About the Authors

Elizabeth A. Gordon, Ph.D., MBA, CPA

ELIZABETH A. GORDON IS ASSOCIATE PROFESSOR OF ACCOUNTING at the Fox School of Business at Temple University and a Merves Research Fellow. She received her doctorate from Columbia University, master's degree in business administration from Yale University, and bachelor's of science degree in accounting with highest distinction from Indiana University.

Dr. Gordon specializes in the areas of financial accounting and international financial reporting and investigates topics such as international financial reporting standards, corporate disclosure, executive compensation, related-party disclosures, and market development. Her research is published in top journals in her field including *Journal of Accounting Research*, *The Accounting Review*; *Review of Accounting Studies*, *Journal of Accounting, Auditing and Finance*; and *Journal of Accounting and Public Policy*. She serves as an editor of *Journal of International Financial Management and Accounting* and an associate editor of *Journal of International Accounting Research*. Dr. Gordon is a past president of the International Accounting Section of the American Accounting Association and serves as the vice president, finance and administration of the International Association for Accounting Education and Research.

Dr. Gordon has taught courses in financial accounting and international accounting at the graduate and undergraduate levels, receiving a number of teaching awards. She has coauthored accounting readings for the CFA Institute, integrating IFRS and U.S. GAAP. She was an auditor with PricewaterhouseCoopers, LLP, and interned at the U.S. Office of Management and Budget before entering academia. Dr. Gordon is a CPA in the State of Maryland. She has been on the faculty of the Graduate School of Business at the University of Chicago, the Rutgers Business School, and a visiting professor at the University of Pennsylvania.

Jana S. Raedy, Ph.D., CPA

JANA RAEDY IS ASSOCIATE PROFESSOR OF ACCOUNTING, associate dean of the Master of Accounting Program, and the Ernst & Young Scholar in Accounting at the Kenan-Flager Business School at the University of North Carolina at Chapel Hill. She received her bachelor of science and master of science degrees from the University of Kentucky and her doctorate from the Pennsylvania State University.

Dr. Raedy's research is primarily focused on issues in international financial reporting as well as areas in which financial reporting and taxation intersect. Her research is published in top journals such as *Journal of Accounting Research*, *Journal of Accounting and Economics*, *The Accounting Review*, *Contemporary Accounting Research*, and *Journal of the American Taxation Association*.

Dr. Raedy has taught a number of courses in financial reporting at the graduate level, including core financial reporting (both introductory and intermediate accounting), international financial reporting, and forensic accounting. For over 15 years, she has taught a self-developed course in applied financial accounting research with a heavy emphasis on judgment and decision making. During her academic career, she has received a number of different teaching awards. She currently is a team member of the Ernst & Young Academic Resource Center, which provides faculty nationwide with comprehensive teaching materials related to topics such as judgment, IFRS, and fair value.

Alexander J. Sannella, Ph.D., CPA

ALEXANDER J. SANNELLA IS CURRENTLY AN ASSOCIATE PROFESSOR of Accounting at the Rutgers Business School and is the Director of the MBA in Professional Accounting Program, Director of the Master of Accountancy in Professional Accounting and the Director of the Rutgers Business School Teaching Excellence Center. He earned a BBA in Finance and an MBA in Accounting from Iona College. He received his doctorate in accounting and finance from New York University and is a New York State Certified Public Accountant.

During his years at Rutgers Business School, Dr. Sannella has taught at both the graduate and undergraduate levels and served as Associate Dean of the Business School and Vice Chair of the Department of Accounting and Information Systems. Previously, Dr. Sannella served on the faculty of New York University as instructor of accounting at the Stern School of Business and as an Associate Professor of Accounting at Iona College's Hagan School of Business.

He has public accounting experience as an auditor for PricewaterhouseCoopers, LLP and KPMG, LLP. Dr. Sannella was also an independent consultant working on many projects with other public accounting firms, bankruptcy trustees, and leasing divisions of major insurance companies. He also served as a consultant to the Line of Business Program at the Federal Trade Commission in Washington.

Dr. Sannella has over 40 years of teaching experience at the university level and over 30 years of experience in developing and teaching commercial and investment bank training programs. His clients have included eight major investment banks and four of the world's largest commercial banks. His training programs include courses designed to train financial analysts and associates as well as special programs for sales and trading professionals.

The author of many scholarly journal articles and three books, Dr. Sannella's articles have focused on accounting education and market-based accounting research. His books focus on the effects of accounting alternatives on the judgment of analysts and other statement users. Many of the books' topics are included on training videos and CPE courses.

Dr. Sannella has been interviewed by several publications including the *Newark Star Ledger* and *NJ Biz*.

Contents

Preface xxvi

CHAPTER 1

The Financial Reporting Environment 1

Introduction 1

Overview of Financial Reporting 2

- Financial Information 2
- Economic Entity 3
- Financial Statement User Groups 4
- Other Parties Involved in the Preparation and Use of Financial Information 6
- Legal, Economic, Political, and Social Environment 6

Role of Standard Setters 8

- The Importance of Understanding International Accounting Standards 8

The Standard-Setting Process 9

- Standard Setting 9

IFRS Standard Setting 12

- History of Global Standard Setting: IFRS 12

Interview: Daniel J. Noll, AICPA 13

The Global Standard-Setting Structure: IFRS 14

Standard-Setting Process: IFRS 15

Standard Setting as a Political Process 15

Trends in Standard Setting 15

- Rules- versus Principles-Based Standards 16
- Asset/Liability Approach 17
- Fair Value Measurements 17

Summary by Learning Objectives 18

Questions 19

- Brief Exercises 20 • Exercises 21

CHAPTER 2

Financial Reporting Theory 23

Introduction 23

Overview of the Conceptual Framework 24

- Conceptual Framework Components 24

Interview: Paul Pacter, Former Member of IASB 26

Conceptual Framework: IFRS 27

The Objective of Financial Reporting 27

The Qualitative Characteristics of Financial Information 27

- Fundamental Characteristics 27
- Enhancing Characteristics 29
- Cost Constraint 30

Elements of Financial Reporting 30

- Elements 32

Elements: IFRS 34

Principles of Recognition and Measurement 36

- General Recognition Principles 36
- Revenue and Expense Recognition 37
- Bases of Measurement 38
- Recognition and Measurement: IFRS 40
- Cash versus Accrual Accounting 41

Assumptions in Financial Reporting 42

- Going Concern Concept 43
- Business or Economic Entity Concept 43
- Monetary Unit Assumption 43
- Periodicity Assumption 43

Assumptions in Financial Reporting: IFRS 43

Summary by Learning Objectives 44

Questions 47

- Brief Exercises 47 • Exercises 51

CHAPTER 3

Judgment and Applied Financial Accounting Research 55

Introduction 55

The Importance and Prevalence of Judgment in Financial Reporting 56

Judgment and the Accountant	56
Judgment: Use and Abuse	56
Judgment and Financial Statement Comparisons	56
The Role of Assumptions and Estimates	57
Assumptions and Estimates in the Financial Statements	57
Judgment-Related Disclosures	57
Key Judgment Areas in Practice	61
Judgment Obstacles in Preparing Financial Information	62
Factors Influencing Management Behavior	62
Cognitive Biases	63
Complexity of the Business Environment and Transactions	64
Authoritative Literature Used in Applied Financial Accounting Research	64
Authoritative Literature	64
Authoritative Literature: IFRS	67
Interview: Robert Herz, Chairman, FASB (Retired)	68
Basis for Conclusions	69
Steps in the Applied Financial Accounting Research Process	69
Step 1: Establish and Understand the Facts	69
Step 2: Identify the Issue: What is the Research Question?	69
Step 3: Search the Authoritative Literature	70
Step 4: Evaluate the Results of the Search	70
Step 5: Develop Conclusions	70
Step 6: Communicate the Results of the Research	70
Applying the Research Process	71
Summary by Learning Objectives	75
Questions	78
Brief Exercises	78 • Exercises 80
CASES	81
Judgment Cases	81 • Surfing the Standards Cases 83 • Basis for Conclusions Cases 83
Appendix A: Structure of U.S. GAAP Codification	85
Appendix B: IFRS Standards	88
CHAPTER 4	
Review of the Accounting Cycle	91
Introduction	91
The Accounting Cycle	92
Step 1: Analyze the Transaction	92
The Accounting Equation	92
Step 2: Journalize the Transactions	97
Accounts	98
Debits and Credits: A Review	99
Journal Entries	99
Step 3: Post to the General Ledger	101
The T-Account	104
Step 4: Prepare the Unadjusted Trial Balance	105
Step 5: Prepare Adjusting Journal Entries	106
Cash versus Accrual Bases of Accounting	106
Deferrals	106
Accruals	110
Step 6: Prepare the Adjusted Trial Balance	113
Step 7: Prepare Financial Statements	115
Step 8: Close Temporary Accounts	117
Step 9: Prepare Post-Closing Trial Balance	118
Comprehensive Example	119
Interview: John Foristall, ShoeBuy	135
Summary by Learning Objectives	136
Questions	140
Multiple-Choice Questions Becker Professional Education*	140 • Brief Exercises 142 • Exercises 144 • Problems 150
Appendix A: Alternative Treatment of Deferred Revenues and Expenses	159
Appendix B: Using a Worksheet	161
Appendix C: Reversing Entries	168
CHAPTER 5	
Statements of Net Income and Comprehensive Income	171
Introduction	171
Overview of the Income Statements	172
Income Statement Terminology	172
Reporting Income	173
THE CONCEPTUAL FRAMEWORK CONNECTION: Usefulness and Limitations of the Income Statements	173

Preface

New to This Edition

Coverage of the Latest Standards

Students need to begin understanding and applying standard changes to critical topics such as revenue recognition and leasing as early as possible in their college curriculum to be prepared for the CPA exam and practice when they graduate. With this in mind, key second edition updates include:

- Chapter 10 incorporates ASU 2015-11, which changes the measurement of the market value for lower-of-cost-or-market computations to net realizable value for all firms except those using LIFO or RIM.
- Chapter 14 incorporates ASU 2015-03, which changes the accounting method for debt issue costs under U.S. GAAP and converges U.S. GAAP with IFRS. Debt issue costs are now netted with the debt, thus changing the effective interest rate.
- Chapter 16 is significantly altered to incorporate ASU 2016-01, ASU 2016-13, and changes to IFRS 9. The principal impact of these standards is to the subsequent measurement of equity investments and the impairment of debt investments.
- Chapter 17 incorporates ASU 2015-17, which simplifies the presentation of deferred tax assets and liabilities on the balance sheet. The deferred tax accounts are now reported only as noncurrent assets and liabilities.
- Chapter 18 is a new chapter that incorporates the entirely new lease standards, ASU 2016-02, and IFRS 16.
- Chapter 19 incorporates ASU 2016-09, which allows companies the option of reporting actual forfeitures in addition to the current method of estimated forfeitures.

Solving Teaching and Learning Challenges

Our textbook is based on the belief that success in today's business environment requires an intuitive understanding of financial reporting and the ability to interpret and apply changing standards. In a world where there are simply too many rules to memorize, a traditional rules-based teaching approach has become inefficient and inadequate. Our goals for this textbook are aligned with the American Accounting Association's Pathways Commission, which seeks to correct misperceptions about the mechanical nature of accounting and to shift focus to the importance of critical thinking by accounting decision makers, particularly when the business context and related accounting rules require judgment.

We seek to develop the judgment and decision-making skills that accountants require to critically evaluate financial accounting methods and the financial statements. Using the conceptual framework fundamentals as a guide throughout, we emphasize solving accounting problems by applying standards, understanding how business activities are reflected in the financial statements, and critically evaluating the trade-offs and assumptions of accounting methods.

Coverage Grounded in the Conceptual Principles

To apply what they learn in the classroom to their professional lives, students need a solid grounding in the conceptual principles of financial reporting and the economic concepts underlying accounting. Thus, we open the textbook with coverage of these foundational topics, including the conceptual framework. In each chapter, sections called "The Conceptual Framework Connection" guide discussions and analyses by explicitly laying out the relevant conceptual underpinnings. For example, in the chapter on long-term operating assets, we discuss the capitalization decision.

Focus on Judgment, Decision Making, and Critical-Thinking Skills

Increasingly, the accounting profession and business world are looking for well-trained professionals with strong problem-solving and critical-thinking skills.

Judgment

To prepare students for future careers, we highlight the various *judgments* involved in all major topics in the context of real-business situations. For example, in Chapter 3, we discuss the factors that Activision Blizzard, a leading provider of interactive game services, considered when applying revenue recognition rules to its new technology and virtual goods. Our goal is to develop students' critical-thinking skills in assessing the assumptions, choices, and judgments that managers make when analyzing and reporting the business activities of a company. For example, many rules govern impairments, but ultimately, reporting comes down to judgment related to issues such as the expectation of future cash flows. Future career success depends on students' understanding the importance and prominence of the many judgments that inform a final set of financial statements.

Real-World Business

We pair our focus on real business situations with meaningful *real-company examples*. We examine financial statements from several high-profile firms—such as Johnson & Johnson, Netflix, Tesla, Amazon, Snap, Facebook, General Electric, Ericsson, Target, Adidas, Nike, Novartis, Coca-Cola, Pepsi Bottling Group, Starbucks, Walmart, and Ford Motor Company—in examples throughout the book.

In addition, our *Practitioner Interviews* feature question-and-answer-style exchanges with leaders in the field that provide insights into topics from a practitioner perspective and timely viewpoints on the business impact of rapidly evolving standards. Interviews profile executives at major firms—the Big Four accounting firms and name-brand companies such as Microsoft—as well as members of standard-setting boards.

Problem-Solving Skills

We emphasize problem solving within the chapters with *worked examples* accompanying every important concept. The consistent problem-solving methodology utilizes a problem/solution format and highlights the logic guiding the process, fostering students' ability to tackle problems on their own.

A variety of *end-of-chapter exercises* revolves around judgment and decision making. We include short problems and time-intensive cases that emphasize building students' ability to read and interpret authoritative accounting literature.

Highlighting Key Differences between U.S. GAAP and IFRS Standards

The book's central focus and grounding for each topic is U.S. GAAP. When IFRS diverges, we address the key conceptual differences in separate sections, often working through examples that parallel the GAAP coverage and providing tables with side-by-side comparisons of the GAAP and IFRS standards. With the aim of preparing students to apply the latest standards, we highlight key differences between IFRS and U.S. GAAP as pertinent. Our approach allows the instructor flexibility in IFRS topics covered and the depth of coverage. End-of-chapter summaries recap the main points for each section and contrast the U.S. GAAP and IFRS standards.

Presenting both sets of standards is important because the business world now operates in a global setting. Given the large number of multinational firms and foreign subsidiaries in the United States and the mobility of the workforce across international borders, students need to understand both IFRS and U.S. GAAP.

Reassessment of Coverage

We give fresh consideration to the necessary and proper content of an intermediate textbook. Due to changes in the business world and in the authoritative accounting literature, some topics may warrant less coverage while others have gained importance. This focused reconsideration of topical coverage will set students on a trajectory for success in their accounting careers and on the CPA exam.

We have chosen to reassess coverage of topics based primarily on five criteria: (1) The topic is repeated elsewhere in the normal accounting curriculum, (2) the topic is industry specific, (3) the topic covers transactions/events that rarely occur, (4) the particular accounting method is not typically allowed under U.S. GAAP or IFRS, and (5) the topic covers transactions/events that do not commonly occur and the accounting treatment of the transaction is rule intensive.

By reassessing the coverage, we have made room for a number of topics not typically included in texts that have gained importance in the field (for example, tax contingencies, and revaluations of long-term operating assets under IFRS).

Get Students Ready . . .

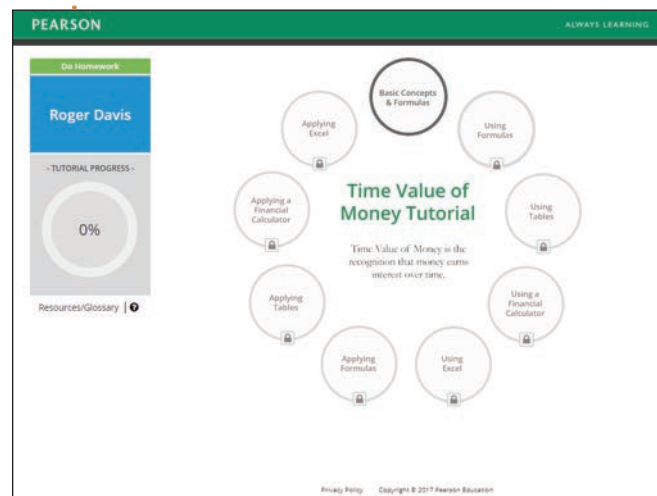

Accounting Cycle Tutorial

Accessed through MyLab Accounting by computer, smartphone, or tablet, the Accounting Cycle Tutorial provides a refresher on the basics so students are ready for intermediate-level work. This updated version includes a new comprehensive problem.

Time Value of Money Tutorial

The Time Value of Money Tutorial in MyLab ensures that students understand the basic theory and formulas of the TVM while helping test their ability to *apply* the TVM in the measurement of financial statement items. Students work through two sections. The first is to help them understand the theory using whichever method the instructor chooses (manually, through Excel, with tables, or via a calculator), and the second is to give students the opportunity to apply the theory by giving them a number of scenarios regarding each financial statement.

Worked Problem Videos

Worked Problem Videos provide step-by-step explanations of problems similar to those students will encounter in the text, helping them to understand how to arrive at the correct answers themselves.

Concept Overview Videos

Concept Overview Videos are short videos focusing on key concepts available in MyLab Accounting to further emphasize major concepts. These videos can be assigned as homework or used as part of a flipped classroom strategy.

To Be Decision Makers . . .

Conceptual Framework Connections

Each chapter guides students through discussions and analysis with a solid grounding in the conceptual framework fundamentals of reporting relevant, useful, timely, and understandable financial information.

Emphasis on Judgment and Decision Making

Sections in each chapter identify key management decision points, and a unique full chapter dedicated to judgment and research identifies the assumptions, choices, and financial statement impacts from reporting business activities.

THE CONCEPTUAL FRAMEWORK CONNECTION: Usefulness and Limitations of the Income Statements

The income statements provide useful information to financial statement users in three ways:

- Evaluate past performance.** Income statements enable financial statement users to evaluate the entity's past performance. By disclosing separate components of revenues and expenses, income statements provide useful information about the entity's overall past performance (i.e., the earnings) and identify the main factors that influence performance. Income statements provide confirmatory value, which is an aspect of relevant information. For example, investors are interested in whether companies meet or beat analysts' forecasts of net income as indicated by the statement of net income.
- Predict future performance.** Income statements have predictive value because they provide a basis for estimating future performance. Predictive value is an aspect of relevance. For example, a firm with a trend of earnings growth over the last 10 years may continue that growth in the future.
- Assess risks or uncertainties of achieving future cash flows.** Income statements provide information that is useful in assessing the risks or uncertainties of achieving future cash flows. Some items of income are more persistent in nature than others, making them strong indicators of future cash flows. For example, revenue from normal sales tends to persist from year to year. However, a gain from the sale of a specialized piece of equipment is

JUDGMENTS IN ACCOUNTING Inventory Costs

Judgment is crucial in determining the initial measurement of inventory. Deciding what costs to include in inventory is often subjective, as indicated by the Codification's statement that "although principles for the determination of inventory costs may be easily stated, their application . . . is difficult because of the variety of considerations in the allocation of costs and charges."⁶ As a simple example, consider the requirement that companies capitalize freight-in costs into the inventory account whereas abnormal freight must be expensed. Deciding what freight cost is normal versus what is abnormal requires subjective judgment. For example, if an auto dealer pays freight for a shipment of vehicles delivered from the factory, it is a normal part of the dealer's business operations. In this case, the freight is considered part of the cost of inventory because it was reasonable and necessary to have the inventory in place and ready for sale. However, if sales begin to slow down and the dealer holds too much inventory, this inventory may have to be shipped to alternate locations. This additional freight may be considered abnormal and expensed because it is not a reasonable and necessary cost and does not represent a part of inventory value.

The decision to use the gross or net method of recording purchase discounts also affects the balance in the inventory account. In Example 10.4, the final balance in the inventory account is \$4,960 using the gross method and \$4,900 using the net method for the same three transactions. Thus, the inventory balance is impacted by management's choice of the method to account for the discount.

Worked Examples

Bolster students' problem-solving skills with model problem solutions for every important concept.

EXAMPLE 15.4 Common Stock Issue Costs

PROBLEM: Piper Products decided to raise additional financing by issuing common stock. The company received \$4,000 in exchange for 1,000 shares of \$1 par value common stock. Piper paid an underwriter \$200 in stock issue costs. What is the necessary journal entry to record this transaction?

SOLUTION: The \$200 of issue costs reduces Piper's cash received from the sale of the stock. Thus, it records the cash received at the net amount of \$3,800, which is the \$4,000 total proceeds less the \$200 stock issue costs. The issue costs also reduce the additional paid-in capital in excess of par—common by \$200. The journal entry follows.

Account	Current Year	
Cash	3,800	
Common Stock – \$1 par		1,000
Additional Paid-in Capital in Excess of Par – Common		2,800

To Think Like Accountants . . .

Focus on Real-Company Financials

Disclosures and statements from well-known companies provide a connection to the application of accounting concepts and financial statement analysis.

EXHIBIT 10.11 Inventory Disclosures, *Foot Locker, Inc.*, Financial Statements, January 28, 2017

From Financial Statement Notes:

NOTE 1: Summary of Significant Accounting Policies

Merchandise Inventories and Cost of Sales

Merchandise inventories for the Company's Athletic Stores are valued at the lower of cost or market using the retail inventory method. Cost for retail stores is determined on the last-in, first-out ("LIFO") basis for domestic inventories and on the first-in, first-out ("FIFO") basis for international inventories. Merchandise inventories of the Direct-to-Customers business are valued at the lower of cost or market using weighted-average cost, which approximates FIFO.

The retail inventory method is commonly used by retail companies to calculate gross margins due to its practicality. Under the retail inventory method, a cost-to-retail percentage is applied to ending inventory at its current own cost of ending inventory on a department basis. The Company providing prices when the inventory has not been marked down to market.

NOTE 5: Merchandise Inventories

	2016	2015
	(in millions)	
LIFO inventories	\$ 861	\$ 847
FIFO inventories	446	438
Total merchandise inventories	<u>\$1,307</u>	<u>\$1,285</u>

The value of the Company's LIFO inventories, as calculated on a LIFO calculated on a FIFO basis.

Source: Foot Locker, Inc. January 28, 2017 Financial Statement. <https://www.data/850209/000085020917000003/11-20170128x10k.htm>, pages 44 and 52.

Inventory Disclosures: IFRS. IFRS inventory disclosures under U.S. GAAP. Additionally, IFRS requires firms to report

Classification of Dividends, Interest, and Taxes: IFRS

IFRS differs from U.S. GAAP in the classification of the following items:

1. Cash receipts from interest and dividends
2. Cash payments for taxes
3. Cash payments for interest
4. Cash payments for dividends

As shown in Exhibit 6.8, U.S. GAAP requires companies to report the preceding items in operating cash flows except for the payment of dividends. IFRS grants companies discretion in classifying these items as operating, investing, or financing activities as Exhibit 6.8 illustrates.

EXHIBIT 6.8 Classification of Dividends, Interest, and Taxes

Activities	Standard	
	U.S. GAAP	IFRS
Cash receipts from interest and dividends	Operating	Operating or Investing
Cash payments for taxes	Operating	Operating activities, unless they can be specifically identified with Financing or Investing activities.
Cash payments for interest	Operating	Operating or Financing
Cash payments for dividends to owners	Financing	Operating or Financing

Key IFRS Differences

To prepare students for the global business world, IFRS material is highlighted in separate chapter sections. Side-by-side comparisons of GAAP and IFRS standards focus students on the key differences.

Interviews

Question-and-answer style exchanges with leaders in the field provide insight on topics from both standard-setter and practitioner perspectives and timely viewpoints on changing standards. Assign the new discussion questions to challenge students' understanding and critical-thinking skills.

Interview

BARBARA J. WIGHT
CHIEF FINANCIAL OFFICER
TAYLOR GUITARS »

Barbara J. Wight

Barbara Wight is Chief Financial Officer at Taylor Guitars, an industry-leading guitar manufacturer whose instruments are played by leading musicians worldwide. She directs all financial, information technology, and legal affairs on behalf of the company and oversees various aspects of operations management, multinational manufacturing, acquisitions, and international compliance.

material market deliveries, it might want to use LIFO for materials subject to inflation and FIFO for materials whose pricing is stable or even in decline.

3 Describe the most common components included in the unit cost of inventory at Taylor.

Taylor states inventories at standard cost based on the expected raw material costs, labor, and overhead. Our primary raw material is wood.

At the beginning of each year, Taylor determines how many total labor hours it will need to build the forecasted number of guitars and allocates overhead (and labor) to each guitar based on the calculated overhead and labor rate. The overhead rate times the number of labor hours per guitar equals overhead applied to each guitar unit. Taylor drives production based on a hybrid model; we build to order and to a sales forecast of specific models to ensure that high-turnover models are in stock at all times.

4 What are the most significant judgments employed in the decision to write inventory down to market when applying the lower-of-cost-or-market rule?

From the First Day of Class and into Their Careers

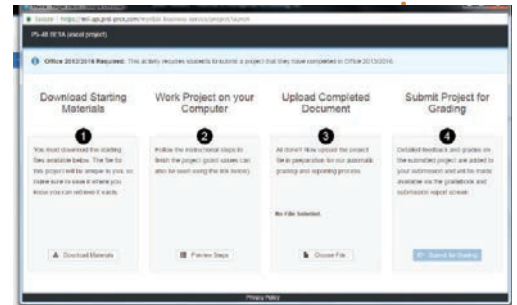

Auto-Graded Excel Projects

Using proven, field-tested technology, MyLab Accounting’s new auto-graded Excel Projects allow instructors to seamlessly integrate Excel content into their course without having to manually grade spreadsheets. Students have the opportunity to practice important accounting skills in Microsoft Excel, helping them to master key concepts and gain proficiency with Excel. Students simply download a spreadsheet, work live on an accounting problem in Excel, and then upload that file back into MyLab Accounting where they receive reports on their work that provide personalized, detailed feedback to pinpoint where they went wrong on any step of the problem.

Becker

Sample problems assignable in MyLab Accounting provide an introduction to the CPA Exam format and an opportunity for early practice with CPA exam style questions.

In partnership with **BECKER** PROFESSIONAL EDUCATION™

Becker CPA Exam Review multiple-choice questions are available in MyLab Accounting.

1 MC9-1. The following are held by YRT Corporation at December 31, Year 1:

Cash in checking account	\$15,000
Petty cash	250
Check from customer dated 01/31/Year 2	350
3-month certificate of deposit, due 01/15/Year 2	40,000
12-month certificate of deposit, due 02/28/Year 2	36,000
Cash in bond sinking fund account	60,000

YRT Corporation classifies investments with original maturities of three months or less as cash equivalents. In its December 31, Year 1, balance sheet, what amount should YRT Corporation report as cash and cash equivalents?

a. \$ 15,250 b. \$ 55,250 c. \$ 55,600 d. \$ 151,250

3/4 MC9-2. Fernandez Company had an accounts receivable balance of \$150,000 on December 31, Year 2, and \$175,000 on December 31, Year 3. The company wrote off \$40,000 of accounts receivable during Year 3. Sales for Year 3 totaled \$600,000, and all sales were on account. The amount collected from customers on accounts receivable during Year 3 was:

a. \$575,000 b. \$531,000 c. \$600,000 d. \$535,000

High-Quality and High-Quantity End-of-Chapter Exercises

Keyed to learning objectives, the items here progress in difficulty to test student understanding from the conceptual to multi-concept applied level.

Case exercises build students’ ability to apply judgment-based analysis, read and interpret accounting literature, and analyze financial statements.

Problems

3/4 P7-1. **Present Value of an Ordinary Annuity, Future Value of an Ordinary Annuity.** FA Manufacturers must make several investment decisions related to its business operations. Interest is compounded annually. Analyze the following independent situations to help FA make a profitable investment.

a. FA Manufacturers reported a \$150,000 debt that matures in eight years. In order to accumulate sufficient funds to pay for the debt, the company decided to make eight equal annual payments into a fund paying 5% interest. What amount must FA Manufacturers deposit into the fund at the end of each year so that the company will be able to liquidate its debt?

b. On January 1, 2019, FA Manufacturers decided to purchase a piece of heavy machinery. FA agreed to pay \$50,000 on the date of purchase and would like to pay the remaining balance with six annual installments of \$20,000 commencing at the end of the first year. How much should FA Manufacturers give to the machinery?

c. FA purchased a new machine and will depreciate it over five years. The machine will be used for five years. Payments start in one year. Given a discount rate of 10%, what is the maximum amount FA Manufacturers should pay for the machine?

2/4 P7-2. **Present Value, Present Value of an Ordinary Annuity.** The CFO of First Things Computing, Inc. (FTC) is evaluating two alternative trucks on the market. Boyne’s two alternative

Noncurrent Assets:	
Investments	\$ 15,000
Property, Plant, and Equipment	
Land	20,000

Instructor Teaching Resources

This program comes with the following teaching resources.

Supplements Available to Instructors at www.pearsonhighered.com/gordon	Supplement Features
Instructor's Manual	Course Content
Created in collaboration with Mary Cline from Rock Valley College Regan Garey from Lock Haven University	<ul style="list-style-type: none"> • Tips for Taking Your Course from Traditional to Hybrid, Blended, or Online • Standard Syllabi for Intermediate Accounting–2-semester course • Standard Syllabi for Intermediate Accounting–3-semester course • “First Day of Class” student handouts include <ul style="list-style-type: none"> • Student Walk-Through to Set Up MAL • Tips on How to Get an A in This Class
	Chapter Content
	<ul style="list-style-type: none"> • Chapter Overview contains a brief synopsis and overview of each chapter. • Learning Objectives • Teaching Outline with Lecture Notes walks instructors through what material to cover and what examples to use when addressing certain items within the chapter. • IFRS Breakaways outline when IFRS diverges and addresses the key conceptual differences in these separate sections. • Student Supplement to Teaching Outline can be printed for (or emailed to) students. This outline will aid students in following the class and taking notes. • Assignment Grid indicates for each question, exercise, and problem the corresponding learning objective, the estimated completion time, and availability of Final Answer Questions and Worked Solutions in MyLab Accounting. • Suggestions for Class Activities are organized by learning objectives, allowing instructors to choose activities that fit with each day's discussions. • Model answers to Interview Discussion Questions • Guidance on Incorporating IFRS Material offers instructors direction on how to discuss the IFRS with their students.
Solutions Manual	
Created by the textbook authors	Contains solutions to all end-of-chapter questions, including short exercises, exercises, and problems

Supplements Available to Instructors at www.pearsonhighered.com/gordon	Supplement Features
Test Bank	Question Types
<p>Created in collaboration with</p> <p>Michael P. Griffin from University of Massachusetts Dartmouth</p> <p>Kate Demarest from Carroll Community College</p>	<p>True/False and multiple-choice questions, essays, and problems make up more than 2,500 questions in this test bank. Most question types consist of both conceptual and computational problems, to ensure that students understand both the theory and the application. The Algorithmic test bank is available in MyLab Accounting. Most computational questions are formulated with an algorithm so that the same question is available with unique values. This offers instructors a greater pool of questions to select from and will help ensure that each student has a different test.</p> <p>All questions include the following annotations:</p> <ul style="list-style-type: none"> • Difficulty level (1 for straight recall, 2 for some analysis, 3 for complex analysis) • Type (multiple-choice and true/false questions, short-answer, essays, and problems) • IFRS/GAAP indicator • Learning Objective reference • AACSB learning standard (Ethical Understanding and Reasoning; Analytical Thinking Skills; Information Technology; Diverse and Multicultural Work; Reflective Thinking; Application of Knowledge)
Computerized TestGen	
	<p>TestGen allows instructors to:</p> <ul style="list-style-type: none"> • Customize, save, and generate classroom tests. • Edit, add, or delete questions from the Test Item Files. • Analyze test results. • Organize a database of tests and student results.
PowerPoints	
<p>Created in collaboration with</p> <p>Alisa Brink from Virginia Commonwealth University</p>	<p><i>Instructor PowerPoint Presentations</i> mirror the organization of the text and include key exhibits, worked examples, and lecture notes. Instructors can download PowerPoint presentations that best match their teaching style.</p> <ul style="list-style-type: none"> • <i>Lecture Support Only</i> presentations consist of the chapter outline mirroring the text and include all main headings, key terms, key figures, and key tables. • <i>Worked Examples Only</i> presentations consist of selected worked examples from the text for use as in-class demonstration problems. • <i>Combined</i> presentations consist of both the lecture support and the examples organized to correspond to the text. <p>Modifying supplied PowerPoint presentations to correspond with classes can be a time-consuming task. To aid in this task, instructors can download a table of contents of the PowerPoint presentations. These documents will list the slide numbers for chapter content for quick removal of content that will not be covered in class.</p> <p><i>Student PowerPoint Presentations</i> are abridged versions of the <i>Instructor PowerPoint Presentations</i> and can be used as a study tool or note-taking tool for students.</p> <p>The <i>Image Library</i> contains all image files from the text to assist instructors in modifying our supplied PowerPoint presentations or in creating their own PowerPoint presentations.</p>

Reach Every Student with MyLab Accounting

MyLab Accounting is the teaching and learning platform that empowers you to reach every student. By combining trusted author content with digital tools and a flexible platform, MyLab personalizes the learning experience and improves results for each student.

Deliver Trusted Content

You deserve teaching materials that meet your own high standards for your course. That's why we partner with highly respected authors to develop interactive content and course-specific resources that you can trust—and that keep your students engaged.

Empower Each Learner

Each student learns at a different pace. Personalized learning pinpoints the precise areas where each student needs practice, giving all students the support they need—when and where they need it—to be successful.

Teach Your Course Your Way

Your course is unique. So whether you'd like to build your own assignments, teach multiple sections, or set prerequisites, MyLab Accounting gives you the flexibility to easily create your course to fit your needs.

Improve Student Results

When you teach with MyLab, student performance improves. That's why instructors have chosen MyLab for over 20 years, touching the lives of over 50 million students.

When you choose Becker Professional Education to help prepare you to pass the new CPA Exam, you gain access to a fully integrated CPA Exam Review course.

Make better use of your study time

Specially designed Adapt2U pre-assessment provides a recommended study path. Plus, short lectures fit your busy schedule.

Make the process easier

Now taking notes, highlighting text, searching for key words and controlling video speed are more intuitive.

Track your progress

Study planner and progress tests track performance, so you can focus on where you need the most help while building your confidence.

Choose from 3 flexible course formats

Online, LiveOnline or Live classroom format with nearly 200 locations worldwide; plus, every format offers the same course materials.

Develop higher-order skills thinking

Interactive simulations and videos move you from memorization to conceptual thinking - essential for the new CPA Exam.

Our **NEW LiveOnline format** is for you if you prefer to learn in the comfort of your home but thrive on a structured schedule with real-time access to engaging and knowledgeable instructors.

Learn what's needed

Course materials relevant to the exam are regularly updated, so you have the most up-to-date content.

1

The Financial Reporting Environment

LEARNING OBJECTIVES

- 1 Define financial accounting and describe the demand for financial information, including the role of general-purpose financial statements, the information needs of financial statement users and other parties, and the factors that influence financial reporting.
- 2 Discuss the role of financial accounting standard setters in the United States and internationally.
- 3 Detail the standard-setting process.
- 4 Explain three recent trends in standard setting: principles-based, rules-based, and objectives-oriented standards; the asset/liability approach; and fair value measurements.

Introduction

WELL-DEVELOPED ACCOUNTING STANDARDS ENABLE WORLDWIDE capital markets to function effectively by providing credibility to published financial information used by investors, creditors, and others. Transparent financial information included in the financial statements

allows these parties to make rational investment and credit decisions that direct capital to corporations that develop new products and technology, create employment, and encourage growth and development.

Consider *Twitter, Inc.*, the social networking company, which raised capital of over \$2.09 billion by issuing 80.5 million shares of stock in its initial public offering. Investors subsequently traded over 194 million shares of *Twitter's* stock valued at \$8.2 billion during the first month after the initial public offering.¹ These investors based their decisions on the financial information provided by *Twitter*. The capital provided by such investments fuels the overall economy and directs capital to its most productive uses.

Multiple factors in the overall accounting environment influence economic decisions at the firm level. For example, user groups such as investors and creditors impact the demand for accounting information and influence the standard-setting bodies. Financial reporting encompasses much more than the financial statements: Other key elements include the footnotes to the financial statements, the letter to the owners, management's discussion and analysis, the auditors' report, the management report, and press releases. Financial statement users rely on all categories of financial information to make rational economic decisions.

In this chapter, we first define *financial accounting* and discuss the demand and supply of financial information. We identify the economic entities that prepare financial information as well as the users of financial information. We then explore factors that shape accounting information. We also overview the historical development of the U.S. and international standard-setting bodies and discuss the standard-setting processes. We conclude the chapter with a review of recent trends in standard setting. «

Andrew Burton/Getty Images

¹Twitter, Inc. is traded on the New York Stock Exchange. It made its initial public offering on November 7, 2013.

- 1 Define financial accounting and describe the demand for financial information, including the role of general-purpose financial statements, the information needs of financial statement users and other parties, and the factors that influence financial reporting.

Overview of Financial Reporting

Financial accounting is the process of identifying, measuring, and communicating financial information about an economic entity to various user groups within the legal, economic, political, and social environment. This definition contains four major elements:

1. Financial information
2. Economic entity
3. User groups
4. Legal, economic, political, and social environment

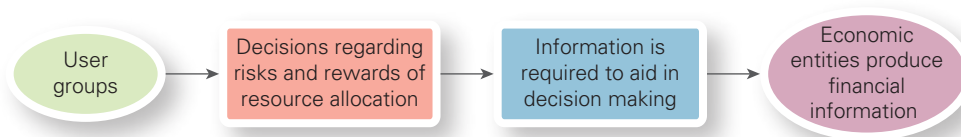

We will examine these elements in the following sections of the chapter.

Financial Information

Financial information falls into two categories: information that is or that is not governed by rules set forth by the accounting standard-setting bodies. Firms prepare the financial statements and the footnotes to the financial statements (also referred to as footnote disclosures) based on accounting standard setters' rules. In contrast, the letter to the owners, management's discussion and analysis, the auditors' report, the management report, and press releases are not governed by the accounting standard-setting bodies, although they are regulated to some degree by other authoritative bodies.²

Demand for Financial Information. The form, content, and extent that firms provide financial information is based on market participant demand. Financial accounting provides information that enables users to evaluate economic entities and make efficient resource allocation decisions based on the risks and returns of a particular investment. This process directs capital flows to their most productive uses. In this way, the demand for financial information is linked to the allocation of scarce resources, as illustrated in Exhibit 1.1.

EXHIBIT 1.1 Demand for Financial Information

Capital is a scarce resource. How do investors and creditors make decisions regarding the amount of capital to invest in a given entity? Accountants report the economic performance and financial position of the firm so that potential debt and equity investors can adequately assess the risks and returns of investing in the entity. Similarly, lenders can use the financial statements to assess the potential for payment. For example, a bank limited in the number of loans that it can make would clearly prefer to lend to a business that has been profitable over the last five years rather than one that has not.

Transparent and complete financial statements aid investors in assessing the amounts and timing of future cash flows, as well as the uncertainty of cash flow realization. However, financial statement users should be aware that performance-based compensation can create an incentive for managers to strategically manage—or to misreport—financial statements. Compensating managers based upon reported net income provides a financial incentive to inflate net income. For example, when the Securities and Exchange Commission found that the *Computer Sciences Corporation (CSC)* committed accounting fraud that increased net earnings in 2010 and 2011,

²For a discussion of the financial statements and many of these other items, see Chapters 5 and 6.

CSC's CEO agreed to pay back \$3.7 million of compensation he received based on the fraudulent earnings.³ Financial accounting standards seek to limit this type of management behavior. Most managers faithfully report their financial statements, but it is important for standard setters and auditors to be aware of incentives to alter net income.

Sources of Financial Information. The financial reporting process generates a significant amount of financial information that yields the four basic financial statements, as well as the footnote disclosures. In the chapters that follow, we examine the theory, rationale, and principles underlying the four basic financial statements:

- The balance sheet (also referred to as the statement of financial position)
- The statement of comprehensive income⁴
- The statement of cash flows
- The statement of shareholders' equity

Published financial statements are called **general-purpose financial statements** because they provide information to a wide spectrum of user groups: investors, creditors, financial analysts, customers, employees, competitors, suppliers, unions, and government agencies. Although considered general purpose, most financial information is provided to satisfy users with limited ability or authority to obtain additional information, which includes investors and creditors. The **Financial Accounting Standards Board (FASB)**, which is the body responsible for promulgating U.S. GAAP, identifies investors, lenders, and other creditors as the primary users of the financial statements.

Financial statements are the culmination of the financial reporting process. These financial statements, along with the accompanying footnote disclosures, are the primary source of publicly available financial information for investors and creditors. None of the other sources of financial information—such as management forecasts, press releases, and regulatory reports—provide as much information as the financial statements.

The term financial information includes more information than the financial statements. The financial statements include the four basic financial statements and the related footnotes. However, financial information also includes items such as:

- A letter to the shareholders
- A formal discussion and analysis of the firm by the management of the firm
- Management report
- Auditors' report
- Financial summary

Therefore, the general-purpose financial statements and the related footnotes are subsets of financial information. The financial statements and the footnotes are governed by U.S. GAAP, which may not always be the case for all components of financial information.⁵

Economic Entity

The second element in the definition of financial accounting involves the *economic entity* for which the financial statements and other financial information are presented. An **economic entity** is an organization or unit with activities that are separate from those of its owners and other entities. Financial information always relates to a particular economic entity. Economic entities can be corporations, partnerships, sole proprietorships, or governmental organizations. Also, economic

³<https://www.sec.gov/news/pressrelease/2015-111.html>

⁴Entities may report comprehensive income either in one combined statement or in two statements—the statement of net income and the statement of comprehensive income.

⁵We discuss these other types of financial information more extensively in Chapter 6.

entities may be privately held or publicly held.⁶ If the entity is publicly held, then its equity can be bought and sold by external parties on stock exchanges.

The management of a particular economic entity prepares its financial information, including the financial statements. While the management of the entity may also use the financial information to some extent, they are better classified as preparers than users of financial information.⁷

Financial Statement User Groups

The third element in the financial accounting definition involves identifying the primary user groups that demand financial information. Some users employ accounting information to make economic decisions for their own benefit while other users employ accounting information to make economic decisions for the benefit of others or to assist others in making investment or credit decisions. Exhibit 1.2 lists the user groups.

EXHIBIT 1.2 User Groups

Users	Description
Equity Investors	Shareholders of the company
Creditors and Other Debt Investors	Entities including banks and other financial institutions that lend money to the company either through a private agreement or through a public debt offering
Competitors	Companies that produce the same service or product
Financial Analysts	Individuals employed at investment banks, commercial banks, and brokerage houses that use financial information to provide guidance to individuals and other entities in making investment and credit decisions
Employees and Labor Unions	Individuals that work for the company and the organizations that represent the employees' interests
Suppliers and Customers	Organizations that provide the necessary inputs for the products or services produced by the entity and companies or individuals that purchase the goods or services from the entity
Government Agencies	Agencies representing the government that are in charge of reviewing and/or regulating the company

Equity Investors. Equity investors are the shareholders of the company. That is, an equity investor purchases a percentage ownership of the company. Equity investors include individuals, other corporations, partnerships, mutual funds, pension plans, and other financial institutions that expect to receive a return on their investment either through dividends (i.e., distributions of cash or other assets to owners) or in the form of an increase in the price of their equity shares.

Equity investors use financial information to determine a company's ability to generate earnings and cash flow, as well as to make an assessment of the potential risks and returns of their investments. Equity investors also use financial information to assess the ability of the entity to pay dividends and to grow over time. Firm growth in earnings and cash flow are important for the investor to sell his or her investment at a gain.

⁶In this text book, we focus primarily on publicly traded entities. We use examples from the financial statements issued by manufacturing, retail, and service entities. We will not focus on financial statements from specialized industries such as insurance, banking, and other regulated industries.

⁷Managers of economic entities use accounting information for internal decision making as detailed in cost and managerial accounting courses.

Creditors and Other Debt Investors. Creditors and other debt investors are entities, including banks and other financial institutions, that lend money to the company. Debt can either be public or privately held. In the case of publicly traded debt, market participants invest in the entity's debt—specifically, the entity's bonds. In the case of privately held debt, companies obtain capital directly from lenders, such as commercial banks. Creditors typically receive a return on their investment in the form of interest income. However, in the case of public debt, they may also receive a return in the form of an increase in the price of the bonds.

Creditors use financial information to determine whether the principal and interest on their loans will likely be paid by debtors when due. Creditors are also concerned with the priority of claims against the assets of the debtor company. Some lenders have priority over others when determining the order of repayment. Finally, creditors can use financial information to assess the entity's current and future profitability and growth prospects.

Competitors. Competitors use financial information to determine their market position relative to the reporting entity. Companies analyze a competitor's financial information to identify its strategy and determine if it is possible to successfully compete with the company. An analysis of a competitor's financial information enables a financial statement user to identify that entity's objectives, assumptions, overall business strategy, and capabilities. For example, a pharmaceutical company would be interested in any increases in a rival's research and development expenses that could indicate new and competing products in the future.

Financial Analysts. Financial analysts employed at investment banks, commercial banks, and brokerage houses use financial information to provide guidance to individuals and other entities in making investment and credit decisions. Analysts use various techniques to estimate the value of an entity based on information obtained from the annual report and other publicly available information, as well as from interviews with company officers and outside industry or economic experts. Some financial analysts are equity analysts who follow an industry or certain companies and provide their opinions or recommendations on a regular basis. These reports result in a recommendation as to whether investors should buy or sell the stock of that company. For example, in the first quarter of 2017, there were 39 analyst recommendations issued for *Twitter*—4 of which were buys, 27 were holds, and 8 were sells or underperforms.⁸ Financial analysts act as market intermediaries in that they are trained to examine an extensive volume of financial data and reduce it to a manageable amount of information for use by investors.

Employees and Labor Unions. Employees and labor unions use financial statements to assess the economic performance and liquidity of entities employing members of the union. For example, the United Auto Workers represents employees in the automobile industry. Financial statement information can be useful during the negotiation of new labor agreements and compensation contracts.

Suppliers and Customers. Suppliers and customers use financial statements to determine a company's financial position. For suppliers, it is critically important to assess the company's ability to pay for goods and services provided. A company's financial condition indicates the quality of its products and its ability to honor warranties to potential customers. *General Motors (GM)* lost many prospective customers when it was in bankruptcy during the economic crisis of 2008. In this case, auto buyers were concerned that *GM* would not be in business long enough to fulfill its warranty obligation to its customers.

Government Agencies. Government agencies review the financial statements of publicly traded companies for a variety of reasons. For example, the U.S. Federal Trade Commission may review publicly available financial information to identify a potential monopoly or an entity in violation of antitrust laws.

⁸See <http://www.nasdaq.com/symbol/twtr/recommendations>

Other Parties Involved in the Preparation and Use of Financial Information

Another important group involved in the financial reporting process is the *preparers* themselves. **Financial statement preparers** are the companies that issue the financial statements.

In addition to preparers and users of the financial statements, other parties involved in the financial reporting process include:

- Auditors
- Accounting standard setters such as the Financial Accounting Standards Board and the *International Accounting Standards Board*
- Regulatory bodies such as the Securities and Exchange Commission and the Public Company Accounting Oversight Board
- Professional organizations such as the American Institute of Certified Public Accountants

Auditors can be *external* or *internal*. **External auditors** are independent of the company and are responsible for ensuring that management prepares and issues financial statements that comply with accounting standards and fairly present the financial position and economic performance of the company. Because external auditors are independent parties, they lend a significant amount of credibility to the financial statements. **Internal auditors** are employees of the company serving in an advisory role to management and providing information regarding the company's operations and proper functioning of its internal controls.

Accounting standard setters develop and promulgate accounting concepts, rules, and guidelines that provide information that is relevant and faithfully represents the economic performance and the financial position of the reporting entity. The Financial Accounting Standards Board (FASB), the primary standard setter in the United States, promulgates U.S. Generally Accepted Accounting Principles (U.S. GAAP). The **International Accounting Standards Board (IASB)** sets International Financial Reporting Standards (IFRS). We discuss the standard setters' role and the standard-setting process in more depth later in the chapter.

Regulatory bodies protect investors and oversee the accounting standard-setting process. In the United States, the U.S. Securities and Exchange Commission (SEC) regulates publicly traded companies.⁹ Privately held companies are not required to comply with the SEC's regulations. The SEC gives the FASB the authority to issue U.S. GAAP. In addition, the SEC reviews the filings of public companies in the United States. The Public Company Accounting Oversight Board (PCAOB) sets auditing standards and oversees the audits of public companies in the United States.

Professional organizations such as the American Institute of Certified Public Accountants (AICPA) are also involved in the financial reporting process. The AICPA is the national professional association for Certified Public Accountants (CPAs) in the United States. The AICPA prepares and grades the Uniform CPA Examination. This organization also supports accounting professionals throughout their careers by providing training, professional skills development, and other resources.

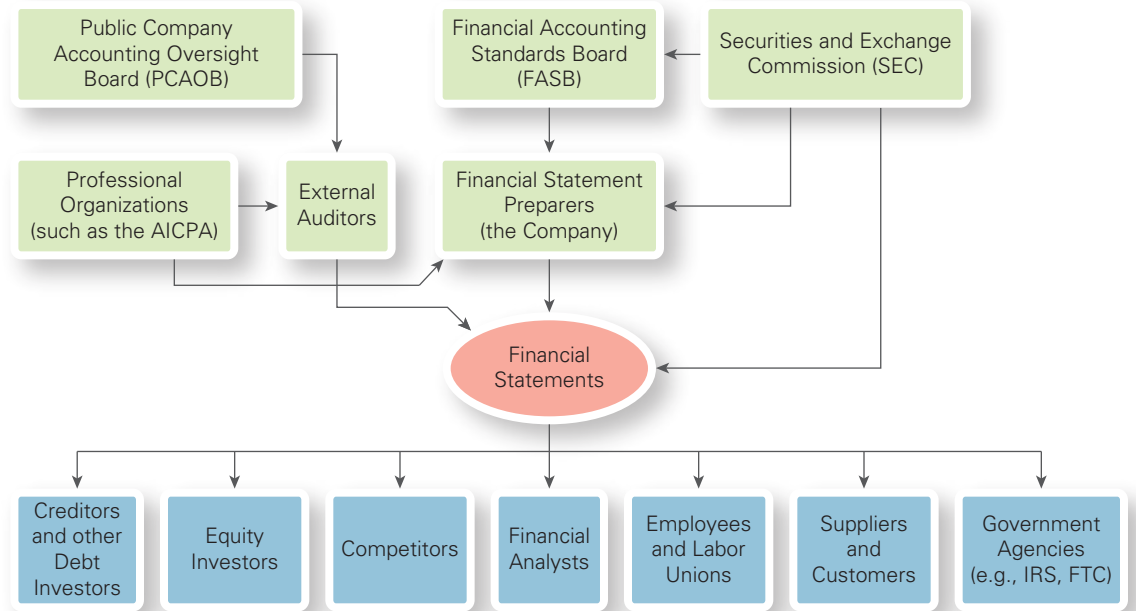

Exhibit 1.3 summarizes the various groups involved in the financial reporting process.

Legal, Economic, Political, and Social Environment

Financial reporting takes place in a complex and dynamic world: Financial statement users' information needs change as business evolves. So, it is natural that environmental factors—legal, economic, political, and social—shape and influence the financial reporting process. The environment is the fourth element of the financial accounting definition. Financial accounting interacts with its environment in both a reactive and a proactive fashion.

Reactive Factors. Financial accounting reacts to pressure (lobbying) from various groups and changes in its environment. Accounting theories and procedures evolve to meet the dynamic changes and demands from the environment. For example, FASB made changes in the accounting

⁹A company is regulated by the SEC if it has either debt or equity that is publicly traded.

EXHIBIT 1.3 Parties Involved in the Financial Reporting Process in the United States

for off-balance sheet subsidiaries following the discovery of the massive fraud scheme at *Enron* in the early 2000s.

In addition, accounting conforms to economic conditions, legal standards, and social values. Today, accounting disclosures highlight a company's policies regarding pollution control, community service, and diversity in business. For example, in the letter to shareholders in *Johnson & Johnson's* 2015 annual report, CEO Alex Gorsky highlighted *Johnson & Johnson's* "legacy of caring through strategic partnerships," as shown in Exhibit 1.4.

EXHIBIT 1.4 *Johnson & Johnson Company's* 2015 Letter to the Shareholders Discussion of Corporate Philanthropy

We understand the important role Johnson & Johnson plays in the world, and we continue to build on our 130-year legacy of caring through strategic philanthropy with hundreds of partner organizations worldwide. Our corporate philanthropy includes work with Operation Smile®—helping to provide safe surgeries for facial deformities in children; Save the Children®—providing care to tens of millions of children around the world in resource limited and crisis situations, including long-term support for Syrian refugees; and the Elizabeth Glaser Pediatric AIDS Foundation®—eliminating HIV infections in children around the world. We also partner with global health agencies and non-governmental organizations to battle some of the most deadly epidemics of our generation, like our commitment and partnership to rapidly develop a vaccine for Ebola. Through these commitments, we envision a world where everyone has the means to be healthy and can thrive. We are committed to using our capabilities, expertise, resources and partnerships to fulfill our role in making the world a better, healthier place for generations to come.

Source: Annual Report, 2015 Johnson and Johnson.

The development of accounting standards is also a political process that is heavily influenced by the various groups within the reporting environment. Lobby groups include investors, creditors, financial analysts, the financial community, academics, accounting organizations, and industry associations.

Proactive Factors. Financial accounting is proactive in that it can change or influence its environment by providing feedback information that is used by organizations and individuals to reshape the economy. Accounting information is used to efficiently allocate resources throughout

the economy by directing capital flows to their most productive uses. For example, start-up capital is needed to develop new technology such as solar power and electric vehicles.

Accounting standards can also influence managerial behavior. For example, expensing research and development costs may slow investment in research during economic downturns because this accounting treatment results in lower earnings figures.

- 2 Discuss the role of financial accounting standard setters in the United States and internationally.

Role of Standard Setters

Standard setters work diligently to develop concepts, rules, and guidelines for financial reporting that will satisfy the requirement to accurately present the economic performance and financial position of the firm. These standards are designed to encourage transparent and truthful reporting. Publicly traded entities must follow the rules and guidelines set forth by the standard setters to maintain public trust and to ensure the efficient functioning of capital markets. The FASB promulgates accounting standards in the United States, and the IASB issues global accounting standards, called International Financial Reporting Standards (IFRS).

The Importance of Understanding International Accounting Standards

Although U.S. GAAP and IFRS are converged in many areas, some differences still remain. Throughout the text, we present the U.S. GAAP standards in detail and highlight pertinent differences with IFRS. Why is it important for an accountant in the United States to learn international accounting standards? There are several reasons:

- U.S. companies operate subsidiaries outside of the United States. Many of these subsidiaries report under IFRS in their home countries. Accountants must convert the subsidiaries' financial statements to U.S. GAAP when preparing consolidated financial statements. For example, *Johnson & Johnson* operates in over 60 countries throughout the world.
- Non-U.S. companies operate in the United States and prepare their financial statements using IFRS. Consequently, if you are working at or auditing an international firm, you will likely see IFRS. For example, *GlaxoSmithKline* is a worldwide pharmaceutical company based in the United Kingdom with 18% of its employees in the United States and a U.S. headquarters in Philadelphia.
- The SEC permits the use of IFRS-based financial statements by international companies with shares trading on U.S. stock exchanges.¹⁰ U.S. accountants and auditors often assist these non-U.S. companies in preparing U.S. regulatory reports. As of September 2016, these companies represented a worldwide market capitalization in excess of \$7 trillion across more than 500 companies.¹¹
- The SEC promotes high-quality, globally accepted accounting standards. U.S. accountants and auditors need a working knowledge of IFRS to implement global standards in companies and perform audits.
- Many U.S. accountants now spend time working outside of the United States. IFRS is required or permitted in over 130 countries worldwide. Exhibit 1.5 presents a map that highlights the countries that require IFRS in red (as of May 2016).
- The accounting profession has determined that a working knowledge of IFRS is important for today's accountant. For example, the American Institute of Certified Public Accountants tests IFRS on the CPA exam.

To ensure that you are prepared to meet these challenges, we address both U.S. GAAP and IFRS in this text. We introduce accounting practices in the United States first. We then compare U.S. GAAP to IFRS in sections with green headings, focusing on similarities and differences. Where there are differences, we cover IFRS at the same level of detail as used for U.S. GAAP.

¹⁰The SEC eliminated the requirement that foreign issuers reconcile their financial statements from IFRS (or other accounting standards) to U.S. GAAP in 2007. To be clear, U.S. companies may not use IFRS in their financial statements. U.S. GAAP is required for U.S. companies.

¹¹See Source: <https://www.sec.gov/news/statement/white-2016-01-05.html>

EXHIBIT 1.5 Global Usage of IFRS

Source: Based on “The Global Financial Reporting Language,” May 2016, IFRS Foundation table on p. 5.

- ③ Detail the standard-setting process.

The Standard-Setting Process

We previously established that the FASB sets accounting standards in the United States and the IASB sets global accounting standards. The standard-setting processes are similar for the two Boards but there are some important differences that we will highlight.

Standard Setting

We begin with the history of U.S. standard setting, the structure of the standard-setting body, and the process of standard setting.

History of Standard Setting. U.S. financial reporting standard setting began with the 1934 Securities Exchange Act, which gave the SEC the power to promulgate accounting standards for all publicly traded firms. The SEC delegated its standard-setting power to the private sector, prompting the accounting profession to establish the first U.S. standard-setting board. The Committee on Accounting Procedures (CAP) was formed in 1939 as a subcommittee of the American Institute of Certified Public Accountants (AICPA) to reduce the number of accounting methods used in practice. Prior to the formation of the CAP, there were significant inconsistencies in the form and content of financial statements. For example, some companies would provide only a balance sheet while others would report only an income statement. During its tenure, the CAP produced 51 standards, referred to as Accounting Research Bulletins (ARBs or Bulletins).

The CAP accomplished its goal of reducing accounting alternatives and was replaced in 1959 by the Accounting Principles Board (APB). The APB, another subcommittee of the AICPA, issued pronouncements known as Opinions and Statements. The APB’s primary objective was to respond to existing and emerging problems in financial reporting. The APB issued 31 APB Opinions and four APB Statements.

The APB was criticized for being slow to develop accounting standards and inactive on several controversial issues. The part-time board members were all CPAs still affiliated with their employers. As a result, board members were not viewed as independent. Further, the APB did not

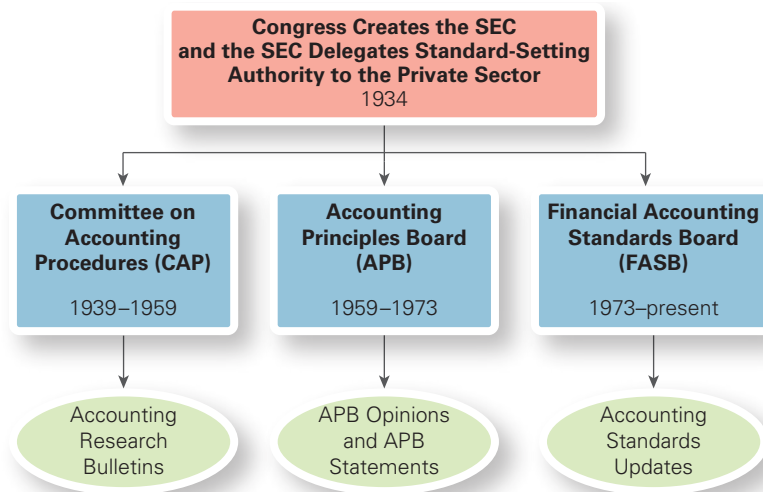

develop standards in anticipation of changes in the accounting environment. Rather, the Board simply responded to long-existing, controversial accounting issues. Due to these criticisms, the Financial Accounting Standards Board (FASB) replaced the APB in 1973.

The FASB is a more independent board than the APB. The seven members employed as full-time board members must sever all relationships with outside entities. In addition, board members of the FASB do not have to be accountants or CPAs—the members can join the board from industry, education, and public service. Members on the board have represented a broad range of constituencies, including members from the corporate world, the accounting profession, the investment community, government, and academia. The FASB is not a subcommittee of the AICPA and is not affiliated with any professional organization.

The FASB currently issues Accounting Standards Updates (ASUs) as part of the *Accounting Standards Codification* (ASC).¹² The **Accounting Standards Codification** (often referred to as the Codification) is the single source of GAAP in the United States and includes all pronouncements issued by any of the standard-setting bodies that have not been superseded.¹³

Exhibit 1.6 presents the history of U.S. standard setting as well as pronouncements issued by each group.

EXHIBIT 1.6 History of Accounting Standard Setting in the United States

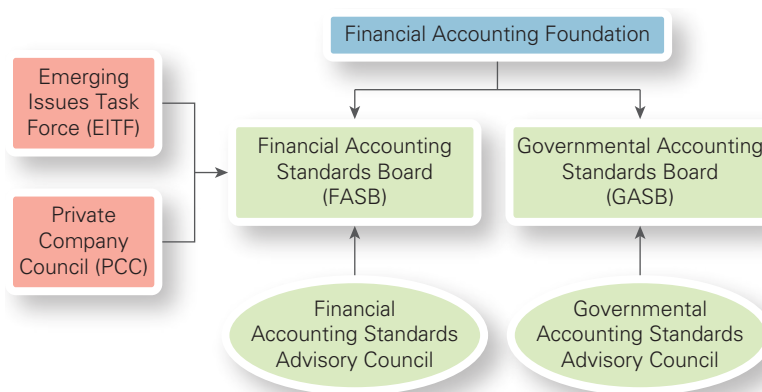

The Standard-Setting Structure. As illustrated by Exhibit 1.7, the FASB is part of a larger organizational structure that also includes the

- Financial Accounting Foundation (FAF)
- Governmental Accounting Standards Board (GASB)
- Financial Accounting Standards Advisory Council (FASAC)
- Governmental Accounting Standards Advisory Council (GASAC)
- Emerging Issues Task Force (EITF)
- Private Company Council (PCC)

The FAF is responsible for the oversight, administration, and finances of the FASB. The FAF obtains funds primarily through the Public Company Accounting Oversight Board (PCAOB), which assesses charges known as accounting support fees against issuers of equity securities based

¹²The primary pronouncements of the FASB were originally called Statements of Financial Accounting Standards (SFAS).

¹³We discuss the Codification in depth in Chapter 3.

EXHIBIT 1.7 Standard-Setting Organizational Structure in the United States

on their market capitalization.¹⁴ Other sources of funds include publications, subscriptions, and contributions from state and local governments for the GASB.

The GASB sets standards for state and local governmental units. The FASAC exists to advise FASB on technical issues and the GASAC serves as an advisory board to the GASB.

The EITF was formed in 1984 to assist the FASB by addressing issues that are not as broad in scope as those found on the FASB's agenda. For example, EITF agenda items often include industry-specific issues. The EITF is made up of 13 representatives, including preparers, auditors, and financial statement users. The group reaches an EITF Consensus when three or fewer members object to a proposed position that has been exposed for public comment. Although the FASB members do not vote on the consensus at the EITF meetings, all consensus decisions must be approved by a majority of the FASB members before they become a part of U.S. GAAP.

In 2012, the PCC was established to set accounting standards for U.S. private companies. Before this time, if a private company was required to present financial information according to U.S. GAAP, it followed the same rules as public companies with minor exceptions. Now the PCC is responsible for determining whether modifications to existing U.S. GAAP standards are warranted for private companies, and, if so, it has the responsibility of developing, deliberating, and voting on these modifications. However, the FASB retains the authority to make the final decision as to incorporating these changes into U.S. GAAP for private companies.

Standard-Setting Process. FASB follows a seven-step process to issue a final standard.¹⁵

Step 1: Identification of an issue. FASB identifies a financial reporting issue based on recommendations from analysts, government agencies, or other market participants.

Step 2: Decision to pursue. After consultation with FASB members and others as appropriate, the FASB Chairperson decides whether to add the issue to the technical agenda.

Step 3: Public meetings. Once added to the technical agenda, the Board holds public meetings where it deliberates the various issues identified by the FASB staff.

Step 4: Exposure Draft. The Board issues an Exposure Draft (ED), which is intended to solicit input from financial statement preparers, auditors, and users of the financial statements.¹⁶

¹⁴Market capitalization is the total value of a company's equity shares. It is equal to the market price per share multiplied by the total number of equity shares outstanding.

¹⁵See <http://www.fasb.org/cs/ContentServer?site=FASB&c=Page&pagename=FASB%2FPage%2FSectionPage&cid=1176157307939>.

¹⁶The Board may also issue a Discussion Paper to obtain input earlier in the project.

Step 5: Public roundtables. The Board may hold public roundtables to discuss the ED, if needed.

Step 6: Redeliberation. The FASB staff analyzes the comment letters received from preparers, financial statement users and auditors, public roundtable discussions, and any other information. The Board then redeliberates the issue.

Step 7: Publication of the final standard. The Board issues an Accounting Standards Update (ASU), which is the final standard. It requires a majority vote of the Board to issue a new standard. The ASU will then be incorporated into the body of the Accounting Standards Codification that makes up U.S. GAAP.

IFRS Standard Setting

We will now discuss the history of global standard setting, the structure of the standard-setting body, and the process for global standard setting.

History of Global Standard Setting: IFRS

Until recently, most countries established their own accounting standards. For instance, France, Germany, and Australia each had its own GAAP. The GAAP of each nation varied due to the country's specific needs for accounting information. Factors such as the country's sources of capital, its culture, tax laws, or other regulations influenced the development of their accounting standards. Given almost 200 countries in the world and almost as many sets of different GAAP standards, global investors and creditors struggled to compare accounting standards when analyzing companies and making investment and credit decisions.

Recognizing the need for comparable accounting information internationally, the professional accounting organizations from 10 countries formed the International Accounting Standards Committee (IASC) in 1973.¹⁷ At that time, the IASC consisted of up to 16 part-time volunteer members setting International Accounting Standards (IAS). Companies in each country could adopt IAS on a voluntary basis. However, the IASC was criticized for allowing highly flexible accounting standards. As a result, most major developed countries continued to require the use of their own standards.

As global business relationships continued to grow, the need for a comparable and rigorous international set of accounting standards became apparent. In the 1990s, the IASC initiated an improvement project to develop a cohesive and uniform set of "core accounting standards" to meet the needs of investors in cross-border offerings and exchange listings. Shortly after this improvement project was completed, the International Organization of Securities Commissions (IOSCO) endorsed IAS for use in cross-border stock offerings and listings, allowing companies to report under IAS within their jurisdictions and on their exchanges.

Around the same time, the IASC began to recognize the limitations in its existing organizational structure. As a result, the International Accounting Standards Board (IASB) replaced the IASC in 2001. The IASB now promulgates standards called International Financial Reporting Standards (IFRS).

The IASB also developed a set of accounting standards to address the needs of private companies, called IFRS for small- and medium-sized entities (IFRS for SMEs). IFRS for SMEs is based on IFRS but eliminates certain costly reporting requirements that are designed to provide information to external financial statement users. IFRS for SMEs was developed because some countries require all public and private companies to prepare financial statements under IFRS. These countries can then allow private companies the option to use the less costly IFRS for SMEs.

¹⁷The original 10 countries were Australia, Canada, France, Germany, Japan, Mexico, the Netherlands, the United Kingdom, Ireland, and the United States. Other countries subsequently joined the committee.

Interview

DIRECTOR, AICPA
DANIEL J. NOLL »

Daniel J. Noll

Daniel J. Noll, Director of Accounting Standards at the American Institute of Certified Public Accountants, works with the Financial Reporting Executive Committee to develop AICPA positions on financial reporting matters. He also provides external financial reporting guidance and leads the AICPA's private company financial reporting efforts.

- 1 What is the role of effective financial reporting in enabling financial statement users to make rational economic decisions?

For users—the ultimate customers of financial reporting—financial statements are a critical information source for investing and lending decisions. Imagine you are the sole owner of the Bank of Your Town and are considering whether to loan money to a local business. Before parting with your cash, you would ask questions such as: How does the business's profit and cash flow look? Are the numbers the business provided trustworthy and developed using accounting practices consistent with how other businesses in the same industry report?

Useful and reliable financial statements allow investors and lenders to make smart capital allocation decisions. The notion of “efficient and effective” allocation of capital helps drive capitalist economies and societies to greater standards of living. An inefficient and wasteful allocation would reward poorly run entities until they ultimately flounder or go bust. Consequently, funding would not be available for well-run businesses that could grow, employ people, and improve their communities.

- 2 What is AICPA's general role in the accounting environment and the standard-setting process?

The AICPA is the world's largest member association representing the CPA profession, with more than 418,000 members in 143 countries, and a history of serving the public interest since 1887. AICPA members represent many areas of practice, including business and industry, public practice, government, education, and consulting. Student membership is free.

The AICPA sets ethical standards for the profession and U.S. auditing standards for private companies; nonprofit organizations; and federal, state, and local governments. It develops and grades the Uniform CPA Examination, offers specialized credentials, builds the pipeline of future talent, and drives professional competency development to advance the vitality, relevance, and quality of the profession. The AICPA's Financial Reporting Executive Committee (FinREC) serves as the official voice on all GAAP matters, advocating for sound external financial reporting practices related to private and public companies, not-for-profit entities, and employee benefit plans.

- 3 What is AICPA's role in improving the effectiveness of financial reporting?

The AICPA routinely interacts with regulators, standard setters, and all participants in the financial reporting process to identify and solve issues and contribute to policy development. AICPA is not an accounting standard setter; rather, it identifies issues needing authoritative FASB resolution or weighs in publicly on what good accounting practices might be under various circumstances.

- 4 What are the key areas in which accounting professionals and financial statement users look to the AICPA for guidance?

The key areas related to GAAP as set by FASB are:

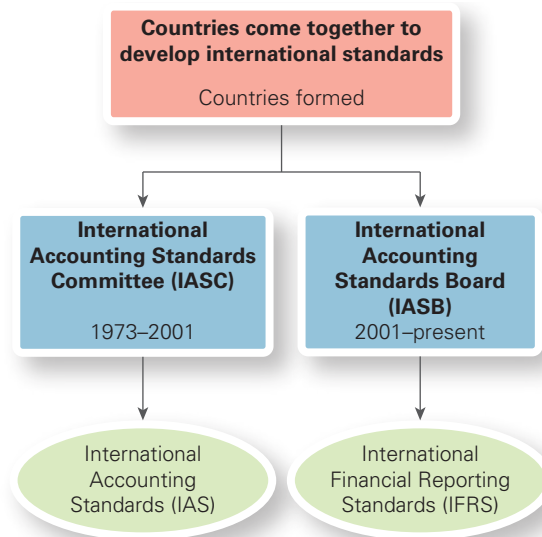

1. The AICPA's industry accounting and audit guides, although not GAAP, are often viewed as a bible for their particular industry. We help professionals understand and apply accounting standards to unique or significant transactions within their industries.
2. The AICPA's accounting and valuation guides, also not GAAP, help bridge any language barriers between accounting/auditing staff and valuation specialists when tackling complex fair value measurements.
3. The AICPA issued revenue recognition accounting guidance based on FASB's newly effective standard that replaced the prior industry-specific GAAP. Our new accounting guide helps upwards of 16 industries understand and apply the newly effective standard to their particular circumstances. Because every entity has revenue, and professionals have been challenged for many years to determine when to recognize it, companies, auditors, and regulators will give this standard front and center attention for many years to come.

Discussion Questions

1. Discuss the role that the AICPA will play in your accounting career as a student and when you join the profession.
2. How would you characterize the current relationship between the FASB and the AICPA?

Exhibit 1.8 presents the history of international accounting standard setting.

EXHIBIT 1.8 History of International Accounting Standard Setting

The Global Standard-Setting Structure: IFRS

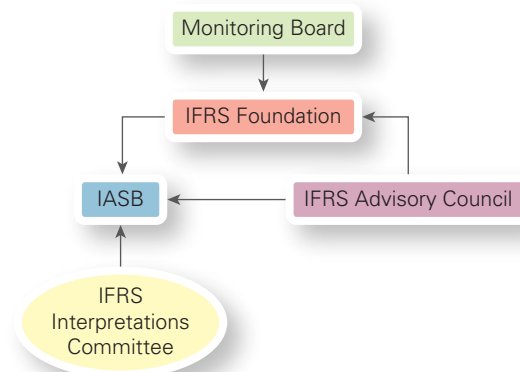

As illustrated by Exhibit 1.9, the IASB is part of a larger organizational structure that also includes:

- The IFRS Foundation
- The Monitoring Board
- The IFRS Advisory Council
- The IFRS Interpretations Committee

The IFRS Foundation oversees the IASB and is responsible for financing the IASB's operations. Unlike funding for the FASB, the IASB relies on contributions from companies and other parties that have an interest in promoting international accounting standards. The Monitoring Board was formed in 2009 to enhance the public accountability of the IFRS Foundation while still allowing for independence in the standard-setting process.

The Monitoring Board oversees the IFRS Foundation, participates in nominating individuals to serve as foundation trustees, and approves appointments. The IFRS Advisory Council advises the IASB and the IFRS Foundation on many issues, including the IASB's agenda and the

EXHIBIT 1.9 International Accounting Organizational Structure

implementation of standards. The IFRS Interpretations Committee is the interpretative body of the IASB, similar to the EITF in the United States.

The IASB is composed of 14 members who are appointed by the IFRS Foundation's board of trustees. At least 11 members serve full time, and no more than 3 can be part-time members. To ensure broad and diverse international representation, the IASB is composed of:

- Four members from the Asia/Oceania region
- Four members from Europe
- Four members from the Americas
- One member from Africa
- One member appointed from any area, subject to maintaining overall geographical balance

The IFRS Interpretations Committee (IFRSIC) develops interpretations of standards that must be approved by the IASB. Whenever the need arises, the IFRS Interpretations Committee forms working groups, which are task forces for individual agenda projects. The IASB will also normally form working groups or other types of specialized advisory groups to advise on major projects; an example is the Emerging Economies Group.

Standard-Setting Process: IFRS

The IASB follows a similar process to the FASB's standard-setting process, so we discuss it only briefly here.

When a topic is identified, the Board considers the nature of the issues, seeks input from its constituents, and prepares an exposure draft. After receiving comments on the exposure draft, the IASB may modify the proposed standard before approving a final standard.

Unlike the FASB, the IASB is required to carry out a post-implementation review of each new standard or significant change to an existing standard. The review focuses on controversial issues identified during the development stage, unexpected costs, and implementation problems. This review is normally carried out up to two years after the new standard has been in effect.

Standard Setting as a Political Process

The issuance of new standards and changes in existing standards can have significant effects on an entity's reported net income. In turn, these income effects impact the flow of capital throughout the economy.

At the company level, managers have incentives to oppose changes in standards or new standards that reduce their company's reported net earnings. On the financial statement user level, a new standard or a change in existing standards should provide better and more transparent financial information that will assist users in making more effective investment and credit decisions.

Standard setters address the concerns of both the managers and financial statement users by employing the standard-setting processes we described in the previous section. These processes rely on the information gathered and opinions of users, managers, and auditors along with comments obtained from responses to exposure drafts and public roundtables. The standard-setting bodies analyze this information to gauge the economic consequences of the proposed standard and to assess the improvements in the quality of the financial information disseminated to the market. Standard setters address this trade-off between the income effects and the value of financial information, reaching a balance before issuing the final standard.

- 4 Explain three recent trends in standard setting: principles-based, rules-based, and objectives-oriented standards; the asset/liability approach; and fair value measurements.

Trends in Standard Setting

We conclude the chapter by introducing three current trends in standard setting, that we will explore further in later chapters:

- A move toward a less *rules-based* (or a more *principles-based*) system as found in International Financial Reporting Standards
- A move toward standards that are focused on the *asset/liability approach*
- A move toward measuring balance sheet items at *fair value* rather than historical cost

Rules- versus Principles-Based Standards

Both the U.S. GAAP and IFRS systems of accounting standards are based on principles and rules. A **principles-based standard** relies on theories, concepts, and principles of accounting that are linked to a well-developed theoretical framework. A **rules-based standard** contains specific, prescriptive procedures rather than relying on a consistent theoretical framework. For example, assume your parents tell you that you must maintain a GPA of at least 3.0 to receive a car at graduation. This is a rules-based standard. Now assume your parents tell you they will buy you a new car at graduation if you do well in school. This is an example of a principles-based standard. The SEC uses the term **objectives-oriented standard** to refer to a standard that is somewhere between a pure principles-based standard and a pure rules-based standard.¹⁸

Principles-Based Standards. Pure principles-based standards exhibit the following characteristics:

- Provide a clear discussion of the accounting objective related to the standard.
- Involve few, if any, exceptions.
- Involve no tests (referred to as **bright-line tests**) that require meeting a pre-established numerical threshold.¹⁹
- Provide insufficient guidance to implement the standard.
- Involve a significant amount of interpretation in application.

With pure principles-based standards, comparability across entities is often lost due to the extensive amount of preparer judgment required. In addition, preparers and auditors worry that regulators will not support the judgment used when reporting under a principles-based system, even judgments made honestly without intent to bias. Finally, the lack of application guidance can make it difficult to enforce principles-based reporting requirements in practice.

Rules-Based Standards. Unlike principles-based standards, rules-based standards may not relate to a consistent theoretical framework. In addition, pure rules-based standards:

- Contain numerous exceptions to the types of firms and industries that are covered by the standard.
- Contain numerous bright-line tests.
- Result in inconsistencies between standards.
- Contain detailed application guidance.
- Do not rely on extensive use of professional judgment.

As is the case with pure principles-based standards, pure rules-based standards also result in implementation problems. At times, reporting entities may circumvent rules and are therefore able to override the intent of the standard. A system of rules-based standards is difficult to interpret from a user perspective. Rules-based standards tend to result in an environment where financial reporting is viewed as an act of compliance rather than a process of disseminating transparent financial information to investors and creditors.

Objectives-Oriented Standards. An SEC report studying rules-based and principles-based standard setting indicated that an objectives-oriented standard is optimal.²⁰ Similar to principles-based standards, objectives-oriented standards are derived from and are consistent with

¹⁸See Study Pursuant to Section 108(d) of the Sarbanes-Oxley Act of 2002 on the Adoption by the United States Financial Reporting System of a Principles-Based Accounting System, U.S. Securities and Exchange Commission, July 2003 for a thorough discussion of principles and rules-based standards. The full text of the study is available at <http://www.sec.gov/news/studies/principlesbasedstand.htm>.

¹⁹For example, a rule specifying that a material item is 10% or more of net income is a bright-line test.

²⁰Study Pursuant to Section 108(d) of the Sarbanes-Oxley Act of 2002 on the Adoption by the United States Financial Reporting System of a Principles-Based Accounting System, U.S. Securities and Exchange Commission, July 2003.

a high-quality theoretical framework and clearly stated accounting objectives. However, objectives-oriented standards include a sufficient level of rules to provide detail and structure, resulting in the consistent application of accounting standards across entities and across time. An objectives-oriented standard would minimize exceptions to a particular standard and reduce the number of bright-line tests used in its implementation. Many of the existing standards in both U.S. GAAP and IFRS qualify as objectives-oriented standards.

U.S. GAAP and IFRS: Rules versus Principles. Neither U.S. GAAP nor IFRS fits perfectly into a rules- or principles-based approach. The greatest difference between the two standards is that U.S. GAAP contains many more rules than does IFRS.²¹ Although U.S. GAAP includes more rules than IFRS, it is not purely rules based. Similarly, IFRS is not purely principles based. Both U.S. GAAP and IFRS base standards on their respective *conceptual frameworks*, which we discuss in more detail in Chapter 2. Exhibit 1.10 shows the placement of U.S. GAAP and IFRS standards on the rules-based and principles-based continuum.

EXHIBIT 1.10 Rules versus Principles

Asset/Liability Approach

The next trend relates to the interrelationship between the balance sheet and income statement. When a firm reports an event on the income statement, the transaction typically also changes a balance sheet account. For example, if a firm reports revenue, it also increases the balance in accounts receivable or cash.

Although the two financial statements are interrelated, which set of accounts is dominant—the revenues and expenses on the income statement or assets and liabilities on the balance sheet? For example, in a typical sales transaction, an accountant will increase accounts receivable and revenue. But how does the accountant decide whether to record the transaction?

1. Recording based on revenue recognition criteria involves an **income statement approach**.
2. Basing the decision on whether an economic resource is received and it meets the definition of an asset, such as accounts receivable, is an **asset/liability (balance sheet) approach**.

In FASB's early years, it tended to focus on an income statement approach. However, in recent years, it has shifted to the asset/liability approach.²²

Fair Value Measurements

Another trend in standard setting is the movement toward the use of *fair value* measurements as a viable alternative to historical cost. **Fair value** is the amount at which an asset (or liability) could be bought (or incurred) or sold (or settled) in a current transaction between willing parties.²³ Twenty years ago, firms reported very few items on the balance sheet at fair value. Today, firms use fair values to measure some balance sheet accounts. For example, firms must report some investments in equity securities that have a readily determinable fair value and some investments in debt at fair value, as opposed to historical cost. We discuss fair value measurements more extensively in Chapter 2.

