept underlying this “crystallisation” approach is that if a liability is deferred indefinitely, then the present value of that liability is zero. No deferred tax liability is recognized if the accumulated deferred tax amount is expected to increase each year, thus delaying indefinitely the ultimate liquidation of this obligation.

In one page or less, address the following questions regarding how crystallisation relates to accounts payable.

1. How might this same concept be applied to the recognition of a liability for accounts payable? That is, if accounts payable are expected to increase each year, should the crystallisation concept apply to this liability?
2. How reasonable does this approach seem?

**Case 16-62****Ethical Dilemma (The valuation allowance)**

You have just completed a preliminary draft of the year-end financial statements and notes and have distributed it to members of the board of directors for the upcoming board meeting. At the meeting, board members will have an opportunity to analyze, ask questions, and offer suggestions regarding the content of the statements and the accompanying notes.

According to your computations, the company will be reporting yet another loss—the third in as many years. The company has taken full advantage of the carryback provisions of the tax law. With this year’s loss, the company will carry forward some of the loss. As a result, you have correctly recorded a deferred tax asset. However, because of continued losses, you have used a valuation allowance account to reduce the amount of the deferred tax asset.

At the board meeting, initial questions focus on the company’s profitability or lack thereof. Following this discussion, an astute member of the board questions the use of a valuation allowance account. You explain that if losses continue, the entire amount of the deferred asset may not be realized and that it is your professional opinion that sufficient evidence exists to justify the use of a valuation allowance account.

Immediately, the board begins to question your assumption of future losses. “Of course we will be profitable next year,” says one board member. “We have a plan to turn this company around,” says another. You overhear another whisper to his colleague, “If the accountants don’t think we are going to make money in the future, why are they staying?”

You have heard this talk about a turnaround in prior years, yet management seems unsuccessful in implementing desired changes. In past years, you have always had prior years’ profits against which you could offset losses. But now the accounting department, of which you are the head, has openly questioned management’s intentions to report

profits in the future. Now the board is questioning your loyalty to the company as well as your judgment.

1. What other factors might be considered when valuing the deferred tax asset account?
2. As the accountant, is it your place to question management's ability to turn a company around?
3. What effect did the journal entry involving the valuation allowance account have on this year's income statement? Did net income go up or down? With this journal entry, are you contributing to the company's loss?

### Case 16-63

#### Cumulative Spreadsheet Analysis

This assignment is based on the cumulative spreadsheet assignment for Chapter 13. Review that assignment for a summary of the assumptions made in preparing a forecasted balance sheet, income statement, and statement of cash flows for 2014 for Skywalker Company. This assignment involves computations related to deferred income taxes and the amount of cash paid for income taxes.

Skywalker would like to estimate the amount of cash it will pay for income taxes in 2014. The only difference between financial accounting income and taxable income for Skywalker is in the area of depreciation. Skywalker uses straight-line depreciation for financial reporting purposes and an accelerated method for tax reporting. This difference has created a deferred tax liability, which is included in the balance sheet's "Other long-term liabilities." The following information is for December 31, 2013:

Accumulated depreciation, financial accounting records . . . . .	\$27.00
Accumulated depreciation, tax records . . . . .	\$50.00
Expected future income tax rate . . . . .	33.0%

Construct a spreadsheet that will allow you to answer the following questions.

1. Given this information, what is Skywalker's deferred tax liability as of December 31, 2013? (Carry calculations to two decimal places.)
2. In 2014, depreciation expense for income tax purposes is expected to be 1.5 times as much as depreciation expense computed for financial reporting purposes. Estimate the amount of cash that Skywalker will pay for income taxes in 2014. Report your answer with two decimal places, and assume the following:
  - (a) Amortization expense is the same for book and for tax purposes.
  - (b) All current income taxes are paid in cash during the year.
  - (c) These calculations do not impact the overall total forecast for "Other long-term liabilities" for 2014; the balance is still expected to increase at the same rate as sales.
3. Repeat (2), assuming the following:
  - (a) Depreciation expense for income tax purposes will be the same as depreciation expense computed for financial reporting purposes.
  - (b) Depreciation expense for income tax purposes will be 2.0 times as much as depreciation expense computed for financial reporting purposes.
4. Comment on what implicit assumption underlies your answer to (3b).

## CHAPTER 17 Employee Compensation—Payroll, Pensions, and Other Compensation Issues

### LEARNING OBJECTIVES

- 1 Account for payroll and payroll taxes, and understand the criteria for recognizing a liability associated with compensated absences.
- 2 Compute performance bonuses, and recognize the issues associated with postemployment benefits.
- 3 Understand the nature and characteristics of employer pension plans, including the details of defined benefit plans.
- 4 Use the components of the pension-related asset/liability and changes in the components to compute the periodic expense associated with pensions and to compute the impact on other comprehensive income.
- 5 Prepare required disclosures associated with pensions, and understand the accounting treatment for pension settlements and curtailments.
- 6 Explain the differences in accounting for pensions and postretirement benefits other than pensions.

Press reports in the United States often talk about the rising “national debt.” As of September 30, 2009, borrowing from the public by the U.S. Treasury totaled \$7.583 trillion. This obligation is the most publicized liability of the U.S. government, but it is not the only large one. As of the same date, the present value of the government liability under military and civilian pension plans and for veterans’ benefits was \$5.284 trillion.<sup>1</sup> These liabilities are certainly large (a trillion dollar bills laid end to end would stretch from the earth to the moon and back 197 times), but all other U.S. government liabilities are surpassed by the Social Security and Medicare obligations. Of course, in one sense it is not correct to view Social Security as a pension plan or Medicare as a company retiree health care plan; those plans are a social insurance arrangement in which current workers pay for the benefits of past workers in the hopes that they (the current workers) will be

<sup>1</sup> *Financial Report of the United States Government—2009* (Washington, DC: Department of the Treasury).

supported by the contributions of future workers. With that qualification, it is still interesting to evaluate the funding status of Social Security and Medicare as if they were private company plans. As of September 30, 2009, the U.S. Treasury estimated that the present value of future Social Security benefits to current and future participants in the plan (over an infinite horizon) exceeded the present value of expected future contributions from those workers and their employers by \$17.5 trillion. And the present value of the Medicare obligation to those same people (in excess of their expected contributions) is \$89.5 trillion!

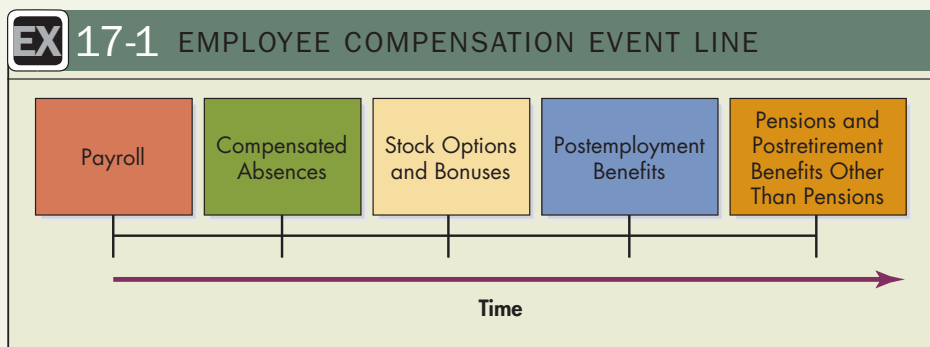

A widely recognized phenomenon of the past 100 years has been the increasing life expectancy of people in almost all countries of the world. For example, in 1900 the average life expectancy of people in the United States was 47.3 years; by 2005 it had increased to 77.8 years.<sup>2</sup> As people live longer, they must deal with the problem of financing their extended retirement years. The magnitude of the problem in the United States will increase in the next 10 to 15 years as the “baby boomer” population of the 1940s and 1950s moves into retirement. It is estimated that the proportion of the U.S. population that is over 65 will increase from the current 12% to 20% by the year 2030.

As a country’s population ages, an increasingly large share of the country’s resources must be used to honor obligations to retired people. This is also true of a business enterprise. For example, it has been reported that approximately \$1,100 of the sales price of each **General Motors** vehicle must be used to

satisfy the pension and health care claims of retired workers who no longer work at General Motors.

Complex accounting issues associated with employee compensation do not begin, however, when an employee retires. As introduced in Chapter 13, stock compensation has become an increasingly complex and controversial issue. In addition, companies must address issues associated with the computation of performance bonuses and liabilities associated with sick and vacation pay. Finally, the compensation issues associated with payroll, such as the differing employee and employer payroll taxes, introduce added complexity to the topic of employee compensation.

The event line displayed in Exhibit 17-1 outlines the various issues associated with employee compensation. Naturally, immediate compensation for services provided is the issue with which we all are most familiar. The next issue on the event line relates to accruing an obligation for sick days, vacation days, and other types of compensated absences. These obligations are accrued in the current period and are often related to the amount of time an employee has been employed. Stock options and other types of performance bonuses, which often are accounted for at the end of an accounting period, constitute the next event. In some instances, employees may leave an employer prior to retirement yet still be entitled to certain benefits. These benefits are known as *postemployment benefits* and are different from the final event listed—pensions and other postretirement benefits.

<sup>2</sup> *Health, United States, 2008*, National Center for Health Statistics, Centers for Disease Control and Prevention, U.S. Department of Health and Human Services, (Table 26. Life expectancy at birth, at 65 years of age, and at 75 years of age, by race and sex: United States, selected years 1900–2005).

## QUESTIONS

1. The U.S. federal government has two obligations that each total over \$5 trillion. One of these obligations is the “national debt.” What is the other?
2. How will the changing age mix of the U.S. population over the next 30 years make the satisfaction of retired workers’ Social Security claims more difficult?
3. In addition to the pension costs associated with retired workers, what other substantial cost must General Motors bear with respect to retired workers?

*Answers to these questions can be found on page 17-46.*

This chapter will proceed in the order of the employee compensation event line. We first focus on payroll, followed by issues related to compensated absences. Stock options and bonuses are then briefly discussed. Issues related to postemployment benefits are then reviewed, followed by a detailed discussion of pensions, including a discussion of the international standards for pension accounting. Postretirement benefits other than pensions are discussed in the final section of this chapter.

## Routine Employee Compensation Issues

1

Account for payroll and payroll taxes, and understand the criteria for recognizing a liability associated with compensated absences.

**WHY** Even routine employee compensation issues involve much more than merely recognizing an expense for an employee’s total salary or wage. Proper reporting of compensation requires an understanding of these issues.

**HOW** In addition to salary or wage expense, a company must recognize payroll tax expense for Social Security and unemployment taxes. A company must also carefully record amounts withheld from an employee’s salary or wage for income taxes and other items. Finally, an adjusting entry for vacation and sick days earned during a year must be made.

In the area of employee compensation, the complexities associated with pensions have received a great deal of attention in recent years. Before we turn our attention to pensions, we will first discuss employee compensation issues associated with the current pay period. Along with accounting for current payroll issues, we will discuss issues associated with compensated absences: sick pay, vacation pay, and so on.

### Payroll and Payroll Taxes

In an ongoing entity, salaries and wages of officers and other employees accrue daily. Normally, no entry is made for these expenses until payment is made. A liability for unpaid salaries and wages is recorded, however, at the end of an accounting period when a more precise matching of revenues and expenses is desired. An estimate of the amount of unpaid wages and salaries is made, and an adjusting entry is prepared to recognize the amount due. Usually, the entire accrued amount is identified as salaries payable with no attempt

to identify the withholdings associated with the accrual. When payment is made in the subsequent period, the amount is allocated between the employee and other entities such as government taxing units, unions, and insurance companies.

For example, assume that a company has 15 employees who are paid every two weeks. At December 31, four days of unpaid wages have accrued. Analysis reveals that the 15 employees earn a total of \$1,000 a day. Thus, the adjusting entry at December 31 would be as follows:

Salaries and Wages Expense .....	4,000	
Salaries and Wages Payable .....		4,000

When payment is made, Salaries and Wages Payable will be debited for \$4,000.

Social Security and income tax legislation impose five taxes based on payrolls:

1. Federal old-age, survivors', and disability (tax to both employer and employee)
2. Federal hospital insurance (tax to both employer and employee)
3. Federal unemployment insurance (tax to employer only)
4. State unemployment insurance (tax to employer only)
5. Individual income tax (tax to employee only but withheld and paid by employer)

**Federal Old-Age, Survivors', and Disability Tax** The Federal Insurance Contributions Act (FICA), generally referred to as Social Security legislation, provides for FICA taxes from both employers and employees to provide funds for federal old-age, survivors', and disability benefits for certain individuals and members of their families. At one time, only employees were covered by this legislation; however, coverage now includes most individuals who are self-employed.

Provisions of the legislation require an employer of one or more employees, with certain exceptions, to withhold FICA taxes from each employee's wages. The amount of the tax is based on a tax rate and wage base as currently specified in the law. The tax rate and wage base both have increased dramatically since the inception of the Social Security program in the 1930s. The initial rate of FICA tax was 1% in 1937; the rate in effect for 2010 was 6.20%. During that same period, the annual wages subject to FICA tax increased from \$3,000 to \$106,800. The taxable wage base is subject to yearly increases based on cost-of-living adjustments in Social Security benefits.

The employer remits the amount of FICA tax withheld for all employees, along with a matching amount, to the federal government. The employer is required to maintain complete records and submit detailed support for the tax remittance. The employer is responsible for the full amount of the tax even if employee contributions are not withheld.

**Federal Hospital Insurance** The Federal Insurance Contributions Act (FICA) also includes a provision for Medicare tax. This tax differs from the tax previously discussed in that the tax is applied to all wages earned; there is no upper limit. The tax rate for 2010 was 1.45% for both the employer and the employee.<sup>3</sup>

**Federal Unemployment Insurance** The Federal Social Security Act and the Federal Unemployment Tax Act (FUTA) provide for the establishment of unemployment insurance plans. Employers with insured workers employed in each of 20 weeks during a calendar year or who pay \$1,500 or more in wages during any calendar quarter are affected.

<sup>3</sup> For illustrative purposes and end-of-chapter exercises and problems, a combined FICA rate of 7.65% will be used.

Under present provisions of the law, the federal government taxes eligible employers on the first \$7,000 paid to every employee during the calendar year. The rate of tax in effect since 1985 has been 6.2%, but the employer is allowed a tax credit limited to 5.4% for taxes paid under state unemployment compensation laws. No tax is levied on the employee. When an employer is subject to a tax of 5.4% or more as a result of state unemployment legislation, the federal unemployment tax is 0.8% of the qualifying wages.

Payment to the federal government is required quarterly. Unemployment benefits are paid by the individual states. Revenues collected by the federal government under the acts are used to meet the cost of administering state and federal unemployment plans as well as to provide supplemental unemployment benefits.

**State Unemployment Insurance** State unemployment compensation laws are not the same in all states. In most states, laws call for tax only on employers, but in a few states, taxes are applicable to both employers and employees. Each state law specifies the classes of exempt employees, the number of employees required or the amount of wages paid before the tax is applicable, and the contributions that are to be made by employers and employees. Exemptions are frequently similar to those under the federal act. Tax payment is generally required on or before the last day of the month following each calendar quarter.

Although the normal tax on employers may be 5.4%, states have merit rating or experience plans providing for lower rates based on employers' individual employment experiences. Employers with stable employment records are taxed at a rate in keeping with the limited amount of benefits required for their former employees; employers with less satisfactory employment records contribute at a rate more nearly approaching 5.4% in view of the higher amount of benefits paid to their former employees. Savings under state merit systems are allowed as credits in the calculation of the federal contribution, so the federal tax does not exceed 0.8% even though an employer entitled to a lower rate under the merit rating system makes payment of less than 5.4%.

**Income Tax** Federal income taxes on the wages of individuals are collected in the period in which the wages are paid. The “pay-as-you-go” plan requires employers to withhold income tax from wages paid to their employees. Most states and many local governments also impose income taxes on the earnings of employees that the employer must withhold and remit. Withholding is required not only of employers engaged in a trade or business but also of religious and charitable organizations, educational institutions, social organizations, and governments of the United States, the states, the territories, and their agencies, instrumentalities, and political subdivisions. Certain classes of wage payments are exempt from withholding although they are still subject to income tax.

An employer must meet withholding requirements under the law even if wages of only one employee are subject to such withholdings. The amounts to be withheld by the employer are developed from formulas provided by the law or from tax withholding tables made available by the government. Withholding is based on the length of the payroll period, the amount earned, and the number of withholding exemptions claimed by the employee. Taxes required under FICA (both employee and employer portions) and income tax that has

**FYI**

Not all countries require employers to withhold income tax from employees. For example, in Hong Kong an employee is entirely responsible to accumulate sufficient funds to pay the 15% flat income tax due at the end of the year. Financial institutions are happy to arrange “tax loans” for those who forget to set aside the money to pay their taxes.

been withheld by the employer are paid to the federal government at the same time. These combined taxes are deposited in an authorized bank quarterly, monthly, or several times each month, depending on the amount of the liability. Quarterly and annual statements providing a summary of all wages paid by the employer must also be filed.

**Accounting for Payroll Taxes** To illustrate the accounting procedures for payroll taxes, assume that salaries for the month of January for a retail store with 15 employees are \$16,000. The state unemployment compensation law provides for a tax on employers of 5.4%. Income tax withholdings for the month are \$1,600. Assume that FICA rates are 7.65% for employer and employee. Entries for the payroll and the employer's payroll taxes follow:

Salaries Expense .....	16,000	
FICA Taxes Payable .....		1,224
Employees Income Taxes Payable .....		1,600
Cash .....		13,176

*To record payment of payroll and related employee withholdings.*

Payroll Tax Expense .....	2,216*	
FICA Taxes Payable .....		1,224
State Unemployment Taxes Payable .....		864
Federal Unemployment Taxes Payable .....		128

*To record the payroll tax liability of the employer.*

\*Computation:

Tax under FICA (0.0765 × \$16,000) .....	\$1,224
Tax under state unemployment insurance legislation (0.054 × \$16,000) .....	864
Tax under FUTA [0.008 (0.062 – credit of 0.054) × \$16,000] .....	128
Total payroll tax expense .....	<u>\$2,216</u>

When tax payments are made to the proper agencies, the tax liability accounts are debited and Cash is credited.

The employer's payroll taxes, as well as the taxes withheld from employees, are based on amounts paid to employees during the period regardless of the basis employed for reporting income. When financial reports are prepared on the accrual basis, the employer will have to recognize both accrued payroll and the employer's payroll taxes relating thereto by adjustments at the end of the accounting period.

For example, assume that the salaries and wages accrued at December 31 were \$9,500. Of this amount, \$2,000 was subject to unemployment tax and \$6,000 to FICA tax. Although the salaries and wages will not be paid until January of the following year, the

concept of matching requires these costs to be allocated in the period in which they were incurred. This allocation is accomplished with an adjusting entry. The adjusting entry for the employer's payroll taxes would be as follows:

Payroll Tax Expense .....	583*	
FICA Taxes Payable .....		459
State Unemployment Taxes Payable .....		108
Federal Unemployment Taxes Payable .....		16

*To accrue the payroll tax liability of the employer.*

## CAUTION

Don't forget that to ensure that the financial statements are properly stated, an adjusting entry is required at the end of an accounting period if salaries and wages are owed.

## \*Computation:

Tax under FICA ( $0.0765 \times \$6,000$ ) . . . . .	\$459
Tax under state unemployment insurance legislation ( $0.054 \times \$2,000$ ) . . . . .	108
Tax under FUTA ( $0.008 \times \$2,000$ ) . . . . .	16
Total payroll tax expense . . . . .	<u>\$583</u>

Agreements with employees may provide for payroll deductions and employer contributions for other items, such as group insurance plans, pension plans, savings bond purchases, or union dues. Such agreements call for accounting procedures similar to those described for payroll taxes.

## Compensated Absences

**Compensated absences** include payments by employers for vacation, holiday, illness, or other personal activities. Employees often earn paid absences based on the time employed. Generally, the longer an employee works for a company, the longer the vacation allowed or the more liberal the time allowed for illnesses. At the end of any given accounting period, a company has a liability for earned but unused compensated absences. The matching principle requires that the estimated amounts earned be charged against current revenue and a liability established for that amount.<sup>4</sup> The difficult part of this accounting treatment is estimating how much should be accrued. The FASB requires a liability to be recognized for compensated absences that (1) have been earned through services already rendered, (2) vest or can be carried forward to subsequent years, and (3) are estimable and probable.

For example, assume that a company has a vacation pay policy for all employees. If all employees had the same anniversary date for computing time in service, the computations would not be too difficult. However, most plans provide for a flexible employee starting date. To compute the liability, a careful inventory of all employees must be made to include the number of years of service, rate of pay, carryover of unused vacation from prior periods, turnover, and the probability of taking the vacation.

To illustrate the accounting for compensated absences, assume that S&N Corporation has 20 employees who are paid an average of \$700 per week. During 2012, employees earned a total of 40 vacation weeks but took only 30 weeks of vacation that year. They took the remaining 10 weeks of vacation in 2013 when the average rate of pay was \$800 per week. The entry to record the accrued vacation pay on December 31, 2012, follows:

Wages Expense . . . . .	7,000	
Vacation Wages Payable . . . . .		7,000
<i>To record accrued vacation wages (<math>\\$700 \times 10</math> weeks).</i>		

This entry assumes that wages expense has already been recorded for the 30 weeks of vacation taken during 2012. Therefore, the income statement would reflect the total wages expense for the entire 40 weeks of vacation earned during the period. On its December 31, 2012, balance sheet, S&N would report a current liability of \$7,000 to reflect the obligation for the 10 weeks of vacation pay that are owed. In 2013, when the additional vacation weeks are taken and the payroll is paid, S&N would make the following entry:

Wages Expense . . . . .	1,000	
Vacation Wages Payable . . . . .		7,000
Cash . . . . .		8,000
<i>To record payment at current rates of previously earned vacation time (<math>\\$800 \times 10</math> weeks).</i>		

<sup>4</sup> FASB ASC paragraphs 710-10-25-1 through 3, Compensated Absences.

Because the vacation weeks have now been used, this entry eliminates the liability. An adjustment to Wages Expense is required because the liability was recorded at the rates of pay in effect during the time the compensation (vacation pay) was earned. However, the cash is being paid at the current rate, which requires an adjustment to Wages Expense. If the rate of pay for the 10 weeks of vacation taken in 2013 had remained the same as the rate used to record the accrual on December 31, 2012, there would not have been an adjustment to Wages Expense. The entry to record payment in 2013 would simply be a debit to the payable and a credit to Cash for \$7,000.

An exception to the requirement for accrual of compensated absences, such as vacation pay, is made for sick pay. The FASB decided that sick pay should be accrued only if it vests with the employee, that is, the employee is entitled to compensation for a certain number of “sick days” regardless of whether the employee is actually absent for that period. Upon

## FASB CODIFICATION

**The Issue:** You are an accounting student and are generally acknowledged to be the best accounting student on campus. Your organic chemistry professor (you are taking a broad set of elective courses to enhance your accounting training), Harold Pearl, has come to you with an accounting question. Professor Pearl reports that he had a very unpleasant conversation with the university accountant the day before. The accountant says that because Professor Pearl receives a university “sabbatical” once every seven years, the cost of that “sabbatical” must be partially accrued (whatever that means; Professor Pearl is not sure) in each of the six years leading up to the “sabbatical” year. The result is that the university compensation cost related to Professor Pearl in each year is one-sixth higher than Professor Pearl’s actual annual cash compensation. As a result, Professor Pearl’s cash compensation must be reduced by 17% ... immediately.

Professor Pearl is dismayed. To him, this seems unfair. He reports to you that this “sabbatical” year is not a year in which he relaxes on the beach. Sure, he has no classes that year. However, during that year he is required to appear at the organic chemistry lab each day and mentor chemistry graduate students. He enjoys the work, but it is not as if he were really taking the year off. He wants you to help him convince the university accountant that it is not right to “accrue,” in advance, the cost of his “sabbatical” year salary.

**The Question:** Should a university accrue an expense, in advance, for faculty who receive a periodic sabbatical year?

**Searching the Codification:** There are two ways to find the answer to Professor Pearl’s question. First, the brute force approach is to just type “sabbatical” into the search bar at the top right of the FASB ASC home page. Unfortunately, this doesn’t work when using the Basic View (free) version of the Codification. So, the second approach is to look through the menu of the 71X (Compensation) family of topics. Here are some hints. This looks like a general compensation issue not related to pensions, stock compensation, or severance benefits (euphemistically called “nonretirement postemployment benefits”). Next, this is an overall issue, not one related to airlines or regulated industries. Final hint: This is an issue of when the sabbatical year cost should be recognized (accrued now or recognized in the sabbatical year itself).

**The Answer:** The correct treatment is described on page 17-47.

leaving the firm, the employee would be compensated for any unused sick time. If the sick pay does not vest, it is recorded as an expense only when actually paid.<sup>5</sup>

Although compensated absences are not deductible for income tax purposes until the vacation, holiday, or illness occurs and the payment is made, GAAP requires them to be recognized as liabilities on the financial statements.

## Nonroutine Employee Compensation Issues

2

Compute performance bonuses, and recognize the issues associated with postemployment benefits.

**WHY** The full cost of employee services includes payments, or promises of payments, associated with bonuses and stock options, as well as termination benefits.

**HOW** The compensation expense associated with a bonus is recognized in the period in which it is earned. Computation of compensation expense associated with stock options requires that the fair value of the options be estimated; details on the accounting for stock-based compensation are included in Chapter 13. The total termination benefits payable to employees are recognized when the termination news is communicated to the employees.

In addition to routine compensation issues that are addressed on a regular basis, several other compensation issues arise, often at the end of the period. These issues, performance-based incentive plans either in the form of stock or bonus, are discussed in this section. We conclude this section with a discussion of the compensation issues that may arise following employment but prior to retirement.

### Stock-Based Compensation and Bonuses

As discussed in Chapter 13, stock options are often a part of an employee's compensation package. While stock option compensation (particularly performance based) is more common for upper management and directors, many companies have stock option plans available for all employees. The amount of compensation expense reported related to stock-based compensation is a function of the fair value of the options on the date they are granted and the type of stock-based compensation plan. With a simple stock-based compensation plan, total compensation expense is the number of options granted multiplied by the fair value of each option as of the grant date. This expense is allocated over the period of time that the employees have to stay with the company in order to earn the options. With a performance-based stock option plan, total compensation expense is equal to the fair value of each option as of the grant date multiplied by the number of options that are probable to be awarded. This amount is re-evaluated at the end of each year. Some stock-based compensation plans call for payment in cash such as with cash stock appreciation rights (SARs). These liability amounts are remeasured

FYI

The existence of an earnings-based bonus plan is intended to encourage managers to work harder and smarter to improve the company's performance. However, such a plan also increases managers' incentive to manipulate reported earnings. In fact, one of the factors looked at by auditors in evaluating the risk of financial statement fraud in a company is whether the company has an earnings-based management bonus plan.

<sup>5</sup> FASB ASC paragraphs 710-10-25-6 through 8, Sick Pay Benefits.

at the end of each year, and a catch-up adjustment is made to compensation expense. Refer back to Chapter 13 for a discussion of the details associated with stock-based compensation.

In addition to stock options, employees often earn bonuses based on a company's performance over a given period of time. This additional compensation should be recognized in the period in which it is earned. Bonuses are often based on some measure of the employer's income. For example, assume that Photo Graphics, Inc., gives its store managers a 10% bonus based on individual store earnings. The bonus is to be based on income after deduction for the bonus but before deduction for income taxes. Assume furthermore that income for a particular store is \$100,000 before charging any bonus or income taxes. The bonus would be calculated as follows:

$$\begin{aligned} B &= 0.10(\$100,000 - B) \\ B &= \$10,000 - 0.10B \\ B + 0.10B &= \$10,000 \\ 1.10B &= \$10,000 \\ B &= \$9,091 \text{ (rounded)} \end{aligned}$$

The bonus would be reported on the income statement as an operating expense, and the bonus payable would be shown as a current liability on the balance sheet unless the bonus was paid immediately in cash. As an example of a bonus plan, **ExxonMobil** disclosed in its 2010 proxy statement filed with the SEC that it has a management bonus plan targeted at its top managers. The plan grants a certain number of "earnings bonus units" to the managers; a manager is entitled to receive cash equal to ExxonMobil's cumulative reported net earnings per share for the next three years up to a cap amount of \$5.75 for each award unit granted in 2009. ExxonMobil's CEO, Rex W. Tillerson, received \$2,400,000 in earnings-based bonus in 2009; his salary for the year was \$2,057,000.

### Postemployment Benefits

In a business world where downsizing has become commonplace, an employee cannot count on remaining with one employer for his or her entire career. In addition, employees are making job changes for reasons such as to facilitate career advancement and to enhance their family's quality of life. For these reasons and others, compensation issues following employment but preceding retirement have increased in magnitude. The most common situation in which this issue arises is when an employee is terminated. Examples of the types of benefits typically granted to terminated employees include supplemental unemployment benefits, severance benefits, disability-related benefits, job training and counseling, and continuation

## 17-2 NOTE DISCLOSURE FOR POSTEMPLOYMENT BENEFITS—NCR

### Employee Severance Costs

In the first quarter of 2007, the Company initiated the manufacturing realignment related to its ATM products, which included outsourcing of certain manufacturing activities in the Americas region and shifting other manufacturing activities from high cost to low cost geographies primarily in the EMEA [Europe, Middle East, and Africa] and APJ [Asia Pacific Japan] regions. As a result of this realignment, the Company recorded \$46 million for employee severance and other termination benefits in cost of products in the Condensed Consolidated Statements of Operations in the first quarter of 2007.

© 2012 Cengage Learning.

of benefits such as health care benefits and life insurance coverage.<sup>6</sup> These are exactly the type of benefits that are often granted to employees as part of a restructuring. Thus, a postemployment benefit obligation would often comprise part of a restructuring charge. In a restructuring, the postemployment benefit obligation is recognized only when the termination is approved by management, the details of the termination are set, and the employees have been notified.<sup>7</sup>

The same criteria used in accounting for compensated absences are applied to postemployment benefits. Those criteria are (1) the employer's obligation in the future relates to services already provided by the employee, (2) the employer's obligation relates to rights that vest, and (3) the payment of the liability is probable and the amount can be reasonably estimated.<sup>8</sup> If these criteria are met, then entries made are similar to those illustrated previously for compensated absences. To illustrate the magnitude of postemployment benefits, consider the disclosure provided by **NCR** in the notes to its 2007 first quarter report, shown in Exhibit 17-2.

## STOP & THINK

Which ONE of the following is NOT a criterion used in identifying a postemployment benefit obligation?

- The employer's obligation is proportional to the amount of the employee's salary or wage.
- The employer's obligation relates to rights that vest.
- The payment of the liability is probable, and the amount can be reasonably estimated.
- The employer's obligation in the future relates to services already provided by the employee.

## Accounting for Pensions

3

Understand the nature and characteristics of employer pension plans, including the details of defined benefit plans.

**WHY** The promises made to employees in a company's pension plan can constitute a huge economic liability. The size of this liability is determined by the details of the plan. Stockholders and creditors need to know how much of the company's future cash flows will be required to be used to satisfy pension promises.

**HOW** With a defined contribution pension plan, pension expense is equal to the amount of the required contribution each year. With a defined benefit plan, annual pension expense is composed of a number of factors, the most important being the implicit interest charge on the actuarial present value of the pension obligation, the present value of new pension benefits earned during the year, offset by a measure of the return on the pension fund for the year.

Financing retirement years is accomplished by establishing some type of **pension plan** that sets aside funds during an employee's working years so that at retirement the funds and earnings from investment of the funds may be returned to the employee in lieu of earned wages. In the United States, three major categories of pension plans have emerged:

- Government plans, primarily Social Security
- Individual plans, such as individual retirement accounts (IRAs)
- Employer plans

The third category, employer pension plans, involves several difficult and controversial accounting and reporting issues.

<sup>6</sup> FASB ASC paragraphs 712-10-25-1 through 5, Other Postemployment Benefits.

<sup>7</sup> FASB ASC paragraphs 420-10-25-4 through 10, One-time Employee Termination Benefits.

<sup>8</sup> FASB ASC paragraph 712-10-25-4.

A related accounting issue is the employer's accounting for **postretirement benefits other than pensions**. These benefits extend beyond the active years of employment and include such items as health care, life insurance, legal services, special discounts on items produced or sold by the employer, and tuition assistance. For both pensions and for other postretirement benefits, the accounting objective is to properly measure both the balance sheet obligation and the current year earnings impact of the value of these promises.

### **Nature and Characteristics of Employer Pension Plans**

The subject of employers' accounting for pensions is very complex, partly because of the many variations in plans that have been developed. Most pension plans are specifically designed for one employer and are known as **single-employer pension plans**. If several companies contribute to the same plan, it is called a *multiemployer pension plan*. This chapter, like the accounting standards, focuses on accounting for single-employer pension plans.

**Funding of Employer Pension Plans** The basic purpose of all employer pension plans is the same: to provide retirement benefits to employees. A principal issue concerning pension plans is how to provide sufficient funds to meet the needs of retirees. The Social Security system of the federal government has frequently been criticized because it is not a "funded" plan. FICA taxes (contributions) paid by employers and employees in the current year are used to pay benefits to individuals who are currently retired. This means that the current employees must have faith that a future generation will do the same for them. Such a system creates much doubt and uncertainty.

Private plans are not permitted to operate in this way. Federal law, such as the Employee Retirement Income Security Act (ERISA) of 1974, requires companies to fund their pension plans in an orderly manner so that the employee is protected at retirement. Some pension plans are funded entirely by the employer and are referred to as **noncontributory pension plans**. In other cases, the employee also contributes to the cost of the pension plan, referred to as a **contributory pension plan**.<sup>9</sup> The amounts and timing of contributions depend on the particular circumstances and plan provisions. While the provisions of pension plans vary widely and in many cases are very complex, there are two basic classifications of pension plans: (1) defined contribution plans and (2) defined benefit plans.

**Defined Contribution Pension Plans** **Defined contribution pension plans** are relatively simple in their construction and raise very few accounting issues for employers. Under these plans, the employer pays a periodic contribution amount into a separate trust fund, which is administered by an independent third-party trustee. The contribution may be defined as a fixed amount each period, a percentage of the employer's income, a percentage of employee earnings, or a combination of these or other factors. As contributions to the fund are made, they are invested by the fund administrator. When an employee retires, the accumulated value in the fund is used to determine the pension payout to the employee. The employee's retirement income therefore depends on how the fund has been managed. If investments have been made wisely, the employee will fare better than if the investments have been managed poorly. In effect, the investment risk is borne by the employee. The employer's obligation extends only to making the specified periodic contribution. This amount is charged to pension expense, and no further accounting is required for the plan. As an example of this type of plan, many college professors belong to

<sup>9</sup> Employee contributions are not considered in subsequent discussions and examples because the chapter is concerned with employers' accounting for pensions.

a defined contribution plan called **TIAA/CREF**. The college or university makes contributions on behalf of the professor, who then must rely on the good judgment of the TIAA/CREF fund managers to ensure his or her retirement security. As of September 2009, TIAA/CREF was the largest private pension plan in the world with assets in excess of \$402 billion held on behalf of 3.8 million active and retired employees.

**Defined Benefit Pension Plans** Defined benefit pension plans are much more complex than defined contribution plans. Under defined benefit plans, the employee is guaranteed a specified retirement income often related to his or her number of years of employment and average salary over a certain number of years. The periodic amount of the employer's contribution is based on the expected future benefits to be paid to employees and is affected by a number of variables. Because the benefits are defined, the contributions (funding) must vary as conditions change. Exhibit 17-3 illustrates the basic nature of a defined benefit plan. A defined contribution plan could be illustrated in the same manner except that the contributions (rather than the benefits) would be defined. This difference, however, is significant and accounts for the complexity of defined benefit plans.

Under defined benefit plans, the investment risk is, in substance, borne by the employer. While a separate trust fund usually is maintained for contributions and investment earnings, the employer ultimately is responsible to ensure that employees receive the defined benefits provided by the plan. A **pension fund** may be viewed essentially as funds set aside to meet the employer's future pension obligation just as funds may be set aside for other purposes, for example, to retire bonds at maturity. One major difference, however, is that a future obligation to retire bonds is a definite amount, while the employer's future obligation for retirement benefits is based on many estimates and assumptions. In addition, U.S. federal law requires minimum pension plan funding, whereas sinking fund requirements are privately negotiated between the borrower and the bondholders.

**Defined benefits.** Defined benefit pension plans provide for an increase in future retirement benefits as additional services are rendered by an employee. In effect, the employee's total compensation for a period consists of current wages or salaries plus deferred compensation represented by the right to receive a defined amount of future benefits. The amount of future benefits earned by employees for a particular period is determined by actuaries, not accountants. However, an understanding of the basic concepts

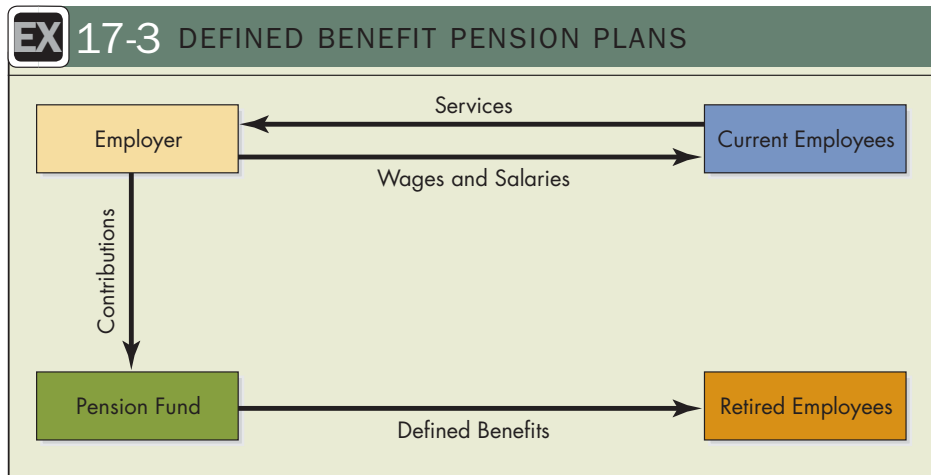

Pensions represent a substantial liability for many companies.

i

FYI

In a sense, all pension plans are funded completely by the employee. When considering an acceptable level of compensation, both the firm and the employee should consider total compensation: current salary, fringe benefits, and deferred compensation. A higher employer pension contribution presumably means lower current compensation.

© 2012 Cengage Learning.

used in measuring future retirement benefits is necessary for understanding the accounting issues relating to pensions.

The amount of future benefits earned for a period is based on the plan's benefit formula, which specifies how benefits are attributed (assigned) to years of employee service. Some plans attribute equal benefits to each year of service rendered, for example, a pension benefit of \$100 per month for each year of employee service rendered. Thus, an employee who retires after 30 years of service would be entitled to a monthly benefit of

\$3,000 ( $\$100 \text{ per month} \times 30 \text{ years of service}$ ). The benefit attributed to each year of service would be \$100 multiplied by the number of months of life expectancy after retirement. Some plans attribute different benefits to different years of service, for example, a pension benefit of \$100 per month for each year of service up to 20 years and \$120 per month for each additional year of service. Many plans include a benefit formula based on current or future employee earnings. For example, a plan might provide monthly benefits of 2% of an employee's average annual earnings for the five years preceding retirement.

The measurement of future benefits is highly subjective. The amount of benefits earned by employees for a period is based on many variables, including the average age of employees, length of service, expected turnover, vesting provisions, and life expectancy. Thus, one must estimate how many of the current employees will retire and

i

## FYI

The issue of risk and who bears it is very important. With a defined benefit plan, the employee is not completely free of risk; receipt of the benefit payments might be in jeopardy if the employing firm goes bankrupt. To mitigate this risk, Congress created the **Pension Benefit Guaranty Corporation (PBGC)**, a federally supported pension plan insurer. The PBGC collects insurance premiums from participating companies and is given a high-priority claim against company assets in case of bankruptcy.

## STOP &amp; THINK

Many companies are changing their plans from defined benefit to defined contribution. Why would employers do this?

- The total cost of a defined contribution plan is always lower.
- The U.S. government has mandated a gradual switch from defined benefit to defined contribution plans.
- A defined contribution pension plan is an attractive form of off-balance-sheet financing.
- A shift from a defined benefit to a defined contribution plan shifts the investment risk from the company to the employee.

when they will retire, the number of employees who will leave the company prior to retirement, the life expectancy of employees after retirement, and other relevant factors.

**Vesting of pension benefits.** A key element in all pension plans is the [vested benefits](#) provision. *Vesting* occurs when an employee has met certain specified requirements and is eligible to receive pension benefits at retirement regardless of whether the employee continues working for the employer. In early pension plans, vesting did not occur for many years. In extreme cases, vesting occurred only when an employee reached retirement. A major outcome of federal regulation is the much earlier vesting privileges for employees. Most pension plans provide for full vesting after 10 years of employment. Colleges and universities typically require professors to remain at the school for three to five years in order for pension contributions to vest. It is not uncommon for a professor to forfeit nonvested pension contributions when moving from one school to another.

**Funding of defined benefit plans.** The periodic amounts to be contributed to a defined benefit plan by the employer are directly related to the future benefits expected to be paid to current employees. The methods of funding pension plans vary widely. Most defined benefit plans require periodic contributions that accumulate to the balance needed to pay the promised retirement benefits to employees. Some plans specify an even amount for each year of employee service. Others require a lower amount in the early years of employee service, with an accelerating schedule over the years. Still other plans provide for a higher amount at first and then a declining pattern of funding. The contribution amounts are determined by actuarial formulas and must be adjusted as estimates and assumptions are revised to reflect changing conditions.

All funding methods are based on present values. The additional future benefits earned by employees each year must be discounted to their present value, referred to as the [actuarial present value](#), using an assumed rate of return on pension fund investments. In many cases, employers contribute an amount equal to the present value of future benefits attributed to current services. As noted, however, funding patterns vary, and the amount contributed for a particular period may be less than or greater than the present value of the additional benefits earned for the period. Assume, for example, that the present value of future benefits earned in the current period is determined to be \$30,000, using a discount rate of 10%. If the funding method requires a contribution of only \$25,000 for the period, the employer has an unfunded obligation of \$5,000. At the end of the following year, this obligation will have increased to \$5,500 to reflect the interest cost of 10%. When contributions exceed the present value of the future benefits, lower contributions will be required in subsequent periods as a result of earnings on the “overfunded” amount.

The Pension Benefit Guaranty Corporation is charged with monitoring the funding status of defined benefit pension plans in the United States. As of December 31, 2009, the PBGC protects the retirement incomes of about 44 million working Americans in 29,000 defined benefit pension plans. The PBGC provides federal insurance for participants in U.S. pension plans much as the FDIC provides insurance for bank depositors. The PBGC is not funded by general tax revenues; instead, it collects insurance premiums from employers, receives income on investments, and receives funds from pension plans that it takes over. In 2009, the PBGC was directly responsible for the future benefits of 1.3 million active and retired workers whose pension plans had failed. The PBGC Web site lists an interesting rogue’s gallery of companies that have declared bankruptcy and passed responsibility for their employees’ pensions to the PBGC. The list includes Circuit City, Polaroid, Lehman Brothers ... and many more.

### Issues in Accounting for Defined Benefit Plans

Although the provisions of defined benefit pension plans can be extremely complex and the application of accounting standards to a specific plan can be highly technical, the accounting issues themselves are identified easily. Following is a list of these issues, all of which relate to accounting and reporting by employers.

1. The amount of net periodic pension expense to be recognized on the income statement
2. The amount of pension liability or asset to be reported on the balance sheet
3. Accounting for pension settlements, curtailments, and terminations
4. Disclosures needed to supplement the amounts reported in the financial statements

The issue of funding pension plans is purposely omitted from the list. Funding decisions are affected by tax laws, governmental regulations, actuarial computations, and contractual terms, not by accounting standards. They should not directly affect the amount that is reported as **net periodic pension expense** under the accrual concept.

The next section of the chapter illustrates the basic computational and accounting issues related to pensions in the context of a simple illustration. The simple example is then followed by a more complex illustration that introduces the intricacies for which pension accounting is famous.

### Simple Illustration of Pension Accounting

Thakkar Company has established a defined benefit pension plan. As of January 1, 2013, only one employee, Lorien Bach, is enrolled in the plan. Some characteristics of the plan and of Bach as of January 1, 2013, are outlined as follows:

- Bach is 35 years old and has worked for Thakkar for 10 years.
- Bach's salary for 2012 was \$40,000.
- Thakkar's pension plan pays a benefit based on an employee's highest salary. Pension payments begin after an employee turns 65, and payments are made at the end of the year. The annual payment is equal to 2% of the highest salary times number of years with the company.
- Bach is an unusually predictable person; it is known with certainty that she will not quit, be fired, or die before age 65. Also, it is known with certainty that she will live exactly 75 years and will therefore collect 10 annual pension payments after she retires. Bach's benefits are already fully vested.
- In valuing pension fund liabilities, Thakkar uses a discount rate of 10%.
- As of January 1, 2013, Thakkar Company has a pension fund containing \$10,000. During 2013, Thakkar made additional contributions to the fund totaling \$1,500. Also, the fund earned a return of \$1,200 during the year. Over the long run, Thakkar expects to earn an average return of 12% on pension fund assets.

**Estimation of Pension Obligation** The first step in estimating Thakkar Company's pension obligation is to compute the amount of the annual pension payment to be made to Bach when she retires. The amount of the payment depends on Bach's years of service and highest salary. As of January 1, 2013, Bach has put in 10 years of service and, assuming that her most recent salary of \$40,000 is her highest salary to date, the forecasted amount of her annual pension payment can be computed as follows:

$$(2\% \times 10 \text{ years}) \times \$40,000 = \$8,000$$

It is known that Bach will live long enough after retirement at age 65 to collect 10 annual pension payments; thus, the total amount of pension benefits that Thakkar expects to pay to Bach is \$80,000 (10 years  $\times$  \$8,000). However, \$80,000 is an overstatement of the value of Thakkar's pension obligation because the payments won't begin for another 30 years. To properly compute the present value of the payments to Bach, allowance must be made for the fact that the first payment won't be made until Bach is 66 years old (recall that pension payments are made at the end of the year), the payments are spread over 10 years, and Thakkar Company's discount rate is 10%. This discount rate can be thought of as the rate of interest Thakkar could earn on a portfolio of high-quality fixed-income investments (such as highly rated corporate bonds).<sup>10</sup> In *IAS 19*, the IASB recognizes that not all countries have an active market in high-quality corporate bonds. In such markets, the IASB requires the use of the rate on government bonds. In the Web Material ([www.cengage.com/accounting/stice](http://www.cengage.com/accounting/stice)) associated with this chapter, it is shown that, using the 10% discount rate, the present value of the expected pension payments to Bach is equal to \$2,817.

The \$2,817 amount can be thought of as follows: If Thakkar Company deposited \$2,817 on January 1, 2013, in a bank account yielding 10%, by the end of 30 years when Bach retires, that \$2,817 will have accumulated to an amount large enough to support payments of \$8,000 per year to Bach for the succeeding 10 years. The \$2,817 is the actuarial present value of Thakkar's pension obligation. An actuarial present value takes into account both time value of money considerations and actuarial assumptions (i.e., how long until Bach retires, how long Bach will live after retirement). In practice, such calculations are performed by professionals called *actuaries*. Financial accountants do not need to know how to perform the detailed actuarial present value calculations, but they should understand the general concepts underlying the calculations.

The \$2,817 pension obligation just computed is called the **accumulated benefit obligation (ABO)**. The ABO is the actuarial present value of the expected future pension payments, using the current salary as the basis for forecasting the amount of the pension benefit payments. The ABO approach ignores the impact of expected future salary increases on the amount of the benefit payments. An alternative measure of the pension obligation that does consider the impact of future salary increases is called the **projected benefit obligation (PBO)**.

## FYI

Over the past 10 years, *Job Rated Almanac* has rated being an actuary as one of the top jobs in America based on income, outlook, physical demands, stress, and security. How much do actuaries make? Starting salaries are around \$54,000, with top salaries exceeding \$130,000. Training in math, computers, communication, and business are needed to become a successful actuary.

To illustrate the difference between the PBO and the ABO, assume that Thakkar Company expects Bach's 2012 salary of \$40,000 to increase 5% every year until retirement. As a result, Bach's salary is expected to increase to \$172,877 by the year 2042, Bach's last year of employment.<sup>11</sup> The pension benefit payment based on this salary is as follows:

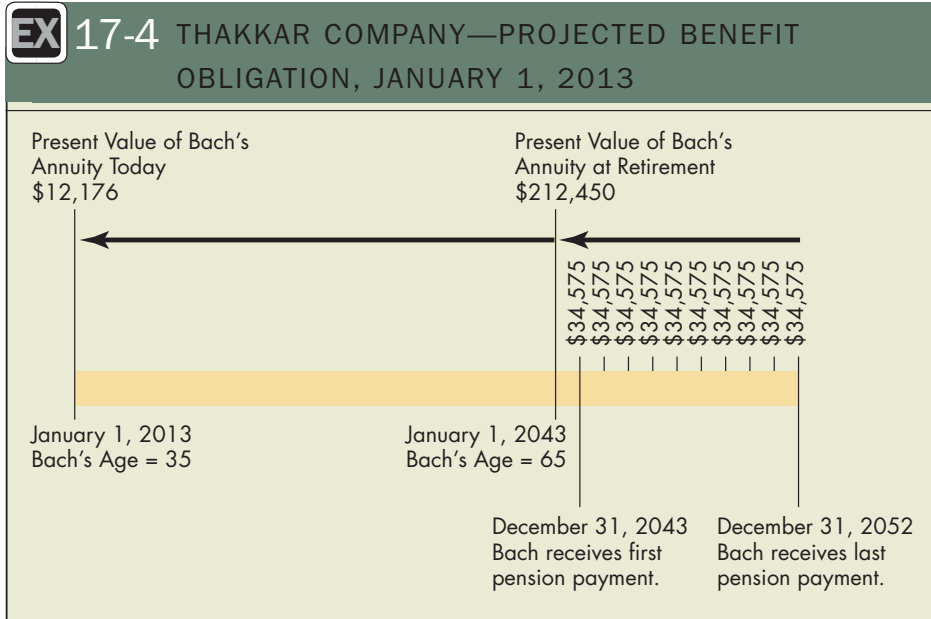

$$(2\% \times 10 \text{ years}) \times \$172,877 = \$34,575 \text{ (rounded)}$$

The PBO at January 1, 2013, is \$12,176 (see the Web Material associated with this chapter for details of the computation). This is the present value of the 10 future annual

<sup>10</sup> FASB ASC paragraph 715-30-35-43

<sup>11</sup>  $PV = \$40,000, N = 30, I = 5\% \rightarrow FV = \$172,877$

© 2012 Cengage Learning.

payments of \$34,575 that Bach is expected to receive. The diagram in Exhibit 17-4 illustrates the relationship between the future payments and the PBO.

Both the PBO and the ABO computations are based on the amount of pension benefits that have already been earned—in this case, on the 10 years of service Bach has provided to Thakkar. The difference between the PBO and the ABO comes in the estimate of Bach's highest salary. The ABO computations ignore likely future salary increases; the PBO computations include estimates of those increases. The quantitative difference between these two approaches can be substantial. For Thakkar, the \$2,817 ABO is substantially lower than the \$12,176 value computed for the PBO.

The numerical relationship between the ABO and the PBO can be presented as follows:

Accumulated benefit obligation, January 1, 2013 .....	\$ 2,817
Additional amounts related to projected pay increases .....	9,359
Projected benefit obligation, January 1, 2013 .....	<u>\$12,176</u>

So which is a better measure of a firm's pension obligation, the PBO or the ABO? FASB ASC Topic 715 identifies the PBO as the measure appropriate for use in the financial statements. The ABO is not involved in any of the pension-related recognition provisions, but it is disclosed in the notes to the financial statements. This choice of the PBO as the primary measure of a firm's pension obligation was not without some controversy.<sup>12</sup> It was argued that use of the PBO is not appropriate because it embodies future salary increases and that the historical cost accounting model does not include recognition of future events. This argument was countered with the observation that the use of a discount rate also results in recognition of future events because the discount rate includes a premium for expected future inflation. It was argued that to allow recognition of the impact of expected future inflation but not to allow consideration of expected salary increases would result in a gross

<sup>12</sup> Adoption of FASB *Statement No. 87* (the source of the standards in FASB ASC Topic 715) was opposed by three of the seven members of the Board. A description of the dissenting views is included at the end of the primary text of this pre-codification *Statement* (following paragraph 77).

understatement of the pension obligation in some cases. Hence, the PBO is the primary measure of a firm's pension obligation.

As of January 1, 2013, the pension obligation for Thakkar, as measured by the PBO, is \$12,176, and from the information given at the beginning of the illustration, the total fair value of the pension fund is \$10,000. One possible way to present this information on a balance sheet is to list the pension fund among the noncurrent assets and the pension obligation as a noncurrent liability. However, FASB standards stipulate that these two items be offset against one another and requires that a single net amount be shown as either a net pension asset or a net pension liability.<sup>13</sup> Thakkar would calculate the appropriate balance sheet amount in the following way:

PBO, January 1, 2013	\$12,176
Pension fund at fair value, January 1, 2013	<u>10,000</u>
Pension-related liability, January 1, 2013	<u>\$ 2,176</u>

If the fair value of the pension fund had exceeded the projected benefit obligation, the resulting net asset would have been labeled Pension-Related Asset.

Why does Topic 715 require offsetting pension obligations and pension funds instead of separate recognition of each? The answer is, in one word, tradition. Accepted practice before *Statement No. 87* was adopted in 1985 was to offset pension obligations and pension funds; to avoid too great a change, the FASB decided to maintain that method. *Statement No. 87* was viewed as an improvement over prior standards but not too different from those standards to preserve the “gradual, evolutionary” nature of accounting standard setting.<sup>14</sup> The existing standard in Topic 715 preserves that traditional method of reporting. The separate components of the pension-related liability or asset are disclosed in the notes to the financial statements in a manner similar to the table shown previously.

**Computation of Pension Expense for 2013** In the simple Thakkar Company example, measurement of pension expense<sup>15</sup> for the year involves consideration of three factors:

1. Implied interest on the beginning-of-the-period pension obligation (which increases the PBO)
2. New pension benefits earned by employees through service during the year (which increase the PBO)
3. Investment return on the pension fund (which increases the fair value of the pension fund)

These three factors will be considered in turn.

**Interest cost.** The projected benefit obligation on January 1, 2013, is \$12,176. This represents an amount owed by Thakkar to its employee, Bach. The 10% discount rate used in the computation of the PBO is called the **obligation discount rate** and can be viewed as the implied interest rate on this debt. In a sense, employees have agreed to loan the company money (by deferring the receipt of some of their compensation) to be repaid

<sup>13</sup> FASB ASC paragraph 715-30-25-1. In a more complicated example, additional pension-related items would also be included in the balance sheet; these items are reported in the accumulated other comprehensive income portion of equity. These items are discussed later in the chapter.

<sup>14</sup> Pre-codification *Statement of Financial Accounting Standards No. 87*, par. 107.

<sup>15</sup> To avoid confusion, the text discussion refers to *pension expense* instead of *pension cost*. Periodic pension cost may be expensed immediately or it may be capitalized as part of an asset such as inventory. In all of our examples, we will assume that pension costs are expensed immediately.

when they retire. As is the case with all loans, there is a charge for interest for the time period for which the money is loaned. Accordingly, one aspect of annual pension expense is the increase in the PBO resulting from implicit interest on this pension obligation, computed as follows:

PBO, Beginning of Period	×	Discount Rate	=	Interest Cost
\$12,176	×	0.10	=	\$1,218 (rounded)

**Service cost.** Bach's work for Thakkar Company during the year results in an increase in the forecasted annual pension benefit payments from Thakkar to Bach because those payments are now computed based on 11 years of service instead of 10 years. The impact of this extra year of service is to increase the December 31, 2013, projected benefit obligation by \$1,339 over what it would have been if Bach had just vacationed for the entire year. (See the Web Material associated with this chapter for the detailed present value computations.) Therefore, the **service cost** element of pension expense for the year is \$1,339. In practice, of course, service cost computations are very complex and are done by actuaries.

**Return on the pension fund.** Pension expense is reduced by the return on the pension fund for the year. Just as liabilities and assets are offset to arrive at a net measure of accrued pension liability or prepaid pension cost, the return on the pension fund is offset against interest and service costs to compute a single net pension expense number. FASB ASC paragraphs 715-30-35-22 and 23 indicate that instead of using the actual return, the expected long-term return should be used; more about why this number is used will be discussed shortly. This return is typically computed by multiplying the fair value of the pension fund as of the beginning of the year by some estimate of the average rate of return the pension fund is expected to earn over the long run. For Thakkar Company, this long-term expected rate of return has been estimated to be 12%, and for this introductory example, we will assume that expected return and actual return are equal. Accordingly, for 2013, Thakkar's net pension expense is reduced by \$1,200 ( $\$10,000 \times 0.12$ ).

In addition to these changes in the PBO and the pension fund, two additional events are common when dealing with pension plans: contributions to the plan and benefits paid from the plan. Contributions increase the amount in the pension fund; in this example, contributions of \$1,500 were made during the year. Benefits paid from the plan have two effects: They reduce the amount in the pension fund, and they reduce the PBO. The reason the PBO is reduced is that if the benefits have been paid, they are no longer projected to be paid. In this simplified example, no benefits were paid during the year.

To review, the PBO is a present value measure of the future benefits expected to be paid to employees based on their employment to date but taking into consideration, if applicable, expected increases in wages that would affect their retirement benefits. The measurement is based on actuarial estimation of such factors as life expectancy, employee turnover, and interest rates. The projected benefit obligation increases each year as additional benefits are earned by employees through another year of service (service cost) and by the passage of time that brings employees one year closer to receiving their benefits (interest cost). The PBO decreases each year by the pension payments to retired employees. In addition, the obligation may increase or decrease by changes in any of the actuarial assumptions enumerated previously. These changes can be summarized as shown on page 17-21.

$$\begin{matrix} \text{Project} \\ \text{benefit} \\ \text{obligation,} \\ \text{beginning} \\ \text{of year} \end{matrix} + \begin{matrix} \text{Service cost} \\ \text{and interest} \\ \text{cost} \end{matrix} - \begin{matrix} \text{Retirement} \\ \text{benefits} \\ \text{paid} \end{matrix} \pm \begin{matrix} \text{Change in} \\ \text{actuarial} \\ \text{assumptions} \end{matrix} = \begin{matrix} \text{Projected benefit} \\ \text{obligation,} \\ \text{end of year} \end{matrix}$$

The **fair value of the pension fund** is based on its market value at a given measurement date. The fair value of the pension fund increases each year by employer contributions to the fund and decreases by the retirement benefits paid. The fair value also changes by the amount of earnings on the pension fund, including changes in the market value of the fund. These changes can be summarized as follows:

$$\begin{matrix} \text{Fair value} \\ \text{of pension} \\ \text{fund,} \\ \text{beginning} \\ \text{of year} \end{matrix} + \begin{matrix} \text{Employer} \\ \text{contribution} \end{matrix} - \begin{matrix} \text{Retirement} \\ \text{benefits} \\ \text{paid} \end{matrix} \pm \begin{matrix} \text{Actual} \\ \text{return on} \\ \text{pension} \\ \text{fund} \end{matrix} = \begin{matrix} \text{Fair value} \\ \text{of pension} \\ \text{fund,} \\ \text{end of year} \end{matrix}$$

Exhibit 17-5 illustrates how service costs, interest costs, and return on the pension fund change the PBO and the fair value of the pension fund (FVFP) and how those changes are combined to be reflected on the income statement.

Net pension expense for 2013 for Thakkar is computed as follows:

Interest cost .....	\$ 1,218
Service cost .....	1,339
Less: Expected return on the pension fund .....	(1,200)
Net pension expense .....	<u>\$ 1,357</u>

Note that benefits paid have no effect on the net pension liability as they reduce the FVFP and the PBO by the same amount. Also note that the amount of contributions to the pension fund is not reflected on the income statement. That amount would be disclosed as a cash outflow on the statement of cash flows.

Components Pension	Fair Value of Pension Fund	Projected Benefit Obligation	Balance Sheet: Pension-Related Liability	Income Statement: Pension Expense
January 1 balance .....	\$10,000	+ \$(12,176)	= \$(2,176)	
Service costs .....		(1,339)		} \$1,357
Interest costs .....		(1,218)		
Expected* return .....	1,200			
Contributions .....	1,500			
Benefits paid .....	0	0		
December 31 balance .....	\$12,700	+ \$(14,733)	= \$(2,033)	

\*In this example, expected return and actual return are equal.

The Thakkar Company illustration contains only the most basic elements of accounting for pensions. In more complex cases, pension expense is affected by amortization of deferred gains and losses from prior periods, amortization of the impact of a change in the terms of the pension plan, and amortization of the impact of changes in the actuarial assumptions. The accounting for these components of pension expense is illustrated in a subsequent example.

**Computation of Pension-Related Liability** As of December 31, 2013, the PBO for Thakkar is \$14,733 (see the Web Material associated with this chapter for the detailed calculations), and the total FVPF is \$12,700 (\$10,000 + \$1,200 return + \$1,500 new contributions). As illustrated previously, the PBO and the FVPF are offset to arrive at a single balance sheet amount. As of December 31, 2013, Thakkar Company would perform the following calculation:

PBO, December 31, 2013 . . . . .	\$ 14,733
Pension fund at fair value, December 31, 2013 . . . . .	(12,700)
Pension-related liability, December 31, 2013 . . . . .	<u>\$ 2,033</u>

The net accrued pension liability of \$2,033 would typically be shown in the Noncurrent Liability section of Thakkar's balance sheet.<sup>16</sup> The preceding table would be included in the notes to the financial statements.

**Basic Pension Journal Entries** The basic accounting entries for pensions are straightforward. An entry is made to accrue the pension expense, and another entry is made to record the contribution to the pension fund. For convenience, a single account, the [pension-related asset/liability](#) account, is used to reflect changes in the net pension asset or liability. Because Thakkar started the year with a credit balance of \$2,176 in this account, it is a liability account in this example. Thakkar Company would make the following journal entries for 2013:

Pension Expense . . . . .	1,357	
Pension-Related Asset/Liability . . . . .		1,357
<i>To record 2013 pension expense.</i>		
Pension-Related Asset/Liability . . . . .	1,500	
Cash . . . . .		1,500
<i>To record 2013 contribution to pension plan.</i>		

As a result of these entries, pension expense of \$1,357 would be reported as an expense on the income statement. The combined effect of the two entries is to decrease the Pension-Related Liability account by \$143 (\$1,500 – \$1,357); the balance in Pension-Related Liability is \$2,033 (\$2,176 beginning balance – \$143 decrease). In a more complicated example, the summary journal entry to recognize pension expense can also involve either a debit or credit to other comprehensive income and/or accumulated other comprehensive income. This is illustrated in the following examples.

**Key Points from the Thakkar Company Example** Before considering a more complicated example, take a moment now to review some important points illustrated with the Thakkar Company example.

<sup>16</sup> FASB ASC paragraph 715-20-45-3. A portion of the pension-related liability is reported as current to the extent that the present value of benefits to be paid in the next 12 months exceeds the fair value of the plan assets.

- The actuarial computations are complicated, even in the simplest possible example. For proof, see the Web Material associated with this chapter. The good news is that in real life these computations are done by actuaries.
- The balance sheet and income statement amounts related to pensions are sensitive to the actuarial assumptions made.
- The balance sheet amount is a combination of two items: the projected benefit obligation and the fair value of the pension fund. The details of the computation are disclosed in the notes to the financial statements.
- Net pension expense is also a conglomeration of several items. The three main items are interest cost, service cost, and expected return on the pension fund.

In the next section, the discussion of pension accounting continues with a more complex example. That example provides detailed coverage of the treatment of deferred items and illustrates the impact of pension accounting on the Accumulated Other Comprehensive Income section of stockholders' equity. A work sheet approach that greatly simplifies the handling of complex pension situations is introduced.

## Comprehensive Pension Illustration

4

Use the components of the pension-related asset/liability and changes in the components to compute the periodic expense associated with pensions and to compute the impact on other comprehensive income.

**WHY** A company's pension obligation and pension fund are long-term items. As a result, pension accounting seeks to minimize the temporary impact of fluctuations in short-term interest rates and investment returns. However, this admirable objective substantially complicates the accounting for pensions. The deferred impact of these temporary items is reported in equity as part of accumulated other comprehensive income.

**HOW** The pension-related asset/liability account reflects the difference between the present value of the amount expected to be paid in the future (PBO) and the fair value of the pension fund. Pension expense is the sum of service cost and interest cost, with a subtraction for the expected return on the pension fund. The computation of pension expense is also impacted by the amortization of prior service cost and of any deferred gain or loss in excess of the corridor amount. Deferred gains and losses are reported in the current period as other comprehensive income. The unamortized balance in prior service cost and deferred gains/losses is reported as part of accumulated other comprehensive income.

The Thakkar Company example included only three factors in the computation of pension expense. In a more general case, a company could recognize as many as five different components of net periodic pension expense. The five components are as follows:

1. Service cost
2. Interest cost
3. Actual return on the pension fund (if any)
4. Amortization of prior service cost (if any)
5. Deferral of current period gain or loss and amortization of deferred net gain or loss

The PBO and the FVFP are used extensively in computing pension cost. Because the FASB (in Topic 715) requires the pension fund (FVFP) and the obligation (PBO) to be offset against each other, they are not reported separately on the employer's balance sheet.

However, detailed records of these and other pension-related balances must be maintained to compute pension cost. These detailed records include accounts for the following three items:

1. Projected Benefit Obligation
2. Fair Value of Pension Fund
3. Accumulated Other Comprehensive Income (AOCI)
  - (a) Deferred pension gains and losses
  - (b) Prior service cost

Exhibit 17-6 contains a summary of the important elements that impact the reported amounts of these pension-related balance sheet items. These different elements will be discussed in the following example. Throughout the discussion of the components of pension expense, an illustration for a hypothetical company, Thornton Electronics, Inc., will be used.

Dec. 1 Balance Sheet	Pension-Related Asset/Liability		Accumulated Other Comprehensive Income	
	Projected Benefit Obligation (-)	Fair Value of Pension Fund (+)	Deferred Gain/Loss (+/-)	Prior Service Cost (+)
Income Statement	- Service Cost	+ Actual Return on Pension Fund	+/- Difference Between Actuarial Estimates with Actual Experience	- Amortization of Prior Service Cost
	- Interest Cost		+/- Amortization of Gain/Loss	
	+ Benefits Paid	- Benefits Paid		
Statement of Cash Flows		+ Contributions		
Dec. 31 Balance Sheet	Projected Benefit Obligation (-)	Fair Value of Pension Fund (+)	Deferred Gain/Loss (+/-)	Prior Service Cost (+)

Note: All signs are relative to the balance sheet. Positive amounts are debits; negative amounts are credits.

### Thornton Electronics—2013

Thornton’s pension-related balances as of January 1, 2013, are as follows:

Item	Where Reported	Amount
Projected benefit obligation . . . . .	Notes	\$1,500,000
Fair value of pension fund . . . . .	Notes	1,385,000
Pension-related liability . . . . .	Balance Sheet	115,000
Prior service cost (Accumulated other comprehensive income; subtraction from equity) . . . . .	Balance Sheet	75,000

The PBO, the FVPE, and the net pension liability have been explained previously. Prior service cost is described below.

**Prior Service Cost** When a pension plan is initially adopted or amended to provide increased benefits, employees are granted additional benefits for services performed in years prior to the plan's adoption or amendment. The cost of these additional benefits to the employer is called *prior service cost*. The amount of prior service cost is determined by actuaries and represents the increase in the PBO arising from the adoption or amendment of the plan. Although **prior service cost** initially arises from a plan adoption or amendment made in the current period, the accounting profession has been in general agreement that the cost should not be recognized as part of expense at the plan's adoption or amendment date but should be amortized over future periods. This treatment assumes that an adoption or amendment is not part of the normal, ongoing cost of the pension plan and so should not be included in its entirety in the computation of net pension expense for the current period. Instead, the cost represented by a plan adoption or amendment is recognized in the current period as a reduction in other comprehensive income. The prior service cost amount is then amortized in subsequent years, increasing net pension expense in those years. Assuming that the plan adoption occurred on December 31, 2012, the journal entry to record the plan adoption is as follows:

## STOP & THINK

What is the relationship between prior service cost and the measurement of the projected benefit obligation (PBO)?

- There is no relationship between prior service cost and the PBO.
- The projected benefit obligation includes some amount related to prior service cost.
- Prior service cost includes some amount related to the projected benefit obligation.
- The projected benefit obligation and prior service cost are always equal to each other.

Other Comprehensive Income .....	75,000
Projected Benefit Obligation .....	75,000
<i>To record December 31, 2012, prior service cost arising from plan amendment.</i>	

As shown in Exhibit 17-6, prior service cost is an element of the Accumulated Other Comprehensive Income section of equity; the other comprehensive income amount of \$75,000 recognized in the journal entry above was closed, at 2012 year-end, to the prior service cost portion of accumulated other comprehensive income. The projection benefit obligation amount is used in computing the net pension-related asset or liability that is reported in the balance sheet.

Under *IAS 19*, "Employee Benefits," prior service cost is often accounted for differently from that explained above. According to paragraph 96 of *IAS 19*, past service cost (equivalent to prior service cost) is recognized as an expense over the period when the retroactive benefits vest. If the retroactive benefits vest over some future time period, then the accounting will be very much like that illustrated above. However, if the retroactive benefits vest immediately, then under *IAS 19* the entire amount of past service cost is expensed immediately.

The January 1, 2013, pension information for Thornton Electronics would appear in a pension work sheet as shown in Exhibit 17-7.

The work sheet is divided into two sections: the Financial Statement Accounts section, which shows the net effect of pension-related items on the balance sheet and income

**EX 17-7** THORNTON ELECTRONICS, INC.—PENSION WORK SHEET,  
JANUARY 1, 2013

Financial Statement Accounts				Detailed Accounts		
Net Pension Expense	Cash	Pension-Related Asset/(Liability)	Accumulated Other Comprehensive Income	Pension Asset/Liability		AOCI
				Projected Benefit Obligation	Fair Value of Pension Fund	Prior Service Cost
Balance, January 1, 2013		(115,000)	75,000	(1,500,000)	1,385,000	75,000

Note: Positive amounts are debits; negative amounts are credits.

© 2012 Cengage Learning.

statement, and the Detailed Accounts section, which lists detailed pension information, to be disclosed in the notes to the financial statements. The formal balance sheet account, Pension-Related Asset/(Liability), summarizes in one number the projected benefit obligation and the fair value of pension fund information contained in the detailed records. The equity account Accumulated Other Comprehensive Income includes deferred gains and losses associated with pension-related items such as the pension plan adoption mentioned earlier. In the work sheet, a credit amount is indicated by parentheses, and the numbers without parentheses are debits.

Information summarizing the 2013 pension activity of Thornton Electronics follows:

Service cost as reported by actuaries .....	\$75,000
Contributions to pension plan .....	\$115,000
Benefits paid to retirees .....	\$125,000
Fair value of pension fund at December 31, 2013. ....	\$1,513,500
Obligation discount rate. ....	11.0%
Long-term expected rate of return on the pension fund .....	10.0%

**FYI**

Many different interest rates are used throughout the accounting standards. The obligation discount rate can vary over time; thus, the computation of the benefit obligation may vary from one year to another as a result of the change in interest rates. An increase in the rate lowers the present value of the liability; a decrease in the rate increases it. In formulating *Concepts Statement No. 7*, the FASB studied the different ways in which accountants use interest rates.

The 2013 pension information has been entered in the pension work sheet shown in Exhibit 17-8. Each entry is explained below.

**Service Cost** Recall that service cost is the present value of additional benefits earned by employees during the period. As explained earlier, service cost for the period is determined by actuaries based on the pension plan's

benefit formula. Thornton Electronics' actuaries reported 2013 service cost of \$75,000. This \$75,000 is recorded in work sheet entry (a) as an increase in net periodic pension expense (a debit which ultimately reduces the retained earnings portion of equity when the expense is closed to Retained Earnings) and an increase to the PBO (a credit).

a. Pension Expense .....	75,000	
Projected Benefit Obligation .....		75,000
<i>To record 2013 service cost.</i>		

## EX 17-8 THORNTON ELECTRONICS, INC.—PENSION WORK SHEET FOR 2013

	Financial Statement Accounts				Detailed Accounts		
	Net Pension Expense	Cash	Pension-Related Asset/(Liability)	Accumulated Other Comprehensive Income	Pension Asset/Liability		AOCI
					Projected Benefit Obligation	Fair Value of Pension Fund	Prior Service Cost
Balance, January 1, 2013			(115,000)	75,000	(1,500,000)	1,385,000	75,000
(a) Service cost	75,000				(75,000)		
(b) Interest cost	165,000				(165,000)		
(c) Actual return	(138,500)					138,500	
(d) Benefits paid					125,000	(125,000)	
(e) PSC amortization	13,636						(13,636)
(f) Pension contribution		(115,000)				115,000	
Balance, December 31, 2013	<u>115,136</u>	<u>(115,000)</u>	<u>(101,500)</u>	<u>61,364</u>	<u>(1,615,000)</u>	<u>1,513,500</u>	<u>61,364</u>

Notes: Positive amounts are debits; negative amounts are credits.  
The gray area indicates that no changes are made directly to these accounts. These accounts simply reflect changes that are made to the detailed accounts.

© 2012 Cengage Learning.

**Interest Cost** The interest cost represents the fact that the present value of Thornton's pension obligation is increased by the interest on the beginning PBO. The obligation discount rate is used to discount the PBO and to compute the interest cost. The interest cost for 2013 is  $\$1,500,000 \times 0.11$ , or  $\$165,000$ . The interest cost is shown in entry (b) as a debit to the net periodic pension expense and a credit to the PBO.

b. Pension Expense	165,000
Projected Benefit Obligation	165,000
<i>To record 2013 interest cost.</i>	

**Actual Return on the Pension Fund** The assets created by employer contributions to a pension plan usually earn a return that reduces the reported amount of annual pension expense. The return is composed of elements such as interest revenue, dividends, rentals, and changes in the market value of the assets. If a decline in the market value of the pension fund exceeds the earnings on the assets, the actual return will be a negative figure that would increase the pension expense rather than decrease it. The actual return can be computed by comparing the fair value of the pension fund at the beginning and end of the year. After adjusting for current-year contributions and benefits paid to retirees, any change is the **actual return on the pension fund**. The actual return on the pension fund for Thornton Electronics in 2013 is  $\$138,500$ , computed as follows:

Fair value of pension fund, December 31, 2013	\$1,513,500
Fair value of pension fund, January 1, 2013	1,385,000
Increase in fair value	\$ 128,500
Add benefits paid	125,000
Deduct contributions made	(115,000)
Actual return on the pension fund	<u>\$ 138,500</u>

The actual return on the pension fund assets is always computed in determining net periodic pension expense. However, as illustrated later, the actual return may be adjusted

to the expected return when there is a difference between the two amounts. In this case, the actual return of \$138,500 is equal to the expected return (\$1,385,000 × 0.10).

The actual return of \$138,500 is shown in entry (c) as a credit to the net periodic pension expense (representing a decrease in the expense and, ultimately, an increase in retained earnings) and a debit to the fair value of pension assets (representing an increase in the asset).

c. Pension Fund . . . . .	138,500
Pension Expense . . . . .	138,500
<i>To record 2013 actual return on pension fund.</i>	

Note that benefits paid from fund assets do not reduce the account Cash; benefit payments are shown in entry (d) as a decrease in both the pension fund and the remaining PBO. The benefit payments are made by the pension plan trustee to the retired employees using the assets in the pension fund, so the company itself does not make those direct cash payments. Instead, the entry to reduce cash because of company contributions to the pension fund is shown later.

d. Projected Benefit Obligation . . . . .	125,000
Pension Fund . . . . .	125,000
<i>To record 2013 benefits paid.</i>	

**Amortization of Prior Service Cost** Prior service cost (PSC) is the cost of benefits granted to employees for past service when a pension plan is adopted or amended. As illustrated in Exhibit 17-7, the prior service cost amount is initially recorded as a credit (increase) to the PBO and a debit (reduction) to Other Comprehensive Income. This other comprehensive income reduction is eventually closed to Accumulated Other Comprehensive Income, reducing this equity account. This deferred loss is then spread out, or amortized to pension expense, over future periods.

The FASB states that prior service cost should be amortized by “assigning an equal amount to each future period of service of each employee active at the date of the amendment who is expected to receive benefits under the plan.”<sup>17</sup> The future period of service is referred to as the **expected service period**. Because employees will have varying years of remaining service, this amortization method will result in a declining amortization charge.

When a company has many employees retiring or terminating in a systematic pattern, a method similar to the sum-of-the-years'-digits depreciation method can be used. The FASB has provided an illustration of how this computation can be made.<sup>18</sup> Assume that Thornton Electronics, Inc., has 150 employees who are expected to receive benefits for prior services under an amendment adopted at the end of 2012. Ten percent of the employees (15 employees) are expected to leave (either retire or quit with vesting privileges) in each of the next 10 years. Employees hired after the plan’s amendment date do not affect the amortization. The formula for the sum-of-the-years'-digits depreciation method illustrated in Chapter 11 can be used with a slight modification to reflect the decreased number of employees each period. Thus, the total service years for Thornton Electronics, Inc., could be computed with the following formula:

$$\frac{N(N + 1)}{2} \times D = \text{Total future years of service}$$

<sup>17</sup> FASB ASC paragraph 715-30-35-11.

<sup>18</sup> Ibid., Appendix B, illustration 3. FASB ASC paragraphs 715-30-55-93 through 100.

where

$N$  = number of remaining years of service

$D$  = decrease in number of employees working each year

Therefore

$$\frac{10(11)}{2} \times 15 = 825$$

The numerator would begin with the total employees at the time of the plan's amendment and decline by  $D$  each period. Under these assumptions, 825 service years will be rendered by the affected employees. The fraction used to determine the amortization has a numerator that declines by 15 employees each year and a denominator that is the sum of the service years, or 825. If the increase in the projected benefit obligation, or prior service cost, arising from the plan's amendment at the end of 2012 was \$75,000, the amortization for 2013 would be  $150/825 \times \$75,000$ , or \$13,636. In the following two years, the amount amortized would be  $135/825 \times \$75,000$ , or \$12,273, and  $120/825 \times \$75,000$ , or \$10,909, respectively.

Although the FASB has indicated a preference for this sum-of-the-years'-digits-type method of amortization, the consistent use of an alternative amortization approach that more rapidly reduces the prior service cost is acceptable. An example of such an alternative is the straight-line amortization of prior service cost over the average remaining service period of the employees. To illustrate the straight-line approach using the Thornton Electronics example, the average remaining service life would be 5.5 years ( $825/150$  employees), and \$13,636 ( $\$75,000/5.5$ ) would be amortized for each full year.

A separate amortization schedule is necessary for each amendment of the plan. There is no need to alter the schedule for new employees because they would not receive benefits from prior services. If the planned termination or retirement pattern does not occur, adjustments may be necessary later to completely amortize the prior service cost.

For the Thornton Electronics example, the amortization amount based on the number of service years remaining is used. For 2013, this amount is \$13,636. In entry (e) of Exhibit 17-8, the \$13,636 is shown as an increase in net periodic pension expense (with a debit) and an increase in accumulated other comprehensive income (with a credit).

e. Pension Expense .....	13,636	
Accumulated Other Comprehensive Income .....		13,636
<i>To record 2013 amortization of prior service cost.</i>		

Recall that prior service cost is a subcategory of Accumulated Other Comprehensive Income, an equity account. Thus, a credit to Accumulated Other Comprehensive Income reduces the amount of unamortized prior service cost, but this then means that the subtraction from equity is smaller; equity is increased. The prior service cost amount is systematically amortized until the entire equity subtraction has been transferred from accumulated other comprehensive, through pension expense and net income, and into retained earnings. The amortization process increases pension expense each year, but there is no net annual effect on equity (or on annual comprehensive income); instead, the net annual equity effect is that a portion of the equity reduction is transferred from accumulated other comprehensive income to retained earnings each year. The entire reduction in equity, and in comprehensive income, caused by the granting of retroactive benefits upon the plan adoption was recognized immediately when the plan adoption journal entry was initially made, as illustrated earlier.

**Plan Contributions** Federal government pension funding rules in the United States make U.S. companies with defined benefit pension plans contribute minimum amounts to their pension funds each year. Under the Pension Protection Act of 2006, companies are required to contribute an amount equal to their service cost and interest cost each year plus an additional contribution designed to eliminate any remaining shortfall within seven years. These shortfalls could arise, for example, if the investment performance of the pension plan is worse than expected. Of course, if past superior pension fund performance has created a surplus in the pension fund, subsequent contributions can be cut back or even eliminated for a time.

In the Thornton example, the cash contribution to the pension fund is \$115,000. The necessary journal entry is shown as entry (f) in the work sheet in Exhibit 17-8 and is as follows:

f. Pension Fund .....	115,000
Cash .....	115,000
<i>To record 2013 contribution to the pension plan.</i>	

Note the large shaded area on the left side, the Financial Statement Accounts side, of the work sheet. This shaded area represents the fact that the detailed factors that impact the pension-related asset/liability and the pension-related portion of accumulated other comprehensive income during the year are not recorded directly in those accounts but are instead recorded in the detailed accounts contained on the right side of the work sheet. The year-end balance sheet balances in the work sheet (\$101,500 for the pension-related liability and \$61,364 for accumulated other comprehensive income) reflect the totals from the detailed accounts. The pension-related liability balance is the combination of the end-of-year projected benefit obligation and the fair value of the pension fund (\$1,615,000 liability and \$1,513,500 asset). In this simple example, the accumulated other comprehensive income balance includes only the unamortized prior service cost.

**Summary Journal Entries** The six detailed journal entries described above and illustrated in the pension work sheet in Exhibit 17-8 can be summarized in two summary journal entries, as follows:

Pension Expense .....	115,136
Pension-Related Asset/Liability .....	101,500
Accumulated Other Comprehensive Income .....	13,636
<i>Summary journal entry to recognize pension expense for 2013.</i>	
Pension-Related Asset/Liability .....	115,000
Cash .....	115,000
<i>Summary journal to record pension fund contribution for 2013.</i>	

In the first journal entry, the amount credited to Pension-Related Asset/Liability is calculated strictly by reference to the three primary components of pension expense: service cost, interest cost, and the actual return on the pension fund. In this case, that total is \$101,500 (\$75,000 + \$165,000 – \$138,500). The remaining amount of pension expense in this example, prior service cost amortization of \$13,636, represents a reclassification from accumulated other comprehensive income to pension expense (which is then closed to Retained Earnings). Additional components of pension expense and their impact on this summary journal entry are illustrated in later examples.

**Financial Statement Reporting** The four numbers on the Financial Statement Accounts side of the work sheet are reported in Thornton's financial statements, as follows:

- *Net pension expense.* The \$115,136 expense is reported as part of compensation expense in Thornton's income statement.
- *Cash.* The \$115,000 negative cash amount associated with Thornton's defined benefit pension plan is reported as a cash outflow from operating activities in Thornton's statement of cash flows.
- *Pension-related liability.* The \$101,500 pension-related liability is reported in Thornton's balance sheet.
- *Accumulated other comprehensive income.* The \$61,364 debit balance in Accumulated Other Comprehensive Income is reported as a subtraction from equity in Thornton's balance sheet.

Note again that the left side of the work sheet includes the items to be reported in Thornton's financial statements and the right side of the work sheet represents the underlying detail that is used to construct the necessary financial statement note disclosure.

### Thornton Electronics—2014

The Thornton Electronics example continues with the following information for 2014:

Service cost as reported by actuaries . . . . .	\$87,000
Contributions to pension plan . . . . .	\$75,000
Benefits paid to retirees . . . . .	\$132,000
Actual return on pension fund . . . . .	\$26,350
Actuarial change increasing projected benefit obligation . . . . .	\$80,000
Obligation discount rate . . . . .	11.0%
Long-term expected rate of return on pension fund . . . . .	10.0%

The pension work sheet to record the 2014 pension information is shown in Exhibit 17-9. Entries (a) through (e) are similar to those shown previously for 2013. Note that the amount of prior service cost (PSC) amortization has decreased because the remaining service years of the employees in place at the time of the plan amendment have declined; referring back to the earlier discussion, the amount is computed as follows:  $135/825 \times \$75,000 = \$12,273$ . Entries (f) and (g) relate to deferred gains and losses and are explained below.

**Deferral of Gains and Losses** Because pension costs include many assumptions and estimates, frequent adjustments must be made for variations between the actual results and the estimates or projections that were used in determining net periodic pension expense for previous periods. For example, the market value of the pension fund may increase at a much higher or lower rate than anticipated, the employee turnover rate may differ from that projected in earlier periods, or the interest rate may differ significantly from expectations. Such differences between expected results and actual experience give rise to a **deferred pension gain or loss**.

Treatment of these pension gains and losses has been a subject of controversy throughout the FASB's long study of pension accounting. Immediate recognition as part of annual pension expense is opposed by many accountants who are concerned about the volatility of pension expense. However, these pension gains and losses do represent economic events that should be reflected in the financial statements. The FASB decided to minimize the volatility of net periodic pension expense by allowing deferral of some gains and losses and amortization over future periods rather than requiring recognition of gains and losses in

**EX 17-9 THORNTON ELECTRONICS, INC.—PENSION WORK SHEET FOR 2014**

	Financial Statement Accounts				Detailed Accounts			
	Net Pension Expense	Cash	Pension-Related Asset/(Liability)	Accumulated Other Comprehensive Income	Pension Asset/Liability		AOCI	
					Projected Benefit Obligation	Fair Value of Pension Fund	Prior Service Cost	Deferred Pension (Gain)/Loss
Balance, January 1, 2013			(101,500)	61,364	(1,615,000)	1,513,500	61,364	
(a) Service cost	87,000				(87,000)			
(b) Interest cost	177,650				(177,650)			
(c) Actual return	(26,350)					26,350		
(d) Benefits paid					132,000	(132,000)		
(e) PSC amortization	12,273						(12,273)	
(f) Deferred loss	(125,000)							125,000
(g) PBO change					(80,000)			80,000
(h) Pension contribution		(75,000)				75,000		
Balance, December 31, 2014	<u>125,573</u>	<u>(75,000)</u>	<u>(344,800)</u>	<u>254,091</u>	<u>(1,827,650)</u>	<u>1,482,850</u>	<u>49,091</u>	<u>205,000</u>

Notes: Positive amounts are debits; negative amounts are credits.  
The gray area indicates that no changes are made directly to these accounts. These accounts simply reflected changes that are made to the detailed accounts.

© 2012 Cengage Learning.

the period they arise.<sup>19</sup> These pension gains and losses are recognized in other comprehensive income instead of in the computation of net pension expense. The cumulative amount of these deferred gains and losses is included in the accumulated other comprehensive income portion of equity in the balance sheet.

Although actuarial estimates may change for several reasons, only two will be considered in this illustration: (1) the current-year difference between the actual and expected return on the pension fund and (2) actuarial changes in determining the PBO.

### Deferral of Current-Year Difference between Actual and Expected Return on the Pension Fund

As mentioned earlier, in estimating the return on the pension fund, the expected long-term rate of return on assets should be used rather than a more volatile short-term rate. Thus, in the short run, the actual return on the pension fund usually will differ from the expected return. By deferring the difference between the expected return and the actual return, pension expense will tend to be reduced by the expected long-term rate of return rather than by the more volatile short-term return rates. If the actual return on the pension fund exceeds the expected return, the difference is a deferred gain; if the expected return exceeds the actual return, the difference is a deferred loss. The deferred gain or loss is recognized as part of other comprehensive income in the current period; the cumulative amount is reported as accumulated other comprehensive income in the Equity section of the balance sheet. The financial statement impact of deferred pension gains and losses can be summarized as shown on page 17-33.

<sup>19</sup> Alternatively, a company may elect to recognize all gains or losses immediately. If this election is made, the company must (1) apply the immediate recognition method consistently, (2) recognize all gains or losses immediately, and (3) disclose the fact that immediate recognition is being followed. FASB ASC paragraph 715-30-35-20. For purposes of this chapter, all illustrations and end-of-chapter material will assume that the deferred recognition method is used.

	Income Statement	Balance Sheet
Deferred gain	<b>Increases</b> pension expense	<b>Increases</b> AOCI
Debit net pension expense		
Credit other comprehensive income (OCI)		
Deferred loss	<b>Decreases</b> pension expense	<b>Decreases</b> AOCI
Credit net pension expense		
Debit other comprehensive income (OCI)		

Now, look at this chart in terms of computing comprehensive income, which is the sum of two things: net income and other comprehensive income. When a gain is deferred, pension expense is increased (reducing net income), but the “other comprehensive income” portion of comprehensive income is increased. The net effect is that there is no overall impact on the amount of comprehensive income, but merely in the mix between net income and other comprehensive income. The same is true, in the opposite direction, with a deferred loss. So, the deferred gain and the deferred loss amount are actually included in the computation of comprehensive income but are excluded in the computation of the “net income” portion of comprehensive income.

The **expected return on the pension fund** is computed by multiplying the **market-related value of the pension fund** by the expected long-term rate of return. The FASB defines *market-related value of the pension fund* as either (1) the fair market value of the pension fund at the beginning of the current year or (2) a weighted-average value based on market values of the pension fund over a period not to exceed five years.<sup>20</sup> If asset values have been increasing, the weighted-average value will be lower than the beginning fair market value, resulting in a lower expected return.

When the actual return on the pension fund exceeds the expected return, the excess is called a *deferred gain*. This amount is added in the computation of pension expense. The reason the deferred gain increases pension expense is because the “gain” (actually it is better-than-expected pension fund performance) is not allowed to reduce pension expense this period. The result is to increase pension expense and to report the deferred gain as an increase in other comprehensive income. When the actual return is less than the expected return, the difference is called a *deferred loss*. This amount is subtracted in the computation of pension expense because the “loss” (worse-than-expected pension fund performance) is not allowed to increase pension expense this period. The deferred loss is reported as a reduction in other comprehensive income. Because the actual return on the pension fund is deducted in computing pension expense, the net effect of the deferred pension gain or loss adjustment is that the expected return, rather than the actual return, is used to reduce pension expense, thus achieving a smoothing of pension expense over time.

To illustrate the computation of the deferred pension gain or loss

## FYI

The net result of using the expected return on the pension fund instead of the actual return is that reported pension expense equals what it would be if the pension fund were to perform exactly as expected, with any large differences amortized to expense in future years, as illustrated later in the chapter.

<sup>20</sup> Different methods of calculating market-related value may be used for different classes of assets. However, a company must apply the methods consistently from year to year.

arising from differences between the actual and expected return, assume that Thornton Electronics computes the expected return on the pension fund using the fair market value of the pension fund at the beginning of the year. The expected return on the pension fund for 2014 is \$151,350 ( $\$1,513,500 \times 0.10$ ). Because the actual return for the year of only \$26,350 is much less than the expected return, the \$125,000 difference is treated as a deferred pension loss and results in a reduction in pension expense.

As mentioned, combining the effects of the actual return and the deferred loss results in a net reduction in pension expense equal to the expected return of \$151,350 (actual return of \$26,350 + deferred loss of \$125,000). The deferred loss is recorded in entry (f) in the 2014 pension work sheet as a credit (decrease) to annual Pension Expense and a debit to Other Comprehensive Income. Once this debit to Other Comprehensive Income is closed at year end to Accumulated Other Comprehensive Income, the cumulative amount is called Deferred Net Pension Gain/Loss and is part of accumulated other comprehensive income in the Equity section of the balance sheet.

f. Other Comprehensive Income .....	125,000
Pension Expense .....	125,000
<i>To record 2014 deferred loss stemming from the actual return on the pension fund being less than expected.</i>	

**Differences in Actuarial Estimates of PBO** As indicated earlier, the actuarial computation of the projected benefit obligation involves many estimates, including future interest rates, life expectancy rates, and future salary rates. The effects of changing these estimates are deferred and accumulated for possible amortization to pension expense over future periods. During 2014, Thornton's actuaries reevaluated their actuarial assumptions in light of experience with Thornton's employees and calculated that the projected benefit obligation should be increased by \$80,000. This increase is identified as a loss and is deferred to future periods. The deferred loss arising from the adjustment to the PBO becomes part of the **deferred net pension gain or loss** for possible future amortization. This adjustment is shown as entry (g) in the 2014 work sheet, as follows.

g. Other Comprehensive Income .....	80,000
Projected Benefit Obligation .....	80,000
<i>To record 2014 impact of a revision in actuarial estimates associated with the projected benefit obligation.</i>	

This change in actuarial estimate is recorded in work sheet entry (g) as a credit (increase) to the PBO and a debit to Other Comprehensive Income. Note that the change has no impact on pension expense for 2014; the reduction in equity bypasses expense and net income and retained earnings and is instead eventually reflected in accumulated other comprehensive income. However, the change will impact future years in two ways. First, because the PBO is higher, interest cost in future years will be higher. Second, depending on future developments, the deferred loss may be amortized to pension expense in future years. Circumstances under which deferred losses and gains are amortized are described later in the chapter.

From the work sheet in Exhibit 17-9, it can be seen that a \$75,000 contribution to the pension fund is recorded in entry (h) as illustrated previously.

**Summary Journal Entries** The eight detailed journal entries described above and illustrated in the pension work sheet in Exhibit 17-9 can be summarized in three summary journal entries, as shown on page 17-35.

Pension Expense. . . . .	125,573	
Other Comprehensive Income . . . . .	125,000	
Pension-Related Asset/Liability. . . . .		238,300
Accumulated Other Comprehensive Income . . . . .		12,273
<i>Summary journal entry to recognize pension expense for 2014.</i>		
Pension-Related Asset/Liability . . . . .	115,000	
Cash. . . . .		115,000
<i>Summary journal to record pension fund contribution for 2014.</i>		
Other Comprehensive Income . . . . .	80,000	
Pension-Related Asset/Liability. . . . .		80,000
<i>To record 2014 impact of a revision in actuarial estimates     associated with the projected benefit obligation.</i>		

In the first journal entry, the amount credited to Pension-Related Asset/Liability is calculated strictly by reference to the three primary components of pension expense: service cost, interest cost, and the actual return on the pension fund. In this case, that total is \$238,300 (\$87,000 + \$177,650 – \$26,350). In addition, as illustrated previously, prior service cost amortization of \$12,273 represents a reclassification from accumulated other comprehensive income to pension expense. Finally, the deferred loss resulting from the underperformance of the pension fund reduces pension expense in the current period and instead is recognized as negative other comprehensive income for the year which is then closed to Accumulated Other Comprehensive Income as part of the regular closing of the accounts.

The pension fund contribution journal entry is recorded as illustrated previously. Also, in this year, one additional summary entry is needed to reflect the \$80,000 increase in the projected benefit obligation from the change in actuarial assumptions. This change does not impact pension expense in the current year but does reduce comprehensive income by \$80,000.

**Financial Statement Reporting** The four numbers on the Financial Statement Accounts side of the work sheet are reported in Thornton’s financial statements, as follows:

- *Net pension expense.* The \$125,573 expense is reported as part of compensation expense in Thornton’s income statement. Note that the combination of \$26,350 actual return plus the \$125,000 deferred loss means that the total amount subtracted in the computation of pension expense is \$151,350 (\$26,350 + \$125,000), which is the expected return on the pension fund for the year.
- *Cash.* The \$75,000 negative cash amount associated with Thornton’s defined benefit pension plan is reported as a cash outflow from operating activities in Thornton’s statement of cash flows.
- *Pension-related liability.* The \$344,800 pension-related liability is reported in Thornton’s balance sheet.
- *Accumulated other comprehensive income.* The \$254,091 debit balance in Accumulated Other Comprehensive Income is reported as a subtraction from equity in Thornton’s balance sheet.

Note again that the left side of the work sheet includes the items to be reported in Thornton’s financial statements, and the right side of the work sheet represents the underlying detail that is used to construct the necessary financial statement note disclosure.

Under old U.S. GAAP rules that were superseded in 2006, the cumulative portion of the deferred gains and losses was combined with the net pension-related asset or liability in the balance sheet. As a result, the reported balance sheet pension item was an unsavory conglomeration of asset, liability, and equity items, all rolled into one number. The resulting mysterious, and often misleading, nature of this number was a primary motivation behind the change in the rules in 2006. In addition, the old rules were viewed as deficient because the most basic facts about a defined benefit pension plan—is the plan overfunded or underfunded, and by how much—were not reflected in the balance sheet. This old, confusing method of accounting is still the accounting mandated under *IAS 19*. Under this approach, the number recognized in Thornton’s balance sheet as of the end of 2014 would be a net liability of \$90,709 (\$344,800 – \$254,091). Under this approach, the negative equity, or debit, items shown as accumulated other comprehensive income separately in the balance sheet would essentially be considered assets (also debits) and used to offset the pension-related liability. This approach was long viewed with disdain by accountants and accounting students in the United States, and there was joy when the FASB eliminated this approach in 2006. The IASB is close to completely revamping its accounting for defined benefit pension plans. The proposed changes are really quite exciting. But you will have to work through the next section (Thornton Electronics for 2015) before we’ll tell you about them.

**Thornton Electronics—2015**

The Thornton Electronics pension information for 2015 follows:

Service cost as reported by actuaries .....	\$115,000
Contributions to pension plan .....	\$80,000
Benefits paid to retirees .....	\$140,000
Actual return on pension fund .....	\$175,500
Obligation discount rate .....	11.0%
Long-term expected rate of return on the pension fund .....	10.0%
Accumulated benefit obligation, December 31, 2015 .....	\$1,795,150

**17-10 THORNTON ELECTRONICS, INC.—PENSION WORK SHEET FOR 2015**

	Financial Statement Accounts				Detailed Accounts			
	Net Pension Expense	Cash	Pension-Related Asset/(Liability)	Accumulated Other Comprehensive Income	Pension Asset/Liability		AOCI	
					Projected Benefit Obligation	Fair Value of Pension Fund	Prior Service Cost	Deferred Pension (Gain)/Loss
Balance, January 1, 2015			(344,800)	254,091	(1,827,650)	1,482,850	49,091	205,000
(a) Service cost	115,000				(115,000)			
(b) Interest cost	201,042				(201,042)			
(c) Actual return	(175,500)					175,500		
(d) Benefits paid					140,000	(140,000)		
(e) PSC amortization	10,909						(10,909)	
(f) Deferred gain	27,215							(27,215)
(g) Amortization of deferred loss	4,447							(4,447)
(h) Pension contribution		(80,000)				80,000		
Balance, December 31, 2015	<u>183,113</u>	<u>(80,000)</u>	<u>(405,342)</u>	<u>211,520</u>	<u>(2,003,692)</u>	<u>1,598,350</u>	<u>38,182</u>	<u>173,338</u>

Notes: Positive amounts are debits; negative amounts are credits.  
The blue area indicates that no changes are made directly to these accounts. These accounts simply reflected changes that are made to the detailed accounts.

This information is recorded in the 2015 pension work sheet shown in Exhibit 17-10. Entries (a) through (f) are similar to those made in 2014. Again, note that the prior service cost amortization amount is lower than in prior years, reflecting the continuing decline in the expected remaining service lives of those employees who were in place when the plan's amendment was initiated; the amount, as computed earlier, is  $120/825 \times \$75,000 = \$10,909$ . Entry (f) reflects the fact that the actual return on the pension fund of \$175,500 for the year exceeded the expected return of \$148,285 ( $\$1,482,850 \times 0.10$ ). The excess of \$27,215 is considered an unexpected gain and is credited to Other Comprehensive Income. The same amount is debited to the net periodic pension expense.

Entry (g) relates to amortization of deferred pension gains and losses and will now be explained.

**Amortization of Deferred Net Pension Gain or Loss from Prior Years** Under certain conditions, an employer's net periodic pension expense will include the amortization of deferred net pension gain or loss. The deferred pension gain or loss from prior years (recognized in accumulated other comprehensive income) is amortized over future years if it accumulates to more than an amount defined by the FASB as a **corridor amount**. Amortization is only required for a deferred net gain or loss that exceeds 10% of the greater of the PBO or the market-related value of the pension fund as of the beginning of the year. The rationale behind this approach is that the deferred gains and losses are not a concern as long as they are small, indicating that the estimates are close to being correct. The 10% rule used in defining the corridor amount is just an arbitrary attempt to define "small." Over time, if the estimates are not systematically bad, one would expect the total deferred net gain or loss to fluctuate randomly around zero.

If the deferred net gain or loss does exceed the corridor amount, that is an indication that the estimates have been systematically incorrect and the cumulative deferred amounts should begin to be recognized. The FASB indicated that any systematic method of amortizing the deferred net gain or loss that equaled or exceeded the straight-line amortization over the remaining expected service years of the employees would be acceptable as long as the procedure is applied consistently to both gains and losses. The amortization of a deferred gain reduces the net periodic pension expense, and the amortization of a deferred loss increases the net periodic pension expense. It is important to remember that only deferred gains and losses from prior years are subject to amortization. Accordingly, the corridor comparison applies only to the beginning balances in Projected Benefit Obligation, Fair Value of Pension Fund, and the deferred net pension gain/loss accounts.

This corridor amortization is a compromise between immediate recognition of gains and losses (which is viewed as causing too much volatility in earnings) and permanent deferral. Permanent deferral makes sense as long as the gains and losses tend to cancel out, but it becomes less reasonable when a "large" deferred gain or loss accumulates. The corridor amount is simply an arbitrary definition of what amount of deferred gain or loss is considered "large."

## STOP&THINK

When would a company find itself exceeding the corridor amount?

- Only when the company has pension fund assets in excess of total stockholders' equity
- Only when the company is off in its pension estimates by a significant amount or by smaller regular amounts over a long period of time
- Only when the company has pension fund assets in excess of 10% of total assets
- Only when the company has a projected benefit obligation in excess of 10% of total liabilities

To illustrate the computation of the corridor amount, Thornton would apply the 10% corridor threshold to the projected benefit obligation at the beginning of the year because the PBO exceeds the market value of the pension fund at the beginning of the year.<sup>21</sup> Thus, the corridor amount is \$182,765 ( $\$1,827,650 \times 0.10$ ). Because the deferred loss at January 1, 2015, is \$205,000, only the excess of \$22,235 ( $\$205,000 - \$182,765$ ) is subject to amortization. The average remaining employee service life on January 1, 2015, is assumed to be five years, so the 2015 amortization is \$4,447 ( $\$22,235/5$ ). This amount represents amortization of a deferred loss and is an addition to the other components in computing pension expense. The loss amortization is recorded in entry (g) in the 2015 pension work sheet as a debit to the net periodic pension expense and a credit to Accumulated Other Comprehensive Income, resulting in a reclassification out of Accumulated Other Comprehensive Income and into pension expense. Note the size of the loss amortization amount (\$4,447) in relation to the size of the deferred loss itself (\$205,000). Clearly, this deferral of gains and losses and subsequent corridor amortization accomplishes the goal of reducing volatility in annual pension expense.

Pension Expense .....	4,447
Accumulated Other Comprehensive Income .....	4,447
<i>To record 2015 amortization of deferred net pension loss in excess of the corridor amount.</i>	

**Summary Journal Entries** The eight detailed journal entries described above and illustrated in the pension work sheet in Exhibit 17-10 can be summarized in two summary journal entries, as follows:

Pension Expense .....	183,113
Other Comprehensive Income .....	27,215
Pension-Related Asset/Liability .....	140,542
Accumulated Other Comprehensive Income .....	15,356
<i>Summary journal entry to recognize pension expense for 2015.</i>	
Pension-Related Asset/Liability .....	80,000
Cash .....	80,000
<i>Summary journal to record pension fund contribution for 2015.</i>	

In the first journal entry, the amount credited to Pension-Related Asset/Liability is calculated strictly by reference to the three primary components of pension expense: service cost, interest cost, and the actual return on the pension fund. In this case, that total is \$140,542 ( $\$115,000 + \$201,042 - \$175,500$ ). In addition, in this year, there are two types of amortization—prior service cost amortization of \$10,909 and deferred loss amortization of \$4,447. Both of these amortization amounts, totaling \$15,356, represent a reclassification from accumulated other comprehensive income to pension expense. Finally, the deferred gain of \$27,215 resulting from the overperformance of the pension fund increases pension expense (and reduces net income) in the current period but is also recognized as an increase in other comprehensive income for the year. From this final aspect of the summary journal entry, it can be seen that ultimately NET income is impacted by the expected return on the pension fund but COMPREHENSIVE income is impacted by the actual return.

**Financial Statement Reporting** The four numbers on the Financial Statement Accounts side of the work sheet are reported in Thornton’s financial statements, as shown on page 17-39.

<sup>21</sup> For simplicity, the fair market value of pension assets is used as the market-related value. Recall that an alternative measure is the weighted average of the fair market value of pension assets from prior years.

- *Net pension expense.* The \$183,113 expense is reported as part of compensation expense in Thornton's income statement. Note that the combination of \$175,500 actual return less the \$27,215 deferred gain means that the net amount subtracted in the computation of pension expense is \$148,285 ( $\$175,500 - \$27,215$ ), which is the expected return on the pension fund for the year.
- *Cash.* The \$80,000 negative cash amount associated with Thornton's defined benefit pension plan is reported as a cash outflow from operating activities in Thornton's statement of cash flows.
- *Pension-related liability.* The \$405,342 pension-related liability is reported in Thornton's balance sheet. This liability represents substantial underfunding of Thornton's pension plan. It is likely that if this were a real company the federal pension regulations would require substantial increases in the pension contribution amount to alleviate this underfunding.
- *Accumulated other comprehensive income.* The \$211,520 debit balance in Accumulated Other Comprehensive Income is reported as a subtraction from equity in Thornton's balance sheet.

**Revolutionary IASB April 2010 Exposure Draft** Perhaps this “corridor amortization” was the last straw in what many view as an arbitrary, ad hoc, and opaque load of accounting compromises. In any event, the IASB decided to do a complete review of pension accounting, and the FASB has agreed to let the IASB take the lead on this. In April 2010, the IASB released a bold exposure draft; the stated IASB goal is to approve a final accounting standard revision in mid 2011. Key elements of this exposure draft are as follows.

- Balance sheet reporting of the net pension liability/asset with adjustments, for example, if the company is constrained in how soon it can recover any pension plan overfunding.
- Use of actual return on the pension fund rather than expected return.
- No accumulated other comprehensive income. The amount of any PBO changes because of, say, changes in actuarial assumptions would be shown as part of other comprehensive income and then would be closed straight to retained earnings rather than to accumulated other comprehensive income.
- Decomposition of the pension expense components. Service cost is shown in the income statement as part of compensation expense. Net interest cost (roughly speaking, the difference between interest cost and return on the pension fund) is shown as part of the net financing cost of the business, along with general company interest expense.

Remember, this is an exposure draft and not a final standard. Also, because international convergence pressure will be on the FASB to adopt any revised IASB standard, the U.S. business community will be active in lobbying the IASB for or against the standard. So, there could be changes, even substantial changes, before the final standard is released in 2011. Stay tuned.

**FYI**

Sir David Tweedie, Chairman of the IASB, is known for his witty, concise, and controversial statements about accounting standards. In a televised interview, he said the following about the usefulness of the numbers generated under the corridor approach: “You may as well take the [cumulative deferred gain or loss], divide it by the cube root of the number of miles to the moon, and multiply it by your shoe size. I mean, it doesn't mean a thing.”

## Disclosure of Pension Plans

5

Prepare required disclosures associated with pensions, and understand the accounting treatment for pension settlements and curtailments.

**WHY** For some companies, the company pension plan can have a substantial impact on the company's future cash flows and its exposure to investment risk. In addition, pension accounting summarizes a huge amount of information into one number on the balance sheet (net pension asset or liability) and one number on the income statement (net pension expense). Detailed disclosure is necessary to understand a company's pension plan.

**HOW** A company with a defined benefit pension plan must disclose how the balances in the projected benefit obligation and the pension fund changed during the year. In addition, the company must disclose details about the computation of pension expense. This disclosure must also be shown for postretirement benefit plans other than pensions. The company must also disclose data about its estimates so that financial statement users can perform some sensitivity analysis. Finally, the company must disclose information about its investment strategy and about the cash flow impact of its postretirement plans.

The disclosure requirements relating to pensions are discussed in FASB ASC Topic 715. The FASB requires information similar to that presented in the work sheet that was used throughout the chapter for calculating pension costs. Specifically, the major disclosure requirements for most publicly traded companies are as follows:

1. A reconciliation between the beginning and ending balances for the projected benefit obligation
2. A reconciliation between the beginning and ending balances in the fair value of the pension fund
3. A disclosure of the accumulated benefit obligation
4. The funded status of the plans and the amounts recognized in the balance sheet
5. The components of pension expense for the period
6. Any effects on other comprehensive income for the period and the details of the existing balances in accumulated other comprehensive income
7. The assumptions used relating to the following items:
  - (a) Discount rate
  - (b) Rate of compensation increase
  - (c) Expected long-term rate of return on the pension fund
8. Disclosure of the percentage of the different types of investments held in the pension fund along with a narrative description of investment strategy
9. For each of the next five years, disclose an estimate of the amount of cash to be paid in benefits (from the pension fund assets) and the amount of cash to be contributed by the company to the pension fund
10. For postretirement benefits (discussed later in this chapter): assumed health care cost trend rates and their effect on service and interest costs and the ABO if the assumed health care cost trend rates were one percentage point higher

As you can see, the work sheet used in this chapter provides much of the information required for disclosure. In addition to the disclosure requirement for defined benefit pension plans, there are also disclosure requirements for defined contribution plans. Specifically, an employer must disclose the amount of pension expense recognized for defined contribution plans separately from the amount of expense recognized for defined benefit

plans. In addition, the nature and effect of any significant changes during the period should be disclosed.

For Thornton Electronics, most of the information needed for the disclosure of the details of the computation of annual pension expense and reconciliation of the funded status of the pension plan can be obtained from the 2015 pension work sheet in Exhibit 17-10. In addition, the accumulated benefit obligation (ABO) of \$1,795,150 is disclosed.

Companies with more than one pension plan may combine the amounts of all pension plans. However, in those cases when the ABO exceeds the FVFP, that information must be disclosed separately in the notes. In addition, companies may combine the disclosure relating to their U.S. and non-U.S. plans unless the obligation associated with the non-U.S. plans is significant or the terms of the non-U.S. plans differ substantially from those of the U.S. plans. *In addition*, companies must separate the disclosures relating to pensions and postretirement benefits other than pensions (these benefits are discussed in the next section). This type of disclosure is illustrated in Exhibit 17-11 using an excerpt from the notes to the 2009 financial statements of General Motors.

Note that General Motors reports information for its U.S. and non-U.S. pension plans separately. Also note that the period covered is only six months (from July 10, 2009 through December 31, 2009). Usually, a note such as this includes two full years of data. However, because of the bankruptcy and reorganization of General Motors in 2009, the note here includes just the post-reorganization details.

### Pension Settlements and Curtailments

If a pension plan is settled or the benefits are curtailed, a question arises as to how the employer should treat a resulting gain or loss. **Settlement of a pension plan** occurs when an employer takes an irrevocable action that relieves the employer of primary responsibility for all or part of the obligation. Examples of a settlement transaction include the employer's purchase of an annuity from an insurance company that would cover employees' vested benefits or a lump-sum cash payment to the employees in exchange for their rights to receive specified pension benefits. A **curtailment of a pension plan** arises from an event that significantly reduces the benefits that will be provided for present employees' future services. Curtailments include (1) the termination of employees' services earlier than expected, for example, as a result of closing a plant or discontinuing a segment of the business and (2) the termination or suspension of a pension plan so that employees do not earn additional benefits for future services.<sup>22</sup>

As discussed throughout this chapter, in Topic 715 the FASB provides for delayed recognition of pension gains and losses arising from the ordinary operations of the pension plan. In addition, the statement provides for delayed recognition of prior service cost. Thus, at any given time, deferred gains, losses, and prior service cost usually exist.

The FASB felt it was clear that if a pension plan is completely terminated and all pension obligations are settled and pension funds are disbursed, previously deferred pension amounts should be recognized. What wasn't clear, however, is what happens when partial settlements or curtailments take place. The rules are discussed below.

**Settlements** Pension plans occasionally become overfunded because a rising stock market causes the value of the pension fund to exceed the pension obligation. To take advantage of this situation, companies sometimes settle their pension plans by purchasing annuity contracts from insurance companies for less than the amount in the pension

<sup>22</sup> FASB ASC paragraph 715-30-15-6.

fund. Subject to regulations such as ERISA, the excess funds can then be used for other corporate purposes.

The accounting issue surrounding settlements centers on whether the gain should be recognized immediately or deferred and recognized in future periods. The FASB decided that if the settlement (1) was an irrevocable action, (2) relieved the employer of primary responsibility for the pension benefit obligation, and (3) eliminated significant risks related to the obligation and the assets used to effect the settlement, the previously deferred net gain or loss should be recognized in the current period. If only part of the

projected benefit obligation (PBO) is settled, a pro rata portion of the gain should be recognized currently.<sup>23</sup>

**Curtailments** As indicated previously, a pension plan curtailment is an event that significantly reduces the expected years of future service of present employees or eliminates for a significant number of employees the accrual of defined benefits for their future services. Examples include termination of employees' services earlier than expected, such as occurs when a segment of the business is discontinued, or termination or suspension of a plan so that it earns no further benefits for future services.

Any prior service cost associated with years of service no longer expected to be rendered as a result of the curtailment is recognized as a loss. In addition, the projected benefit obligation of the pension plan may be changed as a result of the curtailment, giving rise to an additional gain or loss. The FASB provided for offsetting previously deferred pension gains and losses against the gain or loss from changes in the projected benefit obligation and called the difference *curtailment gains or losses*. If the sum of all gains and losses attributed to the curtailment, including the write-off of prior service cost, is a loss, it is recognized in the period when it is probable that the curtailment will occur and the effects are estimable. If the sum of all gains and losses attributed to the curtailment is a gain, it is recognized when the related employees are terminated or when the plan's suspension or amendment is adopted.<sup>24</sup>

## Postretirement Benefits Other than Pensions

6

Explain the differences in accounting for pensions and postretirement benefits other than pensions.

**WHY** For many companies, other postretirement benefits, such as health care benefits for retirees, now represent a bigger economic obligation than the pension obligation.

**HOW** Accounting for other postretirement benefits is quite similar to the accounting for a defined benefit pension plan. One practical difference is that other postretirement benefits are often not a function of salary level. Also, other postretirement benefit plans are often not funded.

FASB ASC Section 715-60-05 includes an overview of the accounting standards for postretirement benefits other than pensions. Although the primary focus is on health care benefits, the rules also apply to other postretirement benefits, such as the cost of life insurance contracts, legal assistance benefits, and tuition assistance. The rules relate only to single-employer-defined benefit postretirement plans. The benefits are defined either in monetary amounts, such as a designated amount of life insurance, or as benefit coverage, such as specified coverage for hospital or doctor care. In general, the costs of these benefits are accounted for by employers in the same way as pension costs, that is, on an accrual basis. However, as noted later, there are some important differences between pensions and other postretirement benefits.

### Nature of Postretirement Health Care Plans

There are a number of unique features of postretirement health care benefits as compared with pension benefits. Because the details of the accounting rules are reflected in these

<sup>23</sup> FASB ASC paragraph 715-30-35-79.

<sup>24</sup> FASB ASC paragraphs 7-15-30-35-92 through 94.

features, they will be considered first before the differences between accounting for pensions and other postretirement benefits are discussed.

**Informal Rather than Formal Plans** Many company postretirement benefit plans are not written into formal contracts. Companies often begin paying for postretirement health care benefits as a continuation of health care coverage for active employees. In some cases, the practice becomes part of union contract bargaining, and informal plans are changed to formal, union-negotiated contractual plans. Even though a plan may be informal, and thus not legally binding, the courts have sometimes interpreted the informal plan as a contract and have required companies to honor the plan. Historically, General Motors has had the largest postretirement benefit plan in the United States, with that nonpension postretirement obligation peaking at \$81.5 billion on December 31, 2005. Interestingly, in the past, General Motors has clearly indicated in its financial statement notes that although it is reporting a liability for these postretirement benefits, it does not recognize these benefits as a legal obligation. In the notes to the 1998 financial statements, the management of General Motors stated the following:

GM has disclosed in the consolidated financial statements certain amounts associated with estimated future postretirement benefits other than pensions and characterized such amounts as “accumulated postretirement benefit obligations,” “liabilities,” or “obligations.” Notwithstanding the recording of such amounts and the use of these terms, GM does not admit or otherwise acknowledge that such amounts or existing postretirement benefit plans of GM (other than pensions) represent legally enforceable liabilities of GM.

This note is especially interesting in light of what occurred between General Motors (GM) and the United Auto Workers (UAW) since 2005. Because of continued large operating losses, GM sought concessions from the UAW to reduce benefits costs. Under an agreement worked out in 2005 and approved in court in 2006, GM retirees were required to begin to pay deductibles, premiums, and copayments for the first time. It was estimated that the changes would save GM about \$1 billion per year and reduce GM’s recognized liability for retiree medical care by \$17.4 billion. Subsequently, in the final negotiations over the General Motors bankruptcy, these retiree health care benefits were sacrificed by GM employees in an effort to help save the restructured company. As seen in Exhibit 17-11, employee concessions had reduced the obligation to \$5.8 billion by the end of 2009. (*Note:* GM’s retiree health care obligation is also discussed at the beginning of Chapter 20.)

**Nonfunded Rather than Funded Plans** Most company plans for postretirement benefits are not funded. Thus, companies rely on current revenues to meet current costs of the plan. Unlike pension contributions, postretirement benefit plan contributions usually are not deductible for income tax purposes. As discussed earlier, ERISA, a federal law, requires companies to fund their pension liability during an employee’s working years. There has been no similar federal legislation to encourage funding of postretirement benefit costs. In some instances, a separate insurance carrier is used to cover the risk. In many cases, especially for larger companies, a form of self-insurance has developed.

**Pay-as-You-Go Accounting Rather than Accrual Accounting** Because postretirement benefit plans usually are not funded, almost all companies previously charged these costs against revenue in the period the benefit costs were incurred rather than in the period when the employee service was rendered. This policy results in uneven charges against revenue and does not recognize a liability for unfunded postretirement benefits. Before the

adoption of pre-codification *SFAS No. 106* in 1990, the total of unfunded postretirement benefits for all companies was estimated to amount to more than \$1 trillion.<sup>25</sup>

**Uncertainty of Future Benefits Rather than Clearly Defined Benefits** Defined benefit pension plans establish terms that make the amount of their future pension obligation measurable with reasonably high reliability. Salary trends, mortality tables, and discount rates are reasonably objective and have been used in accounting for defined benefit pension plans. Health care costs, however, involve many variables that make accrual accounting difficult to implement. Over the years, factors such as longer life expectancy, improved medical treatment facilities, and early retirements have combined to cause health care costs for retired employees to increase dramatically. The amount of these costs absorbed by government Medicare programs has varied over time and will continue to vary as Congress works to bring government finances under control. As the Medicare plans cover fewer of these costs, employers and individuals are required to absorb higher costs.

Other variables that must be considered before an accrual entry can be made for postretirement benefits include age of retirees, geographic location of retirement, geographic differences in health costs, dependent coverage, gender of retiree, costs of new medical technology, emergence of new diseases, retirement dates, and so forth. Estimating future benefit costs based on these variables can be costly and time consuming for companies. However, the alternative is to throw up your hands in despair and record nothing at all. This unacceptable alternative was what existed before 1990.

**Nonpay-Related Rather than Pay-Related Benefits** Most postretirement benefits are granted to employees after a certain number of service years or when an employee reaches a specified preretirement age. The amount of benefits to be received is usually unrelated to the level of compensation. The date when an employee becomes eligible for these benefits is known as the **full eligibility date**. No postretirement benefits are granted unless the employee meets this service or age requirement. After that date is reached, the employee is eligible to receive 100% of the postretirement benefits regardless of any future service or regardless of pay level reached. Thus, the period over which an employee earns postretirement benefits extends from the hire date to the full eligibility date.

In contrast, because most pension plans increase an employee's benefits for each additional year of service rendered and for salary increases, the employee continues to earn pension benefits until retirement. Accordingly, the period over which postretirement benefits are earned differs from that over which pension benefits are earned. There are, of course, many exceptions to this description of pensions and postretirement benefits. Some pension plans are nonpay related, and some health care postretirement benefit plans are pay related.

### Overview of the Accounting for Postretirement Benefits Other than Pensions

Most companies adopted accrual accounting for postretirement benefits beginning with their 1993 financial statements. The same five components for net periodic pension expense listed on page 17-23 are required for net periodic postretirement benefit expense. Service cost and prior service cost are charged (attributed) to the years from the hire date to the full eligibility date rather than from the hire date to the retirement date as is true

<sup>25</sup> Lee Berton, "FASB Plan Would Make Firms Deduct Billions for Potential Retiree Benefits," *The Wall Street Journal*, August 17, 1988, p. 3.

for pension expenses.<sup>26</sup> Any retirement benefit fund assets may be offset against retirement benefit obligations if the assets are clearly restricted for the payment of postretirement benefits.

The disclosure required for postretirement benefit plans includes all requirements for pension plans plus information about health cost trend assumptions and sensitivity analysis of how postretirement expenses and the postretirement obligation would vary if the health care costs trend rate were increased by 1%. The details of accounting for postretirement benefits other than pensions are included in the Web Material associated with this chapter.

### SOLUTIONS TO OPENING SCENARIO QUESTIONS

1. The “national debt,” which represents the total amount borrowed by the U.S. federal government in the form of U.S. Treasury notes, bills, bonds, and so forth, totaled \$7.6 trillion on September 30, 2009. At that same time, the federal government’s pension obligation to its employees totaled \$5.3 trillion. Note that this \$5.3 trillion is NOT the Social Security obligation; instead, this is the amount of pension benefits owed to U.S. federal employees.
2. By the year 2030, it is estimated that 20% of the U.S. population will be over 65 years old. With this high proportion of older people in the population, the Social Security payroll taxes of each working person will be required to cover the Social Security benefits of more retired people. In 1950, each retired person was supported by 16 workers. In 2004, the ratio was 3.3 workers per retiree. In 2025, the ratio will reach two workers per retiree and remain at that level for the foreseeable future. Social Security reform is a political football that neither major political party has mustered the will to attack.
3. General Motors must cover both the pension and the health care costs of its retired workers. In fact, in recent years at General Motors the cost of covering the health care costs of retired workers has exceeded the pension costs. Exhibit 20-1 in Chapter 20 illustrates how the bankruptcy and reorganization of General Motors in 2009 drastically reduced the company’s obligation for retiree health care.

### SOLUTIONS TO STOP & THINK

1. (Page 17-11) The correct answer is A. Notice that the definition of a liability closely parallels the criteria used in accounting for postemployment benefits. The benefits are probable future sacrifices of economic benefit resulting from past transactions. The definitions provided in the Conceptual Framework have been used extensively by the FASB in addressing complex accounting issues.
2. (Page 17-14) The correct answer is D. With a defined benefit plan, the employer bears the majority of the investment risk. With a defined contribution plan, the risk shifts to the employee. Companies would prefer that, where possible, employees bear the investment risk.
3. (Page 17-25) The correct answer is B. Prior service cost is the present value of pension benefits granted to existing employees on the date a plan is initiated. As a result, this amount is included in the computation of the projected benefit obligation (PBO).

<sup>26</sup> If the period of service needed to earn the postretirement benefits does not include previous years, the attribution period will be from a later date, referred to as the *beginning of the credited service period*. FASB ASC paragraph 715-60-35-66.

4. (Page 17-37) The correct answer is B. A company would exceed the corridor amount only when it was off in its estimates by a significant amount over a long period of time. Because the corridor amount is 10% of a very large number (either plan assets or PBO), a company would have to have made a series of bad estimates. Typically, a company will monitor the amount of its unrealized gains and losses and adjust its estimates to compensate.

## SOLUTION TO USING THE FASB'S CODIFICATION

The accounting for sabbatical leaves is discussed in FASB ASC paragraph 710-10-25-4: "The appropriate accounting for a sabbatical leave depends on the purpose of the leave. If a sabbatical leave is granted only to perform research or public service to enhance the reputation of or otherwise benefit the employer, the compensation is not attributable to services already rendered (see paragraph 710-10-25-1(a)); a liability shall not be accrued in advance of the employee's services during such leave. If the leave is granted to provide compensated unrestricted time off for past service and the other conditions for accrual are met, a liability for sabbatical leave shall be accrued."

So, because Professor Pearl will be required to stay on campus and conduct research, at the direction of the university, during the "sabbatical" leave, the anticipated compensation cost for Professor Pearl is NOT judged to be incurred during the six years leading up to the "sabbatical" year, but instead is a cost to be recognized during the "sabbatical" year itself. The university accountant who is using Professor Pearl's future "sabbatical" as a reason to cut his compensation this year is twisting the accounting rules. In fact, it is more accurate to state that the university accountant doesn't understand the accounting rules. He or she needs to get more familiar with the use of the FASB's Codification.

# REVIEW CHAPTER 17

## LEARNING OBJECTIVES

- 1** Account for payroll and payroll taxes, and understand the criteria for recognizing a liability associated with compensated absences.

Accounting for payroll and payroll taxes is a routine event that occurs at the end of every pay period. In addition to accounting for the taxes withheld from employees, care must be taken to ensure that employer payroll taxes are considered. Employers are responsible for FICA as well as state and federal unemployment taxes. As employees work, they often earn the right to receive, in the future, time off for sickness or vacation. These days are referred to as *compensated absences* and must be accounted for as expenses in the period in which the employee earns those rights.

- 2** Compute performance bonuses, and recognize the issues associated with postemployment benefits.

In addition to regular payroll, employees may have the opportunity to receive additional compensation based on the achievement of performance goals. This additional compensation often takes the form of bonuses or stock options. The accounting for stock options requires estimates as to future value and can become quite complex. In some cases, employees will leave a firm, either voluntarily or involuntarily. Benefits promised to these employees following employment but prior to retirement must be accounted for in a fashion similar to the accounting for compensated absences.

- 3** Understand the nature and characteristics of employer pension plans, including the details of defined benefit plans.

Pension plans can be structured as either defined benefit plans or defined contribution plans. With *defined contribution plans*, the employee receives, upon retirement, the funds that have accumulated over time. Accounting for defined contribution plans is straightforward. *Defined benefit plans* are more challenging in that the value of the benefits are often difficult to measure. These benefits are often a function of years of service, future salary levels, and life expectancy. Actuaries are employed to provide estimates as to projected future benefits.

- 4** Use the components of the pension-related asset/liability and changes in the components to compute the periodic expense associated with pensions and to compute the impact on other comprehensive income.

The prepaid/accrued pension account reflects the difference between the present value of the amount expected to be paid in the future (PBO) and the fair value of the pension fund (FVFPF) set aside to meet that obligation. Additional pension-related factors are reported as part of accumulated other comprehensive income. These additional factors include prior service costs and deferred gains/losses related to differences between expected and actual returns on the pension fund.

Each year, an assessment is made as to the additional benefits owed as a result of another year of service, the effects of being a year closer to paying out benefits, and the return received as a result of setting aside funds to meet these future obligations. The additional factors mentioned in the previous paragraph also affect the amount reported on the income statement in that they each may require adjustment over time.

- 5** Prepare required disclosures associated with pensions, and understand the accounting treatment for pension settlements and curtailments.

Detailed disclosure relating to pensions is required. The assumptions made by actuaries relating to expected return on assets, discount rates, and projected increases in salaries are required to be disclosed. In addition, firms are required to disclose the components of the pension-related asset or liability from the balance sheet as well as the periodic pension expense amount disclosed on the income statement. Most of the required disclosures can be provided through presentation of a work sheet such as those illustrated in the chapter.

In the event that the benefits associated with a pension plan are curtailed, any prior service cost associated with the curtailment is recognized as a loss and offset against adjustments required to the PBO. Pension settlements often give rise to gains or losses. The FASB determined that those gains and losses resulting from irrevocable actions by the company that relieve the company of future obligations are to be recognized immediately.

- 6** Explain the differences in accounting for pensions and postretirement benefits other than pensions.

Although many of the concepts used in accounting for pensions are similar to those used in accounting for postretirement benefits other than pensions, there are some important differences. A common difference, unrelated to the accounting for these benefits, relates to other postretirement benefits being largely unfunded by companies. Other differences relate to other postretirement benefits often not being a function of salary levels and to the difficulty of measuring these other benefits.

## FASB-IASB CODIFICATION SUMMARY

Topic	FASB Accounting Standards Codification	Original FASB Standard	Corresponding IASB Standard	Differences between U.S. GAAP and IFRS
Compensated absences	Section 710-10-25 par. 1-8	SFAS No. 43 par. 6-16	IAS 19 par. 11-16	No substantial differences
Postemployment benefits	Section 712-10-05 par. 2-6 Section 712-10-15 par. 3-5 Section 712-10-25 par. 1-5	SFAS No. 112 par. 1-6 SFAS No. 88 par. 15	IAS 19 par. 132-140	No substantial differences
Discount rate for projected benefit obligation	Section 715-30-35 par. 43	SFAS No. 87 par. 44	IAS 19 par.78	IFRS allows use of the interest rate on government bonds in countries lacking a developed corporate bond market.
Prior service cost	Section 715-30-35 par. 10-11	SFAS No. 87 par. 24-25	IAS 19 par.96	Under IFRS, the “past” service cost amount is recognized as an expense immediately IF the benefits are immediately vested.
Balance sheet numbers: one net number for the difference between PBO and the pension fund, with AOCI shown separately	Section 715-30-25 par. 1, 4	SFAS No. 87 par. 35, 38	IAS 19 par.54	Under current IFRS, the reported balance sheet number is the sum of the PBO, the pension fund, and AOCI associated with the pension plan.
Settlements and curtailments	Various sections in Subtopics 715-30 and 715-60; illustrations in Section 715-30-55	SFAS No. 88	IAS 19 par.109-115	No substantial differences
Disclosure	Sections 715-29-50 715-30-50 715-60-50	SFAS No. 132(R)	IAS 19 par.120-125	No substantial differences
Postretirement benefits other than pensions	Subtopic 715-60	SFAS No. 106	In general, no distinction between pensions and other postretirement benefits. Guidance on medical benefits found in IAS 19 par.88-91	Differences similar to the differences in accounting for pensions.

## KEY TERMS

Accumulated benefit obligation (ABO) 17-17	Deferred pension gain or loss 17-31	Market-related value of the pension fund 17-33	Postretirement benefits other than pensions 17-12
Actual return on the pension fund 17-27	Defined benefit pension plans 17-13	Net periodic pension expense 17-16	Prior service cost 17-25
Actuarial present value 17-15	Defined contribution pension plans 17-12	Noncontributory pension plans 17-12	Projected benefit obligation (PBO) 17-17
Compensated absences 17-7	Expected return on the pension fund 17-33	Obligation discount rate 17-19	Service cost 17-20
Contributory pension plan 17-12	Expected service period 17-28	Pension fund 17-13	Settlement of a pension plan 17-41
Corridor amount 17-37	Fair value of the pension fund 17-21	Pension plan 17-11	Single-employer pension plans 17-12
Curtailment of a pension plan 17-41	Full eligibility date 17-45	Pension-related asset/liability 17-22	Vested benefits 17-15

## QUESTIONS

- Gross payroll is taxed by both federal and state governments. Identify these taxes and indicate who bears the cost of the tax, the employer or the employee.
- How should compensated absences be accounted for?
- The sales manager for Off-Road Enterprises is entitled to a bonus equal to 12% of profits. What difficulties may arise in the interpretation of this profit-sharing agreement?
- Distinguish between (a) a defined benefit pension plan and a defined contribution pension plan, (b) a contributory pension plan and a noncontributory pension plan, and (c) a multi-employer pension plan and a single-employer pension plan.
- What is meant by the word *vesting*?
- What factors must actuaries consider in determining the amount of future benefits under a defined benefit pension plan?
- What four accounting issues were addressed by the FASB in relation to defined benefit pension plans?
- Distinguish between the accumulated benefit approach and the projected benefit approach in determining the amount of future benefits earned by employees under a defined benefit pension plan.
- List and briefly describe the five basic components of net periodic pension expense.
- Explain how prior service costs arise (a) at the inception of a pension plan and (b) at the time of a plan's amendment.
- How is the service cost portion of net periodic pension expense to be measured?
- Does pension expense include the actual return on plan assets or the expected return? Explain.
- Is prior service cost recognized as an expense in the period in which it initially arises?
- The FASB permits the use of an average market value of plan assets for some pension computations. In other cases, the fair market value at a specific measurement date must be used. Under what circumstances is the average market value permissible?
- Which pension-related items impact the reported amount of accumulated other comprehensive income?
- Why is a corridor amount identified in recognizing gain or loss from pension plans?
- What is the function of the pension disclosure requirement included in the pension standards?
- Distinguish between a pension settlement and a pension curtailment.
- What is meant by *postretirement benefits*, and what is the primary issue in accounting for their costs?
- Describe the differences between pension plans and other postretirement benefit plans.
- What is the *full eligibility date*, and why is it an important date in accounting for postretirement benefits?
- Describe the major differences between the accounting for pensions and other postretirement benefits.

## PRACTICE EXERCISES

### Practice 17-1

#### Wages and Wages Payable

L01

The company pays its employees each Monday for the work performed during the preceding 5-day work week. Total payroll for one week is \$25,000. December 31 fell on a Wednesday. (1) Make the journal entry necessary to record wages payable as of December 31. (2) Make the journal entry necessary on the following January 5 to record payment of wages for the preceding week. Assume that this is a very strict company and that there were no holidays during the week.

### Practice 17-2

#### Accounting for Payroll Taxes

L01

Total wages and salaries for the month of January were \$50,000. Because it is January, no employee has yet reached the FICA tax cap amount, so the full FICA tax percentage is applicable to the entire amount of wages and salaries. The same is true of the federal unemployment tax amount. The state requires a 5.4% employer tax on all wages and salaries. Income taxes withheld from employees' pay during the month totaled \$7,000. Make the summary journal entries to record payment of wages and salaries and recognition of total salary and wage expense (including payroll tax expense) for the month.

### Practice 17-3

#### Compensated Absences

L01

During Year 1 (the first year of the company's existence), employees of the company earned vacation days as follows:

Employee	Average Wage per Day	Vacation Days Earned This Year	Vacation Days Taken This Year
1	\$160	10	10
2	200	15	10
3	250	20	5

(1) Make the journal entry necessary at the end of Year 1 to record the unused vacation days earned during the year and (2) make the journal entry necessary in Year 2 to record the use of all of these vacation days. Assume that all employees received a 10% pay raise in Year 2.

### Practice 17-4

#### Earnings-Based Bonus

L02

The manager is entitled to a bonus equal to 5% of her store's earnings. The difficult part is that calculation of the store's earnings includes a subtraction for the amount of the bonus. The store's earnings before the bonus total \$200,000. Calculate the store manager's bonus.

### Practice 17-5

#### Postemployment Benefits

L02

The company has decided to restructure operations at one of its stores. As part of this restructuring, the company has determined that the store facility is impaired. The store originally cost \$3,000,000 and has accumulated depreciation of \$1,300,000. The fair value of the store is determined to be \$800,000. In addition, 32 employees at the store are being terminated. As part of the severance package, each employee is entitled to job training benefits (costing \$500 per employee), supplemental health care and life insurance benefits for six months (costing \$3,300 per employee), and two months' salary (averaging \$5,000 per employee). Make the journal entry or entries necessary to record this restructuring.

### Practice 17-6

#### Computing the Accumulated Benefit Obligation (ABO)

L03

Wu Company has established a defined benefit pension plan for its lone employee, Ronald Dalton. Annual payments under the pension plan are equal to Ronald's highest

lifetime salary multiplied by  $(2\% \times \text{number of years with the company})$ . As of the beginning of 2013, Ronald had worked for Wu Company for 10 years. His salary in 2012 was \$50,000. Ronald is expected to retire in 25 years, and his salary increases are expected to average 3% per year during that period. Ronald is expected to live for 15 years after retiring and will receive the first annual pension payment one year after he retires. Compute Wu Company's accumulated benefit obligation (ABO) as of January 1, 2013, assuming (1) an 8% discount rate and (2) a 12% discount rate.

**Practice 17-7****L03****Computing the Projected Benefit Obligation (PBO)**

Refer to Practice 17-6. Compute Wu Company's projected benefit obligation (PBO) as of January 1, 2013, assuming (1) an 8% discount rate and (2) a 12% discount rate.

**Practice 17-8****L03****Simple Computation of the Net Pension Asset or Liability**

On January 1 of Year 1, the company had a projected benefit obligation (PBO) of \$10,000 and a pension fund with a fair value of \$9,200. There was no prior service cost, nor were there deferred pension gains or losses. The following information relates to the pension plan during the year:

Service cost	\$1,200
Actual return on the pension fund	\$250
Benefits paid to retirees	\$100
Contribution to the pension fund	\$1,050
Discount rate for PBO	9%
Expected return on pension fund	10%

Compute (1) the pension-related amount that should be reported on the company's balance sheet on January 1 of Year 1, (2) the PBO as of December 31, and (3) the fair value of the pension fund as of December 31.

**Practice 17-9****L03****Simple Computation of Pension Expense**

Refer to Practice 17-8. Compute pension expense for the year.

**Practice 17-10****L03****Basic Pension Journal Entries**

Refer to Practice 17-8. Make two *summary* journal entries necessary with respect to the pension plan for the year.

**Practice 17-11****L03****Simple Pension Work Sheet**

Refer to Practice 17-8. Enter all of the pension information, including the beginning balances, in a pension work sheet. Use the pension work sheet to display the computation of pension expense for the year as well as the ending balances for all pension-related items.

**Practice 17-12****L04****Amortization of Prior Service Cost**

On January 1, the company adopted a new defined benefit pension plan. Existing employees were given credit in the new plan for their past service to the company. This created an immediate projected benefit obligation of \$1,000,000. The company has 30 employees; three of these employees are expected to leave the company each year for the next 10 years. Using the amortization method that is similar to sum-of-the-years'-digits depreciation, compute the amount of prior service cost that should be amortized for the year.

**Practice 17-13****L04****Difference Between Actual and Expected Return on Pension Fund**

As of January 1, the company had the following pension-related balances:

Projected benefit obligation (PBO)	\$(15,000)
Fair value of pension fund	\$17,000
Deferred net pension (gain)/loss	\$(1,100)
Discount rate for the PBO	8%

During the year, service cost was \$1,500. The actual return on the pension fund was \$700. Compute pension expense for the year and the ending balance in deferred net pension (gain)/loss assuming that (1) the expected return on the pension fund is 10% and (2) the expected return on the pension fund is 12%.

**Practice 17-14****L04****Impact of Changes in Actuarial Estimates**

Refer to Practice 17-6 and Practice 17-7. Assume that as of January 1, 2013, Wu Company changed the discount rate it uses to compute the PBO from 8% to 12%. Assume that before this change, Wu Company had the following pension-related balances:

Projected benefit obligation (PBO) .....	\$(26,169)
Fair value of pension fund .....	23,000
Deferred net pension (gain)/loss .....	1,100
Prior service cost .....	2,000

Compute (1) the pension-related asset/liability balance and accumulated other comprehensive income balance that would be reported in the balance sheet *before* the change to 12%, (2) the PBO balance after the change to 12%, (3) interest cost for 2013, and (4) the pension-related asset/liability balance and accumulated other comprehensive income balance that would be reported in the balance sheet immediately *after* the change to 12% (before the impact of any other 2013 transactions).

**Practice 17-15****L04****Pension Work Sheet**

On January 1 of Year 1, the company had a projected benefit obligation (PBO) of \$10,000 and a pension fund with a fair value of \$9,200. Prior service cost was \$2,000; it was being amortized on a straight-line basis over the 5-year average remaining life of the affected employees. The balance in the deferred pension gain was \$700. The following information relates to the pension plan during the year:

Service cost .....	\$1,200
Actual return on the pension fund .....	\$1,550
Benefits paid to retirees .....	\$300
Contribution to the pension fund .....	\$1,050
Discount rate for PBO .....	8%
Expected return on pension fund .....	11%

Enter all of the pension information, including the beginning balances, in a pension work sheet. Use the work sheet to display the computation of pension expense for the year as well as the ending balances for all pension-related items.

**Practice 17-16****L04****The Corridor Amount**

The company had the following pension-related balances as of January 1:

Projected benefit obligation (PBO) .....	\$(20,000)
Fair value of pension fund .....	23,000
Deferred net pension loss .....	3,100
Prior service cost .....	1,000

The average remaining service life of employees working on January 1 is six years. Compute the amount of the deferred net pension loss that should be amortized during the year.

**Practice 17-17****L04****Reconciliation of Beginning and Ending PBO Balances**

On January 1 of Year 1, the company had a projected benefit obligation (PBO) of \$10,000 and a pension fund with a fair value of \$9,200. Prior service cost was \$2,000; it was being amortized on a straight-line basis over the 5-year average remaining life of the

affected employees. The balance in the deferred pension gain was \$700. The following information relates to the pension plan during the year:

Service cost . . . . .	\$1,200
Actual return on the pension fund . . . . .	\$1,550
Benefits paid to retirees . . . . .	\$300
Contribution to the pension fund . . . . .	\$1,050
Discount rate for PBO . . . . .	8%
Expected return on pension fund . . . . .	11%

Prepare the note disclosure necessary to reconcile the beginning balance in the PBO and the ending balance in the PBO.

**Practice 17-18**

**L04**

**Reconciliation of Beginning and Ending Pension Fund Balances**

Refer to Practice 17-17. Prepare the note disclosure necessary to reconcile the beginning balance in the pension fund and the ending balance in the pension fund.

**EXERCISES**

**Exercise 17-19**

**L01**

**Recording Payroll and Payroll Taxes**

Express Company paid one week’s wages of \$21,200 in cash (net pay after all withholdings and deductions) to its employees. Income tax withholdings were equal to 17% of the gross payroll, and the only other deductions were 7.65% for FICA tax and \$160 for union dues. Give the entries that should be made on the company’s books to record the payroll and the tax accruals to be recognized by the employer, assuming that the company is subject to unemployment taxes of 5.4% (state) and 0.8% (federal). Assume that all wages for the week are subject to FICA and unemployment taxes.

**Exercise 17-20**

**L01**

**Monthly Payroll Entries**

Aggie Co. sells agricultural products. Aggie pays its salespeople a salary plus a commission. The salary is the same for each salesperson, \$1,000 per month. The commission varies by length of employment and is a percentage of the company’s total gross sales. Each salesperson starts with a commission of 1.0%, which is increased an additional 0.5% for each full year of employment with Aggie, to a maximum of 5.0%. The total gross sales for the month of January were \$120,000.

Aggie has six salespeople as follows:

	Number of Years Employment
Frank . . . . .	10
Sally . . . . .	9
Tina . . . . .	8
Barry . . . . .	6
Mark . . . . .	3
Lisa . . . . .	0.75

Assume that the FICA rate is 7.65%, the FUTA rate is 6.2%, and the state unemployment rate is 5.4%. (Assume that the federal government allows the maximum credit for state unemployment tax paid.) The federal income tax withholding rate is 30%. Compute the January salaries and commissions expense, and make any necessary entries to record the payroll transactions including cash payment of all the taxes payable.

**Exercise 17-21****L01****Compensated Absence—Vacation Pay**

General Aviation Company employs six people. Each employee is entitled to three weeks' paid vacation every year the employee works for the company. The conditions of the paid vacation are (a) for each full year of work, an employee will receive three weeks of paid vacation (no vacation accrues for a portion of a year), (b) each employee will receive the same pay for vacation time as the regular pay in the year taken, and (c) unused vacation pay can be carried forward. Based on the following data, compute the liability for vacation pay as of December 31, 2013.

Employee	Starting Date	Cumulative Vacation Taken as of December 31, 2013	Weekly Salary
Marci Clark . . . . .	December 21, 2006	14 weeks	\$850
Bradford Sayer . . . . .	July 17, 2010	5 weeks	725
Sorena Williams . . . . .	April 8, 2012	None	650
Jonathan Beecher . . . . .	December 17, 2005	18 weeks	800
Brian Giles . . . . .	July 17, 2011	1 week	450
Dale Murphy . . . . .	May 31, 2013	None	500

**Exercise 17-22****L02****Calculation of Bonus**

Illinois Wholesale Company has an agreement with its sales manager entitling that individual to 7% of company earnings as a bonus. Company income for the calendar year before bonus and income tax is \$350,000. Income tax is 30% of income after bonus.

1. Compute the amount of bonus if the bonus is calculated on income before deductions for bonus and income tax.
2. Compute the amount of bonus if the bonus is calculated on income after deduction for bonus but before deduction for income tax.

**Exercise 17-23****L03****Computing Defined Benefit Pension Payments**

Francisco Company has established a defined benefit pension plan for its lone employee, Derrald Ryan. Annual payments under the pension plan are equal to 3% of Derrald's highest lifetime salary multiplied by the number of years with the company. Derrald's salary in 2012 was \$75,000. Derrald is expected to retire in 20 years, and his salary increases are expected to average 4% per year during that period. As of the beginning of 2013, Derrald had worked for Francisco Company for 12 years.

1. What is the amount of the annual pension payment that should be used in computing Francisco's accumulated benefit obligation (ABO) as of January 1, 2013?
2. What is the amount of the annual pension payment that should be used in computing Francisco's projected benefit obligation (PBO) as of January 1, 2013?

**Exercise 17-24****L03****Computation of Pension Service Cost**

Pension plan information for Naperville Window Company is as follows:

January 1, 2013	PBO . . . . .	\$4,780,000
	ABO . . . . .	\$3,950,000
During 2013	Pension benefits paid to retired employees . . . . .	\$315,000
December 31, 2013	PBO . . . . .	\$5,425,000
	ABO . . . . .	\$4,245,000
Obligation discount rate	. . . . .	10%

Assuming no change in actuarial assumptions, what is the pension service cost for 2013?

**Exercise 17-25****L04****Computing the Amount of Pension-Related Asset/Liability**

Using the information given for the following three independent cases, compute the amount of pension-related asset/liability that would be reported on the balance sheet. Clearly indicate whether the amount would be shown as an asset or as a liability. Also compute the amount of pension-related accumulated other comprehensive income that would be reported on the balance sheet.

	Case 1	Case 2	Case 3
Prior service cost .....	\$ 310	\$ 190	\$ 50
PBO .....	1,000	900	1,000
Deferred net pension gain .....	70	120	200
ABO .....	750	800	850
FVPF.....	700	1,300	900

**Exercise 17-26****L04****Amortization of Prior Service Cost—Plan Amendment**

Queensland Company has five employees belonging to its pension plan. One employee is expected to retire each year over the next five years.

On January 1, 2013, Queensland initiated an amendment to its pension plan that increased the PBO for the plan by \$620,000. If Queensland amortizes the prior service cost of the pension plan using the sum-of-the-years'-digits method, determine the amortization for the each of the next five years.

**Exercise 17-27****L04****Amount of Funding and Amortization of Prior Service Cost**

Da Vinci Inc. has a workforce of 400 employees. A new pension plan is negotiated on January 1, 2013, with the labor union. Based on the provisions of the pension agreement, prior service cost related to the new plan amounts to \$4,823,000. The cost is to be funded evenly with annual contributions over a 10-year period, with the first payment due at the end of 2013. The cost is to be amortized over the average remaining service life of the covered employees. The interest rate for funding purposes is 12%. It is anticipated that, on the average, 10 employees will retire each year over the next 40 years.

1. Compute the annual amount Da Vinci will pay to fund its prior service cost.
2. Compute the amount of amortization of prior service cost for 2013, 2015, and 2020.

**Exercise 17-28****L04****Amortization of Prior Service Cost—Straight-Line Method**

Oswaldo Awning Co. has prior service cost of \$1,262,000 arising from a pension plan amendment. The board of directors decided to amortize this cost over the average remaining service period for its 45 employees on a straight-line basis. It is assumed that employees will retire at the rate of three employees each year over a 15-year period.

1. Compute the average remaining service life and the annual amortization of prior service cost for Oswaldo.
2. Assume that pension expense other than amortization of prior service cost was \$460,000 for the year and also assume that all of this amount is associated with service cost, interest cost, and actual return on plan assets (meaning that actual return equaled expected return this year). Also assume that \$520,000 was contributed by the employer to the pension fund. Prepare the summary journal entries to record pension expense and the pension contribution for the current year.

**Exercise 17-29****L04****Computation of Actual Return on the Pension Fund**

Longlee Electrical Company maintains a fund to cover its pension plan. The following data relate to the fund for 2013:

January 1	FVPF .....	\$875,000
	Market-related value of the pension fund (5-year weighted average) .....	715,000
During year	Pension benefits paid .....	62,000
	Contributions made to the fund .....	70,000
December 31	FVPF .....	980,000
	Market-related value of the pension fund (5-year weighted average) .....	730,000

Compute the 2013 actual return on the pension fund for Longlee Electrical.

**Exercise 17-30****L04****Return on the Pension Fund—Expected and Actual**

Rasband Photography has a pension plan covering its 100 employees. Rasband anticipates an 11% return on its pension fund. The fund trustee furnishes Rasband with the following information relating to the pension fund for 2013:

January 1	FVPF .....	\$1,500,000
	Market-related value of the pension fund (5-year weighted average) .....	1,350,000
During year	Actual return on the pension fund .....	110,000
December 31	FVPF .....	1,620,000
	Market-related value of the pension fund (5-year weighted average) .....	1,480,000

Compute the difference between the actual and expected return on the pension fund. How should the difference be treated in determining pension expense for 2013? Rasband bases expected return on the market-related value of the pension fund.

**Exercise 17-31****L04****Amortization of Deferred Gain on the Pension Fund**

Melba Enterprises has a deferred gain of \$425,000 relating to its pension plan as of January 1, 2013. Management has chosen to amortize this deferral on a straight-line basis over the 10-year average remaining service life of its employees, subject to the limitation of the corridor amount. Additional facts about the pension plan as of January 1, 2013, are as follows:

PBO .....	\$2,050,000
ABO .....	1,900,000
Fair value of the pension fund .....	1,500,000
Market-related value of the pension fund (5-year weighted average) .....	1,350,000

Compute the minimum amortization of deferred gain to be recognized by Melba in 2013.

**Exercise 17-32****L04****Computations Associated with Deferred Gains and Losses**

The computation of pension expense includes (1) a deferral of the difference between actual and expected return on the pension fund and (2) amortization of deferred pension gains and losses. Determine the proper addition (deduction) to pension expense related to deferred gains and losses and their amortization under each of the following independent conditions.

	A	B	C	D
(1) Actual return on the pension fund .....	\$200,000	\$200,000	\$500,000	\$500,000
(2) Expected return on the pension fund .....	\$180,000	\$230,000	\$400,000	\$550,000
(3) Deferred (gain) loss at beginning of year .....	\$200,000	\$275,000	\$(100,000)	\$(175,000)
(4) Average service life of employees used for amortization .....	10 years	5 years	8 years	12 years
(5) Corridor amount .....	\$100,000	\$150,000	\$50,000	\$175,000

**Exercise 17-33**

**L04**

**Computation of Pension Expense and Summary Journal Entries**

The accountants for Eden Financial Services provide you with the following detailed information at December 31, 2013. Based on these data, prepare the summary journal entries related to the recognition of pension expense and the pension contribution for 2013.

Service cost . . . . .	\$ 52,000
Actual return on pension plan assets . . . . .	81,000
Interest cost . . . . .	59,000
Excess of expected return over actual return on pension plan assets . . . . .	15,000
Amortization of deferred pension loss from prior years . . . . .	24,000
Amortization of prior service cost . . . . .	36,000
Contribution to pension fund . . . . .	100,000

**Exercise 17-34**

**L04**

**Pension Expense Computation**

Fredco's defined benefit pension plan had a PBO of \$10,000,000 at the beginning of the year. This was based on a 10% discount rate (obligation discount rate). The fair value of pension plan assets at the beginning of the year was \$10,400,000. These assets were expected to earn a long-term rate of return on the fair value of 8%. During the year, service cost was \$750,000. At the beginning of the year, prior service cost was \$25,000; this entire remaining amount will be amortized this period. There was no deferred net pension gain (loss) at the beginning of the year. The actual return on pension plan assets for the year was \$900,000. The ABO was \$9,500,000 at the beginning of the year. Compute Fredco's net periodic pension expense for the year.

**Exercise 17-35**

**L04**

**Preparing a Pension Work Sheet**

The following information relates to the defined benefit pension plan of Mascare Company.

January 1, 2013:	
PBO . . . . .	\$9,000
FVPF . . . . .	\$11,000
Expected return on plan assets . . . . .	8%
Obligation discount rate . . . . .	10%
For the year ended December 31, 2013:	
Service cost . . . . .	\$1,200
Benefit payments to retirees . . . . .	500
Contributions to pension fund . . . . .	100
Actual return on plan assets . . . . .	1,500

Prepare a pension work sheet for Mascare Company for 2013.

**Exercise 17-36**

**L05**

**Pension-Related Balance Sheet Items**

From the following information for each of three independent cases, prepare the pension note disclosure that outlines the items that go into the computation of the pension-related asset or liability reported in the balance sheet as well as the pension-related accumulated other comprehensive income reported in the balance sheet.

	(in thousands)		
	Case 1	Case 2	Case 3
Projected benefit obligation . . . . .	\$12,500	\$6,290	\$890
Accumulated benefit obligation . . . . .	9,700	4,100	750
Fair value of the pension fund . . . . .	15,300	4,200	650
Market-related value of the pension fund . . . . .	12,800	5,000	560
Deferred net (gain) or loss from prior years . . . . .	(200)	(850)	100
Prior service cost . . . . .	800	2,300	125

**PROBLEMS**

**Problem 17-37**

**L01**

**Accrued Payroll and Payroll Taxes**

Joey Department Store’s employees are paid on the 6th and 22nd of each month for the period ending the last day of the previous month and the 15th of the current month, respectively. An analysis of the payroll on Monday, October 6, 2013, revealed the following data.

	Gross Pay	FICA	Federal Income Tax	State Income Tax	Net Insurance	Pay
Office staff salaries . . . . .	\$15,450	\$ 810	\$ 2,400	\$ 450	\$ 410	\$11,380
Officer salaries . . . . .	31,000	286	6,300	1,000	500	22,914
Sales salaries . . . . .	20,000	834	4,200	690	480	13,796
Totals . . . . .	<u>\$66,450</u>	<u>\$1,930</u>	<u>\$12,900</u>	<u>\$2,140</u>	<u>\$1,390</u>	<u>\$48,090</u>

It is determined that for the September 30 pay period, no additional employees exceeded the wage base for FICA purposes than had done so in prior pay periods. All of the officer salaries, 75% of the office staff salaries, and 40% of the sales salaries for the payroll period ending September 30 were paid to employees who had exceeded the wage base for unemployment taxes. Assume the unemployment tax rates in force are as follows: federal unemployment tax, 0.8%, and state unemployment tax, 5.4%.

**Instructions:** Prepare the adjusting entries that would be required at September 30, the end of Joey’s fiscal year, to reflect the accrual of the payroll and any related payroll taxes. Separate salaries and payroll tax expense accounts are used for each of the three employee categories: office staff, officer, and sales.

**Problem 17-38**

**L01**

**Accounting for Payroll**

Bags, Inc., a manufacturer of suitcases, has 10 employees; five are paid on a salary basis, and five are hourly employees. The employees and their compensation are as follows:

	Annual Salary
Ken Scott (president) . . . . .	\$91,500
Tatia Furgins . . . . .	57,000
Jennifer Poulins . . . . .	48,750
Robyn Meek . . . . .	23,800
Kyle Roberts . . . . .	13,900
	Rate per Hour
Richard Dean (50 hours per week) . . . . .	\$14.00
Denise Ray (40 hours per week) . . . . .	11.50
Dale Frank (40 hours per week) . . . . .	9.75
Bryan Leslie (30 hours per week) . . . . .	4.50
Albert Lamb (20 hours per week) . . . . .	3.65

The salaried employees are covered by a comprehensive medical and dental plan. The cost of the plan is \$45 per employee and is deducted from each paycheck. The hourly employees are covered only by a medical plan. The cost is calculated at 3.5% of gross pay and is deducted from each check. The FICA rate is 7.65%, and FUTA is 6.2%, with the maximum credit for state unemployment allowed. The state unemployment tax is 5.4%. No employee has reached the FICA, FUTA, or SUTA salary limits. In addition, each of the

hourly employees, except Albert, belongs to the Suitcase Workers of America Union. Union dues are \$5.65 per month and are deducted and paid on behalf of the hourly employees. The income tax withholding rate is 28% for employees with annual incomes above \$29,500 and 15% for employees with annual incomes of \$29,500 or less.

Hourly employees are paid weekly on Friday, January 6, 13, 20, and 27. Salaried employees are paid twice a month, on January 13 and 27. Assume that payroll taxes and all employee withholdings and deductions are paid on the 15th and the last day of each month, for the current month.

**Instructions:** Make all entries related to Bags, Inc.'s, payroll for January 6, January 13, and January 15.

**Problem 17-39**

**Compensated Absences**

**L01**

Ludwig Electronics Inc. has a plan to compensate its employees for certain absences. Each employee can receive five days' sick leave each year plus 10 days' vacation. The benefits carry over for two additional years, after which the provision lapses on a FIFO flow basis. Thus, the maximum accumulation is 45 days. In some cases, the company permits vacations to be taken before they are earned. Payments are made based on current compensation levels, not on the level in effect when the absence time was earned.

Employee	Days Accrued Jan. 1, 2013	Daily Rate Jan. 1, 2013	Days Earned 2013	Days Taken 2013	Days Accrued Dec. 31, 2013	Daily Rate Dec. 31, 2013
A .....	20	\$68	15	13	22	\$70
B .....	15	74	15	15	15	76
C .....	25	62	7	32	0	Terminated, June 15— Rate = \$64
D .....	-5	56	15	20	-10	58
E .....	40	78	15	5	50	82
F .....	Hired July 1	60	8	2	6	60

**Instructions:**

1. How much is the liability for compensated absences at December 31, 2013?
2. Prepare a summary journal entry to record compensation absence payments during the year and the accrual at the end of the year. Assume that the payroll liability account is charged for all payments made during the year for both sick and vacation leaves. The average rate of compensation for the year may be used to value the hours taken except for Employee C, who took leaves at the date of termination. The end-of-year rate should be used to establish the ending liability.

**Problem 17-40**

**Summary Entries to Record Pension Expense and Funding of Pension Costs**

**L03**

United Rental Company reported the following information related to its pension plan for the years 2013–2016. The fund is administered by a separate outside trustee.

Year	Pension Expense	Contribution	Benefit Payments to Retirees	Actual Return on the Pension Fund
2013 .....	\$720,400	\$675,000	\$350,000	\$320,000
2014 .....	810,100	700,000	350,000	350,000
2015 .....	695,700	725,000	300,000	410,000
2016 .....	790,000	680,000	375,000	505,000

**Instructions:**

1. Prepare the required summary journal entries for each year to record pension expense and the pension contribution. Throughout this example, assume that the actual return on the pension fund is equal to the expected return in each year, that there is no existing balance in deferred gain or loss related to the pension, and that there is no prior service cost.
2. Assuming that United had pension-related liability of \$41,000 at January 1, 2013, compute the pension-related asset/liability balance at December 31, 2016.
3. Assuming that the fair value of the pension fund at January 1, 2013, was \$3,200,000, compute the fair value of the pension fund at December 31, 2016.

**Problem 17-41****L04****Computation of Prior Service Cost Funding and Amortization**

Staybrite Electronics Co. amended its pension plan effective January 1, 2013. The increase in the PBO occurring as a result of the plan amendment is \$6,290,000. Staybrite arranged to fund the prior service cost by equal annual contributions over the next 15 years at 10% interest. The first payment will be made December 31, 2013. The company decides to amortize the prior service cost on a straight-line basis over the average remaining service life of its employees. The company has 225 employees at January 1, 2013, who are entitled to the benefits of the amendment. It is estimated that, on the average, 15 employees will retire each year.

**Instructions:**

1. Compute the amount Staybrite will pay each year to fund the prior service cost arising from the plan's amendment.
2. Compute Staybrite's annual prior service cost amortization based on average remaining years of employee service.

**Problem 17-42****L04****Deferred Gains and Losses**

McGrath Financial Corp. has a defined benefit pension plan. As of January 1, 2013, the following balances were computed for the pension plan:

Deferred pension gain . . . . .	\$ 420,000
Fair value of the pension fund . . . . .	3,300,000
Market-related value of the pension fund (5-year weighted average) . . . . .	2,850,000
PBO . . . . .	3,900,000
ABO . . . . .	3,500,000

It was anticipated that the pension plan would earn 12% of the market-related value of the pension fund in 2013. The actual return on the pension fund was \$315,000. The company has elected to amortize the deferred pension gains and losses over 10 years.

**Instructions:**

1. Compute the amount of deferred gain or loss for 2013.
2. Compute the amount of amortization of deferred pension gain or loss for 2013.
3. Computed pension expense is \$534,000. However, this computation ignores any deferred gains or losses for the year (meaning that actual, rather than expected, return on the pension fund was included in the computations) as well as any amortization of deferred gains or losses from prior years. What is pension expense after considering the impact of deferred gains and losses and their amortization?
4. What is the deferred pension gain or loss that McGrath will carry forward to 2014?

**Problem 17-43****L04****Computation, Recording, and Funding of Pension Expense**

Averon Industrial, Inc., computed the following components of pension expense for the years 2013–2015:

Components of Pension Expense	(in thousands)		
	2013	2014	2015
Service cost . . . . .	\$330	\$415	\$580
Interest cost . . . . .	150	170	220
Actual return on the pension fund . . . . .	35	50	40
Expected return on the pension fund . . . . .	30	45	50
Amortization of deferred pension (gain) or loss— above corridor amount . . . . .	(20)	(10)	18
Amortization of prior service cost . . . . .	70	90	90
Amount contributed to fund . . . . .	520	580	750

**Instructions:**

1. Compute the net periodic pension expense for the years 2013–2015.
2. Prepare the summary journal entries to record the computed pension expense in (1) and the funding of the pension plan.
3. If the pension-related asset balance at January 1, 2013, was \$75,000, compute the balance of the pension-related asset/liability account at December 31, 2015. Also compute the balance in pension-related accumulated other comprehensive income at December 31, 2015; the balance on January 1, 2013 was a debit of \$600,000.

**Problem 17-44****L04****Computation of Prior Service Cost Amortization**

The information below was provided relative to the pension plan for Atlas Wholesale Company for the years 2013–2015.

	January 1, 2013	December 31, 2013	December 31, 2014	December 31, 2015
PBO . . . . .	\$27,525	\$28,900	\$30,200	\$31,500
Fair value of the pension fund . . . . .	23,600	27,730	29,830	29,730
Service cost plus interest cost less actual return on plan assets . . . . .		215	1,710	3,810
Contributions made to pension fund . . . . .		2,970	2,510	2,410
Deferred net pension loss (gain) . . . . .	2,520	1,145	1,445	3,795
Prior service cost . . . . .	420	0	0	0

**Instructions:**

1. Compute the amount of net periodic pension expense for each of the three years. Assume that the deferred net pension loss relates only to the difference between the actual and expected return on the pension fund. Also note that this deferred loss is never amortized in 2013, 2014, or 2015 because it is always less than the 10% corridor amount (although it will be amortized in 2016).
2. Prepare the journal entries for recording the net pension expense and the pension funding for the three years.
3. Identify the pension balance sheet accounts and their amounts as of December 31, 2015.

**Problem 17-45****L05****Disclosure of Pension Plan Information**

The following information relates to the pension plan of Circle Manufacturing Company at December 31, 2013:

	(in thousands)
Balances at December 31, 2013:	
PBO .....	\$12,950
Fair value of the pension fund .....	11,600
Prior service cost .....	0
Deferred net pension loss (arose in 2013) .....	220
2013 activity:	
Service cost .....	\$ 950
Interest cost .....	1,300
Actual return on the pension fund .....	1,020
Expected return on the pension fund .....	1,110
Amortization of prior service cost .....	80

**Instructions:** Prepare the pension note at December 31, 2013, that discloses the component parts of pension expense as well as the items that combine to yield the net amounts reported in the balance sheet.

#### Problem 17-46

##### L04

#### Preparing a Pension Work Sheet

The following data relate to the defined benefit pension plan of Haan Company:

Balances at January 1, 2013:	
PBO .....	\$3,500
Prior service cost .....	\$150
Fair value of pension assets .....	\$3,000
ABO .....	\$2,800
Expected return on plan assets .....	7%
Obligation discount rate .....	10%
Activity for 2013:	
Service cost .....	\$400
Benefit payments to retirees .....	170
Contributions to pension fund .....	230
Actual return on plan assets .....	130
Prior service cost amortization .....	40

**Instructions:** Prepare a pension work sheet for Haan Company for 2013.

#### Problem 17-47

##### L04

#### Comprehensive Computation of Pension Cost Components

The actuaries for Interconnect Cable Company provided its accountants with the following information (in thousands of \$) related to the company's pension plan:

December 31, 2012:	
Increase in PBO arising from plan's amendment .....	\$684
January 1, 2013:	
PBO .....	\$2,700
Fair value of the pension fund .....	\$1,860
Market-related value of the pension fund (5-year weighted average) .....	\$1,600
Obligation discount rate .....	10%
Average service life for amortization of deferred gain and prior service costs .....	14 years
Deferred pension gain—prior year .....	\$70
Expected rate of return .....	9%

For year 2013:

Benefit payments to retirees.....	\$173
Contributions to pension plan.....	290
December 31, 2013:	
PBO.....	\$2,917
Fair value of pension plan assets.....	2,137

**Instructions:** Based on the data provided, prepare a pension work sheet for Interconnect Cable Company for 2013. The 5-year weighted-average value of plan assets is used in computing the expected return.

**Problem 17-48**

**L04**

**Pension Cost Components and Reconciliation of Funded Status**

As of January 1, 2013, information related to the defined benefit pension plan of Leffingwell Company was as follows:

PBO.....	\$1,615,000
Fair value of pension assets.....	1,513,500
Prior service cost.....	105,000
Deferred net pension gain or loss.....	0

Pension data for the years 2013 and 2014 are listed as follows:

2013 Pension plan information:

Service cost as reported by actuaries.....	\$87,000
Contributions to pension plan.....	\$120,000
Benefits paid to retirees.....	\$132,000
Actual return on pension plan assets.....	\$26,350
Amortization of prior service cost.....	\$21,000
Actuarial change increasing PBO.....	\$80,000
Obligation discount rate.....	11%
Long-term expected rate of return on pension plan assets.....	10%

2014 Pension plan information:

Service cost as reported by actuaries.....	\$115,000
Contributions to pension plan.....	\$125,000
Benefits paid to retirees.....	\$140,000
Actual return on pension plan assets.....	\$180,000
Amortization of prior service cost.....	\$18,667
Obligation discount rate.....	11%
Long-term expected rate of return on pension plan assets.....	10%

As of January 1, 2014, the remaining expected service life of employees was 5.0 years. Also, Leffingwell uses the fair market value of pension plan assets at the beginning of the year as the market-related value of pension plan assets.

**Instructions:**

1. For both 2013 and 2014, prepare the pension note that discloses the component parts of pension expense as well as the items that combine to yield the net amounts reported in the balance sheet.
2. Prepare the summary journal entries for recording net pension expense and pension funding for 2013 and 2014.

## CASES

### Discussion Case 17-49

#### Recognition or Disclosure?

Before 2006, U.S. accounting standards did not require companies to report the funding status of a defined benefit pension plan (overfunded if the plan assets exceed the projected benefit obligation and underfunded if the plan assets are less than the PBO) in the balance sheet. Some preparers and users of financial statements believe that it isn't absolutely necessary to reflect the pension plan funding status on the face of the balance sheet. Instead, they believe that mere note disclosure of the funding status is enough. Other preparers and users view it as essential to explicitly require a net pension-related asset or liability to be recognized in an amount equal to the funding status of the defined benefit plan. Is note disclosure sufficient for financial statement users, or is it important that information be actually recognized in the financial statements themselves?

### Discussion Case 17-50

#### What Theoretical Support Is There for the Pension Standards?

The topic of pensions and other postretirement benefits was considered at length in an accounting theory class. The discussion centered on the following terms:

- |                                   |                         |
|-----------------------------------|-------------------------|
| (a) Representational faithfulness | (e) Present value       |
| (b) Substance over form           | (f) Conservatism        |
| (c) Verifiability                 | (g) Adequate disclosure |
| (d) Usefulness                    |                         |

How are these terms helpful in justifying the accounting for pension and other postretirement benefit plans on the employer's books? Based on your understanding of these terms, assess the U.S. accounting treatment of pension and other postretirement benefit plans.

### Discussion Case 17-51

#### How Much Do You Need to Save for Retirement?

You plan to retire at age 65. You anticipate needing \$5,000 per month (\$60,000 per year) after you retire. You expect to live for 20 years after you retire. You will work for 40 years, from age 25 to 65. Your average salary per working year will be \$100,000. You estimate that you can earn an average of 8% per year on your investments. This considers inflation by using a "real" interest rate (nominal rate of 11% less an expected inflation rate of 3%). Assume that all cash flows occur at the end of the year and ignore income taxes. Before doing any calculations, estimate what fraction of your annual income you will need to save to have \$60,000 per year for each year of your retirement life. After you make your estimate, compute what percentage of your annual salary during your 40 working years you must invest to be able to withdraw \$60,000 per year for the 20 years after you retire. What if you wait until you are 30 to start saving? 35? 40? Was your initial guess too high or too low?

### Discussion Case 17-52

#### Does Accounting Have Political Consequences?

Let's go back in time to 1990. C. B. Seabright, a U.S. congresswoman, has just received from her staff an analysis of pre-codification FASB *Statement No. 106*, "Employers' Accounting for Postretirement Benefits Other Than Pensions." This is the standard that switched accounting for retiree health care benefit plans from a pay-as-you-go basis to an accrual basis (like that used for defined benefit pension plans). Seabright is very influential in the formation of tax legislation and in federal regulation of employer-provided health care plans. How might pre-codification FASB *Statement No. 106* impact Seabright's legislative agenda?

### Case 17-53

#### Deciphering Financial Statements (The Walt Disney Company)

Locate the information relating to pensions and other postretirement benefits found in **The Walt Disney Company's** annual report (which can be found on the Internet at <http://www.disney.com>) and answer the following questions.

1. What is Disney's PBO at the end of fiscal 2009 (October 3, 2009)?
2. Determine whether Disney's actual return on its pension fund was greater than or less than its expected return in 2009.
3. Because of the high costs associated with medical benefits, Disney has elected to follow a strategy adopted by a number of firms. That strategy has been to not offer those benefits to new employees. In its 1994 annual report, Disney stated that "employees hired after January 1, 1994, are not eligible for postretirement medical benefits." How might the financial accounting rules have caused Disney to make this change in policy in 1994?
4. At the end of 2009, Disney's pension plans appear to be slightly underfunded. What can you say about the status of its postretirement medical benefits plans?

## Case 17-54

**Deciphering Financial Statements (Northrop Grumman)**

**Northrop Grumman** is a leading aerospace/defense company. The company has developed the F-16 fighter, the Apache helicopter, the AWACS early warning airborne radar, and the B-2 Stealth bomber. Grumman, one of the predecessor companies of Northrop Grumman, was the primary contractor for the Lunar Excursion Module (LEM) that landed Neil Armstrong and Buzz Aldrin on the moon in 1969. Information relating to Northrop Grumman's pension and other postretirement benefit plans follows.

\$ in millions	Pension Benefits			Medical and Life Benefits		
	2009	2008	2007	2009	2008	2007
<b>Components of Net Periodic Benefit Cost</b>

<b>Change in Plan Assets</b>				
Fair value of plan assets at beginning of year . . . . .	18,501	22,891	718	951
Gain/(loss) on plan assets . . . . .	2,945	(3,500)	126	(238)

\$ in millions	Pension Benefits		Medical and Life Benefits	
	2009	2008	2009	2008
Employer contributions . . . . .	858	320	162	181
Plan participants' contributions . . . . .	16	14	106	78
Benefits paid . . . . .	(1,359)	(1,179)	(289)	(269)
Acquisitions, curtailments, divestitures and other . . . . .	12	(45)	20	15
Fair value of plan assets at end of year . . . . .	20,973	18,501	843	718
Funded status . . . . .	<u>\$(2,750)</u>	<u>\$(3,646)</u>	<u>\$(1,937)</u>	<u>\$(1,998)</u>
<b>Amounts Recognized in the Consolidated Statements of Financial Position</b>				
Non-current assets . . . . .	\$ 264	\$ 266	\$ 36	\$ 24
Current liability . . . . .	(47)	(45)	(66)	(66)
Non-current liability . . . . .	(2,967)	(3,867)	(1,907)	(1,956)

The following table shows those amounts expected to be recognized in net periodic benefit cost in 2010:

\$ in millions	Pension Benefits	Medical and Life Benefits
<b>Amounts Expected to be Recognized in 2010 Net Periodic Benefit Cost</b>		
Net loss . . . . .	\$244	\$26
Prior service cost (credit) . . . . .	47	(60)

The accumulated benefit obligation for all defined benefit pension plans was \$22.1 billion and \$20.4 billion at December 31, 2009 and 2008, respectively.

\$ in millions	Pension Benefits		Medical and Life Benefits	
	2009	2008	2009	2008
<b>Amounts Recorded in Accumulated Other Comprehensive Loss</b>				
Net actuarial loss . . . . .	\$(4,648)	\$(5,509)	\$(451)	\$(539)
Prior service cost and net transition obligation . . . . .	(242)	(287)	298	357
Income tax benefits related to above items . . . . .	1,923	2,286	61	72
Unamortized benefit plan costs . . . . .	<u>\$(2,967)</u>	<u>\$(3,510)</u>	<u>\$(92)</u>	<u>\$(110)</u>

Based on this information, answer the following questions:

1. Is Northrop Grumman's pension plan overfunded or underfunded? How can you tell?
2. Are Northrop Grumman's medical and life benefits programs overfunded or underfunded? Explain.
3. As of the end of 2009, does Northrop Grumman's pension-related accumulated other comprehensive income increase or decrease its stockholders' equity?
4. During 2009, was the actual return on Northrop Grumman's pension fund more or less than the expected return? What about in 2008? Explain.

**Case 17-55****Deciphering Financial Statements (General Motors)**

Direct your attention to the company with perhaps the largest private pension plan in the world—**General Motors**. GM's note relating to its pension plan is included in Exhibit 17-11 on page 17-42. Use that information to answer the following questions.

1. Compute GM's total PBO as of December 31, 2009. How much has GM set aside in its pension fund to offset the PBO?
2. Now consider GM's postretirement benefits other than pensions. What is GM's TOTAL estimated obligation related to pensions and other postretirement benefits?
3. Why do you think there is a separation into U.S. and non-U.S. plans?
4. For the interval July 10, 2009 to December 31, 2009, compare GM's service cost to the amount of benefits paid to retirees. What can you draw from this comparison?
5. Evaluate the funded status of GM's "other benefits" plans. Treat the U.S. and non-U.S. plans as one large plan.

**Case 17-56****Writing Assignment (Pensions in foreign countries)**

In the United States, accounting for pensions has received a great deal of attention. In other countries, pension accounting is given much less attention. In one page, examine the reasons that would explain why pension accounting is given much less emphasis in most foreign countries as compared to the emphasis it receives in the United States.

**Case 17-57****Cumulative Spreadsheet Analysis**

This assignment is a detailed examination of Skywalker's pension-related items. As of December 31, 2013, the \$253 in "Other long-term liabilities" reported by Skywalker (see Chapter 13) included an amount for a net pension liability. In addition, Skywalker's \$456 in "Other operating expenses" for 2013 included an amount for net pension expense.

The following information relates to Skywalker's pension plan as of December 31, 2013.

Fair value of pension fund assets. . . . .	\$200
Discount rate used in valuing the PBO . . . . .	7%
Long-term expected rate of return on pension fund assets. . . . .	9%
Total annual pension payment earned by Skywalker's employees so far . . . . .	\$50
Number of years that employees are expected to receive pension payments after retirement. . . . .	30 years
Number of years until first pension payment is to be received . . . . .	11 years

Construct a spreadsheet to calculate the following:

1. Given the information above, compute the net pension liability that Skywalker will report as of December 31, 2013. (*Note:* Be careful in computing the PBO; remember that the standard annuity formula yields the present value of the annuity one year *before* the first payment is received.)
2. Compute a forecast of Skywalker's net pension liability as of December 31, 2014, and net pension expense for 2014 using the following information:
  - By working an extra year in 2014, the total annual pension payment earned by Skywalker's employees is expected to increase from \$50 to \$55.
  - Skywalker's employees will be one year closer to receiving the first pension payment.
  - No pension benefits are expected to be paid to employees in 2014.
  - Skywalker expects to contribute \$50 to the pension plan during 2014.
  - Skywalker's best estimate is that the pension fund assets will earn in 2014 an amount equal to the long-term expected rate of return.
3. Repeat (1) and (2) using the following information:
  - (a) The discount rate is 8%, and the long-term expected rate of return on the pension fund assets is 12%.
  - (b) The discount rate is 5%, and the long-term expected rate of return on the pension fund assets is 11%.

# CHAPTER 18

## Earnings Per Share

### LEARNING OBJECTIVES

- 1 Know the difference between a simple and a complex capital structure, and understand how dilutive securities affect earnings per share computations.
  - 2 Compute basic earnings per share, taking into account the sale and repurchase of stock during the period as well as the effects of stock splits and stock dividends.
  - 3 Use the treasury stock method to compute diluted earnings per share when a firm has outstanding stock options, warrants, and rights.
  - 4 Use the if-converted method to compute diluted earnings per share when a company has convertible preferred stock or convertible bonds outstanding.
  - 5 Factor into the diluted earnings per share computations the effect of actual conversion of convertible securities or the exercise of options, warrants, or rights during the period, and understand the antidilutive effect of potential common shares when a firm reports a loss from continuing operations.
  - 6 Determine the order in which multiple potentially dilutive securities should be considered in computing diluted earnings per share.
  - 7 Understand the disclosure requirements associated with basic and diluted earnings per share computations.
- EM EXPANDED MATERIAL**
- 8 Make complex earnings per share computations involving multiple potentially dilutive securities.

With 1.3 billion people and an economy that is growing at almost 10% per year, China's energy needs are exploding. And in today's world, that means that China has an increasing appetite for imported oil. In fact, China is the second largest consumer of oil in the world, after the United States. This thirst for imported oil is having a noticeable impact on China's geopolitics. China is

taking an increased interest in what happens in the oil-producing areas of the world ... in the Persian Gulf, in Nigeria, and in Venezuela.<sup>1</sup>

Of course, the Chinese government would like to maximize its domestic production of oil in order to lessen the country's dependence on foreign oil. **Sinopec**, **PetroChina**, and **CNOOC** are the Big Three in the Chinese oil industry. All three of these companies arose out of the Chinese government's Ministry of Petroleum. For many years, these oil companies were a cross between a business entity and a government agency. Today, even though these companies are still majority owned by the Chinese government, they are each publicly listed and are each operated as business enterprises.

#### **China Petroleum & Chemical Corporation (Sinopec)**

Sinopec Group is a holding company created by the Chinese government. The primary subsidiary of Sinopec Group is the China Petroleum & Chemical Corporation, usually called "Sinopec Corp." or just "Sinopec." Sinopec was incorporated as a separate company on February 28, 2000, and executed an initial public offering (IPO) of "H shares" (shares of a Chinese company that are publicly traded on the Stock Exchange of Hong Kong) in October 2000. After the IPO, Sinopec shares were listed in Hong Kong, New York, and London. In July 2001, Sinopec issued "A shares" (shares of a Chinese company that are publicly traded inside China) in Shanghai. In its early years, Sinopec was primarily a "downstream" oil company, meaning that it used petroleum as an input into its refining and petrochemical operations. In 1998, the Chinese government required Sinopec to exchange some of its refining assets for "upstream," or oil-producing, assets. Today, Sinopec is an integrated petroleum and petrochemical company, meaning that it explores for oil, refines oil, transports oil, and produces and distributes petrochemical products. Sinopec operates over 29,000 retail gasoline stations in China. Sinopec is particularly strong in the southeast part of China.

#### **PetroChina Company Limited (PetroChina)**

China National Petroleum Corporation (CNPC) is a large state-owned enterprise authorized by the Chinese

central government. CNPC created PetroChina as a separate corporation in November 1999. PetroChina was listed on the New York and Hong Kong stock exchanges in April 2000 and on the Shanghai Stock Exchange in November 2007. In contrast to Sinopec, PetroChina was primarily an upstream oil company in its early years. In 1998 PetroChina exchanged some of its oilfield assets for some of Sinopec's refining assets, creating an integrated petroleum and petrochemical company. This interesting move essentially created two large competitors, both majority owned by the Chinese central government. PetroChina is particularly strong in the north and northeast part of China. PetroChina operates China's largest oilfield, the Daqing field in northeastern China, which is the fourth-largest producing oil field in the world.

#### **China National Offshore Oil Corporation (CNOOC)**

China National Offshore Oil Corporation (CNOOC) is the state-owned parent of CNOOC Limited, which is publicly listed in Hong Kong and New York. CNOOC is the smallest of the Big Three and has historically focused on developing China's offshore oil and gas resources. Since its IPO in 2001, CNOOC has made efforts to expand its operations overseas. Its most public attempt, ultimately an unsuccessful one, was its bid to buy Unocal, the U.S. oil company. CNOOC's US\$18.5 billion bid topped the bid of ChevronTexaco, but U.S. political forces, opposed to the purchase of a U.S. oil firm by a company controlled by the Chinese government, ultimately caused CNOOC to withdraw its bid.

With the increasing demand for oil by the Chinese economy, how fast are the profits of these Chinese state-owned oil companies expected to grow? A good way to assess the market consensus on this topic is to look at the relation between the earnings per share and stock prices of these companies. Those numbers, with the corresponding numbers for **ExxonMobil**, are shown in Exhibit 18-1.

Several interesting insights come from the data in Exhibit 18-1. First, note that the earnings per share of the Chinese oil companies are quite small; with the yuan/dollar exchange rate of 7.2941 at that time, the

<sup>1</sup> Gal Luft, "Fueling the dragon: China's race into the oil market," Institute for the Analysis of Global Security, 2003/2004, <http://www.iags.org/china.htm>.

**EX 18-1 EARNINGS PER SHARE AND P/E RATIOS FOR CHINESE OIL COMPANIES (FOR 2007)**

	Sinopec	PetroChina	CNOOC	ExxonMobil
Earnings pre share . . . . .	¥0.63	¥0.75	¥0.72	\$7.36
Market price pre share . . . . .	¥12.51	¥14.79	¥14.13	\$93.69
Price/earnings (P/E) ratio . . . . .	19.9	19.7	19.6	12.7
Total market value of shares (in billion) . . . . .	¥1,084.62	¥2,706.18	¥625.85	\$504.24

As of December 31, 2007, one U.S. dollar was the equivalent of ¥7.2941 (Chinese yuan).

© 2012 Cengage Learning.

earnings per share of each of the Chinese oil companies is about 10 U.S. cents compared to \$7.36 for ExxonMobil. This same relative relation holds for the market prices of the companies' shares; the price of the shares of the Chinese oil companies, after conversion to U.S. dollars, is less than \$2 per share, compared to \$93.69 per share for ExxonMobil. However, a look at the final row in Exhibit 18-1 demonstrates that this large difference merely reflects the fact that Chinese oil companies have many, many shares outstanding. In fact, if you add up the total market values of each of the three Chinese oil companies, and then convert that total into U.S. dollars, you will see that these three companies, as a group, are worth more (\$605.5 billion) than ExxonMobil (\$504.2 billion).

Now, what about the expected profitability growth of the Chinese oil companies? The expected growth is reflected in the price/earnings (P/E) ratio,

which is equal to the company's market price per share divided by its earnings per share. One of the primary factors influencing P/E ratios is expected future earnings growth. In general, companies or industries in which expected future earnings growth is expected to be high are characterized by high P/E ratios. An example is any kind of high technology industry such as software development or pharmaceuticals. Conversely, in industries where expected future earnings growth is low, P/E ratios are low. Examples of these industries are traditional manufacturing businesses such as automobiles or heavy equipment. The P/E ratio of the Big Three Chinese oil companies are all approximately 20, substantially higher than the P/E ratio of about 13 for ExxonMobil. At least as far as the international investment community is concerned, the earnings per share of the Chinese oil companies are expected to grow rapidly in the future.

**QUESTIONS**

1. In general, what does a firm's P/E ratio reflect?
2. Why is the earnings per share of ExxonMobil so much higher than the earnings per share of the three Chinese oil companies?

*Answers to these questions can be found on page 18-27.*

## Simple and Complex Capital Structures

1

Know the difference between a simple and a complex capital structure, and understand how dilutive securities affect earnings per share computations.

**WHY** From the standpoint of a common stockholder, a fundamental and understandable measure of a company's operating performance is the earnings generated for each share of common stock outstanding. The existence of potential shareholders, such as option holders or holders of convertible securities, makes this important computation of earnings per share of common stock more complicated.

**HOW** A complex capital structure is one in which stock options or convertible securities (bonds or preferred stock) exist. With a complex capital structure, the computation of earnings per share must include consideration of the potential impact of options and convertible securities on both earnings available to common stockholders and on the number of common shares outstanding.

Earnings per share figures were historically computed and used primarily by financial analysts. Sometimes the computation was disclosed in the unaudited section of the annual report along with a message from the company's president. However, because this

measurement was not reviewed by an independent third party, figures used to develop EPS were often different from those attested to by the auditor. The situation became more complex when some companies and analysts began computing EPS not only on the basis of common shares actually outstanding but also on the basis of what shares would be outstanding if certain

convertible securities were converted and if certain stock options were exercised. Usually, the conversion or exercise terms were very favorable to the holders of these securities, and EPS would decline if common stock were issued on conversion or exercise. This result, a reduced EPS, is referred to as a **dilution of earnings**. In some cases, however, the exercise of options or conversion of securities might result in an increased EPS. This result is referred to as an **antidilution of earnings**. Securities that would lead to dilution are referred to as **dilutive securities**, and those that would lead to antidilution are referred to as **antidilutive securities**. Rational investors would not convert or exercise antidilutive securities because they could do better by purchasing common stock in the marketplace.

These forward-looking computations of EPS attempt to provide information as to what future EPS might be, assuming conversions and exercises took place. Because these "as if" conditions are based on assumptions, they can be computed in several ways. This is where the accounting standards come in. The standard in the United States is found in FASB ASC Topic 260, Earnings per Share. The corresponding international standard is IAS 33. In the area of earnings per share, U.S. GAAP and IFRS are very similar. In fact, the corresponding standards, both issued in 1997, were among the very first projects in which the FASB and IASB worked closely together. The differences between the two standards lie in technical areas that are outside the scope of this chapter.

A company's capital structure may be classified as simple or complex. If a company has only common stock, or common and nonconvertible preferred stock outstanding and there are no convertible securities, stock options, warrants, or other rights outstanding, it is classified as a company with a **simple capital structure**. Earnings per share is computed

FYI

Although EPS is a common measure used to assess a firm's profitability, the FASB specifically stated that under no circumstances was cash flow per share to be reported. The FASB did not want financial statement users to consider cash flow per share as an alternative to earnings per share.

by dividing income available to common shareholders by the weighted-average number of common shares outstanding for the period. No future-oriented “as if” conditions need to be considered. If net income includes extraordinary gains or losses or other below-the-line items, as discussed in Chapter 4, a separate EPS figure is required for each major component of income, as well as for net income. These historical EPS amounts are referred to as **basic earnings per share**.

Even if convertible securities, stock options, warrants, or other rights do exist, the capital structure may be classified as simple if there is no potential dilution to EPS from the conversion or exercise of these items. Potential EPS dilution exists if the EPS would decrease or the loss per share would increase as a result of the conversion of securities or exercise of stock options, warrants, or other rights based on the conditions existing at the financial statement date. A company with potential earnings per share dilution is considered to have a **complex capital structure**.

For those companies with a complex capital structure, the computation of both basic EPS and diluted EPS provides financial statement users with endpoints as to EPS. The basic EPS computation uses the results of actual transactions to determine both the numerator and the denominator in the EPS calculation. Diluted EPS is computed by making assumptions regarding transactions that did not occur. Why worry about transactions that did not occur? We can answer this question with an example. Suppose an individual is given stock options to purchase shares of stock in a company at \$10 per share. The current market price for the company’s stock is \$15 per share. Why wouldn’t the individual exercise the options and purchase the stock? The most likely reason is that the individual is contractually constrained from exercising the options until a certain time (this is a common feature of employee stock options). Or perhaps the individual is uncertain about the future of the stock and wants to wait to see whether it will go down in value or perhaps go even higher. Thus, even though the transaction (exercising the options) didn’t occur, it could have occurred and, given the current level of the stock price, it is likely that it will occur in the future. The FASB requires events such as this to be included in the diluted EPS computation to disclose to financial statement users the effects of transactions that, although they did not occur, will likely occur in the future.

To summarize, the basic EPS computation uses the results of actual transactions and events to compute an EPS figure. Diluted EPS involves making assumptions about transactions relating to a company’s stock that, based on information available now, will likely occur in the future. In other words, diluted EPS provides financial statement users a “worst-case” estimate as to EPS with the computations made by assuming that all events relating to the exercising of existing options or the conversion of existing securities that will likely occur in the future have in fact already occurred.

The earnings per share figure can significantly influence a firm’s perceived value in the stock market.

## FASB CODIFICATION

**The Issue:** You are the controller for Della Bee Enterprises, a private company. The company is a corporation, so there are ownership shares outstanding. However, all of these shares are held by a few family members and a handful of trusted employees (like yourself). Your summer accounting intern has just told you that the income statements that you have been preparing for the past five years are incomplete because those statements do not include earnings per share data. You told the intern that private companies are not required to include EPS in their income statements. However, you don't know this for sure. You would like to be able to prove to the know-it-all intern that you are right.

**The Question:** In order to comply with U.S. GAAP, are private companies required to provide EPS data on their income statements?

**Searching the Codification:** What you are looking for is some description of the "scope" of the FASB ASC Earnings per Share topic. The "scope" of a standard is a description of the transactions and entities that are subject to the accounting rules included in that standard. In the FASB's ASC, scope descriptions are always sections denoted by the number 15. So, go into Topic 260, Earnings per Share, and look around for any scope descriptions.

**The Answer:** The correct treatment is described on page 18-28.

## Basic Earnings per Share

2

Compute basic earnings per share, taking into account the sale and repurchase of stock during the period as well as the effects of stock splits and stock dividends.

**WHY** Although the computation of diluted earnings per share is complicated and exciting (as illustrated in the next section), the simple computation of earnings per weighted-average common share outstanding during the year is extremely informative.

**HOW** Basic EPS is computed by dividing income available to common shareholders by the weighted-average number of common shares outstanding. If a company splits its stock or declares a stock dividend, a retroactive recognition of this change must be made in determining the weighted-average number of shares outstanding.

The basic EPS computation presents no problem when only common stock has been issued and the number of shares outstanding has remained the same for the entire period. The numerator is the net income (loss) for the period, and the denominator is the number of shares outstanding for the entire period. Frequently, however, either the numerator, the denominator, or both must be adjusted because of the circumstances described in the following sections.

### Issuance or Reacquisition of Common Stock

When common shares have been issued or have been reacquired by a company during a period, the resources available to the company have changed, and this change should affect earnings. To illustrate, suppose a company doubles the number of shares it has outstanding through the sale of additional stock. With the proceeds from the sale, one would expect

the company to be able to invest in additional productive assets and thereby increase net income. Thus, income is not higher because the company suddenly became more profitable. Instead, income is higher because the company had more resources available for its use. This sale of stock must be factored into the EPS computation to provide a measure of per-share profitability given the resources available. Under these circumstances, a weighted average for shares outstanding should be computed.

The weighted-average number of shares can be computed by determining “month-shares” of outstanding stock and dividing by 12 to obtain the weighted average for the year. For example, if a company has 10,000 shares outstanding at the beginning of the year, issues 5,000 more shares on May 1, and reacquires 2,000 shares on November 1, the weighted-average number of shares would be computed as follows. Note that a separate period computation is required each time stock is sold or reacquired.

			Month-Shares
Jan. 1 to May 1		10,000 × 4 months	40,000
May 1 to Nov. 1	(10,000 + 5,000)	15,000 × 6 months	90,000
Nov. 1 to Dec. 31	(15,000 – 2,000)	13,000 × 2 months	26,000
Total month-shares			<u>156,000</u>
Weighted-average number of shares: 156,000/12			<u>13,000</u>

The same answer can be obtained by applying a weight to each period equivalent to the portion of the year since the last change in shares outstanding, as follows:

Jan. 1 to May 1	10,000 × 4/12 year	3,333
May 1 to Nov. 1	15,000 × 6/12 year	7,500
Nov. 1 to Dec. 31	13,000 × 2/12 year	2,167
Weighted-average number of shares		<u>13,000</u>

If stock transactions occurred during a month, the weighted-average computation could be made either on a daily basis or to the nearest month. In examples and end-of-chapter material in this text, assume computations to the nearest month unless otherwise specified.

### Stock Dividends and Stock Splits

When the number of common shares outstanding has changed during a period as a result of a stock dividend, a stock split, or a reverse split, a retroactive recognition of this change must be made in determining the weighted-average number of shares outstanding. Without this retroactive recognition, comparing a share of stock at the beginning of the period to a share of stock at the end of the period (after a stock split or stock dividend) would be like comparing apples and oranges, or perhaps more accurately, like comparing a whole pie to a piece of pie. To illustrate, assume that a company had 2,600 shares outstanding as of January 1 and the following events affecting common stock occurred during the year:

Date	Economic Event	Change in Shares Outstanding
Feb. 1	Exercise of stock option	+ 400
May. 1	10% stock dividend (3,000 × 10%)	+ 300
Sept. 1	Sale of stock for cash	+ 1,200
Nov. 1	Purchase of treasury stock	– 400
Dec. 1	3-for-1 stock split	+ 8,200

The computation of the weighted-average number of shares for the year would be as follows:

Dates	Shares Outstanding		Stock Dividend		Stock Split		Portion of Year		Average
Jan. 1 to Feb. 1	2,600	×	1.10	×	3.0	×	1/12	=	715
Feb. 1—option	<u>400</u>								
Feb. 1 to May 1	3,000	×	1.10	×	3.0	×	3/12	=	2,475
May 1—stock dividend	<u>300</u>								
May 1 to Sept. 1	3,300			×	3.0	×	4/12	=	3,300
Sept. 1—sale	<u>1,200</u>								
Sept. 1 to Nov. 1	4,500			×	3.0	×	2/12	=	2,250
Nov. 1—treasury stock	<u>(400)</u>								
Nov. 1 to Dec. 1	4,100			×	3.0	×	1/12	=	1,025
Dec. 1—split	<u>8,200</u>								
Dec. 1 to Dec. 31	<u>12,300</u>					×	1/12	=	<u>1,025</u>
Weighted-average number of shares									<u>10,790</u>

In the preceding illustration, the shares outstanding for January 1 to May 1 were multiplied by 1.10 to reflect the 10% stock dividend, and the shares outstanding for January 1 to December 1 were multiplied by 3 to reflect the 3-for-1 stock split. When comparative financial statements are presented, the common shares outstanding for all periods shown must be adjusted to reflect any stock dividend or stock split in the current period.

Only with the retroactive recognition of changes in the number of shares can EPS presentations for prior periods be stated on a basis comparable with the EPS presentation for the current period. Similar retroactive adjustments must be made even if a stock dividend or stock split occurs after the end of the period but before the financial statements are prepared; disclosure of this situation should be made in a note to the financial statements. As an example, consider the disclosure provided by Nike relating to its EPS: For the

fiscal year ended May 31, 2006, the company reported basic EPS of \$5.37. In its 2007 annual report, the company reported basic EPS of just \$2.69 for the fiscal year ended May 31, 2006. In the notes accompanying its 2007 financial statements (shown in Exhibit 18-2), Nike explains the reason for the restatement of EPS for 2006: it split its shares 2-for-1 during fiscal 2007.

## CAUTION

As the example illustrates, stock splits and stock dividends must be incorporated to calculate weighted-average shares outstanding. This procedure must be applied for all periods included in the financial statements. Thus, the EPS figures computed in the current period may have to be changed in subsequent years if stock splits or stock dividends occur.

### Preferred Stock Included in Capital Structure

Basic EPS reflects only income available to common stockholders; it does not include preferred stock. It would be inappropriate to report EPS on preferred stock in view of the limited dividend rights of such stock. When a capital structure includes preferred stock, dividends on preferred stock should be deducted from income before extraordinary or other special items and from net income in arriving at the earnings related to common shares. If preferred dividends are not cumulative, only the dividends declared on preferred

## EX 18-2 NIKE NOTE DISCLOSURE RELATING TO STOCK SPLITS

Note 1. STOCK SPLIT On February 15, 2007 the Board of Directors declared a two-for-one stock split of the Company's Class A and Class B common shares, which was effected in the form of a 100% common stock dividend distributed on April 2, 2007. All references to share and per share amounts in the consolidated financial statements and accompanying notes to the consolidated financial statements have been retroactively restated to reflect the two-for-one stock split.

© 2012 Cengage Learning.

stock during the period are deducted. If preferred dividends are cumulative, the full amount of dividends on preferred stock for the period, whether declared or not, should be deducted from income in arriving at the earnings or loss balance related to the common stock. If there is a loss for the period, preferred dividends for the period, including any undeclared dividends on cumulative preferred stock, are added to the loss in arriving at the full loss related to the common stock.

To illustrate the computation of EPS at December 31, 2013, for a company with a simple capital structure for a comparative 2-year period, assume the following data.

## STOP & THINK

Why must basic EPS associated with prior periods be adjusted for stock splits or stock dividends that occurred in the current period?

- Without adjustment, the cash flow impact of stock splits and stock dividends would not be reflected in the EPS numbers.
- Without adjustment, net income for the current period would be overstated.
- Without adjustment, the stock splits and stock dividends would not be properly reflected in the Equity section of the balance sheet.
- Without adjustment, the comparison with prior-year EPS numbers would be misleading.

Summary of Changes in Capital Balances

	8% Cumulative Preferred Stock \$100 Par		Common Stock \$0.10 Par		Retained Earnings
	Shares	Amount	Shares	Amount	
Dec. 31, 2011, balances . . . . .	10,000	\$1,000,000	200,000	\$1,000,000	\$4,000,000
June 30, 2012, issuance of 100,000 shares of common stock . . . . .			100,000	600,000	
June 30, 2012, dividend on preferred stock, 8% . . . . .					(80,000)
June 30, 2012, dividend on common stock, \$0.30 . . . . .					(90,000)
Dec. 31, 2012, net income for year, including extraordinary gain of \$75,000 . . . . .					380,000
Dec. 31, 2012, balances . . . . .	10,000	\$1,000,000	300,000	\$1,600,000	\$4,210,000
May 1, 2013, 50% stock dividend on common stock . . . . .			150,000	15,000	(15,000)
Dec. 31, 2013, net loss for year . . . . .					(55,000)
Dec. 31, 2013, balances . . . . .	10,000	\$1,000,000	450,000	\$1,615,000	\$4,140,000

Because comparative statements are presented, the denominator of weighted-average shares outstanding for 2012 must be adjusted for the 50% stock dividend issued in 2013 as follows:

2012		
Jan. 1–June 30	200,000 × 1.5 (50% stock dividend in 2013) × 6/12 year	150,000
July 1–Dec. 31	[200,000 + 100,000 (issuance of stock on June 30, 2012)] × 1.5 (50% stock dividend in 2013) × 6/12 year	225,000
		<u>375,000</u>
2013		
Jan. 1–May 1	300,000 × 1.5 (50% stock dividend in 2013) × 4/12 year	150,000
May 1–Dec. 31	450,000 (300,000 + 150,000) × 8/12 year	300,000
		<u>450,000</u>

Continuing the example, EPS for 2012 is shown separately for income from continuing operations, the extraordinary gain, and net income. The preferred dividends must be deducted from both income from continuing operations and net income in computing EPS for these income components. For 2013, the reported net loss must be increased by the full amount of the preferred dividend even though the dividend was not declared. If the preferred stock were noncumulative, no adjustment for the undeclared preferred dividend would be necessary in 2013. The adjusted income (loss) figures for computing basic EPS are determined as follows:

2012	
Income from continuing operations (\$380,000 net income – \$75,000 extraordinary gain)	\$ 305,000
Less: Preferred dividend	80,000
Income from continuing operations identified with common stock	<u>\$ 225,000</u>
Net income	\$ 380,000
Less: Preferred dividend	80,000
Net income identified with common stock	<u>\$ 300,000</u>
2013	
Net loss	\$ (55,000)
Less: Preferred dividend	(80,000)
Net loss identified with common stock	<u>\$(135,000)</u>

The basic EPS amounts can now be computed as follows:

2012	
Basic earnings per common share:	
Continuing operations (\$225,000/375,000)	\$ 0.60
Extraordinary gain (\$75,000/375,000)	0.20
Net income per share (\$300,000/375,000)	<u>\$ 0.80</u>
2013	
Basic loss per share (\$135,000/450,000)	<u>\$(0.30)</u>

### Participating Securities and the Two-Class Method

Sometimes a company issues more than one class of stock with ownership privileges. For example, as discussed in Chapter 13, **Google** has both Class A and Class B common stock. In Google's case, both classes of common stock have the same dividend rights, so the earnings that can be claimed by the two classes of shareholders are the same. As a result, the computed and reported amounts of earnings per share for both classes of Google common

stock are the same. However, different classes of stock don't always have the same claim upon dividends. In such a case, earnings attributable to each share of the different classes of stock are different and EPS is computed using the [two-class method](#).

In addition to different classes of common stock, a company can also have preferred stock that includes characteristics similar to that of common stock. In particular, as described in Chapter 13, a company can issue participating preferred stock. With participating preferred stock, the preferred stockholders receive additional dividends, beyond their base amount, once the common stockholders receive a certain level of dividends. In essence, participating preferred stockholders share in the success of the company in the same way that common stockholders do. This sharing in the profits of the company should be reflected in the computation of earnings per share.

To illustrate earnings per share computations when two classes of stock share in the profits, consider the data below for Lily Kay Company.

- Common shares outstanding: 100,000 for the entire year
- Participating preferred shares outstanding: 50,000 shares for the entire year
- Net income: \$500,000
- Dividends on participating preferred shares: \$2.00 per share plus a per-share increase 50% as large as the per-share increase of common dividends above \$1.00 per share. Thus, if the common dividend is \$1.20 per share, the participating preferred dividend is \$2.10 per share [ $\$2.00 + 0.50(\$1.20 - \$1.00)$ ].
- Common dividends paid for the year: \$1.80 per share making a total of \$180,000 ( $\$1.80 \text{ per share} \times 100,000 \text{ shares}$ )
- Participating preferred dividends paid for the year: \$2.40 per share making a total of \$120,000 ( $\$2.40 \text{ per share} \times 50,000 \text{ shares}$ )

To compute basic earnings per share, it is necessary to allocate the undistributed earnings to the two classes of stock. In this case, undistributed earnings total \$200,000 ( $\$500,000 \text{ net income} - \$180,000 \text{ common dividends} - \$120,000 \text{ participating preferred dividends}$ ). The allocation of this \$200,000 in undistributed earnings is done assuming that the \$200,000 “belongs” to the common and preferred shareholders in the proportion that would exist if those undistributed earnings were paid out as dividends. The excess dividends paid so far have been \$80,000 for common shares [ $\$180,000 \text{ total common dividends less } \$100,000 (\$1.00 \text{ per share} \times 100,000 \text{ shares}) \text{ baseline common dividends}$ ] and \$20,000 for participating preferred shares [ $\$120,000 \text{ total preferred dividends less } \$100,000 (\$2.00 \text{ per share} \times 50,000 \text{ shares}) \text{ baseline preferred dividends}$ ]. Thus, 80% of the excess dividends [ $\$80,000 \div (\$80,000 + \$20,000)$ ] have gone to common shareholders and 20% have gone to participating preferred shareholders. The undistributed earnings of \$200,000 are allocated as follows:

	Preferred Stock	Common Stock
Total undistributed earnings . . . . .	\$200,000	\$200,000
Allocation percentage . . . . .	<u><math>\times 0.20</math></u>	<u><math>\times 0.80</math></u>
Allocation of undistributed earnings . . . . .	\$ 40,000	\$160,000
Number of shares . . . . .	<u><math>\div 50,000</math></u>	<u><math>\div 100,000</math></u>
Undistributed earnings per share . . . . .	<u>\$ 0.80</u>	<u>\$ 1.60</u>

The basic earnings per share amounts are computed and reported as follows:

	Participating Preferred Stock	Common Stock
Distributed earnings . . . . .	\$2.40	\$1.80
Undistributed earnings . . . . .	0.80	1.60
Basic earnings per share . . . . .	<u>\$3.20</u>	<u>\$3.40</u>

Similar computations are performed if there are two classes of common stock with different dividend rights.

## Diluted Earnings per Share—Options, Warrants, and Rights

**3** Use the treasury stock method to compute diluted earnings per share when a firm has outstanding stock options, warrants, and rights.

**WHY** Stock options (and warrants and rights) represent potential new shares of common stock that can become actual common shares whether the existing common shareholders approve or not. Because the exercise of these options can potentially impact the portion of the earnings that will flow to the existing common shareholders, those shareholders should be made aware of the magnitude of that potential dilution.

**HOW** If the option exercise price is less than the end-of-period market price for the period, the option, warrant, or right is considered dilutive and is included in computing diluted EPS. This also coincides with the economic circumstance in which the options are most likely to be exercised. The treasury stock method involves determining the number of incremental shares that would be issued assuming that the options, warrants, or rights were exercised and the proceeds used to repurchase treasury shares in the market at the market price prevailing at the end of the period.

When a company has a complex capital structure, additional information may be provided to users of the financial statements to reflect all potential dilution arising from the assumption that additional common stock is issued from exercise of options or conversion of convertible securities. Dilution occurs if inclusion of a potentially dilutive security reduces the basic EPS or increases the basic loss per share. If the opposite results occur, the security is classified as an antidilutive security. If a company reports a below-the-line item (i.e., discontinued operations or an extraordinary item), the “control number” used in determining whether a security is dilutive or not is “Income from continuing operations.”<sup>2</sup> In general, securities classified as antidilutive are not included in computing diluted EPS.

### CAUTION

You must continually remind yourself when dealing with diluted EPS that the events you are analyzing *did not* occur; bonds were not converted; options were not exercised; and so on. Diluted EPS is providing information *as if* these events occurred.

The adjustment of the numerator and/or denominator of basic EPS to compute diluted EPS depends on the nature of the security and its terms. The adjustment process consists of a “what-if” scenario. What would happen to the numerator and denominator if options had been exercised and

<sup>2</sup> FASB ASC paragraph 260-10-45-18.

convertible securities had been converted at the beginning of the year being evaluated? The two major types of potentially dilutive securities are (1) common stock options, warrants, and rights and (2) convertible bonds and convertible preferred stock. Because the purpose of a diluted EPS figure is to disclose how an exercise or conversion would affect future EPS, all computations of diluted EPS are made as if the exercise or conversion took place at the beginning of the company's fiscal year or at the issue date of the stock option or convertible security, whichever comes later. Thus, if a convertible bond has been outstanding the entire year, the diluted EPS computation will be made as if the conversion of the bonds took place at the beginning of the year. However, if the convertible bond is issued on May 1 and the fiscal year is the calendar year, all conversion computations will be made for eight months, or two-thirds of a year.

### Stock Options, Warrants, and Rights

As explained in Chapter 13, stock options, warrants, and rights provide no cash yield to investors, but they have value because they permit the acquisition of common stock at specified prices for a certain period of time. As noted previously, options, warrants, and rights are included in the computation of diluted EPS for a particular period only if they are dilutive. If the price for which stock can be acquired (exercise price) is lower than the average market price for the period, the options, warrants, or rights probably would be exercised and their effect would be dilutive. If the exercise price is higher than the average market price, no exercise would take place; thus, there is no potential dilution from these securities.

It is assumed that exercise of options, warrants, or rights takes place as of the beginning of the year or at the date they are issued, whichever comes later. Additional cash resources would thus have been available for the company's use. To compute diluted EPS when these types of securities exist, either net income must be increased to take into consideration the increase in revenue such additional resources would produce or the cash must be assumed to be used for some non-revenue-producing purpose. The FASB selected the latter approach and recommended it be assumed that the cash proceeds from the exercise of options, warrants, or rights be used to purchase common stock on the market (treasury stock) at the average market price. It is further assumed that the shares of treasury stock are issued to those exercising their options, warrants, or rights, and the remaining shares required to be issued will be added as incremental shares to the actual number of shares outstanding to compute diluted EPS. This method of including warrants, options, and rights in the EPS computation is known as the [treasury stock method](#).

To illustrate, assume that at the beginning of the current year, employees were granted options to acquire 5,000 shares of common stock at \$40 per share. The average market price of the stock for the year is \$50, so exercise is assumed and the effect will be dilutive.<sup>3</sup> The proceeds received by the corporation from the issuance of stock to the employees would be \$200,000 (5,000 shares × \$40 exercise price). Because the average market price of the stock was \$50, these proceeds would purchase 4,000 shares of treasury stock (\$200,000/\$50). If it is assumed that these 4,000 shares are repurchased in the market, the net increase in shares outstanding would be just 1,000: the 5,000 shares issued to the employees who exercised the options less the 4,000 shares that were repurchased

<sup>3</sup> FASB ASC subparagraph 260-10-45-23(b). Over the years, the FASB has waffled back and forth between using the average market price for the year and the ending market price for the year in implementing the treasury stock method. The FASB has recommended the use of the ending market price (in an Exposure Draft released for comment on August 7, 2008), but that proposal has been pushed to the back burner while other more pressing issues are discussed. The examples and exercises in this chapter use average market price for the period, which is what is currently required under both U.S. GAAP and IFRS.

using the proceeds from the exercise of the options. Accordingly, the number of shares of stock for computing diluted EPS would be increased by 1,000 shares.<sup>4</sup>

### Illustration of Diluted Earnings per Share with Stock Options

The use of the treasury stock method in computing diluted EPS is illustrated with the following data for Rasband Corporation.

*Summary of relevant information:*

Net income for the year . . . . .	\$ 92,800
Common shares outstanding (no change during year) . . . . .	100,000
Options outstanding to purchase common shares . . . . .	20,000
Exercise price per share on options . . . . .	\$ 6
Average market price for the period for common shares . . . . .	\$10

*Basic earnings per share:*

Net income for the year . . . . .	\$ 92,800
Actual number of shares outstanding . . . . .	÷100,000
Basic EPS (\$92,800/100,000) . . . . .	<u>\$ 0.93</u>

*Application of proceeds from assumed exercise of options outstanding to purchase treasury stock:*

Proceeds from assumed exercise of options outstanding (20,000 × \$6) . . . . .	<u>\$120,000</u>
Number of outstanding shares assumed to be repurchased with proceeds from options (\$120,000/\$10) . . . . .	<u>12,000</u>

*Number of shares to be used in computing diluted earnings per share:*

Actual number of shares outstanding . . . . .	100,000
Incremental shares:	
Issued on assumed exercise of options . . . . .	20,000
Less: Assumed repurchase of shares from proceeds of options . . . . .	<u>12,000</u> 8,000
Total . . . . .	<u>108,000</u>
Diluted EPS (\$92,800/108,000) . . . . .	<u>\$ 0.86</u>

If the stock options had been issued to the company's employees on April 1 of the current year, the incremental shares would be three-fourths of 8,000, or 6,000 shares, and the diluted EPS would be \$0.88 (\$92,800/106,000).

If the market price of the company's stock is less than the option exercise price, the treasury stock computation would cause the EPS to increase when compared to basic EPS because the incremental shares would be negative rather than positive. To illustrate, assume that the average market price for Rasband Corporation is \$5 rather than \$10. In this case, 24,000 shares could be purchased with the \$120,000 proceeds from the stock options. Because only 20,000 shares would be issued on exercise of the options, the number of shares for computing diluted EPS would be 96,000 and the diluted EPS would be \$0.97. When compared with basic EPS of \$0.93, the result is antidilution.

<sup>4</sup> In this example, the amount of the proceeds from the hypothetical exercise of the options by the employees is set at the exercise price of \$40 per share. According to the FASC ASC paragraph 260-10-45-29, for employee stock options the hypothetical proceeds should be increased by the future compensation expense expected to be recognized in connection with the options before their exercise. Also, the hypothetical proceeds are to be increased by the value of any excess tax benefits expected to be generated by the future exercise of the options. In other words, the hypothetical exercise amount is the total amount of value expected to accrue to the company through the eventual exercise of the options by the employees—exercise price plus the value of future employee services plus the value of excess tax benefits. For simplicity, the examples in this chapter ignore the unrecognized compensation expense and the expected excess tax benefits.

Don't make the mistake of viewing this as just one more example of accounting conservatism in that options that would decrease earnings per share are included in the calculation but that options that would increase earnings per share are excluded. Actually, this is an example of when the accounting rules do a good job at reflecting underlying economic reality. Options that are "in the money" (the stock price is currently greater than the exercise price) are likely to be exercised in the future. Thus, it makes sense to include these options in the calculation of diluted earnings per share. On the other hand, options that are currently "out of the money" (the stock price is currently less than the exercise price) are less likely to be exercised in the future. So, the notion of how likely it is that the options will be exercised corresponds exactly with whether the options are dilutive or antidilutive.

Thus, the test for antidilution of stock options, warrants, and rights is simply to compare the average market price with the exercise price. If the market price exceeds the exercise price, the options are dilutive and would be included "as if" they are exercised in computing diluted EPS. If the average market price is less than the exercise price, the options are antidilutive and would not be used in computing diluted EPS.

FYI

If stock options, warrants, or rights are determined to be dilutive, then only the *denominator* is affected in the diluted EPS computation.

## Diluted Earnings per Share—Convertible Securities

4

Use the if-converted method to compute diluted earnings per share when a company has convertible preferred stock or convertible bonds outstanding.

**WHY** Convertible securities represent potential new shares of common stock that can become actual common shares whether the existing common shareholders approve or not. Because the conversion of these securities can potentially impact the portion of the earnings that will flow to the existing common shareholders, those shareholders should be made aware of the magnitude of that potential dilution.

**HOW** For convertible bonds, interest expense (net of tax) must be added back to the numerator, and the number of shares that would be issued upon conversion is included in the denominator. For convertible preferred stock, preferred dividends must be added back to income available to common shareholders, and the denominator is increased by the number of shares that would be issued upon conversion.

To compute diluted EPS when convertible securities exist, adjustments must be made both to net income and to the number of shares of common stock outstanding. These adjustments must reflect what these amounts would have been if the conversion had taken place at the beginning of the current year or at the date of issuance of the convertible securities, whichever comes later. This method of including convertible securities in the EPS computation is referred to as the **if-converted method**. If the securities are bonds, net income is adjusted by adding back the interest expense, net of tax, to net income; the number of shares of common stock outstanding is increased by the number of shares that would have been issued on conversion.<sup>5</sup> Any amortization of initial premium or discount

<sup>5</sup> In addition to adjustments for interest, adjustments to net income for nondiscretionary or indirect items would have to be made in many situations. These items would include profit-sharing bonuses and other payments whose amount is determined by the net income reported. For simplicity, no indirect effects are illustrated in this chapter.

is included in the interest expense added back. If the convertible securities are shares of preferred stock, no reduction is made from net income for preferred dividends, as is done with the computation of basic EPS; the number of shares of common stock outstanding is increased by the number of shares that would have been issued on conversion. Because preferred stock dividends are not deductible as an expense for tax purposes, no adjustment for tax effects is required. If the convertible securities were issued during the year, adjustments would be made for only the portion of the year since the issuance date.

To test for dilution, each potentially dilutive convertible security must be evaluated individually. If there is only one such security, comparison is made of EPS before considering the convertible security with the EPS after including it. As indicated earlier, if the EPS

decreases or loss per share increases, the convertible security is defined as dilutive. Antidilutive securities are excluded from the computation of diluted EPS. We will now look at an example of the two most common types of dilutive securities: convertible bonds and convertible preferred stock.

FYI

If convertible securities are determined to be dilutive, both the *numerator* and the *denominator* are affected in the diluted EPS computation.

### Illustration of Diluted Earnings per Share with Convertible Securities

The following examples for Reid Corporation illustrate the computation of diluted EPS when convertible securities exist.

#### Summary of relevant information:

8% convertible bonds issued at par	\$ 500,000
Net income for the year	\$ 83,000
Common shares outstanding (no change during year)	100,000
Conversion terms of convertible bonds—80 shares for each \$1,000 bond	
Assumed tax rate	30%

#### Basic earnings per share:

Net income	\$ 83,000
Actual number of shares outstanding	÷ 100,000
Basic EPS (\$83,000/100,000)	<u>\$ 0.83</u>

#### Diluted earnings per share:

Net income	\$ 83,000
Add interest on convertible bonds, net of income tax:	
Interest (\$500,000 × 8%)	\$40,000
Less: Income tax savings (\$40,000 × 30%)	<u>12,000</u>
Adjusted net income	<u>\$ 111,000</u>
Actual number of shares outstanding	100,000
Additional shares issued on assumed conversion of bonds (500 × 80)	<u>40,000</u>
Adjusted number of shares	<u>140,000</u>
Diluted EPS (\$111,000/140,000)	<u>\$ 0.79</u>

### Computation of Diluted Earnings per Share for Securities Issued during the Year

If the convertible bonds had been issued by Reid Corporation on June 30 of the current year, the adjustment would be made to reflect only the period subsequent to the issuance date, or one-half of a year.

*Diluted earnings per share:*

Net income .....		\$ 83,000
Add interest on convertible bonds, net of income tax:		
Interest ( $\$500,000 \times 8\% \times 1/2$ year) .....	\$20,000	
Less: Income tax ( $\$20,000 \times 30\%$ ) .....	6,000	14,000
Adjusted net income .....		<u>\$ 97,000</u>
Actual number of shares outstanding .....		100,000
Additional shares issued on assumed conversion of bonds ( $500 \times 80 \times 1/2$ ) .....		20,000
Adjusted number of shares .....		<u>120,000</u>
Diluted EPS ( $\$97,000/120,000$ ) .....		<u>\$ 0.81</u>

Convertible preferred stock is treated in a manner similar to that for convertible debt securities (bonds). To illustrate application of the if-converted method to preferred stock, assume the same facts as given previously for Reid Corporation except that instead of 8% convertible bonds, the company has 8% preferred stock outstanding, par value \$500,000, convertible into 40,000 shares of common stock. Note that because Reid would have no bond interest under the change in assumptions, the reported net income would be \$111,000 (\$83,000 + \$28,000 bond interest net of tax savings). Assume the preferred stock was outstanding for the entire year.

**CAUTION**

Remember that with convertible preferred stock, preferred dividends were initially subtracted from income to arrive at income available to common shareholders. If we assume conversion, those dividends must be added back. Also remember that no tax effect is associated with preferred dividends.

*Basic earnings per share:*

Net income, without the deduction for interest on bonds .....	\$ 111,000
Less: Preferred dividends .....	<u>40,000</u>
Net income identified with common stock .....	\$ 71,000
Actual number of shares outstanding .....	$\div 100,000$
Basic EPS ( $\$71,000/100,000$ ) .....	<u>\$ 0.71</u>

*Diluted earnings per share:*

Net income assuming no payment of preferred dividends due to conversion .....	\$ 111,000
Actual number of shares outstanding .....	100,000
Additional shares issued on assumed conversion of preferred stock .....	<u>40,000</u>
Adjusted number of shares .....	<u>140,000</u>
Diluted EPS ( $\$111,000/140,000$ ) .....	<u>\$ 0.79</u>

In this example, diluted EPS (\$0.79) is more than basic EPS (\$0.71). Thus, the convertible preferred stock is antidilutive and would not be considered in the computation of EPS. Assuming that the corporation had no other potentially dilutive securities outstanding, only basic EPS would be presented on the income statement.

**Shortcut Test for Antidilution**

It is possible to determine whether a convertible security is antidilutive without actually computing diluted EPS assuming conversion. If a company has net income rather than loss, the antidilutive test is performed by computing what the conversion contributes to per-share earnings. For example, if the 8% bonds are converted, net income to the common shareholders increases by \$28,000, and the number of common shares outstanding

increases by 40,000 shares. The contribution of this conversion to earnings is \$0.70 ( $\$28,000/40,000$ ) per share. Because this amount is less than the preconversion basic EPS of \$0.83, the bonds are dilutive. On the other hand, if the preferred stock is converted, the preferred dividends of \$40,000 would no longer be deducted from net income in computing EPS, and the number of common shares outstanding would increase by 40,000 shares. The contribution of this conversion to earnings is \$1.00 ( $\$40,000/40,000$ ) per share. Because the preferred stock conversion contributes more per share than preconversion basic earnings of \$0.71, the preferred stock is antidilutive.

## Effect of Actual Exercise or Conversion

- 5** Factor into the diluted earnings per share computations the effect of actual conversion of convertible securities or the exercise of options, warrants, or rights during the period, and understand the antidilutive effect of potential common shares when a firm reports a loss from continuing operations.

**WHY** The diluted EPS computation is intended to present the worst-case scenario for the common shareholders. Of course, the worst-case scenario doesn't always actually occur. However, for comparability across companies, the diluted EPS should always reflect the worst that could have happened, whether that actually happened during the period or not.

**HOW** If conversion or exercise actually takes place during a period, an adjustment to the computation of diluted EPS must be made to reflect what the EPS would have been if conversion or exercise had taken place at the beginning of the period or the issuance date if issued during the period. When a company reports a net loss, no presentation of diluted EPS is required because inclusion of stock options or convertible securities would decrease the loss per share and thus always would be antidilutive.

Recall that if additional shares are issued as a result of securities being converted, those newly issued shares would be included in the computation of the weighted-average number of shares outstanding for the period. In addition, however, an adjustment must be made to reflect what the EPS would have been if conversion or exercise had taken place at the beginning of the period or issuance date, whichever comes later. This adjustment is required for all securities actually converted or exercised during the period for computing diluted EPS whether dilutive or not.

When options or warrants are exercised, the adjustment for the period before exercise for diluted EPS uses the market price at exercise date. To illustrate the computation of diluted EPS when stock options are exercised during the year, assume the following data for Weatherby, Inc.

*Summary of relevant information:*

Net income for the year . . . . .	\$2,300,000
Common shares outstanding at beginning of year . . . . .	400,000
Options outstanding at beginning of year to purchase common shares . . . . .	100,000
Exercise price per share on options . . . . .	\$ 9.00
Proceeds from actual exercise of options on October 1 of current year . . . . .	\$ 900,000
Market price of common stock at exercise date, October 1 . . . . .	\$ 15.00

*Number of shares to be used in computing basic earnings per share:*

Actual number of shares outstanding for full year . . . . .	400,000
Weighted-average shares issued on October 1 ( $100,000 \times 3/12$ ) . . . . .	25,000
Weighted-average number of shares for basic EPS . . . . .	<u>425,000</u>
Basic EPS ( $\$2,300,000/425,000$ ) . . . . .	<u>\$ 5.41</u>

Number of shares to be used in computing diluted earnings per share:

Weighted-average number of shares for basic EPS .....	425,000
Incremental shares if options had been exercised on January 1 (included whether dilutive or not):	
Issued on assumed exercise of options .....	100,000
Less: Assumed repurchase of shares with proceeds (\$900,000/\$15) .....	60,000
Incremental shares assumed to be issued .....	<u>40,000</u>
Weighted average of incremental shares assumed to be issued (40,000 × 9/12) ...	30,000
Weighted-average number of shares for diluted EPS .....	<u>455,000</u>
Diluted EPS (\$2,300,000/455,000) .....	<u>\$ 5.05</u>

**Mandatorily Convertible Securities** Typically, convertible preferred stock and convertible bonds are converted at the option of the security holders. However, in some cases convertible instruments must be converted upon the occurrence of some event or upon the passing of a specified amount of time. In a 2008 Exposure Draft, the FASB proposed new EPS treatment for mandatorily convertible bonds and preferred stock. The proposal is that for computation of diluted EPS these instruments be treated as if they had been converted at the beginning of the period in which the conditions were satisfied to make them mandatorily convertible. This means that from that period forward, the completed conversion of these instruments would be assumed in the computation of diluted EPS. This is also consistent with SEC guidance (FASB ASC paragraph 260-10-S99-2). As of this writing, the final adoption of this provision by the FASB is not certain, but it is likely.

## STOP & THINK

In the case of securities actually converted during the year, why must we assume conversion occurred at the beginning of the period in the computation of diluted EPS when we know it did not?

- Without this assumption, the number of shares in the denominator will not be comparable with prior years.
- Without this assumption, the ending retained earnings balance will not be calculated correctly.
- The diluted EPS computation is intended to present the worst-case scenario for the common shareholders.
- The diluted EPS computation is intended to reflect the most likely scenario for the common shareholders.

### Effect of a Loss from Continuing Operations on Earnings per Share

If a company reports a loss from continuing operations—referred to as the *control number*—no dual computation of EPS is necessary because inclusion of convertible securities would decrease the loss per share and thus always would be antidilutive. This is the case even if, as a result of below-the-line items such as discontinued operations, the firm reports net income. To illustrate this situation, assume the following data for Boggs Co.

Summary of relevant information:

Loss from continuing operation .....	\$(50,000)
Extraordinary gain .....	75,000
Net income .....	<u>\$ 25,000</u>
Number of shares of stock outstanding—full year .....	100,000
Number of shares of convertible preferred stock .....	10,000
Conversion terms—2 shares of common for 1 share of preferred	
Dividends on preferred stock .....	\$ 8,000

The computation of basic and diluted EPS would be as follows:

*Basic loss per share:*

Loss from continuing operations . . . . .	\$ (50,000)
Dividends on preferred stock . . . . .	(8,000)
Total loss to common shareholders . . . . .	<u>\$ (58,000)</u>
Actual number of shares outstanding . . . . .	100,000
Basic loss per share—from continuing operations (\$58,000/100,000) . . . . .	\$ (0.58)
Basic EPS—extraordinary gain (\$75,000/100,000) . . . . .	0.75
Basic EPS—net income available to common shareholders (\$17,000/100,000) . . . . .	<u>\$ 0.17</u>

*Diluted loss per share:*

Loss from continuing operations . . . . .	<u>\$ (50,000)</u>
Actual number of shares outstanding . . . . .	100,000
Incremental shares on assumed conversion of preferred stock . . . . .	20,000
Adjusted number of shares . . . . .	<u>120,000</u>
Diluted loss per share (\$50,000/120,000) . . . . .	<u>\$ (0.42)</u>

Because the diluted loss per share from continuing operations is less than the basic loss per share from continuing operations, only information relating to basic EPS computations would be reported on the income statement. This is the case even though net income is positive. The comparison for determining dilution is made using the control number, income (or loss) from continuing operations, not net income.

**FYI**

Options are also ignored when a company reports a loss from continuing operations. This is done because the options most likely to be exercised, those in the money, would spread the loss among a greater number of shares and reduce the loss per share. Because of this counterintuitive impact, all potentially dilutive securities are ignored when a company reports a loss from continuing operations.

## Multiple Potentially Dilutive Securities

**6**

Determine the order in which multiple potentially dilutive securities should be considered in computing diluted earnings per share.

**WHY** For a company with several different potentially dilutive securities, it can be difficult to identify the lowest diluted EPS number among all of the possible combinations. A systematic ordering of the potentially dilutive securities greatly simplifies this process.

**HOW** In those instances when a firm has multiple potentially dilutive securities, the individual effect of each security is computed, and the securities are considered in turn beginning with the security with the least favorable effect on basic EPS. The procedure is repeated until the diluted EPS figure is lower than the next security's incremental EPS impact.

The illustrations in the chapter thus far have dealt primarily with one type of potentially dilutive security at a time. For a company having several different issues of convertible securities and/or stock options and warrants, the FASB requires selection of the combination of securities producing the *lowest possible EPS figure*. To avoid having to test a large number of different combinations to find the lowest one, companies can compute the incremental EPS for each potentially dilutive security. Because the smaller the incremental computation, the greater the impact on basic EPS, the securities are then ranked in order

from the smallest incremental EPS to the largest.<sup>6</sup> Then each security—beginning with the one having the smallest incremental EPS—is introduced into the computation until the EPS is lower than the next security’s incremental computation. At that point, all remaining securities in the list would be antidilutive. Any dilutive stock options and warrants are considered first before introducing convertible securities into the computations.

To illustrate, assume that a company had no stock options but did have four convertible securities that would have the following effects on diluted EPS if each were considered separately.

	Effects of Assumed Conversion		
	Increase in Net Income	Increase in No. of Shares	Incremental EPS
Convertible Security A . . . . .	\$ 75,000	50,000	\$1.50
Convertible Security B . . . . .	150,000	60,000	2.50
Convertible Security C . . . . .	110,000	20,000	5.50
Convertible Security D . . . . .	600,000	100,000	6.00

Assume further that basic EPS was \$6.50 (\$2,275,000 income divided by 350,000 outstanding shares). Each of the four securities considered separately results in an incremental EPS figure lower than basic EPS and thus would be potentially dilutive. However, when considering all four securities together, only the first two (A and B) would be dilutive and therefore included in diluted EPS. This is determined by adding one security at a time to the basic EPS figure as follows:

	Net Income (Adjusted)	No. of Shares (Adjusted)	Diluted EPS
Simple capital structure . . . . .	\$2,275,000	350,000	\$6.50
Convertible Security A . . . . .	<u>75,000</u>	<u>50,000</u>	
	\$2,350,000	400,000	5.88
Convertible Security B . . . . .	<u>150,000</u>	<u>60,000</u>	
	\$2,500,000	460,000	5.43
Convertible Security C . . . . .	<u>110,000</u>	<u>20,000</u>	
	\$2,610,000	480,000	5.44
Convertible Security D . . . . .	<u>600,000</u>	<u>100,000</u>	
	<u>\$3,210,000</u>	<u>580,000</u>	5.53

It would not be necessary to continue the computation beyond Security B because the EPS at that point (\$5.43) is lower than the incremental EPS impact of Security C (\$5.50). Inclusion of Securities C and D would be antidilutive as the computations show.

When a company has multiple potentially dilutive convertible securities, an orderly approach to computing EPS is necessary. Exhibit 18-3 should prove helpful in understanding the above illustration and in solving complex EPS problems. The exhibit summarizes the steps in computing basic and diluted EPS.

<sup>6</sup>FASB ASC paragraph 260-10-45-18.

**EX 18-3 STEPS IN COMPUTING EARNINGS PER SHARE**

1. Compute basic EPS using a weighted-average number of shares for common stock outstanding during the year.
2. For companies with complex capital structures, determine whether stock options, warrants, rights, and convertible securities are potentially dilutive.
  - (a) Stock options, warrants, and rights: Dilutive if the exercise price is less than the average market price of the common stock.
  - (b) Convertible securities: Compute incremental EPS for each security individually. Those with an incremental value greater than basic EPS after considering any stock options, warrants, or rights are antidilutive and are excluded.
3. Compute diluted EPS:
  - (a) Include all dilutive stock options, warrants, and rights first. Apply proceeds using the treasury stock method at the average common stock market price for the period to compute incremental shares.
  - (b) Include potentially dilutive convertible securities one at a time, beginning with the security that has the smallest incremental EPS. Compute a new EPS figure. Continue selecting and applying convertible securities until the next security in the list has an incremental EPS value greater than the last computed EPS. Discontinue the process at that point. All other securities in the list are antidilutive for purposes of computing the lowest possible diluted EPS figure.
4. Report basic and diluted EPS on the face of the income statement.

© 2012 Cengage Learning.

To illustrate the steps in Exhibit 18-3 for computing basic and diluted EPS, assume the following facts related to Wildwood, Inc.

*Summary of relevant information:*

Net income for the year	\$136,000
Common shares outstanding (no change during the year)	125,000
Options outstanding to purchase common shares	30,000
Exercise price per share on options	\$10
Average market price for the period for common shares	\$15
9% convertible bonds, issued at par	\$600,000
Conversion terms for bonds, 100 shares for each \$1,000 bond	
Tax rate	30%

*Step 1—Compute basic earnings per share:*

Net income for the year	\$ 136,000
Actual number of shares outstanding	<u>÷ 125,000</u>
Basic EPS (\$136,000/125,000)	<u>\$ 1.09</u>

*Step 2—Determine whether stock options and convertible bonds are dilutive:*

- (a) Stock options: The options are dilutive because the exercise price is less than the average market price.
- (b) Convertible bonds: The bonds are potentially dilutive because the EPS impact of \$0.63, as computed in the following table, is less than basic EPS of \$1.09. As shown in step 3 below, not only are the convertible bonds potentially dilutive, but they are also actually dilutive since the incremental EPS impact of \$0.63 is less than the adjusted EPS of \$1.01.

Net Income Impact	Number of Shares	EPS Impact
$\$600,000 \times 0.09 \times (1 - 0.30) = \$37,800$	60,000	\$0.63

Step 3—Compute diluted earnings per share:

Description	Net Income	Number of Shares	EPS
Basic EPS . . . . .	<u>\$136,000</u>	125,000	<u>\$1.09</u>
Options as if exercised at beginning of year:			
Number of shares assumed issued . . . . .	30,000		
Less: Number of treasury shares assumed			
Repurchased [(30,000 × \$10)/\$15]. . . . .	<u>(20,000)</u>		
Incremental shares . . . . .	<u>10,000</u>	<u>10,000</u>	
	\$136,000	135,000	<u>\$1.01</u>
9% Convertible bonds . . . . .	37,800	60,000	
Diluted EPS . . . . .	<u>\$173,800</u>	<u>195,000</u>	<u>\$0.89</u>

## Financial Statement Presentation

7

Understand the disclosure requirements associated with basic and diluted earnings per share computations.

**WHY** Because of the great interest of financial statement users in earnings per share data, both basic and diluted EPS are highlighted by being included directly in the income statement.

**HOW** Both basic and diluted EPS are reported on the face of the income statement for those companies with a complex capital structure. For companies with a simple capital structure, only basic EPS is reported. Companies reporting below-the-line items on their income statement may report the per-share effects of these items either on the face of the income statement or in the notes.

Companies with a simple capital structure are required to present basic EPS on the face of the income statement. For those companies with a complex capital structure, both basic and diluted EPS for both income from continuing operations and net income are to be disclosed on the face of the income statement. When earnings of a period include income or loss from discontinued operations or extraordinary items, EPS amounts for these line items may be presented either on the face of the income statement or in the notes to the financial statements.

Firms are also required to provide the following disclosure items in the notes to the financial statements:<sup>7</sup>

1. A reconciliation of both the numerators and the denominators of the basic and diluted EPS computations for income from continuing operations. The example from step 3 in the Wildwood, Inc., example illustrates the type of reconciliation required.
2. The effect that preferred dividends have on the EPS computations.
3. Securities that could potentially dilute basic EPS in the future that were not included in computing diluted EPS this period because those securities were antidilutive for the current period.
4. Disclosure of transactions that occurred after the period ended but prior to the issuance of financial statements that would have materially affected the number of common shares outstanding or potentially outstanding such as the issuance of stock options.

Earnings per share data should be presented for all periods covered by the income statement. If potential dilution exists in any of the periods presented, the dual presentation

<sup>7</sup> FASB ASC paragraph 260-10-50-1.

of basic and diluted EPS should be made for all periods presented.<sup>8</sup> If basic EPS and diluted EPS are the same amount, one amount can be presented on the income statement. Whenever net income of prior periods has been restated as a result of a prior-period adjustment, the EPS for these prior periods should be restated and the effect of the restatements disclosed in the current year.<sup>9</sup> Exhibit 18-4 illustrates the disclosure required when presenting earnings per share, using information from H. J. Heinz's 2009 annual report.

Note that Heinz subtracts preferred dividends in computing basic EPS, includes the incremental number of shares associated with dilutive securities, and does not include some options in the calculations because their effect would have been antidilutive.

It is important that great care be exercised in interpreting EPS data regardless of the degree of refinement applied in the development of the data. These EPS figures are the products of the principles and practices employed in the accounting process and are subject to the same limitations found in the net income measurement reported on the income statement.

## EX 18-4 H. J. HEINZ NOTE DISCLOSURE RELATING TO EARNINGS PER SHARE

### 14. INCOME PER COMMON SHARE

The following are reconciliations of income to income applicable to common stock and the number of common shares outstanding used to calculate basic EPS to those shares used to calculate diluted EPS.

Fiscal Year Ended	April 29, 2009	April 30, 2008	May 2, 2007
(Amounts in thousands)	(52 Weeks)	(52 Weeks)	(52 Weeks)
Income from continuing operations . . . . .	\$923,072	\$844,925	\$791,602
Preferred dividends . . . . .	12	12	13
Income from continuing operations applicable to common stock . . . . .	<u>\$923,060</u>	<u>\$844,913</u>	<u>\$791,589</u>
Average common shares outstanding—basic . . . . .	313,747	317,019	328,625
Effect of dilutive securities:			
Convertible preferred stock . . . . .	106	109	123
Stock options, restricted stock and the global stock purchase plan . . . . .	4,210	4,589	3,720
Average common shares outstanding—diluted . . . . .	<u>318,063</u>	<u>321,717</u>	<u>332,468</u>
Income/(Loss) Per Common Share:			
Diluted			
Continuing operations . . . . .	\$ 2.90	\$ 2.63	\$ 2.38
Discontinued operations . . . . .	—	—	(0.02)
Net Income . . . . .	<u>\$2.90</u>	<u>\$ 2.63</u>	<u>\$ 2.36</u>
Average common shares outstanding—Diluted . . . . .	<u>318,063</u>	<u>321,717</u>	<u>332,468</u>
Basic			
Continuing operations . . . . .	\$2.94	\$2.67	\$2.41
Discontinued operations . . . . .	—	—	(0.02)
Net Income . . . . .	<u>\$2.94</u>	<u>\$2.67</u>	<u>\$ 2.39</u>
Average common shares outstanding—Basic . . . . .	<u>313,747</u>	<u>317,019</u>	<u>328,625</u>
Cash dividends per share . . . . .	<u>\$ 1.66</u>	<u>\$ 1.52</u>	<u>\$ 1.40</u>

Diluted earnings per share is based upon the average shares of common stock and dilutive common stock equivalents outstanding during the periods presented. Common stock equivalents arising from dilutive stock options, restricted common stock units, and the global stock purchase plan are computed using the treasury stock method.

Options to purchase an aggregate of 3.7 million, 6.1 million and 9.1 million shares of common stock as of April 29, 2009, April 30, 2008 and May 2, 2007, respectively, were not included in the computation of diluted earnings per share because inclusion of these options would be anti-dilutive. These options expire at various points in time through 2016.

<sup>8</sup> FASB ASC paragraph 260-10-45-7.

<sup>9</sup> FASB ASC paragraph 260-10-45-25.

**EM EXPANDED MATERIAL**

In this Expanded Material, we take the opportunity to combine most of the complexities associated with EPS computations into one example. This example reviews basic and diluted EPS computations and considers stock options, convertible preferred stock, and convertible debt. As you will see, care must be exercised in determining whether a security is dilutive.

## Comprehensive Illustration Using Multiple Potentially Dilutive Securities

**8** Make complex earnings per share computations involving multiple potentially dilutive securities.

**WHY** The correct computation of diluted EPS is almost hopelessly complex for a company with several potentially dilutive securities UNLESS those computations are done in the correct order.

**HOW** The diluted EPS computations are greatly simplified if they are done in the correct sequence with the securities with the lowest incremental EPS being considered first, then the next lowest, and so forth.

The steps outlined in Exhibit 18-3 (page 18-22) for computing EPS for multiple securities are used in the comprehensive problem that follows. Circle West Transportation Company has the following outstanding stocks and bonds at January 1, 2013. All securities had been sold at par or face value.

Date of Issue	Type of Security	Par or Face Value	No. of Shares or Total Face Value	Conversion Terms
2002–2012	Common stock	\$ 0.25	200,000	None
May 1, 2007	12% debentures	1,000	\$750,000	None
Jan. 1, 2011	6% cumulative preferred stock	100	40,000	4 shares of common for each preferred share
Jan. 1, 2012	6% debentures	1,000	\$1,000,000	15 shares of common for each \$1,000 debenture
June 30, 2012	10% debentures	1,000	\$600,000	30 shares of common for each \$1,000 debenture
Dec. 31, 2012	8% cumulative preferred stock	50	12,500	None

Circle West also had stock options outstanding at January 1, 2013, for the purchase of 20,000 shares of common stock. During 2013, options were granted for an additional 40,000 shares. The terms of these stock options are as follows:

Date of Issue	Exercisable Date	Exercise Price	Number of Options
Jan. 1, 2010	Oct. 1, 2013	\$30	20,000
Oct. 1, 2013	June 30, 2015	60	40,000

Common stock market prices for 2013 were as follows:

Average for year .....	\$61
Average for first 9 months of year .....	62
Oct. 1 price .....	62
Dec. 31 price .....	61

During 2013, Circle West issued the following common stock:

- Apr. 1      30,000 shares sold at \$56.
- Oct. 1      20,000 shares issued from exercise of Jan. 1, 2010, options.

On December 1, 2013, Circle West paid a full year’s dividend on the 6% preferred stock and on the 8% preferred stock. Assume that the company had net income of \$1,026,000 in 2013, all from income from continuing operations. The income tax rate is 30%.

The steps for computing EPS will be applied to the data for Circle West Transportation Company to compute the various EPS amounts.

*Step 1—Compute basic earnings per share:*

Net income .....			\$1,026,000
Less: Preferred dividends:			
6% stock (40,000 × \$100 × 0.06) .....		\$240,000	
8% stock (12,500 × \$50 × 0.08) .....		<u>50,000</u>	<u>290,000</u>
Net income identified with common stock .....			<u>\$ 736,000</u>
Weighted-average number of shares:			
Jan. 1 to Apr. 1	200,000 × 3/12 .....	50,000	
Apr. 1 to Oct. 1	(200,000 + 30,000) 230,000 × 6/12 .....	115,000	
Oct. 1 to Dec. 31	(230,000 + 20,000) 250,000 × 3/12 .....	<u>62,500</u>	
Total weighted-average number of shares .....		<u>227,500</u>	
Basic earnings per share (\$736,000/227,500) .....			<u>\$ 3.24</u>

*Step 2—Determine whether options and convertible securities are dilutive:*

- (a) Stock options: Both stock options are dilutive because the exercise prices (\$30 and \$60) are less than the applicable market prices (\$62 on October 1 for the exercised options and \$61 average market price for the year for the unexercised options).
- (b) Convertible securities:

	Net Income Impact	Number of Shares	Incremental EPS
6% preferred stock .....	\$240,000	160,000	\$1.50
10% debentures .....	42,000*	18,000	2.33
6% debentures .....	42,000†	15,000	2.80

\*\$600,000 × 0.10 × (1 - 0.30)  
 †\$1,000,000 × 0.06 × (1 - 0.30)

All three convertible securities are potentially dilutive because their impact on EPS is less than the \$3.24 basic EPS. Whether the securities are actually dilutive depends on the comparison with the recomputed EPS, as shown in step 3.

Step 3—Compute diluted earnings per share:

Description	Net Income	Number of Shares	Part of Year	Weighted Average Shares	EPS
Basic earnings per share . . . . .	<u>\$ 736,000</u>			227,500	<u>\$3.24</u>
Jan. 1, 2010, options—exercised Oct. 1, as if exercised Jan. 1, 2013:					
Number of shares assumed issued . . . . .		20,000			
Less: Number of treasury shares assumed repurchased (20,000 × \$30)/\$62 . . . . .		(9,677)			
Incremental shares . . . . .		<u>10,323</u>	9/12	7,742	
Oct. 1, 2013, options:					
Number of shares assumed issued . . . . .		40,000			
Number of treasury shares assumed repurchased (40,000 × \$60)/\$61 . . . . .		(39,344)			
Incremental shares . . . . .		<u>656</u>	3/12	164	
	\$ 736,000			235,406	<u>\$3.13</u>
6% preferred stock . . . . .	240,000	160,000	12/12	160,000	
	<u>\$ 976,000</u>			395,406	<u>\$2.47</u>
10% debentures . . . . .	42,000		12/12	18,000	
Diluted EPS . . . . .	<u>\$1,018,000</u>			<u>413,406</u>	<u>\$2.46</u>

6% debentures: Because incremental EPS value of \$2.80 exceeds latest EPS of \$2.46, the debentures are antidilutive and not included in diluted EPS.