²¹It is likely that the considerable number of rules in U.S. GAAP were written in an attempt to protect preparers and auditors from potential, excessive litigation in the U.S. reporting environment.

²²FASB, *Statement of Financial Accounting Standards No. 109*, "Accounting for Income Taxes" (Norwalk, CT: FASB, 1992), which is now codified as FASB ASC 740, *Income Taxes*, provides an example of the trend toward the use of the asset/liability approach. Prior to this standard, the profession employed an income statement approach when accounting for income taxes but now uses a balance sheet approach.

²³See FASB ASC—Master Glossary.

Summary by Learning Objectives

In the following, we summarize the main points by learning objective. Throughout the chapter, we discuss the accounting and reporting of U.S. GAAP and IFRS side-by-side. The following table also highlights the major similarities and differences between the standards.

- 1** Define financial accounting and describe the demand for financial information, including the role of general-purpose financial statements, the information needs of financial statement users and other parties, and the factors that influence financial reporting.

Summary	Similarities and Differences between U.S. GAAP and IFRS
<p>Financial accounting is the process of identifying, measuring, and communicating financial information about an economic entity to various user groups within the political, social, legal, and economic environment.</p> <p>Financial reporting aids investors, lenders, and other creditors in assessing the amounts and timing of future cash flows, as well as any uncertainty regarding those cash flows when making investment and credit decisions.</p> <p>General-purpose financial statements provide information to a wide spectrum of user groups: investors, creditors, financial analysts, insurance companies, unions, government agencies, and such.</p> <p>Financial statement users include equity investors, creditors, financial analysts, employees, labor unions, suppliers, debt investors, competitors, government agencies, and customers.</p> <p>Environmental factors such as legal, economic, political, or social factors impact the financial reporting process.</p> <p>Financial accounting is reactive when it reacts to pressure (lobbying) from various groups and changes in its environment.</p> <p>Financial accounting is proactive in that it can change or influence its environment by providing feedback information that is used by organizations and individuals to reshape the economy.</p>	<p>Similar under U.S. GAAP and IFRS.</p>

- 2** Discuss the role of financial accounting standards setters in the United States and internationally.

Summary	Similarities and Differences between U.S. GAAP and IFRS
<p>The Financial Accounting Standards Board (FASB) is the accounting standard setter in the United States.</p> <p>The International Accounting Standards Board (IASB) establishes International Financial Reporting Standards (IFRS).</p>	<p>► IFRS is required or permitted in over 130 countries worldwide. U.S. GAAP is required for U.S. companies.</p>

Summary by Learning Objectives, continued

3 Detail the standard-setting process.	
Summary	Similarities and Differences between U.S. GAAP and IFRS
<p>In the United States, the Financial Accounting Standards Board (FASB) sets Generally Accepted Accounting Principles (GAAP). In setting standards, the FASB follows a seven-step process:</p> <p>Step 1: Identification of an issue.</p> <p>Step 2: Decision to pursue.</p> <p>Step 3: Public meetings.</p> <p>Step 4: Exposure Draft.</p> <p>Step 5: Public roundtables.</p> <p>Step 6: Redeliberation.</p> <p>Step 7: Publication of the final standard.</p>	<p>► The International Accounting Standards Board (IASB) issues International Financial Reporting Standards (IFRS). The IASB has a similar process as the FASB, and it conducts a post-implementation review after an IFRS is issued.</p>

4 Explain three recent trends in standard setting: principles-based, rules-based, and objectives-oriented standards; the asset/liability approach; and fair value measurements.	
Summary	Similarities and Differences between U.S. GAAP and IFRS
<p>Principles-based standards are standards consistent with a theoretical framework. Rules-based standards do not rely on a consistent theoretical framework but rather contain more specific, prescriptive rules. Objectives-oriented standards refer to standards that are somewhere between pure principles-based and pure rules-based.</p> <p>When deciding if a transaction should be recorded, the asset/liability approach bases the decision on whether an asset or liability should be reported on the balance sheet rather than if revenue or expenses should be recognized on the income statement.</p> <p>Fair value measurement, contrasted with historical cost, reports some items on the balance sheet at fair value.</p>	<p>► We often think of U.S. GAAP as being more rules based than IFRS, but it is not purely rules based. Nor is IFRS purely principles based.</p>

MyLab Accounting

Go to <http://www.pearson.com/mylab/accounting> for the following Questions, Brief Exercises, Exercises. They are available with immediate grading, explanations of correct and incorrect answers, and interactive media that acts as your own online tutor.

1 The Financial Reporting Environment

Questions

- 1 Q1-1. Which items are included in the definition of financial information? Is this concept synonymous with the term financial statements? Explain.
- 1 Q1-2. What is the purpose of generating financial statements and who are the primary users of this information?
- 1 Q1-3. How is the allocation of capital linked to the demand for financial reporting?
- 1 Q1-4. What are the roles and responsibilities of an external auditor?
- 2 Q1-5. What is the function of the accounting standard setters?
- 2 Q1-6. Can U.S. companies listed on U.S. stock exchanges use **IFRS**?
- 3 Q1-7. Who does the FASB consult in the standard-setting process?

- 1 3
4
4
- Q1-8.** Is the promulgation of financial accounting standards a political process? Explain.
- Q1-9.** How does a principles-based standard differ from a rules-based standard?
- Q1-10.** In recent years, what has been the FASB's approach to standard setting?

Brief Exercises

- 1 **BE1-1. General-Purpose Financial Statements.** Describe what is meant by the term "general-purpose financial statements." Discuss what group(s) benefit(s) from general-purpose financial statements.
- 1 **BE1-2. Financial Reporting Definition.** What is the definition of financial accounting?
- 1 **BE1-3. Financial Statement Users and Other Parties Involved in Financial Reporting.** Match the financial statement users and other parties involved in the use of and preparation of financial information with their role.

Financial Statement Users and Other Parties	Role
<input type="checkbox"/> Equity Investors	1. Are banks and other financial institutions that lend money to the company.
<input type="checkbox"/> Creditors	2. Use financial statements to determine whether to conduct business or purchase products from a company.
<input type="checkbox"/> Financial Analysts	3. Use financial information to determine their market position relative to the reporting entity and to attempt to identify future strategies of the reporting entity.
<input type="checkbox"/> Employees and Labor Unions	4. Are independent of the company and responsible for ensuring that management prepares and issues financial statements that comply with accounting standards and fairly present the financial position and economic performance of the company.
<input type="checkbox"/> Suppliers and Customers	5. Use financial information to review and analyze reported results of the companies they cover and make investment recommendations.
<input type="checkbox"/> Government Agencies	6. Are employees of the company serving in an advisory role to management. They provide information to management regarding the company's operations and proper functioning of its internal controls.
<input type="checkbox"/> Competitors	7. Review the financial statements of publicly traded companies for a variety of reasons that are in the public interest.
<input type="checkbox"/> External Auditors	8. Use financial information during negotiation of new labor agreements and compensation contracts.
<input type="checkbox"/> Internal Auditors	9. Support accounting professionals throughout their careers by providing training, professional skills development, and other resources.
<input type="checkbox"/> Regulatory Bodies	10. Are shareholders of the company.
<input type="checkbox"/> Professional Organizations	11. Protect investors and oversee the accounting and auditing standard setting processes.

- 1 **BE1-4. Financial Statement Users.** Identify at least four different types of financial statement users and discuss why each would use the financial statements.
- 1 **BE1-5. Parties in the Financial Reporting Process.** Identify at least three types of parties in the financial reporting process and discuss why each would be interested in the financial statements.
- 1 **BE1-6. Economic Entity.** What is an economic entity?
- 3 **BE1-7. Standard-Setting Process.** Briefly explain how the financial statement preparers, users, and other interested parties are involved in the standard-setting process for U.S. GAAP.
- 3 **BE1-8. Standard-Setting Process.** What is the standard-setting process followed by FASB?

- 3** **BE1-9. FASB's Standard-Setting Process.** Order the steps in the Financial Accounting Standards Board's standard-setting process from 1 to 7.
- _____ The Board issues an Exposure Draft (ED), which is intended to solicit input.
 - _____ After consultation with FASB members and others as appropriate, the FASB Chairperson decides whether to add the issue to the technical agenda.
 - _____ The FASB staff analyzes the comment letters received, public roundtable discussions, and any other information. The Board then redeliberates the issue.
 - _____ The Board may hold public roundtables to discuss the ED, if needed.
 - _____ The Board issues an Accounting Standards Update (ASU), which is the final standard. It then incorporates the ASU into the Accounting Standards Codification that makes up U.S. GAAP.
 - _____ A financial reporting issue is identified either by requests of financial statement users or by some other means.
 - _____ The Board holds public meetings where it deliberates the various issues identified by the FASB staff.
- 3** **BE1-10. IASB's Standard-Setting Process.** What is the composition of the IASB's membership?
- 3** **BE1-11. SEC's Role.** What is the SEC's role in standard setting, both historically and currently?
- 4** **BE1-12. Characteristics of a Principles-Based or Rules-Based Accounting System.** Identify whether the items below are characteristics of a principles-based (P) or rules-based (R) accounting system:
- _____ Provides a clear discussion of the accounting objective related to the standard
 - _____ Contains detailed application guidance
 - _____ Contains numerous exceptions to the types of firms and industries that are covered
 - _____ Involves no bright-line tests
 - _____ Contains numerous bright-line tests
 - _____ Involves a significant amount of interpretation in application
 - _____ Involves few, if any, exceptions
 - _____ Provides insufficient guidance to implement the standard
 - _____ Would not rely on extensive use of professional judgment
 - _____ Results in inconsistencies between standards

Exercises

- 1** **E1-1. Financial Accounting.** Define financial accounting and describe the four main elements in that definition.
- 1** **E1-2. Factors That Influence Financial Reporting.** Alicia O'Malley, a sociology major, is considering changing her major to accounting. Alicia is having some doubts because she fears that accounting and financial reporting are concerned only with numbers and are isolated from society. Convince Alicia to major in accounting by explaining how accounting interacts with its environment. In your answer, include a discussion of proactive and reactive factors.
- 2** **E1-3. Convergence of Accounting Standards, IFRS.** Vikram Patel, one of your friends from high school who is a finance major, is surprised that you are learning about international accounting. Explain why it is important for an accountant in the United States to learn International Financial Reporting Standards (IFRS).
- 3** **E1-4. History of Standard Setting in the United States.** Joe Choi, a history major, is considering transferring to your school of business to study accounting. Joe is having some doubts because he is uncertain if there is any room for history in accounting. Convince Joe to major in accounting by providing a history of standard setting in the United States. In your response, address the following items:
- a. When did financial reporting standard setting begin in the United States?
 - b. Who had initial authority to set accounting standards?
 - c. Which organizations were delegated the authority to set standards? Comment on the types of standards issued and concerns with the standard-setting process under each organization.
 - d. Who currently sets accounting standards in the United States? What is the structure of the organization? What types of standards are issued?
- 4** **E1-5. Rules- versus Principles-Based Accounting.** Provide the key characteristics of rules-based standards and principles-based standards.

4

E1-6. Asset/Liability Approach. Consider the following comment: “Accounting standards have always focused on the asset/liability approach and still do today.” Do you agree or disagree with this comment? Explain your answer.

4

E1-7. Rules- versus Principles-Based Accounting. Review the following statements and indicate if the statement is referring to a principles-based or a rules-based accounting standard.

Statement: An accountant will use a particular accounting standard only if . . .

Principles-Based or Rules-Based Accounting Standard

a. . . . the length of a contract covers substantially all of the useful life of a plant asset.

a. _____

b. . . . the number of new common shares a firm issues is equal to 20% of the previously outstanding shares.

b. _____

c. . . . a corporation owns over 50% of the voting shares of an affiliate company.

c. _____

d. . . . a corporation has the ability to control the operating and financing activities of an affiliate company.

d. _____

e. . . . it is more likely than not that a company's tax position will be sustained upon examination by the Internal Revenue Service.

e. _____

f. . . . the sum of the undiscounted future cash flows from the use of a plant asset is less than its carrying value.

f. _____

2

Financial Reporting Theory

LEARNING OBJECTIVES

- 1 Explain what a conceptual framework is and why it is important in accounting standard setting.
- 2 Define the objective of financial reporting.
- 3 Describe the qualitative characteristics of financial information, including the fundamental and enhancing characteristics of financial reporting.
- 4 Identify the elements of financial reporting.
- 5 Demonstrate an understanding of recognition and measurement in financial reporting including general recognition principles, revenue and expense recognition, and accrual accounting.
- 6 Explain the assumptions used in financial reporting.

Introduction

CHAPTER 1 PROVIDED A DETAILED DISCUSSION of the environment of financial accounting and the standard-setting process. Companies apply standards that are based on a *conceptual framework* that sets forth the theory of financial reporting.

Given diverse economic transactions, complex operating environments, and diverse industries, the standard setters require a logical and consistent basis for the development of the accounting standards. A conceptual framework provides a structure for developing new standards or revising existing standards. The framework ensures that standard setters develop all portions of the authoritative literature on a uniform basis that can be justified by a well-defined theoretical foundation. Companies then apply the authoritative literature in preparing their financial statements.

Consider two companies that generate revenues in different ways like *Facebook, Inc.*, the social media company, and *Johnson & Johnson*, the consumer healthcare, pharmaceutical, and medical device company. *Facebook* generates its revenues from advertising and fees for virtual currency and digital goods. *Johnson & Johnson* manufactures and sells a diverse range of healthcare products. Whereas *Facebook* primarily provides services and *Johnson & Johnson* manufactures and sells goods, both companies determine their costs associated with providing these services and goods based on the authoritative literature, which is grounded in the conceptual framework. Studying the conceptual framework of accounting will prepare you to understand the foundation of the guidance and associated financial reporting.

The conceptual framework defines the objective of financial reporting as providing financial information that is useful in making decisions about resource allocation. It identifies characteristics associated with high-quality financial information. The conceptual framework also defines the elements of the financial reporting system, such as assets and liabilities, and specifies the recognition and measurement criteria to be used in practice. Therefore, when investors and creditors analyze financial statements of companies such as *Facebook* or *Johnson & Johnson*, they understand how the financial statements were prepared, what each financial statement contains, and what each line item on the statements represents.

Pichugin Dmitry/Shutterstock

We will discuss the purpose of a conceptual framework in the first part of this chapter. The FASB and the IASB currently have two separate conceptual frameworks, which are partially converged. The two boards have converged to the same objective of financial reporting and the same qualitative

characteristics. Other areas such as elements and recognition, measurement, and the reporting entity are not converged. For these areas, we will discuss similarities and differences between U.S. GAAP and IFRS. ‹‹

- 1 Explain what a conceptual framework is and why it is important in accounting standard setting.

Overview of the Conceptual Framework

A **conceptual framework** sets forth theory, concepts, and principles to ensure that accounting standards are coherent and uniform. The conceptual framework states that a purpose of the conceptual framework is to assist standard setters in developing and revising accounting standards. However, the conceptual framework does not override accounting standards.

Conceptual Framework Components

In this chapter, we will examine the following conceptual framework components:

- Objective of financial reporting
- Characteristics associated with high-quality financial information
- Elements of the financial reporting system
- Recognition and measurement criteria

Throughout the rest of the text, we refer to this discussion of the conceptual framework. Sections in the text called “The Conceptual Framework Connection” provide a structure to guide our discussions and analyses by explicitly establishing the relevant conceptual underpinnings.

Exhibit 2.1 illustrates the relationship among the conceptual framework components. Specifically, the exhibit shows how the objective of financial reporting flows through to the qualitative characteristics, elements, measurement and recognition, and constraints, leading to financial standards for preparing financial statements. In this way, the financial statements are designed to meet the objective of financial reporting.

EXHIBIT 2.1 Conceptual Framework’s Role in Standard Setting

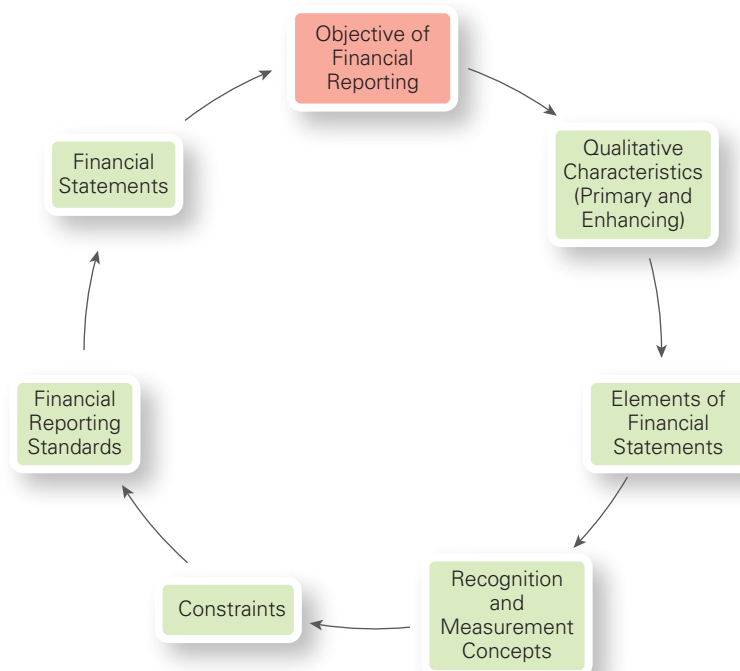

Exhibit 2.1 also illustrates the use of the conceptual framework in developing new standards and justifying existing standards. When developing new standards, the standard setters first determine if the proposed standard meets the objective of financial reporting. Next, the information provided by the new standard must possess the qualitative characteristics that make accounting information useful. The standard setters then consider the elements of the financial statements affected and the recognition and measurement concepts used to support the new standard. Before deciding to issue a new standard, the standard setters weigh constraints such as the cost and benefit of issuing the new standard, which may deter requiring the new standard. If the standard is issued, companies must disclose the changes in the financial statements.

The FASB is currently revising the conceptual framework. Exhibit 2.2 summarizes FASB's six-topic project initiated to revise its conceptual framework. The first topic on the objective of financial reporting and the qualitative characteristics has been completed. The FASB is currently working on Elements, Measurement, Presentation, and Disclosure. The other topic is inactive. At the current time, FASB and IASB are working independently on the conceptual framework.

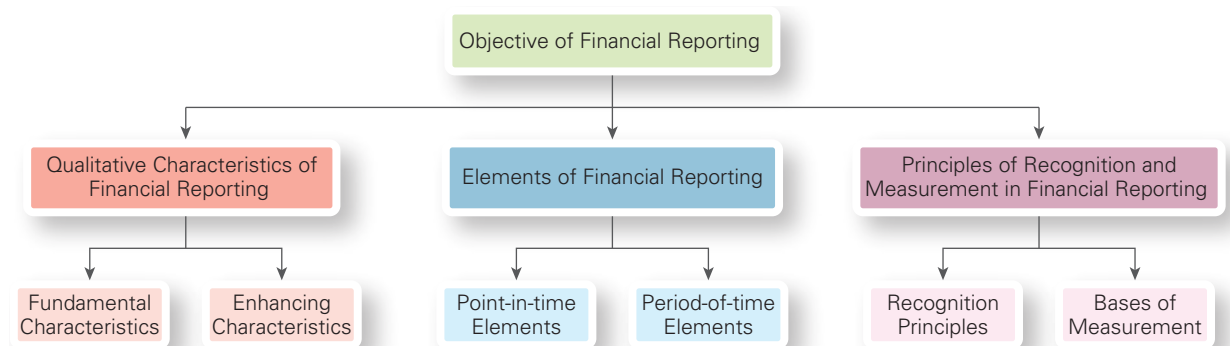

EXHIBIT 2.2 FASB Conceptual Framework Project

Topic	Status
Topic 1: Objective and Qualitative Characteristics	Completed ¹
Topic 2: Elements	Active—No Exposure Draft Issued
Topic 3: Measurement	Active—No Exposure Draft Issued
Topic 4: Reporting Entity	Inactive
Topic 5: Presentation	Active—Exposure Draft Issued
Topic 6: Disclosure	Active—Exposure Draft Issued

Exhibit 2.3 provides a detailed overview of the current conceptual framework. In the following sections, we will discuss the concepts statements that comprise the current conceptual framework.

EXHIBIT 2.3 Overview of the Conceptual Framework

¹The FASB issued *Statement of Financial Accounting Concepts No. 8*, "Conceptual Framework for Financial Reporting—Chapter 1, The Objective of General Purpose Financial Reporting and Chapter 3, Qualitative Characteristics of Useful Financial Information" (Norwalk, CT: Financial Accounting Foundation, 2010). *Statement of Financial Accounting Concepts Statement No. 8* superseded the sections of the existing conceptual framework covering the objective and qualitative characteristics of financial reporting. The IASB issued its own pronouncement, *Conceptual Framework for Financial Reporting* (London, UK: International Accounting Standards Board, 2010).

Interview

PAUL PACTER, FORMER MEMBER OF IASB »

Paul Pacter

Paul Pacter is a former member of the IASB. Prior to joining the Board, he served concurrently as its Director of Standards for Small- and Medium-sized Entities and also as Director in the Deloitte Touche Tohmatsu Global IFRS Office. Paul Pacter left the IASB in December, 2012.

- 1 How does a conceptual framework assist in the development of future accounting standards and reduce the possibility of non-comparable accounting treatments or creating conflicting accounting standards?

A common goal of the IASB and the FASB—and their constituents—is for their standards to be based on an agreed set of fundamental *concepts* rather than being a collection of current *practices*. Fundamental concepts start with agreement on the objective of financial reporting—who uses financial statements, for what kinds of decisions, and what information is relevant to those decisions? These concepts define the basic building blocks of a financial report (what is an asset, liability, income, and expense?) and the general principles for recognizing, measuring, and presenting them. A *conceptual framework* enables accounting standard setters to develop a high-quality and internally consistent body of standards, thereby ensuring that an entity's financial report meets the needs of users.

Without agreement on a conceptual framework, each IASB member would approach an accounting issue with his or her own personal conceptual framework. As board members changed, the underlying concepts would change, resulting in *ad hoc*, inconsistent, and possibly conflicting standards.

- 2 How effective is the current conceptual framework at assisting auditors and preparers of financial information in dealing with events and transactions not covered by a specific accounting pronouncement?

No matter how good a framework is, it will never be a machine where you input some accounting question and out comes a clear accounting answer. Developing and applying accounting standards consistent with the framework always requires judgment. The framework provides standard setters with guidance and direction to exercise those judgments. Although it gives some guidance to a preparer or auditor of financial statements, it is less useful to them.

The IASB has taken the conceptual framework to a higher level than FASB. IAS 8, our standard on accounting policies, sets out a hierarchy of accounting policies: To assert that you comply with IFRS, you must follow all our standards. If no standard directly addresses your accounting question, then you must develop a policy that results in the most relevant and reliable information, drawing an analogy with an existing standard. If you cannot do that, it is mandatory to look to the conceptual framework. So under IFRS, the conceptual framework becomes a part of the standards.

- 3 Why is knowledge of accounting important to be an effective businessperson, particularly in light of the recent global financial turmoil?

A business entity that raises capital from investors and creditors must be accountable to them, providing essential information about its performance, condition, and prospects through accurate and understandable financial accounting. It is also accountable to other constituents—vendors, employees, governments, and the community at large.

Capital providers want transparency. When they understand and have confidence in the financial figures, a company's ability to obtain the capital it needs—priced fairly relative to the risks that the capital provider assumes—improves. Ultimately, the economy in which it operates improves.

Accounting's role is to report faithfully and without bias the results of transactions and other economic events and conditions—both positive and negative—that affect a business entity. For example, obligations that meet the definition of a liability should be on the balance sheet. Impairments of assets that have already happened should be recognized as losses, even if there is cause for optimism that the situation may turn around.

- 4 What critical issues face the accounting profession today? What advice might you offer to future accountants?

The number one challenge for financial reporting is to stay relevant to the needs of investors, lenders, creditors, and other financial statement users. The information must be useful for capital allocation and pricing decisions. That is why governments and regulators require publicly traded companies (and often private companies as well) to publish accurate financial statements. We accountants must never lose sight of the important public interest in our work.

Discussion Questions

1. Discuss several components of the current conceptual framework that provide guidance and direction to accountants when exercising judgment.
2. Discuss the meaning of Paul Pacter's statement, "We accountants must never lose sight of the important public interest in our work."

Conceptual Framework: IFRS

The IASB's objective and qualitative characteristics are identical to U.S. GAAP. However, they differ in the descriptions of elements of financial reporting and principles of recognition and measurement in financial reporting. The IASB is also currently revising its framework.

- ② Define the objective of financial reporting.

The Objective of Financial Reporting

According to the conceptual framework, the objective of financial reporting is:

To provide financial information about the reporting entity that is useful to existing and potential investors, lenders, and other creditors in making decisions about providing resources to the entity. Those decisions involve buying, selling, or holding equity and debt instruments and providing or settling loans and other forms of credit.²

The conceptual framework indicates that the primary users of financial information are the investors, lenders, and other creditors who cannot demand information from the entity.³ For instance, if *Bank of America* extends credit to *Johnson & Johnson*, the bank can demand any information needed to approve the loan. However, an individual investor in *Johnson & Johnson's* publicly traded debt usually cannot obtain additional information from the entity to help assess the amount, timing, and uncertainty of future cash flows. Investors also require financial information to form an opinion about a company's future cash flows and earnings—and many of the standard-setting board's decisions are based on this need.

- ③ Describe the qualitative characteristics of financial information, including the fundamental and enhancing characteristics of financial reporting.

The Qualitative Characteristics of Financial Information

The objective of financial reporting is to provide useful information for decision making by investors, lenders, and other creditors. What characteristics make financial information useful? The conceptual framework divides the qualitative characteristics into *fundamental characteristics* and *enhancing characteristics*, and discusses the cost constraint on providing information.

Fundamental Characteristics

Fundamental characteristics are those basic characteristics that distinguish useful financial information from information that is not useful. The FASB identifies the two fundamental characteristics as *relevance* and *faithful representation*.

Relevance. Financial information is **relevant** if it is capable of making a difference in decision making by exhibiting the following attributes:

- Predictive value
- Confirmatory value
- Materiality

Information has **predictive value** if decision makers can use it as an input into processes that help forecast future outcomes. For example, companies report sales revenue each year. Financial statement users may use the prior year's revenues to predict future revenues. Both *BMW* and *Porsche*, German automobile manufacturers, reported sales increases in their earnings announcements for fiscal 2015. By highlighting the increase in sales, the companies implicitly benchmarked the current sales against past sales. The sales from prior years can then be useful to investors in forecasting future revenues in periods beyond 2015.

²From the FASB's *Concepts Statement No. 8*, Paragraph OB2, and the IASB's *Conceptual Framework for Financial Reporting*, Paragraph OB2.

³If the objective were to provide information to a different group (e.g., regulators), then the boards would arrive at different reporting requirements.

Information has **confirmatory value** if it provides feedback about prior evaluations. For example, financial statement users will often compare reported net income to prior earnings forecasts. Consider *Johnson & Johnson*, which beat or exceeded analysts' forecasted earnings per share in the fourth quarter of 2016, by reporting earnings per share of \$1.58.

The concept of *materiality* also determines the relevance of information. Information is **material** if reporting it inaccurately or omitting it would affect financial statement users' decisions. The materiality of an item can depend on its size or nature. The conceptual framework does not specify a quantitative threshold for the materiality of an item nor does it identify the specific nature of items that would be considered material. Rather, whether an item is material depends on the company and its financial reporting. Preparers and auditors must use professional judgment to determine the materiality of an item.

As an example of materiality varying with size, consider a \$5,000 loss incurred when a computer is damaged. For a small start-up consulting firm, the loss could be material—that is, it could affect a financial statement user's decision such as extending credit to the firm. For a large, profitable consulting firm, a \$5,000 loss would likely be immaterial. The planned disposition of a major operating segment is an example of an item that is material by its nature. Even though there is no quantifiable amount that would be reported in the financial statements, not informing financial statement users of the planned disposition could affect their assessment of the company's future performance and their decisions about investing in or extending credit to the company.

Faithful Representation. The second qualitative characteristic, **faithful representation**, indicates whether financial information depicts the substance of an economic event in a manner that is

- Complete
- Neutral
- Free from error

The depiction of an economic event is considered **complete** if it includes all information—both descriptions and explanations—necessary for the financial statement user to understand the underlying economic event. For example, a company reports a balance of long-lived assets on its balance sheet. From this one amount, a financial statement user cannot fully understand the company's investment in its long-lived assets. A complete depiction of a company's long-lived assets includes a description of the nature of the assets, the balance by type, and a description of the depreciation method used for each type. For example, *Johnson & Johnson* reported \$15,905 million of net property, plant, and equipment on its January 3, 2016, balance sheet, representing about 12% of its total assets. It presents its property, plant, and equipment in more depth in its footnotes to the financial statements to provide a more complete depiction of the company's property, plant, and equipment. In the footnote, *Johnson & Johnson* includes the amount of each major class of property, plant, and equipment such as the \$22,511 million of machinery and equipment. After the table, *Johnson & Johnson* includes other information on its property, plant, and equipment such as the amounts of capitalized interest expense and depreciation expense. Exhibit 2.4 presents note 4 from *Johnson & Johnson's* 2015 annual report.

In its financial statement notes, *Johnson & Johnson* also states that its property, plant, and equipment are reported at cost. The company indicates that it depreciates plant and equipment using the straight-line method and provides estimated useful lives. Further, the company identifies and reports the historical costs of four different categories of property, plant, and equipment. *Johnson & Johnson* also reports the total accumulated depreciation on these assets.

Information is **neutral** if it is free from bias in both the selection and presentation of financial data. For example, assume that Haster Incorporated has three lawsuits pending at the end of the year. It discloses information only about the lawsuit that it expects to have a favorable outcome but not the two for which it expects unfavorable outcomes. This biased reporting does not faithfully represent the firm's financial position.

Information is reported **free from error** when there are no mistakes or omissions in the description of an event or in the process used to produce the financial information. However, the information need not be accurate in all respects. Specifically, firms report a significant amount of

EXHIBIT 2.4 *Johnson & Johnson* Property, Plant and Equipment Note Excerpt, January 3, 2016, Financial Statements

NOTE 4: Property, Plant and Equipment

At the end of 2015 and 2014, property, plant and equipment at cost and accumulated depreciation were:

(Dollars in Millions)	2015	2014
Land and land improvements	\$ 780	\$ 833
Buildings and building equipment	9,829	10,046
Machinery and equipment	22,511	22,206
Construction in progress	<u>3,528</u>	<u>3,600</u>
Total property, plant and equipment, gross	\$ 36,648	\$36,685
Less accumulated depreciation	<u>(20,743)</u>	<u>(20,559)</u>
Total property, plant and equipment, net	<u>\$ 15,905</u>	<u>\$16,126</u>

The Company capitalizes interest expense as part of the cost of construction of facilities and equipment. Interest expense capitalized in 2015, 2014, and 2013 was \$102 million, \$115 million, and \$105 million, respectively.

Depreciation expense, including the amortization of capitalized interest in 2015, 2014, and 2013, was \$2.5 billion, \$2.5 billion, and \$2.7 billion, respectively.

Upon retirement or other disposal of property, plant and equipment, the costs and related amounts of accumulated depreciation or amortization are eliminated from the asset and accumulated depreciation accounts, respectively. The difference, if any, between the net asset value and the proceeds are recorded in earnings.

Source: Annual Report, 2015 Johnson and Johnson

financial information based on estimates. For example, companies estimate the amount of receivables that will ultimately become uncollectible. Because the amount of uncollectible receivables is an estimate, the actual amount could be different.

Enhancing Characteristics

Even if information is relevant and representationally faithful, it may not be the most useful data available for decision making. The FASB identifies the following four **enhancing characteristics** that help distinguish more useful information from less useful information:

- Comparability
- Verifiability
- Timeliness
- Understandability

Comparability. Investors and creditors must be able to compare entities in making capital allocation decisions. **Comparability** allows financial statements users to identify and understand similarities and differences among several entities. Accounting standards often allow alternative methods, such as straight-line or accelerated depreciation, and require estimates, like the useful lives of long-lived assets. A company's financial information is useful if financial statement users can compare it with similar information from another company, companies in its industry, or to its prior year. For example, the requirement to disclose the useful lives of long-lived assets allows financial statement users to compare the aircraft fleets of *American Airlines* and *Delta Airlines*. *American* uses a 16- to 30-year useful life for its fleet whereas *Delta* uses a longer 20- to 32-year

useful life.⁴ The differing useful lives imply that *American* has aircraft with a shorter useful life and probably has different types of planes in its fleet than *Delta*.

Verifiability. **Verifiability** means that a group of reasonably informed financial statement users are able to reach a consensus decision that reported information is a faithful representation of an underlying economic event. For example, two independent accountants would agree that a company owes \$100,000 to a commercial bank by examining the loan agreement.

Timeliness. **Timely information** is available to financial statement users early enough to make a difference in decision making. In the United States, public companies prepare financial statements every quarter and annually. Imagine trying to make an investment decision if financial statements were issued only every five years: You would possess outdated information irrelevant to decision making in the current period. Generally, older information is less useful than more recent information.

Understandability. Information is **understandable** to reasonably informed financial statement users when financial statements classify, characterize, and clearly present all information. Because many companies are incredibly complex, it is very important to distill the vast amounts of financial data into a manageable report for users to read and understand. As an example of how financial statements are organized to aid understandability, companies separate current and non-current assets on their balance sheets. As a result, financial statement users can better understand a company's current and long-term resources.

We summarize the qualitative characteristics in Exhibit 2.5.

Cost Constraint

Providing all relevant and representationally faithful information available is costly. As a result, the conceptual framework stipulates that standard setters should compare the cost of requiring information to the benefits derived from presenting this information when developing accounting standards. Standard setters consider costs for both financial statement reporters and users.

A company consumes a significant amount of resources in collecting, processing, verifying, and communicating its financial results. New standards or significant revisions of existing standards require companies to increase training, update accounting systems, and renegotiate existing contracts based on updated accounting information. On the other hand, if the information required under a new standard is not provided to the users, they incur costs in obtaining or estimating that information on their own.

To illustrate, assume that standard setters are considering requiring that retail stores report the sales and operating profit generated by each store by month. This information may be useful to investors and financial analysts. However, the cost of providing such detailed store-by-store information every month can be greater than its benefits. As a result, the information will not be required.

- 4 Identify the elements of financial reporting.

Elements of Financial Reporting

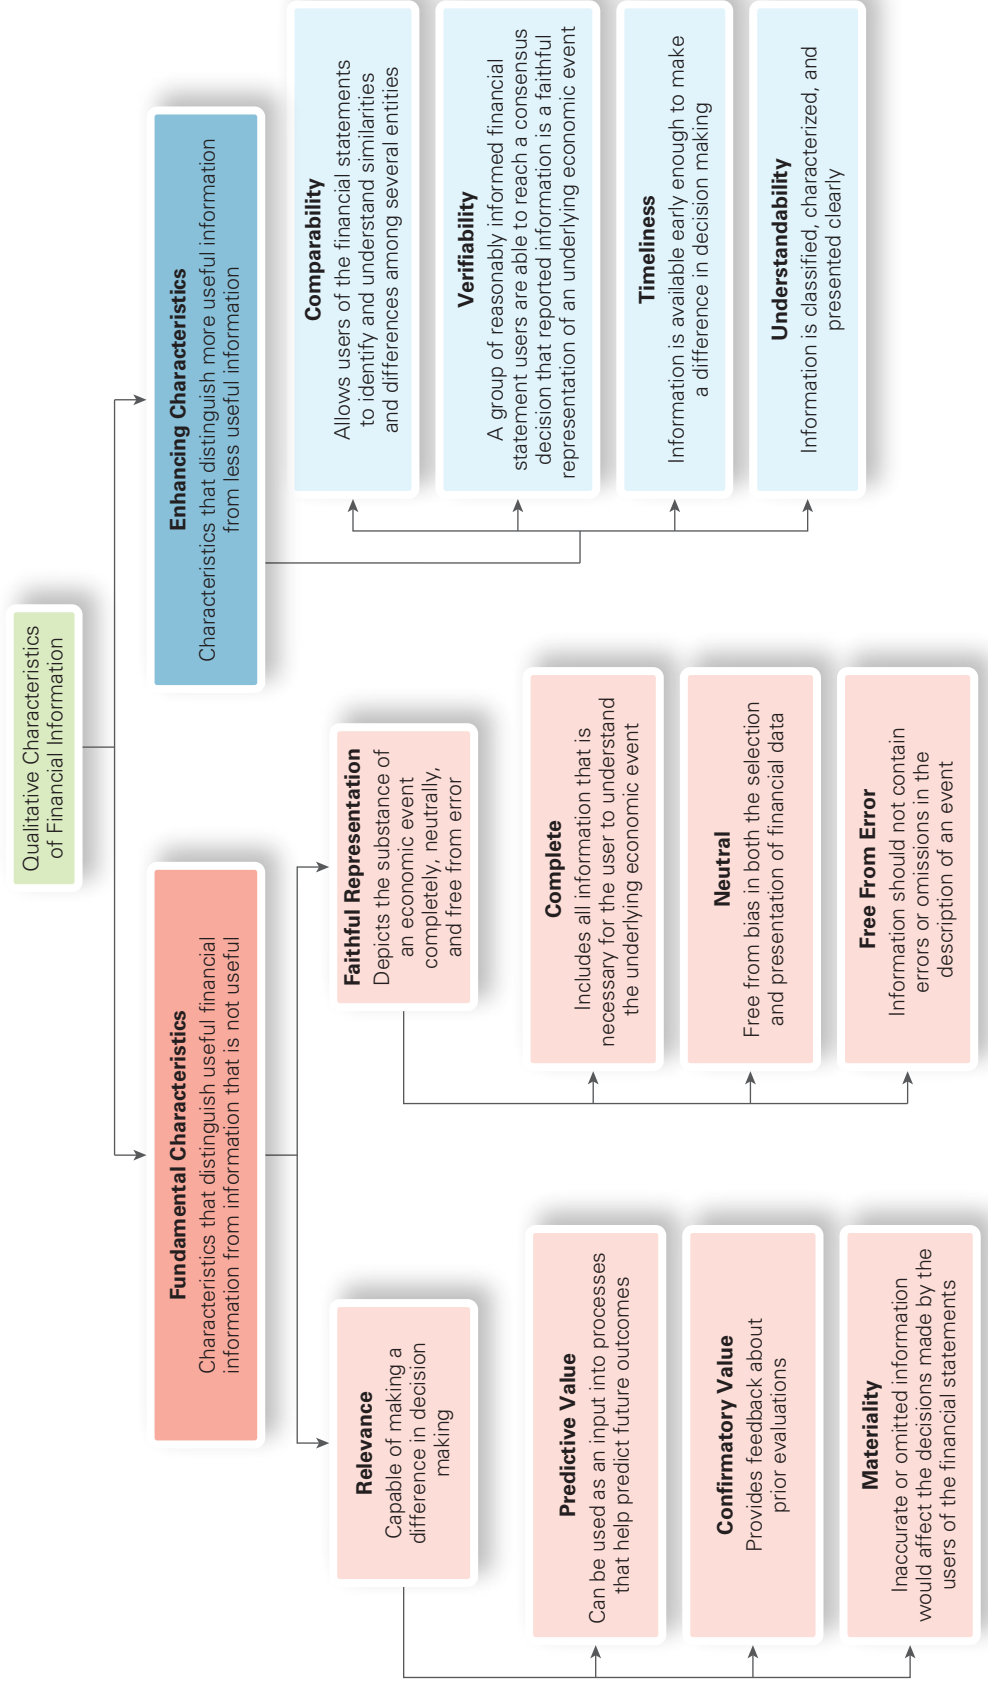

The second phase of the conceptual framework project builds on the objective of financial reporting and characteristics of financial information. This section provides a discussion of the elements of financial reporting, which are the building blocks of the financial statements.

The two groups of elements are *point-in-time elements* and *period-of-time elements*.

1. **Point-in-time elements** represent resources, claims to resources, or interests in resources as of a specific point in time and appear on the balance sheet (statement of financial position). For example, accounts receivable and accounts payable are point-in-time elements.

⁴Sources: <http://d11ge852tjjqow.cloudfront.net/CIK-0000027904/082dbd71-0d08-4ce4-b155-3f7bb2018395.pdf>; <http://phx.corporate-ir.net/phoenix.zhtml?c=117098&p=irol-reportsannual>

EXHIBIT 2.5 Qualitative Characteristics of Financial Information

2. **Period-of-time elements** represent the results of events and circumstances that affect an entity during a period of time and appear on the income statement, statement of comprehensive income, or statement of shareholders' equity. Sales revenue, depreciation expense, and dividends declared are examples of period-of-time elements.

Elements

We begin by examining the point-in-time elements.

Point-in-Time Elements. U.S. GAAP identifies the three point-in-time elements, which represent resources, claims to resources, and interests in resources as of a point in time such as a specific balance sheet date. The point-in-time elements are:

1. Assets
2. Liabilities
3. Equity

Exhibit 2.6 presents the U.S. GAAP definitions of each element.

EXHIBIT 2.6 Definitions of Point-in-Time Elements

Element	Definition
Assets	Probable future economic benefits obtained or controlled by a particular entity as a result of past transactions or events
Liabilities	Probable future sacrifices of economic benefits arising from present obligations of a particular entity to transfer assets or provide services to other entities in the future as a result of past transactions or events
Equity	The net assets or residual interest in the assets of an entity that remains after deducting its liabilities.

Source: FASB, *Statement of Financial Accounting Concepts No. 6*, "Elements of Financial Statements," Paragraphs 25, 35, 49

Assets are probable future economic benefits resulting from some past event. In addition to the asset definition, U.S. GAAP identifies three enhancing characteristics of an asset:⁵

1. "It embodies a probable future benefit that involves a capacity, singly or in combination with other assets, to contribute directly or indirectly to future net cash inflows,
2. A particular entity can obtain the benefit and control others' access to it, and
3. The transaction or other event giving rise to the entity's right to or control of the benefit has already occurred."

The future economic benefit from an asset is the cash flows generated from its use. For instance, an account receivable is an asset because it generates cash upon collection. Controlling an asset means that no other entity can use or access it without permission. For example, another entity does not have the right to use another company's plant and equipment unless these assets are under a lease agreement. Finally, the asset arises out of an event or transaction that has already occurred. An account receivable usually arises when a completed sale transaction occurs.

U.S. GAAP defines **liabilities** as probable future sacrifices of economic benefits arising from present obligations of a particular entity to transfer assets or provide services to other entities in

⁵Financial Accounting Standards Board, *Statement of Financial Accounting Concepts No. 6*, "Elements of Financial Statements" (Stamford, CT: FASB, 1985), Paragraph 26.

the future as a result of past transactions or events. U.S. GAAP also identifies three characteristics that enhance the definition of a liability:⁶

1. “It embodies a present duty or responsibility to one or more other entities that entails settlement by probable future transfer or use of assets at a specified or determinable date, on occurrence of a specified event, or on demand,
2. The duty or responsibility obligates a particular entity, leaving it little or no discretion to avoid the future sacrifice, and
3. The transaction or other event obligating the entity has already happened.”

These characteristics indicate that a liability will result in a future sacrifice, which can be the transfer of an asset such as cash or the use of an asset to fulfill the obligation. For example, salaries payable are a liability because the entity must pay its employees cash in the future in exchange for services they have already provided to the company.

Equity, or net assets, is the difference between assets and liabilities. This residual interest in a company’s assets remains after the claims of creditors have been satisfied and therefore represents the ownership interest. The amount of equity is the cumulative result of investments by owners, comprehensive income, and distributions to owners.

Period-of-Time Elements. Period-of-time elements represent the results of events and circumstances that occur between two balance sheet dates. The point-in-time and period-of-time element groups interrelate or are said to articulate. Period-of-time elements will change point-in-time elements (i.e., assets, liabilities, and equity). For example, revenues will increase equity and expenses will decrease equity. Dividends declared will decrease equity. Another example is accounts receivable increasing when a sale is made on account. Salaries payable increases when employees have not yet been paid for work performed but equity is decreased.

In the conceptual framework, U.S. GAAP identifies seven period-of-time elements:

1. Investments by owners
2. Distributions to owners
3. Revenues
4. Gains
5. Expenses
6. Losses
7. Comprehensive income

The first two elements, investments by owners and distributions to owners, represent transactions with owners. Investments by owners include the issuance of stock. Dividends are an example of distributions to owners. The remaining five elements relate to business activities occurring during the period.

Revenues and expenses are changes in equity that arise in the ordinary course of business. Gains and losses also change equity but are not considered part of normal operations. For example, **Target Corporation** owns some of the stores it operates. **Target** records depreciation expense on the buildings as part of its operating income. Now assume that **Target** sold one of its stores. It would have a gain or loss on the sale measured as the difference between the sale proceeds and the building’s carrying value. **Target** did not include the gain or loss in normal operations and it would not classify it as revenue or expense. Rather, it would recognize the amount as either a gain or loss on disposal.

Comprehensive income includes all changes in equity during a period except those resulting from investments by owners and distributions to owners. As a result, comprehensive income includes net income and other gains or losses currently not recognized on the traditional income statement. For example, if a company invests in certain debt securities and the fair value of these shares declines, the equity of the company decreases. The decline in equity is part of other

⁶FASB, *Statement of Financial Accounting Concepts No. 6*, “Elements of Financial Statements,” Paragraph 36.

comprehensive income and may not be included on the traditional income statement.⁷ The FASB's definition and summary of the period-of-time elements are in Exhibit 2.7.

EXHIBIT 2.7 Period-of-Time Elements

Element	Definition
Investments by Owners	Increases in equity of a particular business enterprise resulting from transfers to it from other entities of something valuable to obtain or increase ownership interests (or equity) in it. Assets are most commonly received as investments by owners, but that which is received may also include services or satisfaction or conversion of liabilities of the enterprise.
Distributions to Owners	Decreases in equity of a particular business enterprise resulting from transferring assets, rendering services, or incurring liabilities by the enterprise to owners. Distributions to owners decrease ownership interest (or equity) in an enterprise.
Revenues	Inflows or other enhancements of an entity's assets or settlements of its liabilities (or a combination of both) from delivering or producing goods, rendering services, or other activities that constitute the entity's ongoing major or central operations.
Gains	Increases in equity (net assets) from an entity's peripheral or incidental transactions and from all other transactions and other events and circumstances affecting the entity except those that result from revenues or investments by owners.
Expenses	Outflows or other consumption of assets or incurrences of liabilities (or a combination of both) from delivering or producing goods, rendering services, or carrying out other activities that constitute the entity's ongoing major or central operations.
Losses	Decreases in equity (net assets) from an entity's peripheral or incidental transactions and from all other transactions and other events and circumstances affecting the entity except those that result from expenses or distributions to owners.
Comprehensive Income	The change in equity of a business enterprise during a period from transactions and other events and circumstances from nonowner sources. It includes all changes in equity during a period except those resulting from investments by owners and distributions to owners.

Source: FASB, *Statement of Financial Accounting Concepts No. 6*, "Elements of Financial Statements"

Elements: IFRS

In this section, we discuss similarities and key differences in the elements under U.S. GAAP and IFRS.

Point-in-Time Elements. IFRS identifies the same three point-in-time elements as U.S. GAAP:

1. Assets
2. Liabilities
3. Equity

⁷We discuss the distinction between net income and comprehensive income in Chapter 5.

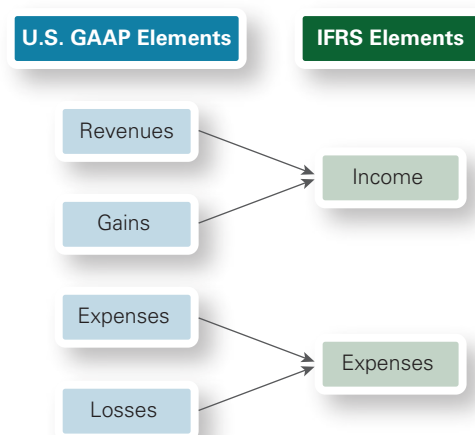

The definitions of these elements differ slightly in IFRS. Companies usually identify the same assets and liabilities under both U.S. GAAP and IFRS, however, so we do not explore the details of the IFRS definitions.⁸

Period-of-Time Elements. IFRS identifies four period-of-time elements:

1. Performance
2. Income (includes both revenues and gains)
3. Expenses (includes both expenses and losses)
4. Capital maintenance adjustments

IFRS explicitly identifies performance, or profit, as a separate element. In contrast, profit is the result of adding revenues and gains and subtracting expenses and losses under U.S. GAAP. Where U.S. GAAP identifies revenues and gains as separate elements, the income element in IFRS encompasses both revenues and gains as both increase equity. Similarly, where U.S. GAAP identifies expenses and losses as separate elements, the expense element under IFRS encompasses both expenses and losses as both decrease equity. Exhibit 2.8 illustrates the links between these definitions under U.S. GAAP and IFRS.

EXHIBIT 2.8 Links between Revenues, Gains, Income, Expenses, and Losses under U.S. GAAP and IFRS

Unlike U.S. GAAP, IFRS determines capital maintenance adjustments from period to period. IFRS defines **capital maintenance adjustments** as restatements or revaluations of reported amounts of assets and liabilities that companies usually report in other comprehensive income. The concept of capital maintenance relates to how a company seeks to assess changes in its equity. Capital is maintained when the amount of equity in the current year is at least as much as it was in the prior year.⁹ Because capital maintenance assesses changes in equity, it is linked to how profit is determined. There are two concepts of capital maintenance:

- *Financial capital maintenance*
- *Physical capital maintenance*

⁸One exception in assets and liabilities reported under U.S. GAAP and IFRS is related to the accounting for research and development costs. Under U.S. GAAP, companies expense all research and development costs. U.S. standard setters view the probable future economic benefits of research and development as so uncertain that research and development cannot be considered an asset. International standard setters also view research costs as uncertain and require companies to expense them under IFRS. However, companies can record development costs as an asset under IFRS when certain conditions are met. The difference in treating development costs as an asset is not due to a difference in the definition of an asset under U.S. GAAP and IFRS. Rather, it is attributable to differences in the interpretation of what is a probable future benefit. We discuss the accounting for research and development costs in Chapter 11.

⁹We exclude distributions to and contributions from owners during the period in determining whether capital has been maintained.

Under the concept of **financial capital maintenance**, capital is viewed as the financial amount, or money amount, invested in a company. A company earns profit only if the financial amount, or dollar amount, of the equity at the end of the period is higher than it was at the beginning of the period. For example, financial capital is maintained and a profit is earned when the ending balance of equity is \$750,000 higher than the beginning balance.

Under the concept of **physical capital maintenance**, capital is viewed as the productive capacity of a company, such as units of output per day. A company earns a profit if its productive capacity is greater at the end of the period than it was at the beginning of the period. The concept of physical capital maintenance relies on current cost measurement and is consistent with the revaluation or restatement of long-lived operating assets and liabilities. For example, physical capital is maintained and a profit is earned when the output of goods produced is 200,000 units higher in the current year than in the prior year. IFRS allows a company to determine the concept of capital maintenance that is most appropriate for its business.

Finally, also note that unlike U.S. GAAP, IFRS does not treat transactions with the owners as separate elements.

- 5 Demonstrate an understanding of recognition and measurement in financial reporting, including general recognition principles, revenue and expense recognition, and accrual accounting.

Principles of Recognition and Measurement

The use of the accrual basis, rather than the cash basis, is a distinguishing feature of financial accounting. We discuss the underlying principles of accrual accounting in this section that include:

- General recognition
- Revenue and expense recognition
- Bases of measurement

General Recognition Principles

Recognition is the process of reporting an economic event in the financial statements. Recognized events are included in a line item on the financial statements as opposed to in the notes to the statements.¹⁰

Companies should recognize items when (and only when) they have met the following four criteria.

1. *The item meets the definition of one of the elements of the financial statements.* For example, before a company records an asset, the item must meet the definition of an asset.
2. *The item is measurable.* Events that are relevant to decision making are recognizable only if the firm can measure them. Consider an entity that has been sued. In the early stages of the lawsuit, it may not be possible to reliably estimate the amount of the potential obligation. Therefore, it does not report a liability on the balance sheet.
3. *The item must be reliable.* This notion is similar to the faithful representation characteristic discussed earlier in that reliable financial information depicts the substance of an economic event in a manner that is complete, neutral, and free from error.
4. *The item is relevant.* That is, it must allow financial statement users to make rational economic decisions.

An item could meet all four of the above criteria and still not be recognized due to the *cost-benefit constraint* or a *materiality threshold*. Similar to the cost constraint that standard setters apply when setting accounting standards, companies use the *cost-benefit constraint* when determining when to recognize an item in the financial statements. The **cost-benefit constraint** requires that the expected benefits from recognition exceed the costs of recognition. Reporting the individual wages and salaries for 2,500 employees worldwide in a company may be more useful

¹⁰FASB, *Statement of Financial Accounting Concepts No. 5*, "Recognition and Measurement in Financial Statements of Business Enterprises" (Stamford, CT: FASB, 1984), Paragraph 6.

in certain analyses than simply reporting total wage and salary expense on the income statement. However, the cost of providing that information will probably exceed its benefit.

The **materiality threshold** requires that an item be recognized in the financial statements if its omission or misstatement would significantly influence the judgment of a reasonably informed statement user. Materiality can apply to a numerical value or a nonquantifiable concern. For example, a company facing an antitrust violation has no amounts to report because the litigation is still in process. However, the firm must disclose the litigation to ensure its financial statements are transparent.

Revenue and Expense Recognition

The financial markets' emphasis on reported earnings makes revenue and expense recognition principles important. Recall from our earlier discussion that *Johnson & Johnson* beat analysts' forecasts in the fourth quarter of 2016. The ability to report earnings in line with or higher than forecasts can be critical to a company's stock price. The intent of the revenue and expense recognition principles is to recognize revenue and expenses in the appropriate time period.

The **revenue recognition principle** in the conceptual framework states that a company should recognize revenue when it is *realized* or *realizable* and *earned*:

1. An item is **realized** or **realizable** when a company exchanges a good or service for cash or claims to cash.
2. Revenues are considered **earned** when the seller has accomplished what it must do to be entitled to the revenues.^{11,12}

A new revenue standard, which public companies can start adopting in 2017, is not completely aligned with the conceptual framework. That is, the new revenue standard indicates that the overarching principle of revenue recognition is the notion of the transfer of control of the goods or services. Five steps are applied to determine the timing and measurement of revenue:

1. Identify the contract with the customer.
2. Identify the separate performance obligations in the contract.
3. Determine the transaction price.
4. Allocate the transaction price to separate performance obligations.
5. Recognize revenue when each performance obligation is satisfied.

We expect that FASB will align the conceptual framework with the new standard when it rewrites the framework.

Expense recognition principles are used to determine the period when a company reports an expense on the income statement. Firms recognize expenses when:

1. The entity's economic benefits are consumed in the process of producing or delivering goods or rendering services.
2. An asset has experienced a reduced (or eliminated) future benefit, or when a liability has been incurred or increased, without an associated economic benefit.

Therefore, a company reports an expense when economic benefits are consumed. There are three main approaches to determine when to report an expense:

- Match with revenues
- Expense in period incurred
- Systematically allocate over periods of use

¹¹See FASB's *Statement of Financial Accounting Concepts No. 5*, "Recognition and Measurement in Financial Statements of Business Enterprises," Paragraph 83 for a complete definition.

¹²Whereas FASB's *Statement of Financial Accounting Concepts No. 5* outlines requirements to recognize revenue, FASB's *Accounting Standards Update 2014-09*, "Revenue from Contracts with Customers" (Norwalk, CT: Financial Accounting Foundation, 2014) updates the guidance on when to recognize revenue.

The approach used depends on the type of expense. For example, some expenses—such as cost of goods sold—consume inventory when used and are matched with their related revenues. Specifically, firms match the cost of goods sold expense directly with the sales of inventory during the same period. Firms can also record expenses in the period in which they are incurred. For example, the salary of a staff accountant is recorded in the period worked. Finally, firms systematically allocate some expenses over the periods during which the related asset provides benefits. For example, a firm depreciates (i.e., expenses) a building over the periods that it will provide a benefit to the entity.

Commonly, firms reduce an asset or increase a liability when expected future cash flows change. For example, in the period that a company determines it can no longer sell certain inventory, it will record a loss on the income statement and write the inventory down on the balance sheet. Exhibit 2.9 summarizes these examples.

EXHIBIT 2.9 Examples of Expense Recognition

Income Statement Line Item	Related Balance Sheet Line Item	When to Recognize the Expense on the Income Statement	Approach to Recognize Expense
Cost of goods sold	Inventory	Upon sale of inventory	Match with revenue
Loss on inventory obsolescence	Inventory	When inventory value declines or becomes obsolete	Loss in period incurred
Supplies expense	Supplies	Upon use in operations and consumption of supplies	Expense in period incurred
Depreciation expense	Accumulated depreciation	Over time with use in production and consumption of future economic benefit	Systematically allocate over periods of use
Salary and wages expense	Salaries and wages payable	Recognize in the period services are performed	Expense in period incurred

Bases of Measurement

After a company determines that it should recognize an item, it has to measure the item.¹³ For example, when a company purchases inventory from a supplier, it also incurs freight costs to have the inventory shipped to its stores. The company recognizes inventory as an asset. It measures the value of the inventory asset as the purchase price plus the freight costs and reports that amount on the balance sheet.

The initial measurement of elements in the financial statements and their subsequent measurement are both pertinent to financial reporting. U.S. GAAP identifies five measurement bases used in financial reporting.¹⁴

1. **Historical cost** is the amount of cash (or equivalent) that the firm paid to acquire the asset. In the case of a liability, historical cost is the amount of cash (or equivalent) that the firm received when it incurred the obligation. The historical cost of an asset may be adjusted for depreciation or amortization.
2. **Current cost** is the amount of cash (or equivalent) that would be required if the firm acquired the asset currently.
3. **Current market value** is the amount of cash (or equivalent) that the firm would receive by selling the asset in an orderly liquidation. Liabilities may also be measured at current market value.

¹³The information included in this section is currently under review. The FASB is developing a revised concepts statement on measurement. An exposure draft has not yet been issued.

¹⁴FASB, *Statement of Financial Accounting Concepts No. 5*, "Recognition and Measurement in Financial Statements of Business Enterprises," Paragraph 67.

4. **Net realizable value** is the amount of cash (or equivalent) to be received in exchange for an asset, less the direct costs of disposal. In the case of a liability, it is the amount of cash (or equivalent) expected to be paid to liquidate the obligation, including any direct costs of liquidation.
5. **Present value of future cash flows** results from discounting net cash flows the firm expects to receive on the exchange of an asset or to pay to liquidate a liability.¹⁵

The historical cost approach results in the general policy that firms initially record assets (and liabilities) at cost and maintain them at cost until selling, consuming, or otherwise disposing of them. Historical cost is the agreed-upon acquisition price arrived at objectively through an *arms-length transaction*. An **arms-length transaction** involves a buyer and seller who are independent and unrelated parties, each bargaining to maximize his or her own wealth. Although historical costs are unrelated to current market values, firms continue to use historical cost information for most assets and in most industries. The use of historical cost is justified because it is objective and subject to verification.

The current cost, current market value, net realizable value, and present value of future cash flows measurement bases are all consistent with fair value reporting.¹⁶ There are times when fair value is observable, such as for a publicly traded equity security. When fair value is not directly observable—for example, an equity security that is not publicly traded—management uses judgment-based models to determine its fair value.

Fair Value Measurement and the Fair Value Hierarchy. The trend toward measuring financial assets and liabilities at fair value discussed in Chapter 1 impacts the amounts reported on the balance sheet. In order to improve user confidence in fair value measurements reported, the FASB requires disclosures that indicate the reliability of the inputs used in all fair value measures reported on the financial statements. This disclosure takes the form of a fair value hierarchy that provides three levels of reliability from the most to the least objective inputs used in the fair value measurement process.

Exhibit 2.10 presents the three levels of the fair value hierarchy.

EXHIBIT 2.10 Fair Value Hierarchy

Level	Inputs Used in the Measurement Process
Level 1	Quoted prices in active markets for an identical asset or liability. A publicly traded equity security is classified in this level.
Level 2	Inputs other than the quoted prices included in Level 1 that are observable for the asset or liability. For example, a building could be valued using a price per square foot obtained from transactions in a comparable building in a similar location.
Level 3	Unobservable inputs to value the asset or liability. For example, to measure the fair value of a private equity investment, a company might perform an analysis that relies on the present value of the expected future cash flows of that investment.

Source: FASB, *Statement of Financial Accounting Standards No. 157*, “Fair Value Measurement” (Norwalk, CT: FASB, 2006), Paragraphs 22–31

Ideally, companies would measure all financial assets and liabilities using Level 1 inputs, but that is not possible. Nonetheless, companies should use the highest level of reliability possible when determining fair values of financial assets or liabilities.

¹⁵Under U.S. GAAP, the present value measurement attribute is discussed in much greater length in the FASB’s *Statement of Financial Accounting Concepts No. 7*, “Using Cash Flow Information and Present Value in Accounting Measurements” (Norwalk, CT: FASB, 2000).

¹⁶FASB, *Statement of Financial Accounting Concepts No. 7*, “Using Cash Flow Information and Present Value in Accounting Measurements,” Paragraph 7.

The standard setters' decision as to whether a particular asset or liability should be measured at fair value often trades off the relevance of information provided with the ability of the information to be a faithful representation of the value of the asset or liability. For example, fair value is more relevant than historical cost, but it is typically a less faithful representation in terms of measuring the economic event than is historical cost.

However, U.S. companies generally do not report their nonfinancial assets such as equipment or land at market or appraisal values or adjust them for inflation. An exception is when an asset is impaired. For declines in fair value, firms are required to write down, or reduce, asset values.¹⁷ In most industries, nonfinancial assets are not valued above initial cost.

Recognition and Measurement: IFRS

In this section, we discuss major differences in recognition and measurement between U.S. GAAP and IFRS.

General Recognition Principles. IFRS also has four recognition criteria. Notice that the first three recognition criteria are similar to U.S. GAAP:

1. The item meets the definition of one of the elements.
2. The item is measurable.
3. The measurement of the item must be reliable.
4. It is probable that future economic benefits will flow to or from the company.

To illustrate the fourth criterion, assume management determines it is probable that the company will collect an estimated amount of receivables, resulting in an economic benefit to the company. Management should not include any receivables unlikely to be collected as assets by establishing an allowance for uncollectible accounts. This fourth criterion is used instead of relevance under U.S. GAAP.

The IFRS cost-benefit constraint and materiality constraint are similar to U.S. GAAP. We summarize the U.S. GAAP and IFRS recognition criteria in Exhibit 2.11.

EXHIBIT 2.11 General Recognition Principles

U.S. GAAP	IFRS
An item is recognized in the financial statements if it is:	
An element of the financial statements	Similar under U.S. GAAP and IFRS
Measurable	Similar under U.S. GAAP and IFRS
Reliable	Similar under U.S. GAAP and IFRS
Relevant	Not included in IFRS
Not included in U.S. GAAP	Probable that any future economic benefit associated with the item will flow to or from the company
Recognition is subject to the:	
Cost-benefit constraint	Similar under U.S. GAAP and IFRS
Materiality constraint	Similar under U.S. GAAP and IFRS

Source: FASB, *Statement of Financial Accounting Concepts No. 5*, "Recognition and Measurement in Financial Statements of Business Enterprises" and IASB, *Conceptual Framework for Financial Reporting*

¹⁷We discuss accounting for long-lived asset write-downs, impairments, in Chapter 12.

Revenue and Expense Recognition. Under the current IFRS conceptual framework, firms recognize revenue when they meet both of the following criteria:

1. An increase in future economic benefits related to an increase in an asset or a decrease of a liability has occurred.
2. The revenue can be measured reliably.¹⁸

Similar to U.S. GAAP, the IASB's recently adopted new revenue standard is not completely aligned with the IFRS conceptual framework.¹⁹ The IASB adopted the same new revenue standard as the FASB, applying the notion of the transfer of control of the goods or services for revenue recognition. We expect that IASB will align the conceptual framework with the new standard when it rewrites the framework.

Firms recognize expenses in the income statement when both of the following criteria are met:

1. A decrease in future economic benefits related to a decrease in an asset or an increase of a liability has occurred.
2. The expense can be measured reliably.²⁰

Firms recognize expenses simultaneously with an increase in liabilities or a decrease in assets. For example, salaries payable is increased when a company recognizes salary expense. Unlike U.S. GAAP, IFRS does not use the matching approach for expense recognition.

Bases of Measurement. IFRS includes four of the five measurement bases used under U.S. GAAP. The four IFRS measurement bases are:

1. Historical cost
2. Current cost
3. Net realizable value
4. Present value of future cash flows

IFRS does not include current market value as a separate measurement basis. Rather, the view under IFRS is that current cost, net realizable value, and the present value of future cash flows are all current market value measures.

Cash versus Accrual Accounting

U.S. GAAP is based on *accrual accounting*. It follows that U.S. GAAP does not allow a *cash-basis system*.²¹ To highlight the advantages of accrual accounting, we will begin by reviewing the cash-basis system.

Cash-Basis Accounting. Under the **cash basis**, firms recognize revenues only when they receive cash and recognize expenses only when they pay cash. Consequently, the cash basis measures cash receipts and disbursements but does not measure economic activity. Further, the cash basis enables firms to manipulate net income with the timing of cash flows. For example, a company using the cash basis could report higher net income by delaying payment of expenses until the next accounting period. Alternatively, to reduce reported earnings, a company could delay billing its customers until the next accounting period to ensure that it would not receive cash revenues in the current period.

¹⁸IASB, *Conceptual Framework for Financial Reporting*, Paragraph 4.47.

¹⁹IASB, *International Financial Reporting Standard 15*, "Revenue from Contracts with Customers" (London, UK: International Accounting Standards Board, 2014).

²⁰IASB, *Conceptual Framework for Financial Reporting*, Paragraph 4.49.

²¹In U.S. GAAP, the mandate for accrual accounting is in the FASB's *Statement of Financial Accounting Concepts No. 6*, "Elements of Financial Statements" (Norwalk, CT: FASB, 1985), Paragraph 134. IFRS discusses accrual accounting in IASB, *Conceptual Framework for Financial Reporting*, Paragraphs OB17-19.

Accrual Accounting. Under the **accrual basis**, firms recognize revenues and expenses according to the principles we have discussed. When the firm receives or pays cash does not matter. Rather, the accrual basis seeks to report the underlying economics of each transaction on the company. In summary, the accrual basis of accounting recognizes revenues when control of a good or service passes to the customer and expenses when incurred. As a result, the major difference between cash and accrual accounting is the timing of revenue and expense recognition.

EXAMPLE 2.1 The Cash versus the Accrual Basis of Accounting

PROBLEM: Yards, Inc. mows lawns at a fee of \$100 per month. In the current year, 200 customers prepaid for the four months in the summer, beginning on May 1. Yards received \$80,000 of cash receipts ($\$100 \text{ per month} \times 200 \text{ customers} \times 4 \text{ months}$) in May. Yards, Inc. provided the required service for four months by mowing lawns throughout May, June, July, and August. During those months, the company incurred expenses of \$10,000, \$13,000, \$12,000, and \$10,000, respectively, and paid these expenses during the same month it consumed the economic benefit. Determine Yards Inc.'s net income for each month from May through August under both the cash and the accrual bases of accounting.

SOLUTION: Because Yards Inc. paid for the expenses in the same month it consumed the benefits, there is no difference in expense recognition between the cash basis and accrual basis. However, there is a difference in revenue recognition.

Under cash-basis accounting, Yards would recognize revenue of \$80,000 in May because that is when it received cash. However, under the accrual basis, it would recognize revenue of \$20,000 ($\$100 \text{ per yard} \times 200 \text{ yards}$) in each of the four months.

Thus, under both systems Yards will ultimately recognize \$80,000 revenue, \$45,000 in expenses, and \$35,000 in net income. However, the timing of the revenue recognition differs, as illustrated in the following table.

Month	Revenue Recognition		Expense Recognition		Net Income (Loss)	
	Cash Basis	Accrual Basis	Cash Basis	Accrual Basis	Cash Basis	Accrual Basis
May	\$80,000	\$20,000	\$10,000	\$10,000	\$70,000	\$10,000
June	- 0 -	20,000	13,000	13,000	(13,000)	7,000
July	- 0 -	20,000	12,000	12,000	(12,000)	8,000
August	- 0 -	20,000	10,000	10,000	(10,000)	10,000
Totals	<u>\$80,000</u>	<u>\$80,000</u>	<u>\$45,000</u>	<u>\$45,000</u>	<u>\$35,000</u>	<u>\$35,000</u>

Note that the cash basis reports only cash receipts and disbursements but does not properly measure economic activity. Yards' cash-basis net income is overstated in May and understated in June, July, and August.

- 6 Explain the assumptions used in financial reporting.

Assumptions in Financial Reporting

We will now examine a number of underlying assumptions that are integral to the financial reporting process. The assumptions we discuss are:

- Going concern concept
- Business or economic entity concept
- Monetary unit assumption
- Periodicity assumption

U.S. GAAP does not directly state these four items as assumptions in the conceptual framework.²² Yet, they are implicit in determining financial reporting standards.

Going Concern Concept

Many assumptions in the financial statements are based on long-term periods. How can a manager assert with certainty that a business will be viable in, say, 25 years? The **going concern concept** indicates that accountants will record transactions and prepare financial statements as if the entity will continue to operate for an indefinite period of time unless there is evidence to the contrary. That is, the entity will exist for a period of time long enough to carry out contemplated operations, utilize existing productive capacity, and liquidate outstanding obligations. This concept justifies accounting practices such as the long-term/short-term classifications on the balance sheet and the depreciation of buildings for as long as 40 years.

The going concern concept is also tied to the use of historical cost. A business planning to operate for an indefinite period of time will not sell productive assets. Consequently, market values are less relevant. If a business is in jeopardy of failing (e.g., bankruptcy), then the going concern assumption would not be valid. If the assumption is not applicable, accountants would measure assets and liabilities at the amount at which they expect to dispose of them, their liquidation values.

Business or Economic Entity Concept

The **business or economic entity concept** states that all transactions and events relate to the reporting entity and must be kept separate from the personal affairs of the owner, related businesses, and the owner's outside business interests. For example, Kyle Perry owns and operates several sporting goods shops called Perry's Sports. Perry's Sports is an economic entity separate from Kyle Perry. Perry's Sports owns its store buildings and reports them in the company's financial statements. Kyle Perry owns his house. The house is an asset of Kyle Perry and is not reported in the financial statements of Perry's Sports. Financial reporting for different entities must be separate and include disclosures describing transactions among related entities.

Monetary Unit Assumption

The **monetary unit assumption** stipulates that an entity measure and report its economic activities in dollars (or some other monetary unit). These dollars are assumed to remain relatively stable over time in terms of purchasing power. This assumption ignores any inflation or deflation experienced in the economy in which the entity operates. This assumption justifies adding dollars of different purchasing power on the balance sheet. For example, a company would add land purchased in the current period to the balance of land acquired in 1969.

Periodicity Assumption

The **periodicity assumption** specifies that an economic entity can divide its life into artificial time periods for the purpose of providing periodic reports on its economic activities. The periodicity assumption results in the need for accrual accounting because revenue and expenses must be reported in a given period under this assumption. In addition, the time periods used will vary depending on the demands of financial statement users. For example, the SEC currently requires quarterly financial statements for publicly traded firms. These statements use significant estimates and may be less representationally faithful than the annual report. However, quarterly statements are more timely (an enhancing characteristic) than reporting on an annual basis because timely information is more useful (relevant) in decision making.

Assumptions in Financial Reporting: IFRS

IFRS explicitly addresses the going concern assumption. The other assumptions are implicit in the standard-setting process.

²²Another assumption, the *full disclosure principle*, states that accountants must report and disclose all information that can significantly affect the judgment of a reasonably informed financial statement user. The revisions to the conceptual framework added that financial information must be complete to be a faithful representation. Completeness, then, makes explicit the prior assumption of full disclosure.

Summary by Learning Objectives

In the following, we summarize the main points by learning objective. Throughout the chapter, we discuss the accounting and reporting of U.S. GAAP and IFRS side-by-side. The following table also highlights the major similarities and differences between the standards.

1 Explain what a conceptual framework is and why it is important in accounting standard setting.	
Summary	Similarities and Differences between U.S. GAAP and IFRS
<p>A conceptual framework sets forth the theory, concepts, and principles that underlie financial reporting. The FASB is working on a conceptual framework project divided into topics with the first one completed to date:</p> <ol style="list-style-type: none"> 1. Objective and Qualitative Characteristics 2. Elements and Recognition 3. Measurement 4. Reporting Entity 5. Presentation 6. Disclosure. 	Similar under U.S. GAAP and IFRS
2 Define the objective of financial reporting.	
Summary	Similarities and Differences between U.S. GAAP and IFRS
The objective of financial reporting is to provide financial information that is useful to investors, lenders, and other creditors in making decisions about providing resources to an entity.	Similar under U.S. GAAP and IFRS
3 Describe the qualitative characteristics of financial information, including the fundamental and enhancing characteristics of financial reporting.	
Summary	Similarities and Differences between U.S. GAAP and IFRS
<p>Fundamental characteristics are relevance and faithful representation that distinguish useful financial reporting information from nonuseful information.</p> <p>Relevant information is capable of making a difference in decision making because</p> <ul style="list-style-type: none"> • Of its predictive value: It can be used as an input into processes that help predict future outcomes. • Of its confirmatory value: It provides feedback about prior evaluations. • It is material: Reporting it inaccurately or omitting it would affect the decisions made by the financial statement users. <p>Financial information is a faithful representation if it depicts the substance of an economic event</p> <ul style="list-style-type: none"> • Completely, • Neutrally, and • Free from error. <p>Enhancing characteristics distinguish more useful information from less useful information. There are four enhancing characteristics:</p> <ul style="list-style-type: none"> • Comparability, • Verifiability, • Timeliness, and • Understandability. 	Similar under U.S. GAAP and IFRS

Summary by Learning Objectives, continued

4 Identify the elements of financial reporting.	
Summary	Similarities and Differences between U.S. GAAP and IFRS
<p>There are two main groupings of elements: point-in-time and period-of-time.</p> <p>U.S. GAAP Point-in-Time Elements:</p> <p>Assets: Probable future economic benefits obtained or controlled by a particular entity as a result of past transactions or events</p> <p>Liabilities: Probable future sacrifices of economic benefits arising from present obligations of a particular entity to transfer assets or provide services to other entities in the future as a result of past transactions or events</p> <p>Equity: Or net assets, the residual interest in the assets of an entity that remains after deducting its liabilities</p> <p>U.S. GAAP Period-of-Time Elements:</p> <p>Investments by owners: Increases in an entity's equity resulting from transfers to it from other entities of something valuable to obtain or increase ownership interests (or equity) in the entity.</p> <p>Distributions to owners: Decreases in an entity's equity resulting from transferring assets, rendering services, or incurring liabilities to owners. Distributions to owners decrease ownership interest (or equity) in an enterprise.</p> <p>Revenues: Inflows or other enhancements of assets or settlements of liabilities (or a combination of both) from delivering or producing goods, rendering services, or other activities of the entity's ongoing major or central operations.</p> <p>Gains: Increases in an entity's equity from peripheral or incidental transactions and from all other transactions and other events and circumstances except those that result from revenues or investments by owners.</p> <p>Expenses: Outflows or other using up of assets or incurrences of liabilities (or a combination of both) from delivering or producing goods, rendering services, or carrying out other activities of the entity's ongoing major or central operations.</p> <p>Losses: Decreases in equity (net assets) from peripheral or incidental transactions of an entity and from all other transactions and other events and circumstances except those that result from expenses or distributions to owners.</p> <p>Comprehensive income: The change in equity of a business enterprise during a period from transactions and other events and circumstances from nonowner sources.</p>	<p>► The point-in-time elements of financial reporting are defined slightly differently under U.S. GAAP and IFRS. In practice, though, IFRS and U.S. GAAP often lead to the same decisions on what is reported as an asset, liability, or equity for the items we discuss in the text.</p> <p>► The period-of-time elements are different under U.S. GAAP and IFRS. The only element in common is expenses, but it is defined differently under U.S. GAAP and IFRS.</p> <p><i>IFRS Period-of-Time Elements:</i></p> <ol style="list-style-type: none"> 1. Performance: A separate element in IFRS. Under U.S. GAAP, profit is the result of adding revenues and gains and subtracting expenses and losses. 2. Income (both revenues and gains). 3. Expenses (both expenses and losses). 4. Capital maintenance adjustments: Restatements or revaluations of reported amounts of assets and liabilities.

Summary by Learning Objectives, continued

5 Demonstrate an understanding of recognition and measurement in financial reporting including general recognition principles, revenue and expense recognition, and accrual accounting.

Summary	Similarities and Differences between U.S. GAAP and IFRS
<p>Recognition is the process of including an item as a line item in the financial statements of the entity.</p> <p>Under general recognition principles, an item is recognized in the financial statements if it is an element of the financial statements, measurable, reliable, and relevant. Recognition is subject to the cost-benefit constraint and materiality threshold constraint.</p> <p>In the FASB's conceptual framework, the revenue recognition principle states that revenue is recognized when it is</p> <ol style="list-style-type: none"> 1. Realized or realizable. An item is considered realized or realizable when a good or service has been exchanged for cash or claims to cash. 2. Earned. Revenues are considered earned "when the entity has substantially accomplished what it must do to be entitled to the benefits represented by the revenues." <p>New revenue recognition standards apply different guidance to recognize revenue—the notion of the transfer of control of goods or services to recognize revenue.</p> <p>Expense recognition involves the timing of when an expense is reported on the income statement. Expenses are recognized when</p> <ol style="list-style-type: none"> 1. The entity's benefits are consumed in the process of producing or delivering goods or rendering services. 2. An asset has experienced a reduced (or eliminated) future benefit or when a liability has been incurred or increased without an associated economic benefit. <p>There are three main approaches to determine when to report an expense:</p> <ul style="list-style-type: none"> • Match with revenues • Expense in period incurred • Systematically allocate over periods of use 	<p>► IFRS differs from U.S. GAAP in how it defines when items are recognized and in revenue and expense recognition criteria.</p> <p>Under IFRS general recognition principles, an item is recognized in the financial statements if it is an element of the financial statements, measurable, reliable, and probable that any future economic benefit associated with the item will flow to or from the company.</p> <p>The IASB conceptual framework states that revenue is recognized when the following two criteria are met:</p> <ol style="list-style-type: none"> 1. An increase in future economic benefits related to an increase in an asset or a decrease of a liability has arisen. 2. It can be measured reliably. <p>Similar to U.S. GAAP, IFRS now uses the notion of a transfer of control of goods or services to recognize revenue.</p> <p>Expenses are recognized when:</p> <ol style="list-style-type: none"> 1. A decrease in future economic benefits related to a decrease in an asset or an increase of a liability has arisen. 2. They can be measured reliably. <p>IFRS does not recognize the matching approach.</p>

6 Explain the assumptions used in financial reporting.

Summary	Similarities and Differences between U.S. GAAP and IFRS
<p>Assumptions in financial reporting:</p> <ul style="list-style-type: none"> • Going concern concept • Business or economic entity assumption • Monetary unit assumption • Periodicity assumption 	<p>► IFRS explicitly addresses the going concern assumption. The other assumptions are implicit in the standard-setting process.</p>

MyLab Accounting

Go to <http://www.pearson.com/mylab/accounting> for the following Questions, Brief Exercises, Exercises. They are available with immediate grading, explanations of correct and incorrect answers, and interactive media that acts as your own online tutor.

2 Financial Reporting Theory

Questions

- 1 Q2-1. What is the conceptual framework for financial reporting?
- 1 Q2-2. Are the FASB and IASB conceptual frameworks fully converged? Explain.
- 1 Q2-3. Why is a conceptual framework of accounting necessary and justifiable?
- 2 Q2-4. Who are the primary financial statement user groups identified in the objective of financial reporting?
- 3 Q2-5. Explain the concept of relevance.
- 3 Q2-6. What are the attributes of relevance?
- 3 Q2-7. Explain the concept of materiality.
- 3 Q2-8. What is predictive value?
- 3 Q2-9. What is the difference between predictive value and confirmatory value?
- 3 Q2-10. When is financial information considered “understandable”?
- 4 Q2-11. What is the difference between a point-in-time element and a period-of-time element?
- 4 Q2-12. What are the elements of financial reporting and where are they reported?
- 4 Q2-13. What is the definition of an asset?
- 5 Q2-14. What is the recognition principle and when is an item considered recognized?
- 5 Q2-15. What is the revenue recognition principle and when is revenue considered recognized?
- 5 Q2-16. When are expenses recognized under **U.S. GAAP**?
- 5 Q2-17. When are expenses recognized under **IFRS**?
- 5 Q2-18. How are transactions recorded under accrual accounting?
- 5 Q2-19. Explain the historical cost concept.
- 6 Q2-20. Explain the going concern concept.

Brief Exercises

- 1 BE2-1. **Components of the Conceptual Framework.** List the components of the current conceptual framework.
- 2 BE2-2. **Users of Financial Information.** Describe the primary users of the financial statements according to the conceptual framework.
- 2 BE2-3. **Objective of Financial Reporting.** Explain the objective of financial reporting.
- 3 BE2-4. **Relevant and Faithful Representation.** Identify whether the following items are characteristics of information that are relevant (REL) or a faithful representation (FR):
- _____ Information that is neutral
 - _____ Information that has decision-making implications because of its predictive value
 - _____ Information that is complete
 - _____ Information that is free from error
 - _____ Information that has decision-making implications because of its confirmatory value
- 3 BE2-5. **Fundamental and Enhancing Characteristics.** Describe the fundamental characteristics of financial information. Explain the enhancing characteristics of financial reporting information.
- 3 BE2-6. **Faithful Representation.** Describe when financial information is a faithful representation.
- 3 BE2-7. **Costs and Benefits of Financial Reporting.** Explain the costs standard setters consider when comparing the cost of requiring information to the benefits to the users of having the information when setting a new standard.
- 3 5 BE2-8. **Historical Cost.** Discuss how well the historical cost concept satisfies the fundamental characteristics of relevance and faithful representation.
- 3 BE2-9. **Fundamental and Enhancing Characteristics.** Identify whether the following items are fundamental characteristics (FC) or enhancing characteristics (EC):
- _____ Comparable
 - _____ Relevant
 - _____ Timely
 - _____ Understandable
 - _____ Faithful representation
 - _____ Verifiable

3 **BE2-10. Faithful Representation.** Match the component of a faithful representation to its definition:

Component of a Faithful Representation	Definition
1. Complete	A. Information is free from bias in both selection and presentation of financial data.
2. Neutral	B. Information should not contain errors or omissions in the description of the economic event and there are no errors in the process used to produce the financial information.
3. Free from error	C. Includes all information that is necessary for the user to understand the underlying economic event being depicted.

3 **BE2-11. Enhancing Characteristics.** Match the enhancing characteristic with its definition:

Enhancing Characteristic	Definition
_____ 1. Comparability	A. Different knowledgeable parties could reach a consensus that a particular depiction is a faithful representation.
_____ 2. Verifiability	B. Information is classified, characterized, and presented clearly.
_____ 3. Timely	C. Users of the financial statements can identify and understand similarities and differences between different entities.
_____ 4. Understandable	D. Information is available to financial statements users soon enough to be useful.

4 **BE2-12. Revenues and Gains.** Explain the difference between revenues and gains.

4 **BE2-13. Capital Maintenance Adjustments, IFRS.** Describe capital maintenance adjustments.

5 **BE2-14. Expense Recognition.** Discuss the three main approaches to recognizing expenses.

4 **BE2-15. Element Definitions.** Identify whether the following definitions relate to assets, liabilities, or equity.

Element	Definition
_____	Probable future sacrifices of economic benefits arising from present obligations of a particular entity to transfer assets or provide services to other entities in the future as a result of past transactions or events.
_____	The net assets are the residual interest in the assets of an entity that remains after deducting its liabilities.
_____	Probable future economic benefits will be obtained or controlled by a particular entity as a result of past transactions or events.

4

BE2-16. Element Definitions. Match each element with its definition.

Element	Definition
_____ 1. Gains	A. Outflows or other consumption of assets or incurrences of liabilities (or a combination of both) from delivering or producing goods, rendering services, or carrying out other activities that constitute the entity's ongoing major or central operations.
_____ 2. Comprehensive income	B. Inflows or other enhancements of an entity's assets or settlements of its liabilities (or a combination of both) from delivering or producing goods, rendering services, or other activities that constitute the entity's ongoing major or central operations.
_____ 3. Losses	C. The change in equity of a business enterprise during a period from transactions and other events and circumstances from nonowner sources. It includes all changes in equity during a period except those resulting from investments by owners and distributions to owners.
_____ 4. Expenses	D. Decreases in equity of a particular business enterprise resulting from transferring assets, rendering services, or incurring liabilities by the enterprise to owners. Distributions to owners decrease ownership interest (or equity) in an enterprise.
_____ 5. Revenues	E. Increases in equity (net assets) from an entity's peripheral or incidental transactions and from all other transactions and other events and circumstances affecting the entity except those that result from revenues or investments by owners.
_____ 6. Distributions to owners	F. Decreases in equity (net assets) from an entity's peripheral or incidental transactions and from all other transactions and other events and circumstances affecting the entity except those that result from expenses or distributions to owners.
_____ 7. Investments by owners	G. Increases in equity of a particular business enterprise resulting from transfers to it from other entities of something valuable to obtain or increase ownership interests (or equity) in it.

4

BE2-17. Element Definitions, U.S. GAAP, IFRS. Identify whether the following elements are elements under U.S. GAAP, IFRS, or both, and point-in-time or period-in-time elements.

Element	U.S. GAAP, IFRS, or Both	Point in Time or Period of Time
Investments by owners	_____	_____
Income	_____	_____
Losses	_____	_____
Liabilities	_____	_____
Equity	_____	_____
Comprehensive income	_____	_____
Assets	_____	_____
Gains	_____	_____
Capital maintenance adjustment	_____	_____
Expenses	_____	_____
Distributions to owners	_____	_____
Revenues	_____	_____
Performance	_____	_____

- 5 BE2-18. Recognition, U.S. GAAP, IFRS.** Identify whether the following items are part of the general recognition principle under U.S. GAAP, IFRS, or both.

Item	U.S. GAAP, IFRS, or Both
Relevant	_____
Subject to materiality constraint	_____
An element of the financial statements	_____
Probable that any future economic benefit associated with the item will flow to or from the company	_____
Measurable	_____
Reliable	_____
Subject to cost-benefit constraint	_____

- 5 BE2-19. Measurement Bases.** Match the measurement basis with its definition.

Measurement Bases	Definition
_____ 1. Historical cost	A. Amount of cash (or equivalent) that would be required if the asset were acquired currently.
_____ 2. Current cost	B. Amount of cash (or equivalent) that would be received by selling the asset in an orderly liquidation. Liabilities may also be measured at current market value.
_____ 3. Net realizable value	C. Amount of cash (or equivalent) that is paid to acquire the asset. In the case of a liability, this measurement base is the amount of cash (or equivalent) that is received when the obligation was incurred. This measurement base may change over the life of the asset/liability if it is adjusted for depreciation or amortization.
_____ 4. Present value of future cash flows	D. Amount of cash (or equivalent) that is expected to be received in exchange for an asset less the direct costs of the disposal. In the case of a liability, it is the amount of cash (or equivalent) expected to be paid to liquidate the obligation, including any direct costs of liquidation.
_____ 5. Current market value	E. Discounted net cash flows expected to be received on exchange of an asset, or paid out in the case of a liability.

- 5 BE2-20. Cash versus Accrual Bases of Accounting.** The following events occurred at VG Consulting during the most recent month.

- a. VG provided consulting services and billed clients \$2,000.
- b. VG collected \$1,500 for consulting services performed in the prior month.
- c. VG paid its monthly electric bill of \$300.
- d. Employees who worked for VG were not paid for services performed. Next month they will be paid \$850.
- e. VG collected fees of \$700 for services to be performed in the following month.

For each event, determine the revenue or expense under the cash and accrual bases of accounting.

- 6 BE2-21. Assumptions in Financial Reporting.** Indicate the assumption (going concern, business/economic entity, monetary unit, or periodicity) that best fits the following scenarios.

Scenario	Related Assumption
a. Monro Manufacturing requires that its division managers report to corporate headquarters on a monthly basis.	_____
b. Rainbow Paints, Inc. owns 15% of New Eljam Company. Rainbow does not consolidate this affiliate company because it cannot control New Eljam's operations.	_____
c. Financial analysts at Nelson Corporation use an infinite-growth assumption in building a model to value the company.	_____
d. Factory buildings are reported on Jack Jones Warehousing Inc.'s balance sheet as the sum of the total cost of two plants; one of the plants was acquired in 1951 and the other was purchased in 2011.	_____

Exercises

3 5 6

E2-1. Conceptual Framework. Noeleen Auto Mall, Ltd. recently completed an initial public offering (IPO) for \$23,000,000 by listing its common shares on the New York Stock Exchange. Prior to its IPO, Noeleen was a privately held family business. As a public company, Noeleen faces increased reporting requirements, particularly those sanctioned by the Securities and Exchange Commission (SEC). Noeleen’s Controller, Donald Lierni, was surprised to learn that a Form 10-Q was required to satisfy the company’s first-quarter filing requirements with the SEC. Lierni lacked sufficient time to develop the “actual” numbers needed to prepare the report, meaning that he needed to make significant estimates before the 10-Q filing due date.

In addition, Noeleen now must satisfy a new group of financial statement users with additional information needs. Noeleen expended resources to meet the new reporting requirements and assess what information and disclosures to include/exclude from the financial reports. Lierni also learned that privately held companies are not subject to U.S. GAAP requirements like a publicly traded entity. That is, the company now must follow additional U.S. GAAP standards and is required to change several of its accounting methods. When considering his options, Lierni decides to take a “safe” approach and report the lowest income possible by adopting income-reducing standards. Here, the Controller proposes taking excessive write-downs for obsolete inventory and potentially impaired assets. He also decides to expense the cost of a significant investment in office equipment.

Finally, Noeleen created a separate legal entity to handle its auto financing, Benedict Arnold Credit Company, during the same year it went public. The separate entity is not consolidated with the primary financial statements. Lierni decides to keep this entity off of the balance sheet and does not see any need for disclosure of Noeleen’s relationship with Benedict Arnold Credit.

Required »

Based on the information provided, list and explain the application of the relevant components of the conceptual framework of accounting. Identify seven issues and use the following table to present your solution.

Issue	Conceptual Framework
1. _____	1. _____
2. _____	2. _____
3. _____	3. _____
4. _____	4. _____
5. _____	5. _____
6. _____	6. _____
7. _____	7. _____

3

E2-2. Qualitative Characteristics. Referring to the qualitative characteristics of accounting information, indicate the fundamental characteristic (relevance or representationally faithful) and its related attribute (confirmatory value, completeness, materiality, neutrality, or predictive value) for each of the following uses of accounting information.

Use of Accounting Information	Fundamental Characteristic	Attribute
a. This year’s reported earnings per share is \$.50 below analysts’ forecasts.	_____	_____
b. Potential creditors review a company’s long-term liabilities footnote to determine that entity’s ability to assume additional debt.	_____	_____
c. A corporation discloses both favorable and unfavorable tax settlements.	_____	_____
d. A company discloses the write-off of an accounts receivable. The receivable due from a major customer accounts for 35% of the company’s current assets.	_____	_____
e. A financial analyst computes a company’s five-year average cost of goods sold in order to forecast next year’s gross profit margin.	_____	_____

- 3** **E2-3. Enhancing Characteristics.** Using the following table, match the enhancing characteristics (comparability, verifiability, timeliness, or understandability) with the following four scenarios. Also indicate if the enhancing characteristic is either satisfied or violated.

Scenario	Enhancing Characteristic	Satisfied or Violated
a. Auditors from two offices of a large public accounting firm agree on the measurement used for a client's plant assets.	_____	_____
b. The Later Than Sooner Company reports income only every two years.	_____	_____
c. Gladys Groceries reports its investments at cost while the other companies in the grocery industry use the fair value option to measure investments.	_____	_____
d. Grant Company engages in complex business transactions. These events are properly classified, characterized, presented clearly, and fully disclosed.	_____	_____

- 3 5 6** **E2-4. Concepts:** Determine the concept that is violated in each of the following cases:
- Management examined registration and legal fees for a trademark, and determined that it should record a trademark for \$5,000.
 - Katia Clothing, a U.S. GAAP reporter, purchased land five years ago and recently had it appraised for \$65,000. The company reported this amount on its most recent balance sheet.
 - Edward McCormick owns two separate business: EMC Enterprises and Edward Associates. McCormick regularly pays the property taxes for EMC from the checking account of Edward Associates.
 - US Motors Inc. recently decided to recall 400,000 vehicles for a safety concern. US Motors did not report this information in its annual report.
 - Abare Company purchased new equipment for \$2,500,000 and charged it to operating expenses on its most recent income statement.
 - Beeke Brothers Incorporated decided not to report its quarterly results to its shareholders.

- 1 3 4 5 6** **E2-5. Terms and Concepts.** Complete the following statements by identifying the appropriate term or concept.
- A _____ sets forth theory, concepts, and principles to ensure that accounting standards are coherent and uniform.
 - Information has _____ if decision makers can use it as an input into processes that help forecast future outcomes.
 - _____ indicates whether financial information depicts the substance of an economic event in a manner that is complete, neutral, and free from error.
 - _____ allows financial statement users to identify and understand similarities and differences among several entities.
 - _____ means that a group of reasonably informed financial statement users are able to reach a consensus decision that reported information is a faithful representation of an underlying economic event.
 - _____ represent resources, claims to resources, or interests in resources as of a specific point in time and appear on the balance sheet (statement of financial position).
 - An _____ involves a buyer and seller who are independent and unrelated parties, each bargaining to maximize his or her own wealth.
 - The _____ indicates that accountants will record transactions and prepare financial statements as if the entity will continue to operate for an indefinite period of time unless there is evidence to the contrary.
 - The _____ specifies that an economic entity can divide its life into artificial time periods for the purpose of providing periodic reports on its economic activities.
 - Financial information is _____ if it is capable of making a difference in decision making by exhibiting the following attributes: predictive value, confirmatory value, and materiality.

- 3 5 6** **E2-6. Concepts.** Review the following accounting practices and indicate whether you believe that the practice is correct or incorrect. Justify your answer with an accounting concept, principle, or assumption.
- Citera Company, a large multinational corporation, expensed the acquisition of a \$4,000 computer system.
 - Mason Manufacturing acquired a new metal stamping machine at a cost of \$50,000. Mason will depreciate the asset over its 10-year useful life.

- c. Gabriel Grocery Stores needed to overhaul one of its stores at a cost of \$75,000. The company decided to expense this amount as repairs and maintenance.
- d. Dina Design Studios charged the \$600 cost of a new laptop for the owner's daughter to office equipment expense.
- e. Walsh Water Services issues financial statements on both a quarterly and an annual basis to its shareholders.

5

E2-7. Cash versus Accrual Bases of Accounting. Top Notch Services was founded on January 2 and offers computer consulting and other technology-related services. During its first quarter of operations, the following events occurred:

- a. In January, Top Notch provided and billed clients for \$40,000 of consulting services. It was paid for these services in March.
- b. In January, Top Notch collected \$25,000 from clients for services provided during the month.
- c. In February, Top Notch provided and billed clients for \$45,000 of consulting services. It collected \$12,000 in the current month and the remaining amount in March.
- d. In March, Top Notch collected \$34,000 from clients for services provided during the month and billed clients for an additional \$21,000 for services provided.
- e. Top Notch pays employees at the end of each month for service provided. Monthly payroll was \$12,000, \$13,000, and \$15,000 in January, February, and March, respectively.
- f. Top Notch pays its utility bills at the end of each month. Utility bills totaled \$800, \$850, and \$1,000 in January, February, and March, respectively.
- g. Top Notch hired an independent contractor who provided \$1,200 of services in February. The contractor was paid in March.

Determine Top Notch's net income for each month from January through March under both the cash and the accrual bases of accounting. Explain any difference in total net income under cash versus accrual accounting for the three months.

5

E2-8. Cash vs. Accrual. You are provided the following information for the Del Campo Consulting Associates.

	2019	2018
Service revenue (accrual basis)	\$250,000	\$185,000
Cash collected from clients	80,000	97,000
Operating expenses:		
Salary expense (accrual basis)	12,000	16,500
Purchased supplies for cash	4,000	2,500
Purchased supplies on account	1,500	1,000
Depreciation expense	2,000	2,000
Rent paid in cash	7,000	3,000
Prepaid insurance	5,500	- 0 -

Required:

Assume that all supplies purchased were used in operations in the year of purchase. Rental payments pertain to rental space used in the year of payment.

- a. Prepare an income statement for Del Campo for 2019 and 2018 under both the cash and the accrual basis of accounting.
- b. Compute operating cash flow for both years under cash and accrual bases.

Judgment and Applied Financial Accounting Research

LEARNING OBJECTIVES

- 1 Explain the importance and prevalence of judgment in the financial reporting process.
- 2 Discuss the role of accountants' assumptions and estimates and the related disclosures in the financial reporting process.
- 3 Identify obstacles to the use of sound judgment in preparing financial information and ways to overcome them.
- 4 Describe the types of authoritative literature and the literature hierarchy.
- 5 Outline and apply the steps in the applied financial accounting research process.

Introduction

ACCOUNTANTS USE *JUDGMENT* almost every day in their work when they evaluate facts to make a decision. For example, analyzing a business event and determining whether to record it or deciding whether to record a liability

for pending litigation involves a great deal of judgment. Selecting and applying accounting methods—such as the choice of a cost-flow assumption (e.g., LIFO versus FIFO) in inventory valuation—and using assumptions and estimates in financial reporting also require judgment. Determining the provision for bad debts relies on the use of estimates. Financial statement preparers use the best information available to make these judgments, knowing business activities could change and there could be new information in the future.

Managers use judgment in preparing financial statements, making the best estimates at that time. Consider *Activision Blizzard*, a leading provider of interactive game services. *Activision Blizzard* users play games for free—yet, within these games, they can purchase virtual currency to obtain virtual goods to enhance their game-playing experience. For example, a Candy Crush player may purchase “gold bars.” How does *Activision Blizzard* determine when the virtual goods are used and when to record revenues? Initially, *Activision Blizzard* records unearned revenue when players buy the virtual currency and virtual goods. *Activision Blizzard* recognizes revenue as the players use their virtual goods. Some virtual goods are consumable and used within days whereas others are durable and used over longer periods of time. *Activision Blizzard* relies on historical data in making judgments about when the virtual goods are used and when to record revenues. However, assumptions based on historical data can change rapidly in a young, growing, and dynamic market such as social game services. If *Activision Blizzard* revises assumptions based on new data, changes its product mix due to new game introductions, or modifies estimates used such as average playing periods, the amount of revenue recognized may differ significantly from one period to the next.

In this chapter, we identify areas in financial reporting that require judgment. We explore the assumptions and estimates disclosed in financial reports and highlight key

Blaize Pascall/Alamy Stock Images

judgment areas found in practice. We then discuss some obstacles to the use of good judgment and ways to overcome them. Because accountants are required to make judgments based on accounting standards and other authoritative literature, we explain the authoritative literature and its hierarchy

in use for both U.S. GAAP and IFRS. We then outline the six steps used in the applied financial accounting research process. While the accounting standards differ, the use of judgment and the applied financial accounting research process are similar under U.S. GAAP and IFRS. ‹‹

- 1 Explain the importance and prevalence of judgment in the financial reporting process.

The Importance and Prevalence of Judgment in Financial Reporting

When first studying accounting, most students expect to encounter clear-cut methods and rules. In practice, accountants frequently use *judgment* to prepare and audit financial statements. **Judgment** is the process by which an accountant or manager reaches a decision in situations in which there are multiple alternatives.

Judgment and the Accountant

Accountants use judgment in several aspects of accounting and financial reporting, including researching and interpreting standards. Here, accountants seek answers to questions such as:

1. Should the company report a business event and, if so, when? For example, at times there are complexities involved in deciding when to recognize revenue. Specifically, should the company recognize revenue this year or defer it until future periods?
2. If the company decides to report a business event in the current period, then what is the appropriate financial reporting treatment? For example, there are multiple methods for reporting an investment in the equity of another company. Thus, when a company acquires that investment, accountants must decide which accounting method is most appropriate.
3. What amount(s) should the company report in the financial statements related to this business event? For example, when a company purchases inventory, there may be costs (such as freight costs) associated with that purchase other than the cost of the inventory itself. Accountants must determine what costs to include in the amount recorded as inventory.

Activision Blizzard, the social game service company, faced these types of questions when it started its business. In the new social media field, *Activision Blizzard*, needed to grapple with how to apply revenue recognition rules developed years earlier to the way it delivers its virtual products.

Judgment: Use and Abuse

Accounting standards allow financial statement preparers to use judgment to report the substance of a transaction in the financial statements, within certain boundaries, in the manner that best reflects economic reality. The ability to apply judgment enhances the usefulness of the financial statements. Of course, management might also use this latitude to engage in *earnings management* behavior. **Earnings management** occurs when managers manipulate financial information and misrepresent the firm's financial position and performance.¹

Judgment and Financial Statement Comparisons

Accounting standards afford management discretion in selecting accounting methods, applying those methods, and changing methods or estimates. This latitude can be problematic for users comparing the financial information reported by two firms in the same industry when each firm uses a different set of accounting methods or estimation techniques. In addition, the same firm may change its methods or estimation techniques over time. However, the flexibility afforded in the selection and application of accounting standards permits managers to choose those methods and assumptions that best reflect the economic reality of their transactions. Therefore, the

¹We discuss earnings management in more depth in Chapter 5.

financial information provided and user decisions based on that information may be enhanced by not requiring all companies to use the same accounting methods.

For example, consider two firms in the same industry: One uses the *average-cost* inventory method and the other uses the *first-in, first-out* (FIFO) inventory costing method. The different inventory costing methods mean that the firms' financial statements will reflect different measurement bases for inventory. To compare the inventory balances as well as the cost of goods sold of these two firms, the investor will need to "undo" the effects of the inventory costing method choice. That is, a reasonably informed financial statement user would understand that ending inventory would be higher under FIFO than under average cost in a period of rising prices. Knowledge of the direction of the bias in the reported inventory valuation enables the financial statement user to interpret the results with ratio analysis and other financial statistics.

Accountants use their judgment to estimate and record economic events as accurately as possible. We highlight the use of judgment in each chapter in this text. We also include judgment cases in the end-of-chapter material to help develop your judgment and decision-making skills.

- ② Discuss the role of accountants' assumptions and estimates and the related disclosures in the financial reporting process.

The Role of Assumptions and Estimates

After a manager or an accountant determines that a firm should report a business event in the financial statements, he or she often uses assumptions and estimates to answer the questions related to when to recognize the transaction, what accounting method to use, and what amount to record.

Assumptions and Estimates in the Financial Statements

Many amounts reported on the financial statements are based upon assumptions. For example:

1. Property, plant, and equipment are depreciated using a particular method (such as straight-line depreciation) that requires managers and accountants to make assumptions about the pattern of use.
2. Investments in another company are accounted for differently depending on how long management intends to hold the investment. Thus, managers and accountants must make assumptions about the duration of the investment.

Many of the balances reported on financial statements are estimates. Consider these two specific examples:

1. The value reported for property, plant, and equipment is net of accumulated depreciation. Depreciation is based upon estimates of the life and pattern of use of the depreciable assets.
2. Accounts receivable are reported on the balance sheet net of an allowance for those receivables that are not likely to be collected. However, the balance in the allowance account is an estimate as to how much of the accounts receivable balance might not be paid by customers.

It is important for financial statement preparers and users to understand the extensive use of assumptions and judgment in the financial statement preparation process.

Judgment-Related Disclosures

How does a financial statement user know where managers used judgment in the financial reporting process? Financial statement disclosures—specifically, the accounting policies footnote—provide this information. U.S. GAAP requires companies to disclose their significant accounting policies.

Accounting Policies Footnote. The accounting policies footnote outlining the portfolio of accounting choices is typically one of the first notes to the financial statements. In *Johnson & Johnson's* 2015 annual report, it listed accounting policy choices for 14 different areas: cash equivalents; investments; property, plant, and equipment and depreciation; revenue recognition; shipping and handling; inventories; intangible assets and goodwill; financial instruments; product liability; concentration of credit risk; research and development; advertising; income taxes; and net earnings per share. For example, *Johnson & Johnson* indicated that it reported inventory at

the *lower-of-cost-or-market* and valued inventory using the *first-in, first-out* method. As another example, **Johnson & Johnson** disclosed that it reports property, plant, and equipment at cost, depreciating these assets using the *straight-line* method, and it also disclosed the lives that it uses to depreciate various groupings of assets. Toward the end of the disclosure, **Johnson & Johnson** also indicated that it uses estimates extensively in the preparation of financial information.

Industry Comparisons. Financial statement users rely on accounting policies footnote information to compare **Johnson & Johnson** to other firms in the industry. **Johnson & Johnson's** competitors include healthcare and pharmaceutical companies such as **Pfizer Inc.**, **GlaxoSmithKline plc**, and **AstraZeneca plc**. Exhibit 3.1 illustrates the different methods, estimates, and assumptions that **Johnson & Johnson** and its competitors use in accounting for common items such as inventory and long-lived tangible assets. Notice that two of the companies—**Johnson & Johnson** and **Pfizer**—are U.S. GAAP reporters and that two report under IFRS—**GlaxoSmithKline** and **AstraZeneca**. Next, two of the four companies use the first-in, first-out (FIFO) inventory cost flow assumption (**Johnson & Johnson** and **GlaxoSmithKline**), one uses average cost (**Pfizer**), and one uses a combination of FIFO and average cost (**AstraZeneca**). For depreciation of long-lived tangible assets, all four companies use the straight-line method. However, the asset categories and useful lives vary considerably among the companies and are influenced by management's judgment. For example, all four companies have a different range of useful lives for their buildings.²

In addition, the accounting policies footnote enables users to determine whether a company employs income-increasing or income-reducing accounting policies or methods. For example, a company using FIFO in a period of inflation will typically report lower cost of sales and higher gross profit than a company using LIFO.

EXHIBIT 3.1 Comparison of Accounting Methods, Estimates, and Assumptions for Inventory and Long-lived Tangible Assets

	Johnson & Johnson	Pfizer Inc.	GlaxoSmithKline plc	AstraZeneca plc
Reporting Standards	U.S. GAAP	U.S. GAAP	IFRS	IFRS
Inventory	FIFO	Average Cost	FIFO	FIFO and average cost
Long-lived Tangible Assets				
Depreciation Method	Straight-line	Straight-line	Straight-line	Straight-line
Useful lives by asset category:				
Building	20–30 years	33–50 years	20–50 years	10–50 years
Plant and equipment				3–15 years
Land and leasehold improvements	10–20 years		20–50 years or lease term	
Machinery and equipment	2–13 years	8–20 years	10–20 years	
Furniture, fixtures, and other		3–12 ¹ / ₂ years	3–10 years	

Sources: Based on Johnson & Johnson; Pfizer; GlaxoSmithKline; AstraZeneca

²Analysts and other financial statement users also employ various financial statement analysis techniques to understand a company's financial position and performance and compare it to other companies. We will discuss some of these techniques in Chapters 5 and 6 and apply them where appropriate throughout this text.

IFRS-Specific Disclosures. Our discussion of required disclosures of significant accounting policies thus far applies to both IFRS and U.S. GAAP. IFRS further requires that companies disclose additional information about the assumptions and estimates they made at the end of the reporting period.³ For example, companies make estimates and assumptions regarding the amount of accounts receivable that will not be collectible. IFRS also requires that companies disclose the judgments (apart from those involving estimates and assumptions) that management has made in determining appropriate accounting treatments for amounts reported on the financial statements.⁴ For example, companies will make judgments as to whether potential obligations are probable and thus should be reported as a liability. Companies also disclose if there is a significant risk that any amounts they reported will change in the coming year due to the underlying assumptions.⁵

In Exhibit 3.2, *Telefonaktiebolaget LM Ericsson*, a Swedish technology, hardware, and equipment company and an IFRS reporter, stipulates in its second financial statement note that

EXHIBIT 3.2 Critical Accounting Estimates and Judgments Note Excerpt, *Telefonaktiebolaget LM Ericsson*, December 31, 2015, Financial Statements

C2

CRITICAL ACCOUNTING ESTIMATES AND JUDGMENTS

The preparation of financial statements and application of accounting standards often involve management's judgment and the use of estimates and assumptions deemed to be reasonable at the time they are made. However, other results may be derived with different judgments or using different assumptions or estimates, and events may occur that could require a material adjustment to the carrying amount of the asset or liability affected. Following are the most important accounting policies subject to such judgments and the key sources of estimation uncertainty that the Company believes could have the most significant impact on the reported results and financial position.

The information in this note is grouped as per:

- Key sources of estimation uncertainty
- Judgments management has made in the process of applying the Company's accounting policies.

Revenue recognition

Key sources of estimation uncertainty

Examples of estimates of total contract revenue and cost that are necessary are the assessing of customer possibility to reach conditional purchase volumes triggering contractual discounts to be given to the customer, the impact on the Company revenue in relation to performance criteria and whether any loss provisions shall be made.

Judgments made in relation to accounting policies applied

Parts of the Company's sales are generated from large and complex customer contracts. Managerial judgment is applied regarding, among other aspects, conformance with acceptance criteria and if transfer of risks and rewards to the buyer has taken place to determine if revenue and costs should be recognized in the current period, degree of completion and the customer credit standing to assess whether payment is likely or not to justify revenue recognition.

Trade and customer finance receivables

Key sources of estimation uncertainty

The Company monitors the financial stability of its customers and the environment in which they operate to make estimates regarding the likelihood that the individual receivables will be paid. Total allowances for estimated losses as of December 31, 2015, were SEK 1.5 (1.5) billion or 2.0% (1.8%) of gross trade and customer finance receivables.

Credit risks for outstanding customer finance credits are regularly assessed as well, and allowances are recorded for estimated losses.

³See paragraphs 125–133 of IASC, *International Accounting Standard 1*, "Presentation of Financial Statements" (London, UK: International Accounting Standards Committee, 1975, Revised).

⁴See paragraphs 122–124 of IASC, *International Accounting Standard 1*, "Presentation of Financial Statements."

⁵In the United States, the SEC requires public companies to provide information in their annual regulatory filing, the 10-K, to supplement, not duplicate, the description of accounting policies in the footnotes to the financial statements. The discussion presents an analysis of the uncertainties involved in applying the accounting policies described in the footnote.

Inventory valuation

Key sources of estimation uncertainty

Inventories are valued at the lower of cost and net realizable value. Estimates are required in relation to forecasted sales volumes and inventory balances. In situations where excess inventory balances are identified, estimates of net realizable values for the excess volumes are made. Inventory allowances for estimated losses as of December 31, 2015, amounted to SEK 2.6 (3.3) billion or 8% (8%) of gross inventory.

Deferred taxes

Key sources of estimation uncertainty

Deferred tax assets and liabilities, are recognized for temporary differences and for tax loss carry-forwards. Deferred tax is recognized net of valuation allowances. The valuation of temporary differences and tax loss carry-forwards, is based on management's estimates of future taxable profits in different tax jurisdictions against which the temporary differences and loss carry-forwards may be utilized.

The largest amounts of tax loss carry-forwards are reported in Sweden, with an indefinite period of utilization (i.e. with no expiry date). For further detailed information, please refer to Note C8, "Taxes".

At December 31, 2015, the value of deferred tax assets amounted to SEK 13.2 (12.8) billion. The deferred tax assets related to loss carry-forwards are reported as non-current assets.

Accounting for income tax, value added tax, and other taxes

Key sources of estimation uncertainty

Accounting for these items is based upon evaluation of income-, value added- and other tax rules in all jurisdictions where we perform activities. The total complexity of rules related to taxes and the accounting for these require management's involvement in judgments regarding classification of transactions and in estimates of probable outcomes of claimed deductions and/or disputes.

Acquired intellectual property rights and other intangible assets, including goodwill

Key sources of estimation uncertainty

At initial recognition, future cash flows are estimated, to ensure that the initial carrying values do not exceed the expected discounted cash flows for the items of this type of assets. After initial recognition, impairment testing is performed whenever there is an indication of impairment, except in the case of goodwill for which impairment testing is performed at least once per year. Negative deviations in actual cash flows compared to estimated cash flows as well as new estimates that indicate lower future cash flows might result in recognition of impairment charges.

For further discussion on goodwill, see Note C1, "Significant accounting policies" and Note C10, "Intangible assets." Estimates related to acquired intangible assets are based on similar assumptions and risks as for goodwill.

At December 31, 2015, the amount of acquired intellectual property rights and other intangible assets amounted to SEK 50.4 (50.9) billion, including goodwill of SEK 41.1 (38.3) billion.

Judgments made in relation to accounting policies applied

At initial recognition and subsequent remeasurement, management judgments are made, both for key assumptions and regarding impairment indicators. In the purchase price allocation made for each acquisition, the purchase price shall be assigned to the identifiable assets, liabilities and contingent liabilities based on fair values for these assets. Any remaining excess value is reported as goodwill.

This allocation requires management judgment as well as the definition of cash-generating units for impairment testing purposes. Other judgments might result in significantly different results and financial position in the future.

Provisions

Key sources of estimation uncertainty

Provisions mainly comprise amounts related to warranty, restructuring, contractual obligations and penalties to customers and estimated losses on customer contracts, risks associated with patent and other litigations, supplier or subcontractor claims and/or disputes, as well as provisions for unresolved income tax and value-added tax issues. The estimates related to the amounts of provisions for penalties, claims or losses receive special attention from the management. At December 31, 2015, provisions amounted to SEK 3.8 (4.4) billion. For further detailed information, see Note C18, "Provisions."

Judgments made in relation to accounting policies applied

Whether a present obligation is probable or not requires judgment. The nature and type of risks for these provisions differ and management's judgment is applied regarding the nature and extent of obligations in deciding if an outflow of resources is probable or not.

Contingent liabilities

Key sources of estimation uncertainty

As disclosed under "Provisions" there are uncertainties in the estimated amounts. The same type of uncertainty exists for contingent liabilities.

Continued

Judgments made in relation to accounting policies

As disclosed under Note C1, "Significant accounting policies" a potential obligation that is not likely to result in an economic outflow is classified as a contingent liability, with no impact on the Company's financial statements. However, should an obligation in a later period be deemed to be probable, then a provision shall be recognized, impacting the financial statements.

Pension and other post-employment benefits*Key sources of estimation uncertainty*

Accounting for the costs of defined benefit pension plans and other applicable post-employment benefits is based on actuarial valuations, relying on key estimates for discount rates, future salary increases, employee turnover rates and mortality tables. The discount rate assumptions are based on rates for high-quality fixed-income investments with durations as close as possible to the Company's pension plans. As disclosed in note C1, "Significant accounting policies," the Company has in Sweden in periods up to the second quarter of 2015 estimated the discount rate for the Swedish pension liability based on the interest rates for Swedish covered bonds. Due to the development since then of the deepness of the Swedish covered bond market and the volatility in interest rates, the Company has decided to apply Swedish government bonds rate for this discounting for the fiscal year 2015. The rate applied is 2.1% (2.75%). At December 31, 2015, defined benefit obligations for pensions and other post-employment benefits amounted to SEK 78.1 (73.8) billion and fair value of plan assets to SEK 58.2 (56.9) billion. For more information on estimates and assumptions, see Note C17, "Post-employment benefits."

Foreign exchange risks*Key sources of estimation uncertainty*

Foreign exchange risk impacts the financial results of the Company: see further disclosure in Note C20, "Financial risk management and financial instruments," under Foreign Exchange Risk.

Source: Ericsson, Financial Statements, December 31, 2015. <https://www.ericsson.com/res/investors/docs/2015/ericsson-annual-report-2015-en.pdf>, pages 69–70

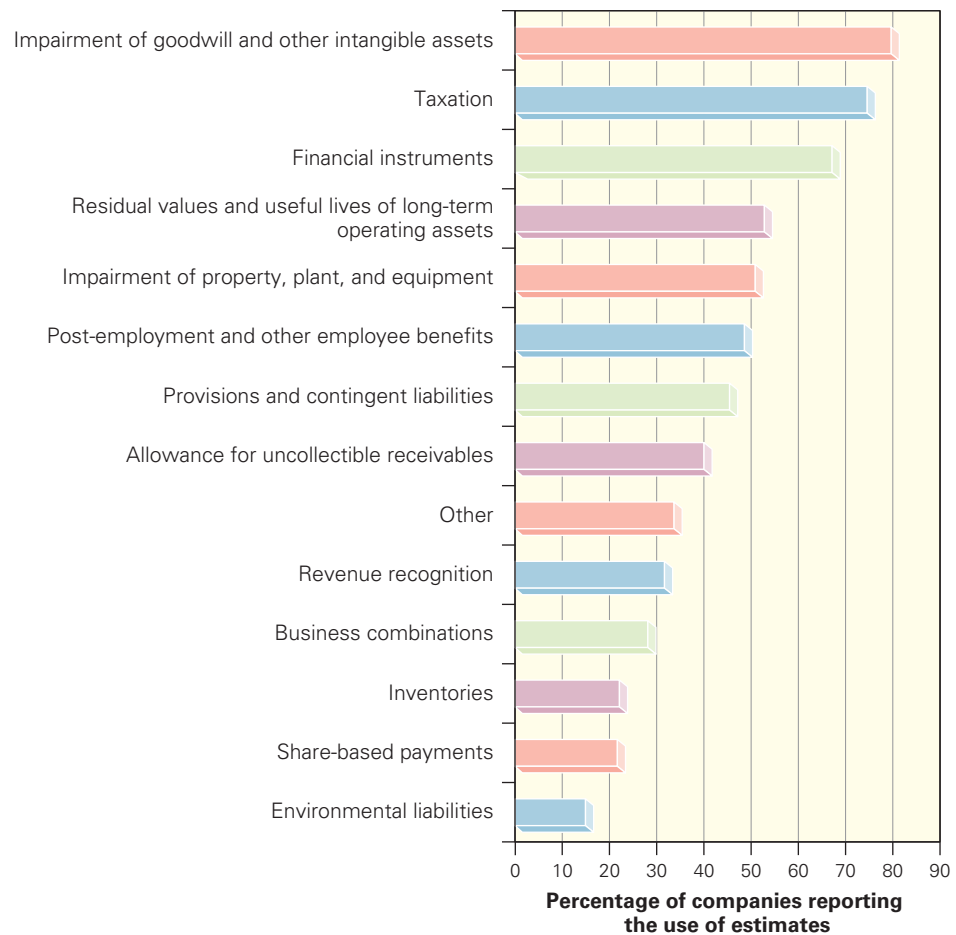

the preparation of its financial statements often involves management's judgment and the use of assumptions and estimates. Notice the distinction between the uncertainty in making estimates in the first bullet point and the judgment management made in applying the accounting policies in the second bullet point. *Ericsson's* note continues to discuss 10 areas involving the use of estimates and assumptions, and 4 areas involving management's judgments in relation to accounting policies. The areas covered are trade and customer finance receivables; inventory valuation; deferred taxes; income tax, value-added tax, and other taxes; intellectual property rights and other intangible assets; provisions; contingent liabilities; pensions; and foreign exchange risks. For example, in the revenue recognition section, *Ericsson* explains that its managers made estimates in the amounts of provisions and the expected volume discounts and applied judgment in evaluating whether the firm could recognize revenue on its large and complex contracts. The section related to trade and customer finance receivables discloses that total allowances for uncollectible accounts were 2.0% of gross trade and customer finance receivables. As another example, *Ericsson* details that its allowance for inventory write-downs was 8% of gross inventory.

Key Judgment Areas in Practice

Based on an analysis of annual reports from 175 companies representing 19 industries and 48 countries, Exhibit 3.3 illustrates 14 major financial statement areas where managers use accounting estimates and judgments. For example, 40% of companies disclose that they use estimates and judgments in accounting for the allowance for uncollectible receivables. As we cover areas such as taxation, employee benefits, provisions, and revenue recognition throughout the textbook, we will highlight the need for judgment and present decision-making methods used to resolve complex accounting issues.⁶

⁶This data is based on a survey of companies reporting under IFRS. However, results would likely be very similar for companies reporting under U.S. GAAP.

EXHIBIT 3.3 Manager's Use of Accounting Estimates and Judgments under IFRS

- ③ Identify obstacles to the use of sound judgment in preparing financial information and ways to overcome them.

Judgment Obstacles in Preparing Financial Information

In preparing or auditing financial information, accountants face a number of potential impediments to the use of good judgment, such as:

- Factors that may influence management to intentionally bias their estimates.
- *Cognitive biases*.
- Complexity of the business environment and transactions.

An understanding and awareness of these obstacles prepares managers to overcome them in the financial reporting process as well as assists financial statement users in critically evaluating firm performance and condition.

Factors Influencing Management Behavior

Factors that influence management to intentionally bias estimates impede the use of good judgment. Areas of financial reporting that require significant judgment are particularly susceptible to management manipulation. For example, if management bonuses are tied to net income, management may have an incentive to bias reported income upward.

Analysts' forecasts may also influence management. Financial analysts use reported information to provide guidance to individuals and other entities in making investment and credit decisions. As part of this process, analysts release earnings forecasts. Because the stock price of a

company tends to react negatively when actual earnings are less than this earnings forecast, management may have an incentive to bias earnings upward if it would otherwise miss the forecast.⁷

To minimize management bias, auditors exercise **professional skepticism**, which is “an attitude that includes a questioning mind and a critical assessment of audit evidence.”⁸ Auditors should not assume that management is dishonest—yet they should consider the possible incentives for management to bias information presented in the financial statements.⁹

Cognitive Biases

Cognitive biases can also impact the way accountants make judgments. **Cognitive biases** are systematic deviations from rationality, to which we are all subject, that can impact judgments on a day-to-day basis. We discuss some of the types of cognitive biases next, followed by techniques that are useful in reducing the impact of these biases.

Types of Cognitive Biases. Examples of cognitive biases are the *availability*, *overconfidence*, *confirmatory*, *groupthink*, and *anchoring* biases.

1. The **availability bias** is the tendency to use the data that is most readily available or most easily recalled to make a decision, as opposed to considering all relevant data. For example, if you were deciding which computer to buy, you might rely on your friend’s advice instead of taking the time to research consumer reviews.
2. The **overconfidence bias** is the tendency to be more confident than your abilities and experience level would objectively warrant. For example, multiple research studies have asked study participants how confident they were in answers they provided to a set of questions. Research results repeatedly show that confidence systematically exceeds accuracy.
3. The **confirmatory bias** is when decision makers under-weight information that is not consistent with their initial beliefs. For example, if individuals have strong political beliefs, they may not adequately consider positions held by someone in another political party.
4. The **groupthink bias** is a phenomenon that occurs in situations where members of a group, in an attempt to avoid conflict, reach a consensus decision without considering all of the reasonable alternatives. For example, a group of students working on a case assignment may agree to a certain answer in order to avoid conflict with a dominant group member, even if everyone else in the group has not had a chance to express his or her views.
5. The **anchoring bias** occurs when the decision maker focuses on one piece of information (often the first piece of data encountered), weighting it more heavily than other pieces of information. For example, when you buy a used car, you may anchor on the sticker price of the car and not consider carefully enough what the car is really worth to you.

Techniques to Mitigate Cognitive Biases. To mitigate cognitive biases, accountants must be as objective as possible, which entails being free from any bias or other influences. The following techniques may prove helpful.

1. Be organized and methodical in the decision-making process. In our discussion of applied financial research later in the chapter, we outline steps in the research process that are also useful in solving a judgment-based problem objectively.
2. Generate alternatives, even when you think you have already arrived at the correct answer. Carefully consider each of these alternatives and reasons that it may be better than your initial assessment of the correct alternative.

⁷We discuss earnings management in more detail in Chapter 5.

⁸Public Company Accounting Oversight Board, *Staff Audit Practice Alert Number 10*, “Maintaining and Applying Professional Skepticism in Audits” (Washington, D.C.: Public Company Accounting Oversight Board, 2012).

⁹Professional skepticism is discussed more extensively in auditing courses.

3. Document your rationale about the alternatives. Often the process of documenting beliefs and thought processes—even if only in bullet format—challenges your thinking.
4. Delay your final judgment until you have gathered all of the facts and information and have considered all of the alternatives. This delay allows you to be more objective in your decision-making process.

Complexity of the Business Environment and Transactions

The increasing complexity of the business environment and related transactions also create an obstacle to the exercise of good judgment. Decisions related to complex transactions can often seem overwhelming, particularly to someone who is relatively new to the accounting profession. Even for experienced accountants, new issues arise all the time. For example, revenue recognition for virtual goods became a new accounting issue with the emergence of social media companies such as *Activision Blizzard*. Also, proper exercise of judgment often requires a substantial amount of research of the authoritative literature.

In these cases, it is helpful to follow an organized process that allows the accountant to stay focused on the issue at hand and make well-informed decisions. That is, the accountant does not need to know every answer, but she does need to understand the steps involved in determining the most appropriate accounting treatment. We discuss this research process later in the chapter.

- 4 Describe the types of authoritative literature and the literature hierarchy.

Authoritative Literature Used in Applied Financial Accounting Research

Accountants undertake financial accounting research whenever they need information to determine the appropriate reporting treatment for a business transaction. In addition, accountants use financial accounting research whenever the analysis and interpretation of an economic event or accounting standard is not clear and thus requires judgment. Accounting standards may be unclear for three main reasons:

1. Judgment is involved because the standard setters allow for management discretion.
2. The issue is sufficiently complex that, although a single correct answer exists, it requires research to determine the correct answer.
3. There is simply no information in the accounting standards that directly provides guidance to resolve a specific reporting issue.

In these cases, accountants must *research* the authoritative literature and develop a recommended accounting treatment. **Research** is the systematic investigation into an issue. We will focus our discussion on applied research that requires critical-thinking skills, a knowledge base, thoroughness, and professional judgment. We begin our discussion with the content of the authoritative literature. The following section will then outline the steps to follow in the research process.

Authoritative Literature

As discussed in Chapter 1, U.S. standard setters have issued a number of different types of authoritative statements over the years that are part of U.S. GAAP. These standards include, but are not limited to, Accounting Research Bulletins of the Committee on Accounting Procedure, Accounting Principles Board Opinions, and Statements of Financial Accounting Standards of the FASB.

Due to the large volume of diverse and complex standards, the body of U.S. GAAP became difficult to use. In response to this problem, the FASB developed the Financial Accounting Standards Board Accounting Standards Codification (ASC), often referred to as the **Codification**, which groups and summarizes all current standards by topic. When the FASB issues a new pronouncement, it is referenced as an Accounting Standards Update (ASU). Once approved, ASUs are incorporated into the Codification.

EXHIBIT 3.4 Major Codification Topic Groupings

Topic	Numbering	Description
General Principles	1XX	Establishes the Codification as the authoritative source for U.S. GAAP.
Presentation	2XX	Covers items such as financial statements, interim reporting, and segment reporting.
Assets	3XX	Covers the accounting treatment for assets.
Liabilities	4XX	Covers the accounting treatment for liabilities.
Equity	5XX	Covers the accounting treatment for equity.
Revenue	6XX	Covers the accounting treatment for revenues.
Expenses	7XX	Covers the accounting treatment for expenses.
Broad Transactions	8XX	Includes items such as business combinations and consolidations, fair value measurements, financial instruments, and foreign currency matters.
Industry	9XX	Presents industry-specific guidance.

Codification Structure. The Codification is divided into topics, subtopics, sections, and paragraphs. Exhibit 3.4 presents the nine major topic groupings. The complete list of topics included in the Codification can be found in Appendix A.¹⁰

The number and type of subtopics vary depending on the main topic but are generally distinguished by accounting area or scope.¹¹ For example, the Codification breaks down the topic on intangibles into the various types of intangibles such as goodwill. Exhibit 3.5 presents the subtopics included under the topic of intangibles. Note that the topics will also cross-reference relevant industry topics. For example, Topic 350 includes Topic 908 *Airlines*.

EXHIBIT 3.5 Codification Subtopics for Topic 350 Intangibles—Goodwill and Other

Subtopic Number	Subtopic Description
10	Overall
20	Goodwill
30	General Intangibles Other Than Goodwill
40	Internal-Use Software
50	Website Development Costs
908	Airlines
920	Entertainment – Broadcasters
922	Entertainment – Cable Television
932	Extractive Activities – Oil and Gas
950	Financial Services – Title Plant
980	Regulated Operations
985	Software

¹⁰Access to the Codification is available to faculty and students for a minimal charge through the Academic Accounting Access program sponsored by the Financial Accounting Foundation (FAF), in a joint initiative with the American Accounting Association (AAA). See <http://aaahq.org/fasb/access.cfm>.

¹¹Appendix A to this chapter presents the subtopics for Topic 350 – *Intangibles*, Topic 450 – *Contingencies*, and Topic 505 – *Equity*.

The sections under each subtopic are uniform throughout the Codification. For example, Section 25 is always recognition and Section 30 is always initial measurement. Appendix A presents the full set of sections included in the Codification.

As we discussed in Chapter 1, the SEC has the authority to promulgate accounting standards. For convenience, the Codification contains S sections written by the SEC (rather than the FASB). For example, S30 is a section that contains information about initial measurement issued by the SEC. All of the S sections refer to Section S99, which contains the actual text of the SEC documents. Accountants exercise caution when using S99 Sections: They do not represent the full breadth of SEC materials and may exclude the most recent information.

Accountants reference material from the Codification with a specific shorthand. To illustrate, consider the reference ASC 350-20–35-1. Exhibit 3.6 illustrates how to disaggregate a Codification reference.

EXHIBIT 3.6 Codification Reference

Reference	Title	Number
Topic	Intangibles – Goodwill and Other	350
Subtopic	Goodwill	20
Section	Subsequent Measurement	35
Paragraph		1

Example 3.1 illustrates the use of the Codification to locate information needed to resolve an accounting question.

EXAMPLE 3.1 Referencing the Codification

PROBLEM: You are the accountant for JC’s Emporium. JC’s has been sued and you have concluded that it must record a liability for the loss (a loss contingency). You are unsure what amount to report on the balance sheet. Using the “Structure of the U.S. GAAP Codification” in Appendix A, what are the best topic, subtopic, and sections to use to find this information in the Codification?

SOLUTION: Start in the Liabilities topic grouping—the 400s. In Appendix A, Contingencies are Topic 450. Within Topic 450, Subtopic 20 covers loss contingencies. Finally, because you are interested in how JC’s should initially record this contingency, you will go to Section 30 – Initial Measurement. Thus, the information is most likely to be found in ASC 450-20-30.

The U.S. GAAP Hierarchy. When researching financial reporting issues, it is important to know the hierarchy of the literature. What if an accountant cannot find guidance for a transaction in the authoritative U.S. GAAP included in the Codification and SEC material? The accountant then must look elsewhere, as depicted by Level 3 in Exhibit 3.7’s description of the levels used in the U.S. GAAP hierarchy.¹²

To illustrate the use of the hierarchy in practice, assume that an industry publication prescribes a particular accounting treatment, but a review of the Codification indicates that a different approach is more appropriate. In this case, the entity would be required to follow the Codification, which is the higher level of authority.

¹²The U.S. GAAP hierarchy is found in Paragraphs 1-3 of FASB ASC 105-10-5, *Generally Accepted Accounting Principles-Overall-Overview and Background*.

EXHIBIT 3.7 U.S. GAAP Hierarchy

Level	Literature Included
Level 1	The Codification and all SEC rules and interpretive releases. While the Codification applies to all entities that report under U.S. GAAP, the SEC materials only apply to publicly traded companies.
Level 2	Authoritative rules and principles from U.S. GAAP for similar transactions.
Level 3	Non-authoritative material such as the FASB Concepts Statements, IFRS, AICPA Issues Papers, Technical Information Services Inquiries and Replies included in AICPA Technical Practice Aids, pronouncements of professional associations or regulatory agencies, industry practice, and textbooks.

Authoritative Literature: IFRS

The IASB includes four categories of standards in IFRS, as listed here:

1. International Accounting Standards (IAS)
2. International Financial Reporting Standards (IFRS)
3. Standing Interpretations Committee (SIC) Interpretations
4. IFRS Interpretations Committee (IFRIC) Interpretations

Appendix B lists the IFRS standards and interpretations.

Hierarchy: IFRS. IFRS employs a four-level hierarchy to rank the authoritative support for its various accounting standards, as outlined in Exhibit 3.8.¹³

EXHIBIT 3.8 IFRS Hierarchy

Level	Literature Included
Level 1	IFRS standards and interpretations that specifically apply to a transaction, event, or condition.
Level 2	Authoritative rules from IFRS for similar and related transactions.
Level 3	The Conceptual Framework definitions, recognition criteria, and measurement concepts for assets, liabilities, income, and expenses.
Level 4	Recent pronouncements of other standard-setting bodies that use a similar Conceptual Framework to develop accounting standards, other accounting literature, and accepted industry practices, to the extent that they do not conflict with the sources in Levels 1 and 2.

When moving to Levels 2 and 3, IFRS addresses the need for management to use judgment in developing and applying accounting policies. Managers use their judgment to provide information that is relevant to the economic decision-making needs of users and is reliable. For information to be considered reliable in the financial statements, it must have the following characteristics:

1. Faithfully represents the financial position, financial performance, and cash flows of the entity.
2. Reflects the economic substance of transactions, other events and conditions, and not merely the legal form.
3. Is neutral (i.e., free from bias).
4. Is prudent (i.e., conservative).
5. Is complete in all material respects.¹⁴

¹³The IFRS hierarchy is found in IASC, *International Accounting Standard 8*, "Accounting Policies, Changes in Accounting Estimates and Errors" (London, UK: International Accounting Standards Committee, 1978, Revised), Paragraphs 7–12.

¹⁴*Ibid.*, Paragraph 10.

Interview

**ROBERT HERZ,
CHAIRMAN, FASB
(RETIRED) »**

Robert Herz

Robert Herz was chairman of the Financial Accounting Standards Board (FASB) from July 2002 to September 2010. During his tenure, he actively promoted the creation of improved accounting standards and greater transparency in financial reporting. Prior to joining FASB, he was a senior partner with PricewaterhouseCoopers and was an original member of the International Accounting Standards Board.

1 How does the Codification enhance the FASB's mission, and what were the key factors that influenced FASB to create it?

FASB's mission is to issue and improve financial accounting and disclosure standards and to ensure that people can understand, use, and apply these standards. Prior to the Codification, U.S. GAAP accounting literature was extremely unwieldy, and users found it difficult to follow and comply with the standards. Codification greatly facilitated its usability. Before I joined the FASB, I had spoken and written about the need to deal with this issue. And once at FASB, I was in a position to address this issue. Together with FASB senior staff and board members, we developed a systematic reorganization of U.S. GAAP, in one place and with a rational structure. This was not a breakthrough concept; other bodies of literature and accounting standards in other countries are codified.

2 How does the Codification simplify accounting research for users?

Everybody in the financial reporting supply chain benefits from the Codification. Users range from managerial accountants who prepare accounting statements for their companies to auditors, investors, analysts who focus on accounting matters, litigation attorneys, SEC staff, and accounting instructors and their students. The Codification is also essential for accounting standards setters who issue proposals and revise standards. The Codification logically reorganized the official U.S. GAAP, resolving overlapping and conflicting U.S. GAAP requirements. No longer do users have to figure out which of maybe 30 documents might have pertinent parts of U.S. GAAP dealing with a particular subject. Functionalities such as keyword searches make it faster and easier for users to navigate U.S. GAAP to find all the relevant requirements of an issue.

3 Why was the Codification process so challenging?

The volume of accounting literature was high—and also came from many disconnected source documents in different

formats. Larry Smith, FASB Director of Technical Application and Implementation Activities, Tom Hoey, the Codification project leader, and key staff developed a blueprint, timeline, and budget for the project. We then surveyed a broad range of users whose responses overwhelmingly supported the business case for Codification. With a green light from the FASB Board and the Trustees of the Financial Accounting Foundation and input from the SEC, we began to create the Codification.

This massive effort took about six years and included extensive reviews. Mappers sorted existing literature from FASB, AICPA, the SEC, and other organizations into 90 different Codification sections, each with many subtopics. Groups of authors compiled the literature and standardized its language. Everything was reviewed internally at the FASB and by external reviewers. A software developer built a state-of-the-art, Web-based, highly customized research platform for it. On July 1, 2009, after an 18-month trial period, the Codification became official and replaced existing U.S. GAAP.

4 What is the procedure for issuing changes to standards in the Codification?

After public due process procedures, the FASB issues a proposed Accounting Standards Update describing proposed modifications and how these would change the Codification. After carefully evaluating comments and other input and reanalyzing issues identified, a final standard is developed and published in the form of an Accounting Standards Update (ASU) that specifically updates or amends the relevant existing Codification sections. The ASU may also contain a discussion of the Board's Basis for Conclusions in developing the standard, as well as implementation guidance.

5 What accounting and reporting standards are not included in the Codification?

The Codification includes everything that is a U.S. GAAP requirement, as well as relevant SEC guidance. Some basic SEC reporting regulations such as Regulation SX are separately codified. The Codification doesn't cover International Financial Reporting Standards (IFRS).

6 What role has the Codification served in the ongoing convergence process?

Codifying U.S. GAAP literature has facilitated convergence with IFRS by making U.S. accounting requirements easier to access and compare with the corresponding international standards. That has helped the Boards in their deliberations of issues subject to convergence efforts.

Discussion Questions

1. Explain the way U.S. GAAP standards were structured prior to the Codification and indicate how the codification simplified research (provide examples).
2. Discuss the advantages and disadvantages of U.S. GAAP and IFRS convergence. What role has the Codification played?

Basis for Conclusions

The FASB includes a section in most of its pronouncements referred to as the **Basis for Conclusions (BC)**, which are discussions of the Board's reasoning and thought processes used to create the standard. The BCs are not considered authoritative, but they are very useful in understanding the thought processes of the Board and thus the substance of the standard. The BCs are not included in the Codification but can be found in the Accounting Standards Updates or the Statements of Financial Accounting Standards themselves. Because of the richness of the material in the BCs, we include cases based on them in the end-of-chapter material.

Basis for Conclusions: IFRS. Unlike U.S. GAAP, the BCs are included directly in the International Accounting Standards and International Financial Reporting Standards.

- 5 Outline and apply the steps in the applied financial accounting research process.

Steps in the Applied Financial Accounting Research Process

Now that you are familiar with the form and content of the authoritative literature, we will outline the six steps used in the financial reporting research process. These steps are presented in Exhibit 3.9 and discussed more extensively below. Financial statement preparers as well as auditors can use this process.

EXHIBIT 3.9 Steps in the Financial Accounting Research Process

1. Establish and understand the facts.
2. Identify the issue: What is the research question?
3. Search the authoritative literature.
4. Evaluate the results of the search.
5. Develop conclusions.
6. Communicate the results of the research.

Step 1: Establish and Understand the Facts

The first step in the research process is to understand the facts involved in the business transaction. What exactly does the business transaction look like? What parties are involved and how? What are the stipulations specified in any relevant contract? What is the timing of the transaction(s)?

The way the facts are presented to the accountant will vary in practice. The facts may be conveyed to you in a concise and thorough manner. For example, your manager may explain the transaction to you at an audit team meeting or a client may email the information. Alternatively, you may need to spend a significant amount of time establishing the facts by talking to the parties involved or reading through documents.

Regardless of the manner in which the facts are initially presented, it is critical that the researcher thoroughly understand the business transaction. Misunderstood facts will often lead to incorrect conclusions.

Step 2: Identify the Issue: What is the Research Question?

After establishing the fact pattern associated with the business transaction, the researcher needs to identify the issue. That is, the researcher needs to determine the exact research question. For example, a research question might be, "Should ABC Company recognize the revenue associated with this business transaction in the current fiscal year or the next fiscal year?" Typically, the research question (or issue) can be articulated in just a few sentences.

Step 3: Search the Authoritative Literature

Searching the authoritative literature can take a considerable amount of time, depending on the specific research question, even for experienced accountants. Understanding the structure of the Codification is invaluable for completing this step. Because the Codification is organized by topic, the research typically begins by identifying the appropriate topic to examine. For example, when researching an issue related to inventory, begin with Topic 330 – *Inventory*. It is sometimes possible to refine the search further, depending on the nature of the research question. If your question related to inventory was an issue as to how to initially record an item of inventory, you would most likely begin at ASC 330-10-30 – *Inventory – Overall – Initial Measurement*.

When searching the authoritative literature, you will often see cross-references to other Codification topics. For example, if you were researching an issue related to disclosure requirements for inventory, you would start in ASC 330-10-50 – *Inventory – Overall – Disclosure*. However, paragraph 6 relates to disclosures of significant estimates and provides a cross-reference to ASC 275-10-50 – *Risks and Uncertainties – Overall – Disclosure*. Always check the applicability of cross-references to be certain that you have done a thorough search of the literature.

You should also be aware that the Codification includes a search engine. Thus, if you are unsure where to start your research or you are unsure whether you have found all of the appropriate literature, you may want to search for various terms within the Codification using the search engine.

Step 4: Evaluate the Results of the Search

After you have found all the relevant authoritative literature, take the time to read it thoroughly, keeping in mind that much of the language used is highly technical and complex.

You may find that after reading through the authoritative literature, you need to change or refine the research question. Thus, these steps can be an iterative process. In fact, sometimes you will discover that you need to obtain additional facts related to the business transaction and return to Step 1.

Step 5: Develop Conclusions

After assimilating the relevant literature, decide on the best financial reporting treatment. Sometimes, there is only one correct answer. In other cases, the answer may not exist in the literature, particularly in Level 1 of the hierarchy. Accountants use judgment to work down the levels of the hierarchy and sometimes have to utilize a similar transaction that is covered in the authoritative literature. Other times, there are multiple legitimate treatments found in the accounting standards. Accountants compare the various treatments and identify the alternative that will result in the most faithful representation of the economic event.

Step 6: Communicate the Results of the Research

After finishing the first five steps, the accountant documents and communicates the results of the research process. This documentation may be done in a variety of forms such as a memo to the file or a client letter. The information included depends upon the audience, but it will most likely include documentation from all of the preceding steps:

- The facts of the business transaction.
- The research question.
- The analysis of the issue (i.e., a summary of the authoritative literature).
- The recommendation.

When articulating your research and recommendation in written form, write clearly and concisely to address the research question and communicate all relevant information.

Applying the Research Process

Building research skills is critical to success in the accounting profession. The significant volume of accounting standards makes it impossible to commit them to memory. In addition, the business environment is constantly changing, requiring revisions of accounting standards. Nonetheless, professionals must be able to find the answers to technical accounting questions in order to function effectively on a day-to-day basis. Acquiring research skills takes a great deal of practice. To illustrate, let's take the case of deciding whether to capitalize or expense certain costs incurred during the production process (Example 3.2).

EXAMPLE 3.2

The Financial Reporting Research Process

PROBLEM: Tough Guy Enterprises, a U.S. GAAP reporter, manufactures high-quality jeans for little boys. The cost to produce one pair of jeans includes \$10 of materials and \$5 for labor. Tough Guy produced the following number of jeans over the past 5 years:

Year 1	5.0 million
Year 2	5.1 million
Year 3	4.9 million
Year 4	4.8 million
Year 5	5.2 million

Additional data are available for the current year (Year 6):

Number of jeans produced	4.2 million pairs
Variable production overhead	\$6.3 million
Fixed production overhead	\$5.0 million
General and administrative expenses	\$1.0 million
Selling costs	\$1 per pair of jeans
Cost of wasted material (spoilage)	\$0.25 million

Search the Codification to determine how to record each type of cost. Write a memo to the file to communicate your results.

SOLUTION: We will follow the steps in the financial accounting research process.

1. Establish and understand the facts.

The facts are straightforward, as captured in the problem statement. In real-world problems, the facts are typically more difficult to identify.

Tough Guy Enterprises is a U.S. GAAP reporter that manufactures jeans. It produced the following number of jeans over the past five years:

Year 1	5.0 million
Year 2	5.1 million
Year 3	4.9 million
Year 4	4.8 million
Year 5	5.2 million

Continued

Additional facts for the current year or Year 6:

Material costs per pair	\$10
Labor costs per pair	\$5
Number of jeans produced	4.2 million
Variable production overhead	\$6.3 million
Fixed production overhead	\$5.0 million
General and administrative expenses	\$1.0 million
Selling costs	\$1 per pair of jeans
Cost of wasted material (spoilage)	\$0.25 million

2. Identify the issue: What is the research question?

The accounting issue is whether Tough Guy should record expenditures as an expense (expensed) or as an asset (capitalized as part of the cost of inventory) and included in cost of goods sold when the inventory is sold. As a result, the research question is: Which of these expenditures should Tough Guy allocate to inventory and which should it expense immediately?

3. Search the authoritative literature.

We begin our search using Codification Topic 330 – *Inventory*. None of the industry sub-topics is relevant (agriculture, airlines, contractors, entertainment, extractive activities, real estate, software). Next, we review the *Overall* subtopic, ASC 330-10. Because we are interested in the way Tough Guy will initially record inventory, we will use Section 30 – *Initial Measurement* of ASC 330-10.

4. Evaluate the results of the search.

A thorough review of Section 30 identifies the relevant parts of the Codification to use in developing a conclusion, as summarized next.

Codification Reference	Standard
ASC 330-10-30-1	Inventory is typically stated at cost (i.e., the cost incurred to bring the inventory to its existing condition and location).
ASC 330-10-30-3	Variable production overhead costs are allocated to each unit of production on the basis of the actual use of the production facilities. The allocation of fixed production overhead is based on the normal capacity of the production facility. Normal capacity is the production expected to be achieved over a number of periods and under normal circumstances.
ASC 330-10-30-6	The actual level of production may be used if it approximates normal capacity. The amount of fixed overhead allocated to each unit of production should not be increased in periods of abnormally low production.
ASC 330-10-30-7	Unallocated overhead costs should be recognized in the period they are incurred. Wasted materials (spoilage) should be recognized in the period they are incurred.
ASC 330-10-30-8	General and administrative expenses are typically recognized as expenses if they are not clearly related to production. Selling costs are not included in inventory.

5. Develop conclusions.

The conclusions are clear in this case with one exception: fixed overhead allocation. The allocation of the fixed production overhead is more complex than the other costs. According to ASC 330-10-30-3, the allocation of fixed production overhead is based on the normal capacity of the production facility. Normal capacity is the production expected to be achieved over a number of periods and under normal circumstances. In this case, we estimate normal capacity at 5 million pairs of jeans per year, which is the average of the prior five years of production (5.0, 5.1, 4.9, 4.8, and 5.2 million). Thus, we would allocate \$1 per pair of jeans to inventory (the fixed overhead of \$5 million divided by the normal capacity of 5 million pairs of jeans). The total amount of fixed overhead allocated to inventory is \$4.2 million (\$1 per pair times 4.2 million pairs produced during the current year).

The following table lists the expenditures and their proper accounting treatment (expense versus capitalize).

Expenditure	Total Cost	Cost per Pair of Jeans (based on production of 4.2 M)	Cost Allocated to Inventory	Cost Allocated to Expense	Relevant ASC Reference
Cost of material	\$42.00 M	\$10.00	\$ 42.00 M		ASC 330-10-30-1
Cost of labor	\$21.00 M	\$ 5.00	\$ 21.00 M		ASC 330-10-30-1
Variable production overhead	\$ 6.30 M	\$ 1.50	\$ 6.30 M (\$1.50 × 4.2 M)		ASC 330-10-30-3
Fixed production overhead	\$ 5.00 M	\$ 1.00 to inventory; Remainder to expense	\$ 4.20 M (\$1.00 × 4.2 M)	\$0.80 M (\$5.0 M – \$4.2 M)	ASC 330-10-30-3, ASC 330-10-30-6, ASC 330-10-30-7
General and administrative expenses	\$ 1.00 M	\$ 0.24		\$1.00 M	ASC 330-10-30-8
Selling costs	\$ 4.20 M	\$ 1.00		\$4.20 M	ASC 330-10-30-8
Wasted materials	\$ 0.25 M	\$ 0.06		\$0.25 M	ASC 330-10-30-7
Totals	\$79.75 M		\$73.5 M	\$6.25 M	

6. Communicate the results of the research.

The following memo to the file documents the results of the research.

MEMORANDUM TO THE FILE

TO: Client File – Tough Guy Enterprises
 FROM: Jane Lawson
 DATE: January 10, 2018
 RE: Allocation of Costs Related to Inventory

Continued

FACTS

Tough Guy Enterprises manufactures jeans and is a U.S. GAAP reporter. The company produced 4.2 million pairs of jeans in the current year and the following number of jeans over the preceding five years:

Year 1	5.0 million
Year 2	5.1 million
Year 3	4.9 million
Year 4	4.8 million
Year 5	5.2 million

Tough Guy has incurred the following expenditures related to its jean production during the current year:

Material costs per pair	\$10
Labor costs per pair	\$5
Variable production overhead	\$6.3 million
Fixed production overhead	\$5.0 million
General and administrative expenses	\$1.0 million
Selling costs	\$1 per pair of jeans
Cost of wasted material (spoilage)	\$0.25 million

ISSUE

Which of these expenditures should Tough Guy allocate to inventory and which should it expense immediately?

ANALYSIS

ASC 330-10-30-1 indicates that inventory is typically stated at cost (i.e., the cost incurred to bring the inventory to its existing condition and location).

ASC 330-10-30-3 states that variable production overhead costs are allocated to each unit of production on the basis of the actual use of the production facilities. The allocation of fixed production overhead is based on the normal capacity of the production facility where normal capacity is defined as the production expected to be achieved over a number of periods and under normal circumstances. ASC 330-10-30-6 allows the actual level of production to be used if it approximates normal capacity.

ASC 330-10-30-6 explains that the amount of fixed overhead allocated to each unit of production should not be increased in periods of abnormally low production.

ASC 330-10-30-7 requires that unallocated overhead costs be recognized in the period they are incurred and that wasted materials (spoilage) be recognized in the period they are incurred.

ASC 330-10-30-8 stipulates that general and administrative expenses should typically be recognized as expenses if they are not clearly related to production. Also, selling costs should not be included in inventory.

CONCLUSION

The conclusions are clear in this case with one exception: fixed overhead allocation. The allocation of the fixed production overhead is more complex than the other costs. According to ASC 330-10-30-3, the allocation of fixed production overhead is based on the normal capacity of the production facility. Normal capacity is the production expected to be achieved over a number of periods and under normal circumstances. In this case, we estimate normal capacity

at 5 million pairs of jeans per year, which is the average of the prior five years of production (5.0, 5.1, 4.9, 4.8, and 5.2 million). Thus, we would allocate \$1 per pair of jeans to inventory (the fixed overhead of \$5 million divided by the normal capacity of 5 million pairs of jeans). The total amount of fixed overhead allocated to inventory is \$4.2 million (\$1 per pair times 4.2 million pairs produced during the current year).

In conclusion, Tough Guy should allocate \$73.5 million to inventory and expense \$6.25 million immediately. Specifics of this allocation are detailed in the following table.

<u>Expenditure</u>	<u>Total Cost</u>	<u>Cost per Pair of Jeans (based on production of 4.2 M)</u>	<u>Cost Allocated to Inventory</u>	<u>Cost Allocated to Expense</u>	<u>Relevant ASC Reference</u>
Cost of material	\$42.00 M	\$10.00	\$42.00 M		ASC 330-10-30-1
Cost of labor	\$21.00 M	\$ 5.00	\$21.00 M		ASC 330-10-30-1
Variable production overhead	\$ 6.30 M	\$ 1.50	\$ 6.30 M (\$1.50 × 4.2 M)		ASC 330-10-30-3
Fixed production overhead	\$ 5.00 M	\$ 1.00 to inventory; Remainder to expense	\$ 4.20 M (\$1.00 × 4.2 M)	\$0.80 M (\$5.0 M – \$4.2 M)	ASC 330-10-30-3, ASC 330-10-30-6, ASC 330-10-30-7
General and administrative expenses	\$ 1.00 M	\$ 0.24		\$1.00 M	ASC 330-10-30-8
Selling costs	\$ 4.20 M	\$ 1.00		\$4.20 M	ASC 330-10-30-8
Wasted materials	\$ 0.25 M	\$ 0.06		\$0.25 M	ASC 330-10-30-7
Totals	<u>\$79.75 M</u>		<u>\$ 73.5 M</u>	<u>\$6.25 M</u>	

Financial research cases (referred to as Surfing the Standards cases) at the end of each chapter will guide you in developing and practicing your research skills.

Summary by Learning Objectives

Here we summarize the main points by learning objective. Throughout the chapter, we discuss the accounting and reporting of U.S. GAAP and IFRS side-by-side. The following table also highlights the major similarities and differences between the standards.

1 Explain the importance and prevalence of judgment in the financial reporting process.

Summary	Similarities and Differences between U.S. GAAP and IFRS
<p>Judgment is the process by which a decision is reached in situations in which there are multiple alternatives. Managers make many judgments in financial reporting, including:</p> <ol style="list-style-type: none"> 1. Whether to report a business event, and if so, when? 2. What is the appropriate financial reporting treatment? 3. What amount should be reported in the financial statements? 	<p>Similar under U.S. GAAP and IFRS.</p>

*Summary by Learning Objectives, continued***2** Discuss the role of accountants' assumptions and estimates and the related disclosures in the financial reporting process.

Summary	Similarities and Differences between U.S. GAAP and IFRS
<p>Managers must make assumptions and estimates in selecting accounting methods and applying accounting standards.</p> <p>Companies report details about the accounting policies they use in one of the first footnotes to the financial statements.</p>	<ul style="list-style-type: none"> ➤ IFRS further requires that companies disclose additional information about the assumptions and estimates they made at the end of the reporting period. ➤ IFRS also requires that companies disclose the judgments (apart from those involving estimates and assumptions) that management has made in determining appropriate accounting treatments for amounts reported on the financial statements (in the process of applying the company's accounting policies).

3 Identify obstacles to the use of sound judgment in preparing financial information and ways to overcome them.

Summary	Similarities and Differences between U.S. GAAP and IFRS
<p>Obstacles are potential impediments to the use of good judgment, including:</p> <ul style="list-style-type: none"> • Factors that may influence management to intentionally bias their estimates. • Cognitive biases. • Increasing complexity of the business environment and transactions. <p>To minimize cognitive bias, auditors exercise professional skepticism, which is "an attitude that includes a questioning mind and a critical assessment of audit evidence."</p> <p>Cognitive biases that impact the way accountants make judgments include:</p> <ul style="list-style-type: none"> • Availability bias. • Overconfidence bias. • Confirmatory bias. • Groupthink bias. • Anchoring bias. <p>Techniques to overcome biases include:</p> <ul style="list-style-type: none"> • Be organized and methodical in the decision-making process. • Generate alternatives, even when you think you have already arrived at the correct answer. • Document your rationale about the alternatives. • Delay your final judgment until you have gathered all of the facts and information and have considered all of the alternatives. 	<p>Similar under U.S. GAAP and IFRS.</p>

Summary by Learning Objectives, continued

4 Describe the types of authoritative literature and the literature hierarchy.	
Summary	Similarities and Differences between U.S. GAAP and IFRS
<p>When the appropriate financial reporting treatment for a business transaction is unclear, accountants must research the literature and develop a recommended accounting treatment.</p> <p>Research is the systematic investigation into an issue.</p> <p>The Financial Accounting Standards Board Accounting Standards Codification (FASB ASC) contains the authoritative U.S. GAAP literature.</p> <p>The U.S. GAAP hierarchy has three levels:</p> <p>Level 1. Codification and all SEC rules and interpretive releases. While the Codification applies to all entities that report under U.S. GAAP, the SEC materials only apply to publicly traded registrants.</p> <p>Level 2. Authoritative rules and principles from U.S. GAAP for similar transactions.</p> <p>Level 3. Other material such as the FASB Concepts Statements, IFRS, industry practice, and textbooks.</p>	<p>► The IFRS literature is comprised of:</p> <ol style="list-style-type: none"> 1. International Financial Reporting Standards (IFRS). 2. International Accounting Standards (IAS). 3. IFRS Interpretations Committee (IFRIC) Interpretations. 4. Standing Interpretations Committee (SIC) Interpretations. <p>The IFRS hierarchy has four levels:</p> <p>Level 1. IFRS standards and interpretations that specifically apply to a transaction, event, or condition.</p> <p>Level 2. Authoritative rules from IFRS for similar and related transactions.</p> <p>Level 3. The Conceptual Framework definitions, recognition criteria, and measurement concepts for assets, liabilities, income, and expenses.</p> <p>Level 4. Recent pronouncements of other standard-setting bodies that use a similar Conceptual Framework to develop accounting standards, other accounting literature and accepted industry practices, to the extent that these do not conflict with the sources in Levels 1 and 2.</p>

5 Outline and apply the steps in the applied financial accounting research process.	
Summary	Similarities and Differences between U.S. GAAP and IFRS
<p>There are six steps in the financial accounting research process:</p> <ol style="list-style-type: none"> 1. Establish and understand the facts. 2. Identify the issue: What is the research question? 3. Search the authoritative literature. 4. Evaluate the results of the search. 5. Develop conclusions. 6. Communicate the results of the research. 	<p>Similar under U.S. GAAP and IFRS.</p>

MyLab Accounting

Go to <http://www.pearson.com/mylab/accounting> for the following Questions, Brief Exercises, Exercises, and Problems. They are available with immediate grading, explanations of correct and incorrect answers, and interactive media that acts as your own online tutor.

3 Judgment and Applied Financial Accounting Research

Questions

- 1 Q3-1. What is judgment and when is it used by accountants?
- 1 3 Q3-2. How can management create an impediment to the exercise of good judgment?
- 2 Q3-3. Does **U.S. GAAP** require that companies disclose information about the assumptions and estimates they make in their financial statements? Explain.
- 2 Q3-4. Does **IFRS** require that companies disclose information about the assumptions and estimates they make in their financial statements? Explain.
- 2 Q3-5. Does **U.S. GAAP** require that companies disclose their accounting policies? Explain.
- 2 Q3-6. Does **IFRS** require that companies disclose their accounting policies? Explain.
- 3 Q3-7. What is the difference between the availability and confirmatory biases?
- 3 Q3-8. What types of biases are individual decision makers subject to when exercising judgment in addressing accounting issues?
- 4 Q3-9. How does the Accounting Standards Codification make the body of **U.S. GAAP** easier to use?
- 4 Q3-10. What is the purpose of a literature hierarchy?
- 4 Q3-11. What is the Basis for Conclusions and where can they be found for **U.S. GAAP**?
- 4 Q3-12. What is the Basis for Conclusions and where can they be found for **IFRS**?
- 4 5 Q3-13. Explain how accountants and auditors use judgment as they prepare and audit financial statements.
- 4 5 Q3-14. What is research and when is financial accounting research required?

Brief Exercises

- 1 2 **BE3-1. Judgment in Accounting for Accounts Receivable.** Identify areas where managers make estimates and assumptions in accounting for accounts receivable.
- 1 2 **BE3-2. Judgment in Accounting for Plant and Equipment.** Identify areas where managers make estimates and assumptions in accounting for plant and equipment.
- 3 **BE3-3. Match Each Cognitive Bias Below with Its Description.**
- | | |
|----------------------------|---|
| Availability bias | a. A phenomenon that occurs in situations where members of a group, in an attempt to avoid conflict, reach a consensus decision without considering all of the reasonable alternatives. |
| Overconfidence bias | b. The tendency to be more confident than your abilities and experience level would objectively warrant. |
| Confirmatory bias | c. The tendency to use the data that is most readily available or most easily recalled to make a decision, as opposed to considering all relevant data. |
| Groupthink bias | d. The decision maker focuses on one piece of information, weighting it more heavily than other pieces of information. |
| Anchoring bias | e. A decision maker under-weights information that is not consistent with her initial beliefs. |
- 3 **BE3-4. Techniques to Overcome Cognitive Biases.** Explain why it is important to understand cognitive biases in decision making. Identify at least three techniques used to mitigate cognitive biases in practice.
- 4 **BE3-5. Literature Hierarchy.** Put the three levels of the literature hierarchy for **U.S. GAAP** in correct order (use 1, 2, 3):

Level	Authoritative Literature
_____	Authoritative rules and principles from U.S. GAAP for similar transactions.
_____	Codification and all SEC rules and interpretive releases. Whereas the Codification applies to all entities that report under U.S. GAAP , the SEC materials apply only to publicly traded registrants.
_____	Other material such as the FASB Concepts Statements, IFRS , industry practice, and textbooks.

- 4** **BE3-6. Literature Hierarchy.** Identify the level of the literature hierarchy for **U.S. GAAP** to which each item belongs.

Authoritative Literature	Level 1, 2, or 3?
a. Industry practice	_____
b. FASB Concepts Statements	_____
c. Codification	_____
d. Textbooks	_____
e. Authoritative rules and principles from U.S. GAAP for similar transactions	_____
f. International Financial Reporting Standards (IFRS)	_____
g. SEC rules and interpretive releases	_____

- 4** **BE3-7. IFRS Literature Hierarchy.** Put the four levels of the **IFRS** literature hierarchy in correct order (use 1, 2, 3, 4):

Level	Authoritative Literature
_____	Recent pronouncements of other standard-setting bodies that use a similar Conceptual Framework to develop accounting standards, other accounting literature, and accepted industry practices, to the extent that these do not conflict with the other sources in Levels 1 and 2.
_____	IFRS standards and interpretations that specifically apply to a transaction, event, or condition.
_____	The Conceptual Framework definitions, recognition criteria, and measurement concepts for assets, liabilities, income, and expenses.
_____	Authoritative rules from IFRS for similar and related transactions.

- 4 5 A** **BE3-8. Codification Research.** Referencing Appendix A, determine the topics, subtopics and sections of the Codification for the following balance sheet events.

Balance Sheet Event	Codification Reference
a. Inventory initial measurement	_____
b. Application of the lower-of-cost-or-market rule for inventory	_____
c. Accounts receivable initial measurement	_____
d. Application of bad debt provision	_____
e. Property, plant, and equipment, initial measurement	_____
f. Depreciation	_____

- 4 5** **BE3-9. Research Process.** Explain why research is important in accounting. Discuss the research process.
5 **BE3-10. Research Process.** Put the six steps of the research process in correct order (use 1–6).

Number	Step
_____	Search the authoritative literature.
_____	Communicate the results of the research.
_____	Establish and understand the facts.
_____	Evaluate the results of the search.
_____	Identify the issue: What is the research question?
_____	Develop conclusions.