Circle West would report basic EPS of \$3.24 and diluted EPS of \$2.46. In addition, Circle West would provide note information similar to that developed in step 3.

### SOLUTIONS TO OPENING SCENARIO QUESTIONS

1. A P/E ratio reflects the relationship between a company's current earnings and its current stock price. In general, a higher P/E ratio is indicative of a company for which the market has higher growth expectations. Lower P/E ratios are associated with companies with lower growth prospects.
2. The Chinese oil companies have many, many more shares outstanding than does ExxonMobil.

Thus, when the amount of earnings is divided by the number of shares, the resulting earnings per share is a low number. Think of it like this: Who has more money—a person with \$1,000,000 in \$100 dollar bills or a person with \$1,000,000 in \$1 bills? Of course, both people have the same amount of money, a million dollars. The difference is that the second person has his or her wealth divided up into many, many more little pieces.

### SOLUTIONS TO STOP & THINK

1. (Page 18-9) The correct answer is D. If prior-period income statements were not adjusted for stock splits and stock dividends occurring in the current period, the comparisons of per-share information across periods would be meaningless in determining trend information.

The per-share computations provide financial statement users with a measure of profitability scaled by the number of ownership shares in the company. If the number of shares should change over time (without any new investment, such as with stock splits and stock dividends),

that new information should be reflected in the current period's financial statements.

2. (Page 18-19) The correct answer is C. The diluted EPS computation is intended to present the worst-case scenario for the common shareholders. Of course, the worst-case scenario doesn't always actually occur. However, for comparability across companies, the diluted EPS should always reflect the worst that could have happened, whether that actually

happened during the period or not. Recall that diluted EPS assumes conversion occurs at the beginning of the period or the date of issuance, whichever comes later. The computations associated with basic EPS already include the time period relating to the actual conversion. For diluted EPS, we must make an additional adjustment to include the time period for which the convertible securities (or options) were outstanding during the period.

## SOLUTION TO USING THE FASB'S CODIFICATION

The only Subtopic under Topic 260, Earnings per Share, is Subtopic 10—General. Under that subtopic, there is a section on scope. The required statement on scope is FASB ASC paragraph 260-10-15-2: "The guidance in the Earnings per Share Topic requires presentation of earnings per share (EPS) by all entities that have issued common stock or potential common stock (that is, securities such as options, warrants, convertible securities, or contingent stock agreements) if those securities trade in a public market either on a stock exchange (domestic or foreign) or in the over-the-counter

market, including securities quoted only locally or regionally. This Topic also requires presentation of EPS by an entity that has made a filing or is in the process of filing with a regulatory agency in preparation for the sale of those securities in a public market."

So, because Della Bee Enterprises does not have shares that trade on any exchange, and is not in the process of preparing to go public, the company does NOT need to present EPS data. You are right, and the intern is wrong.

# REVIEW CHAPTER 18

## LEARNING OBJECTIVES

- 1** Know the difference between a simple and a complex capital structure, and understand how dilutive securities affect earnings per share computations.

FASB ASC Topic 260, Earnings per Share, requires two EPS computations: basic and diluted. *Dilution* relates to those convertible securities and stock options that, if exercised, would result in a decrease in EPS. A simple capital structure exists when a company has no convertible securities, stock options, warrants, or other rights outstanding. A company with convertible securities or stock options that would, if exercised, result in a dilution in EPS is considered to have a complex capital structure.

- 2** Compute basic earnings per share, taking into account the sale and repurchase of stock during the period as well as the effects of stock splits and stock dividends.

Basic EPS is computed by dividing income available to common shareholders by the weighted-average number of common shares outstanding. If a company splits its stock or declares a stock dividend, a retroactive recognition of this change must be made in determining the weighted-average number of shares outstanding. When comparative financial statements are presented, the common shares outstanding for all periods shown must be adjusted to reflect any stock dividend or stock split in the current period.

**3 Use the treasury stock method to compute diluted earnings per share when a firm has outstanding stock options, warrants, and rights.**

If a firm has stock options, warrants, or rights outstanding, a determination must be made as to their potential effects on EPS. If the exercise price is less than the average market price for the period, the option, warrant, or right is considered dilutive and would be included in computing diluted EPS. The treasury stock method involves determining the number of incremental shares that would be issued assuming that the options, warrants, or rights were exercised and the proceeds used to buy treasury shares on the market.

**4 Use the if-converted method to compute diluted earnings per share when a company has convertible preferred stock or convertible bonds outstanding.**

A company with convertible securities may be required to adjust both the numerator and the denominator in computing diluted EPS if those convertible securities are determined to be potentially dilutive. In the case of convertible bonds, interest expense (net of tax) must be added back to the numerator, and the number of shares that would be issued upon conversion would be included in the denominator. For convertible preferred stock, preferred dividends must be added back to income available to common shareholders, and the denominator would be increased by the number of shares that would be issued upon conversion.

**5 Factor into the diluted earnings per share computations the effect of actual conversion of convertible securities or the exercise of options, warrants, or rights during the period, and understand the antidilutive effect of potential common shares when a firm reports a loss from continuing operations.**

If conversion or exercise actually takes place during a period, an adjustment must be made to reflect what the EPS would have been if conversion or exercise had taken place at the beginning of the period or issuance date, whichever comes later.

In the case of a firm reporting a loss from continuing operations, no dual presentation of EPS is required because inclusion of stock options or convertible securities would decrease the loss per share and thus always would be antidilutive.

**6 Determine the order in which multiple potentially dilutive securities should be considered in computing diluted earnings per share.**

In those instances when a firm has multiple potentially dilutive securities, the FASB requires a systematic procedure for determining the order in which the various securities are considered. The individual effect of each security is computed, and the securities are considered in turn beginning with the security with the least favorable effect on basic EPS. The procedure is repeated until the diluted EPS figure is lower than the next security's incremental impact.

**7 Understand the disclosure requirements associated with basic and diluted earnings per share computations.**

Basic and diluted EPS are required to be disclosed on the face of the income statement for those companies with a complex capital structure. Firms reporting below-the-line items on their income statement may report the per-share effects of these items either on the face of the income statement or in the notes. In addition, a schedule reconciling both the numerator and the denominator for the basic and diluted per-share computations must be provided in the notes to the financial statements.

**EM EXPANDED MATERIAL**

**8 Make complex earnings per share computations involving multiple potentially dilutive securities.**

For firms with stock options, warrants, rights, convertible preferred stock, and/or convertible bonds, the computations associated with diluted EPS can become quite complex. For those items that are dilutive or potentially dilutive, considering them in the proper sequence will ensure that diluted EPS is properly calculated.

**FASB-IASB CODIFICATION SUMMARY**

Topic	FASB Accounting Standards Codification	Original FASB Standard	Corresponding IASB Standard	Differences between U.S. GAAP and IFRS
Computing basic earnings per share	Section 260-10-45 par. 10-11	SFAS No. 128 par. 8-9	IAS 33 par. 9-29	No substantial differences
Computing diluted earnings per share	Section 260-10-45 par. 16-17	SFAS No. 128 par. 11, 13	IAS 33 par. 30-44	No substantial differences
Participating securities and the two-class method	Section 260-10-45 par. 59A-66	SFAS No. 128 par. 60-61 EITF 03-06	IAS 33 par. A13-A14	No substantial differences
Treasury stock method for options	Section 260-10-45 par. 23, 25	SFAS No. 128 par. 17-18	IAS 33 par. 45-48	No substantial differences
If-converted method for convertible securities	Section 260-10-45 par. 40-42	SFAS No. 128 par. 26-28	IAS 33 par. 49-51	No substantial differences
Impact of actual conversion or exercise	Section 260-10-45 par. 17	SFAS No. 128 par. 13	IAS 33 par. 38	No substantial differences
Proper order of consideration for multiple potentially dilutive securities	Section 260-10-45 par. 18	SFAS No. 128 par. 14-15	IAS 33 par. 44	No substantial differences
Disclosures associated with basic and diluted EPS	Section 260-10-50 par. 1-2	SFAS No. 128 par. 40-41	IAS 33 par. 70-73A	No substantial differences

**KEY TERMS**

Antidilution of earnings 18-4  
Antidilutive securities 18-4  
Basic earnings per share 18-5

Complex capital structure 18-5  
Dilution of earnings 18-4

Dilutive securities 18-4  
If-converted method 18-15  
Simple capital structure 18-4

Treasury stock method 18-13  
Two-class method 18-11

**QUESTIONS**

- Earnings per share computations have received increased prominence on the income statement. How would an investor use such information in making investment decisions?
- What limitations should be recognized in using EPS data?
- Why are EPS figures computed on the basis of common stock transactions that have not yet happened rather than on the basis of strictly historical common stock data?
- What distinguishes a simple capital structure from a complex capital structure?

5. An enterprise split its common stock 3 for 1 on July 1. Its accounting year ends December 31. Prior to the split, there were 10,000 shares of common stock outstanding. What is the weighted-average number of shares that should be used to compute EPS in the current and preceding years?
6. Why are EPS figures adjusted retroactively for stock dividends, stock splits, and reverse stock splits?
7. What is the two-class method?
8. What is meant by *dilution of EPS*?
9. What is an *antidilutive security*? Why are such securities generally excluded from the computation of EPS?
10. What is the *treasury stock method* of accounting for outstanding stock options, warrants, and rights in computing diluted EPS?
11. Convertible debt that is dilutive requires an adjustment to income. What is the nature of the adjustment?
12. What is the meaning of the if-converted method of computing EPS?
13. If stock options are actually exercised during the year, how is diluted EPS affected?
14. Why are all convertible securities and options antidilutive when a company is operating at a loss?

EM	EXPANDED MATERIAL
----	-------------------

15. If a company has multiple potentially dilutive securities, how are the computations made to ensure obtaining the lowest EPS figure?

## PRACTICE EXERCISES

### Practice 18-1

L02

#### Shares Outstanding: Issuance and Reacquisition

On January 1, the company had 200,000 common shares outstanding. On April 1, the company issued 60,000 additional shares. On August 1, the company reacquired 100,000 shares. What was the weighted-average number of shares outstanding for the year?

### Practice 18-2

L02

#### Shares Outstanding: Stock Dividends and Stock Splits

On January 1, the company had 150,000 common shares outstanding. During the year, the following events occurred:

March 1: 2-for-1 stock split  
 June 1: Issued 45,000 additional shares  
 September 1: 20% stock dividend

What was the weighted-average number of shares outstanding for the year?

### Practice 18-3

L02

#### Impact of Preferred Stock on Basic EPS

On January 1, the company had 100,000 common shares outstanding. This same number of common shares was outstanding throughout the year. The company also had 30,000 shares of 5%, \$100 par preferred stock outstanding throughout the year. The company did *not* declare any common or preferred dividends during the year. Net income for the year was \$220,000. Compute basic earnings per share, assuming that (1) the preferred stock is not cumulative and (2) the preferred stock is cumulative.

### Practice 18-4

L02

#### Computation of Basic EPS

On January 1, the company had 200,000 common shares outstanding. On April 1, the company issued 60,000 additional shares. On August 1, the company performed a 2-for-1 stock split. The company also had 20,000 shares of 8%, \$50 par preferred stock outstanding throughout the year. The company declared the required preferred dividend during the year. Net income for the year was \$300,000. Compute basic earnings per share.

### Practice 18-5

L02

#### Two-Class Method

The company had the following shares of stock outstanding during the year. Data regarding dividend privileges and net income are also given.

- Common shares outstanding: 320,000 for the entire year
- Participating preferred shares outstanding: 100,000 shares for the entire year

- Net income: \$1,000,000
- Dividends on participating preferred shares: \$1.00 per share plus a per-share increase 80% as large as the per-share increase of common dividends above \$0.50 per share
- Common dividends paid for the year: \$1.00 per share

Compute basic earnings per share for both the common shares and the participating preferred shares.

**Practice 18-6****L03****Diluted EPS and Stock Options**

The company had 200,000 shares of common stock outstanding throughout the year. In addition, as of January 1, the company had issued stock options that allowed employees to purchase 50,000 shares of common stock. The option exercise price is \$10 per share. The company has no other potentially dilutive securities. Net income for the year was \$400,000. Compute diluted earnings per share, assuming that (1) the average stock price for the year was \$16 and (2) the average stock price for the year was \$8.

**Practice 18-7****L03****Stock Options Issued During the Year**

Refer to Practice 18-6. Assume that the options were issued on September 1 instead of being outstanding throughout the year. Compute diluted earnings per share, assuming that (1) the average stock price for the year and for the September 1–December 31 period was \$5 and (2) the average stock price for the year and for the September 1–December 31 period was \$14.

**Practice 18-8****L04****Diluted EPS and Convertible Preferred Stock**

The company had 100,000 shares of common stock outstanding throughout the year. In addition, as of January 1, the company had issued 10,000 convertible preferred shares (cumulative, 5%, \$100 par). The company has no other potentially dilutive securities. Net income for the year was \$400,000. Compute diluted earnings per share, assuming that (1) each preferred share was convertible into four shares of common stock and (2) each preferred share was convertible into one share of common stock.

**Practice 18-9****L04****Convertible Preferred Stock Issued During the Year**

Refer to Practice 18-8. Assume that the convertible preferred stock was issued on February 1. Also assume that the issuance agreement stipulates that the preferred stockholders are entitled to their entire preferred dividend for the year even though the shares are issued on February 1. Compute diluted earnings per share, assuming that (1) each preferred share was convertible into five shares of common stock and (2) each preferred share was convertible into one share of common stock.

**Practice 18-10****L04****Diluted EPS and Convertible Bonds**

The company had 50,000 shares of common stock outstanding throughout the year. In addition, as of January 1, the company had issued 100 convertible bonds (\$1,000 face value, 10%). The company has no other potentially dilutive securities. Net income for the year was \$100,000. The income tax rate is 30%. Compute diluted earnings per share, assuming that (1) each bond was convertible into 50 shares of common stock and (2) each bond was convertible into 20 shares of common stock.

**Practice 18-11****L04****Convertible Bonds Issued During the Year**

Refer to Practice 18-10. Assume that the convertible bonds were issued on October 1. Compute diluted earnings per share, assuming that (1) each bond was convertible into 100 shares of common stock and (2) each bond was convertible into 15 shares of common stock.

**Practice 18-12****L04****Shortcut Antidilution Tests**

Net income for the company for the year was \$300,000, and 100,000 shares of common stock were outstanding during the year. The income tax rate is 30%. For each of the

following potentially dilutive securities, perform the shortcut antidilution test to determine whether the security is dilutive. Assume that each of the securities was issued on or before January 1. Treat each security independently; in other words, when testing one security, assume that the others do not exist.

1. 10,000 convertible preferred shares (cumulative, 5%, \$100 par). Each preferred share is convertible into one share of common stock.
2. 500 convertible bonds (\$1,000 face value, 10%). Each bond is convertible into 25 shares of common stock.
3. 20,000 convertible preferred shares (cumulative, 10%, \$50 par). Each preferred share is convertible into four shares of common stock.
4. 2,000 convertible bonds (\$1,000 face value, 8%). Each bond is convertible into 15 shares of common stock.

**Practice 18-13****L05****Basic and Diluted EPS and Actual Conversion of Stock Options**

The company had 100,000 shares of common stock outstanding on January 1. In addition, as of January 1, the company had issued stock options that allowed employees to purchase 40,000 shares of common stock. The option exercise price is \$10 per share. The options were exercised on April 1. The average stock price for the year was \$16; the stock price on the option exercise date (April 1) was \$15. The company has no other potentially dilutive securities. Net income for the year was \$200,000. Compute (1) basic earnings per share and (2) diluted earnings per share.

**Practice 18-14****L05****Basic and Diluted EPS and Actual Conversion of Convertible Preferred**

The company had 200,000 shares of common stock outstanding on January 1. In addition, as of January 1, the company had issued 5,000 convertible preferred shares (cumulative, 5%, \$100 par). These preferred shares were converted on September 1. Each preferred share was converted into five shares of common stock. The preferred dividends for the entire year were paid in full *before* the conversion. The company has no other potentially dilutive securities. Net income for the year was \$300,000. Compute (1) basic earnings per share and (2) diluted earnings per share.

**Practice 18-15****L05****Basic and Diluted EPS and Actual Conversion of Convertible Bonds**

The company had 100,000 shares of common stock outstanding on January 1. In addition, as of January 1, the company had issued 500 convertible bonds (\$1,000 face value, 10%). The company has no other potentially dilutive securities. The bonds were converted on August 1; 40 shares of common stock were issued in exchange for each bond. Accrued interest on the bonds was recognized and paid on that date. Net income for the year was \$400,000. The income tax rate is 40%. Compute (1) basic earnings per share and (2) diluted earnings per share.

**Practice 18-16****L05****Diluted EPS and a Loss**

The company reported a net loss of \$300,000 for the year and 100,000 shares of common stock were outstanding during the year. The income tax rate is 30%. For each of the following potentially dilutive securities, compute (1) basic EPS and (2) diluted EPS. Assume that each of the securities was issued on or before January 1. Treat each security independently; in other words, when doing the EPS computations for one security, assume that the others do not exist.

- (a) 10,000 convertible preferred shares (cumulative, 5%, \$100 par). Each preferred share is convertible into three shares of common stock.
- (b) 500 convertible bonds (\$1,000 face value, 10%). Each bond is convertible into 25 shares of common stock.
- (c) Stock options that allow employees to purchase 40,000 shares of common stock. The option exercise price is \$10 per share. The average stock price for the year was \$16.

**Practice 18-17**

**L06**

**Multiple Potentially Dilutive Securities**

The company reported net income of \$300,000 for the year and 100,000 shares of common stock were outstanding during the year. The income tax rate is 40%. The company has the following potentially dilutive securities. Assume that each of the securities was issued on or before January 1. Compute (1) basic EPS and (2) diluted EPS.

- (a) Stock options that allow employees to purchase 30,000 shares of common stock. The option exercise price is \$10 per share. The average stock price for the year was \$18.
- (b) 10,000 convertible preferred shares (cumulative, 5%, \$100 par). Each preferred share is convertible into four shares of common stock.
- (c) 500 convertible bonds (\$1,000 face value, 10%). Each bond is convertible into 40 shares of common stock.

**Practice 18-18**

**L06**

**Multiple Potentially Dilutive Securities**

The company reported net income of \$430,000 for the year and 120,000 shares of common stock were outstanding during the year. The income tax rate is 30%. The company has the following potentially dilutive securities. Assume that each of the securities was issued on or before January 1. Compute (1) basic EPS and (2) diluted EPS.

- (a) Stock options that allow employees to purchase 20,000 shares of common stock. The option exercise price is \$10 per share. The average stock price for the year was \$8.
- (b) 5,000 convertible preferred shares (cumulative, 5%, \$100 par). Each preferred share is convertible into five shares of common stock.
- (c) 1,000 convertible bonds (\$1,000 face value, 10%). Each bond is convertible into 22 shares of common stock.

**Practice 18-19**

**L07**

**EPS and Financial Statement Presentation**

The income statement for the company is as follows:

Sales .....	\$1,000,000
Operating expenses .....	600,000
Operating income .....	<u>\$ 400,000</u>
Interest expense .....	80,000
Income before income taxes .....	<u>\$ 320,000</u>
Income tax expense (40%) .....	128,000
Income from continuing operations .....	<u>\$ 192,000</u>
Extraordinary loss (net of taxes) .....	(50,000)
Discontinued operations (net of taxes) .....	(35,000)
Net income .....	<u>\$ 107,000</u>

The company had 100,000 common shares outstanding for the entire year. In addition, for the entire year, the company had stock options outstanding that allow employees to purchase 50,000 shares of common stock. The option exercise price is \$10 per share, and the average stock price for the year was \$14. Compute and list all earnings per share numbers that the company is required to report.

**EM** EXPANDED MATERIAL

**Practice 18-20**

**L08**

**Comprehensive Calculation of Diluted EPS**

Refer to Practice 18-17. Assume that the company issued 25,000 new shares of common stock on June 1 and that the company issued a 2-for-1 stock split on December 1. Compute (1) basic EPS and (2) diluted EPS. (Note: The shares in the option, convertible preferred, and convertible bond descriptions are in terms of January 1 shares. The

number of shares in each case—and the exercise price in the case of the options—would be adjusted to reflect the December 1 2-for-1 split. The average stock price of \$18 for the year does *not* reflect the 2-for-1 stock split.)

## EXERCISES

### Exercise 18-21

L02

#### Weighted-Average Number of Shares

Compute the weighted-average number of shares outstanding for Steadman Company, which has a simple capital structure, assuming that the following transactions in common stock occurred during the calendar year.

Date	Transactions in Common Stock	Number of Shares \$10 Par Value
Jan. 1	Shares outstanding	76,000
Feb. 1	Issued for cash	48,000
May 1	Acquired treasury stock	(20,000)
Aug. 1	20% stock dividend	20% of shares outstanding
Sept. 1	Resold part of treasury stock shares	15,000
Nov. 1	Issued 3-for-1 stock split	

### Exercise 18-22

L02

#### Weighted-Average Number of Shares

Transactions involving the common stock account of Higrade Gas Company during the 2-year period 2013 to 2014 were as follows:

##### 2013

- Jan. 1 Had a balance of 200,000 shares of \$10 par common stock.
- Apr. 1 Converted \$2,500,000 of convertible bonds with 50 shares issued for each \$1,000 bond.
- July 1 Declared a 10% stock dividend.
- Oct. 1 Employees exercised options to purchase 7,000 shares for \$20 a share.

##### 2014

- Apr. 1 Declared a 2-for-1 stock split.
- Oct. 1 Sold 170,000 shares for \$30 a share.

From the information given, compute the comparative number of weighted-average shares outstanding for 2013 and 2014 to be used for basic EPS computations at the end of 2014.

### Exercise 18-23

L02

#### Weighted-Average Number of Shares

Assume that the following transactions affected owners' equity for De Soto Inc. during 2013.

- Feb. 1 Sold 40,000 shares of common stock in the market.
- Apr. 1 Purchased 3,000 shares of common stock to be held as treasury stock. Paid cash dividends of \$0.50 per share.
- May 1 Split common stock 2 for 1.
- July 1 Sold 15,000 shares of common stock.
- Oct. 1 Issued a 10% stock dividend.
- Dec. 31 Paid a cash dividend of \$0.70 per share. The total amount paid for dividends on December 31 was \$407,330.

Compute the weighted-average number of shares to be used in computing basic EPS for 2013. Because no beginning share figures are available, you must work backward from December 31, 2013, to compute shares outstanding.

**Exercise 18-24****L02****Basic Earnings per Share—Simple Capital Structure**

At December 31, 2013, Marquis Corporation had 100,000 shares of common stock issued and outstanding, 60,000 of which had been issued and outstanding throughout the year and 40,000 of which had been issued on October 1, 2013. Income before income taxes for the year ended December 31, 2013, was \$636,400. In 2013 and 2014, a dividend of \$70,000 was paid on 70,000 shares of 10% cumulative preferred stock, \$10 par.

On May 1, 2014, there were 20,000 additional shares issued. Total income before income taxes for 2014 was \$461,000, which included an extraordinary gain before income taxes of \$42,000. Assuming a 30% tax rate, what is Marquis's basic earnings per common share for 2013 and for 2014, rounded to the nearest cent? Show computations in good form.

**Exercise 18-25****L02****Basic Earnings per Share—Simple Capital Structure**

The income statement for Fignon Co. for the year ended December 31, 2013, reported the following.

Income from continuing operations before income taxes .....	\$35,000
Income taxes .....	<u>14,000</u>
Income from continuing operations .....	\$21,000
Loss from disposal of segment (net of income taxes) .....	(4,200)
Net income .....	<u>\$16,800</u>

Compute basic EPS amounts for 2013 under each of the following assumptions (consider each assumption separately):

- The company has only one class of common stock with 20,000 shares outstanding.
- The company has shares outstanding as follows: preferred 8% stock, \$15 par, cumulative, 5,000 shares; common, \$12 par, 20,000 shares. Only the current year's preferred dividends are unpaid.
- Same as (b) except that Fignon Co. also has preferred 7% stock, \$10 par, noncumulative, 6,000 shares, and only \$3,000 in dividends on the noncumulative preferred has been declared.

**Exercise 18-26****L03, L04****Dilutive Securities**

Kingston Corporation has basic earnings per common share of \$1.54 for the year ended December 31, 2013. For each of the following independent examples, decide whether the convertible security would be dilutive or antidilutive in computing diluted EPS. Consider each example individually. The tax rate is 35%.

- 7 1/2% debentures, \$500,000 face value are convertible into common stock at the rate of 25 shares for each \$1,000 bond.
- \$6 preferred stock (no par) is convertible into common stock at the rate of three shares of common stock for one share of preferred stock. There are 30,000 shares of preferred stock outstanding.
- Options to purchase 150,000 shares of common stock are outstanding. The exercise price is \$22 per share; average market price is \$27 per share.
- \$800,000 of 11% debentures are convertible at the rate of 25 shares of common stock for each \$1,000 bond.
- Preferred 7% stock, \$100 par, 10,000 shares outstanding is convertible into 5 shares of common stock for each share of preferred stock.

**Exercise 18-27****L03****Number of Shares—Stock Options**

On January 1, 2013, Primavera Corporation had 55,000 shares of common stock outstanding that did not change during 2013. In 2012, Primavera granted options to certain executives to purchase 12,000 shares of its common stock at \$6 each. The average

market price of common was \$8.00 per share for 2013. Compute the number of shares to be used in computing diluted EPS for 2013.

**Exercise 18-28**

**L03**

**Number of Shares—Stock Options**

Barone Company has employee stock options outstanding to purchase 40,000 common shares at \$14 per share. All options were outstanding during the entire year. The average price of the company's common stock for the year was \$20. Compute the incremental shares that would be used in arriving at diluted EPS. Barone has 80,000 shares outstanding at the date the options are granted.

**Exercise 18-29**

**L04**

**Diluted Earnings per Share—Convertible Bonds**

On January 2, 2013, McGregor Co. issued at par \$45,000 of 9% bonds convertible in total into 4,000 shares of McGregor's common stock. No bonds were converted during 2013. Throughout 2013, McGregor had 10,000 shares of common stock outstanding. McGregor's 2013 net income was \$75,000. McGregor's tax rate is 30%.

No other potentially dilutive securities other than the convertible bonds were outstanding during 2013. For 2013, compute McGregor's basic and diluted EPS.

**Exercise 18-30**

**L04**

SPREADSHEET

**Diluted Earnings per Share—Convertible Bonds**

Delgado Manufacturing Company reports long-term liabilities and stockholders' equity balances at December 31, 2013, as follows:

Convertible 5% bonds (par) .....	\$ 800,000
Common stock, \$25 par, 100,000 shares issued and outstanding. ....	2,500,000

Additional information is determined as follows:

Conversion term of bonds—50 shares for each \$1,000 bond	
Income before extraordinary items—2013 .....	\$ 199,800
Extraordinary gain (net of tax) .....	43,520
Net income—2013 .....	<u>\$ 243,320</u>

Compute the basic and diluted EPS for the company for 2013, assuming that the income tax rate is 30%. No changes occurred in the debt and equity balances during 2013.

**Exercise 18-31**

**L04, L05**

**Earnings and Loss per Share—Convertible Preferred Stock, Operating Loss**

During all of 2013, Cougar Inc. had outstanding 180,000 shares of common stock and 16,000 shares of \$5 preferred stock. Each share of the preferred stock is convertible into five shares of common stock. For 2013, Cougar had a \$200,000 loss from operations; no dividends were paid or declared.

Compute the basic and diluted earnings (loss) per share for Cougar, assuming that (1) the preferred stock is noncumulative and (2) the preferred stock is cumulative.

**Exercise 18-32**

**L02, L04, L05**

**Earnings per Share with Actual Conversion**

Atlas, Inc., has the following capital structure at January 1, 2013.

	<b>Outstanding</b>
Common stock, \$10 par .....	800,000 shares
11% stated interest rate convertible bonds issued at par; each \$1,000 bond is convertible into 80 shares of common stock .....	\$5,000,000

During 2013, Atlas had the following stock transactions:

- May 1 Issued 50,000 shares of common stock for \$30 per share.
- Aug. 1 Purchased 100,000 shares of treasury stock at \$35 per share.
- Oct. 1 Converted \$2,000,000 of bonds.

Net income for 2013 was \$950,000. The income tax rate was 30%. Compute basic and diluted EPS for Atlas for 2013.

**Exercise 18-33**

**L01, L02,  
L04, L07**

**Earnings per Share**

At December 31, 2013, the books of Yorke Corporation include the following balances:

Long-term liabilities:

Bonds payable, 8%, each \$1,000 bond is convertible into 50 shares of common stock; bonds sold at par and were issued November 3, 2012 . . . . .	\$ 500,000
--------------------------------------------------------------------------------------------------------------------------------------------------	------------

Stockholders' equity:

Preferred stock, 7%, \$50 par, cumulative, nonconvertible, 10,000 shares outstanding . . . . .	500,000
Paid-in capital in excess of par, preferred stock . . . . .	300,000
Common stock, \$10 par, authorized 300,000 shares; 199,500 shares outstanding . . . . .	1,995,000
Paid-in capital in excess of par, common stock . . . . .	450,000
Retained earnings . . . . .	519,000

The records of Yorke reveal the following additional information.

- (a) Had 150,000 shares of common stock outstanding January 1, 2013.
- (b) Sold 40,000 shares of common stock for cash on April 30, 2013.
- (c) Issued 5% stock dividend on July 1, 2013.
- (d) Had income before extraordinary items (after tax) of \$715,000.
- (e) Had extraordinary loss (net of tax), \$16,000.
- (f) Had income tax rate, 30%.
- (g) Bond indenture does not provide for increase in shares at conversion due to stock dividends declared subsequent to the bond issue date.

1. Is this a simple or complex capital structure?
2. Compute all EPS amounts as required by FASB ASC *Topic 260*. How should the EPS data be presented?

**EM** EXPANDED MATERIAL

**Exercise 18-34**

**L02, L03, L04,  
L06, L08**

**Earnings per Share—Convertible Securities**

Information relating to the capital structure of Harry Porter Corporation at December 31, 2012 and 2013, is as follows:

	<b>Outstanding</b>
Common stock . . . . .	270,000 shares
Convertible preferred stock noncumulative (issued in 2011) . . . . .	24,000 shares
7.5% convertible bonds (issued in 2012) . . . . .	\$900,000
Stock options to purchase 32,000 shares at \$12. The average market price of Harry Porter stock during 2013 was \$18.	

Harry Porter Corporation paid dividends of \$4 per share on its preferred stock. The preferred stock is convertible into 48,000 shares of common stock. The 7.5%

convertible bonds are convertible into a total of 26,000 shares of common stock. The net income for the year ended December 31, 2013, is \$760,000. Assume that the income tax rate is 30%. Compute basic and diluted EPS for the year ended December 31, 2013.

## PROBLEMS

### Problem 18-35

L02

#### Weighted-Average Number of Shares

Outdoor Recreation Products Inc. had 50,000 shares of common stock outstanding at the end of 2012. During 2013 and 2014, the following transactions took place.

#### 2013

- Mar. 31 Sold 10,000 shares at \$24.
- Apr. 26 Paid cash dividend of \$0.45 per share.
- July. 31 Paid cash dividend of \$0.20 per share and issued a 5% stock dividend.
- Nov. 1 Sold 12,000 shares at \$25.

#### 2014

- Feb. 28 Purchased 8,000 shares of common stock to be held in treasury.
- Mar. 1 Paid cash dividend of \$0.50 per share.
- Apr. 30 Issued 4-for-1 stock split.
- Nov. 1 Sold 5,000 shares of treasury stock.
- Dec. 20 Declared cash dividend of \$0.15 per share.

Outdoor Recreation Products Inc. has a simple capital structure.

**Instructions:** Compute the weighted-average number of shares for 2013 and 2014 to be used in the EPS computation at the end of 2014.

### Problem 18-36

L02

#### Basic Earnings per Share—Simple Capital Structure

The following condensed financial statements for Hudson Corporation were prepared by the accounting department.

Hudson Corporation Income Statement For the Year Ended December 31, 2013	
Sales . . . . .	\$11,000,000
Cost of goods sold . . . . .	<u>8,500,000</u>
Gross profit on sales . . . . .	\$ 2,500,000
Expenses:	
Selling expense . . . . .	\$730,000
Administrative expense . . . . .	370,000
Interest expense . . . . .	<u>50,000</u>
Income from continuing operations before income taxes . . . . .	\$ 1,350,000
Income taxes . . . . .	<u>420,000</u>
Income from continuing operations . . . . .	\$ 930,000
Extraordinary loss, net of tax savings . . . . .	<u>(80,000)</u>
Net income . . . . .	<u>\$ 850,000</u>

**Hudson Corporation  
Balance Sheet  
December 31, 2013**

Assets .....	\$6,850,000
Liabilities:	
Current liabilities .....	\$1,200,000
6% bonds, due December 31, 2017 .....	600,000
Stockholders' equity:	
Common stock, \$10 par, 250,000 shares authorized, issued and outstanding .....	2,500,000
Additional paid-in capital .....	750,000
Retained earnings .....	1,800,000
Total liabilities and stockholders' equity .....	\$6,850,000

**Instructions:** Compute the basic EPS under each of the following independent assumptions (the company has a simple capital structure).

1. No change in the capital structure occurred in 2013.
2. On December 31, 2012, there were 160,000 shares outstanding. On May 1, 2013, 60,000 shares were sold at par, and on October 1, 2013, 30,000 shares were sold at par.
3. On December 31, 2012, there were 200,000 shares outstanding. On July 1, 2013, the company issued a 25% stock dividend.

**Problem 18-37**

**L02**

**Basic Earnings per Share—Simple Capital Structure**

Great Northern Inc. reported the following comparative information in the Stockholders' Equity section of its 2014 balance sheet.

	December 31,		
	2014	2013	2012
12% preferred stock, \$50 par .....	\$ 82,500	\$ 67,500	\$ 50,000
Paid-in capital in excess of par—preferred .....	13,400	9,200	5,000
Common stock, \$5 par* .....	410,600	399,600	325,000
Paid-in capital in excess of par—common .....	64,300	58,800	35,000
Paid-in capital from treasury stock .....	1,800	800	800
Retained earnings .....	471,200	396,460	180,200
Total stockholders' equity .....	\$1,043,800	\$932,360	\$596,000

\*Par value after June 1, 2014, stock split.

In addition, company records show that the following transactions involving stockholders' equity were recorded in 2013 and 2014.

**2013**

- May 1 Sold 4,500 shares of common stock for \$12, par value \$10.
- June 30 Sold 350 shares of preferred stock for \$62, par value \$50.
- Aug. 1 Issued an 8% stock dividend on common stock. The market price of the stock was \$15.
- Sept. 1 Declared cash dividends of 12% on preferred stock and \$1.50 on common stock.
- Dec. 31 Income before extraordinary items for the year totaled \$316,200. In addition, Great Northern had an extraordinary gain of \$12,500, net of tax.

**2014**

- Jan. 31 Sold 1,100 shares of common stock for \$15.
- May 1 Sold 300 shares of preferred stock for \$64.

June	1	Issued a 2-for-1 split of common stock, reduced par value to \$5.
Sept.	1	Purchased 500 shares of common stock for \$9 to be held as treasury stock.
Oct.	1	Declared cash dividends of 12% on preferred stock and \$2 per share on outstanding common stock.
Nov.	1	Sold 500 shares of treasury stock for \$11.
Dec.	31	Net income for the year included an extraordinary loss, net of income tax, of \$19,000.

**Instructions:** Compute the basic EPS amounts for 2013 and 2014 to be presented in the income statement for 2014.

**Problem 18-38****L03****Diluted Earnings per Share—Stock Options**

The records of Eureka Gold Company reveal the following capital structure as of December 31, 2012.

\$9 preferred stock, \$100 par, 5,000 shares issued and outstanding	\$ 500,000
Additional paid-in capital on preferred stock	110,000
Common stock, \$10 par, 175,000 shares issued and outstanding	1,750,000
Additional paid-in capital on common stock	550,000
Retained earnings	778,000

To stimulate work incentive and to bolster trade relations, Eureka Gold on May 1, 2013, issued stock options to selected executives, creditors, and others allowing the purchase of 32,000 shares of common stock for \$26 a share. Market prices for the stock at various times during 2013 were:

Option issuance date	\$24
Average for the year	62

A dividend on preferred stock was paid during the year, and there are no dividends in arrears at year-end. There are no other capital transactions during the year. Net income for 2013 was \$500,000.

**Instructions:** Compute basic and diluted EPS for 2013.

**Problem 18-39****L03****Diluted Earnings per Share—Stock Options**

Kukulcan Technology Co. provides the following data at December 31, 2013.

Operating revenue	\$1,460,000
Operating expenses	\$790,000
Income tax rate	35%
Common stock outstanding during the entire year	34,000 shares

On January 1, 2013, there were options outstanding to purchase 9,000 shares of common stock at \$20 per share. The average market price for the year was \$26 per share. The balance sheet reports \$510,000 of 7% nonconvertible bonds at December 31, 2013. (Interest expense is included in operating expenses.)

**Instructions:**

1. Compute basic EPS for 2013.
2. Compute diluted EPS for 2013.

**Problem 18-40****L03, L05****Diluted Earnings per Share with Exercise of Stock Options**

As of January 1, 2013, Anvil Corporation had 25,000 shares of \$10 par common stock outstanding. The company had issued stock options in 2011 to its management personnel, permitting them to acquire 4,000 shares of common stock at \$12 per share. At the time of the issuance, common stock was selling for \$12 per share. The market price of common stock was \$25 on September 1, 2013, and the average price for 2013 was \$27. Income before extraordinary items for 2013 was \$142,400. The company also had an extraordinary gain of \$21,000, net of taxes. Terms of the

options make them currently exercisable. On September 1, 2013, options to acquire 1,500 shares were exercised. The other 2,500 options are still outstanding at December 31, 2013.

**Instructions:** Compute basic and diluted EPS for the year ended December 31, 2013.

**Problem 18-41**

**L05**

**Diluted Earnings per Share—Conversion of Debentures**

The following information relates to the December 31, 2012, balance sheet for Chiapucci Incorporated.

6% convertible 10-year debentures issued at par	\$1,000,000
Common stock, \$12 par, 110,000 shares issued and outstanding	\$1,320,000
Retained earnings	842,000
Total stockholders' equity	<u>\$2,162,000</u>

The convertible debentures include terms stating that each \$1,000 bond can be converted into 30 shares of common stock.

The following events occurred during 2013.

- (a) On August 31, 2013, the complete issue of convertible debentures was converted into common stock.
- (b) Chiapucci reported net income of \$540,000 in 2013. The company's income tax rate was 30%.
- (c) No other common stock transactions took place during the year other than the debenture conversion.

**Instructions:**

- 1. Compute basic and diluted EPS for the year ended December 31, 2013.
- 2. Assume that Chiapucci had a net loss of \$220,000. Show why the convertible debentures are antidilutive under loss conditions.

**Problem 18-42**

**L02, L03,  
L04, L06**

**Diluted Earnings per Share—Complex Capital Structure**

Hillcrest Corporation's capital structure is as follows:

	December 31,	
	2014	2013
Outstanding shares of:		
Common stock	310,000	220,000
Nonconvertible, noncumulative preferred stock	12,000	12,000
10% convertible bonds	\$800,000	\$800,000

The following additional information is available.

- (a) On September 1, 2014, Hillcrest sold 90,000 additional shares of common stock.
- (b) Net income for the year ended December 31, 2014, was \$920,000.
- (c) During 2014, Hillcrest declared and paid dividends of \$6 per share on its preferred stock.
- (d) The 10% bonds are convertible into 50 shares of common stock for each \$1,000 bond.
- (e) Unexercised options to purchase 25,000 shares of common stock at \$24.00 per share were outstanding at the beginning and end of 2014. The average market price of Hillcrest's common stock for 2014 was \$34 per share.
- (f) Warrants to purchase 36,000 shares of common stock at \$36 per share were attached to the preferred stock at the time of issuance. The warrants, which expire on December 31, 2019, were outstanding at December 31, 2014.
- (g) Hillcrest's effective income tax rate was 30% for 2013 and 2014.

**Instructions:**

1. For the year ended December 31, 2014, compute basic EPS.
2. Compute diluted EPS for 2014.

**Problem 18-43****L02, L03, L04,  
L05, L06****Earnings per Share—Complex Capital Structure**

The Stockholders' Equity section of Alta Company's balance sheet as of December 31, 2013, contains the following:

\$2 cumulative preferred stock, \$25 par, convertible, 1,600,000 shares authorized, 1,400,000 shares issued, 750,000 converted to common, 650,000 shares outstanding	\$16,250,000
Common stock, \$0.25 par, 15,000,000 shares authorized, 8,800,000 shares issued and outstanding	2,200,000
Additional paid-in capital	32,750,000
Retained earnings	40,595,000
Total stockholders' equity	<u>\$91,795,000</u>

Included in Alta Company's liabilities are 9% convertible subordinated debentures, face value \$20,000,000, issued at par in 2012. The debentures are due in 2019 and, until then, are convertible into the common stock of Alta Company at the rate of 60 shares of common stock for each \$1,000 debenture. To date, none has been converted.

On April 2, 2013, Alta Company issued 1,400,000 shares of convertible preferred stock at \$40 per share. Quarterly dividends to December 31, 2013, have been paid on these shares. The preferred stock is convertible into common stock at the rate of two shares of common for each share of preferred. On October 1, 2013, 150,000 shares and on November 1, 2013, 600,000 shares of the preferred stock were converted into common stock.

During July 2012, Alta Company granted options to its officers and key employees to purchase 500,000 shares of the company's common stock at a price of \$20 per share. No options were exercised in 2013.

During 2013, dividend payments for the Alta common stock were as follows.

	<b>Dividend per Share</b>
First quarter	\$0.10
Second quarter	0.15
Third quarter	0.10
Fourth quarter	0.15

The average market price for the company's common stock for the year was \$25. Alta Company's net income for the year ended December 31, 2013, was \$12,750,000. The provision for income tax was computed at a rate of 30%.

**Instructions:** Compute basic and diluted EPS for the year ended December 31, 2013.

<b>EM</b>	<b>EXPANDED MATERIAL</b>
-----------	--------------------------

**Problem 18-44****L02, L03, L04,  
L06, L08****Earnings per Share—Complex Capital Structure**

At December 31, 2013, Hemington Company had 320,000 shares of common stock outstanding. Hemington sold 80,000 shares on October 1, 2014. Net income for 2014 was \$1,985,000; the income tax rate was 35%. In addition, Hemington had the following debt and equity securities on its books at December 31, 2013.

- 30,000 shares of \$100 par, 8% cumulative preferred stock.
- 25,000 shares of 10% convertible cumulative preferred stock, par \$100, sold at 110. Each share of preferred stock is convertible into three shares of common stock.
- \$1,500,000 face value of 9% bonds sold at par.

- (d) \$2,500,000 face value of 7% convertible bonds sold to yield 8%. Unamortized bond discount is \$150,000 at December 31, 2013. Each \$1,000 bond is convertible into 22 shares of common stock.

Also, options to purchase 20,000 shares of common stock were issued May 1, 2014. Exercise price is \$20 per share; market value at date of option was \$19; average market value for the year (and for the period May 1 through December 31), \$25.

**Instructions:** For the year ended December 31, 2014, compute basic and diluted EPS.

**Problem 18-45**  
**L04, L06, L08**

**Earnings per Share—Multiple Convertible Securities**

Data for Schrote Powder Company at the end of 2014 follow. All bonds are convertible as indicated and were issued at their face amounts.

Description of Bonds	Amount	Date Issued	Conversion Terms
10-year, 6½% convertible bonds	\$ 600,000	Jan. 1, 2008	110 shares of common for each \$1,000 bond
20-year, 7% convertible bonds	1,200,000	Jan. 1, 2009	45 shares of common for each \$1,000 bond
25-year, 10½% convertible bonds	900,000	June 30, 2013	36 shares of common for each \$1,000 bond

Additional information:

Common shares outstanding at December 31, 2013 . . . . .	880,000
Net income for 2014 . . . . .	\$1,315,000
Income tax rate . . . . .	40%

**Instructions:**

1. Compute basic and diluted EPS for 2014, assuming that no additional shares of common stock were issued during the year.
2. Compute basic and diluted EPS, assuming that the 10-year bonds were converted on July 1, 2014, and that net income for the year was \$1,326,700 (reflects reduction in interest due to bond conversion).

**Problem 18-46**  
**L02, L03, L04, L05, L06, L08**

**Earnings per Share—Multiple Convertible Securities**

Kishkumen Company had the following capital structure at December 31, 2013 and 2014:

	2014	2013
Shares of stock outstanding:		
Common stock . . . . .	776,490	550,000
\$7 convertible preferred stock . . . . .	11,000	24,000
Bonds outstanding:		
7¼%, 10-year convertible bonds . . . . .	\$1,650,000	\$2,200,000

The following additional information is available.

- (a) The conversion terms of the preferred stock and bonds at January 1, 2014, were as follows: Preferred stock, five shares of common for each share of preferred; convertible bonds, 38 shares of common for each \$1,000 bond. These terms are to be adjusted for any issued stock dividends or stock splits.
- (b) On May 1, 2014, Kishkumen sold an additional 70,000 shares of common stock, and on August 1, 2014, a 10% stock dividend on common shares was declared.

- (c) On October 1, 2014, 13,000 shares of preferred stock were converted to 71,500 shares of common stock (5.5 shares common for each share of preferred). The preferred stock was issued at \$100 par in 2010.
- (d) On December 1, 2014, 25% of the convertible bonds were converted (41.8 shares of common for each bond converted). The bonds were issued at par in 2013.
- (e) On December 31, 2014, Kishkumen declared and paid a \$7-per-share dividend on outstanding preferred stock. Income for the year was \$2,300,000.
- (f) Stock options (issued and unexercised) to purchase 70,000 shares of common stock at \$30 per share were outstanding at the beginning of 2014. Average market price for 2014 was \$46.36. The number of shares was adjusted to 77,000 and the exercise price was adjusted to \$27.27 in response to the 10% stock dividend.
- (g) Stock warrants to purchase 50,000 shares of common stock at \$45 per share were initially attached to the preferred stock. This was adjusted to 55,000 shares at \$40.91 per share in response to the 10% stock dividend. The warrants expire on December 31, 2018, and were outstanding at December 31, 2014.
- (h) The effective tax rate was 30% for both years.
- (i) On February 1, 2015, before the 2014 financial statements were issued, Kishkumen split its common stock 2 for 1.

**Instructions:** For the year ended December 31, 2014, compute basic and diluted EPS.

**CASES**

**Discussion Case 18-47**

**But Why Is EPS Different if Income Is the Same?**

Fredrica Brown has \$200,000 that she plans to invest in growth stocks. She has narrowed her choices to two companies in the same industry, White Inc. and Adam Inc. Each company has a documented history of growth and an established, strong position within the industry. Last year, each company reported net income of \$10 million and a return on owners' investment of 17%; however, White reported EPS of \$1.32, and Adam reported EPS of \$2.75.

Fredrica requests that you explain why the EPS differs when other measures of activity and profitability are similar. What factors contribute to and limit the comparability of these data?

**Discussion Case 18-48**

**But Let's Maintain Earnings per Share**

On January 1, 2011, Farnsworth Company had 1,000,000 shares of common stock and 100,000 shares of \$8 cumulative preferred stock issued and outstanding. A principal goal of Farnsworth's management is to maintain or increase EPS.

On January 1, 2012, Farnsworth Company retired 50,000 shares of the preferred stock with excess cash and additional funds provided from the sale of a subsidiary.

At the beginning of 2013, the company borrowed \$5,000,000 at 10% and used the proceeds to retire 200,000 shares of common stock. Operating income, before interest and income taxes (income tax rate is 30%), is as follows:

	2013	2012	2011
Operating income . . . . .	\$6,500,000	\$7,000,000	\$7,500,000

Did Farnsworth Company maintain its EPS even though income declined? What was the impact of the preferred and common stock transactions on EPS?

**Discussion  
Case 18-49****How Does a Complex Capital Structure Affect EPS?**

Big Horn Construction Company has gradually grown in size since its inception in 1919. The third generation of Jensens who now manage the enterprise are considering selling a large block of stock to raise capital for new equipment purchases and to help finance several big projects. The Jensens are concerned about how the EPS information should be presented on the income statement and have many questions concerning the nature of EPS.

1. Discuss the EPS presentation that would be required if Big Horn Construction has (a) a simple capital structure or (b) a complex capital structure. What factors determine whether a capital structure is simple or complex?
2. Assume that Big Horn Construction Company has a complex capital structure. Discuss the effect, if any, of each of the following transactions on the computation of EPS.
  - (a) The firm acquires some of its outstanding common stock to hold as treasury stock.
  - (b) The firm pays a dividend of \$0.50 per common stock share.
  - (c) The firm declares a dividend of \$0.75 per share on cumulative preferred stock.
  - (d) A 3-for-1 common stock split occurs during the year.
  - (e) Retained earnings are appropriated for a disputed construction contract that may be litigated.

**Discussion  
Case 18-50****What Is Dilution?**

You have just finished presenting a summary of this year's financial results to the board of directors. Included in your presentation was an income statement including both basic and diluted EPS figures. One of the board members comments that he understands basic EPS but has no clue as to what diluted EPS is referring to. He actually wondered aloud whether this diluted EPS computation was part of some "full-employment for accountants" project. He asks you to explain the concept of dilution and what diluted EPS is trying to measure.

**Case 18-51****Deciphering Financial Statements (The Walt Disney Company)**

Review the information relating to EPS found in **The Walt Disney Company's** 2009 income statement and notes to the financial statements on the Internet.

Answer the following questions.

1. Using the information provided on the face of the income statement relating to net income and average number of shares outstanding, verify Disney's reported basic EPS figure.
2. From the statement of cash flows, we see that Disney paid dividends of \$648 million in 2009. Using the average number of Disney common shares outstanding from the EPS computation in (1), compute the approximate dividends paid per share. Using this number, compute the dividend payout ratio for Disney. (Note: Dividend payout ratio is dividends per share divided by earnings per share.) Comment on your results.
3. Can you determine from the notes Disney has effected any stock splits recently. How do stock splits affect the presentation of the prior year's information?

**Case 18-52****Writing Assignment (U.S. GAAP and IFRS)**

The project for developing the current standards for earnings per share reporting was the first major project in which the FASB and the IASB collaborated in a formal way. Of course, now the FASB and the IASB have a very formal joint program to increase the international harmonization of accounting standards.

In two pages or less, address the following question: Why is it important for the FASB to work with the IASB to harmonize international accounting standards?

**Case 18-53****Ethical Dilemma (Are there other options?)**

After computing the current period's basic and diluted EPS figures, you notice that while basic EPS continues its upward trend, diluted EPS has dropped slightly. In discussions

with your manager regarding reasons for the decline, you identify numerous potentially dilutive securities that were considered in computing diluted EPS. Because the company has multiple dilutive securities, those securities were considered in turn, beginning with the convertible security that had the least favorable impact on EPS. As a result of considering the potentially dilutive securities in this order, convertible bonds that were potentially dilutive were not included in the computations because they became antidilutive after considering the effect of other convertible securities.

Your manager takes the position that if a security is dilutive when compared to basic EPS, then it should be included in the diluted EPS computations. He maintains that each dilutive security should be considered independently of the others. Including these convertible bonds in the diluted EPS computations would result in maintaining an upward trend for diluted EPS.

1. Is there merit to your manager's position? That is, does the approach he is advocating make some sense?
2. Do the accounting standards allow for this flexibility in interpretation?
3. Prepare your defense for when your manager insists that diluted EPS be computed using his approach. What will you say to convince him that his approach is not acceptable?

#### Case 18-54

#### Cumulative Spreadsheet Analysis

This assignment is an exercise in computing diluted EPS. In prior years, Skywalker has had a simple capital structure. That may change in 2014; Skywalker is considering the following actions at the beginning of 2014.

- Issue options granting top-level managers the opportunity to purchase a total of 2,000,000 shares of Skywalker common stock for \$25 per share.
- Exchange \$600 million in existing long-term debt (with an interest rate of 8%) for \$600 million in 8% convertible bonds (600,000 bonds, each with a \$1,000 face value).

Without these changes, Skywalker expects to have net income of \$15,890,000 in 2014; the net income forecast reflects the expectation that Skywalker will be subject to a 33% tax rate in 2014. (Note: This \$15,890,000 forecasted net income for 2014 comes from the assumptions outlined in Chapter 13; all numbers in Chapter 13 are in millions of dollars.) As of the end of 2013, Skywalker had 10,000,000 common shares outstanding.

Using these data, construct a spreadsheet to answer the following questions.

1. What is Skywalker's basic EPS expected to be in 2014?
2. What is Skywalker's diluted EPS expected to be in 2014 if the options and convertible bonds are issued on January 1, 2014, the average stock price is expected to be \$20 per share for 2014, and each bond is convertible into 40 shares of common stock?
3. What is Skywalker's diluted EPS expected to be in 2014 if the options and convertible bonds are issued on January 1, 2014, the average stock price is expected to be \$40 per share during 2014, and each bond is convertible into 35 shares of common stock?
4. Assuming that Skywalker issues the options and convertible bonds on January 1, 2014, complete the following table.

#### Diluted Earnings per Share in 2014

		Forecasted Average Market Price		
		\$20	\$30	\$40
Common	20			
Shares	35			
Per bond	40

## CHAPTER 19 Derivatives, Contingencies, Business Segments, and Interim Reports

### LEARNING OBJECTIVES

#### DERIVATIVES

- 1 Understand the business and accounting concepts connected with derivatives and hedging activities.
- 2 Identify the different types of risk faced by a business.
- 3 Describe the characteristics of the following types of derivatives: swaps, forwards, futures, and options.
- 4 Define *hedging*, and outline the difference between a fair value hedge and a cash flow hedge.
- 5 Account for a variety of different derivatives and for hedging relationships.

#### CONTINGENCIES

- 6 Apply the accounting rules for contingent items to the areas of lawsuits and environmental liabilities.

#### SEGMENT REPORTING

- 7 Prepare the necessary supplemental disclosures of financial information by product line and by geographic area.

#### INTERIM REPORTING

- 8 Recognize the importance of interim reports, and outline the difficulties encountered when preparing those reports.

This chapter is a little different from the other chapters in the text. The chapter is composed of four modules: derivatives, contingencies, segment reporting, and interim reporting. Each of the modules is self-contained and can be studied independently. So do as much or as little of this chapter as your instructor thinks best. Of course, you are free to sneak a look at any of the modules that your instructor does not assign.

## DERIVATIVES

**Procter & Gamble (P&G)** is a sophisticated marketer of consumer products such as Tide®, Pampers®, Folgers®, and Crest®. Apparently this sophistication hasn't always extended to P&G's understanding of derivative financial instruments. In November 1993, P&G agreed to buy a complex derivative

that would give the company lower current interest payments in exchange for an agreement to make higher payments in the future depending on the future level of interest rates.<sup>1</sup> When interest rates increased after the derivative was purchased, P&G learned a rough lesson relative to the risk associated with speculative derivatives. After the smoke had cleared, the increased interest payments from the derivative arrangement had cost P&G \$195.5 million. A note written by former P&G chairman Edwin Artzt after this fiasco said that the officials who bought the derivative were like "farm boys at a country carnival."<sup>2</sup>

i

FYI

The largest part of Enron's business before its bankruptcy in 2001 was the trading of derivative contracts. When the scandals swirling around Enron caused the company to lose credibility with its customers, its derivative trading activity plummeted literally overnight.

rocter & Gamble is just one in a long list of organizations that lost large amounts of money by trading in derivatives: **Dell Computer**, **Orange County**, **Fannie Mae**, and on and on. The combination of the complexity of derivatives, which are frequently misunderstood even by corporate treasurers and portfolio managers, and the lack of disclosure about derivatives created a dangerous environment in which users of financial statements could be completely unaware of huge company risks. This is exactly the type of situation the SEC was created to address. Accordingly, in recent years the FASB, with the blessing and prodding of the SEC, has significantly improved the accounting for and disclosure of derivative financial instruments. However, don't get the impression that improved accounting disclosure has led to complete understanding of derivatives. Even with this improved accounting, overly aggressive use of derivatives contributed to the worldwide financial institution meltdown in the second half of 2008.

The first module in this chapter explains the general nature of derivatives, the types of risk companies face and how different types of derivatives can be used to hedge those risks, and the standards governing the accounting for derivatives.

<sup>1</sup> Kelley Holland, Linda Himelstein, and Zachary Schiller, "The Bankers Trust Tapes," *Business Week*, October 16, 1995, p. 106.

<sup>2</sup> Carol J. Loomis, "Like Farm Boys at a Country Carnival," *Fortune*, November 27, 1995, p. 34.

## Simple Example of a Derivative

**1** Understand the business and accounting concepts connected with derivatives and hedging activities.

**WHY** Let's be honest—most of us don't even know what a derivative is. Before we can account for derivatives, we need to know what they are and what business purpose they serve.

**HOW** A derivative is a financial instrument or other contract that derives its value from the movement of prices, interest rates, or exchange rates associated with an underlying item. For example, an option to buy a piece of land is a derivative. The option itself increases in value as the piece of land increases in value. Uncertainty about the future fair value of assets and liabilities or about future cash flows exposes firms to risk. One way to manage the risk associated with fair value and cash flow fluctuations is through the use of derivatives.

Assume that you are an employee of Nauvoo Software Solutions. On October 1, 2013, you purchase 100 shares of stock in the company at the market price of \$50 per share, making the total purchase price \$5,000. If you were to prepare a personal balance sheet, how would you report these shares? Obviously, the 100 shares of Nauvoo stock would be reported as a \$5,000 asset.

Now assume that you are nervous about possible price fluctuations in the stock. On January 1, 2014, you need to make a college tuition payment of \$5,000 on behalf of your daughter, and you must make certain that you have \$5,000 on that date. You can't sell the Nauvoo shares now (and put the \$5,000 cash under your mattress) because your employment contract states that any shares you purchase from the company must be held for at least three months before you can sell them. Your risk management dilemma is as follows: You must hold the Nauvoo shares as an asset for the next three months, but a downward movement in the stock price between now and January 1 would be disastrous for you.

The answer to your problem is the following agreement: If the price of Nauvoo stock is above \$50 per share on January 1, you agree to pay a cash amount equal to that excess (multiplied by 100 shares) to John Bennett, a local stock speculator. If the price of Nauvoo stock goes below \$50, John Bennett agrees to pay you a cash amount equal to the deficit (multiplied by 100 shares). As detailed later in the chapter, the broad name given to agreements such as this is a *derivative*. A **derivative** is a financial instrument or other contract that derives its value from the movement of the price, foreign exchange rate, or interest rate on some other underlying asset or financial instrument.

How does this derivative agreement solve your risk management dilemma? Look at the following chart:

	Stock Price on January 1		
	\$45	\$50	\$55
Value of shares.....	\$4,500	\$5,000	\$5,500
Receipt from (payment to) Bennett.....	500	0	(500)
Net amount.....	<u>\$5,000</u>	<u>\$5,000</u>	<u>\$5,000</u>

Because of the structure of the agreement, you wind up with \$5,000 on January 1 no matter what happens to the price of Nauvoo stock between now and then. After the fact,

a derivative contract is sometimes a good deal and sometimes a bad one. If the price actually increases to \$55, it would have been better had you not entered into the agreement. Because of the absolute necessity of having \$5,000 on January 1, however, you are willing to trade off any stock profits you might make for the right to receive payments that will reimburse your stock losses.<sup>3</sup>

i

FYI

In the past, a derivative instrument such as this was said to have “off-balance-sheet risk” because it could fluctuate in value after the initial agreement date, but these fluctuations would not be reflected in the balance sheet. As explained later, the accounting standards have been changed to bring these fluctuations onto the balance sheet.

How much money will change hands between you and John Bennett on October 1, the day you enter into the derivative contract? In other words, do you have to pay John Bennett anything up front to get him to sign the agreement, or does he have to pay you? The valuation of derivatives is way beyond the scope of this book, but two of the factors that would be considered are the expected return on Nauvoo stock over the 3-month period (on average, stock prices move up 3% or 4% per quarter) and the difference in the way you and John Bennett view risk. If you are very nervous about risk and John Bennett is not, he has the advantage in the bargaining and may be able to extract an up-front payment from you. For simplicity, the valuation assumptions made in this chapter will be very basic; for more advanced treatment you will need to talk to your finance professor. The simplest assumptions are that you and John Bennett have the same risk preferences and that the \$50 price of the stock on October 1 is equal to the expected price on January 1. If these two assumptions hold, the money exchanged at the signing of the agreement on October 1 is \$0 because the probability of your being required to make a payment to Bennett on January 1 is equal to the probability that he will have to make a payment to you.

Another way to describe the arrangement between you and John Bennett is as follows: You have agreed, three months in advance, to sell 100 shares of Nauvoo stock to John Bennett at a price of \$50 per share. A forward sale such as this is similar to what the finance people call a *short sale*. To demonstrate that a forward sale is equivalent to the original exchange of cash payments you and John Bennett agreed to, consider the following:

If the shares are worth, say, \$5,500 on January 1, John Bennett will pay you \$5,000 for the shares and then be able to immediately sell them for \$5,500, netting a cash increase of \$500. At the same time, you will have received \$5,000, which is \$500 less than you would have received if you had simply sold the shares in the market. In place of executing the forward sale, the same cash flow effects are achieved if you simply give John Bennett \$500 in cash.

The same analysis could be done to show that requiring John Bennett to buy the shares for \$5,000 when they are worth just \$4,500 is equivalent to a simple cash transfer of \$500 from John Bennett to you. A general characteristic of derivative arrangements is that although they are phrased in terms of the exchange of some underlying item (shares of stock, interest payments, pounds of orange juice concentrate, Japanese yen), they are often settled by a simple exchange of cash.

<sup>3</sup> Another question is why John Bennett, the speculator, would be willing to enter into this agreement. An arrangement such as this is one way for a speculator to make money if a price or rate moves in the direction he or she thinks it will. In this case, John Bennett’s valuation analysis has led him to believe that the price of Nauvoo stock will move up in the next three months, and the derivative is a way for Bennett to make money if his analysis is correct.

Now, let's talk about some accounting. What journal entry would you be required to make to recognize the signing of the agreement on October 1? The answer is that you make no journal entry. No cash changes hands; you and John Bennett have merely exchanged promises about some future action. This type of contract is called an **executory contract** and is very common in business. Another example of an executory contract is an operating lease, a promise to make payments in the future in exchange for the promise to receive the use of an asset in the future. Like an operating lease, the derivative contract is “off balance sheet” on the day it is signed.

On December 31, 2013, the price of Nauvoo stock is \$47 per share, making your investment in Nauvoo shares worth \$4,700 ( $\$47 \times 100$ ). The payment exchange with John Bennett is to be made on the following day. With the price per share at \$47, it appears that you will receive a payment from Bennett of \$300 [ $(\$50 - \$47) \times 100$ ]. How should this information be reflected in the Assets section of your December 31, 2013, balance sheet? Four possibilities are outlined below.

	Option 1	Option 2	Option 3	Option 4
Nauvoo stock . . . . .	\$5,000	\$4,700	\$5,000	\$4,700
Derivative payment receivable . . . . .	\$0	\$0	\$300	\$300
Valuation of stock . . . . .	Cost	Fair value	Cost	Fair value
Recognition of derivative receivable? . . . . .	No	No	Yes	Yes

Option 4 provides the best information because it reports the fair value of both the stock investment and the derivative payment receivable. Historically, the generally accepted treatment in the United States was Option 2, with some added disclosure about the derivative agreement.<sup>4</sup> The FASB has now adopted a standard that results in Option 4, the recognition of the fair value of derivatives in the financial statements.<sup>5</sup>

The remainder of this module details how derivatives are used to hedge risk and how information about derivatives should be reported in the financial statements.

## Types of Risk

### 2 Identify the different types of risk faced by a business.

**WHY** Because the use of derivatives helps companies to manage their risks, an important element in understanding derivatives is understanding the risks they help to manage.

**HOW** Four important risks faced by businesses are price risk (uncertainty about the future price of an asset), credit risk (uncertainty over whether other people or companies will do what they have agreed to do), interest rate risk (uncertainty about future interest rates), and exchange risk (uncertainty about future foreign exchange rates).

Most firms use derivatives as a tool for managing risk. Accordingly, before discussing the different types of derivatives, we will briefly outline the various types of risk.

<sup>4</sup> Pre-Codification *Statement of Financial Accounting Standards No. 119*, “Disclosure about Derivative Financial Instruments and Fair Value of Financial Instruments” (Norwalk, CT: Financial Accounting Standards Board, 1994).

<sup>5</sup> FASB ASC Topic 815 (Derivatives and Hedging).

### Price Risk

**Price risk** is the uncertainty about the future price of an asset. It was uncertainty about the future price of Nauvoo Software Solutions stock that prompted the derivative contract in the preceding example. Firms can be exposed to price risk with existing assets, such as financial securities or inventory, or with assets to be acquired in the future, such as equipment to be purchased next month.

### Credit Risk

**Credit risk** is the uncertainty that the party on the other side of an agreement will abide by the terms of the agreement. The most common example of credit risk is the uncertainty over whether a credit customer will ultimately pay his or her account. Banks are in the business of properly evaluating credit risk, and the success or failure of a bank depends largely on how good the bank's credit analysts are at identifying who will repay a loan and who won't. Credit risk analysis is a specialized skill, and many retail companies, through the acceptance of credit card purchases, have contracted their credit risk analysis to **Visa, MasterCard, Discover, or American Express**. In the Nauvoo stock and derivative contract example, the credit risk is the possibility that John Bennett, the party on the other side of the agreement, will not make the payments required under the agreement.

### Interest Rate Risk

**Interest rate risk** is the uncertainty about future interest rates and their impact on future cash flows as well as on the fair value of existing assets and liabilities. A variable-rate mortgage is a good illustration of one type of interest rate risk. The periodic interest payments on the variable-rate mortgage will fluctuate in the future, depending on the level of future interest rates. A fixed-rate mortgage is a good example of another type of interest rate risk. If interest rates decrease, the present value of future fixed payments to be made under a fixed-rate mortgage will increase. Thus, the fair value of the mortgage liability increases; this is the downside of obligating yourself to a fixed stream of interest payments when there is a possibility that interest rates may go down in the future. In summary, interest rate risk exposes a firm to uncertainty about future cash flows as well as uncertainty about the fair value of assets and liabilities that have values tied to the level of interest rates.

### Exchange Rate Risk

**Exchange rate risk** is the uncertainty about future U.S. dollar cash flows arising when assets and liabilities are denominated in a foreign currency. For example, many compensation packages for U.S. citizens working in foreign countries include an end-of-contract bonus payment if the employee sticks it out and stays on the foreign assignment for the entire length of the contract. If this bonus is denominated in the currency of the foreign country, the employee knows with

certainty the future amount of his or her foreign currency bonus, but the U.S. dollar value bonus depends on the exchange rate prevailing when the bonus is received. U.S. multinational firms face the same risk when sales, purchases, loans, and investments are denominated in foreign currencies.

i

FYI

Other types of risk include liquidity risk, theft risk, competitive risk, and business cycle risk. See Johnson and Swieringa, "Derivatives, Hedging and Comprehensive Income," *Accounting Horizons*, December 1996, p. 109.

Some degree of risk is an unwanted but common side effect of doing business. For example, the variation in the cost of jet fuel is a nuisance and a worry to the major airlines. Similarly, fluctuations in the U.S. dollar/Japanese yen exchange rate wreak havoc on the competitive plans of both U.S. and Japanese car manufacturers. On the other hand, managing risk is the very reason for the existence of some businesses. Much of the revenue generated by a bank arises because the bank has expertise in evaluating and managing credit, interest rate, and exchange rate risk. The following sections discuss derivatives and hedging from the standpoint of a manufacturing, retailing, or service firm that is trying to use these techniques to reduce the risks that arise as part of doing business. Coverage of the more complicated risk management strategies of banks and financial institutions is outside the scope of this text.

## Types of Derivatives

**3**

Describe the characteristics of the following types of derivatives: swaps, forwards, futures, and options.

**WHY** Understanding the use of and accounting for derivatives requires an understanding of the common types of derivatives: swaps, forwards, futures, and options.

**HOW** A swap is an agreement to exchange payments in the future, usually a fixed payment for a variable payment, or vice versa. A forward is an agreement to exchange an item at a set date in the future at a price that is set now. A future is quite similar to a forward except that the terms of futures contracts are standardized and these contracts are traded in markets. An option is the right, but not the obligation, to buy or sell an asset at a specified price in the future.

Recall that a derivative is a financial instrument or other contract that derives its value from the movement of the price, exchange rate, or interest rate on some other underlying asset or financial instrument. In addition, a derivative does not require a firm to take delivery or make delivery of the underlying asset or financial instrument; in situations in which actual delivery is required, the underlying item can easily be converted into cash.<sup>6</sup> For example, you may have heard about the buying and selling of pork belly futures. These contracts (futures contracts are explained later) can qualify as derivatives because, fortunately, they do not require the holder to either deliver or take delivery of a truckload of pork bellies. Instead, these contracts are settled by cash payments, much as the Nauvoo stock derivative contract was settled, not with the delivery of any shares of stock, but by a cash payment.

The most common types of derivatives are swaps, forwards, futures, and options. Each type is explained.

### Swap

A **swap** is a contract in which two parties agree to exchange payments in the future based on the movement of some agreed-upon price or rate. A common type of swap is an **interest rate swap**. In an interest rate swap, two parties agree to exchange future interest payments on a given loan amount; usually, one set of interest payments is based on a fixed interest rate and the other is based on a variable interest rate. To illustrate,

<sup>6</sup> FASB ASC paragraph 815-10-15-83.

assume that Pratt Company has a good working relationship with a bank that issues only variable-rate loans. Pratt takes advantage of its relationship at the bank and on January 1, 2013, receives a 2-year, \$100,000 loan, with interest payments occurring at the end of each year. The interest rate for the first year is the prevailing market rate of 10%, and the rate in the second year will be equal to the market interest rate on January 1 of that year. Pratt is reluctant to bear the risk associated with the uncertainty about what the interest payment in the second year will be. So Pratt enters into an interest rate swap agreement with another party (not the bank) whereby Pratt agrees to pay a fixed interest rate of 10% on the \$100,000 loan amount to that party in exchange for receiving from that party a variable amount based on the prevailing market rate multiplied by \$100,000. This is called a *pay-fixed, receive-variable swap*.

Instead of exchanging the entire amount of the interest payments called for under the swap contract, Pratt would probably settle the agreement by exchanging a small cash payment, depending on what has happened to interest rates. Accordingly, Pratt will receive an amount equal to  $[\$100,000 \times (\text{Jan. 1, 2014, interest rate} - 10\%)]$  if the January 1, 2014, interest rate is more than 10% and will pay the same amount if the rate is less than 10%. The interest swap payment will be made in 2014. To see the impact of this interest rate swap, consider the following table:

	Interest Rate on January 1, 2014		
	7%	10%	13%
Variable-rate interest payment in 2014 . . . . .	\$ (7,000)	\$(10,000)	\$(13,000)
Receipt (payment) for interest rate swap . . . . .	(3,000)	0	3,000
Net interest payment in 2014 . . . . .	<u>\$(10,000)</u>	<u>\$(10,000)</u>	<u>\$(10,000)</u>

The interest rate swap agreement has changed Pratt’s uncertain future interest payment into a payment of \$10,000 no matter what the prevailing interest rates are in 2014. Why didn’t Pratt just go out and get a fixed-rate loan in the first place? Sometimes, in this case because of Pratt’s special relationship with the bank, it is easier to get one type of loan or investment security than another. A derivative instrument can effectively change the loan that you got into the loan that you want.

**Forwards**

A **forward contract** is an agreement between two parties to exchange a specified amount of a commodity, security, or foreign currency at a specified date in the future with the price or exchange rate being set now. To illustrate, assume that on November 1, 2013, Clayton Company sold machine parts to Maruta Company for ¥30,000,000 to be received on January 1, 2014. The current exchange rate is ¥120 = \$1. To

ensure the dollar amount that will be received, Clayton enters into a forward contract with a large bank, agreeing that on January 1 Clayton will deliver ¥30,000,000 to the bank and the bank will give U.S. dollars in exchange at the rate of ¥120 = \$1, or \$250,000 (¥30,000,000/¥120 per \$1). This forward contract guarantees

## CAUTION

Don't forget that one of the characteristics of a derivative, whether it relates to yen, wheat, pork bellies, or stock index levels, is that it can be, and usually is, settled in the end with a cash payment instead of with actual delivery of the underlying item.

the U.S. dollar amount that Clayton will receive from the receivable denominated in Japanese yen.

Operationally, this forward contract would usually be settled as follows. Given the exchange rate on January 1, 2014, if ¥30,000,000 is worth less than \$250,000, the bank will pay Clayton the difference in cash (U.S. dollars). If ¥30,000,000 is worth more than \$250,000, Clayton pays the difference to the bank in cash. Therefore, no yen need be delivered as part of the contract; the contract is settled with a U.S. dollar cash payment.

The impact of the forward exchange contract is shown in the following table:

	Exchange Rate on January 1		
	¥118 = \$1	¥120 = \$1	¥122 = \$1
Value of ¥30,000,000 .....	\$254,237	\$250,000	\$245,902
Clayton receipt (payment) to settle forward contract .....	(4,237)	0	4,098
Net U.S. dollar receipt by Clayton .....	<u>\$250,000</u>	<u>\$250,000</u>	<u>\$250,000</u>

If Clayton is nervous about exchange rate changes, why agree to denominating the transaction in Japanese yen in the first place? The answer is that some types of transactions and some products are routinely negotiated in terms of a certain currency. For example, almost all crude oil sales are denominated in U.S. dollars, regardless of the countries of the companies conducting the transaction. In addition, if denominating a sale in a certain currency will make the customer feel more comfortable, companies are likely to follow the policy that “the customer is always right.”

In this simple example, the forward exchange rate of ¥120 = \$1 is equal to the prevailing exchange rate, called the spot rate, on the date the forward contract is signed. Usually, the forward rate would differ from the spot rate in order to compensate the bank for providing this risk-reduction service to Clayton. For example, a forward rate of ¥121 = \$1 means that the bank would receive cash payments from Clayton when the

## STOP & THINK

What type of credit risk is associated with a forward contract?

- a) The risk that the party required to make the settlement payment will refuse to pay
- b) The risk that the price, interest rate, or exchange rate will increase
- c) The risk that the price, interest rate, or exchange rate will decrease
- d) The risk that overall company net income will decrease between now and the contract settlement date

F. Schuster/PhotoLibrary/Photodisc/Getty Images

A wheat futures contract can protect the farmer from wide fluctuations in wheat prices.

dollar value of ¥30,000,000 was higher than \$247,934 ( $¥30,000,000/¥121$  per \$1). With this lower threshold (instead of \$250,000), it would be more likely that the bank would receive cash from Clayton to settle the forward contract. In this chapter, we will make the simplifying assumption that spot rates and forward rates are equal to one another.

## Futures

A **futures contract** is a contract, traded on an exchange, that allows a company to buy or sell a specified quantity of a commodity or a financial security at a specified price on a specified future date. A futures contract is very similar to a forward contract with the difference being that a forward contract is a private contract negotiated between two parties, whereas a futures contract is a standardized contract that is sponsored by a trading exchange and can be traded among different parties many times in a single day. So, with a forward contract, you know the party with whom you will be exchanging cash to settle the contract; with a futures contract, all these cash settlements are handled through the exchange and you never

know, or care, who is on the other side of the contract.

As an example of the use of a futures contract, assume that Hyrum Bakery uses 1,000 bushels of wheat every month. On December 1, 2013, Hyrum decides to protect itself against price movements for its January 1, 2014, wheat purchase because long-term spring weather forecasts often come out in December, causing wide fluctuations in wheat prices. To protect against these fluctuations, Hyrum buys a futures contract on December 1 that obligates it to purchase 1,000 bushels of wheat on January 1, 2014, at a price of \$4 per bushel (which is also the prevailing price of wheat on December 1). This is a standardized exchange-traded futures contract, so Hyrum has no idea who is on the other side of the agreement; that is, Hyrum doesn't know who is promising to deliver the wheat.

As with other derivatives, a wheat futures contract is usually settled by a cash payment at the end of the contract instead of by actual delivery of the wheat. Settlement of Hyrum's futures contract would be as follows. If the price of wheat is less than \$4 per bushel on January 1, Hyrum will make a cash payment of that difference, multiplied by 1,000 bushels. If the price of wheat is more than \$4 per bushel on January 1, Hyrum will receive a cash payment equal to that difference multiplied by 1,000 bushels.<sup>7</sup> The effect of the futures contract is illustrated in the table shown on page 19-11.

<sup>7</sup> For exchange-traded futures contracts, cash settlements usually are not deferred until the end of the contract but occur at the end of every day based on price movements during that day.

### FYI

The difference between a *forward contract* and a *futures contract* is similar to the difference between investing as a partner in a company and buying stock in a company. When you invest, you personally negotiate the amount you will invest and your percentage ownership, and you know who sold you the investment. When you buy stock, you buy a standardized chunk of a company and because the shares are purchased through an exchange, you have no idea who owned the shares before you bought them.

### FYI

Hedging future purchases is where derivative use sometimes is abused. The people in the corporate finance office start to think that they can forecast changes in wheat prices, so they buy forward contracts far in excess of that needed to hedge future wheat purchases. These extra contracts are speculations on the movement of wheat prices, and they expose the company to substantial speculative risk.

	Wheat Price on January 1		
	\$3.80	\$4.00	\$4.20
Cost to purchase 1,000 bushels . . . . .	\$(3,800)	\$(4,000)	\$(4,200)
Hyrum receipt (payment) to settle futures contract . . . . .	<u>(200)</u>	<u>0</u>	<u>200</u>
Net cost of January wheat . . . . .	<u>\$(4,000)</u>	<u>\$(4,000)</u>	<u>\$(4,000)</u>

## Option

An **option** is a contract giving the owner the right, but not the obligation, to buy or sell an asset at a specified price any time during a specified period in the future. Options come in two general types: call options and put options. A **call option** gives the owner the right to buy an asset at a specified price, and a **put option** gives the owner the right to sell an asset at a specified price. In exchange for the rights inherent in the option, the owner of the option pays an amount in advance to the party on the other side of the transaction, who is called the *writer of the option*. Like a futures contract, many options are standardized contracts that are traded on organized exchanges.

An option differs from the derivative instruments discussed previously because it protects the owner against unfavorable movements in prices or rates while allowing the owner to benefit from favorable movements. With the swaps, forwards, and futures discussed earlier, the protection from unfavorable movements was “paid for” by sacrificing the benefits from favorable movements. With an option, the protection is “paid for” with an up-front cash payment when the option is purchased.

Because of the asymmetrical nature of options, the owner of an option and the writer of an option are in very different positions. With a call option, for example, the owner of the option can buy the designated asset at a fixed price no matter how high the market price of the asset goes. If the market price of the asset decreases, the option owner can just throw the option away because it is cheaper to buy the asset at the low market price. So, the maximum amount that the owner of an option can lose is the price paid to buy the option. On the other side of the transaction, the writer of the option has no such downside protection. No matter how high market prices increase, the writer of a call option must sell the asset at the fixed option price. So, there is no limit to the amount that a call option writer can lose.<sup>8</sup> Because this discussion of derivative instruments focuses on the use of derivatives for risk management and risk reduction, only buyers of options will be considered.

To illustrate the use of options in managing risk, assume that, on October 1, 2013, Woodruff Company decides that it will need to purchase 1,000 ounces of gold for use in its computer chip manufacturing process in January 2014. Gold is selling for \$1,100 per ounce on October 1, 2013. For cash flow reasons, Woodruff plans to delay the purchase of the gold until January 1, 2014, and is concerned about potential increases in the market price of gold between October 1, 2013, and January 1, 2014.

To reduce the price risk associated with the gold, Woodruff enters into a call option contract on October 1. The contract gives Woodruff the right, but not the obligation, to purchase 1,000 ounces of gold at a price of \$1,100 per ounce. The option period extends

<sup>8</sup> The losses of the writer of a put option are limited to the full amount of the option price. Even if the asset becomes completely worthless, the put option writer must buy it at the option price.

to January 1, 2014, and Woodruff has to pay \$20,000 to buy this option.<sup>9</sup> In exchange for this \$20,000 payment, the option arrangement protects Woodruff from unfavorable movements in the price of gold but also allows Woodruff to benefit from favorable movements. This can be seen from the following table:

	Gold Price (per ounce) on January 1		
	\$1,000	\$1,100	\$1,200
Cost of 1,000 ounces of gold if			
· Buy gold at January 1 price . . . . .	\$1,000,000	\$1,100,000	\$1,200,000
· Exercise option . . . . .	\$1,100,000	\$1,100,000	\$1,100,000
Will option be exercised? . . . . .	No	Same either way	Yes
Cost of gold . . . . .	\$1,000,000	\$1,100,000	\$1,100,000

!

## CAUTION

Remember that an option is a right, not an obligation. The owner of the option can always throw it away and forget the whole deal.

The existence of the option contract means that Woodruff will pay no more than \$1,100,000 for the gold. Because the option is a right and not an obligation, Woodruff can ignore it, as in the preceding case in which the January 1 price of gold is \$1,000 per ounce, and just buy gold at

the market price prevailing on January 1. Remember that this ability to enjoy protection from unfavorable price changes but to benefit from favorable price changes was not free; it cost Woodruff \$20,000 at the beginning of the option period. As with the other derivative instruments, this option can be settled on January 1 by a direct cash payment from the option writer to Woodruff in place of the actual delivery of the gold. If the cost of 1,000 ounces of gold is more than \$1,100,000 on January 1, the option writer pays Woodruff the difference.

## Types of Hedging Activities

**4** Define *hedging*, and outline the difference between a fair value hedge and a cash flow hedge.

**WHY** Hedging is the structuring of transactions to reduce risk. Because derivatives are often used as hedges, an understanding of derivative accounting requires an understanding of hedging.

**HOW** A business can carefully structure its transactions to hedge, or partially offset, many of its risks. Derivatives can be used as fair value hedges (where the change in the fair value of the derivative offsets changes in fair values of assets or liabilities) and cash flow hedges (where cash flows from the derivative offset variability in the cash flows from forecasted transactions).

<sup>9</sup> Computation of option values was outlined in Chapter 13, but a detailed treatment is beyond the scope of this text. Briefly, the price that must be paid to purchase a call option is higher when the option exercise price is lower, when the length of the option is longer, and when the movement of the price of the underlying asset (gold in this example) is more volatile.

The preceding illustrations of the different types of derivatives—swaps, forwards, futures, and options—also illustrated how these derivatives are used in hedging activities. Broadly defined, **hedging** is the structuring of transactions to reduce risk. Hedging occurs naturally as part of many business activities, examples of which follow.

- In the retail sale of gasoline, one risk to the gasoline retailer is that movement in worldwide oil prices will cause variation in the cost to purchase gasoline. This “cost of goods sold” risk is partially offset by the fact that the retail selling price of gasoline also goes up when oil prices rise. So, the increase in the cost is offset by the increase in the selling price.
- Banks are vulnerable to interest rate increases because this increases the amount they must pay to get the use of depositors’ money. However, this risk is hedged because an interest rate increase also allows a bank to raise the rates it charges on its loans.
- Multinational companies can be impacted by changes in exchange rates. If a U.S. multinational has a subsidiary in France, a decline in the value of the euro will cause the dollar value of the subsidiary’s euro-denominated assets to decline. This loss is partially offset, however, because the dollar value of the subsidiary’s euro-denominated liabilities will also decline.

Derivatives can be used in hedging activities through the acquisition of a derivative with the characteristic that changes in the value of the derivative are expected to offset changes in the value of the item being hedged. Let’s review how derivatives were used as hedges in each of the derivative illustrations given in the preceding section.

- *Pratt swap.* The interest rate swap was structured to offset changes in the variable-rate interest payments.
- *Clayton forward.* The forward currency contract was entered into to offset changes in the dollar value of the receivable denominated in Japanese yen.
- *Hyrum future.* The wheat futures contract was acquired to offset movements in the expected purchase price of the following month’s supply of wheat.
- *Woodruff option.* The gold call option was purchased to offset the negative impact on the cost of gold for production purposes of changes in the market price of gold.

The FASB has defined two of the broad categories of hedging activities as follows:<sup>10</sup>

- *Fair value hedges.* A **fair value hedge** is a derivative that offsets, at least partially, the change in the fair value of an asset or a liability. A derivative can also serve as a hedge of the fair value of firm commitments even though the assets and liabilities associated with a firm commitment are not recognized until the actual transaction date.
- *Cash flow hedges.* A **cash flow hedge** is a derivative that offsets, at least partially, the variability in cash flows from forecasted transactions that are probable.

**FYI**

Historically, cash flow hedges have been very controversial. Firms have claimed to be using derivatives to hedge forecasted transactions when in fact the dollar value of supposed hedging activity has been far greater than any possible future transactions. Using a derivative in this way transforms the derivative from a hedging tool into a speculative investment.

<sup>10</sup> FASB ASC paragraph 815-20-35-1.

The FASB has identified a third category of hedges related to foreign currency risk. Some of these hedges are fair value hedges, and some are cash flow hedges. In addition, some of these hedges relate to the foreign currency risk associated with the net investment in foreign subsidiaries. This category of hedges is covered in more detail in advanced accounting courses.

The next section illustrates the proper accounting for derivatives, particularly those designated as hedges.

## Accounting for Derivatives and for Hedging Activities

5

Account for a variety of different derivatives and for hedging relationships.

**WHY** In practice, the accounting for derivatives is extremely complex. However, as you will see in this section, it is not too hard to gain a solid understanding of the basics of derivative accounting.

**HOW** If a derivative is not a hedge, changes in the fair value of the derivative are reported as gains or losses in the income statement. If a derivative is a fair value hedge, changes in the fair value of the derivative are reported as gains or losses in the income statement and are offset by gains or losses on changes in the fair value of the asset or liability being hedged. If a derivative is a cash flow hedge, changes in the fair value of the derivative are deferred and reported as part of other comprehensive income. These deferred gains and losses are recognized in income on the forecasted date of the cash flows being hedged.

Several factors combined in 1993 and 1994 to move the accounting for derivatives to the top of the FASB's agenda. First was the tremendous proliferation in the use of derivatives by U.S. businesses. Second was the derivative-related catastrophes experienced by companies such as Procter & Gamble. And third was the SEC's urging for improvement in the accounting for derivatives. In October 1994, the FASB released pre-Codification *Statement No. 119* with the main focus being on improved disclosure (not recognition) for the 1994 fiscal year. *Statement No. 119* was viewed as a temporary stopgap standard.

A more comprehensive recognition standard for derivatives, FASB pre-Codification *Statement No. 133*, was adopted in June 1998; its effective date was subsequently delayed to fiscal years beginning after June 15, 2000. The delay was motivated by two reasons: Companies wanted more time to figure out how to implement the standard and they did not want to implement the standard before January 1, 2000, because of "Y2K" concerns with their computer systems. The adoption of FASB *Statement No. 133* was not the end of the quest for better derivative accounting. A special Derivatives Implementation Group (DIG) was established by the FASB with the sole purpose of handling derivative accounting issues. Until it stopped meeting in June 2009, the DIG had commented on 190 different issues relative to accounting for derivatives. So keep in mind that the brief treatment of derivative accounting in this chapter is just an overview. However, this overview does cover the key elements of accounting for derivatives.

## Overview of Accounting for Derivatives and Hedging Activities

The accounting difficulty caused by derivatives is illustrated in this simple matrix:

	Historical Cost	Subsequent Changes in Value
Traditional assets and liabilities	Focus	Frequently ignored
Derivatives	Small or zero	Everything

As the matrix shows, the historical cost focus of traditional accounting is misplaced with derivatives because derivatives often have little or no up-front historical cost. With derivatives, the subsequent changes in prices or rates are critical to determining the value of the derivative, yet these changes are frequently ignored in traditional accounting.

Because derivatives do not mesh well with the traditional accounting model, the FASB has endorsed a different approach, based on two simple notions:

1. *Balance sheet.* Derivatives should be reported in the balance sheet at their fair value as of the balance sheet date. No other measure of value is relevant for derivatives.
2. *Income statement.* When a derivative is used to hedge risk, the gains and losses on the derivative should be reported in the same income statement in which the income effects on the hedged item are reported. This sometimes requires unrealized gains and losses being temporarily deferred in an accumulated other comprehensive income account that is reported as part of equity.

A consequence of this approach is that the appropriate treatment of changes in the fair value of a derivative depends on whether the derivative serves as a hedge and, if so, the type of hedge, as follows:

- *No hedge.* All changes in the fair value of derivatives that are not designated as hedges are recognized as gains or losses in the income statement in the period in which the value changes. In a sense, a derivative that does not serve as a hedge can be thought of as a speculation about the direction of movement of some price or rate.
- *Fair value hedge.* Changes in the fair value of derivatives designated as fair value hedges are recognized as gains or losses in the period of the value change. These derivative gains or losses are offset (either in whole or in part) by the recognition of gains or losses on the change in fair value of the item being hedged. The net effect is that when gains or losses on derivatives designated as fair value hedges exceed the gains or losses on the item being hedged, the excess affects reported net income.
- *Cash flow hedge.* Changes in the fair value of derivatives designated as cash flow hedges are recognized as part of the accumulated other comprehensive income account. In effect, this treatment defers recognition of the gain or loss and classifies the deferred item as an equity adjustment. These deferred derivative gains and losses are recognized in net income in the period in which the hedged cash flow transaction was forecasted to occur.

An important aspect of this approach is that derivatives must be identified as hedges of specific items at the beginning of the hedging relationship. Firms cannot

**FYI**

Assessing hedge effectiveness when the critical elements of the hedged item and the hedging derivative are not the same involves statistical procedures and can be quite difficult. For a discussion, see John D. Finnerty and Dwight Grant, "Alternative Approaches to Testing Hedge Effectiveness under SFAS No. 133," *Accounting Horizons*, June 2002, p. 95.

wait until after they see the results for the period to decide whether they want to designate certain derivatives as hedges. The designation of a derivative as a hedge should be supported with formal documentation.

To account for a derivative as a hedge, a company must define, in advance, how it will determine whether the derivative is functioning as an effective hedge. For the simple examples given in this chapter, hedge effectiveness is easy to assess because the terms of the derivatives have been constructed to exactly match the amount and timing of the underlying hedged item. Partial hedge ineffectiveness would occur if, for example, the derivative maturity date did not exactly match the date of a forecasted purchase. Similarly, hedge ineffectiveness occurs when the amount in the derivative agreement (such as the number of units of foreign currency or of pounds of a commodity) is either more or less than the amount of the underlying hedged item. Derivative gains or losses associated with hedge ineffectiveness are recognized in income immediately in the period in which they occur.

**Disclosure** Companies are required to provide a description of their risk management strategy and how derivatives fit into that strategy. For both fair value and cash flow hedges, companies also must disclose the amount of derivative gains or losses that are included in income because of hedge ineffectiveness. Finally, for cash flow hedges, a company must describe the transactions that will cause deferred derivative gains and losses to be recognized in net income and disclose the amount of deferred gains or losses that are expected to be recognized in net income in the next 12 months.<sup>11</sup>

Another item that is often referred to in the business press is the *notional amount* of the derivative instrument. The **notional amount** is the total face amount of the asset or liability that underlies the derivative contract.

For example, with a forward contract, the notional amount is the U.S. dollar value of the commodity or currency to be exchanged. The notional amount of derivative instruments is often reported and is frequently misleading. For example, the Clayton forward contract

described earlier in the chapter has a notional amount of \$250,000 (¥30,000,000/¥120 per \$1) but has a fair value of \$0 on the day the forward agreement is signed, and in the example, the total cash payment stemming from the derivative does not exceed \$4,237. In summary, notional amounts grossly overstate both the fair value and the potential cash flows of derivatives.

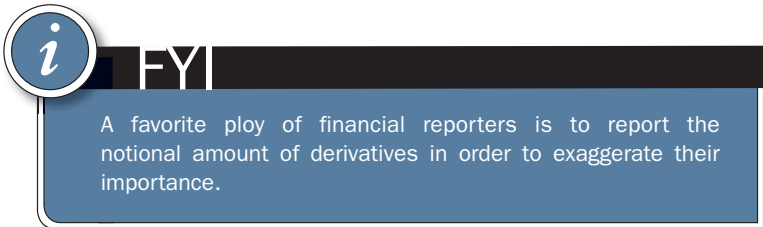

The accounting for derivatives will be illustrated using the information from the previous four derivative examples.

**Illustrations of Accounting for Derivatives and Hedging Activities**

**Pratt Swap** On January 1, 2013, Pratt Company received a 2-year, \$100,000, variable-rate loan and entered into an interest rate swap agreement. The journal entry to record this information follows:

2013			
Jan. 1	Cash .....	100,000	
	Loan Payable .....		100,000

<sup>11</sup> FASB ASC paragraph 815-30-50-1.

**FYI**  
A favorite ploy of financial reporters is to report the notional amount of derivatives in order to exaggerate their importance.

No entry is made to record the swap agreement because as of January 1, 2013, the swap has a fair value of \$0. The value is zero because the interest rate on January 1, 2013, is 10%, and if it is assumed that the best forecast of the future interest rate is the current rate of 10%, it is expected that, on average, no payments will be exchanged under the swap agreement.<sup>12</sup>

Assume now that the actual market interest rate on December 31, 2013, is 11%. With this rate, Pratt will receive a \$1,000 payment [ $\$100,000 \times (0.11 - 0.10)$ ] at the end of 2014 under the swap agreement. Accordingly, on December 31, 2013, Pratt has a \$1,000 receivable under the swap agreement, and the receivable has a present value of \$901 ( $FV = \$1,000$ ,  $N = 1$ ,  $I = 11\%$ ,  $PV = \$901$ ). The impact of the change in interest rates on the interest rate swap and on reported interest expense is accounted for as follows:

	2013 Balance Sheet	2013 Income Statement
Underlying item	No change in the reported loan balance	No impact on 2013 interest expense; the impact will show up in 2014 interest expense
Derivative	Creation of a \$901 receivable under the interest rate swap	Deferred gain of \$901 on the interest rate swap; gain recognized in 2014 to offset increased interest expense

The interest rate swap asset is reported at its present value of \$901 in the December 31, 2013, balance sheet. However, the \$901 gain from the increase in the value of the swap is not included in the 2013 income statement. The swap is intended to offset changes in interest expense in 2014. Accordingly, the gain on the swap is deferred so that it can be offset against the increased interest expense to be reported in 2014. The deferral of the gain merely means that it is temporarily reported as an increase in equity under Accumulated Other Comprehensive Income. The deferred gain would also be included as an addition in the statement of comprehensive income (but not in the normal income statement) for 2013.

The journal entry to record Pratt's 2013 interest payment, along with the adjusting entry to recognize the change in the fair value of the swap, is as follows:

2013

Dec. 31	Interest Expense . . . . .	10,000	
	Cash ( $\$100,000 \times 0.10$ ) . . . . .		10,000
	Interest Rate Swap (asset) . . . . .	901	
	Other Comprehensive Income . . . . .		901

The journal entries necessary in Pratt's books at the end of 2014 are as follows:

2014

Dec. 31	Interest Expense . . . . .	11,000	
	Cash ( $\$100,000 \times 0.11$ ) . . . . .		11,000
	Cash (from swap agreement) . . . . .	1,000	
	Interest Rate Swap (asset) . . . . .		901
	Other Comprehensive Income ( $\$901 \times 0.11$ ; rounded) . . . . .		99
	Accumulated Other Comprehensive Income . . . . .	1,000	
	Interest Expense . . . . .		1,000
	Loan Payable . . . . .	100,000	
	Cash . . . . .		100,000

<sup>12</sup> As mentioned earlier, detailed treatment of the valuation of derivatives is outside the scope of this text. Remember that the valuation assumptions used here represent a simplification.

The \$99 credit to Other Comprehensive Income represents the increase in the value of the swap payment receivable stemming from the passage of time. Also, recall that Other Comprehensive Income is closed to the equity account Accumulated Other Comprehensive Income at the end of each year. The debit to Accumulated Other Comprehensive Income of \$1,000 removes this amount from the Accumulated Other Comprehensive Income portion of equity and transfers it, after the accounts are closed, to Retained Earnings.

An important thing to notice in these journal entries is that net interest expense is \$10,000 because of the hedging effect of the swap. Also notice that the value changes in a derivative designated as a cash flow hedge are deferred in comprehensive income and then reflected in earnings in the period when the hedged cash flow occurs.

**Clayton Forward** On November 1, 2013, Clayton Company sold machine parts to Maruta Company for ¥30,000,000 to be received on January 1, 2014. On the same date, Clayton also entered a yen forward contract. The journal entry to record this information is as follows:

2013		
Nov. 1	Yen Receivable (¥30,000,000/¥120 per \$1) .....	250,000
	Sales .....	250,000

No entry is made to record the forward contract because as of November 1, 2013, the forward has a fair value of \$0. The value is zero because settlement payments are made under the contract only if the exchange rate on January 1, 2014, differs from ¥120 = \$1. If the current exchange rate of ¥120 = \$1 is assumed to be the best forecast of the future rate, it is expected that, on average, no payments will be exchanged under the forward contract.

Assume now that the actual exchange rate on December 31, 2013, is ¥119 = \$1. At this exchange rate, Clayton will have a loss on the forward contract and be required to make a \$2,101 payment [(¥30,000,000/¥119 per \$1) – \$250,000] on January 1, 2014, to settle the forward contract. Accordingly, on December 31, 2013, Clayton has a \$2,101 loss and payable under the forward contract. However, there is also an increase in the yen receivable and a corresponding gain on foreign exchange due to the change in yen value relative to the U.S. dollar. The impact of the change in the yen exchange rate on both the yen receivable and the value of the forward contract is accounted for as follows:

	2013 Balance Sheet	2013 Income Statement
Underlying item	Increase of \$2,101 in the value of the yen receivable	Exchange gain of \$2,101
Derivative	Creation of a \$2,101 liability	Loss on forward contract of \$2,101 under the forward contract

**FYI**

These journal entries illustrate that, after the fact, hedging is not always a good idea. In the Clayton example, the forward contract hedge wipes out the gain on the increase in the value of the yen receivable. The advantage of a hedge is that it reduces volatility, but that sometimes means canceling out gains.

The forward contract liability is reported at its fair value of \$2,101 in the December 31, 2013, balance sheet. In addition, the \$2,101 loss on the forward contract is included in the 2013 income statement, thus offsetting the gain reported from the increase in dollar value of the yen receivable. This accounting treatment accurately

reflects the intent of the forward contract hedge; that is, unrealized gains and losses from changes in value of the forward contract are meant to offset similar changes in value in the item of concern, the yen receivable.

The adjusting entries to recognize the change in the fair value of the forward contract and in the U.S. dollar value of the yen receivable are as follows:

2013

Dec. 31	Loss on Forward Contract .....	2,101	
	Forward Contract (liability) .....		2,101
	Yen Receivable .....	2,101	
	Gain on Foreign Currency .....		2,101

The increase in the yen receivable reflects the \$2,101 increased dollar value of the receivable after the change in the exchange rate to ¥119 = \$1. This gain is offset by the loss from the change in value of the forward contract. The forward contract is a fair value hedge of the value of the receivable, so both changes in value are recognized in earnings.

The journal entries necessary in Clayton's books on January 1, 2014, to record receipt of the yen payment and settlement of the yen forward contract are as follows:

2014

Jan. 1	Cash (¥30,000,000/¥119 per \$1) .....	252,101	
	Yen Receivable .....		252,101
	Forward Contract (liability) .....	2,101	
	Cash (forward contract settlement) .....		2,101

It should be noted that the Clayton forward contract does not qualify for hedge accounting under FASB ASC Topic 815. The FASB explicitly excluded foreign currency-denominated assets and liabilities from the set of items that can be considered as items underlying a hedge.<sup>13</sup> Thus, derivatives that serve as economic hedges of foreign currency assets and liabilities are accounted for as speculations, with all gains and losses recognized as part of income immediately. However, because the accounting standards [in Topic 830 (Foreign Currency Matters)] already require that foreign currency assets and liabilities be revalued at current exchange rates at the end of each period, with the resulting exchange gains and losses recognized in income, the net effect is the same as if the foreign currency derivatives were accounted for as fair value hedges after all. This fact can be seen by reviewing the Clayton forward example: The gains and losses from both the foreign currency receivable and the yen forward contract are recognized in income immediately, effectively offsetting one another.<sup>14</sup>

By excluding derivatives associated with foreign currency assets and liabilities from the hedge accounting rules of Topic 815, the FASB has reduced the disclosure burden of companies that use such derivatives as hedges. The fair value option of Section 825-10-25, which was discussed in detail in Chapter 12, is another effort by the FASB to allow companies to report the economic effects of hedging activity without the elaborate documentation that is required under Topic 815.

<sup>13</sup> FASB ASC paragraph 815-20-25-43.

<sup>14</sup> As mentioned earlier, in this chapter we make the simplifying assumption that spot rates and forward rates are equal to one another. When this is not true, the foreign currency and derivative gains and losses will not exactly offset because foreign currency assets and liabilities are valued using the spot rate and derivative instruments are valued using the forward rate.

**Hyrum Future** On December 1, 2013, Hyrum Company decided to hedge against potential fluctuations in the price of wheat for its forecasted January 2014 purchases and bought a futures contract entitling and obligating Hyrum to purchase 1,000 bushels of wheat on January 1, 2014, for \$4.00 per bushel. No entry is made to record the futures contract because, as of December 1, 2013, the future has a fair value of \$0. The value is zero because settlement payments are made under the contract only if the price of wheat on January 1, 2014, differs from \$4.00 per bushel. If the current price of \$4.00 per bushel is assumed to be the best forecast of the future price, it is expected that, on average, no payments will be exchanged under the futures contract.

Assume that the actual price of wheat on December 31, 2013, is \$4.40 per bushel. At this price, Hyrum will receive a \$400 payment [1,000 bushels × (\$4.40 – \$4.00)] on January 1, 2014, to settle the futures contract. Accordingly, on December 31, 2013, Hyrum has a \$400 receivable under the futures contract. The impact of the change in wheat prices on the wheat futures contract and on the anticipated cost of wheat purchases in January 2014 is accounted for as follows:

	2013 Balance Sheet	2013 Income Statement
Underlying item	No impact; the higher-priced wheat won't be purchased until January 2014	No impact on 2013 cost of goods sold; the impact will show up in 2014 cost of goods sold
Derivative	Creation of a \$400 receivable under the wheat futures contract	Deferred gain of \$400 on the wheat futures contract; gain recognized in 2014 to offset increased cost of goods sold

The wheat futures asset is reported at its fair value of \$400 in the December 31, 2013, balance sheet. However, the \$400 gain from the increase in the value of the futures contract is not included in the 2013 income statement. The futures contract is intended to offset changes in the purchase price of wheat in January 2014. Accordingly, the gain on the futures contract is deferred so that it can be offset against the increased cost of goods sold to be reported in 2014. As with the interest

rate swap discussed earlier, the deferral of the gain means that it is temporarily reported as an increase in equity under Accumulated Other Comprehensive Income.

The adjusting entry to recognize the change in the fair value of the futures contract is as follows:

2013			
Dec. 31	Wheat Futures Contract (asset)	.....	400
	Other Comprehensive Income	.....	400

The gain from the increase in the value of Hyrum's futures contract is deferred as part of other comprehensive income. The wheat futures contract is a cash flow hedge, with the futures contract payment intended to offset the increased amount that Hyrum will have to pay to make its forecasted purchase of 1,000 bushels of wheat on January 1, 2014.

**CAUTION**

It is *not* the case that derivative losses are reported immediately and derivative gains are deferred. If wheat prices had declined, Hyrum would have experienced a loss on the wheat futures contract, which would have been deferred until 2014.

The journal entries necessary in Hyrum's books on January 1, 2014, to record the purchase of 1,000 bushels of wheat in the open market and cash settlement of the wheat futures contract are as follows:

2014		
Jan. 1	Wheat Inventory .....	4,400
	Cash (1,000 bushels × \$4.40) .....	4,400
	Cash (futures contract settlement) .....	400
	Wheat Futures Contract (asset) .....	400
	Accumulated Other Comprehensive Income .....	400
	Gain on Futures Contract .....	400

The gain on the futures contract is recognized in earnings on January 1, 2014, the forecasted date of the transaction that was hedged. To the extent that the wheat inventory is used to make bread and that bread is sold in 2014, the gain on the futures contract will offset the increased cost of goods sold arising from the increase in the price of wheat to \$4.40 per bushel.

**Woodruff Option** On October 1, 2013, Woodruff Company paid \$20,000 to purchase a call option to buy 1,000 ounces of gold at a price of \$1,100 per ounce some time before January 1, 2014. This option is intended to protect Woodruff against increases in the price of the gold that it needs for 2014. Because Woodruff paid cash for the gold call option, the following journal entry is made on October 1:

2013		
Oct. 1	Gold Call Option (asset) .....	20,000
	Cash .....	20,000

Assume that the actual price of gold on December 31, 2013, is \$1,128 per ounce. At this gold price, Woodruff will receive a \$28,000 payment  $[(\$1,128 \times 1,000 \text{ ounces}) - (\$1,100 \times 1,000 \text{ ounces})]$  on January 1, 2014, to settle the call option. Accordingly, on December 31, 2013, the call option is worth \$28,000. The impact of the change in the price of gold on the gold call option and on the anticipated cost of gold purchases in January 2014 is accounted for as follows:

	2013 Balance Sheet	2013 Income Statement
Underlying item	No impact; the higher-priced gold won't be purchased until January 2014	No impact on 2013 cost of goods sold; the impact will show up in 2014 cost of goods sold
Derivative	Increase from \$20,000 to \$28,000 of the recorded value of the gold call option	Deferred gain of \$8,000 on the gold call option; gain recognized in 2014 to offset increased cost of goods sold

The gold call option is reported at its fair value of \$28,000 in the December 31, 2013, balance sheet. This represents an \$8,000 increase  $(\$28,000 - \$20,000)$  over the amount originally paid for the option. However, the \$8,000 gain from the increase in the value of the call option is not included in the 2013 income statement. The call option is intended to offset changes in the purchase price of gold in January 2014. Accordingly, the gain on the call option is deferred so that it can be offset against the increased production costs to be reported in 2014.

The adjusting entry to recognize the change in the fair value of the option is as follows:

2013			
Dec. 31	Gold Call Option (\$28,000 – \$20,000) . . . . .	8,000	
	Other Comprehensive Income . . . . .		8,000

The journal entries necessary in Woodruff’s books on January 1, 2014, to record the purchase of 1,000 ounces of gold and the cash settlement of the option contract are as follows:

2014			
Jan. 1	Gold Inventory . . . . .	1,128,000	
	Cash (1,000 ounces × \$1,128) . . . . .		1,128,000
	Cash (gold call option settlement) . . . . .	28,000	
	Gold Call Option (asset) . . . . .		28,000
	Accumulated Other Comprehensive Income . . . . .	8,000	
	Gain on Gold Call Option . . . . .		8,000

As mentioned previously, the gain from the increase in the value of the gold call option would be offset against the increased production costs in January 2014 resulting from the increase in the price of gold. The \$8,000 gain does not completely offset the \$28,000 increase in production costs because Woodruff had to pay \$20,000 to purchase the gold call option in the first place.

## FASB CODIFICATION

**The Issue:** You have been doing some part-time bookkeeping for a local ski resort. Because of your accounting background, the general manager of the resort has come to rely on your understanding of business transactions. A salesperson for a local brokerage firm has just visited the general manager. The salesperson was trying to sell the general manager on the idea of a “weather derivative” to help manage the risk the ski resort faces from low or late snowfall. The general manager had never heard of such a thing. The general manager has asked you to find out if there is such a thing as a “weather derivative.”

**The Question:** Is there such a thing as a “weather derivative”?

**Searching the Codification:** Of course, the quickest way to find out the answer to this question is to just do a general search online. However, that wouldn’t be nearly as sophisticated, or fun, as searching the FASB Codification. In addition, if you can find some coverage of “weather derivatives” in the Codification, you will know that this is a mainstream transaction, common enough to be addressed by the FASB. This is a good opportunity to just relax and scan through Topic 815 (Derivatives and Hedging—Broad Transactions).

**The Answer:** The existence of weather derivatives is discussed on page 19–38.

## Summary

The centerpiece of accounting for derivatives and hedging activities is that derivatives are recognized as assets and liabilities and reported on the balance sheet at their fair values. For a derivative designated as a fair value hedge, changes in fair value are included in earnings and offset against changes in fair value of the hedged item. For a cash flow hedge, gains and losses are deferred in accumulated other comprehensive income and recognized in earnings on the forecasted date of the hedged transaction. In formulating an International Financial Reporting Standard for derivatives, the International Accounting Standards Board (IASB) drew heavily on the work done by the FASB. The general provisions of *IAS 39* are very similar to the provisions of FASB ASC Topic 815.

## CONTINGENCIES

During 1983, **Pennzoil** initiated negotiations for the acquisition of **Getty Oil**. Before the Pennzoil-Getty deal could be closed, **Texaco** swooped in and bought Getty right out from underneath Pennzoil's nose for \$10.2 billion. Pennzoil immediately sued Texaco for \$14 billion in damages caused by Texaco's interference in Pennzoil's attempted acquisition of Getty. In December 1985, a Houston jury awarded \$10.5 billion to Pennzoil. The case was appealed in both 1986 and 1987, with judgment in each instance against Texaco. With the uncertainty of a multibillion-dollar judgment hanging over its head, Texaco found it increasingly difficult to calm the fears of its suppliers and creditors. Texaco played its trump card in April 1987 and declared Chapter 11 bankruptcy. This action forced Pennzoil to the bargaining table, and in

December 1987 the two companies negotiated a \$3 billion payment to settle the case. Texaco made the payment on April 7, 1988.<sup>15</sup>

In addition to illustrating the strategic use of Chapter 11 bankruptcy, the Texaco-Pennzoil case serves as a classic example of the difficulties surrounding the accounting for contingencies. Among the interesting accounting questions here are the following:

- During the 4.5-year life of this lawsuit, when should Texaco have recognized a liability, and for what amount?
- At the same time, when should Pennzoil have recognized an asset for the receivable from Texaco?

As the Texaco-Pennzoil case suggests, uncertainty about the future sometimes makes it difficult to identify a company's assets and liabilities. The definitions of assets and liabilities given in the conceptual framework discussed in Chapter 1 use the word "probable"; an asset is a probable future economic benefit, and a liability is a probable future economic sacrifice. In this module, the specific accounting rules governing the accounting for contingent items will be discussed. These rules will be illustrated with coverage of the accounting for lawsuits and for environmental liabilities.

<sup>15</sup> Edward B. Deakin, "Accounting for Contingencies: The Pennzoil-Texaco Case," *Accounting Horizons*, March 1989, p. 21.

## Accounting for Contingencies: Probable, Possible, and Remote

6

Apply the accounting rules for contingent items to the areas of lawsuits and environmental liabilities.

**WHY** Understanding the accounting for contingent items is extremely important in a broader sense because many issues in accounting revolve around probabilities and uncertainty.

**HOW** If a contingent liability is probable and can be reasonably estimated, it should be recognized in the financial statements. If a contingent liability is only possible, it should be disclosed in the financial statement notes. Contingent liabilities that are remote should not, in general, be disclosed. Contingent assets are generally not recognized until any remaining uncertainty is very small.

A contingency is defined in FASB ASC Topic 450 (Contingencies) as follows:

. . . an existing condition, situation, or set of circumstances involving uncertainty as to possible gain . . . or loss . . . to an entity that will ultimately be resolved when one or more future events occur or fail to occur.<sup>16</sup>

As defined, contingencies may relate to either assets or liabilities and to either a gain or loss. The primary focus of this module is on [contingent losses](#) that might give rise to a liability, but the accounting for [contingent gains](#) is also discussed briefly.

Historically, when the existence of an obligation depended on the occurrence of a future event, recognition of the liability was deferred until the event occurred. This approach can fail to reflect the existence of significant obligations that are highly likely to materialize and that exist because of past transactions or events. For example, Texaco's contingent obligation to Pennzoil arose because of Texaco's interference in Pennzoil's attempted acquisition of Getty Oil, a past event. The future events determining whether Texaco would have to make payments to Pennzoil were the court verdicts. For Texaco to fail to record its liability until the day the \$3 billion was actually paid to Pennzoil would be grossly misleading to users of the financial statements.

FASB ASC Topic 450 specifies different accounting for contingent items based on the probability of the occurrence of the resolving future event. The likelihood of the event and the accounting actions recommended are shown in Exhibit 19-1.

If the occurrence of an event that would create a liability is probable and if the amount of the obligation can be reasonably estimated, the contingency should be recognized as a liability. Many estimated liabilities are in reality probable contingent liabilities because the existence of the obligation depends on some future event occurring. For example, the estimated amount of warranty liability is a probable contingent liability because warranties depend on the need to provide future repairs or service. In addition, a pension obligation depends on employees staying with the company long enough to earn full pension benefits, and frequent-flier trips are contingent on whether customers accumulate enough miles for free trips and whether they actually claim their free trips.

The rules governing accounting for contingent assets are somewhat confused. The wording in FASB ASC Topic 450 about contingent gains goes back to *ARB No. 50*, which was originally adopted in 1958. *ARB No. 50* says that contingent gains (and, by extension,

<sup>16</sup> FASB ASC Section 450-10-20—Glossary.

## EX 19-1 ACCOUNTING FOR CONTINGENCIES

### Contingent Losses:

Likelihood	Accounting Action
Probable	Recognize a probable liability if the amount can be reasonably estimated. If not estimable, disclose facts in a note. FASB ASC paragraph 450-20-25-2.
Reasonably possible	Disclose a possible liability in a note. FASB ASC paragraph 450-20-50-3.
Remote	Make no recognition or disclosure unless contingency represents a guarantee. Then note disclosure is required. FASB ASC paragraph 460-10-50-2.

### Contingent Gains:

Likelihood	Accounting Action
Probable plus	Recognize a contingent asset if the probability of its occurrence is very high (more than probable) and if the amount can be reasonably estimated. Otherwise, disclose the facts in a note. FASB ASC paragraph 450-30-25-1.
Reasonably possible	Disclose a possible asset in a note, but be careful to avoid misleading implications. In practice, possible contingent gains are often not disclosed. FASB ASC paragraph 450-30-50-1.
Remote	Make no recognition or disclosure.

© 2012 Cengage Learning.

contingent assets) are not to be recognized before they are “realized.” This appears to be in conflict with the asset definition in *Concepts Statement No. 6*, which says that an asset is a “probable future economic benefit.” The international rules add another view. In *IAS 37*, paragraph 33, we read that a contingent asset should be recognized when it “is virtually certain.” The only thing we can conclude with certainty from all of this is that the probability threshold for the recognition of a contingent asset is higher than that for a contingent liability. This reflects the conservatism that has been at the roots of accounting for years.

If a contingent liability is *reasonably possible*, defined as more than remote but less than likely, it should be disclosed in a note to the financial statements. Possible gains are often not disclosed to avoid any misleading implications about the likelihood that the gain will eventually be realized. If a contingent item is *remote*, that is, the chance of occurrence is slight, there is no requirement that it be disclosed unless it is a contingent liability under a guarantee arrangement such as guaranteeing, or co-signing, the loan of another party. The requirement to disclose certain contingencies that have a remote probability of occurrence does NOT exist in *IAS 37*.

The timing of the disclosures made in the Texaco-Pennzoil case illustrates the different treatment of contingent losses and contingent gains. As seen in Exhibit 19-2, the initial lawsuit was filed in early 1984, and Texaco was careful to mention the possibility of a loss in its 1984 and 1985 financial statements. Pennzoil made no mention of the contingent gain in its 1984 or its 1985 financial statements. In the body of the 1986 annual report, Texaco management took two pages to discuss the Pennzoil litigation. In addition, the financial statements included another page in the notes discussing the case. Texaco’s management concluded the discussion by stating that the Pennzoil litigation could materially affect Texaco. At the same time, the uncertainty surrounding Texaco’s future, given the large judgment hanging over its head, caused Texaco’s auditor to render a qualified audit opinion. While Texaco’s financial statements were being drastically

## EX 19-2 ACCOUNTING TREATMENT IN THE TEXACO-PENNZOIL CASE

TEXACO's Accounting Treatment					
Brief Note; Post Year-End Event	Extensive Note	Primary Note; "Subject To" Audit Opinion	Primary Note; "Subject To" Audit Opinion	Loss Recognized; "Subject To" Audit Opinion	Cash Payment; "Clean" Audit Opinion
Initial Suit Filed January 1984	Litigation under Way	Trial Courts Rule for Pennzoil	Judgment Upheld on Appeal	Texas Supreme Court Upholds; Texaco Files for Bankruptcy	Settlement Finalized
December 1983	December 1984	December 1985	December 1986	December 1987	December 1988
PENNZOIL's Accounting Treatment					
Nothing	Nothing	Nothing	Contingency Note	Expanded Contingency Note	Gain Recognized

© 2012 Cengage Learning.

impacted by this contingent loss, Pennzoil's financial statements included just a brief note about the contingent gain. In 1987, Texaco formally recognized the \$3 billion liability and filed for Chapter 11 bankruptcy. Pennzoil did not recognize the gain until 1988 when the payment was actually received. This case nicely illustrates the asymmetry between the treatment of contingent losses and the treatment of contingent gains.

As described here, the accounting for contingent liabilities and contingent assets is inconsistent with fair value measurement.<sup>17</sup> Even a contingent liability with remote probability of realization has a fair value which would be reflected if, for example, another company were to accept responsibility for that contingency. As FASB standards move increasingly to a fair value measurement standard, it is likely that the area of accounting for contingencies will be revisited.

FASB ASC Topic 450 does not provide specific guidelines as to how the words *probable*, *possible*, and *remote* should be interpreted in terms of probability percentages. For example, is a 60% likelihood "probable" or just "possible"? Surveys of statement preparers and users

reveal a great diversity in the numerical interpretations of these probability terms as used in the accounting standards. Thus, the contingency standard that seems fairly easy to apply given the straightforward guidelines outlined in Exhibit 19-1 is actually very difficult to apply consistently in

practice. This is illustrated below with a discussion of the accounting for lawsuits and environmental liabilities.

### Accounting for Lawsuits

The United States is the land of the lawsuit. Companies are sued by customers who claim they were injured by defective products, auditors are sued by stockholders who claim

<sup>17</sup> See FASB ASC paragraphs 450-20-05-4 through 7

### FYI

In the area of deferred taxes, the FASB has introduced a fourth probability term, "more likely than not," defined as a probability level of 50%. Use of the more-likely-than-not criterion is discussed in Chapter 16.

they were injured by defective financial statements, and parents are sued by children who claim they were injured by defective upbringing. Typically, a lawsuit takes a long time to wind its way through the courts. Even after a decision has been handed down by a lower court, many appeal opportunities are available. Thus, both the amount and timing of a loss arising from litigation are generally highly uncertain. Some companies carry insurance to protect themselves against these losses, so the impact of the losses on the financial statements is minimized. For uninsured risks, however, a decision must be made as to when the liability for litigation becomes probable, and thus, a recorded loss. In ASC Topic 450, the FASB identifies several key factors to consider in making the decision. These include the following:<sup>18</sup>

1. The nature of the lawsuit
2. Progress of the case in court, including progress between date of the financial statements and their issuance date
3. Views of legal counsel as to the probability of loss
4. Prior experience with similar cases
5. Management's intended response to the lawsuit

If analysis of these and similar factors results in the judgment that a loss is probable and the amount of the loss can be reasonably estimated, the liability should be recorded. A settlement after the balance sheet date but before the statements are issued would be evidence that the loss was probable at year-end, and it would result in reporting the loss in the current financial statements.

Another area of potential liability involves unasserted claims; that is, a cause of action has occurred but no claim has yet been asserted. For example, a person may be injured on a company's property, but as of the date the financial statements are issued, no legal action has been taken. As another example, a violation of a government regulation may have occurred, but no federal action has yet been taken. If it is probable that a substantiated claim will be filed and upheld and the amount of the claim can be reasonably estimated, accrual of the liability should be made. If the amount cannot be reasonably estimated, note disclosure is required. If assertion of the claim is judged not to be at least reasonably possible, no accrual or disclosure is necessary.

As a practical matter, it should be noted that a company would be very unlikely to record a loss from unasserted claims or from pending litigation unless negotiations for a settlement had been substantially completed. When that is the case, the loss is no longer a contingency but an estimated loss.

Once a company has determined that the facts and circumstances require that it recognize a liability, the company must then generate a reasonable estimate of the amount of the liability. Even though the company doesn't know the exact amount of the future payout, it can usually specify a range of possible payouts. Under U.S. GAAP, the company should choose the amount within the range that is the best estimate. If no amount in the range is any better than any other amount, the company should recognize the lowest amount in the range and then disclose the potential additional loss exposure.<sup>19</sup>

Under IFRS, the estimation process for recognizing an amount associated with a probable future payout differs substantially from U.S. GAAP. The focus in *IAS 37* is on recognizing the fair value of the obligation. Accordingly, the company is expected to

<sup>18</sup> Ibid., par. 36.FASB ASC paragraph 450-20-55-12.

<sup>19</sup> FASB ASC paragraph 450-20-30-1.

estimate the amount that would have to be paid right now in order to settle the obligation or to transfer the obligation to a third party.<sup>20</sup> This estimate involves consideration of the possible payouts, the probabilities of each, and the time value of money if the payout is expected to stretch over a long time period. As you can see, this process results in a recognized liability with much more economic meaning than does the U.S. GAAP process of picking either the single most likely outcome or the lowest in a range of equally probable outcomes.