Exercises

1 2

- E3-1. Accounting Policy Disclosures.** To compare entities in the same industry, it is important to determine the accounting methods used by each firm. Answer the following questions regarding accounting methods.
- Where do firms provide information about their accounting methods?
 - Provide at least two examples of the accounting methods commonly covered in your first accounting course.

3

- E3-2. Cognitive Bias.** A team of accounting students is working on a case where they are required to assess a set of information to determine a company's allowance for bad debts. The students have many pieces of information to analyze, including:

- The company's allowance for bad debts has been 5% of its receivables for the last several years.
- This year, the company has strengthened its credit extension policy.
- The average time that an accounts receivable has been outstanding has increased from 40 to 50 days this year.
- The economy has weakened over the year, with a pending recession.

Following is part of the discussion at their first team meeting. Analyze the discussion and determine the type of cognitive bias most consistent with the statements made by each student, providing an explanation for your answer.

Discussion »

Tom initiated the discussion saying, "I have seen this kind of situation before when a company has to report a higher allowance than last year. Allowances are always increasing."

Jennifer offered, "The first piece of information in the case is always the most important. The bad debts have historically been 5%. Therefore, the allowance has to be 5%."

Jake added, "As I look at the case, I keep coming back to the fact that the average time that an account receivable has been outstanding has increased by 10 days. In my view, this is the most important piece of information—the other facts don't matter."

Marina's view was, "Even though the economy has deteriorated, the historical data is always more important. The general trends in the economy are not relevant."

3

- E3-3. Cognitive Bias.** A team of accounting students is working on a case where they are required to assess a set of information to determine the useful life used to depreciate a company's machinery used to produce smart phone cases. The students have many pieces of information to analyze, including:

- The company has used a 20-year useful life for the last several years.
- The industry average useful life for similar equipment is 15 years.
- The company purchased the equipment 5 years ago.
- The demand for smart phone cases has increased over the last several years.
- This year, the company has explored purchasing new machinery using a more efficient technology to produce the cases. This equipment would have a useful life of about 10 years.
- The average time that a machine is down for repairs has increased from 3 days to 12 days per year.

Following is part of the discussion at their first team meeting. Analyze the discussion and determine the type of cognitive bias most consistent with the statements made by each student, providing an explanation for your answer.

Discussion »

Khalil initiated the discussion saying, "Information on what the other companies in the industry are using is what is relevant. The industry average is an aggregate of all the useful lives used and represents the best overall estimate. We need to use 15 years."

Ashanti's view was, "Even though the industry average is 15 years, the company's history is most important here. The company's history is the first piece of information presented because it is the most important. What another company is doing is just not relevant. So, we do not change the 20-year useful life."

Amanda asserted, "This is obvious. Of course, the answer is 10 years. Anyone can see that. All the facts support a 10-year useful life."

Joe suggested, "Amanda is convinced the answer is 10 years and is sure about it. Khalil wants 15 years. I am not sure what the answer is, but let's take the average of 12.5 years. Can we all agree to 12.5 years? We all should be happy with this answer."

4 5 A

E3-4. Authoritative Literature. Provide the reference to the topic, subtopic and section in the Codification where you would most likely begin your research for the following areas.

- Determine what amount to record upon acquisition of a receivable that you received when you sold services.
- Resolve a question related to the way in which an airline company depreciates property, plant, and equipment.
- Determine whether to recognize a contingent loss liability.

4 5 A

E3-5. Authoritative Literature. Provide the reference to the Codification paragraph where you can find a listing of the items that should appear in other comprehensive income.

4 5 A

E3-6. Authoritative Literature. To what entity types does ASC 330-10: *Inventory – Overall* not apply? Provide the Codification reference.

4 5 A

E3-7. Authoritative Literature. How does FASB define cash equivalents? Provide the Codification reference.

4 5 A

E3-8. Authoritative Literature. What is the objective of the statement of cash flows? Provide the Codification reference.

CASES

Judgment Cases

Judgment Case 1: Judgment and Estimation Uncertainty

Unlike **U.S. GAAP**, **IFRS** requires that an entity disclose (a) management's judgments with the most significant effect on the financial statements and (b) information about the major sources of estimation uncertainty that may result in a material adjustment to the carrying values of the entity's assets and liabilities. These disclosure requirements are included in IAS 1, *Presentation of Financial Statements*. Paragraph 122 contains the requirement related to judgments, and paragraph 125 contains the requirement related to estimation uncertainty.

Read paragraphs 122 through 133 and paragraph BC83 of IAS 1.

- What are the two examples of judgments that could have a significant impact on the financial statements?
- What are four examples of estimation uncertainty that could result in a material adjustment in future years?
- Consider an entity that reports an asset at fair value when the fair value is based on recently observed market prices. If it is likely that this value might change significantly within the next year, should the entity disclose the estimation uncertainty? Explain your answer.

Judgment Case 2: Estimations on the Balance Sheet

Part 1: Read paragraph OB11 of Statement of Financial Accounting Concepts No. 8, *Conceptual Framework for Financial Reporting: Chapter 1, The Objective of General Purpose Financial Reporting*, and *Chapter 3, Qualitative Characteristics of Useful Financial Information*. What does FASB say about the degree to which the balance sheet is made up of estimates as opposed to exact depictions of the underlying economic position of the entity?

Part 2: The disclosures related to critical accounting estimates and judgments were previously seen in Exhibit 3.2 for *Telefonaktiebolaget LM Ericsson (Ericsson)*. The balance sheets are presented on the following page. Focusing on *Ericsson's* assets, do you agree with the FASB's assessment about the degree to which the balance sheet is made up of estimates? Explain your answer.

TELEFONAKTIEBOLAGET LM ERICSSON

Surfing the Standards Cases

Surfing the Standards Case 1: U.S. GAAP Hierarchy

The third level of the **U.S. GAAP** Hierarchy involves nonauthoritative materials such as textbooks. Read paragraph 3 of ASC 105-10-05, *Generally Accepted Accounting Principles – Overall – Overview and Background*. What examples of nonauthoritative sources does the FASB provide?

Surfing the Standards Case 2: Inventory Disclosures

Abtos Company is a U.S. manufacturer that is publicly traded. Abtos reports \$12 million of inventory on its balance sheet. Inventory includes raw materials, work-in-process, and finished goods. Is Abtos required to disclose the amounts for each class of inventory, or can it simply report the total \$12 million balance on its balance sheet? Provide Codification references to support your answer to this question.

Surfing the Standards Case 3: Research Expenditures

PharmY, Inc. is a **U.S. GAAP** reporter that is in the pharmaceutical industry. In the current year, PharmY incurred expenditures related to laboratory experiments designed to discover a new drug. The expenditures were as follows:

Laboratory equipment that will be used for this project only	\$1,000,000
Materials that will be used for this project only	750,000
Wages for employees involved exclusively in the project	500,000

Search the Codification to determine how to record each type of cost. Write a memo to the file to communicate your results.

Basis for Conclusions Cases

Basis for Conclusions Case 1: Judgment and Estimation Uncertainty

Unlike **U.S. GAAP**, **IFRS** requires that an entity disclose (a) management's judgments with the most significant effect on the financial statements and (b) information about the major sources of estimation uncertainty that may result in a material adjustment to the carrying values of the entity's assets and liabilities. These disclosure requirements are included in *IAS 1*, "Presentation of Financial Statements." Paragraph 122 contains the requirement related to judgments and paragraph 125 contains the requirement related to estimation uncertainty.

Read paragraphs BC77 through BC84 in the basis for conclusions in *IAS 1*. What reasons did the Board give for requiring the disclosures about judgment? What reasons did the Board give for requiring the disclosures about estimation uncertainty?

Basis for Conclusions Case 2: Income Statement or Balance Sheet?

Certain transactions require a choice about which financial statement is more important—the income statement or the balance sheet. Read paragraphs BC1.31 and BC1.32 in the basis for conclusions of Statement of Financial Accounting Concepts No. 8, *Conceptual Framework for Financial Reporting: Chapter 1, The Objective of General Purpose Financial Reporting*, and *Chapter 3, Qualitative Characteristics of Useful Financial Information*.

- a. The original portion of the **U.S. GAAP** conceptual framework that dealt with the objectives of financial reporting (Concepts Statement 1) has now been superseded. What opinion did it express related to the importance of these two financial statements?
- b. What opinion did the original **IFRS** conceptual framework (the *Framework*) express related to the importance of these two financial statements?
- c. What opinion does the new conceptual framework under **U.S. GAAP** express regarding the importance of these two financial statements?

Review of the Accounting Cycle

LEARNING OBJECTIVES

- 1 Describe the accounting cycle.
- 2 Explain transaction analysis, including the use of the accounting equation.
- 3 Illustrate journalizing transactions, including determining whether to debit or credit accounts.
- 4 Explain the importance of and show how to post journal entries to the general ledger.
- 5 Explain the importance of and illustrate the preparation of an unadjusted trial balance.
- 6 Discuss the need for adjusting journal entries and explain deferrals and accruals.
- 7 Explain the use of and illustrate the preparation of an adjusted trial balance.
- 8 Describe the preparation of the financial statements from the adjusted trial balance.
- 9 Explain the difference between permanent and temporary accounts and demonstrate the process of closing temporary accounts.
- 10 Explain the importance of and illustrate the preparation of a post-closing trial balance.

Introduction

COMPANIES SELL MERCHANDISE, purchase inventory, and compensate employees every day—and each individual event represents a *transaction*. Consider the retailer **Target**. In its 1,792 U.S. stores, it reported sales of over \$73 billion and employed over 390,000 people in fiscal year 2015. These statistics indicate the magnitude of **Target's** *transactions*. For example, if **Target** paid each employee weekly, there would be over 20 million paychecks issued in a year.

A company's accounting system tracks all the *transactions* that occur every day and ultimately aggregates and summarizes them in publicly available financial statements. The *accounting cycle* describes the process by which a company records *transactions* in its books and summarizes their effects in the financial statements.

In this chapter, we discuss the nine steps in the *accounting cycle*. The process starts with a transaction analysis to determine whether an economic event has occurred that changes assets, liabilities, or stockholders' equity. After making this determination, a company *journalizes* transactions and *posts* them to its ledger accounts. Next, the entity ensures numerical accuracy of the process by preparing a *trial balance*. Before preparing financial statements, a company determines whether adjustments are required to ensure that it has reported all economic events occurring in that period. Finally, it prepares the financial statements and closes all *temporary accounts*.

These steps ensure that every *transaction* flows to the financial statements, enabling investors, creditors, and other financial statement users to use the statements to analyze a company's financial position and economic performance. ⏪

Darryl Brooks/Alamy Stock Photo

- 1 Describe the accounting cycle.

The Accounting Cycle

The **accounting cycle** describes the process by which a company records business *transactions* and ultimately aggregates and summarizes them in the financial statements. As a roadmap for the chapter, Exhibit 4.1 presents the nine steps in the accounting cycle. The accounting cycle steps do not depend on the accounting standards being used: Whether a company uses U.S. GAAP or IFRS, the accounting cycle begins with analyzing transactions and ends with a post-closing trial balance.

EXHIBIT 4.1 The Accounting Cycle

- 2 Explain transaction analysis, including the use of the accounting equation.

Step 1: Analyze the Transaction

A **transaction** is an economic event that involves a change in an asset, a liability, or a stockholders' equity account that companies record in their accounting records. The *accounting equation* (also called the balance sheet equation) is initially used to analyze transactions. We begin this section by reviewing the accounting equation and then expand it to illustrate transaction analysis.

The Accounting Equation

The **accounting equation** illustrates the relationship among assets, liabilities, and stockholders' equity as follows:

$$\text{Assets} = \text{Liabilities} + \text{Stockholders' Equity} \quad (4.1a)$$

Or, using abbreviations, this equation is:

$$A = L + E \quad (4.1b)$$

The accounting equation demonstrates that creditors and owners have claims to a company's assets. We review the definition of each element of the accounting equation in Exhibit 4.2, along with examples of each element.

EXHIBIT 4.2 Accounting Equation Definitions¹

Element	Definition	Examples
Assets	Probable future economic benefits obtained or controlled by a particular entity as a result of past transactions or events.	Cash, receivables, inventory, buildings
Liabilities	Probable future sacrifices of economic benefits arising from present obligations of a particular entity to transfer assets or provide services to other entities in the future as a result of past transactions or events.	Accounts payable, salaries payable, notes payable, bonds payable
Stockholders' Equity	The net assets or residual interest in the assets of an entity that remains after deducting its liabilities.	Contributed capital, retained earnings, accumulated other comprehensive income

The fact that all transactions affect at least two accounts and that the accounting equation will always balance is referred to as the **double-entry system**. For example, if an asset increases, then there must be either a decrease in another asset, an increase in liabilities, or an increase in stockholders' equity.

An expanded version of the accounting equation includes the various components of stockholders' equity. Stockholders' equity in equation form is:

$$\begin{aligned} \text{Stockholders' Equity} = & \text{Contributed Capital} + \text{Ending Retained Earnings} \\ & + \text{Accumulated Other Comprehensive Income} \end{aligned} \quad (4.2)$$

Contributed capital consists primarily of owners' investments in the business. Accumulated other comprehensive income increases or decreases with other comprehensive income. Other comprehensive income is an additional component of comprehensive income. We introduce other comprehensive income and accumulated other comprehensive income now, due to its complexity, and we explore it in much more detail in future chapters.

Revenue and gains increase retained earnings, whereas expenses, losses, and distributions to owners (dividends) decrease retained earnings. We represent retained earnings in equation form as follows:

$$\begin{aligned} \text{Ending Retained Earnings} = & \text{Beginning Retained Earnings} + \text{Revenues} + \text{Gains} \\ & - \text{Expenses} - \text{Losses} - \text{Dividends Declared} \end{aligned} \quad (4.3)$$

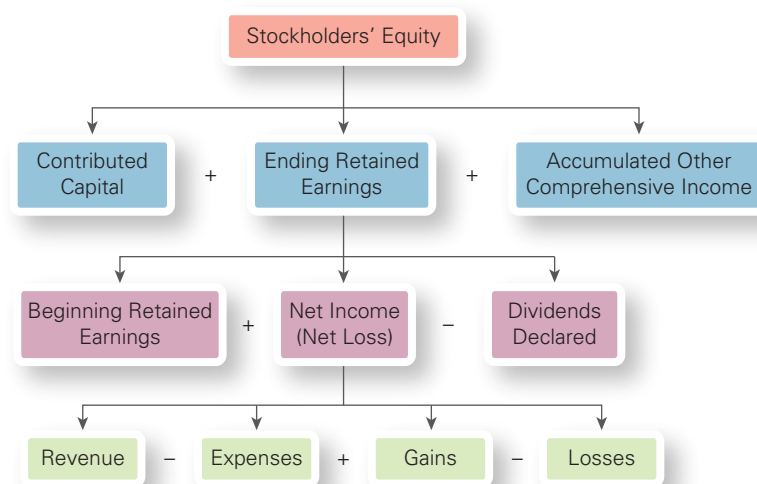

When revenues and gains exceed expenses, losses, and dividends over time, retained earnings is positive. Retained earnings is negative when expenses, losses, and dividends exceed revenues and gains over time. A negative balance in retained earnings is called a **deficit**. We review definitions of each of these terms in Exhibit 4.3.

¹U.S. GAAP definitions from FASB Concepts Statement No. 6, *Elements of Financial Statements*. IFRS definitions are nearly identical.

EXHIBIT 4.3 Expanded Accounting Equation Elements²

Element	Definition
Investments by Owners	Increases in equity of a particular business enterprise resulting from transfers to it from other entities of something valuable to obtain or increase ownership interests (or equity) in it. Assets are most commonly received as investments by owners, but that which is received may also include services or satisfaction of conversion of liabilities of the enterprise.
Distributions to Owners	Decreases in equity of a particular business enterprise resulting from transferring assets, rendering services, or incurring liabilities by the enterprise to owners. Distributions to owners decrease ownership interest (or equity) in an enterprise. Dividends are common distributions to owners.
Revenues	Inflows or other enhancements of an entity's assets or settlements of its liabilities (or a combination of both) from delivering or producing goods, rendering services, or other activities that constitute the entity's ongoing major or central operations.
Gains	Increases in equity (net assets) from an entity's peripheral or incidental transactions and from all other transactions and other events and circumstances affecting the entity except those that result from revenues or investments by owners.
Expenses	Outflows or other consumption of assets or incurrences of liabilities (or a combination of both) from delivering or producing goods, rendering services, or carrying out other activities that constitute the entity's ongoing major or central operations.
Losses	Decreases in equity (net assets) from an entity's peripheral or incidental transactions and from all other transactions and other events and circumstances affecting the entity except those that result from expenses or distributions to owners.

Exhibit 4.4 presents the components of stockholders' equity graphically. Consistent with Equation 4.2, stockholders' equity is comprised of contributed capital, ending retained earnings, and accumulated other comprehensive income. Also, ending retained earnings is equal to beginning retained earnings and is increased by net income and decreased by net losses and dividends. Net income (and net loss) is increased by revenues and gains and decreased by expenses and losses.

EXHIBIT 4.4 Components of Stockholders' Equity

²U.S. GAAP definitions from FASB Concepts Statement No. 6, *Elements of Financial Statements*. IFRS definitions are somewhat different, as explained in Chapter 2, but these differences do not affect the explanations of the steps in the accounting cycle.

Given Equations 4.2 and 4.3, we expand the basic accounting equation to represent the elements of stockholders' equity as follows:

Assets	=	Liabilities	+	Stockholders' Equity										
Assets	=	Liabilities	+	Contributed Capital	+	Ending Retained Earnings			+	Accumulated Other Comprehensive Income				
						Beginning Retained Earnings	+	Revenues and Gains	-	Expenses and Losses	-	Dividends Declared		

This expanded equation allows companies to analyze complex transactions.

EXAMPLE 4.1

Analysis of Transactions with the Expanded Accounting Equation

PROBLEM: Plush Service Corporation began 2018 with the following account balances.

Account	Balance	
Cash	\$38,000	
Accounts Receivable	30,000	}
Store Equipment	70,000	
Accounts Payable	3,000	
Legal Fees Payable	5,000	}
Notes Payable	30,000	
Common Stock	60,000	
Retained Earnings	40,000	

The company engaged in the following transactions during 2018:

- a. Issued an additional 10,000 shares of common stock on January 2. The stock was sold for \$80,000, which equals the par value of the stock.
- b. Purchased store equipment for \$10,000 cash on January 3.
- c. Provided services for cash of \$35,000 on February 5.
- d. Provided services on credit for \$90,000 on February 10.
- e. Received bill and paid utilities of \$15,000 on February 15.
- f. Sales employees worked and were paid sales salaries of \$30,000 on March 1.
- g. Incurred legal fees of \$6,000 on April 10 but did not pay for these services.
- h. Declared and paid dividends to stockholders of \$2,000 on April 30.
- i. Collected \$25,000 for services to be provided over the coming year on June 30.
- j. Paid \$72,000 for a three-year insurance policy on July 10 with coverage beginning on August 1.
- k. Paid \$1,000 for a three-week equipment rental on September 10.
 1. Collected \$10,000 from the February 10 transaction on October 20.
- m. Paid \$1,000 of the amount owed for legal fees incurred on April 10 on November 18.

Continued

Assume that Plush Service is not subject to tax. Illustrate the effect of each transaction on the expanded accounting equation.

SOLUTION: We analyze each transaction below, explaining the effect on the accounting equation by determining the increases and decreases in assets, liabilities, and components of stockholders' equity. Changes in assets must equal changes in liabilities and stockholders' equity after each transaction. Note that the first row of the table on the next page contains balances at the beginning of the period. For simplicity, we are adding the noncash asset accounts together as well as the liability accounts. Noncash assets include accounts receivable and store equipment. Liabilities include accounts payable, legal fees payable, and notes payable.

TRANSACTIONS ANALYSIS

- a. Plush received cash in exchange for equity. As a result, it will increase its assets and increase stockholders' equity through the contributed capital (common stock) account.
- b. Because Plush paid cash to purchase store equipment. Store equipment increases and the asset cash decreases. This transaction changes the composition of the assets but not the total.
- c. Because Plush received cash for services provided, it will increase its assets and will increase stockholders' equity through the service revenue account.
- d. Plush provided services on account. Therefore, it will increase its noncash assets (for the receivable) and will also increase stockholders' equity through the service revenue account for services provided.
- e. Because Plush used and paid for utilities, it will decrease the asset cash and decrease stockholders' equity by recognizing expenses.
- f. Plush used and paid for the services of its employees, so it will decrease the asset cash and decrease stockholders' equity through expenses.
- g. Because Plush incurred legal fees but did not yet pay for them, it will increase a liability and decrease stockholders' equity by recognizing expenses.
- h. Plush declared and paid dividends. In this case, it will decrease the asset cash and decrease stockholders' equity due to the dividends declared.
- i. Because Plush collected cash, it will increase the asset cash. However, Plush still owes services to the customer so it will also increase liabilities.
- j. Plush acquired an asset (the benefit of an insurance policy) and paid cash. Thus, it will increase an asset, prepaid insurance, and decrease the asset cash.
- k. Plush paid cash for an equipment rental. It will decrease the asset cash and increase an expense, thus decreasing equity.
- l. Because Plush collected cash for amounts owed to the company, it will increase an asset, cash, and decrease another asset, accounts receivable.
- m. Plush paid cash for amounts it owed for unpaid legal fees. The company will decrease the asset cash and decrease liabilities.

Ref	Assets		=	Liabilities	+	Stockholders' Equity					
	Cash	Noncash Assets	=	Liabilities		Contributed Capital (Common Stock)	Ending Retained Earnings				Acc. OCI*
						Beginning Retained Earnings	Revenues and Gains	Expenses and Losses	Dividends Declared		
Bal.	\$38,000	\$100,000	=	\$38,000		\$60,000	\$40,000				
(a)	+80,000		=			+80,000					
(b)	-10,000	+10,000 Store Equipment	=								
(c)	+35,000		=				+35,000 Service Revenue				
(d)		+90,000 Accounts Receivable	=				+90,000 Service Revenue				
(e)	-15,000		=					-15,000 Utilities Expense			
(f)	-30,000		=					-30,000 Salaries Expense			
(g)			=	+6,000 Legal Fees Payable				-6,000 Legal Fees Expense			
(h)	-\$2,000		=						-2,000 Dividends		
(i)	+25,000		=	+25,000 Unearned Service Revenues							
(j)	-72,000	+72,000 Prepaid Insurance	=								
(k)	-1,000		=					-1,000 Rental Expense			
(l)	+10,000	-10,000 Accounts Receivable	=								
(m)	-1,000		=	-1,000 Legal Fees Payable							
Bal.	<u>\$57,000</u>	<u>\$262,000</u>	=	<u>\$68,000</u>		<u>\$140,000</u>	<u>\$40,000</u>	<u>\$125,000</u>	<u>-\$52,000</u>	<u>-\$2,000</u>	<u>- 0-</u>

Ending Retained Earnings = \$111,000**

*Accumulated Other Comprehensive Income

**\$40,000 + \$125,000 - \$52,000 - \$2,000 = \$111,000

- 3 Illustrate journalizing transactions, including determining whether to debit or credit accounts.

Step 2: Journalize the Transactions

After analyzing the transaction, the second step in the accounting cycle is to *journalize* the transaction by formally recording the transaction in the accounting system. We will explain the journalization process, including the specific *accounts*, *debits* and *credits*, and *journal entries*.

Accounts

A company records each transaction in specific *accounts*, not just broad groupings such as assets and liabilities. An **account** is an individual record of increases and decreases in specific asset, liability, and stockholders' equity items. Exhibit 4.5 provides examples of asset, liability, and stockholders' equity accounts.

EXHIBIT 4.5 Account Examples

Account Type	Examples
Asset	Cash Accounts Receivable Inventory Prepaid Rent Building Equipment
Liability	Accounts Payable Wages Payable Notes Payable Bonds Payable
Stockholders' Equity	Common Stock Retained Earnings Sales Revenue Cost of Goods Sold Salary Expense Gain on Sale of Equipment Loss on Sale of Investments

A company's accounting system assigns each account a unique account number shown in the **chart of accounts**, a numerical listing of the account names and numbers that assists in locating the account in the ledger. The accounts are typically numbered in balance sheet order: assets, liabilities, equity, and the components of stockholders' equity including dividends, revenues, gains, expenses, and losses. Exhibit 4.6 presents a sample chart of accounts.

EXHIBIT 4.6 Sample Chart of Accounts

Assets
100 Cash
101 Accounts Receivable
102 Inventory
103 Prepaid Expenses
104 Office Supplies
150 Equipment
151 Accumulated Depreciation—Equipment
190 Other Assets
Liabilities
200 Accounts Payable
201 Tax Payable
202 Accrued Expenses Payable
210 Notes Payable
Stockholders' Equity
300 Common Stock
301 Retained Earnings
320 Dividends
Revenues
400 Sales Revenue
Expenses
500 Depreciation Expense
508 Wage Expense

Debits and Credits: A Review

Companies use *debits* and *credits* to *journalize* transactions. The terms *debit* and *credit* simply mean the left and the right side of an account, respectively—they do not imply increases or decreases. Conventions related to the type of account determine whether a debit or credit increases or decreases an account. Regardless of the accounts used to record the economic event, all transactions will result in debits being equal to credits. Just as assets equal liabilities plus stockholders' equity, debits always equal credits. This simple fact that debits equal credits forms the foundation of the double-entry system of accounting. Exhibit 4.7 presents the conventions for debits and credits in terms of increasing and decreasing accounts.

EXHIBIT 4.7 Debits and Credits

Account	Debits	Credits	Normal Balance*
Assets	Increase ↑	Decrease ↓	Debit
Liabilities	Decrease ↓	Increase ↑	Credit
Common Stock	Decrease ↓	Increase ↑	Credit
Retained Earnings	Decrease ↓	Increase ↑	Credit**
Accumulated Other Comprehensive Income	Decrease ↓	Increase ↑	Debit or Credit***
Dividends	Increase ↑	Decrease ↓	Debit
Revenues and Gains	Decrease ↓	Increase ↑	Credit
Expenses and Losses	Increase ↑	Decrease ↓	Debit

*The normal balance is the side of the account increase.

**The balance of retained earnings can be a debit when expenses, losses, and dividends exceed revenues and gains over time. A debit balance in retained earnings is called a deficit.

***Accumulated OCI will be a debit when cumulative OCI items net to a loss, or losses exceed gains. Accumulated OCI will be a credit when cumulative OCI items net to a gain, or gains exceed losses.

Asset accounts, such as cash and inventory, increase with a debit and decrease with a credit. When a company makes a sale of \$400 and collects cash, it debits cash by \$400. When a company pays employees, cash decreases, so it credits the cash account.

In general, liabilities and stockholders' equity increase with a credit and decrease with a debit. When a company purchases inventory on account, it credits accounts payable to reflect an increase in a liability. When the company pays its supplier the amount owed, it debits accounts payable to reflect a reduction in the liability.

Equity accounts, such as common stock and retained earnings, also increase with credits and decrease with debits. Revenues and gains are increases in equity, so these accounts will increase with credits. However, expenses and losses decrease equity, so they will increase with a debit. Similarly, dividends decrease equity so dividends also increase with debits.

The **normal balance** refers to the expected balance in an account, and it is the side that increases the value of the account. If an account increases with a debit, then its normal balance is a debit. Conversely, if an account increases by a credit, then its normal balance is a credit.

Journal Entries

Journalizing a transaction is the process of entering a transaction in the *general journal*. To journalize a transaction, companies prepare a **journal entry**, which contains the following elements in the common format:

- The date the transaction occurred is in the first column.
- Accounts debited are listed first and positioned at the left side. The dollar amount debited is placed in the debit column.
- Accounts credited are recorded next and indented to the right a few spaces. The dollar amount credited is placed in the credit column.
- A brief explanation is frequently included below the entry.

For example, Plush Service Corporation issued 10,000 shares of its common stock for \$80,000 on January 2, 2018, as indicated by the following journal entry for this transaction.

<i>Date</i>	<i>Account Titles and Explanations</i>	<i>Ref.</i>	<i>Debit</i>	<i>Credit</i>
2018				
Jan 2	Cash		80,000	
	Common Stock			80,000
	(To record issuance of common stock)			

Companies initially record transactions in the *general journal*. The **general journal** presents transactions in chronological order with a column for the date, the account titles and explanations, reference number, debits, and credits. The column for the reference number is left blank until the entries are posted to the *general ledger* accounts, at which time the account number is included in the reference column. Because events are recorded in the general journal first, it is known as the book of original entry.

Using the general journal as the first record of the economic event has several advantages. The general journal maintains a complete record of the transaction and provides an explanation of the event when the transaction involves complex events. In addition, all economic events are listed in chronological order, facilitating the location and correction of errors.

In Example 4.2, we journalize the transactions from Example 4.1.

EXAMPLE 4.2 Journal Entries

PROBLEM: Consider the transactions for Plush Service Corporation from Example 4.1. Provide the journal entry for each transaction.

SOLUTION: We analyzed each transaction earlier. In the following journal entries, we indicate the increases and decreases in assets, liabilities, and stockholders' equity, the specific accounts affected, and whether the account is debited or credited.

<i>GENERAL JOURNAL</i>				<i>PAGE J1</i>	
<i>Trans*</i>	<i>Date</i>	<i>Account Titles and Explanations</i>	<i>Ref.</i>	<i>Debit</i>	<i>Credit</i>
(a)	January 2	Cash		80,000	
		Common Stock			80,000
		(To record issuance of common stock)			
(b)	January 3	Store Equipment		10,000	
		Cash			10,000
		(To record purchase of store equipment)			
(c)	February 5	Cash		35,000	
		Service Revenue			35,000
		(To record services rendered)			
(d)	February 10	Accounts Receivable		90,000	
		Service Revenue			90,000
		(To record services rendered on account)			
(e)	February 15	Utilities Expense		15,000	
		Cash			15,000
		(To record payment for utilities)			

<i>Trans*</i>	<i>Date</i>	<i>Account Titles and Explanations</i>	<i>Ref.</i>	<i>Debit</i>	<i>Credit</i>
(f)	March 1	Salaries Expense Cash (To record payment for salaries)		30,000	30,000
(g)	April 10	Legal Fees Expense Legal Fees Payable (To record incurrence of legal fees)		6,000	6,000
(h)	April 30	Dividends Cash (To record the declaration and payment for dividends)		2,000	2,000
(i)	June 30	Cash Unearned Service Revenue (To record receipt of payment for future services)		25,000	25,000
(j)	July 10	Prepaid Insurance Cash (To record payment for insurance)		72,000	72,000
(k)	September 10	Rental Expense Cash (To record payment for equipment rental)		1,000	1,000
(l)	October 20	Cash Accounts Receivable (To record the receipt of amounts due)		10,000	10,000
(m)	November 18	Legal Fees Payable Cash (To record the payment of amounts owed)		1,000	1,000

*For reference only and not part of the recording process.

- 4 Explain the importance of and show how to post journal entries to the general ledger.

Step 3: Post to the General Ledger

The next step in the accounting cycle is to *post* the journal entries to the *general ledger*. The **general ledger** contains all accounts maintained by the company with each account reflecting its increases, decreases, and balance. Each account is maintained in a single location for management analysis. An account has a debit balance if debits exceed credits, and a credit balance when credits are greater than debits. The account has a zero balance if debits equal credits.

Posting is the process of transferring information contained in journal entries to the individual ledger accounts. Each general ledger account has a column for the date, explanation, reference, debit, credit, and balance. The reference is the general journal page number.

The typical general ledger account has three money columns with the account balance determined after each journal entry is posted. The reference column, which contains the general journal page number, is completed when the event is posted from the journal to the ledger. For example, Exhibit 4.8 illustrates Plush Service Corporation's posting of the journal entry to the general ledger for the common stock issued on January 2, 2018. The balance in the cash account, No. 100, increases by \$80,000 to \$118,000. The balance in the common stock account, No. 300, also increases by \$80,000 to \$140,000. The reference column in the general ledger indicates the entry is from page J1 of the general journal.

EXHIBIT 4.8 Posting a Transaction from the General Journal to the General Ledger

GENERAL JOURNAL					PAGE J1
Date	Account Titles and Explanations	Ref.	Debit	Credit	
2018					
Jan 2	Cash	100	80,000		
	Common Stock	300		80,000	
	(To record issuance of common stock)				

GENERAL LEDGER					
Cash					No. 100
Date	Explanation	Ref.	Debit	Credit	Balance
2018					
	Balance				38,000
Jan 2	Issued common stock	J1	80,000		118,000

Common Stock					No. 300
Date	Explanation	Ref.	Debit	Credit	Balance
2018					
	Balance				60,000
Jan 2	Issued common stock	J1		80,000	140,000

In Example 4.3, we post the journal entries made in Example 4.2.

EXAMPLE 4.3 Posting Journal Entries to the General Ledger

PROBLEM: Consider the transactions and beginning balances for Plush Service Corporation from Example 4.1. Post the journal entries from Example 4.2 to the general ledger.

SOLUTION:

GENERAL LEDGER					
Cash					No. 100
Date	Explanation	Ref.	Debit	Credit	Balance
2018					
	Balance				38,000
Jan 2	Issued common stock		80,000		118,000
Jan 3	Purchased store equipment			10,000	108,000
Feb 5	Received cash for services provided		35,000		143,000
Feb 15	Paid for utilities			15,000	128,000
Mar 1	Paid salaries			30,000	98,000
Apr 30	Paid dividends			2,000	96,000
June 30	Received cash in advance of services		25,000		121,000
July 10	Paid insurance			72,000	49,000
Sept 10	Paid for equipment rental			1,000	48,000
Oct 20	Collected account receivable		10,000		58,000
Nov 18	Paid legal fees			1,000	57,000

Accounts Receivable					No. 101
Date	Explanation	Ref.	Debit	Credit	Balance
2018					
	Balance				30,000
Feb 10	Provided services on account		90,000		120,000

Rental Expense					No. 506
Date	Explanation	Ref.	Debit	Credit	Balance
2018					
Sept 10	Incurred rental expense		1,000		1,000

The T-Account

We typically do not use the formal general ledger accounts when presenting illustrations in the text. Rather, we use a simplified version of the ledger accounts known as **t-accounts** with three main parts:

1. The account title,
2. A left (debit) side, and
3. A right (credit) side.

Exhibit 4.9 presents a sample t-account.

We will use the t-account rather than formal general ledger accounts for the remainder of the chapter.

EXHIBIT 4.9 T-Account

- 5 Explain the importance of and illustrate the preparation of an unadjusted trial balance.

Step 4: Prepare the Unadjusted Trial Balance

Throughout the accounting cycle, companies prepare several *trial balances*. A **trial balance** is a listing of the accounts and their ending debit or credit balances at a point in time. The accounts are listed with the balance sheet accounts first (assets, liabilities, and stockholders' equity), followed by dividends and the income statement accounts (revenues, gains, expenses, and losses).

The trial balance provides a check on the recording process by ensuring the equality of debits and credits; however, it does not prove the accuracy of the recording process. Debits can equal credits while numerous errors exist. For example, a trial balance will not reveal the following errors:

- A transaction that is not journalized.
- A correct journal entry that is not posted.
- An entry that is posted twice.
- The debiting or crediting of incorrect accounts.
- The debiting and crediting of incorrect dollar amounts.

After completing the posting process, the company prepares the **unadjusted trial balance**, an initial listing of all accounts and their debt or credit balances. Note that an unadjusted trial balance may not reflect all of a company's events and transactions because it has not made the *adjusting journal entries* at the time it prepares the unadjusted trial balance. For example, if equipment has not been depreciated throughout the accounting period, an adjusting entry to record depreciation in the current period will be recorded after the unadjusted trial balance is prepared. Example 4.4 illustrates preparing an unadjusted trial balance.

EXAMPLE 4.4

Unadjusted Trial Balance

PROBLEM: Using the information in Example 4.3, prepare an unadjusted trial balance for Plush Service Corporation.

SOLUTION: We take the ending balances in each of the accounts from the solution to Example 4.3 to prepare the trial balance, as presented here:

Plush Service Corporation Unadjusted Trial Balance At December 31, 2018			
<i>Account</i>	<i>Account #</i>	<i>Debit</i>	<i>Credit</i>
Cash	100	\$ 57,000	
Accounts Receivable	101	110,000	
Prepaid Insurance	102	72,000	
Store Equipment	150	80,000	
Accounts Payable	200		\$ 3,000
Legal Fees Payable	201		10,000
Unearned Service Revenue	202		25,000
Notes Payable	210		30,000
Common Stock	300		140,000
Retained Earnings	301		40,000
Dividends	320	2,000	
Service Revenue	400		125,000
Utilities Expense	501	15,000	
Salaries Expense	502	30,000	
Legal Fees Expense	504	6,000	
Rental Expense	506	1,000	
Totals		<u>\$373,000</u>	<u>\$373,000</u>

- 6 Discuss the need for adjusting journal entries and explain deferrals and accruals.

Step 5: Prepare Adjusting Journal Entries

The unadjusted trial balance may not reflect all of a company's events and transactions because the *adjusting journal entries* have not been made. **Adjusting journal entries** are entries made to ensure that all revenues are recognized in the period when control of a good or service has passed to the customer, and all expenses are recognized in the period incurred. Adjusting journal entries are necessary because U.S. GAAP requires that financial information be reported using the *accrual basis* of accounting. The company prepares the *adjusted trial balance* after making all adjusting journal entries and posting these entries to the ledger accounts at the end of the reporting period. The **adjusted trial balance** is the listing of all accounts and their ending debit or credit balances after making the adjusting journal entries.

Cash versus Accrual Bases of Accounting

The *cash basis* of accounting is not acceptable for financial reporting under U.S. GAAP. Under the **cash basis**, companies recognize revenues only when cash is received and expenses only when cash is paid. This approach of revenue and expense recognition measures only cash receipts and disbursements but does not accurately measure the economic activity underlying cash receipts and payments.

Under the **accrual basis**, companies recognize revenues when control of a good or service has passed to the customer, regardless of when cash is received. Expenses are recognized when incurred, regardless of when cash is paid. Because U.S. GAAP requires the preparation of financial statements under the accrual basis and companies present these financial statements throughout the life of the firm, *adjusting journal entries* are needed at the end of each reporting period. Companies record adjusting journal entries (AJEs) to ensure that all economic events are properly reflected in the financial statements. Every AJE will impact one balance sheet account and one income statement account.

Adjusting journal entries involve accounting for both *deferrals* and *accruals*.

Deferrals

Deferrals occur when a company receives or pays cash before recognizing the revenue or expense in the financial statements. AJEs are required for both deferred expenses and deferred revenues.

Deferred Expenses. A **deferred expense** occurs when a company makes a cash payment before incurring an expense under accrual basis accounting. For example, paying rent on the first of the year for occupancy of a building during that year creates a deferred expense. The cash payment occurs on the first day of the year, but the expense is incurred ratably over the year. Thus, the company should not record the full amount of the expense until the end of the year. Deferred expenses are also referred to as **prepaid expenses**.

Companies record deferred expenses as assets until they are used or consumed in operations. Therefore, an adjusting journal entry for deferred expenses will cause a change in both an asset and an expense account as the asset is derecognized and the expense is recognized. Examples of deferred expenses include prepaid rent, prepaid insurance, supplies, and depreciation. Exhibit 4.10 illustrates this asset-expense relationship.

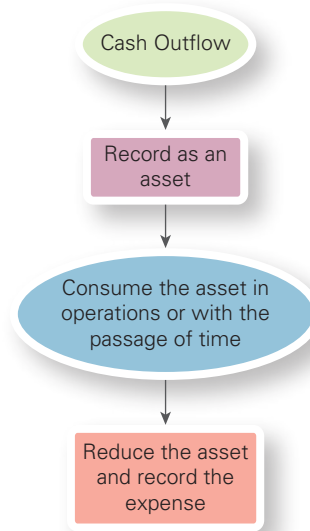

If the company does not adjust the prepaid expense, it will overstate assets and understate expenses. The adjusting journal entry results in a debit to an expense account and a credit to an asset account. It may be the case that the company initially records the cash payment as an expense, a scenario we discuss in Appendix A.

Depreciation and *amortization* are other types of deferred expenses. **Depreciation** is the systematic and rational allocation of the cost of a long-term operating asset to expense over the asset's expected useful life. **Amortization** is the systematic and rational allocation of the cost of an intangible asset to expense over the asset's expected useful life.

When a company purchases a long-term operating asset, it records the asset with a debit. As the company uses the asset over time, the company reports an expense on the income statement, debiting expense. It also reduces the carrying value of the asset by the same amount. In the case of depreciation, the credit to reduce the value of the asset is to an account referred to as

accumulated depreciation. Accumulated depreciation is a **contra-asset account**, which is an asset account that has a normal credit balance. The contra-asset accumulated depreciation directly offsets the asset account, and the net value of the two accounts is the asset's net carrying value. In the case of amortization, the company may credit an accumulated amortization account or the intangible asset account directly.³ Example 4.5 presents preparing an adjusting journal entry for a deferred expense.

EXHIBIT 4.10 Deferred Expenses

EXAMPLE 4.5 Deferred Expenses

PROBLEM: Plush Service Corporation paid \$72,000 for a three-year insurance policy on July 10 with coverage beginning on August 1. As we saw in Example 4.2, on the date it purchased the insurance, Plush made the following journal entry:

<i>Date</i>	<i>Account</i>	<i>Debit</i>	<i>Credit</i>
July 10	Prepaid Insurance	72,000	
	Cash		72,000
	(To record payment for insurance)		

What adjusting journal entry is needed on December 31? Prepare the t-accounts for prepaid insurance and insurance expense both before and after the adjusting journal entry.

SOLUTION: The t-accounts for the prepaid insurance and insurance expense accounts would appear as follows on December 31 before Plush records the adjusting journal entry and posts to the t-accounts.

	Prepaid Insurance		Insurance Expense	
July 10	72,000		0	
	<u>72,000</u>		<u>0</u>	

Continued

³We discuss depreciation and amortization in more depth in Chapter 11.

On December 31, insurance expense is understated because Plush has received five months' insurance coverage and that portion of the coverage has expired. Prepaid insurance is overstated because there are only 31 of the 36 months of prepaid insurance remaining. In order to adjust the prepaid insurance account, Plush must prepare the following adjusting journal entry:

<i>Date</i>	<i>Account</i>	<i>Debit</i>	<i>Credit</i>
Dec 31	Insurance Expense (\$72,000/36 mos.) × 5 mos.	10,000	
	Prepaid Insurance		10,000
	(To record expired insurance)		

After Plush posts the adjusting journal entry, the t-accounts will reflect the correct balances of the asset and the expense:

Prepaid Insurance		Insurance Expense	
July 10	72,000	Unadjusted Balance	0
Unadjusted Balance	72,000	AJE, Dec 31	10,000
AJE, Dec 31	10,000	Adjusted Balance	<u>10,000</u>
Adjusted Balance	<u>62,000</u>		

Example 4.6 illustrates recording depreciation expense.

EXAMPLE 4.6 Depreciation Expense

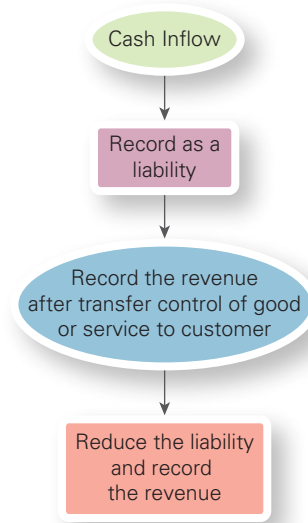

PROBLEM: Plush Service Corporation depreciates its store equipment at a rate of \$8,000 per year. Provide the adjusting journal entry to record depreciation for the current year.

SOLUTION: Plush debits an expense account and credits accumulated depreciation for \$8,000.

<i>Date</i>	<i>Account</i>	<i>Debit</i>	<i>Credit</i>
Dec 31	Depreciation Expense—Store Equipment	8,000	
	Accumulated Depreciation—Store Equipment		8,000
	(To record annual depreciation expense on equipment)		

Deferred Revenues. A **deferred revenue** occurs when a company receives cash before revenue should be recognized in the financial statements under accrual basis accounting. That is, deferred revenue represents cash that has been received before the occurrence of the underlying economic event that generates revenue. For example, a company receiving cash in advance for an online magazine subscription records deferred revenue. The cash receipt occurs on the first day of the year, but the revenue is recognized only when the magazine is made available for use (i.e., delivered) over the subscription period. Thus, the company should not record the full amount of the revenue until the product has been provided over the entire term of the subscription. Deferred revenues are also referred to as **unearned revenues** or **advance collections**.

Companies record unearned revenues as liabilities until control of a good or service passes to the customer. Therefore, an adjusting journal entry for unearned revenues will cause a change in both a liability and a revenue account as the liability is derecognized and the revenue is recognized. Examples of unearned revenues include advance collections of insurance, rent, and subscriptions. Exhibit 4.11 illustrates this liability-revenue relationship.

EXHIBIT 4.11 Deferred Revenues

If the company does not adjust unearned revenue, it overstates liabilities and understates revenues. The adjusting journal entry results in a debit to a liability account and a credit to a revenue account. It may be the case that the company initially records the cash receipt as revenue, a scenario we discuss in Appendix A. Example 4.7 presents preparing an adjusting journal entry for a deferred revenue situation.

EXAMPLE 4.7 Deferred Revenues

PROBLEM: Plush Service Corporation collected \$25,000 on June 30, 2018, for services to be provided over the next 12 months.

Plush estimated that 30% of the service fees collected in advance had been performed by the end of the year. As illustrated in Example 4.2, on the date it received the cash, Plush made the following journal entry to increase cash, an asset, and increase unearned service revenue, a liability:

<i>Date</i>	<i>Account</i>	<i>Debit</i>	<i>Credit</i>
June 30	Cash	25,000	
	Unearned Service Revenue		25,000
	(To record receipt of payment for future services)		

What adjusting journal entry is needed on December 31? Prepare the t-accounts for unearned service revenue and service revenue both before and after the adjusting journal entry.

SOLUTION: The t-accounts for the unearned service revenue and service revenue accounts would appear as follows on December 31 before Plush records the adjusting journal entry and posts it to the t-accounts.

	Unearned Service Revenue	Service Revenue	
June 30	25,000	35,000	Feb 5
		90,000	Feb 10
Dec 31	<u>25,000</u>	<u>125,000</u>	Dec 31

Continued

On December 31, service revenue is understated because a portion of the unearned revenue has now been performed. Plush determines that \$7,500 should be recorded as service revenue ($30\% \times \$25,000$). In order to adjust the unearned service revenue liability account, Plush must prepare the following adjusting journal entry:

<i>Date</i>	<i>Account</i>	<i>Debit</i>	<i>Credit</i>
Dec 31	Unearned Service Revenue	7,500	
	Service Revenue		7,500
	(To record revenue for services performed)		

After posting the adjusting journal entries, Plush's accounts will reflect the correct balances of the liability and the revenue.

	Unearned Service Revenue			Service Revenue	
June 30		25,000		35,000	Feb. 5
				90,000	Feb. 10
Unadjusted Balance		25,000	Unadjusted Balance	125,000	
AJE, Dec 31	7,500		AJE, Dec 31	7,500	
Adjusted Balance		<u>17,500</u>	Adjusted Balance	<u>132,500</u>	

Accruals

Accruals occur when the economic event that gives rise to revenue or expenses occurs before the cash is received or paid. The two types of accruals are *accrued revenues* and *accrued expenses*.

Accrued Revenues. **Accrued revenues** occur when control of the good or service has passed to the customer but the seller has not yet received cash. For example, a wholesaler may deliver goods to a retailer on credit. In this case, there is an unrecorded asset (a receivable) and an unrecognized revenue. So, both assets and revenues are understated until the company makes an adjusting journal entry. Exhibit 4.12 presents this asset-revenue relationship.

EXHIBIT 4.12 Accrued Revenues

If the company does not adjust accrued revenue, then assets and revenues are both understated. The adjusting journal entry is needed to debit the asset account and credit the revenue account. Once the cash is received, the company debits cash and credits the asset (receivable) account.

EXAMPLE 4.8 Accrued Revenues

PROBLEM: On December 31, Plush Service Corporation received an invoice from a field technician indicating that services amounting to \$35,000 had been provided but not yet billed to customers.

What adjusting journal entry is needed as of the end of the accounting period? Prepare the t-accounts for accounts receivable and service revenue earned both before and after the adjusting journal entry.

SOLUTION: Without the adjusting journal entry, Plush's assets and revenues are both understated. Currently, Plush has not prepared any journal entries related to this transaction.

Accounts Receivable			Service Revenue		
Bal.	30,000		Balance from		
Feb 10	90,000		Example 4.7		132,500
		10,000	Oct 20		
Unadjusted Bal.			Unadjusted Bal.		
Dec 31	<u>110,000</u>		Dec 31		<u>132,500</u>

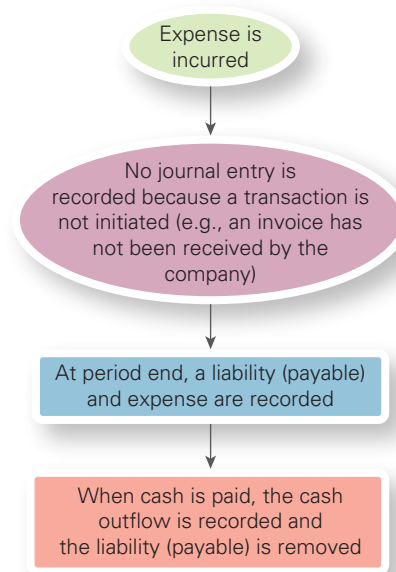

On December 31, an adjusting journal entry is required that will debit accounts receivable and credit service revenue.

Date	Account	Debit	Credit
Dec 31	Accounts Receivable	35,000	
	Service Revenue		35,000
	(To record revenue for services performed)		

Thus, at the end of the accounting period, the adjusted balances in these accounts are correct.

Accounts Receivable			Service Revenue		
Bal.	30,000		Balance from		
Feb 10	90,000		Example 4.7		132,500
		10,000	Oct 20		
Unadjusted Balance	110,000		Unadjusted Balance		132,500
AJE, Dec 31	35,000		AJE, Dec 31		35,000
Adjusted Balance	<u>145,000</u>		Adjusted Balance		<u>167,500</u>

Accrued Expenses. Accrued expenses occur when a company has incurred expenses but has not paid cash. For example, companies may incur an utility expense before a bill is received at the end of the month, and that amount remains unpaid at the end of the accounting period. Other common examples of accrued expenses are salaries and interest. In these cases, there is an unrecorded liability (a payable) and an unrecognized expense. The company understates both liabilities and expenses until it makes the adjusting journal entry. Exhibit 4.13 presents this liability-expense relationship.

EXHIBIT 4.13 Accrued Expenses

The adjusting journal entry debits the expense account and credits the liability account. Once cash is paid, the company debits the liability (payable) and credits cash.

EXAMPLE 4.9 Accrued Expenses

PROBLEM: Plush Service Corporation incurs salaries of \$4,000 at the end of the year. The next payroll date is January 2 of the following year.

What adjusting journal entry is needed as of the end of the accounting period on December 31? Prepare the t-accounts for salaries payable and salaries expense both before and after the adjusting journal entry.

SOLUTION: Without the adjusting journal entry, Plush's liabilities and expenses are both understated. Currently, Plush has not prepared any journal entries related to this transaction.

Salaries Payable			Salaries Expense	
	0	Mar 1	30,000	
Unadjusted Balance	0	Unadjusted Balance	30,000	

On December 31, an adjusting journal entry is required that will debit salaries expense and credit salaries payable.

Date	Account	Debit	Credit
Dec 31	Salaries Expense	4,000	
	Salaries Payable		4,000
	(To accrue salaries incurred)		

Thus, at the end of the accounting period, the adjusted balances in these accounts are correct.

Salaries Payable			Salaries Expense	
	0	Mar 1	30,000	
Unadjusted Balance	0	Unadjusted Balance	30,000	
AJE, Dec 31	4,000	AJE, Dec 31	4,000	
Adjusted Balance	4,000	Adjusted Balance	34,000	

Exhibit 4.14 summarizes the different types of adjusting journal entries.

EXHIBIT 4.14 Summary of Adjusting Journal Entries

Adjustment	Need for Adjustment	Over/Understatement Prior to Adjustment	Adjusting Journal Entry
Deferred (Prepaid) Expense	Deferred cost originally recorded as an asset is now fully or partially used or expired.	Asset overstated Expense understated	Dr: Expense Cr: Asset
Deferred (Unearned) Revenue	Deferred revenues originally recorded as a liability are now recorded as revenue when transfer control of good or service to customer.	Liability overstated Revenue understated	Dr: Liability Cr: Revenue
Accrued Expense	Expenses incurred but unrecorded at the end of the accounting period.	Liability understated Expense understated	Dr: Expense Cr: Liability
Accrued Revenue	Revenues should be recorded but unrecorded at the end of the accounting period.	Asset understated Revenue understated	Dr: Asset Cr: Revenue

- 7 Explain the use of and illustrate the preparation of an adjusted trial balance.

Step 6: Prepare the Adjusted Trial Balance

Companies prepare *adjusted trial balances* after journalizing and posting all adjusting journal entries. Similar to the unadjusted trial balance, the *adjusted trial balance* lists all accounts and ending balances, including the accounts created during the adjustment process. Like the unadjusted trial balance, the adjusted trial balance ensures the equality of debits and credits after adjusting journal entries are made but cannot be used to prove the accuracy of the financial information included in the accounts. Note that the accounts included in the adjusted trial balance contain all the data needed to prepare the financial statements.

EXAMPLE 4.10

Adjusted Trial Balance

PROBLEM: Consider Plush Service Corporation from our prior examples. Prepare t-accounts that begin with the unadjusted balances from the unadjusted trial balance. Post the adjusting journal entries to the t-accounts and determine the adjusted balances. Prepare an adjusted trial balance at December 31, 2018.

SOLUTION:

Cash		Accounts Receivable	
Unadjusted Balance	57,000	Unadjusted Balance	110,000
		Ex. 4.8 Adjusting Entry	35,000
Adjusted Balance	<u>57,000</u>	Adjusted Balance	<u>145,000</u>
Prepaid Insurance		Store Equipment	
Unadjusted Balance	72,000	Unadjusted Balance	80,000

Dividends	320	2,000	
Service Revenue	400		167,500
Utilities Expense	501	15,000	
Salaries Expense	502	34,000	
Legal Fees Expense	504	6,000	
Rental Expense	506	1,000	
Insurance Expense	507	10,000	
Depreciation Expense—Store Equipment	508	8,000	
Totals		<u>\$420,000</u>	<u>\$420,000</u>

- 8** Describe the preparation of the financial statements from the adjusted trial balance.

Step 7: Prepare Financial Statements

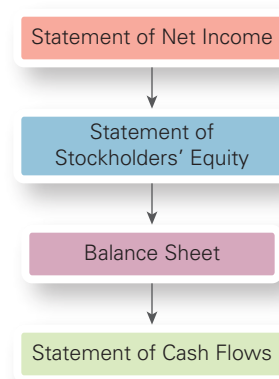

After completing the adjusted trial balance, the company can prepare financial statements, a process we explore in depth in subsequent chapters. First, it prepares the statement of net income, which presents the financial results of operations, using the revenue and expense accounts.⁴ Next, the company uses the resulting net income for the period, along with the equity accounts, to prepare the statement of stockholders' equity. The balance sheet includes all assets, liabilities, common stock, and the ending retained earnings balance obtained from the statement of stockholders' equity. The final step is preparing the statement of cash flows.⁵

Accountants occasionally use a worksheet to facilitate the preparation of the adjusting entries and financial statements (see Appendix B). Accountants may also use reversing entries as part of the accounting cycle (see Appendix C).

Exhibit 4.15 presents the sequence of financial statement preparation.

⁴ We will not consider the statement of comprehensive income in this chapter. We will cover comprehensive income in depth in Chapter 5.

⁵ The statement of cash flows is excluded from this illustration. We will discuss the statement of cash flows in subsequent chapters.

EXHIBIT 4.15 Sequence of Preparation of Financial Statements**EXAMPLE 4.11** Financial Statements

PROBLEM: Using the adjusted trial balance for Plush Service Corporation in Example 4.10, prepare a statement of net income, a statement of stockholders' equity, and a balance sheet.

SOLUTION: The financial statements are presented here. We first identify the income statement accounts and include them on the statement of net income. Net income is computed as revenues less expenses.

Plush Service Corporation
Statement of Net Income
For the Year Ended December 31, 2018

Service Revenue		\$167,500
Expenses:		
Salaries Expense	\$34,000	
Utilities Expense	15,000	
Depreciation Expense—Store Equipment	8,000	
Legal Fees Expense	6,000	
Insurance Expense	10,000	
Rental Expense	<u>1,000</u>	
Total Expenses		<u>(74,000)</u>
NET INCOME		<u>\$ 93,500</u>

Net income is needed to prepare the statement of stockholders' equity.

Plush Service Corporation
Statement of Stockholders' Equity
For the Year Ended December 31, 2018

	<u>Common Stock</u>	<u>Retained Earnings</u>	<u>Total Equity</u>
Balance, January 1, 2018	\$ 60,000	\$ 40,000	\$100,000
Additional Stock Issue	80,000		80,000
Net Income		93,500	93,500
Dividends Declared		<u>(2,000)</u>	<u>(2,000)</u>
Balance, December 31, 2018	<u>\$140,000</u>	<u>\$131,500</u>	<u>\$271,500</u>

Note that the ending retained earnings balance is \$131,500. We use this balance in the balance sheet as follows. The other accounts are obtained directly from the adjusted trial balance.

Plush Service Corporation		
Balance Sheet		
At December 31, 2018		
Assets		
Cash		\$ 57,000
Accounts Receivable		145,000
Prepaid Insurance		62,000
Store Equipment	\$80,000	
Accumulated Depreciation—Store Equipment	<u>(8,000)</u>	<u>72,000</u>
TOTAL ASSETS		<u><u>\$336,000</u></u>
LIABILITIES AND STOCKHOLDERS' EQUITY		
Liabilities		
Accounts Payable		\$ 3,000
Legal Fees Payable		10,000
Unearned Service Revenue		17,500
Salaries Payable		4,000
Notes Payable		<u>30,000</u>
TOTAL LIABILITIES		<u>\$ 64,500</u>
Stockholders' Equity		
Common Stock		\$140,000
Retained Earnings		<u>131,500</u>
TOTAL STOCKHOLDERS' EQUITY		<u>\$271,500</u>
TOTAL LIABILITIES AND STOCKHOLDERS' EQUITY		<u><u>\$336,000</u></u>

- 9 Explain the difference between permanent and temporary accounts and demonstrate the process of closing temporary accounts.

Step 8: Close Temporary Accounts

The next step in the accounting cycle requires *closing* all **temporary accounts**, which are all income statement accounts and dividends that must be reduced to a zero balance in order to report net income (or net loss) and dividends for the next accounting period. The temporary accounts begin the next period with a zero balance to ensure that prior-period revenues and expenses are not included in the computation of the next year's net income or loss. **Closing** is the process of bringing all temporary accounts to a zero balance.

In contrast to the income statement temporary accounts, the balance sheet consists of **permanent accounts**, which are accounts with cumulative balances carried forward period after period. Permanent accounts are not closed at the end of the period.

Closing each revenue and expense temporary account to retained earnings would involve a significant amount of detail flowing through the retained earnings account. To avoid this excessive detail in retained earnings, companies use another temporary account, income summary, to accumulate revenues and expenses and transfer the net value of the income summary to retained earnings in a single journal entry.

Four closing entries are required to close the temporary accounts.

1. Close out revenue and gain accounts: Debit all revenue and gain accounts and credit income summary for the total of the accounts debited.
2. Close out expense and loss accounts: Debit income summary for total expenses and losses and credit each expense and loss account for its balance.

3. Close out income summary account: Debit income summary and credit retained earnings for the amount of net income; conversely, credit income summary and debit retained earnings in the event of a net loss.
4. Close out the dividends account: Debit retained earnings and credit the dividends account for the year.

EXAMPLE 4.12 Closing Entries

PROBLEM: Consider Plush Service Corporation from the prior examples. Prepare the closing entries for Plush Service Corporation.

SOLUTION: We record each of the four closing entries. First, we debit the service revenue account and credit income summary. Second, we credit each of the expense accounts and debit the total amount to income summary. At this point, income summary will have a credit balance because revenues are greater than expenses and represent net income for the period. Third, we debit income summary for its balance (which, in this case, is net income as opposed to net loss) and credit retained earnings. Finally, we credit the dividends account for its balance and debit retained earnings. The closing entries on December 31 are presented here:

GENERAL JOURNAL		PAGE J4	
No.	Account	Debit	Credit
①	Service Revenue	167,500	
	Income Summary		167,500
	(To close revenue account)		
②	Income Summary	74,000	
	Salaries Expense		34,000
	Utilities Expense		15,000
	Depreciation Expense—Store Equipment		8,000
	Legal Fees Expense		6,000
	Insurance Expense		10,000
	Rental Expense		1,000
	(To close expense accounts)		
③	Income Summary	93,500	
	Retained Earnings		93,500
	(To close income summary)		
④	Retained Earnings	2,000	
	Dividends		2,000
	(To close dividends)		

- ⑩ Explain the importance of and illustrate the preparation of a post-closing trial balance.

Step 9: Prepare Post-Closing Trial Balance

After journalizing and posting all closing entries, the company prepares a *post-closing trial balance*. Similar to any trial balance, the objective of the *post-closing trial balance* is to prove the equality, not the accuracy, of the debits and credits related to the remaining accounts with non-zero balances. The **post-closing trial balance** contains only permanent balance sheet accounts because all temporary accounts were closed out and have zero balances.

EXAMPLE 4.13**Post-Closing Trial Balance**

PROBLEM: Prepare the post-closing trial balance for Plush Service Corporation using the information provided in the prior examples.

SOLUTION: The post-closing trial balance only includes the permanent accounts because the temporary accounts have all been closed and now reflect zero balances. Plush updates the ending balance for retained earnings, a permanent account, to reflect the closing of all temporary accounts to retained earnings.

Plush Service Corporation Post-Closing Trial Balance At December 31, 2018			
Account	Account #	Debit	Credit
Cash	100	\$ 57,000	
Accounts Receivable	101	145,000	
Prepaid Insurance	102	62,000	
Store Equipment	150	80,000	
Accumulated Depreciation—Store Equipment	151		\$ 8,000
Accounts Payable	200		3,000
Legal Fees Payable	201		10,000
Unearned Service Revenues	202		17,500
Salaries Payable	204		4,000
Notes Payable	210		30,000
Common Stock	300		140,000
Retained Earnings	301		131,500
Totals		<u>\$344,000</u>	<u>\$344,000</u>

Comprehensive Example

Example 4.14 provides a comprehensive example of the complete illustration of the accounting cycle.

EXAMPLE 4.14**Comprehensive Accounting Cycle Example**

PROBLEM: The DS Wilson Company, which provides consulting services to major utility companies, was formed on January 2 of the current year. Transactions completed during the first year of operation are presented here.

- January 2: Issued 600,000 shares of common stock for \$10,000,000, which is the par value of the stock.
- January 10: Acquired equipment in exchange for \$2,000,000 cash and a \$6,000,000 note payable. The note is due in 10 years.
- February 1: Paid \$24,000 for a business insurance policy covering the two-year period beginning on February 1.
- February 22: Purchased \$900,000 of supplies on account.
- March 1: Paid wages of \$185,600.
- March 23: Billed \$2,730,000 for services rendered on account.
- April 1: Paid \$100,000 of the amount due on the supplies purchased on February 22.

Continued

April 17:	Collected \$210,000 of the outstanding accounts receivable.
May 1:	Paid wages of \$200,400.
May 8:	Received bill and paid \$98,200 for utilities.
May 24:	Paid \$42,500 for sales commissions.
June 1:	Made the first payment on the note issued on January 10. The payment consisted of \$60,000 of interest and \$200,000 to be applied against the principal of the note.
June 16:	Billed customers for \$560,000 of services rendered.
June 30:	Collected \$300,000 on accounts receivable.
July 10:	Purchased \$155,000 of supplies on account.
Aug 25:	Paid \$160,000 for administrative expenses.
Sept 23:	Paid \$30,000 for warehouse repairs.
October 1:	Paid wages of \$90,000.
Nov 20:	Purchased supplies for \$60,000 with cash.
Dec 15:	Collected \$125,600 in advance for services to be provided in December and January of the following year.
Dec 30:	Declared and paid a \$50,000 dividend to shareholders.

The chart of accounts used by DS Wilson is presented here

Chart of Accounts		
Group	Account #	Account Title
100: Assets	101	Cash
	102	Accounts Receivable
	103	Supplies
	104	Prepaid Insurance

	510	Depreciation Expense—Equipment
	520	Interest Expense
600: Other		
	601	Income Summary

- a. Journalize the transactions for the year.
- b. Post the journal entries to t-accounts.
- c. Prepare an unadjusted trial balance as of December 31.
- d. Journalize and post adjusting entries to t-accounts based on the following additional information.
 - i. Eleven months of the insurance policy expired by the end of the year.
 - ii. Depreciation for the equipment is \$400,000.
 - iii. The company provided a portion of the services related to the advance collection of December 15. The company recognized \$70,000 as service revenue earned.
 - iv. There are \$500,000 of supplies on hand at the end of the year.
 - v. An additional \$170,000 of interest has accrued on the note by the end of the year.
 - vi. Wilson accrued wages in the amount of \$200,000.
- e. Prepare an adjusted trial balance as of December 31.
- f. Prepare a single-step income statement and statement of stockholders' equity for the current year and a classified balance sheet as of the end of the year.
- g. Journalize and post closing entries.
- h. Prepare a post-closing trial balance as of December 31.

SOLUTION

- a. We first analyze each transaction and then present journal entries. Note that the reference numbers would not be added until the entries are posted.

- January 2: Wilson will increase cash with a debit and increase common stock with a credit.
- January 10: Wilson will increase equipment with a debit, decrease cash with a credit, and increase notes payable with a credit.
- February 1: In the journal entry, Wilson will increase prepaid insurance with a debit and decrease cash with a credit.
- February 22: Wilson will increase supplies with a debit and increase accounts payable with a credit.
- March 1: Wilson will increase wage expense with a debit and decrease cash with a credit in the journal entry.
- March 23: Wilson will increase accounts receivable with a debit and increase service revenue with a credit.
- April 1: Wilson will decrease accounts payable with a debit of \$100,000 and decrease cash with a credit of the same amount.

Continued

- April 17: Wilson will increase cash with a debit of \$210,000 and decrease accounts receivable with a credit of the same amount.
- May 1: Wilson will increase wage expense with a debit and decrease cash with a credit.
- May 8: Wilson will increase utilities expense with a debit and decrease cash with a credit.
- May 24: Wilson will increase selling expense with a debit and decrease cash with a credit.
- June 1: Wilson will decrease the notes payable with a debit of \$200,000, increase interest expense with debit of \$60,000, and decrease cash with a credit of \$260,000.
- June 16: Wilson will increase accounts receivable with a debit and increase service revenue with a credit.
- June 30: Wilson will increase cash with a debit and decrease accounts receivable with a credit.
- July 10: Wilson will increase supplies with a debit and increase accounts payable with a credit.
- Aug 25: Wilson will increase administrative expense with a debit and decrease cash with a credit.
- Sept 23: Wilson will increase repairs expense with a debit and decrease cash with a credit.
- October 1: Wilson will increase wage expense with a debit and decrease cash with a credit.
- Nov 20: Wilson will increase supplies with a debit and decrease cash with a credit.
- Dec 15: Wilson will increase cash with a debit and increase unearned service revenue with a credit.
- Dec 30: Wilson will increase dividends with a debit and decrease cash with a credit.

c. We prepare the unadjusted trial balance using the balances from the t-accounts in b. The unadjusted trial balance is as follows:

DS Wilson Company Unadjusted Trial Balance At December 31			
Account	Debit	Credit	
Cash	\$ 7,334,900		
Accounts Receivable	2,780,000		
Supplies	1,115,000		
Prepaid Insurance	24,000		
Equipment	8,000,000		
Accounts Payable		\$ 955,000	
Unearned Service Revenue		125,600	
Notes Payable		5,800,000	
Common Stock		10,000,000	
Retained Earnings		0	
Dividends	50,000		
Service Revenue		3,290,000	
Wage Expense	476,000		
Utilities Expense	98,200		
Selling Expense	42,500		
Administrative Expense	160,000		
Repairs Expense	30,000		
Interest Expense	60,000		
Totals	<u>\$20,170,600</u>	<u>\$20,170,600</u>	

- d. We analyze the additional information provided in order to prepare the adjusting entries.
- i. On February 1, insurance was prepaid for 24 months. Policy begins on February 1. Because 11 months of the insurance policy have expired by the end of the year, Wilson will record 11 months of insurance expense with a debit and reduce prepaid insurance with a credit. The amount of insurance expense is \$11,000, computed as follows:

$$\$24,000 \text{ prepaid insurance} / 24 \text{ months} = \$1,000 \text{ per month}$$

$$\$1,000 \text{ per month} \times 11 \text{ months} = \$11,000$$
 - ii. Wilson will increase depreciation expense with a debit of \$400,000 and increase accumulated depreciation with a credit for the same amount.
 - iii. Wilson will reduce its liability, unearned service revenue, with a debit of \$70,000, and increase service revenue with a credit of \$70,000.
 - iv. In the unadjusted trial balance, the balance of the supplies account is \$1,115,000. However, at the end of the year, Wilson has \$500,000 of supplies. Therefore, \$615,000 of supplies must have been used.

$$\$615,000 = \$1,115,000 - \$500,000$$

Wilson will increase supplies expense by \$615,000 with a debit and decrease supplies with a credit for the same amount.
 - v. Wilson will increase interest expense by \$170,000 with a debit and increase interest payable with a credit of the same amount.
 - vi. Wilson will increase wage expense with a debit and increase wages payable with a credit.

The adjusting entries are as follows:

Interview

**JOHN FORISTALL,
EXECUTIVE VICE
PRESIDENT AND CHIEF
FINANCIAL OFFICER
SHOEBUY »**

John Foristall

As executive vice president and chief financial officer of ShoeBuy, John Foristall oversees all aspects of corporate finance, including accounting and risk management, as well as other key operational areas including human resources and the company's warehouse operations, which is pivotal for the online retailer. Launched in 2000, ShoeBuy is the world's largest, most diverse shoe, clothing, and accessories shopping site, with billions of dollars of inventory available for sale.

1 How often does ShoeBuy create internal financial reports, and how does management use them?

As with most mature and growing businesses operating in a competitive landscape, ShoeBuy must understand its financial trajectory on a monthly—if not daily—basis. We use many daily and weekly reports and dashboards providing real-time data on key performance indicators to manage the business. We also create formal internal financial reports for management use monthly, quarterly, and annually. Management reviews these financials, accompanied by written commentaries, and discusses them monthly with the senior management team. Because we are a subsidiary of a public parent company, we also participate in the quarterly and annual public filing process.

On a macro level, we use our reports to gauge the financial performance and financial position of the company compared to previous periods and to our expectations (i.e., plan/forecast). These reports also drive accountability throughout the organization, providing a means to measure departmental performance. For example, at monthly financial reviews, the Merchandising team addresses the revenue performance of specific brands and footwear categories.

2 What are the most important adjusting entries made at the end of the accounting cycle and why?

The most significant end-of-cycle adjustment for ShoeBuy is an entry to estimate future customer returns. ShoeBuy provides a great customer experience by offering free shipping, both outbound and for returns. While ShoeBuy's return rate is well below the industry average, future returns can have a material impact on results, because our calendar-year reporting period coincides with our peak holiday season. Predicting January returns on sales from December (our biggest sale month) is a key

component of ShoeBuy's year-end reporting process. Accurately estimating these returns requires historical data and trends—and given that ShoeBuy was founded more than 15 years ago, management can estimate this with a high degree of precision.

3 How do transactions flow through your accounting system?

ShoeBuy's key ecommerce transaction is the sale of product—footwear and related apparel. Online customers initiate purchase orders via ShoeBuy.com, triggering many entries as each order flows through our proprietary order fulfillment platform. We record the majority of our orders upon shipment and then recognize revenue and book the receivable. ShoeBuy's receivables are primarily from credit card providers that are paid within three to five days. Some ShoeBuy products ship directly from the footwear partner to the consumer (a drop-ship model), so shipment also triggers a payable to our footwear partners as well as an expense and a payable to various operational partners, such as shipping and marketing providers.

4 Are any adjusting entries reversed and if so, why?

At the beginning of any accounting period, ShoeBuy records and reverses certain entries made in the immediately preceding accounting period. They are used in situations where revenue or expenses were accrued in the preceding period to avoid double counting in the current period. Examples include our payroll accrual for unpaid wages and unshipped product ordered in the prior period.

5 What controls are in place to enhance the quality of the financial information generated by your accounting cycle?

First, we ensure proper segregation of duties and levels of review, ensuring that the Controller and CFO review and approve all journal entries and checks. We have very robust dashboards and scorecards allowing for detailed variance analysis to quickly alert us to results that differ from expectations. For example, we track revenue in a very granular fashion by using dashboards showing revenue by brand, by category, and even by marketing channel (e.g., did the customer come directly to ShoeBuy, via Google, or via an email promotion). We have standing meetings, such as our Monthly Financial Reviews, to discuss results and accountability with the senior management team. Last, ShoeBuy has monthly and quarterly calls with our parent company to discuss financial results as well as accounting and control updates.

Discussion Questions

1. John Foristall indicates that ShoeBuy's receivables are primarily from credit card sales. Discuss how the use of credit card sales impact cash flows relative to using open trade accounts receivable.
2. ShoeBuy uses reversing entries for events such as accrued payroll at year-end. How would the company's accounting be affected if reversing entries were not made for payroll?

Summary by Learning Objectives

In the following, we summarize the main points by learning objective. Throughout the chapter, we discuss the accounting and reporting of U.S. GAAP and IFRS. This table also highlights the major similarities and differences between the standards.

1 Describe the accounting cycle.	
Summary	Similarities and Differences between U.S. GAAP and IFRS
The accounting cycle describes the process by which companies record business transactions in their books, which they ultimately aggregate and summarize in the financial statements.	Similar under U.S. GAAP and IFRS.

2 Explain transaction analysis, including the use of the accounting equation.	
Summary	Similarities and Differences between U.S. GAAP and IFRS
<p>A transaction is an economic event that involves a change in an asset, a liability, or stockholders' equity.</p> <p>The accounting equation assesses the effects of transactions on assets, liabilities, or stockholders' equity:</p> $\text{Assets} = \text{Liabilities} + \text{Stockholders' Equity}$ <p>The expanded accounting equation includes income statement items and dividends:</p> $\text{Assets} = \text{Liabilities} + \text{Contributed Capital} + \text{Accumulated Other Comprehensive Income} + \text{Beginning Retained Earnings} - \text{Dividends Declared} + \text{Revenues and Gains} - \text{Expenses and Losses}$ <p>A double-entry system is one in which all transactions affect at least two accounts and the accounting equation always holds.</p>	Similar under U.S. GAAP and IFRS.

Summary by Learning Objectives, continued

3 Illustrate journalizing transactions, including determining whether to debit or credit accounts.	
Summary	Similarities and Differences between U.S. GAAP and IFRS
<p>Journalizing a transaction involves preparing a journal entry. The common format includes:</p> <ol style="list-style-type: none"> The date the transaction occurred in first column. Accounts that are debited are listed first and positioned to the left side. Accounts that are credited are recorded next and indented to the right. A brief explanation below the entry. <p>An account is an individual record of increases and decreases in specific asset, liability, and stockholders' equity items.</p> <p>The terms <i>debit</i> and <i>credit</i> mean left and right, respectively.</p> <p>Assets increase with a debit and decrease with a credit.</p> <p>Liability and equity accounts increase with a credit and decrease with a debit.</p> <p>Revenues and gains are increases in equity; these accounts will increase with credits.</p> <p>Expenses and losses decrease equity, so they increase with a debit. Similarly, dividends decrease equity, so they increase with debits.</p> <p>The normal balance of an account refers to its typical account balance—debit or credit.</p>	<p>Similar under U.S. GAAP and IFRS.</p>
4 Explain the importance of and show how to post journal entries to the general ledger.	
Summary	Similarities and Differences between U.S. GAAP and IFRS
<p>Posting describes the transferring of information contained in journal entries to the individual ledger accounts.</p> <p>The general ledger contains all accounts maintained by the company—with each account reflecting its increases, decreases, and balance—in a single location for management analysis.</p> <p>The general ledger has a column for the date, explanation, reference, debit, credit, and balance. The reference is the general journal page number where the original journal entry occurred.</p> <p>T-accounts are used to depict the account. They have three main parts:</p> <ol style="list-style-type: none"> The account title A left (debit) side A right (credit) side 	<p>Similar under U.S. GAAP and IFRS.</p>

*Summary by Learning Objectives, continued***5** Explain the importance of and illustrate the preparation of an unadjusted trial balance.

Summary	Similarities and Differences between U.S. GAAP and IFRS
<p>A trial balance is a listing of the accounts and their ending debit or credit balances at a point in time. The balance sheet accounts are listed first (assets, liabilities, and equity), followed by dividends and the income statement accounts (revenues, gains, expenses, and losses).</p> <p>The trial balance provides a check on the recording process by ensuring the equality of debits and credits. The trial balance does not prove the accuracy of the recording process and will not reveal whether:</p> <ul style="list-style-type: none"> • A transaction is not journalized. • A correct journal entry is not posted. • An entry is posted twice. • Incorrect accounts are used. • An entry is made using incorrect dollar amounts. <p>An unadjusted trial balance may not reflect all of the events and circumstances of the company because the adjusting journal entries have not been made at the time the unadjusted trial balance is compiled.</p>	<p>Similar under U.S. GAAP and IFRS.</p>

6 Discuss the need for adjusting journal entries and explain deferrals and accruals.

Summary	Similarities and Differences between U.S. GAAP and IFRS
<p>Companies record adjusting journal entries (AJEs) at the end of each accounting period to ensure that the financial statements are presented under the accrual basis of accounting.</p> <p>Deferral AJEs occur when cash is received or paid before the revenue or expense is recognized in the financial statements.</p> <ul style="list-style-type: none"> • A deferred expense occurs when a cash payment is made before an expense should appropriately be recognized in the financial statements under accrual basis accounting. • A deferred revenue occurs when cash is received before revenue should appropriately be recognized in the financial statements under accrual basis accounting. <p>Accrual AJEs are created when the economic event that gives rise to accrual basis revenue or expense occurs before the cash is received or paid.</p> <ul style="list-style-type: none"> • Accrued revenues occur when control of a good or service has passed to the customer, but cash has not yet been received. • Accrued expenses occur when expenses have been incurred, but cash has not yet been paid out. 	<p>Similar under U.S. GAAP and IFRS.</p>

7 Explain the use of and illustrate the preparation of an adjusted trial balance.

Summary	Similarities and Differences between U.S. GAAP and IFRS
<p>An adjusted trial balance reflects all of the events and circumstances of the company after it makes the adjusting journal entries to check that the amount of debits equals the amount of credits.</p>	<p>Similar under U.S. GAAP and IFRS.</p>

Summary by Learning Objectives, continued

8 Describe the preparation of the financial statements from the adjusted trial balance.	
Summary	Similarities and Differences between U.S. GAAP and IFRS
<p>From the account balances in the adjusted trial balance, the company can prepare financial statements.</p> <ul style="list-style-type: none"> • The income statement is prepared first, using the revenue, gains, losses, and expense accounts. • The resulting net income for the period, along with the equity accounts, is used to prepare the statement of stockholders' equity. • The balance sheet is prepared by including all assets, liabilities, common stock, and the ending retained earnings balance obtained from the statement of stockholders' equity. 	<p>► Differences in the income statement are illustrated in Chapter 5. Differences in the balance sheet are shown in Chapter 6.</p>
9 Explain the difference between permanent and temporary accounts and demonstrate the process of closing temporary accounts.	
Summary	Similarities and Differences between U.S. GAAP and IFRS
<p>Income statement accounts and dividends are temporary accounts. These accounts must be reduced to a zero balance at the end of each period.</p> <p>Closing is the process of zeroing out temporary accounts. In addition to all of the income statement accounts, dividends is also a temporary account and must be closed.</p> <p>Permanent accounts are on the balance sheet. Permanent accounts are not closed at the end of the period.</p> <p>Four entries are required to close the temporary accounts:</p> <ol style="list-style-type: none"> 1. Close out revenue and gain accounts: Debit each revenue and gain account and credit income summary for the total of the accounts debited. 2. Close out expense and loss accounts: Debit income summary for total of expenses and losses, and credit each expense and loss account for its balance. 3. Close out income summary account: Debit income summary and credit retained earnings for the amount of net income; conversely, credit income summary and debit retained earnings for the amount of any net loss. 4. Close out dividends account: Debit retained earnings and credit dividends for the period. <p>The income summary account facilitates the closing process and is not included in the financial statements.</p>	<p>Similar under U.S. GAAP and IFRS.</p>
10 Explain the importance of and illustrate the preparation of a post-closing trial balance.	
Summary	Similarities and Differences between U.S. GAAP and IFRS
<p>A post-closing trial balance is prepared after all closing entries have been journalized and posted. The post-closing trial balance proves the equality of the debits and credits. The post-closing trial balance contains only permanent (balance sheet) accounts, because all temporary accounts were closed out before preparation of the post-closing trial balance and will have zero balances.</p>	<p>Similar under U.S. GAAP and IFRS.</p>

MyLab Accounting

Go to <http://www.pearson.com/mylab/accounting> for the following Questions, Multiple-Choice Questions, Brief Exercises, Exercises, and Problems. They are available with immediate grading, explanations of correct and incorrect answers, and interactive media that acts as your own online tutor.

4 Review of the Accounting Cycle

Questions

- 1 Q4-1. Describe the accounting cycle.
- 2 Q4-2. What is the accounting equation and what does it demonstrate?
- 2 Q4-3. What is equity? What are the three components of shareholders' equity? Explain each component.
- 2 Q4-4. When will retained earnings contain a positive balance? Negative balance?
- 2 Q4-5. Will all transactions have a dual effect on the accounting equation? Explain.
- 3 Q4-6. What do the terms *debit* and *credit* mean?
- 3 Q4-7. What is meant by the term *normal balance*? Provide the normal balance for assets, liabilities, and stockholders' equity.
- 3 Q4-8. Why is the general journal referred to as the "book of original entry"? How are transactions presented in the journal?
- 4 Q4-9. Are account balances found in the general ledger? Explain.
- 5 Q4-10. What is the purpose of an unadjusted trial balance?
- 6 Q4-11. Explain the difference between the accrual basis of accounting and the cash basis of accounting? Which basis is acceptable under **U.S. GAAP**? Explain.
- 6 Q4-12. Under the accrual basis of accounting, when do companies record deferrals and accruals?
- 6 Q4-13. Why are adjusting journal entries made? When do companies make these entries?
- 6 Q4-14. What is a deferred revenue? When will the full amount of the deferred revenue be recorded?
- 7 Q4-15. What is the purpose of the adjusted trial balance? What items are included in the adjusted trial balance?
- 7 8 Q4-16. Which statements can be prepared from the adjusted trial balance? What must be done before preparing the financial statements?
- 9 Q4-17. What are closing entries? Describe the four closing entries and their effects.

Multiple-Choice Questions

Becker CPA Exam Review multiple-choice questions are available in **MyLab Accounting**.

- 3 6 MC4-1. Jefferson, CPAs provides accounting services for a client at a flat contract rate of \$10,000 a month. The terms of the contract include a required payment on the 15th day of each month for the prior month's accounting services. Assuming Jefferson, CPAs posts journal entries each month end, what is (are) the journal entry (entries) posted on December 31?
- | | | |
|------------------------|--------|--------|
| a. Cash | 10,000 | |
| Service Revenue | | 10,000 |
| b. Cash | 10,000 | |
| Accounts Receivable | | 10,000 |
| c. Accounts Receivable | 5,000 | |
| Cash | 10,000 | |
| Service Revenue | | 15,000 |
| d. Cash | 10,000 | |
| Accounts Receivable | | 10,000 |
| Accounts Receivable | 10,000 | |
| Service Revenue | | 10,000 |

- 6 MC4-2.** Gates Accounting Services (GAS), a sole proprietorship, entered into a new 18-month office space contract on September 15, Year 1, paying the full \$36,000 rent contract to the real estate company on that day (lease expiration March 15, Year 3). Assuming that GAS reports on a calendar year-end and that journal entries are posted on a quarterly basis (only), what adjusting journal entry (if any) would be made to the prepaid rent account prior to closing the December 31, Year 1, financial statements?
- Debit prepaid rent \$8,000.
 - Credit prepaid rent \$6,000.
 - Credit prepaid rent \$7,000.
 - No adjusting entry made.
- 6 MC4-3.** Windy Harbor Boat Company pays its employees on a weekly basis each Friday. During the week ended Friday, January 3, Year 2, the company had a weekly payroll of \$125,750. Assuming that the company is on a calendar basis, has a five-day workweek, and that daily wages are always the same, what adjusting journal entry (if any) would be made on December 31, Year 1?
- | | | |
|----------------|--------|--------|
| Salary Expense | 50,300 | |
| Cash | | 50,300 |
 - | | | |
|--------------------------|--------|--------|
| Salary Expense | 50,300 | |
| Accrued Salaries Payable | | 50,300 |
 - | | | |
|--------------------------|---------|---------|
| Salary Expense | 125,750 | |
| Accrued Salaries Payable | | 125,750 |
 - No journal entry necessary.
- 6 MC4-4.** State University sold all of its basketball tickets to its students for 15 home games on September 30 for \$1,200,000 (basketball season starts November 1). Assuming the college basketball team played six home games prior to year-end, what adjusting journal entry (if any) is necessary on December 31, assuming the initial student ticket transactions were recorded on September 30?
- | | | |
|--------------------|---------|---------|
| Cash | 480,000 | |
| Basketball Revenue | | 480,000 |
 - | | | |
|--------------------|---------|---------|
| Unearned Revenue | 480,000 | |
| Basketball Revenue | | 480,000 |
 - | | | |
|---------------------|---------|---------|
| Unearned Revenue | 720,000 | |
| Student Receivables | | 720,000 |
 - No journal entry necessary.
- 6 MC4-5.** During the fourth quarter ended December 31, Year 1, Lighting Fixtures Inc. (LFI) had average outstanding revolving bank loans of \$1.2 million. Assume that the quarterly interest charges associated with these loans was \$7,500. If LFI makes the interest payment to the banks on January 15, Year 2, what is the journal entry (if any) made by the company on December 31 to reflect this information?
- | | | |
|--------------------------|-------|-------|
| Accrued Interest Payable | 7,500 | |
| Interest Expense | | 7,500 |
 - | | | |
|--------------------------|-------|-------|
| Interest Expense | 7,500 | |
| Accrued Interest Payable | | 7,500 |
 - | | | |
|------------------|-------|-------|
| Interest Expense | 7,500 | |
| Loans Payable | | 7,500 |
 - No journal entry necessary.
- 6 MC4-6.** Sampson Manufacturing Company (SMC) has an empty warehouse that it rents out to a local beer distributor for a monthly rental fee of \$6,000. Terms of the rental agreement include a 10-day payment grace period and an additional \$200 monthly utility expense, necessary to maintain the beer distributor's products at the proper temperature, paid by SMC. Assuming that SMC records journal entries on a monthly basis and that it receives the December monthly rent payment on January 9, what is the adjusting journal entry (if any) made by SMC on December 31 (with December's \$200 utility payment made on January 2)?
- | | | |
|-----------------|-------|-------|
| Rent Receivable | 6,000 | |
| Rent Revenue | | 6,000 |

b. Rent Receivable	5,800	
Utilities Expense	200	
Rent Revenue		6,000
c. Rent Receivable	6,000	
Utilities Expense	200	
Rent Revenue		6,000
Utilities Payable		200

d. No journal entry necessary.

- 6** **MC4-7.** On July 15, Year 1, Southeastern University hired an associate professor for its Math Department at an annual (12-month) salary of \$150,000. The salary is effective for its new school year, which commences August 16, and is payable in four quarterly calendar installments. Assuming that the university records journal entries on a monthly basis, what is the adjusting journal entry (if any) for August 31, Year 1?

a. Salaries Expense	6,250	
Accrued Salaries Payable		6,250
b. Salaries Payable	6,250	
Cash		6,250
c. Salaries Expense	12,500	
Accrued Salaries Payable		12,500

d. No journal entry necessary.

- 6** **MC4-8.** Embree Corp. purchased a four-year insurance policy on May 1, Year 2, for \$12,000, effective immediately. The company expensed the full cost of the policy in Year 2. The correct journal entry for Year 2 (ending December 31) will include a:

- a. Debit to prepaid insurance of \$10,000. b. Credit to prepaid insurance of \$9,000.
c. Debit to insurance expense of \$3,000. d. Credit to insurance expense of \$2,000.

- 6** **MC4-9.** The Cougars football team sells season tickets in advance for \$480 each. The season consists of 16 games. Half of these games are home games, and half of them are away games. For Year 3, the team has sold and collected payment for 10,000 season tickets. Through November 30, Year 3, six home games and five away games have been played. How much of the revenue collected in advance should be recognized on the income statement for the 11 months ended November 30, Year 3?

- a. \$1,800,000 b. \$3,300,000 c. \$3,600,000 d. \$4,800,000

- 3 9** **MC4-10.** Choco-Delite Cookies Company (Choco) declared a \$1,600,000 cash dividend on December 15, Year 2, payable to all stockholders on record the following month. On December 31, Year 2, the company completed a two-for-one stock split (*Note:* Prior to the split there were 2 million common shares outstanding with a par value of \$2). If Choco had net income of \$3,000,000 for Year 2, what is the *net* journal entry impact on the company's retained earnings account for December, assuming that Choco posts journal entries on a monthly basis and that temporary accounts are closed at year-end?

- a. \$3,400,000 credit (net) b. \$1,600,000 debit (net)
c. \$3,000,000 credit (net) d. \$1,400,000 credit (net)

Brief Exercises

- 2** **BE4-1. Transaction Analysis.** At the beginning of the year, Buxton Builders purchased raw materials in the amount of \$15,000 to produce goods to sell. Buxton paid cash. What is the effect of this transaction on the accounting equation?

- 2** **BE4-2. Transaction Analysis.** Florence's Floral Arrangements, Inc. had the following transactions in the month of January: The owners invested \$100,000 (the par value of the stock) for 20,000 shares of common stock; the company purchased furniture for the florist shop in the amount of \$12,000, which was put on a credit account with the vendor; and the company paid employees wages of \$6,000 in cash. What is the effect of each of these transactions on the accounting equation?

- 3** **BE4-3. Journal Entries.** Using the information provided in BE4-2, prepare Florence's journal entries for the month of January. Omit explanations.

- 2 3** **BE4-4. Transaction Analysis; Journal Entries.** Cal's Computer Servicing, Inc., a service company that provides installation services for computer programs, had a service revenue transaction in the amount of \$120,000 on May 31, 2018, with one customer. This customer chose to put the balance owed on its credit account with Cal's, and it will pay off the balance in the following month. What is the effect of the revenue transaction on the accounting equation? What is the journal entry for this transaction? Omit explanation.

- 2 3** BE4-5. **Transaction Analysis; Journal Entries.** Using the information provided in BE4-4, assume now that Cal's customer pays off the balance owed of \$120,000 in full on June 23, 2018. What is the effect of this transaction on the accounting equation? What is the journal entry for this transaction? Omit explanation.
- 4** BE4-6. **Journal Entries; T-accounts.** Using the information provided in BE4-4 and BE4-5, show the t-accounts for the cash, accounts receivable, and service revenue accounts reflecting the revenue transaction in May and the payment in June, assuming no other transactions have taken place.
- 2 8** BE4-7. **Retained Earnings.** In its first year of operations, Jones Journals, Inc. recorded net income in the amount of \$470,000. Jones Journals also declared and paid a \$25,000 dividend at year-end on December 31. What is the balance in Jones' retained earnings account after it records the dividend?
- 2 8** BE4-8. **Retained Earnings.** Using the information provided in BE4-7, assume that Jones Journals is now in its second year of operations. In the second year, Jones incurred a net loss of \$124,000 and paid no dividends. What is the retained earnings balance as of December 31 of Year 2?
- 3** BE4-9. **General Journal Entries.** Mario's Grocery began operations on December 1, 2018, and has a year-end of December 30. On December 1, the owners invested \$50,000 (the par value of the stock) in return for 5,000 shares of common stock. On December 7, the company took out a loan from the bank in the amount of \$150,000, and on December 15, the company purchased a building to be used as its selling facility for \$90,000 in cash. Prepare the general journal entries for the month of December.
- 2 8** BE4-10. **Retained Earnings.** Over the course of 2018, the first year of operations, Medical Supplies, Inc. had the following income transactions: Sales Revenue of \$4,340,000; Cost of Goods Sold of \$1,936,000; Wage Expense of \$876,000; Insurance Expense of \$324,000; Administrative Expense of \$414,000; Utilities Expense of \$192,000; and Selling Expense of \$42,000. At the end of 2018, the company declared and paid dividends in the amount of \$62,000. What is the ending balance in the retained earnings account at year-end?
- 3 6** BE4-11. **Adjusting Journal Entries.** Barnard and Associates, a law firm, paid \$18,000 for 12 months' rent in advance on October 1 of the current year. The company's fiscal year-end is December 31. Prepare the journal entries for the rent payment on October 1 and the necessary adjusting journal entry on December 31. Omit explanations.
- 3 4** BE4-12. **Adjusting Journal Entries; T-accounts.** Using the information provided in BE4-11, prepare the t-accounts for Rent Expense and Prepaid Rent for Barnard and Associates as of December 31 after adjusting journal entries.
- 3 6** BE4-13. **Adjusting Journal Entries.** Gerhard News collects payments from customers for newspaper subscriptions on a yearly basis (specifically, in one-year subscriptions). Each month, Gerhard must record an adjusting entry to recognize the monthly revenue that has been provided. On March 1, Gerhard collected \$24,000 cash for one-year subscriptions. Prepare the journal entry to record the initial transaction and the entry that Gerhard will prepare on March 31 to recognize the monthly subscription revenue. Omit explanation.
- 3 4** BE4-14. **Adjusting Journal Entries; T-accounts.** Using the information provided in BE4-13, prepare the t-accounts for Subscription Revenue and Unearned Subscription Revenue for Gerhard News as of March 31, before and after preparing the adjusting entries.
- 3 6** BE4-15. **Adjusting Journal Entries.** Pat's Auto Dealership purchased a building on January 15 for \$300,000 to be used for the business. The residual value on the building is \$0 and its expected useful life is 30 years. Prepare the adjusting entry required at year-end to record a full year of straight-line depreciation expense for this building. Omit explanation.
- 9** BE4-16. **Closing Entries.** Using the information provided in BE4-10, prepare the necessary year-end closing entries for Medical Supplies, Inc. Omit explanations.
- 9** BE4-17. **Closing Entries.** At year-end, Nelson's Nursery, Inc. had account balances as follows: Sales Revenue of \$220,000; Wage Expense of \$74,000; Administrative Expense of \$12,000; Utility Expense of \$6,000; and Rent Expense of \$10,000. Prepare the necessary year-end closing entries. Omit explanations.
- 9** BE4-18. **Closing Entries.** Readers, Inc., an online bookstore, had the following account balances at year-end: Sales Revenue of \$420,000; Cost of Goods Sold of \$240,000; Salary Expense of \$120,000; Insurance Expense of \$5,000. Also, it declared and paid a dividend in the amount of \$10,000 at year-end. Prepare the necessary closing entries for Readers. Omit explanations.
- A** BE4-19. **Adjusting Journal Entries.** Barnard and Associates, a law firm, paid \$18,000 for twelve months' rent in advance on October 1 of the current year. Barnard recorded the full amount as rent expense. The company's fiscal year-end is December 31. Prepare the entry made on October 1 and the necessary adjusting journal entry on December 31. Omit explanations.
- A** BE4-20. **Adjusting Journal Entries; T-accounts.** Using the information provided in BE4-19, prepare the t-accounts for Rent Expense and Prepaid Rent for Barnard and Associates as of December 31 after adjusting journal entries.
- A** BE4-21. **Adjusting Journal Entries.** Gerhard News collects payments from customers for newspaper subscriptions on a yearly basis, that is, in one-year subscriptions. On March 1, Gerhard collected \$24,000 cash for one-year subscriptions. Gerhard recorded the full amount as revenue. Prepare the entry made on March 1 and the necessary adjusting journal entry on December 31. Omit explanations.

- A** **BE4-22. Adjusting Journal Entries; T-accounts.** Using the information provided in BE4-21, prepare the t-accounts for Subscription Revenue and Unearned Subscription Revenue for Gerhard News as of December 31, before and after preparing adjusting entries.
- C** **BE4-23. Reversing Entries.** Thomas and Associates, a law firm, accrued \$4,000 for four days of wages on December 31. On January 7, it paid two weeks of wages, totaling \$10,000, to employees. The company's fiscal year-end is December 31. Prepare the journal entries for the accrued wages on December 31, the reversing entry at the beginning of the new fiscal year, and the payment on January 7. Omit explanations.
- C** **BE4-24. Reversing Entries.** Mueller Consulting is under contract to provide consulting services for \$150,000 to Ames Computers. At the end of the current year, Mueller provided \$30,000 of the services. It completes the services in the next year and receives the \$150,000 payment on February 12. Prepare the journal entries for the service revenue recognized during the current year on December 31, the reversing entry at the beginning of the new fiscal year, and the payment on February 12. Omit explanations.

Exercises

- 2** **E4-1. Transaction Analysis.** The following transactions are taken from the books of Miller Manufacturing.
- Bought office equipment with cash, \$30,000.
 - Bought supplies on credit from a vendor, \$15,000.
 - Sold goods for cash, \$40,000 (ignore the inventory and cost of goods sold entry of this transaction).
 - Bought raw materials from a supplier on account, \$22,000.
 - Sold goods to customers on account, \$65,000 (ignore the inventory and cost of goods sold entry of this transaction).
 - Purchased raw materials by issuing a note payable, \$14,000.
 - Paid cash toward note payable balance, \$4,000.
 - Received cash from customer to apply to credit account balance, \$3,000.
 - Paid for accounting and legal fees in cash, \$5,000.
 - Paid salaries in cash, \$12,000.
- Show the effect of each transaction on assets, liabilities, and equity using the accounting equation.
- 3** **E4-2. Journal Entries.** Using the information given in E4-1, prepare the journal entry for each transaction for Miller Manufacturing. Omit explanations.
- 2 3** **E4-3. Transaction Analysis; Journal Entries.** Master Mind Games, Inc. is a new corporation started on January 1, 2018. The following transactions occurred during the first year of operations.
- On January 1, the owners invested a total of \$50,000 (the par value of the stock) to start the company. In exchange, the corporation issued the owners 5,000 shares of common stock.
 - On March 14, the company paid cash to purchase office equipment for \$10,000.
 - On April 6, the company obtained a note from the bank for \$100,000.
 - On May 31, salaries were accrued for time worked in May in the amount of \$12,000. These salaries will be paid in June.
 - On June 15, the company paid cash to employees for salaries accrued on May 31.
 - On July 12, the company paid cash for legal fees associated with the startup of the company in the amount of \$5,000.
 - On September 6, the company sold \$32,000 of merchandise to a large customer. The customer paid cash for half of the transaction and put the other half on her credit account with the vendor (ignore the inventory and cost of goods sold entry of this transaction).
 - On November 1, the customer that purchased goods on September 6 paid off its credit account balance of \$16,000 with cash.
 - On December 14, the company made a \$10,000 cash payment towards its outstanding bank note balance.
- Required »**
- Show the effect of each transaction on assets, liabilities, and equity using the accounting equation.
 - Prepare the journal entry for each transaction. Omit explanations.
- 4** **E4-4. T-accounts.** Using the information provided in E4-3, prepare Master Mind's t-accounts for each transaction.
- 3** **E4-5. Preparing Journal Entries in the General Journal.** The Dover Direct Insurance Agency began operations on June 1, 2018. In the month of June, the following transactions occurred:
- June 2: Dover Direct's owner invested \$80,000 (the par value of the stock) cash and acquired 4,000 shares of common stock.
- June 8: Dover Direct purchased \$8,000 of office supplies with cash.
- June 15: Dover Direct paid employees \$8,000 in cash for the biweekly payroll.
- June 20: Dover Direct acquired new office furniture for \$25,000. The company paid \$10,000 in cash and financed the remainder by issuing a \$15,000 note payable to the vendor.
- June 22: Dover Direct collected \$120,000 in sales revenue for the month, all of which was paid in cash.

Dover uses the following chart of accounts:

Assets

100 Cash
101 Accounts Receivable
102 Office Supplies
121 Furniture

Liabilities

200 Accounts Payable
210 Notes Payable

Stockholders' Equity

300 Common Stock

Revenues

400 Sales Revenue

Expenses

501 Wage Expense

Prepare the journal entries in the general journal format for Dover's transactions using appropriate account numbers. Assume the journal entries are posted to the ledger.

- 4** **E4-6. Posting to the General Ledger.** Using the information provided in E4-5, post Dover Direct Insurance Agency's journal entries to the general ledger for all relevant accounts for the month ended June 30, 2018. You do not need to provide explanations.
- 3** **E4-7. Preparing Journal Entries in the General Journal.** Cookies, Cakes & Crumbs Bakery (CC&C) ended its first year of operations on December 31, 2018. During 2018, the following transactions occurred:

January 10:	The owners of CC&C invested \$200,000 (the par value of the stock) and acquired 20,000 shares of common stock.
March 15:	CC&C purchased equipment in the amount of \$48,000 on credit account with the vendor.
April 12:	CC&C purchased supplies in the amount of \$24,000 and paid cash.
May 31:	CC&C collected \$82,000 in sales revenue for the month, all of which was paid in cash. Ignore Cost of Goods Sold.
June 15:	CC&C paid employees \$22,000 in cash for wages.
July 31:	CC&C purchased supplies in the amount of \$16,000 on credit account with the supplier.
September 30:	CC&C paid the balance due to the equipment vendor for the purchase made on March 15.
November 10:	CC&C paid the balance due to the supplier for the purchase made on July 31.
November 30:	CC&C recorded sales revenue in the amount of \$216,000, half on credit and the other half paid in cash. Ignore Cost of Goods Sold.
December 20:	The customers who owed CC&C for the November 30 sales paid their balances in full with cash.

CC&C uses the following chart of accounts:

Assets

100 Cash
101 Accounts Receivable
102 Supplies
111 Equipment

Liabilities

200 Accounts Payable

Stockholders' Equity

300 Common Stock

Revenues

400 Sales Revenue

Expenses

503 Wage Expense

Prepare the journal entries in the general journal format for CC&C's transactions using appropriate account numbers. Assume the journal entries are posted to the ledger.

4

E4-8. Preparing the T-accounts. Using the information provided in E4-7, prepare CC&C's t-accounts for all relevant accounts for the year ended December 31, 2018. Post journal entries in E4-7 to the general ledger.

2 3 4

E4-9. Transaction Analysis; Journal Entries and Posting to T-Accounts. G&S Auto Body, Inc. started 2018 with the following balances:

Cash	\$40,000
Accounts Receivable	100,000
Equipment	550,000
Accounts Payable	14,500
Salaries Payable	6,000
Notes Payable	108,000
Common Stock	235,000
Retained Earnings	326,500

The following transactions occurred during the current year:

- On January 1, the owners invested a total of \$150,000 (the par value of the stock) as an additional capital contribution. In exchange, the corporation issued the owners 50,000 shares of common stock.
- On March 23, the company paid cash to purchase office equipment for \$108,000.
- On April 18, the company made a payment on the note due to a bank, \$10,000.
- On May 5, collected the balance of accounts receivable due from the prior year.
- On May 31, salaries were accrued for time worked in May in the amount of \$2,000. These salaries will be paid in June.
- On June 30, the company paid cash to employees for salaries accrued on May 31 as well as the balance due from the prior year.
- On July 8, the company paid cash for accounting fees in the amount of \$6,000.
- On September 6, the company performed repair work on a fleet of vehicles at a total charge of \$76,000. The customer paid cash for half of the transaction and put the other half on its credit account with G&S.
- On November 9, the customer who engaged G&S to do the repair work on September 6 paid off its account balance with cash.
- On December 15, the company made a \$10,000 cash payment to purchase parts and supplies (record in Parts and Supplies Inventory).

Required »

- Show the effect of each transaction on assets, liabilities, and equity using the accounting equation.
- Prepare the journal entry for each transaction. Omit explanations.
- Post each journal entry to the t-accounts and determine the ending balances of each account at the end of the year.

2 3 4

E4-10. Transaction Analysis; Journal Entries and Posting to T-Accounts.

Hartman Housewares Company began the current year with the following account balances:

Cash	\$70,000
Accounts Receivable	25,000
Supplies	5,000
Accounts Payable	28,000
Common Stock	32,000
Retained Earnings	40,000

The following transactions were completed during the current year.

- Bought office equipment with cash, \$10,000.
- Bought supplies on credit from a vendor, \$5,000.
- Sold goods for cash, \$12,000 (ignore the inventory and cost of goods sold entries of this transaction).
- Bought raw materials from a supplier on account, \$2,000.
- Sold goods to customers on account, \$6,000 (ignore the inventory and cost of goods sold entries of this transaction).
- Purchased raw materials by issuing a note payable, \$3,000.
- Paid cash toward note payable balance, \$500.

- h. Received cash from customer to apply to credit account balance, \$3,000.
- i. Paid for accounting and legal fees in cash, \$400.
- j. Paid salaries in cash, \$1,000.

Required:

- a. Show the effect of each transaction on assets, liabilities, and equity using the accounting equation.
- b. Prepare journal entries. Omit explanations.
- c. Post each transaction to t-accounts.
- d. Determine the ending balances for each account.

5

E4-11. Preparing the Trial Balance. Using the information provided in E4-6, prepare Dover Direct Insurance Agency's unadjusted trial balance at June 30, 2018.

6

E4-12. Adjusting Journal Entries; T-accounts. Fanatical Fashions, a department store, has the following unadjusted account balances as of December 31, 2018, the company's year-end:

- Cash: \$3,230,000
- Accounts Receivable: \$1,240,000
- Prepaid Insurance: \$252,000
- Prepaid Rent: \$480,000
- Buildings: \$3,540,300
- Accumulated Depreciation—Buildings: \$360,000
- Accounts Payable: \$980,000
- Wages Payable: \$420,000
- Note Payable: \$360,000
- Common Stock: \$1,000,000
- Sales Revenue: \$7,450,300
- Wage Expense: \$1,120,000
- Utilities Expense: \$94,000
- Insurance Expense: \$120,000
- Interest Expense: \$234,000
- Rent Expense: \$260,000
- Depreciation Expense—Buildings: \$0

At year-end, Fanatical Fashions makes necessary adjusting journal entries to properly record revenues and expenses for the year. The following information applies to the adjusting journal entries:

- The prepaid insurance balance relates to a two-year insurance policy purchased in June that covers the period of July 1, 2018, to June 30, 2020.
- The prepaid rent balance relates to rent that was paid in January to cover the company's facilities for the current year.
- Wages for the year in the amount of \$236,000 will be paid after year-end and have not yet been recorded.
- Fanatical purchased the buildings in the beginning of the year and depreciates on a yearly basis. It must record a full year of depreciation at the end of 2018. The buildings have no residual value, a 30-year estimated useful life, and will be depreciated on a straight-line basis.
- Fanatical has not yet recorded interest expense for 2018 on the note payable in the amount of \$16,000.

Prepare the journal entries necessary to record the adjustments at year-end. Omit explanations..

7

E4-13. Adjusted Trial Balance. Using the information provided in E4-12, prepare an adjusted trial balance for Fanatical Fashions as of December 31, 2018.

6

E4-14. Adjusting Journal Entries; T-Accounts. MPS, Inc. has the following unadjusted account balances as of December 31, 2018, the company's year-end:

- Cash: \$430,000
- Accounts Receivable: \$2,000
- Prepaid Insurance: \$14,000
- Prepaid Rent: \$22,000
- Equipment: \$60,000
- Accumulated Depreciation—Equipment: \$0
- Accounts Payable: \$10,000

- Common Stock: \$16,000
- Sales Revenue: \$823,100
- Wage Expense: \$290,400
- Utilities Expense: \$11,200
- Insurance Expense: \$8,500
- Rent Expense: \$11,000
- Depreciation Expense—Equipment: \$0

At year-end, MPS makes adjusting journal entries to properly record revenues and expenses. The following information applies to the adjusting journal entries:

- The prepaid insurance balance relates to an insurance policy purchased on January 1, 2018, that covers the period of January 1, 2018, to December 31, 2018.
- The prepaid rent balance relates to rent paid in June 2018 to cover the period of July 1, 2018, to June 30, 2019.
- Wages for 2018 in the amount of \$26,000 will be paid after year-end and have not yet been recorded.
- MPS purchased the equipment in the beginning of January 2018 and will depreciate it on a yearly basis. No depreciation has been recorded yet. The equipment has a useful life of 15 years, no residual value, and will be depreciated on a straight-line basis.

Prepare the journal entries necessary to record the adjustments at year-end. Omit explanations.

- 5 6 7** **E4-15. Unadjusted Trial Balance; Adjusted Trial Balance.** Using the information provided in E4-14:

Required »

- Prepare an unadjusted trial balance for MPS, Inc. as of December 31, 2018.
- Prepare an adjusted trial balance for MPS, Inc. as of December 31, 2018.

- 9 10** **E4-16. Closing Entries; Post-Closing Trial Balance.** Using the information provided in E4-14:

Required »

- Prepare the necessary closing entries for MPS, Inc. at December 31, 2018. Omit explanations.
- Prepare the post-closing trial balance for MPS, Inc. at December 31, 2018.

- B** **E4-17. Worksheet Preparation.** Using the information provided in E4-14, prepare a worksheet including the columns for the unadjusted trial balance, adjustments, the adjusted trial balance, income statement, and balance sheet.

- 6 7** **E4-18. Adjusting Journal Entries; Adjusted Trial Balance.** Magic Cleaning Services (MCS) has a fiscal year-end of December 31. It is the first year of operations. As of year-end, MCS has the following unadjusted trial balance:

**Magic Cleaning Services
Unadjusted Trial Balance
At December 31**

Account	Debit	Credit
Cash	\$430,900	
Accounts Receivable	158,000	
Supplies	111,000	
Prepaid Rent	2,400	
Building	90,000	
Accounts Payable		\$ 45,900
Unearned Service Revenue		98,000
Common Stock		100,000
Retained Earnings		0
Service Revenue		619,200
Wage Expense	48,600	
Utilities Expense	6,200	
Administrative Expense	16,000	
Totals	<u>\$863,100</u>	<u>\$863,100</u>

In addition, it has not adjusted for the following transactions:

- All of the prepaid rent expired by the end of the year.
- The building was purchased early this year and has a 30-year life with no residual value. Depreciation is to be recorded for a full year on a straight-line basis.
- The company provided a portion of the services related to an advance collection on December 20. It performed one-half of the services to be performed in the current year.
- Wages for the current year in the amount of \$24,000 should be accrued and are set to be paid out to workers in January.

Required ▶

- a. Journalize necessary adjusting journal entries. Omit explanations.
- b. Prepare an adjusted trial balance as of December 31, 2018.

8
9 10

E4-19. Preparing Financial Statements. Using the adjusted trial balance for Magic Cleaning Services in E4-18, prepare a single-step income statement, a statement of shareholders' equity, and a balance sheet.

E4-20. Closing Entries; Post-Closing Trial Balance. Using the information provided in E4-18:

Required ▶

- a. Prepare the necessary closing entries for Magic Cleaning Services at year-end. Omit explanations.
- b. Prepare the post-closing trial balance for Magic Cleaning Services at year-end.

B

E4-21. Worksheet Preparation. Using the information provided in E4-18, prepare a worksheet including the columns for the unadjusted trial balance, adjustments, the adjusted trial balance, income statement, and balance sheet.

9

E4-22. Closing Entries. Diane's Dairy Sales & Delivery finished its first year of operations on December 31, 2018. After adjusting journal entries, the company presented the following adjusted trial balance.

Diane's Dairy Sales & Delivery
Adjusted Trial Balance
At December 31

Account	Debit	Credit
Cash	\$ 833,000	
Accounts Receivable	179,000	
Supplies	83,000	
Prepaid Insurance	13,000	
Prepaid Rent	30,000	
Equipment	350,000	
Accumulated Depreciation—Equipment		\$ 30,000
Accounts Payable		150,500
Wages Payable		24,000
Unearned Revenue		12,000
Notes Payable, due 2019		80,000
Common Stock		1,000,000
Retained Earnings		0
Dividends	12,000	
Sales Revenue		1,000,500
Wage Expense	320,000	
Utility Expense	32,000	
Selling Expense	122,500	
Administrative Expense	192,500	
Insurance Expense	14,000	
Supplies Expense	85,000	
Depreciation Expense—Equipment	31,000	
Totals	\$2,297,000	\$2,297,000

Using this trial balance, prepare Diane's necessary entries to close out temporary accounts at year-end. Omit explanations.

- 8** **E4-23. Preparing Financial Statements.** Using the adjusted trial balance for Diane's Dairy Sales & Delivery in E4-22, prepare a single-step income statement, a statement of shareholders' equity, and a balance sheet.
- 10** **E4-24. Post-Closing Trial Balance.** Using the information in E4-22, prepare the post-closing trial balance for Diane's Dairy Sales & Delivery.

Problems

- 2 3 6** **P4-1. Transaction Analysis; Journal Entries; Adjusting Journal Entries.** Jester Entertainment Company began operations on January 1, 2018. The company had the following transactions in its first year of business:
- January 4: Owners invested \$120,000 (the par value of the stock) in exchange for 20,000 shares of common stock.
 - February 2: Jester took out a 10-year note payable in the amount of \$80,000 to pay for operating expenses. Interest payments are due every six months, and the balance of the note will be paid off in a lump-sum in 10 years. The interest rate is 10% annually, that is, 5% every six months.
 - February 16: Jester signed a rental lease for its operating facility and paid a year of rent up front in the amount of \$60,000. The rental lease runs from March 1, 2018, through February 29, 2019.
 - March 1: Jester purchased office supplies in the amount of \$12,000 and paid in cash.
 - March 12: Jester paid \$18,000 cash for advertising expenses.
 - April 1: Jester purchased a two-year insurance policy that runs from April 1, 2018, to March 31, 2020, in the amount of \$40,000 and paid in full for the policy in cash.
 - May 12: Jester negotiated a contract with a customer to provide entertainment services for a one-year period running from June 1, 2018, to May 31, 2019. The customer paid the contract in full on May 12 with cash in the amount of \$64,000.
 - June 16: Jester paid wages in the amount of \$12,000 to employees in cash.
 - July 20: Jester negotiated a contract with a customer to provide entertainment services for a six-month period running from September 1, 2018, to February 28, 2019. The customer paid the contract in full on July 20 with cash in the amount of \$42,000.
 - August 2: Jester paid cash in the amount of \$4,000 for the first interest payment on the note payable taken out on February 2.
 - August 18: Jester received and paid a utilities bill in the amount of \$7,000 in cash.
 - September 10: Jester paid wages in the amount of \$28,000 in cash.
 - October 1: Jester negotiated a contract with a customer to provide entertainment services for a one-year period running from October 1, 2018, to September 30, 2019, in the amount of \$420,000. The customer paid the contract in full on October 1.
 - November 14: Jester purchased office supplies in the amount of \$26,000 on account with the vendor.
 - December 6: Jester received an advertising bill for \$22,000. The services were provided in 2018 and the bill will be paid in January.

Note: At year-end, Jester had \$18,000 of office supplies remaining on hand.

Required »

- a. Prepare the journal entries for the original transactions. Omit explanations.
 - b. Show the accounting equation effect of each of the original transactions.
 - c. Prepare any necessary year-end adjusting journal entries for these transactions.
 - d. Show the accounting equation effect of each of the adjusting journal entries.
- 2 3 6** **P4-2. Transaction Analysis; Journal Entries; Adjusting Journal Entries.** Branton Stores began operations on January 1, 2018. Branton had the following transactions in its first year of business:
- January 4: Owners invested \$400,000 (the par value of the stock) in exchange for 40,000 shares of common stock.
 - January 31: Branton purchased an office building for \$320,000 and paid for the purchase with a note payable. Interest in the amount of \$16,000 will be due annually on January 31 of each year, beginning in 2019.
 - February 1: Branton rented out a portion of its office building to another company. The renter signed a rental lease for the period of February 1, 2018, to January 31, 2019, and paid the annual rent amount of \$60,000 upfront in cash.
 - March 1: Branton paid \$12,000 cash for administrative expenses.

- March 28: Branton purchased supplies in the amount of \$42,000 on account with the supplier.
- April 8: Branton purchased a one-year insurance policy that runs from May 1, 2018, to April 30, 2019, in the amount of \$62,000 and paid for the policy in full in cash.
- May 1: Branton recorded sales revenue in the amount of \$240,000 that was received in cash from customers. Ignore Cost of Goods Sold.
- July 6: Branton paid employees \$34,000 in wages in cash.
- September 30: Branton recorded \$320,000 in sales revenue. Of this amount, \$200,000 was paid in cash and the remainder was on account. Ignore Cost of Goods Sold.
- October 31: Branton received a cash payment from a customer in the amount of \$40,000 to be applied to its account balance related to the September 30 sale.
- November 15: Branton purchased supplies in the amount of \$26,000 on account with the vendor.
- December 1: Branton recorded sales revenue in the amount of \$222,000, all on credit. Ignore Cost of Goods Sold.
- December 22: Branton received a legal bill for \$14,000, which it will pay when due in February 2019.

Note: Branton records straight-line depreciation on buildings, using a 32-year life and a salvage value of zero. At year-end, wages for 2018 in the amount of \$86,000 are due to employees and will be paid in January 2019. Supplies in the amount of \$6,000 remain on hand on December 31.

Totals	<u>\$8,750</u>	<u>\$8,750</u>

The company reported the following transactions during the current year:

- January 2: Heron took out a 5%, 2-year note payable in the amount of \$3,000 to pay for operating expenses. Interest is paid annually on January 1.
- February 1: Heron prepaid \$600 for a one-year insurance policy. Policy begins February 1.
- March 1: Heron purchased office supplies for cash, \$275.
- March 23: Heron paid \$300 cash for advertising expenses.
- April 1: The existing balance of prepaid rent expired, so the company prepaid an additional \$480 for a one-year lease on a warehouse.

- May 1: Heron signed a contract to perform consulting services and collected \$550. Heron will not provide the services until next year.
- June 30: Heron paid wages in the amount of \$200 to employees in cash.
- July 1: The company received \$2,150 in cash for services rendered that day.
- August 8: Heron paid a utilities bill in the amount of \$70 in cash.
- September 1: Heron paid wages in the amount of \$80 in cash.
- October 1: Heron collected \$250 of the accounts receivable balance.
- November 14: Heron purchased office equipment in the amount of \$1,800 with cash. Heron will record \$50 of depreciation on the equipment this year.
- December 6: Heron received a bill for \$100 for deliveries made this year and will pay the bill next year.

Note: At year-end, Heron had \$100 of supplies remaining on hand. Also, services pertaining to the beginning balance of unearned service revenue were performed during the year. Finally, Heron reports \$500 of depreciation expense related to the buildings.

Required »

- a. Show the accounting equation effect of each of the original transactions.
- b. Prepare the journal entries for the original transactions. Omit explanations.
- c. Prepare any necessary year-end adjusting journal entries for these transactions. Show the accounting equation effect of each of the adjusting journal entries.
- d. Post all entries to the T-accounts.
- e. Prepare the adjusted trial balance at the end of the year.

P4-11. Transaction Analysis; Journal Entries, Posting, Unadjusted Trial Balance, Adjusting Journal Entries, Adjusted Trial Balance, Financial Statements, Closing Entries, Post-Closing Trial Balance.

The Umbro Company, which is a fitness center, was formed on January 2 of the current year. Transactions completed during the first year of operation are presented below.

January 2:	Issued 900,000 shares of common stock for \$15,000,000, which is the par value of the stock.
January 10:	Acquired equipment in exchange for \$2,500,000 cash and a \$6,000,000 note payable. The note is due in 10 years.
February 1:	Paid \$36,000 for a business insurance policy covering the two-year period beginning on February 1.
February 22:	Purchased \$930,000 of supplies on account.
March 1:	Paid wages of \$194,600.
March 23:	Billed \$2,820,000 for services rendered on account.
April 1:	Paid \$130,000 of the amount due on the supplies purchased on February 22.
April 17:	Collected \$190,000 of the outstanding accounts receivable.
May 1:	Paid wages of \$209,400.
May 8:	Received bill and paid \$96,700 for utilities.
May 24:	Paid \$45,500 for sales commissions.
June 1:	Made the first payment on the note issued on January 10. The payment consisted of \$50,000 of interest and \$210,000 to be applied against the principal of the note.
June 16:	Billed customers for \$680,000 of services rendered.
June 30:	Collected \$450,000 on accounts receivable.
July 10:	Purchased \$166,000 of supplies on account.
Aug 25:	Paid \$150,000 for administrative expenses.
Sept 23:	Paid \$35,000 for warehouse repairs.
October 1:	Paid wages of \$100,000.
Nov 20:	Purchased supplies for \$45,000 with cash.
Dec 15:	Collected \$134,700 in advance for services to be provided in December and January of the following year.
Dec 30:	Declared and paid a \$50,000 dividend to shareholders.

The chart of accounts used by the Umbro Company follows:

APPENDIX A

Alternative Treatment of Deferred Revenues and Expenses

Depending on a company's accounting information system, prepaid expenses may initially be recorded as an expense instead of an asset. That is, the accounting information system could automatically debit all payments to insurers, landlords, and other payees to an expense account. Thus, if any prepaid amounts remain at the end of the year, assets are understated and expenses are overstated prior to the adjustment. In this case, the adjusting journal entry requires the creation of an asset for the unexpired portion of the prepaid asset and a reduction of the expense account for the same amount.

EXAMPLE 4A.1

Alternative Treatment of Prepaid Expenses

PROBLEM: FSU Corporation paid \$3,000 on January 1 for a three-year insurance policy. The policy starts on January 1. FSU records all cash disbursements of this type by debiting an expense account as follows:

<i>Date</i>	<i>Account</i>	<i>Debit</i>	<i>Credit</i>
Jan 1	Insurance Expense	3,000	
	Cash		3,000
	(To record payment for insurance)		

Prepare the adjusting journal entry required on December 31.

SOLUTION: The insurance expense and prepaid insurance accounts would appear as follows on December 31 before any adjustment is made:

Insurance Expense	
January 1	3,000
Dec 31 Bal.	<u>3,000</u>

Prepaid Insurance	
January 1	0
Dec 31 Bal.	<u>0</u>

On December 31, insurance expense is overstated because only one year of insurance coverage has expired, not three. There are two years of prepaid insurance remaining, meaning that prepaid insurance, the asset, is understated. In order to adjust the insurance expense and the prepaid insurance accounts, FSU must record the following adjusting journal entry:

<i>Date</i>	<i>Account</i>	<i>Debit</i>	<i>Credit</i>
Dec 31	Prepaid Insurance	2,000	
	Insurance Expense		2,000
	(To record unexpired insurance)		

Continued

After FSU posts the adjusting journal entry, the accounts will reflect the correct balance for the asset and the expense.

Insurance Expense	
January 1	3,000
AJE	2,000
Dec 31 Bal.	<u>1,000</u>

Prepaid Insurance	
January 1	0
AJE	2,000
Dec 31 Bal.	<u>2,000</u>

In addition, companies may initially record revenues collected in advance as revenue rather than crediting a liability account. Prior to the adjustment, revenues are overstated and liabilities are understated. The adjusting journal entry requires recording a liability for the unperformed portion and reducing the revenue account to properly reflect the amount performed at the end of the reporting period.

EXAMPLE 4A.2

Alternative Treatment of Unearned Revenue

PROBLEM: Nancy Frank Realty collected \$100,000 in advance for a one-year lease on June 30 of the current year. One-half of the rent is earned by year-end, December 31.

On the date the rent was collected, Nancy Frank made the following journal entry.

<i>Date</i>	<i>Account</i>	<i>Debit</i>	<i>Credit</i>
June 30	Cash	100,000	
	Rent Revenue		100,000
	(To record advance collection)		

What adjusting journal entry is necessary on December 31?

SOLUTION: The rent revenue and unearned revenue accounts would appear as follows on December 31 before any adjustment is made:

Rent Revenue	
June 30	100,000
Dec 31 Bal.	<u>100,000</u>

Unearned Rent Revenue	
June 30	0
Dec 31 Bal.	<u>0</u>

On December 31, the revenue account is overstated and the liability account, unearned rent revenue, is understated because only one-half of the advance payment is performed at the

Continued

end of the year. To adjust the rent revenue account, Nancy Frank must prepare the following adjusting journal entry:

<i>Date</i>	<i>Account</i>	<i>Debit</i>	<i>Credit</i>
Dec 31	Rent Revenue	50,000	
	Unearned Rent Revenue (liability)		50,000
	(To record unearned rent revenue)		

After Nancy Frank posts the adjusting journal entries, the accounts will reflect the correct balances of the liability and revenue accounts.

Rent Revenue	
June 30	100,000
AJE	50,000
Dec 31 Bal.	<u>50,000</u>

Unearned Rent Revenue	
June 30	0
AJE	50,000
Dec 31 Bal.	<u>50,000</u>

APPENDIX B

Using a Worksheet

A worksheet is a multiple-column form that may be used to simplify the adjustment process and the preparation of the financial statements. It includes columns for the account titles, the unadjusted trial balance, AJEs, adjusted trial balance, income statement, and balance sheet. Exhibit 4B.1 presents the standard form of the worksheet.

EXHIBIT 4B.1 Format of the Worksheet

	A	B	C	D	E	F	G	H	I	J	K
1	Account Title	Unadjusted Trial Balance		Adjustments		Adjusted Trial Balance		Income Statement		Balance Sheet	
2		Dr.	Cr.	Dr.	Cr.	Dr.	Cr.	Dr.	Cr.	Dr.	Cr.

The unadjusted trial balance and the adjusted trial balance columns reflect the account balances in the ledger at these two points in the accounting cycle. The adjustments column reflects the adjusting journal entries. After the worksheet has been completed, the income statement and balance sheet columns allow for the preparation of financial statements: The income statement is prepared from the income statement columns, and the statement of stockholders' equity and balance sheet are prepared from the balance sheet columns.

The steps in preparing a worksheet are as follows:

1. Prepare an unadjusted trial balance. Prepare the unadjusted trial balance directly on the worksheet—there is no need for a separate document.
2. Enter the adjusting journal entries in the adjustments columns. Note that the AJEs must also be recorded in the journal.
3. Compute the adjusted balances in the adjusted trial balance columns.
4. Place adjusted trial balance amounts in appropriate income statement and balance sheet columns.
5. Total the statement columns, compute the net income (or loss), and complete the worksheet.

A sample worksheet outlining the five steps is presented in Exhibit 4B.2.

EXHIBIT 4B.2 Sample Worksheet

	A	B	C	D	E	F	G	H	I	J	K
1		Unadjusted Trial Balance (STEP 1)		Adjustments (STEP 2)		Adjusted Trial Balance (STEP 3)		Income Statement (STEP 4)		Balance Sheet (STEP 4)

15	Rent Expense										
16	Depreciation Expense— Machinery & Equipment										
17	Insurance Expense										
18	Totals										
19	Net Income (Loss)										
20	Totals										

STEP 5

Example 4B.1 illustrates worksheet preparation.

EXAMPLE 4B.1

Worksheet Preparation

PROBLEM: Enzo Educational Services provided the following unadjusted trial balance as of December 31 of the current year:

Account	Debit	Credit
Cash	\$215,000	
Accounts Receivable	50,000	
Prepaid Insurance	40,000	
Machinery & Equipment	275,000	
Accumulated Depreciation—Machinery & Equipment		\$ 27,500
Accounts Payable		24,000
Wages Payable		19,500
Common Stock		120,000
Retained Earnings		303,000
Dividends	9,000	
Fees Earned		200,000
Wage Expense	25,000	
Rent Expense	80,000	
Totals	<u>\$694,000</u>	<u>\$694,000</u>

In addition, note that:

- a. Depreciation for the year is \$27,500.
- b. \$8,000 of wages has accrued for the last pay period of the year to be paid on January 2.
- c. The company rented equipment on account for \$3,500 on December 15 and used the equipment for two weeks. The company has not recorded the event as of the date of the trial balance.
- d. There should be \$30,000 remaining in the prepaid insurance account.

Prepare the worksheet for Enzo Educational Services.

Enzo first enters the unadjusted trial balance on the worksheet, followed by the AJEs in the adjustments column. Enzo then computes the amounts for the adjusted trial balance. For example, the unadjusted balance for prepaid insurance is a debit of \$40,000. An adjusting journal entry credits the account for \$10,000, leaving a \$30,000 debit adjusted balance.

Next, Enzo extends each amount from the adjusted trial balance to either the income statement or balance sheet columns. The income statement columns initially will not balance—the difference (revenues less expenses) is the net income or net loss for the period. Likewise, the balance sheet will not balance because the balance in retained earnings is the beginning balance, not the ending balance. Here as well, the difference between the debit and credit columns is the net income or net loss amount.

Totals	<u>694,000</u>	<u>694,000</u>	<u>49,000</u>	<u>49,000</u>	<u>49,000</u>	<u>49,000</u>	<u>733,000</u>	<u>733,000</u>	<u>733,000</u>	<u>733,000</u>	<u>154,000</u>	<u>200,000</u>	<u>200,000</u>	<u>579,000</u>	<u>579,000</u>	<u>533,000</u>	<u>46,000</u>	<u>579,000</u>	<u>579,000</u>
Net Income											<u>46,000</u>	<u>200,000</u>	<u>200,000</u>	<u>579,000</u>	<u>579,000</u>	<u>46,000</u>	<u>579,000</u>	<u>579,000</u>	<u>579,000</u>

STEP 5

APPENDIX C

Reversing Entries

Companies make **reversing entries** as an optional step in the accounting cycle at the beginning of the next accounting period to reverse the effects of the adjusting journal entries made in the previous period. Reversing entries simplify the recording of subsequent transactions related to the adjusting journal entries, and they typically apply to adjusting journal entries for accrued revenues and accrued expenses.

Because reversing entries are made in the accounting period following the period in which the adjusting journal entries were made, their use does not change the amounts reported in the previously issued financial statements.

EXAMPLE 4C.1 Reversing Entries

PROBLEM: EO Eleven, Inc. made the following adjusting journal entry on December 31, 2018, to accrue the first week, which is one-half of its bi-weekly \$75,000 payroll:

<i>Date</i>	<i>Account</i>	<i>Debit</i>	<i>Credit</i>
Dec 31, 2018	Salary Expense	37,500	
	Salary Payable		37,500
	(To accrue salary expense)		

The related t-accounts follow:

Salary Expense		
Dec 31, 2018	<u>37,500</u>	
	Salary Payable	
	<u>37,500</u>	Dec 31, 2018

The closing entry for the 2018 salary expense is presented here:

<i>Date</i>	<i>Account</i>	<i>Debit</i>	<i>Credit</i>
Dec 31, 2018	Income Summary	37,500	
	Salary Expense		37,500
	(To close salary expense)		

Salary Expense		
AJE, Dec 31, 2018	37,500	
		Dec 31, 2018
Balance	<u>0</u>	

What reversing entry will EO Eleven make related to this adjusting journal entry? What entry will EO Eleven make at the time of its next payroll on January 10? Provide t-accounts.

SOLUTION: On January 1, 2019, EO Eleven prepares the following reversing entry:

<i>Date</i>	<i>Account</i>	<i>Debit</i>	<i>Credit</i>
Jan 1, 2019	Salary Payable	37,500	
	Salary Expense		37,500
	(To reverse prior year's accrual)		

The t-accounts are as follows:

Salary Expense		Salary Payable	
37,500	Jan 1, 2019	37,500	Dec 31, 2018
	Jan 1, 2019	37,500	
			Bal.
		<u>0</u>	

At this point, EO Eleven can make its regular entry to record the January 10, 2019, biweekly payroll for \$75,000 in the usual way. That is, the accounting information system does not have to be modified and it can process the regular payroll entry as follows:

<i>Date</i>	<i>Account</i>	<i>Debit</i>	<i>Credit</i>
Jan 10, 2019	Salary Expense	75,000	
	Cash		75,000
	(To record payment of salaries)		

The t-accounts are as follows:

Salary Expense		Salary Payable	
	37,500	37,500	Dec 31, 2018
Jan 10, 2019	75,000	37,500	Jan 1, 2019
2019 Bal.	<u>37,500</u>		Bal.
		<u>0</u>	

EO Eleven reports the correct expense of \$37,500 for 2019.

Statements of Net Income and Comprehensive Income

LEARNING OBJECTIVES

- 1 Explain the difference between net income and comprehensive income; assess the usefulness and limitations of the income statements.
- 2 Define earnings quality, including permanent and transitory earnings and earnings management.
- 3 Identify the four primary elements on the statement of net income, and explain the nature and functional approaches to classifying items.
- 4 Explain the presentation of the statement of net income, including the multiple-step and single-step income statement formats.
- 5 Define income from continuing operations, including the components of operating income, non-operating income, and the income tax provision.
- 6 Demonstrate the accounting for a discontinued operation, including the criteria used to determine a discontinued operation and presentation on the statement of net income.
- 7 Describe the presentation of net income, noncontrolling interest, and earnings per share on the statement of net income.

- 8 Discuss the statement of comprehensive income.
- 9 Describe the components of and the reporting requirements for the statement of stockholders' equity.

Introduction

NET INCOME, REVENUES, AND GAINS less all expenses and losses, is one of the most important numbers companies report in the financial statements. It represents the return to the shareholders over a given time period—and, everything else being equal, shareholders prefer net income to a net loss. That is, investors prefer increased net income to no growth or decreased net income. In a survey of over 400 executives, 52% indicated that net income was the most important performance measure for a company.¹

In analyzing a company, net income is an important measure of financial performance—but it represents only one view of a company's performance. Consider **Kimberly-Clark Corporation**, the U.S.-based global manufacturer of personal care products, consumer tissues, and healthcare items with brands such as Kleenex, Scott, and Huggies. Its bottom-line net income increased to \$2,166 million in 2016, representing a \$1,153 million, or 114%, increase from the prior year.² Why would net income increase by over 100% in one year?

To obtain a complete picture of a company's financial performance, a company will often present steps, or subtotals, to get to net income. Let's consider **Kimberly-Clark's** gross profit and operating profit, steps to get to net income. During 2016,

¹John Graham, Campbell Harvey, and Shiva Rajgopal, "The Economic Implications of Corporate Financial Reporting," *Journal of Accounting & Economics*, 2005, pp. 3–73.

²See Kimberly-Clark Corporation's annual report at http://www.cms.kimberly-clark.com/umbracoimages/UmbracoFileMedia/KMB-2016-10K_umbracoFile.pdf

Kimberly-Clark's gross profit, revenues less cost of goods sold, of \$6,651 million increased only 0.4%, suggesting that **Kimberly-Clark's** manufacturing performance was relatively steady. However, **Kimberly-Clark's** operating income increased by \$1,704 million, or 106%. Examining **Kimberly-Clark's** 2016 financial statements further, we find **Kimberly-Clark** reported a one-time expense in the prior year of \$1,568 million primarily related to employee pension costs. This one-time expense depressed **Kimberly-Clark's** 2015 net income. In other words, **Kimberly-Clark's** 2016 net income figure looked much higher because its 2015 net income was unusually low due to a one-time expense. We will examine numerous measures of income—including net income, operating income, and

gross profit—that include different aspects of performance and return to the shareholders.

In this chapter, we will discuss the reporting of income on the income statement and statement of comprehensive income. We begin with an overview and then cover specific presentation and format requirements, including the *single-step* and *multiple-step income statements*. Here, we will also discuss *discontinued operations*. Next, we will present important differences between U.S. GAAP and IFRS income statements. We then discuss the presentation of other comprehensive income and the statement of comprehensive income. We conclude by providing a discussion of the statement of stockholders' equity. «

- 1 Explain the difference between net income and comprehensive income; assess the usefulness and limitations of the income statements.

Overview of the Income Statements

The first step in our discussion of the income statements is outlining important terminology, the requirements for reporting the two components of *comprehensive income*, and the key advantages and limitations of the income statements. We first present U.S. GAAP requirements, and then discuss similarities and differences between U.S. GAAP and IFRS.

Income Statement Terminology

Comprehensive income is the change in a company's equity during a period of time resulting from transactions, events, and circumstances other than transactions with owners. For example, comprehensive income does not include new issues of shares or dividend distributions. Comprehensive income is composed of two parts: *net income* and *other comprehensive income*.

$$\text{Comprehensive income} = \text{Net income} + \text{Other Comprehensive Income}$$

1. **Net income** is a measure of financial performance resulting from the aggregation of revenues, expenses, gains, and losses that are not items of other comprehensive income. Net income is also referred to as net earnings.
2. **Other comprehensive income** (OCI) is composed of revenues, expenses, gains, and losses that are explicitly excluded from net income in specific accounting standards.³ Standard setters specify that other comprehensive income includes unrealized gains and losses on an available-for-sale debt investment portfolio, unrealized gains and losses on cash flow hedges, foreign currency translation adjustments, and certain pension adjustments.⁴

³FASB ASC 220-10-20.

⁴FASB ASC 220-10-45-10A and IASC, *International Accounting Standard 1*, "Presentation of Financial Statements" (London, UK: International Accounting Standards Committee, 1975, Revised), Paragraph 7 (a)–(f) provide lists of items that should be included in OCI that we discuss in more detail later.

Reporting Income

Income statements are designed to reflect all components of comprehensive income by presenting an entity's financial performance and results of operations over a period of time. Entities may report comprehensive income in two ways:

- In one statement usually called the statement of comprehensive income, or
- In two consecutive statements: the statement of net income and the statement of comprehensive income.

The computation of net income and comprehensive income are the same under either alternative—only the format of the presentation differs. We will discuss both formats in depth later in this chapter. For consistency, we will refer to the financial statement(s) related to comprehensive income as the income statements throughout the rest of this chapter.

THE CONCEPTUAL FRAMEWORK CONNECTION: Usefulness and Limitations of the Income Statements

The income statements provide useful information to financial statement users in three ways:

1. **Evaluate past performance.** Income statements enable financial statement users to evaluate the entity's past performance. By disclosing separate components of revenues and expenses, income statements provide useful information about the entity's overall past performance (i.e., the earnings) and identify the main factors that influence performance. Income statements provide confirmatory value, which is an aspect of relevant information. For example, investors are interested in whether companies meet or beat analysts' forecasts of net income as indicated by the statement of net income.
2. **Predict future performance.** Income statements have predictive value because they provide a basis for estimating future performance. Predictive value is an aspect of relevance. For example, a firm with a trend of earnings growth over the last 10 years may continue that growth in the future.
3. **Assess risks or uncertainties of achieving future cash flows.** Income statements provide information that is useful in assessing the risks or uncertainties of achieving future cash flows. Some items of income are more persistent in nature than others, making them strong indicators of future cash flows. For example, revenue from normal sales tends to persist from year to year. However, a gain from the sale of a specialized piece of equipment is unlikely to reoccur in the following year.

While income statements are quite important to financial statement users, there are three main limitations. Income statements

1. **Exclude certain items.** Companies cannot measure certain revenues, expenses, gains, and losses reliably and therefore do not report them on the income statements. Unreliable information would result in financial statements that lack faithful representation, one of the fundamental qualitative characteristics identified in the conceptual framework. For example, assume an entity has been sued and a loss is likely. If the firm cannot reasonably estimate the loss, it would not report it on the income statement.
2. **Depend on accounting methods selected.** The measurement of income is dependent upon the accounting methods selected. For example, identical companies that purchase the same asset but depreciate that asset using different depreciation methods will report a different net income, resulting in reduced comparability.
3. **Require extensive judgment and estimation.** In general, allowing managers to use judgment when making accounting policy choices that best reflect the economic reality of a transaction will enhance the usefulness of the financial statements. However, due to significant subjectivity and estimation uncertainties involved in financial reporting, management can bias their judgments to enhance the entity's financial performance by manipulating revenues, gains, expenses, and losses. Even if management is not intentionally biasing reported earnings, different judgments will lead to different income numbers, resulting in reduced comparability.

- ② Define earnings quality, including permanent and transitory earnings and earnings management.

Earnings Quality

All the information included in the financial statements is important and useful for assessing a firm's financial position and performance—yet earnings is the single most important measure for financial statement users. Thus, preparers, auditors, regulators, and academics devote a considerable amount of time to focusing on *earnings quality*. **Earnings quality** captures the degree to which reported income provides financial statement users with useful information for predicting future firm performance.

We focus our discussion on two factors impacting earnings quality:

1. Earnings quality is dependent upon whether the components of earnings presented are *permanent* or *transitory* in nature.
2. Management will sometimes engage in earnings management by using the discretion afforded under the accounting standards to manipulate earnings to meet desired goals.

Permanent and Transitory Earnings

In assessing earnings quality, financial statement users gauge the portion of reported earnings that is *permanent* versus those that are *transitory*. **Permanent components of earnings** are likely to continue into the future. For example, earnings from sales revenue from regular customers are likely to continue into the future. **Transitory components of earnings** are unlikely to continue in the future. For example, gains or losses from the sale of equipment are usually transitory. Permanent earnings result in higher earnings quality whereas transitory earnings result in lower earnings quality.

The order of the income elements on the statement of net income guides financial statement users in distinguishing the permanent and transitory elements. Elements presented earlier in the statement of comprehensive income are typically more permanent than those included later in the statement. Exhibit 5.1 lists income statement line items commonly viewed as permanent and transitory.

EXHIBIT 5.1 Common Permanent and Transitory Items

Permanent	Transitory
<ul style="list-style-type: none"> • Sales • Cost of goods sold • Selling expenses • General and administrative expenses • Interest expense 	<ul style="list-style-type: none"> • Gains and losses on disposal of long-lived assets • Impairment losses • Other unusual or infrequent items • Discontinued operations

Elements in OCI are often transitory in nature, such as unrealized gains and losses on investments that are held by the entity. Also, income that is included in special sections of the statement of net income such as income from discontinued items is typically transitory. Generally, they occur in one year and then do not reoccur in the foreseeable future.

Most elements presented in operating income are permanent in nature. For example, the salary expense related to an entity's sales force is likely to occur in every period for the foreseeable future. However, not all elements included in operating income are considered permanent. For example, discretionary expenses such as R&D expenses and training expenses are generally more transitory.

Given the issues and concerns with the usefulness of the income statement and earning quality, Appendix A introduces financial statement analysis as a technique for understanding and interpreting a company's performance. Appendix B extends the discussion of financial statement analysis to profitability analysis.

JUDGMENTS IN ACCOUNTING: Earnings Management

In addition to assessing the nature of the reported earnings, financial statement users should be aware of the possibility of earnings management, which lowers a firm's earnings quality.

Accounting standards allow managers to make judgments that affect the reported earnings number so that they can report the firm's financial position and performance in the

most accurate and informative manner possible. A company's management understands the company's financial position and performance best. Thus, managers who are honest and have a desire to communicate accurate information to their stakeholders can do so.

However, some managers may use the areas of judgment inherent in financial reporting to manage earnings in an opportunistic—and sometimes fraudulent—fashion. For example, managers must determine which expenditures for equipment are material enough to record as an asset as opposed to an expense. They will likely expense a stapler but record a tractor as an asset. There is a gray area in this type of decision that provides an opportunity for earnings management. For example, should we expense a chair or record it as an asset? Of course, recording an asset for a material expenditure that the authoritative literature clearly designates as an expense constitutes fraud. Extreme forms of earnings management are fraudulent and thus illegal.

Motivation for Earnings Management. The flexibility in accounting standards gives management the ability to manipulate its reported earnings to meet company objectives. One of managers' overriding goals for the earnings presentation is to meet or exceed analysts' earnings forecasts. Financial analysts are trained to analyze a company, summarize relevant financial information for investors, and provide an opinion about whether investors should buy or sell stock in a company. In addition, financial analysts publish forecasts of a company's sales and earnings. If the company's actual earnings fall below this forecast, the market will most often react negatively, causing a drop in stock price.

For example, the share price of *Nike Inc.* declined about 7% when it released its sales for the second quarter of fiscal 2016 of \$8.24 billion. Although this sales figure was a 6% increase from prior periods, the analysts' forecasts were \$8.27 billion.⁵ If *Nike* had reported sales higher than \$8.27 billion, its share price likely would not have decreased. Thus, although it didn't do so, *Nike* had an incentive to manage revenues upward to beat analysts' forecasts.

Managers are also motivated to manage earnings to:

1. Beat benchmarks such as prior-quarter earnings or earnings from the same quarter of a prior year.
2. Avoid reporting a loss.
3. Present a firm's earnings as a smooth, upward trend.
4. Increase their own compensation when bonus plans are based on the net income (or stock price) of the firm.

In a survey of over 400 executives, 85.1% of those surveyed agreed that the earnings from the same quarter in the prior year is an important benchmark. In this same survey, 73.5% noted that analysts' forecasts were an important benchmark, and 65.2% indicated that avoiding a loss is important. Finally, 54.2% stated that earnings from the prior quarter is an important benchmark.⁶

In another study, researchers found evidence suggesting that 8% to 12% of companies that would have reported small earnings decreases instead exercised discretion in order to report small increases in earnings.⁷ This same study found evidence suggesting that 30% to 44% of companies that would have reported a small loss instead exercised discretion in order to report a small profit.

Earnings Management Techniques. Managers employ earnings management techniques when actual earnings are either lower or higher than expected.

When low earnings are expected, the **big bath** earnings management technique involves increasing a net loss to allow the firm to show increased net income in the future. Managers can intentionally report very low or negative earnings in a period by accelerating the recognition of expenses into current-period earnings or deferring revenue recognition to the future reporting periods. This then allows them to report higher earnings in future periods than they would otherwise have reported because they have shifted expenses back to the prior period or shifted revenues to the future period.

⁵See <http://fortune.com/2016/06/28/nike-shares-are-falling/>

⁶John Graham, Campbell Harvey, and Shiva Rajgopal "The Economic Implications of Corporate Financial Reporting," *Journal of Accounting & Economics*, 2005, pp. 3–73.

⁷David Burgstahler and Ilia Dichev, "Earnings Management to Avoid Earnings Decreases and Losses," *Journal of Accounting & Economics*, 1997, pp. 99–126.

When earnings are higher than expected in the current period, managers may elect to reduce earnings to create *cookie jar reserves*. **Cookie jar reserves** are used in future periods to increase earnings as needed, possibly to exceed analysts' forecasts. For instance, managers could recognize an overstated warranty expense when earnings are high, thus increasing warranty expense and the warranty liability and reducing reported earnings. In later years, the managers have a sufficient warranty liability and may not need to increase the accrual. Therefore, management can report lower warranty expense and increase reported earnings in that period.

For example, let's assume that the management of Willens Retailers prepares an income statement for the year ended 2018 and realizes that earnings will exceed analysts' forecasts by \$150,000. The company may choose to increase the estimate of warranty liability by an additional \$125,000, thus increasing warranty expense by that amount. Willens will still exceed the analysts' forecasts, but only by \$25,000. In future years, the company has \$125,000 as a "reserve" to be used to increase income. Therefore, if management determines that the company is going to miss analysts' 2019 forecast by an amount less than or equal to \$125,000, they can reduce their warranty liability, report little or no warranty expense, and thus increase net income.

Earnings Management in Practice. A survey of auditors provides a summary of the approaches management uses to manipulate earnings. The most common approach is through the manipulation of expenses and losses (52% of the occurrences of an earnings management attempt) followed by the manipulation of revenues (22% of the occurrences) and opportunities around business combinations (13%), as illustrated in Exhibit 5.2.⁸

EXHIBIT 5.2 Earnings Management Approaches Used in Practice

- ③ Identify the four primary elements on the statement of net income, and explain the nature and functional approaches to classifying items.

Statement of Net Income Elements and Classifications

We begin our in-depth discussion of the income statement with the statement of net income, first discussing the elements and then presenting the format of the statement of net income.

Statement of Net Income Elements

The statement of net income includes four primary elements: revenues, expenses, gains, and losses. We discussed these elements in Chapter 2, and repeat them in Exhibit 5.3 on the following page.

⁸Mark Nelson, John Elliott, and Robin Tarpley, "How Are Earnings Managed? Example from Auditors," *Accounting Horizons*, Supplement 2003, pp. 17–35.

EXHIBIT 5.3 Statement of Net Income Elements⁹

Element	Definition	Example
Revenues	Revenues are the inflows or other enhancements of an entity's assets. Revenues also include the settlements of liabilities from delivering or producing goods, rendering services, or other activities that constitute the entity's ongoing major or central operations.	A clothing retailer records revenue when it sells clothing to customers because this transaction is an inflow that occurs from its major operations.
Expenses	Expenses are the outflows or other consumption of assets or incurrences of liabilities from delivering or producing goods, rendering services, or carrying out other activities that constitute the entity's ongoing major or central operations.	A clothing retailer records the cost of the clothing that it sold as an expense because this transaction is an outflow related to its major operations.
Gains	Gains are increases in equity from an entity's peripheral or incidental transactions. Gains also arise from all other transactions and other events and circumstances affecting the entity, except those that result from revenues or investments by owners.	A clothing retailer sells some of its cash registers. If it sells the registers for more than their book value, then this transaction results in a gain. This inflow would only be classified as revenue if the retailer were in the business of selling cash registers.
Losses	Losses are decreases in equity from an entity's peripheral or incidental transactions. Losses also arise from all other transactions and other events and circumstances affecting the entity, except those that result from expenses or distributions to owners.	A clothing retailer would record a loss on the sale of an investment in government bonds if these securities are sold for a price less than their carrying amount. It would be an expense if the company were in the business of buying and selling government bonds.

Statement of Net Income Classifications

Managers make several decisions regarding the presentation, format, and the elements to include on the income statement, such as:

- Aggregating and summarizing accounts into financial statement components or line items.
- Grouping, or classifying, the components.
- Providing subtotals and totals.

For example, a company could have several accounts for salary and benefit expenses in its general ledger. Management may decide to aggregate salaries and benefits with selling and other expenses and summarize them in a line item on the income statement called, "Selling, General, and Administrative Expenses." Firms aggregate and summarize expenses by either *nature* or *function*. The **nature** approach refers to classification by the source of the expense such as:

- payroll costs,
- cost of raw materials used, or
- depreciation expense.

The **functional** approach refers to classification by the use of the expense such as:

- cost of goods sold (manufacturing or merchandising function),
- sales expenses (selling function), or
- administration expenses (administrative function).

The choice between the presentation by nature or function depends on factors such as the industry and company experience. Management selects the presentation that is faithfully representative and most relevant. U.S. GAAP allows firms to choose to group revenues and expenses either by the nature or functional approach. However, the SEC requires reporting by function. Companies using a functional presentation must include specific disclosures in the financial statement notes about the nature of the expenses.

⁹From FASB's Concept Statement No. 6, *Elements of Financial Statements*. IFRS's similar definitions are in the IASB's *Conceptual Framework for Financial Reporting* (London: International Accounting Standards Board, 2010).

- 4 Explain the presentation of the statement of net income, including the multiple-step and single-step income statement formats.

Statement of Net Income Presentation

There are two acceptable income statement formats:

- **Multiple-step income statement format**, which reports several critical subtotals before computing income from continuing operations (when discontinued operations included) and net income.
- **Single-step income statement format**, which combines all revenues and gains and all expenses and losses into single categories.

The multiple-step income statement format provides more useful information for evaluating and predicting performance than the single-step net income statement because a multiple-step format clearly separates key performance measures. Income statement elements are commonly grouped by and subtotaled into key performance measures. Key performance measures on the statement of net income include:

1. Gross profit
2. Operating income
3. Income before tax (income from continuing operations before tax when discontinued operations included)
4. Income from continuing operations (when discontinued operations included)
5. Net income
6. Earnings per share

These subtotals help financial statement users evaluate past performance, predict future performance, and assess risks or uncertainties of achieving future cash flows.

Because a multiple-step income statement clearly separates key performance measures, over 85% of U.S. companies use this format.¹⁰ Therefore, we first focus our discussion on the multiple-step format and then describe the single-step format.

Multiple-Step Net Income Statement

The multiple-step income statement contains five common sections for reporting key performance measures. Exhibit 5.4 presents these five sections; we discuss each of these in more depth later in the chapter.

EXHIBIT 5.4 Five Common Sections of a Multiple-Step Net Income Statement

Section	Explanation
Operating Section	Reports the revenues and expenses related to the entity's principal operations. Also called major or central operations.
Non-Operating Section	Reports the revenues and expenses related to any secondary operations of the entity; also includes net financing costs (interest expense less interest income), unusual and/or infrequent items, and other gains and losses. Arises from peripheral or incidental transactions.
Income Tax Provision	Reports the income taxes related to continuing operations from all jurisdictions in which the entity operates (e.g., U.S. federal taxes, state taxes, and income taxes levied by foreign countries).
Discontinued Operations	Reports the results of operations for a component of an entity that has been disposed of by the end of the reporting period or that is held for sale at the end of the reporting period; also includes any gain or loss from the actual disposal of the component of the entity.
Net Income and Earnings per Share	Reports net income and several computations of the amount of earnings available to each shareholder in a company.

Exhibit 5.5 on the following page provides a sample multiple-step net income statement with the five sections highlighted by color as per Exhibit 5.4. The operating section is yellow and the non-operating section is green. The income tax provision is blue and discontinued operations is pink.

¹⁰Based on a survey reported in AICPA, *Accounting Trends and Techniques*—2010 (New York, NY: AICPA, 2010).

EXHIBIT 5.5 Multiple-Step Statement of Net Income

Puppini Products Statement of Net Income For the Year Ended December 31, 2018		
Sales	\$234,800	
Less: Cost of Goods Sold	(65,000)	
Gross Profit		\$169,800 ← Key performance measure 1
Operating Expenses		
<i>Selling Expenses:</i>		
Selling Expenses and Salaries	\$ 32,000	
Advertising Expense	14,000	(46,000)
<i>General and Administrative Expenses:</i>		
Office Supplies Expense	\$ 30,000	
Office Salaries Expense	10,000	
Depreciation Expense	5,000	(45,000)
Operating Income		\$ 78,800 ← Key performance measure 2
Other Revenues and Gains		
Interest Income	\$ 23,000	
Dividend Income	7,500	
Equity Investment Income	7,000	
Gain on Disposal of Plant Assets	4,700	42,200
Other Expenses and Losses		
Interest Expense	\$ (2,500)	
Loss on Asset Impairment	(1,500)	
Loss from Earthquake	(5,850)	(9,850)
Income from Continuing Operations Before Tax		\$ 111,150 ← Key performance measure 3
Income Tax Expense		(33,650)
Income from Continuing Operations		\$ 77,500 ← Key performance measure 4
Discontinued Operations		
Income from Operations of Discontinued Segment, net of tax of \$3,500	\$ 12,500	
Loss from Disposal of Discontinued Segment, net of tax of \$3,000	(9,800)	2,700
Net Income		<u>\$ 80,200</u> ← Key performance measure 5
Earnings Per Share:		
Income from Continuing Operations		\$1.94
Income from Discontinued Operations		0.07
Earnings Per Share		<u>\$2.01</u> ← Key performance measure 6

Condensed Statement of Net Income

Companies use condensed income statements when a large number of line items limits the usefulness of the net income statement. That is, too much detail distracts the user from identifying key measures and relationships on the net income statement. Rather than present a cluttered income statement, many companies will provide a condensed income statement and disclose the details of significant revenues and expenses in the footnotes or supporting schedules.

Exhibit 5.6 on the following page presents a sample condensed, multiple-step statement of net income for Puppini Products.

EXHIBIT 5.6 Condensed Income Statement

Puppini Products Statement of Net Income For the Year Ended December 31, 2018		
Sales	\$234,800	
Less: Cost of Goods Sold	<u>(65,000)</u>	
Gross Profit		\$169,800 ← Key performance measure 1
Operating Expenses		
Selling Expenses	\$ 46,000	
General and Administrative Expenses	<u>45,000</u>	
Total Operating Expenses		<u>(91,000)</u>
Operating Income		\$ 78,800 ← Key performance measure 2
Other Revenues/Gains and Expenses/Losses

Earnings Per Share:		
Income from Continuing Operations		\$1.94
Income from Discontinued Operations		<u>0.07</u>
Earnings Per Share		<u>\$2.01</u> ← Key performance measure 6

Exhibit 5.7 shows a sample footnote as an example of detailed footnotes or supplementary schedules needed to explain material income statement line items.

EXHIBIT 5.7 Footnote to Support Condensed Income Statement Line Items

Selling Expenses consist of the following:	
Selling Expenses and Salaries	\$32,000
Advertising Expense	<u>14,000</u>
Total Selling Expenses	<u>\$46,000</u>
General and Administrative Expenses consist of the following:	
Office Supplies Expense	\$30,000
Office Salaries Expense	10,000
Depreciation Expense	<u>5,000</u>
Total General and Administrative Expenses	<u>\$45,000</u>
Other Revenues/Gains and Expenses/Losses consist of the following:	
Interest Income	\$23,000
Interest Expense	(2,500)
Dividend Income	7,500
Equity Investment Income	7,000
Gain on Disposal of Plant Assets	4,700
Loss on Asset Impairment	(1,500)
Loss from Earthquake	<u>(5,850)</u>
Total Other Revenues and Expenses	<u>\$32,350</u>

Exhibit 5.8 presents the multiple-step income statement of *Kimberly-Clark Corporation*. The multiple-step income statement includes gross profit, operating profit, and income before taxes and equity interests. The company includes a separate section to highlight its equity investment income (called share of net income of equity companies), which is about 6% of net income in 2016. Although *Kimberly-Clark* is a vast company, its income statement is very concisely presented.

EXHIBIT 5.8 Income Statement, *Kimberly-Clark Corporation*, Financial Statement, December 31, 2016

Kimberly-Clark Corporation and Subsidiaries			
Consolidated Income Statement

Single-Step Statement of Net Income

Approximately 15% of reporting entities use a single-step format, which combines all revenues and gains and all expenses and losses into single categories.¹¹ Net income is arrived at in a “single step” by subtracting aggregate expenses and losses from aggregate revenues and gains. Exhibit 5.9 on the following page presents a sample single-step net income statement.

¹¹Based on a survey reported in AICPA, *Accounting Trends and Techniques*—2010 (New York, NY: AICPA, 2010).

EXHIBIT 5.9 Single-Step Statement of Net Income

Puppini Products Statement of Net Income For the Year Ended December 31, 2018		
Revenues and Gains		
Sales	\$234,800	
Interest Income	23,000	
Dividend Income	7,500	
Equity Investment Income	7,000	
Gain on Disposal of Plant Assets	4,700	
Total Revenues and Gains		\$ 277,000
Expenses and Losses		
Cost of Goods Sold	\$ 65,000	
Selling Expenses and Salaries	32,000	
Office Supplies Expense	30,000	
Advertising Expense	14,000	
Office Salaries Expense	10,000	
Depreciation Expense	5,000	
Interest Expense	2,500	
Loss on Asset Impairment	1,500	
Loss from Earthquake	5,850	
Income Tax Expense	33,650	
Total Expenses and Losses		199,500
Income from Continuing Operations		\$ 77,500
Discontinued Operations		
Income from Operations of Discontinued Segment, net of tax of \$3,500	\$ 12,500	
Loss from Disposal of Discontinued Segment, net of tax of \$3,000	(9,800)	2,700
Net Income		\$ 80,200
Earnings per Share:		
Income from Continuing Operations		\$ 1.94
Income from Discontinued Operations		0.07
Earnings per Share		\$ 2.01

There are several drawbacks to the single-step format that limit the transparency of information for financial statement users:

- It combines revenues and gains and expenses and losses without classification.
- It does not separate operating and non-operating items.
- It does not classify expenses by function, such as selling expenses and general and administrative expenses.
- It does not identify key performance measures.

Exhibit 5.9 illustrates the shortcomings of the single-step format. Puppini combines operating and non-operating items. Specifically, total revenues and gains include sales revenue (operating) and interest income (non-operating revenue). The single-step statement also fails to separate items by function. For example, the cost of goods sold is a critical part of Puppini's manufacturing function, and sales salaries and advertising expenses are part of the selling function. Finally, Puppini's net income statement does not include key performance measures such as gross profit and operating income.¹²

¹²The information needed to compute these key measures are in fact included on a single-step net income statement. However, additional computations are required by the financial statement user to derive gross profit and operating income, resulting in added complexity for the average statement reader.

Statement of Net Income Presentation: IFRS

Whereas IFRS allows the single-step or multiple-step formats, IFRS requires that companies report the following line items on the income statement:

1. Revenue (Sales revenues are also called Turnover)
2. Finance costs
3. Share of income/loss of associates
4. Tax expense
5. After-tax profit or loss on discontinued operations
6. Net Income, also called Net Profit or Net Loss¹³

IFRS reporters present additional line items and subtotals that each company's management decides are relevant to financial statement users' understanding of its operating performance. So, these will vary by company. For example, *Unilever Group*, a global Dutch consumer products and personal care company discussed later in Exhibit 5.11, does not report cost of goods sold on its income statement.

IFRS also requires companies to disclose the following other items if they are not presented on the income statement:

- Write-downs of inventories or of property, plant, and equipment, as well as reversals
- Restructuring costs
- Disposals of property, plant, and equipment items
- Disposals of investments
- Discontinued operations
- Litigation settlements
- Other reversals of provisions¹⁴

If a company classifies expenses by function, it will disclose additional information on the nature of expenses, including depreciation and amortization expense and employee benefits expense.

Using IFRS requirements, Exhibit 5.10 formats the financial information and presents the income statement for Puppini Products (from Exhibits 5.6 and 5.7).¹⁵ IFRS also requires line items or footnote disclosure for the gain on disposal of plant assets, \$4,700, and the loss on asset impairment, (\$1,500). Note the comments where IFRS requires certain line items and the similar key performance measures used under U.S. GAAP.

Exhibit 5.11 presents the IFRS income statement of *Unilever Group*. Its income statement includes the required lines: turnover (revenue), finance costs, income from associates, taxation, and net profit. It reported no discontinued operations. The income statement does not report operating expenses, which is unusual. Rather, *Unilever* details operating expenses and gross profit in note 3 of the financial statements. The first table in note 3 provides the cost of goods sold and selling and administrative expenses not found on the income statement. The next table includes more detail on operating expense items. Observe that the final table classifies many of these expenses by their nature, such as staff costs and raw materials and goods purchased for resale.