**Disclosure** Some companies do not disclose any information regarding potential liabilities from lawsuits. Others provide a brief, general description of pending lawsuits. Sometimes companies provide fairly specific information about pending actions and claims. However, companies must be careful not to increase their chances of losing pending lawsuits, and they generally do not disclose dollar amounts of potential losses, which might be interpreted as an admission of guilt and a willingness to pay a certain amount. As an illustration, **ExxonMobil** disclosed the information in Exhibit 19-3 in its 1991, 1997, 2007, and 2009 annual reports in connection with lawsuits filed as a result of the *Valdez* oil spill. Note that, in 1991, Exxon sounds quite optimistic that it has settled the bulk of the claims related to the oil spill and that any further claims “will not have a materially adverse effect” upon the company. This optimistic disclosure is particularly interesting in light of the \$5 billion adverse judgment discussed in the 1997 disclosure (although the amount of this judgment was later reduced by order of the U.S. Supreme Court).

Another example of disclosure relating to contingent liabilities can be found in the financial statements of **Altria**, maker of Marlboro cigarettes. The company’s 2009 financial statements contain more than 20 pages of disclosure relating to thousands of lawsuits (in various stages of litigation) against the company involving billions of dollars in damage awards. In Item 3. *Legal Proceedings*, the company gives the following statement:

Altria Group, Inc. and its subsidiaries record provisions in the consolidated financial statements for pending litigation when they determine that an unfavorable outcome is probable and the amount of the loss can be reasonably estimated. At the present time, while it is reasonably possible that an unfavorable outcome in a case may occur, except as discussed elsewhere in this Item 3. *Legal Proceedings*: (i) management has concluded that it is not probable that a loss has been incurred in any of the pending tobacco-related cases; (ii) management is unable to estimate the possible loss or range of loss that could result from an unfavorable outcome in any of the pending tobacco-related cases; and (iii) accordingly, management has not provided any amounts in the consolidated financial statements for unfavorable outcomes, if any. Legal defense costs are expensed as incurred.

Altria Group, Inc. and its subsidiaries have achieved substantial success in managing litigation. Nevertheless, litigation is subject to uncertainty and significant challenges remain. It is possible that the consolidated results of operations, cash flows or financial position of Altria Group, Inc., or one or more of its subsidiaries, could be materially affected in a particular fiscal quarter or fiscal year by an unfavorable outcome or settlement of certain pending litigation.

<sup>20</sup> IAS 37 paragraphs 36 through 47.

## 19-3 EXXON—1991, 1997, 2007, AND 2009 DISCLOSURE CONCERNING EXXON VALDEZ OIL SPILL

### Disclosure in 1991 (in part)

On March 24, 1989, the Exxon Valdez, a tanker owned by Exxon Shipping Company, a subsidiary of Exxon Corporation, ran aground on Bligh Reef in Prince William Sound off the port of Valdez, Alaska, and released approximately 260,000 barrels of crude oil. More than 315 lawsuits, including class actions, have been brought in various courts against Exxon Corporation and certain of its subsidiaries.

On October 8, 1991, the United States District Court for the District of Alaska approved a civil agreement and consent decree. . . . These agreements provided for guilty pleas to certain misdemeanors, the dismissal of all felony charges and the remaining misdemeanor charges by the United States, and the release of all civil claims against Exxon . . . by the United States and the state of Alaska. The agreements also released all claims related to or arising from the oil spill by Exxon. . . .

Payments under the plea agreement totaled \$125 million—\$25 million in fines and \$100 million in payments to the United States and Alaska for restoration projects in Alaska. Payments under the civil agreement and consent decree will total \$900 million over a ten-year period. The civil agreement also provides for the possible payment, between September 1, 2002, and September 1, 2006, of up to \$100 million for substantial loss or decline in populations, habitats, or species in areas affected by the oil spill which could not have been reasonably anticipated on September 25, 1991.

The remaining cost to the corporation from the Valdez accident is difficult to predict and cannot be determined at this time. It is believed the final outcome, net of reserves already provided, will not have a materially adverse effect upon the corporation's operations or financial condition.

### Disclosure in 1997 (in part)

On September 24, 1996, the United States District Court for the District of Alaska entered a judgment in the amount of \$5.058 billion in the Exxon Valdez civil trial that began in May 1994. The District Court awarded approximately \$19.6 million in compensatory damages to fisher plaintiffs, \$38 million in prejudgment interest on the compensatory damages and \$5 billion in punitive damages to a class composed of all persons and entities who asserted claims for punitive damages from the corporation as a result of the Exxon Valdez grounding. The District Court also ordered that these awards shall bear interest from and after entry of the judgment. The District Court stayed execution on the judgment pending appeal based on a \$6.75 billion letter of credit posted by the corporation. Exxon has appealed the judgment. The corporation continues to believe that the punitive damages in this case are unwarranted and that the judgment should be set aside or substantially reduced by the appellate courts. Since it is impossible to estimate what the ultimate earnings impact will be, no charge was taken in 1996 or 1997 related to these verdicts.

### Disclosure in 2007 (in part)

A number of lawsuits, including class actions, were brought in various courts against Exxon Mobil Corporation and certain of its subsidiaries relating to the accidental release of crude oil from the tanker Exxon Valdez in 1989. All the compensatory claims have been resolved and paid. All of the punitive damage claims were consolidated in the civil trial that began in 1994. The first judgment from the United States District Court for the District of Alaska in the amount of \$5 billion was vacated by the United States Court of Appeals for the Ninth Circuit as being excessive under the Constitution. The second judgment in the amount of \$4 billion was vacated by the Ninth Circuit panel without argument and sent back for the District Court to reconsider in light of the recent U.S. Supreme Court decision in *Campbell v. State Farm*. The most recent District Court judgment for punitive damages was for \$4.5 billion plus interest and was entered in January 2004. The Corporation posted a \$5.4 billion letter of credit. ExxonMobil and the plaintiffs appealed this decision to the Ninth Circuit, which ruled on December 22, 2006, that the award be reduced to \$2.5 billion. On January 12, 2007, ExxonMobil petitioned the Ninth Circuit Court of Appeals for a rehearing en banc of its appeal. On May 23, 2007, with two dissenting opinions, the Ninth Circuit determined not to re-hear ExxonMobil's appeal before the full court. ExxonMobil filed a petition for writ of certiorari to the U.S. Supreme Court on August 20, 2007. On October 29, 2007, the U.S. Supreme Court granted ExxonMobil's petition for a writ of certiorari. Oral argument was held on February 27, 2008. While it is reasonably possible that a liability for punitive damages may have been incurred from the Exxon Valdez grounding, it is not possible to predict the ultimate outcome or to reasonably estimate any such potential liability.

### Disclosure in 2009 (in part)

A number of lawsuits, including class actions, were brought in various courts against ExxonMobil Corporation and certain of its subsidiaries relating to the accidental release of crude oil from the tanker Exxon Valdez in 1989. All the compensatory claims and the punitive damage award have been paid.

In June 2008, the FASB released an Exposure Draft that seeks to improve the disclosures associated with loss contingencies. Among other things, the FASB proposal would require companies to provide more detailed, systematic loss contingency disclosure, including a table summarizing the reasons for any increases or decreases in a company's recognized losses relative to contingencies. The FASB expects to issue a final standard on improved loss contingency disclosure in 2010.

### Accounting for Environmental Liabilities

An area that is receiving increasing attention in our society, both politically and from an accounting perspective, is the environment. Most citizens recognize the need to protect our environment and, in many instances, to recover from past environmental abuses. What is not so obvious are the staggering costs associated with environmental liabilities. As but one example, current legislation in the United States mandates the cleanup of existing toxic waste sites. The Environmental Protection Agency (EPA) is empowered to clean up waste sites and then can charge the cleanup costs to those parties the EPA deems responsible. This can cost companies \$25 to \$100 million or more for each polluted site. The total environmental cleanup obligation in the United States has been estimated to be at least \$750 billion and may perhaps exceed \$1 trillion.<sup>21</sup>

Even though environmental costs represent one of the critical issues facing businesses today, many, if not most, companies do not fully reflect those costs in their financial statements. The primary reason is that these loss contingencies often cannot be reasonably estimated. As discussed earlier in this chapter, if a liability cannot be reasonably estimated, no amount can be recognized.

In recent years, accounting standard setters have issued several statements and Exposure Drafts designed to improve the environmental liability information reported in the financial statements and notes. The SEC staff has issued *Staff Accounting Bulletin (SAB) No. 92*, which sets forth the SEC's interpretation of GAAP regarding contingent liabilities, with particular applicability to companies having environmental liabilities. In 1996, the AICPA issued *Statement of Position (SOP) 96-1*, "Environmental Remediation Liabilities (Including Auditing Guidance)." *SOP 96-1* outlines key events that can be used to determine whether an environmental liability is probable. For example, if a company acknowledges that it has some responsibility for environmental damage and if an initial cleanup feasibility study has been completed, it is reasonable to assume that the contingent liability is probable and the firm should recognize its share of the total cost. In addition, because a big part of dealing with the cleanup of an environmental site involves legal recovery of cleanup costs from other firms that initially refused to pay for their share of the cleanup, firms are allowed to recognize these potential recoveries as assets if they are probable.

The FASB has codified the accounting standards related to environmental remediation costs in FASB ASC Subtopic 410-30 (Environmental Obligations). Accounting standards related to asset retirement obligations (costs associated with cleaning up after retiring a long-term asset) are included in FASB ASC Subtopic 410-20 (Asset Retirement Obligations) and are discussed in Chapters 10 and 11.

## SEGMENT REPORTING

Who sells more soft drinks, **Coca-Cola** or **PepsiCo**? Coke sells more soft drinks in the United States, with a 2009 market share of 41.9%, compared to 29.9% for Pepsi.<sup>22</sup> So how is it that PepsiCo employs 203,000 people, whereas Coke employs just 92,800? The answer is that PepsiCo does much more than sell soft drinks. PepsiCo's revenue is split 50–50 between its food (**Frito-Lay** and **Quaker Oats**) and soft drink (Pepsi-Cola) segments. Which business strategy is more successful, the concentrated strategy of

Coke or the diversified strategy of Pepsi? In recent years, the focused approach of Coke has been the winner; the May 2009 market value of The Coca-Cola Company was \$122 billion, which is greater than the \$107 billion of PepsiCo. An attempt at increased focus was behind the October 1997 strategic change of direction at PepsiCo involving the spinoff of its restaurant businesses (**Pizza Hut**, **Taco Bell**, and **KFC**) to focus more attention on soft drinks and snack foods.<sup>23</sup>

Like PepsiCo, many businesses today are large, complex organizations engaged in a variety of activities that bear little relationship to each other. For example, a company might manufacture airplane engines, operate a real estate business, and manage a professional hockey team. Such companies, referred to as diversified companies, or **conglomerates**, operate in multiple industries and do not fit into any one specific industry category. The different segments of a diversified company often operate in distinct and separate markets, involve different management teams, and experience different growth patterns, profit potentials, and degrees of risk. In effect, the segments of the company behave almost like, and in some cases are, separate companies within an overall corporate structure. Yet, if only total company information is presented for a highly diversified company, the different degrees of risk, profitability, and growth potential for major segments of the company cannot be analyzed and compared.

## Business Segments

7

Prepare the necessary supplemental disclosures of financial information by product line and by geographic area.

**WHY** For companies with several different lines of business, the overall financial statements have limited usefulness. In order to generate their forecasts and their industry comparative analyses, financial statement users need detailed information by business segment and by geographic area.

**HOW** Companies are required to disclose the following information for each business segment: revenues, operating profit, assets, capital expenditures, and certain income statement items such as depreciation and interest revenue and expense. Companies are to define their reportable business segments using the same practice that is used internally.

Historically, the United States has led the world in the quality and quantity of financial information required to be disclosed about business segments. In 1939, U.S. companies were encouraged to make separate disclosures concerning operations of foreign business segments because of the “disturbed conditions abroad”—polite language for World

<sup>22</sup> “Top-10 CSD [Carbonated Soft-Drinks] for 2009,” *Beverage Digest*, March 24, 2010.

<sup>23</sup> Lori Bongiorno, “Fiddling with the Formula at Pepsi?” *Business Week*, October 14, 1996, p. 42; and Nikhil Deogun, “Pepsi Has Had Its Fill of Pizza, Tacos, Chicken,” *The Wall Street Journal*, January 24, 1997, p. B1.

War II.<sup>24</sup> Increased creation of firms with many diverse lines of business in the 1960s caused the APB to issue a nonbinding statement encouraging diversified companies to provide summary business segment information to financial statement users. The segment disclosure rules were refined and made mandatory in 1976 with the issuance of pre-Codification *Statement No. 14* by the FASB.

Information to be disclosed in the financial statement notes under the provisions of FASB *Statement No. 14* included revenues, operating profit, and identifiable assets for each significant industry segment of a company. Other provisions of *Statement No. 14* required disclosure of revenues from major customers and information about foreign operations and export sales.

Although the disclosure required of U.S. companies under pre-Codification *Statement No. 14* was more extensive than the segment disclosure required by the accounting standards of any other country in the world, financial statement users have consistently requested that firms be required to disclose more. In 1994, the AICPA Special Committee on Financial Reporting (often called the *Jenkins Committee*) made the improvement of segment reporting its first recommendation. In response to this push for even better segment reporting, the FASB issued pre-Codification *Statement No. 131* in June 1997. In an early example of international cooperation in creating accounting standards, the FASB worked closely with the Accounting Standards Board in Canada and with the International Accounting Standards Board in developing the segment reporting standard. The provisions of pre-Codification *Statement No. 131* are now contained in FASB ASC Topic 280 (Segment Reporting).

According to the provisions of FASB ASC Topic 280, companies are required to disclose the following information concerning business segments:

1. Total segment operating profit or loss
2. Amounts of certain income statement items such as operating revenues, depreciation, interest revenue, interest expense, tax expense, and significant noncash expenses
3. Total segment assets
4. Total capital expenditures
5. Reconciliation of the sum of segment totals to the company total for each of the following items:
  - Revenues
  - Operating profit
  - Assets

In addition to these five items, companies must also disclose how operating segments are identified. Segments are to be identified using the same criteria, whatever they might be, used by management to distinguish business segments for internal reporting purposes. The objective of this requirement is to provide external users with the same type of information about business segments that is used internally. Some companies were concerned about this definition of reportable business segments because they have dozens or even hundreds of internally reportable segments. The FASB responded to this concern by specifying how large a segment must be for separate disclosure to be required. Specifically, a segment is reportable if it meets any one of the following three criteria:

<sup>24</sup> The information in this historical review is adapted from the following source: *Research Report* (prepared by Paul Pacter), "Reporting Disaggregated Information" (Norwalk, CT: Financial Accounting Standards Board, February 1993).

- *Revenue test.* A segment should be reported if its total revenue (both to external customers and to other internal segments) is 10% or more of the company's total revenue (external and internal).
- *Profit test.* A segment should be reported if the absolute value of its operating profit (or loss) is more than 10% of the total of the operating profit for all segments that reported profits (or the total of the losses for all segments that reported losses).
- *Asset test.* A segment should be reported if it contains 10% or more of the combined assets of all operating segments.

The FASB also decided that segments can be combined for reporting purposes, even if they are treated as separate segments internally, if the segments have similar products or services, similar processes, similar customers, similar distribution methods, and are subject to similar regulations.

Companies typically define their business segments in terms of product lines or geographic areas. For those firms defining their segments along product lines, the FASB requires additional disclosure of revenues and long-lived assets for the company's home country and for all foreign operations combined. If one foreign country comprises a material portion of operations, separate revenue and long-lived asset disclosure should be made for that country. A company may consider also showing revenue and long-lived asset subtotals for "groups" of countries, such as for Europe or Asia.

For companies defining their business segments geographically, additional revenue information must be disclosed by product line. This product line information is provided on a companywide basis, however, not by geographic segment.

Companies are also required to disclose supplemental information about major customers. If revenues from any one customer are more than 10% of total revenue, this fact must be disclosed (although the name of the customer isn't disclosed) along with the amount of the revenue and the names of the operating segments in which the revenue is reported.

To illustrate the type of business segment disclosure provided under FASB ASC Topic 280, the segment information given in the 2009 annual report of PepsiCo will be used. PepsiCo discloses that it has six reportable segments, as follows:

- Frito-Lay North America (PepsiCo defines North America to be the United States and Canada.)
- Quaker Foods North America
- Latin America Foods
- PepsiCo Americas Beverages
- Europe
- Asia, Middle East & Africa

## FYI

The FASB received more than 200 comment letters in response to its June 1996 Exposure Draft for pre-Codification *Statement No. 131*. A key concern of businesses was that the Exposure Draft required them to disclose information that might be used by competitors. In response to these concerns, the FASB dropped the original proposal that firms be required to report research and development expenditures and liabilities by segment.

## EX 19-4 NET SALES, OPERATING PROFIT, AND TOTAL ASSETS BY REPORTABLE SEGMENT, FOR PEPSICO

<b>BUSINESS SEGMENTS</b>

Exhibit 19-4 contains information on PepsiCo's sales and operating profit by segment.

Notice that the bulk of PepsiCo's sales and operating profit occur in North America. In addition to this sales, operating profit, and total asset disclosure, PepsiCo gives information, by segment, on amortization of intangibles, depreciation, and capital spending.

Application of accounting principles to individual segments of a business presents some unique problems. For example, if a firm uses LIFO and all of the inventory is part of one LIFO pool for financial reporting purposes, how is LIFO to be applied in calculating cost of goods sold for individual segments? Another example is the allocation of income tax expense to different segments when the income tax return is prepared for the entire company as a whole. Because of difficulties such as these, the FASB states in Topic 280 that, for segment reporting purposes, firms are to report to external users using the same accounting practices that are used for internal purposes. What this means is that the financial data reported in the segment disclosures won't always conform with GAAP. The FASB views this as part of the price to be paid to reduce the incremental bookkeeping cost required for firms to provide segment information. With the release of *IFRS 8* in November 2006, the IASB adopted this same method of identifying reportable segments.

In summary, consider the question of how much segment information is enough. Of course, when asked whether they want more information or less, financial statement users will always reply that they want more. Ultimately, every user would like unlimited access to the accounting records of all companies. Understandably, companies are reluctant to disclose everything to everyone. The FASB must set segment reporting standards to balance users' desire for relevant data against firms' legitimate concern about disclosing proprietary information.

## STOP & THINK

How could The Coca-Cola Company use PepsiCo's reported segment information to aid it in formulating its competitive strategy?

- To compute total company sales
- To compute total company return on equity
- To compute segment profit margins
- To determine segment advertising strategies

## INTERIM REPORTING

The Business Roundtable is an organization of approximately 160 CEOs of top U.S. corporations. On August 20, 1990, The Business Roundtable sent a letter to one of the commissioners of the SEC.<sup>25</sup> The letter was critical of the work of the FASB and suggested that FASB rules were burdening U.S. business "with a costly reporting infrastructure that overloads the user with data but provides very little insight into the economic condition or results of the enterprise." The Roundtable also complained that FASB rules were putting U.S. firms at a competitive disadvantage overseas where foreign accounting standard setters are more sympathetic to business concerns.

One of the specific problem areas identified by The Business Roundtable was quarterly reporting. The Roundtable described quarterly reports as being very costly in terms of preparation and counterproductive because they cause management to focus on short-term earnings rather than long-term growth.

The Roundtable pointed out that many foreign companies (such as those in the United Kingdom) are required to report only semiannually.

This concern about the counterproductivity of quarterly reporting was echoed by Peter A. Magowan, then-CEO of **Safeway**, the large supermarket chain based in Oakland, California. In November 1986, Safeway was taken private in a \$5.3 billion leveraged buyout (LBO). In looking back on the success of the restructuring that followed the LBO, Magowan reported that one of the key advantages enjoyed by Safeway was that as a private company, it was no longer locked into the cycle of fixation on reported quarterly earnings. According to Magowan, this freedom from pressure to report ever-increasing quarterly profits made it possible for Safeway to institute aggressive pricing, store expansion, and increased spending for training and technology—all actions that would hurt reported profits in the short run but were for the long-term good of the company.<sup>26</sup>

In spite of concerns that quarterly reports lead to a myopic focus on short-term profits by management, they are still required disclosure in the United States. Publicly traded firms must file quarterly financial statements with the SEC in a 10-Q filing within 40 days of the end of the quarter for large firms and 45 days for smaller firms. An outline of the special problems associated with the preparation of interim reports is given in this module.

<sup>25</sup> John S. Reed, Chairman, Accounting Principles Task Force of The Business Roundtable; letter dated August 20, 1990, addressed to Philip R. Lochner, Jr., Commissioner, Securities and Exchange Commission.

<sup>26</sup> Peter A. Magowan, "The Case for LBOs: The Safeway Experience," *California Management Review*, Fall 1989, p. 9. In April 1990, Safeway again issued shares to the public.

## Interim Reports

8

Recognize the importance of interim reports, and outline the difficulties encountered when preparing those reports.

**WHY** In this age of instant information, it just isn't reasonable to expect financial statement users to wait an entire year between receipt of financial statements for a company. SEC regulations require publicly traded companies to release financial statements each quarter. The preparation of these interim financial statements involves difficult issues of estimation and allocation.

**HOW** Interim financial statements are prepared using the "integral part of annual period" concept. Using this concept, each quarter is not viewed as a separate period but as an integral part of the year, and estimates are used to appropriately allocate a share of the annual results to each quarter. Quarterly reports are typically not audited, but they still are to be prepared in accordance with GAAP.

Statements showing financial position and operating results for intervals of less than a year are referred to as **interim financial statements**. Interim reports are considered essential in providing investors and others with timely information as to the position and progress of an enterprise. Notwithstanding the need for interim reports, significant difficulties are associated with them. One problem is caused by the seasonal factors of certain businesses. For example, in some companies, revenues fluctuate widely among interim periods; in other businesses, significant fixed costs are incurred during a single period but are to benefit several periods. Not only must costs be allocated to appropriate periods of benefit but also they must be matched against the realized revenues for the interim period to determine a reasonable income measurement.

In preparing interim reports, adjustments for accrued items, generally required only at year-end, must be considered at the end of each interim period. Because of the additional time and extra costs involved to develop complete information, many estimates of expenses are made for interim reports. The increased number of estimates adds an element of subjectivity to these reports. Another problem is that extraordinary items or the disposal of a business segment will have a greater impact on an interim period's earnings than on the results of operations for an entire year. In analyzing interim financial statements, special attention should be given to these and similar considerations.

Two prominent viewpoints exist in relation to the reporting of interim results. One viewpoint is that each reporting interval is to be recognized as a separate accounting period. Thus, the results of operations for each interim period are determined in essentially the same manner as for the annual accounting period. Under this approach, the same judgments, estimations, accruals, and deferrals are recognized at the end of each interim period as for the annual period. This is the approach followed in *IAS 34*.

The other viewpoint, and the one accepted by the FASB, is that the interim period is an integral part of the annual period.<sup>27</sup> Essentially, the revenues and expenses for the total period are allocated among interim periods on some reasonable basis, for example, time, sales volume, or productive activity. Under the **integral part of annual period concept**, the same general accounting principles and reporting practices employed for annual reports are to be utilized for interim statements, but modifications may be required so the interim

<sup>27</sup> FASB ASC paragraphs 270-10-45-1 and 2.

results will better relate to the total results of operations for the annual period. As an example of the type of modification that may be required, assume that a company uses the LIFO method of inventory valuation and encounters a situation where liquidation of the base period inventory occurs at an interim date but the inventory is expected to be replaced by the end of the annual period. Under these circumstances, the inventory reported at the interim date should not reflect the LIFO liquidation, and the cost of goods sold for the interim period should include the expected cost of replacing the liquidated LIFO base.

Another example of a required modification deals with a change in accounting principle during an interim period. As explained in Chapter 20, these changes should follow the provisions of FASB ASC Topic 250 (Accounting Changes and Error Corrections). Those provisions state that the change should be applied retroactively to all of the results reported.<sup>28</sup>

To illustrate the added insight that quarterly information can provide, quarterly data for Toys “R” Us from its 2009 annual report are provided in Exhibit 19-5. The retail toy business is very seasonal, and this fact is reflected in the quarterly numbers for Toys “R” Us. Reported revenue is at its maximum in the quarter that concludes at the end of January (the fourth quarter), which encompasses the Christmas selling season. Anyone reading only the annual net income numbers of Toys “R” Us misses the potentially valuable information contained in the wide variation in net income from quarter to quarter.

Notice that Toys “R” Us’ quarterly results are labeled “unaudited.” Obviously, the small amount of information provided about each quarter does not “present fairly” the results of Toys “R” Us’ operations for that quarter. Accordingly, quarterly reports

## STOP & THINK

What is the biggest barrier to the release of *daily* financial statements by publicly traded companies?

- a) Generation of daily stock price data
- b) Generation of daily accounting estimates
- c) Generation of daily sales data
- d) Generation of daily cost of goods sold data

### EX 19-5 SUMMARY QUARTERLY DATA FOR TOYS “R” US

Quarterly Financial Data (In millions)				
The following table sets forth certain unaudited quarterly financial information:				
	First Quarter	Second Quarter	Third Quarter	Fourth Quarter
2009 Net Sales . . . . .	\$2,477	\$2,567	\$2,667	\$5,857
2009 Gross Margin . . . . .	890	951	950	1,987
2009 Net Earnings/(Loss) . . . . .	(35)	27	(67)	387
2008 Net Sales . . . . .	2,719	2,771	2,773	5,461
2008 Gross Margin . . . . .	977	1,014	960	1,797
2008 Net Earnings/(Loss) . . . . .	(36)	13	(104)	345

© 2012 Cengage Learning.

<sup>28</sup> FASB ASC paragraphs 250-10-45-14 through 16.

are almost always labeled “unaudited” because they do not fairly present a firm’s operations, cash flows, and financial position in the same way as do the annual financial statements that are audited. Quarterly reports submitted to the SEC in the 10-Q filing are not required to be audited although they are to be prepared in accordance with GAAP.

### SOLUTIONS TO STOP & THINK

- (Page 19-9) The correct answer is A. Credit risk is the uncertainty over whether the party on the other side of an agreement will abide by the terms of the agreement. A forward contract is a private agreement negotiated between two parties. There is always the possibility that the party required to make the settlement payment at the end of the forward contract will refuse to pay. Accordingly, there is credit risk associated with a forward contract.
- (Page 19-35) The correct answer is C. PepsiCo’s segment information can tell Coke where Pepsi is enjoying the most soft drink success, where PepsiCo is weak, and what PepsiCo’s profit margins are. The profit margin information is probably the most useful to Coca-Cola. Without any disclosure by Pepsi, market research can probably tell Coca-Cola where Pepsi’s strengths and weaknesses are with regard to sales. However, the information about Pepsi’s costs and profits is hard to find out unless Pepsi discloses it.
- (Page 19-37) The correct answer is B. Technically, it is possible right now for most large firms to prepare daily financial statements. And many firms actually do compile daily sales and gross profit reports. However, it isn’t clear whether making the estimates necessary to prepare full financial statements would provide useful information. As discussed in the chapter, even the preparation of quarterly reports requires more estimates and approximations than does the preparation of the annual report. The cost of the timeliness of daily reports very likely exceeds any associated benefit.

### SOLUTION TO USING THE FASB’S CODIFICATION

In FASB ASC Topic 815 (Derivatives and Hedging), you can see listed Subtopic 815-45 (Weather Derivatives). This is a good indication that “weather derivatives” actually exist. Clicking on the Glossary yields the following definition of a “weather derivative”: “A forward-based or option-based contract for which settlement is based on a climatic or geological variable. One example of such a variable is the occurrence or nonoccurrence of a specified amount of snow at a specified location within a specified period of time.”

Section 815-45-55 provides some illustrations of accounting for a weather derivative. The weather

derivative used in the illustration is based on daily temperature. The firms involved in the weather derivative arrangement are described as follows: “Entity A is a construction materials entity that has its sales decrease during cold winters or a chemical manufacturer that has its natural gas consumption costs increase during cold winters. Entity B is a natural gas distribution entity that experiences lower revenues during warm winters.” Whether the company receives cash or pays cash under the weather derivative contract depends on the average temperature for a specified period.

# REVIEW CHAPTER 19

## DERIVATIVES

### 1 Understand the business and accounting concepts connected with derivatives and hedging activities.

Uncertainty about the future fair value of assets and liabilities or about future cash flows exposes firms to risk. One way to manage this risk is through the use of derivatives. A *derivative* is a financial instrument or other contract that derives its value from the movement of prices, interest rates, or exchange rates associated with an underlying item. Many derivatives are executory contracts, meaning that they are not a transaction but are an exchange of promises about future actions.

### 2 Identify the different types of risk faced by a business.

Of the many types of risk faced by a firm, four important types are as follows:

- *Price risk.* Uncertainty about the future price of an asset
- *Credit risk.* Uncertainty over whether the party on the other side of a transaction will abide by the terms of the agreement
- *Interest rate risk.* Uncertainty about future interest rates and their impact on cash flows and the fair value of financial instruments
- *Exchange rate risk.* Uncertainty about the future U.S. dollar cash flows stemming from assets and liabilities denominated in foreign currencies

### 3 Describe the characteristics of the following types of derivatives: swaps, forwards, futures, and options.

- *Swap.* Contract in which two parties agree to exchange payments in the future based upon some price or rate. A good example is the exchange of a stream of variable-rate interest payments for a stream of fixed-rate payments. A swap can transform the

stream of future cash flows that you have into the cash flow stream that you want.

- *Forwards.* Agreement between two parties to exchange a specified amount of a commodity, security, or foreign currency at a specified date with the price or rate being set now. Forward contracts are usually settled with cash payments instead of by actual delivery of the underlying asset.
- *Futures.* Very similar to a forward contract, with the difference being that a futures contract is a standardized instrument that is sponsored by and traded on an organized exchange.
- *Option.* Contract giving the owner the right, but not the obligation, to buy or sell an asset at a specified exercise price. A *call option* gives the owner the right to buy an asset; a *put option* gives the owner the right to sell an asset. The buyer of an option must pay cash in advance for the option; in exchange, the buyer is protected against unfavorable price or rate movements but can still benefit from favorable movements.

### 4 Define *hedging*, and outline the difference between a fair value hedge and a cash flow hedge.

Hedging is the structuring of transactions to reduce risk. Much hedging occurs naturally in business as increases in costs or in the value of liabilities are offset by related increases in revenues or in the value of assets. Derivatives are also used for hedging. The FASB has identified two general types of hedges for which derivatives can be used:

- *Fair value hedge.* The change in the fair value of the derivative offsets changes in fair values of assets or liabilities
- *Cash flow hedge.* Cash flows from the derivative offset variability in the cash flows from forecasted transactions

**5 Account for a variety of different derivatives and for hedging relationships.**

The fair value of all derivatives is to be recognized and reported in the balance sheet. Changes in fair value are reported as follows:

- *Derivative is not a hedge.* Changes in fair value are reported as gains or losses in the income statement.
- *Derivative is a fair value hedge.* Changes in fair value are reported as gains or losses in the income statement and are offset by gains or losses on changes in the fair value of the asset or liability being hedged.
- *Derivative is a cash flow hedge.* Changes in fair value are deferred and reported in comprehensive income (an equity adjustment). These deferred gains and losses are recognized in income on the forecasted date of the cash flows being hedged.

#### CONTINGENCIES

**6 Apply the accounting rules for contingent items to the areas of lawsuits and environmental liabilities.**

If a contingent liability is probable and can be reasonably estimated, it should be recognized in the financial statements. If a contingent liability is only possible, it should be disclosed in the financial statement notes. Contingent liabilities that are remote should not, in general, be disclosed. Contingent assets are generally not recognized until any remaining uncertainty is very small.

In accounting for lawsuits, firms are usually reluctant to disclose specific amounts or to overestimate the likelihood of losing the suit because they don't want to increase their chances of losing the lawsuit or of paying a large judgment amount.

Accounting for environmental remediation liabilities is complicated by the fact that the future cost of the cleanup is very difficult to estimate. In addition, each cleanup project is surrounded by suits and countersuits

between government agencies and the responsible firms and among the responsible firms themselves. The SEC requires substantial disclosure of the details of a firm's environmental cleanup projects.

#### SEGMENT REPORTING

**7 Prepare the necessary supplemental disclosures of financial information by product line and by geographic area.**

Historically, segment reporting in the United States has been more extensive than in any other country. The FASB worked with the AcSB in Canada and with the IASB to improve segment reporting worldwide.

Under the provisions of FASB ASC Topic 280, companies are required to disclose the following information for each business segment: revenues, operating profit, assets, capital expenditures, and certain income statement items such as depreciation and interest revenue and expense.

Companies are to define their reportable business segments using the same practice that is used internally. The objective of this requirement is to provide external users the same type of segment information used inside the company.

#### INTERIM REPORTING

**8 Recognize the importance of interim reports, and outline the difficulties encountered when preparing those reports.**

In the United States, publicly traded firms are required to file quarterly summary financial statements with the SEC in a filing called a *10-Q*. These interim financial statements are prepared using the "integral part of annual period" concept. Using this concept, each quarter is not viewed as a separate period but as an integral part of the year, and estimates are used to appropriately allocate a share of the annual results to each quarter. Quarterly reports are typically not audited, but they still are to be prepared in accordance with GAAP.

## FASB-IASB CODIFICATION SUMMARY

Topic	FASB Accounting Standards Codification	Original FASB Standard	Corresponding IASB Standard	Differences between U.S. GAAP and IFRS
Accounting for derivatives	Topic 815	SFAS No. 133	IAS 39	No substantial differences at the conceptual level, but numerous technical differences that are beyond the scope of this book.
Recognition of contingent liabilities and contingent assets	Contingent liabilities: Section 450-20-25 Contingent assets: Section 450-30-25	SFAS No. 5 par. 3 and 17	IAS 37 par. 10,27-28,31,34	Generally the same. Under IFRS, there is no requirement to disclose contingent guarantee obligations when their likelihood is remote.
Measurement of contingent liabilities	Section 450-20-30 par. 1	FIN No. 14 par. 3	IAS 37 par. 36-47	Under U.S. GAAP, the estimated liability is the low end of the estimated range if each estimate in the range is equally likely. Under IFRS, the estimated liability is the amount required to settle the obligation.
Segment reporting	Topic 280	SFAS No. 131	IFRS 8	No substantial differences
Relation between interim reporting and annual reporting	Section 270-10-45 par. 1-2	APB Opinion No. 28 par. 9	IAS 34 par. 28	Under U.S. GAAP, an interim period is viewed as a subcomponent of the annual period. Under IFRS, accounting principles are applied to an interim period in the same way they are applied to an annual period.

## KEY TERMS

Call option 19-11	Derivative 19-3	Hedging 19-13	Notional amount 19-16
Cash flow hedge 19-13	Exchange rate risk 19-6	Integral part of annual period	Option 19-11
Conglomerates 19-31	Executory contract 19-5	concept 19-36	Price risk 19-6
Contingent gains 19-24	Fair value hedge 19-13	Interest rate risk 19-6	Put option 19-11
Contingent losses 19-24	Forward contract 19-8	Interest rate swap 19-7	Swap 19-7
Credit risk 19-6	Futures contract 19-10	Interim financial statements 19-36	

## QUESTIONS

## DERIVATIVES

- How does a derivative differ from other financial instruments and contracts?
- Why is a derivative often an executory contract? Give another example of an executory contract.
- Briefly describe the four types of risk discussed in the chapter.
- Why would a company enter into an interest rate swap?
- What is the difference between a forward contract and a futures contract?

6. How does an option differ from the other types of derivatives discussed in the chapter?
7. Describe the purpose of a cash flow hedge, and give an example of a cash flow hedge.
8. Why is traditional historical cost accounting inappropriate when accounting for derivative contracts?
9. When does partial hedge ineffectiveness occur?
10. Derivatives are to be reported in the balance sheet at their fair value on the balance sheet date. How are unrealized gains and losses on derivatives recognized in the financial statements?
11. What is the notional amount of a derivative? How can the notional amount be misleading?
12. A derivative used as an economic hedge of foreign currency risk associated with a foreign currency-denominated asset or liability is not accounted for as a hedge under the provisions of FASB ASC Topic 815 (Derivatives and Hedging). How are these derivatives accounted for?
13. How does the accounting for a speculative derivative investment differ from that for a derivative that serves as a hedge?
14. What international standard governs the accounting for derivatives? How does this standard differ from U.S. GAAP?

#### CONTINGENCIES

15. How should contingent liabilities that are reasonably possible of becoming liabilities be reported in the financial statements?

16. Describe the appropriate treatment of contingent gains.
17. What factors are important in deciding whether a pending lawsuit should be reported as a liability on the balance sheet?
18. What factors must a company consider in estimating the amount to recognize for a probable contingent liability?
19. Under what circumstances should the existence of an environmental liability be considered “probable”?

#### SEGMENT REPORTING

20. In what ways can segment information assist in the analysis of a company's financial statements?
21. How is a business segment to be identified under the provisions of FASB ASC Topic 280 (Segment Reporting)?
22. How large must an internally defined segment be for separate financial statement disclosure to be required?
23. Is segment information prepared according to GAAP? Explain.

#### INTERIM REPORTING

24. Distinguish between the two primary viewpoints concerning the preparation of interim financial statements.
25. Why should investors be careful in interpreting interim reports?

## PRACTICE EXERCISES

### Practice 19-1

#### L03

#### Understanding the Terms of an Interest Rate Swap

On January 1 of Year 1, the company entered into a 2-year \$100,000 variable interest rate loan. In the first year of the loan, the interest rate is 10%. In its second year, the interest rate is equal to the prime lending rate on January 1 of Year 2. The company does not want to bear the risk associated with the uncertain interest rate in the second year. Accordingly, on January 1 of Year 1, the company enters into a pay-fixed, receive-variable interest rate swap with a speculator. This swap obligates the company to pay the speculator a fixed amount of \$10,000 ( $\$100,000 \times 0.10$ ) on December 31 of Year 2. In return, the company will receive from the speculator on December 31 of Year 2 a variable amount equal to \$100,000 multiplied by the prime lending rate on January 1 of Year 2. This amount received from the speculator is exactly enough to pay the interest due on the variable-rate loan in Year 2. Typically, interest rate swaps such as this are settled with a single net cash payment rather than the actual payment of \$10,000 and receipt of the variable amount. What net amount will the company pay or receive on December 31 of Year 2 if the prime lending rate on January 1 of Year 2 is (1) 8%, (2) 12%, and (3) 10%?

**Practice 19-2****L03****Understanding the Impact of an Interest Rate Swap**

Refer to Practice 19-1 and complete the following:

1. Compute the total amount (including all swap-related cash flows) that the company will pay in interest in Year 2, assuming that the prime lending rate on January 1 of Year 2 is (a) 8%, (b) 12%, and (c) 10%. Comment on your computations.
2. When the speculator entered into the interest rate swap agreement on January 1 of Year 1, which direction did the speculator think that interest rates were going to go—up or down? Explain.

**Practice 19-3****L03****Understanding the Terms of a Forward Contract**

The company is a golf course developer that constructs approximately 15 courses per year. Next year, the company will buy 5,000 trees to install in the courses it builds. In recent years, the price of trees has fluctuated wildly. To eliminate this uncertainty, the company has found a reputable financial institution that will enter into a forward contract for 5,000 trees. On January 1 of Year 1, the company agrees to buy 5,000 trees on January 1 of Year 2 from the financial institution. The price is set at \$400 per tree. Of course, the financial institution doesn't own any trees. As with most derivative contracts, this agreement will be settled by an exchange of cash on January 1 of Year 2 based on the price of trees on that date. What net amount will the golf course developer pay or receive on January 1 of Year 2 under the forward contract if the price of each tree on that date is (1) \$250, (2) \$600, and (3) \$400? Remember that the forward contract was for 5,000 trees.

**Practice 19-4****L03****Understanding the Impact of a Forward Contract**

Refer to Practice 19-3 and complete the following:

1. Compute the total amount (including all forward-related cash flows) that the golf course developer will pay to buy 5,000 trees in Year 2, assuming that the price of a tree on January 1 of Year 2 is (a) \$250, (b) \$600, and (c) \$400. Comment on your computations.
2. When the financial institution entered into the tree forward contract on January 1 of Year 1, which direction did the financial institution think that tree prices were going to go—up or down? Explain.

**Practice 19-5****L03****Understanding the Terms of a Futures Contract**

The mining company produces 25,000 pounds of copper each month in its mining operations. To eliminate the price risk associated with copper sales, on December 1 of Year 1, the mining company entered into a futures contract to sell 25,000 pounds of copper on January 1 of Year 2. The futures price is \$0.77 per pound. The futures contract is managed through an exchange, so the mining company does not know the party on the other side of the contract. As with most derivative contracts, this futures contract will be settled by an exchange of cash on January 1 of Year 2 based on the price of copper on that date. What net amount will the mining company pay or receive on January 1 of Year 2 under the futures contract if the price of copper per pound on that date is (1) \$0.62, (2) \$0.88, and (3) \$0.77? Remember that the futures contract is for 25,000 pounds and that the mining company is selling the copper.

**Practice 19-6****L03****Understanding the Impact of a Futures Contract**

Refer to Practice 19-5 and complete the following:

1. Compute the total amount (including all futures-related cash flows) that the mining company will receive to sell 25,000 pounds of copper in January of Year 2, assuming that the price of copper per pound on January 1 of Year 2 is (a) \$0.62, (b) \$0.88, and (c) \$0.77. Comment on your computations.
2. Assume that the party on the other side of the futures contract was a speculator. When that speculator entered into the copper futures contract on December 1 of

Year 1, which direction did the speculator think that copper prices were going to go—up or down? Explain.

**Practice 19-7****L03****Understanding the Terms of an Option Contract**

The company makes colorful 100% cotton shirts that are very popular among sophisticated business executives. The company uses 100,000 pounds of cotton each month in its production process. On December 1 of Year 1, the company purchased a call option to buy 100,000 pounds of cotton on January 1 of Year 2. The option exercise price is \$0.39 per pound. It cost the company \$2,500 to buy this option. As with most derivative contracts, this option contract will be settled by an exchange of cash on January 1 of Year 2 based on the price of cotton on that date. What net amount will the shirt company pay or receive on January 1 of Year 2 under the option contract if the price of cotton per pound on that date is (1) \$0.52, (2) \$0.30, and (3) \$0.39? Remember that the option contract is for 100,000 pounds and that the shirt company has the option to buy the cotton.

**Practice 19-8****L03****Understanding the Impact of an Option Contract**

Refer to Practice 19-7 and complete the following:

1. Compute the total amount (including all option-related cash flows) that the shirt company will pay to buy 100,000 pounds of cotton in January of Year 2, assuming that the price of cotton per pound on January 1 of Year 2 is (a) \$0.52, (b) \$0.30, and (c) \$0.39. Comment on your computations.
2. Assume that the party who wrote the cotton call option contract was a speculator. When that speculator wrote the cotton call option on December 1 of Year 1, which direction did the speculator think that cotton prices were going to go—up or down? Explain.

**Practice 19-9****L04****Understanding the Impact of Overhedging: Interest Rate Swap**

Refer to Practice 19-1 and Practice 19-2. What would be the impact on the company's total cash payment in Year 2 if the pay-fixed, receive-variable interest rate swap had been based on a loan amount of \$300,000 instead of \$100,000? In other words, what would be the company's total cash payment in Year 2 if the variable-rate loan is \$100,000 but the interest rate swap is for a \$300,000 loan and the January 1 of Year 2 prime lending rate is (1) 8%, (2) 12%, and (3) 10%? Comment on your computations.

**Practice 19-10****L04****Understanding the Impact of Partial Hedging: Forward Contract**

Refer to Practice 19-3 and Practice 19-4. What would be the impact on the golf course developer's total cash payment to purchase trees in Year 2 if the forward contract had been for just 1,500 trees rather than the full 5,000 trees expected to be purchased in Year 2? In other words, what would be the golf course developer's total cash payment in Year 2 if it purchases 5,000 trees but the forward contract is for 1,500 trees and the January 1 of Year 2 tree price is (1) \$250, (2) \$600, and (3) \$400? Comment on your computations.

**Practice 19-11****L05****Overview of Accounting for Derivatives: Fair Value Hedge**

On December 1 of Year 1, the company made a \$100,000 investment in a highly risky Internet stock. The investment is classified as a trading security. Part of the investment agreement prevents the company from selling the investment before January 1 of Year 2. To remove uncertainty about fluctuations in the value of the investment, the company entered into a forward contract with a speculator. Under the forward contract, the company will sell the investment to the speculator on January 1 of Year 2 for \$100,000. (Note: For simplicity, ignore the inconsistency in the fact that the securities are classified as trading yet the forward contract guarantees that the company will not earn any return when the securities are sold.) Make all journal entries necessary on December 31 of Year 1 in connection with both the investment securities and the forward contract, assuming that the market value of the securities on December 31 is (1) \$130,000, (2) \$75,000, and (3) \$100,000.

**Practice 19-12****L05****Overview of Accounting for Derivatives: Cash Flow Hedge**

A farmer expects to sell 5,000 bushels of corn on January 1 of Year 2. On December 1 of Year 1, the farmer enters into a futures contract to sell the corn on January 1 of Year 2 at \$2.30 per bushel. The market price of corn on December 1 was also \$2.30 per bushel. Make all journal entries necessary on December 31 of Year 1 in connection with the futures contract, assuming that the market price of corn per bushel on December 31 is (1) \$2.55, (2) \$2.10, and (3) \$2.30.

**Practice 19-13****L05****Computing the Notional Amount**

Compute the notional amount of the derivative contract for each of the following:

1. The interest rate swap contract. See Practice 19-1.
2. The tree forward contract. See Practice 19-3.
3. The copper futures contract. See Practice 19-5.
4. The corn futures contract. See Practice 19-12.

**Practice 19-14****L05****Accounting for an Interest Rate Swap**

Refer to Practice 19-1. Make any necessary journal entry on the borrowing company's books on December 31 of Year 1 in connection with the interest rate swap, assuming that the prime lending rate on December 31 is (1) 8%, (2) 12%, and (3) 10%. Even though the swap payment is not made until December 31 of Year 2, for simplicity ignore the time value of money.

**Practice 19-15****L05****Accounting for a Forward Contract**

Refer to Practice 19-3. Make any necessary journal entry on the golf course developer's books on December 31 of Year 1 in connection with the tree forward contract, assuming that the price per tree on that date is (1) \$250, (2) \$600, and (3) \$400.

**Practice 19-16****L05****Accounting for a Futures Contract**

Refer to Practice 19-5. Make any necessary journal entry on the mining company's books on December 31 of Year 1 in connection with the copper futures contract, assuming that the price of copper per pound on that date is (1) \$0.62, (2) \$0.88, and (3) \$0.77.

**Practice 19-17****L05****Accounting for an Option Contract**

Refer to Practice 19-7. Make any necessary journal entry on the shirt company's books on December 31 of Year 1 in connection with the cotton option contract, assuming that the price of cotton per pound on that date is (1) \$0.52, (2) \$0.30, and (3) \$0.39. Remember that the cotton option was purchased for \$2,500.

**Practice 19-18****L05****Accounting for a Foreign Currency Futures Contract**

On December 1 of Year 1, Lorien Company made a credit sale to a Thai company. The amount of the sale was 100,000 Thai baht. Lorien will collect the account on January 1 of Year 2. On December 1, the exchange rate was 40 Thai baht for 1 U.S. dollar. On December 1, Lorien entered into a futures contract to sell 100,000 Thai baht on January 1 of Year 2 at an exchange rate of 40 Thai baht for 1 U.S. dollar. Make all journal entries necessary on December 31 of Year 1 in connection with both the account receivable and the futures contract, assuming that the exchange rate for 1 U.S. dollar on December 31 is (1) 50 Thai baht, (2) 37 Thai baht, and (3) 40 Thai baht.

**Practice 19-19****L05****Accounting for a Derivative Speculation**

The company specializes in speculating on the direction of movements in the price of gold. On December 1 of Year 1, the company entered into a futures contract to sell 100 ounces of gold at \$1,119 per ounce on January 1 of Year 2. The company expected the price of gold to decline between December 1 and January 1. The market price of gold on December 1 of Year 1 was \$1,119 per ounce. Make all journal entries necessary on December 31 of Year 1 in connection with the futures contract, assuming that the price per ounce of gold on December 31 is (1) \$1,050, (2) \$1,213, and (3) \$1,119.

**Practice 19-20**

**Contingent Liabilities**

**L06**

The company has the following three potential obligations. Describe how each will be reported in the financial statements.

1. The company has guaranteed a loan for one of its suppliers. If the supplier fails to repay the loan, the company will be required to repay it. Currently, the probability of the supplier defaulting on the loan is considered remote.
2. The company has been sued by a group of shareholders who claim that they were deceived by the company's financial reporting practices. It is possible that the company will lose this lawsuit.
3. The company is involved in litigation over who must clean up a toxic waste site near one of the company's factories. It is probable, but not certain, that the company will be required to pay for the cleanup.

**Practice 19-21**

**Accounting for Contingent Losses and Contingent Gains**

**L06**

In each of the following cases, make the necessary journal entry, if any. If no journal entry is necessary, describe how the item would be reported in the financial statements.

1. The company has sued another company for patent infringement and won a preliminary judgment of \$800,000 in the case. This judgment is under appeal. The company's attorneys agree that it is possible (not probable) that the sued company will win this appeal.
2. The company has long owned a manufacturing site that has now been discovered to be contaminated with toxic waste. The company has acknowledged its responsibility for the contamination. An initial cleanup feasibility study has shown that it will cost at least \$450,000 to clean up the toxic waste.
3. The company has been sued for patent infringement and lost the case. A preliminary judgment of \$290,000 was issued and is under appeal. The company's attorneys agree that it is possible (not probable) that the company will lose this appeal.

**Practice 19-22**

**Segment Reporting**

**L07**

Rainbow Company has internally organized itself into the following seven segments:

	Total Revenues	Operating Profit	Total Assets
Segment 1 . . . . .	\$1,000	\$150	\$ 600
Segment 2 . . . . .	600	30	100
Segment 3 . . . . .	500	80	200
Segment 4 . . . . .	700	100	300
Segment 5 . . . . .	200	20	800
Segment 6 . . . . .	100	10	110
Segment 7 . . . . .	80	15	100
Total . . . . .	<u>\$3,180</u>	<u>\$405</u>	<u>\$2,210</u>

Segments 3 and 4 have similar products, use similar processes, and distribute their products through similar channels.

Rainbow Company is concerned about reporting segment information for each segment. According to FASB ASC Topic 280 (Segment Reporting), which of the segments should be separately reported?

**Practice 19-23**

**Interim Reporting**

**L08**

The company has historically reported bad debt expense of 1% of sales in each quarter. For the current year, the company followed the same procedure in the first three quarters of the year. However, in the fourth quarter, the company, in consultation with its auditor,

determined that bad debt expense for the year should be \$280. Sales in each quarter of the year were as follows: first quarter, \$2,000; second quarter, \$1,600; third quarter, \$2,200; fourth quarter, \$3,000. Make the adjusting journal entry necessary to record bad debt expense in the fourth quarter.

## EXERCISES

### Exercise 19-24

L04

#### Derivatives: Identifying a Hedge

Shank Company manufactures candy. On September 1, Shank purchased a futures contract that obligates it to sell 150,000 pounds of sugar on September 30 at \$0.41 per pound. Shank typically purchases 150,000 pounds of sugar per month to use as a raw material in the candy production process. It purchased the futures contract to hedge against movements in the price of sugar during the month of September.

In Shank's case, the sugar futures contract does not hedge against movements in the price of sugar. Demonstrate this by computing the net cost of the 150,000 pounds of sugar purchased in September under three sets of circumstances, at the price per pound of \$0.38, \$0.41, and \$0.44.

### Exercise 19-25

L05

#### Derivatives: Accounting for Swaps

On January 1, 2013, Slidell Company received a 2-year, \$500,000 loan, with interest payments occurring at the end of each year and the principal to be repaid on December 31, 2014. The interest rate for the first year is the prevailing market rate of 8%, and the rate in 2014 will be equal to the market interest rate on January 1, 2014. In conjunction with this loan, Slidell enters into an interest rate swap agreement to receive a swap payment (based on \$500,000) if the January 1, 2014, interest rate is greater than 8% and will make a swap payment if the rate is less than 8%. The interest swap payment will be made on December 31, 2014.

Make all journal entries necessary on Slidell's books in 2013 and 2014 to record this loan and the interest rate swap. On January 1, 2014, the interest rate is 6%.

### Exercise 19-26

L05

#### Derivatives: Accounting for Forward Contracts

On September 1, 2013, Ramus Company purchased machine parts from Ho Man Tin Company for 6,000,000 Hong Kong dollars to be paid on January 1, 2014. The exchange rate on September 1 is HK\$7.7 = \$1. On the same date, Ramus enters into a forward contract and agrees to purchase HK\$6,000,000 on January 1, 2014, at the rate of HK\$7.7 = \$1.

Make all journal entries necessary on Ramus' books on three dates—September 1, 2013, December 31, 2013, and January 1, 2014—to record this purchase and the forward contract. On December 31, 2013, and on January 1, 2014, the exchange rate is HK\$8.0 = \$1. Ramus uses a perpetual inventory system.

### Exercise 19-27

L05

#### Derivatives: Accounting for Futures Contracts

Shelby Organics produces bottled orange juice. Orange juice concentrate is typically bought and sold by the pound, and Shelby uses 50,000 pounds of orange juice concentrate each month. On December 1, 2013, Shelby entered into an orange juice concentrate futures contract to buy 50,000 pounds of concentrate on January 1 at a price of \$0.95 per pound, which is also the market price of concentrate on December 1. Shelby designates the futures contract as a hedge of the forecasted purchase of orange juice concentrate in January.

Make all journal entries necessary on Shelby's books on December 1, 2013, December 31, 2013, and January 1, 2014, to record this futures contract and to record the purchase of 50,000 pounds of orange juice concentrate on January 1. On December 31, 2013, and on January 1, 2014, the market price of concentrate is \$0.85 per pound.

### Exercise 19-28

L05

#### Derivatives: Accounting for Options

Far West Clothing Mills uses approximately 300,000 pounds of cotton each month to make the cotton fabric used in its patented no-wrinkle, long-sleeved white shirts. On

December 1, 2013, Far West purchased an option to buy 300,000 pounds of cotton on January 1, 2014, at a price of \$0.50 per pound. The market price on December 1 is \$0.50 per pound. Far West had to pay \$2,000 to purchase the cotton option. Far West designated the option as a hedge against price fluctuations for its January purchases of cotton.

Make all journal entries necessary on Far West's books on December 1, 2013, December 31, 2013, and January 1, 2014, to record this option and to record the purchase of 300,000 pounds of cotton on January 1. On December 31, 2013, and on January 1, 2014, the market price of cotton is \$0.42 per pound.

**Exercise 19-29****L05****Derivatives: Notional Amounts**

Refer back to Exercises 19-26 and 19-27.

1. What is the notional value of the Hong Kong dollar forward contract described in Exercise 19-26? What is the fair value of the forward contract on December 31, 2013?
2. What is the notional value of the orange juice concentrate futures contract described in Exercise 19-27? What is the fair value of the futures contract on December 31, 2013?

**Exercise 19-30****L05****Derivatives: Accounting for a Speculation**

Warsaw Signal Company specializes in predicting price movements in the soybean market. On November 1, 2013, it was convinced that soybean prices were too low. Accordingly, Warsaw entered into futures contracts to purchase 50,000 bushels of soybeans at \$5.00 per bushel on January 1, 2014. The market price of soybeans on November 1, 2013 was \$5.00 per bushel.

1. Make the adjusting journal entry necessary on December 31, 2013, if the market price of soybeans is \$4.75 per bushel on that date.
2. Make the adjusting journal entry necessary on December 31, 2013, if the market price of soybeans is \$5.20 per bushel on that date.

**Exercise 19-31****L06****Contingencies: Types of Liabilities**

For each of the following scenarios, identify whether the event described is an actual liability, a contingent liability, or not a liability.

- (a) Apple Inc. has used the toxic substance, iocaine powder, in its production process. Recently adopted federal regulations require companies to clean up any factory sites contaminated with iocaine. Apple has begun a preliminary investigation into the iocaine contamination at its factory sites.
- (b) Banana Corp. financed its warehouse facilities with a long-term mortgage that calls for semiannual payments of \$7,000. The mortgage's current outstanding balance is \$98,000.
- (c) Orange Company sells computer systems and supplies. It offers its customers a 1-year, money-back guarantee. In the past, approximately 10% of customers have exercised this return privilege.
- (d) Kiwi Industries manufactures and distributes outdoor recreational equipment. An individual recently filed a lawsuit as a result of injuries sustained while using Kiwi equipment. Attorneys for Kiwi believe the chance of losing the case is minimal.
- (e) Berry Incorporated, a newly formed company, has an unfunded pension plan that calls for retirement benefits to be paid to employees who retire after a minimum of 10 years of employment with the company.
- (f) John Townson, a successful entrepreneur, has expressed a desire to establish university scholarships for disadvantaged youth in his community. He has been contacted by numerous universities, but as of yet, nothing firm has been established.

**Exercise 19-32****L06****Contingencies: Disclosure of Contingencies**

A lawsuit has been filed against See-Me-Here, Inc., a manufacturer of video postcards, by See-Me-Wherever, another manufacturer of video postcards. The suit alleges patent

right infringements by See-Me-Here and asks for compensatory damages. For the following possible situations, determine whether See-Me-Here should report the information concerning the lawsuit as a liability on the balance sheet, and if so, how much; disclose it in a note; or do nothing. Give reasons for your answers.

- The suit hasn't been filed, but See-Me-Here's legal counsel has informed management that an unintentional patent infringement has occurred.
- See-Me-Here's legal counsel believes an out-of-court settlement is probable and will cost See-Me-Here approximately \$700,000.
- See-Me-Here's legal counsel believes it is probable that the case will result in an undeterminable loss to See-Me-Here.
- See-Me-Here's legal counsel is convinced that the suit will result in a loss to See-Me-Here but isn't sure of the dollar damages.
- See-Me-Here's legal counsel believes there is a remote chance for a loss to occur.
- See-Me-Here's legal counsel believes it is reasonably possible that the case will result in a \$2,800,000 loss to See-Me-Here.

**Exercise 19-33****L06****Contingencies: Contingent Losses**

Conrad Corporation sells motorcycle helmets. In 2013, Conrad sold 4 million helmets before discovering a significant defect in their construction. By December 31, 2013, two lawsuits had been filed against Conrad. The first lawsuit, which Conrad has little chance of winning, is expected to settle out of court for \$750,000 in January 2014. Conrad's attorneys think the company has a 50–50 chance of winning the second lawsuit, which is for \$400,000. What accounting treatment should Conrad give the pending lawsuits in the 2013 year-end financial statements? (Include any necessary journal entries.)

**Exercise 19-34****L06****Contingencies: Contingent Liabilities**

Bell Industries is a multinational company. In preparing the annual financial statements, the auditors met with Bell's attorneys to discuss various legal matters facing the firm. For each of the following independent items, determine the appropriate disclosure:

- Bell is being sued by a distributor for breach of contract. The attorneys believe there is a 30% chance Bell will lose the suit.
- One of Bell's subsidiaries has been accused by a federal agency of violating numerous environmental laws. The company faces significant fines if found guilty. The attorneys believe that the subsidiary has complied with all applicable laws, and they therefore place the probability of incurring the fines at less than 10%.
- A subsidiary operating in a foreign country whose government is unstable was recently taken over by the government and nationalized. Bell is negotiating with representatives of that government, but company attorneys believe the probability of the company losing possession of its assets is approximately 90%.

**Exercise 19-35****L07****Segment Reporting: Reporting Segment Information**

Multitasking Industries sells five different types of products. Internally, Multitasking is divided into five different divisions based on these five different product lines. Multitasking has prepared the following information to disclose to external users in the notes to its 2013 financial statements:

<b>Multitasking Industries</b>						
<b>Business Segment Information</b>						
<b>For the Year Ended December 31, 2013</b>						
<b>(in millions of dollars)</b>						
	<b>Division 1</b>	<b>Division 2</b>	<b>Division 3</b>	<b>Division 4</b>	<b>Division 5</b>	<b>Total</b>
Revenues . . . . .	\$320	\$ 750	\$ 94	\$290	\$105	\$1,559
Operating profit . . . . .	51	104	14	20	7	196
Total assets . . . . .	530	2,110	372	415	280	3,707

According to the provisions of FASB ASC Topic 280 (Segment Reporting), what additional information must Multitasking provide?

**Exercise 19-36**

**L07**

**Segment Reporting: Types of Information Disclosed by Business Segment**

Companies are required to disclose selected results in the financial statements for significant business segments. This information often takes the form of industry segment reporting by diversified companies, but it also can be by geographic areas.

Locate the annual report of **The Walt Disney Company** on the Internet at <http://www.disney.com> and identify the kind of segment disclosure Disney provides. Is this information useful to prospective investors? Why or why not?

**Exercise 19-37**

**L08**

**Interim Reporting: Interim Income Statements**

The income statement of Heifer Technology Inc. for the year ended December 31, 2013, is given below. Using the yearly income statement and the supplemental information, reconstruct the third-quarter interim statement for Heifer.

Supplemental information:

- (a) Assume a 35% tax rate.
- (b) Third-quarter sales were 30% of total sales.
- (c) For interim reporting purposes, a gross profit rate of 41% can be justified.
- (d) Variable operating expenses are allocated in the same proportion as sales. Fixed operating expenses are allocated based on the expiration of time. Of the total operating expenses, \$70,000 relate to variable expenses.
- (e) The equipment was sold June 1, 2013.
- (f) The extraordinary loss occurred September 1, 2013.

<b>Heifer Technology Inc.</b> <b>Income Statement</b> <b>For the Year Ended December 31, 2013</b>	
Sales .....	\$1,200,000
Cost of goods sold .....	<u>710,000</u>
Gross profit on sales .....	\$ 490,000
Operating expenses .....	<u>104,000</u>
Operating income .....	\$ 386,000
Gain on sale of equipment .....	<u>22,000</u>
Income from continuing operations before income taxes .....	\$ 408,000
Income taxes .....	<u>142,800</u>
Income from continuing operations .....	\$ 265,200
Extraordinary loss (net of income tax savings of \$45,000) .....	<u>(80,000)</u>
Net income .....	<u><u>\$ 185,200</u></u>

**Exercise 19-38**

**L08**

**Interim Reporting: Interim LIFO Liquidation**

On December 31, 2012, Courtney Company had LIFO ending inventory consisting of 800 units with a LIFO cost of \$15 per unit. During the first quarter of 2013, Courtney sold 1,400 units. As of March 31, 2013, the inventory of Courtney is 650 units, and the current purchase price of inventory is \$38 per unit. The reduction in the level of inventory is temporary, and Courtney fully expects inventory levels to be at or above 800 units by December 31, 2013. The recorded cost of goods sold for Courtney for the first quarter of 2013 is \$49,750 [(1,250 × \$38) + (150 × \$15)]. What adjusting entry, if any, should Courtney make on March 31, 2013, to correctly apply LIFO to the reporting of quarterly results?

## PROBLEMS

## Problem 19-39

L04

**Derivatives: Identifying a Hedge**

Kanesville Company is still new at using derivatives to hedge business risk. Kanesville has entered into five derivative agreements in an attempt to hedge five specific items. The derivatives, and associated items, are briefly described here:

- Euro futures contract.* If the U.S. dollar value of €500,000 is higher than \$300,000 on July 31, Kanesville must pay the difference; if the U.S. dollar value is less than \$300,000, Kanesville receives the difference. This futures contract is intended to hedge a €500,000 account payable due to be paid on July 31.
- Copper forward contract.* If the price of copper is more than \$1.10 per pound on August 31, Kanesville must pay the difference (multiplied by 100,000 pounds); if the price is less than \$1.10, Kanesville receives the difference. This forward contract is intended to hedge Kanesville's expected purchases of copper (as a raw material) for the month of August.
- Japanese yen futures contract.* If the U.S. dollar value of ¥10 million is higher than \$90,000 on July 15, Kanesville receives the difference; if the U.S. dollar value is less than \$90,000, Kanesville must pay the difference. This futures contract is intended to hedge Kanesville's expected purchase of some equipment from a Japanese company on July 15 for ¥5 million.
- Interest rate swap.* If the interest rate on March 31 of next year is more than 12%, Kanesville receives the difference (on a principal amount of \$2,000,000); if the interest rate is less than 12%, Kanesville must pay the difference. This interest rate swap is intended to hedge a \$2,000,000 variable-rate loan. The loan is expected to be fully repaid this year on May 10.
- Call option on Williams Company stock.* If the price of a share of Williams Company stock is more than \$60 on September 24, Kanesville receives the difference (multiplied by 25,000 shares); if the price of the stock is less than \$60, the option is worthless and will be allowed to expire. This call option is intended to hedge an investment in 25,000 shares of Williams Company stock.

**Instructions:** For each of these five pairs (derivative and associated item), state whether the derivative serves as an effective hedge. Explain your answer.

## Problem 19-40

L05

SPREADSHEET

**Derivatives: Accounting for Swaps**

On January 1, 2013, Nathan Company received a 5-year, \$7,000,000 loan, with interest payments occurring at the end of each year and the principal to be repaid on December 31, 2017. The interest rate for the first year is the prevailing market rate of 8%, and the rate in each succeeding year will be equal to the market interest rate on January 1 of that year. In conjunction with this loan, Nathan enters into an interest rate swap agreement whereby, in each year of the loan starting with 2014, Nathan will receive a swap payment (based on \$7,000,000) if the January 1 interest rate is more than 8% and will make a swap payment if the rate is less than 8%. The swap payments are made at the end of the year.

On January 1, 2014, the interest rate is 11%, and on December 31, 2014, the interest rate is 7%.

**Instructions:** Make all journal entries necessary on Nathan's books in 2013 and 2014 to record this loan and the interest rate swap. For purposes of estimating future swap payments, assume that the current interest rate is the best forecast of the future interest rate.

## Problem 19-41

L05

**Derivatives: Accounting for Forward Contracts**

Candra Christensen Cuisine operates a chain of fine seafood restaurants. The company makes very detailed long-term plans. On October 1, 2013, Candra Christensen determined that it would need to purchase 800,000 pounds of New England lobster

on January 1, 2015. Because of the fluctuations in the price of New England lobster, on October 1 the company negotiated a special forward contract with Lisa Investment Bank for Candra Christensen to purchase 800,000 pounds of New England lobster on January 1, 2015, at a price of \$9,600,000. The price of New England lobster was \$12 per pound on October 1. Lisa Investment Bank has a staff of financial analysts who specialize in forecasting lobster prices. These analysts are predicting a drop in worldwide lobster prices between October 1, 2013, and January 1, 2015.

On December 31, 2013, the price of a pound of New England lobster is \$15. On December 31, 2014, the price of a pound of New England lobster is \$9. The appropriate discount rate throughout this period is 10%.

**Instructions:** Make all journal entries necessary on Candra Christensen's books in 2013, 2014, and 2015 to record the forward contract and the purchase of the lobster. For purposes of estimating future settlement payments under the forward contract, assume that the current price of lobster is the best forecast of the future price.

**Problem 19-42**

L05

**Derivatives: Accounting for Futures Contracts**

On January 1, 2013, Jessica Marie Company sold equipment to Gwang Ju Company for 30,000,000 Korean won, with payment to be received in two years on January 1, 2015. The exchange rate on January 1, 2013, is 800 won = \$1. On the same date, Jessica Marie enters into a futures contract and agrees to sell 30,000,000 won on January 1, 2015, at the rate of 800 won = \$1.

On December 31, 2013, the exchange rate is 790 won = \$1. On December 31, 2014, the exchange rate is 830 won = \$1. The appropriate discount rate throughout this period is 10%.

**Instructions:** Make all journal entries necessary on Jessica Marie's books in 2013, 2014, and 2015 to record this sale, the futures contract, and the collection of the receivable. For purposes of estimating future settlement payments under the futures contract, assume that the current exchange rate is the best forecast of the future exchange rate. (Note: Don't forget to record the receivable at its present value.)

**Problem 19-43**

L05

**Derivatives: Accounting for Options**

Pratt Agriculture sells approximately 600,000 bushels of grain each month. On January 1, 2013, Pratt purchased an option to sell 600,000 bushels of grain on January 1, 2015, at a price of \$1.25 per bushel. The market price on January 1, 2013, is \$1.25 per bushel. Pratt had to pay \$90,000 to purchase this grain put option, which it designated as a hedge against price decreases for its January 2015 sales of grain.

On December 31, 2013, the price of grain is \$1.75 per bushel. Because there is still time for the price of grain to potentially fall below \$1.25 per bushel before the option expires (thus making it advantageous to exercise the put option), the option has a value on December 31, 2013, of \$23,000. (Note: This December 31, 2013, option value already takes into account an appropriate adjustment for the time value of money.) On December 31, 2014, the price of grain is \$1.35 per bushel.

**Instructions:** Make all journal entries necessary on Pratt's books in 2013, 2014, and 2015 to record this option and the sale of 600,000 bushels of grain in January 2015.

**Problem 19-44**

L05

**Derivatives: Notional Amounts**

Refer to Problems 19-41 and 19-42.

**Instructions:**

1. What is the notional value of the lobster forward contract described in Problem 19-41? What is the fair value of the forward contract during its life?
2. What is the notional value of the Korean won futures contract described in Problem 19-42? What is the fair value of the futures contract during its life?

**Problem 19-45****L05****Derivatives: Accounting for a Speculation**

Martins Cove Company employs 25 analysts who closely track news about supply and demand for livestock and agricultural commodities. Martins Cove uses that information to enter into futures contracts based on its prediction of which way agriculture prices are heading. On December 1, 2013, Martins Cove entered into the following three contracts:

Type of Contract	Quantity	Futures Price per Pound	Market Price per Pound on Dec. 1, 2013
Purchase feeder cattle . . . . .	250,000 pounds	\$1.65	\$1.65
Sell pork bellies . . . . .	800,000	0.45	0.45
Purchase milk . . . . .	500,000	0.70	0.70

All three of the contracts are to be settled on January 1, 2014.

**Instructions:**

1. Make the adjusting journal entries necessary on December 31, 2013, assuming the following market prices per pound on that date: feeder cattle, \$1.53; pork bellies, \$0.55; and milk, \$0.67.
2. Martins Cove has much information about agricultural products. What advantages are there to using this information to trade derivative contracts rather than buying and selling cattle, hogs, and milk directly? What are the disadvantages?

**Problem 19-46****L06****Contingencies: Contingent Liabilities**

Southern Outpost Co. has several contingent liabilities at December 31, 2013. The auditor obtained the following brief description of each liability:

- (a) In May 2012, Southern Outpost became involved in litigation. In December 2013, the court assessed a judgment for \$600,000 against Southern. Southern is appealing the amount of the judgment. Its attorneys believe it is probable that they can reduce the assessment on appeal by 50%. Southern has made no entries pending completion of the appeal process, which is expected to take at least a year.
- (b) In July 2013, Duval County brought action against Southern for polluting the St. Johns River with its waste products. It is reasonably possible that Duval County will be successful, but the amount of damages Southern might have to pay should not exceed \$280,000. Southern has made no entry to reflect the possible loss.
- (c) Southern Outpost has signed as guarantor for a \$70,000 loan by Guaranty Bank to Northern Supply Inc., a principal supplier to Southern. At this time, there is a only a remote likelihood that Southern Outpost will have to make payments on behalf of Northern Supply.

**Instructions:**

1. What amount should be reported as a liability on the December 31, 2013, balance sheet for each of these items?
2. What note disclosure should be included as part of the balance sheet for each of these items?
3. Prepare the journal entries necessary to adjust Southern's books to reflect your answers in (1) and (2).

**Problem 19-47****L06****Contingencies: Entries and Disclosure**

This chapter briefly outlined the legal history of the case between **Pennzoil** and **Texaco**. Texaco was ordered to pay \$10.5 billion to Pennzoil in 1985. Subsequent appeals in 1986 and 1987 affirmed the judgment against Texaco. The two companies agreed in late 1987 to a settlement of \$3 billion, and in 1988 Texaco paid Pennzoil.

**Instructions:**

1. In 1984, when the lawsuit was initially filed, how should Texaco have disclosed the event? If a journal entry is required, prepare it.
2. In 1986, following the initial jury award and Texaco's failure to have the judgment reversed on appeal, how should Texaco have disclosed the event? If a journal entry is required, prepare it.
3. In 1987, following the \$3 billion agreement between Texaco and Pennzoil, how should Texaco have disclosed the event? If a journal entry is required, prepare it.
4. Prepare the journal entry to record Texaco's settlement in 1988.
5. How should Pennzoil have disclosed this event during the years 1984 through 1987?

**Problem 19-48****L06****Contingencies: Accounting for Environmental Liabilities and Other Events**

Mercury Rising Inc. manufactures thermometers for use in labs. Management has prepared financial statements for the year ended 2013 for review by the auditors. The audit team has questioned several items in the financial statements and has asked for your advice concerning the proper treatment of these items. Each of the items being questioned follows.

- (a) In November 2013, attorneys for current and former employees of Mercury Rising Inc. filed a class action lawsuit, alleging that exposure to mercury has caused significant medical problems. Attorneys for Mercury Rising Inc. are uncertain as to the outcome of the case. However, similar lawsuits against other firms in the mercury industry have resulted in significant payments by the employer.
- (b) On January 12, 2014, a fire at a production facility damaged a number of adjacent buildings (owned by other businesses). Mercury's insurance policy does not cover damage to the property of others. Insurance companies for those other businesses have billed Mercury for the estimated cost of \$5.3 million required to restore the damaged buildings.
- (c) One of Mercury's production plants is located on the shores of Lake Hogwarts. The lake has been rising for a number of years, and the company has installed dikes to prevent flooding. The dikes are currently operating at or near capacity. Weather forecasters have predicted that the lake will rise another eight inches this coming summer. If this occurs, significant damage will likely result from stressing the dikes beyond capacity.
- (d) A national magazine printed an article regarding the dangers of mercury and specifically named Mercury Rising Inc. as a "killer of innocent victims." Attorneys for Mercury filed suit for libel and were awarded \$2.1 million in damages on December 16, 2013. The magazine has indicated it would appeal the verdict.

**Instructions:** Determine how each of these events should be disclosed in the financial statements of Mercury Rising Inc. for the year ended December 31, 2013. Provide support for your position.

**Problem 19-49****L07****Segment Reporting: Reporting Segment Data**

ProCom Industries operates in several different industries. Total sales for ProCom are \$14,000,000, and total common costs are \$6,500,000 for 2013. For internal reporting purposes, ProCom allocates common costs based on the ratio of a segment's sales to total sales. Additional information regarding the different segments follows:

	Segment 1	Segment 2	Segment 3	Segment 4	Other Segments
Contribution to total sales	25%	12%	31%	23%	9%
Costs specific to the segment	\$1,100,000	\$1,000,000	\$1,300,000	\$880,000	\$400,000

**Instructions:**

1. Compute the operating profit that would be reported internally for each of the four segments.
2. Comment on whether it is appropriate for ProCom to report segment information in the external financial statements using the same common cost allocation method that is used for internal reports.

**Problem 19-50****L07****Segment Reporting: Product Line and Country Disclosure**

Chatterton Company has two different product lines and makes significant sales in both the United States and Brazil. Chatterton has compiled the following information:

	Revenue	Operating Profit	Depreciation	Plant and Equipment	Total Assets	Total Liabilities	Capital Expenditure
Product X/U.S. . . . . .	\$500	\$110	\$10	\$ 90	\$150	\$ 60	\$30
Product X/Brazil . . . . .	210	60	12	70	135	70	20
Product Y/U.S. . . . . .	300	80	40	200	640	325	80
Product Y/Brazil . . . . .	120	40	35	130	410	250	60

**Instructions:**

1. Assume that Chatterton has structured its company internally into divisions based on the two products, X and Y. Prepare the segment disclosure necessary under the provisions of FASB ASC Topic 280.
2. Assume that Chatterton has structured its company internally into two divisions, one for operations in the United States and one for operations in Brazil. Prepare the segment disclosure necessary under the provisions of FASB ASC Topic 280.

**Problem 19-51****L08****Interim Reporting: Forecasting Fourth-Quarter Sales**

Harper Company sells toys, so its sales are heavily concentrated in the last quarter of the year because of holiday buying. Harper reported total sales for the past three years as follows (all numbers are in thousands):

	Quarter Ending				Total
	March 31	June 30	September 30	December 31	
2011 . . . . .	\$ 6,000	\$ 6,000	\$ 6,000	\$12,000	\$30,000
2012 . . . . .	8,000	8,000	8,000	16,000	40,000
2013 . . . . .	10,000	10,000	10,000	20,000	50,000

To make advance arrangements with suppliers, you have been asked to forecast Harper's fourth-quarter sales for the year 2014.

**Instructions:**

1. Ignore the quarterly sales data given by Harper. Forecast fourth-quarter 2014 sales using just the annual sales data. Describe your assumptions.
2. Repeat (1), but this time use the quarterly sales data.
3. Repeat (2), but also incorporate the fact that first-quarter sales in 2014 were \$14,000.
4. Comment on the usefulness of quarterly data.

**Problem 19-52****L06, L08****Sample CPA Exam Questions**

- Eagle Co. has cosigned the mortgage note on the home of its president, guaranteeing the indebtedness in the event that the president should default. Eagle considers the likelihood of default to be remote. How should the guarantee be treated in Eagle's financial statements?
  - Disclosed only.
  - Accrued only.
  - Accrued and disclosed.
  - Neither accrued nor disclosed.
- In FASB ASC Topic 270 (Interim Reporting), the FASB concludes that interim financial reporting should be viewed primarily in which of the following ways?
  - As useful only if activity is spread evenly throughout the year.
  - As if the interim period were an annual accounting period.
  - As reporting for an integral part of an annual period.
  - As reporting under a comprehensive basis of accounting other than GAAP.

**CASES****Discussion  
Case 19-53****Derivatives: What Risks Do We Face?**

Palmer Equipment Company is a multinational firm that sells exercise equipment to fitness clubs and to individuals. When customers buy Palmer's equipment, they typically pay 20% down and pay the balance within one year. Palmer's primary market is the United States, where it makes 60% of its sales. Palmer makes 10% of its sales in Japan and 30% in Europe. All foreign sales are denominated in the local currencies.

All of the equipment that Palmer sells is manufactured in southern China. Palmer doesn't own the factories but contracts with various factory owners for the manufacture and delivery of equipment. Palmer's equipment purchase contracts are denominated in Hong Kong dollars.

Palmer has obtained its long-term debt financing from a mixture of U.S., Japanese, and German banks. About half of the loans from U.S. banks are variable-rate loans; the remainder of Palmer's bank loans have fixed rates.

Recently, Palmer has seen its earnings fluctuate wildly from one year to the next. As the recently appointed head of the corporate risk management committee, you have been asked by Jefferson Todd Palmer, CEO of Palmer Equipment, to briefly summarize the different types of risk that Palmer faces.

**Discussion  
Case 19-54****Derivatives: Are Derivatives Just Another Way to Gamble?**

Laurie Seals and Julie Winn are roommates at Upland State College. Laurie majors in political science, and Julie is an accounting major. Recently, one of Laurie's political science classes has been discussing the impact of derivative trading losses on the finances of several public institutions in the United States, including city governments and public colleges. The political science class has decided that derivatives are nothing more than a sophisticated form of gambling and that their trading in the United States should be banned.

How should Julie explain to Laurie that derivatives serve a vital business purpose?

**Discussion  
Case 19-55****Contingencies: When Is a Loss a Loss?**

How should Newport Company report each of the following contingencies?

- A reasonably possible threat of expropriation exists for one of Newport's manufacturing plants located in a foreign country. Any compensation from the foreign government would be less than the plant's carrying amount (book value).

- (b) Potential costs exist due to the discovery of a safety hazard related to one of Newport's products. These costs are probable and can be reasonably estimated.
- (c) One of Newport's warehouses located at the base of a mountain can no longer be insured against rockslide losses. As of yet, no rockslide losses have occurred.

**Discussion  
Case 19-56**

**Contingencies: Accounting Standards in Court**

Judge Daniel H. Wells is currently deliberating over a suit filed by three stockholders against Transcontinental Corporation. The stockholders allege that Transcontinental's year-end balance sheet was misleading because it did not accurately reflect the company's financial position. The stockholders claim that they relied on the published financial statements and subsequently lost money on their investments in Transcontinental. The primary point at issue is that Transcontinental did not disclose anything about a contingent liability relating to a significant pending lawsuit with a supplier, which Transcontinental subsequently lost. The three stockholders contend that this information was material and relevant and should have been disclosed.

Tomorrow, Transcontinental's accountant will take the stand. Before the lawyers for the opposing parties begin their questioning of the accountant, Judge Wells intends to ask a few questions to determine whether Transcontinental was negligent in its accounting practices. What questions should Judge Wells ask?

**Discussion  
Case 19-57**

**Contingencies: Do We Need Specific Standards for Environmental and Other Contingent Liabilities?**

Many state and federal laws place possible future liabilities on companies as a result of environmental pollution, gender discrimination, safety requirements, and other social responsibilities. In general, these items are part of those potential losses and liabilities covered by FASB ASC Topic 450 (Contingencies). Some companies are reporting these items as liabilities; others are waiting for more specific guidelines by the FASB before reporting them. Should the FASB adopt specific guidelines for reporting these liabilities, or should the decision be left to companies based on the general conceptual guidelines of Topic 450?

**Discussion  
Case 19-58**

**Segment Reporting: By Product Line or by Country?**

Eliza Snow is the controller for Lorenzo Manufacturing. Lorenzo has five different product lines and conducts significant operations in six different countries. Lorenzo's internal organization is set up so that a division manager is in each of the six different countries, with responsibility for sale of all five products in that country. Internal accounting reports are prepared based on this same organizational structure.

Snow has heard rumors that the FASB rules will require Lorenzo to externally report summary segment information by product line. Snow is very upset because this is completely at odds with what Lorenzo does internally. She estimates that compiling segment information by product line will require at least a week's worth of work by her and her entire staff.

Does Snow have a correct understanding of the provisions of FASB ASC Topic 280 (Segment Reporting)? Explain.

**Discussion  
Case 19-59**

**Interim Reporting: The Quarterly Report Must Be Exactly Like the Annual Report!**

J. M. Grant has recently been elected to the board of directors of Montrose Company. The other directors of Montrose are beginning to regret this action. Grant has proved to be very opinionated, very stubborn, and quite old fashioned. Every decision by the board members since Grant joined the board has taken two to three times as long as it should have because Grant seems to disagree with everything that everyone else says.

The most recent crisis is over the preparation of the quarterly report. Grant was shocked to learn that quarterly reports do not include the same detail as is contained in the annual report and that estimates and assumptions are used extensively in preparing

the summary information that goes into the quarterly report. The last straw for Grant was when he learned that the quarterly report is not audited. Grant has absolutely refused to accept this slipshod method of quarterly reporting and has vowed that he will bottle up board action on all other decisions until the board agrees to the preparation of a quarterly report that contains the same detail, the same accounting practices, and the same type of audit opinion as the annual report.

You have been appointed by the board to reason with Grant. What will you tell him?

**Case 19-60**

**Deciphering Financial Statements (The Walt Disney Company)**

Locate the 2009 financial statements for **The Walt Disney Company** on the Internet.

Once you have located those financial statements, consider the following questions.

1. In Note 17 on derivative instruments, Disney explains how the company manages interest rate risk and foreign exchange risk. What types of instruments does Disney use to manage foreign exchange risk? What specific currency risk is Disney trying to hedge against? Does Disney speculate with its foreign currency transactions?
2. What types of instruments does Disney use to manage interest rate risk?
3. What interesting details about pending lawsuits does Disney include in the notes to the financial statements?
4. Disney has five primary business segments: Media Networks, Parks and Resorts, Studio Entertainment, Consumer Products, and Interactive Media. Which of these five yields the highest return on assets (Operating income/Identifiable assets)? (Note: Use information from the financial statement notes.)
5. Find Disney's Quarterly Financial Summary. Do you detect any seasonal pattern in Disney's revenues? Explain.

**Case 19-61**

**Deciphering Financial Statements (Interim Reporting: Toys "R" Us)**

**Toys "R" Us** is the biggest toy store chain in the United States, with significant operations outside the United States as well. The following quarterly financial data were taken from the 2009 annual report of Toys "R" Us.

	First Quarter	Second Quarter	Third Quarter	Fourth Quarter
2009 Net Sales . . . . .	\$2,477	\$2,567	\$2,667	\$5,857
2009 Gross Margin . . . . .	890	951	950	1,987
2009 Net Earnings/(Loss) . . . . .	(35)	27	(67)	387
2008 Net Sales . . . . .	2,719	2,771	2,773	5,461
2008 Gross Margin . . . . .	977	1,014	960	1,797
2008 Net Earnings/(Loss) . . . . .	(36)	13	(104)	345

1. Does Toys "R" Us have any seasonal pattern in its sales?
2. Compute gross profit (or margin) percentage (Gross margin/Sales) for each quarter for fiscal years 2008 and 2009. Is the gross profit percentage in the fourth quarter substantially different from other quarters?
3. Assume that first-quarter sales for fiscal 2010 are \$2,700 million. What is your prediction of fourth-quarter sales?

**Case 19-62**

**Deciphering Financial Statements (Derivatives: IBM)**

In Note L to its 2009 financial statements, **IBM** includes disclosure about its derivatives as follows:

**Fair Values of Derivative Instruments on the Consolidated Statement of Financial Position**  
(\$ in millions)

	Fair Value of Derivative Assets			Fair Value of Derivative Liabilities		
	Designated as Hedging Instruments	Not Designated as Hedging Instruments	Total	Designated as Hedging Instruments	Not Designated as Hedging Instruments	Total
<b>At December 31, 2009:</b>						
Interest rate contracts:						
Prepaid expenses and other current assets . . . . .	\$ 43	\$ —	\$ 43	\$ —	\$ —	\$ —
Investments and sundry assets . . . . .	383	—	383	—	—	—
Other liabilities . . . . .	—	—	—	2	—	2
Foreign exchange contracts:						
Prepaid expenses and other current assets . . . . .	74	151	225	—	—	—
Investments and sundry assets . . . . .	156	26	182	—	—	—
Other accrued expenses and liabilities . . . . .	—	—	—	602	304	906
Other liabilities . . . . .	—	—	—	423	224	647
Equity contracts:						
Prepaid expenses and other current assets . . . . .	—	5	5	—	—	—

Long-term debt . . . . .	NA	NA	NA	2,618	—	2,618
<b>Total</b> . . . . .			<b>\$838</b>			<b>\$5,613</b>

**The Effect of Derivative Instruments on the Consolidated Statement of Earnings**  
(\$ in millions)

**For the year ended December 31, 2009:**

Derivative Instruments in Fair Value Hedges	Consolidated Statement of Earnings Line Item	Gain (Loss) Recognized in Earnings	
		Recognized on Derivatives(2)	Attributable to Risk Being Hedged(3)
Interest rate contracts . . . . .	Cost of financing	\$ (172)	\$344
	Interest expense	(97)	193
<b>Total</b> . . . . .		<b>\$(269)</b>	<b>\$537</b>

Derivative Instruments in Cash Flow Hedges	Effective Portion Recognized in AOCI	Consolidated Statement Of Earnings Line Item	Gain (Loss) Recognized in Earnings and Other Comprehensive Income	
			Effective Portion Reclassified from AOCI to Earnings	Ineffectiveness and Amounts Excluded from Effectiveness Testing(4)
Interest rate contracts	\$ (0)	Interest income	\$ (13)	\$—
Foreign exchange contracts	(718)	Other (income) and expense	143	(3)
		Cost of sales	(49)	
		SG&A expense	14	
<b>Total</b>	<b>\$(718)</b>		<b>\$ 94</b>	<b>\$(3)</b>

Gain (Loss) Recognized in Earnings and Other Comprehensive Income				
Derivative Instruments in Net Investment Hedges	Effective Portion Recognized in AOCI	Consolidated Statement of Earnings Line Item	Effective Portion Reclassified from AOCI to Earnings	Ineffectiveness and Amounts Excluded from Effectiveness Testing(5)
Foreign exchange contracts	\$234	Interest income	\$—	\$1
		Other (income) and expense	\$—	\$—

Derivative Instruments Not Designated as Hedging Instruments(1)	Consolidated Statement of Earnings Line Item	Gain (Loss) Recognized in Earnings
Foreign exchange contracts	Other (income) and expense	\$(128)
Equity contracts	SG&A expense	177
<b>Total</b>		<b>\$ 50</b>

Note: AOCI represents Accumulated other comprehensive income/(loss) in Consolidated Statement of Changes in Equity.

- (1) See pages 76 and 77 for additional information on the purpose for entering into derivatives not designated as hedging instruments.
- (2) Includes changes in clean fair values of the derivative instruments in fair value hedging relationships and the periodic accrual for coupon payments required under these derivative contracts.
- (3) Includes basis adjustments to the carrying value of the hedged item recorded during the period and amortization of basis adjustments recorded on de-designated hedging relationships during the period.
- (4) Amount of gain (loss) recognized in income represents ineffectiveness on hedge relationships.
- (5) Amount of gain (loss) recognized in income represents amounts excluded from effectiveness assessment.

At December 31, 2009, in connection with cash flow hedges of anticipated royalties and cost transactions, the company recorded net losses of \$718 million (before taxes) in accumulated other comprehensive income/(loss); \$427 million of losses are expected to be reclassified to net income within the next 12 months, providing an offsetting economic impact against the underlying anticipated transactions. At December 31, 2009, net losses of approximately \$18 million (before taxes) were recorded in accumulated other comprehensive income/(loss) in connection with cash flow hedges of the company's borrowings; \$10 million of losses are expected to be reclassified to net income within the next 12 months, providing an offsetting economic impact against the underlying transactions.

For the 12 months ending December 31, 2009, there were no significant gains or losses recognized in earnings representing hedge ineffectiveness or excluded from the assessment of hedge effectiveness (for fair value hedges), or associated with an underlying exposure that did not or was not expected to occur (for cash flow hedges); nor are there any anticipated in the normal course of business.

1. IBM reports that it uses both fair value and cash flow hedges in its debt risk management program. Most of these hedges are accomplished through interest rate swaps. Some of the interest rate swaps are pay-fixed, receive-variable swaps, and some are pay-variable, receive-fixed swaps. Which of these two types of swaps are fair value hedges, and which are cash flow hedges? Explain.
2. IBM lists \$2,618 million in long-term debt as a hedge. What does this debt hedge, and how does the debt serve as an effective hedge?
3. As of December 31, 2009, IBM has recognized \$736 million in net unrealized losses associated with cash flow hedges. Of these net losses, how much is related to cash flow transactions expected to occur within one year?
4. What type of disclosure would give the best indication of IBM's exposure to foreign exchange and interest rate risk?

### Case 19-63

#### Deciphering Financial Statements (Segment Reporting: PepsiCo)

Refer to the 2009 segment information for **PepsiCo** given in Exhibit 19-4.

1. Compute operating profit margin (Operating profit/Net revenue) for 2009 for each of the following: (a) Frito-Lay North America, (b) Quaker Foods North America, (c) Latin America Foods, (d) PepsiCo Americas Beverages, (e) Europe, and (f) Asia, Middle East & Africa
2. For each of the segments listed in (1), compute asset turnover (Net revenue/Total assets).

- Given your calculations in (1) and (2), what is your analysis of the different segments of PepsiCo?

**Case 19-64****Writing Assignment (The FASB is an eco-villain!)**

You are one of the seven members of the FASB. The FASB was recently criticized in a cover story in a major newsmagazine. The topic was “accounting for environmental liabilities.” The main point of the article was that the accounting for potential environmental liabilities is governed by the obscure terms “probable, possible, and remote.” In addition, the article claimed that firms could avoid recognizing a liability for future environmental cleanup costs by simply arguing that the costs cannot be “reasonably estimated.”

Of course, the charges in the newsmagazine cover story were repeated in the network TV news programs. Various accounting academics appeared on the morning news shows to pontificate about the slowness of the FASB to address the vital area of environmental accounting. Environmental groups have started picketing outside FASB headquarters, shouting that the FASB is conspiring with “Big Business” to hide the corporate responsibility for cleaning up the environment.

You have been chosen to write the FASB’s response to this criticism. Address your memo to the editor of the weekly newsmagazine and restrict it to 1 page or less.

(Note: This scenario is hypothetical—you are not a member of the FASB, the FASB’s environmental accounting practices have not been the subject of a *Time* or *Newsweek* cover story, and environmental groups have not picketed the FASB. Yet.)

**Case 19-65****Ethical Dilemma (Once a hedge, always a hedge)**

You are the controller/treasurer for a small import-export company. You make all the finance and accounting decisions. Your company makes sales in Germany, Poland, and the Czech Republic. Historically, your Polish sales have been denominated in zlotys. Early this year, you decided to enter into some zloty futures contracts to protect against the effect of changes in the dollar/zloty exchange rate on the cash flows from next year’s sales in Poland. In accordance with proper accounting procedure, you formally designated the futures contracts as a cash flow hedge.

In December of this year, your customers in Poland notified you that they are nervous about the impact of European currency consolidation on the strength of the zloty, and they wish all future sales prices to be denominated in U.S. dollars. The good news is that this action removes the need to worry about the effect of exchange rate changes on Polish sales. The bad news is that you have already entered into the futures contracts and, at the end of the year, the futures have a fair value of \$5 million (liability).

Your dilemma is this: The futures no longer serve as a hedge because future Polish sales will be denominated in U.S. dollars. However, if you account for the futures as speculative investments, you will be forced to recognize a loss in earnings this year of \$5 million. This entire hedging operation was your idea, and you convinced the president of the company that you knew what you were doing and there was no chance of a major loss. If this loss is recognized, reported profits for the year will be wiped out, and the company will show a net loss for the first time in its history.

What should you do?

**Case 19-66****Cumulative Spreadsheet Analysis**

This assignment is an exercise in simple derivative valuation. Skywalker is considering using derivative contracts in 2014 to hedge interest rate risk. However, before entering into any derivative contract agreements, the management of Skywalker wishes to better understand how the values of derivative financial instruments fluctuate.

For 2014, Skywalker is considering converting \$600 of its long-term debt into 3-month renewable debt; by so doing, Skywalker will be able to receive various preferential privileges from its lender. However, Skywalker doesn’t want to bear the associated interest rate risk that would arise from the interest rate on the debt being reset at the prevailing market interest rate every three months as the loan is renewed. As a result, Skywalker

has inquired about entering into an interest rate swap with another financial institution. The terms of the swap would be as follows: loan amount, \$600; swap interest rate, 8%.

Skywalker would pay a fixed amount of \$12 ( $\$600 \times 0.08 \times 3/12$ ) to the financial institution each quarter; in exchange, Skywalker would receive a variable amount equal to \$600 multiplied by the current market interest rate (for a 3-month period). This is called a pay-fixed, receive-variable swap. Skywalker could then use the variable amount received to pay the variable interest amount on its 3-month renewable loan.

In practice, the swap will be settled by Skywalker's paying an amount equal to  $[\$600 \times (0.08 - \text{Market interest rate}) \times 3/12]$  when interest rates are below 8% and receiving the same amount when interest rates are above 8%.

The financial staff at Skywalker have done some research on the historical behavior of interest rates and have prepared the table at the left. The data in this table mean that if, for example, the current market interest rate is 8.0%, the probability that the market interest rate will still be 8.0% in three months is 30%. In addition, there is a 5% probability that the market rate will increase to 8.3% in three months, and a 3% probability that the market rate will decrease to 7.6% in three months.

Using these data, construct a spreadsheet to answer the following questions:

1. What is the value of the pay-fixed, receive-variable swap contract to Skywalker if there are three months remaining in the contract term and the current market interest rate is 8.0%? Be sure to indicate whether the swap contract is an asset or a liability for Skywalker.
2. Repeat (1) using the following assumptions about the current market interest rate: (a) 7.2%, (b) 8.1%, and (c) 9.0%
3. Comment on the relative sizes of the fair values of the derivative contract and the notional value of the contract.

Interest Rate Expected to Prevail in 3 Months	Probability
Current rate + 0.5%	2%
Current rate + 0.4%	3
Current rate + 0.3%	5
Current rate + 0.2%	10
Current rate + 0.1%	15
Current rate	30
Current rate - 0.1%	15
Current rate - 0.2%	10
Current rate - 0.3%	5
Current rate - 0.4%	3
Current rate - 0.5%	2

## CHAPTER 20 Accounting Changes and Error Corrections

### LEARNING OBJECTIVES

- 1 Understand the two different types of accounting changes that have been identified by accounting standard setters.
- 2 Recognize the difference between a change in accounting estimate and a change in accounting principle, and know how a change in accounting estimate is reflected in the financial statements.
- 3 Prepare the retrospective adjustment of prior periods' financial statements, and any necessary cumulative adjustment, associated with a change in accounting principle.
- 4 Report pro forma results for prior years following a business combination.
- 5 Recognize the various types of errors that can occur in the accounting process, understand when errors counterbalance, and be able to correct errors when necessary.

*Statement of Financial Accounting Standards No. 106*, "Employers' Accounting for Postretirement Benefits Other Than Pensions," was issued in 1992 (and is now included in the FASB Codification as Section 715-60). These "postretirement benefits other than pensions" are primarily retiree health care costs. The overall impact of this standard on corporate profits established a record for a new accounting rule and was estimated to result in a decrease in the reported profits of major U.S. companies by as much as \$1 trillion.<sup>1</sup> As an example of the effect, the standard required **General Motors** to recognize a liability relating to retiree health care benefits of \$33 billion.

The amazing thing about the accounting change mandated by the FASB back in 1992 is that before the rule change, the liability amount recorded by all U.S. companies for their retiree health care obligations totaled exactly zero. Nil. Nada. Zilch. Let's be honest: This wasn't very informative accounting for these obligations. The economic obligations certainly existed before 1992, but the accounting rules did not require companies to report the obligations in their balance sheets.

For General Motors, the after-tax income effect of the adoption of *Statement No. 106* was to decrease earnings by \$21 billion and decrease earnings per share (EPS) by \$33.38. Because this

<sup>1</sup> Lee Berton and Robert J. Brennan, "New Medical-Benefits Accounting Rule Seen Wounding Profits, Hurting Shares," *The Wall Street Journal*, April 22, 1992, p. C1.

retiree health care obligation had been built up over many years preceding the mandated accounting change in 1992, it makes sense to ask whether the entire estimated after-tax cost of \$21 billion should have been reported by General Motors as an expense in the year of adoption, or whether there was a more informative way to recognize this cost. This issue, the proper reporting of accounting changes, is discussed in this chapter.

The retiree health care obligation created by General Motors through the company's promises to its employees over the years, and finally recognized in the financial statements starting in 1992, has had an extremely interesting and controversial history. The controversy swirls around the claim that these health care promises contributed to the eventual bankruptcy of General Motors. And part of the blame is placed at the

feet of the accounting profession. The fact that, before 1992, the true cost of these health care promises was not included in the financial statements may have led pre-1992 GM decision makers to have the mistaken impression that the promises were "free." The cost of these "free" benefits eventually helped kill the company.

In the negotiations over the General Motors bankruptcy, these retiree health care benefits were sacrificed by GM employees in an effort to help save the restructured company. Exhibit 20-1 shows that the recorded obligation went from \$0 in 1991 (because of the flaw in the accounting rules described above), to a high of over \$80 billion in 2005, and then back to almost \$0 in 2009 (because GM's employees agreed to release the financially ruined company from its previous promises).

**? QUESTIONS**

1. Before FASB *Statement No. 106*, companies typically recognized no cost and no liability for their retiree health care benefit plans. List several reasons for a firm to reduce its retiree health benefits in response to the FASB's requirement that companies recognize the cost and obligation associated with such plans.
2. FASB *Statement No. 106* resulted in firms reporting lower earnings and higher liabilities. Would you expect stock prices to decline for companies with large retiree health care plans? Would you expect it to be harder for these firms to obtain loans?
3. General Motors was required to recognize a one-time \$21 billion expense upon its adoption of FASB *Statement No. 106*. This \$21 billion represented the cumulative after-tax cost of GM's retiree health care plan for all years preceding 1992. How else might GM have recorded this \$21 billion?

Answers to these questions can be found on page 20-27.

company's financial statements sometimes report significantly different results from year to year. This may be due to changes in economic circumstances, but it also may be due to changes in accounting methods or corrections of errors in recording past transactions.

Changing the accounting methods used can have a dramatic impact on a company's financial statements. Because of this impact, one can argue that accounting changes detract from the informational characteristics of comparability and consistency discussed in Chapter 1. So why are these accounting changes made? The main reasons for such changes can be summarized as follows:

1. A company, as a result of experience or new information, may change its estimates of revenues or expenses—for example, the estimate of uncollectible accounts receivable or the estimated service lives of depreciable assets.
2. Due to changes in economic conditions, companies may need to change methods of accounting to more clearly reflect the current economic situation.
3. Accounting standard-setting bodies may require the use of a new accounting method or principle, such as new reporting requirements for postretirement benefits.
4. Management may be pressured to report profitable performance. Clever accounting changes can result in higher net income, thereby reflecting favorably on management.

Whatever the reason, accountants must keep the primary qualitative characteristic of usefulness in mind. They must determine whether the reasons for accounting changes are appropriate and then how best to report the changes to facilitate understanding of the financial statements.

The detection of errors in accounting for past transactions presents a similar problem. The errors must be corrected and appropriate disclosures made so that readers of the financial statements will clearly understand what has happened. The purpose of this chapter is to discuss the different types of accounting changes and error corrections and the related accounting procedures that should be used.

## Accounting Changes

Understand the two different types of accounting changes that have been identified by accounting standard setters.

**WHY** Changes in accounting estimates are made routinely and are a natural result of the improved information that comes through experience. Changes in accounting principle occur relatively infrequently and are the result of either the adoption of a new accounting standard by the FASB or a shift from one acceptable principle to another.

**HOW** These two types of accounting “changes”—change in estimate and change in principle—are substantially different from one another. Accordingly, the accounting treatment of these two types of changes is substantially different, as explained in subsequent sections.

The accounting profession has identified two main categories of [accounting changes](#):<sup>2</sup>

1. Change in accounting estimate
2. Change in accounting principle

<sup>2</sup> FASB ASC Section 250-10-20, Presentation—Accounting Changes and Error Corrections—Overall—Glossary. [SFAS No. 154, “Accounting Changes and Error Corrections: A Replacement of APB Opinion No. 20 and FASB Statement No. 3,” May 2005, par. 2.] A third category of accounting changes, changes in reporting entity, is much less common and is not covered in any detail in this chapter.

As pointed out in Chapter 1, a major objective of published financial statements is to provide users information to help them predict, compare, and evaluate future earning power and cash flows of the reporting entity. When a reporting entity adjusts its past estimates of revenues earned or costs incurred or changes its accounting principles from one method to another, it becomes more difficult for a user to predict the future from past historical statements. The basic accounting issue is whether accounting changes should be reported as adjustments of the prior periods' statements (thus increasing their comparability with current and future statements) or whether the changes should affect only the current and future years.

Several alternatives have been suggested for reporting accounting changes.

1. Restate the financial statements presented for prior periods to reflect the effect of the change. Adjust the beginning retained earnings balance of the earliest period reported for the cumulative effect of the change in all preceding years.
2. Make no adjustment to statements presented for prior periods. Report the cumulative effect of the change in the current year as a direct entry to Retained Earnings.
3. Same as (2), except report the cumulative effect of the change as a special item in the income statement instead of directly to Retained Earnings.
4. Report the cumulative effect in the current year as in (3) but also present limited pro forma information for all prior periods included in the financial statements reporting "what might have been" if the change had been made in the prior years.
5. Make the change effective only for current and future periods with no catch-up adjustment.

Each of these methods for reporting an accounting change has been used by companies in the past, and arguments can be made for each of the approaches. For example, some accountants argue that accounting principles should be applied consistently for all reported periods. Therefore, if a new accounting principle is used in the current period, the financial statements presented for prior periods should be restated so that the results shown for all reported periods are based on the same accounting principles. Other accountants contend that restating financial statements may dilute public confidence in those statements. Principles applied in earlier periods were presumably appropriate at that time and should be considered final. In addition, restating financial statements is costly, requires considerable effort, and is sometimes impossible due to lack of data.

Consider the General Motors (GM) example at the beginning of this chapter. How should the liability and the effect on earnings have been reported? Specifically, what would have been the appropriate journal entry? Obviously, GM would recognize a liability of \$33 billion. Because GM will not receive a tax deduction for the other postretirement benefits until those expenses are actually paid, GM would also recognize a deferred tax asset of \$12 billion. This deferred tax asset would be recognized because GM expensed the cost of the benefits now for financial accounting purposes but does not expect to receive the tax deduction for those expenses until they are paid in the future: Recall from Chapter 16 that this would result in taxable income being higher than financial income in the current period, resulting in a deferred tax asset. As a result, the journal entry would appear as follows:

Deferred Tax Asset .....	12 billion	
???? .....	21 billion	
Other Postretirement Benefits Liability .....		33 billion

What account should replace the question marks? Should it be an income statement account, a balance sheet account, or some other type of account? In accordance with the accounting rules in existence at the time, General Motors debited an expense called “Cumulative Effect of an Accounting Change” and reported the \$21 billion reduction in earnings as a below-the-line item on the income statement. International practice is different with respect to the handling of this type of accounting change. Under the provisions of *International Accounting Standard (IAS) 8*, companies would debit the beginning balance in the retained earnings account, reasoning that the adjustment was related to prior periods and the income from those prior periods had been previously closed to the retained earnings account. In addition, all income statements presented for prior years would be retrospectively restated as if the new standard had always been in effect; this is alternative (1) described above.

FYI

Cumulative effects of changes in accounting principles used to be shown as below-the-line items on the income statement.

As part of its continuing effort to harmonize U.S. GAAP with International Accounting Standards, the FASB adopted *Statement No. 154* in May 2005. This statement changed the U.S. approach to accounting for accounting changes and error corrections to be in conformity with *IAS 8*. The coverage in this chapter reflects this new standard which now forms the basis of FASB Codification Topic 250, “Accounting Changes and Error Corrections.”

## Change in Accounting Estimate

2

Recognize the difference between a change in accounting estimate and a change in accounting principle, and know how a change in accounting estimate is reflected in the financial statements.

**WHY** Preparation of accrual-based financial statements requires that estimates be made. When those good faith estimates are found in later periods to have been inaccurate, no attempt is made to go back and “fix” previously issued financial statements because those statements reflect the best information that was available at the time.

**HOW** A change in accounting estimate does not involve a restatement of prior periods’ financial statements. Instead, the effects of these types of changes are reflected in the current and future periods.

Contrary to what many people believe, accounting information cannot always be measured and reported precisely. Also, to be reported on a timely basis for decision making, accounting data often must be based on estimates of future events. The financial statements incorporate these estimates, which are based on the best professional judgment given the information available at that time. At a later date, however, additional experience or new facts sometimes make it clear that the estimates need to be revised to more accurately reflect the existing business circumstances. When this happens, a **change in accounting estimate** occurs.

Examples of areas for which changes in accounting estimates often are needed include the following:

1. Uncollectible receivables
2. Useful lives of depreciable or intangible assets

3. Residual values for depreciable assets
4. Warranty obligations
5. Quantities of mineral reserves to be depleted
6. Actuarial assumptions for pensions or other postemployment benefits
7. Number of periods benefited by deferred costs

Exhibit 20-2 provides examples of disclosure relating to estimates contained in the 2009 annual reports of two companies: **H. J. Heinz Company** and **McDonald's**. Even though the companies had different auditors (**PricewaterhouseCoopers** and **Ernst & Young**, respectively), it is surprising how similar the note disclosures are.

## STOP & THINK

Why aren't changes in estimates accounted for by restating prior years' financial statements?

- a) The data necessary to perform restatements typically are not available.
- b) Restating prior years' financial statements would force most companies to make a large penalty payment to the Internal Revenue Service.
- c) With most restatements, the deferred tax consequences would cause an unusually large reduction in retained earnings.
- d) With restatements, prior-period financial statements would be constantly revised, reducing the reliance placed on them by investors and creditors.

Accounting for a change in estimate has already been discussed in Chapter 4 and throughout the text in areas for which changes in estimates are common. By way of review, all changes in estimates should be reflected either in the current period or in current and future periods. No retroactive adjustments or pro forma (as-if) statements are to be prepared for a change in accounting estimate. Changes in estimates are considered to be part of the normal accounting process, not corrections or changes of past periods. However, disclosures

such as the ones in Exhibit 20-3, reported by **United Airlines**, are useful in helping readers of financial statements understand the impact of changes in estimates.

Some changes in accounting principle are actually just another form of a change in estimate. For example, if a company changes its depreciation method, it is really making a statement about a change in the expected usage pattern with respect to that asset. As required by the Accounting Changes and Error Corrections Topic (250) of the FASB ASC,

## 20-2 H. J. HEINZ COMPANY AND MCDONALD'S—DISCLOSURE RELATING TO ESTIMATES

### NOTES TO CONSOLIDATED FINANCIAL STATEMENTS

#### H. J. Heinz Company and Subsidiaries

##### I. Significant Accounting Policies

*Use of Estimates:* The preparation of financial statements, in conformity with accounting principles generally accepted in the United States of America, requires management to make estimates and assumptions that affect the reported amounts of assets and liabilities, the disclosure of contingent assets and liabilities at the date of the financial statements, and the reported amounts of revenues and expenses during the reporting period. Actual results could differ from these estimates.

#### McDonald's Corporation

##### Summary of Significant Accounting Policies

##### Estimates in financial statements

The preparation of financial statements in conformity with accounting principles generally accepted in the U.S. requires management to make estimates and assumptions that affect the amounts reported in the financial statements and accompanying notes. Actual results could differ from those estimates.

## 20-3 UNITED AIRLINES—DISCLOSURE OF CHANGE IN ESTIMATE

UAL Corporation (the “Company”) follows a deferred revenue accounting policy to record the fair value of its Mileage Plus frequent flyer obligation. The Company defers the portion of the sales proceeds of ticketed revenue on United and our alliance partners, as well as revenue associated with mileage sales to third parties, that represents the estimated air transportation fair value of the miles awarded. This deferred revenue is then recognized when the miles are redeemed.

Some of these miles will never be redeemed by Mileage Plus members, and the Company recognizes an estimate of revenue from the expected expired miles, which is referred to as breakage, over an estimated redemption period. The Company reviews its breakage estimates annually based upon the latest available information regarding mileage redemption and expiration patterns.

During the first quarter of 2010 the Company obtained additional historical data, previously unavailable, which has enabled the Company to refine its breakage estimates. This new data indicates that a larger number of miles than previously estimated are expected to expire. As a result, the Company has changed its estimate of Mileage Plus breakage on a prospective basis, effective beginning in the first quarter of 2010. In addition to this change in estimate, the Company is making an improvement to the accounting model for Mileage Plus breakage that is inseparable from the change in estimate.

These changes will result in the recognition of approximately \$64 million of incremental passenger revenue in the first quarter of 2010, reducing the net amount of revenue that we otherwise would have deferred to future periods.

© 2012 Cengage Learning.

a change in depreciation method is accounted for as a change in estimate and is called “a change in accounting estimate effected by a change in accounting principle.”

To illustrate a change in accounting estimate effected by a change in accounting principle, assume that Telstar Company, a high-power telescope sales and manufacturing firm, elected in 2013 to change from the double-declining-balance method of depreciation to the straight-line method to make its financial reporting more consistent with the majority of its competitors. Telstar’s depreciable assets have a cost of \$500,000 and, to keep things simple, assume that they were all acquired on January 1, 2010, have an expected useful life of 10 years, and have an expected salvage value of zero. For tax purposes, assume that Telstar had elected to use the straight-line method and will continue to do so. Assume further that Telstar presents comparative income statements for three years and that the past difference in book and tax depreciation is the only difference in accounting treatment impacting Telstar’s financial and taxable income.

These and other assumptions are necessary because, in most instances, a change in accounting principle involves temporary differences between book and tax income, creating the need for interperiod tax allocation. The exact amounts of any deferred income tax liabilities or potential deferred income tax assets are dependent on several factors, such as current tax laws and current and future tax rates. Therefore, in this chapter, including the end-of-chapter material, the impact of income tax either is ignored or the assumed amounts are provided to simplify the illustrations and focus on the effects of accounting changes and error corrections.

For Telstar, the greater accelerated depreciation charged on the books in prior years, as compared to the straight-line tax depreciation taken, resulted in a previously recorded deferred tax asset. The income tax rate is assumed to be 30%. This and other relevant information for Telstar is presented below.

Year	Double-Declining-Balance Depreciation (used for books)	Straight-Line Depreciation (used for taxes)	Depreciation Difference	Deferred Tax Effects	Effects on Income (net of taxes)
2010	\$100,000	\$ 50,000	\$50,000	\$15,000	\$35,000
2011	80,000	50,000	30,000	9,000	21,000
2012	64,000	50,000	14,000	4,200	9,800
Cumulative before 2013	<u>\$244,000</u>	<u>\$150,000</u>	<u>\$94,000</u>	<u>\$28,200</u>	<u>\$65,800</u>

The data indicate that cumulative depreciation expense for the years prior to 2013 would have been \$94,000 (\$244,000 – \$150,000) less if the straight-line method had been used. Thus, income would have been \$94,000 higher, less the applicable income taxes of \$28,200, leaving a net income difference of \$65,800. The total impact on Telstar’s balance sheet as of January 1, 2013, is as follows:

<b>ASSETS</b>	
Gross Property, Plant, and Equipment	No impact
Accumulated Depreciation	\$94,000 higher with double declining balance
Net Property, Plant, and Equipment	\$94,000 lower with double declining balance
Deferred Tax Asset	\$28,200 higher with double declining balance
Total Assets	\$65,800 lower with double declining balance
<b>LIABILITIES</b>	
No impact	
<b>EQUITIES</b>	
Retained Earnings	\$65,800 lower with double declining balance

Because a change in depreciation method is to be accounted for as “a change in accounting estimate effected by a change in accounting principle,” no attempt is made to go back and change the depreciation and deferred tax information reported in 2010, 2011, and 2012. Instead, the change is accounted for in the current and future periods as illustrated in Chapter 11 in the discussion of changes in depreciation lives. The remaining depreciable book value as of January 1, 2013, is depreciated over the remaining life of seven years using the new straight-line method. Depreciation expense for 2013 is computed as follows:

$$[(\$500,000 - \$244,000) - \$0 \text{ salvage value}] / 7 \text{ years} = \$36,571$$

The table below shows the depreciation amount that would be reported in the books and for income tax purposes after the accounting change. You can see that the lower depreciation expense reported under the straight-line method applied on the books results in the gradual reversal of the deferred tax asset that had been recognized previously. By the end of seven years (in 2019), the deferred tax effects will have completely reversed.

Year	First Double-Declining-Balance and then Straight-Line Depreciation (used for books)	Straight-Line Depreciation (used for taxes)	Depreciation Difference	Deferred Tax Effects	Effects on Income (net of taxes)
Cumulative before 2013	\$244,000	\$150,000	\$ 94,000	\$28,200	\$65,800
2013	36,571	50,000	(13,429)	(4,029)	(9,400)
2014	36,571	50,000	(13,429)	(4,029)	(9,400)
.					
.					
.					
2019 (adjusted for rounding)	36,574	50,000	(13,426)	(4,026)	(9,400)
Cumulative through 2019	<u>\$500,000</u>	<u>\$500,000</u>	<u>\$ 0</u>	<u>\$ 0</u>	<u>\$ 0</u>

## Change in Accounting Principle

- 3** Prepare the retrospective adjustment of prior periods' financial statements, and any necessary cumulative adjustment, associated with a change in accounting principle.

**WHY** An extremely important characteristic of good financial reports is that they are based on consistent application of accounting principles so that the results and financial position in the current year can be meaningfully compared to the preceding years.

**HOW** A change in accounting principle is implemented by recomputing all financial statement amounts for the preceding years (at least those that will be included in the current year's comparative financial statements). These recomputed amounts are included in the comparative financial statements reported this year. Any income effect in even earlier years is shown as an adjustment to the beginning balance in retained earnings for the earliest year reported.

A [change in accounting principle](#) involves a change from one generally accepted principle or method to another.<sup>3</sup> A change in principle does not include the initial adoption of an accounting principle as a result of transactions or events that had not occurred (or were immaterial) in previous periods. A change from a principle that is not generally accepted to one that is generally accepted is considered to be an error correction rather than a change in accounting principle.

As indicated in previous chapters, companies may select among alternative accounting principles to account for business transactions. For example, for financial reporting purposes, inventory may be accounted for using FIFO, LIFO, or other acceptable methods. These alternative methods are often equally available to a given company, but in most instances, criteria for selection among the methods are inadequate. As a result, companies have found it rather easy to justify changing from one accounting principle or method to another.

The effect of a change from one accepted accounting principle to another is reflected by retrospectively adjusting the financial statements for all years reported, and reporting the cumulative effect of the change in the income for all preceding years as an adjustment to the beginning balance in retained earnings for the earliest year reported. For example, in a standard set of financial statements presenting balance sheets for two years and income statements and statements of cash flows for three years, all of the statements would be redone using the new accounting principle. In addition, the statement of stockholders' equity that is typically included with the financial statements would reflect the cumulative effect on income in prior years with an adjustment to beginning retained earnings in the first of the three years reported.

To illustrate the general treatment of a change in accounting principle, assume that as of January 1, 2013, Forester Company changed from the LIFO inventory costing method to the FIFO method for both financial reporting and income tax purposes. There are no deferred tax consequences because both the old and new methods apply to both financial and tax reporting. However, additional taxes will be payable for prior years as a result of the change in inventory method used for tax purposes. The income tax rate is 30%. The following balance sheet and income statement data are based on LIFO as shown on page 20-10.

<sup>3</sup> The classification "change in accounting principle" includes changes in methods used to account for transactions. No attempt is made in FASB ASC Topic 250 to distinguish between a principle and a method.

	If Continued Using LIFO	As Originally Reported Using LIFO	
	2013	2012	2011
<b>Balance Sheet</b>			
Cash . . . . .	\$ 150	\$ 120	\$ 100
Inventory . . . . .	3,800	3,000	2,500
Total assets . . . . .	<u>\$3,950</u>	<u>\$3,120</u>	<u>\$2,600</u>
Income taxes payable . . . . .	\$ 165	\$ 105	\$ 90
Paid-in capital . . . . .	1,645	1,260	1,000
Retained earnings . . . . .	2,140	1,755	1,510
Total liabilities and equities . . . . .	<u>\$3,950</u>	<u>\$3,120</u>	<u>\$2,600</u>
<b>Income Statement</b>			
Sales . . . . .	\$1,500	\$1,200	\$1,000
Cost of goods sold . . . . .	950	850	700
Gross profit . . . . .	<u>\$ 550</u>	<u>\$ 350</u>	<u>\$ 300</u>
Income tax expense . . . . .	165	105	90
Net income . . . . .	<u>\$ 385</u>	<u>\$ 245</u>	<u>\$ 210</u>

The data for 2011 and 2012 are the actual financial statements that were released for those years. The LIFO data for 2013 are the financial statements that would have been released had Forester decided to continue using LIFO.

The following LIFO and FIFO inventory valuation data have been assembled:

	LIFO	FIFO	Difference
January 1, 2011, inventory . . . . .	\$2,100	\$2,350	\$250
December 31, 2011, inventory . . . . .	2,500	2,900	400
December 31, 2012, inventory . . . . .	3,000	3,600	600
December 31, 2013, inventory . . . . .	3,800	4,500	700

As discussed in Chapter 9, the excess of FIFO inventory valuation over LIFO inventory valuation is called the LIFO reserve and can be thought of as inventory holding gains (during times of inflation) that are recognized when FIFO is used (reducing reported cost of goods sold) but that are not recognized when LIFO is used. The LIFO financial statement data and the inventory valuation differences can be used to construct the FIFO financial statements for 2011–2013, as follows:

	After Changing to FIFO	If Originally Used FIFO	
	2013	2012	2011
<b>Balance Sheet</b>			
Cash . . . . .	\$ 150	\$ 120	\$ 100
Inventory . . . . .	4,500	3,600	2,900
Total assets . . . . .	<u>\$4,650</u>	<u>\$3,720</u>	<u>\$3,000</u>
Income taxes payable . . . . .	\$ 195	\$ 105	\$ 90
FIFO taxes payable . . . . .	180	180	120
Paid-in capital . . . . .	1,645	1,260	1,000
Retained earnings . . . . .	2,630	2,175	1,790
Total liabilities and equities . . . . .	<u>\$4,650</u>	<u>\$3,720</u>	<u>\$3,000</u>

(Continued)

<b>Income Statement</b>	<b>2013</b>	<b>2012</b>	<b>2011</b>
Sales .....	\$1,500	\$1,200	\$1,000
Cost of goods sold .....	850	650	550
Gross profit .....	\$ 650	\$ 550	\$ 450
Income tax expense .....	195	165	135
Net income .....	<u>\$ 455</u>	<u>\$ 385</u>	<u>\$ 315</u>

Details of the computations of retained earnings and the FIFO taxes payable amounts are given below.

**Retained Earnings** As of January 1, 2011, a retrospective switch to FIFO means that cumulative before-tax profits from the years before 2011 are increased by \$250, corresponding to the amount of the LIFO reserve on that date. The increase in cumulative after-tax profits is \$175 ( $\$250 \times [1 - 0.30]$ ). Accordingly, retained earnings as of January 1, 2011, is increased by \$175. The computation of the ending balance in retained earnings for 2011 would be shown as follows in the 2013 3-year comparative statement of stockholders' equity for Forester.

Retained earnings, January 1, 2011, as originally reported .....	\$1,300
Add adjustment for cumulative effect on prior years of retrospectively applying the FIFO method of inventory valuation .....	<u>175</u>
Adjusted retained earnings, January 1, 2011 .....	<u>\$1,475</u>
Add net income for 2011 (under FIFO) .....	315
Retained earnings, December 31, 2011 .....	<u>\$1,790</u>

**FIFO Taxes Payable** Because the switch is being made for both book and tax purposes, the increase in taxable profits of \$250 creates a "FIFO taxes payable" of \$75 ( $\$250 \times 0.30$ ) corresponding to the tax that is now owed on excess FIFO profits from the years before 2011. In addition, the \$45 increased tax expense for 2011 ( $\$135 \text{ FIFO} - \$90 \text{ LIFO}$ ) represents additional FIFO taxes payable as of the end of 2011. The total of \$120 ( $\$75 + \$45$ ) is reported in the revised December 31, 2011, balance sheet. This amount increases by \$60 ( $\$165 \text{ FIFO taxes in 2012} - \$105 \text{ LIFO taxes in 2012}$ ), to \$180, by the end of 2012 to reflect the additional FIFO taxes payable created in 2012.