Now that we have discussed the overall presentation of the statement of net income, we turn to a more extensive discussion of each section of the multiple-step statement of net income.

¹³See IASC, *International Accounting Standard 1*, "Presentation of Financial Statements," Paragraph 82.

¹⁴*Ibid.*, Paragraph 98.

¹⁵In reformatting from U.S. GAAP to IFRS, we assume the amounts of all reported items are the same. In practice, the measurements could differ, as we will explain in subsequent chapters.

EXHIBIT 5.10 IFRS Income Statement (Based on Condensed Income Statement in Exhibit 5.6 and Footnote in Exhibit 5.7)

Puppini Products Statement of Profit and Loss For the Year Ended December 31, 2018		Comments
Sales	\$234,800	Required under IFRS
Less: Cost of Goods Sold	<u>(65,000)</u>	
Gross Profit	\$169,800	← Key performance measure
Operating Expenses		
Selling Expenses	\$ 46,000	
General and Administrative Expenses	<u>45,000</u>	
Total Operating Expenses	<u>(91,000)</u>	
Operating Profit	\$ 78,800	← Key performance measure
Finance Costs	(2,500)	Required under IFRS
Interest Income	23,000	
Income from Associates	7,000	Required under IFRS
Other Revenues/Gains and Expenses/ Losses	<u>4,850</u>	This item includes dividend income of \$7,500, gain on disposal of plant assets of \$4,700, loss on asset impairment of \$1,500, and loss from earthquake of \$5,850.
Profit before Tax	\$ 111,150	← Key performance measure
Income Tax Expense	<u>(33,650)</u>	Required under IFRS
Profit from Continuing Operations	\$ 77,500	← Key performance measure
Discontinued Operations, Profit	<u>2,700</u>	Required under IFRS
Net Profit	<u>\$ 80,200</u>	← Key performance measure; Required under IFRS
Earnings Per Share:		
Profit from Continuing Operations	\$ 1.94	Same under IFRS and U.S. GAAP
Profit from Discontinued Operations	<u>0.07</u>	
Earnings Per Share	<u><u>\$ 2.01</u></u>	← Key performance measure

- 5 Define income from continuing operations, including the components of operating income, non-operating income, and the income tax provision.

Income from Continuing Operations

In this section, we review several line items from a multiple-step income statement.

Income from continuing operations is income from portions of the business that are expected to continue into the future. Therefore, income from continuing operations does not include **discontinued operations**, which are portions of a company that have been disposed of or that are held for sale. Firms typically calculate income from continuing operations as the sum of three income statement items:

1. Operating income¹⁶
2. Non-operating items or non-operating revenues/gains and expenses/losses
3. Income tax provision

We discuss each of these items in the following sections.

¹⁶Operating income is often referred to as “earnings before interest and taxes” or EBIT.

Operating Income

Operating income includes revenues and expenses from the entity's principal operations. Exhibit 5.12 presents a typical operating income section of the income statement.

EXHIBIT 5.12 The Operating Section of the Statement of Net Income

Net Sales Revenue*
Less: <u>Cost of Goods Sold</u>
Gross Profit
Less: Selling Expenses
Less: <u>General and Administrative Expenses</u>
Operating Income

*Net Sales Revenue equals sales net of sales discounts and estimated returns and allowances.

Gross profit, net sales revenue less cost of goods sold, represents the amount of sales revenue available to cover operating and other expenses and contributes to overall net income that can potentially be distributed to shareholders. Financial statement users analyze the firm's gross profit to assess trends in profit margins.

Operating income is gross profit less all operating expenses (i.e., selling expenses and general and administrative expenses).¹⁷ Operating income is a key financial performance measure because it:

1. Reflects the results of the core operations of the business.
2. Assists a financial statement user in comparing different firms' operations before considering sources of financing and their costs.
3. Provides a measure of income available to all outside stakeholders. The entity's stakeholders are the providers of capital (both debt and equity holders) and the government (through taxation).

Non-Operating Income

Non-operating income items include gains and losses along with revenues and expenses resulting from a company's peripheral activities. Non-operating income items are less useful than operating income items for predicting future earnings. Consequently, companies separate non-operating income items from the operating items on the statement of net income. For example, a gain or loss on the sale of a specialized piece of equipment is not likely to reoccur and is not part of the core operations of the business.

Specific non-operating items include interest revenue, interest expense, dividend revenue, and gains and items with an *unusual nature* and/or *infrequency in occurrence*. Items with an **unusual nature** are transactions or events possessing a high degree of abnormality and unrelated—or only remotely related—to the company's ordinary activities. Items that are **infrequent in occurrence** are transactions or events not reasonably expected to reoccur in the foreseeable future. If a gain or loss results from a transaction that is either unusual in nature and/or infrequent in occurrence, then companies report the event as a separate line item within income from continuing operations or disclose the item in the notes. Examples of transactions or events that are unusual or infrequent include:

- Restructuring charges.
- Losses on asset impairments.

¹⁷U.S. GAAP do not define operating income.

- Gains and losses on disposals of assets.
- Losses due to natural disasters such as an earthquake or hurricane.

Typically, companies sum operating income with the non-operating items to determine **income before tax**.

Income Tax Provision

The **income tax provision** reports the tax expense determined by considering the income tax effects of operating in all jurisdictions. Specifically, it includes U.S. federal, state, local, and foreign income taxes.

The income tax provision does not include other types of taxes. For example, payroll tax and property taxes are included in operating expenses. Also, note that companies report discontinued operations net of tax. Consequently, companies do not report the income tax expense associated with discontinued operations in the income tax provision.

Companies deduct the income tax provision from income before taxes to report **net income**. For many companies, net income is the final line on the income statement. As we address in the sections that follow, if companies report any discontinued operations, they include these gains, losses, and income following net income. As a result, income after the income tax provision is then called **income from continuing operations**, and the line item before income tax expense is called income from continuing operations before tax.

- 6 Demonstrate the accounting for a discontinued operation, including the criteria used to determine a discontinued operation and presentation on the statement of net income.

Discontinued Operations

Discontinued operations are portions of the business that a company has disposed of or is in the process of disposing of. The discontinued operations section of the statement of net income includes any income from *components of an entity* or a group of components of an entity that have been disposed of, abandoned during the reporting period, or are classified as held for sale as of the end of the reporting period.¹⁸ We will identify the characteristics of discontinued operations before examining the reporting requirements.

Characteristics of a Discontinued Operation

A **component of an entity** has three main characteristics: It is (1) a portion of the entity (2) comprising operations and cash flows (3) that can be clearly distinguished, operationally and for financial reporting purposes, from the rest of the entity. A component of an entity can be:

- a reportable segment,
- an operating segment,
- a reporting unit,
- a subsidiary, or
- an asset group.

That is, a company must be able to separate the discontinued component's operations and cash flows from the continuing operations' earnings and cash flows. It should also be able to separately report discontinued operations in its financial statements.

After a company has determined that a portion of a business is a component of an entity or a group of components of an entity, the company must also demonstrate that the disposal represents a strategic shift that has or will have a major effect on the entity's operations and financial results. For example, the disposal of a major line of business would constitute a strategic shift that would have a major impact on the entity.

¹⁸A discontinued operation may also be composed of a business or nonprofit activity.

Discontinued Operations Reporting Requirements

Companies report income from discontinued operations and continuing operations separately. The separate reporting provides financial statement users with a measure of income from continuing operations, which is a preferred basis for predicting future performance. Clearly, a discontinued portion of a business will no longer generate future earnings and cash flows. Companies report three main types of income, gain, or loss under discontinued operations on the income statement:

1. Income or loss from operations of discontinued segment, unit or group, net of tax.
2. Loss on initial remeasurement of net assets held for sale to fair value less disposal costs, net of tax. In subsequent remeasurements, a loss or gain up to previously recognized losses can be reported.
3. Gain or loss on disposal of assets or disposal group(s) constituting the discontinued operation, net of tax.

Companies present the operating income, loss, or gain from the discontinued operation and income from continuing operations separately. If the company has *sold* the discontinued operation, it includes the operating income from the beginning of the reporting period to the date of disposal in the discontinued operations section of the statement of net income. If the company is *holding* the discontinued operation for sale as of the end of the reporting period, it presents the operating income from the entire reporting period in the discontinued operations section of the statement of net income. For example, assume a company earned \$22 million of net income of which \$3 million was from a loss on discontinued operations. The company would report income from continuing operations of \$25 million and a \$3 million loss from discontinued operations.

When a company decides to discontinue an operation, it remeasures the assets and liabilities of that operation to their fair values less selling costs if this amount is lower than their carrying value. Because the assets and liabilities are being held for sale, their value in the market is the most relevant value to financial statement users.

In the first period that the company remeasures the assets and liabilities of the operation, only a loss is permitted. If a write-down is necessary, the loss is equal to the difference between the book value of the net assets and their fair value net of selling costs. If the company writes down the net assets to fair value net of selling costs in one period and still holds the net assets in the next period, the company will report a gain in the subsequent period if the fair value net of selling costs increased. However, the write-up cannot result in a carrying value greater than the carrying value of the net assets before the write-down.¹⁹

When the company sells the discontinued operation, there could be a realized gain or loss on the sale. Companies present all amounts on the income statement related to discontinued operations *net of tax*. **Net of tax** means that the amount of income, gain, or loss, reported includes any income tax effects. As noted earlier, the income tax expense (or benefit) related to discontinued operations is not included in the tax provision related to continuing operations.

Companies are also required to disclose the following other income and expense items related to discontinued operations in the footnotes to the financial statements:

1. Pre-tax income (loss)
2. Pre-tax income (loss) attributable to the company's shareholders
3. Major line items to arrive at pre-tax income (loss) such as revenues and cost of sales, depreciation, and interest expense
4. Reconciliation of the major items making up the pre-tax profit (loss) disclosed in the notes to financial statements to the after-tax profit (loss) presented in the income statement
5. Carrying amounts of the major classes of assets and liabilities included as part of a discontinued operations and classified as held for sale
6. Gain or loss on remeasurement of net assets held for disposal

¹⁹See FASB ASC 205-20-45-3 and FASB ASC 360-10-35-40 for the related authoritative literature. Also, we discuss this issue in more detail in Chapter 12.

7. Reconciliation of the carrying amounts of major classes of assets and liabilities disclosed in the notes to financial statements to total assets and liabilities classified as held for sale on the balance sheet
8. Either total operating and investing cash flows related to the discontinued operation, or the depreciation, amortization, capital expenditures, and significant operating and investing non-cash items associated with the discontinued operation.

For example, *General Electric's* earnings included an after-tax loss of \$954 million on discontinued operations of its financial services business in 2016.²⁰ Of this amount, \$1,252 million was the after-tax loss on the disposal of the discontinued component.

EXAMPLE 5.1

Reporting Discontinued Operations When Company Is Holding the Discontinued Operation at the End of the Year

PROBLEM: ChooChoo, Inc. reported pre-tax income from all of its operations (including its toy car division) of \$30 million for the year ended December 31, 2018. On August 1, 2018, ChooChoo committed to dispose of its toy car division. This division qualifies as a component of an entity that should be reported as a discontinued operation. The operating income related to this division for 2018 was \$4 million. The carrying value of the toy car division exceeded the fair value less selling costs by \$350,000. ChooChoo's income tax rate is 35% on all income. Prepare a partial statement of net income for ChooChoo for 2018, beginning with income from continuing operations before tax.

SOLUTION: Income from continuing operations before tax only relates to income from continuing operations; thus, ChooChoo would report \$26 million, which is \$30 million less the \$4 million associated with the discontinued operation. Income tax is 35% of \$26 million (\$9.1 million).

ChooChoo should report \$2.6 million of income from discontinued operations, which is the \$4 million less tax expense of \$1.4 million ($\$4 \text{ million} \times 35\%$). In addition, there is an after-tax remeasurement loss of \$227,500, which is the total loss of \$350,000 less the tax benefit of \$122,500 ($\$350,000 \times 35\%$).

ChooChoo, Inc.		
Partial Statement of Net Income		
For the Year Ended December 31, 2018		
Income from Continuing Operations Before Tax	\$26,000,000	
Income Tax Expense	(9,100,000)	
	\$16,900,000	\$16,900,000
Discontinued Operations		
Income from Operations of Discontinued Operations, net of tax of \$1,400,000	2,600,000	
Unrealized Loss on Remeasurement of Net Assets, net of tax of \$122,500	(227,500)	
	2,372,500	2,372,500
Net Income		\$ 19,272,500

We now extend this example by assuming that ChooChoo sells the toy car division in the following year.

²⁰See the General Electric Company's annual report at http://www.ge.com/ar2016/assets/pdf/GE_AR16.pdf

EXAMPLE 5.2 Reporting Discontinued Operations with Disposition during the Year

PROBLEM: ChooChoo has pre-tax profit from all operations in 2019 of \$32 million. This amount includes a \$5 million operating loss from the toy car division incurred between the beginning of the year and August 15, the disposal date of the division. The \$32 million profit does not include a pre-tax gain on the sale of the toy car division of \$2 million. Prepare a partial statement of net income for ChooChoo for 2019, beginning with income from continuing operations before tax.

SOLUTION: Income from continuing operations before tax relates only to income from continuing operations; thus, ChooChoo reports \$37 million, which is \$32 million with the \$5 million loss associated with the discontinued operation added back in. Income tax is 35% of \$37 million (\$12.95 million).

ChooChoo reports two income classifications in the discontinued operation section:

1. An operating loss of \$3.25 million, which is the \$5 million loss less the tax benefit of \$1.75 million ($\$5 \text{ million} \times 35\%$).
2. A gain from the disposal of \$1.3 million, which is the \$2 million pre-tax gain, less the associated tax expense of \$0.7 million ($\$2 \text{ million} \times 35\%$).

ChooChoo, Inc.		
Partial Statement of Net Income		
For the Year Ended December 31, 2019		
Income from Continuing Operations Before Tax	\$ 37,000,000	
Income Tax Expense	<u>(12,950,000)</u>	
Income from Continuing Operations		\$24,050,000
Discontinued Operations		
Loss from Operations of Discontinued Operations, net of tax benefit of \$1,750,000	(3,250,000)	
Gain from Disposal of Discontinued Segment, net of tax of \$700,000	<u>1,300,000</u>	
Loss on Discontinued Operations		<u>(1,950,000)</u>
Net Income		<u>\$22,100,000</u>

After a company reports a component of an entity as a discontinued operation, it must separately report the results of operations of the discontinued component in the comparative statements of net income for all prior periods.²¹

Exhibit 5.13 illustrates *General Electric Company's* presentation of discontinued operations on the statement of net income and in additional footnote disclosures. The income from discontinued operations changed significantly over the three years presented with a loss of \$954 million in 2016, a loss of \$7,495 million in 2015, and income of \$5,855 million in 2014.²² In Note 2, *General Electric* provides more information about the portions of its businesses that it defined as discontinued operations, primarily its financial services businesses in GE Capital. The note further details the income related to the two classifications of total income or loss from discontinued operations: earnings or loss from discontinued operations, net of tax, and the gain or loss on disposal of the component, net of tax.

Companies often dispose of **individually significant operations**, operations that do not meet the definition of a discontinued operation. Because these disposals can be major and the amounts involved large, a company must disclose the pre-tax profit (loss) and the amount attributable to its shareholders.

²¹We discuss prior-period adjustments in Chapter 15. In addition to the impact on the net income statement, companies report assets that are classified as components of an entity held for sale separately on the balance sheet. We discuss this in detail in Chapter 12.

²²See General Electric Company's annual report at http://www.ge.com/ar2016/assets/pdf/GE_AR16.pdf

EXHIBIT 5.13 Discontinued Operations, *General Electric Company*, Financial Statements and Notes, December 31, 2016**Excerpt from Net Income Statement**

General Electric Company and Consolidated Affiliates Statement of Earnings			
For the years ended December 31 (In millions; per-share amounts in dollars)	2016	2015	2014
EARNINGS FROM CONTINUING OPERATIONS	\$9,494	\$1,700	\$9,490
Earnings (loss) from discontinued operations, net of taxes (Note 2)	<u>(954)</u>	<u>(7,495)</u>	<u>5,855</u>
NET EARNINGS	<u>\$8,540</u>	<u>(\$5,795)</u>	<u>\$15,345</u>

Excerpt from Note 2**Discontinued Operations**

Discontinued operations primarily relate to our financial services businesses as a result of the GE Capital Exit Plan and include our Consumer business, most of our CLL business, our Real Estate business and our U.S. mortgage business (WMC). All of these operations were previously reported in the Capital segment. Results of operations, financial position and cash flows for these businesses are separately reported as discontinued operations for all periods presented.

(In millions)	2016	2015	2014
OPERATIONS			
Total revenues and other income (loss)	\$ 2,968	\$23,003	\$31,136
Earnings (loss) from discontinued operations before income taxes	\$ (162)	\$ 887	\$ 6,615
Benefit (provision) for income taxes	<u>460</u>	<u>(791)</u>	<u>(776)</u>
Earnings (loss) from discontinued operations, net of taxes	<u>\$ 298</u>	<u>\$ 96</u>	<u>\$ 5,839</u>
DISPOSAL			
Gain (loss) on disposal before income taxes	\$ (750)	\$ (6,612)	\$ 14
Benefit (provision) for income taxes ^(a)	<u>(502)</u>	<u>(979)</u>	<u>1</u>
Gain (loss) on disposal, net of taxes	<u>\$ (1,252)</u>	<u>\$ (7,591)</u>	<u>\$ 15</u>
Earnings (loss) from discontinued operations, net of taxes ^{(b)(c)}	<u>\$ (954)</u>	<u>\$ (7,495)</u>	<u>\$ 5,854</u>

^(a) GE Capital's total tax benefit (provision) for discontinued operations and disposals included current tax benefit (provision) of \$945 million, \$(6,834) million and \$(925) million for the years ended December 31, 2016, 2015 and 2014, respectively, including current U.S. Federal tax benefit (provision) of \$1,224 million, \$(6,245) million and \$80 million for the years ended December 31, 2016, 2015 and 2014, respectively, and deferred tax benefit (provision) of \$(988) million, \$5,073 million and \$154 million for the years ended December 31, 2016, 2015 and 2014, respectively.

^(b) The sum of GE industrial earnings (loss) from discontinued operations, net of taxes, and GE Capital earnings (loss) from discontinued operations, net of taxes, after adjusting for earnings (loss) attributable to noncontrolling interests related to discontinued operations, is reported within GE industrial earnings (loss) from discontinued operations, net of taxes, on the Consolidated Statement of Earnings (Loss).

^(c) Earnings (loss) from discontinued operations attributable to the Company, before income taxes, was \$(911) million, \$(6,038) million, and \$6,472 million for the years ended December 31, 2016, 2015, and 2014, respectively.

Discontinued Operations: IFRS

We first describe the characteristics of discontinued operations under IFRS, noting differences with U.S. GAAP, and then outline the specific reporting requirements.

Characteristics of a Component of an Entity: IFRS. Similar to U.S. GAAP, IFRS defines a discontinued operation as a component of a company that it has either disposed of or classified as held for sale. However, IFRS defines a component of discontinued operations differently than U.S. GAAP. Specifically, IFRS requires that a discontinued operation represent a:

- Separate major line of business or geographical area of operations, or
- Subsidiary acquired exclusively with a view to resale.

Additionally, IFRS requires that the discontinued operation be part of a single, coordinated plan to dispose of a separate major line of business or geographical area of operations.²³

EXAMPLE 5.3 IFRS Discontinued Operations

PROBLEM: Iron Horse Manufacturing Corporation, a maker of train engines and cars, is contemplating disposing of its Coach Car Company, which is one of its primary business segments. It plans to focus on engine manufacturing, where it has experienced significant growth. Iron Horse is considering the sale of Coach Car within the next 18 months but has not yet made a firm commitment. Would the disposal of Coach Car qualify as a discontinued operation under IFRS?

SOLUTION: The disposal of the Coach Car would not qualify as a discontinued operation under IFRS. Even though Coach Car meets the requirement of being a primary business segment, the discontinued operation is not a component of an entity held for sale and has not been disposed because Coach Car is not yet held for sale. It also appears that Iron Horse's management has not developed a plan to dispose of Coach Car.

Discontinued Operations Reporting Requirements: IFRS. IFRS income statement reporting is similar to U.S. GAAP. Disclosures under U.S. GAAP and IFRS differ, as noted in Exhibit 5.14.

EXHIBIT 5.14 Criteria and Reporting for Discontinued Operations: U.S. GAAP and IFRS

	U.S. GAAP	IFRS
Criteria for Determining a Discontinued Operation		
What is a discontinued operation?	Component of an entity held for sale or one that has been disposed.	Same as U.S. GAAP
What is the definition of a component of an entity?	1. A portion of the entity 2. comprising operations and cash flows 3. that can be clearly distinguished, operationally and for financial reporting purposes, from the rest of the entity.	1. Represents a separate major line of business or geographical area of operations or 2. A subsidiary acquired exclusively with a view to resale
Does the discontinued operation have to represent a strategic shift that has or will have a major impact on the entity?	Yes, it must represent a strategic shift.	Not a requirement under IFRS
Does the discontinued operation have to be part of a single coordinated disposal plan?	Not a requirement under U.S. GAAP	Yes, it must be part of a single, coordinated plan to dispose of a separate major line of business or geographical area of operations.

²³IASB, *International Financial Reporting Standard 5*, "Non-current Assets Held for Sale and Discontinued Operations" (London, UK: International Accounting Standards Board, 2004, Revised), Paragraph 32.

	U.S. GAAP	IFRS
Reporting Requirements		
How is the discontinued operation reported on the income statement?	The operations and cash flows of the component have been or will be removed from the ongoing operations of the entity as a result of the disposal transaction.	Same as U.S. GAAP
What additional income statement disclosures related to discontinued operations are required?	<ul style="list-style-type: none"> - Pre-tax income (loss) - Pre-tax income (loss) attributable to the company's shareholders - Major line items to arrive at pre-tax income (loss) - Reconciliation of the major items making up the pre-tax profit (loss) disclosed in notes to the after-tax profit (loss) presented in the income statement - Carrying amounts of the major classes of assets and liabilities included in discontinued operations and classified as held for sale - Gain or loss on remeasurement of net assets held for disposal - Reconciliation of the carrying amounts of major classes of assets and liabilities disclosed in notes to total assets and liabilities classified as held for sale on the balance sheet - Either total operating and investing cash flows related to the discontinued operation, or the depreciation, amortization, capital expenditures, and significant operating and investing noncash items associated with the discontinued operation 	<ul style="list-style-type: none"> - Revenues - Expenses - Income taxes on operations and income taxes on gains (losses) - Income taxes on gain (loss) on remeasurement related to discontinued operations - Pre-tax income (loss) - Gain (loss) on remeasurement for discontinued operations

IFRS reporters include any profit or loss related to discontinued operations on the income statement, net of taxes, on one line. Only one line is reported, and the amount reported is the sum of:

- Income or loss from discontinued operations, net of tax.
- Unrealized loss from remeasurement of net assets held for sale to lower of carrying value and fair value less disposal costs, net of tax.
- Realized gain or loss on disposal of assets or disposal group(s) constituting the discontinued operations, net of tax.

- 7 Describe the presentation of net income, noncontrolling interest, and earnings per share on the statement of net income.

Net Income, Noncontrolling Interest and Earnings per Share

Companies present net income on the income statement after discontinued operations. We discuss net income and two other items related to net income—*noncontrolling interest* and *earnings per share*—in this section.

Net income is the sum of the income from continuing operations and income, gains, or losses from discontinued operations. Companies commonly separate net income into net income attributable to their stockholders and net income attributable to the *noncontrolling interests*. Companies close net income attributable to their shareholders to retained earnings.

There is a **noncontrolling interest** when one company controls another company (e.g., a subsidiary) but owns less than 100% of its voting shares. The controlling company adds all of the subsidiary's income to its own because it controls the subsidiary's ability to generate income. However, because it does not own 100% of the subsidiary, the controlling company must identify

the amount that is attributable to noncontrolling owners. The noncontrolling interest line item on the income statement represents the income attributable to the portion of a subsidiary owned by others.²⁴ The portion of income (loss) attributed to the noncontrolling interest is deducted (added) on the income statement to arrive at income attributed to the controlling interest.

Exhibit 5.8 shown previously presents the net income statement of *Kimberly-Clark Corporation*. *Kimberly-Clark* reported \$2,219 million of net income in 2016.²⁵ Of this, \$2,166 million is attributable to its shareholders and will be added to retained earnings, and \$53 million is attributable to the noncontrolling interests.

Earnings per share represents the amount of earnings assigned to each outstanding share of the company's common stock. Companies report earnings per share for continuing operations, discontinued operations, and net income in a supplemental section of the income statement, directly below net income or loss for the period. Companies report earnings per share on both a basic and diluted basis.²⁶

- 8 Discuss the statement of comprehensive income.

The Statement of Comprehensive Income

So far we have focused our discussion on the statement of net income, which does not include other comprehensive income (OCI). Companies may choose to report comprehensive income in one statement (usually called the statement of comprehensive income) or in two consecutive statements (the statement of net income and the statement of comprehensive income). The primary difference is whether a firm presents the income statement(s) on one page or two. In this section, we outline the elements presented and the format used for the statement of comprehensive income; note that these areas are consistent between the one- and two-statement alternatives.

Companies presenting in *two* statements are required to include the statement of comprehensive income immediately after the statement of net income (i.e., on the next page of the financial report). The statement of comprehensive income begins with net income and then presents the components of other comprehensive income, ultimately arriving at a figure for comprehensive income. Firms presenting *one* statement of comprehensive income combine the statement of net income with a presentation of OCI.

Statement of Comprehensive Income Elements

The Codification does not clearly define the concepts of net income versus OCI. However, U.S. GAAP provides a full list of the elements that should be included in OCI.²⁷ The key line items consist of:

1. Unrealized gains and losses from the available-for-sale portfolio of debt investment securities and derivatives classified as cash flow hedges.
2. Foreign currency translation gains and losses.
3. Unrecognized pension costs (benefits) from adjustments needed to bring the accounting pension asset or liability to the funded status of the pension plan.²⁸

²⁴We briefly discuss noncontrolling interest in this chapter because it is a common item reported on the income statement. The accounting for the ownership and control of other companies is commonly covered in advanced accounting courses.

²⁵Source: Kimberly-Clark Corporation's Annual report at http://www.cms.kimberly-clark.com/umbracoimages/UmbracoFileMedia/KMB-2016-10K_umbracoFile.pdf

²⁶We cover the computation of earnings per share in Chapter 20.

²⁷The U.S. GAAP list is found in FASB ASC 220-10-45-10A.

²⁸Unrealized gains and losses from available-for-sale investments are covered in Chapter 16. Derivatives and foreign currency translation gains and losses are typically covered in an advanced accounting course. Pensions are covered in Chapter 19.

The items reported as other comprehensive income typically have at least one of these three characteristics:

1. There is a low probability of cash realization in the short run.
2. These items are transitory components of income; excluding them from the income statement reduces earnings volatility.
3. The majority of these items are not part of the entity's normal operations.

Although not included in the net income statement, the disclosure of OCI items significantly improves the usefulness of the financial statements. For example, the disclosure of the unrealized gain or loss on available-for-sale investments can enhance an analyst's ability to understand how effectively a company is managing its investment portfolio. This information also assists the analyst in identifying potential realized gains or losses on future disposals of the investments. Similarly, OCI will provide information regarding future realized gains or losses from the sale of assets held by foreign subsidiaries or the liquidation of significant pension obligations.

Statement of Comprehensive Income Elements: IFRS

The presentation of the statement of comprehensive income is similar under U.S. GAAP and IFRS—but the line items can vary, depending on whether the standard setter allows certain items to go through OCI rather than net income.²⁹ In addition to the three items that go through other comprehensive income under U.S. GAAP, IFRS also allows companies to revalue long-lived assets and include the upward revaluations in OCI.

Statement of Comprehensive Income Format

We established that companies can present the elements of OCI in a separate statement or combined with the elements of net income into one statement. In the two-statement approach, companies first present the statement of net income, followed by a separate statement of comprehensive income. The statement of comprehensive income begins with net income and then presents the elements of OCI to arrive at comprehensive income for the period. In the one-statement approach, companies first present the elements of net income followed by the elements of OCI, netting to the comprehensive income for the period.

Companies may apply the tax effects to the OCI items in total or to each individual item comprising other comprehensive income. The majority of companies use the two-statement approach. With the two-statement approach, net income retains its emphasis as the primary income measure.

As we will discuss in Chapter 15, the standards require companies to report the accumulated balance of other comprehensive income in the stockholders' equity section of the balance sheet. The codification presents examples of the income statements under both approaches. We extend the Puppini Products income statement example from Exhibit 5.6 to include other comprehensive income. Exhibit 5.15 presents the two-statement approach, and Exhibit 5.16 presents the one-statement approach. Notice that net income and other comprehensive income are the same in both exhibits; only the presentation and formatting differ.

²⁹The IFRS list of items in comprehensive income is found in IASC, *International Accounting Standard 1*, "Presentation of Financial Statements," Paragraph 7.

EXHIBIT 5.15 Statements of Net Income and Comprehensive Income:
Two-Statement Approach

Puppini Products Statement of Net Income For the Year Ended December 31, 2018		
Sales	\$234,800	
Less: Cost of Goods Sold	<u>(65,000)</u>	
Gross Profit		\$169,800
Operating Expenses:		
Selling Expenses	\$ 46,000

		<u>(5,400)</u>
Other Comprehensive Income (Loss)		<u>(2,300)</u>
Comprehensive Income		<u>\$ 77,900</u>

Exhibits 5.8 and 5.17 illustrate *Kimberly-Clark's* use of the two-statement approach. Note that its statement of comprehensive income begins with net income from its statement of net income in Exhibit 5.8. Two main other comprehensive income items in 2016 are \$(107) million of loss from foreign currency translation adjustments and loss of \$(113) million from postretirement adjustments. Each of these items is reported net of tax. In all years presented, *Kimberly-Clark's* comprehensive income attributable to stockholders was lower than its net income.

- 9 Describe the components of and the reporting requirements for the statement of stockholders' equity.

The Statement of Stockholders' Equity

The **statement of stockholders' equity** is a financial statement that summarizes the changes in stockholders' equity during a period and includes the following accounts:

1. Contributed capital accounts (e.g., common stock, preferred stock, and paid-in capital in excess of par) related to investments by owners
2. Retained earnings, including net income (loss) and distributions to owners
3. Accumulated other comprehensive income, also called reserves under IFRS³⁰
4. Treasury stock
5. Noncontrolling interests

Although the balance sheet reports the final balances in each of these accounts, the statement of stockholders' equity provides an analysis of the changes in these accounts for the year.

Stockholders' Equity Requirements

Although U.S. GAAP does not require a statement of stockholders' equity, it is required by the SEC. Thus, U.S. non-public companies are not required to provide the statement of stockholders' equity with their financial statements. However, most non-public companies do include a statement of stockholders' equity on a voluntary basis.

Statement of Stockholders' Equity Accounts

In general, changes in contributed capital accounts are related to additional investments by equity investors and purchases and disposals of treasury stock by the entity. The net income (or loss) of the entity along with dividend declarations result in changes to the entity's retained earnings. Items included in other comprehensive income close into accumulated other comprehensive income.

³⁰Chapter 15, "Accounting for Stockholders' Equity," discusses these accounts in detail.

Interview

**GREG TIERNEY,
VICE PRESIDENT,
FINANCE, PLANNING &
ANALYSIS AND
CORPORATE CONTROLLER
MILLERCOORS »**

Greg Tierney

Greg Tierney is Chief Financial Officer at MillerCoors, the U.S. business unit of the Molson Coors Brewing Company. He is responsible for establishing strong financial management and commercial disciplines for the company and reporting financial performance to its shareholders. Prior to his current role, Greg served as MillerCoors' vice president of financial planning and corporate controller.

- 1 How is the income statement used in projecting future earnings and cash flows at MillerCoors?

We analyze our income statement line items to understand what trends drive our business performance. Being able to forecast drivers of performance—sales volumes, input costs, product mix, pricing, marketing investments, general and administrative spending—is key to projecting future earnings. Given that earnings are a significant component of cash flows, increases in net income drive higher operating cash flows. While, in general, strong earnings lead to strong cash flow, other items impact cash flow. Non-cash income statement items such as reserve adjustments, depreciation, or amortization do not impact the current period's cash flows, although capital expenditures do. If the company requires significant capital investment to generate earnings, such as building a new bottling plant, overall cash flow would be negatively impacted at the time of the addition, whereas the income statement will reflect the charge over time as the asset is depreciated. Working capital analysis is also critical for cash flow projections. For example, a significant lengthening of receivables (or days sales outstanding) could negatively impact operating cash flow in that period.

- 2 What are the most critical estimates used in measuring and reporting revenues and expenses at MillerCoors?

Revenue recognition at MillerCoors is fairly straightforward. We generally recognize revenue at the time of shipment, when the significant risks and rewards of ownership are transferred to the customer. Some expenses, however, require estimates and assumptions. Among the most significant are employee benefit-related assumptions such as pension and post-retirement medical expenses, as well as incentive compensation expenses where liabilities are tied to the attainment of performance targets. We also make estimates for inventory valuation related to obsolescence.

- 3 Describe the importance of separating income from continuing operations from other, nonrecurring items. Briefly discuss any nonrecurring items reported by MillerCoors in recent years.

Nonrecurring gains or losses that are infrequent and unusual by definition are not expected to recur. Separately reporting these items provides the financial statements reader with a clear perspective of the business's core operations and underlying performance. Similarly, removing income from discontinued operations allows the reader to understand the profitability of remaining business operations.

MillerCoors has reported several unusual and nonrecurring items. Recently, these included changes to employee benefit plans, as well as the impairment of intangible assets and material one-time charges related to the 2008 formation of MillerCoors as a joint venture between SABMiller and Molson Coors.

- 4 What primary factors affect earnings quality at MillerCoors?

Underlying business results, or ongoing activities, are the best measure of earnings quality. One-time events can skew earnings, either positively or negatively, on a period-by-period basis; however, these items are poor indicators of the core operations of the business. A one-time gain related to the sale of an asset or a one-time charge for restructuring will affect current-period earnings but has little bearing on future results. Adjusting for these items gives managers and the investment community a more accurate picture of how a company is performing and a better estimate of future performance. In external communications, we identify unusual items to give greater transparency and ensure that the analyst community understands the impact of these items.

- 5 How do the components of other comprehensive income affect the judgment of an informed financial statement user, and what common elements of comprehensive income does MillerCoors report?

Gains and losses appear in other comprehensive income (OCI) when they have not yet been realized in net income. This classification gives an understanding of the magnitude of charges that will have a future impact on earnings. MillerCoors reports pension and postretirement benefit gains and losses, as well as unrealized gains or losses on derivative instruments, as OCI.

Discussion Questions

1. Consider Greg Tierney's response to the second interview question in which he describes estimates used at MillerCoors LLC in preparation of the company's income statement. What other significant estimates impact the income statement?
2. Greg Tierney mentions that the other comprehensive income (OCI) classification assists users in understanding the magnitude of these charges and the future impact on earnings. Explain how OCI disclosures provide information about the future impact on earnings. «

Exhibit 5.18 illustrates the equity components changed by net income, comprehensive income, and transactions with owners. Net income increases retained earnings whereas net losses and dividends decrease retained earnings. Also, positive other comprehensive income will increase accumulated other comprehensive income, and negative other comprehensive income (loss) will decrease accumulated other comprehensive income. Finally, share issuances and the sale of treasury shares increase contributed capital, while share repurchases decrease it.

EXHIBIT 5.18 Income and Transactions with Owners in the Statement of Stockholders' Equity

Item		Component of Equity in Statement of Stockholders' Equity
Net Income (also called Net Profit or Net Loss)	Closes to	Retained Earnings
+/- Other Comprehensive Income	Closes to	Accumulated Other Comprehensive Income
= Comprehensive Income		
Dividends Declared	Closes to	Retained Earnings
Share Issuances or Repurchases	Accumulates in	Contributed Capital (or Retained Earnings for Certain Treasury Stock Transactions)

EXAMPLE 5.4 Computation of Stockholders' Equity

PROBLEM: Starling Corporation started the year on January 1 with the following balances in stockholders' equity on its balance sheet.

Retained earnings	\$ 876,000
Common stock, \$1 par (100,000 shares)	\$ 100,000
Additional paid-in-capital	\$ 342,000
Accumulated other comprehensive income	\$ 17,000

It reported the following income items and transactions with owners during the current year:

Net loss	\$ (29,000)
Dividends declared	\$ 5,000
Issued 20,000 shares of common stock for \$400,000	\$ 400,000
Unrecognized pension costs, net of taxes	\$ (12,000)
Unrealized gains on available-for-sale investments, net of taxes	\$ 68,000
Foreign currency translation adjustments—loss, net of taxes	\$ (34,000)

What is the amount of Starling's retained earnings, contributed capital, and accumulated other comprehensive income at the end of the year?

Use the following template to prepare a Statement of Stockholders' Equity and answer the questions.

	Common Stock	Additional Paid-in-Capital	Retained Earnings	Accumulated Other Comprehensive Income	Total
Balance, January 1	_____	_____	_____	_____	_____
Net loss	_____	_____	_____	_____	_____
Dividends Declared	_____	_____	_____	_____	_____
Issuance of Common Stock	_____	_____	_____	_____	_____
Other Comprehensive Income, net of taxes	_____	_____	_____	_____	_____
Balance, December 31	_____	_____	_____	_____	_____

SOLUTION: We first identify the component of stockholders' equity associated with each line item and transactions with owners.

Item	Component of Stockholders' Equity
Net loss	Retained Earnings
Dividends declared	Retained Earnings
Issued 20,000 shares of common stock for \$400,000	Par value in Common Stock, Remaining amount in Additional Paid-in-Capital
Unrecognized pension costs, net of taxes	Other Comprehensive Income, then to Accumulated Other Comprehensive Income
Unrealized gains on available-for-sale investments, net of taxes	Other Comprehensive Income, then to Accumulated Other Comprehensive Income
Foreign currency translation adjustments—loss, net of taxes	Other Comprehensive Income, then to Accumulated Other Comprehensive Income

Next, we place the beginning balances in the template and add the income items and transactions with owners in the appropriate columns. We compute other comprehensive income as follows:

Unrecognized Pension Costs, net of taxes	\$ (12,000)
Unrealized Gains on Available-for-sale Investments, net of taxes	68,000
Foreign Currency Translation Adjustments—Loss, net of taxes	<u>(34,000)</u>
Other Comprehensive Income, net of taxes	<u>\$ 22,000</u>

Finally, we compute the totals across rows and down columns.

	Common Stock	Additional Paid-in-Capital	Retained Earnings	Accumulated Other Comprehensive Income	Total
Balance, January 1	\$100,000	\$342,000	\$876,000	\$17,000	\$1,335,000
Net loss			(29,000)		(29,000)
Dividends Declared			(5,000)		(5,000)
Issuance of Common Stock	20,000	380,000			400,000
Other Comprehensive Income, net of taxes				<u>22,000</u>	<u>22,000</u>
Balance, December 31	<u>\$120,000</u>	<u>\$722,000</u>	<u>\$842,000</u>	<u>\$39,000</u>	<u>\$1,723,000</u>

At the end of the year, retained earnings is \$842,000, contributed capital is \$842,000 (\$120,000 + \$722,000), and accumulated other comprehensive income is \$39,000.

Exhibit 5.19 presents *Kimberly-Clark's* 2016 Statement of Stockholders' Equity. The first column reports the number of issued shares of common stock. The second column reports the dollar amount of common stock issued and the third the amount of additional paid-in-capital. The number of shares and dollar amount in treasury stock, which reduces equity, is in the next two columns. Retained earnings is in the sixth column, which increases with net income and decreases with dividends. The second-to-last column presents accumulated other comprehensive income. The last column represents the noncontrolling interests.

Stockholders' Equity Requirements: IFRS. Unlike U.S. GAAP, IFRS requires a statement of stockholders' equity.

EXHIBIT 5.19 Statement of Stockholders' Equity, *Kimberly-Clark Corporation*, Financial Statements, December 31, 2016

Kimberly-Clark Corporation and Subsidiaries
Consolidated Statement of Stockholders' Equity

	Common Stock Issued		Additional Paid-in Capital		Treasury Stock		Retained Earnings	Accumulated Other Comprehensive Income (Loss)	Noncontrolling Interests
	Shares	Amount	Shares	Amount	Shares	Amount

Summary by Learning Objectives

In the following, we summarize the main points by learning objective. Throughout the chapter, we discuss the accounting and reporting of U.S. GAAP and IFRS side-by-side. This table also highlights the major similarities and differences between the standards.

1 Explain the difference between net income and comprehensive income; assess the usefulness and limitations of the income statements.	
Summary	Similarities and Differences between U.S. GAAP and IFRS
<p>Comprehensive income is the change in a company's equity during a period of time resulting from transactions and other events and circumstances from non-owner sources. Comprehensive income is the sum of net income and other comprehensive income.</p> <p>Net income is a measure of financial performance resulting from the aggregation of revenues, expenses, gains, and losses that are not items of other comprehensive income.</p> <p>Other comprehensive income (OCI) is revenues, expenses, gains, and losses that are explicitly excluded from net income in specific accounting standards.</p> <p>Advantages of the income statement include:</p> <ol style="list-style-type: none"> 1. Provides confirmatory value. 2. Has predictive value. 3. Assesses the risks or uncertainties of achieving future cash flows. <p>Disadvantages of the income statement include:</p> <ol style="list-style-type: none"> 1. Certain revenues, expenses, gains, and losses that cannot be measured reliably are not reported on the income statements. 2. The measurement of income is dependent upon the accounting methods selected. 3. Even if management is not intentionally biasing the earnings figure, different judgments will lead to different income numbers, resulting in a lack of comparability. 	<p>Similar under U.S. GAAP and IFRS.</p>
2 Define earnings quality, including permanent and transitory earnings, and earnings management.	
Summary	Similarities and Differences between U.S. GAAP and IFRS
<p>Earnings quality captures the degree to which currently reported earnings provide financial statement users with information that is useful, particularly in predicting future firm performance.</p> <p>Permanent earnings are likely to continue into the future.</p> <p>Transitory earnings are not likely to continue into the future.</p> <p>Earnings management occurs when management uses the discretion afforded them under the accounting standards to inappropriately manipulate earnings to meet certain goals.</p>	<p>Similar under U.S. GAAP and IFRS.</p>

Summary by Learning objectives, continued

3 Identify the four primary elements on the statement of net income, and explain the nature and functional approaches to classifying items.

Summary	Similarities and Differences between U.S. GAAP and IFRS
<p>The four primary elements included in the statement of net income are:</p> <ul style="list-style-type: none"> • Revenues • Expenses (arranged by nature or function) • Gains • Losses <p>The SEC requires presentation by function. U.S. GAAP allows presentation by either nature or function.</p>	<p>➤ Similar under U.S. GAAP and IFRS except that IFRS allows presentation by either nature or function.</p>

4 Explain the presentation of the statement of net income, including the multiple-step and single-step income statement formats.

Summary	Similarities and Differences between U.S. GAAP and IFRS
<p>Two common income statement formats are:</p> <ul style="list-style-type: none"> • Single-step income statement format that combines all revenues and gains and all expenses and losses into single categories • Multiple-step income statement format that reports several critical performance measures before computing income from continuing operations and net income, including: <ol style="list-style-type: none"> 1. Gross profit 2. Operating income 3. Income before tax (Income from continuing operations before tax when discontinued operations included) 4. Income from continuing operations (when discontinued operation is included) 5. Net income 6. Earnings per share 	<p>➤ IFRS allows multiple-step and single-step income statement formats but has additional requirements.</p> <p>IFRS requires certain line items to be reported on the income statement.</p> <ul style="list-style-type: none"> • Revenue (Sales revenues are also called Turnover) • Finance costs • Share of income/loss of associates • Tax expense • After-tax profit or loss on discontinued operations • Net Income, also called Net Profit or Net Loss <p>A company presents additional line items and subtotals relevant to understanding its financial performance. A company is required to disclose certain other items if they are not presented on the income statement.</p>

5 Define income from continuing operations, including the components of operating income, non-operating income, and the income tax provision.

Summary	Similarities and Differences between U.S. GAAP and IFRS
<p>Net income from continuing operations is income from portions of the business that are expected to continue into the future. It is commonly presented as the sum of three income statement items:</p> <ol style="list-style-type: none"> 1. Operating income: Revenues and expenses from the entity's principal operations. 2. Non-operating income items: Gains and losses along with revenues and expenses resulting from peripheral activities of the company including items with an unusual nature and/or are infrequent in occurrence. A transaction or event is unusual if it possesses a high degree of abnormality and is unrelated or only tangentially related to ordinary activities. A transaction or event is infrequent if it is not reasonably expected to reoccur in the foreseeable future. 3. Income tax provision: Reports the income tax expense associated with all income items included in income from continuing operations. 	<p>➤ Can be similar under IFRS formats but has additional requirements covered in LG6.</p>

Summary by Learning objectives, continued

6 Demonstrate the accounting for a discontinued operation, including the criteria used to determine a discontinued operation and presentation on the statement of net income.	
Summary	Similarities and Differences between U.S. GAAP and IFRS
<p>Companies report discontinued operations for various income-related items associated with portions of the business that</p> <ol style="list-style-type: none"> 1. have been disposed of, or 2. are in the process of being disposed of. <p>A discontinued operation is a component or a group of components of an entity that is (1) a portion of the entity (2) comprising operations and cash flows (3) that can be clearly distinguished, operationally and for financial reporting purposes from the rest of the entity.</p> <p>The portion of the entity that is viewed as a component may be</p> <ul style="list-style-type: none"> • a reportable segment • an operating segment • a reporting unit • a subsidiary • an asset group <p>Companies must also demonstrate that the disposal represents a strategic shift that has or will have a major effect on the company's operations and financial results.</p> <p>Discontinued operations are reported net of taxes on the income statements. Companies report three main types of income, gain or loss under discontinued operations.</p> <p>For discontinued operations, companies disclose</p> <ul style="list-style-type: none"> – Pre-tax income (loss) – Pre-tax income (loss) attributable to the company's shareholders – Major line items to arrive at pre-tax income (loss) – Reconciliation of the major items making up the pre-tax profit (loss) disclosed in notes to the after-tax profit (loss) presented in the income statement – Carrying amounts of the major classes of assets and liabilities included as part of discontinued operations and classified as held for sale – Gain or loss on remeasurement of net assets held for disposal – Reconciliation of the carrying amounts of major classes of assets and liabilities disclosed in notes to total assets and liabilities classified as held for sale on the balance sheet – Either total operating and investing cash flows related to the discontinued operation, or the depreciation, amortization, capital expenditures, and significant operating and investing noncash items associated with the discontinued operation <p>For individually significant operations disposed of, companies disclose the pre-tax income (loss) and amount attributable to the company's shareholders.</p>	<p>► IFRS defines discontinued operations differently than U.S. GAAP: IFRS does not allow asset groups to be discontinued operations. A discontinued operation under IFRS could:</p> <ol style="list-style-type: none"> (a) Represent a separate major line of business or geographical area of operations, or (b) Be a subsidiary acquired exclusively with the intention to resell. <p>A discontinued operation should also be part of a single coordinated plan to dispose of a separate major line of business or geographical area of operations.</p> <p>The income statement presentation is similar under U.S. GAAP and IFRS with one exception; any income or loss from the operations and gain or loss on the sale or remeasurement must be summed for IFRS presentation.</p> <p>For discontinued operations, companies disclose</p> <ul style="list-style-type: none"> – Revenues – Expenses – Income taxes on operations and income taxes on gains (losses) – Income taxes on gains and losses on remeasurement related to discontinued operations. – Pre-tax income (loss) – Gain (loss) on remeasurement for discontinued operations. <p>No additional disclosures are required for those disposals not meeting the conditions to be reported as a discontinued operation.</p>

Summary by Learning objectives, continued

7 Describe the presentation of net income, noncontrolling interest, and earnings per share on the statement of net income.

Summary	Similarities and Differences between U.S. GAAP and IFRS
<p>Net income is presented after discontinued operations.</p> <p>Net income is separated into net income attributable to shareholders and net income attributable to the noncontrolling interests. There is a noncontrolling interest when one company controls another company but owns less than 100% of its voting shares.</p> <p>Earnings per share represents the amount of earnings assigned to each outstanding share of the company's common stock. Companies report earnings per share for income from continuing operations, discontinued operations, and net income in a supplemental section of the income statement directly below net income or loss for the period.</p>	<p>Similar under U.S. GAAP and IFRS.</p>

8 Discuss the statement of comprehensive income.

Summary	Similarities and Differences between U.S. GAAP and IFRS
<p>Companies have two choices in reporting comprehensive income:</p> <ul style="list-style-type: none"> • In one statement, usually called the statement of comprehensive income, or • In two consecutive statements: the statement of net income and the statement of comprehensive income. <p>OCI consists of:</p> <ol style="list-style-type: none"> 1. Unrealized gains and losses from the available-for-sale portfolio of investment securities and derivatives classified as cash flow hedges. 2. Foreign currency translation gains and losses. 3. Unrecognized pension costs (benefits) from adjustments needed to bring the accounting pension asset or liability to the funded status of the pension plan. <p>All OCI items must be shown net of tax. The tax effects can be applied to the OCI items in total or on each individual item comprising other comprehensive income.</p>	<p>Similar under U.S. GAAP and IFRS.</p> <p>► OCI items will vary depending on the specific U.S. GAAP and IFRS accounting standards. For instance, IFRS allows the revaluation of long-lived assets and the effects of the upward revaluations are reported in OCI.</p>

9 Describe the components of and the reporting requirements for the statement of stockholders' equity.

Summary	Similarities and Differences between U.S. GAAP and IFRS
<p>The statement of stockholders' equity summarizes the changes in stockholders' equity, both by account and in total, during the period. The accounts summarized are:</p> <ul style="list-style-type: none"> • Contributed capital accounts (common stock, treasury stock, preferred stock, and additional paid-in capital) • Retained earnings • Accumulated other comprehensive income • Noncontrolling interests <p>A statement of stockholders' equity is not required under U.S. GAAP; however, the SEC requires a statement of stockholders' equity.</p>	<p>► Similar under U.S. GAAP and IFRS except a statement of stockholders' equity is required under IFRS.</p>

MyLab Accounting

Go to <http://www.pearson.com/mylab/accounting> for the following Questions, Multiple-Choice Questions, Brief Exercises, Exercises, and Problems. They are available with immediate grading, explanations of correct and incorrect answers, and interactive media that acts as your own online tutor.

5 Statements of Net Income and Comprehensive Income

Questions

- 1 Q5-1. What are the three limitations of the income statement?
- 1 Q5-2. In what way is the income statement useful for financial statement users?
- 1 Q5-3. Can the terms *net income* and *comprehensive income* be used interchangeably? Explain.
- 2 Q5-4. What is meant by the term *earnings quality*?
- 2 Q5-5. What management behavior does the term *earnings management* describe?
- 2 Q5-6. What is the difference between permanent and transitory earnings?
- 3 Q5-7. Do entities report revenues, expenses, gains, and losses in net income or other comprehensive income? Explain.
- 3 Q5-8. Can entities combine cost of goods sold, payroll costs, and administrative expenses when aggregating and summarizing expenses by function on the income statement? Explain.
- 3 Q5-9. Explain the difference between a single-step and multiple-step income statement. Which statement is more transparent?
- 4 Q5-10. Is the presentation of the statement of net income under IFRS and U.S. GAAP identical? Explain.
- 4 Q5-11. What are the six key items to be reported on the statement of net income under IFRS? Must a company report operating income under IFRS?
- 4 Q5-12. Explain why operating income is an important measure of financial performance.
- 5 Q5-13. Does a business segment qualify as a discontinued operation? Explain.
- 6 Q5-14. If *Procter & Gamble* sells its Fabric Care and Home Care business segment, would it account for the sale as a discontinued operation? Explain.
- 6 Q5-15. What items are included in net income?
- 7 Q5-16. Are items of other comprehensive income included in the computation of net income? Explain.
- 8 Q5-17. What two choices must companies make when reporting comprehensive income?
- 8 Q5-18. Is the presentation of comprehensive income identical under IFRS and U.S. GAAP? Explain.
- 8 9 Q5-19. Can entities report other comprehensive income in the statement of stockholders' equity? Explain.
- 9 Q5-20. Are companies reporting under U.S. GAAP required to prepare a statement of stockholders' equity? Explain.
- 9 Q5-21. What accounts are summarized on the statement of stockholders' equity?
- A Q5-22. What is financial statement analysis?
- A Q5-23. Do auditors use financial statement analysis techniques? Explain.
- A Q5-24. What are comparative financial statements and why are they useful?
- A Q5-25. What is the difference between vertical and horizontal analysis?
- B Q5-26. What defines a company's profitability?
- B Q5-27. Explain the difference between return on equity and return on assets.
- B Q5-28. How is a company's profit margin calculated?

Multiple-Choice Questions

Becker CPA Exam Review multiple-choice questions are available in MyLab Accounting.

- 1 **MC5-1.** Lyon Company has the following transactions in the current year. Assuming that all of the transactions are material, which of them will most likely have no effect on current year net income?
- The sale of a factory building that was contributed by a shareholder in the prior year.
 - The settlement of litigation over an accident that occurred in the prior year but for which a loss had not previously been considered to be probable and reasonably estimable.
 - The determination that certain junk bonds purchased on a speculative basis several years previous were worthless.
 - The collection of a receivable from a customer whose account was written off in the prior year by a charge to the allowance for bad debts account.
- 2 **MC5-2.** Moore Furniture Inc., a public company, has experienced a consistent 5% increase in net income over the past three years. Moore's management team is under a lot of pressure from investors to maintain its earnings ratios. In order to do so, the CEO could manipulate net income in order to manage the earnings of the company. Which one of the following is *not* a method typically used to manage earnings?
- Acquire a related business to allow management the opportunity to restructure transactions.
 - Move up the timing related to the launch of a new product that has a huge demand.
 - Engage in research and development projects to entice investors.
 - Recognize revenues prematurely from sales promotions with retailers.
- 4 **MC5-3.** Beach and Poole, CPA is reviewing income statement presentation with some interns that are working with the firm during the summer break. The interns were asked to list three things that were true about the multiple-step income statement. Choose the item below that is a true statement.
- The multiple-step income statement lists gains and losses as part of income from normal operations.
 - The multiple-step income statement shows income or loss from operations *after* the gross margin and operating expenses lines but before other revenues and gains.
 - Freight out is classified as part of the inventory cost and moved to cost of goods sold when the item is purchased by a third party.
 - Gain/loss on the sale of equipment held for disposal from discontinued operations is included in the continuing operations section of the income statement.
- 5 **MC5-4.** Mission Flowers Company had the following transactions for the year ended December 31:
- Sales revenues of \$775,000.
 - Operating expenses of \$550,000.
 - Losses due to employee strike of \$200,000. This was the first employee strike in the history of the company. Operating income of \$100,000 from a subsidiary sold on November 1. The decision to dispose was made on February 28. The income was earned evenly over the 10 months ended October 31.
 - The company's effective tax rate is 35%.
- What amount should Mission Flowers report as income from continuing operations for the year ended December 31?
- a. \$33,750 b. \$16,250 c. \$81,250 d. \$146,250
- 5 **MC5-5.** Allison Corporation's current year income from continuing operations before taxes was \$1,000,000 before taking the following items into consideration:
- Depreciation was understated by \$100,000.
 - A strike by the employees of a supplier resulted in a loss of \$200,000. This strike was the first such strike that Allison had encountered.
 - The inventory at December 31 of the prior year was overstated by \$300,000. The inventory at December 31 of the current year was correct.
 - A flood in Allison's Houston facility destroyed equipment worth \$500,000. The facility had just been rebuilt from damages that occurred in a flood in the prior year.
- What was Allison's adjusted income from continuing operations before taxes?
- a. \$1,000,000 b. \$900,000 c. \$700,000 d. \$500,000

- 6** **MC5-6.** On May 15, Year 1, Moran Inc. approved a plan to dispose of a component of its business. It is expected that the sale will occur on February 1, Year 2, at a selling price of \$500,000, which was the current fair value of the component. During Year 1, disposal costs incurred by Moran totaled \$15,000. The disposal of the component represents a strategic shift in the financial results for the entity. The component had actual or estimated operating losses as follows:

January 1 – May 14, Year 1	\$130,000
May 15 – December 31, Year 1	50,000
January 1 – January 31, Year 2	15,000

The carrying amount of the component on May 15, Year 1 was \$850,000. Before income taxes, what amount should Moran report for discontinued operations in its Year 1 Income Statement?

- 8** **MC5-7.** Chili Co. had the following balances at December 31:

Foreign currency translation gain	\$150,000
Unrealized loss on trading security	(35,000)
Net income	650,000
Loss on discontinued operations	(75,000)

The company's effective tax rate is 40%. What amount should Chili Co. report as comprehensive income for the year ended December 31?

- 8** **MC5-8.** Szuba Corporation reported the following transactions for the current year:

Sales	\$500,000
Cost of goods sold	300,000
Operating expenses	100,000
Cash dividend	50,000
Unrealized gain on available-for-sale security	10,000
Unrealized gain on trading security	20,000

Ignoring income taxes, Szuba should report other comprehensive income of:

- 9** **MC5-9.** Glass Doors Inc. (GDI) is preparing the stockholders' equity section of their balance sheet. The following items occurred during the year. Which one of the following will *not* directly impact the stockholder's equity section of the balance sheet?

- a. GDI owns securities classified as available for sale (AFS) with a cost basis of \$376,000 and a fair value of \$321,000. An unrealized loss was recorded of \$55,000.
- b. 100 shares of treasury stock were repurchased under the cost method for \$7,500. The stock had a par value of \$10.00 per share.
- c. GDI sold 1,000 shares of common stock with a par value of \$10 for \$15,000.
- d. GDI sold some old inventory for lower than originally paid.

Brief Exercises

- 1** **BE5-1. Advantages and Disadvantages of the Income Statement.** For each item in the following, identify whether it is an advantage or disadvantage of the income statement.

Item	Advantage/Disadvantage
1. Can be manipulated and managed.	_____
2. Assesses risks or uncertainties of achieving future cash flows.	_____
3. Depends on accounting methods selected.	_____
4. Requires extensive judgment.	_____
5. Predicts future performance.	_____
6. Evaluates past performance.	_____
7. Excludes certain items.	_____

- 1** **BE5-2. Advantages and Disadvantages of the Income Statement.** Match the description with the advantages and disadvantages of the income statements.

Advantage/Disadvantage	Description
1. Can be manipulated and managed.	a. The income statements provide confirmatory value.
2. Depends on accounting methods selected.	b. The income statements provide predictive value.
3. Predicts future performance.	c. Accounting policies determine amounts reported.
4. Evaluates past performance.	d. Items cannot be measured reliably and are therefore not reported on the income statements.
5. Excludes certain items.	e. Management can bias their judgments.

- 1** **BE5-3. Advantages and Disadvantages of the Income Statement.** Match the item with the advantages and disadvantages of the income statements.

Item	Advantage/Disadvantage
1. Evaluates past performance.	a. The sale of a specialized piece of equipment is unlikely to reoccur in the following year.
2. Predicts future performance.	b. The income statements provide confirmatory value.
3. Assesses risks or uncertainties of achieving future cash flows.	c. Managers make estimates and assumptions.
4. Excludes certain items.	d. Investors expect past growth to continue.
5. Depends on accounting methods selected.	e. Managers manage earnings to meet analysts' forecasts.
6. Can be manipulated and managed.	f. Pending lawsuits may not be reported.
7. Requires extensive judgment.	g. Managers can choose from several inventory cost flow assumptions.

- 2** **BE5-4.** Identify each of the earnings items as primarily permanent or transitory in nature.

Item	Permanent or Transitory?
Selling expenses	_____
Sales salaries expense	_____
Unrealized loss on available-for-sale bonds	_____
Interest income	_____
Depreciation expense	_____
Amortization expense	_____
Interest expense	_____
Loss on asset impairment	_____
Loss on sale of discontinued operations before tax	_____
Gain due to flood damage	_____
Sales	_____
Gain on disposal of plant assets	_____
Office supplies expense	_____
Advertising expense	_____
Office salaries expense	_____
Gain on trading investments	_____
Cost of goods sold	_____

- 4** **BE5-5. Income Statement Presentation.** Place the performance measures in the order in which they are commonly presented on the statement of net income.

- Earnings per Share
- Gross profit
- Income from Continuing Operations
- Net Income
- Operating Income

- 4** **BE5-6. Statement of Net Income Presentation, IFRS.** Which of the following items are required to be presented on an **IFRS** statement of net income?

Item	Yes/No?
Cost of Goods Sold	_____
General and Administrative Expenses	_____
Sales	_____
Net Profit	_____
Interest Expense	_____
Gross Profit	_____
Share of Income/Loss of Associates	_____
Income Tax Expense	_____
Operating Profit	_____
Profit/Loss from Discontinued Operations, net of taxes	_____
Profit from Continuing Operations	_____

- 4 5** **BE5-7. Single-Step Statement of Net Income.** Carr Corporation provided the following partial-trial balance for the current year. Prepare a single-step income statement for the year ended December 31. Carr is subject to a 40% income tax rate.

Carr Corporation
Trial Balance (Selected Accounts)
For the Year Ended December 31

Account	Debit	Credit
Dividends	\$ 1,345	
Sales		\$123,750
Dividend Income		560
Interest Income		1,000
Gain on Disposal of Plant Assets		986
Unrealized Gain on Trading Investments		2,000
Cost of Goods Sold	45,678	
Office Supplies Expense	4,500	
Sales Salaries Expense	3,570	
Selling Expenses	12,000	
Accounting and Legal Fees—General Expense	800	
Advertising Expense	4,000	
Office Salaries Expense	6,780	
Depreciation Expense—General Expense	9,000	
Interest Expense	2,100	
Loss on Asset Impairment	1,840	

- 4 5** **BE5-8. Statement of Net Income, IFRS.** Using the information provided in BE5-7, prepare a statement of net income and additional disclosures that would meet **IFRS** requirements. Indicate items that **IFRS** requires be reported on the statement of net income. Use the condensed format.
- 4 5** **BE5-9. Multiple-Step Statement of Net Income.** Using the information provided in BE5-7, prepare a multiple-step income statement for the current year.
- 4 5** **BE5-10. Condensed Statement of Net Income.** Using the information provided in BE5-7, prepare a condensed, multiple-step income statement for the current year. Include supporting schedules.
- 6** **BE5-11. Discontinued Operations, IFRS.** Woorley Corporation needs to determine whether the disposal of its Tools Division qualifies as a discontinued operation. The Tools Division is one of Woorley's three major business segments. Its recent financial performance has been strong, yet Woorley believes that this segment will contract over the next three to five years. Woorley has developed a plan to dispose of the Tools Division and focus on its other two operating segments going forward. Does the disposal of the Tools Division qualify as a discontinued operation under **IFRS**?

- 6 **BE5-12. Discontinued Operations.** The Banks Corporation sold its credit subsidiary on December 31 of the current year at a gain of \$237. See the following for the corporation's income statement before removing the discontinued subsidiary and before the inclusion of the gain on the sale of the subsidiary:

Banks Corporation
Statement of Net Income
For the Year Ended December 31

Sales	\$ 10,000
Cost of Goods Sold	<u>6,700</u>
Gross Profit	\$ 3,300
Selling, General, and Administrative Expenses	700
Depreciation and Amortization Expense	<u>950</u>
Income Before Tax	\$ 1,650
Income Tax Expense (at 40%)	<u>660</u>
Net Income	<u>\$ 990</u>

Prepare Banks Corporation's statement of net income for the current year reflecting the discontinued subsidiary, assuming that it met all of the necessary conditions to be reported as a discontinued operation. The discontinued subsidiary accounted for 20% of revenues and 15% of all operating expenses.

- 6 **BE5-13. Discontinued Operations.** Jojo, Inc. held a discontinued operation as of December 31, 2018. The operating loss from the discontinued operation was \$500,000 for the period. As of December 31, 2018, the net assets of the discontinued operations had decreased in fair value by \$272,000. Jojo's tax rate is 30%. Prepare the discontinued operations part of its income statement.
- 6 **BE5-14. Discontinued Operations.** Coftee Company committed to a plan on October 1 of the current year to discontinue its beverage segment. Income from operating the segment was \$1,250,000 for January through September and \$727,000 for October through November. Coftee sold the segment on November 30 for a loss of \$168,000. Coftee's tax rate is 20%. Prepare the discontinued operations part of Coftee's income statement.
- 8 **BE5-15. Comprehensive Income Statement, One-statement Approach.** Steven Stores, Inc. provided the following statement of net income for the current year. All income is subject to a 40% income tax rate.

Steven Stores, Inc.
Statement of Net Income
For the Year Ended December 31

Sales	\$ 12,000	
Less: Cost of Goods Sold	<u>(4,000)</u>	
Gross Profit		\$ 8,000
Operating Expenses:		
Selling Expenses	\$ 3,500	
General and Administrative Expenses	<u>1,500</u>	
Total Operating Expenses		<u>(5,000)</u>
Operating Income		\$ 3,000
Income Tax Expense		<u>(1,200)</u>
Net Income		<u>\$ 1,800</u>

The company also had \$735 of unrealized holding gains on its available-for-sale investment portfolio. Prepare a statement of comprehensive income using the one-statement approach.

- 8 **BE5-16. Comprehensive Income Statement, Separate Statement Approach.** Using the information provided in BE5-15, report comprehensive income in a separate statement of comprehensive income.
- 9 **BE5-17. Computation of Retained Earnings.** Taxi Cabs, Inc. reported the following account balances on its balance sheet as of the beginning of the current year.

Retained Earnings	\$1,250,000
Common Stock, \$1 Par (200,000 Shares)	\$ 200,000
Additional Paid-in-Capital in Excess of Par—Common	\$ 775,000
Accumulated other Comprehensive Income	\$ 345,000

It reported the following information for the current year:

Net Income	\$140,000
Unrecognized Pension Costs	\$ (67,000)
Dividends Declared	\$ 10,000
Issued 50,000 Shares of Common Stock for \$125,000	\$125,000
Unrealized Losses on Available-for-Sale Investments	\$(22,000)
Foreign Currency Translation Adjustments—Gain	\$ 13,000

What is the balance in the retained earnings account at the end of the year?

- 9** **BE5-18. Computation of Contributed Capital.** Using the information from BE5-17 what is the amount of Taxi Cabs' contributed capital at the end of the year?
- 9** **BE5-19. Computation of Accumulated Other Comprehensive Income.** Using the information from BE5-17 what is the balance in the accumulated other comprehensive income account at the end of the year? Ignore taxes.
- A** **BE5-20. Horizontal Analyses.** Complete the following horizontal analyses of Dragonfly Corporation's income statement. What was the largest percentage increase in expenses? What was the largest percentage decrease in expenses? What would explain the changes?

(in millions)	2019	2018	Change	Percent Change
Sales	\$ 63,762	\$61,890	_____	_____
Cost of Goods Sold	<u>33,092</u>	<u>30,096</u>	_____	_____
Gross Profit	30,670	31,794	_____	_____
Selling, General, and Administrative Expenses	15,335	15,897	_____	_____
Research and Development Expense	7,052	7,844	_____	_____
Interest Expense	<u>145</u>	<u>142</u>	_____	_____
Earnings Before Provision for Taxes	8,138	7,911	_____	_____
Provision for Taxes	<u>2,848</u>	<u>2,769</u>	_____	_____
Net Income	<u>\$ 5,290</u>	<u>\$ 5,142</u>	_____	_____

- A** **BE5-21. Vertical Analyses.** Complete the following vertical analyses of Dragonfly Corporation's income statement. What line item is the largest percent of sales in 2019? How has it changed from 2018 to 2019?

(in millions)	2019	2018	As of percent of sales	
			2019	2018
Sales	\$ 63,762	\$ 61,890	_____	_____
Cost of Goods Sold	<u>33,092</u>	<u>30,096</u>	_____	_____
Gross Profit	30,670	31,794	_____	_____
Selling, General, and Administrative Expenses	15,335	15,897	_____	_____
Research and Development Expense	7,052	7,844	_____	_____
Interest Expense	<u>145</u>	<u>142</u>	_____	_____
Earnings Before Provision for Taxes	8,138	7,911	_____	_____
Provision for Taxes	<u>2,848</u>	<u>2,769</u>	_____	_____
Net Income	<u>\$ 5,290</u>	<u>\$ 5,142</u>	_____	_____

- B** **BE5-22. Ratio Analyses.** Green Grasshopper Incorporated is interested in assessing the following scenarios on its indicators of profitability. Solve each scenario independently.
- Green Grasshopper has taken significant steps to decrease expenses and expects its net income to increase by \$6 million to \$54 million. If its profit margin is 7.5%, what will the profit margin be after considering the decreased expenses?
 - Green Grasshopper has taken significant steps to decrease expenses and expects its net income to increase by \$6 million to \$54 million. If its average total assets are \$490 million, what will its return on assets be?

Exercises

4 5 6 **E5-1. Multiple-Step and Single-Step Statements of Net Income.**

The Tamer Tire Company provided the following partial trial balance for the current year ended December 31. The company is subject to a 40% income tax rate.

Tamer Tire Company
Trial Balance (Selected Accounts)
For the Year Ended December 31

Account	Debit	Credit
Dividends	\$ 2,300	
Sales		\$320,000
Interest Income		12,000
Dividend Income		8,000
Gain on Flood Damage		32,000
Gain on Disposal of Plant Assets		3,400
Unrealized Gain on Trading Investments		46,000
Cost of Goods Sold	64,000	
Office Supplies Expense	5,000	
Advertising Expense	10,000	
Office Salaries Expense	14,000	
Selling Expenses	36,000	
Accounting and Legal Fees—General	3,500	
Sales Salaries Expense	7,000	
Systems Consulting Fees—General	2,000	
Depreciation Expense—General	18,000	
Amortization Expense—General	11,000	
Interest Expense	4,500	
Loss on Asset Impairment	12,500	
Loss on Discontinued Operations—Before Tax	20,000	
Unrealized Loss on Available-for-Sale Bonds	5,600	

Required »

- Prepare a single-step income statement.
- Prepare a multiple-step income statement.

- 4 5 6** **E5-2. Condensed Statement of Net Income.** Using the trial balance provided in E5-1, prepare a condensed, multiple-step income statement with all supporting schedules.

4 5 6

E5-3. Condensed Statement of Net Income. Bradley Corporation provided the following account balances as of the end of the current year. The company is subject to a 40% income tax rate.

Bradley Corporation
Trial Balance (Selected Accounts)
For the Year Ended December 31

Account	Debit	Credit
Dividends	\$13,200	
Sales		\$1,245,890
Interest Income		6,700
Dividend Income		5,400
Unrealized Gain on Trading Securities		12,000
Gain on Disposal of Plant Assets		16,700
Gain on Flood Damage—Before Tax		18,700
Gain on Discontinued Operations—Before Tax		30,000
Cost of Goods Sold	65,000	
Sales Salaries Expense	32,500	
Office Supplies Expense	21,500	
Advertising Expense	79,500	
Office Salaries Expense	23,500	
Systems Consulting Fees—General	18,900	
Selling Expenses	75,000	
Accounting and Legal Fees—Administrative	34,500	
Depreciation Expense—General	89,750	
Amortization Expense—General	12,000	
Interest Expense	14,000	
Loss on Asset Impairment	58,900	
Unrealized Loss on Available-for-Sale Bonds	6,080	

Required »

- a. Prepare a condensed, multiple-step statement of net income for the current year ended December 31.
- b. Prepare a footnote containing the supporting schedules needed for the condensed statement of net income format.

4 5 6

E5-4. Multiple-step and Single-Step Statements of Net Income. Using the information provided in E5-3, prepare a single-step and a multiple-step statement of net income for Bradley Corporation.

4 5 6

E5-5. Multiple-step Statement of Net Income. The current year's statement of net income for Boley Boxes, Inc. in a single-step format follows.

Boley Boxes, Inc.
Income Statement
For the Year Ended December 31

Revenues and Gains	
Sales	\$875,650
Interest Income	325
Dividend Income	780
Gain on Sale of Investment Securities	4,300
Unrealized Gain on Trading Securities	<u>6,000</u>
Total Revenues and Gains	\$887,055

Boley Boxes, Inc.
Income Statement
For the Year Ended December 31

Expenses and Losses		
Cost of Goods Sold	\$ 45,000	
Selling Expenses	32,560	
Sales Salaries Expense	14,567	
Advertising Expense	16,400	
Depreciation Expense—General	2,500	
Amortization Expense—General	1,680	
Office Salaries Expense	19,400	
Office Supplies Expense	23,000	
Loss on Asset Impairment	3,450	
Legal Fees—General	2,150	
Accounting Fees—General	4,300	
Interest Expense	5,000	
Income Tax Expense at 40% *	<u>286,819</u>	
Total Expenses and Losses		<u>(456,826)</u>
Income from Continuing Operations		\$430,229
Gain on Discontinued Operations—Net of tax		<u>2,700</u>
Net Income		<u>\$432,929</u>

*40% × (\$887,055 – \$170,007) = 40% × \$717,048 = \$286,819.

Prepare Boley's income statement using a multiple-step format.

4 5 6

E5-6. Condensed Statement of Net Income. Using the information provided in E5-5, prepare a condensed, multiple-step statement of net income for Boley Boxes, Inc. that includes all supporting schedules.

4 5 6

E5-7. Multiple-step Income Statement. Ciara's Cookie Company provided the following accounts from its year-end trial balance.

Ciara's Cookie Company
Adjusted Trial Balance (Selected Accounts)
For the Current Year Ended

Account	Debit	Credit
Common Stock (no par): Beginning Balance		\$ 456,000
Retained Earnings: Beginning Balance		1,200,950
Accumulated Other Comprehensive Income: Beginning Balance	\$ 55,675	
Dividends	57,000	
Sales		1,200,895
Interest Income		3,400
Dividend Income		3,250
Gain on Disposal of Plant Assets		76,000
Unrealized Gain on Trading Securities		27,250
Gain on Sale of Discontinued Operations—Before Tax		56,780
Unrealized Gain on Available-for-Sale Bonds—Before Tax		3,500
Cost of Goods Sold	450,000	
Selling Expenses	37,450	
Office Salaries Expense	65,000	
Legal Fees—General	8,000	
Sales Salaries Expense	23,500	
Advertising Expense	21,500	

Ciara's Cookie Company
Adjusted Trial Balance (Selected Accounts)
For the Current Year Ended

Account	Debit	Credit
Office Supplies Expense	\$54,800	
Accounting Fees—Administrative	10,425	
Amortization Expense—General	12,000	
Depreciation Expense—General	25,500	
Interest Expense	6,700	
Loss on Asset Impairment	9,050	

The company is subject to a 40% income tax rate.

Prepare a multiple-step income statement for the current year.

- 6** **E5-8. Discontinued Operations.** Elegant Homes Corporation provided the following statement of net income on December 31, 2018, before the disposal of a business segment. The income statement includes the results of operations of Elegant's mobile home division. The company made a commitment to dispose of the mobile home division on December 1, 2018.

Elegant Homes Corporation
Income Statement
For the Year Ended December 31, 2018

Sales	\$500
Cost of Goods Sold	<u>(120)</u>
Gross Profit	\$380
Selling Expenses	(80)
General and Administrative Expenses	(65)
Other Revenues and Expenses	(40)
Loss on Asset Impairment	<u>(38)</u>
Income Before Tax	\$157
Income Tax Expense (at 40%)	<u>(63)</u>
Net Income	<u>\$ 94</u>

The mobile home division accounts for 20% of sales, cost of goods sold, selling, and general and administrative expenses. Assume no gain or loss on remeasurement of the division.

Prepare the multiple-step income statement for 2018 only, assuming that Elegant sells the segment on December 31 at a \$130 pretax loss. Round to the nearest dollar.

- 9** **E5-9. Prepare Statement of Stockholders' Equity.** Dane Products, Incorporated provided the following information for the current year ended December 31.

Retained Earnings, Beginning Balance	\$520,000
Common Stock-no par: Beginning Balance	234,500
Net Income	89,500
Dividends Declared	(15,000)
Unrealized Gain on Available-for-Sale Debt Investments—Net of tax	11,000
New Issue of Common Stock	25,000
Accumulated Other Comprehensive Income (loss): Beginning Balance	(55,675)

Required »

Prepare a statement of stockholders' equity for the current year.

- 9 E5-10. Prepare Statement of Stockholders' Equity.** Ciara's Cookie Company provided the following account balances from its year-end trial balance.

**Ciara's Cookie Company
Trial Balance (Selected Accounts)
For the Current Year Ended December 31**

Account	Debit	Credit
Retained Earnings, Beginning Balance		\$1,200,950
Accumulated Other Comprehensive Income, Beginning Balance	\$ 55,675	
Dividends	57,000	
Sales		1,200,895
Interest Income		3,400
Dividend Income		3,250
Gain on Sale of Property		6,789
Gain on Disposal of Plant Assets		76,000
Unrealized Gain on Trading Investments		27,250
Unrealized Gain on Available-for-Sale Bonds Before Tax		3,500
Gain on Sale of Discontinued Operations Before Tax		56,780
Cost of Goods Sold	450,000	
Selling Expenses	37,450	
Office Supplies Expense	54,800	
Amortization Expense	12,000	
Sales Salaries Expense	23,500	
Advertising Expense	21,500

Delaney issued \$55,000 of common stock on October 1 of the current year. The company also repurchased \$13,500 of its shares at the end of the reporting period. The company is subject to a 40% income tax rate.

Required »

- Prepare an income statement for the current year using each reporting format (single-step, multiple-step, and condensed, multiple-step with supporting disclosures). Round to the nearest dollar.
- Prepare a separate statement of comprehensive income for the current year.

8

P5-8. Statement of Comprehensive Income, Single- and Two-Statement Approaches. Tortarella Timber Company provided the following information for the current year:

- Operating income amounted to \$345,000.
- The company sold investments in bonds at a pre-tax loss of \$23,500.
- Tortarella reported a \$5,600 unrealized loss on an available-for-sale portfolio that is included in other comprehensive income.
- The company reported a \$12,000 unrealized gain on its trading portfolio, which is included in net income.
- Tortarella committed to discontinue its retail lumber stores division on January 1 of the current year. The retail lumber stores meet the criteria to be presented as a discontinued operation. The retail lumber stores accounted for 15% of the company's operating income. The stores were operated all year.
- The retail lumber stores division was sold at December 31 of the current year for a \$16,850 pre-tax loss. There was no gain or loss on remeasurement on January 1.

The company is subject to a 30% income tax rate.

Required »

- Prepare a single statement of comprehensive income beginning with operating income.
- Prepare separate statements of net income and comprehensive income.

9

P5-9. Prepare Statement of Stockholders' Equity. Use the information in P5-3 for Right Angle Manufacturing Company and the following additional information provided to complete the requirements.

Right Angle issued \$20,000 of no-par common stock in the current year. The company also repurchased \$15,000 of its shares at the end of the reporting period. The company is subject to a 40% income tax rate. The beginning balance of common stock (no par) was \$75,000.

Required »

- Prepare a statement of stockholders' equity for the year ended December 31.
- Prepare a partial balance sheet to show the ending balances in the stockholders' equity section.

A B

P5-10. Vertical Analyses, Profitability Analyses. The Golden Fence Company and Stone Wall Corporation are competitors in manufacturing walls and fences. You are interested in comparing the two firms' profitability. Their income statements and other information follow.

(amounts in millions)	Golden Fence Company	Stone Wall Corporation
Sales	\$ 987,236	\$ 67,450
Cost of Goods Sold	<u>678,626</u>	<u>43,370</u>
Gross Profit	308,610	24,080
Selling, General, and Administrative Expenses	58,636	2,408
Other Operating Expenses	12,344	722
Interest Expense	<u>24,689</u>	<u>193</u>
Earnings Before Provision for Taxes	212,941	20,757
Provision for Taxes	<u>74,529</u>	<u>7,265</u>
Net Income	<u>\$ 138,412</u>	<u>\$ 13,492</u>
Average Total Assets	<u>\$1,258,287</u>	<u>\$102,211</u>
Average Stockholders' Equity	<u>\$ 654,309</u>	<u>\$ 74,614</u>

Golden Fence is the larger company based on sales and total assets, so you perform the following steps to compare and analyze the companies.

Required »

- Prepare common-size income statements. Comment on differences in the relative size of each line item.
- Compute profit margin, return on assets, and return on stockholders' equity. Which company appears more profitable?

Excel Project

Autograded Excel Project available in **MyLab Accounting**

CASES

Judgment Cases

Judgment Case 1: Earnings Management

The CFO of First Things Computing, Inc. (FTC) prepared the following net income statement for the year ended December 31, 2019.

First Things Computing, Inc.
Statement of Net Income
For the Year Ended December 31, 2019

Revenues and Gains		
Sales	\$234,800	
Interest Income	23,000	
Dividend Income	7,500	
Equity Investment Income	7,000	
Gain on Disposal of Plant Assets	4,700	
Total Revenues and Gains		\$ 277,000
Expenses and Losses		
Cost of Goods Sold	\$ 65,000	
Selling Expenses and Salaries	32,000	
Office Supplies Expense	30,000	
Advertising Expense	14,000	
Office Salaries Expense	10,000	
Depreciation Expense	5,000	
Interest Expense	2,500	
Loss on Asset Impairment	6,000	
Total Expense and Losses		164,500
Income before income taxes		112,500
Income Tax Expense		(39,375)
Net income from Continuing Operations		<u>\$ 73,125</u>
Discontinued Operations		
Income from Operations of Discontinued Segment, Net of Tax of \$6,730	\$ 12,500	
Loss from Disposal of Discontinued Segment, Net of Tax of \$5,277	(9,800)	2,700
Net Income		<u>\$ 75,825</u>
Earnings per share:		
Income from Continuing Operations		\$4.88
Income from Discontinued Operations		0.18
Earnings per share		<u>\$ 5.06</u>

FTC had 15,000 common shares outstanding for the entire year. It had no preferred stock or dilutive securities. Thus, its earnings per share (EPS) is computed simply as earnings divided by shares outstanding. According to the current statement of net income, its EPS is \$5.06 (\$75,825 net income divided by 15,000 shares).