The primary financial statements reported in 2013 are the three years of retrospectively prepared FIFO-based financial statements. The disadvantage of this retrospective approach is that the comparative balance sheet and income statement for 2012 that are included in the 2013 financial statements are different from the balance sheet and income statement for 2012 that were originally released the year before. Some financial statement users may be confused by the fact that, for example, Forester's 2012 net income of \$245 as originally reported has been retrospectively changed to \$385 in the financial statements released in 2013. This disadvantage is outweighed by the fact that the comparative financial statements released in 2013 all reflect the FIFO method of inventory valuation, and so those financial statements can be meaningfully compared from one year to the next.

In addition to the preparation of retrospectively adjusted primary financial statements, the change in accounting principle from LIFO to FIFO also necessitates note disclosure that shows the impact of the change on each financial statement item in each year reported. The information on page 20-12 would be reported in the financial statements notes in 2013, the year of the change. Note that because balance sheet data are typically reported only for two years, disclosure of the balance sheet comparisons for 2011 is not needed.

For 2013	Computed Using LIFO	As Reported Using FIFO	Effect of Change
<b>Balance Sheet</b>			
Cash .....	\$ 150	\$ 150	\$ 0
Inventory .....	3,800	4,500	700
Total assets .....	<u>\$3,950</u>	<u>\$4,650</u>	<u>\$ 700</u>
Income taxes payable .....	\$ 165	\$ 195	\$ 30
FIFO taxes payable .....	0	180	180
Paid-in capital .....	1,645	1,645	0
Retained earnings .....	2,140	2,630	490
Total liabilities and equities .....	<u>\$3,950</u>	<u>\$4,650</u>	<u>\$ 700</u>
<b>Income Statement</b>			
Sales .....	\$1,500	\$1,500	\$ 0
Cost of goods sold .....	950	850	(100)
Gross profit .....	<u>\$ 550</u>	<u>\$ 650</u>	<u>\$ 100</u>
Income tax expense .....	165	195	30

**Impractical to Determine Period-Specific Effects** Sometimes the cumulative effect of a change in accounting principle can be determined, but it is impractical to determine the precise periods when past differences arose. For example, it is possible that in a case such as the Forester example just given, the company may be able to determine the LIFO and FIFO inventory valuations on January 1, 2013, when the accounting change is made, but not be able to determine differences in prior years. In such a case, the beginning balance sheet accounts, including beginning retained earnings, are adjusted for the earliest year in which the necessary data are available. If Forester were only able to determine the January 1, 2013, inventory balances under LIFO (\$3,000) and FIFO (\$3,600), the following retained earnings computation would be presented for 2013:

Retained earnings, January 1, 2013, as originally reported . . . . .	\$1,755
Add adjustment for cumulative effect on prior years of retrospectively applying the FIFO method of inventory valuation. . . . .	420
Adjusted retained earnings, January 1, 2013 . . . . .	<u>\$2,175</u>
Add net income for 2013 (under FIFO) . . . . .	455
Retained earnings, December 31, 2013 . . . . .	<u>\$2,630</u>

## FASB CODIFICATION

**The Issue:** You are the newly hired accountant for Deedle Development, a real estate company that develops time share units in beautiful but out-of-the-way places. One of your company's current projects is a multi-stage development on the hillside overlooking picturesque South Willow Lake located in the Stansbury Mountains southwest of Grantsville, Utah. In past years, for financial reporting purposes Deedle has accounted for this development as a three-phase project, even though one of the phases involves the construction of two separate buildings. Legal fees and development costs have been appropriately allocated among the three phases. Starting this year, Deedle has decided to account for the South Willow development as a four-phase project. This change was not prompted by any changes in the project design or timeline; instead, Deedle's management has merely decided that separation of the costs (and revenues) of the development into four phases will more accurately reflect the economics of the project.

**The Question:** Is this change from three phases to four phases to be accounted for as a change in estimate (prospectively), or a change in principle (retrospectively)?

**Searching the Codification:** There are three ways to search for the answer to this question.

- Scan the table of contents for Topic 250, Accounting Changes and Error Corrections. Because this question appears to be specific to a particular industry (real estate), Topic 250 might list guidance on industry-specific issues.
- Scan the table of contents for the collection of Industry topics in the Codification; these have topic numbers in the 900s. You will find a number of industry topics specific to real estate.
- Use the "Search" box in the top right corner of the Codification home page. Try the search term "time share."

**The Answer:** The correct treatment is described on page 20-28.

**Prospective Application** In other cases, it is simply impossible to determine the past impact of an accounting change. For example, a change to the LIFO method of inventory valuation is usually made effective with the beginning inventory in the year of change rather than with some prior year because of the difficulty in identifying prior-year LIFO layers or dollar-value pools. Thus, the beginning inventory in the year of change becomes the same as the previous inventory valued using another costing method, such as FIFO, and this becomes the base LIFO layer. The LIFO assumption is then applied prospectively, meaning that it is used from that time forward.

**Accounting Change Mandated by a Change in Accounting Standards** Most changes in accounting principle are recognized in connection with a company's adoption of a mandated new accounting principle. For example, the opening scenario of this chapter describes the large impact on companies when they adopted *SFAS No. 106* and were required to recognize a large liability for their previously unrecognized obligation for retirees' health care. Almost all standards include specific instructions about how to account for the necessary change in accounting principle. In the unlikely event that a new standard does not include specific instructions on how to report the impact of the change, FASB ASC 250-10-45 (paragraphs 3 and 5) states that the presumption is that the change is to be accounted for retrospectively, as illustrated earlier.

## Pro Forma Disclosures after a Business Combination

**4** Report pro forma results for prior years following a business combination.

**WHY** A business combination can drastically change the size and economic character of an accounting entity. To give financial statement users some basis on which to perform a time-series analysis of this new entity, supplemental accounting disclosure is needed.

**HOW** After a business combination, supplemental disclosure of revenues and net income must be made as if the combination had occurred at the beginning of both the combination year and the preceding year.

A business combination can substantially alter the size and mix of the operations reported in a single set of financial statements. For example, on January 11, 2001, **America Online** merged with **Time Warner** to form **AOL Time Warner**. This merger was accounted for as the acquisition of Time Warner by America Online. A comparison of the financial statements for AOL before and after this acquisition is quite startling. For example, AOL revenues in 2000 were \$6.886 billion. Revenues in 2001, the year after the merger, were \$38.234 billion. Assets in 2000 were \$10.673 billion; assets in 2001 were \$208.559 billion. Clearly, investors are not able to decipher this drastic change in the make-up of an economic entity without substantial supplemental disclosure. (*Note:* Setting the accounting aside, this merger was a disaster from a business standpoint. In 2003, after recognizing a record-breaking loss of \$99 billion in 2002, the merger company dropped the "AOL" from the name and reverted to the name "Time Warner.")

The supplemental disclosure required following a business combination is explained in FASB ASC Section 805-10-50.<sup>4</sup> The combined company is required to disclose pro forma results for the year of the combination as if the combination had occurred at the beginning

<sup>4</sup> FASB ASC paragraphs 805-10-50-1,2.

of the year. In addition, the same pro forma disclosure is required for the preceding year, as if the business combination had occurred at the beginning of that year. At a minimum, a company must include revenue and net income for the respective periods in this pro forma disclosure.<sup>5</sup> Preparing these pro forma disclosures involves more than simply adding together the sales and net income amounts from the financial statement prepared by the separate companies before they combined. For example, depreciation expense must be recomputed using the fair value amounts recorded for the depreciable assets of the acquired company when the purchase was recorded.

To illustrate the adjustments that must be made in preparing these pro forma disclosures, assume that on December 31, 2013, Sump Pump Company acquired Rock Wall Company for \$500,000. This amount exceeded the recorded value of Rock Wall Company's net assets by \$100,000 on the acquisition date. The entire excess was attributable to a piece of Rock Wall's equipment that had a remaining useful life of five years as of the acquisition date. Information reported for the two companies for 2012 and 2013 was as follows:

	2013	2012
Sump Pump Company:		
Revenue .....	\$3,500,000	\$3,000,000
Net income .....	250,000	200,000
Rock Wall Company:		
Revenue .....	\$ 250,000	\$ 400,000
Net income .....	40,000	75,000

The necessary pro forma information that would be included in the notes to Sump Pump Company's 2013 financial statements is as follows:

	2013 Reported Results	2013 Results for Combined Companies	2012 Reported Results	2012 Results for Combined Companies
Revenue .....	\$3,500,000	\$3,750,000	\$3,000,000	\$3,400,000
Net income .....	250,000	270,000	200,000	255,000

2013 combined income computation:

$$\$250,000 + \$40,000 - \text{extra depreciation } (\$100,000/5 \text{ years}) = \$270,000$$

2012 combined income computation:

$$\$200,000 + \$75,000 - \text{extra depreciation } (\$100,000/5 \text{ years}) = \$255,000$$

<sup>5</sup> Companies sometimes change their structures or report their operations in such a way that the financial statements are, in effect, those of a different reporting entity. Specifically, a change in reporting entity includes (1) presenting consolidated or combined statements in place of statements of individual companies, (2) changing specific subsidiaries composing the group of companies for which consolidated statements are presented, and (3) changing the companies included in combined financial statements. In these cases, the financial statements must be adjusted retroactively to disclose what the statements would have looked like if the current entity had been in existence in the prior years. Thus, previous years' financial statements presented for comparison with the current year (the year of change) must be restated to reflect results of operations, financial condition, and cash flows as if the current reporting entity had been in existence in those years.

## Error Corrections

5

Recognize the various types of errors that can occur in the accounting process, understand when errors counterbalance, and be able to correct errors when necessary.

**WHY** A financial statement error can impact the interpretation of the financial statements in the year of the error and in all subsequent years when the error year is used for comparison.

**HOW** For financial reporting purposes, when an error is detected, all financial statements presented for comparative purposes are corrected and restated. For bookkeeping purposes, most errors that go undetected counterbalance over a 2-year period; those errors that impact income and that have not counterbalanced are corrected by making a direct adjustment to retained earnings.

Error corrections are not considered accounting changes, but their treatment is specified in FASB ASC Topic 250. [Accounting errors](#) made in prior years are corrected from a reporting standpoint by restating the financial statements for all years presented and, if needed, by reporting an adjustment to the beginning retained earnings for the earliest year reported. Basically, errors in the financial statements are fixed in subsequent years by releasing corrected financial statements and providing note disclosure of the line-by-line impact of the errors. This reporting is essentially the same as the reporting required for a change in accounting principle, as discussed in the preceding section.

From a bookkeeping standpoint, errors that have not already been “counterbalanced” or reversed are reported as prior-period adjustments and debited or credited directly to Retained Earnings for the current year. Examples of errors include mathematical mistakes, improper application of accounting principles, omissions of material facts, or fraudulent financial reporting. These bookkeeping corrections will be illustrated in this section. As you will soon see, the bookkeeping correction of accounting errors is a good test of how well you understand your debits and credits.

### Types of Errors

There are a number of different kinds of errors. Some errors are discovered in the period in which they are made and are easily corrected. Others may not be discovered currently and are reflected on the financial statements until discovered. Some errors are never discovered; however, the effects of these errors may be counterbalanced in subsequent periods, and after this takes place, account balances are again accurately stated. Errors may be classified as follows:

1. *Errors discovered currently in the course of normal accounting procedures.* Examples of this type of error are clerical errors, such as an addition error, posting to the wrong account, misstating an account, or omitting an account from the trial balance. These types of errors usually are detected during the regular summarizing process of the accounting cycle and are readily corrected.
2. *Errors limited to balance sheet accounts.* Examples include debiting Accounts Receivable instead of Notes Receivable, crediting Interest Payable instead of Notes Payable, or crediting Interest Payable instead of Salaries Payable. Another example is not recording the exchange of convertible bonds for stock. Such errors are frequently discovered and corrected in the period in which they are made. When such errors

- are not found until a subsequent period, corrections must be made at that time and balance sheet data subsequently restated for comparative reporting purposes.
3. *Errors limited to income statement accounts.* The examples and correcting procedures for this type of error are similar to those in (2). For example, Office Salaries may be debited instead of Sales Salaries. This type of error should be corrected as soon as it is discovered. Even though the error would not affect net income, the misstated accounts should be restated for analysis purposes and comparative reporting.
  4. *Errors affecting both income statement accounts and balance sheet accounts.* Certain errors, when not discovered currently, result in the misstatement of net income and thus affect both the income statement accounts and the balance sheet accounts. The balance sheet accounts are carried into the succeeding period; hence, an error made currently and not detected will affect future earnings. Such errors may be classified into two groups:
    - (a) *Errors in net income that, when not detected, are automatically counterbalanced in the following fiscal period.* Net income amounts on the income statements for two successive periods are inaccurately stated; certain account balances on the balance sheet at the end of the first period are inaccurately stated, but the account balances in the balance sheet at the end of the succeeding period will be accurately stated. In this class are errors such as the misstatement of inventories and the omission of adjustments for prepaid and accrued items at the end of the period.
    - (b) *Errors in net income that, when not detected, are not automatically counterbalanced in the following fiscal period.* Account balances on successive balance sheets will be inaccurately stated until such time as entries are made compensating for or correcting the errors. In this class are errors such as the recognition of capital expenditures as expenses and the omission of charges for depreciation and amortization.

When errors affecting income are discovered, careful analysis is necessary to determine the required action to correct the account balances. As indicated, most errors will be caught and corrected prior to closing the books. The few material errors not detected until subsequent periods and those that have not already been counterbalanced must be treated as prior-period adjustments.

The following sections describe and illustrate the procedures to be applied when error corrections require prior-period adjustments. It is assumed that each of the errors is material. Errors that are discovered usually affect the income tax liability for a prior period. Amended tax returns are usually prepared either to claim a refund or to pay any additional tax assessment. For simplicity, the examples on the following pages and in the exercises and problems at the end of the chapter ignore the income tax effects of errors.

### Illustrative Example of Error Correction

Assume that Supply Master, Inc., began operations at the beginning of 2011. An auditing firm is engaged for the first time in 2013. Before the accounts are adjusted and closed for 2013, the auditor reviews the books and accounts and discovers the errors summarized on pages 20-18 and 20-19. Effects of these errors on the financial statements, before any correcting entries, are indicated as follows: A plus sign (+) indicates an overstatement and a minus sign (−) indicates an understatement. Each error correction is discussed in the following paragraphs.

**(1) Understatement of Merchandise Inventory** It is discovered that the merchandise inventory as of December 31, 2011, was understated by \$1,000. The effects of the misstatement were as shown on page 20-18.

	Income Statement	Balance Sheet
2011	Cost of goods sold overstated (ending inventory too low)	Assets understated (inventory too low)
	Net income understated	Retained earnings understated
2012	Cost of goods sold understated (beginning inventory too low)	Balance sheet items not affected, retained earnings understatement for 2011 being corrected by net income overstatement for 2012
	Net income overstated	

Because this type of error counterbalances after two years, no correcting entry is required in 2013.

#### Analysis Sheet to Show Effects

	At End of 2011			
	Income Statement		Balance Sheet	
	Section	Net Income	Section	Retained Earnings
(1) Understatement of merchandise inventory of \$1,000 on December 31, 2011.	Cost of Goods Sold +	-	Current Assets -	-
(2) Failure to record merchandise purchases on account of \$850 in 2011; purchases were recorded in 2012.	Cost of Goods Sold -	+	Current Liabilities -	+
(3) Failure to record merchandise sales on account of \$1,800 in 2012. (It is assumed that the sales for 2012 were recognized as revenue in 2013.)				
(4) Failure to record accrued sales salaries of \$450 on December 31, 2011; expense was recognized when payment was made.	Selling Expense -	+	Current Liabilities -	+
(5) Failure to record prepaid taxes of \$275 on December 31, 2011; amount was included in Miscellaneous General Expense.	General Expense +	-	Current Assets -	-
(6) Failure to record accrued interest on notes receivable of \$150 on December 31, 2011; revenue was recognized when collected in 2012.	Other Revenue -	-	Current Assets -	-
(7) Failure to record unearned service fees of \$225 on December 31, 2012; amount received was included in Miscellaneous Revenue.				
(8) Failure to record depreciation of delivery equipment. On December 31, 2011, \$1,200.	Selling Expense -	+	Noncurrent Assets +	+
On December 31, 2012, \$1,200.				
(9) Incorrectly capitalizing an expenditure for operating expenses on January 1, 2011; depreciation expense of \$400 was incorrectly recognized in 2011 and 2012.	Operating Expense -	+	Noncurrent Assets +	+

## CAUTION

Errors (1) through (6) provide examples of errors that will counterbalance over two periods. However, errors that will “fix themselves” still result in misstated financial statements for each year of the 2-year period. Investors and creditors may make ill-advised decisions based on those misstated financial statements.

If the error had been discovered in 2012 instead of 2013, an entry would have been made to correct the account balances so that operations for 2012 would be reported accurately. The beginning inventory for 2012 would have been increased by \$1,000, the amount of the asset

understatement, and Retained Earnings would have been credited for this amount, representing the income understatement in 2011. The correcting entry in 2012 would have been as follows:

## CAUTION

This entry is made only if the error is identified at the end of 2012.

Merchandise Inventory.....	1,000
Retained Earnings .....	1,000

This correcting entry is the same whether the company uses a periodic or a perpetual inventory system. As seen with error (2), the correcting entry is sometimes different, depending on what type of inventory system the company uses.

### of Errors on Financial Statements

At End of 2012				At End of 2013			
Income Statement		Balance Sheet		Income Statement		Balance Sheet	
Section	Net Income	Section	Retained Earnings	Section	Net Income	Section	Retained Earnings
Cost of Goods Sold	-						
	+						
Cost of Goods Sold	+						
	-						
Sales	-	Accounts Receivable	-	Sales	+		
	-		-		+		
Selling Expense	+						
	-						
General Expense	-						
	+						
Other Revenue	+						
	+						
Other Revenue	+	Current Liabilities	-	Other Revenue	-		
	+		+		-		
		Noncurrent Assets	+			Noncurrent Assets	+
			+				+
Selling Expense	-	Noncurrent Assets	+			Noncurrent Assets	+
	+		+				+
Operating Expense	+	Noncurrent Assets	+			Noncurrent Assets	+
	-		+				+

**(2) Failure to Record Merchandise Purchases** It is discovered that purchase invoices as of December 28, 2011, for \$850 had not been recorded until 2012. The goods had been included in the inventory at the end of 2011. The effects of failure to record the purchases were as shown on page 20-20.

	Income Statement	Balance Sheet
2011	Cost of goods sold understated (purchases too low) Net income overstated	Liabilities understated (accounts payable too low) Retained earnings overstated
2012	Cost of goods sold overstated (purchases too high) Net income understated	Balance sheet items not affected, retained earnings overstatement for 2011 being corrected by net income understatement for 2012

Because this is a counterbalancing error, no correcting entry is required in 2013.

If the error had been discovered in 2012 instead of 2013, a correcting entry would have been necessary. In 2012, Purchases was debited and Accounts Payable was credited for \$850 for merchandise acquired in 2011 and included in the ending inventory of 2011. Retained Earnings would have to be debited for \$850, representing the net income overstatement for 2011, and Purchases would have to be credited for the same amount to reduce the balance in 2012. The correcting entry in 2012, assuming the company uses a periodic inventory system, would have been as follows:

Retained Earnings	850
Purchases	850

If the company had used a perpetual system, the incorrect purchase would have been debited directly to Inventory. Accordingly, the correcting entry would have been made in 2012:

Retained Earnings	850
Inventory	850

**(3) Failure to Record Merchandise Sales** It is discovered that sales on account of \$1,800 for the last week of December 2012 had not been recorded until 2013. The goods sold were not included in the inventory at the end of 2012. The effects of the failure to report the revenue in 2012 follow:

	Income Statement	Balance Sheet
2012	Revenue understated (sales too low) Net income understated	Assets understated (accounts receivable too low) Retained earnings understated

When the error is discovered in 2013, Sales is debited for \$1,800 and Retained Earnings is credited for this amount, representing the net income understatement for 2012. The following entry is made:

Sales	1,800
Retained Earnings	1,800

**(4) Failure to Record Accrued Expense** Accrued sales salaries of \$450 as of December 31, 2011, were overlooked in adjusting the accounts. Sales Salaries is debited for salary payments. The effects of the failure to record the accrued expense of \$450 as of December 31, 2011, were as shown on page 20-21.

	Income Statement	Balance Sheet
2011	Expenses understated (sales salaries too low)  Net income overstated	Liabilities understated (accrued salaries not reported)  Retained earnings overstated
2012	Expenses overstated (sales salaries too high) Net income understated	Balance sheet items not affected, retained earnings overstatement for 2011 being corrected by net income understatement for 2012

No entry is required in 2013 to correct the accounts for the failure to record the accrued expense at the end of 2011, the misstatement in 2011 having been counterbalanced by the misstatement in 2012. However, if comparative income statements were presented in 2013, then the amounts reported for sales salaries in 2011 and 2012 would be corrected. If the error had been discovered in 2012, an entry would have been required to correct the accounts for the failure to record the accrued expense at the end of 2011 if the net income for 2012 is not to be misstated. If accrued expenses are to be properly recorded at the end of 2012, Retained Earnings would be debited for \$450, representing the net income overstatement for 2011, and Sales Salaries would be credited for the same amount, representing the amount to be subtracted from salary expenses in 2012. The correcting entry made in 2012 follows:

Retained Earnings	450
Sales Salaries	450

**(5) Failure to Record Prepaid Expense** It is discovered that Miscellaneous General Expense for 2011 included taxes of \$275 that should have been deferred in adjusting the accounts on December 31, 2011. The effects of the failure to record the prepaid expense were as follows:

	Income Statement	Balance Sheet
2011	Expenses overstated (miscellaneous general expense too high)  Net income understated	Assets understated (prepaid taxes not reported)  Retained earnings understated
2012	Expenses understated (miscellaneous general expense too low) Net income overstated	Balance sheet items not affected, retained earnings understatement for 2011 being corrected by net income overstatement for 2012

Because this is a counterbalancing error, no entry to correct the accounts is required in 2013.

If the error had been discovered in 2012 instead of 2013, a correcting entry would have been necessary. If prepaid taxes had been properly recorded at the end of 2012, Miscellaneous General Expense would have to be debited for \$275, the expense relating to operations of 2012, and Retained Earnings would have to be credited for the same amount, representing the net income understatement for 2011. The following correcting entry would have been made in 2012:

Miscellaneous General Expense	275
Retained Earnings	275

**(6) Failure to Record Accrued Revenue** Accrued interest on notes receivable of \$150 was overlooked in adjusting the accounts on December 31, 2011. The revenue was recognized when the interest was collected in 2012. The effects of the failure to record the accrued revenue follow:

	Income Statement	Balance Sheet
2011	Revenue understated (interest revenue too low) Net income understated	Assets understated (interest receivable not reported) Retained earnings understated
2012	Revenue overstated (interest revenue too high) Net income overstated	Balance sheet items not affected, retained earnings understatement for 2011 being corrected by net income overstatement for 2012

Because the balance sheet items at the end of 2012 were correctly stated, no entry to correct the accounts is required in 2013.

If the error had been discovered in 2012 instead of 2013, an entry would have been necessary to correct the account balances. If accrued interest on notes receivable had been properly recorded at the end of 2012, Interest Revenue would have to be debited for \$150, the amount to be subtracted from receipts of 2012, and Retained Earnings would have to be credited for the same amount, representing the net income understatement for 2011. The correcting entry in 2012 would have been as follows:

Interest Revenue . . . . .	150
Retained Earnings . . . . .	150

**(7) Failure to Record Unearned Revenue** Fees of \$225 received in advance for miscellaneous services as of December 31, 2012, were overlooked in adjusting the accounts. Miscellaneous Revenue had been credited when fees were received. The effects of the failure to recognize the unearned revenue of \$225 at the end of 2012 were as follows:

	Income Statement	Balance Sheet
2012	Revenue overstated (miscellaneous revenue too high) Net income overstated	Liabilities understated (unearned service fees not reported) Retained earnings overstated

An entry is required to correct the accounts for the failure to record the unearned revenue at the end of 2012 if the net income for 2013 is not to be misstated. If the unearned revenue was properly recorded at the end of 2013, Retained Earnings would be debited for \$225, representing the net income overstatement for 2012, and Miscellaneous Revenue would be credited for the same amount, representing the revenue that is to be identified with 2013. The correcting entry follows:

Retained Earnings . . . . .	225
Miscellaneous Revenue . . . . .	225

CAUTION

Error (8) does not counterbalance in the following year. Thus, financial statements have the potential to be misstated for several years. In this example, the error could continue until the delivery equipment is removed from the books.

**(8) Failure to Record Depreciation**  
Delivery equipment was acquired at the beginning of 2011 at a cost of \$6,000. The equipment has an estimated 5-year life. Its depreciation

of \$1,200 was overlooked at the end of 2011 and 2012. The effects of the failure to record depreciation for 2011 were as follows:

	Income Statement	Balance Sheet
2011	Expenses understated (depreciation of delivery equipment too low)	Assets overstated (accumulated depreciation of delivery equipment too low)
	Net income overstated	Retained earnings overstated
2012	Expenses not affected	Assets overstated (accumulated depreciation of delivery equipment too low)
	Net income not affected	Retained earnings overstated

It should be observed that the misstatements arising from the failure to record depreciation are not counterbalanced in the succeeding year.

Failure to record depreciation for 2012 affected the statements as follows:

	Income Statement	Balance Sheet
2012	Expenses understated (depreciation of delivery equipment too low)	Assets overstated (accumulated depreciation of delivery equipment too low)
	Net income overstated	Retained earnings overstated

When the omission is recognized, Retained Earnings must be decreased by the net income overstatements of prior years and Accumulated Depreciation must be increased by the depreciation that should have been recorded. The correcting entry in 2013 for depreciation that should have been recognized for 2011 and 2012 is as follows:

Retained Earnings . . . . .	2,400
Accumulated Depreciation—Delivery Equipment . . . . .	2,400

**(9) Incorrectly Capitalizing an Expenditure** Operating expenses of \$2,000 were paid in cash at the beginning of 2011. However, the payment was incorrectly recorded as the purchase of equipment. The “equipment” was assumed to have an estimated 5-year life with \$0 residual value, and depreciation of \$400 was recognized at the end of 2011 and 2012. The effects of this incorrect capitalization of an expenditure were as follows:

	Income Statement	Balance Sheet
2011	Expenses understated (operating expenses too low, partially offset by depreciation expense)	Assets overstated (asset, net of accumulated depreciation, is recorded when there should not be any asset)
	Net income overstated	Retained earnings overstated
2012	Expenses overstated (depreciation too high)	Assets overstated (asset is still incorrectly recorded, though the net amount is less)
	Net income understated	Retained earnings overstated

When the error is discovered, Retained Earnings must be decreased by the net income overstatement of 2011 (partially offset by the net income understatement in 2012) and the accounts related to the “equipment” (Equipment and Accumulated Depreciation) must be eliminated. The correcting entry in 2013 is as follows:

Retained Earnings . . . . .	1,200
Accumulated Depreciation—Equipment . . . . .	800
Equipment . . . . .	2,000

### Required Disclosure for Error Restatements

If an error (either accidental or intentional in nature) is subsequently discovered that affected a prior period, the nature of the error, its effect on previously issued financial statements, and the effect of its correction on current period's net income and EPS should be disclosed in the period in which the error is corrected.<sup>6</sup> In addition, any comparative financial statements provided must be corrected.

An example of the disclosure provided when an error correction is made through a prior-period adjustment is given in Exhibit 20-4; the error correction (intentional errors in this instance) was made in 2000 by **Xerox Corporation**. Xerox provides extensive disclosure as to the effect of the errors on the income statement and the balance sheet for each year affected. Recall that Xerox's accounting difficulties were discussed in Chapter 6. As you read over the businesslike description of the accounting errors uncovered at Xerox, keep in mind that underlying this dry verbiage lie the destroyed careers of many accountants and managers at Xerox who stepped over the earnings management line into the area of earnings misstatement (see Chapter 6). Between the lines of this note one can also sense the lost trust of Xerox shareholders, customers, suppliers, and regulators.

### Summary of Accounting Changes and Error Corrections

The summary listed below presents the appropriate accounting procedures applicable to each of the four main categories covered in FASB ASC Topic 250, Accounting Changes and Error Corrections. Naturally, accountants must apply these guidelines with judgment and should seek to provide the most relevant and reliable information possible.

Summary of Procedures for Reporting Accounting Changes and Error Corrections	
Category	Accounting Procedures
I. Change in estimate	<ol style="list-style-type: none"> <li>1. Adjust either current-period results or current- and future-period results.</li> <li>2. No separate cumulative adjustment or restated financial statements.</li> </ol>
II. Change in accounting principle	<ol style="list-style-type: none"> <li>1. Direct cumulative adjustment to beginning retained earnings balance of earliest year presented in the financial statements.</li> <li>2. Restate financial statements to reflect new principle for comparative purposes.</li> </ol>
III. Pro forma disclosures after a business combination	<ol style="list-style-type: none"> <li>1. Supplemental disclosure for the year of the combination and the preceding year of revenues and net income as if the combination had occurred at the beginning of both the combination year and the preceding year.</li> </ol>
IV. Error corrections	<ol style="list-style-type: none"> <li>1. If detected in period error occurred, correct accounts through normal accounting cycle adjustments.</li> <li>2. If detected in a subsequent period, adjust for effect of material errors by making prior-period adjustments directly to Retained Earnings balance for the years affected by those errors. If the error relates to a year that is not presented in the financial statements, the Retained Earnings balance for the earliest year presented is adjusted. Also correct each item presented in comparative financial statements.</li> <li>3. Once an error is discovered in previously issued financial statements, the nature of the error, its effect on the financial statements, and its effect on the current period's income and EPS should be disclosed.</li> </ol>

<sup>6</sup> FASB ASC paragraph 250-10-50-7.

## 20-4 XEROX CORPORATION—DISCLOSURE OF ERROR CORRECTION

### 2. Restatement

We have restated our Consolidated Financial Statements for the fiscal years ended December 31, 1999 and 1998 as a result of two separate investigations conducted by the Audit Committee of the Board of Directors. These investigations involved previously disclosed issues in our Mexico operations and a review of our accounting policies and procedures and application thereof. As a result of these investigations, it was determined that certain accounting practices and the application thereof misapplied GAAP and certain accounting errors and irregularities were identified. The Company has corrected the accounting errors and irregularities in its Consolidated Financial Statements. The Consolidated Financial Statements have been adjusted as follows:

In fiscal 2000 the Company had initially recorded charges totaling \$170 (\$120 after taxes) which arose from imprudent and improper business practices in Mexico that resulted in certain accounting errors and irregularities. Over a period of years, several senior managers in Mexico had collaborated to circumvent certain of Xerox's accounting policies and administrative procedures. The charges related to provisions for uncollectible long-term receivables, the recording of liabilities for amounts due to concessionaires and, to a lesser extent, for contracts that did not fully meet the requirements to be recorded as sales-type leases. The investigation of the accounting issues discovered in Mexico has been completed. The Company has restated its prior year Consolidated Financial Statements to reflect reductions to pre-tax income of \$53 and \$13 in 1999 and 1998, respectively. It is not practical to determine what portion, if any, of the approximate remaining \$101 of the Mexican charge reflected in adjusted 2000 results of operations relates to prior years.

In connection with our acquisition of the remaining 20 percent of Xerox Limited from Rank Group, Plc in 1997, we recorded a liability of \$100 for contingencies identified at the date of acquisition. During 1998, we determined that the liability was no longer required. During 1998 and 1999, we charged to the liability certain expenses incurred as part of the consolidation of our European back-office operations. This reversal should have been recorded as a reduction of Goodwill and Deferred tax assets. Therefore, we have restated our previously reported Consolidated Financial Statements to reflect decreases of \$67 to Goodwill and \$33 of Deferred tax assets and increases in Selling, administrative and general expenses of \$76 in 1999 and \$24 in 1998.

In addition to the above items, we have made adjustments in connection with certain misapplications of GAAP under SFAS No. 13, "Accounting for Leases." These adjustments primarily relate to the accounting for lease modifications and residual values as well as certain other items. The following table presents the effects of all of the aforementioned adjustments on pre-tax income (loss).

	<b>Year Ended December 31,</b>		
	<b>2000</b>	<b>1999</b>	<b>1998</b>
Increase (decrease) to pre-tax income (loss):			
Mexico .....	\$ 69	\$ (53)	\$ (13)
Rank Group acquisition .....	6	(76)	(24)
Lease issues, net .....	87	83	(165)
Other, net .....	<u>10</u>	<u>(82)</u>	<u>18</u>
Total .....	<u>\$172</u>	<u>\$(128)</u>	<u>\$(184)</u>

These adjustments resulted in the cumulative net reduction of Common shareholders' equity and Consolidated Tangible Net Worth (as defined in our \$7 Billion Revolving Credit Agreement) of \$137 and \$76, respectively, as of December 31, 2000.

Retained earnings at December 31, 1997 was restated from \$3,960 to \$3,852 as a result of the effect of these aforementioned adjustments on years prior to 1998.

The following tables present the impact of the adjustments and restatements on a condensed basis.

(Continued)

**EX 20-4 XEROX CORPORATION—DISCLOSURE OF  
ERROR CORRECTION (CONTINUED)**

	Amount Previously Reported	As Adjusted
<b>(in millions, except per share amounts)</b>		
<b>Year ended December 31, 2000:*</b>		
Statement of operations:		
Revenues . . . . .	\$18,632	\$18,701

<b>Year ended December 31, 1998:**</b>		
Statement of operations:		
Revenues . . . . .	\$19,747	\$19,593
Costs and expenses . . . . .	18,984	19,014
Income (loss) from continuing operations . . . . .	585	463
Basic earnings per share . . . . .	\$ 0.82	\$ 0.63
Diluted earnings per share . . . . .	\$ 0.80	\$ 0.62

\*As reported in the Company's unaudited financial statements included in its report on Form 8-K dated April 19, 2001.

\*\*Revenues and costs and expenses have been reclassified to reflect the Change in classification of shipping and handling costs as discussed in Note 1.

## SOLUTIONS TO OPENING SCENARIO QUESTIONS

- Reducing retiree health benefits would reduce the earning impact and the size of the liability to be reported under *FASB Statement No. 106*. Without the changes, firms might fear that the adverse financial statement effects would lower their stock price, reduce their ability to maintain management bonuses, or make it more difficult to obtain loans. In one sense, the existence of such consequences is counterintuitive, because *FASB Statement No. 106* mandated only a change in accounting for retiree benefit plans—plans that have been in existence for years. However, the fact that firms seemed to be willing to change their retiree plans in response to a change in accounting again supports the belief that the way something is accounted for has real economic consequences.

Another reason that a company might have reduced its retiree health benefits in response to the adoption of *FASB Statement No. 106* is that, in the absence of the accounting requirement, the company had never before quantified the cost of the promises it was making to its workers. *FASB Statement No. 106* forced some companies to face economic reality and acknowledge that they could no longer make these costly promises to employees.
- In a perfect world, one would expect no impact on stock prices or on the ability to get loans. This is because the impact of retiree health care plans on the financial condition of a company would have already been taken into account by sophisticated investors and bankers who are known to use all sorts of data not found in financial statements when doing their financial analyses. However, the world is not perfect, and it is possible that the financial effects of retiree health care plans either were not fully factored into investment decisions, or the estimates of those effects were systematically in error. There is some evidence that firms found that they had been underestimating the cost of their retiree health care plans. If this is true, *FASB Statement No. 106* could have impacted stock prices and creditworthiness of firms with large retiree health care plans.
- General Motors could have recognized this \$21 billion after-tax cost as correction of a past error with a restatement of past income statements to reflect the cost in the years in which it occurred. As explained in this chapter, this approach, the restatement approach, is the approach now required by the FASB.

## SOLUTIONS TO STOP & THINK

- (Page 20-6) The correct answer is D. Changes in estimates are made on an ongoing basis and are a routine part of the accounting process. Each year, estimates as to the percentage of accounts receivable that will be uncollected, the amount of warranty claims that will be serviced, and percentage of costs incurred on long-term contracts, to name a few, must be reassessed. If previously issued financial statements were required to be restated in every case where an estimate was changed, then prior-period statements would continually be reissued. Investors and creditors would be unable to rely on the information provided by companies because they would know that the information would be changing. It is a good thing that accounting standards do not require financial statements to be restated for every change in estimate.

**SOLUTION TO USING THE FASB'S CODIFICATION**

Your search of the Codification will lead you to Topic 978, Real Estate—Time-Sharing Activities. The table of contents for this topic reveals that there is material specific to Topic 250, Accounting Changes and Error Corrections. Paragraph 978-250-35-2 says the following (in part): “A change in the delineation of a project or its phases without a significant change in facts and circumstances related to the project’s development shall be accounted for as a change in the method of applying an accounting principle under Subtopic 250-10. An example of this latter change

would be a decision to divide the same development of a project into more or fewer phases, which would be a change only in how the project is accounted for rather than a change in the nature (that is, the facts and circumstances) of the project itself.”

So, Deedle Development’s change in accounting for the South Willow project from three phases to four phases would be accounted for as a change in accounting principle and thus would be applied retrospectively.

## REVIEW CHAPTER 20

### LEARNING OBJECTIVES

- 1** Understand the two different types of accounting changes that have been identified by accounting standard setters.

The accounting profession has identified two different types of accounting changes: change in accounting estimate and change in accounting principle. The distinction between the two is important because different accounting treatment and disclosure are required for each type of accounting change.

- 2** Recognize the difference between a change in accounting estimate and a change in accounting principle, and know how a change in accounting estimate is reflected in the financial statements.

A change in accounting estimate does not involve a restatement of prior periods’ financial statements. Instead, the effects of these types of changes are reflected in the current and future periods. Previous chapters discussed the accounting for common areas involving changing estimates. Examples include bad debt expense (Chapter 7), depreciation (Chapter 10), and actuarial assumptions (Chapter 17). A change in depreciation method is accounted for as a change in estimate and is called “a change in accounting estimate

effected by a change in accounting principle.”

- 3** Prepare the retrospective adjustment of prior periods’ financial statements, and any necessary cumulative adjustment, associated with a change in accounting principle.

A change in accounting principle is implemented by recomputing all financial statement amounts for the preceding years (at least those that will be included in the current year’s comparative financial statements). These recomputed amounts are included in the comparative financial statements reported this year. Any income effect in even earlier years is shown as an adjustment to the beginning balance in Retained Earnings for the earliest year reported. Note disclosure gives a line-by-line comparison between these retrospectively adjusted financial statements and the financial statements (using the former accounting principles) that were originally reported.

- 4** Report pro forma results for prior years following a business combination.

After a business combination, supplemental disclosure for the year of the combination and the preceding year is

required. Pro forma disclosure of revenues and net income must be made as if the combination had occurred at the beginning of both the combination year and the preceding year.

**5** Recognize the various types of errors that can occur in the accounting process, understand when errors counterbalance, and be able to correct errors when necessary.

Numerous errors can occur during the accounting process. Many of those errors will be discovered and corrected in the

normal course of business. Some errors will be detected after the books have been closed for an accounting period, thereby requiring an adjustment to the Retained Earnings balance. Most errors that go undetected counterbalance over a 2-year period, but those that do not often require a cumulative adjustment once they have been detected. When an error is detected, all financial statements presented for comparative purposes are corrected and restated.

**FASB- IASB CODIFICATION SUMMARY**

Topic	FASB Accounting Standards Codification	Original FASB Standard	Corresponding IASB Standard	Differences between U.S. GAAP and IFRS
Disclosure after a business combination	Section 805-10-50 par. 1-2	SFAS No. 141(R) par. 68	IFRS 3 par. 59-63 and B64-B67	No substantial Differences
Change in accounting principle	Section 250-10-45 par. 1-16 Section 250-10-50 par. 1- 3	SFAS No. 154 par. 4-18 APB No. 28 par. 28	IAS 8 par. 14-31	No substantial Differences
Change in accounting estimate	Section 250-10-45 par. 17-20 Section 250-10-50 par. 4- 5	SFAS No. 154 par. 19-22 SFAS No. 157 par. 20	IAS 8 par. 32-40	No substantial Differences

**KEY TERMS**

Accounting changes 20-3

Accounting errors 20-16

Change in accounting estimate 20-5

Change in accounting principle 20-9

**QUESTIONS**

- How do accounting changes detract from the informational characteristics of comparability and consistency as described in FASB *Concepts Statement No. 2*?
- What are the two categories of accounting changes? Explain briefly why such changes are made.
- What alternative procedures have been suggested as solutions for reporting accounting changes?

4. (a) List several examples of areas for which changes in accounting estimates are often made. (b) Explain briefly the proper accounting treatment for a change in estimate. (c) Why is this procedure considered proper for recording changes in accounting estimates?
5. What is the proper way to account for a change in depreciation method?
6. (a) List several examples of changes in accounting principle that a company may make. (b) Explain briefly the proper accounting treatment for recognizing currently a change in accounting principle.
7. Why does a change in accounting principle require justification?
8. (a) When should the effects of a change in accounting principle be reported only as a direct adjustment to the current year's beginning Retained Earnings balance? (b) When should the effects of a change in accounting principle be reported only prospectively?
9. Dallas Company purchased a delivery van in 2010. At the time of purchase, the van's service life was estimated to be seven years with a salvage value of \$500. The company has been using the straight-line method of depreciation. During 2013, the company determined that because of extensive use, the van's service life would be only five years with no salvage value. Also, the company has decided to change the depreciation method used from straight-line to the sum-of-the-years'-digits method. How would these changes be treated?
10. Describe the required disclosures following a business combination.
11. Describe the effect of each of the following:
  - a. Depreciation is changed from the straight-line method to an accelerated method.
  - b. Depreciation is changed from an accelerated method to the straight-line method.
  - c. Income on construction contracts that had been reported on a completed-contract basis is now reported on the percentage-of-completion basis.
  - d. The valuation of inventories is changed from a FIFO to a LIFO basis.
  - e. It is determined that warranty expenses in prior years should have been 5% of sales instead of 4%.
  - f. The valuation of inventories is changed from a LIFO to a FIFO basis.
  - g. Your accounts receivable clerk has learned that a major customer has declared bankruptcy.
  - h. Your patent lawyer informs you that your rival has perfected and patented a new invention making your product obsolete.
12. (a) How are accounting errors to be treated? (b) What are counterbalancing errors?
13. Mendez Manufacturing Company failed to record accrued interest for 2010, \$800; 2011, \$700; and 2012, \$950. What is the amount of overstatement or understatement of the retained earnings account at December 31, 2013?
14. Goods purchased FOB shipping point were shipped to Merkley & Co. on December 31, 2013. The purchase was recorded in 2013, but the goods were not included in ending inventory. (a) What effect would this error have had on reported income for 2013 had it not been discovered? (b) What entry should be made on the books to correct this error, assuming that the books have not yet been closed for 2013?

## PRACTICE EXERCISES

### Practice 20-1

L02

#### Change in Depreciation Life

On January 1, 2009, the company purchased equipment for \$200,000. Originally, the equipment had a 12-year expected useful life and \$8,000 residual value. The company uses straight-line depreciation. On January 1, 2013, the company realized that the equipment would have a total useful life of 15 years instead of 12 years and that the residual value would be \$30,000 instead of \$8,000. Compute depreciation expense for 2013. (Note: If you need some hints on how to do this exercise, look back at Chapter 11.)

### Practice 20-2

L02

#### Change from Double-Declining-Balance to Straight-Line Depreciation

On January 1, 2010, the company purchased equipment for \$600,000. The equipment has a 20-year expected useful life and \$0 residual value. Initially, the company used double-declining-balance depreciation. On January 1, 2013, the company changed to straight-line depreciation. The expected useful life and residual value are unchanged. Compute depreciation expense for 2013. Ignore income taxes.

**Practice 20-3****L02****Deferred Tax Impact of a Change in Depreciation Method**

Refer to Practice 20-2. Assume that before 2013 the company used straight-line depreciation for tax purposes while using double-declining-balance depreciation for book purposes. The change to straight-line depreciation in 2013 is made for book purposes; the company continues to use straight-line depreciation for tax purposes. The income tax rate is 40%. (1) Compute the amount of the deferred tax asset or liability that would be included in the December 31, 2012, balance sheet and (2) compute the amount of the deferred tax asset or liability that would be included in the December 31, 2013, balance sheet.

**Practice 20-4****L02****Change from Straight-Line to Double-Declining-Balance Depreciation**

On January 1, 2010, the company purchased equipment for \$600,000. The equipment has an 8-year expected useful life and \$0 residual value. Initially, the company used straight-line depreciation. On January 1, 2013, the company changed to double-declining-balance depreciation. Compute depreciation expense for 2013. Ignore income taxes.

**Practice 20-5****L03****Change from LIFO to FIFO: First Year Retained Earnings**

As of January 1, 2013, the company decided to change from the LIFO method of inventory valuation to the FIFO method. The change is being made for both book and tax purposes. Data for the past four years (including 2013) are as follows:

	2013	2012	2011	2010
Sales . . . . .	\$2,000	\$1,500	\$1,200	\$1,000
Cost of goods sold—LIFO . . . . .	1,200	900	720	600
Ending inventory—LIFO . . . . .	200	150	120	100
Ending income taxes payable—LIFO . . . . .	n/a	240	192	160
Ending retained earnings—LIFO . . . . .	1,668	1,188	828	540
Cost of goods sold—FIFO . . . . .	1,170	880	710	595
Ending inventory—FIFO . . . . .	300	220	170	140

The ending income taxes payable—LIFO amount is not given because, in 2013, income taxes payable will be computed using the newly adopted FIFO numbers. As you can see from the prior years, it is the practice of the company to pay all income taxes in the subsequent year.

The company's income tax rate is 40%, and the company has no expenses except for cost of goods sold and income tax expense. Compute the retrospectively recalculated Retained Earnings balance as of January 1, 2011, after the change to FIFO is made.

**Practice 20-6****L03****Change from LIFO to FIFO: Year-by-Year Retained Earnings Calculations**

Refer to Practice 20-5. Compute (1) the retrospectively recalculated Retained Earnings balances as of December 31, 2011, and December 31, 2012, and (2) the Retained Earnings balance as of December 31, 2013, after the change to FIFO is made. Note that the company does not pay dividends.

**Practice 20-7****L03****Change from LIFO to FIFO: Year-by-Year Income Taxes Payable Calculations**

Refer to Practice 20-5. Compute TOTAL income taxes payable, after the change to FIFO is made, as of December 31, 2011, December 31, 2012, and December 31, 2013. Recall that the change to FIFO will necessitate the payment of any tax savings that had been created by the use of LIFO.

**Practice 20-8****L03****Change from LIFO to FIFO: Income Statement Comparative Disclosure**

Refer to Practice 20-5. Prepare the comparative note disclosure that would be provided in the notes to the 2013 financial statements with respect to the income statements for 2011, 2012, and 2013.

**Practice 20-9****L03****Change from LIFO to FIFO: Impractical to Identify Yearly Differences**

Refer to Practice 20-5. Assume that the detailed information listed in Practice 20-5 is not available. Instead, the company only knows that the beginning inventory for 2013 is \$150 using LIFO and \$220 using FIFO. Show the retained earnings computation for 2013 that would be included in the statement of stockholders' equity for the year.

**Practice 20-10****L04****Disclosures Following a Business Combination**

On December 31, 2013, Big Company acquired Tiny Company for \$150,000. This amount exceeded the recorded value of Tiny Company's net assets by \$30,000 on the acquisition date. The entire excess was attributable to a Tiny Company building that had a remaining useful life of 20 years as of the acquisition date. Information reported for the two companies for 2012 and 2013 was as follows:

	2013	2012
Big Company:		
Revenue .....	\$500,000	\$400,000
Net income .....	60,000	50,000
Tiny Company:		
Revenue .....	\$ 75,000	\$ 90,000
Net income .....	12,000	20,000

Prepare the necessary pro forma information that would be included in the notes to Big Company's 2013 financial statements. For simplicity, ignore income taxes.

**Practice 20-11****L05****Misstatement of Inventory**

The company miscounted its inventory at the end of the year. The correct amount of inventory was \$100,000. The error was not discovered until the following May when the books for the preceding year were already closed. Make the correcting entry necessary the following May, assuming that the incorrectly reported amount of inventory at the end of the preceding year was (1) \$75,000 and (2) \$110,000. Ignore income taxes.

**Practice 20-12****L05****Failure to Record Inventory Purchases**

The company purchased inventory for \$10,000 on December 28. The inventory purchase was not recorded until the following January 5. However, the inventory was appropriately included in the inventory count on December 31. The error was not discovered until the following May when the books for the preceding year had already been closed. Make the correcting entry necessary the following May, assuming that the company uses (1) the periodic inventory method and (2) the perpetual inventory method. Ignore income taxes.

**Practice 20-13****L05****Failure to Record Inventory Purchases and Inventory**

Refer to Practice 20-12. Assume that in addition to failing to record the purchase, the company also failed to include the inventory in the ending inventory count. Make the correcting entry necessary the following May, assuming that the company uses (1) the periodic inventory method and (2) the perpetual inventory method. Ignore income taxes.

**Practice 20-14****L05****Misstatement of Sales**

The company miscounted its total credit sales in the last two weeks of the year. The correct amount of credit sales for this period was \$310,000. The error was not discovered until the following year when the books for the preceding year were already closed. Make the correcting entry necessary the following year, assuming the facts that follow. Ignore income taxes and assume (perhaps unreasonably) that no errors occurred in recording expenses associated with the sales.

- (a) The incorrectly reported amount of credit sales was \$260,000, and the error was found when the accounts were collected in cash.

- (b) The incorrectly reported amount of credit sales was \$260,000, and *none* of these credit sales had been collected in cash by the time the error was discovered.
- (c) The incorrectly reported amount of credit sales was \$325,000, and the error was found when the accounts were collected in cash.
- (d) The incorrectly reported amount of credit sales was \$325,000, and *none* of these credit sales had been collected in cash by the time the error was discovered.

**Practice 20-15****L05****Failure to Record Accrued Expense**

In December 2012, the company neglected to accrue a \$1,000 expense for rent. The expense was recognized in January 2013 when the rent was paid in cash. Make the necessary correcting entry, assuming that (1) the error was found in May 2013 after the 2012 books had been closed and (2) the error was found in May 2014 after the 2013 books had been closed. Ignore income taxes.

**Practice 20-16****L05****Failure to Record Prepaid Expense**

In December 2012, the company paid \$1,800 for insurance for the first six months of 2013. This payment was mistakenly recorded as insurance expense in 2012. Make the necessary correcting entry, assuming that (1) the error was found in August 2013 after the 2012 books had been closed and (2) the error was found in August 2014 after the 2013 books had been closed. Ignore income taxes.

**Practice 20-17****L05****Failure to Record Accrued Revenue**

In December 2012, the company failed to recognize \$5,700 in consulting revenue earned during 2012. This revenue was recognized when the cash was received in January 2013. Make the necessary correcting entry, assuming that (1) the error was found in May 2013 after the 2012 books had been closed and (2) the error was found in May 2014 after the 2013 books had been closed. Ignore income taxes.

**Practice 20-18****L05****Failure to Record Unearned Revenue**

In December 2012, the company received \$6,000 for services to be provided in early 2013. This payment was mistakenly recorded as service revenue in 2012. Make the necessary correcting entry, assuming that (1) the error was found in May 2013 after the 2012 books had been closed and (2) the error was found in May 2014 after the 2013 books had been closed. Ignore income taxes.

**Practice 20-19****L05****Failure to Record Depreciation**

In January 2011, the company purchased equipment for \$10,000. The equipment has a useful life of 10 years with \$0 expected salvage value. The company uses straight-line depreciation. The company mistakenly failed to record depreciation expense on this equipment. Make the necessary correcting entry, assuming that (1) the error was found in May 2013 after the 2012 books had been closed and (2) the error was found in May 2014 after the 2013 books had been closed. Ignore income taxes.

**Practice 20-20****L05****Immediately Expensing Equipment that Is Subsequently Sold**

On January 1, 2010, equipment was purchased for \$20,000. The entire purchase price was expensed immediately. The equipment has a useful life of 10 years with \$0 expected salvage value. The company uses straight-line depreciation. On January 1, 2013, the equipment was sold for \$11,000 cash. The incorrect expensing of the purchase price, along with the subsequent failure to recognize depreciation, was discovered in May 2013 after the books for 2012 had been closed. (1) Make the necessary correcting entry in 2013 and (2) describe any necessary corrections to the 2013 comparative income statement (which includes 2011 and 2012).

**Practice 20-21****L05****Incorrect Capitalization**

In January 2011, the company made \$24,000 in expenditures. These expenditures should have been expensed immediately. Instead, the company recorded this \$24,000 payment as a purchase of equipment with a useful life of 12 years and \$0 expected

salvage value. The company uses straight-line depreciation. The company proceeded to depreciate this “equipment.” Make the necessary correcting entry, assuming that (1) the error was found in May 2013 after the 2012 books had been closed and (2) the error was found in May 2014 after the 2013 books had been closed. Ignore income taxes.

**Practice 20-22**

**L05**

**Disclosure of a Prior-Period Adjustment**

Refer to Practice 20-21. Assume that the error was found in May 2013. Net income for 2013 (correctly stated) was \$50,000. Dividends for 2013 were \$15,000. The Retained Earnings balance as originally reported at the end of 2012 was \$130,000. Prepare a statement of retained earnings for 2013.

**EXERCISES**

**Exercise 20-23**

**L02**

**Change in Accounting Estimate and in Depreciation Method**

Manchester Manufacturing purchased a machine on January 1, 2009, for \$100,000. At the time, it was determined that the machine had an estimated useful life of 10 years and an estimated residual value of \$4,000. The company used the double-declining-balance method of depreciation. On January 1, 2013, the company decided to change its depreciation method from double-declining balance to straight line. The machine’s remaining useful life was estimated to be five years with a residual value of \$1,000.

Give the entry required to record the company’s depreciation expense for 2013.

**Exercise 20-24**

**L02**

**Change in Accounting Estimate**

Danje Corporation purchased a machine on January 1, 2010, for \$3,600,000. At the date of acquisition, the machine had an estimated useful life of 10 years with no residual value. The machine is being depreciated on a straight-line basis. On January 1, 2013, Danje determined, as a result of additional information, that the machine had an estimated useful life of 15 years from the date of acquisition with no residual value.

What is the amount of depreciation expense on the machine that should be charged to Danje Corporation’s income statement for the year ended December 31, 2013?

**Exercise 20-25**

**L02**

**Change in Accounting Estimate**

Albrecht Inc. began business in 2010. An examination of the company’s allowance for bad debts account reveals the following.

	Estimated Bad Debts	Actual Bad Debts
2010 .....	\$11,000	\$4,500
2011 .....	13,000	6,800
2012 .....	16,500	8,950
2013 .....	No adjustment yet	9,500

In the past, the company has estimated that 3% of credit sales would be uncollectible. The accountant for Albrecht has determined that the percentage used in estimating bad debts has been inappropriate. She would like to revise the estimate downward to 1.5%. The company president has stated that if the previous estimates of bad debt expense were incorrect, the financial statements should be restated using the more accurate estimate.

1. Assuming that credit sales for 2013 are \$650,000, provide the adjusting entry to record bad debt expense for the year.

2. What catch-up entry, if any, would be made to correct the inaccurate estimates for previous years?
3. How would you respond to the president's request to restate the prior years' financial statements?

**Exercise 20-26**

**L02**

**Change in Accounting Estimate**

On January 1, 2013, management of Micro Storage Inc. determined that a revision in the estimates associated with the depreciation of storage facilities was appropriate. These facilities, purchased on January 5, 2011, for \$300,000, had been depreciated using the straight-line method with an estimated salvage value of \$30,000 and an estimated useful life of 20 years. Management has determined that the storage facilities' expected remaining useful life is 10 years and that they have an estimated salvage value of \$40,000.

1. How much depreciation was recognized by Micro Storage in 2011 and 2012?
2. How much depreciation will be recognized by Micro Storage in 2013 as a result of the changes in estimates?
3. What journal entry is required to account for the changes in estimates at the beginning of 2013?

**Exercise 20-27**

**L02**

**Change in Estimate of Natural Resources**

Hollow Mining Company purchased a tract of land with estimated copper ore deposits totaling 1,500,000 tons. The purchase price for the land was \$4.8 million. During the first year of operation, Hollow mined and sold 160,000 tons of ore. During the second year, Hollow mined and sold 210,000 tons of ore. At the beginning of the third year, new geological engineering estimates determined that a total of 790,000 tons of copper ore remained. During Year 3, 245,000 tons of ore were mined and sold.

1. What was the original depletion rate used by Hollow in Years 1 and 2?
2. Make the accounting entries for depletion expense for Hollow Mining Company at the end of Years 1 and 2.
3. What is the depletion rate, carried to four decimals, for Year 3, and what accounting entry should be made to reflect the change in accounting estimate in Year 3? (Note: Round to four decimal places.)

**Exercise 20-28**

**L02**

**Change in Depreciation Method**

Modern Lighting Inc. has in the past depreciated its computer hardware using the straight-line method, assuming a 10% salvage value and an expected useful life of five years. As a result of the rapid obsolescence associated with the computer industry, Modern Lighting has determined that it receives most of the benefit from its computer systems in the first few years of ownership. Therefore, as of January 1, 2013, Modern Lighting proposes changing to the sum-of-the-years'-digits method for depreciating its computer hardware. The following information is available regarding all of Modern Lighting's computer purchases:

	Cost
2010 .....	\$45,000
2011 .....	25,000
2012 .....	30,000

1. Compute the depreciation taken by Modern Lighting during 2010, 2011, and 2012. Assume that all purchases were made at the beginning of the year.
2. Compute the amount of depreciation expense for 2010–2012, assuming the sum-of-the-years'-digits had been used.
3. Compute the amount of depreciation expense for 2013.

**Exercise 20-29**  
**L03**

**Change in Accounting Principle**

Keairnes Supplies decided to change from LIFO to FIFO as of January 1, 2013. The change is being made for both book and tax purposes.

Year	Net Income Computed Using LIFO	Excess of LIFO Cost of Goods Sold over FIFO Cost of Goods Sold	Income Effect (Net of Tax)
Prior to 2011		\$14,000	\$ 9,000
2011	\$68,000	7,200	4,800
2012	61,500	8,750	5,250
2013	86,000	10,500	7,500
		<u>\$40,450</u>	<u>\$26,550</u>

- Using LIFO, the beginning retained earnings as of January 1, 2011, was \$182,000. Compute adjusted beginning retained earnings, using FIFO, as of January 1, 2011.
- The 3-year comparative income statement for 2013 includes net income for 2011, 2012, and 2013. In that comparative income statement, prepared after the change for FIFO has been adopted, what amount of net income will be reported for each year?

**Exercise 20-30**  
**L03**

**Change in Accounting Principle without Detailed Prior-Year Information**

Refer to Exercise 20-29. Assume that the detailed information for 2011 and 2012 is not available. During 2013, dividends of \$20,000 were paid (compared to dividends of \$16,500 in both 2011 and 2012). Based on this information, prepare the retained earnings statement for 2013. (Note: Do NOT prepare the comparative retained earnings statements for 2011 and 2012.) The December 31, 2012, Retained Earnings balance as reported using LIFO was \$290,000.

**Exercise 20-31**  
**L02, L03**

**Changes in Accounting Estimates and Accounting Principles**

Due to changing economic conditions and to making its financial statements more comparable to those of other companies in its industry, the management of Kelsea Inc. decided on January 1, 2013, to review its accounting practices.

Kelsea decided to change its allowance for bad debts from 2% to 4.5% of its outstanding receivables balance.

Kelsea decided to begin using the straight-line method of depreciation on its building instead of the sum-of-the-years'-digits method. The change will be effective as of January 1, 2013. Based on further information, it also was decided that the building has 10 more years of useful life as of January 2, 2013. Kelsea bought the building on January 1, 2003, at a cost of \$550,000. At that time, Kelsea estimated it would have a 15-year useful life. The building has no expected salvage value. Prior years' depreciation is as follows:

2003	\$68,750	2008	\$45,833
2004	64,167	2009	41,250
2005	59,583	2010	36,667
2006	55,000	2011	32,083
2007	50,417	2012	27,500

Kelsea determined that starting with the current year, it would depreciate the company's printing press using hours of use as the depreciation base. The press, which had been purchased on January 1, 1998, at a cost of \$930,000, was being depreciated for 25 years using the straight-line method. No salvage value was anticipated. It is estimated that this type of press provides 200,000 total hours of use and, as of

January 1, 2013, it had been used 76,000 hours. At the end of 2013, the plant manager determined that the press had been run 6,250 hours during the year. Ignore income taxes relating to this change.

1. Evaluate each of the foregoing changes and determine whether it is a change in estimate or a change in accounting principle.
2. Give the journal entries required at December 31, 2013, to account for bad debt expense and depreciation expense given the preceding changes. Kelsea's receivable balance at December 31, 2013, was \$345,000. Allowance for Bad Debts carried a \$1,000 debit balance before adjustment.

### Exercise 20-32

L05

#### Accounting Errors

The following errors in the accounting records of the Chipp & Simon Partnership were discovered on January 10, 2013.

Year of Error	Ending Inventories Overstated	Accrued Rent Depreciation Understated	Accrued Interest Revenue Not Recorded	Expense Not Recorded
2010 .....	\$42,000		\$11,000	
2011 .....		\$18,000	31,000	
2012 .....	34,000			\$7,000

The partners share net income and losses as follows: 65%, Chipp; 35%, Simon.

1. Prepare a correcting journal entry on January 10, 2013, assuming that the books were closed for 2012.
2. Prepare a correcting journal entry on January 10, 2013, assuming that the books are still open for 2012 and that the partnership uses the perpetual inventory system.

### Exercise 20-33

L05

#### Analysis of Errors

State the effect of each of the following errors made in 2012 on the balance sheets and the income statements prepared in 2012 and 2013.

- (a) The ending inventory is understated as a result of an error in the count of goods on hand.
- (b) The ending inventory is overstated as a result of the inclusion of goods acquired and held on a consignment basis. No purchase was recorded on the books.
- (c) A purchase of merchandise at the end of 2012 is not recorded until payment is made for the goods in 2013; the goods purchased were included in the inventory at the end of 2012.
- (d) A sale of merchandise at the end of 2012 is not recorded until cash is received for the goods in 2013; the goods sold were excluded from the inventory at the end of 2012.
- (e) Goods shipped to consignees in 2012 were reported as sales; goods in the hands of consignees at the end of 2012 were not recognized for inventory purposes; sale of such goods in 2013 and collections on such sales were recorded as credits to the receivables established with consignees in 2012.
- (f) The total of one week's sales during 2012 was credited to Gain on Sale—Machinery.
- (g) No depreciation is taken in 2012 for equipment sold in April 2012. The company reports on a calendar-year basis and computes depreciation to the nearest month.
- (h) No depreciation is taken in 2012 for equipment purchased in October 2012. The company reports on a calendar-year basis and computes depreciation to the nearest month.
- (i) Customer notes receivable are debited to the accounts receivable account.

**Exercise 20-34**  
**L05**

**Error Disclosure**

Comparative statements for Bodie Corporation are as follows:

<b>Bodie Corporation</b>		
<b>Income Statements and Statement of Retained Earnings</b>		
<b>For the Years Ended December 31</b>		
	<b>2012</b>	<b>2011</b>
Sales . . . . .	\$4,600,000	\$4,350,000
Cost of goods sold . . . . .	2,346,000	2,305,500
Gross profit . . . . .	<u>\$2,254,000</u>	<u>\$2,044,500</u>
Expenses . . . . .	1,598,000	1,533,000
Net income. . . . .	<u>\$ 656,000</u>	<u>\$ 511,500</u>
Beginning retained earnings. . . . .	\$1,441,000	\$1,077,500
Net income. . . . .	656,000	511,500
Dividends . . . . .	(157,000)	(148,000)
Ending retained earnings . . . . .	<u>\$1,940,000</u>	<u>\$1,441,000</u>

In 2012, Bodie Corporation discovers that ending inventory for 2011 was understated by \$77,000.

Prepare comparative income and retained earnings statements for 2011 and 2012. Ignore income tax effects, and assume that the 2012 books have not been closed.

**Exercise 20-35**  
**L05**

**Journal Entries to Correct Accounts**

The first audit of the books for Ringer Company was made for the year ended December 31, 2013. In reviewing the books, the auditor discovered that certain adjustments had been overlooked at the end of 2012 and 2013 and that other items had been improperly recorded. Omissions and other failures for each year are summarized as follows:

	<b>2012</b>	<b>2013</b>
Sales Salaries Payable . . . . .	\$1,800	\$1,400
Interest Receivable . . . . .	700	550
Prepaid Insurance . . . . .	450	250
Advances from Customers . . . . .	1,900	2,200
(Collections from customers had been included in sales but should have been recognized as advances from customers because goods were not shipped until the following year.)		
Equipment . . . . .	1,600	1,300
(Expenditures had been recognized as repairs but should have been recognized as cost of equipment; the depreciation rate on such equipment is 10% per year, but depreciation in the year of the expenditure is to be recognized at 5%.)		

Prepare journal entries to correct revenue and expense accounts for 2013, and record assets and liabilities that require recognition on the balance sheet as of December 31, 2013. Assume that the nominal accounts for 2013 have not yet been closed into the income summary account.

## Exercise 20-36

L05

**Error Analysis**

In early 2012, while reviewing Huffman Inc.'s 2011 financial records, the accountant discovered several errors. For each of the following errors, indicate the effect on net income (i.e., understatement, overstatement, or no effect) for both 2011 and 2012, assuming that no correction had been made and the company uses a periodic system for inventory.

- Certain items of ending inventory were accidentally not counted at the end of 2011.
- Machinery was sold in May 2011, but the company continued to deduct depreciation for the remainder of 2011, although the asset was removed from the books in May.
- The 2011 year-end purchases of inventory were not recorded until the beginning of 2012, although the inventory was correctly counted at the end of 2011.
- Goods sold on account in 2011 were not recorded as sales until 2012.
- Insurance costs incurred but unpaid in 2011 were not recorded until paid in 2012.
- Interest revenue in 2011 was not recorded until 2012.
- The 2011 year-end purchases were not recorded until the beginning of 2012. The inventory associated with these purchases was omitted from the ending inventory count in 2011.
- A check for January 2012 rent was received and recorded as revenue at the end of 2011.
- Interest accrued in 2011 on a note payable was not recorded until it was paid in 2012.

**PROBLEMS**

## Problem 20-37

L02

**Change in Depreciation Estimates and Depreciation Method**

Yuki, Inc., acquired the following assets on January 1, 2010.

Equipment, estimated useful life 5 years; residual value \$13,000 . . . . .	\$513,000
Building, estimated useful life 40 years; no residual value. . . . .	900,000

The equipment has been depreciated using the sum-of-the-years'-digits method for the first three years. In 2013, the company decided to change the method of depreciation to straight line. No change was made in the estimated service life or residual value. The company also decided to change the total estimated useful life of the building from 40 to 45 years with no change in the estimated residual value. The building is depreciated on the straight-line method. The company has 200,000 shares of capital stock outstanding. Partial results of operations for 2013 and 2012 are as follows:

	2013	2012
Income before depreciation . . . . .	\$956,000	\$890,000

**Instructions:**

- Compute depreciation expense for 2012 and 2013.
- Compute earnings per share for 2012 and 2013. (Ignore income tax effects.)

## Problem 20-38

L02, L03

**Accounting Changes**

Barney Corporation began business on January 1, 2011. The company has released the following financial statements for 2011 and 2012 and has prepared the following proposed statements for 2013.

<b>Barney Corporation</b>			
<b>Comparative Balance Sheets</b>			
<b>December 31</b>			
	<b>2013</b>	<b>2012</b>	<b>2011</b>
<b>Assets</b>			
Cash . . . . .	\$249,000	\$219,000	\$165,000
Capitalized exploration costs . . . . .	60,000	45,000	30,000
Equipment . . . . .	150,000	150,000	150,000
Accumulated depreciation—equipment . . . . .	(45,000)	(30,000)	(15,000)
Total assets . . . . .	<u>\$414,000</u>	<u>\$384,000</u>	<u>\$330,000</u>
<b>Liabilities and Stockholders' Equity</b>			
Current liabilities . . . . .	\$177,000	\$177,000	\$147,000
Common stock . . . . .	165,000	165,000	165,000
Retained earnings . . . . .	72,000	42,000	18,000
Total liabilities and stockholders' equity . . . . .	<u>\$414,000</u>	<u>\$384,000</u>	<u>\$330,000</u>

<b>Barney Corporation</b>			
<b>Comparative Income Statements</b>			
<b>For the Years Ended December 31</b>			
	<b>2013</b>	<b>2012</b>	<b>2011</b>
Sales . . . . .	\$315,000	\$300,000	\$255,000
Cost of goods sold . . . . .	\$240,000	\$225,000	\$189,000
Administrative expenses . . . . .	12,500	23,500	28,000
Amortization of capitalized exploration costs . . . . .	17,500	12,500	5,000
Depreciation expense—equipment . . . . .	15,000	15,000	15,000
Total costs . . . . .	<u>\$285,000</u>	<u>\$276,000</u>	<u>\$237,000</u>
Net income . . . . .	<u>\$ 30,000</u>	<u>\$ 24,000</u>	<u>\$ 18,000</u>

Barney Corporation acquired the equipment for \$150,000 on January 1, 2011, and began depreciating the equipment over a 10-year estimated useful life with no salvage value, using the straight-line method of depreciation. The capitalized exploration costs reflect oil and gas drilling costs that Barney has capitalized under the full cost method.

As of January 1, 2013, Barney has decided to make the following accounting changes.

- (a) For justifiable reasons, Barney Corporation changed to the double-declining-balance method of depreciation for the equipment as of January 1, 2013.
- (b) For justifiable reasons, Barney Corporation changed from the full cost to the successful efforts method of accounting for oil and gas drilling costs as of January 1, 2013. Because none of Barney's drilling so far can be classified as "successful," all drilling costs would be expensed as incurred under the successful efforts method.

**Instructions:** In 3-year comparative format, prepare the balance sheets, statements of income, and statements of retained earnings that would be reported in 2013 for the years 2011, 2012, and 2013. Barney has not yet paid any dividends. Make sure to correctly treat the accounting changes mentioned above. (Ignore any income tax effects.)

**Problem 20-39****L02****Change in Depreciation Estimates and Depreciation Method**

The following information relates to depreciable assets of Strata Technologies.

- Machine A was purchased for \$80,000 on January 1, 2008. The entire cost was erroneously expensed in the year of purchase. The machine had a 16-year useful life and no residual value.
- Machine B cost \$220,000 and was purchased January 1, 2009. The straight-line method of depreciation was used. At the time of purchase, the expected useful life was 10 years with no residual value. In 2013, it was estimated that the total useful life of the asset would be only seven years and that there would be a \$12,000 residual value.
- Building C was purchased January 1, 2010, for \$750,000. The straight-line method of depreciation was originally chosen. The building was expected to be useful for 25 years and to have zero residual value. On January 1, 2013, a change was made from the straight-line depreciation method to the sum-of-the-years'-digits method. Estimates relating to the useful life and residual value remained the same.

Income before depreciation expense was \$620,000 for 2013. Depreciation on assets other than those described totaled \$65,000. (Note: Ignore all income tax effects.)

**Instructions:**

- Compute total depreciation expense for 2013.
- Prepare the statement of retained earnings for 2013. The beginning Retained Earnings balance, before considering items (a) through (c) above, was \$890,000. For this problem, assume that only the statements for 2013 are presented, so any prior-period adjustment to retained earnings is done as of January 1, 2013. Strata declared and paid dividends totaling \$210,000 in 2013.
- Make the January 1, 2013, correcting journal entry necessary with respect to item (a), the erroneous expensing of the machine cost.

**Problem 20-40****L02****Change in Accounting Estimates and Depreciation Method**

Johnston Doors began operations on January 1, 2010. On that day, Johnston purchased the following assets, both of which were depreciated using the straight-line method.

Equipment: Cost, \$48,000; estimated salvage value, \$5,000; estimated useful life, 10 years.

Building: Cost, \$85,000; estimated salvage value, \$15,000; estimated useful life, 15 years.

As of January 1, 2014, Johnston reviewed its accounting records and determined that the building should have a total useful life of 20 years. In addition, because of significant wear on the equipment, Johnston has decided to use the sum-of-the-years'-digits method for depreciating equipment.

Johnston also has found that its estimated bad debt expense has been consistently higher than actual bad debts. Management proposes lowering the percentage from 3% of credit sales to 2%. If 2% had been used since 2010, the balance in Allowance for Bad Debts at the beginning of 2014 would have been \$3,200 rather than \$6,900. Credit sales for 2014 totaled \$250,000, and accounts written off as uncollectible during 2014 totaled \$5,500.

**Instructions:** (Ignore income tax effects.)

- What is the proper accounting treatment for each of the proposed changes?
- Prepare the journal entries necessary to record the depreciation expense for 2014 for both the equipment and the building.
- Prepare the journal entry to record the write-off of accounts deemed uncollectible during 2014 and the adjusting entry at year-end to record the bad debt expense for the period.
- What adjustment is made to the allowance account at the beginning of 2014 as a result of changing the bad debt estimate percentage?

**Problem 20-41**

**Reporting Accounting Changes**

**L02**

The following are two independent, unrelated sets of facts concerning accounting changes.

- (a) Case 1: Runyon Development Company determined that the amortization rate on its patents is unacceptably low due to current advances in technology. The company decided at the beginning of 2013 to decrease the estimated useful life on all existing patents from 10 years to seven years. Patents were purchased on January 1, 2008, for \$3,000,000. The estimated residual value is \$0.
- (b) Case 2: Cartwright Corporation decided on January 1, 2013, to change its depreciation method for manufacturing equipment from an accelerated method to the straight-line method. The straight-line method is to be used for new acquisitions as well as for previously acquired equipment. As of January 1, 2013, the total historical cost of depreciable assets is \$800,000; accumulated depreciation on those assets is \$343,000. The expected remaining useful life of Cartwright's depreciable assets as of January 1, 2013, is 10 years; the expected salvage value is \$25,000.

**Instructions:** For each of the cases:

- 1. Identify the type of accounting change.
- 2. Explain how the accounting change should be reported in 2013.
- 3. Explain the effect of the change on the December 31, 2013, balance sheet and the 2013 income statement.

**Problem 20-42**

**Change in Accounting Principle**

**L03**

During 2013, Magma Company changed its inventory valuation method from LIFO to FIFO. The following information shows the effect of this change.

Year	Net Income Computed Using LIFO	Excess of LIFO Cost of Goods Sold over FIFO Cost of Goods Sold	Income Effect (Net of Tax)
Prior to 2011		\$130,000	\$95,700
2011	\$310,000	52,000	38,500
2012	240,000	66,000	45,000
2013	500,000	96,000	80,000

**Instructions:**

- 1. Before the change from LIFO to FIFO, the Retained Earnings balance on January 1, 2011, was \$700,000. Magma Company does not pay any dividends. Prepare the comparative statement of retained earnings, reflecting the change to FIFO, for 2011, 2012, and 2013.
- 2. What additional information would you need to prepare all the necessary disclosures to include in the notes to the 2013 financial statements?

**Problem 20-43**

**Change in Accounting Estimate**

**L02**

On January 3, 2012, Airflow Corporation, a company selling stunt kites, purchased a large number of personal computers. The cost of these computers was \$170,000. On the date of purchase, Sandy's management estimated that the computers would last approximately four years and would have a salvage value at that time of \$20,000. The company used the double-declining-balance method to depreciate the computers.

During January 2013, Airflow's management realized that technological advancements had made the computers virtually obsolete. The new salvage value is estimated to be \$1,000. Management proposed changing the estimated useful life of the computers to two years.

**Instructions:** Prepare the journal entry necessary at the end of 2013 to record depreciation on the computers.

**Problem 20-44**  
**L03**

**Change in Accounting Principle—LIFO to FIFO**

On January 1, 2013, Down Under, Inc. decided to change from the LIFO method of inventory valuation to the FIFO method. The net income (using LIFO) for the four years Down Under has been in business is as follows:

2010 .....	\$120,000	2012 .....	\$156,000
2011 .....	138,000	2013 .....	180,000

Analysis of the inventory records revealed that the following inventories were on hand at the end of each year as valued under both the LIFO and FIFO methods.

	LIFO Method	FIFO Method
January 1, 2010 .....	\$ 0	\$ 0
December 31, 2010 .....	178,000	208,000
December 31, 2011 .....	220,000	216,000
December 31, 2012 .....	252,000	290,000
December 31, 2013 .....	295,000	349,000

For simplicity, assume that Down Under's sales for each year are \$500,000. The income tax rate is 40%. Down Under has only two expenses—cost of goods sold and income tax expense.

**Instructions:**

1. Prepare the 3-year comparative income statement for 2013 which will include FIFO numbers for 2013 and retrospectively adjusted FIFO numbers for 2011 and 2012. [*Hint:* You will have to work backwards to figure out income tax expense (using net income) and then calculate cost of goods sold using pretax income and sales.]
2. Prepare the 3-year comparative retained earnings statement for Down Under for 2013. Note that the company started business on January 1, 2010. Dividends declared and paid have been as follows: 2010—\$10,000; 2011—\$15,000; 2012—\$15,000; 2013—\$25,000.
3. Prepare the year-by-year income statement note disclosure that Down Under must provide in the notes to its 2013 financial statements.

**Problem 20-45**  
**L05**

**Correction of Errors**

Hiatt Textile Corporation is planning to expand its current plant facilities and is in the process of obtaining a loan at City Bank. The bank has requested audited financial statements. Hiatt has never been audited before. It has prepared the following comparative financial statements for the years ended December 31, 2013 and 2012.

<b>Hiatt Textile Corporation</b>		
<b>Comparative Balance Sheets</b>		
<b>December 31, 2013 and 2012</b>		
	<b>2013</b>	<b>2012</b>
<b>Assets</b>		
Current assets:		
Cash .....	\$ 602,500	\$ 400,000
Accounts receivable .....	980,000	740,000
Allowance for bad debts .....	(92,500)	(45,000)
Inventory .....	<u>517,500</u>	<u>505,000</u>
Total current assets .....	<u>\$2,007,500</u>	<u>\$1,600,000</u>

	2013	2012
Plant assets:		
Property, plant, and equipment . . . . .	\$ 417,500	\$ 423,750
Accumulated depreciation . . . . .	(304,000)	(266,000)
Total plant assets . . . . .	<u>\$ 113,500</u>	<u>\$ 157,750</u>
Total assets . . . . .	<u>\$2,121,000</u>	<u>\$1,757,750</u>
<b>Liabilities and Stockholders' Equity</b>		
Liabilities:		
Accounts payable . . . . .	\$ 303,500	\$ 490,250
Stockholders' equity:		
Common stock, par value \$25; authorized, 30,000 shares; issued and outstanding, 26,000 shares . . . . .	\$ 650,000	\$ 650,000
Retained earnings . . . . .	1,167,500	617,500
Total stockholders' equity . . . . .	<u>\$1,817,500</u>	<u>\$1,267,500</u>
Total liabilities and stockholders' equity . . . . .	<u>\$2,121,000</u>	<u>\$1,757,750</u>

**Hiatt Textile Corporation**  
**Comparative Income Statements**  
**For the Years Ended December 31, 2013 and 2012**

	2013	2012
Sales . . . . .	\$2,500,000	\$2,250,000
Cost of goods sold . . . . .	1,075,000	987,500
Gross margin . . . . .	<u>\$1,425,000</u>	<u>\$1,262,500</u>
Operating expenses . . . . .	\$ 575,000	\$ 512,500
General and administrative expenses . . . . .	300,000	262,500
	<u>\$ 875,000</u>	<u>\$ 775,000</u>
Net income . . . . .	<u>\$ 550,000</u>	<u>\$ 487,500</u>

The following facts were uncovered during the audit.

- (a) On January 20, 2012, Hiatt had charged a 5-year fire insurance premium to expense. The total premium amounted to \$15,500.
- (b) Over the last two years, the amount of loss due to bad debts has steadily decreased. Hiatt has decided to reduce the amount of bad debt expense from 2% to 1.5% of sales, beginning with 2013. (A charge of 2% has already been made for 2013.)
- (c) The inventory account (maintained on a periodic basis) has been in error the last two years. The errors were as follows:
 

2012:	Ending inventory overstated by \$37,750
2013:	Ending inventory overstated by \$49,500
- (d) A machine costing \$75,000, purchased on January 4, 2012, was incorrectly charged to operating expense. The machine has a useful life of 10 years and a residual value of \$12,500. The straight-line depreciation method is used by Hiatt.

**Instructions:**

1. Prepare the journal entries to correct the books at December 31, 2013. The books for 2013 have not been closed. (Ignore income taxes.)
2. Prepare a schedule showing the computation of corrected net income for the years ended December 31, 2012 and 2013, assuming that any adjustments are to be reported on the comparative statements for the two years. Begin your schedule with the net income for each year. (Ignore income taxes.)

## Problem 20-46

L05

**Analysis and Correction of Errors**

A CPA was engaged by Blackbird Company in 2013 to examine its books and records and to make whatever corrections are necessary. An examination of the accounts discloses the following.

- Dividends had been declared on December 15 in 2010 and 2011 but had not been entered in the books until paid.
- Improvements in buildings and equipment of \$10,800 had been debited to expense at the end of April 2009. Improvements are estimated to have 12-year life. The company uses the straight-line method in recording depreciation and computes depreciation to the nearest month.
- The physical inventory of merchandise had been understated by \$3,200 at the end of 2010 and by \$4,750 at the end of 2011.
- The merchandise inventories at the end of 2011 and 2012 did not include merchandise that was then in transit and to which the company had title. These shipments of \$2,100 and \$2,900 were recorded as purchases in January of 2012 and 2013, respectively.
- The company had failed to record sales commissions payable of \$3,600 and \$1,100 at the end of 2011 and 2012, respectively.
- The company had failed to recognize supplies on hand of \$850 and \$1,720 at the end of 2011 and 2012, respectively.

The retained earnings account appeared as shown below on the date the CPA began the examination.

**Account: RETAINED EARNINGS**

Date	Item	Debit	Credit	Balance	
				Debit	Credit
2010					
Jan. 1	Balance				65,000
Dec. 31	Net income for year		28,000		93,000
2011					
Jan. 10	Dividends paid	15,500			77,500
Mar. 6	Stock sold—excess over par		21,000		98,500
Dec. 31	Net loss for year	17,800			80,700
2012					
Jan. 10	Dividends paid	15,500			65,200
Dec. 31	Net loss for year	19,300			45,900

**Instructions:**

- Journalize the necessary corrections.
- Prepare a statement of retained earnings covering the 3-year period beginning January 1, 2010. The statement should report the corrected Retained Earnings balance on January 1, 2010, the annual changes in the account, and the corrected Retained Earnings balances as of December 31, 2010, 2011, and 2012.
- Set up an account for retained earnings before correction, and post correcting data to this account for (1). Balance the account, showing the corrected retained earnings as of January 1, 2013.

**Problem 20-47**  
**L05**

**Correction of Errors**

Hinckley Company is in the process of adjusting its books at the end of 2013. Hinckley's records reveal the following information:

- (a) Hinckley failed to accrue sales commissions at the end of 2011 and 2012 as follows:

2011 .....	\$44,000
2012 .....	30,000

In each case, the sales commissions were paid (and expensed) in January of the following year.

- (b) Errors in ending inventories for the last three years were discovered to be as follows:

2011 .....	\$41,300 understated
2012 .....	54,200 overstated
2013 .....	15,000 understated

The incorrect amount has already been recorded for 2013.

**Instructions:**

1. Prepare the necessary journal entries at December 31, 2013, to record the preceding information. Assume that the books are still open for 2013. Ignore all income tax effects.
2. Assume that the unadjusted retained earnings balance at the beginning of 2013 was \$1,265,000 and that the unadjusted net income for 2013 was \$300,000. Also assume that dividends of \$175,000 were declared during 2013. Prepare a statement of retained earnings for Hinckley Company for 2013, reflecting appropriate adjustments from (1). Assume that there are no income taxes.

**Problem 20-48**  
**L02, L03, L05**

**Sample CPA Exam Questions**

1. On January 1, 2011, Frank Company purchased equipment for \$200,000. The equipment has an 8-year expected useful life and a \$10,000 expected residual value. Initially, Frank Company used double-declining-balance depreciation. On January 1, 2013, Frank Company changed to straight-line depreciation. The expected useful life and residual value are unchanged. Compute depreciation expense for 2013.
  - (a) \$28,125
  - (b) \$17,083
  - (c) \$12,813
  - (d) \$23,750
2. Jean Company decided to change from LIFO to FIFO as of January 1, 2013. The change is being made for both book and tax purposes. LIFO and FIFO data for 2013 and preceding years are given below.

Year	Net Income Computed Using LIFO	Excess of LIFO Cost of Goods Sold over FIFO Cost of Goods Sold	Income Effect (Net of Tax)
Prior to 2011 .....		\$12,500	\$ 7,500
2011 .....	\$62,500	6,250	3,750
2012 .....	54,500	7,500	4,500
2013 .....	78,000	11,250	6,750
		<u>\$37,500</u>	<u>\$22,500</u>

- Using the provisions of FASB ASC Topic 250 *Statement No. 154*, compute Jean Company's net income for 2013. Remember that Jean Company switched to FIFO on January 1, 2013.
- \$84,750
  - \$100,500
  - \$85,500
  - \$93,750
3. Goods sold FOB destination were shipped by Brook Company (the seller) on December 31, 2013. The sale was recorded in 2013, and the goods were not included in 2013 ending inventory. The shipment arrived on January 4, 2014. The goods cost \$3,000, and the sales price was \$4,400. As a result of this transaction, was net income overstated or understated, and by how much? Ignore income taxes.
- Reported net income was correct.
  - Net income in 2013 was overstated by \$4,400.
  - Net income in 2013 was understated by \$3,000.
  - Net income in 2013 was overstated by \$1,400.

## CASES

### Discussion Case 20-49

#### Accounting Changes

*Situation A:* Tucker Corporation has determined that the depreciable lives of several operating machines are too long and thus do not fairly match the cost of the assets with the revenues produced. Tucker therefore decides to reduce the depreciable lives of these machines by three years.

*Situation B:* Trent Company decides that at the beginning of the year, it will adopt the FIFO method of inventory valuation. Trent had previously used LIFO.

What types of accounting changes are involved in the two situations? Describe the method of reporting the changes under current GAAP.

### Discussion Case 20-50

#### Change in Accounting Principle or Change in Accounting Estimate?

Jill Stanton, president of Central Company, is confused about why your accounting firm has recommended that she report certain events as changes in principle instead of changes in estimate, which is what Jill thought they should be. She has asked you for an explanation. Describe a change in an accounting principle and a change in accounting estimate. Explain how each is reported in the income statement of the period of change.

### Discussion Case 20-51

#### Why Do They Make the Change?

An interesting phenomenon can sometimes occur when companies are in danger of not meeting their projected earnings goals. Management suddenly realizes that they have been far too conservative in their previous estimates associated with bad debts, estimated useful lives of equipment, and residual values, to name a few. With this newfound realization, management proceeds to revise these estimates to, as is often stated, "more closely reflect economic reality."

What is the primary difference in financial statement disclosure between a change in estimate and a change in principle? Why do you think managers who are in danger of not meeting their goals would prefer to revise an accounting estimate rather than change an accounting principle?

### Discussion Case 20-52

#### How Long Can Airplanes Fly?

Airline A depreciates its airplanes over a 15-year period and estimates a salvage value of 10% of the cost of the plane. At the same time, Airline B depreciates identical airplanes over a 25-year period and provides for a 15% salvage value. These different assumptions resulted in markedly different operating results. For example, if one airplane costs \$10 million, Airline A would depreciate \$260,000 more per year for 15 years than would Airline B.

Which company's estimate of useful life more closely reflects reality? Would you feel comfortable as a passenger in an airplane that is 25 years old? Does the fact that Airline B subsequently went out of business provide any information as to why its estimates were so substantially different from those of financially sound Airline A?

**Case 20-53****Deciphering Financial Statements (Bausch & Lomb Inc.)**

**Bausch & Lomb**, maker of eye-care products, found itself in the news because of certain procedures that were outside accepted accounting and business practices. The note below from its 1995 annual report provides information about the company's problems.

**Prior Period Adjustment**

BAUSCH & LOMB INCORPORATED (DEC)  
NOTES TO FINANCIAL STATEMENTS

## Note 2. Restatement of Financial Information

The Company has restated its financial statements for the years ended December 31, 1994 and December 25, 1993. This action was taken as a result of an ongoing investigation which identified uncertainties surrounding the execution of a fourth quarter 1993 contact lens sales program and the improper recording of 1993 sunglass sales in Southeast Asia. In the fourth quarter of 1993 a marketing program was initiated to implement a business strategy to shift responsibility for the sale and distribution of a portion of the U.S. Traditional contact lens business to optical distributors. Subsequently, this strategy proved unsuccessful and, in the 1994 third quarter, led to the implementation of a new pricing policy for traditional contact lenses and a decision to accept on a one-time basis returns from these distributors. The investigation of this marketing program disclosed instances where unauthorized terms may have been or were offered which were inconsistent with the stated terms and conditions of the program. The resulting uncertainties relating to the execution of this marketing program led to a decision to restate the 1993 financial statements to account for shipments under the program as consigned inventory and to record revenues when the products were sold by the distributors to their customers and to reverse the effect of subsequent product returns and pricing adjustments related to this program which had been previously recognized in 1994. The investigation of Southeast Asia sunglass sales disclosed that in certain instances distributor transactions recorded as revenues in 1993 had not actually resulted from a sale to those customers, and thus were improperly recorded. The 1993 financial statements have been restated to reverse the improperly recorded sales with a corresponding restatement of the 1994 financial statements to reverse the effect of sales returns previously recognized in that period. In the opinion of management, all material adjustments necessary to correct the financial statements have been recorded. The impact of these adjustments on the Company's financial results as originally reported is summarized below:

Dollar Amounts in Thousands (Except Per Share Data)	1994		1993	
	As Reported	As Restated	As Reported	As Restated
Net Sales:				
Healthcare . . . . .	\$1,227,648	\$1,249,923	\$1,191,467	\$1,169,192
Optics . . . . .	622,904	642,763	680,717	660,858
Total . . . . .	<u>\$1,850,552</u>	<u>\$1,892,686</u>	<u>\$1,872,184</u>	<u>\$1,830,050</u>
Business Segment Earnings:				
Healthcare . . . . .	\$ 73,466	\$ 91,541	\$ 210,393	\$ 192,318
Optics . . . . .	64,148	72,075	87,456	79,529
Total . . . . .	<u>\$ 137,614</u>	<u>\$ 163,616</u>	<u>\$ 297,849</u>	<u>\$ 271,847</u>
Net Earnings . . . . .	\$ 13,478	\$ 31,123	\$ 156,547	\$ 138,902
Net Earnings Per Share . . . . .	\$ 0.23	\$ 0.52	\$ 2.60	\$ 2.31
Retained Earnings At End of Year . . . . .	\$ 846,245	\$ 846,245	\$ 889,325	\$ 871,680

Review this information to answer the questions that follow.

1. What exactly was the company doing that was wrong?
2. Compare the "As Reported" and "As Restated" columns to determine what income was included in both categories over the combined 2-year period. What did the company gain?

3. If this error had been uncovered in 1994 after the 1993 reporting year had been closed, what journal entry would have been made to correct the error?
4. When this error was uncovered in 1995 after the 1994 reporting year had been closed, what journal entry was made to correct the error?

**Case 20-54****Deciphering Financial Statements (The Walt Disney Company)**

Locate the 2009 financial statements for **The Walt Disney Company** on the Internet. Once you have located these financial statements, consider the following questions.

1. Review the notes to the financial statements and determine whether the company had any accounting changes for any of the years reported. (Note: Most, if not all, of these changes will be as a result of accounting rule changes by the FASB.) To what did those changes relate?
2. Briefly describe the nature of any changes identified in (1).

**Case 20-55****Writing Assignment (Counterbalancing errors)**

As stated in the chapter, most accounting-related errors are detected and corrected in the current period. Of those that go undetected, some will fix themselves over two periods, while other errors may remain undetected for years.

The objective of this writing assignment is to have you think about what it is that is different between those errors that will counterbalance and those that carry over from period to period. In a short memo, identify these differences considering such issues as whether the accounts involved are balance sheet and/or income statement accounts, whether they are current and/or noncurrent accounts, and whether they involve revenue or expense accounts. Finally, provide a systematic method for analyzing an error to determine if it counterbalances or if a journal entry is necessary to correct the books.

**Case 20-56****The Debate (Restating prior years' financial statements)**

This chapter began with an illustration of the impact that *Statement No. 106* had on the earnings of several companies. Recall that **General Motors** reported a \$33 billion decline in income in 1992. One-time "hits" such as this can make comparison of financial statements and ratios over time difficult.

This debate relates to the different methods for dealing with changes in accounting principle by either making a cumulative adjustment or restating the financial statements. Divide your group into two teams.

- One team will argue that when a new standard is issued, all prior years' financial statements being disclosed with the current year's information should be restated to comply with the new standard. This is the approach now required under FASBASC Topic 250.
- The other team will argue that a cumulative adjustment that summarizes the new standard's effect on prior periods is sufficient. This is the approach that was required at the time GM adopted *Statement No. 106*.

**Case 20-57****Ethical Dilemma (Changing a change in principle)**

Your company has recently decided to change its method of depreciating long-term assets to be consistent with major competitors. While your company has used the straight-line method in the past, most other companies in the industry use a declining-balance method. Preliminary computations indicate that changing this accounting principle will reduce EPS by about 10% in the current year. Naturally, those to whom you report would like to know if there is any way to lessen the impact of this change.

You know that other factors in computing depreciation expense are the estimates of useful life and salvage value. You reason that if the estimated useful life of all long-term assets is reassessed with minor modifications being made to these estimated lives, then switching the depreciation method will not decrease net income this period.

1. Can the plan of reassessing the estimated lives of long-term assets achieve the desired result of allowing the firm to change depreciation accounting methods to a declining-balance method without reducing net income this period?
2. Will the firm have a higher cash inflow as a result of either the change in principle or the change in estimate?
3. Should the level of a company's income determine the accounting methods that it uses and the accounting estimates that it makes? Why or why not?

**Case 20-58****Cumulative Spreadsheet Analysis**

This spreadsheet assignment is an extension of the spreadsheet assignment given in Chapter 13, part (1). Refer back to the instructions given in Chapter 13. That spreadsheet can form the foundation for this assignment.

1. In addition to preparing forecasted financial statements for 2014, Skywalker also wishes to prepare forecasted financial statements for 2015. All assumptions applicable to 2014 are assumed to be applicable to 2015. Sales in 2015 are expected to be 40% higher than sales in 2014. (Clearly state any additional assumptions that you make.)
2. Assume that Skywalker expects the number of days' sales in inventory in both 2014 and 2015 to be 60 days instead of 107.6 days. This change should make the forecasted level of the short-term loans payable in your spreadsheet negative for both 2014 and 2015.
  - (a) Explain why this change causes negative short-term loans payable.
  - (b) Because a negative amount of short-term loans payable is not possible, adjust your spreadsheet so that the value of short-term loans payable cannot be less than zero. What is the forecasted current ratio for 2014 and 2015 after you make this adjustment?

P4

OTHER DIMENSIONS OF FINANCIAL REPORTING

# CHAPTER 21 Statement of Cash Flows Revisited

## LEARNING OBJECTIVES

- 1 Prepare a complete statement of cash flows and provide the required supplemental disclosures.
- 2 Understand the differences among cash flow statements prepared according to U.S. GAAP and IASB standards.
- 3 Incorporate material from the entire text into the preparation of a statement of cash flows.
- 4 Perform a detailed case analysis of a company's operations and performance using cash flow data.

In 1968, Robert Noyce and Gordon Moore left their jobs as engineers at **Fairchild Semiconductor** to start their own firm. They saw a business opportunity in using semiconductor technology to build a better, cheaper alternative to the magnetic core memory that was, at the time, the dominant computer memory technology. Their problem was that the cost of semiconductor memory was 100 times the cost of magnetic core memory.

With \$2.5 million in financing from a venture capitalist, Noyce and Moore founded **Intel**, short for integrated electronics. Andy Grove soon joined Intel, and together these three solved the computer memory problem. The 1103, introduced in 1970, quickly became the world's largest selling semiconductor device.

But cheaper computer memory was not to be the innovation that put Intel on the

map. In 1971, a Japanese calculator company asked Intel to design a set of custom computer chips. In response, Intel created the first microprocessor, the 4004. However, the design contract stipulated that the rights for the completed microprocessor were owned by **Busicom**, the calculator company. Intel bought back the rights to the microprocessor for \$60,000.

FYI

The name "Intel" had to be purchased from a hotel chain.

The 4004 chip was smaller than a thumbnail and cost \$200, yet it provided as much computing power as the first electronic computer. The first electronic computer, made in 1946, required 18,000 vacuum tubes and occupied 3,000 cubic feet of space.

Intel continued to develop its microprocessor technology. In the mid-1970s, the idea of combining a processor, a keyboard, and a monitor for sale as a personal computer for home use was presented to Intel Chairman Gordon Moore. He asked: "What's it good for? And the only answer was that a housewife could keep her recipes on it. I personally didn't see anything useful in it, so we never gave it another thought."

In 1981, Intel combined with **IBM** to develop the first personal computer using the 8088 processor. After that, microprocessor technology accelerated dramatically. The rate of change, both in terms of time and in terms of capacity, for microprocessors gave rise to Moore's Law (a phrase coined by Gordon Moore)—every two years computing power will double.

While the capacity of chips has increased, their costs have decreased. In 1991, the 486 cost \$225 per MIPS (million instructions per second). The Pentium II costs about \$2 per MIPS. Moore made the following comparison, "If the auto industry advanced as rapidly as the semiconductor industry, a Rolls Royce would get a half a million miles per gallon, and it would be cheaper to throw it away than to park it."

By April 2010, Intel's total market value had grown to almost \$126 billion, and the market value of the computer giant IBM that Intel had partnered with to produce the first IBM PC had grown to nearly \$165 billion.

The fact that Intel is a very successful company can be seen quite easily by looking at the company's cash flow statement. Exhibit 21-1 contains Intel's statement of cash flows for the three years ending December 26, 2009. When looking at a statement of cash flows, the first thing to find is the company's cash from operating activities. For Intel, operating

cash flow in 2009 was \$11.2 billion, up 2% from the \$10.9 billion in 2008.

Intel defines a microprocessor as follows: "A microprocessor is an integrated circuit built on a tiny piece of silicon. It contains thousands, or even millions, of transistors, which are interconnected via superfine traces of aluminum. The transistors work together to store and manipulate data so that the microprocessor can perform a wide variety of useful functions. The particular functions a microprocessor performs are dictated by software."

The next thing you should look at is the operations-related investing cash needs of the company. For Intel in 2009, investing cash flow related to the operations of the company totaled \$5.4 billion and was the sum of the cash paid to buy new property, plant, and equipment and the cash used to make business acquisitions. These items are sometimes called the capital expenditures (or capex) of a business. A comparison of operating cash flow to the capital expenditures yields the company's free cash flow. For 2009, Intel's free cash flow was \$5.8 billion (\$11.2 billion operating cash inflow minus \$5.4 bil-

The sum of the market values of Intel and IBM is only \$23 billion greater than the \$268 billion April 2010 market value of software giant Microsoft, which was a small 30-person software company when it was chosen by IBM to provide the operating system for the first IBM PC.

lion capital expenditures cash outflow). Intel's large amount of free cash flow means that the company is a cash cow. The company's operations are generating so much cash that the capital expenditures required for the company's expansion plans can be completely paid for with cash left over.

Finally, in our simple analysis, let's see what Intel is doing with its surplus cash flow. In the Financing Activities section, we see that in 2009 Intel spent \$1.8 billion buying back shares of its own stock and \$3.1 billion paying cash dividends to the remaining

## 21-1 INTEL'S STATEMENT OF CASH FLOWS FOR 2009 (IN MILLIONS)

### Intel Corporation Consolidated Statements of Cash Flows

Consolidated Statements of Cash Flows (USD \$) In Millions	12 Months Ended		
	Dec. 26, 2009	Dec. 27, 2008	Dec. 29, 2007
<b>Statements of Cash Flows [Abstract]</b>			
Cash and cash equivalents, beginning of year . . . . .	\$ 3,350	\$ 7,307	\$ 6,598

Income taxes, net of refunds . . . . .	\$ 943	\$ 4,007	\$ 2,762

shareholders. What else could Intel do with this \$5.8 billion in free cash flow? Anything it wants. The amount of free cash flow is an indication of the flexibility a company has. If Intel wants to expand more quickly, it has the cash flow to do so. If the company

wants to increase cash dividends, it can do so. If the company wants to repay its loans more quickly, it can do that. In short, because of its substantial free cash flow, Intel can do anything.

## QUESTIONS

1. What is Moore's Law?
2. What is the meaning of the term "capex"?
3. What is free cash flow?
4. How much did Intel pay for income taxes in 2009? (*Hint: Look at the supplemental disclosure at the bottom of the company's statement of cash flows.*)

*Answers to these questions can be found on page 21-45.*

The title of this chapter is "Statement of Cash Flows Revisited." Hopefully, you recall that we introduced the statement of cash flows back in Chapter 5. Since that basic coverage, we have learned a lot of accounting. We now know about leases, goodwill impairment, accounting for bad debts, and a host of other accounting items. The purpose of this chapter is to revisit the statement of cash flows and add some of the accounting complexities that we skipped over in our earlier discussion. If you need a quick refresher course on the basics of the statement of cash flows, look back at Chapter 5.

## Preparing a Complete Statement of Cash Flows

1

Prepare a complete statement of cash flows and provide the required supplemental disclosures.

**WHY** A complete statement of cash flows provides an excellent summary of all of the activities—operating, investing, and financing—undertaken by a company during a period.

**HOW** Most of the information to prepare the three sections of the cash flow statement comes from the following portions of the balance sheet and the income statement:

- Operating—income statement and current assets and liabilities
- Investing—long-term assets
- Financing—long-term liabilities and owners' equity

Preparation of a complete cash flow statement is not finished until each income statement item has been considered, all changes in balance sheet items have been explained, and the net change in cash has been exactly reconciled.

In this section, we will work through a comprehensive problem to illustrate the preparation of a complete statement of cash flows. This same process was illustrated in Chapter 5 using a basic example. For this more complex example, we will use financial statement and transaction information for Western Resources, a hypothetical company, for fiscal year 2013. During fiscal 2013, Western Resources completed the following transactions (in summary form).

- (1) Sales on account, \$688,800.
- (2) Collections on account, \$692,300.
- (3) Received payments from customers in advance for services to be delivered in the future (i.e., unearned sales revenue, \$72,000).
- (4) Performed services related to sales revenue unearned in prior years, \$65,000.
- (5) Cost of goods sold, \$524,100.
- (6) Purchased inventory on account, \$522,600.
- (7) Paid accounts payable (all related to inventory), \$529,300.
- (8) Purchased buildings and equipment for cash, \$117,000.
- (9) Purchased land for \$108,500, the seller accepting in payment \$40,000 of common stock and \$68,500 in cash.
- (10) On December 31, purchased available-for-sale securities for cash, \$2,000. The existing available-for-sale securities (recorded at \$10,000) did not change in value during the year.
- (11) Sold a building for cash of \$10,000 (original cost, \$40,000; accumulated depreciation, \$26,000).
- (12) On January 1, sold long-term investments recorded at \$96,000 for \$102,500.
- (13) Borrowed short-term debt, \$7,500.
- (14) Borrowed long-term debt, \$20,000.
- (15) Issued common stock, \$10,000.
- (16) Repurchased common stock, \$3,200.
- (17) Recorded depreciation expense on property, plant, and equipment and amortization expense on patent, \$20,900 and \$5,000, respectively.
- (18) Paid interest on debt, \$3,600.
- (19) Paid operating and administrative expenses, \$150,900. For simplicity, assume that all of these amounts were payments in advance.
- (20) Recorded a restructuring charge of \$11,700. The entire amount related to a liability for employee severance benefits, none of which have been paid as of the end of the year.
- (21) Incurred operating and administrative expenses, \$146,400.
- (22) Computed the amount of income tax that must be paid as a result of taxable transactions occurring this year, \$21,300.
- (23) Computed total income tax expense for the year, \$24,000. [Note: This is higher than the amount in (22) because the income tax code allows taxation of some income earned this year to be deferred to the future.]
- (24) Paid income taxes, \$23,500.
- (25) Declared a dividend of \$25,100. During the year, paid \$20,700 of this dividend.

A work sheet summarizing the beginning balances in Western Resources' balance sheet accounts for fiscal 2013, the journal entries to record the 25 summary transactions for the year, and the ending preclosing account balances is given in Exhibit 21-2.

From the work sheet in Exhibit 21-2, the information regarding the transactions impacting the cash account can be isolated. This is the information needed to construct the statement of cash flows for Western Resources. A summary and categorization of all the transactions impacting cash is given in Exhibit 21-3.

As you can see, if one has access to the detailed transaction data from the cash account, preparing a statement of cash flows is easy. In fact, if transactions are properly coded as operating, investing, or financing when they are first input into an accounting system, the preparation of a statement of cash flows is no more complicated than a simple 3-way sort of the transactions.

## 21-2 WORK SHEET ANALYZING WESTERN RESOURCES' FISCAL 2013 TRANSACTIONS

Western Resources Work Sheet December 31, 2013 (Amounts in millions)						
Account Title	Beginning Balance		Transactions During the Year		Ending Balance	
	Debits	Credits	Debits	Credits	Debits	Credits
Cash	55,000		(2) 692,300	(7) 529,300	50,600	
			(3) 72,000	(8) 117,000

### Preparing a Statement of Cash Flows in the Absence of Detailed Transaction Data

In this section, we discuss how a statement of cash flows is prepared if we do not have ready access to detailed cash inflow and outflow information or if cash transactions are not coded as being operating, investing, or financing. A solid understanding of the process needed to construct a cash flow statement is important for several reasons. First, the majority of cash flow statements are prepared using the indirect method. Without a detailed understanding of how this type of statement is prepared, your ability to understand and interpret the numbers is severely limited. Second, an understanding of the intricacies of the statement of cash flows allows you to see how individual transactions can affect all of the financial statements. Thus, when we analyze the statement of cash flows, we are also looking at the income statement and the balance sheet. Finally, small companies that are not publicly traded frequently prepare only balance sheets and income statements, so external users of financial statements, such as banks and potential investors, are required to construct cash flow statements using partial information.

If we do not have access to detailed cash flow information, the preparation of a statement of cash flows involves analyzing the income statement and comparative balance sheets to determine how a business generated and used cash. A company's cash inflow and outflow can be determined through a careful analysis of each account contained in these statements. Our knowledge of the activities associated with each balance sheet and income statement account, coupled with our knowledge of the relationship between these two financial statements, allows us to infer the cash flow effects of the various transactions of a business during a period.

For example, consider the accounts receivable account. We know that an increase in Accounts Receivable is associated with a credit sale. Similarly, we know that a decrease in Accounts Receivable usually means that cash was collected. Accordingly, if you know the beginning and ending balances for the accounts receivable account (from comparative balance sheets) and you know sales for the period (from the income statement), you can then infer the cash collected from customers during the period.

To illustrate, consider the following information taken from Western Resources' beginning and ending balance sheets and income statement for fiscal 2013. Remember that we are assuming that the detailed transaction information is not available to us; we have only the summary information available in the resulting financial statements.

Beginning accounts receivable (initial amount owed to Western Resources) . . . . .	\$ 70,500
+ Sales during the year (\$688,800 + \$65,000) . . . . .	<u>753,800</u>
= Total amount owed to Western Resources by customers . . . . .	\$824,300
– Ending accounts receivable (amount not yet collected) . . . . .	<u>67,000</u>
= Cash collections for goods and services already provided . . . . .	<u>\$757,300</u>

In addition to cash collected from customers who have already received services, Western Resources also received an additional \$7,000 from customers in advance; this is the increase in the unearned sales revenue account (\$32,000 – \$25,000). This \$7,000 must be added to the previous figure to arrive at total cash collections for the period.

Cash collections for goods and services already provided . . . . .	\$757,300
+ Increase in unearned sales revenue for the period . . . . .	<u>7,000</u>
Total cash collections for the period . . . . .	<u>\$764,300</u>

Because we know what was owed to Western Resources at the start of the period, what was owed to it at the end of the period, what happened to the unearned sales revenue account during the period, and sales that were made during the period, we can

infer the amount of cash that must have been collected during the period. As you can see from this analysis, we don't necessarily need the detailed cash account information to prepare a statement of cash flows. We can use our knowledge of business and accounting to infer those details.

**CAUTION**

Some students are skeptical of this analysis because it appears to exclude cash sales since they are never recorded as part of Accounts Receivable. Think of a cash sale as a credit sale with an extremely short collection period.

A similar analysis is conducted for every balance sheet account. We use our knowledge of the relationship between the income statement and balance sheet accounts and couple it with our knowledge of what accounts are associated with operating, investing, and financing activities. Consider another example, common stock. First, we know that changes in the common stock account are considered to be financing activities. Second, we know that increases are associated with the issuance of shares of stock. Finally, we know that decreases to the common stock account are associated with the retirement of previously issued shares of stock. Using comparative balance sheet information for the common stock account of Western Resources in fiscal 2013, we can infer the stock-related activities that occurred during the period.

	Beginning Balance	Ending Balance	Change
Common Stock	\$250,000	\$300,000	\$50,000 Increase

From this information, it is reasonable to infer that Western Resources issued stock in exchange for \$50,000 during the year. Of course, it is possible that some of these shares were not issued in exchange for cash. For example, we know from transaction (9) that \$40,000 of this increase in common stock arose as part of a noncash exchange for land. As will be illustrated later, information about significant noncash transactions such as this

must be disclosed somewhere in the financial statement notes and would be used to modify the analysis. By the way, note that we don't use information from the income statement in analyzing transactions impacting the common stock account because transactions in a company's own stock are not reflected in the income statement.

As one other illustration, consider Western Resources' buildings and equipment account. This account is associated with investing activities: Increases in buildings and equipment correspond to purchases of new buildings and equipment and decreases relate to the sale of old buildings and equipment. Western Resources' financial statement notes reveal that a building with an original cost of \$40,000 and accumulated depreciation of \$26,000 was sold during 2013 for \$10,000. Based on this information, and using information from the comparative balance sheets, we can infer that the following buildings and equipment purchases were made during the period.

Beginning buildings and equipment balance . . . . .	\$345,000
+ Purchases during the period . . . . .	?
– Disposals during the period . . . . .	(40,000)
= Ending buildings and equipment balance . . . . .	<u>\$422,000</u>

Calculation reveals that the unknown amount is \$117,000, which is the amount of buildings and equipment purchased during fiscal 2013. Again, we see that we don't need the detail of the cash account to be able to infer the cash inflow and outflow for the company. Our knowledge of accounting allows us to do a little detective work and infer what transactions impacted Western Resources' cash account.

### A 6-Step Process for Preparing a Statement of Cash Flows

The following 6-step process outlines a systematic method that can be used in analyzing the income statement and comparative balance sheets in preparing a statement of cash flows.

1. Compute how much the cash balance changed during the year. The statement of cash flows is not complete until the sum of cash from operating, investing, and financing activities exactly matches the total change in the cash balance during the year.
2. Convert the income statement from an accrual-basis to a cash-basis summary of operations. This is done in three steps.
  - (a) Eliminate expenses that do not involve the outflow of cash, such as depreciation expense.
  - (b) Eliminate gains and losses associated with investing or financing activities to avoid counting these items twice.
  - (c) Adjust for changes in the balances of current operating assets and operating liabilities (usually, but not always, current) because these changes indicate cases in which the operating cash flow associated with an item does not match the revenue or expense reported for that item.

The final result of these adjustments is that net income is converted into cash flow from operating activities.

3. Analyze the long-term assets to identify the cash flow effects of investing activities. Changes in property, plant, and equipment as well as in long-term investments could indicate that cash has either been spent or been received. Also, examine certain investment securities accounts because purchases and sales of some investment securities are classified as investing activities.
4. Analyze the long-term debt and stockholders' equity accounts to determine the cash flow effects of any financing transactions. These transactions include borrowing or

repaying debt, issuing or buying back stock, and paying dividends. Also examine changes in short-term loan accounts; borrowing and repaying under short-term arrangements are also classified as financing activities.

5. Make sure that the total net cash flow from operating, investing, and financing activities is equal to the net increase or decrease in cash as computed in step 1. Then prepare a formal statement of cash flows by classifying all cash inflows and outflows according to operating, investing, and financing activities. The net cash flows from each of the three main activities should be highlighted.
6. Prepare supplemental disclosure, including the disclosure of any significant investing or financing transactions that did not involve cash. This disclosure is made outside the cash flow statement itself. The types of transactions disclosed in this way include the purchase of land by issuing stock and the retirement of bonds by issuing stock. In addition, supplemental disclosure of cash paid for interest expense and taxes is required.

### An Illustration of the 6-Step Process

We will illustrate this 6-step process using the information from the Western Resources example presented earlier. Remember that we will prepare the statement of cash flows without reference to the detailed cash flow information. Thus, we are going to have to make inferences about cash flows by examining the balance sheet and income statement accounts.

**Step 1. Compute How Much the Cash Balance Changed During the Year** Recall that Western Resources began the year with a cash balance of \$55,000 and ended with a cash balance of \$50,600. Thus, our target in preparing the statement of cash flows is to explain why the cash account decreased by \$4,400 during the year.

**Step 2. Convert the Income Statement from an Accrual-Basis to a Cash-Basis Summary of Operations** Recall that converting accrual net income into cash from operations involves eliminating noncash expenses, removing the effects of gains and losses, and adjusting for the impact of changes in current operating asset and liability balances. These adjustments are shown in the work sheet, Exhibit 21-4, and are explained below.

**Depreciation and amortization (adjustments A1 and A2).** The first two adjustments involve adding the amounts of depreciation and amortization expense. Because these expenses do not involve an outflow of cash and because depreciation and amortization were initially subtracted to arrive at net income, these adjustments effectively eliminate depreciation and amortization from the computation of cash from operations. In the far right column of the work sheet in Exhibit 21-4, adjustment A1 results in a \$0 ( $-\$20,900 + \$20,900 = \$0$ ) cash flow effect from depreciation; the same is true of the \$5,000 amortization expense. These adjustments are often the largest adjustments that are made. For example, in 2009, **Time Warner** reported net income of \$2.5 billion and cash flow from operations of \$3.4 billion; its adjustment for depreciation and amortization involved adding \$7.6 billion.

**Gains and losses (adjustments B1 and B2).** Adjustment must also be made for any gains or losses included in the computation of net income. To illustrate the need for this type of adjustment, consider the case of a company that sells some equipment and records a gain on the sale. The cash flow effect of the equipment sale is shown in the Investing Activities section of the cash flow statement. To avoid counting this twice, the gain should be excluded

## EX 21-4 ADJUSTMENTS TO CONVERT WESTERN RESOURCES' ACCRUAL NET INCOME INTO CASH FROM OPERATIONS—WORK SHEET

	Income Statement			Adjustments	Cash Flow from Operations
Sales	\$ 753,800	C1	3,500	Decrease in accounts receivable	\$ 764,300
		C2	7,000	Increase in unearned sales revenue	
Cost of Goods Sold	(524,100)	C3	1,500	Decrease in inventory	(529,300)
		C4	(6,700)	Decrease in accounts payable	
Operating and Administrative Expenses	(146,400)	C5	(4,500)	Increase in prepaid expenses	(150,900)
Depreciation Expense	(20,900)	A1	20,900	Not a cash flow item	0
Amortization Expense	(5,000)	A2	5,000	Not a cash flow item	0
Interest Expense	(3,600)		0	No adjustment	(3,600)
Loss on Sale of Building	(4,000)	B1	4,000	Avoid double counting	0
Restructuring Charge	(11,700)	C6	11,700	Increase in obligation	0
Gain on Sale of Long-Term Investment	6,500	B2	(6,500)	Avoid double counting	0
Income Tax Expense	(24,000)	C7	(2,200)	Decrease in income taxes payable	(23,500)
		C8	2,700	Increase in deferred tax liability	
Net Income	<u>\$ 20,600</u>		<u>36,400</u>		<u>\$ 57,000</u>

© 2012 Cengage Learning.

from the Operating Activities section. However, the gain has already been added in the computation of net income. To exclude the gain from the Operating Activities section, it must be subtracted from net income. If there had been a loss on the equipment sale, that loss would be added back to net income in the Operating Activities section so that it would not impact cash flows from operations.

### FYI

Treatment of gains and losses on investments in the cash flow statement can actually be a bit more complicated than illustrated here. The correct treatment depends on what type of security the investment is (trading, available for sale, etc.) and whether the gain or loss is realized or unrealized. This topic is covered in Chapter 14.

In 2013, Western Resources reported a \$4,000 loss on the sale of a building. The entire \$10,000 cash proceeds from this sale are reported as a cash inflow in the Investing Activities section. To remove this loss from impacting the computation of operating cash flow, it is added (adjustment B1) in Exhibit 21-4. In 2013 Western Resources reported a gain of \$6,500 from selling a long-term investment; this gain is subtracted (adjustment B2) in the Operating Activities section. The full \$102,500 cash flow impact of the sale of this investment is reported in the Investing Activities section.

**Changes in current assets and liabilities.** The remaining adjustments (C1–C8 in Exhibit 21-4) are needed because the computation of accrual net income involves reporting revenues and expenses when economic events occur, not necessarily when cash is received or paid. The timing differences between the receipt or payment of cash and the earning of revenue or the incurring of an expense are reflected in the shifting balances in the current operating assets and liabilities. This is illustrated through a discussion of each of Western Resources' current operating asset and liability accounts.

*Accounts receivable (adjustment C1).* Recall from our analysis earlier in the chapter that the amount of cash Western Resources collected from customers in 2013 differed from sales for the period. In fact, collections exceeded sales by \$3,500, which explains why

the accounts receivable account decreased by \$3,500. In computing cash from operations, an adjustment must be made to increase the accrual-basis sales figure to its cash-basis counterpart. The \$3,500 decrease in accounts receivable is added, as shown in Exhibit 21-4.

*Unearned sales revenue (adjustment C2).* In converting the accrual-based sales into cash collected from customers, we must also make an adjustment for cash received from customers in advance of the revenue being earned. The unearned sales revenue account increased by \$7,000 (from \$25,000 to \$32,000), representing cash received from customers in 2013 that won't be reflected in sales and included in the computation of net income until a subsequent year. The \$7,000 increase reflects an additional amount of cash not yet included in the computation of 2013 net income and is added in the computation of cash from operations, as shown in Exhibit 21-4. This adjustment for unearned revenue is typically a significant item in the cash flow statement of Microsoft because a portion of the selling price of software is considered to be advance payment for technical and support services. In 2009, **Apple's** operating cash flow increased by \$6.9 billion because of an increase in unearned revenue.

*Inventory (adjustment C3).* The statement of cash flows should reflect the amount of cash paid for inventory during the year, which is not necessarily the same as the cost of inventory sold. Western Resources' inventory decreased by \$1,500 (from \$76,500 to \$75,000) during 2013, indicating that the amount of inventory purchased during 2013 was less than the amount of inventory sold. Accordingly, in the computation of cash from operations, we must reduce the cost of goods sold number to reflect the fact that part of the inventory sold this period was actually purchased last period. To reduce cost of goods sold (which is subtracted in the computation of net income), the adjustment involves adding \$1,500, as shown in Exhibit 21-4. As mentioned earlier in the chapter, the inventory increases experienced by rapidly growing companies result in a decrease in cash from operations because the cash is tied up in the form of inventory. In its February 2008 cash flow statement, **Home Depot** reported a reduction of \$491 million in cash from operations stemming from increased inventories.

*Accounts payable (adjustment C4).* The balance in Western Resources' accounts payable account decreased by \$6,700 during 2013. This decrease occurred because Western Resources paid for more than it bought from its suppliers during the year. The adjustment necessary to reflect this additional cash outflow is to subtract \$6,700 in computing cash from operations, shown as adjustment C4 in Exhibit 21-4. On the other hand, an increase in the accounts payable account results in more operating cash flow because cash that otherwise would have been used to pay bills is kept within the business. **Enron**, in its 2000 annual report, provides an example of just how significant this source of cash can be. In computing cash provided by operations, Enron added \$7.167 billion to reflect the effect of an increase in its accounts payable account balance. Perhaps hinting at the troubles that lay ahead in 2001 for Enron, operating cash flow for 2000 would have been negative (by about \$3 billion!) without this addition for an increase in accounts payable.

*Prepaid operating expenses (adjustment C5).* Prepaid operating expenses increased by \$4,500 (from \$12,000 to \$16,500) during 2013. Prepaid expenses are increased when a company pays cash in advance for a service that it will use later. Thus, an increase in prepaid expenses indicates that Western Resources paid \$4,500 over and above its obligation for operating expense services used during the year. Accordingly, the increase in prepaid expenses is subtracted in computing cash from operations, as shown in adjustment C5.

*Restructuring charge (adjustment C6).* Recall from Chapter 4 that a restructuring charge is an accounting estimate of the decrease in value of some assets and the creation of future obligations as a result of the decision to restructure parts of a business. The important point to note is that this charge is an accounting estimate, not necessarily an immediate cash payment. From Western Resources' balance sheet, we can see that the \$11,700 obligation for employee severance benefits recognized in connection with the restructuring charge is still unpaid as of the end of the year. In computing cash from operating activities, the unpaid portion of an obligation associated with a restructuring charge should be added back to net income. In Exhibit 21-4, this adjustment (C6) is shown as an addition of \$11,700, resulting in a net cash flow effect from the restructuring charge of \$0 this year. Restructuring charges also involve asset write-downs, and these also do not require an immediate cash outlay.

*Interest expense.* Because an interest payable account does not exist, we can safely assume that all interest expense was paid for in cash. Therefore, there is no need for an adjustment. If there were an interest payable account, the reasoning used when analyzing the accounts payable account would apply.

*Income tax expense (adjustments C7 and C8).* Computation of cash paid for income taxes requires two adjustments. First, as explained in Chapter 16, the amount of income tax expense reported in the financial statements is not the same as the amount of income tax that is owed to the taxing authorities for the year. Accrual accounting requires the immediate recognition of *all* of the tax effects stemming from a transaction, whether those effects will occur this year or in a subsequent year. Thus, it is quite common for companies to recognize a liability for income taxes that relates to income that was earned in the current year but, according to the tax rules, won't become taxable until a subsequent year. This type of liability is called a *deferred income tax liability*. In 2013 the deferred income tax liability for Western Resources increased by \$2,700, indicating that some of the \$24,000 income tax expense reported won't actually become payable to the taxing authorities until some future year. This means that income taxes owed for 2013 operations are just \$21,300:

Reported income tax expense . . . . .	\$24,000
Less: Increase in deferred income tax liability . . . . .	2,700
Taxes owed for current year operations . . . . .	<u>\$21,300</u>

The effect of the increase in the deferred income tax liability is to reduce the amount of cash paid for income taxes this year; this is shown in adjustment C8. In addition, the Western Resources balance sheet indicates that income taxes payable, which is the liability that relates to the income taxes that are payable to the taxing authorities right now, decreased by \$2,200 during the year. An operating accrual such as income taxes payable is reduced by paying additional cash; this is reflected in adjustment C7.

FYI

The matrix used to illustrate the analysis associated with the Operating Activities section is just one way to do this analysis. A T-account approach is illustrated later in this chapter.

**The direct and indirect methods.** The final task in reporting cash flow from operations relates to preparing the Operating Activities section of the statement of cash flows. Two alternative reporting methods are available: the indirect method and the direct method.

The indirect method begins with net income as reported in the income statement and then details the adjustments needed to arrive at cash flow from operations. Continuing the Western Resources illustration, the indirect method involves reporting the information

**EX 21-5 OPERATING CASH FLOW ITEMS REPORTED UNDER THE INDIRECT METHOD—WORK SHEET**

	Income Statement		Adjustments	Cash Flow from Operations
Sales	\$ 753,800	C1	3,500 Decrease in accounts receivable	\$ 764,300
		C2	7,000 Increase in unearned sales revenue	
Cost of Goods Sold	(524,100)	C3	1,500 Decrease in inventory	(529,300)
		C4	(6,700) Decrease in accounts payable	
Operating and Administrative Expenses	(146,400)	C5	(4,500) Increase in prepaid expenses	(150,900)
Depreciation Expense	(20,900)	A1	20,900 Not a cash flow item	0
Amortization Expense	(5,000)	A2	5,000 Not a cash flow item	0
Interest Expense	(3,600)		0 No adjustment	(3,600)
Loss on Sale of Building	(4,000)	B1	4,000 Avoid double counting	0
Restructuring Charge	(11,700)	C6	11,700 Increase in obligation	0
Gain on Sale of Long-Term Investment	6,500	B2	(6,500) Avoid double counting	0
Income Tax Expense	(24,000)	C7	(2,200) Decrease in income taxes payable	(23,500)
		C8	2,700 Increase in deferred tax liability	
<b>Net Income</b>	<u>\$ 20,600</u>		<u>36,400</u>	<u>\$ 57,000</u>

shown in the shaded segment of the work sheet in Exhibit 21-5. The actual format of the Operating Activities section of the cash flow statement, using the indirect method, is shown in Exhibit 21-6.

Because understanding the adjustments made under the indirect method requires some practice, it is useful at this point to review the rationale behind each addition and subtraction reported in Exhibit 21-6:

- *Add the amount of depreciation and amortization expense.* These amounts are added back to net income because no cash flow was associated with these expenses in the current period.
- *Subtract the amount of gains and add the amount of losses* because the full cash effect of these items is reported in the Investing Activities section. Because gains and losses

**EX 21-6 CASH FROM OPERATING ACTIVITIES: INDIRECT METHOD**

Cash flows from operating activities:	
Net income . . . . .	\$20,600
Adjustments:	
Add Depreciation expense . . . . .	\$20,900
Add Amortization expense . . . . .	5,000
Add Loss on sale of building . . . . .	4,000
Subtract Gain on sale of long-term investment . . . . .	(6,500)
Add Decrease in accounts receivable . . . . .	3,500
Add Increase in unearned sales revenue . . . . .	7,000
Add Decrease in inventory . . . . .	1,500
Subtract Decrease in accounts payable . . . . .	(6,700)
Subtract Increase in prepaid expenses . . . . .	(4,500)

Subtract Decrease in income taxes payable . . . . .	(2,200)
Add Increase in deferred income tax liability . . . . .	2,700
	<u>36,400</u>
Net cash provided by operating activities . . . . .	<u>\$57,000</u>

© 2012 Cengage Learning.

are included in the computation of net income, failing to adjust for them here would result in their being double counted.

- *Add the decrease in Accounts Receivable.* The accounts receivable account decreases when customers pay for more than they purchased this year. Thus, Western Resources has more cash than it would have had if customers had not paid down their accounts.
- *Add the increase in Unearned Sales Revenue.* Unearned Sales Revenue goes up when customers pay for goods or services in advance. Thus, an increase in Unearned Sales Revenue represents cash collected over and above the sales amount.
- *Add the decrease in Inventory.* By allowing the Inventory amount to decrease, Western Resources has conserved cash that otherwise would have been used to purchase inventory.
- *Subtract the decrease in Accounts Payable.* Western Resources paid extra cash to reduce the balance in Accounts Payable.
- *Subtract the increase in Prepaid Operating Expenses.* Western Resources paid extra cash by prepaying for services that it won't use until a future period.
- *Add the increase in Obligation for Employee Severance.* A restructuring charge does not involve an immediate outlay of cash. The increase in this liability indicates that Western Resources has not yet paid any cash associated with the restructuring, so the amount of the increase is added in computing operating cash flow.
- *Subtract the decrease in Income Taxes Payable.* Western Resources paid extra cash to reduce the balance in Income Taxes Payable.
- *Add the increase in Deferred Income Tax Liability.* A portion of income tax expense relates to income taxes that will not become payable until a future year. Accordingly, this portion of income tax expense does not involve a current cash outlay and is added back in computing operating cash flow.

The direct method involves simply reporting the information contained in the last column of the adjustment work sheet, shown as the shaded portion in Exhibit 21-7. The resulting Operating Activities section is given in Exhibit 21-8.

<b>EX 21-7 OPERATING CASH FLOW ITEMS REPORTED UNDER THE DIRECT METHOD</b>					
	<b>Income Statement</b>	<b>Adjustments</b>			<b>Cash Flow from Operations</b>
Sales	\$ 753,800	C1	3,500	Decrease in accounts receivable	\$ 764,300

**Some rules of thumb for the indirect method.** Because the indirect method is the more commonly used of the two methods and because the adjustments required under the indirect method are sometimes difficult to understand, we outline some simple rules to aid in your understanding.

Item	Direction of Change	Necessary Adjustment
Current operating asset	Increase	Subtract the increase
Current operating asset	Decrease	Add the decrease
Current or noncurrent operating liability	Increase	Add the increase
Current or noncurrent operating liability	Decrease	Subtract the decrease

Examples of noncurrent operating liabilities that necessitate adjustments in the computation of operating cash flow are deferred income tax liability and obligation for employee severance, as illustrated in the Western Resources example.

More important than memorizing whether an increase is added or subtracted is understanding the business rationale for doing so. When a current operating asset increases, cash that otherwise would have been available for buying equipment or paying dividends is tied up in the form of that current operating asset. Thus, the current operating asset increase means a decrease in the cash generated by operations. As an example, an Accounts Receivable increase during the year means that cash that could be used for other purposes has not yet been collected from customers. On the other hand, an Accounts Receivable decrease means that, in addition to collecting all cash from sales during the period, the business has also collected enough extra cash to reduce the outstanding balance in Accounts Receivable. In short, current operating assets represent cash tied up in noncash form; an increase in current operating assets means more cash tied up, and a decrease means cash has been freed for other purposes.

In the case of operating liabilities (current and noncurrent), an increase means that more cash is available to the business because the cash was not used to pay the liability. For example, an increase in Accounts Payable means that the amount of cash used to pay suppliers was less than the amount of purchases made during the period. This results in an increase in cash from operations because more cash is available to be used for other purposes within the business. A decrease in Accounts Payable means that extra cash was paid to reduce the balance in the liability account; this extra cash is therefore not available for other uses in the business and represents a decrease in the cash generated by operating activities.

Some old-fashioned people will tell you that it is a waste of time to learn about the direct method because all companies use the indirect method. Well, those old-fashioned

people are wrong on two counts. First, there are a few companies that use the direct method, although so few well-known companies use the direct method that it is difficult to find an example. As a matter of fact, the first hit in an April 2010 search of the SEC archives for companies using the direct method was **PT Telekomunikasi Indonesia**, the largest telecommunications company in Indonesia. Not exactly a household name in the United States. Second, both the FASB and the IASB are formally on record as preferring the direct method over the indirect method. And, as described in more detail later in the chapter, the FASB and the IASB currently are circulating a proposal that would make the direct method *mandatory*. So, the best thing for you to do is to use the matrix format illustrated in this textbook and become comfortable with both the direct and indirect methods.

### Step 3. Analyze the Long-Term Assets to Identify the Cash Flow Effects of Investing Activities

Western Resources reports four long-term asset accounts.

- Long-Term Investments
- Land
- Buildings and Equipment
- Patents

We will analyze each of these in turn to determine how much cash flow was associated with each during 2013.

**Long-term investments.** The long-term investments account was reduced by \$96,000 (\$106,000 – \$10,000) during the year. This could be a combination of the purchase of new investments and the sale of old investments. We must rely on supplemental information outside the financial statements to determine whether any new long-term investments were purchased during the year. In this case, none were, indicating that the entire \$96,000 reduction in the account balance represents the book value of long-term investments sold during the year. To calculate the amount of cash collected from this sale, we must use income statement information to determine whether there was a gain or loss on the sale. Computation of the cash proceeds is as follows:

Book value of long-term investments sold .....	\$ 96,000
Plus: Gain on sale .....	6,500
Cash proceeds .....	<u>\$102,500</u>

**Land.** The land account increased by \$108,500 (\$183,500 – \$75,000) during the year. Again, this could be a combination of purchases and sales of land. Because there is no indication of land sales during the year, we conclude that the \$108,500 represents the price of new land purchased during the year. One additional element arises in this case; the entire purchase price was not paid in cash. Supplemental information tells us that payment for the land was a combination of \$68,500 of cash and common stock valued at \$40,000. Only the \$68,500 cash outlay for the land will be shown in the cash flow statement; the \$40,000 in common stock exchanged for the land will be disclosed separately in the notes to the financial statements, as illustrated later.

**Buildings and equipment.** The balance in Western Resources' buildings and equipment account increased by \$77,000 (\$422,000 – \$345,000) during 2013. In the absence of any other information, this increase would suggest that Western Resources purchased buildings and equipment with a cost of \$77,000. In this case, however, additional information is

available, indicating that buildings and equipment with an original cost of \$40,000 were sold for \$10,000 during the year. This \$10,000 cash proceeds from the sale is a cash inflow from investing activities. When this information is combined with the fact that the beginning balance in PP&E was \$345,000, we can make the following computation:

Beginning buildings and equipment balance	.....	\$345,000
– Original cost of buildings and equipment sold during the year	.....	(40,000)
= Ending buildings and equipment balance without additional purchases	.....	<u>\$305,000</u>

The actual ending balance sheet for Western Resources reports a buildings and equipment balance of \$422,000. We can therefore infer that Western Resources purchased buildings and equipment for \$117,000 (\$422,000 – \$305,000) to account for the difference. This \$117,000 purchase of buildings and equipment represents cash used for investing activities.

A useful way to summarize all purchase and sale information for buildings and equipment is to reconstruct the T-accounts for both the buildings and equipment account and the associated accumulated depreciation account. Those T-accounts appear as follows:

Buildings and Equipment				Accumulated Depreciation			
Beginning	345,000		Historical cost of items sold	Accum. depr. on items sold	198,500	20,900	Beginning
Purchases	<u>117,000</u>	40,000		<u>26,000</u>			Depr. exp.
Ending	422,000				193,400		Ending

The amounts in boxes (amount of purchases and amount of accumulated depreciation associated with the items sold) are those amounts that can be inferred given the other information. With this information, we can compute whether the sale of buildings and equipment resulted in a gain or in a loss as follows:

Cash proceeds (given earlier)	.....	\$10,000
Book value of items sold (\$40,000 – \$26,000)	.....	<u>14,000</u>
Loss on sale of buildings and equipment	.....	<u>\$ (4,000)</u>

The existence of a \$4,000 loss is confirmed by examination of the Western Resources income statement information. Note that with the income statement information and the amounts inferred using these T-accounts, we could have traced backward and computed the cash proceeds from the sale of the buildings and equipment. The T-accounts are very useful devices for structuring the information that we have so that we can infer the missing values needed to complete the statement of cash flows.

**Patents.** Finally, the patents account began the year with a \$40,000 balance and ended with a \$35,000 balance. This decrease arose as follows:

Beginning Patents	.....	\$40,000
– Patent amortization recognized during the year	.....	(5,000)
+ New patents purchased during the year	.....	???
= Ending Patents	.....	<u>\$35,000</u>

The numbers indicate that no new patents were purchased during the year. Thus, there were no investing cash flow implications for the change in the patent balance because the entire change in the patent balance is explained by the patent amortization expense for the year.

One additional item must be considered before we can complete the Investing Activities section of the statement of cash flows. Although investment securities are not always long-term assets, their purchase and sale are sometimes reported as investing activities. Specifically, purchases and sales of available-for-sale and held-to-maturity securities are reported as part of investing activities whereas purchases and sales of trading securities are usually part of operating activities.<sup>1</sup> For Western Resources, the balance in the available-for-sale securities account increased by \$2,000 (\$12,000 – \$10,000). As explained in Chapter 14, this increase could have arisen because of an increase in the market value of existing available-for-sale securities. If this were the case, no cash flow impact would be reported. In this case, we have to rely on other information to confirm that the increase came from the purchase of new securities for cash. This \$2,000 cash outflow for the purchase of available-for-sale securities is reported as part of investing activities.

The Investing Activities section of the statement of cash flows for Western Resources is as follows:

Cash flows from investing activities:

Sold building .....	\$ 10,000
Sold long-term investment .....	102,500
Purchased available-for-sale securities .....	(2,000)
Purchased land .....	(68,500)
Purchased buildings and equipment .....	(117,000)
Net cash used by investing activities .....	<u>\$ (75,000)</u>

This Investing Activities section, which we just constructed using balance sheet, income statement, and financial statement note information, would be identical to one prepared using detailed cash transaction data. With a solid understanding of accounting, we can infer the cash flow effects of transactions without having access to all the details.

#### **Step 4. Analyze the Long-Term Debt and Stockholders' Equity Accounts to Determine the Cash Flow Effects of any Financing Transactions**

Long-term debt accounts increase when a company borrows more money—an inflow of cash—and decrease when the company pays back the debt—an outflow of cash. In the case of Western Resources, we observe that the company's balance in Long-Term Debt increased by \$20,000 (\$20,000 – \$0) during the year. Accordingly, we can infer that Western Resources borrowed an additional \$20,000 during 2013. This \$20,000 in new borrowing represents cash provided by financing activities. The same analysis applies to short-term debt; the increase of \$7,500 (\$24,500 – \$17,000) during the year represents a cash inflow from financing activities arising from new short-term loans.

The \$50,000 (\$300,000 – \$250,000) increase in Western Resources' common stock account during the year potentially represents a cash inflow from the issuance of new shares of stock. However, as mentioned earlier, additional information indicates that \$40,000 of this increase arose from the exchange of common stock for land. Accordingly, the actual cash generated by the issuance of new shares during the year is just \$10,000 (\$50,000 – \$40,000). This cash inflow is reported as part of cash from financing activities.

When companies repurchase some of their own common stock during the year, the price paid to repurchase the stock is shown as a reduction in stockholders' equity and is usually labeled *treasury stock*. Thus, an increase in the treasury stock account reflects a cash repurchase of the company's own shares. The balance in Western Resources' treasury stock account increased by \$3,200 (\$59,700 – \$56,500) during the year. Thus, Western

<sup>1</sup> FASB ASC paragraph 320-10-45-11.

Resources should report a cash outflow of \$3,200 from treasury stock purchases in the Financing Activities section.

The retained earnings account increases from the recognition of net income (an operating activity), decreases as a result of net losses (also an operating activity), and decreases through the payment of dividends (a financing activity). In the absence of detailed information, it is possible to infer the amount of dividends declared by identifying the unexplained change in the retained earnings account balance. An efficient way to do this is to recreate the retained earnings T-account as follows:

Retained Earnings		
	234,300	Beginning
Dividends declared	<u>25,100</u>	Net income
	229,800	Ending

The increase in the Western Resources’ dividends payable account during the year indicates that not all of the \$25,100 in dividends declared were paid in cash during the year. Computation of the amount of cash paid for dividends during the year is as follows:

Dividends declared	\$25,100
Less: Increase in dividends payable	<u>4,400</u>
Cash paid for dividends	<u>\$20,700</u>

Of course, it is usually the case that the amount of dividends paid is disclosed somewhere in the financial statements. However, you never know the level of detailed information to which you will have access. After all, it is a relatively simple (and fun!) analytical exercise.

The following information summarizes the cash flow effects of Western Resources’ financing activities during 2013:

Cash flows from financing activities:	
Issued common stock	\$ 10,000
Borrowed short-term debt	7,500
Borrowed long-term debt	20,000
Paid dividends	(20,700)
Treasury stock purchases	<u>(3,200)</u>
Net cash provided by financing activities	<u>\$ 13,600</u>

Again, and not surprisingly, this section of Western Resources’ statement of cash flows would be identical to the one prepared using the detailed cash information. We hope that you are convinced that if you know enough about accounting, you can conduct some powerful analyses using very limited information.

**Step 5. Prepare a Formal Statement of Cash Flows** Based on our analyses of the income statement and balance sheet accounts, we have identified all inflows and outflows of cash for Western Resources for 2013, and we have categorized those cash flows based on the type of activity. The resulting statement of cash flows (prepared using the indirect method, which is by far the more common method of presentation) is shown in Exhibit 21-9.

The FASB’s decision to classify interest paid as part of operating activities was a controversial one. In fact, many users do not consider cash paid for either interest or

## 21-9 STATEMENT OF CASH FLOWS FOR WESTERN RESOURCES FOR FISCAL 2013

Western Resources Statement of Cash Flows For the Year Ended December 31, 2013		
Cash flows from operating activities:		
Net income . . . . .		\$ 20,600
Adjustments:		
Add Depreciation expense . . . . .	\$ 20,900	
Add Amortization expense . . . . .	5,000	
Add Loss on sale of building . . . . .	4,000	
Subtract Gain on sale of long-term investment . . . . .	(6,500)	
Add Decrease in accounts receivable . . . . .	3,500	
Add Increase in unearned sales revenue . . . . .	7,000	
Add Decrease in inventory . . . . .	1,500	
Subtract Decrease in accounts payable . . . . .	(6,700)	
Subtract Increase in prepaid expenses . . . . .	(4,500)	
Add Increase in restructuring charge obligation . . . . .	11,700	
Subtract Decrease in income taxes payable . . . . .	(2,200)	
Add Increase in deferred income tax liability . . . . .	<u>2,700</u>	<u>36,400</u>
Net cash provided by operating activities . . . . .		\$ 57,000
Cash flows from investing activities:		
Sold building . . . . .	\$ 10,000	
Sold long-term investment . . . . .	102,500	
Purchased available-for-sale securities . . . . .	(2,000)	
Purchased land . . . . .	(68,500)	
Purchased buildings and equipment . . . . .	<u>(117,000)</u>	
Net cash used by investing activities . . . . .		(75,000)
Cash flows from financing activities:		
Issued common stock . . . . .	\$ 10,000	
Borrowed short-term debt . . . . .	7,500	
Borrowed long-term debt . . . . .	20,000	
Paid dividends . . . . .	(20,700)	
Treasury stock purchases . . . . .	<u>(3,200)</u>	
Net cash provided by financing activities . . . . .		<u>13,600</u>
Net decrease in cash . . . . .		\$ (4,400)
Beginning cash balance . . . . .		<u>55,000</u>
Ending cash balance . . . . .		<u>\$ 50,600</u>

© 2012 Cengage Learning.

income taxes to be part of operating cash flow. As a compromise, the FASB requires companies to separately disclose the amount of cash paid for interest and for income taxes during the year. This allows users to recast and reclassify the reported cash flow numbers into the format they think is more useful. When the direct method is used, the amounts of cash paid for interest and for income taxes are part of the Operating Activities section, so no additional disclosure is needed. When the indirect method is used, as in Exhibit 21-9, these amounts must be shown separately, either at the bottom of the cash flow statement or in an accompanying note. For example, as you saw in Exhibit 21-1, Intel uses the indirect method and discloses separately at the bottom of its statement of cash flows that \$4 million and \$943 million were paid in 2009 for interest and income taxes, respectively.

Remember, if you have access to the details of the cash account, a statement of cash flows can be easily prepared. Also, if operating cash flow is reported using the direct method, the cash flow statement can be easily understood. However, it is likely that at some point you will need to construct a cash flow statement using summary balance sheet

and income statement data. In addition, most cash flow statements that you encounter will use the indirect method. The adjustments required to compute cash flow numbers can be confusing if you have no understanding of the “why” behind the adjustments. This section has covered the “gory” details of preparing a statement of cash flows to help you gain an understanding of why the adjustments are made.

**Step 6. Prepare Supplemental Disclosure** Three categories of supplemental disclosure are associated with the statement of cash flows. These are as follows:

- Cash paid for interest and income taxes
- Reconciliation schedule
- Noncash investing and financing activities

**Cash paid for interest and income taxes.** As mentioned previously, the FASB requires separate disclosure of the cash paid for interest and for income taxes during the year. When the direct method is used, the amounts of cash paid for interest and for income taxes are part of the Operating Activities section, so no additional disclosure is needed. When the indirect method is used, these amounts must be shown separately, either at the bottom of the cash flow statement or in an accompanying note. In the case of Western Resources, the supplemental information might be presented as follows:

Supplemental Disclosure:

Cash paid for interest . . . . .	\$ 3,600
Cash paid for income taxes . . . . .	23,500

**Reconciliation schedule.** An important aspect of the indirect method is that it highlights the differences between net income and cash from operations. This comparison is absent when the direct method is used. The FASB concluded that this comparison is of such value to financial statement users that when the direct method is used, a schedule should be included that reconciles net income to cash from operations. Fortunately, you don’t have to learn anything new because the schedule is the same as the Operating Activities section prepared using the indirect method (the middle column in our work sheets). So, when a company uses the direct method, in essence it provides both operating cash flow computations: the direct method in the body of the cash flow statement and the indirect method as a supplemental schedule. When the indirect method is used, no additional reconciliation schedule is necessary.

**Noncash investing and financing activities.** When a company has significant noncash transactions, such as purchasing property, plant, and equipment by issuing debt or in exchange for shares of stock, these transactions must be disclosed in the notes to the financial statements. In 2013, Western Resources had one such transaction: the exchange of common stock for land valued at \$40,000. The existence of this transaction would be reported in the financial statements either as a note at the bottom of the statement of cash flows or in a separate financial statement note. As another example of this type of noncash transaction, **Wal-Mart** discloses at the bottom of its January 2010 statement of cash flows that during the year it used capital lease arrangements to acquire property, plant, and equipment worth \$61 million. A capital lease is a long-term, noncancelable lease that effectively serves as mortgage financing for the acquisition of assets. Acquiring assets using capital leases does not require the immediate outlay of cash in the full amount of the lease, so a capital lease constitutes a significant noncash transaction. Capital leases were explained in detail in Chapter 15.

## FASB CODIFICATION

**The Issue:** As a part-time job while you are attending school, you are the accountant for a local equipment rental company. The company needs financing for a major expansion and so is preparing to seek a sizeable bank loan. You have been asked to prepare the financial statements in advance of this loan application. Most of this preparation is routine, but you have come across one vexing issue. The company has two types of equipment. One type is maintained strictly for rental purposes; these items are rarely sold. Items in this set include large construction cranes and concrete pumper extensions. The other type of equipment is usually rented for a few months and then sold. Items in this set include pressure washers and concrete saws.

You are wondering how the cash spent to buy these two different types of equipment should be classified in the statement of cash flows. Are these operating cash outflows or investing cash outflows? You could call the local CPA who sometimes does consulting work for your company, but you would prefer to add to your personal credibility by finding out the answer yourself.

**The Question:** When equipment is purchased to then be rented, and sometimes sold, should the cash paid to purchase the equipment be classified as an operating cash outflow or as an investing cash outflow?

**Searching the Codification:** OK, let's just dig in and find the answer. Start by locating Topic 230 under the "Presentation" tab in the FASB ASC home page. None of those industry-specific sets of standards seem applicable here, so click to open up the menu under "Overall." This is a presentation matter and relates to how cash flows should be classified. Finally, the issue here is how the cash flows associated with a certain activity (purchase of equipment to be rented and then, perhaps, sold) should be classified when there appear to be two classes of cash flows (operating and investing) involved.

**The Answer:** The correct treatment is described on page 21-45.

## International Cash Flow Statements

2

Understand the differences among cash flow statements prepared according to U.S. GAAP and IASB standards.

**WHY** The primary differences in cash flow reporting around the world relate to alternative classifications of selected cash transactions such as payment of interest and income taxes.

**HOW** Relative to U.S. GAAP, IAS 7 allows greater flexibility in classifying cash transactions such as interest and dividends paid and received and income taxes paid. In the United Kingdom, FRS 1 specifies eight different categories for classifying cash flow transactions.

With the adoption of pre-codification *FASB Statement No. 95* in 1987, the FASB set the benchmark for cash flow reporting around the world. Before that time, cash flow reporting was either ignored or done using an antiquated "funds flow" approach. It wasn't until 1992 that the International Accounting Standards Board (IASB) adopted a comparable cash flow standard, *IAS 7*. In this section, the provisions of *IAS 7* are compared to those of U.S. GAAP (now contained in FASB ASC Topic 230). In addition,

the U.K. standard for cash flow reporting is also examined. As will be seen, the primary differences in cash flow reporting around the world relate to alternative classifications of selected cash transactions.

### International Accounting Standard 7

*IAS 7* closely matches the provisions of the U.S. cash flow reporting standard, with the primary difference being greater flexibility in classifying cash transactions as either operating, investing, or financing. The IASB opted to allow more company discretion in deciding how to classify items such as interest and dividends paid and received. Within the FASB, there was great debate about how these items should be classified, but the final version of the U.S. standard mandates that these items be classified as operating activities. The more flexible standard of the IASB is discussed next.

**Interest and Dividends Received** When the FASB adopted pre-codification *SFAS No. 95* in 1987, three of the seven Board members objected to the classification of interest and dividends received as operating activities. Those three Board members argued that interest and dividends received were investing activities since they represent returns on investments in debt and equity securities. Ultimately, the majority of the FASB decided that, because interest and dividends received are included in the computation of net income, they should be classified as operating activities. In *IAS 7*, the IASB acknowledges the merits of both sides of the philosophical debate over classifying interest and dividends received, as discussed earlier, and allows companies to classify them as either operating or investing activities.

**Interest Paid** The same three FASB members also objected to the classification of interest paid as an operating activity. They contended that interest paid is the cost of obtaining financing and should be classified as a financing activity. Again, the majority of the FASB voted to classify interest paid as an operating activity because it is included in the computation of net income. The provisions of *IAS 7* allow interest paid to be classified as either an operating activity or a financing activity; whichever classification is chosen, it should be applied on a consistent basis.

**Dividends Paid** *IAS 7* allows dividends paid to be classified as either a financing activity (as in the United States) or as an operating activity. The rationale for allowing dividend payments to be classified as operating activities is that this classification helps investors determine whether the operations of the business have the ability to generate enough cash to support the continued payment of dividends. This reasoning seems a little dubious and has led some to criticize *IAS 7* of not being an effective accounting standard because it allows too much classification flexibility.

**Income Taxes** According to *IAS 7*, the amount of income taxes paid should be reported as an operating activity unless the income taxes can be specifically identified with a financing or an investing activity. For example, if the disposal of equipment results in a gain on which income taxes are paid, those income taxes could be classified as a cash outflow from an investing activity. The FASB considered this approach and rejected it as being too complex and arbitrary and not worth the benefit that it might provide to

financial statement users. No matter how income taxes are classified, *IAS 7* requires separate disclosure of the total amount of income taxes paid for the period.

### United Kingdom Cash Flow Standard, *FRS 1*

The accounting standard setters in the United Kingdom first adopted a cash flow standard in 1991. In recognition of the fact that the cash flow statement has become an increasingly important addition to the set of primary financial statements, the U.K. Accounting Standards Board (ASB) revised its standard in 1996. The revised version of *Financial Reporting Standard (FRS) 1* specifies eight different categories for classifying cash flow transactions and represents the most innovative and, probably, the most useful standard for cash flow reporting currently in existence in the world. Because of the flexibility in the current version of *IAS 7*, both the U.S. approach in FASB ASC Topic 230 and the U.K. approach in *FRS 1* are in conformity with the international standard.

**The Eight Cash Flow Categories** The eight cash flow categories specified in *FRS 1* are as follows:

1. Operating activities
2. Returns on investments and servicing of finance
3. Taxation
4. Capital expenditure and financial investment
5. Acquisitions and disposals
6. Equity dividends paid
7. Management of liquid resources
8. Financing

The U.K. amount reported as cash from operating activities excludes items such as interest and income taxes that are included in the U.S. measure of operating cash flow but that are widely viewed as being nonoperating activities. As a result, the U.K. measure of “operating” cash flow is more precise than is the U.S. measure. For example, as discussed earlier, reasonable people can disagree about the classification of interest and dividends received and interest paid. In recognition of this fact, *FRS 1* dictates that these items be reported in a separate category. Income taxes paid and dividends paid are also reported in their own separate categories. Finally, *FRS 1* requires U.K. companies to report an amount called *management of liquid resources*, which summarizes the net amount of cash used to purchase and sell short-term investment securities; in the United States no separate category is reported because these items are typically considered to be cash equivalents.

**Example: Tesco** Tesco is one of the largest supermarket chains in the United Kingdom, and the company is also expanding its international operations, nonfood business, and service businesses. Tesco’s 2009 cash flow statement is reproduced in Exhibit 21-10. In the notes to its financial statements, Tesco reports the following about the standards it used in preparing its 2009 financial statements:

The consolidated financial statements have been prepared in accordance with International Financial Reporting Standards (IFRS) and International Financial Reporting Interpretation Committee (IFRIC) interpretations as endorsed by the European Union.

**EX 21-10 STATEMENT OF CASH FLOWS FOR TESCO FOR FISCAL 2009**

<b>Tesco</b>		
<b>Group Cash Flow Statement</b>		
<b>53 weeks ended 28 February 2009</b>		
	<b>2009</b>	<b>2008</b>

Effect of foreign exchange rate changes . . . . .	120	(55)
<b>Cash and cash equivalents at end of year . . . . .</b>	<b><u>3,509</u></b>	<b><u>1,788</u></b>

© 2012 Cengage Learning.

However, as mentioned above, the international standard contained in *IAS 7* is quite flexible. It appears that Tesco's cash flow statement is an artful combination of adherence to IFRS while at the same time providing almost all the information required under the U.K. standard in *FRS 1*. For example, note the following:

- Tesco reports two operating cash flow numbers—"cash generated from operations" and "net cash from operating activities." The primary number is "net cash from operating activities," and this number satisfies the general requirements of *IAS 7*, but the "cash generated from operations" number is in conformity with the required categorizations under *FRS 1*.

- To allow financial statement users to recreate the other categories required under *FRS 1*, Tesco separately lists cash paid for interest, cash paid for taxes, cash received for dividends, and cash received for interest. This separate disclosure allows for the computation of the *FRS 1* numbers “returns on investments and servicing of finance” and “taxation.”
- The line items reported in the “Cash Flows from Investing Activities” section allow the financial statement user to compute the cash flows associated with acquisitions and disposals as well as with net capital expenditures. Again, this satisfies the requirements of both *IAS 7* and *FRS 1*.

**Summary of FRS 1** As seen in Tesco’s cash flow statement, the provisions of *FRS 1* result in companies in the United Kingdom providing a more detailed breakdown of the types of activities that create cash inflows and outflows than is required under either U.S. GAAP or IFRS. In terms of benefits to financial statement users, it appears that the focus on cash flow reporting required by *FRS 1* makes the U.K. standard the premier cash flow standard in the world.

**FASB-IASB Project on Financial Statement Presentation** As mentioned in Chapter 3, the FASB and IASB are in the middle of major project aimed at restructuring the way information is displayed in the three primary financial statements. The focus of this effort is to give financial statement users a coherent picture, across all three financial statements, of a company’s operating, investing, and financing activities. The FASB and IASB plan to have a final standard issued in 2011.

So, will you have to learn a completely new set of statement of cash flows principles? No. And even better, you already have a good idea of what the future statement of cash flows is going to look like because the joint FASB–IASB proposal is staying close to what you have just read about with respect to the U.K. standard, *FRS 1*. This should not be too surprising because we (the authors) having been saying for several editions of this textbook that *FRS 1* is (to quote ourselves) “the premier cash flow standard in the world.” Some of the changes that will be seen in U.S. GAAP are as follows.

- This will be a true cash flow statement, not a “cash and cash equivalents” flow statement. Accordingly, the statement will focus on cash only, and any changes in short-term liquid investments will be shown separately, as in the “management of liquid resources” section required under *FRS 1*.
- The FASB and IASB have tentatively agreed to require the direct method of reporting operating cash flow. However, there will also be an additional requirement to show a reconciliation between operating cash flow and operating income. This reconciliation will look very much like the indirect method.
- Cash flows related to income taxes are to be reported separately, as under *FRS 1*.
- Cash flows associated with non-operating income, such as dividends and interest received on investments, are to be reported outside of operating activities.
- The cash flows associated with financing activities, such as interest paid, are to be reported outside of operating activities.

In summary, there will be significant changes to the details of the statement of cash flows, but your study of this chapter prepares you completely for understanding those changes.

## Expanded Illustration of Statement of Cash Flows

3

Incorporate material from the entire text into the preparation of a statement of cash flows.

**WHY** Preparing a complete statement of cash flows for a company with many accounts and a variety of complex transactions requires a systematic approach to ensure that you don't miss anything.

**HOW** Preparation of a complex statement of cash flows is greatly aided by T-account analysis of each balance sheet account.

The basic techniques for preparing a statement of cash flows were first explained in Chapter 5 and then reviewed in the first part of this chapter. More complex circumstances have been addressed as the topics have come up in subsequent chapters. Here we present an expanded problem that illustrates many of the cash flow issues that have been treated in the text. The example also demonstrates a T-account approach to preparing the statement of cash flows.

The following comparative balance sheets for December 31, 2013, and December 31, 2012, are for Willard Company.

<b>Willard Company Comparative Balance Sheet December 31, 2013 and 2012</b>		
	<b>2013</b>	<b>2012</b>
<b>Assets</b>		
Cash and cash equivalents . . . . .	\$ 42,400	\$ 180,000
Investment securities (net) . . . . .	47,000	0
Accounts receivable . . . . .	400,000	345,000
Allowance for bad debts . . . . .	(20,000)	(31,000)
Inventories . . . . .	680,000	643,000
Property, plant, and equipment . . . . .	810,500	743,400
Accumulated depreciation . . . . .	(229,000)	(228,000)
Total assets . . . . .	<u>\$1,730,900</u>	<u>\$1,652,400</u>
<b>Liabilities and Stockholders' Equity</b>		
Accounts payable . . . . .	\$ 46,000	\$ 103,000
Short-term notes payable . . . . .	100,000	120,000
Accrued liabilities . . . . .	76,500	48,000
Bonds payable . . . . .	250,000	278,000
Discount on bonds payable . . . . .	(19,600)	(20,800)
Deferred income tax liability . . . . .	108,000	97,000
Total liabilities . . . . .	<u>\$ 560,900</u>	<u>\$ 625,200</u>
Common stock, \$10 par . . . . .	\$ 840,000	\$ 790,000
Paid-in capital in excess of par . . . . .	52,000	20,000
Retained earnings . . . . .	301,000	217,200
Other equity . . . . .	(23,000)	0
Total stockholders' equity . . . . .	<u>\$1,170,000</u>	<u>\$1,027,200</u>
Total liabilities and stockholders' equity . . . . .	<u>\$1,730,900</u>	<u>\$1,652,400</u>

Additional information includes:

1. Net income for the year ended December 31, 2013, was \$175,300. There were no extraordinary items.
2. During 2013, uncollectible accounts receivable of \$43,000 were written off. Bad debt expense for the year was \$32,000.
3. During 2013, machinery and land were purchased at a total cost of \$115,100.
4. Machinery with a cost of \$48,000 and a book value of \$4,200 was sold for \$3,600.
5. The bonds payable mature at the rate of \$28,000 every year.
6. In January 2013, the company issued an additional 1,000 shares of its common stock at \$14 per share.
7. In May 2013, the company declared and issued a 5% stock dividend on its outstanding stock; there were 80,000 shares of stock outstanding at the time, and the market value per share after the stock dividend was issued was \$17.
8. During the year, cash dividends of \$20,000 were paid on the common stock.
9. In November 2013, 1,000 shares of treasury stock were purchased for \$20 per share. Willard uses the cost method.
10. The notes payable relate to operating activities.
11. During 2013, a prior-period adjustment was made to correct an understatement of depreciation on equipment. The amount of the adjustment was \$3,500 after taxes.
12. During the year, investment securities were purchased for \$50,000. As of December 31, 2013, the securities have a market value of \$47,000. The securities are classified as available-for-sale securities.
13. Depreciation expense for the year totaled \$41,300.

The preparation of the statement of cash flows will be illustrated using the indirect method of determining cash flows from operations. The analysis uses T-accounts, which are shown below and on the following page. Explanations for the individual adjustments and the related entries that are recorded in the T-accounts follow the T-accounts. These entries and T-accounts are only presented to aid in the preparation of the statement of cash flows; the entries are not actually posted to the accounts and the T-accounts do not represent actual ledger accounts. The letter preceding each explanation corresponds with that used in the T-accounts.

Cash Flows—Operating		Cash Flows—Investing	
(a)	175,300	(g)	3,600

(j)	3,000		
End. bal.	23,000		

(a) Net income is recorded as follows:

Cash Flows—Operating	175,300
Retained Earnings	175,300

(b) Cash dividends paid are recorded as follows:

Retained Earnings	20,000
Cash Flows—Financing	20,000

(c) The 5% stock dividend results in a transfer of Retained Earnings to Common Stock at Par and to Paid-In Capital in Excess of Par. However, the stock dividend has no effect on cash. The amount of the transfer is the number of new shares (80,000 × 0.05 = 4,000) multiplied by the market value of the new shares (\$17):

Retained Earnings	68,000
Common Stock, \$10 par	40,000
Paid-In Capital in Excess of Par	28,000

- (d) The recognition that depreciation had been understated in prior periods is recorded by a debit to Retained Earnings and a credit to Accumulated Depreciation. This correction of earnings of prior periods has no effect on cash:

Retained Earnings .....	3,500	
Accumulated Depreciation .....		3,500

- (e) The purchase of the treasury shares is a financing activity and, because the cost method is used, is recorded as follows:

Other Equity .....	20,000	
Cash Flows—Financing .....		20,000

- (f) The purchase of the machinery and land is recorded as follows:

Property, Plant, and Equipment .....	115,100	
Cash Flows—Investing .....		115,100

- (g) The amount of cash received in the sale of machinery was \$3,600, and this is shown as cash provided by investing activities. The sale involved a loss of \$600. Because this loss reduced net income but involved no cash effects beyond the \$3,600 received, the \$600 must be added to cash flows from operating activities to avoid understating the cash effect of the transaction:

Cash Flows—Investing .....	3,600	
Accumulated Depreciation .....	43,800	
Cash Flows—Operating .....	600	
Property, Plant, and Equipment .....		48,000

- (h) Depreciation reduces net income but does not involve cash, so the following adjustment to cash flows is necessary:

Cash Flows—Operating .....	41,300	
Accumulated Depreciation .....		41,300

- (i) The purchase of investment securities that are available-for-sale or held-to-maturity is an investing activity; purchase of trading securities is usually an operating activity. The necessary entry is:

Investment Securities—Available-for-Sale .....	50,000	
Cash Flows—Investing .....		50,000

- (j) A decline in the market value of the investment securities caused them to be written down. Because the securities are classified as available-for-sale, the \$3,000 write-down reduced equity but did not impact net income; no cash is involved:

Other Equity .....	3,000	
Investment Securities—Available-for-Sale .....		3,000

- (k) Bonds retired for \$28,000 during the year resulted in an outflow of cash for financing activities:

Bonds Payable .....	28,000	
Cash Flows—Financing .....		28,000

- (l) The amortization of bond discount represents another item that reduced net income but did not involve cash. The necessary adjustment to cash flows is as follows:

Cash Flows—Operating .....	1,200	
Discount on Bonds Payable .....		1,200

- (m) The \$11,000 increase in Deferred Income Tax Liability is added back to cash flows provided by operating activities because it represents income taxes recognized as an expense of the current period for which no cash was paid:

Cash Flows—Operating	11,000	
Deferred Income Tax Liability		11,000

- (n) The issuance of new common stock is shown as an increase in cash from financing activities:

Cash Flows—Financing	14,000	
Common Stock, \$10 par		10,000
Paid-In Capital in Excess of Par		4,000

Cash flows from operating activities must be adjusted for changes in the levels of current assets and current liabilities. These adjustments follow. The simplest way to handle bad debt expense and account write-offs is to make the adjustment using the net receivable balance. If this is done and the indirect method is used, no special adjustments are required.

(o) Accounts Receivable (net)	66,000	
Cash Flows—Operating		66,000
(p) Inventories	37,000	
Cash Flows—Operating		37,000
(q) Accounts Payable	57,000	
Cash Flows—Operating		57,000
(r) Short-Term Notes Payable	20,000	
Cash Flows—Operating		20,000
(s) Cash Flows—Operating	28,500	
Accrued Liabilities		28,500

After all changes in account balances for the year have been reconciled, the balances in the three cash flows T-accounts are transferred to a summary account. The \$137,600 excess credit amount in this summary account represents a net decrease in cash for the year. The final entry records this decrease in the cash account and completes the analysis:

(t) Net Decrease in Cash	137,600	
Cash and Cash Equivalents		137,600

The formal statement of cash flows is prepared using the data in the three cash flows T-accounts.

**Willard Company**  
**Statement of Cash Flows**  
**For the Year Ended December 31, 2013**

Cash flows from operating activities:	
Net income	\$ 175,300
Adjustments:	
Loss on sale of machinery	600
Depreciation expense	41,300
Amortization of bond discount	1,200
Increase in deferred income tax liability	11,000
Increase in net accounts receivable	(66,000)
Increase in inventories	(37,000)

(Continued)

Decrease in accounts payable . . . . .	(57,000)	
Decrease in short-term notes payable . . . . .	(20,000)	
Increase in accrued liabilities . . . . .	28,500	
Net cash provided by operating activities . . . . .		\$ 77,900
Cash flows from investing activities:		
Purchase of machinery and land . . . . .	\$(115,100)	
Sale of machinery . . . . .	3,600	
Purchase of investment securities . . . . .	(50,000)	
Net cash used in investing activities . . . . .		(161,500)
Cash flows from financing activities:		
Payment of cash dividends . . . . .	\$ (20,000)	
Purchase of treasury stock . . . . .	(20,000)	
Retirement of bonds payable . . . . .	(28,000)	
Issuance of common stock . . . . .	14,000	
Net cash used in financing activities . . . . .		(54,000)
Net decrease in cash . . . . .		\$(137,600)
Cash and cash equivalents, beginning of year . . . . .		180,000
Cash and cash equivalents, end of year . . . . .		\$ 42,400

An essential element in the preparation of a statement of cash flows is the systematic consideration of every single item listed in the balance sheet and the income statement. An advantage of the T-account approach illustrated in this Willard Company example is that the approach forces you to explain the changes in balance during the year of every single balance sheet account. Use of a systematic approach such as this ensures that you don't overlook any potential inflows or outflows of cash as you prepare the statement of cash flows.

## Cash Flow Analysis

4

Perform a detailed case analysis of a company's operations and performance using cash flow data.

**WHY** Analysis of cash flow data can add additional insight into the performance of a company, over and above what can be learned by analyzing the balance sheet and the income statement.

**HOW** For many nonpublic companies in the United States, only a balance sheet and an income statement are prepared internally. Using the techniques illustrated in this chapter and throughout the text, these balance sheet and income statement data can be used to generate cash flow data.

In this section, we will use the tools that we have developed for preparing a statement of cash flows to perform a detailed case analysis of a company's operations and performance. This analysis will be done using case data for a fictitious company, Kamila Software.

This section is structured as follows. First, background data, financial statements, and more detailed specifics about Kamila Software are given. Then a decision context will be explained in which we will take on the role of consultants. In our consulting role, we will be asked to consider several specific aspects of Kamila Software's performance and finally to make a recommendation about Kamila's financial viability and attractiveness as a business partner. This case material is then followed by a detailed solution and an explanation.

Ryan McVay/Photodisc/Getty Images

**Kamila Software: Background, Financial Statements, and Extra Details**

Kamila Software develops, produces, and sells software. The company headquarters is located in Panaca, Nevada. In addition to developing, producing, and selling software, Kamila also maintains a team of consultants who are engaged in a variety of systems consulting projects, some lasting for several years. Five years ago, Kamila established an office in Kazakhstan; this office employs programmers who are integrated online with programming teams working at company headquarters in Panaca.

Kamila’s headquarters campus consists of two buildings. The company office building houses the company executives, the administrative staff, and all of the programmers and consultants. The company factory, situated next door, contains the machinery for actually burning the software CDs in large quantities and for packaging the software. The factory building also contains the storage and shipping warehouse.

Kamila Software’s balance sheets (for 2010 through 2013) and income statements (for 2011 through 2013) are contained in Exhibits 21-11 and 21-12, respectively.

Cash flow data are extremely useful in analyzing a company’s operations and gauging its performance.

Additional details about Kamila Software's operations in 2011 through 2013 are as follows:

1. In 2013, Kamila's accounts receivable balance includes amounts related to both regular software sales and consulting projects. In prior years, the accounts receivable balance included only receivables from regular software sales. The year-by-year detail is as follows:

	2013	2012	2011	2010
Regular software sales . . . . .	\$400	\$60	\$100	\$80
Consulting projects . . . . .	<u>200</u>	<u>0</u>	<u>0</u>	<u>0</u>
Total accounts receivable . . . . .	<u>\$600</u>	<u>\$60</u>	<u>\$100</u>	<u>\$80</u>

2. Over the past three years (2011 through 2013), Kamila's systems consultants have worked on a total of nine different projects (designated A through I). The total contract price, and the amount of revenue recognized in each year with respect to these projects, are given in the following table.

	Total Contract Price	Revenue Recognized Each Year		
		2013	2012	2011
A . . . . .	\$200	\$ 0.0	\$ 0.0	\$200.0
B . . . . .	150	7.5	45.0	45.0
C . . . . .	100	5.0	55.0	5.0
D . . . . .	500	100.0	100.0	50.0
E . . . . .	300	75.0	0.0	0.0
F . . . . .	250	62.5	0.0	0.0
G . . . . .	100	25.0	0.0	0.0
H . . . . .	200	50.0	0.0	0.0
I . . . . .	100	25.0	0.0	0.0
Total . . . . .		<u>\$350.0</u>	<u>\$200.0</u>	<u>\$300.0</u>

- Both of Kamila’s buildings are leased. Both leases were signed on January 1, 2010. The factory is leased under a capital lease arrangement; the office building is leased under an operating lease arrangement. The office building lease payments are \$100 per year. Under the office building lease contract, Kamila can elect to defer an annual payment for one year in exchange for a 20% payment surcharge. The factory lease payment is \$30 per year. The required lease payment disclosure is given below.

A summary of future minimum lease payments under capital leases and noncancellable operating leases with a remaining term in excess of one year at December 31, 2013, is as follows:

	<b>Capital Leases</b>	<b>Operating Leases</b>
2014 .....	\$ 30	\$ 220
2015 .....	30	100
2016 .....	30	100
2017 .....	30	100
2018 .....	30	100
Thereafter .....	330	1,100
	<u>\$480</u>	<u>\$1,720</u>

At December 31, 2013, the present value of future minimum lease payments for capital lease obligations was \$264.

- In December 2013, Kamila sold some land that it had held since the company’s inception. The land was in the neighboring town of Pioche, Nevada, and had been sometimes spoken of as a spot for future expansion. The land had a historical cost of \$50 and was appraised at \$80 just before the sale. In the same transaction, Kamila also sold some of its manufacturing equipment. No property, plant, or equipment was purchased in 2013.
- An important part of Kamila’s business is developing new software. As required under FASB ASC Section 985-20-25, Kamila expenses all software research costs incurred up until technological feasibility has been established. Software development costs incurred after technological feasibility are capitalized and amortized over three years.
- In order to increase customer satisfaction in its software, Kamila offers a broad warranty with each piece of software it sells. This warranty has become Kamila’s trademark. Under the warranty, Kamila not only agrees to replace defective software, but also agrees to reimburse customers for the reasonable costs they incur as a result of a failure by a piece of Kamila software still under warranty. For example, Kamila has paid a customer for the direct and indirect costs associated with an inventory outage when Kamila’s inventory software failed. Kamila has also paid for extra accounting help at a company that used a failed piece of Kamila payroll software.
- One of the unfortunate facts about Kamila’s software production process is that a variety of toxic materials are generated as by-products. These toxic materials include benzene, dioxin, and cocaine powder. Some of these toxic materials have leaked into the ground under Kamila’s factory. The management of Kamila is aware that Kamila’s factory site will eventually have to be completely cleaned up. In fact, Kamila pays an outside cleanup firm to do some environmental remediation work each year. An estimate of the total cleanup cost is used at the end of each year to calculate an annual environmental cleanup expense.

8. Of the “Accounts, Salaries, and Miscellaneous Operating Payables” balance of \$100 at December 31, 2013, a total of \$25 relates to Kamila’s Kazakhstan office. Kamila had some contract disputes in 2012 with its Kazakh employees and so has withheld \$25 in salaries (for about 18 months now) pending a resolution of the disputes. Actually, the original amount withheld was the equivalent of \$40 (which is included in the December 31, 2012, Salaries Payable amount); however, because the salaries are payable in Kazakh tenge and the tenge has declined in value drastically over the past 18 months, the recorded amount of the obligation is now just \$25.

### The Decision Context: Is Kamila a Financially Viable Software Partner?

It is May 15, 2014, and you have been hired by a large manufacturer, ManuFab, Inc., which is considering entering into a long-term strategic alliance with Kamila Software. Specifically, ManuFab is planning to adopt robotic technology in its manufacturing facilities and will need continuing technical software design, programming, and support for the foreseeable future. It is extremely important to ManuFab to have a financially viable software partner. Kamila Software is the lead candidate for this partnership.

The in-house analysis team at ManuFab is very positive about Kamila Software based on a traditional financial statement analysis. You sense that you have been hired primarily to provide an “independent” outside stamp of approval to bolster ManuFab’s management team’s proposal to the board of directors. Keep in mind that ManuFab’s in-house analysis suggests that this alliance with Kamila is a winner. Your evidence to the contrary, if you find any, must be clear and persuasive.

Consider the following issues as you prepare your recommendation to ManuFab’s board regarding the advisability of entering into a long-term strategic alliance with Kamila Software.

1. What traditional financial ratios indicate that Kamila Software is in strong financial health?
2. Using the financial statement data and additional information that you have, prepare a complete statement of cash flows (operating, investing, and financing) for Kamila Software for 2011, 2012, and 2013.
3. Compare actual cash flows to the income statement amounts for the following items. In particular, look at the trends over the 3-year period from 2011 through 2013.
  - (a) Software sales
  - (b) Consulting project revenue
  - (c) Software development costs
  - (d) Warranties
  - (e) Environmental cleanup
4. Kamila Software is a private company and has never been audited by external auditors. Is there any specific evidence in Kamila’s reported financial statements that the company’s accounting practices are aggressive or deceptive?
5. What is your overall recommendation—should ManuFab enter into a long-term strategic alliance with Kamila Software? Explain your recommendation.

### Kamila Software: Solution

The discussion and analysis of the Kamila Software case follows the sequence given in the questions above.

**Traditional Financial Ratios** A quick indication of Kamila’s performance measured using traditional financial ratios comes from computing the company’s return on equity for the

three years 2011, 2012, and 2013. In these calculations, average total equity is used in the denominator.

	2013	2012	2011
Return on equity .....	86.0%	(98.1%)	104.0%

This is quite an erratic series, but the very strong numbers in 2011 and 2013 may indicate that 2012 was just a one-time blip. The average annual return on equity for these three years is 30.6%, which is very strong.

Another factor to consider in deciding whether to enter into a partnership with Kamila Software is the company's financial structure. Kamila's debt ratio for the past four years is as follows:

	2013	2012	2011	2010
Debt ratio .....	59.2%	93.3%	78.3%	88.8%

These numbers definitely show a more comfortable position in 2013 relative to the preceding years. One can interpret these numbers as suggesting that Kamila is in a strong financial position to move forward in the years following 2013.

In terms of profitability measures, of course the net loss in 2012 is of some concern. However, the strong profits in 2013 suggest that Kamila has put the 2012 problems into the past. The gross profit percentage for software sales is very stable, as shown below.

	2013	2012	2011
Software gross profit percentage.....	79.0%	78.6%	79.0%

In summary, Kamila has an extremely high return on equity, has reduced its leverage to a normal level, and has demonstrated very stable profitability in its software sales. The bad year in 2012 may have just been an aberration.

**Statement of Cash Flows** The balance sheet and income statement data, coupled with the additional data given and with the cash flow statement preparation skills covered earlier in the chapter, lead to the statements of cash flows for Kamila Software for 2011, 2012, and 2013 contained in Exhibit 21-13. In terms of preparing these statements of cash flows, most of the items are straightforward, and you should be able to figure everything out by looking at the balance sheets and income statements. Additional explanation of a few items is given below.

**Foreign currency gain in 2013.** Note that the foreign currency gain is NOT subtracted in the computation of operating cash flow. The foreign currency gain does not involve any cash flow (just a reduction in the reported value of salaries payable), so there is a temptation to eliminate it as a noncash item. However, eliminating the gain but retaining the \$15 reduction in salaries payable (a subset of the total operating payables amount) gives the impression of a cash outflow; in the indirect method calculations, a salaries payable reduction leads to a decrease in operating cash flow. So, we can subtract the gain and also adjust the change in salaries payable to reflect this noncash reduction, or we can simply include the total change in salaries payable and leave the gain in net income in

Issuance (repayment) of long-term debt . . . . .	(6)	(5)	(5)
Cash from issuance of shares of stock . . . . .	226	44	27
Cash paid for dividends . . . . .	0	(50)	(50)
Net cash flow from financing activities . . . . .	<u>220</u>	<u>(11)</u>	<u>(28)</u>
Net change in cash . . . . .	13	(5)	5
Beginning cash balance . . . . .	10	15	10
Ending cash balance . . . . .	<u>23</u>	<u>10</u>	<u>15</u>

© 2012 Cengage Learning.

the computation of operating cash flow. Basically, the reduction in salaries payable looks like an outflow of cash, but it isn't, and the gain looks like an inflow of cash, but it isn't. Leaving both of these items in the calculation of operating cash flow allows them to offset one another. This treatment is similar to what is sometimes done with the realized and unrealized gains and losses on trading securities in the computation of operating cash flow, as explained in Chapter 14.

**Cash from the sale of property, plant, and equipment in 2013.** From Note 4 given on page 21-36, it appears that land costing \$50 was sold for \$80. The gain on this portion of the sale was \$30. This sale occurred in conjunction with the sale of some manufacturing equipment. The book value of the equipment sold can be computed using the following T-accounts.

Property, Plant, and Equipment			Accumulated Depreciation		
Beginning	500			129	Beginning
		50 Cost of land	Accum. depr.		
		?? Cost of equipment	on equip. sold ??	45	Depr. exp.
Ending	360			116	Ending

From these T-accounts, we can compute that the cost of the equipment sold was \$90 and the accumulated depreciation was \$58, making a book value of \$32 (\$90 – \$58). From

the income statement, we see that there was an overall gain of \$10 on the sale of the land and equipment. Because there was a gain of \$30 (\$80 appraised value – \$50 cost) on the land alone, the equipment portion of the sale must have resulted in a loss of \$20. The total cash proceeds from the sale can be computed as follows:

	Land	Equipment
Book value . . . . .	\$50	\$ 32
Plus gain/minus loss . . . . .	30	(20)
Cash proceeds . . . . .	<u>\$80</u>	<u>\$ 12</u>

The total cash proceeds is \$92 (\$80 land + \$12 equipment), which is reported in the Investing Activities section of Kamila's 2013 statement of cash flows.

**Cash paid for capitalized software development costs.** The amount of cash paid for capitalized software development costs is computed using the beginning and ending balances in the capitalized software development cost asset account and the annual amount of costs amortized, as follows:

Capitalized Software Development Costs, net	2013	2012	2011
Beginning balance . . . . .	\$255	\$165	\$ 67
Less amortization for the year . . . . .	143	110	52
Balance without any additions for the year . . . . .	\$112	\$ 55	\$ 15
Cash paid for software development costs capitalized during the year . . . . .	<b>80</b>	<b>200</b>	<b>150</b>
Ending balance . . . . .	<u>\$192</u>	<u>\$255</u>	<u>\$165</u>

In these calculations, all of the information comes from the balance sheet and the income statement with the exception of cash paid for capitalized software development costs, which is the plug figure in each annual computation.

**Cash paid for dividends.** As illustrated in earlier examples, the amount of dividends can be computed using the change in retained earnings during the year. The computation for 2013 is shown below.

Retained Earnings			
Beginning—2013	121		
Dividends—2013	50	208	Net income—2013
		37	Ending—2013

The plug figure in the T-account is the \$50 in dividends declared during 2013. However, note in the balance sheet that the dividends payable account increases from \$0 to \$50 during the year. Accordingly, for the year 2013, the amount of cash paid for dividends was \$0 because the entire \$50 in dividends declared for the year was still unpaid as of year-end.

Overall, Kamila's statement of cash flows presents very bad news. Operating cash flow drops from a positive amount of \$243 and \$206 in 2011 and 2012, respectively, to a negative amount of \$219 in 2013. In light of these numbers, the net loss reported in 2012 no longer looks like a one-time stumble from which Kamila has recovered. Instead, the loss in 2012 was just a precursor to the substantial negative operating cash flow in 2013. In fact, we now look with some skepticism upon the positive net income

of \$208 reported by Kamila in 2013. The negative operating cash flow for 2013 makes us wonder whether Kamila achieved the positive reported income through aggressive accrual accounting assumptions rather than through improved operating performance. We need to do some further analysis on individual items in order to see whether our suspicions are justified.

**Comparison of Cash Flow and Accrual Amounts** When a company has a strong incentive to favorably bias its accrual assumptions in order to make it look good on paper for an initial public offering (IPO) or a big loan application, cash flow data can provide a reality check on the underlying performance of the company. A comparison of cash flow and accrual amounts for several important items for Kamila Software is given below.

**Software sales.** The Operating Activities sections of the statements of cash flows shown in Exhibit 21-13 are prepared using the indirect method. In this case, we can gain additional insight into Kamila Software's operations by doing some direct method calculations. The annual calculations of cash collected for software sales are as follows:

<b>Software Sales</b>	<b>2013</b>	<b>2012</b>	<b>2011</b>
Reported software sales . . . . .	\$1,050	\$700	\$1,000
Plus beginning accounts receivable for software sales . . . . .	60	100	80
Less ending accounts receivable for software sales . . . . .	(400)	(60)	(100)
Cash collected for software sales . . . . .	<u>\$ 710</u>	<u>\$740</u>	<u>\$ 980</u>

The news is not good. Software sales revenue, as reported in the income statement, made a recovery in 2013. However, the cash flow data suggest that Kamila's fortunes have been steadily declining since 2011. These numbers give us some cause for concern and make us wonder whether the accrual numbers in the income statement have been boosted through favorable revenue recognition assumptions.

**Consulting revenue.** The annual calculations of cash collected from consulting customers are as follows:

<b>Consulting Revenue</b>	<b>2013</b>	<b>2012</b>	<b>2011</b>
Reported consulting revenue . . . . .	\$ 350	\$ 200	\$ 300
Plus beginning accounts receivable for consulting . . . . .	0	0	0
Less ending accounts receivable for consulting . . . . .	(200)	0	0
Less beginning unearned consulting revenue . . . . .	(80)	(100)	(150)
Plus ending unearned consulting revenue . . . . .	20	80	100
Cash collected from consulting customers . . . . .	<u>\$ 90</u>	<u>\$ 180</u>	<u>\$ 250</u>

As with the cash collected from software customers, the cash flow numbers for consulting have been steadily deteriorating since 2011. The income statement gives the impression that 2013 was a recovery year. In contrast, the cash flow numbers suggest that 2013 represents the continuation of a negative trend.

**Software development costs.** The calculation of the amount of cash paid for capitalized software development was illustrated previously. The software research costs are expensed

as incurred. Accordingly, the computation of total cash paid for software research and development for each year is as follows:

<b>Total Software Development Costs</b>	<b>2013</b>	<b>2012</b>	<b>2011</b>
Cash paid for capitalized software development costs . . . . .	\$ 80	\$200	\$150
Cash paid for software research costs expensed immediately. . . . .	20	200	150
Total cash paid for software research and development . . . . .	<u>\$100</u>	<u>\$400</u>	<u>\$300</u>

A generous and optimistic way to interpret this trend is that Kamila is becoming more efficient at doing software research and development and was therefore able to cut down on expenditures in 2013. However, a more likely interpretation is that the continued downturn in business, indicated by the cash inflow calculations illustrated above, led Kamila to cut back drastically on software research and development in 2013. This is an ominous sign in terms of Kamila's ability to stay competitive and innovative in future years.

**Warranties.** The warranty expense estimates reported in Kamila Software's income statement indicate that the expense has declined steadily in each year since 2011. The cash outflow numbers, computed below, show exactly the opposite.

<b>Warranties</b>	<b>2013</b>	<b>2012</b>	<b>2011</b>
Beginning warranty obligation . . . . .	\$118	\$ 113	\$ 50
Plus warranty expense . . . . .	40	70	100
Less ending warranty obligation . . . . .	(38)	(118)	(113)
Cash paid for warranties . . . . .	<u>\$120</u>	<u>\$ 65</u>	<u>\$ 37</u>

One could make the argument that the increase in cash paid for warranties is just a natural result of the delayed nature of the warranties—the sales are first made and then the warranty-related expenditures occur in subsequent years. To explore this possibility, a subsequent section contains a brief analysis of the accrual assumptions underlying the reported warranty expense.

**Environmental cleanup.** The annual cash flow calculations for environmental remediation costs are as follows:

<b>Environmental Cleanup</b>	<b>2013</b>	<b>2012</b>	<b>2011</b>
Beginning environmental obligation . . . . .	\$153	\$ 52	\$ 17
Plus environmental expense . . . . .	25	150	50
Less ending environmental obligation . . . . .	(58)	(153)	(52)
Cash paid for environmental remediation. . . . .	<u>\$120</u>	<u>\$ 49</u>	<u>\$ 15</u>

As with the warranty expenditures, the cash paid for environmental remediation has increased each year, with a very large increase in 2013. This is just one more piece of cash flow evidence that suggests that 2013 was a catastrophic year for Kamila Software.

**Evaluation of Accounting Practices** As mentioned earlier, the cash flow numbers can provide a reality check when there is a chance that the accrual assumptions have been strategically biased by management. In the case of Kamila Software, the cash

flow data certainly do indicate that 2013 was a terrible year rather than an awesome recovery year as suggested in the income statement. Because the cash flow data have raised our suspicions, this section contains a closer look at some of Kamila's accrual assumptions.

**Consulting revenue.** The total contract price and annual revenue numbers for Kamila's nine consulting contracts (A through I) can be used to compute the annual completion percentage for each contract as follows:

Percentage Completed	2013	2012	2011
A .....	0%	0%	100%
B .....	5	30	30
C .....	5	55	5
D .....	20	20	10
E .....	25	0	0
F .....	25	0	0
G .....	25	0	0
H .....	25	0	0
I .....	25	0	0

Because our suspicions about Kamila's accrual assumptions have been aroused, given the poor operating cash flow performance in 2013, let's look at these completion percentages with a skeptical eye. First, we note that Kamila did not complete any contracts in 2013. The small amounts estimated for Contracts B and C make us wonder whether these contracts are really even active any more. But the most troubling evidence is the 25% assumed completion percentage for each one of the five contracts begun in 2013 (Contracts E through I). It is highly unlikely that each one of these contracts would be exactly one quarter completed. It is more likely that Kamila has hurriedly signed these contracts and then made arbitrary estimates of completion in order to bolster reported revenue. This scenario is supported by the cash flow evidence, which indicates that cash collected from consulting customers in 2013 was at an all-time low of \$90.

**Operating lease payment.** In the income statement, we see that Kamila reported rental expense of \$100 associated with its operating lease in 2013. Because the rent payable amount at the end of 2013 is \$100, we can deduce that Kamila didn't actually make any operating lease payment in 2013. This deduction is supported by the lease note disclosure, which shows that Kamila must pay \$220 in 2013. This \$220 includes the \$100 late payment for 2013, the \$100 regular payment for 2014, and a \$20 late payment fee as mentioned in the description of the lease contract. The fact that no payment was made in 2013 is consistent with the other evidence suggesting that Kamila was desperately trying to cut back on cash expenditures during the year. From an accrual accounting standpoint, the expense for the year should probably be \$120 (with a corresponding \$120 rent payable) to reflect both the regular payment amount and the \$20 late fee.

**Proportion of software R&D expenditures capitalized and expensed.** In the previous section, we computed the total cash paid for software research and development for each year, and we were disturbed to see a substantial drop in R&D spending in 2013. Using those same

numbers, the percentage of software R&D expenditures that were capitalized in each year can be computed as follows:

	2013	2012	2011
Percentage of software R&D capitalized . . . . .	80%	50%	50%

By assuming that 80% of the R&D in 2013 was completed after technological feasibility was established, Kamila was able to capitalize \$80 ( $\$100 \times 0.80$ ) in R&D costs, rather than the \$50 ( $\$100 \times 0.50$ ) that would have been capitalized if the same percentage had been used in 2013 that had been used in 2011 and 2012. Kamila may have used this generous 80% assumption in order to reduce reported software research expense and thus boost reported profit in 2013.

**Warranty expense as a percentage of software sales.** Kamila's reported warranty expense, as a percentage of sales, is as follows:

	2013	2012	2011
Warranty expense as a percentage of software sales . . . . .	3.8%	10.0%	10.0%

The cash flow numbers indicate that Kamila spent \$120 on warranty-related costs in 2013, up from \$65 in 2012. At the same time warranty costs were going up, Kamila's estimate of warranty expense, as a percentage of software sales, was reduced dramatically, from 10.0% to 3.8%. Again, this looks like a favorable accrual assumption made to boost reported income in 2013.

**Environmental expense.** Kamila's reported environmental expense, as a percentage of sales, is as follows:

	2013	2012	2011
Environmental expense as a percentage of software sales . . . . .	2.4%	21.4%	5.0%

As with warranties, the cash paid for environmental remediation costs was actually up in 2013 compared to 2012, from \$49 to \$120. At the same time, environmental expense as a percentage of software sales was reduced to 2.4%. These calculations make it appear that 2012 was a "big-bath" year, with a large expense recognized in 2012 in order to be able to recognize lower expenses in subsequent years.

**Overall Recommendation** The evidence is overwhelming—ManuFab should NOT enter into a strategic partnership with Kamila Software. The operating cash flow evidence indicates that 2013 was a very bad year for Kamila. These cash flow data caused us to look closely at Kamila's accrual assumptions in 2013, and we found that those assumptions were favorably biased to make 2013 look like a year of record-breaking profits. Our recommendation to ManuFab? Stay away from Kamila Software.

The point of the Kamila Software case analysis is to show you how useful your cash flow analysis skills can be. Many people are skilled in computing and interpreting traditional financial ratios based on the balance sheet and the income statement. You can set yourself apart as a true master of the financial statements if you have the added skill of performing cash flow analysis.

## SOLUTIONS TO OPENING SCENARIO QUESTIONS

1. Moore's Law is a prediction by Intel cofounder Gordon Moore that computing power would double every two years. Moore's Law is cited in a host of variations—density of transistors, memory capacity, and so forth. And sometimes the doubling time period is given as 18 months rather than two years.
2. "Capex," short for "capital expenditures," is the amount of cash paid by a company to buy new property, plant, and equipment and to make business acquisitions.
3. "Free cash flow" is the difference between the cash flow generated by operations and the cash flow used for capital expenditures. Free cash flow represents the discretionary cash flow generated by the company, above the cash needed for regular business operations and long-term asset acquisition.
4. As seen at the bottom of Intel's statement of cash flows shown in Exhibit 21-1, cash paid for income taxes in 2009 was \$943 million.

## SOLUTION TO USING THE FASB'S CODIFICATION

FASB ASC paragraph 230-10-45-22 says the following: "Certain cash receipts and payments may have aspects of more than one class of cash flows. For example, a cash payment may pertain to an item that could be considered either inventory or a productive asset. If so, the appropriate classification shall depend on the activity that is likely to be the predominant source of cash flows for the item. For example, the acquisition and sale of equipment to be used by the entity or rented to others generally are investing activities. However, equipment sometimes is acquired or produced to be used by the entity or rented to others for a short period and then sold. In those circumstances, the

acquisition or production and subsequent sale of those assets shall be considered operating activities."

So, the key issue here is the "predominant source of cash flows for the item." For the large equipment purchased strictly for rental, the equipment itself is a long-term asset of the company, and its purchase is an investing cash outflow. For the small equipment that is purchased to be rented for a short time and then sold, the equipment is more like inventory. Accordingly, the cash used to purchase these equipment items is a cash outflow from operating activities.

# REVIEW CHAPTER 21

## LEARNING OBJECTIVES

- 1 Prepare a complete statement of cash flows and provide the required supplemental disclosures.

Basic information to prepare the three sections of the cash flow statement comes from the following portions of the balance sheet and the income statement:

- Operating—income statement and current assets and liabilities

- Investing—long-term assets
- Financing—long-term liabilities and owners' equity

Preparation of a complete cash flow statement is not done until each income statement item has been considered, all changes in balance sheet items have been explained, and the net change in cash has been exactly reconciled.

Six steps to preparing a cash flow statement are as follows:

1. Determine the change in cash (including cash equivalents). This is the target number.
2. Operating activities—analyze each income statement item and the changes in all current operating assets and operating liabilities (current and noncurrent).
3. Investing activities—analyze the changes in all noncurrent assets as well as changes in all nonoperating current assets.
4. Financing activities—analyze the changes in all noncurrent liabilities, all owners' equity accounts, and all nonoperating current liabilities.
5. Prepare a formal statement of cash flows, reconciling the beginning and ending cash balances. If the sum of operating, investing, and financing activities does not equal the total balance sheet change in cash, something in the cash flow statement is wrong. Fix it.
6. Prepare supplemental disclosure, including the disclosure of any significant investing or financing transactions that did not involve cash.

**2 Understand the differences among cash flow statements prepared according to U.S. GAAP and IASB standards.**

The primary differences in cash flow reporting around the world relate to

alternative classifications of selected cash transactions. *IAS 7* closely matches the provisions of the U.S. cash flow reporting standard, with the difference being greater flexibility in classifying cash transactions such as interest and dividends paid and received and income taxes paid. In the United Kingdom, *Financial Reporting Standard (FRS) 1* specifies eight different categories for classifying cash flow transactions and represents the most innovative and, probably, the most useful standard for cash flow reporting currently in existence in the world.

**3 Incorporate material from the entire text into the preparation of a statement of cash flows.**

Preparation of a complex statement of cash flows is greatly aided by T-account analysis of each balance sheet account. Once the cash flow implications of each balance sheet account change have been categorized, the formal statement of cash flows can be prepared from the summary T-accounts for operating, investing, and financing activities.

**4 Perform a detailed case analysis of a company's operations and performance using cash flow data.**

Analysis of cash flow data can add additional insight into the performance of a company, over and above what can be learned by analyzing the balance sheet and the income statement. Cash flow analysis is particularly important when a company has a special incentive (such as an upcoming IPO or loan application) to favorably bias the accrual assumptions.

## FASB-IASB CODIFICATION SUMMARY

Topic	FASB Accounting Standards Codification	Original FASB Standard	Corresponding IASB Standard	Differences between U.S. GAAP and IFRS
Definition of cash equivalents	Section 230-10-20 (Glossary) – Cash equivalents	SFAS No. 95 par. 8	IAS 7 par. 7	No substantial differences
Noncash investing and financing activities	Section 230-10-50 par. 3	SFAS No. 95 par. 32	IAS 7 par. 43	No substantial differences
Direct and indirect methods	Section 230-10-45 par. 25,28	SFAS No. 95 par. 27-28	IAS 7 par. 18-19	No substantial differences
Classification of interest paid	Section 230-10-45 par. 17(d)	SFAS No. 95 par. 23(d)	IAS 7 par. 33	U.S. GAAP – operating IFRS – operating or financing
Classification of income taxes paid	Section 230-10-45 par. 17(c)	SFAS No. 95 par. 23(c)	IAS 7 par. 35	U.S. GAAP – operating IFRS – operating, investing, or financing
Classification of interest received	Section 230-10-45 par. 16(b)	SFAS No. 95 par. 22(b)	IAS 7 par. 33	U.S. GAAP – operating IFRS – operating or investing
Classification of dividends received	Section 230-10-45 par. 16(b)	SFAS No. 95 par. 22(b)	IAS 7 par. 33	U.S. GAAP – operating IFRS – operating or investing
Classification of dividends paid	Section 230-10-45 par. 15(a)	SFAS No. 95 par. 20(a)	IAS 7 par. 34	U.S. GAAP – financing IFRS – operating or financing

## QUESTIONS

- When preparing a statement of cash flows, the sum of cash flow from operations, cash flow from investing, and cash flow from financing should equal what number?
- What is the most common event that causes the accounts receivable account to increase? decrease?
- What is the most common event that causes the inventory account to increase? decrease?
- What is the most common event that causes the accounts payable account to increase? decrease?
- What is the most common event that causes the equipment account to increase? decrease?
- What is the most common event that causes the accumulated depreciation account to increase? decrease?
- What is the most common event that causes the long-term debt account to increase? decrease?
- What is the most common event that causes the capital stock account to increase? decrease?
- What is the most common event that causes the retained earnings account to increase? decrease?
- When using the indirect method, why is depreciation added back to the net income figure when computing cash flow from operations?
- When using the indirect method, why is a gain subtracted from net income and a loss added to net income when computing cash flow from operations?

12. Why is an increase in accounts receivable shown as a decrease in cash when computing cash flow from operations?
13. Why is a decrease in inventory shown as an increase in cash when computing cash flow from operations?
14. Why is a decrease in accounts payable shown as a decrease in cash when computing cash flow from operations?
15. When the indirect method is used to report cash flow from operations, what two operating cash flow items must be disclosed either on the cash flow statement or in the notes?
16. With respect to the statement of cash flows, what is a reconciliation schedule, and when is it required?
17. The international cash flow standard (*IAS 7*) treats several items differently than does the U.S. cash flow standard. Identify those items, and discuss how they are treated differently.
18. What are the eight categories in a statement of cash flows prepared according to the U.K. standard (*FRS 1*)?

**PRACTICE EXERCISES**

Use the following information for Practices 21-1 through 21-3.  
The company provides the following information:

	December 31	January 1
Accounts Payable . . . . .	\$68,600	\$72,300
Inventory . . . . .	47,800	43,100
Accounts Receivable . . . . .	95,000	99,700

- (a) All purchases of inventory were on account.
- (b) Sales for the year were \$995,000.
- (c) Cost of goods sold for the year was \$451,000.

**Practice 21-1**

**L01**

**Cash Collected from Customers**

Compute how much cash was collected from customers during the year.

**Practice 21-2**

**L01**

**Amount of Inventory Purchases**

Compute how much inventory was purchased during the year. (*Hint:* Remember that all purchases of inventory were on account.)

**Practice 21-3**

**L01**

**Cash Paid for Inventory**

Using your answer to Practice 21-2, compute how much cash was paid for inventory during the year.

**Practice 21-4**

**L01**

**Cash Paid for Expenses**

During the year, the company expensed \$140,600 in other operating expenses. The beginning and ending balances in the prepaid expenses account were \$14,100 and \$12,500, respectively. Compute the amount of cash paid for other operating expenses for the year.

**Practice 21-5**

**L01**

**Depreciation Expense**

If depreciation expense is \$20,000 and the beginning and ending accumulated depreciation balances are \$100,000 and \$110,000, respectively, how much cash was paid for depreciation?

**Practice 21-6**

**L01**

**Cash Paid for Equipment**

The company began the year with a balance in its equipment account of \$928,500. During the year, equipment with an original cost of \$106,000 was sold. The ending balance in the equipment account was \$880,000. How much equipment was purchased during the year?

**Practice 21-7**

L01

**Proceeds from Sale of Equipment**

During the year, the company sold equipment that originally cost \$61,000. Accumulated depreciation associated with the equipment was \$17,500. A gain of \$8,500 on the sale of the equipment was recognized. How much cash was received from the sale?

**Practice 21-8**

L01

**Loan Repayment**

The company began the year with a balance in its long-term debt account of \$235,400. During the year, additional debt of \$172,000 was incurred. The ending balance in the long-term debt account was \$365,000. How much long-term debt was repaid during the year?

**Practice 21-9**

L01

**Cash Paid for Dividends**

The company began the year with a balance in its retained earnings account of \$955,500. At the end of the year, net income of \$176,000 was closed into the retained earnings account. The ending balance in the retained earnings account was \$1,070,500. Dividends of how much were paid during the year? (Note: All dividends that were declared were paid.)

**Practice 21-10**

L02

**Statement of Cash flows in the United Kingdom**

Using the following information, compute cash flow from operating activities under (1) the U.S. approach and (2) the U.K. approach.

(a) Cash paid to purchase inventory . . . . .	\$ 7,800
(b) Cash received from sale of a building . . . . .	5,600
(c) Cash paid for interest . . . . .	450
(d) Cash paid to repay a loan . . . . .	1,000
(e) Cash collected from customers . . . . .	10,000
(f) Cash received from issuance of new shares of common stock . . . . .	1,200
(g) Cash paid for dividends . . . . .	780
(h) Cash paid for income taxes . . . . .	1,320
(i) Cash paid to purchase machinery . . . . .	1,950

**EXERCISES**

**Exercise 21-11**

L01

**Analysis of the Accounts Receivable Account**

Yosef Company reports the following information:

Credit sales for the year . . . . .	\$457,200
Accounts receivable, end of year . . . . .	77,500
Cash collections during the year . . . . .	415,000

Compute the balance in Accounts Receivable as of the beginning of the year.

**Exercise 21-12**

L01

**Working Backwards from Cash from Operations to Net Income**

Patriot Corporation's statement of cash flows shows cash flow from operations of \$322,000. The following items also appear on Patriot's balance sheet and income statement:

Depreciation expense . . . . .	\$78,000
Accounts receivable increase . . . . .	23,000
Inventory decrease . . . . .	41,000
Accounts payable decrease . . . . .	11,000

What is Patriot's net income?

**Exercise 21-13**

**L01**

**Working Backwards from Operating Cash Flow to an Income Statement**

Thornton Inc. had the following operating balances for 2013:

	December 31, 2013	January 1, 2013
Accounts Payable . . . . .	\$58,200	\$61,500
Inventory . . . . .	39,400	37,300
Accounts Receivable . . . . .	87,000	89,100
Prepaid Expenses . . . . .	12,500	14,100

Additional information for Thornton is as follows:

- (a) All purchases of inventory were on account.
- (b) Depreciation Expense of \$96,000 was recognized during 2013.
- (c) Equipment was sold during 2013, and a gain of \$3,000 was recognized.

Thornton provides the following cash flow information for 2013:

Cash collected from customers . . . . .	\$ 950,000
Cash paid for inventory . . . . .	(410,000)
Cash paid for other expenses . . . . .	(139,000)
Cash from operations . . . . .	<u>\$ 401,000</u>

Prepare an income statement for Thornton for 2013.

**Exercise 21-14**

**L01**

**Computing Cash from Operations**

Executive Inc. had the following operating balances for 2013:

	December 31, 2013	January 1, 2013
Accounts Payable . . . . .	\$54,400	\$62,800
Inventory . . . . .	21,800	29,900
Accounts Receivable . . . . .	73,600	77,200

All purchases of inventory were on account.

Executive provides the following income statement information for 2013:

Revenues . . . . .	\$ 740,000
Cost of goods sold . . . . .	(360,000)
Other expenses . . . . .	(104,000)
Depreciation expense . . . . .	(87,000)
Loss on sale of equipment . . . . .	(9,000)
Net income . . . . .	<u>\$ 180,000</u>

Compute cash from operations.

**Exercise 21-15**

**L01**

**Preparing a Complete Statement of Cash Flows**

Sunnyvale Corporation prepared the following balance sheet data for 2013 and 2012:

	Dec. 31, 2013	Dec. 31, 2012
Cash and cash equivalents . . . . .	\$ 518,500	\$ 675,000
Accounts receivable . . . . .	360,000	345,000

(Continued)

	Dec. 31, 2013	Dec. 31, 2012
Merchandise inventory . . . . .	750,000	654,000
Prepaid insurance . . . . .	4,500	6,000
Buildings and equipment . . . . .	5,515,500	4,350,000
Accumulated depreciation—buildings and equipment . . . . .	(2,235,000)	(1,995,000)
Total assets . . . . .	<u>\$ 4,913,500</u>	<u>\$ 4,035,000</u>
Accounts payable . . . . .	\$ 613,500	\$ 945,000
Salaries payable. . . . .	75,000	105,000
Notes payable—bank (current) . . . . .	150,000	600,000
Notes payable—bank (long-term). . . . .	1,500,000	—
Common stock. . . . .	2,400,000	2,400,000
Retained earnings (deficit) . . . . .	175,000	(15,000)
Total liabilities and stockholders' equity . . . . .	<u>\$ 4,913,500</u>	<u>\$ 4,035,000</u>

Cash needed to purchase new equipment and to improve the company's working capital position was raised by borrowing from the bank with a long-term note. Equipment costing \$75,000 with a book value of \$15,000 was sold for \$18,000; the gain on the sale was included in net income. The company paid cash dividends of \$90,000 and reported earnings of \$280,000 for 2013. There were no entries in the retained earnings account other than to record the dividends and net income for the year.

Prepare a statement of cash flows for 2013 using the indirect method.

### Exercise 21-16

#### L01

### Preparing a Complete Statement of Cash Flows

The following are financial statements for Germaine Company:

<b>Germaine Company</b>		
<b>Comparative Balance Sheet</b>		
<b>December 31, 2013 and 2012</b>		
<b>(Dollars in thousands)</b>		
	2013	2012
<b>Assets</b>		
Cash . . . . .	\$ 22	\$ 16
Accounts receivable . . . . .	225	245
Inventory . . . . .	105	125
Prepaid general expenses . . . . .	21	12
Plant assets . . . . .	1,025	1,000
Accumulated depreciation—plant assets . . . . .	(530)	(585)
Total assets . . . . .	<u>\$ 868</u>	<u>\$ 813</u>
<b>Liabilities and Stockholders' Equity</b>		
Accounts payable . . . . .	\$ 70	\$ 45
Interest payable . . . . .	15	12
Income taxes payable . . . . .	80	77
Bonds payable . . . . .	105	97
Common stock . . . . .	362	354
Retained earnings . . . . .	236	228
Total liabilities and stockholders' equity . . . . .	<u>\$ 868</u>	<u>\$ 813</u>

**Germaine Company**  
**Condensed Income Statement**  
**For the Year Ended December 31, 2013**  
**(Dollars in thousands)**

Sales .....		\$1,450
Cost of goods sold .....		990
Gross profit .....		<u>\$ 460</u>
Operating expenses:		
Depreciation expense .....	\$ 55	
General expenses .....	340	
Interest expense .....	12	
Income tax expense .....	15	422
Net income .....		<u>\$ 38</u>

The following information is also available for 2013:

- (a) Plant assets were sold for their book value of \$180 during the year. The assets had an original cost of \$290.
- (b) Cash dividends totaling \$30 were paid during the year.
- (c) All accounts payable relate to inventory purchases.
- (d) All purchases of plant assets were cash transactions.

Prepare a statement of cash flows for 2013 using the indirect method.

**Exercise 21-17****L01****Statement of Cash Flows—Direct Method**

Using the information given in Exercise 21-16, prepare a statement of cash flows for 2013 for Germaine Company using the direct method.

**PROBLEMS****Problem 21-18****L01****Cash Flow from Operations—Direct Method**

The following combined income and retained earnings statement, along with selected balance sheet data, is provided for Gemini Corporation:

**Gemini Corporation**  
**Combined Income and Retained Earnings Statement**  
**For the Year Ended December 31, 2013**

Revenues:		
Net sales revenue .....		\$340,000
Other revenues .....		6,000*
Total revenues .....		<u>\$346,000</u>
Expenses:		
Cost of goods sold .....	\$188,000	
Selling and administrative expenses .....	52,600	
Depreciation expense .....	13,500	
Interest expense .....	3,200	
Total expenses .....		<u>257,300</u>
Income before income taxes .....		<u>\$ 88,700</u>
Income taxes .....		<u>21,850</u>

(Continued)

Net income . . . . .	\$ 66,850
Retained earnings, January 1, 2013 . . . . .	56,000
	<u>\$122,850</u>
Dividends declared and paid . . . . .	16,000
Retained earnings, December 31, 2013 . . . . .	<u>\$106,850</u>

\*Gain on sale of equipment (cost, \$20,000; book value, \$12,000; sales price, \$18,000).

#### Balance Sheet Amounts

	Beginning of Year	End of Year
Accounts receivable . . . . .	\$47,000	\$53,000
Inventory . . . . .	73,400	75,400
Prepaid expenses . . . . .	4,500	3,600
Accounts payable . . . . .	31,800	38,300
Interest payable . . . . .	5,500	4,300
Income taxes payable . . . . .	2,900	7,200

#### Instructions:

- Using the direct method, compute the amount of net cash provided by (used in) operating activities for Gemini Corporation for 2013.
- What is the impact of dividends paid on net cash flow from operations? Explain.

#### Problem 21-19

#### L01

#### Cash Flow from Operations—Comparison of Indirect and Direct Methods

The statement of cash flows for Riker Company (prepared using the indirect method) follows. Consider the following additional information:

- Sales for the year totaled \$812,350. Cost of goods sold was \$500,000. Operating expenses were \$100,000. Interest expense was \$23,000. Income tax expense was \$40,430.
- Of the decrease in accounts payable, 80% is related to inventory purchases; the remaining 20% related to operating expenses.
- Depreciation and amortization are period costs; they do not enter into the computation of cost of goods sold.

#### Riker Company Statement of Cash Flows (Indirect Method) For the Year Ended December 31, 2013

Cash flows from operating activities:	
Net income . . . . .	\$ 68,850
Adjustments:	
Depreciation expense . . . . .	\$ 65,000
Amortization expense . . . . .	10,000
Loss on sale of machine . . . . .	7,400
Gain on retirement of long-term debt . . . . .	(2,330)
Increase in accounts receivable . . . . .	(8,600)
Decrease in inventory . . . . .	12,430
Decrease in prepaid operating expenses . . . . .	1,680
Decrease in accounts payable . . . . .	(2,400)

(Continued)

Increase in interest payable . . . . .	500	
Increase in income taxes payable . . . . .	2,500	86,180
Net cash provided by operating activities . . . . .		<u>\$155,030</u>
Cash flows from investing activities:		
Sale of machine . . . . .	\$ 12,000	
Purchase of fixed assets . . . . .	(78,000)	
Net cash used in investing activities . . . . .		(66,000)
Cash flows from financing activities:		
Retirement of long-term debt . . . . .	\$(65,000)	
Payment of dividends . . . . .	(27,000)	
Net cash used in financing activities . . . . .		(92,000)
Net decrease in cash . . . . .		\$ (2,970)
Cash at beginning of year . . . . .		5,320
Cash at end of year . . . . .		<u>\$ 2,350</u>

**Instructions:** Prepare the Operating Activities section of the statement of cash flows for Riker Company using the direct method.

**Problem 21-20**

**L01**

**Preparation of Income Statement Using Balance Sheet and Cash Flow Data**

The following financial statements are for Troi Company. Consider the following additional information:

- (a) All accounts payable relate to inventory purchases.
- (b) Property, plant, and equipment sold had an original cost of \$75,000 and a book value of \$22,000.

**Troi Company  
Comparative Balance Sheet  
December 31, 2013 and 2012**

	<b>2013</b>	<b>2012</b>
<b>Assets</b>		
Cash . . . . .	\$ 4,000	\$ 3,400

Total liabilities and stockholders' equity . . . . .	<u>\$ 302,200</u>	<u>\$ 291,500</u>

**Troi Company**  
**Statement of Cash Flows**  
**For the Year Ended December 31, 2013**

Cash flows from operating activities:	
Cash collected from customers . . . . .	\$685,300
Cash payments for:	
Inventory purchases . . . . .	\$300,000
General expenses . . . . .	102,000
Wages expense . . . . .	150,000
Interest expense . . . . .	11,000
Income tax expense . . . . .	23,900
Net cash provided by operating activities . . . . .	\$ 98,400
Cash flows from investing activities:	
Sale of property, plant, and equipment . . . . .	\$ 27,200
Purchase of property, plant, and equipment . . . . .	(60,000)
Net cash used in investing activities . . . . .	(32,800)
Cash flows from financing activities:	
Retirement of bonds payable . . . . .	\$ (23,000)
Payment of dividends . . . . .	(42,000)
Net cash used in financing activities . . . . .	(65,000)
Net increase in cash . . . . .	\$ 600
Cash at beginning of year . . . . .	3,400
Cash at end of year . . . . .	\$ 4,000

**Instructions:** Prepare the income statement for Troi Company for the year ended December 31, 2013.

**Problem 21-21**

**L01**

**Preparation of Balance Sheet Using Cash Flow and Income Statement Data**

Terra Company just completed its first year of operations. The company's income statement and statement of cash flows are provided.

**Income Statement**

Sales . . . . .	\$140,000
Gain on sale of equipment . . . . .	2,000
Cost of goods sold . . . . .	(86,000)
Depreciation expense . . . . .	(16,000)
Interest expense . . . . .	(8,400)
Other expenses . . . . .	(34,000)
Net income (loss) . . . . .	\$ (2,400)

**Statement of Cash Flows**

Operating Activities	
Collected from customers . . . . .	\$ 132,000
Paid for inventory . . . . .	(87,000)
Paid for interest . . . . .	(7,000)
Paid for other expenses . . . . .	(30,000)
Net cash provided by operating activities . . . . .	\$ 8,000
Investing Activities	
Purchase of buildings and equipment . . . . .	\$(175,000)
Sale of equipment . . . . .	19,000
Net cash used in investing activities . . . . .	(156,000)

(Continued)

Financing Activities			
Sale of stock . . . . .		\$ 100,000	
Issuance of bonds . . . . .		88,000	
Payment of dividends . . . . .		(4,000)	184,000
Net increase in cash for the period . . . . .			<u>\$ 36,000</u>

The following information is also available:

- Equipment with an original cost of \$21,000 and a book value of \$17,000 was sold during the year.
- All sales of inventory are on account.
- Purchases of inventory on account totaled \$93,300.

**Instructions:** Prepare a balance sheet for Terra Company as of December 31.

### Problem 21-22

#### L01, L03

### Comprehensive Statement of Cash Flows

The following schedule shows the account balances of Beneficio Corporation at the beginning and end of the fiscal year ended October 31, 2013.

Debits	October 31, 2013	October 31, 2012
Cash and Cash Equivalents . . . . .	\$ 222,000	\$ 50,000
Investment Securities—Trading . . . . .	10,000	40,000
Accounts Receivable . . . . .	148,000	100,000
Inventories . . . . .	291,000	300,000
Prepaid Insurance . . . . .	2,500	2,000
Land and Building . . . . .	195,000	195,000
Equipment . . . . .	305,000	170,000
Discount on Bonds Payable . . . . .	8,500	9,000
Treasury Stock (at cost) . . . . .	5,000	10,000
Cost of Goods Sold . . . . .	539,000	
Selling and General Expenses . . . . .	287,000	
Income Taxes . . . . .	35,000	
Unrealized Loss on Trading Securities . . . . .	4,000	
Loss on Sale of Equipment . . . . .	1,000	
Total debits . . . . .	<u>\$2,053,000</u>	<u>\$876,000</u>
Allowance for Bad Debts . . . . .	\$ 8,000	\$ 5,000
Accumulated Depreciation—Building . . . . .	26,250	22,500
Accumulated Depreciation—Equipment . . . . .	39,750	27,500
Accounts Payable . . . . .	55,000	60,000
Notes Payable—Current . . . . .	70,000	20,000
Miscellaneous Expenses Payable . . . . .	18,000	8,700
Taxes Payable . . . . .	35,000	10,000
Unearned Revenue . . . . .	1,000	9,000
Notes Payable—Long-Term . . . . .	40,000	60,000
Bonds Payable—Long-Term . . . . .	250,000	250,000
Deferred Income Tax Liability . . . . .	47,000	53,300
Common Stock, \$2 par . . . . .	359,400	200,000
Retained Earnings Appropriated for Possible Building Expansion . . . . .	43,000	33,000
Unappropriated Retained Earnings . . . . .	34,600	112,000

(Continued)

Debits	October 31, 2013	October 31, 2012
Paid-In Capital in Excess of Par Value . . . . .	\$ 116,000	\$ 5,000
Sales . . . . .	898,000	
Gain on Sale of Investment Securities . . . . .	12,000	
Total credits . . . . .	<u>\$2,053,000</u>	<u>\$876,000</u>

The following information was also available:

- (a) All purchases and sales were on account.
- (b) Equipment with an original cost of \$15,000 was sold for \$7,000.
- (c) Selling and general expenses include the following:
 

Building depreciation . . . . .	\$ 3,750
Equipment depreciation . . . . .	25,250
Bad debt expense . . . . .	4,000
Interest expense . . . . .	18,000
- (d) A 6-month note payable for \$50,000 was issued toward the purchase of new equipment.
- (e) The long-term note payable requires the payment of \$20,000 per year plus interest until paid.
- (f) Treasury stock was sold for \$1,000 more than its cost.
- (g) During the year, a 30% stock dividend was declared and issued. At the time, there were 100,000 shares of \$2 par common stock outstanding. However, 1,000 of these shares were held as treasury stock at the time and were prohibited from participating in the stock dividend. Market price was \$10 per share after the stock dividend was issued.
- (h) Equipment was overhauled, extending its useful life at a cost of \$6,000. The cost was debited to Accumulated Depreciation—Equipment.
- (i) Beneficio has determined that its purchases and sales of trading securities are operating activities.

**Instructions:** Prepare a *complete* statement of cash flows for the year ended October 31, 2013, using the *indirect* method of reporting cash flows from operations.

**Problem 21-23**  
**L01, L03**

**Complete Statement of Cash Flows**

Below are balance sheet and income statement data for Blue Panel Corporation. (*Note:* For the balance sheet data, the end-of-year information is in the left column.)

Balance Sheet		
	2013	2012
Cash . . . . .	\$ 8,261	\$ 1,506
Investment securities (available-for-sale) . . . . .	300	250
Accounts receivable . . . . .	2,200	1,365
Paid-in capital . . . . .	7,200	6,000
Inventory . . . . .	4,874	5,168
Prepaid selling and administrative expenses . . . . .	208	224
Retained earnings (deficit) . . . . .	8,768	(2,042)
Accumulated depreciation . . . . .	3,200	2,780
Accounts payable . . . . .	370	450
Unearned revenue . . . . .	110	170
Income taxes payable . . . . .	78	54

(Continued)

	2013	2012
Other long-term liabilities . . . . .	\$ 490	\$ 185
Property, plant, and equipment . . . . .	12,000	8,400
Long-term debt . . . . .	7,952	9,816
Accumulated other comprehensive income (credit balance) . . . . .	50	0
Intangible assets . . . . .	375	500

**Income Statement (for 2013)**

Sales . . . . .		\$57,860
Cost of goods sold . . . . .	\$32,600	
Loss on sale of property, plant, and equipment . . . . .	80	
Selling and administrative expenses . . . . .	6,550	
Amortization expense . . . . .	125	
Depreciation expense . . . . .	2,355	
Income tax expense . . . . .	2,400	
Total expenses and losses . . . . .		44,110
Net income . . . . .		<u>\$13,750</u>

Additional information for Blue Panel Corporation is as follows:

- (a) Property, plant, and equipment with an original historical cost of \$2,100 was sold during 2013.
- (b) All accounts payable relate to inventory purchases.
- (c) The “Other long-term liabilities” item is Blue Panel’s pension liability. Pension expense is reported as part of selling and administrative expenses.
- (d) During 2013, Blue Panel issued shares of common stock to an investor in exchange for property, plant, and equipment valued at \$800.
- (e) The accumulated other comprehensive income relates solely to the available-for-sale investment securities.

**Instructions:** Prepare a *complete* statement of cash flows for 2013 for Blue Panel Corporation. Use the *direct* method for reporting cash flows from operating activities.

**Problem 21-24**  
**L01, L03**

**Complete Statement of Cash Flows**

The balance sheet and income statement data for Howard Bannister Company follow. (Note: For the balance sheet data, the end-of-year information is in the left column.)

**Balance Sheet**

	2013	2012
Cash . . . . .	\$ 228	\$ 120
Investment securities (available-for-sale) . . . . .	170	250
Accounts receivable . . . . .	400	568
Paid-in capital . . . . .	4,900	3,000
Inventory . . . . .	2,795	2,259
Retained earnings (deficit) . . . . .	(132)	117
Accumulated depreciation . . . . .	900	1,090
Accounts payable . . . . .	300	270
Unearned revenue . . . . .	92	106
Property, plant, and equipment . . . . .	7,000	5,900

(Continued)

	2013	2012
Long-term debt . . . . .	\$5,247	\$5,164
Accumulated other comprehensive income (all related to available-for-sale securities) . . . . .	70	100
Investments (accounted for using the equity method) . . . . .	784	750

#### Income Statement (for 2013)

Sales . . . . .		\$22,535
Income from investments (accounted for using the equity method). . . . .		100
Realized gain on sale of available-for-sale securities . . . . .		45
Cost of goods sold . . . . .	\$14,800	
Impairment loss . . . . .	170	
Selling and administrative expenses . . . . .	3,380	
Depreciation expense . . . . .	1,068	
Income tax expense . . . . .	1,200	
Total expenses and losses . . . . .		20,618
Net income . . . . .		<u>\$ 2,062</u>

Additional information for Howard Bannister Company is as follows:

- (a) All accounts payable relate to inventory purchases.
- (b) Equipment with an original historical cost of \$1,200 was judged to be impaired during 2013. The fair value of the equipment on the date the impairment was recognized was \$210.
- (c) Howard Bannister made *only* two purchases of property, plant, and equipment during the year. One purchase was for \$2,300 cash. The other purchase, for \$650, was completely financed with a mortgage. The mortgage is shown as part of "Long-term debt" on the balance sheet.
- (d) No available-for-sale securities were purchased *before* January 1, 2012. Available-for-sale investment securities sold during 2013 had an original cost of \$65.
- (e) The accumulated other comprehensive income balance represents an increase, or credit, to equity.

**Instructions:** Prepare a *complete* statement of cash flows for 2013 for Howard Bannister Company. Use the *direct* method for reporting cash flows from operating activities.

---

Additional information for Supersonic Corporation is as follows:

- (a) Bad debt expense of \$185 is included in selling and administrative expenses.
- (b) Property, plant, and equipment was sold during 2013 for \$900 cash.
- (c) All accounts payable relate to inventory purchases.
- (d) During 2013, Supersonic capitalized \$75 of interest associated with the construction of a building. None of the interest payable relates to this capitalized interest.
- (e) On July 15, 2013, Supersonic repurchased shares of its own stock for \$130. On December 19, 2013, Supersonic resold the shares for \$90. Supersonic uses the cost method for accounting for treasury stock.
- (f) On November 17, 2013, Supersonic declared and issued a 10% stock dividend. The number of shares of common stock outstanding increased from 200 to 220. After the stock dividend, the market price per share of common stock was \$60.

- (g) During the year, Supersonic capitalized \$160 in expenditures for software. The capitalized costs are being amortized over the estimated useful life of the development costs.
- (h) On January 1, 2013, Supersonic signed an agreement to lease a piece of equipment. The lease is being accounted for as a capital lease. The annual lease payment is \$50. The present value of the minimum lease payments is \$257. The leased asset has been included in property, plant, and equipment, and the lease liability is included in long-term debt. The lease term is nine years, and the implicit interest rate is 13%.
- (i) Supersonic uses the LIFO method of inventory valuation. During the year, Supersonic dipped into its LIFO layers. As a result, cost of goods sold was \$128 lower than it otherwise would have been.
- (j) On January 1, 2013, Supersonic purchased 30% of Micro Inc. for \$240 cash. At the time, the book value of Micro's net assets was \$800. Net income for 2013 for Micro Inc. was \$200.
- (k) During the year, all of the convertible preferred stock was converted into shares of Supersonic common stock.

**Instructions:** Prepare a *complete* statement of cash flows for 2013 for Supersonic Corporation. Use the *direct* method for reporting cash flows from operating activities.

## CHAPTER 22

## Accounting in a Global Market

### LEARNING OBJECTIVES

- 1 Understand the importance and potential impact of a common worldwide set of accounting standards.
- 2 Outline the history of the IASB.
- 3 Identify key differences between U.S. GAAP and IFRS.
- 4 Convert foreign currency financial statements into U.S. dollars using the translation method.

Henry Ford's Model T is sometimes mistakenly viewed as the first automobile built. Although the Model T, first sold in 1908 with a base sticker price of \$260, may rightly be considered the first car produced for the masses, the first automobile was actually produced 22 years earlier in Germany. In 1886, Carl Benz patented the world's first 3-wheel motor carriage. This motorized tricycle is considered by many as the first automobile. Later in that same year and also in Germany, Gottlieb Daimler equipped a horse-drawn coach with a fast-running engine to produce his first 4-wheeled automobile. Daimler had patented the world's first motorcycle the previous year.

In 1894, Carl Benz manufactured the first production car, the Velo-Motorwagon. In 1896, Daimler produced the world's first truck. Daimler and Benz competed with one another for years, both for customers and on race tracks. Auto racing was seen by both as the best way to advertise their products. It was through auto racing that Gottlieb Daimler met Emil Jellinek. Jellinek raced Daimler cars in France and in 1900 had established an auto dealership in Monaco for selling Daimler automobiles. He obtained the exclusive rights to sell Daimler cars in Austria-Hungary, France, Belgium, and the United States. Because Daimler had already sold the rights to sell Daimler cars in France, the Daimler car line was renamed Mercedes after Jellinek's 10-year-old daughter.

Benz and Daimler continued to compete against one another until the First World War, at which point most German factories were converted to war production. During the hyperinflation in Germany that followed the First World War, Daimler issued its own currency because confidence in the German mark was so low. In 1926, Daimler and Benz merged to form **Daimler-Benz AG** with corporate headquarters located in Berlin.

And while all this was happening in Europe, what was going on in the United States? Piano maker William Steinway acquired the Daimler patent licenses for the United States in 1888 and founded the **Daimler Motor Company** in New York that same year. But it wasn't until 1906 that the first Mercedes was

another world war, and Chrysler avoided bankruptcy in 1980 only because the U.S. federal government guaranteed Chrysler's debt.

In the fall of 1993, Daimler-Benz became the first German company to list its shares on the New York Stock Exchange (NYSE). In those days, non-

U.S. companies listed on the NYSE were required to provide financial information prepared according to U.S. GAAP. For 1993, Daimler-Benz reported a profit of DM 615 million using German accounting principles.<sup>1</sup> For the same year, the net loss for Daimler-Benz was DM 1,839

million according to U.S. GAAP. As you can see, in those days there were very significant differences between reported results using U.S. GAAP and, in this case, German GAAP. As a result, the Securities and Exchange Commission (SEC) required foreign companies with shares traded in the United States to report and reconcile the differences in their reported net income to what their net income would have been using U.S. GAAP. A sample of this reconciliation for Daimler-Benz for 1993, included in SEC Form 20-F, appears in Exhibit 22-1.

A close look at Exhibit 22-1 reveals why Daimler-Benz might have been reluctant to report income using U.S. GAAP. The DM 2.454 billion reduction in

**FYI**

The AG stands for Aktiengesellschaft, which is the German word for *stock company*, or *corporation*.

produced in America—appropriately called the American Mercedes. And in 1912, a young man named Walter Chrysler became the production manager at **Buick Motor Company**, a subsidiary of **General Motors Company**. Within five years, Chrysler had become president and general manager of Buick. In 1920, because of differences with General Motors President William Durant, Chrysler left General Motors to take charge of a floundering car company that would in 1925 become **Chrysler Motor Company**.

During the next 65 years, Daimler-Benz and Chrysler competed for market share in the global automotive market, and both companies had their fair share of financial difficulties. Daimler-Benz suffered through

<sup>1</sup> DM stands for Deutsche mark, which was the currency in Germany until 1999 when Germany adopted the euro as its legal tender.

net income in converting from German GAAP to U.S. GAAP is caused primarily by a removal from income of DM 4.262 billion in “appropriated retained earnings.” This innocent-sounding adjustment actually represents the removal of some serious income manipulation that was allowable under German GAAP. In good years, German companies often overstated their expenses by creating provisions (liability accounts such as “provision for future environmental cleanup costs”), by creating reserves (separate categories of equity, as described in Chapter 13), or by writing down the value of assets. Created in good years, these so-called “hidden reserves” could be reversed in bad years, thus increasing income. In 1993, Daimler-Benz took advantage of German GAAP and reversed DM 4.262 billion in hidden reserves, thus increasing reported net income and covering up an operating loss. Under the more restrictive standards of U.S. GAAP at the time, this huge reversal of hidden reserves was not allowable, necessitating the large adjustment shown in Exhibit 22-1.

In 1998, companies founded by Gottlieb Daimler, Carl Benz, and Walter Chrysler combined forces to become, in terms of 1998 revenues, the fourth largest company in the world—**DaimlerChrysler**. The merger came under fire right from the start. Chrysler supporters cried that Daimler had paid too small a price for Chrysler, while Daimler supporters worried that the price was too high. In addition, in the aftermath of the merger, the expected synergies between the two companies’ product lines did not emerge as powerfully as hoped. After a rocky 9-year “marriage,” the two companies split up with Daimler selling Chrysler to **Cerberus Capital Management**, a large U.S. private equity firm, in 2007. On April 30, 2009, in the wake of the implosion of the worldwide economy and the associated collapse of the market for new cars in

the United States, Chrysler declared bankruptcy. After a restructured Chrysler emerged from bankruptcy proceedings, it was owned by an interesting collection of stakeholders of the former company: 2.5% by the Canadian government, 10% by the U.S. government, 20% by the Italian automaker **Fiat**, and 67.5% by the employee and retiree health care plan of Chrysler’s auto workers.

As illustrated in Daimler-Benz’s 1993 reconciliation of German GAAP net income to U.S. GAAP net income, the divergent national accounting practices that existed around the world before the widespread acceptance of IASB standards had an extremely significant impact on reported financial statements. Cross-border mergers such as that between Daimler-Benz and Chrysler illustrate the increasing integration of the worldwide economy. Other examples of cross-border mergers are the purchase of the quintessential American company **Anheuser-Busch** (brewer of Budweiser) by **InBev**, a Belgian company, and the purchase of U.S. wireless company **Voicestream** by German company **Deutsche Telekom**. With this global business integration, accounting differences have become impossible to ignore. This chapter reviews the efforts of the Financial Accounting Standards Board (FASB) and the International Accounting Standards Board (IASB) to accelerate the harmonization of accounting standards around the world.

This chapter also includes a discussion of an important issue faced by U.S. multinational companies operating through foreign subsidiaries around the world. In order to consolidate these foreign results into the financial reports of their overall operations, U.S. multinational companies with foreign subsidiaries must convert the subsidiary financial reports into U.S. dollars. This process is called *translation* and is explained in this chapter.

## QUESTIONS

1. What is the purpose of the SEC’s Form 20-F?
2. Can U.S. companies create “hidden reserves”? Explain.

*Answers to these questions can be found on page 22–22.*

# The Need for One Worldwide Financial Accounting Standard

1

Understand the importance and potential impact of a common worldwide set of accounting standards.

**WHY** Fundamentally, the purpose of financial statements is to communicate. Globalization of business operations and of capital markets has created the need for companies to communicate with one common financial accounting language to investors and other stakeholders around the world.

**HOW** An educated preparer or user of financial statements must understand the impact that differing accounting standards can have on the reported numbers.

Companies of all sizes and types are operating in the international environment. Well-conceived global financing strategies are an important part of successful international operations. For a U.S. firm, these strategies might include a stock listing on a foreign exchange, such as the Tokyo Stock Market or the London Stock Exchange; selling bonds and other debt securities in countries other than or in addition to the United States; and borrowing from non-U.S. financial institutions. For example, **Disney** has significant currency hedging operations with respect to the euro, the British pound, the Japanese yen, and the Canadian dollar.

Similarly, to raise debt or equity capital, many non-U.S. firms, such as **Sony**, **Cadbury**, and **Toyota**, list their securities on U.S. exchanges and borrow from U.S. financial institutions. For example, Daimler lists its shares on three different stock exchanges around the world—New York, Frankfurt, and Stuttgart. The number of non-U.S. companies listed on the New York Stock Exchange is substantial. As detailed in Exhibit 22-2, 414 foreign share issues were trading on the NYSE as of April 30, 2008, including 77 from Canadian companies and 41 from Chinese companies.

International financing strategies impose a variety of financial reporting standards on these multinational corporations. Firms such as Daimler and Disney must produce financial statements for users not only in their own countries but also in other countries. The significant differences in accounting standards that have existed throughout the world have complicated both the preparation of financial statements and the understanding of those financial statements by users.

## Dangers of Differing National Accounting Standards

Chapter 23 follows this chapter and pulls together the techniques of analyzing financial statement data that have been included throughout the text. Learning Objective #2 of Chapter 23 contains an extended example showing the impact that the use of differing accounting methods can have on a financial statement analysis comparison. The two fictitious companies in that example are Sai Kung Company and Tuen Mun Limited. As you will see when you study Chapter 23, a careful comparison of the financial statements for Sai Kung and Tuen Mun reveals that the companies are economically identical. However, as you can see from the sampling of financial ratios in Exhibit 22-3, on paper the companies appear to be anything but identical.

The differences between the two sets of financial statements are caused by differences in accounting treatment. In fact, as shown in Chapter 23, the differences in these ratios are caused by just four accounting differences: classification of investment securities, inventory valuation method, depreciation life assumption, and lease classification. In this example, these four accounting differences cause significant differences between the financial

## 22-2 NUMBER OF FOREIGN COMPANIES LISTED ON THE NEW YORK STOCK EXCHANGE BY COUNTRY OF ORIGIN

Country of Origin	Number of Listed Companies

statements of two otherwise essentially identical companies. The differences in accounting method have made Tuen Mun appear to be a superior company on almost every dimension. Tuen Mun has better return on equity, better profitability, and better overall efficiency. In addition, Tuen Mun appears to be a less risky company because its leverage is lower and its liquidity, as indicated by the current ratio, is higher.

The point of this example (and don't forget to work through the details when you get to Chapter 23) is that ratio comparisons can yield misleading implications if the ratios come from companies with differing accounting practices. And historically, this is exactly the situation that existed between different countries around the world. For example, Japanese financial reporting standards were known for being extremely conservative, so net income numbers for companies from Japan always looked lower than their U.S. or UK counterparts even though the companies might have been economically identical. The Daimler-Benz example that opened this chapter demonstrates the huge difference in reported net income that could result from the strategic use of hidden reserves which were created under the financial accounting rules then in existence under German GAAP.

A key function of accounting standards is to create a common set of rules to be used by all companies so that outsiders, who do not have control over or access to the detailed

financial records, can receive financial reports that are comparable among all of the different companies that they might want to analyze. Without this comparability, financial reports are virtually worthless. As the globalization of business has forced investors, creditors, and other stakeholders to perform an increasing number of cross-border financial statement comparisons, the need for a common set of global standards has become apparent. For a number of years, both the FASB and the IASB vied for the honor of being the provider of that worldwide set of standards. The IASB won. The next section gives a brief history of the IASB.

## Brief History of the IASB and Its Standards (IFRS)

### 2 Outline the history of the IASB.

**WHY** It is likely that within the next five years all publicly traded companies in the United States will be required to prepare their financial statements using IFRS as issued by the IASB.

**HOW** Over the past 20 years, the IASB has made great strides in improving the quality of its financial reporting standards and in improving the transparency of its standard-setting process. The IASB's standards, collectively called IFRS, are now generally accepted around the world.

Both the FASB and the IASC (predecessor of the IASB) were established in 1973. For many years, there was a real question about which set of accounting standards would become the worldwide standard—U.S. GAAP set by the FASB or IFRS (International Financial Reporting Standards) set by the IASB based in London.<sup>2</sup> Until the mid-1990s, the FASB was clearly the dominant accounting standard setter in the world. The FASB had the advantage of being an independent board with broad representation from the U.S. business

<sup>2</sup> The original standards of the IASC were, and are, called International Accounting Standards (IAS). These standards maintain this title even though most of them have been subsequently amended, sometimes substantially, by the IASB. The body of standards issued by the IASC/IASB is now referred to as "IFRS" whether the label of the actual standard is IAS or IFRS.

community. In contrast, the IASC was a consortium of national CPA organizations, and committee members served part time while maintaining their connections with their firms and their clients. In addition, the FASB standards, by and large, were viewed as being conceptually consistent with an underpinning of the Conceptual Framework. The early IASC standards were really just a compilation of the diverse accounting practices from around the world with some expression of a preferred alternative but no coherent conceptual foundation. Finally, the IASC's set of standards was viewed as being incomplete with the most conspicuous deficiency being the lack of a standard on financial instruments.<sup>3</sup>

In spite of its head start, the FASB began to give ground to the IASC in terms of international acceptance. Part of this was due to international reluctance to allow the “Americans” to become the worldwide standard setter. As one French accounting standard setter put it, the French will never accept U.S. GAAP as the worldwide standard precisely because they will not bow to U.S. dominance no matter how reasonable are the standards themselves.<sup>4</sup> But more important than this international aversion to U.S. dominance was the improvement in the IASC standards themselves. All during the 1990s, the IASC worked to eliminate the large number of alternative accounting treatments allowable under IAS and also to improve the overall quality of the standards. The immediate goal of the IASC was to have its set of standards endorsed by the [International Organization of Securities Commissions \(IOSCO\)](#), which includes as one of its members the U.S. Securities and Exchange Commission. Although the IASC never received the unqualified endorsement of its set of standards that it hoped to receive from the IOSCO, its efforts to satisfy IOSCO greatly enhanced the perceived quality of both the IASC's standards and of the organization itself.

In 2001, the IASC made a strong bid to become THE international accounting standard setter through a substantial organizational restructuring. To symbolize this change, the group's name was changed to the International Accounting Standards Board. The similarity with the name of the FASB is no coincidence. With this restructuring, the IASB became an operational clone of the FASB. The Board members were to be full time, just as the FASB Board members have always been. The Board members are not to represent specific national constituencies, unlike the IASC and also unlike what was envisioned under several IASC restructuring proposals. Like the FASB, the IASB Board members come from a much broader background than the CPA community (this continued a trend that had already been started in the IASC). The 15 Board members of the IASB come from many countries and represent a variety of professional backgrounds. As of May 2010, the 15 Board members included individuals from the United States, the United Kingdom, France, Sweden, China, Australia, South Africa, Brazil, and Japan.<sup>5</sup> Many of the Board members are CPAs with audit experience, but in May 2010 the IASB also included a financial analyst and several people with national regulatory experience. And the IASB deliberative process was to be much more along the lines of the FASB's operating procedure—public meetings, open debate, lots of public input into the process, transparent decisions, and so forth.

In 2002, the IASB and the FASB entered into a joint agreement, called the Norwalk Agreement, in which they pledged to work together to develop a set of “fully compatible” accounting standards as soon as possible, and to continue to work together to make sure that those standards stay compatible. This joint effort is proceeding along two fronts. First,

<sup>3</sup> Kees Camfferman and Stephen A. Zeff, *Financial Reporting and Global Capital Markets: A History of the International Accounting Standards Committee, 1973–2000* (Oxford University Press, 2007), p. 10. This book is the definitive and authoritative history of the IASC.

<sup>4</sup> Summer Research Symposium, Hong Kong University of Science and Technology, Hong Kong, 1998.

<sup>5</sup> The IASB will be expanded to 16 members by 2012.

the IASB and the FASB identified several accounting standard issues on which they could achieve full compatibility without too much difficulty. These issues included the accounting for some inventory costs, accounting for the exchange of nonmonetary assets, and the reporting of accounting changes, all of which have been completed, and the computation of earnings per share, which is still in progress. Second, the IASB and the FASB are working together on larger projects involving fundamental issues such as revenue recognition, the accounting for business combinations, and a joint conceptual framework.

In spite of this surface appearance of amiable cooperation between the IASB and the FASB, the IASB has been very aggressive at promoting its standards as THE worldwide standard. For a time, the IASB Web site was almost like a scoreboard proudly proclaiming the number of countries that had accepted IASB standards as their national standard. But as it has become apparent that the IASB would eventually become the source for worldwide accounting standards and that the FASB would fade in influence, the FASB appears to have gracefully accepted this and has worked closely with the IASB on their many joint projects.

This shift from the FASB to the IASB as the acknowledged source of high-quality global accounting standards is illustrated by an historic announcement by the SEC in 2007 that approved the use of IASB standards for the financial reports of non-U.S. companies with shares traded on U.S. stock exchanges. This change took effect in 2008. Specifically, on March 4, 2008, Chapter II of Title 17 of the CFR (Code of Federal Regulations) was amended by the SEC to allow non-U.S. companies to use International Financial Reporting Standards, instead of U.S. GAAP, in their financial statement filings with the SEC. Before this, non-U.S. companies wishing to have their shares traded in the United States had to provide U.S. shareholders with a summary showing what key reported financial statement numbers would have been had the company used U.S. GAAP. An example of this disclosure, called Form 20-F, was shown for Daimler-Benz in Exhibit 22-1.

An even more earth-shaking development occurred on August 27, 2008. Here is the first paragraph of an article that appeared in *The Wall Street Journal* the next day:

“The Securities and Exchange Commission signaled the demise of U.S. accounting standards, kicking off a process Wednesday that could ultimately require all publicly listed American companies to follow an international model instead.”<sup>6</sup>

Additional details from this landmark SEC announcement revealed a “time line” for the rapid shift from U.S. GAAP to IFRS, with all U.S. publicly traded companies being required to use IASB standards by 2014. As explained in detail in the opening scenario of Chapter 1 of this textbook, this rosy “time line” exploded in a blaze of controversy in October 2008. In brief, external pressure caused the IASB to short-circuit its due process deliberations and cave in to European bank urgings for a favorable accounting standard change. This blatant politicization of the accounting standard-setting process caused many in the U.S. business community to rethink the transfer of sovereignty over U.S. accounting standards from the FASB, which can be closely monitored by the SEC,

to the IASB, which is completely outside any U.S. regulatory jurisdiction. The revised “work plan” of the SEC promises that no switch from U.S. GAAP to IFRS will occur until 2015, at the earliest.

**FYI**

Look again at the opening scenario for Chapter 1 to see the details of the October 2008 IASB debacle.

<sup>6</sup> Kara Scannell and Joanna Slater, “SEC Moves to Pull Plug on U.S. Accounting Standards,” *The Wall Street Journal*, August 28, 2008, p. A1.

Although the details of the U.S. transition to some form of IFRS are uncertain, it is now very likely that all publicly traded U.S. companies will be using IFRS very early in your career. Of course, some skeptics are claiming that U.S. investors and accountants will find the new international financial statements hard to understand. But you won't be one of those without understanding. As you will see in the U.S. GAAP/IFRS comparison summary in the next learning objective in this chapter, this textbook has already given you very thorough exposure to IFRS.

## Summary of U.S. GAAP/IFRS Differences

**3** Identify key differences between U.S. GAAP and IFRS.

**WHY** Students of accounting in the United States must know U.S. GAAP as well as IFRS.

**HOW** Throughout this textbook, you have learned U.S. accounting rules as well as key areas of difference between U.S. GAAP and IFRS. Once a person understands U.S. GAAP in a certain area, it doesn't take much additional study to understand any significant differences under IFRS.

In almost every chapter in this textbook, you have been presented with comparisons of the important differences between U.S. GAAP and IFRS. A summary of those differences is included on the next few pages. Before you become overwhelmed by this list of differences, you should stop for a moment and consider the much longer list that could be made of the similarities between U.S. GAAP and IFRS. The large majority of accounting standards and treatments discussed in this long, long textbook are the same under both sets of standards. And as you will be reminded as you look through the list below, once you understand U.S. GAAP, the IFRS differences are reasonable alternatives that fit comfortably under the conceptual umbrella of generally accepted accounting principles.

The following comparisons also include side-by-side references to both the current FASB Codification and the historical standards from which the Codification was generated. Most practicing accountants still think in terms of the old standard numbers. For example, if you say "Statement 133," a seasoned accountant will immediately think, "Derivatives!" In contrast, those of us friendly with the FASB's Codification associate "Topic 815" with "derivatives." The following summary tables can help as you attempt to communicate with accountants who received their education before the Codification.