FTC records income tax expense at 35% of income from continuing operations before income taxes. The CFO will make the following adjustments before finalizing the financial statements:

1. FTC will need to record some amount of bad debt expense. The offset will be a reduction in accounts receivable. This adjustment is a matter of judgment and reasonable estimates range between \$1,000 and \$3,000.
2. FTC will need to write down its inventory (i.e., reduce the reported value of inventory). The offset will be to cost of goods sold. This adjustment is a matter of judgment and reasonable estimates range between \$2,500 and \$3,750.
3. FTC may need to record an impairment of property, plant, and equipment (PPE) (i.e., reduce the reported value of PPE). The offset will be an impairment loss reported on the statement of net income. This adjustment is a matter of judgment and reasonable estimates range between \$0 and \$5,000.
4. FTC may need to record an impairment of noncurrent investments (i.e., reduce the reported value of noncurrent investments). The offset will be an impairment loss reported on the statement of net income. This adjustment is a matter of judgment and reasonable estimates range between \$250 and \$750.

5. FTC may need to record a litigation contingency (i.e., it may need to record a liability for an unresolved lawsuit). The offset is to litigation expense. The lawsuit is expected to be settled in 2020. FTC's attorneys believe that they can provide a point estimate of the amount for which FTC will be liable. The estimate will either be \$2,000 or \$10,000.
6. FTC may need to reduce the reported amount of its deferred tax asset. The amount by which the asset needs to be reduced is highly judgmental and ranges from \$0 to \$5,000. The offset to this adjustment is income tax expense. (Thus, this adjustment impacts post-tax net income, but no pre-tax net income).
7. FTC currently has unearned revenue on its balance sheet of \$5,400. However, up to \$5,000 of this amount could possibly be recognized as revenue in 2019. However, this amount is a matter of judgment.

Required »

- a. If FTC makes the most conservative choices for all these adjustments resulting in the lowest income number, what is the impact on net income and earnings per share?
- b. If FTC makes the least conservative choices for all these adjustments by making the choices that will result in the highest income number, what is the impact on net income and earnings per share?
- c. Do you think that the management of FTC will care very much about the choices related to these adjustments? Why or why not?

Financial Statement Analysis Cases

Financial Statement Analysis Case 1: Vertical Analyses of *Johnson & Johnson* and *Pfizer Inc.*

Pfizer Inc. is a US company that manufactures and distributes pharmaceutical and consumer healthcare products that are similar to those sold by *Johnson & Johnson*. Use the excerpts of *Johnson & Johnson's* and *Pfizer's* income statements to answer the following questions:

- a. Compute each line item as a percentage of sales for both companies.
- b. If sales are used as a measure of size, which company is larger?
- c. Which company has a higher cost of goods sold relative to sales?
- d. Which company has higher selling, general, and administrative expenses relative to sales?
- e. Which company has higher research and development expenses relative to sales?
- f. Which company has a higher income from continuing operations relative to sales? Comment on the difference or lack of difference given other relationships observed.
- g. Which company has a higher profit margin? Comment on the difference between the two companies.

	Johnson & Johnson	Pfizer
<i>(amounts in millions)*</i>	2016	2016
Net Sales	\$71,890	\$52,824
Cost of Goods Sold	<u>21,685</u>	<u>12,329</u>
Gross Profit	50,205	40,495
Selling, General, and Administrative Expenses	19,945	14,837
Research and Development Expenses	9,095	7,872
In-Process Research and Development	29	0
Amortization of Intangible Assets	-	4,056
Restructuring Charges, Net	491	1,724
Interest Expense	726	-
Interest Income	(368)	-
Other Expense (income), Net	<u>484</u>	<u>3,655</u>
Income from Continuing Operations Before Income Taxes	19,803	8,351
Income Tax Expense	<u>3,263</u>	<u>1,123</u>
Income from Continuing Operations	\$16,540	\$ 7,229
Income from Discontinued Operations, Net of Income Taxes	<u> </u>	<u>17</u>
Net Income Before Noncontrolling Interests	\$16,540	\$ 7,246
Income Attributable to Noncontrolling Interests	<u> </u>	<u>31</u>
Net Income	<u>\$ 16,540</u>	<u>\$ 7,215</u>

* The captions for some lines have been changed for consistency in comparing the two companies.

Financial Statement Analysis Case 2: Profitability Analysis of *Johnson & Johnson* and *Pfizer Inc.*

Pfizer Inc. is a U.S. company that manufactures and distributes pharmaceutical and consumer healthcare products that are similar to those sold by *Johnson & Johnson*. In the following, we present *Johnson & Johnson's* profitability ratios computed in Example 5B.1 in the chapter appendix. Use these and the excerpts of *Pfizer's* income statements to answer the following questions:

- If *Johnson & Johnson's* sales are \$71,890 million in 2016, which company is larger using sales as a measure of size?
- Compute *Pfizer's* profit margin in 2016 and 2015.
- Compute *Pfizer's* return on assets in 2016 and 2015.
- Compute *Pfizer's* return on equity in 2016 and 2015.
- Compare *Johnson & Johnson's* and *Pfizer's* profit margins in 2016 and 2015.
- Compare *Johnson & Johnson's* and *Pfizer's* return on assets in 2016 and 2015.
- Compare *Johnson & Johnson's* and *Pfizer's* return on equity in 2016 and 2015.

Pfizer Inc. (all dollars in millions)

Balance Sheets (excerpts)			
End of Year	2016	2015	2014
Total assets	\$171,615	\$167,381	\$167,566
Total stockholders' equity	\$ 59,544	\$64,720	\$ 71,301
Statement of Earnings (excerpts)			
For the year	2016	2015	2014
Sales to customers	\$52,824	\$48,851	\$49,605
Net earnings	\$7,215	\$6,960	\$9,135

Johnson & Johnson (from Example 5B.1 in Appendix B)

Profitability Measure	2016	2015
Profit Margin	23.0%	22.0%
Return on Assets	12.0%	11.7%
Return on Equity	23.6%	21.9%

Surfing the Standards Cases

Surfing the Standards Case 1: Interest Allocation to Discontinued Operations

Kimbro Concrete Companies is disposing of its blacktop segment this year and is reporting it as a discontinued operation on the statement of net income in the current year.

The ratio of consolidated debt to equity is uniform for all operations of the company. What is the minimum amount of interest that Kimbro Concrete can allocate to its discontinued operations? What is the maximum amount of interest that it can allocate to discontinued operations? Provide explanations of your calculations, including references to the codification.

The following information is available related to the net assets and debt of Kimbro Concrete. Interest expense for all debt is 7% of the principal balance.

Net Assets of Kimbro Concrete	\$10,500,000
Net Assets of Blacktop Segment	\$ 1,200,000

Debt of Kimbro Concrete:	Principal	Interest
Directly attributable to continuing operations	\$ 500,000	\$ 35,000
Required to be repaid upon disposal of the blacktop segment	100,000	7,000
Debt that will be assumed by the buyer of the blacktop segment	150,000	10,500
All other debt	<u>1,250,000</u>	<u>87,500</u>
TOTAL	<u>\$ 2,000,000</u>	<u>\$140,000</u>

Surfing the Standards Case 2: Amounts Paid by Shareholders for an Entity's Expenses

Moocher Company, a publicly traded company that has a December 31 year-end, manufactures and sells novelty toys. Recently, one of the toys that Moocher produced and sold was found to cause serious digestive problems for dogs that ate the toy. Accordingly, Moocher was sued by a group of consumers in May of the current year. Moocher didn't believe that it would lose the suit in a court ruling, but it did not want the bad publicity. Because Moocher did not have extensive cash reserves, the primary shareholder (55% owner) of Moocher transferred 40,000 shares to the plaintiffs to settle the case in December of the current year. The market value of the shares was \$25 per share at the time of the transfer.

Does Moocher Company need to report anything in its annual financial statements for the current year related to this transaction?

Use the U.S. authoritative literature to support your conclusions.

Basis for Conclusions Cases

Basis for Conclusions Case 1: Presentation of the Tax Effects of Items Included in Other Comprehensive Income

Companies report all amounts related to other comprehensive income net of tax. *Net of tax* means that the amount of income (or loss) reported includes any income tax effects. Companies do not include the income tax expense (or benefit) related to items included in other comprehensive income in the income tax expense line item reported on the statement of income immediately following the net income before income tax line item.

Read paragraphs BC14 and BC15 of ASU 2011-05 – *Presentation of Comprehensive Income* and answer the following questions.

1. What are the requirements related to the presentation of the gross amounts, the net of tax amounts, and the tax impact of items include in OCI?
2. Did respondents to the exposure draft agree with this approach? Did any respondents disagree? If so, what were their concerns?
3. Why did the board make the decision that it did?

Basis for Conclusions Case 2: Reporting Other Comprehensive Income

Both **U.S. GAAP** and **IFRS** include the concept of comprehensive income. Comprehensive income is divided into net income and other comprehensive income. Read paragraphs 58 through 67 in SFAS No. 130 and paragraph BC49 through BC54 in IAS 1. Also read the discussion of the dissenting opinions in SFAS No. 130.

Required »

1. In theory, what four possible reporting methods for OCI could standard setters allow?
2. What are the pros and cons of these four possible methods of reporting OCI?
3. Which method of reporting OCI do you think is best? Explain why you prefer your chosen method.

APPENDIX A

Financial Statement Analysis

As discussed in Chapter 2, the objective of financial reporting is to provide financial information that investors and creditors can use to make rational resource allocation decisions. The annual report contains a significant amount of information about a company's financial performance and financial position for use in decision making. In this appendix, we discuss **financial statement analysis**, which provides the tools and techniques necessary to evaluate a company's performance over time, relative to certain benchmarks or compared to similar entities.

The Importance of Financial Statement Analysis

Financial statements should provide information that allows users to understand important relationships among financial statement line items and changes in them for a company over time. Consider the following scenarios:

1. Assume an auditor observes that accounts receivable is increasing as a percent of total assets. She may seek additional information such as whether sales are also increasing, collections are decreasing, or the firm has relaxed credit extension practices.
2. If the percentage of cost of goods sold to sales has increased, a company's manager would seek to determine the reason. Higher cost of sales percentages could be due to higher raw material costs.
3. Consider a bank reviewing a credit line application for a company. If the company's existing debt is high or its cash flows are decreasing, the bank would be concerned about its ability to repay the loan.

Horizontal Analysis and Vertical Analysis of Financial Statements

Johnson & Johnson's annual report includes balance sheets for the past two years and income and cash flow statements for a three-year period. Reporting results of operations, financial position, and cash flows for more than one year results in **comparative financial statements**. Companies issue comparative financial statements in order to provide financial information for more than one reporting period, thus allowing a user to compare the company on a year-to-year basis. Year-to-year changes in a company's financial position, operating performance, or cash flows can identify changes in activities, confirm projections, or identify trends to consider for the future.

Comparative financial statements can also be used to create *common-size financial statements*. **Common-size financial statements** measure each financial statement line item relative to some key amount or total. For example, to convert all income statement line items into a common-size percentage, divide each line by sales. Financial statement users can use common-size financial statements to compare a company to itself over time or to compare different firms of varying size.

There are two types of financial statement analyses: *vertical analysis* and *horizontal analysis*. Vertical analysis uses common-size financial statements. Horizontal analysis examines financial statements over time. In this section, we use horizontal and vertical analyses to compare one company to itself over time.

Horizontal Analysis

Horizontal analysis examines the percentage change in financial statement items from year to year. Horizontal analyses can provide information about increases or decreases in a company's income and expenses, which could indicate growth or a change in business strategy. For example, a company entering a new line of business could experience rapid sales growth or higher advertising costs. Example 5A.1 presents an illustration of a horizontal analysis for *Johnson & Johnson*.

EXAMPLE 5A.1**Horizontal Analysis of *Johnson & Johnson's* 2015 and 2016 Income Statements**

PROBLEM: Use the excerpts of *Johnson & Johnson's* income statements provided to answer the following questions about changes in line items from the income statement from 2015 to 2016.

- Compute the difference in each line item from 2015 to 2016.
- Using 2015 as a base year, determine the change and percentage change in each line item from 2015 to 2016.
- Did sales to customers increase or decrease from 2015 to 2016?
- Did net income increase or decrease from 2015 to 2016?
- What line item(s) is (are) driving the differences between sales to customers and net income from 2015 to 2016?

Johnson & Johnson Income Statements (excerpt)		
(dollars in millions)	2016	2015
Sales to customers	\$71,890	\$70,074
Cost of products sold	<u>21,685</u>	<u>21,536</u>
Gross profit	50,205	48,538
Selling, marketing, and administrative expenses	19,945	21,203
Research and development expense	9,095	9,046
In-process research and development	29	224
Interest income	(368)	(128)
Interest expense, net of portion capitalized	726	552
Other (income) expense, net	484	(2,064)
Restructuring	<u>491</u>	<u>509</u>
Earnings before provision for taxes on income	19,803	19,196
Provision for taxes on income	<u>3,263</u>	<u>3,787</u>
Net earnings	<u>\$16,540</u>	<u>\$15,409</u>

Note: The line item in-process research and development is a loss that relates to asset write-off of in-process research and development assets acquired when Johnson & Johnson purchased other companies.

Source: Johnson & Johnson Company's 2015 and 2016 Income Statements. See the Johnson & Johnson Company annual report at <http://files.shareholder.com/downloads/JNJ/3809936545x0xS200406-17-6/200406/filing.pdf>

SOLUTION:

- and b. The table on the next page computes the dollar difference from 2015 to 2016 and the percentage change by dividing the 2016 changes by the 2015 amounts.
- Sales to customers increased by \$1,816 million from 2015 to 2016. Sales increased by about 2.6%.
- Net income increased by \$1,131 million from 2015 to 2016. Net earnings increased by 7.3%.
- The increase in net income is due primarily to an increase of \$1,816 million in sales; a decrease in selling, marketing and administrative expense of \$1,258 million; and a decrease in provision for taxes of \$524 million.

(dollars in millions)	2016	2015	Change 2016–2015	Percent Change from 2015
Sales to customers	\$71,890	\$70,074	\$1,816	2.6%
Cost of products sold	<u>21,685</u>	<u>21,536</u>	<u>149</u>	<u>0.7%</u>
Gross profit	50,205	48,538	1,667	3.4%
Selling, marketing, and administrative expenses	19,945	21,203	(1,258)	(5.9%)
Research and development expense	9,095	9,046	49	0.5%
In-process research and development	29	224	(195)	(87.1%)
Interest income	(368)	(128)	240	187.5%
Interest expense, net of portion capitalized	726	552	174	31.5%
Other (income) expense, net	484	(2,064)	2,548	(123.4%)
Restructuring	<u>491</u>	<u>509</u>	<u>(18)</u>	<u>(3.5%)</u>
Earnings before provision for taxes on income	19,803	19,196	607	3.2%
Provision for taxes on income	<u>3,263</u>	<u>3,787</u>	<u>(524)</u>	<u>(13.8%)</u>
Net earnings	<u>\$16,540</u>	<u>\$15,409</u>	<u>\$1,131</u>	<u>7.3%</u>

Vertical Analysis

Vertical analysis expresses financial information in relation to some relevant total or amount within one year. On the income statement, each income statement line item is expressed as a proportion of sales. On the balance sheet, each item is expressed as a percent of total assets.³¹

EXAMPLE 5A.2

Vertical Analysis of *Johnson & Johnson's* 2015 and 2016 Income Statements

PROBLEM: Use the excerpts of *Johnson & Johnson's* income statements to answer the following questions about changes in sales from 2015 to 2016.

- Compute each line item as a percentage of sales for 2015 and 2016.
- Which line item makes up the largest proportion of sales in 2015 and 2016? (Keep in mind that some of the items like gross profit and earnings before provision for taxes on income are subtotals.)
- Comment on any changes in the income and expenses as a percent of sales from 2015 and 2016.

(dollars in millions)	2016	2015
Sales to customers	\$71,890	\$70,074
Cost of products sold	<u>21,685</u>	<u>21,536</u>
Gross profit	50,205	48,538
Selling, marketing, and administrative expenses	19,945	21,203
Research and development expense	9,095	9,046
In-process research and development	29	224
Interest income	(368)	(128)
Interest expense, net of portion capitalized	726	552
Other (income) expense, net	484	(2,064)
Restructuring	<u>491</u>	<u>509</u>
Earnings before provision for taxes on income	19,803	19,196
Provision for taxes on income	<u>3,263</u>	<u>3,787</u>
Net earnings	<u>\$16,540</u>	<u>\$15,409</u>

Source: Johnson & Johnson Company's 2015 and 2016 Income Statements. See Johnson & Johnson Company's Annual Report at <http://files.shareholder.com/downloads/JNJ/3809936545x0xS200406-17-6/200406/filing.pdf>

³¹Sales and total assets do not have to be used as the denominator for vertical analyses. However, they are the most common bases used in practice.

SOLUTION:

(dollars in millions)	2016	2015	Percent of Sales	
			2016	2015
Sales to customers	\$71,890	\$70,074	100.0%	100.0%
Cost of products sold	<u>21,685</u>	<u>21,536</u>	<u>30.2%</u>	<u>30.7%</u>
Gross profit	50,205	48,538	69.8%	69.3%
Selling, marketing, and administrative expenses	19,945	21,203	27.7%	30.3%
Research and development expense	9,095	9,046	12.7%	12.9%
In-process research and development	29	224	0.0%	0.3%
Interest income	(368)	(128)	(0.5%)	(0.2%)
Interest expense, net of portion capitalized	726	552	1.0%	0.8%
Other (income) expense, net	484	(2,064)	0.7%	(2.9%)
Restructuring	<u>491</u>	<u>509</u>	<u>0.7%</u>	<u>0.7%</u>
Earnings before provision for taxes on income	19,803	19,196	27.5%	27.4%
Provision for taxes on income	<u>3,263</u>	<u>3,787</u>	<u>4.5%</u>	<u>5.4%</u>
Net earnings	<u>\$16,540</u>	<u>\$15,409</u>	<u>23.0%</u>	<u>22.0%</u>

- The preceding table computes the percent of each line item to sales for 2015 and 2016. For example, net earnings of \$16,540 million in 2016 is 23.0% of sales (\$16,540 million divided by \$71,890 million).
- In 2016 and 2015, cost of products sold made up over 30.2% and 30.7% of sales in 2016 and 2015, respectively.
- The percent of cost of products sold, research and development expense, in-process research and development expense, interest income, interest expense, and the provision for taxes on income to sales remains very similar from year to year with most items changing less than 1% of sales. Selling, marketing, and administrative expenses is a smaller percentage of sales in 2016 at 27.7% compared to 30.3% in 2015. Other (income) expense was negative in 2015 and (2.9%) of sales. In 2016, other (income) expense was positive and 0.7% of sales. It is a greater percentage of sales in 2015 when compared to 2016.

APPENDIX B**Profitability Analysis**

Ratio analysis is one of the most common financial statement analysis tools. **Ratios** compute meaningful relationships between financial statement items useful in:

- Understanding a company over time.
- Comparing one company to another company.
- Benchmarking a company to an industry standard.

In this section, we introduce the most common ratios for profitability analyses.³² In management's discussion and analysis of financial condition and results of operations, companies will often comment on the profitability using the ratios we discuss on the next page.³³

³²We will expand our coverage of ratios as we cover additional topics in later chapters.

³³We present commonly used ratio definitions and computations. It is important to understand how each company defines its ratios because computations could vary.

Profitability

Profitability is a company's ability to generate a return for its shareholders based on the revenues or resources available. The "bottom-line" return to the shareholders is the company's net income. Profitability analysis allows a financial statement user to assess how well a company has performed and how much return it has generated relative to its revenues or resources. Three common measures of profitability are:

1. Profit margin
2. Return on assets
3. Return on equity

Profit Margin

Firms measure profitability as the percent of each dollar of sales that is available for distribution. The **profit margin** indicates the percent of each dollar of sales remaining after covering cost of sales and other business expenses. The profit margin is computed as net income divided by sales revenue:

$$\text{Profit Margin} = \frac{\text{Net Income}}{\text{Sales Revenue}} \quad (5B.1)$$

A higher profit margin indicates a higher return to shareholders.

Return on Assets

Firms also assess profitability based on how well a company is using its resources. The **return on assets ratio** measures the income generated for shareholders from each dollar of average total assets.

$$\text{Return on Assets} = \frac{\text{Net Income}}{\text{Average Total Assets}} \quad (5B.2)$$

Average total assets is used as the base in the denominator. A firm earns income over a period of time. However, total assets are measured at a point in time, the balance sheet date. To obtain a measure of the assets in use over the period in which income is earned, we take the average of total assets at the beginning and ending of the period. The assumption is that the firm earns net income evenly over the year on assets it employs. Average total assets is computed as:

$$\text{Average Total Assets} = \frac{\text{Beginning Total Assets} + \text{Ending Total Assets}}{2} \quad (5B.3)$$

Return on Equity Ratio

The **return on equity ratio** measures the return on shareholders' investment in the company. Return on equity is the amount of net income the company generates by using the equity provided by shareholders:

$$\text{Return on Equity} = \frac{\text{Net Income}}{\text{Average Stockholders' Equity}} \quad (5B.4)$$

Similar to using average total assets in return on assets, we use the average shareholders' equity as the base in the denominator. Again, the assumption is that the firm earns net income evenly over the year. Average shareholders' equity is computed as:

$$\text{Average Stockholders' Equity} = \frac{\text{Beginning Stockholders' Equity} + \text{Ending Stockholders' Equity}}{2} \quad (5B.5)$$

The various return ratios address the question of how well a company is using its resources. In contrast to the return on assets ratio, the return on equity is an indicator of a company's return to its shareholders.

When analyzing ratios based on net income, it is important to assess whether the income items are recurring or non-recurring. Recurring income items are better indicators of future performance and profitability than nonrecurring items. For example, a loss on discontinued operations is not expected to recur. In Example 5A.1, *Johnson & Johnson* reported losses on the restructuring of \$491 million and \$509 million in 2016 and 2015, respectively. Whereas a large company like *Johnson & Johnson* is expected to have these types of losses and expenses, the amounts can vary each year and may not recur.

EXAMPLE 5B.1

Profitability Analysis of *Johnson & Johnson's* 2015 and 2016

PROBLEM: Use the following information provided from the 2016 *Johnson & Johnson* annual report to compute the profit margin, return on assets, and return on equity for 2015 and 2016. What does each measure indicate about *Johnson & Johnson's* profitability? What do the measures taken together indicate about *Johnson & Johnson's* profitability?

(dollars in millions)

Balance Sheets (excerpts)

End of Year	2016	2015	2014
Total assets	\$141,208	\$133,411	\$130,358
Total stockholders' equity	\$ 70,418	\$ 69,752	\$ 71,150

**Statement of Earnings (excerpts)
For the Year**

	2016	2015	2014
Sales to customers	\$71,890	\$70,074	\$74,331
Net earnings	\$16,540	\$15,409	\$16,323

Source: Johnson & Johnson Company's Annual Report at <http://files.shareholder.com/downloads/JNJ/3809936545x0xS200406-17-6/200406/filing.pdf>

SOLUTION: The table on the next page provides the computations of the profit margin, return on assets, and return on equity for 2016 and 2015.

Johnson & Johnson reported profit margins of 23.0% and 22.0% in 2016 and 2015, respectively. The results indicate that *Johnson & Johnson* is able to return 23.0 and 22.0 cents of each dollar of sales to its stockholders in 2016 and 2015, respectively. Its return on assets of 12.0% and 11.7% in 2016 and 2015, respectively, suggests that for each dollar invested in assets, the return is about \$0.12 and \$0.12 in 2016 and 2015, respectively. The return on equity of 23.6% and 21.9% in 2016 and 2015, respectively, indicates that for each dollar of equity invested, the return is about \$0.24 and \$0.22 in 2016 and 2015, respectively.

All profitability ratios are positive. All three ratios increased from 2015 to 2016. One reason for the increase is higher income in 2016; however, further analysis is required to determine the contributing factors. For example, an analyst could examine the income statement line items for any changes or unusual items. In this case, part of the increase in net income in 2016 is due to the lower selling, marketing, and administrative expenses. In addition, the denominator in two of the ratios is increasing, suggesting that *Johnson & Johnson* is able to increase overall profitability as a percentage of sales and total assets.

Profitability Measure	2016	2015
Profit Margin = $\frac{\text{Net Income}}{\text{Sales}}$	$\frac{\$16,540}{\$71,890} = 23.0\%$	$\frac{\$15,409}{\$70,074} = 22.0\%$
Return on Assets = $\frac{\text{Net Income}}{\text{Average Total Assets}}$	$\frac{\$16,540}{\$137,310} = 12.0\%$	$\frac{\$15,409}{\$131,885} = 11.7\%$
Average Total Assets = $\frac{\text{Beginning Total Assets} + \text{Ending Total Assets}}{2}$	$\frac{\$133,411 + 141,208}{2} = \$137,310$	$\frac{\$130,358 + 133,411}{2} = \$131,885$
Return on Equity = $\frac{\text{Net Income}}{\text{Average Stockholders' Equity}}$	$\frac{\$16,540}{\$70,085} = 23.6\%$	$\frac{\$15,409}{\$70,451} = 21.9\%$
Average Stockholders' Equity = $\frac{\text{Beginning Stockholders' Equity} + \text{Ending Stockholders' Equity}}{2}$	$\frac{\$69,752 + 70,418}{2} = \$70,085$	$\frac{\$71,150 + 69,752}{2} = \$70,451$

Exhibit 5B.1 summarizes profitability ratios, computations, desirable characteristics, and potential problems.

EXHIBIT 5B.1 Profitability Ratios

Ratios	Equation	Desirable Characteristics	Potential Problems
Profit Margin = $\frac{\text{Net Income}}{\text{Sales}}$	(5B.1)	Higher ratio is preferred to lower.	Net income can include non-recurring items.
Return on Assets = $\frac{\text{Net Income}}{\text{Average Total Assets}}$	(5B.2)	Higher ratio is preferred to lower.	Net income can include non-recurring items.
<i>Denominator:</i>			
Average Total Assets = $\frac{\text{Beginning Total Assets} + \text{Ending Total Assets}}{2}$	(5B.3)		
Return on Equity = $\frac{\text{Net Income}}{\text{Average Stockholders' Equity}}$	(5B.4)	Higher ratio is preferred to lower.	Net income can include non-recurring items.
<i>Denominator:</i>			
Average Stockholders' Equity = $\frac{(\text{Beginning Stockholders' Equity} + \text{Ending Stockholders' Equity})}{2}$	(5B.5)

Statements of Financial Position and Cash Flows and the Annual Report

LEARNING OBJECTIVES

- 1 Discuss the usefulness and limitations of the statement of financial position, including its use in understanding liquidity, solvency, and financial flexibility.
- 2 Provide an overview of classifications on the statement of financial position for typical assets, liabilities, and stockholders' equity.
- 3 Explain the presentation of current and noncurrent assets and liabilities on the statement of financial position and name the common statement formats.
- 4 Explain the statement of cash flows and classify common business activities into operating, investing, and financing cash flows.
- 5 Explain the direct and indirect formats of the statement of cash flows.
- 6 Review the four primary financial statements and financial statement articulation.
- 7 Explain the purpose of the notes to the financial statements, including the summary of significant accounting policies, subsequent events, going concern uncertainties, and related-party transactions.
- 8 Identify and describe the typical content of an annual report.

Introduction

THE BALANCE SHEET, or statement of financial position, summarizes an entity's economic resources (assets), obligations (liabilities), and stockholders' equity. Financial statement users rely on the balance sheet information to help determine an entity's ability to generate future cash flows and to evaluate its exposure to risk. A strong balance sheet generally indicates a firm with solid financial health.

What makes a balance sheet strong? In simple terms, a strong balance sheet has limited obligations so that a company can make timely debt payments. A company with significant levels of debt may be at risk of defaulting on payments or even filing for bankruptcy when the economy is faltering or markets are weak. Declining sales and low cash flows make it difficult for a company to liquidate its debt when due.

Companies actively manage their levels of debt. To maximize shareholder return, companies seek to borrow at low interest rates and operate efficiently. Too much debt can drain a company's ability to grow when cash is used to make debt payments rather than to invest. Consider *Zoe's Kitchen Inc.*, a fast, casual restaurant chain that raised over \$80 million in its 2014 initial public offering (IPO). *Zoe's Kitchen* planned to use about \$50 million to "clean up" its balance sheet by paying off debt and allocating the remaining \$30 million to support growth plans. With the cash raised from the IPO, *Zoe's Kitchen* was able to both lower

marcelokrelling/Fotolia

its debt and fund future growth. The lower debt also frees up cash for investment that would have otherwise been used to pay principal and interest on the debt.

A healthy balance sheet, then, provides adequate cash and other assets for managing day-to-day operations, making timely debt payments, stimulating future growth, and funding any unexpected needs. The importance of cash management necessitates a separate financial statement, the *statement of cash flows*, to explain changes in cash.

In this chapter, we complete our look at the four basic financial statements by examining the *statement of financial position* and the *statement of cash flows*. (We addressed the statements of net income and comprehensive income and the statement of stockholders' equity in Chapter 5.) The discussion begins with an overview of the balance sheet, followed by an examination of the presentation of current and noncurrent

assets and liabilities on the statement of financial position. We then introduce the statement of cash flows. We also discuss the differences between U.S. GAAP and IFRS regarding the form and content of the statement of financial position and the statement of cash flows.

Next, we examine how the four basic financial statements interrelate, or *articulate*, to provide comprehensive information on a company's operating performance and financial position. Financial reports also include the notes that accompany the financial statements, a key source of essential information regarding a company's accounting policies and further explain the amounts reported. The financial statements are usually part of a company's annual report to shareholders, which also includes additional disclosures that supplement and enhance the financial statements. We outline the components of the annual report using the *Johnson & Johnson* 2016 annual report. «

- 1 Discuss the usefulness and limitations of the statement of financial position, including its use in understanding liquidity, solvency, and financial flexibility.

The Statement of Financial Position

The **statement of financial position**, also called the **balance sheet**, lists an entity's assets, liabilities, and equity as of a specific point in time.¹ The balance sheet consists of permanent accounts with cumulative balances that the company carries forward period to period over the life of the firm. As noted in Chapter 4, permanent accounts are not closed at year-end.

THE CONCEPTUAL FRAMEWORK CONNECTION: Usefulness and Limitations of the Balance Sheet

The balance sheet provides critical information to financial statement users in three key areas. Specifically, the balance sheet:

1. Summarizes the economic resources and obligations that impact the entity's ability to generate future cash flows.
2. Is useful in assessing an entity's rate of return on its investments when examined in conjunction with the income statement.
3. Aids in assessing the risk associated with an entity by providing inputs for cash flow measures.

Three common cash flow measures based on balance sheet information are *liquidity*, *solvency*, and *financial flexibility*. **Liquidity** is a measure of an asset's nearness to cash—that is, how quickly the firm can convert assets into cash and pay liabilities with minimal risk of loss. Analyzing an entity's liquidity allows investors to determine whether it will have the resources needed to pay its currently maturing obligations, pay dividends, and/or buy back its own equity shares. Thus, the more liquid an entity, the lower the risk associated with that entity.

Solvency is a measure of a firm's long-term ability to pay its obligations as they mature. A firm with a high level of debt relative to its equity may have difficulty meeting the fixed payments associated with its debt and therefore is in a position of low solvency. We discuss various financial ratios that are used to measure liquidity and solvency in Appendix B.

¹We use the terms statement of financial position and balance sheet interchangeably in this chapter.

Financial flexibility indicates an entity's ability to respond to unexpected needs and opportunities by taking actions that alter the amounts and timing of cash flows. For example, expanding into international markets may require additional debt financing. An entity with low levels of debt on its balance sheet can borrow the funds needed to finance this expansion. The greater an entity's financial flexibility, the lower its risk.

Whereas the statement of financial position provides a number of benefits, financial statement users also realize that the statement has certain limitations related to the following issues.

- Many of the accounts on the balance sheet are reported at historical cost as opposed to market values or liquidation values. For example, assume an entity purchased land 10 years ago for \$1,000 that now has a market value of \$10,000. The firm reports the asset on the balance sheet under U.S. GAAP at the historical cost of \$1,000. In this way, relying on historical costs limits the relevance of information in the balance sheet.
- A number of assets and liabilities are not reported on the balance sheet. For example, assets such as human capital and a company's reputation for quality products will not be reported on the balance sheet.
- Many of the accounts reported on the balance sheet are based on estimates as opposed to determinable amounts. For example, the net realizable value of accounts receivable is based on the estimated amount of cash that the entity expects to collect.

- ② Provide an overview of classifications on the statement of financial position for typical assets, liabilities, and stockholders' equity.

Balance Sheet Classifications

The three primary classifications on the balance sheet are assets, liabilities, and stockholders' equity. The balance sheet utilizes sub-classifications within each of these broad groups that enhance the usefulness of the balance sheet by grouping the accounts according to characteristics such as nature, function, or size. One of the primary distinctions is *current* versus *noncurrent*. **Noncurrent assets** are resources that the firm expects to convert to cash, use, or consume in a period of more than one year or one operating cycle, whichever is longer. **Noncurrent liabilities** are obligations that are due after one year or one operating cycle, whichever is longer. Exhibit 6.1 presents the typical groupings used to subdivide these categories; we discuss each of these sub-classifications in more detail in the following pages.

EXHIBIT 6.1 Balance Sheet Classifications

Assets	Liabilities	Stockholders' equity
Current assets	Current liabilities	Contributed capital
Noncurrent assets	Noncurrent liabilities	
– Long-term investments		Retained earnings
– Property, plant, and equipment		Accumulated other comprehensive income
– Intangible assets		Noncontrolling interest
– Other assets		

Managers make several decisions related to how to report, or format, the classifications in Exhibit 6.1 on the balance sheet. The reporting options include:

- Aggregating and summarizing accounts into financial statement components or line items. For example, a company could have several accounts for property, plant, and equipment in its general ledger that it aggregates and summarizes in a single line item called "Property, plant, and equipment."
- Grouping or classifying the components. Specifically, assets and liabilities can be grouped or classified as current and noncurrent.
- Providing subtotals and totals. Subtotals often relate to how items are grouped.

Assets

As indicated in Exhibit 6.1, assets are generally subdivided on the balance sheet as *current assets*; *long-term investments*; *property, plant, and equipment*; *intangible assets*; and *other assets*.

Current Assets. **Current assets** are resources that the firm expects to convert to cash, to use, or to consume within one year or one *operating cycle*, whichever is longer. The **operating cycle** is the period of time from the acquisition of goods to the point at which the entity receives cash from the sale of the goods. For example, consider a clothing wholesaler whose operating cycle begins when it purchases clothing inventory. It will then sell the inventory to retailers on credit. The operating cycle is completed when the wholesaler receives payment from its customers.

Current assets primarily include:

- *Cash and cash equivalents.*
- *Short-term investments.*
- *Accounts receivable.*
- *Inventory.*
- *Prepaid expenses.*

Cash and cash equivalents include cash (coins, currency, and money orders) and cash equivalents (short-term, highly liquid investments acquired with three months or less to maturity). Cash equivalents include:

- Commercial paper (i.e., short-term loans receivable from high-quality corporations sold by commercial banks).
- Money market funds.
- U.S. Treasury bills.

For example, a three-year Treasury instrument acquired with two months to maturity is a cash equivalent.

Short-term investments not classified as cash equivalents are investments in debt or equity securities of other corporations or governmental entities that the entity has the ability and intent to sell within the next year or operating cycle, whichever is longer. For example, an entity would classify 100 shares of *Microsoft* that it intends to sell within the next year as a short-term investment.

Accounts receivable (also called trade receivables) are amounts owed to the entity resulting from the sale of goods or services to customers on credit. Accounts receivable arise in the normal course of a company's trade or business and do not require a formal written agreement.² Accounts receivable are measured net of an allowance for estimated bad debts and are classified as current assets because they are usually due within 30 to 60 days.

Inventory is tangible property that is either (a) held for sale in the ordinary course of business, (b) used as raw materials in the manufacturing process to produce finished goods to be sold in the ordinary course of business, or (c) held as supplies to be currently consumed when providing goods or services. For a retail or wholesale business, inventory includes all goods held for resale. In the case of a manufacturing company, inventory is made up of three components: raw materials, work-in-process, and finished goods. Inventory is classified as a current asset.

Prepaid expenses are assets that arise when expenses are paid before they are incurred. Common examples are prepaid rent and prepaid insurance. Prepaid expenses are typically considered current assets because the benefits associated with these prepayments are usually consumed within a year or operating cycle if longer. However, any portion of the associated benefit that extends beyond the upcoming year is classified as noncurrent in other assets.

Long-Term Investments. **Long-term investments** are noncurrent assets that are not used directly in the operations of the business. Examples are investments in debt and equity securities and investments in land and other property that are not used in operations. Long-term investments

²A *note receivable* is a receivable supported by a formal agreement that specifies payment terms.

are classified as noncurrent because management does not intend to convert them into cash within the next year (or operating cycle, if longer).

Property, Plant, and Equipment. **Property, plant, and equipment** are assets that are tangible, long-lived, and used in the production and sale of the company's goods and services. This balance sheet category includes items such as buildings, land, machinery and equipment, office furniture and equipment, and natural resources. With the exception of land (which is not depreciated), all property, plant, and equipment is reported on the balance sheet net of accumulated depreciation or depletion.

Intangible Assets. **Intangible assets** are assets that lack physical substance but have economic value due to the rights they confer upon the holder. This classification does not include financial assets. Common examples of intangible assets include trademarks, trade names, broadcast licenses, patents, copyrights, and franchises. Certain intangible assets are reported on the balance sheet net of accumulated amortization, but others are not subject to amortization. Intangible assets that have a definite or finite useful life are amortized whereas those that have an indefinite life are not amortized.³

Other Assets. This other assets category includes any noncurrent asset that does not fall into any of the primary balance sheet classifications. For example, long-term prepaid expenses and land held for resale may be classified as other assets.

Liabilities

Liabilities are generally classified on the balance sheet as either *current* or *noncurrent*. We discuss each next.

Current Liabilities. **Current liabilities** are obligations that the firm expects to liquidate through the use of current assets or the creation of other current liabilities. Current liabilities will typically be paid within one year or operating cycle, whichever is longer. Current liabilities commonly include:

- *Accounts payable.*
- *Short-term notes payable.*
- *Current maturities of long-term debt.*
- *Accrued liabilities.*
- *Unearned revenues.*

Accounts payable (also called trade payables) are obligations due to suppliers of goods or services incurred in the normal course of business operations. There is no formal, written agreement required for an accounts payable.⁴ If customers pay on time, there is no interest on accounts payable. Accounts payable are classified as current liabilities because they are generally due within 30 to 60 days.

Short-term notes payable are formal, written promises to pay cash at a fixed maturity date in the future. The maturity date is within the next year or operating cycle, if longer. Notes payable will usually carry a fixed rate of interest but may have an interest rate of zero.⁵

Current maturities of long-term debt represent the portion of any long-term debt that is payable within the next year or operating cycle, if longer. However, this amount must be paid from current assets or result in the creation of other current liabilities in order to be classified as current. For example, if the maturity of the debt is extended or if the debt is replaced by equity or other long-term debt, the debt is classified as long term.

³We discuss depreciation and amortization in depth in Chapter 11.

⁴If a formal agreement exists, then the payable is classified as a note payable.

⁵We discuss these notes payable in Chapter 14.

Accrued liabilities represent expenses incurred by an entity that remain unpaid at the end of the accounting period. Accrued liabilities include items such as utilities payable, wages and salaries payable, interest payable, and taxes payable. These accounts will be paid within the next year or operating cycle, if longer. If the entity will not pay an accrued liability within the next year, it classifies it as a *long-term liability*.

Unearned revenues (sometimes referred to as deferred revenues) are liabilities resulting from advance collections of cash from a customer for goods or services to be provided in the future under existing sales or service contracts. The firm removes the liability from the balance sheet when it provides the goods or services to the customer. If the firm will not provide the goods or services associated with the unearned revenues to the customer within the next year (or operating cycle, if longer), it classifies the unearned revenue as a *long-term liability*.

Noncurrent Liabilities. **Noncurrent liabilities** are obligations an entity does not expect to satisfy within one year or operating cycle, whichever is longer. Noncurrent liabilities are not liquidated through the use of current assets or the creation of other current liabilities. Long-term notes payable, the long-term portion of capital lease obligations, bonds payable, and pension obligations are examples of noncurrent liabilities.

Stockholders' Equity

Stockholders' equity, also referred to as shareholders' equity and owners' equity, is generally separated into four major categories: *contributed capital*, *retained earnings*, *accumulated other comprehensive income*, and *noncontrolling interest*.⁶

Contributed Capital. **Contributed capital** (also called paid-in capital) primarily represents the amounts invested by shareholders. It includes the stock sold by the entity at face or *par value* and amounts received above *par value*, known as additional paid-in capital or paid-in capital in excess of par. The face or stated value on the share certificate is its **par value**, which is an arbitrary value that the organizers of the corporation place on the stock.⁷

Retained Earnings. **Retained earnings** are the cumulative earnings (losses) of the company that have not been distributed as dividends to shareholders.

Accumulated Other Comprehensive Income. Comprehensive income is the change in an entity's equity during the period resulting from transactions with nonowners. In other words, it includes all changes in equity during a period except those changes that result from investments and distributions to owners. Comprehensive income is the sum of net income and other comprehensive income. Other comprehensive income includes revenues, expenses, gains, and losses that are excluded from net income but included in comprehensive income.

Accumulated other comprehensive income (or loss) is the cumulative amount of other comprehensive income (or loss) over the life of the entity.⁸

Noncontrolling Interest. A **noncontrolling interest** exists when one company controls another company (e.g., a subsidiary) but owns less than 100% of its voting shares. The controlling company adds all of the subsidiary's assets and liabilities to its own balance sheet. However, because it does not own 100% of the voting shares, it must separate the amount that is owned by outside shareholders. The noncontrolling interest is the amount of the company's net assets owned by outside shareholders.⁹ To illustrate, assume a parent company owns 90% of the voting shares of a subsidiary that reports \$100 in assets and \$40 in liabilities. The shareholders' equity (net assets) of the subsidiary is equal to \$60 with \$6 ($10\% \times \$60$) of the net assets owned by the noncontrolling interest.

⁶We will expand our discussion of stockholders' equity in Chapter 15 to include transactions such as treasury stock and dividends.

⁷We discuss capital stock in greater detail in Chapter 15.

⁸IFRS uses the term *reserves* for accumulated other comprehensive income.

⁹The noncontrolling interest is a required classification in the stockholders' equity section of corporate balance sheets. The accounting for the ownership and control of other companies is covered in detail in advanced accounting courses.

IFRS Balance Sheet Classification

IFRS has additional requirements for the presentation of specific asset and liability line items.

Assets: IFRS. As an additional requirement, IFRS specifies that, at a minimum, companies report the following asset categories:¹⁰

- Cash and cash equivalents
- Trade and other receivables
- Investments accounted for using the equity method¹¹
- Financial assets (other than those included in investments, receivables, and investment properties)
- Inventories
- Property, plant, and equipment
- Biological assets (i.e., living animals or plants)
- Investment properties
- Intangible assets
- Receivables related to current taxes
- Deferred-tax assets

Similar to U.S. GAAP, IFRS defines current assets as resources that the firm expects to convert to cash, use, or consume within one year or one operating cycle, whichever is longer. However, IFRS also requires that current assets be held primarily for trading or cash and cash equivalents (unless they are restricted for use).

Liabilities: IFRS. IFRS specifically requires that, at a minimum, companies report the following liabilities:¹²

- Trade and other payables
- Provisions (such as warranty liabilities and pension benefits)
- Financial liabilities (other than the above)
- Taxes payable
- Deferred tax liability

IFRS defines current liabilities similarly to U.S. GAAP as obligations that the firm expects to liquidate through the use of current assets or the creation of other current liabilities that will typically be paid within one year or operating cycle, whichever is longer. In addition, IFRS specifies that current liabilities are obligations held primarily for trading and for which a company does not have the right to defer settling beyond the current year.

- ③ Explain the presentation of current and noncurrent assets and liabilities on the statement of financial position and name the common statement formats.

Balance Sheet Presentation and Format

Assets, liabilities, and equity are the key elements on corporate balance sheets. We now describe the balance sheet presentation and the two formats found in practice.

Asset Presentation

After grouping assets as current and noncurrent, companies make further classifications. Specifically, within current and noncurrent assets, companies list each asset in decreasing order of liquidity. Current assets precede noncurrent assets. The most liquid asset is first, followed by less liquid assets. Cash, the most liquid asset, is usually listed first, followed by short-term investments, receivables, and then other less liquid assets.

¹⁰This list is from IASC, *International Accounting Standard 1*, “Presentation of Financial Statements” (London, UK: International Accounting Standards Committee, Revised), Paragraph 54. Although the FASB does not require that any particular asset categories be reported, the SEC does have this requirement. See Regulation S-X Rule 5-02.

¹¹We discuss these investments in detail in Chapter 16.

¹²This list is from IASC, *International Accounting Standard 1*, “Presentation of Financial Statements,” Paragraph 54. Although FASB does not require that any particular liability categories be reported, the SEC does have this requirement. See Regulation S-X Rule 5-02.

Liabilities Presentation

Companies list liabilities in increasing order of maturity. That is, current liabilities are listed before long-term liabilities. Also, within each group, the individual liability accounts are listed in order of maturity. Thus, accounts payable is often the first liability listed on the balance sheet and is reported before the current portion of long-term debt.

Balance Sheet Format

There are two balance sheet formats:

1. The **account format** lists assets on the left side and liabilities and stockholders' equity on the right side of the statement.
2. The **report format** lists liabilities and stockholders' equity directly below assets on the same page.

Exhibit 6.2 presents a sample account format balance sheet for Breanne Baking Equipment Company. Exhibit 6.3 presents a sample report format balance sheet for the same company. Notice that there is no quantitative difference between these two formats: It is simply a matter of whether the liabilities and equity sections appear in a column beside the assets (the account format) or below the assets (the report format).

EXHIBIT 6.2 Account Form Balance Sheet

Breanne Baking Equipment Company Balance Sheet As of December 31, 2018			
Assets		Liabilities	
Current Assets:		Current Liabilities:	
Cash	\$ 5,000	Accounts Payable	\$ 2,700
Trading Securities at fair value	700	Short-Term Notes Payable	1,000
Accounts Receivable – net	11,000	Current Portion of Long-Term Debt	300

Balance Sheet Presentation: IFRS

IFRS allows an alternative presentation of assets and liabilities by liquidity rather than current and noncurrent groupings so that companies can choose the most effective presentation for financial statement users. Company managers determine the presentation based on their knowledge of the company and its operations.

Asset Presentation: IFRS. IFRS-reporting companies can present either current assets or noncurrent assets first. So, IFRS permits asset presentation in either a decreasing or an increasing order of liquidity. When using an increasing order of liquidity, the least-liquid assets are typically presented first within each balance sheet section. Exhibit 6.4 recasts the Breanne Baking Equipment Company's balance sheet into an IFRS-allowable format by reporting noncurrent assets before current assets and using reverse liquidity ordering.

Liabilities Presentation: IFRS. Similarly to asset presentation, IFRS does not prescribe the ordering of liabilities within each group. In Exhibit 6.4, Breanne Baking Company reports current liabilities before noncurrent liabilities on its balance sheet unlike its presentation of non-current assets before current assets.

Balance Sheet Format: IFRS. Under IFRS, aside from the current and noncurrent (or liquidity) presentations, companies have flexibility regarding the format of their balance sheets. For example, Breanne Baking Equipment Company's balance sheet in Exhibit 6.4 includes the total of *net assets*, \$66,000 at December 31, 2018. **Net assets**, equal to assets minus liabilities, is another term used for equity. Notice in Exhibit 6.4 that Breanne's total stockholders' equity is also \$66,000.

Exhibit 6.4 illustrates the use of the increasing order of liquidity with regard to assets.

Judgment and the Balance Sheet

We introduced earnings management in Chapters 3 and 5 related to reported earnings numbers. Managers also make judgments related to amounts reported as assets and liabilities on the balance sheet. Because managers have incentives to manage the balance sheet, financial statement users should be aware of balance sheet management.

Consider the concepts of liquidity, solvency, and financial flexibility that we discussed earlier. Financial statement users prefer to provide resources to entities with a high level of liquidity, solvency, and financial flexibility. Thus, managers may classify liabilities as noncurrent as opposed to current to enhance the users' perception of the entity's liquidity. As another example, managers have an incentive to classify an item as equity as opposed to debt or not to report a debt on the balance sheet at all in order to enhance the perception of solvency and financial flexibility.

In addition to these incentives, a judgment that results in earnings management in turn results in balance sheet management. For example, if an entity makes a choice not to record warranty expense, then it is simultaneously making the decision not to report a warranty liability, which improves a company's liquidity position.

- 4 Explain the statement of cash flows and classify common business activities into operating, investing, and financing cash flows.

The Statement of Cash Flows

Cash, one of a company's most important assets, is critical to successful operations and growth. A company needs cash to purchase equipment to manufacture products, to pay employees, and to invest in research. The importance of cash flow merits a separate financial statement devoted to explaining how a company generates cash and indicating where cash is employed. The **statement of cash flows** summarizes a firm's cash inflows and outflows over a period of time.

In this section, we discuss the purpose of the statement of cash flows and the classifications used in the statement. Appendix A presents an overview of the preparation of the statement of cash flows; we revisit this material in more depth in Chapter 22.

Retained Profits	<u>5,000</u>
Total Shareholders' Equity	<u>\$ 66,000</u>
Total Liabilities and Shareholders' Equity	<u>\$ 172,100</u>

THE CONCEPTUAL FRAMEWORK CONNECTION: Purpose of the Statement of Cash Flows

The statement of cash flows provides information to financial statement users about a firm's cash receipts and cash payments during a period of time. The statement reconciles the change in the cash balance (where cash is defined as cash and cash equivalents) to the cash flows for the period and summarizes the firm's cash flows by *operating*, *investing*, and *financing activities*. The statement of cash flows enables financial statements users to:

1. Assess the entity's ability to meet its obligations and pay dividends.
2. Determine whether the entity will require external financing.
3. Identify the differences between net income and the associated cash receipts and payments.

The statement of cash flows explains and reconciles many other significant changes in balance sheet items, particularly when it is analyzed with the other financial statements and related footnote disclosures.

Statement of Cash Flows Classifications

The statement of cash flows is divided into three distinct sections: *operating*, *investing*, and *financing* activities. The statement presents operating activities first, followed by cash flows from investing activities, and finally cash flows from financing activities. The sum of cash inflows or outflows for these three activities results in the net increase or decrease in cash and cash equivalents for the period. The next step is reconciling this change in cash and cash equivalents to the beginning and ending cash and cash equivalents balances. Therefore, the change in cash and cash equivalents on the statement of cash flows plus the beginning cash and cash equivalents balance equals the ending cash and cash equivalents balance as depicted in Exhibit 6.5.

EXHIBIT 6.5 Statement of Cash Flows Classifications

	Net Cash Provided (Used) by Operating Activities
Plus (Minus)	Net Cash Provided (Used) by Investing Activities
Plus (Minus)	Net Cash Provided (Used) by Financing Activities
Equals	Net Increase (Decrease) in Cash and Cash Equivalents
Plus	Beginning Cash and Cash Equivalents
Equals	Ending Cash and Cash Equivalents

Operating Activities. Operating activities include cash receipts and disbursements related to the production and delivery of goods and services that are reported on an accrual basis on the statement of net income. A firm must have a positive net cash flow related to operating activities over the long run in order to sustain its operations. Analyzing cash flows from operating activities enables financial statement users to assess the firm's ability to generate future cash flows from its normal earnings cycle.

Cash flows from operating activities primarily include:

1. Cash receipts from customers.
2. Cash receipts from interest and dividends.
3. Cash payments for the purchase of goods for resale or for use in production.
4. Cash payments to suppliers and employees.
5. Cash payments for taxes.
6. Cash payments for interest.

From Exhibit 6.6, *Golden Enterprises, Inc.*, a food company making Gold Flake brand snack foods, net cash provided by operating activities was \$7,135,855 for the year ended June 3, 2016.

EXHIBIT 6.6 Statement of Cash Flows, *Golden Enterprises*, Financial Statements, June 3, 2016

GOLDEN ENTERPRISES, INC. AND SUBSIDIARY CONSOLIDATED STATEMENTS OF CASH FLOWS For the Fiscal Years Ended June 3, 2016 and May 29, 2015		
	<u>2016</u>	<u>2015</u>
Cash flows from operating activities		
Cash received from customers	\$136,289,283	\$131,980,056
Miscellaneous income	97,108	88,918
Cash paid to suppliers and employees for cost of goods sold	(66,550,001)	(63,720,473)
Cash paid for suppliers and employees for selling, general and administrative	(61,224,782)	(61,947,388)
Income taxes	(1,140,191)	(1,839,759)
Interest expense	(335,562)	(458,184)
Net cash provided by operating activities	7,135,855	4,103,170
Cash flows from investing activities		
Purchases of property, plant and equipment	(1,182,854)	(2,725,450)

Net cash used in investing activities	(1,126,408)	(2,440,644)
Cash flows from financing activities		
Change in line of credit	(2,823,477)	294,966
Debt (repayments) proceeds	(824,435)	1,698,505
Principal payments under capital lease obligation	(30,970)	–
Purchases of treasury shares	–	(2,204,375)
Cash dividends paid	(1,496,160)	(1,452,803)
Net cash used in financing activities	(5,175,042)	(1,663,707)
Net increase (decrease) in cash and cash equivalents	834,405	(1,181)
Cash and cash equivalents at beginning of year	1,159,449	1,160,630
Cash and cash equivalents at end of year	<u>\$ 1,993,854</u>	<u>\$ 1,159,449</u>
Supplementary Cash Flow information:		
In the period ending June 3, 2016 the Company entered into capital leases totaling \$239,382.		

Source: Golden Enterprises, Inc. Statement of Cash Flows, June 3, 2016. https://www.sec.gov/Archives/edgar/data/42228/000114420416120097/v447241_10ka.htm#a_014

Investing Activities. Cash flows from **investing activities** relate to acquiring and disposing of productive property, investing in debt and equity securities, and making and collecting loans. Cash flows from investing activities primarily include:

1. Cash receipts from the collection or sale of notes receivable from lending to others.
2. Cash receipts from the sale of debt and equity securities of other entities.
3. Cash receipts from the sale of productive assets (e.g., property, plant, and equipment).
4. Cash payments for extending credit to others.
5. Cash payments for investments in the debt and equity securities of other entities.
6. Cash payments for property, plant, and equipment, and other productive assets.

From Exhibit 6.6, *Golden Enterprises'* net investing cash flows were \$(1,126,408) for the year ended June 3, 2016. Its investing cash outflows include cash payments for items such as the acquisition of property, plant, and equipment whereas its investing cash inflows are from the sale of property, plant, and equipment.

Financing Activities. Financing activities involve the cash receipts and payments from debt and equity financing. Cash flows from financing activities primarily include:

1. Cash receipts from issuing equity to owners.
2. Cash receipts from borrowing through bonds and notes or other debt instruments.
3. Cash payments to repurchase equity from owners.
4. Cash payments for principal on debt.
5. Cash payments for dividends.

Golden Enterprises' net financing cash flows for the year ended June 3, 2016, were \$(5,175,042) as Exhibit 6.6 illustrates. The company's financing cash outflows primarily include cash payments for lines of credit, debt, and dividends. Exhibit 6.7 summarizes common cash inflows and outflows by operating, investing, and financing activities.

EXHIBIT 6.7 Common Cash Inflows and Outflows: Operating, Investing, and Financing Activities

	Cash Receipts	Cash Payments
Operating	<ul style="list-style-type: none"> • Receipts from customers • Receipts from interest and dividends 	<ul style="list-style-type: none"> • Payments for the purchase of goods for resale or for use in production • Payments to suppliers and employees • Payments for taxes • Payments for interest
Investing	<ul style="list-style-type: none"> • Receipts from the collection or sale of notes • Receipts from the sale of investments in debt and equity securities • Receipts from the sale of productive assets (e.g., property, plant, and equipment) 	<ul style="list-style-type: none"> • Payments for extending credit to others • Payments for investments in debt and equity securities • Payments for property, plant, and equipment, and other productive assets
Financing	<ul style="list-style-type: none"> • Receipts from issuing equity to owners • Receipts from borrowing through bonds, notes, or other debt instruments 	<ul style="list-style-type: none"> • Payments to repurchase equity from owners (e.g., treasury stock) • Payments for principal on debt • Payments for dividends

Classification of Dividends, Interest, and Taxes: IFRS

IFRS differs from U.S. GAAP in the classification of the following items:

1. Cash receipts from interest and dividends
2. Cash payments for taxes
3. Cash payments for interest
4. Cash payments for dividends

As shown in Exhibit 6.8, U.S. GAAP requires companies to report the preceding items in operating cash flows except for the payment of dividends. IFRS grants companies discretion in classifying these items as operating, investing, or financing activities as Exhibit 6.8 illustrates.

EXHIBIT 6.8 Classification of Dividends, Interest, and Taxes

Activities	Standard	
	U.S. GAAP	IFRS
Cash receipts from interest and dividends	Operating	Operating or Investing
Cash payments for taxes	Operating	Operating activities, unless they can be specifically identified with Financing or Investing activities.
Cash payments for interest	Operating	Operating or Financing
Cash payments for dividends to owners	Financing	Operating or Financing

- 5 Explain the direct and indirect formats of the statement of cash flows.

Format for Cash Flows from Operating Activities

There are two acceptable formats for cash flows from operating activities:

- The *indirect method* (or the reconciliation format)
- The *direct method* (or the income statement format)

The only difference between the statement of cash flows under the direct and indirect methods is reporting cash flows from operating activities: The investing and financing sections of the direct and indirect reporting formats are the same. The FASB prefers the direct method, but it is the least popular in practice—it is used by only 1% of U.S. companies.¹³ What explains this disconnect? Companies generally indicate that they do not have systems in place to provide them with the needed information to prepare a statement of cash flows under the direct format.¹⁴

We begin our discussion by presenting operating activities under the indirect method. Appendix A presents additional detail on the different formats for cash flows from operating activities; we examine the preparation of the statement of cash flows in more depth in Chapter 22.

The Indirect Method of Reporting Cash Flows from Operating Activities. The **indirect method** (also referred to as the reconciliation format) begins with net income from the income statement and then reconciles the net income to net cash generated from operating activities. Reconciling items are separated into two groups:

- Adjustments for noncash items
- Changes in operating assets and liabilities

Exhibit 6.9 lists a few of the common adjustments or reconciling items.

¹³AICPA, *Accounting Trends and Techniques* – 2012 (New York, NY: AICPA, 2012).

¹⁴For example, see pages 12 through 15 of the comment letter from the Financial Executives International to the FASB concerning the discussion paper on Financial Statement Presentation. This letter can be found at <http://www.fasb.org/cs/BlobServer?blobkey=id&blobwhere=1175818489075&blobheader=application%2Fpdf&blobcol=urldata&blobtable=MungoBlobs>

EXHIBIT 6.9 Reconciling Items for the Indirect Method**ADDITIONS:****Additions—Noncash Transactions**

- Depreciation, depletion, and amortization expense
- Bad debt expense
- Loss on sale of long-term assets
- Unrealized losses on investment trading securities and certain other investments

Additions—Changes in Operating Assets and Liabilities

- Decreases in current assets (accounts receivable, inventory, prepaid expenses)
- Increases in current liabilities (accounts payable, accrued liabilities)

DEDUCTIONS:**Deductions—Noncash Transactions**

- Gain on sale of long-term assets
- Unrealized gains on investment trading securities and certain other investments

Deductions—Changes in Operating Assets and Liabilities

- Increases in current assets (accounts receivable, inventory, prepaid expenses)
- Decreases in current liabilities (accounts payable, accrued liabilities)

Exhibit 6.10 provides the operating activities section of *Johnson & Johnson's* Statement of Cash Flows using the indirect method. Note that the first line in the operating section is net income, followed by the adjustments for noncash items such as depreciation and bad debt expense (referred to in the exhibit as “accounts receivable allowances”). Although depreciation expense and bad debt expense are deducted on the income statement, they are not cash outflows. Thus, *Johnson & Johnson* must add them back to net income to arrive at net operating cash flows.

Next, *Johnson & Johnson* adjusts for changes in operating assets and liabilities such as accounts receivable and accounts payable. Other common operating asset and liability adjustments are for inventory, prepaid expenses, and accrued liabilities.

EXHIBIT 6.10 Statement of Cash Flows, Operating Activities, *Johnson & Johnson*, Financial Statements, for the Year Ended January 1, 2017

JOHNSON & JOHNSON AND SUBSIDIARIES CONSOLIDATED STATEMENTS OF CASH FLOWS For Year Ended January 1, 2017			
(Dollars in Millions) (Note 1)			
	2016	2015	2014
Cash flows from operating activities			
Net earnings	\$16,540	\$15,409	\$16,323
Adjustments to reconcile net earnings to net cash flows from operating activities:			
Depreciation and amortization of property and intangibles	3,754	3,746	3,895
Stock-based compensation	878	874	792
Venezuela adjustments	–	122	87
Asset write-downs	283	624	410
Net gain on sale of assets/businesses	(563)	(2,583)	(2,383)
Deferred tax provision	(341)	(270)	441
Accounts receivable allowances	(11)	18	(28)
Changes in assets and liabilities, net of effects from acquisitions and divestitures:			
Increase in accounts receivable	(1,065)	(433)	(247)
Increase in inventories	(249)	(449)	(1,120)
Increase in accounts payable and accrued liabilities	656	287	1,194
Decrease in other current and noncurrent assets	18	65	442
(Decrease)/Increase in other current and noncurrent liabilities	(1,133)	2,159	(1,096)
Net cash flows from operating activities	<u>\$18,767</u>	<u>\$19,569</u>	<u>\$18,710</u>

Source: Johnson & Johnson's Statement of Cash Flows: Operating Activities, 2016. <http://files.shareholder.com/downloads/JNJ/3809936545x0xS200406-17-6/200406/filing.pdf>

To illustrate changes in operating assets and liabilities, consider accounts receivable. Assume that NRR Company reported accounts receivable of \$10,000 and \$12,000 at the beginning and end of the year, respectively. The company also reported \$55,000 in sales revenue. The increase in accounts receivable indicates that \$2,000 of this year's sales were not collected. As a result, NRR collected \$53,000 from customers (\$55,000 – \$2,000). Therefore, NRR subtracts the increase in accounts receivable (\$2,000) from net income to arrive at net cash provided by operations.

EXAMPLE 6.1 Operating Cash Flows: Indirect Method

PROBLEM: Walker Welding Company provided you with the following information for the current year:

Income Statement	Amount
Sales	\$25,000
Depreciation Expense	(3,000)
Selling, General, and Administrative Expenses	<u>(7,000)</u>
Operating Income	15,000
Tax Expense	<u>(6,000)</u>
Net Income	<u>\$ 9,000</u>

Account Changes from the Balance Sheet	
Increase in Accounts Receivable	\$6,000
Increase in Accounts Payable	\$2,500
Decrease in Income Taxes Payable	\$4,000

Compute net cash flow from operating activities for Walker Welding under the indirect reporting format.

SOLUTION: The indirect method requires applying a series of adjustments to net income to arrive at net cash flow from operating activities. We first add back depreciation expense because it is a noncash expense. That is, depreciation is an expense deducted on the income statement reducing net income, but it does not use cash.

Because accounts receivable increased by \$6,000 during the year, Walker Welding did not collect all of its sales. As a result, we subtract the increase in accounts receivable from net income to determine the cash collected from customers.

Accrual-basis expense is recognized at the same time that the accounts payable is recognized. However, if accounts payable increase, this indicates that Walker Welding has not yet paid the balance. Therefore, less cash is paid for expenses than reported under the accrual basis on the income statement. So, we add the increase in accounts payable back to net income to reflect the cash paid for these expenses.

The accrual-basis income tax expense is recognized at the same time that the income taxes payable is reported. Because the payable balance decreased, Walker Welding actually paid more for income taxes than it recorded as expense this year. In other words, the company paid all of this year's taxes and the remaining liability from last year. Thus, its cash-basis tax expense was higher than its accrual-basis tax expense, and we deduct the decrease in income tax payable from net income to arrive at operating cash flow.

Walker's operating activities section of the statement of cash flows follows.

Walker Welding Company	
Partial Statement of Cash Flows	
Operating Activities	Amount
Net Income	\$9,000
Add back: Depreciation Expense	3,000
Increase in Accounts Receivable	(6,000)
Increase in Accounts Payable	2,500
Decrease in Income Taxes Payable	<u>(4,000)</u>
Net Cash Provided by Operating Activities	<u>\$4,500</u>

Indirect Method: IFRS. Under IFRS, a company can begin its reconciliation to operating cash flows with other income numbers, such as income before taxes or operating income.¹⁵

The Direct Method of Reporting Cash Flows from Operating Activities. Under the **direct method** (also referred to as the income statement format) for reporting cash flows from operating activities, companies report actual cash inflows and outflows in the operating section of the statement of cash flows. That is, instead of presenting a reconciliation between net income and net operating cash flows, a company converts each individual income statement line item from the accrual to the cash basis.

The FASB prefers the direct method because the cash receipts and cash payments approach is easy to understand.

EXAMPLE 6.2 Operating Cash Flows: Direct Method

PROBLEM: Using the information provided by Walker Welding Company, compute net cash flow from operating activities using the direct reporting format.

SOLUTION: The direct method uses the same adjustments as the indirect method but applies the adjustments to each income statement line item, as illustrated in the following computation.

Income Statement	Accrual Basis		Cash Flow
	Amount	Adjustment	
Sales	\$25,000	Increase in Accounts Receivable: (\$6,000)	\$19,000
Depreciation Expense	(3,000)	Depreciation expenses: +\$3,000	0
Selling, General and Administrative Expenses	(7,000)	Increase in accounts payable: +\$2,500	(4,500)
Operating Income	15,000		
Tax Expense	(6,000)	Decrease in taxes payable: (\$4,000)	(10,000)
Net Income	<u>\$ 9,000</u>		<u>\$ 4,500</u>

We are now able to prepare the operating activities section under the direct method.

Walker Welding Company Partial Statement of Cash Flows	
Operating Activities	
Cash Collected from Customers	\$19,000
Cash Paid to Other Suppliers	(4,500)
Cash Paid for Taxes	(10,000)
Net Cash Provided by Operating Activities	<u>\$ 4,500</u>

- 6 Review the four primary financial statements and financial statement articulation.

Financial Statement Articulation

Financial statement articulation, the relationships among financial statements and financial statement elements, is a critical concept in understanding financial statements. The elements of the four basic financial statements are intrinsically interrelated:

- Firms compute net income and other comprehensive income (OCI) on the statements of net income and comprehensive income. Revenues and gains increase net income and expenses and losses decrease net income.

¹⁵We provide an in-depth discussion of this difference in the preparation of the statement of cash flows in Chapter 22.

- Both net income and OCI are then included in the stockholders' equity section of the balance sheet and affect the statement of stockholders' equity. Net income is used to arrive at ending retained earnings, and current-year OCI is used to arrive at the ending balance in accumulated OCI.
- Firms report ending retained earnings and ending accumulated OCI in the stockholders' equity section of the statement of financial position.
- Firms use the statement of net income (or the statement of comprehensive income) and the balance sheet to prepare the statement of cash flows. For example, operating cash flows are computed as net income, adjusted for the changes in operating working capital accounts on the balance sheet and noncash revenues and expenses on the statement of net income.

Exhibit 6.11 provides an overview of financial statement articulation.

EXHIBIT 6.11 Financial Statement Articulation

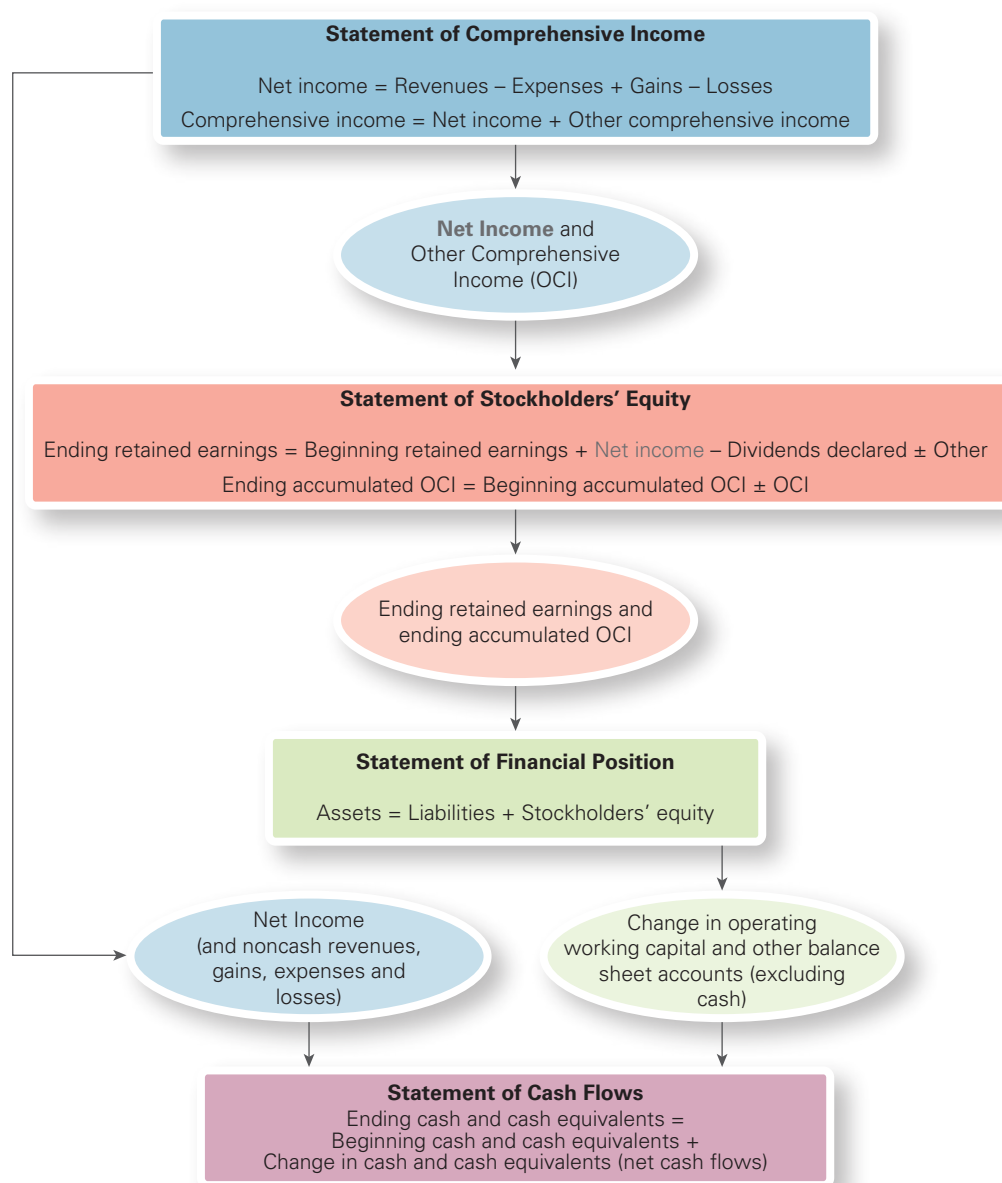

Exhibit 6.12 illustrates financial statement articulation using the 2016 *Johnson & Johnson* financial statements.

1. *Johnson & Johnson* reported net income of \$16,540 million on the statement of comprehensive income (and the statement of net income). This number then flows into the statement of stockholders' equity, resulting in an increase in retained earnings.
2. OCI for the year on the statement of comprehensive income is a loss of \$1,736 million, resulting in a decrease in accumulated OCI on the statement of stockholders' equity.
3. *Johnson & Johnson* reported the ending retained earnings balance, \$110,551 million, and the ending accumulated OCI balance, \$(14,901) million, from the statement of stockholders' equity on the balance sheet.
4. Under the indirect method, the cash flow statement begins with net income from the statement of comprehensive income, \$16,540 million, and adjusts for changes in various balance sheet accounts such as accounts receivable and inventory.
5. On the cash flow statement, the increase in cash and cash equivalents of \$5,240 million reconciles to the change in cash and cash equivalents from the balance sheet, where beginning cash and cash equivalents are \$13,732 million and ending cash and cash equivalents are \$18,972 million.

EXHIBIT 6.12 *Johnson & Johnson* Financial Statement Articulation (in millions), Financial Statements, For Year Ending January 1, 2017

STATEMENT OF COMPREHENSIVE INCOME		STATEMENT OF STOCKHOLDERS' EQUITY		
Revenues			Retained Earnings	Accumulated Other Comprehensive Income (Loss)
Expenses				
Net Income or Loss	\$16,540	Beginning Balance	\$103,879	\$(13,165)
Other Comprehensive Income (Loss)	(1,736)	Net Income	16,540	
Comprehensive Income	\$14,804	Other Comprehensive Income (Loss)		(1,736)
		Dividends	(8,621)	
		Other	(1,247)	
		Ending Balance	\$ 110,551	\$(14,901)

STATEMENT OF CASH FLOWS		BALANCE SHEETS		
Net Income or Loss	\$16,540		Beginning of Year	End of Year
Net Cash Provided by Operating Activities		Cash and Cash Equivalents	\$13,732	\$18,972
Net Cash Provided by Investing Activities		Total Assets		
Net Cash Provided by Financing Activities		Total Liabilities		
Increase (Decrease) in Cash and Cash Equivalents	\$ 5,240	Stockholders' Equity		
Add: Beginning Cash and Cash Equivalents	13,732	Common Stock		
Ending Cash and Cash Equivalents	\$18,972	Additional Paid-in Capital		
		Retained Earnings		110,551
		Accumulated Other Comprehensive Income (Loss)		(14,901)
		Total Liabilities & Stockholders' Equity		

EXAMPLE 6.3**Financial Statement Articulation**

PROBLEM: Complete the following financial statement articulation exercises.

- If net income is \$52,000 and comprehensive income is \$70,000, what is other comprehensive income?
- If ending retained earnings are \$122,000, beginning retained earnings are \$98,000, and dividends declared are \$20,000, what is net income?
- If the beginning balance of cash was \$653,000 and the ending balance of cash is \$522,000, what is the net change in cash?

SOLUTION:

- Other comprehensive income is \$18,000. We use the following relationship to solve for other comprehensive income:

$$\begin{aligned}\text{Comprehensive Income} &= \text{Net Income} + \text{Other Comprehensive Income} \\ 70,000 &= 52,000 + \text{Other Comprehensive Income} \\ 18,000 &= \text{Other Comprehensive Income}\end{aligned}$$

- The amount of net income is \$44,000. We use the following relationship to solve for net income:

$$\begin{aligned}\text{Ending Retained Earnings} &= \text{Beginning Retained Earnings} + \text{Net Income} \\ &\quad - \text{Dividends Declared} \pm \text{Other} \\ 122,000 &= 98,000 + \text{Net Income} - 20,000 \pm 0 \\ 44,000 &= \text{Net Income}\end{aligned}$$

- The amount of net cash flows is a \$131,000 decrease in cash. We use the following relationship to solve for net change in cash:

$$\begin{aligned}\text{Net Change in Cash} &= \text{Ending Cash} - \text{Beginning Cash} \\ \text{Net Change in Cash} &= \$522,000 - \$653,000 \\ \text{Net Change in Cash} &= \$(131,000)\end{aligned}$$

- Explain the purpose of the notes to the financial statements, including the summary of significant accounting policies, subsequent events, going concern uncertainties, and related-party transactions.

Notes to the Financial Statements

The notes (or footnotes) are an integral part of the financial statements that provide descriptive information regarding a company's accounting policies, supplemental disclosures of items not reported on the financial statements, and additional details for transactions reported on the four main financial statements. For example, a company will disclose its depreciation policy for long-lived assets in its financial statement footnotes. A company could also provide additional disclosures on historical cost and accumulated depreciation according to significant types of assets. Notes to the financial statements are typically extensive. For example, in *Johnson & Johnson's* 2016 annual report, the financial statements are covered on 5 pages; the notes span 43 pages!

Johnson & Johnson's notes, summarized in Exhibit 6.13, are representative of the information provided by most reporting entities and are typical for an entity of its size and complexity.

Johnson & Johnson's balance sheet refers readers to Notes 1 and 3 for further information on inventories. Note 1 explains that the firm measures inventory with the *lower-of-cost-or-market rule* determined by the *first-in, first-out* method. Note 3, presented in Exhibit 6.14, segregates the \$8,144 million aggregate inventory amount into its components: raw materials and supplies, goods in process, and finished goods.

THE CONCEPTUAL FRAMEWORK CONNECTION: Notes to the Financial Statements

In early 2014, the FASB issued an exposure draft of Chapter 8 of the Conceptual Framework addressing the notes to the financial statements. FASB stated that the notes to the financial statements provide relevant information that is not included in the face of the financial statements and categorized the disclosures into three types:

1. Information about specific line items on the financial statements that amplifies or explains that information more fully.

2. Information about the nature of the entity and its activities along with information about the entities' advantages, disadvantages, restrictions, and privileges.
3. Information about events and circumstances that may affect the entity's future cash flows.

We address the current disclosure requirements for most of the notes to the financial statements in subsequent chapters. In the sections that follow, we describe general disclosures: the summary of significant accounting policies, and disclosures pertaining to *subsequent events*, going concern uncertainties, and *related-party transactions*.

Summary of Significant Accounting Policies. Companies must disclose their significant accounting policies, usually in the first footnote. The **summary of significant accounting policies** note provides the entity's portfolio of GAAP methods used in preparing its financial statements. For example, an entity selects from four methods when measuring the cost of its inventory: *specific identification*, *weighted average*, *first-in, first-out*, or *last-in, first-out*. Companies disclose the method used whenever there are acceptable alternatives.

The summary of significant accounting policies—the first footnote in *Johnson & Johnson's* annual report—includes definitions, policies, and methods used to account for areas such as cash equivalents; investments; property, plant, and equipment; revenue recognition; inventories; intangible assets and goodwill; financial instruments; product liability; credit risk; research and development; income taxes; and earnings per share. Exhibit 6.15 includes *Johnson & Johnson's* significant accounting policies for property, plant, and equipment; inventories; and intangible assets.

EXHIBIT 6.15 Selected Disclosures of Significant Accounting Policies, *Johnson & Johnson*, Financial Statements, January 1, 2017

Property, Plant and Equipment and Depreciation

Property, plant and equipment are stated at cost. The Company utilizes the straight-line method of depreciation over the estimated useful lives of the assets:

Building and building equipment	20–30 years
Land and leasehold improvements	10–20 years
Machinery and equipment	2–13 years

The Company capitalizes certain computer software and development costs, included in machinery and equipment, when incurred in connection with developing or obtaining computer software for internal use. Capitalized software costs are amortized over the estimated useful lives of the software, which generally range from 3 to 8 years.

The Company reviews long-lived assets to assess recoverability using undiscounted cash flows. When certain events or changes in operating or economic conditions occur, an impairment assessment may be performed on the recoverability of the carrying value of these assets. If the asset is determined to be impaired, the loss is measured based on the difference between the asset's fair value and its carrying value. If quoted market prices are not available, the Company will estimate fair value using a discounted value of estimated future cash flows.

Inventories

Inventories are stated at the lower of cost or market determined by the first-in, first-out method.

Intangible Assets and Goodwill

The authoritative literature on U.S. GAAP requires that goodwill and intangible assets with indefinite lives be assessed annually for impairment. The Company completed the annual impairment test for 2016 in the fiscal fourth quarter. Future impairment tests will be performed annually in the fiscal fourth quarter, or sooner if warranted. Purchased in-process research and development is accounted for as an indefinite lived intangible asset until the underlying project is completed, at which point the intangible asset will be accounted for as a definite lived intangible asset, or abandoned, at which point the intangible asset will be written off or partially impaired.

Intangible assets that have finite useful lives continue to be amortized over their useful lives, and are reviewed for impairment when warranted by economic conditions. See Note 5 for further details on Intangible Assets and Goodwill.

Subsequent Events. A **subsequent event** is a significant event that occurs after the date of the fiscal year-end but before the financial statements are issued or available to be issued. Examples of common subsequent events are the sale of a business, the issuance of debt or equity securities, and the settlement of litigation.

Firms either recognize material subsequent events in the financial statements for the preceding year or disclose them in the notes to the financial statements. The recognition versus disclosure decision depends upon whether the event relates to a condition that existed on the balance sheet date (the end of the fiscal year):

1. If the condition existed as of the balance sheet date, the firm should make an adjustment to the financial statements to account for the subsequent event.
2. If the condition did not exist as of the balance sheet date, the entity is required to disclose only the subsequent event as opposed to adjusting the financial statements.