Topic	U.S. GAAP	IASB
<b>Chapter 1: Financial Reporting</b>		
Accounting standard setter	Financial Accounting Standards Board (FASB)	International Accounting Standards Board (IASB)
Financial accounting standards	FASB Accounting Standards Codification (ASC)	<ul style="list-style-type: none"> <li>International Financial Reporting Standards (IFRS)</li> <li>International Accounting Standards (IAS)</li> </ul>
Group to address issues of interpretation or for which no formal standard currently exists	Emerging Issues Task Force (EITF)	<ul style="list-style-type: none"> <li>International Financial Reporting Interpretations Committee (IFRIC)</li> <li>Standing Interpretations Committee (SIC) before 2002</li> </ul>

Topic	FASB Accounting Standards Codification	Original FASB Standard	Corresponding IASB Standard	Differences between U.S. GAAP and IFRS
<b>Chapter 3: The Balance Sheet and Notes to the Financial Statements</b>				
Classified balance sheet	Section 210-10-05 par. 4 Section 210-10-45 par. 1 through 12	ARB 43 Ch, 3A par. 4-8	IAS 1 par. 60-61	No substantial differences in the descriptions and definitions of current assets and current liabilities
Classification of short-term obligations to be refinanced	Section 470-10-45 par. 14	SFAS No. 6 par. 10-11	IAS 1 par. 72	Under IFRS, for a short-term obligation to be classified as long term, the refinancing must take place by the balance sheet date.
Upward revaluation	Topic 855	SFAS No. 165	IAS 10	No substantial differences
<b>Chapter 4: The Income Statement</b>				
Discontinued operations	Subtopic 205-20	SFAS No. 144	IFRS 5	Under IFRS, a discontinued operation must be a major line of business or geographic segment. Also, under IFRS, separate disclosure must be made of the cash flows of the discontinued operations.
Extraordinary items	Subtopic 225-20	APB Opinion No. 30	IAS 1 par. 87	Under IFRS, no income or expense items are allowed to be classified as "extraordinary."
Change in accounting principle	Section 250-10-45 par. 1-16 Section 250-10-50 par. 1- 3	SFAS No. 154 par. 4-18 APB No. 28 par. 28	IAS 8 par. 14-31	No substantial differences
<b>Chapter 5: Statement of Cash Flows and Articulation</b>				
Definition of cash equivalents	Section 230-10-20 (Glossary) – Cash equivalents	SFAS No. 95 par. 8	IAS 7 par. 7	No substantial differences
Noncash investing and financing activities	Section 230-10-50 par. 3	SFAS No. 95 par. 32	IAS 7 par. 43	No substantial differences
Direct and indirect methods	Section 230-10-45 par. 25,28	SFAS No. 95 par. 27-28	IAS 7 par. 18-19	No substantial differences
Classification of interest paid	Section 230-10-45 par. 17(d)	SFAS No. 95 par. 23(d)	IAS 7 par. 33	U.S. GAAP – operating IFRS – operating or financing
Classification of income taxes paid	Section 230-10-45 par. 17(c)	SFAS No. 95 par. 23(c)	IAS 7 par. 35	U.S. GAAP – operating IFRS – operating, investing, or financing
Classification of interest received	Section 230-10-45 par. 16(b)	SFAS No. 95 par. 22(b)	IAS 7 par. 33	U.S. GAAP – operating IFRS – operating or investing
Classification of dividends received	Section 230-10-45 par. 16(b)	SFAS No. 95 par. 22(b)	IAS 7 par. 33	U.S. GAAP – operating IFRS – operating or investing
Classification of dividends paid	Section 230-10-45 par. 15(a)	SFAS No. 95 par. 20(a)	IAS 7 par. 34	U.S. GAAP – financing IFRS – operating or financing

Topic	U.S. GAAP	IASB Standard
<b>Chapter 6: Earnings Management</b>		
General characterization of the standards	Rules oriented. U.S. GAAP contains about 25,000 pages with lots of detailed guidance.	Principles oriented. IFRS contains just 2,500 pages with many detailed accounting decisions left up to the professional judgment of the accountant.

Topic	FASB Accounting Standards Codification	Original FASB Standard	Corresponding IASB Standard	Differences between U.S. GAAP and IFRS
<b>Fair Value Module</b>				
Fair values in financial reporting	Topic 820	SFAS No. 157	Exposure Draft: <i>Fair Value Measurement</i> , May 2009	No substantial differences. Both the FASB and the IASB plan to have revised fair value standards finalized by the end of 2010; the revised standards will be mutually consistent.
<b>Chapter 7: The Revenue/Receivables/Cash Cycle</b>				
Bad debts	Section 310-10-35 par. 7-9	SFAS No. 5 par. 22	No explicit standard	No apparent differences
Warranties	Section 460-10-25 par. 5-7	SFAS No. 5 par. 24	IAS 37 par. 14, 39	No substantial differences
Compensating balances	Section 210-10-S99 par. 1	SEC Regulation S-X, Rule 5-02, Caption 1	IAS 7 par. 48	No substantial differences
Imputation of interest on receivables	Section 835-30-25 par. 2, 12	APB No. 21 par. 9, 13	No explicit standard	No apparent differences
Derecognition of receivables	Section 860-10-40 par. 5	SFAS No. 140 par. 9	IAS 39 par. 20	U.S. GAAP includes a list of three criteria that must be satisfied for derecognition. IFRS has a conceptual 2-step test based on risks and rewards and control. In practice, the derecognition result is almost always the same.
<b>Chapter 8: Revenue Recognition</b>				
Revenue recognition	Topic 605	Contained in a large number of different standards	IAS 18, IAS 11	U.S. GAAP and IFRS are generally consistent, but many detailed differences exist. The FASB and IASB are currently working on a joint revenue recognition project.
Completed-contract method	Subtopic 605-35	ARB 45 and SOP 81-1	IAS 11	Under IFRS, the completed contract method is not allowed.
Pre-sale revenue recognition for biological assets	Section 905-330-35	SOP 85-3	IAS 41	Under IFRS, changes in the fair value of biological assets are recognized as gains and losses. Under U.S. GAAP a similar procedure is acceptable under some circumstances, but not required.

Topic	FASB Accounting Standards Codification	Original FASB Standard	Corresponding IASB Standard	Differences between U.S. GAAP and IFRS
Multiple-element arrangements	Subtopic 605-25	EITF 08-1	IAS 18	IFRS does not contain any specific provisions related to multiple-element arrangements.
<b>Chapter 9: Inventory and Cost of Goods Sold</b>				
LIFO	Section 330-10-30 par. 9-11	ARB 43, Chapter 4	IAS 2 par. 23-27	LIFO is not allowable under IFRS.
Lower of cost or market	Section 330-10-35 par. 1-12	ARB 43, Chapter 4	IAS 2 par. 28-33	Under IFRS, inventory is recorded at lower of cost or net realizable value, and inventory write-down losses can be reversed if the selling price subsequently recovers.
Foreign currency transactions	Section 830-20-35 par. 2	SFAS No. 52 par. 16b	IAS 21 par. 23a, 28	No substantial differences
<b>Chapter 10: Investments in Noncurrent Operating Assets—Acquisition</b>				
Interest capitalization	Subtopic 835-20	SFAS No. 34	IAS 23	Under IFRS, net “borrowing costs” are capitalized. The net amount is the gross interest paid less interest received on investment of idle funds.
Asset retirement obligation	Subtopic 410-20	SFAS No. 143	IAS 16 and IAS 37	No substantial differences
Business combinations	Topic 805	SFAS No. 141R	IFRS 3	No substantial differences
Intangible assets	Topic 350	SFAS No. 142	IAS 38	No substantial differences
Research and development	Topic 730	SFAS No. 2 SFAS No. 86	IAS 38	Under IFRS, development costs, which are costs incurred after technological feasibility, are capitalized. This matches U.S. GAAP for software development costs, but not for ordinary R&D.
<b>Chapter 11: Investments in Noncurrent Operating Assets—Utilization and Retirement</b>				
Impairment of tangible assets	Subtopic 360-10 various subsections on “Impairment”	SFAS No. 144	IAS 36	Under U.S. GAAP, the impairment test is a 2-step test. Under IFRS, the impairment test involves just one step, a comparison of the book value to the “recoverable amount” of the asset.
Impairment of intangible assets	Topic 350	SFAS No. 142	IAS 36	U.S. GAAP includes three different impairment tests for intangibles. Under IFRS, there is just one test, which is the same as is used for tangible assets.
Upward revaluation	Not part of U.S. GAAP	Not part of U.S. GAAP	IAS 16	Upward revaluations of property, plant, and equipment are generally not allowable under U.S. GAAP.

<b>Topic</b>	<b>FASB Accounting Standards Codification</b>	<b>Original FASB Standard</b>	<b>Corresponding IASB Standard</b>	<b>Differences between U.S. GAAP and IFRS</b>
Asset retirement obligations	<i>Subtopic 410-20</i>	SFAS No. 143	IAS 16 and IAS 37	No substantial differences
Assets classified as held for sale	<i>Section 360-10-45</i>	SFAS No. 144	IFRS 5	No substantial differences
<b>Chapter 12: Debt Financing</b>				
Short-term obligations expected to be refinanced	<i>Section 470-10-45 par. 14</i>	SFAS No. 6 par. 10-11	IAS 1 par. 72	Under IFRS, for a short-term obligation to be classified as long term, the refinancing must take place by the balance sheet date.
Splitting convertible debt proceeds into debt and equity	<i>Subtopic 470-20</i>	APB Opinion No. 14	IAS 32 par. 28-32	Under IFRS, ALL convertible debt issues are divided into their debt and equity components. This separation is only done under certain circumstances under U.S. GAAP.
Consolidation of variable interest entities (VIE)	<i>Section 810-10-25 par. 20 through 59</i>	FIN 46R	SIC 12	Under IFRS, a VIE is consolidated when the economic substance of the relationship indicates that the VIE is controlled. Compared to U.S. GAAP, this is very much a principles-based approach.
Fair value option	<i>Topic 825, "Fair Value Option" subsections</i>	SFAS No. 159	IFRS 9	There is a fair value option for financial assets under IFRS, but as of 2010 there was not yet a fair value option for financial liabilities.
Troubled debt restructuring	<i>Subtopic 470-60</i>	SFAS No. 15	IAS 39 par. 39 through 41	No substantial differences
<b>Chapter 13: Equity Financing</b>				
Stock warrants	<i>Section 470-20-25 par. 2</i>	APB Opinion No. 14 par. 16	IAS 32 par. 28	Under IFRS, all compound financial instruments, such as stock warrants, are to be separated into separate debt and equity components. Under U.S. GAAP, this is required only if the stock warrants are "detachable."
Stock-based compensation	<i>Topic 718</i>	SFAS No. 123R	IFRS 2	No substantial differences
Reporting equity-related items as liabilities	<i>Topic 480</i>	SFAS No. 150	IAS 32	No substantial differences
Noncontrolling interest	<i>Section 810-10-45 par. 16</i>	SFAS No. 160 par. 5	IAS 27 par. 27	No substantial differences

Topic	FASB Accounting Standards Codification	Original FASB Standard	Corresponding IASB Standard	Differences between U.S. GAAP and IFRS
<b>Chapter 14: Investments in Debt and Equity Securities</b>				
Classification as trading, available for sale, or held to maturity	Section 320-10-25 par. 1	SFAS No. 115 par. 6-12	IFRS 9 par 4.1, 5.4.4	No substantial differences
Equity method	Topic 323	APB Opinion No. 18	IAS 28	No substantial differences
Fair value option	Topic 825, "Fair Value Option" subsections	SFAS No. 159	IFRS 9	There is a fair value option for financial assets under IFRS, but as of 2010 there was not yet a fair value option for financial liabilities.
Derecognition of investment securities	Topic 860	SFAS No. 140	IAS 39 par. 20	Under U.S. GAAP, the transfer of a financial asset is recorded as a sale if control of the asset passes from the transferor to the transferee. Under IFRS, the transfer is recorded as a sale if the risks and rewards associated with the cash flows from the financial assets pass from the transferor to the transferee.
Classification of cash flows from the purchase and sale of investment securities	Section 320-10-45 par. 11	SFAS No. 115 par. 18	IAS 7 par. 15-16	Under IFRS, cash flows from the purchase and sale of trading securities are classified under operating activities; for other security categories, the cash flows are investing activities. Under U.S. GAAP, trading security cash flows may be operating or investing, depending on management intent.
Loan impairment	Section 310-10-35	SFAS No. 114	IAS 39 par. 58 through 65	No substantial differences
<b>Chapter 15: Leases</b>				
Lease classification criteria	Section 840-10-25 par. 1	SFAS No. 13 par. 7	IAS 17 par. 8-10	In substance, the standards are the same. IFRS provides less detail.
Lease discount rate (for lessees)	Section 840-10-25 par. 31	SFAS No. 13 par. 7	IAS 17 par. 20	In IFRS, no explicit mention is made of using the lower of the implicit rate or the incremental borrowing rate. Instead, the implicit rate is to be used if known.
Revenue recognition criteria (for lessor)	Section 840-10-25 par. 42	SFAS No. 13 par. 8	IAS 17 par. 42	Substantially the same. Rather than the two explicit criteria, IFRS merely says that a sale in a sales-type lease is recognized "in accordance with the policy followed by the entity for outright sales."

<b>Topic</b>	<b>FASB Accounting Standards Codification</b>	<b>Original FASB Standard</b>	<b>Corresponding IASB Standard</b>	<b>Differences between U.S. GAAP and IFRS</b>
Initial direct costs (for lessors)	Section 840-20-35 par. 2 Section 840-30-35 par. 23 Section 840-30-25 par. 6	SFAS No. 13 par. 19 SFAS No. 13 par. 18 SFAS No. 13 par. 17	IAS 17 par. 38, 42	No substantial differences
Sale-leaseback accounting	Section 840-40-25 par. 3 Section 840-40-35 par. 1	SFAS No. 13 par. 7	IAS 17 par. 58-63	No substantial differences
<b>Chapter 16: Income Taxes</b>				
Use of currently enacted tax rates	Section 740-10-10 par. 3	SFAS No. 109 par. 18	IAS 12 par. 46	Under U.S. GAAP, currently enacted tax rates for future years are used in valuing deferred tax assets and liabilities. Under IFRS, tax rates that have been “substantively enacted” are also used. Substantively enacted tax rates are future tax rates that have been announced by the government but that have not yet been formally enacted into law.
Current/noncurrent classification of deferred tax assets and liabilities	Section 740-10-45 par. 4	SFAS No. 109 par. 41	IAS 1 par. 56	Under U.S. GAAP, deferred tax assets and liabilities are classified current or noncurrent based on the classification of the associated asset or liability. Under IFRS, all deferred tax items are classified as noncurrent.
Recognition of deferred tax assets	Section 740-10-30 par. 5e	SFAS No. 109 par. 17e	IAS 12 par. 24	Under U.S. GAAP, deferred tax assets are recognized if it is “more likely than not” (50%+ probability) that the future tax benefits will be realized. Under IFRS, the probability threshold is “probable,” which is generally seen to be higher than “more likely than not.”
Uncertain tax positions	Topic 740	FASB FIN No. 48	No specific accounting standard in IAS	Under IFRS, there is no standard regarding the recognition of a tax liability related to an uncertain tax position.
Cash paid for income taxes	Section 230-10-50 par. 2	SFAS No. 95 par. 121	IFRS 7 par. 35	Both U.S. GAAP and IFRS require separate disclosure of the amount of cash paid for income taxes. Under IFRS, this amount may be allocated among operating, investing, and financing activities.
<b>Chapter 17: Employee Compensation—Payroll, Pensions, and Other Compensation Issues</b>				
Compensated absences	Section 710-10-25 par. 1-8	SFAS No. 43 par. 6-16	IAS 19 par. 11-16	No substantial differences

Topic	FASB Accounting Standards Codification	Original FASB Standard	Corresponding IASB Standard	Differences between U.S. GAAP and IFRS
Postemployment benefits	Section 712-10-05 par. 2-6 Section 712-10-15 par. 3-5 Section 712-10-25 par. 1-5	SFAS No. 112 par. 1-6 SFAS No. 88 par. 15	IAS 19 par. 132-140	No substantial differences
Discount rate for projected benefit obligation	Section 715-30-35 par. 43	SFAS No. 87 par. 44	IAS 19 par.78	IFRS allows use of the interest rate on government bonds in countries lacking a developed corporate bond market.
Prior service cost	Section 715-30-35 par. 10-11	SFAS No. 87 par. 24-25	IAS 19 par.96	Under IFRS, the "past" service cost amount is recognized as an expense immediately IF the benefits are immediately vested.
Balance sheet numbers: one net number for the difference between PBO and the pension fund, with AOCI shown separately	Section 715-30-25 par. 1, 4	SFAS No. 87 par. 35, 38	IAS 19 par.54	Under current IFRS, the reported balance sheet number is the sum of the PBO, the pension fund, and AOCI associated with the pension plan.
Settlements and curtailments	Various sections in Subtopics 715-30 and 715-60; illustrations in Section 715-30-55	SFAS No. 88	IAS 19 par.109-115	No substantial differences
Disclosure	Sections 715-29-50 715-30-50 715-60-50	SFAS No. 132(R)	IAS 19 par.120-125	No substantial differences
Differences similar to the differences in accounting for pensions.	Subtopic 715-60	SFAS No. 106	In general, no distinction between pensions and other postretirement benefits. Guidance on medical benefits found in IAS 19 par. 88-91	Differences similar to the differences in accounting for pensions.
<b>Chapter 18: Earnings per Share</b>				
Computing basic earnings per share	Section 260-10-45 par. 10-11	SFAS No. 128 par. 8-9	IAS 33 par. 9-29	No substantial differences
Computing diluted earnings per share	Section 260-10-45 par. 16-17	SFAS No. 128 par. 11, 13	IAS 33 par. 30-44	No substantial differences

<b>Topic</b>	<b>FASB Accounting Standards Codification</b>	<b>Original FASB Standard</b>	<b>Corresponding IASB Standard</b>	<b>Differences between U.S. GAAP and IFRS</b>
Participating securities and the two-class method	Section 260-10-45 <i>par. 59A-66</i>	SFAS No. 128 <i>par. 60-61</i> EITF 03-06	IAS 33 <i>par. A13-A14</i>	No substantial differences
Treasury stock method for options	Section 260-10-45 <i>par. 23, 25</i>	SFAS No. 128 <i>par. 17-18</i>	IAS 33 <i>par. 45-48</i>	No substantial differences
If-converted method for convertible securities	Section 260-10-45 <i>par. 40-42</i>	SFAS No. 128 <i>par. 26-28</i>	IAS 33 <i>par. 49-51</i>	No substantial differences
Impact of actual conversion or exercise	Section 260-10-45 <i>par. 17</i>	SFAS No. 128 <i>par. 13</i>	IAS 33 <i>par. 38</i>	No substantial differences
Proper order of consideration for multiple potentially dilutive securities	Section 260-10-45 <i>par. 18</i>	SFAS No. 128 <i>par. 14-15</i>	IAS 33 <i>par. 44</i>	No substantial differences
Disclosures associated with basic and diluted EPS	Section 260-10-50 <i>par. 1-2</i>	SFAS No. 128 <i>par. 40-41</i>	IAS 33 <i>par. 70-73A</i>	No substantial differences
<b>Chapter 19: Derivatives, Contingencies, Business Segments, and Interim Reports</b>				
Accounting for derivatives	<i>Topic 815</i>	SFAS No. 133	IAS 39	No substantial differences at the conceptual level, but numerous technical differences that are beyond the scope of this book.
Recognition of contingent liabilities and contingent assets	<i>Contingent liabilities: Section 450-20-25</i> <i>Contingent assets: Section 450-30-25</i>	SFAS No. 5 <i>par. 3</i> <i>and 17</i>	IAS 37 <i>par. 10,27-28,31,34</i>	Generally the same. Under IFRS, there is no requirement to disclose contingent guarantee obligations when their likelihood is remote.
Measurement of contingent liabilities	Section 450-20-30 <i>par. 1</i>	FIN No. 14 <i>par. 3</i>	IAS 37 <i>par. 36-47</i>	Under U.S. GAAP, the estimated liability is the low end of the estimated range if each estimate in the range is equally likely. Under IFRS, the estimated liability is the amount required to settle the obligation.
Segment reporting	<i>Topic 280</i>	SFAS No. 131	IFRS 8	No substantial differences
Relation between interim reporting and annual reporting	Section 270-10-45 <i>par. 1-2</i>	APB Opinion No. 28 <i>par. 9</i>	IAS 34 <i>par. 28</i>	Under U.S. GAAP, an interim period is viewed as a subcomponent of the annual period. Under IFRS, accounting principles are applied to an interim period in the same way they are applied to an annual period.

# Foreign Currency Financial Statements

4

Convert foreign currency financial statements into U.S. dollars using the translation method.

**WHY** Almost every large U.S. corporation has foreign subsidiaries. Anyone associated with the financial statements of a large multinational should understand how the financial statements of the foreign subsidiaries are folded into those of the parent.

**HOW** Assets and liabilities are translated using the current exchange rate prevailing as of the balance sheet date. Income statement items are translated at the average exchange rate for the year. Dividends are translated using the exchange rate prevailing on the date the dividends were declared. Capital stock is translated at the historical rate, that is, the rate prevailing on the date the subsidiary was acquired or the stock was issued. Retained earnings is translated in the first year using historical rates, but in subsequent years, it is computed by taking the balance in Retained Earnings from the prior period's translated financial statements, adding translated net income, and subtracting translated dividends. The translation adjustment is recognized as a separate component of the U.S. parent company's stockholders' equity and included as part of accumulated other comprehensive income.

In Chapter 9 (inventory purchases) and Chapter 19 (derivatives), the issues associated with foreign exchange rates and their impact on accounting for transactions were introduced. In this section, the concepts associated with foreign currency are extended to include entire foreign currency financial statements. Foreign currency financial statements are financial statements prepared in a currency other than the U.S. dollar. For example, **IBM** has many European subsidiaries whose internal financial statements are prepared in euros. Those financial statements, when submitted to IBM headquarters in Armonk, New York, must be converted into U.S. dollars. There are two methods for converting foreign currency financial statements: translation and remeasurement. **Translation** is used when the foreign subsidiary is a relatively self-contained unit that is independent from the parent company's operations. **Remeasurement** is appropriate when the subsidiary does not operate independently of the parent company. The translation process simply converts the foreign currency financial statements into U.S. dollars for consolidation with the parent company's statements; remeasurement involves remeasuring the financial statements as though the transactions had been originally recorded in U.S. dollars.

To determine the correct method of conversion, the **functional currency** of the foreign subsidiary must first be determined. In most instances, the functional currency is the currency in which most of the subsidiary's transactions are denominated.<sup>7</sup> If the functional currency is the local currency, the subsidiary is considered to be self-contained, and its financial statements are translated into U.S. dollars. If the functional currency is the U.S. dollar, the subsidiary is considered to be just a branch office of the parent, and the financial statements are remeasured into U.S. dollars. Most foreign entities are self-contained and use their local currency as the functional currency; thus, their financial statements are converted into U.S. dollars by translation. Therefore, this chapter

<sup>7</sup> FASB ASC Subtopic 830-30 (Foreign Currency Matters—Translation of Financial Statements).

discusses the translation process. Coverage of remeasurement is left to an advanced accounting course.

### Translation

Translation involves converting financial statement information from a subsidiary's functional currency to the parent company's reporting currency using the current exchange rate. The specifics follow:

- Assets and liabilities are translated using the current exchange rate prevailing as of the balance sheet date.
- Income statement items are translated at the average exchange rate for the year.
- Dividends are translated using the exchange rate prevailing on the date the dividends were declared.
- Capital stock is translated at the historical rate, that is, the rate prevailing on the date the subsidiary was acquired or the stock was issued.
- Retained earnings is translated in the first year using historical rates, but in subsequent years, it is computed by taking the U.S. dollar balance in Retained Earnings from the prior period's translated financial statements, adding translated net income and subtracting translated dividends.

Double-entry accounting works the same for foreign subsidiaries as it does for U.S. companies: When a local currency trial balance is prepared, debits equal credits. However, as a result of the translation process, debits in the translated U.S. dollar trial balance typically will not equal credits. The balancing figure is called a **translation adjustment** and is recognized as part of the U.S. parent company's stockholders' equity.

To illustrate the translation process, consider the following example. USA Company purchased Swiss Inc. on January 1, 2013, for 50,000 francs. On that date, the exchange rate for 1 Swiss franc was \$0.25, so the acquisition price was equivalent to \$12,500. On December 31, 2013, the following trial balance for Swiss Inc. is available. The current exchange rate is \$0.28, and the average exchange rate for the year was \$0.27. Dividends were declared and paid when the exchange rate was \$0.275.

Cash . . . . .	10,000	francs	Accounts Payable . . . . .	50,000	francs
Accounts Receivable . . . . .	35,000		Long-Term Debt . . . . .	80,000	
Inventory . . . . .	65,000		Capital Stock . . . . .	30,000	
Equipment . . . . .	90,000		Retained Earnings . . . . .	20,000	
Cost of Goods Sold . . . . .	60,000		Sales . . . . .	120,000	
Expenses . . . . .	30,000				
Dividends . . . . .	10,000				
Total debits . . . . .	<u>300,000</u>	francs	Total credits . . . . .	<u>300,000</u>	francs

If Swiss Inc. determines its functional currency to be the Swiss franc, translation is required to convert the financial statements into U.S. dollars for consolidation with USA Company's financial statements. As stated previously, the current rate is used to translate assets and liabilities, and the average rate is used to translate income statement items. The translation process is as shown on page 22-21.

December 31, 2013	Trial Balance (In Swiss francs)	Exchange Rate	Trial Balance (In U.S. dollars)
Cash .....	10,000	\$0.28	\$ 2,800
Accounts Receivable .....	35,000	0.28	9,800
Inventory .....	65,000	0.28	18,200
Equipment .....	90,000	0.28	25,200
Cost of Goods Sold .....	60,000	0.27	16,200
Expenses .....	30,000	0.27	8,100
Dividends .....	10,000	0.275	2,750
	<u>300,000</u>		<u>\$83,050</u>
Accounts Payable .....	50,000	\$0.28	\$14,000
Long-Term Debt .....	80,000	0.28	22,400
Capital Stock .....	30,000	0.25	7,500
Retained Earnings .....	20,000	0.25	5,000
Sales .....	120,000	0.27	32,400
Translation Adjustment .....			1,750
	<u>300,000</u>		<u>\$83,050</u>

Note that the retained earnings amount in the trial balance is the BEGINNING retained earnings for the year. We know this because we see both retained earnings and the detailed revenue, expense, and dividend accounts listed in the same trial balance. Once the books are closed so that the ending Retained Earnings balance is recorded in the accounts, the revenue, expense, and dividend accounts are zero.

In this example, Swiss Inc. requires an additional credit of \$1,750 to balance the U.S. dollar trial balance. This translation adjustment can be thought of as a deferred gain. USA Company invested 50,000 francs in Swiss Inc. when 1 franc was worth \$0.25. By year-end, each franc was worth \$0.28, suggesting that USA Company had experienced a gain of approximately \$1,500 [50,000 francs × (\$0.28 – \$0.25)]. The reason the deferred gain is not exactly equal to \$1,500 is that the investment just didn't sit there during the year, but transactions occurred (sales, expenses, and dividends) that impacted the amount of USA Company's net franc investment.

The U.S. dollar amounts for the Swiss Inc. financial statement items are added to USA Company's amounts as part of the consolidation process. In addition, the translation adjustment is shown as a separate item in USA Company's Equity section as part of accumulated other comprehensive income. The annual change in the translation adjustment is recognized as part of other comprehensive income (essentially, a deferred gain or loss) rather than as an income statement gain or loss because the only way the foreign currency gain can be realized is through liquidation

## FYI

For comparison, remeasurement uses historical rates in converting assets such as equipment and land. The historical rate is also used for converting the associated depreciation expense.

## FYI

With remeasurement, the adjustment needed to balance the foreign subsidiary's U.S. dollar trial balance is recognized as a foreign currency gain or loss and is included in the income statement of the U.S. parent company.

of all the assets and liabilities of the foreign subsidiary. If the foreign subsidiary is a self-contained going concern, as it is assumed to be when the functional currency is the local currency and translation is used, it makes sense to defer the translation gain (or loss) because actual liquidation and conversion of the foreign subsidiary's net assets into U.S. dollars is not expected any time soon.

## FASB CODIFICATION

**The Issue:** You and some old friends from high school have been sitting around talking about old times. Inevitably, the conversation has turned to accounting. You mentioned that you have learned how to translate foreign currency balance sheets and income statements into U.S. dollars. This pronouncement brought some “oohs” and “aahs” from your friends. But one friend cut short the respectful exclamations when he said: “Listen, don’t talk to me about the balance sheet and the income statement. I care about the statement of cash flows. Tell me how to translate a statement of cash flows into U.S. dollars.”

Well, the gauntlet has been thrown down. You have asked for a laptop so that you can go online, look at the FASB’s Codification, and answer your friend’s challenge.

**The Question:** How is a foreign currency statement of cash flows translated into U.S. dollars?

**Searching the Codification:** The Codification’s foreign currency material is contained in Topic 830 (Foreign Currency Matters). Let’s hope there is something there about the statement of cash flows.

**The Answer:** The procedure necessary to translate a foreign currency statement of cash flows into U.S. dollars is described below.

### SOLUTIONS TO OPENING SCENARIO QUESTIONS

1. The SEC’s Form 20-F provides a reconciliation between the reported net income of a non-U.S. company and what that net income would have been had the company used U.S. GAAP. The company is also required to provide a reconciliation of stockholders’ equity. Since 2008, non-U.S. companies using IFRS have been able to have their shares traded on U.S. exchanges without providing a supplemental 20-F reconciliation.
2. Yes, U.S. companies can create “hidden reserves.” Recall that hidden reserves are simply overstatements of expenses that can be reversed in future years to bolster income. A prime example of a “hidden reserve” used by U.S. companies is an overly large restructuring charge. Similarly, an excessive bad debt allowance can serve as a “hidden reserve.”

### SOLUTION TO USING THE FASB’S CODIFICATION

Under Topic 830, you can see Subtopic 230 (Statement of Cash Flows). A quick look through that subtopic reveals FASB ASC paragraph 830-230-45-1: “A statement of cash flows of an entity with foreign currency transactions or foreign operations shall report the reporting currency equivalent of foreign currency cash flows using the exchange rates in

effect at the time of the cash flows. An appropriately weighted average exchange rate for the period may be used for translation if the result is substantially the same as if the rates at the dates of the cash flows were used. (That is, paragraph 830-30-45-3 applies to cash receipts and cash payments.) The statement of cash flows shall report the effect

of exchange rate changes on cash balances held in foreign currencies as a separate part of the reconciliation of the change in cash and cash equivalents during the period.”

So, the translated statement of cash flows is generated using much the same process as with the income statement. For cash flows occurring evenly throughout the year (such as cash collected from

customers and cash paid to suppliers), an average rate for the year can be used. For discrete cash flows on a specific date (such as loan proceeds or dividend payments), the exchange rate on that date should be used. Finally, the impact of exchange rates changes on the U.S. dollar value of cash balances is to be shown as a separate line item in the statement of cash flows.

## REVIEW CHAPTER 22

### LEARNING OBJECTIVES

- 1** Understand the importance and potential impact of a common worldwide set of accounting standards.

Financial ratio comparisons can yield misleading implications if the ratios come from companies with differing accounting practices. Historically, this is exactly the situation that existed between different countries around the world. A key function of accounting standards is to create a common set of rules to be used by all companies so that outsiders can receive financial reports that are comparable among all of the different companies that they might want to analyze. Globalization of business has forced investors, creditors, and other stakeholders to perform an increasing number of cross-border financial statement comparisons, and the need for a common set of global standards has become apparent.

- 2** Outline the history of the IASB.

The IASC (predecessor of the IASB) was created by national CPA organizations from around the world, and the committee members did their work on a part-time basis. The early standards of the IASC were compilations of accounting practices around the world with, perhaps, a preferred treatment identified. In order to get the stamp of approval on its standards from IOSCO (an international association of securities regulators such as the SEC in the United States), the IASC improved its standards and created a comprehensive set of standards. In 2001, the IASC was restructured into the IASB with full-time

Board members representing a broad business constituency. In 2002, the IASB and the FASB signed the Norwalk Agreement pledging to work together to develop a single set of high-quality accounting standards to be used around the world. The SEC is currently considering whether and when to require the adoption of IASB standards by all publicly traded U.S. companies.

- 3** Identify key differences between U.S. GAAP and IFRS.

Almost every chapter in this textbook contains a comparison of the important differences between U.S. GAAP and IFRS. A summary of those differences is included in Learning Objective #3.

- 4** Convert foreign currency financial statements into U.S. dollars using the translation method.

A foreign subsidiary’s functional currency is the currency in which most of the subsidiary’s transactions are denominated. If the functional currency is the local currency, the subsidiary is considered to be self-contained and its financial statements are converted into U.S. dollars through a process called *translation*. The financial statements of most foreign subsidiaries of U.S. companies are translated as follows:

- Assets and liabilities are translated using the current exchange rate prevailing as of the balance sheet date.
- Income statement items are translated at the average exchange rate for the year.
- Dividends are translated using the exchange rate prevailing on the date the dividends were declared.

- Capital stock is translated at the historical rate, that is, the rate prevailing on the date the subsidiary was acquired or the stock was issued.
- Retained earnings is translated in the first year using historical rates, but in subsequent years, it is computed by taking the balance in Retained Earnings from the prior period's translated financial statements, adding translated net income, and subtracting translated dividends.

The translation adjustment is a balancing figure and can be thought of as a deferred gain or loss stemming from the impact of exchange rate changes on the value of the U.S. parent's investment in the foreign subsidiary. The translation adjustment is recognized as a separate component of the U.S. parent company's stockholders' equity and included as part of accumulated other comprehensive income.

**FASB- IASB CODIFICATION SUMMARY**

Topic	FASB Accounting Standards Codification	Original FASB Standard	Corresponding IASB Standard	Differences between U.S. GAAP and IFRS
Foreign currency translation	Subtopic 830-30	SFAS No. 52	IAS 21	No substantial differences

**KEY TERMS**

Functional currency 22-19

International Organization of Securities Commissions (IOSCO) 22-7

Remeasurement 22-19  
Translation 22-19

Translation adjustment 22-20

**QUESTIONS**

1. Why is there a need for one set of worldwide financial accounting standards?
2. What kind of people served on the IASC when it was initially established?
3. Briefly describe the nature of the early IASC standards.
4. In the 1990s, what organization provided a push to the IASC to improve the quality of its standards?
5. Briefly describe the structural changes that accompanied the renaming of the IASC to the IASB.
6. What is the Norwalk Agreement?
7. What historic announcement did the SEC make in 2007 regarding IFRS?
8. What announcement did the SEC make on August 27, 2008?
9. What happened in October 2008 to derail the SEC's time line for transition to IFRS?
10. How do accounting differences impact the usefulness of financial ratio comparisons?
11. A foreign subsidiary's functional currency determines whether its financial statements should be translated or remeasured. Identify the primary factor in determining a subsidiary's functional currency. What other factors can influence management's determination as to the subsidiary's functional currency?
12. When financial statements are translated, which exchange rate is used for translating assets and liabilities? Which exchange rate is used for translating common stock? Which exchange rate is used for translating income statement items?
13. When financial statements are translated, what is the difference between the resulting debits and credits called? Where is this difference reported on the balance sheet?

## PRACTICE EXERCISES

## Practice 22-1

## L04

**Foreign Currency Translation**

U.S. Multi Company established a foreign subsidiary, called ForSub Company, on January 1, 2013. The local currency is the crown; on the date the subsidiary was established, the exchange rate was 2 crowns to 1 U.S. dollar. U.S. Multi invested U.S.\$6,000 to get things started. In addition, a local loan in the amount of 8,000 crowns, equivalent to U.S.\$4,000, was obtained. ForSub used the 20,000 crowns in initial financing to acquire the following assets:

	(in crowns)
Cash .....	2,000
Accounts receivable .....	4,000
Inventory.....	6,000
Land .....	8,000
Total assets .....	<u>20,000</u>

During 2013, ForSub conducted *no business operations* beyond the purchase of the assets listed above. Prepare a translated balance sheet, in U.S. dollars, for ForSub as of December 31, 2013, assuming that on that date the exchange rate is (1) 4 crowns to each U.S. dollar and (2) 1 crown to each U.S. dollar. (Note: Don't forget the Liability and Equity sections of the balance sheet.)

## Practice 22-2

## L04

**Foreign Currency Translation**

Refer to Practice 22-1. Now, instead of assuming that ForSub conducted no business operations during 2013, assume that ForSub conducted the following business operations during 2013:

- Sales were 100,000 crowns.
- Expenses totaled 90,000 crowns.
- Dividends paid were 2,000 crowns.

The December 31, 2013, balance sheet differs from the January 1 balance sheet and is as follows:

	(in crowns)
Cash .....	3,000
Accounts receivable .....	6,000
Inventory .....	11,000
Land .....	8,000
Total assets .....	<u>28,000</u>

Prepare a translated balance sheet, in U.S. dollars, for ForSub as of December 31, 2013. Also prepare a translated income statement for 2013. Assume the following exchange rates:

End of year .....	4.0
Average for the year .....	3.0
Rate when dividends were paid .....	3.5

**EXERCISES****Exercise 22-3****L04****Translating Foreign Currency Financial Statements**

On January 3, 2013, Pecos Yo Company purchased International Metals, a Canadian company. On the day of the purchase, the exchange rate for 1 Canadian dollar was U.S.\$0.79. International Metals' balance sheet on the date of the purchase follows.

(In Canadian dollars)	
<b>Assets</b>	
Cash .....	\$ 58,000
Accounts receivable .....	112,500
Inventory .....	91,800
Plant assets .....	145,400
Total assets .....	<u>\$407,700</u>
<b>Liabilities and Equity</b>	
Accounts payable .....	\$165,600
Long-term debt .....	98,000
Capital stock .....	65,100
Retained earnings .....	79,000
Total liabilities and equity .....	<u>\$407,700</u>

Prepare a translated balance sheet as of January 3, 2013.

**Exercise 22-4****L04****Translating Foreign Currency Financial Statements**

The following trial balance in Japanese yen for World Mind Company, a Japanese subsidiary of American Mind Company, is available.

(In Japanese yen)	
Cash .....	¥ 7,000,000
Accounts Receivable .....	17,200,000
Inventory .....	23,500,000
Equipment .....	32,300,000
Cost of Goods Sold .....	28,550,000
Expenses .....	18,900,000
Dividends .....	6,000,000
Total debits .....	<u>¥133,450,000</u>
Accounts Payable .....	¥ 32,000,000
Long-Term Debt .....	15,000,000
Capital Stock .....	16,500,000
Retained Earnings .....	13,750,000
Sales .....	56,200,000
Total credits .....	<u>¥133,450,000</u>

The exchange rate when the subsidiary was purchased was \$0.0059. The current exchange rate is \$0.008, the average exchange rate for the year is \$0.0072, and the exchange rate on the date dividends were declared and paid was \$0.0074. The computed Retained Earnings balance from the previous year's translated financial statements was \$130,000.

1. Prepare a translated trial balance for World Mind Company using the information provided.
2. Prepare a combined income and retained earnings statement and a balance sheet for World Mind Company using the information contained in the translated trial balance.

## PROBLEMS

### Problem 22-5

#### L04

### Translating Foreign Currency Financial Statements

Crab Beach Systems, a U.S. multinational producer of computer hardware, has subsidiaries located throughout the world. The company recently received year-end financial statements from its Swiss subsidiary, Doghead Technology. Doghead was purchased by Crab Beach on January 1, 2012. Doghead's financial statements are prepared and submitted to Crab Beach headquarters in Swiss francs. The accountant in charge of translating the financial statements has been unable to locate last year's translated financial statements. Instead, the only data available from last year are the financial statements prepared in francs. Doghead's adjusted trial balances as of December 31, 2012 and 2013, in Swiss francs, are as follows:

	Trial Balance Dec. 31, 2013	Trial Balance Dec. 31, 2012
Cash . . . . .	925,000	750,000
Accounts Receivable . . . . .	1,875,000	1,215,000
Inventory . . . . .	2,115,000	1,850,000
Equipment . . . . .	1,025,000	975,000
Cost of Goods Sold . . . . .	7,985,000	6,505,000
Expenses . . . . .	4,234,000	3,156,000
Dividends . . . . .	900,000	500,000
Total debits . . . . .	<u>19,059,000</u>	<u>14,951,000</u>
Accounts Payable . . . . .	2,100,000	1,825,000
Long-Term Debt . . . . .	1,000,000	1,125,000
Capital Stock . . . . .	1,200,000	1,200,000
Retained Earnings (balance at beginning of year) . . . . .	640,000	301,000
Sales . . . . .	<u>14,119,000</u>	<u>10,500,000</u>
Total credits . . . . .	<u>19,059,000</u>	<u>14,951,000</u>

Relevant exchange rates for 2013 and 2012 are as follows. The numbers shown are the U.S. dollar equivalent of one franc.

	2013	2012
January 1 . . . . .	\$0.196	\$0.175
Date of dividend payment . . . . .	0.205	0.188
Average rate for the year . . . . .	0.210	0.178
December 31 . . . . .	0.228	0.196

**Instructions:** Using the information given, prepare a translated income and retained earnings statement and balance sheet, in U.S. dollars, for Doghead Technology for 2013.

**Problem 22-6****L04****Translating Foreign Currency Financial Statements**

Kingscraft Inc., a company with headquarters in London, England, is a fully owned subsidiary of Dover Company. The accountant for Dover just received Kingscraft's financial statements and must translate them from British pounds into U.S. dollars to prepare consolidated financial statements. Income statement and balance sheet data for the year just ended, along with relevant exchange rates, are as follows:

	(in pounds)
Revenues . . . . .	£445,000
Cost of goods sold . . . . .	260,000
Gross margin . . . . .	<u>£185,000</u>
Other expenses . . . . .	80,000
Net income . . . . .	<u>£105,000</u>
Cash . . . . .	£ 46,000
Accounts receivable . . . . .	102,000
Inventory . . . . .	84,000
Plant and equipment . . . . .	172,000
Total assets . . . . .	<u>£404,000</u>
Current liabilities . . . . .	£ 62,000
Long-term debt . . . . .	54,000
Common stock . . . . .	90,000
Retained earnings . . . . .	198,000
Total liabilities and equity . . . . .	<u>£404,000</u>

Exchange rates follow. The numbers shown are the U.S. dollar equivalent of one pound.

On date of purchase . . . . .	\$2.03
Average rate for the year . . . . .	1.87
On the balance sheet date . . . . .	1.84
On date of dividend payment . . . . .	1.89

In addition, dividends of 60,000 pounds were paid during the year. Kingscraft's translated financial statements at year-end result in a translation adjustment with a debit balance of \$73,000.

**Instructions:** Determine Kingscraft's Retained Earnings balance, in U.S. dollars, at the beginning of the year.

**CASES****Discussion  
Case 22-7****Are International Ratios Comparable?**

As the world economy becomes more integrated, one question facing financial analysts is whether financial ratios can be compared across national boundaries. For example, at one time the average P/E ratio for Japanese companies was around 60, and the average for U.S. companies was between 15 and 20. (A P/E ratio in excess of 30 is considered quite high in the United States.) This dramatic variation was a result of differences in the two national economies and in their accounting methods. One of the accounting differences is that Japanese companies generally depreciate their fixed assets over shorter lives than do U.S. companies.

In addition to differences in accounting methods, what other challenges are faced by financial analysts in comparing the financial ratios of a U.S. company to those of a Japanese, German, or British company?

**Discussion  
Case 22-8****Fear of Reporting Under U.S. GAAP**

You are on the board of directors of a large German corporation. You are in the years before 2008 when the SEC required all U.S.-listed companies to prepare reports using U.S. GAAP. For several years, the board has been discussing the possibility of listing the company's shares on the New York Stock Exchange. The CEO has approached the SEC several times asking for permission to list in the United States without also being required to reconcile its reported income to U.S. GAAP. So far, the SEC has refused to compromise. As a result, the CEO has decreed that the company will not list its shares in the United States.

You know that the reason the CEO is so vehemently opposed to reporting net income under U.S. GAAP is that doing so would reveal the income manipulation that your company has engaged in during the past few years. Historically, your company has overstated expenses, thereby creating a large amount of "hidden reserves." During the past two years, those hidden reserves have been reversed, increasing reported income and covering up mounting operating losses.

You are fearful of the company's survivability in the long run as long as operating losses are being covered up instead of addressed head on. The board of directors meets tomorrow, and one of the items on the agenda is yet another proposal to list shares on the New York Stock Exchange. What points should you bring up during that discussion?

**Discussion  
Case 22-9****Translation or Remeasurement?**

As the chief financial officer for Harvestors Inc., you are responsible for preparing its consolidated financial statements. Your first problem is how to consolidate the French subsidiary it purchased during the past year. You recently received the subsidiary's year-end financial statements and find that they are stated in euros. Before you can consolidate the financial statements, you must first convert them from euros to U.S. dollars. You know that foreign financial statements can be either translated or remeasured, and you must now determine which method is appropriate.

What factors should you consider in determining whether the financial statements should be translated or remeasured? Who has the final say in determining which method is used? What are the major differences between translation and remeasurement?

**Case 22-10****Deciphering Financial Statements (The Walt Disney Company)**

Locate the 2009 financial statements for **The Walt Disney Company** on the Internet.

Once you have located those financial statements, consider the following question. From Disney's foreign currency translation adjustment, deduce whether the foreign currencies got stronger or weaker in 2009 (relative to the U.S. dollar) in the countries where Disney has subsidiaries.

**Case 22-11****Writing Assignment (Choosing the Functional Currency)**

You are on the accounting staff at Jeff Pong Company. Jeff Pong is based in California and has recently acquired a subsidiary, Mak Hung Enterprises, located in Guangzhou, China. The board of directors of Jeff Pong is curious about how the Chinese currency (yuan) financial statements of Mak Hung will be consolidated with Jeff Pong's U.S. dollar financial statements. Yesterday, your boss, the controller, made a presentation to the board explaining the adjustments that will be made to Mak Hung's financial statements to restate them from IFRS to U.S. GAAP.

The controller has asked you to write a memo to the board explaining how the yuan financial statements, once restated to be in conformity with U.S. GAAP, will be converted into U.S. dollars. The controller has decided that Mak Hung's functional currency is the yuan. Make sure you explain to the board what a functional currency is, how it is determined, and what implications it has for the way financial statements are converted into U.S. dollars.

# CHAPTER 23

## Analysis of Financial Statements

### LEARNING OBJECTIVES

- 1 Organize a systematic financial ratio analysis using common-size financial statements and the DuPont framework.
- 2 Recognize the potential impact that differing accounting methods can have on the financial ratios of otherwise essentially identical companies.
- 3 Perform a simple valuation of a company using financial statement data.

**Home Depot** is the leading retailer in the do-it-yourself home improvement market. As of January 31, 2010, Home Depot had 2,244 stores throughout the United States, Canada, China, and Mexico. With each store averaging 105,000 square feet (and an additional 24,000 square feet in the outside garden center), that is a lot of shelf space filled with paint, lumber, hardware, and plumbing fixtures. If plumbing fixtures don't seem very exciting to you, consider this: Home Depot is the 118th largest company in the United States (in terms of market value), with a 2010 market value of \$61 billion.<sup>1</sup> In fiscal 2010, Home Depot's sales reached \$66.2 billion.<sup>2</sup>

Home Depot's prospects weren't always so rosy. Back in 1985, when sales were only \$700 million, Home Depot experienced severe profitability problems that threatened to terminate the company's expansion in its infancy. For example, Home Depot's gross profit percentage (gross profit/sales) had decreased from 27.3% to 25.9%. This decrease of 1.4 percentage points doesn't seem like much until you calculate that this decrease, with sales of \$700 million, caused a gross profit reduction of \$9.8 million ( $\$700 \text{ million} \times 0.014$ ) and reduced total operating profit by 34%. Overall, Home Depot's net income in 1985 was only \$8.2 million, down 42% from the year before.

<sup>1</sup> 2010 Forbes Global 2000 listing. This list can be viewed by accessing Forbes' Web site at <http://www.forbes.com>.

<sup>2</sup> 2010 10-K filing of The Home Depot, Inc.

Home Depot also experienced cash flow problems, in large part due to rapid increases in the level of inventory. Part of this inventory increase was the natural result of Home Depot's expansion. But Home Depot stores were also starting to fill up with excess inventory because of lax inventory management. In 1983, the average Home Depot store contained enough inventory to support average sales for 75 days. By 1985, the number of days' sales in inventory had increased to 83 days. Combined with Home Depot's rapid growth, this inventory inefficiency caused total inventory to increase by \$69 million in 1985, and this increase in inventory was instrumental in Home Depot's negative cash from operations of \$43 million. Driven by this declining profitability and negative cash flow, Home Depot's stock value took a

dive in 1985, and the beginning of 1986 found Home Depot wondering where it would find the investors and creditors to finance its aggressive expansion plans.

In 1986, however, Home Depot pulled off an incredible turnaround. Gross profit percentage went back up to 27.5%, operating income almost tripled compared to 1985, and net income increased from \$8.2 million to \$23.9 million. A computerized inventory management program was instituted, and the number of days' sales in inventory dropped to 80 days. Improved profitability and more efficient management of inventory combined to transform the negative \$43 million operating cash flow in 1985 into positive cash from operations of \$66 million in 1986. Home Depot even used a clever sale-leaseback arrangement to get \$32 million of debt off its balance sheet.<sup>3</sup>

## QUESTIONS

1. Company A had sales of \$1,000 and a gross profit percentage of 20%. By how many dollars would total gross profit increase if the gross profit percentage were to increase from 20% to 23%?
2. What was the primary cause of Home Depot's negative operating cash flow of \$43 million in 1985?
3. By how much did Home Depot's operating cash flow increase from 1985 to 1986?

*Answers to these questions can be found on page 23-27.*

The Home Depot example illustrates how financial statement information can be used to evaluate the health of a business and identify specific areas that need improvement. This final chapter in the textbook covers financial statement analysis and reinforces the principle that the entire purpose of preparing financial statements is so that the statements can be used. This chapter summarizes the discussions of financial ratios that have appeared throughout the text and presents a coherent framework in which ratios can be systematically analyzed. The chapter also illustrates how differing accounting assumptions impact the values of financial ratios. The chapter concludes with a brief introduction to the use of financial statement data in valuing a company.

<sup>3</sup> The troubles of Home Depot in 1985 are the subject of a popular Harvard Business School case: Professor Krishna Palepu, "The Home Depot, Inc.," Harvard Business School, 9-188-148.

## Framework for Financial Statement Analysis

**1** Organize a systematic financial ratio analysis using common-size financial statements and the DuPont framework.

**WHY** Financial statements are made to be used. Information can be extracted from the financial statements much more efficiently through a structured approach rather than just computing a hodgepodge of ratios.

**HOW** Common-size financial statements are computed by dividing all financial statement amounts for a given year by sales for that year. The DuPont framework decomposes return on equity (ROE) into three areas: profitability, efficiency, and leverage. The informativeness of financial ratios is greatly enhanced when they are compared with past values and with values for other firms in the same industry.

Financial statement analysis is the examination of both the relationships among financial statement numbers and the trends in those numbers over time. One purpose of financial statement analysis is to use the past performance of a company to predict its future profitability and cash flows. Another purpose of financial statement analysis is to evaluate the performance of a company with an eye toward identifying problem areas. For example, the Home Depot numbers from 1985 indicated that the company had an inventory management problem that was severely reducing cash from operations. Home Depot's management used this information to spur inventory management improvements, and Home Depot's investors and creditors used the information in forecasting cash from operations for subsequent years. In summary, financial statement analysis is both diagnostic, identifying where a firm has problems, and prognostic, predicting how a firm will perform in the future.

Most pieces of information are meaningful only when they can be compared to some benchmark. For example, if you ask your friend how she feels and she says, "38," you will have some difficulty interpreting the information. If you know, however, that she felt 32 yesterday and that the happiest people you know are between 39 and 41, you can reasonably infer that your friend was unhappy yesterday but is feeling much better today. Similarly, the informativeness of financial ratios is greatly enhanced when they are compared with past values and with values for other firms in the same industry.

To enhance users' ability to do time-series comparisons, the SEC requires comparative financial reporting. Annual statements, for example, must include income and cash flow statements for three years and balance sheets for two years. These are minimum standards. Many companies include comparative statistics for 10 years in their annual reports.

Industry comparisons can be made by comparing financial statements for specific companies in an industry and by comparing a company's ratios with overall industry averages. The *COMPUSTAT* database from which the information in many of the exhibits in this text has been extracted is one source of industry data. Other well-known commercial sources for industry benchmark ratios include **Value Line** and **Dun & Bradstreet**.

**FYI**

Financial information is almost always compared to what was reported the previous year. For example, when Home Depot publicly announced on November 17, 2009, that its third-quarter sales were \$16.4 billion, the press release also stated that this amount represented an 8.0% decrease from the prior year.

The Accounting Principles Board stated that comparisons between financial statements are most informative and useful under the following conditions:<sup>4</sup>

1. The presentations are in good form; that is, the arrangement within the statements is identical.
2. The content of the statements is identical; that is, the same items from the underlying accounting records are classified under the same captions.
3. Accounting principles are not changed, or, if they are changed, the financial effects of the changes are disclosed.
4. Changes in circumstances or in the nature of the underlying transactions are disclosed.

To the extent that the foregoing criteria are not met, comparisons may be misleading. Consistent practices and procedures are also important, especially when comparisons are made for a single enterprise. The potential impact of accounting differences on financial ratio comparisons is illustrated in a later section in this chapter.

Financial statement analysis is sometimes wrongly viewed as just the computation of a bunch of financial ratios: Take every financial statement number and divide it by every other number. This is a very inefficient and ineffective approach to analyzing a set of financial statements. This shotgun approach usually fails to lead to any concrete conclusions.

This section of the chapter introduces the DuPont framework, which is one useful way to structure the analysis of financial ratios. In addition, this section explains the use of common-size financial statements, which are easy to prepare, easy to use, and should be the first step in any comprehensive financial statement analysis.

## CAUTION

This chapter presents only an introduction to financial statement analysis. A good source for further information is Palepu and Healy, *Business Analysis and Valuation: Using Financial Statements, Text and Cases*, South-Western: Mason, Ohio, 2008 Fourth Edition.

### Common-Size Financial Statements

The first problem encountered when using comparative data to analyze financial statements is that the scale, or size, of the numbers is usually different. If a firm has more sales this year than last year, it is now a larger company, and the levels of expenses and assets this year can't be meaningfully compared to the levels last year. In addition, if a company is of medium size in its industry, how can its financial statements be compared to those of the larger firms? The quickest and easiest solution to this comparability problem is to divide all financial statement numbers for a given year by sales for the year. The resulting financial statements are called **common-size financial statements**, with all amounts for a given year being shown as a percentage of sales for that year.

Exhibit 23-1 is a common-size income statement for Colesville Corporation, a hypothetical example. To illustrate the usefulness of a common-size income statement, consider the question of whether Colesville's gross profit in 2013 is too low. In comparison to the gross profit of \$1,280,000 in 2011, the \$1,700,000 gross profit for 2013 looks pretty good. Sales in 2013 are higher than sales in 2011, however, so the absolute levels of gross profit in the two years cannot be compared. But looking at the common-size information it is seen that gross profit is 33.7% of sales in 2011, compared to 29.8% in 2013. The

<sup>4</sup> *Statement of the Accounting Principles Board No. 4, "Basic Concepts and Accounting Principles Underlying Financial Statements of Business Enterprises"* (New York: American Institute of Certified Public Accountants, 1970), pars. 95–99.

common-size information reveals something that was not apparent in the raw numbers: In 2011, an item selling for \$1 yielded an average gross profit of 33.7 cents; in 2013, an item selling for \$1 yielded an average gross profit of 29.8 cents. Is this good or bad? Well, in 2013, Colesville made less gross profit from each dollar of sales than in 2011, so this is bad news. The good news is that gross profit as a percentage of sales is improved in 2013 relative to 2012 (27.3%).

Each item in the income statement can be analyzed in the same way. In 2013, bottom-line net income was 3.2% of sales, compared to just 1.6% in 2011. How can the gross profit percentage be better in 2011 while the net income percentage is worse? The answer lies in an examination of the remaining income statement items. Total operating expenses were 35.8% of sales in 2011, compared to just 26.6% in 2013. With a common-size income statement, each of the income statement items can be examined in this way, yielding much more information value than just looking at the raw income statement numbers.

A full analysis of Colesville's common-size income statement requires a comparison to industry averages. Assume that for companies in Colesville's industry, gross profit averages 31.5% of sales. Combined with the information previously discussed, this suggests that Colesville was outperforming its industry in 2011, suffered serious gross profit problems in 2012, and has started a slow comeback in 2013.

At this point, you should be saying to yourself: Yes, but what is the exact explanation for Colesville's drop in gross profit percentage from 2011? And how was Colesville able to reduce operating expenses? These questions illustrate the usefulness and the limitation of financial statement analysis. Our analysis of Colesville's income statement has pointed out two areas in which Colesville has experienced significant income statement change in the past two years, but the only way to find out why these financial statement numbers changed is to gather information from outside the financial statements: Ask management, read press releases, talk to financial analysts who follow the firm, and/or read industry newsletters. In short, financial statement analysis may not give you all the final answers, but it can guide you toward the questions you should be asking.

## EX 23-1 COMMON-SIZE INCOME STATEMENT

<b>Colesville Corporation</b>						
<b>Comparative Income Statements</b>						
<b>For the Years Ended December 31</b>						
	<b>2013</b>	<b>%</b>	<b>2012</b>	<b>%</b>	<b>2011</b>	<b>%</b>
Net sales . . . . .	\$5,700,000	100.0	\$6,600,000	100.0	\$3,800,000	100.0
Cost of goods sold . . . . .	4,000,000	70.2	4,800,000	72.7	2,520,000	66.3
Gross profit on sales . . . . .	<u>\$1,700,000</u>	29.8	<u>\$1,800,000</u>	27.3	<u>\$1,280,000</u>	33.7
Selling expenses . . . . .	\$1,120,000	19.6	\$1,200,000	18.2	\$ 960,000	25.3
General expense . . . . .	400,000	7.0	440,000	6.7	400,000	10.5
Total operating expenses . . . . .	<u>\$1,520,000</u>	26.6	<u>\$1,640,000</u>	24.9	<u>\$1,360,000</u>	35.8
Operating income (loss) . . . . .	\$ 180,000	3.2	\$ 160,000	2.4	\$ (80,000)	(2.1)
Other revenue (expense) . . . . .	80,000	1.4	130,000	2.0	160,000	4.2
Income before taxes . . . . .	\$ 260,000	4.6	\$ 290,000	4.4	\$ 80,000	2.1
Income taxes . . . . .	80,000	1.4	85,000	1.3	20,000	0.5
Net income . . . . .	<u>\$ 180,000</u>	3.2	<u>\$ 205,000</u>	3.1	<u>\$ 60,000</u>	1.6

Minor adjustments to percentage computations have been made to counteract the cumulative effect of rounding.

i

FYI

A common-size balance sheet can also be prepared using total assets to standardize each amount instead of using total sales. If this is done, the asset percentages are good indications of the company's asset mix.

A common-size balance sheet also expresses each amount as a percentage of sales for the year. As an illustration, a comparative balance sheet for Colesville Corporation with each item expressed in both dollar amounts and percentages is shown in Exhibit 23-2.

The most informative section of the common-size balance sheet is the Assets section, which can be used to determine how efficiently a company is using its assets. For example, compare total assets for Colesville in 2012 and 2013. Colesville has total assets of \$2,278,000 in 2013. Is Colesville managing its assets more efficiently than in 2012 when total assets were \$2,191,000? Comparing the raw numbers cannot give a clear answer because Colesville's level of sales is different in the two years. The common-size balance sheet indicates that each dollar of sales in 2012 required assets of 33.2 cents, whereas each dollar of sales in 2013 required assets of 40.0 cents. So, in which of the two years is Colesville more efficient at using its assets to generate sales? In 2012, when each dollar of sales required a lower level of assets. Examination of the individual asset accounts suggests that the primary reason for less efficient total asset usage in 2013 is land, building, and equipment: A dollar of sales in 2012 required only 16.3 cents of land, building, and equipment, compared to 22.4 cents in 2013.

### DuPont Framework

As discussed in Chapter 3, return on equity (net income/equity) is the single measure that summarizes the financial health of a company. Return on equity can be interpreted as the number of cents of net income an investor earns in one year by investing one dollar in the company. As a very rough rule of thumb, return on equity (ROE) consistently above 15% is a sign of a company in good health; ROE consistently below 15% is a sign of trouble.

## EX 23-2 COMMON-SIZE BALANCE SHEET

	2013	%	2012	%	2011	%
<b>Assets</b>						
Current assets . . . . .	\$ 855,000	15.0	\$ 955,500	14.5	\$ 673,500	17.7
Land, building, and equipment (net) . . . . .	1,275,000	22.4	1,075,000	16.3	925,000	24.4
Intangible assets . . . . .	100,000	1.8	100,000	1.5	100,000	2.6
Other assets . . . . .	48,000	0.8	60,500	0.9	61,500	1.6
Total assets . . . . .	<u>\$2,278,000</u>	<u>40.0</u>	<u>\$2,191,000</u>	<u>33.2</u>	<u>\$1,760,000</u>	<u>46.3</u>
<b>Liabilities and Stockholders' Equity</b>						
Current liabilities . . . . .	\$ 410,000	7.2	\$ 501,000	7.6	\$ 130,000	3.4
Noncurrent liabilities . . . . .	400,000	7.0	600,000	9.1	400,000	10.5
Total liabilities . . . . .	<u>\$ 810,000</u>	<u>14.2</u>	<u>\$1,101,000</u>	<u>16.7</u>	<u>\$ 530,000</u>	<u>13.9</u>
Paid-in capital . . . . .	\$1,100,000	19.3	\$ 800,000	12.1	\$1,000,000	26.3
Retained earnings . . . . .	368,000	6.5	290,000	4.4	230,000	6.1
Total stockholders' equity . . . . .	<u>\$1,468,000</u>	<u>25.8</u>	<u>\$1,090,000</u>	<u>16.5</u>	<u>\$1,230,000</u>	<u>32.4</u>
Total liabilities and stockholders' equity . . . . .	<u>\$2,278,000</u>	<u>40.0</u>	<u>\$2,191,000</u>	<u>33.2</u>	<u>\$1,760,000</u>	<u>46.3</u>

Minor adjustments to the percentage computations have been made to counteract the cumulative effect of rounding.

Return on equity for Colesville Corporation for the years 2013 and 2012 is computed as follows.

	2013	2012
Net income . . . . .	\$ 180,000	\$ 205,000
Stockholders' equity . . . . .	\$1,468,000	\$1,090,000
Return on equity . . . . .	12.3%	18.8%

So, what can we say about Colesville’s overall performance in 2013? It was bad relative to the rough ROE benchmark of 15%, and it was bad relative to ROE in 2012 of 18.8%. How do we pin down the exact reason(s) for the poor performance in 2013? That’s what this section is about.

The **DuPont framework** (named after a system of ratio analysis developed internally at **DuPont** around 1920) provides a systematic approach to identifying general factors causing ROE to deviate from normal. The DuPont system also provides a framework for computing financial ratios to yield more in-depth analysis of a company’s areas of strength and weakness. The insight behind the DuPont framework is that ROE can be decomposed into three components as shown in Exhibit 23-3.

EX
23-3
ANALYSIS OF ROE USING THE DUPONT FRAMEWORK

Return on Equity	=	Profitability	×	Efficiency	×	Leverage
		Return on Sales		Asset Turnover		Assets-to-Equity Ratio
		$\frac{\text{Net Income}}{\text{Sales}}$		$\frac{\text{Sales}}{\text{Assets}}$		$\frac{\text{Assets}}{\text{Equity}}$

© 2012 Cengage Learning.

For each of the three ROE components—profitability, efficiency, and leverage—one ratio summarizes a company’s performance in that area. These ratios are as follows:

- *Return on sales* is computed as net income divided by sales and is interpreted as the number of pennies in profit generated from each dollar of sales.
- *Asset turnover* is computed as sales divided by assets and is interpreted as the number of dollars in sales generated by each dollar of assets.
- *Assets-to-equity ratio* is computed as assets divided by stockholders’ equity and is interpreted as the number of dollars of assets a company is able to acquire using each dollar invested by stockholders.

The DuPont analysis of Colesville’s ROE for 2013 and 2012 is as follows:

Return on Equity	=	$\frac{\text{Net Income}}{\text{Sales}}$	×	$\frac{\text{Sales}}{\text{Assets}}$	×	$\frac{\text{Assets}}{\text{Equity}}$
<b>2013</b>	12.3%	$= \frac{\$180,000}{\$5,700,000}$		$\times \frac{\$5,700,000}{\$2,278,000}$		$\times \frac{\$2,278,000}{\$1,468,000}$
		= 3.16%		× 2.50		× 1.55
<b>2012</b>	18.8%	$= \frac{\$205,000}{\$6,600,000}$		$\times \frac{\$6,600,000}{\$2,191,000}$		$\times \frac{\$2,191,000}{\$1,090,000}$
		= 3.11%		× 3.01		× 2.01

The results of the DuPont analysis suggest that Colesville's ROE is lower in 2013, not because of a decrease in profitability of sales but because of the following.

1. In 2013, assets are used less efficiently to generate sales. Each \$1 of assets generated \$3.01 in sales in 2012 but only \$2.50 in sales in 2013.
2. In 2013, Colesville is less effective at leveraging stockholders' investment. By use of borrowing, Colesville was able to turn each \$1 of invested funds in 2012 into \$2.01 of assets, which is more than the \$1.55 in assets in 2013.

This preliminary DuPont analysis is only the beginning of a proper ratio analysis. If a DuPont analysis suggests problems in any of the three ROE components, there are further ratios in each area that can shed more light on the exact nature of the problem. A sampling of those ratios is discussed next. Many of these ratios were introduced in prior chapters.

**Profitability Ratios** If the DuPont calculations had shown that Colesville had a profitability problem in 2013, a common-size income statement could have been used to identify which expenses were causing the problem. Referring back to the common-size income statement in Exhibit 23-1, cost of goods sold as a percentage of sales is lower in 2013 than in 2012 (70.2% vs. 72.7%). This positive development is partially offset by higher 2013 selling expenses (19.6% vs. 18.2%) and higher general expenses (7.0% vs. 6.7%). To summarize, the return on sales gives an overall indication of whether a firm has a problem with the profitability of each dollar of sales; the common-size income statement can be used to pinpoint exactly which expenses are causing the problem.

**Efficiency Ratios** The asset turnover ratio suggests that Colesville is less efficient at using its assets to generate sales in 2013 than it was in 2012. Which assets are causing this problem? One way to get a quick indication is to review the common-size balance sheet in Exhibit 23-2. The common-size balance sheet numbers indicate that in 2013, Colesville has a much larger amount of land, buildings, and equipment as a percentage of sales (22.4%) than in 2012 (16.3%), suggesting that Colesville is using its land, buildings, and equipment less efficiently in 2013. If the individual current assets were listed on the balance sheets (only total current assets are reported on the balance sheets in Exhibit 23-2), a similar analysis could be done with each individual current asset account.

In addition to the common-size balance sheet, specific financial ratios have been developed to indicate whether a firm is holding too much or too little of a particular asset. A selection of the most common of these ratios is discussed next. Many of the detailed asset balances used in the following calculations are not listed in Colesville's summary balance sheets contained in Exhibit 23-2.

**Accounts receivable turnover.** The amount of receivables usually bears a close relationship to the volume of credit sales. The appropriateness of the level of receivables may be evaluated by computing the accounts receivable turnover. This ratio is computed by dividing sales by the average accounts receivable for the year. The sales amount is used because companies typically don't separately disclose the amount of credit sales. The computations for Colesville Corporation for 2012 and 2013 follow.

	2013	2012
Sales .....	\$5,700,000	\$6,600,000
Net receivables:		
Beginning of year .....	\$ 375,000	\$ 333,500
End of year .....	\$ 420,000	\$ 375,000
Average receivables		
[(beginning balance + ending balance)/2] .....	\$ 397,500	\$ 354,250
Accounts receivable turnover .....	14.3 times	18.6 times

Receivables turnover represents the average number of sales/collection cycles completed by the firm during the year. The higher the turnover, the more rapid is a firm's average collection period for receivables. The numbers indicate that Colesville collected its receivables more rapidly in 2012 (18.6 times) than in 2013 (14.3 times).

## CAUTION

If sales occur seasonally, the ending balance in receivables may be unusually large (if many sales occur near the end of the year) or small (if the year-end occurs during a natural business lull). Averaging the beginning and ending balance will not correct for seasonality because the same thing happens each year. If quarterly data are available, the average of the quarterly balances can be used to correct for seasonality.

The average accounts receivable balance is used in the calculation because of the desire to compare sales, which were made throughout the year, with the average level of receivables outstanding throughout the year. The ending balance in receivables may not be a good reflection of the normal receivable balance prevailing during the year. For example, if a business grows significantly during the year, the ending balance in the receivables account is greater than the average prevailing balance during the year. The opposite is true if the business shrinks during the year. Using the average receivables balance is a way to adjust for changes in the size of a business during the year. Similar adjustments are made with other ratios that compare end-of-year balance sheet amounts to sales made or expenses incurred throughout the year.

**Average collection period.** Average receivables are sometimes expressed in terms of the average collection period, which shows the average time required to collect receivables. Average receivables outstanding divided by average daily sales gives the average collection period. This measure is computed for Colesville as illustrated here.

	2013	2012
Average receivables .....	\$ 397,500	\$ 354,250
Sales .....	\$5,700,000	\$6,600,000
Average daily sales (sales/365) .....	\$ 15,616	\$ 18,082
Average collection period		
(average receivables/average daily sales) .....	25.5 days	19.6 days

This same measurement can be obtained by dividing the number of days in a year by the receivables turnover.

What constitutes a reasonable average collection period varies with individual businesses. For example, if the credit sale contract gives customers 60 days to pay, a 40-day

average collection period would be reasonable. If customers are supposed to pay in 30 days, however, a 40-day average collection period would indicate slow collections.

**Inventory turnover.** The amount of inventory carried relates closely to sales volume. The inventory position and the appropriateness of its size may be evaluated by computing the inventory turnover. The inventory turnover is computed by dividing cost of goods sold by average inventory. Inventory turnover for Colesville is computed as follows:

	2013	2012
Cost of goods sold . . . . .	\$4,000,000	\$4,800,000
Inventory:		
Beginning of year . . . . .	\$ 330,000	\$ 125,000
End of year . . . . .	\$ 225,000	\$ 330,000
Average receivables		
[(beginning balance + ending balance)/2] . . . . .	\$ 277,500	\$ 227,500
Inventory turnover . . . . .	14.4 times	21.1 times

## CAUTION

Be careful when using ratios computed by someone else or extracted from a published source. Make sure you know exactly what formula was used to compute the ratio.

Inventory turnover sometimes is computed using sales instead of cost of goods sold. This is not entirely correct because sales is a retail number and both cost of goods sold and inventory are wholesale numbers. However, when it comes to ratios,

people are free to perform the calculations any way they wish. The most important thing is that the computation is made the same way and is compared with other values computed in the same way.

**Number of days' sales in inventory.** Average inventories are sometimes expressed as the number of days' sales in inventory. Information is thus afforded concerning the average time it takes to turn over the inventory. The number of days' sales in inventory is calculated by dividing average inventory by average daily cost of goods sold. The number of days' sales also can be obtained by dividing the number of days in the year by the inventory turnover rate. The latter procedure for Colesville is illustrated here.

	2013	2012
Inventory turnover for year . . . . .	14.4 times	21.1 times
Number of days' sales in inventory		
(365/inventory turnover) . . . . .	25.3 days	17.3 days

Colesville is holding a 25-day supply of inventory in 2013 compared to a 17-day supply in 2012. Is the 2013 level too high? The important thing with inventory, receivables, cash, and all other assets is for a company to hold just enough but not too much. For example, the 17-day supply of inventory in 2012 might be too low, exposing Colesville to the risk of running out of inventory. As mentioned earlier, drawing meaningful conclusions requires that the ratio values be compared to an industry benchmark to find out what level of inventory is normal for Colesville's industry.

## STOP & THINK

You have probably heard of just-in-time inventory systems. What would a just-in-time system do to a company's number of days' sales in inventory?

- Increase it
- Reduce it
- Leave it unchanged

**Fixed asset turnover.** In addition to analyzing the level of the individual current assets, ratios can be used to determine whether the level of long-term assets is appropriate. As mentioned previously, the common-size balance sheet indicates that in 2013 Colesville has a much larger amount of land, buildings, and equipment, as a percentage of sales (22.4%), than in 2012 (16.3%). An alternate way to represent this same information is to compute the fixed asset turnover. Fixed asset turnover is computed as sales divided by average long-term assets and is interpreted as the number of dollars in sales generated by each dollar invested in fixed assets. The computation for Colesville follows.

	2013	2012
Sales .....	\$5,700,000	\$6,600,000
Land, building, and equipment:		
Beginning of year .....	\$1,075,000	\$ 925,000
End of year .....	\$1,275,000	\$1,075,000
Average fixed assets		
[(beginning balance + ending balance)/2] .....	\$1,175,000	\$1,000,000
Fixed asset turnover .....	4.85 times	6.60 times

As suggested by the common-size balance sheet, Colesville is less efficient at using its fixed assets to generate sales in 2013 than it was in 2012.

**Other measures of activity.** The efficiency ratios just outlined are not the only ratios that can be used to evaluate how efficiently a company is using its resources. For example, in its 2010 annual report, Home Depot reports that its average weekly sales per store is \$563,000 and its annual sales per square foot of store space is \$279. The key thing to remember with ratios is that there are no rules limiting the ratios that can be computed; users and managers are free to calculate and use any ratios they think will aid their understanding of the company.

**Margin vs. turnover.** Profitability and efficiency combine to determine a company's return on assets. Return on assets is computed as net income divided by total assets and is the cents amount of net income generated by each dollar of assets. The return on assets is impacted by both the profitability of each dollar of sales and the efficiency of using assets to generate sales. Return on assets for Colesville is computed as follows:

	2013	2012
Net income .....	\$ 180,000	\$ 205,000
Total assets:		
Beginning of year .....	\$2,191,000	\$1,760,000
End of year .....	\$2,278,000	\$2,191,000
Average total assets		
[(beginning balance + ending balance)/2] .....	\$2,234,500	\$1,975,500
Return on assets .....	8.1%	10.4%

Even though profitability, as measured by return on sales, is approximately the same in 2013 and 2012, the return on assets is higher in 2012 because in that year Colesville was more efficient at using assets to generate sales.

**FYI**

Thomas Selling and Clyde Stickney have documented the trade-off between margin and turnover described above. They report that industries with high levels of fixed costs and other barriers to entry are characterized by a low asset turnover and high profit margins. Industries with low fixed costs and commodity like products have a high asset turnover and low profit margins. See *Financial Analysts Journal* (January–February 1989), p. 43.

The profitability of each dollar in sales is sometimes called a company’s **margin**. The degree to which assets are used to generate sales is called **turnover**. The nature of business is that some industries, such as the supermarket industry, are characterized by low margin but high turnover. Other industries, such as the jewelry store business, are characterized by high margin but low turnover. The important point to remember is that

companies with a low margin can still earn an acceptable level of return on assets if they have a high turnover. This is illustrated with the information for selected U.S. companies given in Exhibit 23-4. Notice the wide variation in return on sales, ranging from negative 2.7% for **Safeway** to 24.9% for **Microsoft**. Notice also that the variation in return on assets is less (if you leave out the bad year for Safeway). The companies with a high return on sales (Microsoft and **McDonald’s**) have a low asset turnover, whereas those with a low return on sales (Home Depot and **Wal-Mart**) have a high turnover. Margin isn’t everything, nor is turnover everything—the important thing is how they combine to generate return on assets.

**Leverage Ratios** Leverage ratios are an indication of the extent to which a company is using other people’s money to purchase assets. Leverage is borrowing so that a company can purchase more assets than the stockholders are able to pay for through their own investment. The assets-to-equity ratios for Colesville for 2012 and 2013 indicate that leverage was higher in 2012. Higher leverage increases return on equity through the following chain of events.

**EX 23-4 RETURN ON SALES AND ASSET TURNOVER FOR SELECTED U.S. COMPANIES IN 2009**

Company	Return on Sales	Asset Turnover	Return on Assets
Microsoft	24.9%	0.75	18.7%
Home Depot	4.0%	1.62	6.5%
McDonald’s	20.0%	0.75	15.1%
Safeway	(2.7%)	2.73	(7.3%)
Wal-Mart	3.5%	2.37	8.4%

© 2012 Cengage Learning.

- More borrowing means that more assets can be purchased without any additional equity investment by stockholders.
- More assets means that more sales can be generated.
- More sales means that net income should increase.

Investors generally prefer high leverage to increase the size of their company without increasing their investment, but lenders prefer low leverage to increase the safety of their loans. The field of corporate finance deals with how to optimally balance these opposing tendencies and choose the perfect capital structure for a firm. As a general rule of thumb, most large U.S. companies borrow about half the funds they use to purchase assets.

Two common leverage ratios, debt ratio and debt-to-equity ratio, are explained here.

**Debt ratio.** Debt ratio is computed as total liabilities divided by total assets and can be interpreted as the percentage of total funds, both borrowed and invested, that a company acquires through borrowing. Debt ratios for Colesville for 2012 and 2013 are computed here.

	2013	2012
Total liabilities .....	\$ 810,000	\$1,101,000
Total assets .....	\$2,278,000	\$2,191,000
Debt ratio .....	35.6%	50.3%

**Debt-to-equity ratio.** Another common way to measure the level of leverage is the debt-to-equity ratio, computed as total liabilities divided by total equity. This ratio is computed for Colesville as follows:

	2013	2012
Total liabilities .....	\$810,000	\$1,101,000
Stockholders' equity .....	\$1,468,000	\$1,090,000
Debt-to-equity ratio .....	0.55	1.01

The assets-to-equity ratio used in the DuPont framework, the debt ratio, and the debt-to-equity ratio measure the same thing: the level of borrowing relative to funds (borrowing and investment) used to finance the company. The most important thing to remember, as stated before, is that you use comparable ratios when analyzing a company. It doesn't matter whether you use the debt ratio or the debt-to-equity ratio, but make sure you don't compare one company's debt ratio to another company's debt-to-equity ratio.

To illustrate the impact of financial leverage on stockholders, assume that Company A has stockholders' equity of \$500,000 and has no liabilities. The company estimates that its income before income taxes will be \$80,000 without any borrowed capital.

## STOP & THINK

Company Z has an assets-to-equity ratio of 2.5. What are its debt and debt-to-equity ratios?

- Debt ratio = 0.60; debt-to-equity ratio = 1.50
- Debt ratio = 0.40; debt-to-equity ratio = 0.60
- Debt ratio = 0.60; debt-to-equity ratio = 1.00
- Debt ratio = 1.50; debt-to-equity ratio = 0.60

Income taxes are estimated to be 30% of income; therefore, net income is estimated to be \$56,000 [ $\$80,000 - (0.30 \times \$80,000)$ ]. This would result in a return on equity of 11.2% ( $\$56,000/\$500,000$ ).

Exhibit 23-5 illustrates the effects of borrowing an extra \$1 million at 12% interest under the assumptions (1) that the \$1,000,000 in additional assets earns a before-tax return on assets of 15%, more than the cost of the borrowed funds and (2) that the additional assets earn a before-tax return of 5%, less than the cost of the borrowed funds. In the first case, because the company can earn a higher return from the new \$1,000,000 in assets than it must pay to use the borrowed money, return on equity increases from 11.2% to 15.4%. In essence, the stockholders get to keep the difference between what they can earn from the assets and what they must pay the lender to borrow the money. On the other hand, the risk of financial leverage can be seen under the second assumption as the return on equity decreases from 11.2% to 1.4%.

**Times interest earned.** A measure of the debt position of a company in relation to its earnings ability is the number of times interest is earned. The times interest earned calculation is made by dividing income before any charges for interest or income taxes by the interest requirements for the period. The resulting figure reflects the company’s ability to meet interest payments and the degree of safety afforded the creditors. The times interest earned ratio for Colesville is computed as follows:

	2013	2012
Income before income taxes . . . . .	\$260,000	\$290,000
Add interest: 10% of long-term debt		
\$400,000 × 0.10 . . . . .	40,000	
\$600,000 × 0.10 . . . . .		60,000
Earnings before interest and taxes . . . . .	<u>\$300,000</u>	<u>\$350,000</u>
Times interest earned . . . . .	7.5 times	5.8 times

Pretax income was used in the computation because income tax applies only after interest is deducted, and it is pretax income that protects creditors. The times interest

	Assumption 1: Borrowed Capital Earns 15%	Assumption 2: Borrowed Capital Earns 5%
	Income before interest and taxes:	
Without borrowed funds . . . . .	\$ 80,000	\$ 80,000
On \$1,000,000 borrowed . . . . .	<u>150,000</u>	<u>50,000</u>
	\$230,000	\$130,000
Interest (12% × \$1,000,000) . . . . .	<u>120,000</u>	<u>120,000</u>
Income before taxes . . . . .	\$110,000	\$ 10,000
Income taxes (30%) . . . . .	33,000	3,000
Net income . . . . .	<u>\$ 77,000</u>	<u>\$ 7,000</u>
Stockholders’ equity . . . . .	\$500,000	\$500,000
Return on equity . . . . .	15.4%	1.4%

© 2012 Cengage Learning.

earned ratio indicates that Colesville's creditors are happier in 2013 because their interest requirements are covered 7.5 times, offering a larger margin of safety than in 2012. However, this high times interest earned value might also indicate that Colesville has not properly leveraged its investment capital in 2013. Again, the appropriate level of times interest earned represents a balancing of the desire of investors to leverage their investment with the desire of creditors for safety concerning the collection of their loans.

A computation similar to times interest earned, but more inclusive, is the fixed charge coverage. Fixed charges include such obligations as interest on bonds and notes, lease obligations, and any other recurring financial commitments. The number of times that fixed charges are covered is calculated by adding the fixed charges to pretax income and then dividing the total by the fixed charges.

### Other Common Ratios

Not all commonly used ratios fit into the DuPont framework. Ratios for measuring liquidity, cash flow, dividend payments, and stock price performance are outlined in this section.

**Current ratio.** An important concern about any company is its liquidity, or the ability to meet its current obligations. If a firm cannot meet its obligations in the short run, it may not be around to enjoy the long run. The most commonly used measure of liquidity is the current ratio. Current ratio is computed by dividing total current assets by total current liabilities. For Colesville, current ratios for December 31, 2012, and December 31, 2013, are computed as follows:

	2013	2012
Current assets . . . . .	\$855,000	\$955,500
Current liabilities . . . . .	\$410,000	\$501,000
Debt ratio . . . . .	2.09	1.91

Historically, the rule of thumb has been that a current ratio below 2.0 suggests the possibility of liquidity problems. However, advances in information technology have enabled companies to be much more effective in minimizing the need to hold cash, inventories, and other current assets. As a result, current ratios for successful companies these days are frequently less than 1.0. As mentioned previously in relation to other ratios, the best way to interpret a current ratio is to compare the value to the current ratio for the same firm in previous years and to different companies in the same industry. Current ratios for selected U.S. companies are given in Exhibit 23-6.

**Cash flow adequacy ratio.** The current ratio is an indirect measure of a company's ability to meet its upcoming obligations. Ratios based on cash flow from operations give a more direct indication of a company's ability to generate sufficient cash to satisfy predictable cash requirements. One overall indicator of cash flow sufficiency is the cash flow adequacy ratio.<sup>5</sup> This ratio is computed by dividing cash flow from operating activities by the total primary cash requirements, defined as the sum of dividend payments, long-term asset purchases, and long-term debt repayments. The following information for Colesville Corporation is needed to compute this ratio.

<sup>5</sup> See Chapter 5 for a summary of other cash flow ratios.

**EX 23-6** CURRENT RATIOS FOR SELECTED U.S. COMPANIES IN 2009

Company	Current Ratio
Coca-Cola	1.28
Delta Air Lines	0.79
Home Depot	1.34
McDonald's	1.14
Wal-Mart	0.87

© 2012 Cengage Learning.

	2013	2012
Net income . . . . .	\$180,000	\$ 205,000
Depreciation expense . . . . .	100,000	80,000
(Increase) Decrease in noncash current assets . . . . .	60,000	(231,500)
Increase (Decrease) in current liabilities . . . . .	(91,000)	371,000
Cash from operating activities . . . . .	<u>\$249,000</u>	<u>\$ 424,500</u>
Long-term asset purchases . . . . .	\$300,000	\$ 230,000
Long-term debt repayments . . . . .	200,000	0
Dividends paid . . . . .	<u>102,000</u>	<u>145,000</u>
Total primary cash requirements . . . . .	<u>\$602,000</u>	<u>\$ 375,000</u>

Note that long-term asset purchases in 2013 and 2012 were enough to offset the depreciation of assets for the year and increase the level of net land, buildings, and equipment.

The computation of the cash flow adequacy ratio is as follows:

	2013	2012
Cash from operating activities . . . . .	\$249,000	\$424,500
Total primary cash requirements . . . . .	\$602,000	\$375,000
Cash flow adequacy ratio . . . . .	0.41	1.13

Because the cash flow adequacy ratio in 2013 is less than 1.0, Colesville was not able to satisfy its primary cash requirements with cash generated by operations. A look at Colesville's balance sheets in Exhibit 23-2 indicates that the shortfall has been partially compensated for by the issuance of additional stock in 2013. One study has shown that for a sample of Fortune 500 companies, the cash flow adequacy ratio averaged 0.88.<sup>6</sup>

<sup>6</sup> Don E. Giacomino and David E. Mielke, "Cash Flows: Another Approach to Ratio Analysis," *Journal of Accountancy*, March 1993, pp. 55–58.

**Earnings per share.** Earnings per share (EPS) is such a fundamental number that we usually forget that it is a financial ratio. The necessary adjustments for dilutive securities and so forth were covered fully in Chapter 18 and are not repeated here. For Colesville, EPS for 2013 and 2012 is computed as follows:

	2013	2012
Net income .....	\$180,000	\$205,000
Weighted shares outstanding .....	90,000	75,000
Earnings per share .....	\$ 2.00	\$ 2.73

**Dividend payout ratio.** All net income belongs to the stockholders. Cash dividends are the portion of net income paid to the stockholders in the form of cash. An important ratio in analyzing a firm's dividend policy is the dividend payout ratio, computed as dividends divided by net income. Colesville's dividend payout ratios for 2013 and 2012 are computed as follows:

	2013	2012
Dividends .....	\$102,000	\$145,000
Net income .....	\$180,000	\$205,000
Dividend payout ratio .....	56.7%	70.7%

In general, high-growth firms have low dividend payout ratios (Microsoft didn't begin paying cash dividends to its common stockholders until 2003), and low-growth stable firms have higher dividend payout ratios.

**Price-earnings ratio.** The market price of a share of stock is often expressed as a multiple of earnings to indicate how attractive the market views the stock as an investment. This ratio is called the *price-earnings ratio*, or *P/E ratio*, and is computed by dividing the market price per share of stock by the EPS. In the United States, P/E ratios typically range between 10.0 and 30.0. Assuming market values per share of Colesville stock at the end of 2013 of \$29 and at the end of 2012 of \$60, P/E ratios would be computed as follows:

	2013	2012
Market value per share .....	\$29.00	\$60.00
Earnings per share .....	\$ 2.00	\$ 2.73
Price-earnings ratio .....	14.5	22.0

High P/E ratios are generally associated with firms for which strong future growth is predicted.

FYI

Finance and accounting professors often prefer to compute the inverse of the P/E ratio, called the *earnings-price (EP) ratio*. There are some interesting econometric reasons that EP is better than P/E, but so far the business press and most businesspeople have stuck with the P/E ratio.

**Book-to-market ratio.** The ratio of book value to market value, called the *book-to-market ratio*, is frequently used in investment analysis. The book-to-market ratio reflects the difference between a company's balance sheet value and the company's actual market value. A company's book-to-market ratio is almost always less than 1.0. This is so because many assets are reported at historical cost, which is usually less than market value, and other assets are not included in the balance sheet at all. Research has shown that firms with high book-to-market ratios tend to have high stock returns in future years.<sup>7</sup> One possible reason for this is that the accounting book value reflects fundamental underlying value and a high book-to-market ratio indicates that the market is currently undervaluing a company. For Colesville Corporation, the book-to-market ratio is computed as follows:

	2013	2012
Book value of stockholders' equity . . . . .	\$1,468,000	\$1,090,000
Year-end shares outstanding . . . . .	100,000	70,000
Market value per share . . . . .	× \$29	× \$60
Total market value of equity . . . . .	<u>\$2,900,000</u>	<u>\$4,200,000</u>
Book-to-market ratio . . . . .	0.51	0.26

## FASB CODIFICATION

**The Issue:** To you, it seems to create a lot of extra work to have to provide financial statements for several past years instead of just one year. You wonder who made up this requirement, and do companies really have to provide several years of data.

**The Question:** Where is the authoritative guidance saying that comparative financial statements are to be presented?

**Searching the Codification:** Well, we aren't going to use the Codification for this one. If we did, we would find this generic statement in FASB ASC paragraph 205-10-45-1: "The presentation of comparative financial statements in annual and other reports enhances the usefulness of such reports and brings out more clearly the nature and trends of current changes affecting the entity. Such presentation emphasizes the fact that statements for a series of periods are far more significant than those for a single period and that the accounts for one period are but an installment of what is essentially a continuous history."

Somewhere we read (actually, it was in Chapter 3 of this book) that the detailed comparative financial statement requirements come from the SEC. U.S. Federal regulations are contained in the Code of Federal Regulations (CFR). The regulations related to the public trading of securities are contained in Title 17, Commodity and Securities Exchanges. So, get your favorite search engine and type in the following search string:

"CFR Title 17 consolidated balance sheet"

Have fun!

**The Answer:** The correct treatment is described on page 23-28.

<sup>7</sup> See Eugene F. Fama and Kenneth R. French, "The Cross-Section of Expected Stock Returns," *The Journal of Finance*, June 1992, p. 427.

A summary of the financial ratios discussed in this section is presented in Exhibit 23-7. This overview of financial ratios is intended to emphasize the point that the preparation of the financial statements by the accountant is not the end of the process but just the beginning. Those financial statements are then analyzed by investors, creditors, and management to detect signs of existing deficiencies in performance and to predict how the firm will perform in the future. As repeated throughout this section, proper interpretation of a ratio depends on comparing the ratio value to the value for the same firm in previous years and to values for other firms in the same industry. In addition, diversity or inconsistency in accounting practice can harm the comparability of ratio values. This point is illustrated in the next section.

## Impact of Alternative Accounting Methods

**2** Recognize the potential impact that differing accounting methods can have on the financial ratios of otherwise essentially identical companies.

**WHY** Naive financial statement users can be excused for not knowing that reported financial statement numbers, and the financial ratios computed using those numbers, can be significantly impacted by accounting assumptions. But as someone who has reached this chapter in this textbook, you have no excuse.

**HOW** Before computing all of the financial ratios described in the preceding section, a careful financial statement user should make adjustments for accounting differences among the companies being analyzed.

This section illustrates the impact of accounting method differences on reported financial statement numbers and the resulting financial ratios. The balance sheets and income statements for 2013 for two hypothetical companies, Sai Kung Company and Tuen Mun Limited, both of which started business on January 1, 2013, are shown on page 23-21. To keep things simple, there are no income taxes in the example.

The following additional information relates to Sai Kung and Tuen Mun.

1. Sai Kung and Tuen Mun both purchased investment securities for \$275. In both cases, the fair value of the securities dropped to \$200. Sai Kung classifies the securities as trading; Tuen Mun classifies them as available for sale.
2. Sai Kung uses LIFO, and Tuen Mun uses FIFO. If Sai Kung had used FIFO, ending inventory would have been \$1,000.
3. Both companies purchased similar buildings and equipment for \$3,000 at the start of the year. Sai Kung assumes a 10-year useful life; Tuen Mun uses a 30-year life.
4. Both companies leased additional buildings and equipment at the beginning of the year. The annual lease payment is \$150. The present value of the lease obligation on the lease signing date was \$1,000. The terms of the leases are very similar. Sai Kung classifies its lease as a capital lease; Tuen Mun classifies its lease as an operating lease.

## EX 23-7 SUMMARY OF SELECTED FINANCIAL RATIOS

(1) Return on equity	$\frac{\text{Net income}}{\text{Stockholders' equity}}$	Number of pennies earned during the year on each dollar invested.
<b>DuPont Framework</b>		
(2) Return on sales	$\frac{\text{Net income}}{\text{Sales}}$	Number of pennies earned during the year on each dollar of sales.
(3) Asset turnover	$\frac{\text{Sales}}{\text{Total assets}}$	Number of dollars of sales during the year generated by each dollar of assets.
(4) Assets-to-equity ratio	$\frac{\text{Total assets}}{\text{Stockholders' equity}}$	Number of dollars of assets acquired for each dollar of funds invested by stockholders.
<b>Efficiency:</b>		
(5) Accounts receivable turnover	$\frac{\text{Sales}}{\text{Average accounts receivable}}$	Number of sales/collection cycles completed during the year.
(6) Average collection period	$\frac{\text{Average accounts receivable}}{\text{Average daily sales}}$	Average number of days that elapse between sale and cash collection.
(7) Inventory turnover	$\frac{\text{Cost of goods sold}}{\text{Average inventory}}$	Number of purchase/sale cycles completed during the year.
(8) Number of days' sales in inventory	$\frac{\text{Average inventory}}{\text{Average daily cost of goods sold}}$	Average number of days of sales that can be made using only the supply of inventory on hand.
(9) Fixed asset turnover	$\frac{\text{Sales}}{\text{Average fixed assets}}$	Number of dollars of sales during the year generated by each dollar of fixed assets.
<b>Leverage:</b>		
(10) Debt ratio	$\frac{\text{Total liabilities}}{\text{Total assets}}$	Percentage of funds needed to purchase assets that were obtained through borrowing.
(11) Debt-to-equity ratio	$\frac{\text{Total liabilities}}{\text{Stockholders' equity}}$	Number of dollars of borrowing for each dollar of equity investment.
(12) Times interest earned	$\frac{\text{Earnings before interest and taxes}}{\text{Interest expense}}$	Number of times that interest payments could be covered by operating earnings.
<b>Other Financial Ratios</b>		
(13) Return on assets	$\frac{\text{Net income}}{\text{Total assets}}$	Number of pennies of income generated by each dollar of assets.
(14) Current ratio	$\frac{\text{Current assets}}{\text{Current liabilities}}$	Measure of liquidity; number of times current assets could cover current liabilities.
(15) Cash flow adequacy ratio	$\frac{\text{Cash flow from operations}}{(\text{Purchases of long-term assets} + \text{Repayments of long-term debt} + \text{Cash dividend payments})}$	Number of times that cash from operations can cover predictable cash requirements.
(16) Earnings per share	$\frac{\text{Net income}}{\text{Weighted number of shares outstanding}}$	Dollars of net income attributable to each share of common stock.
(17) Dividend payout ratio	$\frac{\text{Cash dividends}}{\text{Net income}}$	Percentage of net income paid out to the stockholders as dividends.
(18) Price-earnings ratio	$\frac{\text{Market price per share}}{\text{Earnings per share}}$	Amount investors are willing to pay for each dollar of earnings; indication of growth potential.
(19) Book-to-market ratio	$\frac{\text{Stockholders' equity}}{\text{Market value of shares outstanding}}$	Number of dollars of book equity for each dollar of market value.

	Sai Kung	Tuen Mun
Cash . . . . .	\$ 100	\$ 100
Investment securities . . . . .	200	200
Accounts receivable . . . . .	500	500
Inventory . . . . .	700	1,000
Total current assets . . . . .	<u>\$ 1,500</u>	<u>\$ 1,800</u>
Buildings and equipment (net) . . . . .	2,700	2,900
Capital lease assets . . . . .	900	0
Total assets . . . . .	<u>\$ 5,100</u>	<u>\$ 4,700</u>
Current liabilities . . . . .	\$ 1,000	\$ 1,000
Long-term debt . . . . .	1,500	1,500
Capital lease obligations . . . . .	950	0
Total liabilities . . . . .	<u>\$ 3,450</u>	<u>\$ 2,500</u>
Paid-in capital . . . . .	\$ 1,500	\$ 1,500
Retained earnings . . . . .	150	775
Other equity . . . . .	0	(75)
Total equities . . . . .	<u>\$ 1,650</u>	<u>\$ 2,200</u>
Total liabilities and equities . . . . .	<u>\$ 5,100</u>	<u>\$ 4,700</u>
Sales . . . . .	\$ 6,000	\$ 6,000
Cost of goods sold . . . . .	4,000	3,700
Gross profit . . . . .	\$ 2,000	\$ 2,300
Depreciation expense . . . . .	(400)	(100)
Lease expense . . . . .	0	(150)
Other operating expenses . . . . .	(1,125)	(1,125)
Operating income . . . . .	\$ 475	\$ 925
Interest expense:		
Long-term debt ( $\$1,500 \times 0.10$ ) . . . . .	(150)	(150)
Capital lease ( $\$1,000 \times 0.10$ ) . . . . .	(100)	0
Loss on investment securities . . . . .	(75)	0
Net income . . . . .	<u>\$ 150</u>	<u>\$ 775</u>

A careful comparison of the financial statements for Sai Kung and Tuen Mun reveals that the companies are economically identical. The differences between the two sets of financial statements are caused by differences in accounting treatment. Consider the following:

1. Both companies have a \$75 economic loss on investment securities. Sai Kung recognizes this loss in its income statement; Tuen Mun recognizes the loss as an equity adjustment.
2. If both companies had used FIFO, ending inventory, cost of goods sold, and gross profit would have been the same for both.
3. The purchased buildings and equipment are similar; the difference is that Sai Kung recognized \$300 ( $\$3,000/10$ ) of depreciation in 2013, whereas Tuen Mun assumed a longer life and recognized depreciation of \$100 ( $\$3,000/30$ ).
4. The leased buildings and equipment are also similar, as are the terms of the lease contracts. Because Sai Kung accounts for the lease as a capital lease, it recognizes depreciation expense of \$100 ( $\$1,000/10$  years) and interest expense of \$100 ( $\$1,000 \times 0.10$ ). Tuen Mun accounts for the lease as an operating lease and reports lease expense equal to the annual lease payment of \$150.

In this example, these four accounting differences cause significant differences between the financial statements of two otherwise essentially identical companies. To illustrate the impact of these accounting differences on the financial ratios of the two companies, ratios (1) through (14) in Exhibit 23-7 are computed and compared for Sai Kung and Tuen Mun. When required, end-of-year amounts are used in place of average balances.

	Sai Kung	Tuen Mun
(1) Return on equity . . . . .	9.1%	35.2%
(2) Return on sales . . . . .	2.5%	12.9%
(3) Asset turnover . . . . .	1.18	1.28
(4) Assets-to-equity ratio . . . . .	3.09	2.14
(5) Accounts receivable turnover . . . . .	12.0	12.0
(6) Average collection period . . . . .	30.4	30.4
(7) Inventory turnover . . . . .	5.71	3.7
(8) Number of days' sales in inventory . . . . .	63.9	98.6
(9) Fixed asset turnover . . . . .	1.67	2.07
(10) Debt ratio . . . . .	67.6%	53.2%
(11) Debt-to-equity ratio . . . . .	2.09	1.14
(12) Times interest earned . . . . .	1.90	6.17
(13) Return on assets . . . . .	2.9%	16.5%
(14) Current ratio . . . . .	1.5	1.8

The differences in accounting method have made Tuen Mun appear to be a superior company on almost every dimension. Tuen Mun has better return on equity, better profitability, and better overall efficiency. In addition, Tuen Mun appears to be a less risky company because its leverage is lower and its liquidity, as indicated by the current ratio, is higher.

The point of this example is that ratio comparisons can yield misleading implications if the ratios come from companies with differing accounting practices. Frequently, financial ratios from companies are compared without adjusting for underlying accounting differences. Be careful.

## Introduction to Equity Valuation

**3** Perform a simple valuation of a company using financial statement data.

**WHY** Various models exist for estimating values of equity securities. Proper equity valuation is a challenging art, and comparison of estimated values to actual market values can yield insights into what market participants are currently expecting about the future performance of a company.

**HOW** By using numbers from the financial statements such as net income, operating cash flow, and dividends, you can generate an estimate of the market value of a company. Four models used in estimating values of equity securities are constant future dividends, constant dividend growth, price-earnings multiple, and discounted free cash flow.

In Chapter 12, we discussed the valuation of bonds. You saw that once you are given the appropriate market interest rate to use in valuing bonds, the calculation of the current value of the bond is quite straightforward. The ease of this process stems from the fact that the future cash flows associated with the bonds are certain because they are set as part of the original bond contract. Thus, the art of bond trading really boils down to being able to determine what the correct market interest rate is, given the riskiness of the bond being valued; after that is done, the actual calculation of the bond value is simple arithmetic.

Valuing stocks is much more difficult than valuing bonds. When valuing stocks, not only does one need to determine the appropriate interest rate to use, but also one must estimate uncertain future cash flows. Because accounting numbers are frequently used in equity valuation models, we introduce the topic of equity valuation here. Realize that this is a basic introduction. The experts in equity valuation are the finance professors, and this topic is covered at length in finance courses.

To illustrate several simple equity valuation models, we use the following information for McDonald's as of the end of 2009.

	2009	2008	2007	2006
Diluted earnings per share . . . . .	\$4.11	\$ 3.76	\$1.98	\$2.83
Dividends per share . . . . .	2.05	1.625	1.50	1.00

For simplicity, we will assume that the required rate of return on equity capital for McDonald's is 15%. Don't be deceived by the seemingly casual manner in which we are assuming a 15% rate of return—in any valuation exercise, determining the correct required rate of return, given the riskiness of the company being valued, is crucial to arriving at a reasonable valuation. Entire courses in finance are devoted to learning how to properly compute required rates of return on equity investments.

**Constant Future Dividends** In this simple model, the equity shares are valued as if the current cash dividend amount is a guaranteed fixed payment to be received each year forever. Valuation in this case is easy; the future dividend stream is a [perpetuity](#) (an annuity of infinite length). The appropriate valuation formula is as follows:

$$\text{Price} = \frac{\text{Dividends}}{r}$$

where  $r$  is the required rate of return on equity capital.

Using this simple model, the implied price per share for McDonald's is computed as follows:

$$\text{Price} = \$2.05 \div 0.15 = \$13.67$$

**Constant Dividend Growth** In this simple model (sometimes called the Gordon growth model), dividends are assumed to grow at a constant rate forever. The valuation formula is as follows:

$$\text{Price} = \frac{\text{Forecasted Dividend Next Year}}{r - g}$$

where  $g$  is the expected future dividend growth rate.

**FYI**

Including the 50% increase in dividends during 2007 in the computation of the average dividend growth for McDonald's would have been a bad idea because it is safe to assume that McDonald's (or any company for that matter) will not be able to increase its dividends by 50% every year. In addition, in our simple model, a long-term dividend growth rate in excess of the required return yields a counterintuitive negative value. And if you look at the mathematics underlying this simple model, a long-term growth rate in excess of the required rate of return actually implies an infinite stock value, suggesting that such a high sustainable growth rate is impossible.

For McDonald's, the dividend growth rate from 2006 to 2009 averaged 27% per year with the dividend growth rate in 2007 reaching 50%. This 27% average annual growth rate is extremely high, so high that it is clearly not sustainable. For example, if McDonald's were to continue increasing its dividends at this rate, in 50 years the dividend per share would be more than \$300,000. Even the long-run dividend growth rate for McDonald's (over the past 12 years) has exceeded 20%. For this example,

we will assume a slower future McDonald's dividend growth rate of 12% per year. Using this value, the implied price per share is computed as follows:

$$\text{Price} = (\$2.05 \times [1 + 0.120]) \div (0.150 - 0.120) = \$76.53$$

**Price-Earnings Multiple** Market prices incorporate all kinds of information. For example, the market prices for firms in a given industry include average investor expectations about future earnings growth in that industry and required rates of return for firms in that industry. This information is summarized in the price-earnings (P/E) ratio, computed as (price per share ÷ earnings per share). Rather than directly estimating growth rates and required rates of return, an investor can value a company's shares by using the information in the P/E ratio as follows:

$$\text{Price} = \text{Earnings} \times \text{P/E Ratio}$$

P/E ratios for a selection of restaurant chains as of the end of 2009 are as follows.

Brinker International .....	23.6
Darden Restaurants .....	16.6
Starbucks .....	49.5
Yum! Brands .....	18.2

These companies are considered to be competitors of McDonald's. **Brinker International** operates restaurants all over world under the names Chili's, Macaroni Grill, and others. **Darden Restaurants** operates under the names Red Lobster and Olive Garden, among others. **Starbucks** sells coffee in more than 11,000 locations worldwide. **Yum! Brands** operates over 37,000 fast-food locations worldwide under the names KFC, Pizza Hut, Taco Bell, A&W, and more.

Using the average of these ratios (27.0), the implied price per share for McDonald's is computed as follows:

$$\text{Price} = \$4.11 \times 27.0 = \$110.97$$

**Discounted Free Cash Flow** In theory, a company should be worth the discounted value of the future cash flows to be generated by the company. A way to look at this directly is to compute the discounted present value of free cash flow. In this context, free cash flow is defined as:

- Cash from operating activities
- Cash paid for capital expenditures
- = Free cash flow

Free cash flow for McDonald's for 2007, 2008, and 2009 is computed as follows.

(millions of dollars)	2009	2008	2007
Cash from operating activities . . . . .	\$5,751.0	\$5,917.2	\$4,876.3
— Capital expenditures . . . . .	<u>1,952.1</u>	<u>2,135.7</u>	<u>1,946.6</u>
Free cash flow . . . . .	<u>\$3,798.9</u>	<u>\$3,781.5</u>	<u>\$2,929.7</u>

In order to use this discounted free cash flow model, we need to make forecasts about the following:

- Future growth rates in free cash flow
- Forecasting horizon
- What happens in the “terminal year”

**Future Growth Rates** Free cash flow increased by 29.1% from 2007 to 2008 but increased only 0.5% from 2008 to 2009. Growth rates in the preceding five years suggest that McDonald's free cash flow has been growing over 20% per year. For our analysis, we will assume a slowdown in future growth and will use the 14.8% average increase from 2007 to 2009.

**Forecasting Horizon** We should extend our free cash flow growth rate forecasts for as many years in the future for which we have reliable data. Also, as shown in the next section, our forecasts only need to extend for as long as we think the firm can generate above-normal cash flows from new investments. We will choose a 3-year forecasting horizon to keep the illustration simple; in this case, the choice is arbitrary.

**Terminal Year** Bill Gates of Microsoft may be the smartest person in the United States—he is certainly the richest. If you were to go into partnership with Bill and give him \$1 billion, he probably would have enough great business ideas in his head that he could take that \$1 billion and start an innovative business that would generate cash flows with a present value far in excess of \$1 billion. Now, what if you were to give him another \$10 billion? Does he have enough good ideas to be able to use that additional \$10 billion to generate excess profits? What if you next gave him another \$100 billion? The point is this: Eventually, even Bill Gates is going to run out of innovative ideas. At that time, any additional investment funds you give him will be used in just an average way, earn an average return, and the present value of the cash flows from the investment will exactly equal the amount of the investment. To use a phrase often used in finance, all that will be left will be “zero net present value” projects—projects that return exactly the average required rate of return.

The key thing to remember: You don't increase the value of your business by engaging in average, “zero net present value” projects. With such projects, the discounted value of future cash flows is completely offset by the initial cost of the project. Instead, you increase the value of your business by using investment funds in innovative ways that earn above-normal returns. Once a business has run out of innovative ideas, growth via new projects will not increase its value because the discounted present value of new projects is exactly offset by the initial cost of the projects. So, once the terminal year is reached, when it is expected that the company will have no new above-average ideas, the valuation impact

of any additional growth can be ignored. For illustration purposes, we will assume that McDonald's will run out of innovative ideas after three years (from 2009), at the end of 2012. After that, free cash flow will be assumed to be constant forever.

**FYI**

Remember that this is merely an introduction to equity valuation using discounted cash flow analysis. In this example, we have used a short forecasting horizon and an unsophisticated cost of capital number, and we have assumed (without stating it) that McDonald's has no debt. In your finance and financial statement analysis courses, you will learn how to enhance this simple model.

The forecasted free cash flow for McDonald's, given our assumptions, is given in Exhibit 23-8. Remember, in this example we are picturing ourselves as standing at the end of 2009 looking into McDonald's future. The exhibit also illustrates the calculation of the present value of these forecasted free cash flows.

At the end of 2009, McDonald's had 1,077 million shares outstanding. Thus, the estimated price per share is computed as follows.

$$\text{Price} = \$36,551 \text{ million} \div 1,077 \text{ million shares} = \$33.94$$

**Comparison of the Valuation Models** The computed prices for McDonald's shares at the end of 2009, using each of the four models, are as follows.

	Estimated Price
Model 1 (constant future dividends) . . . . .	\$ 13.67
Model 2 (constant dividend growth) . . . . .	76.53
Model 3 (price-earnings multiple) . . . . .	110.97
Model 4 (discounted free cash flow) . . . . .	33.94

**EX 23-8 FORECASTED FREE CASH FLOW FOR MCDONALD'S**

<b>Present Value of Forecasted Free Cash Flow for McDonald's</b> <b>2009 Free Cash Flow Value — \$3,798.9 million</b> <b>3 Years of 14.8% Growth; Constant Free Cash Flow Thereafter</b> <b>15% Required Rate of Return</b>					
(millions of dollars)	2010	2011	2012	2013	2014
Free cash flow . . . . .	\$ 4,361	\$5,007	\$5,748	\$ 5,748	\$5,748
Present value as of the end of 2009;					
using 15% rate of return . . . . .	\$ 3,792	\$3,786	\$3,779	\$25,194*	
Total present value . . . . .	<u>\$36,551</u>				
Note: All numbers shown are rounded.					
*This is the present value of the cash flows to occur after it is assumed that McDonald's runs out of new ideas (at the end of 2012). The present value of this perpetuity (an annuity of infinite length) extending from 2013 into the future is computed in two steps:					
1. As of the end of 2012, the perpetuity of \$5,748 per year forever has a present value of \$38,320, computed as \$5,748/0.15.					
2. In order to add the \$38,320 value of the perpetuity to the present value of the other free cash flows, it must be discounted back as a lump sum three more years to the end of 2009, resulting in the \$25,194 shown above.					

© 2012 Cengage Learning.

The actual market price of a share of McDonald's stock at the end of 2009 was \$61.91.

This valuation exercise should leave you feeling dissatisfied for two reasons. First, our estimates are all over the map, ranging from \$13.67 per share to \$110.97 per share. Second, except for the constant dividend growth model, our estimated values are not even close to the actual \$61.91 value of McDonald's shares at the end of 2009. You should come away from this simple valuation exercise with the following three lessons.

**Equity valuation is difficult.** Proper use of the price-earnings multiple model would involve considering which of the four benchmark companies we used in computing an average P/E ratio might be the best match with McDonald's. Also, we would probably look at the accounting practices of each of the benchmark companies to determine if their net incomes were reflecting their underlying business performance in the same way as McDonald's. To fully implement the discounted free cash flow model, we would be required to gather information on McDonald's expansion plans in order to give more sophisticated estimates of future growth rates. In addition, we would have to make a more informed decision rather than just assuming that McDonald's will run out of innovative ideas in three years. And we would put a lot more work into calculating the cost of capital.

**Price-earnings valuation is simple and often relatively accurate, but it begs the question of identifying the underlying determinants of value.** The price-earnings multiple model frequently yields a price that is not far off the actual market price because, with this model, we are allowing the market to do most of the work for us in terms of forecasting industry growth rates, setting an appropriate rate of return, and so forth. This model is often used in getting a ballpark estimate for the appropriate price of a company's shares, especially when a company is issuing shares for the first time. However, this model is a black box that avoids consideration of the fundamental operating performance forecasts for a company.

**The most useful part of equity valuation is often what it reveals about what investors must believe about a stock in order to give it its current market price.** One thing we learn from the McDonald's discounted free cash flow valuation is that investors must believe that McDonald's free cash flow is going to grow faster than 14.8%, or McDonald's is not going to run out of innovative ideas in three years, or both. In fact, it would require assumptions more like 12.7% growth for the next 20 years to yield an estimated price close to McDonald's actual market price. Thus, this valuation analysis can yield interesting insights into how a company is currently viewed by market participants.

#### SOLUTIONS TO OPENING SCENARIO QUESTIONS

1. Total gross profit would increase by \$30, from \$200 ( $\$1,000 \times 0.20$ ) to \$230 ( $\$1,000 \times 0.23$ ).
2. The primary cause of Home Depot's negative operating cash flow of \$43 million in 1985 was an increase in inventory during the year of \$69 million.
3. Home Depot's operating cash flow increased by \$109 million, from a negative \$43 million in 1985 to a positive \$66 million in 1986.

## SOLUTIONS TO STOP & THINK

- (Page 23-11) The correct answer is B. The objective of a just-in-time inventory system is to reduce the level of inventory as far as possible. Reduced inventory means a lower number of days' sales in inventory.
- (Page 23-13) The correct answer is A. With an assets-to-equity ratio of 2.5, hypothetical Company Z has the following simplified balance sheet:

Assets	2.5
Liabilities	1.5
Equities	1.0
Assets-to-equity ratio:	$2.5 \div 1.0 = 2.5$
Debt ratio:	$1.5 \div 2.5 = 0.60$
Debt-to-equity ratio:	$1.5 \div 1.0 = 1.5$

It is always true (prove it to yourself using algebra) that the debt-to-equity ratio is equal to the assets-to-equity ratio minus 1.

## SOLUTION TO USING THE FASB'S CODIFICATION

Hopefully you found the following.

Title 17 CFR Section 210.3-01: "There shall be filed, for the registrant and its subsidiaries consolidated, audited balance sheets as of the end of each of the two most recent fiscal years."

With the clue that the balance sheet requirement is in Section 210.3-01, you may then have been able to find the requirements for the income statement and statement of cash flows as well.

Title 17 CFR Section 210.3-02: "There shall be filed, for the registrant and its subsidiaries consolidated and for its predecessors, audited statements of income and cash flows for each of the three fiscal years preceding the date of the most recent audited balance sheet being filed."

# REVIEW CHAPTER 23

## LEARNING OBJECTIVES

- 1 Organize a systematic financial ratio analysis using common-size financial statements and the DuPont framework.

Financial statement analysis is used to predict a company's future profitability and cash flows from its past performance and to evaluate the performance of a company with an eye toward identifying problem areas. The informativeness of financial ratios is greatly enhanced when they are compared with past values and with values for other firms in the same industry.

Common-size financial statements are computed by dividing all financial statement amounts for a given year by

sales for that year. A common-size income statement reveals the number of pennies of each expense for each dollar of sales. The Assets section of a common-size balance sheet tells how many pennies of each asset are needed to generate each dollar of sales.

The DuPont framework decomposes return on equity (ROE) into three areas:

- *Profitability.* Return on sales is computed as net income divided by sales and is interpreted as the number of pennies in profit generated from each dollar of sales.
- *Efficiency.* Asset turnover is computed as sales divided by assets and is interpreted as the number of dollars in sales generated by each dollar of assets.

- **Leverage.** Assets-to-equity ratio is computed as assets divided by equity and is interpreted as the number of dollars of assets a company is able to acquire using each dollar invested by stockholders.

If a company has a profitability problem, the common-size income statement is the best tool for detecting which expenses are responsible. Financial ratios for detailed analysis of a company's efficiency and leverage have been developed; a number of them are summarized in Exhibit 23-7.

Margin is the profitability of each dollar in sales, and turnover is the degree to which assets are used to generate sales. Companies with a low margin can still earn an acceptable level of return on assets if they have a high turnover.

**2** Recognize the potential impact that differing accounting methods can have on the financial ratios of otherwise essentially identical companies.

Ratio comparisons can yield misleading implications if the ratios come from companies with differing accounting

practices. Adjustments for accounting differences should be made before financial ratios are compared.

**3** Perform a simple valuation of a company using financial statement data.

Four models used in estimating values of equity securities are as follows.

- Constant future dividends
- Constant dividend growth
- Price-earnings multiple
- Discounted free cash flow

Three lessons to be learned from simple equity valuation are as follows.

- Equity valuation is difficult.
- Price-earnings valuation is simple and often relatively accurate, but it begs the question of identifying the underlying determinants of value.
- The most useful part of equity valuation is often what it reveals about what investors must believe about a stock in order to give it its current market price.

## KEY TERMS

Common-size financial statements 23-4

DuPont framework 23-7

Financial statement analysis 23-3

Margin 23-12  
Perpetuity 23-23

Turnover 23-12

## QUESTIONS

1. Financial statement analysis can be used to identify a company's weak areas so that management can work for improvement. Can financial statement analysis be used for any other purpose? Explain.
2. Why are comparative financial statements considered more meaningful than statements prepared for a single period? What conditions increase the usefulness of comparative statements?
3. An analysis of a company's financial ratios reveals the underlying reasons for profitability and efficiency problems. Do you agree or disagree? Explain.
4. What is a *common-size financial statement*? What are its advantages?
5. What is the purpose of the DuPont framework?
6. (a) How is the inventory turnover computed? (b) What precautions are necessary in arriving at the inventory number to be used in the turnover calculation? (c) How would you interpret a rising inventory turnover rate?
7. Indicate how each of the following measurements is calculated, and appraise its significance.
  - (a) Times interest earned
  - (b) Return on equity
  - (c) Earnings per share
  - (d) Price-earnings ratio

- (e) Dividend payout ratio
- (f) Book-to-market ratio
- 8. Explain how the turnover of assets can affect return on assets.
- 9. Under what conditions is the return on assets equal to the ROE?
- 10. How do accounting differences impact the usefulness of financial ratio comparisons?
- 11. What variables are used to determine a share price when using the constant dividend growth model?
- 12. In using the discounted free cash flow valuation model, what is the significance of the terminal year?
- 13. What are three lessons one can learn by studying basic equity valuation models?

**PRACTICE EXERCISES**

**Practice 23-1**

**Preparing a Common-Size Income Statement**

**L01**

Company A reported the following income statement data for the most recent three years:

	Year 3	Year 2	Year 1
Sales .....	\$ 350,000	\$ 260,000	\$ 300,000
Cost of goods sold .....	(163,000)	(144,000)	(156,000)
Operating expenses:			
Marketing expense .....	(21,000)	(21,000)	(22,000)
R&D expense .....	(27,000)	(6,000)	(14,000)
Administrative expense .....	(45,000)	(50,000)	(48,000)
Operating income .....	\$ 94,000	\$ 39,000	\$ 60,000
Interest expense .....	(6,000)	(11,000)	(7,000)
Income before income taxes .....	\$ 88,000	\$ 28,000	\$ 53,000
Income tax expense .....	(25,000)	(8,000)	(20,000)
Net income .....	<u>\$ 63,000</u>	<u>\$ 20,000</u>	<u>\$ 33,000</u>

Prepare a common-size income statement for each year.

**Practice 23-2**

**Interpreting a Common-Size Income Statement**

**L01**

Refer to Practice 23-1. Briefly explain why overall profitability declined in Year 2 and then went back up in Year 3.

**Practice 23-3**

**Preparing a Common-Size Balance Sheet**

**L01**

Company A reported the following balance sheet data for the most recent three years:

	Year 3	Year 2	Year 1
Cash .....	\$ 8,000	\$ 8,000	\$ 6,000
Accounts receivable .....	18,000	37,000	18,000
Inventory .....	36,000	47,000	36,000
Current assets .....	\$ 62,000	\$ 92,000	\$ 60,000
Property, plant, and equipment (net) .....	138,000	126,000	123,000
Total assets .....	<u>\$200,000</u>	<u>\$218,000</u>	<u>\$183,000</u>
Accounts payable .....	\$ 28,000	\$ 39,000	\$ 21,000
Short-term debt .....	15,000	20,000	15,000
Current liabilities .....	\$ 43,000	\$ 59,000	\$ 36,000
Long-term debt .....	52,000	65,000	58,000
Total liabilities .....	\$ 95,000	\$124,000	\$ 94,000
Paid-in capital .....	19,000	19,000	19,000
Retained earnings .....	86,000	75,000	70,000
Total liabilities and equities .....	<u>\$200,000</u>	<u>\$218,000</u>	<u>\$183,000</u>

Prepare the Assets section of a common-size balance sheet for each year. (Note: Refer to Practice 23-1 for sales data.)

**Practice 23-4****Interpreting a Common-Size Balance Sheet****L01**

Refer to Practice 23-3. Briefly explain why overall efficiency declined in Year 2 and then went back up in Year 3.

**Practice 23-5****Computing the DuPont Framework Ratios****L01**

Refer to Practices 23-1 and 23-3. Compute the following ratios for Year 1, Year 2, and Year 3 for Company A:

1. Return on equity
2. Return on sales
3. Asset turnover
4. Assets-to-equity ratio

**Practice 23-6****Interpreting the DuPont Framework Ratios****L01**

Refer to Practice 23-5. Interpret the changes in the DuPont framework ratios from Year 1 to Year 2 and from Year 2 to Year 3.

**Practice 23-7****Accounts Receivable Ratios****L01**

Refer to Practices 23-1 and 23-3. Compute the following ratios for Year 2 and Year 3 for Company A:

1. Accounts receivable turnover
2. Average collection period

**Practice 23-8****Inventory Ratios****L01**

Refer to Practices 23-1 and 23-3. Compute the following ratios for Year 2 and Year 3 for Company A:

1. Inventory turnover
2. Number of days' sales in inventory

**Practice 23-9****Fixed Asset Turnover****L01**

Refer to Practices 23-1 and 23-3. Compute fixed asset turnover for Year 2 and Year 3 for Company A.

**Practice 23-10****Margin and Turnover****L01**

Refer to Practice 23-5. Company B and Company C had the following DuPont framework ratio values for Year 3:

	Company B	Company C
Return on sales . . . . .	7.8%	24.7%
Asset turnover . . . . .	2.75	0.87
Assets-to-equity ratio . . . . .	1.90	1.90

Which company—A, B, or C—had the highest ROE in Year 3? Comment on your results.

**Practice 23-11****Debt Ratio and Debt-to-Equity Ratio****L01**

Refer to Practices 23-1 and 23-3. Compute the following ratios for Year 1, Year 2, and Year 3 for Company A:

1. Debt ratio
2. Debt-to-equity ratio

**Practice 23-12**

**Times Interest Earned**

**L01**

Refer to Practices 23-1 and 23-3. Compute times interest earned for Year 1, Year 2, and Year 3 for Company A.

**Practice 23-13**

**Current Ratio**

**L01**

Refer to Practices 23-1 and 23-3. Compute the current ratio for Year 1, Year 2, and Year 3 for Company A.

**Practice 23-14**

**Cash Flow Adequacy Ratio**

**L01**

The company reported the following information with respect to its statement of cash flows:

Cash from issuance of additional shares of stock . . . . .	\$1,000
Decrease in inventory . . . . .	75
Cash used to purchase property, plant, and equipment . . . . .	400
Net income . . . . .	780
Cash used to repay long-term loans . . . . .	600
Increase in accounts payable . . . . .	100
Depreciation . . . . .	300
Cash dividends paid . . . . .	200
Increase in accounts receivable . . . . .	150

Compute the company's cash flow adequacy ratio.

**Practice 23-15**

**Earnings per Share and Dividend Payout Ratio**

**L01**

	Company S	Company T
Net income . . . . .	\$1,000	\$15,000
Dividends . . . . .	50	6,000
Weighted shares outstanding . . . . .	200	10,000

Compute (1) earnings per share and (2) dividend payout ratio for Companies S and T. Indicate which of the two companies is more likely to be an older company in a low-growth industry.

**Practice 23-16**

**Price-Earnings Ratio and Book-to-Market Ratio**

**L01**

	Company M	Company N
Net income . . . . .	\$5,000	\$65,000
Stock price per share . . . . .	\$64.00	\$35.00
Weighted shares outstanding . . . . .	625	125,000
Total stockholders' equity . . . . .	\$56,000	\$600,000

Compute (1) the price-earnings ratio and (2) the book-to-market ratio for Companies M and N. Indicate which of the two companies is more likely to be in a high-growth industry.

**Practice 23-17****L03****Equity Valuation Using Dividends and P/E Ratio**

The following information has been collected regarding John Scott Company:

Most recent annual cash dividend per share . . . . .	\$0.65
Dividend growth rate over the past five years . . . . .	7%
Most recent earnings per share . . . . .	\$1.53
Average P/E ratio of similar firms . . . . .	18
Required rate of return on equity capital . . . . .	12%

Estimate a price per share for John Scott's stock using the following equity valuation models.

1. Constant future dividends
2. Constant dividend growth
3. Price-earnings multiple

**Practice 23-18****L03****Equity Valuation Using Discounted Free Cash Flow**

The following information has been collected regarding Burton Dee Company:

Free cash flow . . . . .	\$3,500
Annual growth rate in free cash flow over the past five years . . . . .	25%
Number of shares outstanding . . . . .	3,000
Required rate of return on equity capital . . . . .	12%
Length of time until terminal year . . . . .	4 years

Estimate a price per share for Burton Dee's stock using the discounted free cash flow model.

**EXERCISES****Exercise 23-19****L01****Common-Size Income Statements**

Comparative income statements for Xenon Corporation for 2013 and 2012 follow.

	2013	2012
Sales . . . . .	\$950,000	\$600,000
Cost of goods sold . . . . .	<u>595,000</u>	<u>325,000</u>
Gross profit . . . . .	\$355,000	\$275,000
Selling and general expenses . . . . .	<u>115,000</u>	<u>94,000</u>
Operating income . . . . .	\$240,000	\$181,000
Interest expense . . . . .	<u>45,000</u>	<u>35,000</u>
Income before income taxes . . . . .	\$195,000	\$146,000
Income taxes . . . . .	<u>72,000</u>	<u>57,000</u>
Net income . . . . .	<u>\$123,000</u>	<u>\$ 89,000</u>

1. Prepare common-size income statements for Xenon Corporation for 2013 and 2012.
2. Return on sales for Xenon is lower in 2013 than in 2012. What expense or expenses are causing this lower profitability?

**Exercise 23-20**

**L01**

**Common-Size Balance Sheets**

The following data are taken from the comparative balance sheets prepared for Gubler Wholesale Company.

	2013	2012
Cash .....	\$ 43,000	\$ 22,000
Accounts receivable (net) .....	31,000	42,000
Inventories .....	71,000	33,000
Property, plant, and equipment (net) .....	106,000	59,000
Total assets .....	<u>\$251,000</u>	<u>\$156,000</u>

Sales for 2013 were \$1,200,000. Sales for 2012 were \$1,000,000.

1. Prepare the Assets section of common-size balance sheets for Gubler Wholesale Company for 2013 and 2012.
2. Overall, Gubler Wholesale is less efficient at using its assets to generate sales in 2013 than in 2012. What asset or assets are responsible for this decreased efficiency?

**Exercise 23-21**

**L01**

**DuPont Framework**

Using the following data, estimate the return on equity (ROE) for the following industries.

	Assets-to-Equity Ratio	Asset Turnover	Return on Sales
Retail jewelry stores .....	1.6	1.5	0.040
Retail grocery stores .....	1.8	5.6	0.014
Electric service companies .....	2.6	0.5	0.069
Legal services firms .....	1.7	3.5	0.073

**Exercise 23-22**

**L01**

**Ratios for Receivables and Fixed Assets**

The following financial statement data are for Moonbeam Inc.

	2013	2012	2011
Sales .....	\$275,000	\$220,000	\$180,000
Accounts receivable (net) .....	75,000	65,000	30,000
Property, plant, and equipment (net) .....	190,000	155,000	160,000

For 2012 and 2013, compute:

- (a) Accounts receivable turnover
- (b) Average collection period
- (c) Fixed asset turnover

Use the average of the beginning and ending asset balances in computing the ratios.

**Exercise 23-23****L01**

SPREADSHEET

**Analysis of Inventory**

Income statements for Eldermon Sales Company follow. Analyze the inventory position at the end of each year as well as the profitability of inventory sales in each year. What conclusions would you make concerning the inventory trend?

	2013	2012	2011
Sales .....	\$125,000	\$100,000	\$75,000
Cost of goods sold:			
Beginning inventory .....	\$ 30,000	\$ 25,000	\$ 5,000
Purchases .....	105,000	80,000	85,000
	\$135,000	\$105,000	\$90,000
Ending inventory .....	45,000	30,000	25,000
	\$ 90,000	\$ 75,000	\$65,000
Gross profit .....	\$ 35,000	\$ 25,000	\$10,000

**Exercise 23-24****L01****Effect of Leverage**

Trunks Company estimates that pretax earnings for the year ended December 31, 2013, will be \$230,000 if it operates without borrowed capital. Income tax is 40% of earnings. Average stockholders' equity for 2013 is \$740,000. Assuming that the company is able to borrow \$800,000 at 12% interest, indicate the effects on net income and return on equity if borrowed capital earns (1) 15% and (2) 8%. Explain the cause of the variations.

**Exercise 23-25****L01**

SPREADSHEET

**Margin and Turnover**

The following information is obtained from the primary financial statements of two retail companies. One company markets its gift merchandise in a resort area; the other company is a discount household goods store. Neither company has any debt. By analyzing these data, indicate which company is more likely to be the gift shop and which is the discount household goods store. Support your answer.

	Company A	Company B
Revenue .....	\$6,000,000	\$6,000,000
Average total assets .....	1,200,000	6,000,000
Net income .....	125,000	600,000

**Exercise 23-26****L01**

SPREADSHEET

**Equity Ratios**

Montpelier Lumber Corp. reported the following information.

	2013	2012	2011
8% bonds payable .....	\$ 800,000	\$ 800,000	\$ 800,000
Common stock, \$1 par .....	250,000	220,000	220,000
Additional paid-in capital .....	2,000,000	1,430,000	1,430,000
Retained earnings .....	250,000	150,000	100,000
Net income .....	190,000	110,000	90,000
Dividends .....	90,000	60,000	40,000
Year-end stock price per share .....	22	25	12

Compute the following for each year, 2011–2013.

1. Return on equity
2. Times interest earned (ignore income taxes)
3. Earnings per share
4. Dividend payout ratio

5. Price-earnings ratio
6. Book-to-market ratio

**Exercise 23-27**

**L01**

**Debt Covenants and Financing Alternatives**

Cubicle Company is in need of another factory building. The building will cost \$500,000. Cubicle is considering the following possible financing alternatives to acquire the building.

- (a) Lease the building under an operating lease.
- (b) Issue common stock in the amount of \$500,000.
- (c) Negotiate a long-term bank loan for \$500,000.
- (d) Negotiate a long-term bank loan for \$350,000 and increase short-term borrowing by \$150,000.

Currently, Cubicle has current assets of \$600,000, noncurrent assets of \$975,000, current liabilities of \$280,000, and noncurrent liabilities of \$410,000. Under existing loan covenants, Cubicle must maintain a current ratio of 2.0 or more and a debt-to-equity ratio of less than 0.80. Which, if any, of the financing alternatives will allow Cubicle to avoid violating the loan covenants?

**Exercise 23-28**

**L01**

**Analysis of Financial Data**

The December 31, 2013, balance sheet of Copepper's Inc. and additional information follow. These are the only accounts on Copepper's balance sheet.

Amounts indicated by a question mark (?) can be calculated from the additional information given.

Assets		Liabilities and Stockholders' Equity	
Cash .....	\$ 25,000	Accounts payable .....	\$ ?
Accounts receivable (net) .....	?	Income taxes payable (current) .....	25,000
Inventory .....	?	Long-term debt .....	?
Property, plant, and equipment (net) .....	294,000	Common stock .....	300,000
	<u>\$432,000</u>	Retained earnings .....	<u>?</u>
			<u>\$ ?</u>

Additional information follows:

Current ratio (at year-end) .....	1.5 to 1
Total liabilities divided by total stockholders' equity .....	0.8
Inventory turnover based on sales and ending inventory .....	15 times
Inventory turnover based on cost of goods sold and ending inventory .....	10.5 times
Gross margin for 2013 .....	\$315,000

1. What was Copepper's December 31, 2013, balance in Accounts Payable?
2. What was Copepper's December 31, 2013, balance in Retained Earnings?
3. What was Copepper's December 31, 2013, balance in Inventory?

**Exercise 23-29**

**L03**

**Equity Valuation**

The following information has been collected about DeeAnn Company:

Most recent annual cash dividend per share .....	\$0.35
Dividend growth rate over the past five years .....	5%
Most recent earnings per share .....	\$2.80
Average P/E ratio of similar firms .....	19
Required rate of return on equity capital .....	14%
Free cash flow for most recent year .....	\$12,800
Annual growth rate in free cash flow over past five years .....	25%
Number of shares outstanding .....	4,000
Length of time until terminal year .....	4 years

Estimate a price per share for DeeAnn's stock using the following equity valuation models.

1. Constant future dividends
2. Constant dividend growth
3. Price-earnings multiple
4. Discounted free cash flow
5. Which of the four estimates do you think is most reliable? Why?

## PROBLEMS

### Problem 23-30

L01

#### Common-Size Income Statements

Operations for Probe Corporation for 2012 and 2013 are summarized here.

	2013	2012
Net sales	\$280,000	\$230,000
Cost of goods sold	198,000	110,000
Gross profit	\$ 82,000	\$120,000
Selling and general expenses	50,000	53,000
Operating income	\$ 32,000	\$ 67,000
Other expenses	40,000	28,000
Income (loss) before income taxes	\$ (8,000)	\$ 39,000
Income taxes (refund)	(3,000)	16,000
Net income (loss)	\$ (5,000)	\$ 23,000

#### Instructions:

1. Prepare common-size income statements for 2013 and 2012.
2. Comment on Probe's profitability in 2013 relative to 2012.

### Problem 23-31

L01

#### Common-Size Balance Sheets

As of December 31, 2013, balance sheet data for Stay-Trim Company and Tone-Up Company are as follows:

	Stay-Trim Company	Tone-Up Company
<b>Assets</b>		
Current assets	\$ 51,000	\$ 240,000
Long-term investments	5,000	280,000
Land, buildings, and equipment (net)	48,000	520,000
Intangible assets	1,000	100,000
Other assets	5,000	60,000
Total assets	\$110,000	\$1,200,000
<b>Liabilities and Stockholders' Equity</b>		
Current liabilities	\$ 15,000	\$ 180,000
Long-term liabilities	25,000	300,000
Deferred revenues	5,000	70,000
Total liabilities	\$ 45,000	\$ 550,000

(Continued)

	Stay-Trim Company	Tone-Up Company
Preferred stock .....	\$ 5,000	\$ 100,000
Common stock .....	30,000	200,000
Additional paid-in capital .....	20,000	185,000
Retained earnings .....	10,000	165,000
Total stockholders' equity .....	<u>\$ 65,000</u>	<u>\$ 650,000</u>
Total liabilities and stockholders' equity .....	<u>\$110,000</u>	<u>\$1,200,000</u>

**Instructions:**

1. Prepare comparative common-size balance sheets for these two companies using total assets.
2. What conclusions can be drawn from these comparative common-size balance sheets?

**Problem 23-32**

**L01**

**DuPont Analysis of Three Companies**

Financial information (in thousands of dollars) relating to three different companies follows.

	Company A	Company B	Company C
Net sales .....	\$ 60,000	\$28,000	\$21,000
Net income .....	9,600	1,850	360
Total assets .....	155,400	21,500	3,200
Total equity .....	61,000	11,300	1,690

**Instructions:**

1. Compute the following ratios:
  - (a) Return on sales
  - (b) Asset turnover
  - (c) Assets-to-equity ratio
  - (d) Return on assets
  - (e) Return on equity
2. Assume that the three companies are (a) a large department store, (b) a large grocery store, and (c) a large utility. Based on the above information, identify each company. Explain your answer.

**Problem 23-33**

**L01**

**Analysis of Inventory and Receivables**

Inventory and receivable balances and gross profit data for Mountain Electric follow.

	2013	2012	2011
Balance sheet data:			
Inventory, December 31 .....	\$230,000	\$180,000	\$140,000
Accounts receivable, December 31 .....	120,000	95,000	60,000
Income statement data:			
Net sales .....	\$630,000	\$560,000	\$510,000
Cost of goods sold .....	<u>325,000</u>	<u>290,000</u>	<u>265,000</u>
Gross profit .....	<u>\$305,000</u>	<u>\$270,000</u>	<u>\$245,000</u>

**Instructions:** Compute the following ratios for 2013 and 2012.

1. Accounts receivable turnover
2. Average collection period (Use the receivables balance at the end of the year.)
3. Inventory turnover
4. Number of days' sales in inventory (Use the inventory balance at end of year.)

**Problem 23-34**

**L01**

**Inventory Turnover**

The following data are taken from Clayburgh Corporation's records for the years ended December 31, 2013, 2012, and 2011.

	2013	2012	2011
Finished goods inventory	\$ 60,000	\$ 40,000	\$ 30,000
Goods in process inventory	60,000	65,000	60,000
Raw materials inventory	60,000	40,000	35,000
Sales	400,000	340,000	300,000
Cost of goods sold	225,000	230,000	210,000
Cost of goods manufactured	260,000	250,000	200,000
Raw materials used in production	150,000	130,000	120,000

**Instructions:**

1. Compute turnover rates for 2013 and 2012 for the following:
  - (a) Finished goods
  - (b) Goods in process
  - (c) Raw materials
2. Analyze the turnover results as to reasonableness and the message they send to a statement reader.

**Problem 23-35**

**L01**

**Comparative Ratio Analysis**

The following are comparative data for Sunshine State Equipment, Inc., for the 3-year period 2011–2013.

Income Statement Data			
	2013	2012	2011
Net sales	\$1,400,000	\$1,100,000	\$1,220,000
Cost of goods sold	760,000	600,000	610,000
Gross profit on sales	\$ 640,000	\$ 500,000	\$ 610,000
Selling, general, and other expenses	340,000	280,000	250,000
Income before taxes	\$ 300,000	\$ 220,000	\$ 360,000
Income taxes	120,000	89,000	152,000
Net income	\$ 180,000	\$ 131,000	\$ 208,000
Dividends paid	155,000	150,000	208,000
Net increase (decrease) in retained earnings	\$ 25,000	\$ (19,000)	\$ 0

<b>Balance Sheet Data</b>			
	<b>2013</b>	<b>2012</b>	<b>2011</b>
<b>Assets</b>			
Cash .....	\$ 50,000	\$ 40,000	\$ 75,000
Accounts receivable (net) .....	300,000	320,000	250,000
Inventory .....	380,000	420,000	350,000
Prepaid expenses .....	30,000	10,000	40,000
Land, buildings, and equipment (net) .....	760,000	600,000	690,000
Intangible assets .....	110,000	100,000	125,000
Other assets .....	70,000	10,000	20,000
	<u>\$1,700,000</u>	<u>\$1,500,000</u>	<u>\$1,550,000</u>
<b>Liabilities and Stockholders' Equity</b>			
Accounts payable .....	\$ 120,000	\$ 185,000	\$ 220,000
Wages, interest, and dividends payable .....	25,000	25,000	25,000
Income tax payable .....	29,000	5,000	30,000
Miscellaneous current liabilities .....	10,000	4,000	10,000
8% bonds payable .....	300,000	300,000	250,000
Deferred revenues (long term) .....	10,000	10,000	25,000
No-par common stock, \$10 stated value .....	500,000	400,000	400,000
Additional paid-in capital .....	510,000	400,000	400,000
Retained earnings .....	196,000	171,000	190,000
	<u>\$1,700,000</u>	<u>\$1,500,000</u>	<u>\$1,550,000</u>

**Instructions:**

- From the foregoing data, calculate financial ratios for the three years 2011–2013 as follows (for all ratios using balance sheet amounts, use the end-of-year balance):
  - Return on equity
  - Return on sales
  - Asset turnover
  - Assets-to-equity ratio
  - Return on assets
  - Current ratio
  - Dividend payout ratio
- Based on the ratios calculated in (1), evaluate Sunshine State Equipment, Inc., in 2013 as compared with 2012.

**Problem 23-36****L01****Comparative Ratio Analysis**

Use the comparative data for Sunshine State Equipment, Inc., as given in Problem 23-35. In addition, the year-end price per share of Sunshine's stock was \$50 for 2011, \$25 for 2012, and \$35 for 2013.

**Instructions:**

- Compute financial ratios for the three years 2011–2013 as follows (for ratios normally using average balances, assume that 2010 figures are the same as 2011):
  - Accounts receivable turnover
  - Average collection period
  - Inventory turnover
  - Number of days' sales in inventory

- (e) Fixed asset turnover
  - (f) Debt ratio
  - (g) Debt-to-equity ratio
  - (h) Times interest earned (Assume that Bonds Payable is the only interest-bearing liability.)
  - (i) Earnings per share
  - (j) Price-earnings ratio
  - (k) Book-to-market ratio
2. Based on the ratios calculated in (1), evaluate Sunshine State Equipment, Inc., in 2013 as compared with 2012.

**Problem 23-37****L01, L02****Accounting Differences and Ratio Analysis**

The following three ratios have been computed using the financial statements for the year ended December 31, 2013, for Fun Science Company:

$$\begin{aligned}\text{Current ratio} &= (\text{Current assets}/\text{Current liabilities}) \\ &= \$62,000/\$41,000 \\ &= 1.51\end{aligned}$$

$$\begin{aligned}\text{Debt-to-equity ratio} &= (\text{Total liabilities}/\text{Stockholders' equity}) \\ &= \$103,000/\$115,000 \\ &= 0.90\end{aligned}$$

$$\begin{aligned}\text{Return on sales} &= (\text{Net income}/\text{Sales}) \\ &= \$53,000/\$550,000 \\ &= 9.6\%\end{aligned}$$

The following additional information has been assembled:

- (a) Fun Science uses the LIFO method of inventory valuation. Beginning inventory was \$23,000, and ending inventory was \$32,000. If Fun Science had used FIFO, beginning inventory would have been \$41,000 and ending inventory would have been \$57,200.
- (b) Fun Science's sole depreciable asset was purchased on January 1, 2010. The asset cost \$140,000 and is being depreciated over seven years with no estimated salvage value. Although the 7-year life is within the acceptable range, most firms in Fun Science's industry depreciate similar assets over five years.
- (c) For 2013, Fun Science decided to recognize a \$24,000 liability for future environmental cleanup costs. Most other firms in Fun Science's industry have similar environmental cleanup obligations but have decided that the amounts of the obligations are not reasonably estimable at this time; on average, these firms recognized only 10% of their total environmental cleanup obligation.

**Instructions:**

- 1. How would the values for the three ratios just computed differ if Fun Science had used FIFO, depreciated the asset over five years, and recognized only 10% of its environmental cleanup obligation? Do not think of these as accounting changes; compute how the financial statements would differ if the alternate accounting methods had been used to begin with. Ignore any income tax effects.
- 2. What dangers are there in comparing a company's financial ratios with summary industry ratios?

**Problem 23-38****L01****Sample CPA Exam Questions**

- 1. A company pays \$75,000 in cash to pay a current account payable. Would this transaction increase, decrease, or have no effect on the current ratio that now stands at 2:1?
  - (a) Increase
  - (b) Decrease
  - (c) No effect

2. A company purchases equipment by making a down payment and financing the remainder through a 4-year bank loan, due in monthly installments. What effect would this transaction have on the company's current ratio, which currently stands at 1.5:1?
  - (a) Increase
  - (b) Decrease
  - (c) No effect
3. A firm borrows \$200,000 from a bank. The principal and interest on the loan are due in 18 months. Would this transaction increase, decrease, or have no effect on the debt ratio (Total liabilities/Total assets) that now stands at 36%?
  - (a) Increase
  - (b) Decrease
  - (c) No effect

**CASES**

**Discussion Case 23-39**

**Are International Ratios Comparable?**

As the world economy becomes more integrated, one question facing financial analysts is whether financial ratios can be compared across national boundaries. For example, at one time the average P/E ratio for Japanese companies was around 60, and the average for U.S. companies was between 15 and 20. (A P/E ratio in excess of 30 is considered quite high in the United States.) This dramatic variation was a result of differences in the two national economies and in their accounting methods. One of the accounting differences is that Japanese companies generally depreciate their fixed assets over shorter lives than do U.S. companies.

In addition to differences in accounting methods, what other challenges are faced by financial analysts in comparing the financial ratios of a U.S. company to those of a Japanese, German, or British company?

**Discussion Case 23-40**

**Analyzing Earnings**

Royer Donahoe owns two businesses, a drug store and a retail department store.

	Drug Store	Department Store
Net sales	\$1,050,000	\$670,000
Cost of goods sold	1,000,000	600,000
Average total assets	50,000	200,000
Other expenses	39,500	36,500

Which business is more profitable? Which business is more efficient? Overall, which business would you consider to be a more attractive investment?

**Discussion Case 23-41**

**Can a Ratio Be Too Good?**

Tony Christopher is analyzing the financial statements of Shaycole Company and has computed the following ratios.

	Shaycole	Industry Comparison
Current ratio	4.7	1.9
Inventory turnover	14.8 times	6.1 times
Accounts receivable turnover	27.4 times	8.7 times
Debt-to-equity ratio	0.117	0.864

Andy Martinez, Tony's colleague, tells Tony that Shaycole looks great. Andy points out that although Shaycole's ratios deviate significantly from the industry norms, all deviations suggest that Shaycole is doing better than other firms in its industry. Is Andy right?

**Discussion  
Case 23-42**

**Evaluating Alternative Investments**

Judy Snow is considering investing \$10,000 and wishes to know which of two following companies offers the better alternative.

Hoffman Company earned net income of \$63,000 last year on average total assets of \$280,000 and average stockholders' equity of \$210,000. The company's shares are selling for \$100 per share; 6,300 shares of common stock are outstanding.

McMahon Company earned \$24,375 last year on average total assets of \$125,000 and average stockholders' equity of \$100,000. The company's common shares are selling for \$78 per share; 2,500 shares are outstanding.

Which stock should Snow buy?

**Case 23-43**

**Deciphering Financial Statements (The Walt Disney Company)**

Locate the 2009 financial statements for **The Walt Disney Company** on the Internet.

Once you have located those financial statements, consider the following questions.

1. Disney has five primary business segments: Media Networks, Parks and Resorts, Studio Entertainment, Consumer Products, and Interactive Media. Which of these five has the best 2009 profitability as measured by return on sales?
2. Which of Disney's five segments has the best overall asset efficiency in 2009 as measured by asset turnover?
3. Which of Disney's five segments best combines margin and turnover in 2009 to yield the highest return on assets?
4. Discuss why ROE cannot be computed for each segment. What is Disney's overall ROE in 2009?

**Case 23-44**

**Deciphering Financial Statements (McDonald's)**

Shown on the next page are comparative income statements for **McDonald's** for 2007, 2008, and 2009.

1. There are two kinds of McDonald's restaurants—restaurants that McDonald's itself owns and restaurants owned by McDonald's franchisees. For each of the three years, prepare a mini income statement for McDonald's containing the following items:
 

Sales by company-operated restaurants
Less: Food & paper
Less: Payroll & employee benefits
Less: Occupancy & other operating expenses
= Operating income from company-operated restaurants
2. From the mini income statements prepared in (1), prepare common-size income statements for McDonald's company-operated restaurants for the three years 2007–2009.
3. Comment on the common-size income statements prepared in (2).
4. Where does McDonald's get more of its total operating income—from company-owned restaurants or from franchise operations?

**McDonald's**  
**Consolidated Statement of Income**

Statement of Income Alternative (USD \$) In Millions, except Per Share data	12 Months Ended		
	Dec. 31, 2009	Dec. 31, 2008	Dec. 31, 2007
Revenues			
Sales by Company-operated restaurants . . . . .	\$15,458.5	\$16,560.9	\$16,611.0
Revenues from franchised restaurants . . . . .	7,286.2	6,961.5	6,175.6
Total revenues . . . . .	<u>22,744.7</u>	<u>23,522.4</u>	<u>22,786.6</u>
Company-operated restaurant expenses			
Food & paper . . . . .	5,178	5,586.1	5,487.4
Payroll & employee benefits . . . . .	3,965.6	4,300.1	4,331.6
Occupancy & other operating expenses . . . . .	3,507.6	3,766.7	3,922.7
Franchised restaurants-occupancy expenses . . . . .	1,301.7	1,230.3	1,139.7
Selling, general & administrative expenses . . . . .	2,234.2	2,355.5	2,367.0
Impairment and other charges (credits), net . . . . .	(61.1)	6.0	1,670.3
Other operating (income) expense, net . . . . .	(222.3)	(165.2)	(11.1)
Total operating costs and expenses . . . . .	<u>15,903.7</u>	<u>17,079.5</u>	<u>18,907.6</u>
Operating income . . . . .	6,841.0	6,442.9	3,879.0
Interest expense-net of capitalized interest of \$11.7, \$12.3 and \$6.9 . . . . .	473.2	522.6	410.1
Nonoperating (income) expense, net . . . . .	(24.3)	(77.6)	(103.2)
Gain on sale of investment . . . . .	(94.9)	(160.1)	0
Income from continuing operations before provision for income taxes . . . . .	6,487.0	6,158.0	3,572.1
Provision for income taxes . . . . .	1,936.0	1,844.8	1,237.1
Income from continuing operations . . . . .	4,551.0	4,313.2	2,335.0
Income from discontinued operations (net of taxes of \$34.5) . . . . .	0	0	60.1
Net income . . . . .	<u>\$ 4,551.0</u>	<u>\$ 4,313.2</u>	<u>\$ 2,395.1</u>

**Case 23-45****Deciphering Financial Statements (Coke vs. Pepsi)**

The following information is from the 2009 annual reports of **The Coca-Cola Company** and of **PepsiCo** (all amounts are in millions of U.S. dollars). The information for PepsiCo is separated into overall results and results for just the beverage segments. Coca-Cola reports that substantially all of its operations are beverage-related.

- Using the overall data, compute return on equity, return on sales, asset turnover, and assets-to-equity ratio for both PepsiCo and Coca-Cola.

	PepsiCo		Coca-Cola
	Overall	Beverages	Overall
Sales . . . . .	\$43,232	\$22,421	\$30,990
Operating income . . . . .	8,044	3,820	8,231
Net income . . . . .	5,946	—	6,824
Identifiable operating assets . . . . .	32,837	21,928	41,916
Total assets . . . . .	39,848	—	48,671
Total equity . . . . .	16,908	—	24,799

- Using the Beverages segment data for PepsiCo, compute return on beverage sales, beverage asset turnover, and return on beverage assets for both PepsiCo

and Coca-Cola. Because Coca-Cola has only one operating segment, the overall results are the same as the beverage segment results. Use operating income and identifiable operating assets in your calculations (in place of net income and total assets, respectively).

- Some writers have claimed that Coca-Cola has outperformed PepsiCo historically because Coke has concentrated on the profitable soft drink business, whereas PepsiCo has diversified into snack foods. Evaluate this claim in light of your calculations in (1) and (2).

### Case 23-46

#### Deciphering Financial Statements (Safeway)

Below are sales data, in nominal dollars, for **Safeway**, the supermarket chain, from 1981 through 2009 (in millions of U.S. dollars). In addition, the consumer price index (CPI) for each year is given (1982–1984 = 100).

Year	Sales	CPI	Year	Sales	CPI
1981	\$16,580	90.9	1996	\$17,269	156.9
1982	17,633	96.5	1997	22,484	160.5
1983	18,585	99.6	1998	24,484	163.0
1984	19,642	103.9	1999	28,860	166.6
1985	19,651	107.6	2000	31,977	172.2
1986	20,312	109.6	2001	34,301	177.1
1987	18,301	113.6	2002	34,917	179.9
1988	13,612	118.3	2003	35,727	184.0
1989	14,325	124.0	2004	35,823	188.9
1990	14,874	130.7	2005	38,416	195.3
1991	15,119	136.2	2006	40,185	201.6
1992	15,152	140.3	2007	42,286	207.3
1993	15,215	144.5	2008	44,104	215.3
1994	15,627	148.2	2009	40,851	214.5
1995	16,398	152.4			

Nominal dollar sales are just the regular sales as reported. Constant dollar sales are sales adjusted to the price level of a common comparison year in order to remove the distortions caused by inflation. Nominal dollar sales are converted into constant dollar sales by dividing by the price index for the year in which the sales were made and multiplying by the price index in the comparison year.

- Use the CPI to restate all the Safeway sales numbers in terms of 2009 dollars.
- In terms of nominal dollar sales, Safeway's sales have been growing steadily since 1988 (until the recession year of 2009). Do the constant dollar sales data give the same picture? Explain.
- In the latter part of 1986, Safeway underwent a leveraged buyout and began to get rid of a number of its stores. Is there any evidence of this in the nominal dollar sales data? In the constant dollar sales data?

### Case 23-47

#### Ethical Dilemma (Does the Bonus Plan Reward the Right Thing?)

Roaring Springs Booksellers is a mail-order book company. Customers choose their purchases from a catalog and send in their order by mail, fax, phone, or e-mail. Roaring Springs then assembles the books from its warehouse inventory, packs the order, and ships it to the customer within three working days. This rapid turnaround time on orders requires Roaring Springs to have a large warehouse staff; wage expense averages almost 20% of sales.

Each member of the top management of Roaring Springs receives an annual bonus equal to 1% of his or her salary for every 0.1% that Roaring Springs' return on sales exceeds 5.0%. For example, if return on sales is 5.3%, each top manager would receive a bonus of 3% of salary. Historically, return on sales for Roaring Springs has ranged from 4.5% to 5.5%.

The management of Roaring Springs has come up with a plan to dramatically increase return on sales, perhaps to as high as 6.5% to 7.0%. The plan is to acquire a sophisticated, computerized packing machine that can receive customer order information, mechanically assemble the books for each individual order, box the order, print an address label, and route the box to the correct loading dock for pickup by the delivery service. Acquisition of this machine will allow Roaring Springs to lay off 100 warehouse employees, resulting in a significant savings in wage expense. Top management intends to acquire the machine using new investment capital from stockholders. In this way, there will be no increase in interest expense. Because the depreciation expense on the new machine will be much less than the savings in reduced wage expense, return on sales will increase.

All top managers of Roaring Springs are excited about this plan: It could increase their bonuses to as much as 20% of salary. As assistant to the chief financial officer of Roaring Springs, you have been asked to prepare a briefing for the board of directors explaining exactly how this new packing machine will increase return on sales. As part of your preparation, you decide to examine the impact of the machine acquisition on the other two components of the DuPont framework—efficiency and leverage. You find that even with the projected increase in return on sales, the decrease in asset turnover and in the assets-to-equity ratio will cause total ROE to decline from its current level of 18.0% to around 14.0%.

Your presentation is scheduled for the next board of directors meeting in two weeks. What should you do?

**Case 23-48**

**Cumulative Spreadsheet Analysis**

This spreadsheet assignment is an extension of the spreadsheet assignment given in Chapter 20, part (1). Refer back to the instructions given in Chapter 20. If you completed the spreadsheet assignment for Chapter 20, that spreadsheet can form the foundation for this assignment.

1. In addition to preparing forecasted financial statements for 2014 and 2015, Skywalker also wishes to prepare forecasted financial statements for 2016, 2017, and 2018. All assumptions applicable to 2014 and 2015 are assumed to be applicable to the subsequent years. Refer back to Chapter 13, part (1), for an explanation of each of the assumptions. Sales in each year are expected to be 40% higher than sales in the year before. [Note: For this part of the assignment, use the original 107.6-day value for the number of days' sales in inventory; ignore the change assumed in (2) of the Chapter 20 assignment.] Clearly state any additional assumptions that you make.
2. As a company matures, it expects to generate enough cash from its operating activities to pay for a significant portion of its investing activities. Comment on whether it appears that Skywalker will reach that condition between 2013 and 2018.
3. Repeat (1), with the following changes in assumptions:

Average collection period . . . . .	9.06 days
Number of days' sales in inventory . . . . .	66.23 days
Fixed asset turnover . . . . .	3.989 times
Gross profit percentage . . . . .	27.55%
Other operating expenses/sales . . . . .	19.86%
Number of days' purchases in accounts payable . . . . .	50.37 days

(Note: After making these changes in ratio values, your spreadsheet may have negative amounts for Short-Term Loans Payable. This is impossible. Adjust your spreadsheet so that Short-Term Loans Payable is never less than zero. This will require a relaxation of the requirement that the current ratio be at least 2.0.)

4. Discuss why Skywalker has a projected current ratio of less than 2.0 in some years when using the ratios in (3).
5. Which company would you rather loan money to: a company with the projected financial statements prepared in (1) or a company with the projected financial statements prepared in (3)? Explain your answer.

## Summary of U.S. GAAP/IFRS Differences

Topic	U.S. GAAP	IASB
<b>Chapter 1: Financial Reporting</b>		
Accounting standard setter	Financial Accounting Standards Board (FASB)	International Accounting Standards Board (IASB)
Financial accounting standards	FASB Accounting Standards Codification (ASC)	<ul style="list-style-type: none"> <li>International Financial Reporting Standards (IFRS)</li> <li>International Accounting Standards (IAS)</li> </ul>
Group to address issues of interpretation or for which no formal standard currently exists	Emerging Issues Task Force (EITF)	<ul style="list-style-type: none"> <li>International Financial Reporting Interpretations Committee (IFRIC)</li> <li>Standing Interpretations Committee (SIC) before 2002</li> </ul>

Topic	FASB Accounting Standards Codification	Original FASB Standard	Corresponding IASB Standard	Differences between U.S. GAAP and IFRS
<b>Chapter 3: The Balance Sheet and Notes to the Financial Statements</b>				
Classified balance sheet	Section 210-10-05 par. 4 Section 210-10-45 par. 1 through 12	ARB 43 Ch. 3A par. 4-8	IAS 1 par. 60-61	No substantial differences in the descriptions and definitions of current assets and current liabilities
Classification of short-term obligations to be refinanced	Section 470-10-45 par. 14	SFAS No. 6 par. 10-11	IAS 1 par. 72	Under IFRS, for a short-term obligation to be classified as long term, the refinancing must take place by the balance sheet date.
Upward revaluation	Topic 855	SFAS No. 165	IAS 10	No substantial differences
<b>Chapter 4: The Income Statement</b>				
Discontinued operations	Subtopic 205-20	SFAS No. 144	IFRS 5	Under IFRS, a discontinued operation must be a major line of business or geographic segment. Also, under IFRS, separate disclosure must be made of the cash flows of the discontinued operations.
Extraordinary items	Subtopic 225-20	APB Opinion No. 30	IAS 1 par. 87	Under IFRS, no income or expense items are allowed to be classified as "extraordinary."
Change in accounting principle	Section 250-10-45 par. 1-16 Section 250-10-50 par. 1-3	SFAS No. 154 par. 4-18 APB No. 28 par. 28	IAS 8 par. 14-31	No substantial differences

Topic	FASB Accounting Standards Codification	Original FASB Standard	Corresponding IASB Standard	Differences between U.S. GAAP and IFRS
<b>Chapter 5: Statement of Cash Flows and Articulation</b>				
Definition of cash equivalents	Section 230-10-20 (Glossary) – Cash equivalents	SFAS No. 95 par. 8	IAS 7 par. 7	No substantial differences
Noncash investing and financing activities	Section 230-10-50 par. 3	SFAS No. 95 par. 32	IAS 7 par. 43	No substantial differences
Direct and indirect methods	Section 230-10-45 par. 25,28	SFAS No. 95 par. 27-28	IAS 7 par. 18-19	No substantial differences
Classification of interest paid	Section 230-10-45 par. 17(d)	SFAS No. 95 par. 23(d)	IAS 7 par. 33	U.S. GAAP – operating IFRS – operating or financing
Classification of income taxes paid	Section 230-10-45 par. 17(c)	SFAS No. 95 par. 23(c)	IAS 7 par. 35	U.S. GAAP – operating IFRS – operating, investing, or financing
Classification of interest received	Section 230-10-45 par. 16(b)	SFAS No. 95 par. 22(b)	IAS 7 par. 33	U.S. GAAP – operating IFRS – operating or investing
Classification of dividends received	Section 230-10-45 par. 16(b)	SFAS No. 95 par. 22(b)	IAS 7 par. 33	U.S. GAAP – operating IFRS – operating or investing
Classification of dividends paid	Section 230-10-45 par. 15(a)	SFAS No. 95 par. 20(a)	IAS 7 par. 34	U.S. GAAP – financing IFRS – operating or financing

Topic	U.S. GAAP	IASB Standard
<b>Chapter 6: Earnings Management</b>		
General characterization of the standards	Rules oriented. U.S. GAAP contains about 25,000 pages with lots of detailed guidance.	Principles oriented. IFRS contains just 2,500 pages with many detailed accounting decisions left up to the professional judgment of the accountant.

Topic	FASB Accounting Standards Codification	Original FASB Standard	Corresponding IASB Standard	Differences between U.S. GAAP and IFRS
<b>Fair Value Module</b>				
Fair values in financial reporting	Topic 820	SFAS No. 157	Exposure Draft: Fair Value Measurement, May 2009	No substantial differences. Both the FASB and the IASB plan to have revised fair value standards finalized by the end of 2010; the revised standards will be mutually consistent.
<b>Chapter 7: The Revenue/Receivables/Cash Cycle</b>				
Bad debts	Section 310-10-35 par. 7-9	SFAS No. 5 par. 22	No explicit standard	No apparent differences
Warranties	Section 460-10-25 par. 5-7	SFAS No. 5 par. 24	IAS 37 par. 14, 39	No substantial differences

Topic	FASB Accounting Standards Codification	Original FASB Standard	Corresponding IASB Standard	Differences between U.S. GAAP and IFRS
Compensating balances	Section 210-10-S99 par. 1	SEC Regulation S-X, Rule 5-02, Caption 1	IAS 7 par. 48	No substantial differences
Imputation of interest on receivables	Section 835-30-25 par. 2, 12	APB No. 21 par. 9, 13	No explicit standard	No apparent differences
Derecognition of receivables	Section 860-10-40 par. 5	SFAS No. 140 par. 9	IAS 39 par. 20	U.S. GAAP includes a list of three criteria that must be satisfied for derecognition. IFRS has a conceptual 2-step test based on risks and rewards and control. In practice, the derecognition result is almost always the same.
<b>Chapter 8: Revenue Recognition</b>				
Revenue recognition	Topic 605	Contained in a large number of different standards	IAS 18, IAS 11	U.S. GAAP and IFRS are generally consistent, but many detailed differences exist. The FASB and IASB are currently working on a joint revenue recognition project.
Completed-contract method	Subtopic 605-35	ARB 45 and SOP 81-1	IAS 11	Under IFRS, the completed contract method is not allowed.
Pre-sale revenue recognition for biological assets	Section 905-330-35	SOP 85-3	IAS 41	Under IFRS, changes in the fair value of biological assets are recognized as gains and losses. Under U.S. GAAP, a similar procedure is acceptable under some circumstances, but not required.
Multiple-element arrangements	Subtopic 605-25	EITF 08-1	IAS 18	IFRS does not contain any specific provisions related to multiple-element arrangements.
<b>Chapter 9: Inventory and Cost of Goods Sold</b>				
LIFO	Section 330-10-30 par. 9-11	ARB 43, Chapter 4	IAS 2 par. 23-27	LIFO is not allowable under IFRS.
Lower of cost or market	Section 330-10-35 par. 1-12	ARB 43, Chapter 4	IAS 2 par. 28-33	Under IFRS, inventory is recorded at lower of cost or net realizable value, and inventory write-down losses can be reversed if the selling price subsequently recovers.
Foreign currency transactions	Section 830-20-35 par. 2	SFAS No. 52 par. 16b	IAS 21 par. 23a, 28	No substantial differences
<b>Chapter 10: Investments in Noncurrent Operating Assets—Acquisition</b>				
Interest capitalization	Subtopic 835-20	SFAS No. 34	IAS 23	Under IFRS, net "borrowing costs" are capitalized. The net amount is the gross interest paid less interest received on investment of idle funds.
Asset retirement obligation	Subtopic 410-20	SFAS No. 143	IAS 16 and IAS 37	No substantial differences

Topic	FASB Accounting Standards Codification	Original FASB Standard	Corresponding IASB Standard	Differences between U.S. GAAP and IFRS
Business combinations	<i>Topic 805</i>	<i>SFAS No. 141R</i>	<i>IFRS 3</i>	No substantial differences
Intangible assets	<i>Topic 350</i>	<i>SFAS No. 142</i>	<i>IAS 38</i>	No substantial differences
Research and development	<i>Topic 730</i>	<i>SFAS No.2</i> <i>SFAS No.86</i>	<i>IAS 38</i>	Under IFRS, development costs, which are costs incurred after technological feasibility, are capitalized. This matches U.S. GAAP for software development costs, but not for ordinary R&D.
<b>Chapter 11: Investments in Noncurrent Operating Assets—Utilization and Retirement</b>				
Impairment of tangible assets	<i>Subtopic 360-10 various subsections on "Impairment"</i>	<i>SFAS No. 144</i>	<i>IAS 36</i>	Under U.S. GAAP the impairment test is a 2-step test. Under IFRS, the impairment test involves just one step, a comparison of the book value to the "recoverable amount" of the asset.
Impairment of intangible assets	<i>Topic 350</i>	<i>SFAS No. 142</i>	<i>IAS 36</i>	U.S. GAAP includes three different impairment tests for intangibles. Under IFRS, there is just one test, which is the same as is used for tangible assets.
Upward revaluation	<i>Not part of U.S. GAAP</i>	<i>Not part of U.S. GAAP</i>	<i>IAS 16</i>	Upward revaluations of property, plant, and equipment are generally not allowable under U.S. GAAP.
Asset retirement obligations	<i>Subtopic 410-20</i>	<i>SFAS No. 143</i>	<i>IAS 16 and IAS 37</i>	No substantial differences
Assets classified as held for sale	<i>Section 360-10-45</i>	<i>SFAS No. 144</i>	<i>IFRS 5</i>	No substantial differences
<b>Chapter 12: Debt Financing</b>				
Short-term obligations expected to be refinanced	<i>Section 470-10-45 par. 14</i>	<i>SFAS No. 6 par. 10-11</i>	<i>IAS 1 par. 72</i>	Under IFRS, for a short-term obligation to be classified as long term, the refinancing must take place by the balance sheet date.
Splitting convertible debt proceeds into debt and equity	<i>Subtopic 470-20</i>	<i>APB Opinion No. 14</i>	<i>IAS 32 par. 28-32</i>	Under IFRS, ALL convertible debt issues are divided into their debt and equity components. This separation is only done under certain circumstances under U.S. GAAP.
Consolidation of variable interest entities (VIE)	<i>Section 810-10-25 par. 20 through 59</i>	<i>FIN 46R</i>	<i>SIC 12</i>	Under IFRS, a VIE is consolidated when the economic substance of the relationship indicates that the VIE is controlled. Compared to U.S. GAAP this is very much a principles-based approach.

Topic	FASB Accounting Standards Codification	Original FASB Standard	Corresponding IASB Standard	Differences between U.S. GAAP and IFRS
Fair value option	Topic 825, "Fair Value Option" subsections	SFAS No. 159	IFRS 9	There is a fair value option for financial assets under IFRS, but as of 2010 there was not yet a fair value option for financial liabilities.
Troubled debt restructuring	Subtopic 470-60	SFAS No. 15	IAS 39 par. 39 through 41	No substantial differences
<b>Chapter 13: Equity Financing</b>				
Stock warrants	Section 470-20-25 par. 2	APB Opinion No. 14 par. 16	IAS 32 par. 28	Under IFRS, all compound financial instruments, such as stock warrants, are to be separated into separate debt and equity components. Under U.S. GAAP this is required only if the stock warrants are "detachable."
Stock-based compensation	Topic 718	SFAS No. 123R	IFRS 2	No substantial differences
Reporting equity-related items as liabilities	Topic 480	SFAS No. 150	IAS 32	No substantial differences
Noncontrolling interest	Section 810-10-45 par. 16	SFAS No. 160 par. 5	IAS 27 par. 27	No substantial differences
<b>Chapter 14: Investments in Debt and Equity Securities</b>				
Classification as trading, available for sale, or held to maturity	Section 320-10-25 par. 1	SFAS No. 115 par. 6-12	IFRS 9 par 4.1, 5.4.4	No substantial differences
Equity method	Topic 323	APB Opinion No. 18	IAS 28	No substantial differences
Fair value option	Topic 825, "Fair Value Option" subsections	SFAS No. 159	IFRS 9	There is a fair value option for financial assets under IFRS, but as of 2010 there was not yet a fair value option for financial liabilities.
Derecognition of investment securities	Topic 860	SFAS No. 140	IAS 39 par. 20	Under U.S. GAAP, the transfer of a financial asset is recorded as a sale if control of the asset passes from the transferor to the transferee. Under IFRS, the transfer is recorded as a sale if the risks and rewards associated with the cash flows from the financial assets pass from the transferor to the transferee.

Topic	FASB Accounting Standards Codification	Original FASB Standard	Corresponding IASB Standard	Differences between U.S. GAAP and IFRS
Classification of cash flows from the purchase and sale of investment securities	Section 320-10-45 par. 11	SFAS No. 115 par. 18	IAS 7 par. 15-16	Under IFRS, cash flows from the purchase and sale of trading securities are classified under operating activities; for other security categories, the cash flows are investing activities. Under U.S. GAAP, trading security cash flows may be operating or investing, depending on management intent.
Loan impairment	Section 310-10-35	SFAS No. 114	IAS 39 par. 58 through 65	No substantial differences
<b>Chapter 15: Leases</b>				
Lease classification criteria	Section 840-10-25 par. 1	SFAS No. 13 par. 7	IAS 17 par. 8-10	In substance, the standards are the same. IFRS provides less detail.
Lease discount rate (for lessees)	Section 840-10-25 par. 31	SFAS No. 13 par. 7	IAS 17 par. 20	In IFRS, no explicit mention is made of using the lower of the implicit rate or the incremental borrowing rate. Instead, the implicit rate is to be used if known.
Revenue recognition criteria (for lessor)	Section 840-10-25 par. 42	SFAS No. 13 par. 8	IAS 17 par. 42	Substantially the same. Rather than the two explicit criteria, IFRS merely says that a sale in a sales-type lease is recognized "in accordance with the policy followed by the entity for outright sales."
Initial direct costs (for lessors)	Section 840-20-35 par. 2 Section 840-30-35 par. 23 Section 840-30-25 par. 6	SFAS No. 13 par. 19 SFAS No. 13 par. 18 SFAS No. 13 par. 17	IAS 17 par. 38, 42	No substantial differences
Sale-leaseback accounting	Section 840-40-25 par. 3 Section 840-40-35 par. 1	SFAS No. 13 par. 7	IAS 17 par. 58-63	No substantial differences
<b>Chapter 16: Income Taxes</b>				
Use of currently enacted tax rates	Section 740-10-10 par. 3	SFAS No. 109 par. 18	IAS 12 par. 46	Under U.S. GAAP, currently enacted tax rates for future years are used in valuing deferred tax assets and liabilities. Under IFRS, tax rates that have been "substantively enacted" are also used. Substantively enacted tax rates are future tax rates that have been announced by the government but that have not yet been formally enacted into law.

Topic	FASB Accounting Standards Codification	Original FASB Standard	Corresponding IASB Standard	Differences between U.S. GAAP and IFRS
Current/noncurrent classification of deferred tax assets and liabilities	Section 740-10-45 par. 4	SFAS No. 109 par. 41	IAS 1 par. 56	Under U.S. GAAP deferred tax assets and liabilities are classified current or noncurrent based on the classification of the associated asset or liability. Under IFRS, all deferred tax items are classified as noncurrent.
Recognition of deferred tax assets	Section 740-10-30 par. 5e	SFAS No. 109 par. 17e	IAS 12 par. 24	Under U.S. GAAP, deferred tax assets are recognized if it is "more likely than not" (50%+ probability) that the future tax benefits will be realized. Under IFRS, the probability threshold is "probable," which is generally seen to be higher than "more likely than not."
Uncertain tax positions	Topic 740	FASB FIN No. 48	No specific accounting standard in IAS	Under IFRS, there is no standard regarding the recognition of a tax liability related to an uncertain tax position.
Cash paid for income taxes	Section 230-10-50 par. 2	SFAS No. 95 par. 121	IFRS 7 par. 35	Both U.S. GAAP and IFRS require separate disclosure of the amount of cash paid for income taxes. Under IFRS, this amount may be allocated among operating, investing, and financing activities.
<b>Chapter 17: Employee Compensation—Payroll, Pensions, and Other Compensation Issues</b>				
Compensated absences	Section 710-10-25 par. 1-8	SFAS No. 43 par. 6-16	IAS 19 par. 11-16	No substantial differences
Postemployment benefits	Section 712-10-05 par. 2-6 Section 712-10-15 par. 3-5 Section 712-10-25 par. 1-5	SFAS No. 112 par. 1-6 SFAS No. 88 par. 15	IAS 19 par. 132-140	No substantial differences
Discount rate for projected benefit obligation	Section 715-30-35 par. 43	SFAS No. 87 par. 44	IAS 19 par. 78	IFRS allows use of the interest rate on government bonds in countries lacking a developed corporate bond market.
Prior service cost	Section 715-30-35 par. 10-11	SFAS No. 87 par. 24-25	IAS 19 par. 96	Under IFRS, the "past" service cost amount is recognized as an expense immediately IF the benefits are immediately vested.
Balance sheet numbers: one net number for the difference between PBO and the pension fund, with AOCI shown separately	Section 715-30-25 par. 1, 4	SFAS No. 87 par. 35, 38	IAS 19 par. 54	Under current IFRS, the reported balance sheet number is the sum of the PBO, the pension fund, and AOCI associated with the pension plan.

<b>Topic</b>	<b>FASB Accounting Standards Codification</b>	<b>Original FASB Standard</b>	<b>Corresponding IASB Standard</b>	<b>Differences between U.S. GAAP and IFRS</b>
Settlements and curtailments	<i>Various sections in Subtopics 715-30 and 715-60; illustrations in Section 715-30-55</i>	SFAS No. 88	IAS 19 par.109-115	No substantial differences
Disclosure	<i>Sections 715-29-50 715-30-50 715-60-50</i>	SFAS No. 132(R)	IAS 19 par.120-125	No substantial differences
Differences similar to the differences in accounting for pensions.	<i>Subtopic 715-60</i>	SFAS No. 106	In general, no distinction between pensions and other postretirement benefits. Guidance on medical benefits found in IAS 19 par. 88-91	Differences similar to the differences in accounting for pensions.
<b>Chapter 18: Earnings per Share</b>				
Computing basic earnings per share	<i>Section 260-10-45 par. 10-11</i>	SFAS No. 128 par. 8-9	IAS 33 par. 9-29	No substantial differences
Computing diluted earnings per share	<i>Section 260-10-45 par. 16-17</i>	SFAS No. 128 par. 11, 13	IAS 33 par. 30-44	No substantial differences
Participating securities and the two-class method	<i>Section 260-10-45 par. 59A-66</i>	SFAS No. 128 par. 60-61 EITF 03-06	IAS 33 par. A13-A14	No substantial differences
Treasury stock method for options	<i>Section 260-10-45 par.23, 25</i>	SFAS No. 128 par. 17-18	IAS 33 par. 45-48	No substantial differences
If-converted method for convertible securities	<i>Section 260-10-45 par. 40-42</i>	SFAS No. 128 par. 26-28	IAS 33 par. 49-51	No substantial differences
Impact of actual conversion or exercise	<i>Section 260-10-45 par. 17</i>	SFAS No. 128 par. 13	IAS 33 par. 38	No substantial differences
Proper order of consideration for multiple potentially dilutive securities	<i>Section 260-10-45 par. 18</i>	SFAS No. 128 par. 14-15	IAS 33 par. 44	No substantial differences
Disclosures associated with basic and diluted EPS	<i>Section 260-10-50 par. 1-2</i>	SFAS No. 128 par. 40-41	IAS 33 par. 70-73A	No substantial differences

Topic	FASB Accounting Standards Codification	Original FASB Standard	Corresponding IASB Standard	Differences between U.S. GAAP and IFRS
<b>Chapter 19: Derivatives, Contingencies, Business Segments, and Interim Reports</b>				
Accounting for derivatives	Topic 815	SFAS No. 133	IAS 39	No substantial differences at the conceptual level, but numerous technical differences that are beyond the scope of this book.
Recognition of contingent liabilities and contingent assets	Contingent liabilities: Section 450-20-25 Contingent assets: Section 450-30-25	SFAS No. 5 par. 3 and 17	IAS 37 par. 10,27-28,31,34	Generally the same. Under IFRS, there is no requirement to disclose contingent guarantee obligations when their likelihood is remote.
Measurement of contingent liabilities	Section 450-20-30 par. 1	FIN No. 14 par. 3	IAS 37 par. 36-47	Under U.S. GAAP the estimated liability is the low end of the estimated range if each estimate in the range is equally likely. Under IFRS, the estimated liability is the amount required to settle the obligation.
Segment reporting	Topic 280	SFAS No. 131	IFRS 8	No substantial differences
Relation between interim reporting and annual reporting	Section 270-10-45 par. 1-2	APB Opinion No. 28 par. 9	IAS 34 par. 28	Under U.S. GAAP, an interim period is viewed as a subcomponent of the annual period. Under IFRS, accounting principles are applied to an interim period in the same way they are applied to an annual period.
<b>Chapter 20: Accounting Changes and Error Corrections</b>				
Disclosure after a business combination	Section 805-10-50 par. 1-2	SFAS No. 141(R) par. 68	IFRS 3 par. 59-63 and B64-B67	No substantial differences
Change in accounting principle	Section 250-10-45 par. 1-16 Section 250-10-50 par. 1-3	SFAS No. 154 par. 4-18 APB No. 28 par. 28	IAS 8 par. 14-31	No substantial differences
Change in accounting estimate	Section 250-10-45 par. 17-20 Section 250-10-50 par. 4-5	SFAS No. 154 par. 19-22 SFAS No. 157 par. 20	IAS 8 par. 32-40	No substantial differences
Correction of an error	Section 250-10-45 par. 22-28 Section 250-10-50 par. 7-11	SFAS No. 154 par. 25-26 SFAS No. 16 par. 10-15 APB No. 9 par. 17-18 APB No. 9 par. 26-27 APB No. 28 par. 29	IAS 8 par. 41-49	No substantial differences
<b>Chapter 21: Statement of Cash Flows Revisited</b>				
Definition of cash equivalents	Section 230-10-20 (Glossary) – Cash equivalents	SFAS No. 95 par. 8	IAS 7 par. 7	No substantial differences

<b>Topic</b>	<b>FASB Accounting Standards Codification</b>	<b>Original FASB Standard</b>	<b>Corresponding IASB Standard</b>	<b>Differences between U.S. GAAP and IFRS</b>
Noncash investing and financing activities	Section 230-10-50 par. 3	SFAS No. 95 par. 32	IAS 7 par. 43	No substantial differences
Direct and indirect methods	Section 230-10-45 par. 25,28	SFAS No. 95 par. 27-28	IAS 7 par. 18-19	No substantial differences
Classification of interest paid	Section 230-10-45 par. 17(d)	SFAS No. 95 par. 23(d)	IAS 7 par. 33	U.S. GAAP – operating IFRS – operating or financing
Classification of income taxes paid	Section 230-10-45 par. 17(c)	SFAS No. 95 par. 23(c)	IAS 7 par. 35	U.S. GAAP – operating IFRS – operating, investing, or financing
Classification of interest received	Section 230-10-45 par. 16(b)	SFAS No. 95 par. 22(b)	IAS 7 par. 33	U.S. GAAP – operating IFRS – operating or investing
Classification of dividends received	Section 230-10-45 par. 16(b)	SFAS No. 95 par. 22(b)	IAS 7 par. 33	U.S. GAAP – operating IFRS – operating or investing
Classification of dividends paid	Section 230-10-45 par. 15(a)	SFAS No. 95 par. 20(a)	IAS 7 par. 34	U.S. GAAP – financing IFRS – operating or financing
<b>Chapter 22: Accounting in a Global Market</b>				
Foreign currency translation	Subtopic 830-30	SFAS No. 52	IAS 21	No substantial differences

P21-21	Inventory = \$7,300
P21-22	Net Cash Provided by Operations = \$83,000
P21-23	Cash Paid for Inventory = \$32,386
P21-24	Cash Flow from Investing Activities = (\$1,783)
P21-25	Cash Flow from Financing Activities = (\$2,252)

### Chapter 22

E22-3	Total assets (U.S. \$) = \$322,083
E22-4	2. Ending retained earnings = \$148,600
P22-5	Total assets = \$1,354,320
P22-6	Total debits (U.S. \$) = \$1,565,560

### Chapter 23

E23-19	2013 Net Income = 12.9% of Sales
E23-20	2013 Total Assets = 20.9% of Sales
E23-21	Electric Service Companies ROE = 9.0%
E23-22	2013 A/R Turnover = 3.93 times
E23-23	2011 Inventory Turnover—Average = 2.4
E23-24	W/O Borrowed Capital, Net Income = \$138,000
E23-25	Company A, Return on Sales = 2.08%
E23-26	2013 ROE = 7.6%
E23-27	Operating Lease, Debt-to-Equity Ratio = 0.78
E23-28	1. Current Liabilities = \$92,000
P23-31	Stay-Trim Total Liabilities = 41%
P23-32	Company A, Asset Turnover = 0.39
P23-33	1. 2013 Avg. Receivables = \$107,500
P23-34	2013 Raw Materials Turnover = 3.0 times
P23-35	1. (a) 2013 ROE = 14.9%
P23-36	b. 2012 Avg. Collection Period = 94.6 days
P23-37	1. (a) Beg. Retained Earnings Increases by \$18,000

# GLOSSARY

# G

- accelerated cost recovery system (ACRS)** Adaptation of the declining-balance depreciation method introduced for tax purposes in 1981 and subsequently modified.
- accelerated depreciation** Method of computing depreciation that yields higher annual depreciation in the early years of an asset's life than in later years.
- account** A record used to classify and summarize the effects of transactions.
- accounting** A service activity whose "function is to provide quantitative information, primarily financial in nature, about economic entities that is intended to be useful in making economic decisions—in making reasoned choices among alternative courses of action" (*Statement of the Accounting Principles Board No. 4*, par. 40).
- accounting changes** A general term used to describe the use of different estimates or accounting principles or reporting entities from those used in a prior year.
- accounting errors** Incorrect accounting treatment resulting from mathematical mistakes, improper application of accounting principles, or omissions of material facts.
- accounting periods** The time intervals used for financial reporting; due to the need for timely information, the life of a business or other entity is divided into specific accounting periods for external reporting purposes. One year is the normal reporting period, although most large U.S. companies also provide quarterly statements.
- Accounting Principles Board (APB)** A board of the AICPA that issued Opinions establishing accounting standards during the period 1959–1973.
- accounting (cycle) process** The procedures used for analyzing, recording, classifying, and summarizing the information to be presented in accounting reports; also referred to as the *accounting cycle*.
- Accounting Standards Updates** Accounting standards researched and established by the Financial Accounting Standards Board.
- accounting system** The procedures and methods used, including data processing equipment, to collect and report accounting data.
- accounts payable** Amounts due for the purchase of materials by a manufacturing company or merchandise by a wholesaler or retailer.
- accounts receivable** Trade receivables that are not evidenced by a formal agreement or "note"; accounts receivable are usually unsecured "open accounts" and represent an extension of short-term credit to customers.
- accounts receivable factoring** The sale of receivables without recourse for cash to a third party, usually a bank or other financial institution.
- accounts receivable turnover** An analytical measurement of how rapidly customers' accounts are being collected. The net accounts receivable turnover formula is net sales divided by average trade accounts receivable for a period.
- accrual accounting** A basic assumption that revenues are recognized when earned and expenses are recognized when incurred without regard to when cash is received or paid.
- accumulated benefit obligation (ABO)** The actuarial present value of pension benefits based on the plan formula for employee service earned to date using the existing salary structure; used to compute the minimum liability.
- acid-test ratio** A financial ratio used as a measure of short-term liquidity; also called *quick ratio*.
- activity-based cost (ABC) system** Cost system that allocates overhead based on clearly identified characteristics of the production process that are known to create overhead costs.
- actual return on the pension fund** A component of net periodic pension expense measured by the difference between the fair value of pension plan assets at the end of the period and the fair value at the beginning of the period, adjusted for contributions and payments of benefits during the period.
- actuarial present value** The present value of pension obligations determined by using stated actuarial assumptions and estimates.
- additional paid-in capital** The investment by stockholders in excess of the amounts assignable to capital stock as par or stated value, as well as invested capital from other sources, such as sale of treasury stock.
- additions** Enlargements and extensions of existing facilities.
- adjusting entries** Entries required at the end of each accounting period to update the accounts as necessary and to fully recognize, on an accrual basis, revenues and expenses for the period.
- aging receivables** The most commonly used method for establishing an allowance for bad debts account based on outstanding receivables. This method involves analyzing individual accounts to determine those not yet due and those past due. Past-due accounts are classified in terms of length of the period past due.
- allowance method** A method of recognizing the estimated losses from uncollectible accounts as

expenses during the period in which the sales occur; this method is required by GAAP.

**American Accounting Association (AAA)** An organization primarily for accounting professors. The AAA's role in establishing accounting standards includes research projects to help the FASB and a forum for representing different points of view on various issues.

**American Institute of Certified Public Accountants (AICPA)** A professional organization for CPAs in which membership is voluntary. It publishes a monthly journal, the *Journal of Accountancy*.

**amortization** (1) The process of allocating the cost of intangible assets to periodic expense. (2) An adjustment to interest expense (for either a premium or a discount) to reflect the effective interest being incurred on bonds. This periodic adjustment results in the convergence of the carrying value of a bond to its face value over time.

**annuity** A series of equal payments over a specified number of equal time periods.

**annuity due** A type of annuity in which periodic receipts or payments are made at the beginning of the period and one period of the annuity term remains after the last payment.

**antidilution of earnings** Assumed conversion of convertible securities or exercise of stock options that results in an increase in earnings per share (or decrease in loss per share).

**antidilutive securities** Securities whose assumed conversion or exercise results in an antidilution of earnings per share.

**appropriated retained earnings** Amount of retained earnings restricted (i.e., made unavailable for dividend payments) at the discretion of the board of directors.

**arm's-length transactions** Exchanges between parties who are independent of each other. A traditional assumption in accounting is that recorded transactions and events are executed between independent parties, each of which is acting in its own best interest.

**articulation** The idea that the three primary financial statements are not isolated lists of numbers but are an integrated set of reports on a company's financial health.

**asset** A resource of an entity.

**asset and liability method of interperiod tax allocation** A method of income tax allocation that determines deferred tax assets or tax liabilities based on the expected future benefit or obligation associated with temporary difference reversals. If tax rates change, the asset or liability balances are adjusted to reflect the tax rates legislated to be in effect in the year when reversal is expected to occur.

**asset mix** The proportion of total assets in each asset category.

**asset retirement obligation** Obligation incurred in the act of acquiring a long-term operating asset to restore

costs in the future when the asset is retired. Required to be recognized at its estimated fair value when it is incurred and be added to the cost of acquiring the long-term operating asset.

**asset turnover** Financial ratio measuring how efficiently a company uses its assets to generate sales. The ratio formula is total sales divided by total assets.

**assignment of receivables** The borrowing of money with receivables pledged as security on the loan.

**available-for-sale securities** Investment securities not intended for immediate trading but, in the case of debt securities, not intended to be held until maturity.

**average collection period** Average number of days that lapse between the time that a sale is made and the time that cash is collected. Computed by dividing average receivables outstanding by average daily sales.

**average cost method** An inventory valuation method that assigns the same average cost to each unit sold and to each item in the inventory.

**balance sheet** A statement that reports, as of a given point in time, the assets, liabilities, and owners' equity of a business.

**bank reconciliation** A process that identifies differences between the cash balance on the depositor's books and the balance reported on the bank statement. The reconciliation provides information needed to adjust the book balance to a corrected cash amount.

**bank service charge** Monthly fee sometimes charged by a bank to service the depositor's account.

**bargain purchase option** A lease provision that allows for the purchase of a leased asset in the future by the lessee at a price so low that the lessee is almost certain to exercise the option.

**bargain renewal option** A lease provision that allows for renewal of the lease by the lessee at significantly reduced lease payments from the original lease. The bargain terms strongly imply that the lease will be renewed.

**basic earnings per share** An earnings per share computation that considers only common stock issued and outstanding. It is computed as the net income less preferred dividends divided by the weighted-average common shares outstanding for the period.

**basket purchase** The purchase of a number of assets for one lump-sum purchase price.

**bearer (coupon) bonds** Bonds whose ownership is determined by possession and for which interest is paid to the holder (bearer) of an interest coupon.

**betterments** Changes in assets designed to provide increased or improved services.

**big bath** The concept that a company expecting to have a series of hits to earnings in future years is better off to try to recognize all of the bad news in one year, leaving future years unencumbered by continuing losses.

- board of directors** Group elected by the shareholders to oversee the strategic and long-run planning for the corporation.
- bond certificates** Certificates of indebtedness issued by a company or government agency guaranteeing payment of a principal amount at a specified future date plus periodic interest; usually issued in denominations of \$1,000.
- bond discount** The difference between the face value and the sales price when bonds are sold below their face value.
- bond indenture** The contract between the issuing entity and the bondholders specifying the terms, rights, and obligations of the contracting parties.
- bond issuance costs** Costs incurred by the issuer for legal services, printing and engraving, taxes, and underwriting in connection with the sale of a bond.
- bond premium** The difference between the face value and the sales price when bonds are sold above their face value.
- bond refinancing** Issuing new bonds to replace outstanding bonds either at maturity or prior to maturity.
- book value** The long-term asset cost remaining to be allocated to future periods; computed as historical cost less accumulated depreciation.
- book-to-market ratio** A financial ratio measuring the deviation between accounting book value of equity and market value of equity. The ratio formula is book equity divided by market equity.
- business combination** The combining of two businesses accomplished through the exchange of cash or an exchange of stock.
- business (source) document** Business record used as the basis for analyzing and recording transactions; examples include invoices, check stubs, receipts, and similar business papers.
- call option** Contract giving the owner the right, but not the obligation, to buy an asset at a specified price.
- callable** A security, such as a bond or a preferred stock, that can be redeemed and canceled at the option of the issuing company.
- callable bonds** Bonds for which the issuer reserves the right to pay the obligation prior to the maturity date.
- callable obligation** A debt instrument that is (1) payable on demand or (2) has a specified due date but is payable on demand if the debtor defaults on the provisions of the loan agreement.
- capital lease** A lease that is economically equivalent to the purchase of the leased asset.
- capital stock** The portion of the amount invested by stockholders that is designated as par or stated value.
- capitalized interest** Interest incurred during the self-construction of an asset that is considered to be part of the asset cost.
- cash** Coin, currency, and other items that are acceptable for deposit at face value; serves as a medium of exchange and provides a basis of measurement for accounting.
- cash (sales) discount** A reduction in sales price allowed if payment is received within a specified period, usually offered to customers to encourage prompt payment.
- cash dividend** The payment of cash to shareholders in proportion to the number of shares owned.
- cash equivalents** Short-term, highly liquid investments that can be converted easily to cash. Generally, only investments that on the day of acquisition have less than three months remaining to maturity qualify as cash equivalents.
- cash flow adequacy ratio** Computed as cash from operations divided by expenditures for fixed asset additions and acquisitions of new businesses; indicates whether a business is a “cash cow.”
- cash flow hedge** Derivative that offsets the variability in cash flows from forecasted transactions that are probable.
- cash flow-to-net income ratio** Financial ratio used to analyze the cash flow relationship between cash from operations and reported net income; computed as cash from operations divided by net income.
- cash method** The method of accounting under which all costs are charged to expense as incurred and revenue is recognized as collections are made.
- cash overdraft** A credit balance in the cash account; results from checks being written for more than the cash amount on deposit; should be reported as a current liability.
- cash times interest earned ratio** A measure used to indicate a company’s interest-paying ability; computed as pretax cash flow divided by cash paid for interest.
- cash-basis accounting** A system of accounting in which revenues and expenses are recorded as they are received and paid.
- ceiling** The net realizable value; used as an upper limit in defining market when valuing inventory at the lower of cost or market.
- certified public accountant (CPA)** An accountant who has met specified professional requirements established by the AICPA and local and state societies. A CPA often does not work for a single business enterprise but provides a variety of professional services for many different individual and business clients. A key service provided by CPAs is the performance of independent audits of financial statements.
- change in accounting estimate** A specific type of accounting change that modifies predictions of future events, for example, the useful life of a depreciable asset; changes in estimates are to be reflected in current and future periods.
- change in accounting principle** A specific type of accounting change that uses an accounting principle

- or method different from that used previously, for example, using straight-line depreciation instead of the declining-balance method. Generally, changes in principle require the reporting of a cumulative effect of the change in the current year's income statement as well as pro forma information.
- closing entries** Entries that reduce all temporary accounts to a zero balance at the end of each accounting period, transferring the preclosed balances to a permanent account.
- collateral trust bond** Bonds that are secured by the stocks and bonds of other corporations owned by the issuer but held in trust for the benefit of the bondholders.
- commodity-backed (asset-linked) bonds** Bonds that may be redeemed in terms of commodities, such as oil or precious metals.
- common stock** The class of stock issued by corporations that represents the basic ownership of the company; allows shareholders the right to vote and to receive dividends if declared, although the right to dividends is generally secondary to that of preferred stockholders.
- common-size financial statements** Financial statements standardized by a measure of size, either sales or total assets. All amounts are stated in terms of a percentage of the size measure.
- comparability** A quality of useful accounting information based on the premise that information is more useful when it can be related to a benchmark or standard, such as data for other firms within the same industry.
- comparative financial statements** Statements that enable users to analyze performance over multiple periods and identify significant trends that might affect future performance.
- compensated absences** Payments by employers for vacation, holiday, illness, or other personal activities.
- compensating balances** The portion of a demand deposit that must be maintained as support for existing borrowing arrangements.
- completed-contract method** An accounting method that recognizes revenues and expenses on long-term construction contracts only when completed.
- complex capital structure** A corporate structure that includes convertible securities and/or stock options, warrants, or rights that could result in the issuance of additional common stock through exercise or conversion.
- component** A portion of a property, plant, or equipment item that is separately identifiable and for which a separate useful life can be estimated.
- composite depreciation** Computation of depreciation on an entire group of related but dissimilar assets as if the group were one asset.
- compound interest** Interest that is calculated by adding the amount of interest earned for a certain period to the principal. Interest for the subsequent period is then computed on this sum, which includes both principal and accumulated interest.
- comprehensive income** A concept of income measurement and reporting that includes all changes in owners' equity except investments by and distributions to owners.
- conceptual framework** A theoretical foundation underlying accounting standards and practice. The framework established by the FASB encompasses the objectives, fundamental concepts, and implementation guidelines described in FASB *Concepts Statement Nos. 1–7*.
- conglomerates** Complex companies that operate in multiple industries.
- conservatism** The notion that when doubt exists concerning two or more reporting alternatives, users should select the alternative with the least favorable impact on reported income, assets, and liabilities.
- consigned goods** Inventory that is physically located at a dealer but whose ownership is retained by the shipper until the dealer sells the inventory.
- consistency** A quality of useful accounting information requiring that accounting methods be followed consistently from one period to the next.
- consolidated financial statements** Financial statements that combine the financial results of a parent company and its subsidiaries.
- contingent gains** Circumstances involving potential gains that will not be resolved until some future event occurs.
- contingent liability** A potential obligation whose existence is uncertain because it depends on the outcome of a future event, such as a pending lawsuit. The amount of the potential obligation may or may not be determinable.
- contingent losses** Circumstances involving potential losses that will not be resolved until some future event occurs.
- contra account** An account used to record subtractions from a related account. Also called an *offset account*.
- contributed capital** The portion of corporate capital that represents investments by the stockholders. Also referred to as *paid-in capital*.
- contributory pension plan** A pension plan in which employees make contributions to the plan and thus bear part of the cost.
- control** The ability of an investor to decisively influence the operating, investing, and financing decisions made by an investee.
- control account** A general ledger account that summarizes the detailed information in a subsidiary ledger.
- convertible** Securities, such as bonds and preferred stock, whose terms permit the holder to convert the investment into common stock of the issuing company.

- convertible bonds** Bonds that provide for conversion into common stock at the option of the bondholder.
- convertible debt securities** Securities that have an interest rate lower than the issuer could establish for nonconvertible debt, an initial conversion price higher than the market value of the common stock at time of issuance, and a call option retained by the issuer.
- corporation** A business entity that is a separate legal entity owned by its shareholders.
- corridor amount** An amount established as a minimum before amortization of pension gains and losses is required. Only amortization of unrecognized pension gains and losses that exceed 10% of the greater of the projected benefit obligation or the market-related asset value as of the beginning of the period is included in the net periodic pension expense. Any systematic method of amortization that exceeds the minimum may be used as long as it is consistently applied to both gains and losses and it is disclosed in the statements.
- cost driver** Characteristic of the production process that is known to create overhead costs.
- cost method** Method of accounting for treasury stock purchases in which the entire cost of the treasury stock is shown as a subtraction from equity.
- cost of capital** The cost a company bears to obtain external financing.
- cost of debt financing** The after-tax interest cost associated with obtaining external financing through borrowing.
- cost of equity financing** The expected return (both as dividends and as an increase in the market value of the investment) necessary to induce investors to provide equity capital.
- cost percentage** A percentage computed by dividing the goods available for sale at cost by the goods available for sale at retail.
- cost recovery method** A revenue recognition method that requires recovery of the total cost (investment) prior to the recognition of revenue.
- cost-to-cost method** A method for determining the percentage of completion for long-term construction contracts using a ratio of the actual cost incurred to date to the estimated total costs.
- credit** An entry on the right side of an account.
- credit risk** Uncertainty that the party on the other side of an agreement will abide by the terms of the agreement.
- creditors** Outside parties who are owed money by a company.
- cumulative preferred stock** Preferred stock that has a right to receive current dividends as well as any dividends in arrears before common stockholders receive any dividends.
- current asset** Cash or assets that are reasonably expected to be converted into cash during the normal operating cycle of a business or within one year, whichever period is longer.
- current liability** Obligations that are reasonably expected to be paid within one year.
- current ratio** Current assets divided by current liabilities.
- current replacement cost** The cash equivalent price that would be paid currently to purchase or replace goods or services.
- curtailment of a pension plan** An event that significantly reduces the expected number of years of future services of present employees or eliminates for a significant number of employees the accrual of defined benefits for their future services.
- debenture bonds, or debentures** Another name for unsecured bonds which are not protected by the pledge of any specific assets.
- debit** An entry on the left side of an account.
- debt ratio** A financial ratio used to measure the degree of leverage of a company. The debt ratio formula is total liabilities divided by total assets.
- debt securities** Financial instruments issued by a company that typically have the following characteristics: (1) a maturity value, (2) an interest rate (either fixed or variable) that specifies the periodic interest payments, and (3) a maturity date.
- debt-to-equity ratio** A ratio that measures the relationship between the debt and equity of an entity. The debt-to-equity formula is total debt divided by total stockholders' equity.
- declining-balance depreciation** Computation of periodic depreciation expense with a decreasing amount of depreciation recognized in each successive period, based on depreciation of a fixed percentage of a declining book value.
- deductible temporary differences** Differences between financial and taxable income that will result in deductible amounts in future years; expected benefits (tax savings) are reported on the balance sheet as deferred tax assets.
- deferred income tax asset** Expected future benefits from tax deductions that have been recognized as expenses in the income statement but not yet deducted for income tax purposes.
- deferred income tax liability** Expected future income taxes to be paid on income that has been recognized in the income statement but not yet taxed. Deferred income tax liabilities often arise from the temporary tax shielding provided by accelerated depreciation.
- deferred net pension gain or loss** Cumulative amount after Other Comprehensive Income is closed at year end to Accumulated Other Comprehensive Income.
- deferred pension gain or loss** Differences between expected results and actual experience in pension market value.
- deficit** A negative retained earnings balance caused by an excess of dividend payments and losses over net income.

- defined benefit pension plans** Pension plans that define the benefits that employees will receive at retirement. In these plans, it is necessary to determine what the contribution should be to meet the future benefit requirements. FASB *Statement No. 87* deals primarily with this type of pension plan.
- defined contribution pension plans** Pension plans that specify the employer's contributions based on a formula that includes such factors as age, length of service, employer's profits, and compensation levels. FASB *Statement No. 87* does not deal with these types of plans. The pension expense is the amount funded each year.
- demand deposits** Funds deposited in a bank that can be withdrawn upon demand.
- depletion** Process of allocating the cost of mineral and other natural resource assets to periodic expense.
- deposit in transit** A deposit made near the end of the month and recorded on the depositor's books but is not received by the bank in time to be reflected on the bank statement.
- depreciation** Process of allocating the cost of tangible long-term assets to periodic expense.
- derecognition** The process of designing QSPEs to use as financing vehicles to get cash through borrowing without showing the borrowing on the balance sheet.
- derivative** A financial instrument, such as an option or a future, that derives its value from the movement of a price, an exchange rate, or an interest rate associated with some other item.
- detachable warrants** Stock warrants that can be traded separately from the security with which they were originally issued.
- development** Activities that involve applying research findings to develop a plan or design for new or improved products and processes; includes the formulation, design, and testing of products; construction of prototypes; and operation of pilot plants.
- dilution of earnings** A reduction in earnings per share (or increase in loss per share) resulting from the assumption that convertible securities have been converted or that options and warrants have been exercised or other shares have been issued upon the fulfillment of certain conditions.
- dilutive securities** Securities whose assumed exercise or conversion results in a reduction in earnings per share (or increase in loss per share).
- direct financing leases** A lease in which the lessor is primarily engaged in financial activities and views the lease as an investment.
- direct materials** Materials used directly in the production of goods; the primary physical materials making up the final product.
- direct method** An approach to calculating and reporting cash flow from operating activities that itemizes the major operating cash receipt and cash payment categories.
- direct write-off method** A method of recognizing the actual losses from uncollectible accounts as expenses during the period in which the receivables are determined to be uncollectible; this method is not in accordance with GAAP.
- disclosure** Reporting the details of a transaction in the notes to the financial statements. Disclosure is sometimes used in place of recognition; that is, instead of including the results of a transaction in the financial statements themselves, it is disclosed in the notes.
- discontinued operations** The disposal of a separately identifiable component of a business either through sale or abandonment. The operations and cash flows of the component must be clearly distinguishable, both physically and operationally, from other activities of the company.
- discovery** The finding of valuable resources located on property that is already owned.
- dividends in arrears** Dividends on cumulative preferred stock that are passed or not paid. Dividends in arrears must be paid before any dividends can be paid to common stockholders.
- dollar-value LIFO** An adaptation of LIFO that measures inventory by total dollar amount rather than by individual units. LIFO incremental layers are determined based on total dollar changes.
- dollar-value LIFO retail method** A method in which LIFO layers are stated in terms of retail values.
- donation** The receipt of assets without being required to give goods or services in return.
- double extension** A technique that requires a record of base-year prices and end-of-year prices for each individual inventory item.
- double-declining-balance depreciation** Computation of periodic depreciation expense with depreciation equal to double the straight-line rate multiplied by a declining book value.
- double-entry accounting** A system of recording transactions in a way that maintains the equality of the accounting equation:  
$$\text{Assets} = \text{Liabilities} + \text{Owners' Equity}.$$
- DuPont framework** Systematic approach to identifying general factors impacting return on equity; decomposes return on equity into profitability, efficiency, and leverage components.
- earnings management continuum** A continuum that describes earnings management ranging from savvy timing of transactions to outright fraud; in most companies, if practiced at all, does not extend beyond savvy transaction timing.
- earnings per share (EPS)** Income for the period reported on a per-share-of-common-stock basis. The presentation of earnings per share on the income statement is required by generally accepted accounting principles. Separate

- EPS amounts are required for income from continuing operations and for each irregular or extraordinary component of reported income.
- economic entity** A specific reporting unit, separate and distinct from its owners or other entities.
- effective rate of interest** The interest rate used in compound interest problems.
- effective tax rate** Rate computed by dividing reported income tax expense by earnings before income taxes.
- effective-interest method** An amortization method that provides for recognition of an equal rate of amortization of bond premium or discount each period; uses a constant interest rate times a changing investment balance.
- efforts-expended methods** Methods for determining the percentage of completion for long-term construction contracts using an estimate of work or service performed. The estimates may be based on labor hours, labor dollars, or estimates of experts.
- Emerging Issues Task Force (EITF)** A task force of representatives from the accounting profession and industry created by the FASB to take timely action on emerging issues of financial reporting. The EITF identifies significant emerging issues and develops consensus positions when possible.
- entry cost** The acquisition cost of an asset.
- equity** The residual interest in the assets of an entity that remains after deducting its liabilities; sometimes referred to as *net assets*.
- equity method** The method of accounting for long-term investments in the stock of another company where significant influence exists (generally, 20%–50% ownership); the initial investment is recorded at cost but is increased by a proportionate share of investor's income and decreased by dividends and a proportionate share of losses to reflect the underlying claim by the investor on the net assets of the investee company.
- equity method securities** Equity securities purchased with the intent of being able to control or significantly influence the operations of the investee.
- equity reserve** A partition of total equity common in the financial statements of foreign companies. Each equity reserve has specific legal restrictions dictating whether it can be distributed to shareholders.
- equity securities** Securities that represent ownership in a company. These shares of stock typically carry with them the right to collect dividends and to vote on corporate matters.
- estimated liability** A liability for an indefinite amount that must be estimated.
- exchange rate risk** Uncertainty about future U.S. dollar cash flows arising when assets and liabilities are denominated in a foreign currency.
- executory contract** An exchange of promises to engage in a transaction in the future.
- executory costs** Costs to maintain leased property such as repairs, insurance, and taxes.
- exit value** The value received for an asset when sold.
- expected return on the pension fund** An amount calculated as a basis for determining the extent of delayed recognition of the effects of changes in the fair value of pension plan assets. The expected return on pension plan assets is determined based on the pension plan's expected long-term rate of return and market-related value.
- expected service period** Estimated number of years an employee will work before receiving pension benefits. Can be estimated as the average computed life based on the total expected future years of service divided by the number of employees. The expected future years of service may be computed by the formula  $[N(N + 1)/2] \times D$ , where N equals the number of years over which service is to be performed and D is the decrease in number of employees through retirement or termination of services per year.
- expense recognition** The process of determining the period in which expenses are to be recorded. Expense recognition is divided into three categories: (1) direct matching, (2) systematic and rational allocation, and (3) immediate recognition.
- expenses** Outflows or other "using up" of assets of an entity or incurrences of liabilities (or a combination of both) from delivering or producing goods, rendering services, or carrying out other activities that constitute the entity's ongoing major or central operations.
- Exposure Draft** A preliminary statement of a standard that includes specific recommendations made by the FASB. Reaction to the Exposure Draft is requested from the accounting and business communities, and the comments received are carefully considered before a final Statement of Financial Accounting Standards is issued.
- extraordinary items** Gains or losses resulting from events and transactions that are both unusual in nature and infrequent in occurrence or otherwise defined as an extraordinary item per accounting standards.
- fair value** The cash equivalent price that could be obtained by selling an asset in an orderly transaction.
- face value, par value, or maturity value** The amount that will be paid on a bond at the maturity date.
- fair value hedge** Derivative that offsets the change in the fair value of an asset or a liability.
- fair value of the pension fund** Value based on the pension fund's market value at a given measurement date that increases each year by employer contributions to the fund and decreases by the retirement benefits paid; also changes by the amount of earnings on the pension fund, including changes in its market value.

- feedback value** A key ingredient of relevant accounting information; helps to confirm or change a decision maker's beliefs based on whether the information matches what was expected.
- financial accounting** The activity associated with the development and communication of financial information for external users.
- Financial Accounting Foundation (FAF)** An organization responsible for selecting members of the FASB, GASB, and their advisory councils.
- Financial Accounting Standards Board (FASB)** The organization responsible for studying accounting issues and establishing accounting standards to govern financial reporting in the United States.
- financial capital maintenance** A concept under which income is defined as the excess of net assets at the end of an accounting period over the net assets at the beginning of the period, excluding effects of transactions with owners.
- financial income** Income reported on the financial statements as opposed to taxable income that is reported to taxing authorities in accordance with tax regulations.
- financial ratios** Mathematical relationships between financial statement amounts, used to quantify various characteristics of a company's performance such as efficiency and profitability.
- financial statement analysis** Examination of the relationships among financial statement numbers and the trends in those numbers over time.
- financing activities** One of three major categories included in a statement of cash flows; includes transactions and events whereby cash is obtained from or repaid to owners and creditors.
- finished goods** Manufactured products for which the manufacturing process is complete.
- first-in, first-out (FIFO) method** An inventory valuation method that assumes that the units sold are the first ones purchased or manufactured.
- fixed asset turnover ratio** A ratio that uses financial statement data to roughly indicate how efficiently a company is utilizing its property, plant, and equipment to generate sales; computed as sales divided by net property, plant, and equipment.
- floor** The net realizable value less a normal profit; used as a lower limit in defining market when valuing inventory at the lower of cost or market.
- FOB (free on board) destination** Terms of sale under which title of goods passes to the purchaser at the point of destination.
- FOB (free on board) shipping point** Terms of sale under which title of goods passes to the purchaser at the point of shipment.
- foreign currency transaction** For a U.S. company, a transaction denominated in a currency other than the U.S. dollar.
- foreign currency translation adjustment** Equity item arising from the change in the equity of foreign subsidiaries resulting from changes in foreign currency exchange rates.
- forward contract** Agreement between two parties to exchange a specified amount of a commodity, security, or foreign currency at a specified date with the price being set now.
- full cost method** A method of accounting developed to account for oil and gas exploratory costs by capitalizing all exploratory costs; the reasoning is that the cost of drilling dry wells is part of the cost of locating productive wells.
- full disclosure principle** A basic accounting concept that requires that all relevant information be presented in an unbiased, understandable, and timely manner.
- full eligibility date** The date at which an employee attains full eligibility for the benefits that employee is expected to earn under the terms of a postretirement benefit plan.
- functional currency** Currency in which most of a foreign subsidiary's transactions are denominated.
- future value of an annuity due** A value that is calculated by selecting the appropriate table value for an ordinary annuity for one additional period ( $n + 1$ ) and subtracting the extra payment.
- future values** The value of money in the future.
- futures contract** Contract, traded on an exchange, that allows a company to buy a specified quantity of a commodity or a financial security at a specified price on a specified future date.
- GAAP oval** Represents the flexibility a manager has, within GAAP, to report one earnings number from among many possibilities based on different methods and assumptions.
- gain** Amount by which the proceeds from disposing of an asset exceed the book value of the asset.
- general journal** An accounting record used to record all business activities for which a special journal is not maintained.
- general ledger** A collection of all the accounts used by a business that could appear on the financial statements.
- Generally Accepted Accounting Principles (GAAP)** Accounting standards recognized by the accounting profession as required in the preparation of financial statements for external users. Currently, the FASB is the principal issuer of generally accepted accounting principles.
- general-purpose financial statements** A balance sheet, income statement, and statement of cash flows.
- going concern** An entity that is expected to continue in existence for the foreseeable future.
- goodwill** A residual number, the value of all of the synergies of a functioning business that cannot be

- specifically identified with any other intangible factor, that is recognized only when it is purchased as part of the acquisition of another company.
- Governmental Accounting Standards Board (GASB)** An independent private organization responsible for establishing standards in state and local governmental areas.
- gross method** A method of inventory accounting that records inventory cost before considering cash discounts.
- gross profit** Revenue from net sales minus cost of goods sold.
- gross profit method** An inventory estimation technique based on the relationship between gross profit and sales. The gross profit percentage is used to estimate cost of goods sold, which in turn, is used to estimate the value of the inventory not yet sold.
- gross profit percentage** Gross profit divided by sales; a measure of the profitability of sales in relation to the cost of the goods sold.
- group depreciation** Computation of depreciation on an entire group of similar assets as if the group were one asset.
- guaranteed residual value** A guarantee by lessee of a minimum value for the residual value of a leased asset. If the residual value is less than the guarantee, the lessee must pay the difference to the lessor.
- half-year convention** Assumption sometimes used in computing depreciation; one-half of a year's depreciation is recognized for assets acquired or disposed of during a year.
- hedge** To hide.
- hedging** Structuring transactions to reduce risk.
- held-to-maturity securities** Debt securities purchased by a company with both the intent and ability to hold the securities to maturity.
- historical cost** The cash equivalent price of goods or services at the date of acquisition.
- if-converted method** A method used to adjust the earnings per share computation to consider the impact of the possible conversion of convertible securities. Under this method, the earnings per share computation is made as if the convertible securities were converted at the beginning of the year or the date the convertible security was issued, whichever is later.
- impairment** Reduction in the expected cash flow to be generated by a long-term asset sufficient to warrant reducing the recorded value of the asset.
- implicit (effective) interest** The actual interest rate earned or paid on a note, bond, or similar instrument.
- implicit interest rate** The interest rate that would discount the minimum lease payments to the fair market value of the leased asset at the lease signing date.
- imputed interest rate** A rate of interest assigned to a note when there is no current market price for either the property, goods or services, or the note. The assigned rate of interest is used to discount future receipts or payments to the present in computing the present value of the note.
- income** A measure of a company's "well-offness." It is often defined as the amount that an entity could return to its investors and still be as well-off at the end of the period as it was at the beginning.
- income from continuing operations** A measure of the profitability of a firm's operations. The number is obtained by subtracting expenses and losses from revenues and gains. Income from continuing operations is always disclosed after taxes have been subtracted.
- income smoothing** The practice of carefully timing the recognition of revenues and expenses to even out the amount of reported earnings from one year to the next.
- incremental borrowing rate** The interest rate at which the lessee could borrow the amount of money necessary to purchase the leased asset, taking into consideration the lessee's financial situation and the current conditions in the marketplace.
- indicated gain** The excess of the market value over the book value of the asset given up in an exchange of assets.
- indicated loss** The excess of the book value over the market value of the asset given up in an exchange of assets.
- indirect materials** Materials that are necessary to facilitate the production process but are not directly incorporated in the final product.
- indirect method** An approach to calculating and reporting cash flow from operating activities that reconciles net income with operating cash flow; net income is adjusted for noncash revenues and expenses, for any gains or losses associated with investing and financing activities, and for changes in current operating assets and liabilities that indicate noncash sources of revenues and expenses.
- initial direct costs** Costs such as commissions, legal fees, and preparation of documents that are incurred by the lessor in negotiating and completing a lease transaction.
- initial markup** The original increase over cost.
- input measures** Measures of the earnings process in percentage-of-completion accounting based on cost or efforts devoted to a contract.
- installment sales method** A revenue recognition method that recognizes revenue and related expenses as cash is received.
- intangible assets** Legal or economic rights controlled by a company that are expected to generate future economic benefits.
- integral part of annual period concept** Concept guiding the preparation of interim statements; accounting

- practices may be slightly modified to make sure the interim results relate properly to the annual results.
- interest** Payment for the use of money.
- interest rate risk** Uncertainty about future interest rates and their impact on future cash flows as well as on the fair value of existing assets and liabilities.
- interest rate swap** Contract in which two parties agree to exchange future interest payments on a given loan amount; usually, one set of interest payments is fixed and the other is variable.
- interest-bearing note** A note written in a form in which the maker promises to pay the face amount plus interest at a specified rate; in this form, the face amount is usually equal to the present value upon issuance of the note.
- interim financial statements** Statements showing financial position and operating results for an interval of less than a year.
- internal earnings target** An important tool in motivating managers to increase sales efforts, control costs, and use resources more efficiently.
- Internal Revenue Service (IRS)** U.S. government agency responsible for administering U.S. income tax rules.
- International Accounting Standards Board (IASB)** International group, based in London, representing accounting bodies in over 100 countries formed to develop accounting standards that can serve as the basis for harmonizing conflicting national standards.
- International Organization of Securities Commissions (IOSCO)** International securities regulation firm, including member groups such as the U.S. Securities and Exchange Commission, that approves and endorses the overall quality of accounting standards.
- interperiod tax allocation** An accounting method that recognizes the tax effect of temporary differences between financial and taxable income in the financial statements rather than reporting as tax expense the actual tax liability in each year. The allocation may be made either by (1) the deferred method or (2) the asset and liability method. The latter method is currently required by GAAP.
- intraproduct income tax allocation** A method of income statement presentation of irregular or extraordinary items in which the tax effect of each of these special items is reported with the individual item rather than in the income tax expense related to current operations.
- inventory** Assets held for sale in the normal course of business; also, assets held to be used as materials in a production process.
- inventory turnover** Measured by dividing cost of goods sold by average inventory; used to evaluate whether the level of inventory is appropriate, given the volume of business.
- investing activities** One of three major categories included in a statement of cash flows; primarily includes purchases and sales of noncurrent assets such as land, buildings, and nontrading financial instruments.
- investors** Owners and potential owners of a company.
- joint venture** A separate economic entity created when companies join forces with other companies to share the costs and benefits associated with a specifically defined project.
- journal entry** A recording of a transaction in which debits equal credits; it usually includes a date and an explanation of the transaction.
- journals** Accounting records in which transactions are first entered, providing a chronological record of business activity.
- junk bonds** High-risk, high-yield bonds issued by companies in a weak financial condition.
- large stock dividend** A stock dividend of 25% or more of the shares outstanding.
- last-in, first-out (LIFO) method** An inventory valuation method that assumes that the units sold are the most recent ones purchased or manufactured.
- lease** A contract specifying the terms under which the owner of the property, the lessor, transfers the right to use the property to a lessee.
- lease term** The noncancelable period of a lease designated in the lease contract plus the period of any bargain renewal periods over which the lease is likely to be renewed.
- ledger** A collection of accounts maintained by a business.
- lessee** The party using property that is owned by another party (lessor).
- lessor** The owner of leased property who transfers the right to use the property to a second party (lessee).
- leverage** The degree to which a company uses borrowed funds instead of invested funds. By adding borrowed funds to their own capital, owners are said to “leverage” their investment.
- liabilities** The claims of creditors against an entity’s resources: technically defined by the FASB as “probable future sacrifices of economic benefits arising from present obligations of a particular entity to transfer assets or provide services to other entities in the future as a result of past transactions or events.”
- LIFO conformity rule** A federal tax regulation that requires the use of LIFO for financial reporting purposes if LIFO is used for income tax purposes.
- LIFO inventory pool** A group of inventory items having common characteristics and assumed to be the same when applying LIFO.
- LIFO layer** An incremental group of LIFO inventory items created in any year in which the number of units purchased or produced exceeds the number sold.

- LIFO liquidation** Reduction or elimination of old LIFO layers because total purchases or production in the current period is less than sales.
- LIFO reserve** The difference between LIFO ending inventory and the amount obtained using another method such as FIFO or average cost.
- line of credit** A negotiated arrangement with a lender in which the terms are agreed to prior to the need for actual borrowing.
- liquidating dividend** A distribution to stockholders representing a return of a portion of their contributed capital.
- liquidity** The ability of a company to pay its short-term obligations.
- loan (mortgage) amortization** The process by which payments on a loan are allocated between principal and interest components.
- loan covenant** Provision of a loan contract restricting the actions of the borrower or allowing for some monitoring of the borrower's actions.
- long-term debt** Obligations that are not expected to be paid in cash or other current assets within one year or the normal operating cycle.
- loss** Amount by which the proceeds from disposing of an asset are less than the book value of the asset.
- lower of cost or market (LCM)** Generally accepted method for valuation of inventories in which assets are recorded at the lower of their cost or market value; this method can be applied to inventories on an aggregate or individual item basis.
- maintenance** Expenditures made to maintain plant assets in good operating condition.
- management accounting** The activity associated with financial reporting for internal users.
- manufacturing overhead** All manufacturing costs other than direct materials and direct labor.
- margin** Profitability of each dollar in sales; another term for *return on sales*.
- markdowns** Decreases that reduce sales prices below original retail.
- market (in "lower of cost or market")** The replacement cost adjusted for an upper and lower limit that reflects the estimated net realizable value.
- market, yield, or effective interest rate** The actual rate of interest earned or paid on a bond.
- market-related value of the pension fund** Value of pension plan assets used in computing the expected return. Either of the following can be used as the market-related value: (1) the fair market value of pension plan assets as of the beginning of the year or (2) a weighted-average value based on the market value of plan assets over a preceding period not exceeding five years.
- markups** Increases that raise sales prices above original retail.
- matching** A basic accounting concept that is applied to determine when expenses are recognized (recorded). Under this principle, expenses for a period are determined by associating or "matching" them with specific revenues over a particular time period.
- materiality** An important constraint underlying the reporting of accounting information; it relates to how large an item is in terms of a dollar amount. Accounting standards do not need to be applied to items that are considered to be immaterial.
- minimum lease payments** The lease payments required over the lease term plus any amount to be paid for the residual value either through a bargain purchase option or a guarantee of residual value.
- minority interest** The amount of equity investment made by outside shareholders to consolidated subsidiaries that are not 100% owned by the parent.
- modified accelerated cost recovery system (MACRS)** Modification of the ACRS tax depreciation method that is based on declining-balance depreciation, fixed cost recovery periods, and no residual values.
- mortgage** A loan backed by an asset with the asset title pledged to the lender.
- multiple-step form** A format of the income statement that lists operating revenues and expenses first, resulting in operating income. From this figure, gains and losses are then added or subtracted to arrive at income from continuing operations. Irregular and extraordinary items are then added or subtracted to arrive at net income.
- municipal debt** Debt securities issued by state, county, and local governments and their agencies.
- natural resources** Products of the earth, such as oil, gold, and timber. Also called *wasting assets*.
- negotiable notes** Notes that are legally transferable by endorsement and delivery.
- net method** A method of inventory accounting that records inventory net of any cash discounts.
- net operating loss (NOL) carryback** The amount of operating loss that can be carried back and offset against the income of earlier profitable years to obtain a refund of previously paid income taxes.
- net operating loss (NOL) carryforward** The amount of operating loss that can be carried forward and offset against income of future profitable years to reduce the tax liability for those years.
- net periodic pension expense** The amount recognized in an employer's financial statements as an expense of a pension plan for a period. Components of net periodic pension expense are service cost, interest cost, actual return on plan assets, pension gain or loss, amortization of unrecognized prior service cost, and amortization of deferred gain or loss in excess of the corridor amount.
- net realizable value** The amount of cash expected to be received from the conversion of assets in the normal

- course of business; net realizable value equals selling price less normal selling costs for inventory and equals gross receivables less the allowance for bad debts for accounts receivable.
- neutrality** A key ingredient of reliable accounting information requiring that information be presented in an unbiased manner; neutrality relates to the concept of fairness to users.
- nominal (temporary) accounts** Accounts that are closed to a zero balance at the end of an accounting period.
- noncancelable** A lease contract that can be canceled only under very unlikely circumstances or with extremely expensive penalties to the lessee.
- noncash investing and financing activities** Investing and financing transactions that affect a company's financial position but not the cash flows during the period; an example is the purchase of land by issuing stock.
- noncontributory pension plans** Plans in which the employer bears the total cost of the plan.
- noncontrolling interest** The term used by the FASB to replace "minority interest" and directs that this item be classified in the consolidated balance sheet as part of equity.
- noncumulative preferred stock** Preferred stock that has no claim on any prior year dividends that may have been "passed."
- noncurrent operating assets** Assets used in the normal course of business that are expected to have a useful life exceeding one year, or one operating cycle, whichever is longer.
- nondetachable warrants** Stock warrants that cannot be traded separately from the security with which they were originally issued.
- non-interest-bearing note** A note written in a form in which the face amount includes an interest charge; in this form, the difference between the face amount and the present value of the note is the implicit or effective interest.
- nonreciprocal transfer to owners** Transfer of cash or property to shareholders in which nothing is received by the company in return.
- nontrade notes payable** Notes issued to nontrade creditors for purposes other than to purchase goods or services.
- nontrade receivables** Any receivables arising from transactions that are not directly associated with the normal operating activities of a business.
- notes payable** Formal written promises to pay a sum of money in the future. Notes payable are generally evidenced by a promissory note.
- notes receivable** Receivables that are evidenced by a formal written promise to pay a certain sum of money at a specified date.
- notional amount** Total face amount of the asset or liability that underlies a derivative contract.
- not-sufficient-funds (NSF) check** A check that is not honored by a bank because of insufficient cash in the maker's account.
- number of days' sales in inventory** Measured by dividing average inventory by average daily cost of goods sold; used to evaluate whether the level of inventory is appropriate, given the volume of business.
- objective acceleration clause** A clause in a debt agreement that identifies specific conditions that will cause the debt to be callable immediately.
- obligation discount rate** The 10% discount rate used in the computation of the projected benefit obligation and viewed as the implied interest rate on this debt.
- off-balance-sheet financing** Procedures used by companies to avoid disclosing all of their debt on the balance sheet to make their financial position look stronger.
- operating activities** One of three major categories included in a statement of cash flows; includes transactions and events that normally enter into the determination of net income, including interest and taxes.
- operating income** A measure of the performance of a company's business operations. The formula is revenues minus cost of goods sold and operating expenses. Also called *earnings before interest and taxes*.
- operating lease** A lease that is economically equivalent to the rental of the leased asset.
- option** Contract giving the owner the right, but not the obligation, to buy or sell an asset at a specified price any time during a specified period.
- ordinary annuity** A type of annuity in which periodic receipts or payments are made at the end of each period and the last payment coincides with the end of the annuity term.
- original retail** The initial sales price, including the original increase over cost referred to as the *initial markup*.
- other comprehensive income** The summary typically provided by companies as part of their statement of stockholders' equity showing changes in owners' equity exclusive of net income and contributions by and distributions to owners; required by the FASB beginning in 1998.
- output measures** Measures of the earnings process in percentage-of-completion accounting based on units produced, contract milestones reached, or values added.
- outstanding checks** Checks written near the end of the month that have reduced the depositor's cash balance but have not yet cleared the bank as of the bank statement date.
- paid-in capital** The portion of corporate capital that represents investments by the stockholders. Also referred to as *contributed capital*.

- par value** A nominal value that is assigned to stock by the terms of a corporation's charter.
- par (or stated) value method** Method of accounting for treasury stock purchases in which the repurchased shares are accounted for as if they were being retired.
- parent company** A company that exercises control over another company, known as a subsidiary, through majority ownership (more than 50%) of the subsidiary's voting stock.
- participating preferred stock** Preferred stock that provides for additional dividends to be paid to preferred stockholders after dividends of a specified amount are paid to common stockholders.
- partnership** A business entity owned by two or more people.
- pension fund** Fund set aside to meet the employer's future pension obligation.
- pension plan** An agreement, usually written, that provides for benefits to employees upon retirement from active employment. The plan usually includes provisions as to how the benefits are to be funded, who receives benefits, the amount of benefits to be paid, and restrictions on investments of pension plan assets.
- pension-related asset/liability** An account used to reflect changes in the net pension asset or liability.
- percentage-of-completion accounting** An accounting method for long-term construction contracts that recognizes revenue and related expenses prior to delivery of the goods. Recognition is based on either an input or output measure of the earning process.
- performance-based stock option plan** A plan in which the terms are dependent on how well the individual or company performs after the date the options are granted.
- period cost** Cost that is recognized as an expense during the period in which it is incurred; not included as part of inventory cost.
- periodic inventory system** A method of accounting for inventory in which cost of goods sold is determined and inventory is adjusted to the proper balance at the end of the accounting period. Purchases are recorded in the purchases account, and ending inventory is determined by a physical count.
- permanent differences** Nondeductible expenses or nontaxable revenues that are recognized for financial reporting purposes but that are never part of taxable income.
- perpetual inventory system** A method of accounting for inventory in which detailed records of each inventory purchase and sale are maintained. This system provides a current record of inventory on hand and cost of goods sold to date.
- perpetuity** Annuity of infinite length.
- physical capital maintenance** A concept under which income is defined as the excess of physical productive capacity at the end of an accounting period over the physical productive capacity at the beginning of the period, excluding the effects of transactions with owners.
- post-balance sheet event** Event occurring between the balance sheet date and the date financial statements are issued and made available to external users. Also called a *subsequent event*.
- post-closing trial balance** A list of all real accounts and their balances after the closing process has been completed.
- posting** The process of summarizing transactions by transferring amounts from the journals to the ledger accounts.
- postretirement benefits other than pensions** Benefits other than pensions provided by an employer to former employees. Includes health insurance, life insurance, and disability payments. Current standards require these benefits to be accrued in a manner similar to pension costs.
- predictive value** Helps a decision maker predict future consequences based on information about past transactions and events.
- preferred stock** A class of stock that usually confers dividend and liquidation rights that take precedence over those of common stock; preferred stockholders usually aren't allowed to vote in the selection of the board of directors.
- prepaid expenses** Payments that a company makes in advance for items normally charged to expenses.
- present value** The amount of net future cash inflows or outflows discounted to their present value at an appropriate rate of interest.
- present value of an annuity due** A value that is calculated by selecting the appropriate table value for an ordinary annuity for one less period ( $n - 1$ ) and adding the extra payment.
- price index** An overall measure of how much prices have increased during the year.
- price risk** Uncertainty about the future price of an asset.
- price-earnings (P/E) ratio** A measure of the relationship between the market price of a company's stock and its profitability. The formula is the market price per share of common stock divided by the earnings per share of common stock.
- principal (face amount)** The amount, excluding interest, that the maker of a note or the issuer of a bond agrees to pay at the maturity date; this amount is printed on the note or bond contract.
- prior service cost** The present value of the increased benefits granted by a pension plan's amendment (or initial adoption of a plan). Recognized as a component of net periodic pension expense through amortization over the future service life of the covered employees.
- prior-period adjustment** An adjustment made directly to the retained earnings account to correct errors made in prior accounting periods.

- pro forma cash flow statement** A forecast or projection of the amounts that will be in the cash flow statement in a future period.
- pro forma earnings number** The regular GAAP earnings number with some revenues, expenses, gains, or losses excluded because companies claim that the GAAP results do not fairly reflect the company's performance.
- product (inventoriable) cost** Costs included in the total cost of manufactured inventory.
- productive-output depreciation** Computation of periodic depreciation expense based on how many units of output were produced during the period relative to estimated total lifetime output units.
- projected benefit obligation (PBO)** The actuarial present value of pension benefits using the benefits/years of service approach that requires assumptions about future compensation levels, such as increases over time by interest, amendments to the plan, additional service years, and changes in actuarial assumptions.
- promissory note** A formal written promise to pay a certain amount of money at a specified future date.
- property dividend** A dividend paid in the form of some asset other than cash.
- proportional performance method** An accounting method for recording service revenue and related expenses prior to completion of a service contract.
- proprietorship** A business entity owned by one person.
- purchase commitment** An advance commitment to purchase inventory in the future at a set price.
- put option** Contract giving the owner the right, but not the obligation, to sell an asset at a specified price.
- quick ratio** A financial ratio used as a measure of short-term liquidity. Also called *acid-test ratio*.
- raw materials** Inventory acquired by a manufacturer for use in the production process.
- real (permanent) accounts** Accounts that are not closed to a zero balance at the end of each accounting period.
- recognition** The process of formally recording an item in the accounting records and eventually reporting it in the financial statements; includes both the initial recording of an item and any subsequent changes related to that item.
- redeemable preferred stock** Preferred stock that may be redeemed at the option of the holder, at a fixed price on a specific date, or upon other conditions not solely within the control of the issuer.
- registered bonds** Bonds for which the bondholders' names and addresses are kept on file by the issuing company.
- relevance** One of two primary qualities inherent in useful accounting information; essentially, information is relevant if it will affect a decision. The key ingredients of relevance are feedback value, predictive value, and timeliness.
- reliability** One of two primary qualities inherent in useful accounting information; to be reliable, information must contain the key ingredients of verifiability, neutrality, and representational faithfulness.
- remeasurement** Method of converting a foreign subsidiary's financial statements into U.S. dollars; used when most of the subsidiary's transactions are denominated in U.S. dollars.
- renewals** Expenditures made for overhauling plant assets.
- repairs** Expenditures made to restore assets to good operating condition upon their breakdown or to restore and replace broken parts.
- replacement cost** The cost that would be required to replace an existing asset.
- replacements** Expenditures to purchase substitutions of parts or entire units of plant assets.
- representational faithfulness** A key ingredient of reliable accounting information requiring that the amounts and descriptions reported in the financial statements reflect the actual results of economic transactions and events.
- research** Investigation to discover new knowledge that will be useful in developing new products, services, or processes or that will result in significant improvements of existing products or processes.
- research and development (R&D)** Activities undertaken to discover new knowledge or apply research findings in developing new products, services, processes, or significant improvements of existing ones and to formulate, design, and test products; construct prototypes; and operate pilot plants.
- residual (salvage) value** Estimate of the amount for which an asset can be sold when it is retired.
- restructuring charge** An estimate of the costs expected to be incurred as a result of a plan to significantly modify a company's operations.
- retail inventory method** An inventory method that permits the estimation of an inventory amount without the time and expense of taking a physical inventory or maintaining detailed perpetual inventory records.
- retained earnings** The portion of owners' equity that represents the net accumulated earnings of a corporation.
- return on assets** A financial ratio used to measure the degree to which assets have been used to generate profits. The return on assets formula is net income divided by total assets.
- return on equity** A financial ratio used to measure the degree to which funds invested by owners have been used to generate profits. The return on equity formula is net income divided by total equity.
- return on sales** A measure of the profitability of a company that relates net income to the sales of the company. The formula is net income divided by net sales.

- revenue recognition** A basic accounting concept that is applied to determine when revenue should be recognized (recorded). Generally, under this principle, revenues are recognized when two criteria are met: The earnings process is substantially complete, and the revenues are realized, or realizable.
- revenues** Inflows or other enhancements of assets of an entity or settlements of its liabilities (or a combination of both) from delivering or producing goods, rendering services, or other activities that constitute the entity's ongoing major or central operations.
- sale-leaseback** An arrangement in which one party sells an asset and then immediately leases back and uses the same asset. The seller becomes the seller-lessee and the purchaser is the purchaser-lessor.
- sales-type leases** A lease in which the lessor is a manufacturer or dealer utilizing the lease to facilitate the sale of goods.
- secured bonds** Bonds for which assets are pledged to guarantee repayment.
- secured loan** A loan backed by certain assets as collateral.
- Securities and Exchange Commission (SEC)** A U.S. government agency created to regulate the issuance and trading of securities in the United States. As part of this function, the SEC is vitally interested in financial accounting and reporting standards. The SEC has the legal authority to establish accounting standards, but it has historically relied heavily on the private sector to perform this function.
- selling receivables with recourse** A purchaser advances cash in return for receivables but retains the right to collect from the seller if debtors fail to make payments when due.
- serial bonds** Bonds that mature in a series of installments at future dates.
- service cost** A component of net periodic pension expense representing the actuarial present value of benefits accruing to employees for services rendered during that period.
- service-hours depreciation** Computation of periodic depreciation expense based on how many hours of service were used during the period relative to estimated total lifetime service hours.
- settlement of a pension plan** An irrevocable action taken by an employer that relieves the employer of primary responsibility for all or part of the pension obligation. Examples include purchasing from an insurance company an annuity that would cover employees' vested benefits or a lump-sum payment to employees in exchange for their rights to receive specified pension benefits.
- shrinkage** The amount of inventory that is lost, stolen, or spoiled.
- significant influence** The ability of an investor to impact the operating, investing, and financing decisions of an investee but not absolutely determine those decisions.
- simple capital structure** A corporate structure that includes only common and nonconvertible preferred stock and has no convertible securities, stock options, warrants, or other rights outstanding.
- simple interest** A type of interest that is computed using the formula:  $i = p \times r \times t$ .
- single-employer pension plans** Pension plans established for a single employer. FASB *Statement No. 87* primarily refers to this type of plan.
- sinking fund** Assets that have been accumulated in order to repay a loan.
- small stock dividend** A stock dividend of less than 25% of the shares outstanding.
- software development costs** Costs that are examined in FASB *Statement No. 86*.
- source document** Also known as a "business document," it is the first record of each transaction.
- special journal** An accounting record used to list a particular type of frequently recurring transaction.
- specific identification method** Inventory valuation method that assigns the actual cost of inventory items sold to cost of goods sold.
- spot rate** The exchange rate at which currencies can be traded immediately.
- stable monetary units** An accounting assumption that the measuring unit maintains constant purchasing power; based on this assumption, U.S. financial statements have traditionally reported items in nominal dollars without adjustment for changes in purchasing power.
- stakeholders** All parties interested in the performance of a company.
- stated (contract) rate** The rate of interest printed on the bond.
- stated value** A nominal value that may be assigned to no-par stock by the board of directors of a corporation; similar in concept to par value.
- statement of cash flows** One of the three primary financial statements. The cash flow statement provides information about the cash receipts (inflows) and cash payments (outflows) of a company during a period of time. The statement is separated into cash flows from operating, investing, and financing activities.
- statement of changes in owners' equity** A report that shows the total changes in all owners' equity accounts during a period of time; provides a reconciliation of the beginning and ending owners' equity amounts.
- statement of changes in stockholders' equity** A report that summarizes the reasons for the changes in all equity accounts during a period of time.
- Statements of Financial Accounting Concepts** A set of guidelines established by the FASB to provide

- a conceptual framework for establishing and administering accounting standards.
- stock appreciation rights (SARs)** Awards an employee a cash amount equal to the market value of the issuing firm's shares above a specified threshold price.
- stock options** Rights granted to officers or employees as part of a compensation plan; the options allow for the purchase of shares at a specified exercise price.
- stock rights** Rights issued to existing shareholders to buy shares of stock in order to maintain their proportionate ownership interests.
- stock split** A reduction in the par or stated value of stock accompanied by a proportionate increase in the number of shares outstanding.
- stock warrants** Rights to purchase shares of stock; warrants are generally issued in conjunction with the issuance of another security.
- stockholders' (shareholders') equity** Total owners' equity of a corporation.
- straight-line depreciation** Computation of periodic depreciation expense with an equal amount of depreciation recognized in each year.
- straight-line method** An amortization method that provides for recognition of an equal amount of bond premium or discount amortization each period.
- subjective acceleration clause** A clause in a debt agreement that identifies general conditions that can cause the debt to be callable immediately, but violation of the conditions cannot be determined objectively.
- subscription** A contract between the purchaser of stock and the issuer in which the purchaser promises to buy shares of the issuing company's stock.
- subsequent event** Event occurring between the balance sheet date and the date financial statements are issued and made available to external users. Also called a *post-balance sheet event*.
- subsidiary company** A company that is owned or controlled by another company, known as the parent company.
- subsidiary ledgers** A grouping of supporting accounts that in total equal the balance of a control account in the general ledger.
- successful efforts method** An accounting method developed to account for oil and gas exploratory costs that expenses costs related to dry holes and capitalizes only exploratory costs for successful wells; used by most large, successful oil companies.
- sum-of-the-years'-digits depreciation** Computation of periodic depreciation expense with a decreasing amount of depreciation recognized in each successive period, based on a fraction derived from the sum of the digits from 1 to the asset's original useful life.
- swap** Contract in which two parties agree to exchange payments in the future based on the movement of some agreed-upon price or rate.
- taxable income** Income as defined by income tax regulations as the basis for determining the income tax liability for a given entity.
- taxable temporary differences** Differences between financial and taxable income that result in future taxable amounts; income taxes expected to be paid on future taxable amounts are reported in the balance sheet as a deferred tax liability.
- technological feasibility** Stage attained in software development when an enterprise has produced either a detailed program design or a working model.
- temporary differences** Differences between pretax financial income and taxable income arising from business events that are recognized for both financial and tax purposes, but in different time periods. For example, it is common for a temporary difference to result from depreciation expense on equipment.
- term bonds** Bonds that mature in one lump sum at a specified future date.
- time deposits** Funds deposited in a bank that legally require prior notification before they can be withdrawn.
- time-factor depreciation** Computation of periodic depreciation expense based on the passage of time.
- timeliness** Quality of information that is provided on a timely basis.
- times interest earned** An indicator of a company's ability to meet interest payments; calculated as income before income taxes plus interest expense divided by interest expense for the period.
- trade discount** A reduction in the "list" sales price of an item to the "net" sales price actually charged the customer; trade discounts are generally dependent on the volume of business or size of order from the customer.
- trade notes payable** A note issued to trade creditors for the purchase of goods or services.
- trade receivables** Receivables associated with the normal operating activities of a business (e.g., credit sales of goods or services to customers).
- trademark** A distinctive name, symbol, or slogan that distinguishes a product or service from similar products or services.
- trading securities** Debt and equity securities that are purchased with the intent of selling them in the near future to generate profits from short-term changes in market prices.
- transaction approach** A method of determining income by defining the financial statement effects of certain events classified as revenues, gains, expenses, and losses. Also known as the *matching method*, this is the traditional accounting approach to measuring and defining income.
- transactions** Exchanges of goods or services between/among two or more entities or some other event having an economic impact on a business enterprise.

- translation** Method of converting a foreign subsidiary's financial statements into U.S. dollars; used when most of the subsidiary's transactions are denominated in the local (foreign) currency.
- translation adjustment** Balancing figure to equate a foreign subsidiary's U.S. dollar debits and credits; can be thought of as an unrealized gain or loss from the impact of exchange rate changes on the U.S. dollar value of a foreign subsidiary's equity.
- treasury stock** Stock issued but subsequently bought back by the same company and held for possible future reissuance or retirement.
- treasury stock method** A method of recognizing the use of proceeds that would be obtained upon exercise of options and warrants in computing earnings per share. It assumes that any proceeds would be used to purchase common stock at current market prices.
- trial balance** A list of all accounts and their balances.
- troubled debt restructuring** A situation involving a concession by creditors to allow debtors to eliminate or significantly modify debt obligations due to the debtor's financial difficulties.
- trust indenture** A legal agreement specifying how a bond fund should be administered by its trustees.
- turnover** The degree to which assets are used to generate sales.
- two-class method** When different classes of stock don't always have the same claim upon dividends. In such a case, earnings attributable to each share of the different classes of stock are different and EPS is computed using this method.
- uncertain tax positions** Might be taken by taxpayers but the tax benefits are not immediately recognized for financial accounting purposes because those benefits are not yet more likely than not.
- unearned revenues** Amounts received before the actual earning of revenues.
- unguaranteed residual value** A residual value of leased property that reverts to the lessor at the end of the lease term. Because there is no guarantee of the residual value, market factors and asset condition determine the value of the leased asset at the end of the lease.
- unit depreciation** Computation of depreciation on an individual asset as a separate unit.
- unrecorded liabilities** Liabilities created by expenses being incurred prior to being paid or recorded.
- unrecorded receivables** Revenues that have been earned but have not yet been collected or recorded.
- unsecured (debenture) bonds** Bonds for which no specific collateral has been pledged.
- use-factor depreciation** Computation of periodic depreciation expense based on how much the asset is used during the period.
- useful life** Length of time over which a long-term asset is forecasted to provide economic benefits.
- valuation allowance** A contra-asset account that reduces an asset to its expected realizable value. This type of account is used, for example, in valuing accounts receivable and deferred tax assets.
- variable interest entity (VIE)** A category of unconsolidated subsidiaries, formerly called *special-purpose entities*.
- verifiability** A key ingredient of reliable accounting information; reported information should be based on objectively determined facts that can be verified by other accountants using the same measurement methods.
- vested benefits** The amount of pension benefits an employee will retain if employment with the employer is terminated.
- warranties** Obligations of a company to provide free service on units failing to perform satisfactorily or to replace defective goods.
- weighted-average cost of capital** The average of the cost of debt and equity financing, weighted by the proportion of each type of financing.
- window dressing** Practice of companies to boost their reported earnings when the companies enter phases in which it is critical that reported earnings look good.
- work in process** Inventory of a manufacturer that is partly processed and requires further work before it can be sold.
- working capital** Current assets less current liabilities; a measure of liquidity.
- zero-interest (deep-discount) bonds** Bonds that do not bear interest but instead are sold at significant discounts, providing the investor with a total interest payoff at maturity.