EXAMPLE 6.4 Recognized Subsequent Event

PROBLEM: LAStyles Company is involved in a patent-infringement lawsuit. As of December 31, 2017 (its fiscal year-end), the company recorded an estimated liability related to the lawsuit of \$1 million. On January 15, 2018, it settled the lawsuit for \$1.2 million.

In addition, on January 15, 2018, a customer fell on the ice in front of one of LAStyles' stores. The customer sued LAStyles the next day, and the suit was settled for \$1 million on February 27, 2018.

LAStyles will issue its financial statements on March 1, 2018. Should the company make an adjustment to its financial statements for these lawsuits? Should LAStyles disclose any information regarding these events in the notes to the financial statements?

SOLUTION: With regard to the infringement lawsuit, because the subsequent event (the settlement of the lawsuit) related to a condition that existed as of December 31, LAStyles should make an adjustment to the financial statements by increasing the liability and loss by \$0.2 million. A related disclosure is also required in the notes to the financial statements.

With regard to the lawsuit initiated by the customer who fell on the ice, because the subsequent event is related to a condition (i.e., the customer's injury) that did not exist as of December 31, no adjustment is necessary. However, LAStyles should include this information in a footnote disclosure.

In its fiscal 2015 annual report, *Wal-Mart Stores, Inc. (Walmart)* reported a subsequent event for dividends declared after year-end (see Exhibit 6.16).

EXHIBIT 6.16 Subsequent Event Disclosure, *Wal-Mart Stores, Inc.*, Financial Statements, January 31, 2016

NOTE 15: Subsequent Event

Dividends Declared

On February 18, 2016, the Board of Directors approved an increase in the annual dividend for fiscal 2017 to \$2.00 per share, an increase over the \$1.96 per share. For fiscal 2017, the annual dividend will be paid in four quarterly installments of \$0.50 per share, according to the following record and payable dates:

Record Date	Payable Date
March 11, 2016	April 4, 2016
May 13, 2016	June 6, 2016
August 12, 2016	September 6, 2016
December 9, 2016	January 3, 2017

Source: http://s2.q4cdn.com/056532643/files/doc_financials/2016/annual/2016-Annual-Report-PDF.pdf

Going Concern Uncertainties. As discussed in Chapter 2, the going concern concept indicates that accountants record transactions and prepare financial statements if the entity will continue to operate for an indefinite period of time unless there is evidence to the contrary. Management must evaluate whether there is substantial doubt as to whether the entity will continue to operate within one year after the financial statements are issued. If substantial doubt does exist, then management must consider any plans it has to mitigate the entity's going concern issue. If it is probable that these plans will be implemented and will alleviate the conditions that raise doubt about the entity's ability to continue operating, then the entity must disclose information about:

- The conditions or events that raised substantial doubt about the entity's ability to continue operations.
- Management's evaluation of the significance of those conditions.
- Management's plans that alleviate substantial doubt about the entity's continued operations.

If conditions exist that raise substantial doubt about the entity's ability to continue as a going concern and this doubt is not alleviated by management's plans, then the entity must disclose that there is substantial doubt about the entity's ability to continue as a going concern within one year from the date that the financial statements are issued (or available to be issued). Additionally, the entity should disclose information about:

- The conditions that raise substantial doubt about the entity's ability to continue operations.
- Management's evaluation of the significance of those conditions.
- Management's plans that are intended to mitigate the conditions or events that raise substantial doubt about the entity's ability to continue as a going concern.

Related-Party Transactions. Related-party transactions are transactions that an entity engages in with owners, firm management, affiliated entities, or any other entity that can exert significant influence on the company.¹⁶

FASB requires disclosure of related-party transactions because it is possible that the transaction was not objective and not completed at market prices. For example, if a corporate officer borrows funds from her employer, she may do so below the market rate of interest. The disclosure of a related-party transaction must include:

1. The nature of the relationship.
2. A description of the transaction.
3. The amount of the transaction.
4. Any amounts due from or to related parties.

Exhibit 6.17 presents part of the disclosure provided by *Luby's, Inc.*, the restaurant operator, related to the CEO and CFO's transactions with the company, including owning two *Luby's* restaurants.

EXHIBIT 6.17 Related-Party Transaction Disclosure (partial), *Luby's Inc.*, Financial Statements, August 31, 2015

NOTE 14: Related Parties

Affiliate Services

The Company's Chief Executive Officer, Christopher J. Pappas, and Harris J. Pappas, a Director of the Company, own two restaurant entities (the "Pappas entities") that may provide services to the Company and its subsidiaries, as detailed in the Master Sales Agreement dated November 8, 2013, among the Company and the Pappas entities.

Under the terms of the Master Sales Agreement, the Pappas entities continue to provide specialized (customized) equipment fabrication primarily for new construction and basic equipment maintenance, including stainless steel stoves, shelving, rolling carts, and chef tables. The total costs under the Master Sales Agreement of custom-fabricated and refurbished equipment in fiscal years 2016, 2015, and 2014 were approximately \$2,000, zero, and \$4,000, respectively. Services provided under this agreement are subject to review and approval by the Finance and Audit Committee of the Company's Board of Directors.

Source: Luby's Inc., 2016 Annual Report. http://www.lubysinc.com/investors/filings/files/Lubys_083116_Form10K_FiscalYear.pdf

¹⁶The complete list of related parties can be found in FASB ASC 850-10-20, *Related Party Disclosures – Overall – Glossary*.

IFRS Notes to the Financial Statements. IFRS requires similar information in the notes to the financial statements such as significant accounting policies, subsequent events, going concern uncertainties, and related-party transactions. However, the identification of subsequent events and disclosure of going concern uncertainties and related parties differ slightly. Additionally, IFRS requires disclosure of sources of uncertainty in the measurement of assets and liabilities.

Subsequent Events: IFRS. Under IFRS, a subsequent event must be reported if it occurs after the balance sheet date but before the financial statements have been authorized for issuance.¹⁷ A company must disclose when the financial statements have been authorized and who authorized them. Commonly, a company's board of directors will authorize the financial statements for issuance. The authorization date is usually before the issuance date that U.S. GAAP uses. Therefore, a U.S. GAAP reporter may report a subsequent event that would not be required under IFRS.

EXAMPLE 6.5

Subsequent Events: IFRS

PROBLEM: Augsburg Company's board of directors met and authorized its financial statements on February 2. The company plans to make its financial statements available to the public on February 10. On February 8, a flood destroyed Augsburg's major manufacturing facility. Does Augsburg need to report the loss of the manufacturing facility as a subsequent event under IFRS?

SOLUTION: Under IFRS, Augsburg is not required to report the loss of the manufacturing facility as a subsequent event. Augsburg's board authorized the financial statements for issuance before the flood. Therefore, although the event occurred before Augsburg issued the financial statements, Augsburg is not required to report it as a subsequent event under IFRS.

Going Concern Uncertainties: IFRS. IFRS requires disclosures about going concern uncertainties when management is aware of material uncertainties related to conditions that may cause significant doubt about the entity's ability to continue as a going concern. However, under IFRS, the assessment period is at least one year from the financial statement date with no upper time limit.

Related-Party Transactions: IFRS. IFRS defines related-party transactions and requires disclosures similar to U.S. GAAP.¹⁸ However, IFRS also includes specific disclosure requirements on executive compensation in total and by type such as short-term employee benefits, post-employment benefits, other long-term benefits, and share-based payments.

Sources of Estimation Uncertainty: IFRS. Under IFRS, companies are required to disclose information about the assumptions and estimates made at the end of the reporting period.¹⁹ Assumptions and estimates can result in estimation uncertainty about the carrying values reported for assets and liabilities, as discussed in Chapter 3. Given the assumptions and estimates made, companies determine whether there is a significant risk of a material adjustment to the carrying amounts of assets and liabilities within the next financial year. For assets and liabilities, the company reports their nature and their carrying amounts at the end of the reporting period. Exhibit 6.18 presents *Unilever's* disclosure to financial statement items where it made significant estimates and assumptions, including pension obligations and deferred taxes, referring to more detail on these items in the specific notes to the financial statements.

¹⁷See IASC, *International Accounting Standard 10* "Events After the Reporting Period" (London, UK: International Accounting Standards Committee, Revised).

¹⁸See IASC, *International Accounting Standard 24*, "Related Party Disclosures" (London, UK: International Accounting Standards Committee, Revised).

¹⁹See Paragraphs 125 through 133 of IASC, *International Accounting Standard 1*, "Presentation of Financial Statements."

Interview

MICHAEL COHEN
MANAGING PARTNER,
COHNREZNICK »

Michael Cohen

Recently retired, Michael Cohen oversaw all accounting and tax operations for CohnReznick's New Jersey offices. In this capacity, he directed over 400 people, including over 70 partners, and was a member of the firm's Management Committee. Mr. Cohen provided accounting and advisory services to middle market companies in diverse industries that range in size from \$1 million to \$3 billion.

- 1 How can financial statement users, most of whom focus on net income, assess a company's ability to create shareholder wealth using the balance sheet?

Assets and liabilities aren't nearly as eye catching to financial statement users as revenue and earnings. While earnings are important, they don't tell the whole story. The balance sheet reflects the financial condition of a company and offers a snapshot of a company's health.

Business owners create shareholder wealth by keeping the cost of capital below the rate of return on investment. By reviewing the balance sheet, a reader should be able to determine the various drivers of shareholders' wealth, including invested capital, cost of capital (including cost of debt), and incremental capital expenditures.

- 2 How does the information reported in the balance sheet enable a financial statement user to effectively measure a company's liquidity, solvency, and financial stability?

Investors use ratio analysis to measure a company's liquidity, solvency, and financial stability. Typically, they use the current ratio, quick ratio, net working capital, and debt-to-equity ratio, among others, to evaluate whether a company has sufficient resources to satisfy existing obligations in a timely manner. They can also determine whether a company's financial condition allows it to take advantage of potential opportunities and withstand unexpected crises.

- 3 What are the most critical estimates used in developing information reported in the balance sheet, and how do these estimates affect risk assessment for CohnReznick?

Typically, critical estimates include allowance for bad debts, allowance for inventory obsolescence and slow-moving items, fair value of financial instruments, impairment of long-lived assets and intangible assets, warranty liabilities, contingent

liabilities, stock-based compensation, valuation of deferred tax assets, uncertain tax positions, and valuations in business combinations. These are high-risk audit areas because significant judgment is involved in determining estimates. Sometimes management's estimates are not reasonable and require revision. Such estimates must be challenged by auditors, who spend considerable time reviewing critical estimates to ensure that a client's accountants used proper methods and procedures, reasonable inputs, and consistent methods from year to year.

- 4 Do you believe that the historical cost model is still relevant in today's reporting environment?

The balance sheet does not portray the fair value of the entity as a going concern or its liquidation value. Despite this limitation, the balance sheet provides information useful for assessing future cash flows and near- and long-term liquidity. Using 100% fair value accounting does not currently seem practical for various reasons, including the increased cost involved in determining fair value estimates, the differences in values based upon the methods used to determine fair value, and a lack of expertise in the market place to value all balance sheet items at fair value.

- 5 How significant are off-balance sheet entities? How do you apply current disclosure requirements to factor in the impact of these off-balance sheet entities when assessing a company's financial condition?

The Enron fraud and bankruptcy revealed how certain companies used off-balance sheet entities to offload debt from their books. The FASB tightened requirements by adopting rules for Special Purpose Entities (SPEs) and Variable Interest Entities (VIEs). If consolidation of SPEs and VIEs is not required under U.S. GAAP, the auditors must review whether the company has contractual obligations to fund the operations of the off-balance sheet entities. The contractual obligations should be disclosed in the notes to the financial statements.

- 6 What is the role of the balance sheet, when used with the other financial statements, in assessing a company's ability to efficiently use capital and generate future cash flows?

No financial statement, standing by itself, can give a user a clear picture of a company's financial position and/or performance. Users should interrelate the income statement, cash flow statement, and balance sheet in their financial analysis to determine a company's overall financial health.

Discussion Questions

1. Discuss how the balance sheet can be used to project the cash-generating ability of an entity.
2. Discuss the advantages and disadvantages of using fair value to measure the elements reported on the balance sheet. Include specific examples and connect your response to the conceptual framework.

EXHIBIT 6.18 Disclosure of Sources of Estimation Uncertainty, *Unilever Group*, Financial Statements, December 31, 2016

Financial Statements *Unilever Group*

NOTE 1: Accounting Information and Policies (Partial)

Information about critical judgements in applying accounting policies, as well as estimates and assumptions that have the most significant risk of causing a material adjustment to the carrying amounts of assets and liabilities within the next financial year, are included in the following notes:

- separate presentation of items in the income statement – note 3;
- measurement of defined benefit obligations – note 4B;
- utilisation of tax losses and recognition of other deferred tax assets – note 6B;
- key assumptions used in discounted cash flow projections for impairment testing of goodwill and intangible assets – note 9;
- likelihood of occurrence of provisions and contingencies, including tax investigations and audits – notes 6A, 19 and 20; and
- measurement of consideration and assets and liabilities acquired as part of business combinations – note 21.

Source: Unilever. https://www.unilever.com/Images/unilever-annual-report-and-accounts-2016_tcm244-498880_en.pdf

- 8 Identify and describe the typical content of an annual report.

The Annual Report

The financial statements are included in an annual report that provides a comprehensive picture of a company's operations, the risks it faces, and its operating and financial performance. A country's security regulators usually determine the form and content of the annual report. In the United States, the Securities and Exchange Commission (SEC) has the authority to promulgate standards that establish the structure of the annual report called the 10-K.²⁰ The U.S. annual report contains detailed information on 15 major areas. The financial statements and the notes to the financial statements are included in the 10-K. In addition, we discuss the following areas that are most relevant to the course material:

- Management discussion and analysis
- Auditor's report
- Management's report
- Board of directors

We use the *Johnson & Johnson* annual report for fiscal year 2016 ending January 1, 2017, to illustrate the contents of a company's annual report. Companies can also voluntarily provide other disclosures and discussions in a variety of other areas. For example, *Johnson & Johnson* prepares a report on sustainability and corporate responsibility that includes areas such as quality and safety of products, climate, water, governance, transparency, and stakeholder engagement. Companies report many of these other items in the investor relations part of their Web sites.

Management Discussion and Analysis

Management's discussion and analysis of the financial condition and results of operations (typically referred to as the *MD&A*) is a required part of the annual report. The MD&A section provides the information necessary to understand the entity's financial condition, changes in financial condition, and results of operations.²¹ The SEC specifies the topics discussed including:

1. Liquidity
2. Capital resources

²⁰For IFRS reporters, the content of the annual report varies with the country and the regulator in which the company operates. The IASB has issued a statement describing important disclosures in a management commentary that companies can voluntarily follow.

²¹See SEC Rule 240.14a-d(b)(5)(ii), Item 303 of SEC Regulation S-K and SEC Interpretative Guidance.

3. Results of operations
4. Off-balance sheet arrangements
5. Disclosure of contractual obligations
6. Critical accounting policies²²

The MD&A section focuses on material events and uncertainties known to management that could affect the faithful representation of the financial information reported elsewhere in the annual report. Examples include trends, events, and uncertainties that did not impact the entity in the past but could affect future financial position, operating results, and cash flows. Conversely, the MD&A provides information related to prior trends and events and uncertainties that may not occur in future reporting periods.

The MD&A section allows top management to provide the reader with an extensive analysis related to the firm's future performance. Although the discussion may contain some management bias, auditors are required to read the MD&A to ensure consistency with all the information provided throughout the financial statements. Thus, although it is not part of the audited financial statements and should be viewed with some degree of caution, there are some assurances that the information is accurate.

Johnson & Johnson's MD&A on pages 14 to 32 of its 2016 10-K begins with a description of the company, business segments, and management objectives. The MD&A then reviews the results of operations and provides an analysis of consolidated sales. This analysis addresses multiple dimensions, such as U.S. versus international results, performance by geographic region, and performance across the company's three business segments (consumer, pharmaceutical, and medical devices and diagnostics). The MD&A section also presents a combined discussion of *Johnson & Johnson's* liquidity and capital resources with a breakdown of its contractual obligations and commitments.

Critical accounting policies involve estimates and assumptions that could have a material impact on the company's financial condition or operating performance. These are areas with high levels of subjectivity and judgment necessary to account for uncertain matters or matters subject to change. Company disclosure supplements rather than duplicates the description of accounting policies that are already disclosed in the notes to the financial statements. *Johnson & Johnson* begins its discussion of critical accounting policies on page 26. *Johnson & Johnson* identifies the following critical areas: revenue recognition, income taxes, legal and self-insurance contingencies, valuation of long-lived assets, assumptions used to determine the amounts recorded for pensions, and other employee benefit plans and accounting for stock-based awards.

Auditors' Report

An audit is an examination of the financial statements (including the footnote disclosures) and the internal controls over the systems that generate the financial statements and notes. Auditors then attest to the fairness of the financial statements. For public companies, the auditors must also test the internal controls and attest to their effectiveness. The SEC requires all public companies to conduct an annual audit of their financial statements and footnote disclosures. Many private companies also choose to have an annual audit.

The format of most auditors' reports is nearly identical because the report must be in compliance with standards set forth by the Public Company Accounting Oversight Board (PCAOB).²³

Typically, companies will receive an unqualified opinion, but other opinions are sometimes found in practice. Exhibit 6.19 summarizes the types of auditors' opinions.

The firm may issue the auditors' report on the effectiveness of the internal controls as a separate report within the annual report or include it with the opinion regarding the presentation of the financial statements within the annual report.

²²Item 303 of SEC Regulation S-K requires that these topics be discussed but does not mandate the level of detail to be provided within each topic.

²³The PCAOB sets the standards for public company audits, whereas the AICPA sets the standards for private company audits.

EXHIBIT 6.19 Auditors' Opinions

Type of Auditors' Opinion	Issued When . . .
Unqualified opinion (also referred to as a clean opinion)	The financial statements are presented fairly and are in compliance with GAAP. All required financial statements are included, the audit was performed in compliance with appropriate audit standards, the financial statements are in conformity with GAAP, and there are no additional circumstances that require an explanatory paragraph.
Unqualified opinion with an explanatory paragraph	Additional explanation is needed. Some of the most common are: <ol style="list-style-type: none"> 1. GAAP is not consistently applied. 2. Concern that the company might not continue in existence. 3. A particular matter may need to be emphasized (such as significant subsequent events).
Qualified opinion	<ol style="list-style-type: none"> 1. The auditor concludes that the financial statements are fairly presented, but the scope of the audit was subject to significant limitations or 2. The financial statements are not in compliance with GAAP.
Adverse opinion	The auditor determines that the financial statements are not fairly presented.
Disclaimer opinion	The auditor is either not independent or is unable to form an opinion.

Johnson & Johnson's auditors prepared a combined report, as presented on page 84 of its 10-K filing. The first paragraph of the report states that *Johnson & Johnson* received an unqualified opinion; it goes on to state that the auditors believe that *Johnson & Johnson's* internal controls are effective.

Financial statement users should always read the auditors' report. The statements should be used with caution if a company receives anything other than a clean opinion on its financial statements.

Management Report

The management of a publicly traded entity is required to provide two letters in the annual report: a letter stating its responsibility for the financial statements and a letter providing an assessment of the effectiveness of the internal controls over the financial reporting process.²⁴

Management's Responsibility for the Financial Statements. The management of a firm is ultimately responsible for the preparation and presentation of the financial statements. In order to emphasize this point and hold management accountable, the annual report or Form 10-K of a publicly traded entity must include certifications from the firm's management that include:

- A statement that the officers have reviewed the financial report.
- A statement that the financial statements do not contain any material omissions or untrue or misleading statements.
- A statement that the financial statements fairly present the financial condition and results of the entity.
- A statement that the officers are responsible for and have evaluated the internal controls.
- A list of all deficiencies in the internal controls.
- Information on any fraud that involves employees who are involved with internal activities.
- A discussion of any significant changes in internal controls that could have a negative impact on the internal controls.²⁵

²⁴The letter of management responsibility for the financial statements and the management assessment of internal controls letter can be combined.

²⁵Section 302 of the Sarbanes-Oxley Act.

Johnson & Johnson includes the certifications in Exhibits 31(a) and 31(b) of its Form 10-K.

Management’s Report on Internal Control over Financial Reporting. Annual reports of publicly traded entities must also include a letter that provides an assessment of the company’s internal controls. In this letter, management is required to provide a statement:

- On management’s responsibility for establishing and maintaining adequate internal control over financial reporting for the company.
- On management’s assessment of the effectiveness of the company’s internal control over financial reporting.
- Identifying the framework used by management to evaluate the effectiveness of the company’s internal control over financial reporting.
- That the registered public accounting firm that audited the company’s financial statements included in the annual report has issued an attestation report on management’s assessment of the company’s internal control over financial reporting.²⁶

Johnson & Johnson’s letter, presented on page 85 of its 10-K filing, states that management has assessed the effectiveness of internal controls and concluded that the internal controls over financial reporting are effective. As is the case with the management responsibility letter for the financial statements, this letter is signed by the CEO and the CFO.

Board of Directors

Public entities must provide a disclosure of the members of its **board of directors**, a body that oversees the activities of the company. Companies are also required to provide the principal occupations of their board members. This disclosure includes the names and the principal business activities of the entities employing the members of the board.

Johnson & Johnson’s 10 directors, including the CEO and Chairman, approved the corporation’s annual report. A number of its Board members are retired CEOs from other large corporations.

Summary by Learning Objectives

In the following, we summarize the main points by learning objective. Throughout the chapter, we discuss the accounting and reporting of U.S. GAAP and IFRS side by side. The following table also highlights the major similarities and differences between the standards.

<p>1 Discuss the usefulness and limitations of the statement of financial position, including its use in understanding liquidity, solvency, and financial flexibility.</p>	
Summary	Similarities and Differences between U.S. GAAP and IFRS
<p>The balance sheet:</p> <ol style="list-style-type: none"> 1. Summarizes the economic resources and obligations. 2. Aids in assessing the rate of return. 3. Aids in an assessment of the riskiness of the entity. <p>The balance sheet consists of permanent accounts with cumulative balances that are carried forward period to period and accumulate over the life of the firm.</p>	<p>Similar under U.S. GAAP and IFRS.</p>

²⁶Section 404 of the Sarbanes-Oxley Act.

Summary by Learning objectives, continued

2 Provide an overview of classifications on the statement of financial position for typical assets, liabilities, and stockholders' equity.	
Summary	Similarities and Differences between U.S. GAAP and IFRS
<p>The three primary classifications on the balance sheet are assets, liabilities, and stockholders' equity. Within each, typical accounts are</p> <p>Assets:</p> <ul style="list-style-type: none"> • Current assets <ul style="list-style-type: none"> • cash and cash equivalents • short-term investments • accounts receivable • inventory • prepaid expenses • Long-term investments • Property, plant, and equipment • Intangible assets • Other assets 	<p>► Similar under U.S. GAAP and IFRS except that IFRS requires reporting certain assets, liabilities, and equity at a minimum. IFRS further considers current assets as assets that are held primarily for trading and cash and cash equivalents <i>unless</i> they are restricted for use.</p>
<p>Liabilities:</p> <ul style="list-style-type: none"> • Current liabilities <ul style="list-style-type: none"> • accounts payable • short-term notes payable • current maturities of long-term debt • accrued liabilities • unearned revenues • Noncurrent liabilities <p>Equity:</p> <ul style="list-style-type: none"> • Contributed capital • Retained earnings • Accumulated other comprehensive income • Noncontrolling interest <p>One of the primary distinctions is current versus noncurrent. Current assets include resources that are expected to be converted to cash or consumed</p> <ul style="list-style-type: none"> • within the next year or • within the <i>operating cycle</i>, whichever is longer. <p>Current liabilities are obligations that are expected to be liquidated through</p> <ul style="list-style-type: none"> • the use of current assets or • the creation of other current liabilities 	<p>► IFRS also considers current liabilities as liabilities that are held primarily for trading or liabilities that a company does not have the right to defer settling beyond the current year.</p> <p>IFRS refers to accumulated other comprehensive income as reserves. IFRS also refers to common stock as share capital, paid-in capital in excess of par as share premium, and retained earnings as retained profits.</p>

Summary by Learning objectives, continued

3 Explain the presentation of current and noncurrent assets and liabilities on the statement of financial position and name the common statement formats.	
Summary	Similarities and Differences between U.S. GAAP and IFRS
<p>Current assets (liabilities) are presented before noncurrent assets (liabilities). Within current and noncurrent, assets are ordered by liquidity while liabilities are arranged by maturity.</p> <p>Two common balance sheet formats are the</p> <ol style="list-style-type: none"> 1. Account format, which lists assets on the left side and liabilities and stockholders' equity on the right side of the statement. 2. Report format, which lists liabilities and stockholders' equity directly below assets on the same page. 	<p>► IFRS allows companies discretion in presenting current assets (liabilities) before or after noncurrent assets (liabilities). Within current and noncurrent, companies also have the choice of how they want to order each component. If more informative, companies can present assets and liabilities by liquidity rather than by current and noncurrent.</p> <p>Aside from the current and noncurrent (or liquidity) presentations, companies have flexibility in how to format their balance sheets.</p>

4 Explain the statement of cash flows and classify common business activities into operating, investing, and financing cash flows.	
Summary	Similarities and Differences between U.S. GAAP and IFRS
<p>The statement of cash flows summarizes cash inflows and outflows for a firm over a period of time by operating, investing, and financing activities.</p> <p>Operating activities:</p> <ol style="list-style-type: none"> 1. Cash receipts from customers 2. Cash payments for the purchase of goods for resale or for use in production 3. Cash payments to suppliers and employees 4. Cash payments related to taxes 5. Cash receipts related to interest and dividend income 6. Cash payments of interest <p>Investing activities:</p> <ol style="list-style-type: none"> 1. Cash receipts from the collection or sale of loans made by the entity 2. Cash receipts from the sale of debt and equity securities of other entities 3. Cash receipts from the sale of productive assets (e.g., property, plant, and equipment) 4. Cash payments for extending credit to others 5. Cash payments for investments in debt and equity securities of other entities 6. Cash payments for property, plant, and equipment and other productive assets <p>Financing activities:</p> <ol style="list-style-type: none"> 1. Cash receipts from issuing equity to owners 2. Cash receipts from borrowing through bonds or notes or other instruments 3. Cash payments to repurchase equity from owners 4. Cash payments for principal on debt 5. Cash payments for dividends 	<p>► Similar under U.S. GAAP and IFRS, except companies have choices in where to classify interest paid, dividends paid, and taxes paid, as well as interest received and dividends received, under IFRS.</p>

*Summary by Learning objectives, continued***5** Explain the direct and indirect formats of the statement of cash flows.

Summary	Similarities and Differences between U.S. GAAP and IFRS
<p>The indirect method (also referred to as the reconciliation format) begins with net income from the income statement and reconciles it to net cash generated from operating activities.</p> <p>The direct method (also referred to as the income statement format) reports cash receipts and payments for all activities.</p> <p>The investing and financing sections of the direct and indirect statement of cash flows are the same. The only difference is how cash flows are reported in the operating activities section.</p>	<p>► Similar under U.S. GAAP and IFRS except that IFRS does not specify the income line item that must begin the reconciliation of operating cash flows under the indirect method.</p>

6 Review the four primary financial statements and financial statement articulation.

Summary	Similarities and Differences between U.S. GAAP and IFRS
<p>The main financial statements are:</p> <ul style="list-style-type: none"> – Statements of Net Income and Comprehensive Income <p>(Alternatively, both statements can be replaced with the Statement of Comprehensive Income)</p> <ul style="list-style-type: none"> – Statement of Stockholders' Equity – Statement of Financial Position – Statement of Cash Flows <p>Financial statement articulation makes clear the interaction among assets, liabilities, and equity elements with revenues and expenses.</p> <p>Common relationships are:</p> <p><u>Statements of Net Income and Comprehensive Income</u></p> $\text{Net income} = \text{Revenues} - \text{Expenses} + \text{Gains} - \text{Losses}$ $\text{Comprehensive Income} = \text{Net Income} + \text{Other Comprehensive Income}$ <p><u>Statement of Stockholders' Equity</u></p> $\text{Ending Retained Earnings} = \text{Beginning Retained Earnings} + \text{Net income} - \text{Dividends Declared} \pm \text{Other}$ $\text{Ending Accumulated OCI} = \text{Beginning Accumulated OCI} \pm \text{OCI}$ <p><u>Statement of Financial Position</u></p> $\text{Assets} = \text{Liabilities} + \text{Stockholders' Equity}$ <p><u>Statement of Cash Flows</u></p> $\text{Net Change in Cash} = \text{Ending Cash} - \text{Beginning Cash}$	<p>Similar under U.S. GAAP and IFRS.</p>

Summary by Learning objectives, continued

- 7** Explain the purpose of the notes to the financial statements, including the summary of significant accounting policies, subsequent events, going concern uncertainties, and related-party transactions.

Summary	Similarities and Differences between U.S. GAAP and IFRS
<p>Notes are an integral part of the financial statements and provide additional information related to the line items presented. The notes both expand on financial information included in the financial statements and provide additional disclosures. Examples of notes that provide additional disclosures include:</p> <ul style="list-style-type: none"> • Summary of significant accounting policies: Details the methods that the entity has selected in reporting various accounts. • Subsequent events: Describes significant events that occur after the date of the fiscal year-end but before the financial statements are issued or available to be issued. • Going concern uncertainties: Management must evaluate whether there is substantial doubt as to whether the entity will continue to operate within one year after the financial statements are issued. If substantial doubt does exist, disclosures are required. • Related-party transactions: Details transactions that an entity engages in with owners, firm management, affiliated entities, or any other entity that can exert significant influence on the company. 	<p>► Similar under U.S. GAAP and IFRS except for the following.</p> <ul style="list-style-type: none"> • Subsequent events: Events that occur after the balance sheet date but before the financial statements have been authorized for issuance must be reported. • Going concern uncertainties: The window of evaluation for IFRS is at least one year from the financial statement date with no upper time limit. • Related-party transactions: IFRS includes specific disclosure requirements on total executive compensation. • Sources of estimation uncertainty: Companies disclose information about the source of estimation uncertainty resulting from assumptions and estimates they made at the end of the reporting period.

- 8** Identify and describe the typical content of an annual report.

Summary	Similarities and Differences between U.S. GAAP and IFRS
<p>A company's annual report provides insight into its operating performance, financial position, and cash flows. It includes:</p> <ul style="list-style-type: none"> • The management discussion and analysis. • The auditors' report. • The management report. • Board of directors. • Financial statements. • The footnotes to the financial statements. <p>The U.S. Securities and Exchange Commission determines the content of the annual report, called the 10-K, for publicly traded companies.</p>	<p>► A country's security regulator usually determines the content of the annual report. Therefore, the content of the annual report varies for IFRS reporters. The IASB has issued a statement that companies can voluntarily follow describing important disclosures in a management commentary.</p>

6 Statements of Financial Position and Cash Flows and the Annual Report

Questions

- 1 Q6-1. What are the limitations of the balance sheet?
- 1 Q6-2. What does a firm's liquidity measure?
- 1 Q6-3. What does a firm's solvency measure?
- 2 Q6-4. What are the four major components of stockholders' equity? Explain each component.
- 2 Q6-5. What items are included in cash and cash equivalents? How would financial statement preparers report these items on the balance sheet?
- 2 Q6-6. When can a liability be classified as current?
- 2 Q6-7. Where is accumulated other comprehensive income reported on the financial statements? Why?
- 3 Q6-8. How do firms report assets on the balance sheet?
- 3 Q6-9. How do firms report assets on the balance sheet under IFRS?
- 3 Q6-10. What are the two main balance sheet formats? Explain both formats.
- 4 Q6-11. Why is the cash flow statement useful to the users of the financial statements?
- 4 Q6-12. What is the purpose of the cash flow statement?
- 5 Q6-13. What are the two formatting options for reporting the operating activities section of the statement of cash flows? Explain both formats.
- 6 Q6-14. What is financial statement articulation?
- 6 Q6-15. How is net income closed? Is the closing entry the same for other comprehensive income? Explain.
- 7 Q6-16. Why are the notes to the financial statements an integral part of the financial statements?
- 7 Q6-17. What is included in the summary of significant accounting policies disclosure?
- 7 Q6-18. What is a subsequent event?
- 7 Q6-19. What is a subsequent event under IFRS?
- 7 Q6-20. How do firms report a material subsequent event on the financial statements?
- 7 Q6-21. Over what period must management assess the entity's ability to continue as a going concern under U.S. GAAP?
- 7 Q6-22. Over what period must management assess the entity's ability to continue as a going concern under IFRS?
- 7 Q6-23. What is a related-party transaction? Why does the FASB require disclosure of related parties?
- 8 Q6-24. How does the role of the FASB differ from that of the Securities and Exchange Commission with regard to the establishment of accounting standards?
- 8 Q6-25. What information is provided in the Management's Discussion and Analysis section of the financial statements?
- 8 Q6-26. What do auditors attest to in an audit report?
- 8 Q6-27. What does it mean when an auditor issues an adverse opinion on the financial statements?
- 8 Q6-28. Explain the five different types of auditor's opinions.
- 8 Q6-29. Where do auditors include their report on the effectiveness of a firm's internal controls? Explain.
- 8 Q6-30. What is management's responsibility for the financial statements?
- 8 Q6-31. What information is included in the annual report letter written by managers of publicly traded companies?
- 8 Q6-32. Who is responsible for designing and implementing a company's system of internal controls? Where is this policy stated?
- B Q6-33. What is the difference between liquidity and solvency?
- B Q6-34. What are the two key measures of liquidity? Explain each measure.
- B Q6-35. What does the debt-to-equity ratio measure for a company?
- B Q6-36. What does a high current ratio indicate about a company?
- B Q6-37. Is it useful to compare working capital among companies in the same industry to determine relative liquidity? Explain.

Multiple-Choice Questions

Becker CPA Exam Review multiple-choice questions are available in MyLab Accounting.

- 4 MC6-1. Sykes Corporation's comparative balance sheets at December 31, Year 2 and Year 1, reported accumulated depreciation balances of \$800,000 and \$600,000, respectively. Property with a cost of \$50,000 and a carrying amount of \$40,000 was the only property sold in Year 2. Depreciation charged to operations in Year 2 was:
- | | | | |
|--------------|--------------|--------------|--------------|
| a. \$190,000 | b. \$200,000 | c. \$210,000 | d. \$220,000 |
|--------------|--------------|--------------|--------------|
- 4 MC6-2. During Year 1, Brianna Company had the following transactions related to its financial operations:
- | | |
|---|---------|
| Payment for the retirement of long-term bonds payable (carrying value \$740,000) | 750,000 |
| Distribution in Year 1 of cash dividend declared in Year 0 to preferred shareholders | 62,000 |
| Carrying value of convertible preferred stock of Brianna converted into common shares | 120,000 |
| Proceeds from sale of treasury stock (carrying value at cost \$86,000) | 95,000 |
- On its Year 1 statement of cash flows, net cash used in financing activities should be:
- | | | | |
|--------------|--------------|--------------|--------------|
| a. \$717,000 | b. \$716,000 | c. \$597,000 | d. \$535,000 |
|--------------|--------------|--------------|--------------|
- 4 MC6-3. Which of the following items would *not* be included in the operating activities section of an entity's statement of cash flows under U.S. GAAP?
- | | |
|----------------------|---|
| a. Interest received | b. Proceeds from the sale of trading securities |
| c. Dividends paid | d. Income taxes paid |
- 4 MC6-4. Kong Co. purchased a three-month U.S. Treasury bill. Kong's policy is to treat as cash equivalents all highly liquid investments with an original maturity of three months or less when purchased. How should this purchase be reported in Kong's statement of cash flows?
- | |
|--|
| a. As an outflow from operating activities |
| b. As an inflow from investing activities |
| c. As an outflow from financing activities |
| d. Not reported |
- 4 MC6-5. Bales Company is preparing a statement of cash flows. Which of the following would be shown on the statement?
- | | |
|---------------------------------------|--|
| a. Stock dividend | b. Stock split |
| c. Appropriation of retained earnings | d. None of the answer choices is correct |
- 5 MC6-6. Big Dollars Corporation's comparative financial statements included the following amounts for the current year:
- | | |
|--|-----------|
| Net income | \$650,000 |
| Depreciation expense | 93,000 |
| Equity in earnings of unconsolidated affiliate | 61,000 |
| Gain on sale of fixed assets | 4,000 |
| Increase in accounts receivable | 25,000 |
| Decrease in inventory | (57,000) |
| Decrease in fixed assets | 38,000 |
| Increase in accounts payable | 42,000 |
| Decrease in notes payable (nontrade) | (75,000) |
- On its current-year statement of cash flows, what is Big Dollars' net cash provided by operating activities?
- | | | | |
|--------------|--------------|--------------|--------------|
| a. \$677,000 | b. \$714,000 | c. \$752,000 | d. \$790,000 |
|--------------|--------------|--------------|--------------|
- 5 MC6-7. In its year-end income statement, Black Knights Company reported cost of goods sold of \$450,000. Changes occurred in several balance sheet accounts during the year as follows:
- | | | |
|----------------------------|-----------|----------|
| Inventory | \$160,000 | decrease |
| Accounts payable-suppliers | 40,000 | decrease |
- What amount should the Black Knights Company report as cash paid to suppliers in its cash flow statement prepared under the direct method?
- | | | | |
|--------------|--------------|--------------|--------------|
| a. \$250,000 | b. \$330,000 | c. \$570,000 | d. \$650,000 |
|--------------|--------------|--------------|--------------|

- 5 MC6-8. On its current year income statement, Vegas Parties, Inc. reported sales revenue of \$945,000. Changes occurred in several balance sheet accounts, including the following:

Accounts receivable:	90,000	decrease
Unearned revenue:	\$75,000	increase

What amount should Vegas report as cash received from customers in its current year statement of cash flows prepared using the direct method?

- a. \$780,000 b. \$930,000 c. \$960,000 d. \$1,110,000

Brief Exercises

- 1 **BE6-1. Advantages of the Statement of Financial Position.** List and explain the three primary advantages of the statement of financial position.
- 1 **BE6-2. Disadvantages of the Statement of Financial Position.** List and explain the three primary disadvantages of the statement of financial position.
- 2 **BE6-3. Account Classification: Current and Noncurrent Assets and Liabilities, Equity.** Classify the following accounts as current assets, noncurrent assets, current liabilities, noncurrent liabilities, contributed capital, or accumulated other comprehensive income.

Account	Balance Sheet Classification
Current portion of long-term debt	_____
Property, plant, and equipment – net	_____
Investments in affiliate companies (noncurrent)	_____
Accounts receivable	_____
Investments at fair value held for immediate sale	_____
Accounts payable	_____
Additional paid-in capital	_____
Dividends payable	_____
Equipment under capital lease	_____
Intangible assets – net	_____
Merchandise inventory	_____
Income taxes payable	_____
Bonds payable, due in 10 years	_____
Common stock, \$1 par value	_____
Cash	_____
Notes payable due in 90 days	_____
Obligations under capital leases	_____
Obligations under pension plans	_____

- 2 **BE6-4. Account Classification: Current and Noncurrent Assets and Liabilities, Equity.** Classify the following accounts as current assets, noncurrent assets, current liabilities, noncurrent liabilities, or stockholders' equity.

Account	Balance Sheet Classification
Property, plant, and equipment – net	_____
Accounts receivable	_____
Accounts payable	_____
Additional paid-in capital	_____
Dividends payable	_____
Intangible assets – net	_____
Merchandise inventory	_____
Income taxes payable	_____
Bonds payable, due in 10 years	_____
Common stock, \$1 par value	_____
Cash	_____
Notes payable (36-month term)	_____

3

BE6-5. Classified Balance Sheet. Armstrong Associates provided the following balance sheet for its current year ended December 31.

**Armstrong Associates
Balance Sheet
At December 31**

Assets	Amount
Cash	\$ 255,000
Receivables	1,390,000
Prepaid Assets and Supplies	722,000
Property, Plant, and Equipment – net	<u>2,075,000</u>
Total Assets	<u>\$4,442,000</u>
Liabilities	
Payables and Accrued Expenses	\$1,040,500
Income Taxes Payable	316,750
Notes Payable, due in 5 years	<u>1,007,000</u>
Total Liabilities	<u>\$2,364,250</u>
Stockholders' Equity	
Contributed Capital	\$1,855,000
Retained Earnings	<u>222,750</u>
Total Stockholders' Equity	<u>\$ 2,077,750</u>
Total Liabilities and Stockholders' Equity	<u>\$4,442,000</u>

The following account analyses were made during the company's recent year-end audit.

Receivables	
Accounts Receivable	\$ 450,000
Indefinite-life Intangible Assets	<u>940,000</u>
Receivables	<u>\$1,390,000</u>
Prepaid Assets and Supplies	
Merchandise Inventory	\$ 641,000
Prepaid Rent	<u>81,000</u>
Prepaid Assets and Supplies	<u>\$ 722,000</u>
Payables and Accrued Expenses	
Accounts Payable	\$ 519,000
Accrued Expenses	<u>521,500</u>
Payables and Accrued Expenses	<u>\$1,040,500</u>
Contributed Capital	
Common Stock, \$1 par value	\$ 815,000
Additional Paid-in Capital	<u>1,040,000</u>
Contributed Capital	<u>\$1,855,000</u>

Required »

Prepare a corrected classified balance sheet.

- 3 BE6-6. Classified Balance Sheet, Report Format.** Martell Manufacturing Incorporated provided the following list of account balances for the current year ended December 31.

Account	Debit	Credit
Accounts receivable	\$ 300,000	
Bonds payable, due in 20 years		\$ 400,000
Investments at fair value (trading)	58,000	
Accounts payable		175,000
Additional paid-in capital		587,000
Accumulated other comprehensive loss	165,300	
Current portion of long-term debt		25,000
Property, plant, and equipment – net	1,264,500	
Dividends payable		135,000
Merchandise inventory	254,000	
Income taxes payable		65,800
Cash	145,000	
Notes payable, due in 5 years		138,500
Retained earnings		625,500
Common stock, \$1 par value	—	35,000
Totals	<u>\$2,186,800</u>	<u>\$2,186,800</u>

Prepare a classified balance sheet for the current year using the report format.

- 3 BE6-7. Classified Balance Sheet, Account Format.** Using the information provided in BE6-6, prepare a classified balance sheet using the account format.

- 3 BE6-8. Classified Balance Sheet, Report Format.** Bowe Company provided the following list of accounts.

Account	Debit	Credit
Accumulated other comprehensive loss	\$ 14,900	
Current portion of long-term debt		\$ 45,600
Property, plant, and equipment – net	876,500	
Accounts receivable	50,000	
Bonds payable, due in 20 years		125,000
Accounts payable		76,500
Additional paid-in capital		345,000
Dividends payable		1,200
Merchandise inventory	200,000	
Income taxes payable		32,500
Cash	15,325	
Notes payable, due in 10 years		9,000
Retained earnings		400,900
Common stock, \$1 par value	—	121,025
Totals	<u>\$1,156,725</u>	<u>\$1,156,725</u>

Prepare a classified balance sheet using the report format.

- 3 BE6-9. Classified Balance Sheet, Account Format.** Using the information provided in BE6-8, prepare a classified balance sheet using the account format.

- 4 5** **BE6-10. Classification as Operating, Investing, or Financing Activity on the Statement of Cash Flows.** A list of cash receipts and cash payments for Exis Communications follows. Classify each amount as operating, investing, or financing. Use the direct method.

Cash Receipt or Payment	Classification
Cash payments for extending credit to others	_____
Cash payments to repurchase equity from owners	_____
Cash payments to suppliers and employees	_____
Cash payments for taxes	_____
Cash receipts from the collection or sale of loans made by the entity	_____

- 4 5** **BE6-11. Classification as Operating, Investing, or Financing Activity on the Statement of Cash Flows.** A list of cash receipts and cash payments for Mexis Communications follows. Classify each amount as operating, investing, or financing. Use the direct method.

Cash Receipt or Payment	Classification
Cash receipts from borrowing through bonds, notes, or other instruments	_____
Cash payments for debt and equity securities of other entities	_____
Cash payments for the purchase of goods for resale or for use in production	_____
Cash receipts from dividends	_____
Cash payments for dividends	_____

- 4 5** **BE6-12. Classification as Operating, Investing, or Financing Activity on the Statement of Cash Flows.** A list of cash receipts and cash payments for Axis Communications follows. Classify each amount as operating, investing, or financing. Use the direct method.

Cash Receipt or Payment	Classification
Cash receipts from interest	_____
Cash payments for principal on debt	_____
Cash receipts from customers	_____
Cash payments for property, plant, and equipment and other productive assets	_____
Cash receipts from the sale of debt and equity securities of other entities	_____

- 4 5** **BE6-13. Classification as Operating, Investing, or Financing Activity on the Statement of Cash Flows.** A list of cash receipts and cash payments for Bexis Communications follows. Classify each amount as operating, investing, or financing. Use the direct method.

Cash Receipt or Payment	Classification
Cash receipts from issuing equity to owners	_____
Cash payments for interest	_____
Cash receipts from the sale of productive assets (e.g., property, plant, and equipment)	_____
Cash receipts from customers	_____
Cash payments to suppliers and employees	_____

- 4 5** **BE6-14. Classification as Operating, Investing, or Financing Activity on the Statement of Cash Flows, IFRS.** A list of cash receipts and cash payments for Exis Communications follows. Classify each amount as operating, investing, or financing, assuming that Exis Communications reports under IFRS. Use the direct method.

Cash Receipt or Payment	Classification
Cash payments for extending credit to others	_____
Cash payments to repurchase equity from owners	_____
Cash payments to suppliers and employees	_____
Cash payments for taxes	_____
Cash receipts from the collection or sale of loans made by the entity	_____

- 4 5** **BE6-15. Classification as Operating, Investing, or Financing Activity on the Statement of Cash Flows, IFRS.** A list of cash receipts and cash payments for Mexis Communications follows. Classify each amount as operating, investing, or financing, assuming that Mexis Communications reports under IFRS. Use the direct method.

Cash Receipt or Payment	Classification
Cash receipts from borrowing through bonds, notes, or other instruments	_____
Cash payments for debt and equity securities of other entities	_____
Cash payments for the purchase of goods for resale or for use in production	_____
Cash receipts from dividends	_____
Cash payments for dividends	_____

- 4 5** **BE6-16. Classification as Operating, Investing, or Financing Activity on the Statement of Cash Flows, IFRS.** A list of cash receipts and cash payments for Axis Communications follows. Classify each amount as operating, investing, or financing, assuming that Axis Communications reports under IFRS. Use the direct method.

Cash Receipt or Payment	Classification
Cash receipts from interest	_____
Cash payments for principal on debt	_____
Cash receipts from customers	_____
Cash payments for property, plant, and equipment and other productive assets	_____
Cash receipts from the sale of debt and equity securities of other entities	_____

- 4 5** **BE6-17. Classification as Operating, Investing, or Financing Activity on the Statement of Cash Flows, IFRS.** A list of cash receipts and cash payments for Bexis Communications follows. Classify each amount as operating, investing, or financing, assuming that Bexis Communications reports under IFRS. Use the direct method.

Cash Receipt or Payment	Classification
Cash receipts from issuing equity to owners	_____
Cash payments for interest	_____
Cash receipts from the sale of productive assets (e.g., property, plant, and equipment)	_____
Cash receipts from customers	_____
Cash payments to suppliers and employees	_____

- 4 5** **BE6-18. Statement of Cash Flows, Direct Method.** A list of cash receipts and cash payments for Tucson Telecommunications follows. Compute cash flows from operating activities under the direct reporting format.

Cash Receipts and Payments	Amount
Cash collected from customers	\$1,971,300
Cash paid to suppliers	\$860,740
Cash receipts from borrowing	445,000
Cash paid to purchase equipment	347,000
Cash paid for taxes	244,300
Cash receipts from issuing equity	236,900
Cash payments for property, plant, and equipment	145,600
Cash payments for loans made	56,096
Cash payments on principal on debt	50,700
Cash payments for dividends	6,500
Cash paid for interest	4,300
Cash receipts from interest	480

- 5** **BE6-19. Statement of Cash Flows, Indirect Method.** Identify whether each of the following items is added or subtracted from net income to compute cash flows from operating activities under the indirect method.

Item	Add or Subtract from Net Income to Compute Cash Flows from Operating Activities
a. Depreciation expense	_____
b. Decrease in taxes payable	_____
c. Increase in accounts receivable	_____
d. Gain on the sale of equipment	_____
e. Increase in accounts payable	_____
f. Decrease in prepaid rent	_____

- 6** **BE6-20. Financial Statement Articulation.** Complete the following financial statement articulation exercises.
- If net income is \$40,000 and comprehensive income is \$32,000, what is other comprehensive income (loss)?
 - If ending retained earnings is \$76,000, beginning retained earnings is \$42,000, and net income is \$40,000, what is the amount of dividends declared?
 - If ending retained earnings is \$34,000, beginning retained earnings is \$42,000, and dividends declared is \$3,000, what is net income (loss)?
 - If ending retained earnings is \$76,000, net income is \$40,000, and dividends declared is \$10,000, what is the amount of beginning retained earnings?
 - If the beginning balance of cash was \$96,000 and the ending balance of cash is \$128,000, what is the net change in cash?
 - If the beginning balance of cash was \$128,000 and the ending balance of cash is \$96,000, what is the net change in cash?

- 7** **BE6-21. Subsequent Events.** The Junebug Corporation is preparing its annual financial statements and needs to determine which of the following events are subsequent events. If the event is a subsequent event, identify whether it should be recognized or disclosed in the financial statements. For all scenarios, assume Junebug has a December 31 year-end and issues its financial statements on February 10.

Scenario	Subsequent Event	Disclosed or Recognized
a. On January 25, an earthquake caused \$1.2 million in damages to the company's manufacturing facility.	_____	_____
b. The company hired a new chief executive officer on February 1.	_____	_____

Scenario	Subsequent Event	Disclosed or Recognized
c. On February 8, a judge ruled against the company and found it liable for \$500,000 in a case that had been ongoing for the last year.	_____	_____
d. On January 18, the company settled a lawsuit for \$275,000 that had been ongoing for the last year.	_____	_____
e. On February 9, the company settled a lawsuit for \$0.7 million arising from an accident in its manufacturing plant on January 2.	_____	_____
f. On February 12, a severe blizzard caused \$450,000 in damages to the company's manufacturing facility.	_____	_____
g. On January 6, the company acquired a medium-sized competitor for \$207 million.	_____	_____

7

BE6-22. Related Parties. The Firefly Company is preparing its annual financial statements and needs to identify all its related parties. Which of the following would be related parties of the Firefly Company?

Party	Related Party (Yes or No)
a. A member of Firefly's board of directors	_____
b. A shareholder who owns 25% of Firefly's shares	_____
c. A shareholder who owns two shares of Firefly's stock	_____
d. Firefly's chief executive officer	_____
e. The husband of Firefly's chief financial officer	_____
f. Firefly's pension trust fund	_____
g. A company in which Firefly owns 40% of its stock	_____
h. A company in which Firefly owns 100 shares, less than 1% of its stock	_____

8

BE6-23. Contents of the Annual Report. Match each annual report section with its description.

Annual report sections:

- Management's discussion and analysis
- Auditors' report
- Management's responsibility for the financial statements
- Management's report on internal control over financial reporting
- Board of directors

Description:

_____	Statement of independent opinion on whether the financial statements are presented fairly and in compliance with U.S. GAAP .
_____	Description of the body that oversees the activities of the company and its members.
_____	Statement from the chief executive officer and chief financial officer that they are in charge of the preparation and presentation of the financial statements.
_____	Description of significant aspects of the company's financial condition and results of operations, including liquidity, capital resources, results of operations, off-balance sheet arrangements, and contractual obligations.
_____	Statement from the chief executive officer and chief financial officer that they have assessed the processes used in preparing the financial reports.

- BE6-24. Statement of Cash Flows, Direct Method.** Identify and compute the cash flow related to each item on the following income statement. Use the direct method.

	<u>Balance Sheet Accounts</u>		<u>Income Statement Accounts</u>	
	Beginning Balance	Ending Balance		
a. Accounts Receivable	\$1,035	\$1,123	Sales	\$35,678
b. Prepaid Insurance	400	514	Insurance Expense	1,346
c. Inventory	5,461	6,723	Cost of Goods Sold	34,762
d. Accounts Payable	4,312	5,125		
e. Taxes Payable	3,009	2,400	Tax Expense	45,098

- BE6-25. Statement of Cash Flows, Indirect Method.** Tennis Emporium provided the following information for the current year.

Tennis Emporium Statement of Net Income for the Current Year Ended		Amount
Sales		\$767,000
Depreciation Expense		(52,000)
Selling, General, and Administrative Expenses		<u>(688,000)</u>
Operating Income		27,000
Tax Expense		<u>(6,000)</u>
Net Income		<u>\$ 21,000</u>

Changes in Balance Sheet Accounts

Increase in Accounts Receivable	\$10,000
Increase in Accounts Payable (Related to Selling, General, and Administrative Expenses)	\$ 5,000
Decrease in Income Taxes Payable	\$ 3,000

Compute the net cash flow from operating activities for Tennis Emporium under the indirect reporting format.

- BE6-26. Statement of Cash Flows, Direct Method.** Use the information from BE6-25 to compute the net cash flow from operating activities for Tennis Emporium under the direct reporting format.

- BE6-27. Ratio Analyses.** Identify whether the following measures are indicators of liquidity, solvency, or profitability.

Measure	Indicator of
a. Current Ratio	_____
b. Debt-to-Equity Ratio	_____
c. Profit Margin	_____
d. Interest Coverage Ratio	_____
e. Return on Assets	_____
f. Working Capital	_____
g. Return on Stockholders' Equity	_____

- BE6-28. Ratio Analyses.** Green Grasshopper Incorporated is interested in assessing the following scenarios on its indicators of liquidity, solvency, and profitability. Solve each scenario independently.

- Green Grasshopper's debt-to-equity ratio is 40%. It is considering issuing \$13 million in bonds that would increase its total liabilities to \$68 million. What would Green Grasshopper's debt-to-equity ratio be if it issued the bonds?
- Green Grasshopper's current ratio is 1.45. It is considering issuing \$30 million in bonds to purchase a new manufacturing facility. Its current liabilities are \$28 million, but the new debt would increase the current portion of its long-term debt payable by \$3.2 million. What would Green Grasshopper's current ratio be if it issued the bonds and used the proceeds to purchase the facility?

Exercises

- 2** **E6-1. Classification of Assets and Liabilities.** Darin Development Company engaged in the following transactions during the current year.
- Borrowed \$400,000 from Pleasantville Community Bank at the beginning of the year. The terms of the note call for annual payments of \$50,000. The first annual payment has not been paid as of the end of the current year. (Ignore any interest payable.)
 - Made sales for the current year amounting to \$2,900,000 with 40% collected during the current year.
 - Acquired inventory costing \$345,000 on account.
 - Incurred taxes due on the current year's income of \$76,000.
 - Paid \$60,000 for a three-year insurance policy in advance on January 1 of the current year.
 - Acquired new equipment costing \$890,000 by borrowing the full amount at the end of the current year. The loan is due in 5 years.

Required »

Identify and classify the noncash assets and liabilities resulting from the current-year transactions. Assume that your classification is made as of the end of the current year.

- 2** **E6-2. Classification of Assets, Liabilities, and Equity.** Classify each of the following accounts as an asset, liability, or stockholders' equity. In the case of the assets, further classify them as current assets; long-term investments; property, plant, and equipment; intangible assets; or other assets. In the case of liabilities, further classify the accounts as current or noncurrent.

Account	Asset, Liability, or Stockholders' Equity	Classification
Accounts payable	_____	_____
Trademark	_____	_____
Cash	_____	_____
Income taxes payable	_____	_____
Tractors	_____	_____
Common stock	_____	_____
Accounts receivable	_____	_____
Retained earnings	_____	_____

- 2** **E6-3. Classification of Assets, Liabilities, and Equity.** Classify each of the following accounts as an asset, liability, or stockholders' equity. In the case of the assets, further classify them as current assets; long-term investments; property, plant, and equipment; intangible assets; or other assets. In the case of liabilities, further classify the accounts as current or noncurrent.

Account	Asset, Liability, or Stockholders' Equity	Classification
Notes payable – due in 10 years	_____	_____
Preferred stock	_____	_____
Investments held for immediate trading	_____	_____
Accumulated other comprehensive income	_____	_____
Accrued salaries payable	_____	_____
Factory building	_____	_____
Notes payable due in 6 months	_____	_____
Inventory	_____	_____

- 2** **E6-4. Classification of Assets, Liabilities, and Equity.** Classify each of the following accounts as asset, liability, or stockholders' equity. In the case of the assets, further classify them as current assets; long-term investments; property, plant, and equipment; intangible assets; or other assets. In the case of liabilities, further classify the accounts as current or noncurrent.

Account	Asset, Liability, or Stockholders' Equity	Classification
Unearned revenues – related to services to be performed within the next year	_____	_____
Cash equivalents	_____	_____
Investment in debt instrument – held for long-term appreciation	_____	_____
Interest payable	_____	_____
Patent	_____	_____
Additional paid-in capital	_____	_____
Current maturity of long-term debt	_____	_____
Prepaid expenses	_____	_____

Cash – Beginning of Year	(c)	37,000	6,700
Increase (Decrease) in Cash	3,000	(5,000)	(h)

- 7** **E6-13. Subsequent Events.** For each of the following subsequent event financial statement disclosures, determine whether the treatment is proper. The fiscal year-end is December 31 in each scenario. The financial statements are issued on February 7, 2019.

- On January 21, 2019, the Company settled a product liability lawsuit for \$4.5 million. The Company had previously recorded a liability for \$3.0 million related to this lawsuit. No additional liability and loss are recorded on January 21, 2019.
- On February 15, 2019, the Company announced that it had entered into an agreement to acquire the Snap Cracker Company for approximately \$1.7 billion, which it expects to fund by issuing approximately \$1.5 billion of long-term debt. The transaction is subject to customary conditions, including the receipt of regulatory approval. The Company expects the transaction to close in fall 2019. The company did not record a journal entry or prepare a footnote.
- On February 2, 2019, an earthquake destroyed the Company's pasta manufacturing facility in Italy, causing \$2.6 million in losses that reduced its 2018 net income.

- 8** **E6-14. Contents of the Annual Report.** Use *Johnson & Johnson's* 2016 Annual Report, 10-K, to answer the following questions. You can locate *Johnson & Johnson's* financial statements on its Web site, the Securities and Exchange Commission's Web site of company reports, or the accompanying textbook Web site.

- From Item 1, Business, how does the management describe *Johnson & Johnson's* business? What are *Johnson & Johnson's* main business segments?
- In Item 7, Management Discussion and Analysis, on the top of page 15, *Johnson & Johnson* decomposed its annual change in sales into three factors. What are these three factors?
- In Item 7, Management Discussion and Analysis, starting on page 23, *Johnson & Johnson* provides an analysis of Income Before Tax by Segment. Which business segment or segments show increasing income before tax?
- In Item 7, Management Discussion and Analysis, on page 24, *Johnson & Johnson* begins to discuss Liquidity and Capital Resources. From the first paragraph in Liquidity and Capital Resources, what are *Johnson & Johnson's* primary sources and uses of cash?
- In Item 7, Management Discussion and Analysis, on pages 26–27, *Johnson & Johnson* discusses its Critical Accounting Policies and Estimates. What accounting topics does it discuss?
- How many footnotes are in *Johnson & Johnson's* financial statements?
- What accounting firm performed *Johnson & Johnson's* independent audit?
- Who signed *Johnson & Johnson's* Management's report on internal control over financial reporting?

- A** **E6-15. Statement of Cash Flows, Indirect Method.** Use the following information Hockey Apparel Providers, Inc. provided for the current year to compute net cash flow from operating activities under the indirect reporting format.

Hockey Apparel Providers, Inc.
Statement of Net Income
for the Current Year Ended

	Amount
Sales	\$2,452,000
Cost of Goods Sold	(1,251,000)
Depreciation Expense	(178,000)
Selling, General, and Administrative Expenses	<u>(558,000)</u>
Operating Income	465,000
Tax Expense	<u>(145,000)</u>
Net Income	<u>\$ 320,000</u>

	Amount
Decrease in Accounts Receivable	\$ 29,000
Decrease in Inventory	43,000
Increase in Prepaid Expenses	9,000
Decrease in Accounts Payable	34,000
Increase in Income Taxes Payable	32,000

A **E6-16. Statement of Cash Flows, Direct Method.** Use the information from E6-15 that Hockey Apparel Providers, Inc. provided for the current year to compute net cash flow from operating activities under the direct reporting format.

B **E6-17. Liquidity Analyses.** Use the following excerpt of Dragonfly Corporation's asset balances to compute Dragonfly's working capital and current ratio for 2019 and 2018. Comment on Dragonfly's liquidity and changes in liquidity from 2018 to 2019. Dragonfly's current liabilities are \$89,754 million and \$82,271 million in 2019 and 2018, respectively.

Assets (dollars in millions)	2019	2018
Current assets		
Cash and cash equivalents	\$ 13,420	\$ 19,355
Marketable securities	7,623	2,394
Accounts receivable trade – net	22,120	20,872
Inventories	47,415	45,630
Prepaid expenses and other receivables	<u>1,312</u>	<u>1,264</u>
Total current assets	91,890	89,515
Property, plant, and equipment – net	67,045	65,762
Other assets	<u>3,773</u>	<u>3,770</u>
Total assets	<u>\$162,708</u>	<u>\$159,047</u>

B **E6-18. Solvency Analyses.** The following items are from the financial statements of Tall Oak Company.

Item	2019	2018
Total liabilities	\$450,000	\$414,000
Total stockholders' equity	634,000	621,000
Net income	63,000	61,000
Tax expense	18,900	18,300
Interest expense	13,500	12,420
Interest paid	12,100	13,660

Compute Tall Oak's debt-to-equity ratio and interest coverage ratio for 2018 and 2019. Comment on Tall Oak's solvency and changes in solvency from 2018 to 2019.

Problems

- 3** **P6-1. Prepare Balance Sheet.** Larkin Corporation provided the following account balances prepared at December 31 of the current year.

Account	Debit	Credit
Additional paid-in capital		\$ 891,500

Account	Debit	Credit
Loss on disposal of plant assets	\$ 740	
Dividends	790	
Cost of goods sold	548,450	
Selling expenses	70,515	
Dividend income		\$ 65
Advertising expense	39,175	
Office salaries expense	6,268	
Depreciation expense	94,020	
Loss on asset impairment	3,250	
Accounting and legal fees	15,600	
Interest income		712
Unrealized loss on available-for-sale bonds before tax	450	
Interest expense	9,600	
Sales		783,500
Retained earnings: beginning balance		368,900
Accumulated other comprehensive loss: beginning balance	5,700	
Common stock – no par: beginning balance		85,800

Society Teas issued \$5,400 of no-par common stock on April 1 of the current year.

Required »

Prepare the stockholders' equity section of the balance sheet at December 31 of the current year. Ignore taxes.

- 3 P6-6. Prepare Classified Balance Sheet.** Centre Company provided the following listing of the current year's post-closing account balances.

Account	Debit	Credit
Cash	Solve	
Notes payable, due in 10 years		\$12,000
Treasury stock at cost	\$ 5,600	
Accumulated other comprehensive income		1,000
Current portion of long-term debt		500
Property, plant, and equipment – net	46,500	
Investments in affiliate companies (noncurrent)	3,000	
Accounts receivable	8,000	
Bonds payable, due in 20 years		20,000
Common stock, \$1 par value		15,000
Investments at fair value (available-for-sale) (noncurrent)	2,100	
Accounts payable		6,200
Additional paid-in capital		14,800
Dividends payable		300
Intangible assets – net	4,000	
Merchandise inventory	5,800	
Income taxes payable		1,500
Retained earnings		6,800

Centre reported net income of \$3,200 and declared dividends amounting to \$600. Unrealized losses on the company's available-for-sale portfolio amounted to \$400 for the current year. There are no other events that affect stockholders' equity.

Required »

Prepare a classified balance sheet at December 31 of the current year.

CASES

Judgment Cases

Judgment Case 1: Balance Sheet Management

The CFO of First Things Computing, Inc. (FTC) prepared the following balance sheet as of December 31, 2019.

First Things Computing, Inc.
Balance Sheet
As of December 31, 2019

Assets

Current Assets:

Cash	\$ 5,000
Trading Securities at Fair Value	700
Accounts Receivable – net	11,000
Merchandise Inventory	24,000
Office Supplies	600
Prepaid Rent	200
Total Current Assets	<u>\$ 41,500</u>

Noncurrent Assets:

Investments	\$ 15,000
Property, Plant, and Equipment	
Land	20,000
Buildings	80,000
Machinery and Equipment	70,000
Less: Accumulated Depreciation	<u>(62,000)</u>
Total Property, Plant, and Equipment – net	108,000
Deferred Tax Asset	5,000
Intangible Assets: Franchise – net	4,500
Other Assets	3,100
Total Noncurrent Assets	<u>\$135,600</u>
Total Assets	<u>\$ 177,100</u>

Liabilities

Current Liabilities:

Accounts Payable	\$ 2,700
Short-term Notes Payable	1,000
Current Portion of Long-term Debt	300
Interest Payable	200
Income Taxes Payable	1,500
Unearned Revenue	5,400
Total Current Liabilities	<u>\$ 11,100</u>

Noncurrent Liabilities:

Notes Payable, due 10 years	\$ 40,000
Bonds Payable, due 20 years	60,000
Total Noncurrent Liabilities	<u>100,000</u>
Total Liabilities	\$ 111,100

Stockholders' Equity

Common Stock – at par	\$ 20,000
Additional Paid-in Capital	30,000
Retained Earnings	5,000
Accumulated Other Comprehensive Income	11,000
Total Stockholders' Equity	<u>\$ 66,000</u>
Total Liabilities and Stockholders' Equity	<u>\$ 177,100</u>

For the sake of simplicity, assume that FTC does not incur income tax expense. Thus, the impact on equity can be computed as the combination of the impact on assets and the impact on the liabilities.

The CFO must make the following adjustments before finalizing the financial statements:

1. FTC will need to record some amount of bad debt expense. The offset will be a reduction in accounts receivable. This adjustment is a matter of judgment, and reasonable estimates range between \$1,000 and \$3,000.
2. FTC will need to write down its inventory (i.e., reduce the reported value of inventory). The offset will be to cost of goods sold. This adjustment is a matter of judgment, and reasonable estimates range between \$2,500 and \$3,750.
3. FTC may need to record an impairment loss on its PPE (i.e., reduce the reported value of PPE). The offset will be an impairment loss reported on the statement of net income. This adjustment is a matter of judgment, and reasonable estimates range between \$0 and \$5,000.
4. FTC may need to record an impairment loss on its noncurrent investments (i.e., reduce the reported value of noncurrent investments). The offset will be an impairment loss reported on the statement of net income. This adjustment is a matter of judgment, and reasonable estimates range between \$250 and \$750.
5. FTC may need to record a litigation contingency (i.e., it may need to record a liability for an unresolved lawsuit). The offset is to litigation expense. The lawsuit is expected to be settled in 2020. FTC's attorneys believe that they can provide a point estimate of amount for which FTC will be liable. The estimate will either be \$2,000 or \$10,000.
6. FTC may need to reduce the reported amount of its deferred tax asset. The amount by which the asset needs to be reduced is highly judgmental and ranges from \$0 to \$5,000. The offset to this adjustment is income tax expense. Assume the deferred tax asset is noncurrent.
7. FTC currently has unearned revenue on its balance sheet of \$5,400. Up to \$5,000 of this amount could possibly be recognized as revenue in 2019. However, this amount is a matter of judgment.

Required »

- a. If FTC makes the most conservative choices for all these adjustments that will result in the lowest net income number, what is the impact on assets and liabilities in terms of absolute dollar impact and percentage change?
- b. If FTC makes the least conservative choices for all these adjustments that will result in the highest net income number, what is the impact on assets and liabilities in terms of absolute dollar impact and percentage change?
- c. What is the impact on the current ratio and the debt-to-equity ratio of these choices if management makes the most conservative choices? What is the impact on these ratios if management makes the least conservative choices?
- d. Do you think that the management of FTC will care very much about the choices related to these adjustments?

Financial Statement Analysis Case

Financial Statement Analysis Case 1: Liquidity, Solvency, and DuPont Analysis of *Foot Locker*

Use *Foot Locker, Inc.*'s balance sheet and other information provided on the next page to answer the following questions.

- a. Compute *Foot Locker*'s working capital in 2015 and 2014.
- b. Compute *Foot Locker*'s current ratio in 2015 and 2014.
- c. Comment on what the working capital and current ratio indicate about *Foot Locker* in 2015 and 2014.
- d. Compute *Foot Locker*'s debt-to-equity ratio for 2015 and 2014. Comment on what the debt-to-equity ratio indicates about *Foot Locker* in 2015 and 2014.

- e. Use DuPont analysis to decompose *Foot Locker's* return on equity into return on assets and financial leverage. *Foot Locker's* net income in 2015 was \$541 million. Comment on the effect of financial leverage on return on equity.

Surfing the Standards Cases

Surfing the Standards Case 1: Liquidation Accounting

Techy Corporation, a calendar-year company, manufactures innovative technological equipment. Techy began experiencing extensive financial difficulties in the current fiscal year due to the entrance of several competitors into the industry. On December 31, Techy's Board of Directors approved a plan for liquidation. The Board has the authority to make this decision and there are no other parties that could block the plan.

The balance sheet for Techy is on the next page followed by additional information. Using the codification as a guide, prepare a statement of net assets in liquidation for Techy Corporation for December 31 of the current year. Provide a discussion for each additional item of information that explains any necessary adjustments or why an adjustment is not necessary.

**Techy Corporation Balance Sheet
As of December 31**

Assets	
Current Assets:	
Cash	\$ 95,000
Trading Securities at fair value	7,200
Accounts Receivable – net	154,500
Merchandise Inventory	99,000
Other Current Assets	<u>15,800</u>
Total Current Assets	<u>\$ 371,500</u>
Noncurrent Assets:	
Investments at fair value	\$ 98,000
Property, Plant, and Equipment	
Land	550,000
Buildings	789,000
Machinery and Equipment	351,000
Less: Accumulated Depreciation	<u>(395,400)</u>
Total Property, Plant, and Equipment – net	<u>1,294,600</u>
Total Noncurrent Assets	<u>\$1,392,600</u>
Total Assets	<u>\$1,764,100</u>
Liabilities	
Current Liabilities:	
Accounts Payable	\$ 37,000
Short-term Notes Payable	6,500
Current Portion of Long-term Debt	25,000
Accrued Liabilities	6,400
Unearned Revenue	<u>5,400</u>
Total Current Liabilities	<u>\$ 80,300</u>
Noncurrent Liabilities:	
Notes Payable	\$ 320,000
Bonds Payable	<u>570,000</u>
Total Noncurrent Liabilities	<u>\$ 890,000</u>
Total Liabilities	<u>\$ 970,300</u>
Stockholders' Equity	
Common Stock – at par	\$ 140,000
Additional Paid-in Capital	275,000
Accumulated Other Comprehensive Income	35,000
Retained Earnings	<u>343,800</u>
Total Stockholders' Equity	<u>\$ 793,800</u>
Total Liabilities and Stockholders' Equity	<u>\$1,764,100</u>

1. Techy has a backorder on one of its products that it plans on fulfilling for 100 units at a selling price of \$1,500 per unit. Techy expects to incur payroll costs of \$45,000 related to this back order.
2. Techy's investments and trading securities are all investments in entities that are traded in highly liquid markets. Techy typically incurs brokerage fees of 1% to trade these securities.
3. Techy has discussed selling its accounts receivable to another party. The potential buyer has indicated that it will purchase the receivables at a 10% discount. Techy does not anticipate any significant costs to this transaction.
4. Techy plans on selling its remaining merchandise inventory to a competitor. The competitor will purchase the inventory at Techy's cost.

5. Techy does not anticipate that it will have the ability to sell any of its other current assets, which are mostly prepaid items.
6. Although the fair value of the property, plant, and equipment is close to \$2 million, Techy management does not believe that it will be able to receive this much from property due to the speed with which it will need to be disposed. Management estimates that the property, plant, and equipment will sell for \$1.5 million. They anticipate costs associated with the disposal of 6% of consideration received.
7. Techy anticipates that it will receive special terms from the bank that holds its note and will most likely need to repay only 80% of the balance. It is likely that the other liabilities of the firm will be paid off as originally scheduled.
8. Techy holds several patents that are not reported on its balance sheet. Management expects to sell these patents for \$550,000. They anticipate incurring costs of disposal of \$27,000.

Surfing the Standards Case 2: True and Fair Override

IFRS has a feature commonly referred to as the *true and fair override*. Read *International Accounting Standard 1*, paragraphs 19 through 24.

1. What is the true and fair override, and should it be used frequently?
2. When can an entity use the true and fair override and what should management consider in deciding whether to use the true and fair override?

Basis for Conclusions Cases

Basis for Conclusions Case 1: Liquidation Accounting

If liquidation is imminent for an entity, then the company must use the liquidation basis of accounting. The rules for the liquidation basis of accounting were set forth in ASU 2013-07 and subsequently incorporated into the codification.

When the FASB was deliberating on the issue of the liquidation basis of accounting, the board addressed when the entity should start applying liquidation accounting. Originally, prior to issuing an exposure draft, FASB had decided that liquidation would be considered imminent when the plan for liquidation had been approved by the parties that had the authority to do so.

1. What problem did the FASB discover with this approach? What did it then conclude should be done?

Later, the FASB issued an exposure draft on the liquidation basis of accounting. Many of the respondents to the exposure draft expressed a concern with the definition of “imminent.”

2. What concern did the respondents express? What was the board’s response?

Other issues related to the liquidation basis of accounting involve the measurement bases used. The recognition bases under liquidation accounting are generally inconsistent with the measurement used in general-purpose financial statements.

3. How did the FASB respond to this contradiction within its own framework?

The FASB concluded that in measuring assets under the liquidation basis of accounting, the entity should measure the assets based on the amounts it expects to receive.

4. Why did the FASB not just state that the measurement should be based on fair value? Is it correct that fair value is the same as the amounts the entity expects to receive in liquidation?

The FASB also concluded that liabilities should not be written down until the entity is legally released from them.

5. What was FASB’s reasoning for this conclusion?

Basis for Conclusions Case 2: Notes to the Financial Statements

On March 4, 2014, the FASB issued an exposure draft on *Conceptual Framework for Financial Reporting - Chapter 8: Notes to Financial Statements*. The purpose of this project is to identify a broad range of possibilities for the board to consider when it makes disclosure rules related to particular topics.

1. An issue arose in deliberations of this exposure draft related to whether the FASB should require disclosure of alternative measures. For example, an entity would record the historical cost of an asset on the face of the balance sheet but be required to disclose its fair value. What are the pros and cons of requiring alternative disclosures in some circumstances? What did the FASB decide?
2. Another issue in the deliberations related to whether future-oriented information should be included in the disclosures to the financial statements. Why were some respondents opposed to including this information in the notes to the financial statements? What did the FASB decide?

APPENDIX A

Overview of the Preparation of the Statement of Cash Flows

We outlined the purpose of the statement of cash flows and its classifications in the chapter. In this appendix, we provide an overview of the preparation of the statement.²⁷

Reporting Cash Flows from Operating Activities: Indirect Method

The indirect method begins with net income from the income statement and then reconciles the net income to net cash provided by operating activities. Reconciling items are separated into two groups:

- Adjustments for items such as depreciation expense and unrealized gains and losses.
- Changes in operating assets and liabilities such as increases in accounts payable or decreases in inventory.

Exhibit 6A.1 shows the effects of changes in specific common current assets and current liabilities.

EXHIBIT 6A.1 The Effect of Changes in Current Assets and Current Liabilities

Current Asset/ Liability	Increase/ Decrease	Effect on Cash Flow	Rationale	Action
Trade Receivables	Increase	Decrease	An increase in trade receivables represents uncollected sales.	Deduct the amount of the increase from net income to adjust sales to the amount of cash collected from customers.
	Decrease	Increase	A decrease in trade receivables indicates that all of this year's sales as well as a portion of prior years' sales were collected.	Add the amount of the decrease back to net income to adjust sales to the amount of cash collected from customers.
Inventory	Increase	Decrease	An increase in inventory indicates the company acquired inventory to cover the cost of goods sold and increased inventory held in the warehouse. The increase in warehouse inventory results in additional cash outflow to pay for this inventory.	Deduct the amount from net income to adjust cost of goods sold to cash paid for purchases.
	Decrease	Increase	A decrease in inventory indicates that of the cost of inventory sold this year, some of the units sold were purchased in prior years.	Add the amount back to net income to adjust the cost of goods sold to the cash paid for inventory.
Prepaid Expenses	Increase	Decrease	An increase in prepaid expenses is a cash outflow that appears on the balance sheet and does not affect net income. However, the cash is paid as part of cash outflow from operations.	Deduct the increase in prepaid expense from net income to adjust to the amount of cash paid for operating expenses.

²⁷We provide an in-depth discussion of the preparation of the statement of cash flows in Chapter 22.

Current Asset/ Liability	Increase/ Decrease	Effect on Cash Flow	Rationale	Action
Prepaid Expenses	Decrease	Increase	A decrease in prepaid expenses represents a cash outflow made in a previous period that is reflected as an expense on the income statement in the current period.	Add the decreased amount back to net income to arrive at cash paid for operating expenses.
Accounts Payable	Increase	Increase	An accounts payable increase represents invoices for inventory not paid in the current year.	Add the increase in accounts payable to net income to adjust cost of goods sold to cash paid for inventory acquired.
	Decrease	Decrease	If accounts payable decreases, the current invoices as well as a portion of last year's invoices were paid.	Deduct this decrease from net income to adjust cost of goods sold to arrive at cash paid for inventory acquired.
Accrued Expenses Payable	Increase	Increase	An accrued expense increase represents operating expenses not paid in the current year.	Add the increase in accrued expenses to net income to adjust operating expenses to cash paid to suppliers.
	Decrease	Decrease	Decreases in accrued expenses indicate that this year's operating expenses as well as a portion of prior years' expenses were paid in cash.	Deduct the decrease in accrued expenses from net income to adjust operating expenses to cash paid to suppliers.

Example 6A.1 provides a comprehensive illustration of the preparation of the operating activities section of the statement of cash flows under the indirect method.

EXAMPLE 6A.1 Operating Cash Flows: Indirect Method

PROBLEM: Aries Endoscope, Inc. presents the following income statement and select balance sheet accounts. Prepare the operating cash flows section of the cash flow statement using the indirect method.

Aries Endoscope, Inc. Statement of Net Income For the Current Year Ended	
Sales Revenue	\$1,345,000
Cost of Goods Sold	<u>852,000</u>
Gross Profit	493,000
Wage Expense	54,000
General and Administrative Expenses	112,000
Depreciation Expense	<u>27,000</u>
Operating Income	300,000
Interest Expense	<u>10,000</u>
Income before Taxes	290,000
Income Tax Expense	<u>87,000</u>
Net Income	<u>\$ 203,000</u>

Additional information:

Select Balance Sheet Accounts

Account	Beginning	Ending
Accounts Receivable	\$ 20,000	\$ 15,250
Inventory	543,400	575,300
Prepaid Expenses	12,450	10,590
Accounts Payable	55,670	52,000
Wages Payable	5,400	6,700
Interest Payable	2,250	2,000

SOLUTION: We begin with net income and adjust for noncash expenses. From the income statement and additional information, we identify depreciation expense of \$27,000 as a noncash expense. We add this noncash expense back to net income. There are no noncash revenues to include in the adjustments.

We then adjust for changes in the current assets and liabilities, according to Exhibit 6A.1. The following table identifies the balance sheet accounts, the change in each account, and how the change is presented in the operating cash flow section of the statement of cash flows.

Account	Ending Balance	Beginning Balance	Change	Action	Rationale
Accounts Receivable	\$ 15,250	\$ 20,000	\$(4,750)	Add decrease	A decrease in trade receivables indicates that all of this year's sales as well as a portion of prior years' sales were collected.
Inventory	575,300	543,400	31,900	Subtract increase	An increase in inventory indicates the company acquired inventory to cover the cost of goods sold and increased inventory held in the warehouse. The increase in warehouse inventory results in additional cash outflow to pay for this inventory.
Prepaid Expenses	10,590	12,450	(1,860)	Add decrease	A decrease in prepaid expenses reduces net income but no cash is paid, so the decrease is added to net income.
Accounts Payable	52,000	55,670	(3,670)	Subtract decrease	If accounts payable decreases, the current invoices as well as a portion of last year's invoices were paid.
Wages Payable	6,700	5,400	1,300	Add increase	An increase in wages payable represents operating expenses not paid in the current year.
Interest Payable	2,000	2,250	(250)	Subtract decrease	Decreases in interest payable indicate that this year's interest expense as well as a portion of last years' interest expense was paid in cash.

The completed operating activities section of the statement of cash flows under the indirect method follows.

Aries Endoscope, Inc.
Statement of Cash Flows (Partial)
For the Current Year Ended

Operating Activities:

Net Income	\$203,000
Adjustments to reconcile net income to net cash provided by operating activities:	
Depreciation Expense	27,000
Changes in Operating Working Capital Accounts:	
Decrease in Accounts Receivable	4,750
Increase in Inventory	(31,900)
Decrease in Prepaid Expenses	1,860
Decrease in Accounts Payable	(3,670)
Increase in Wages Payable	1,300
Decrease in Interest Payable	(250)
Net Cash Provided by Operating Activities	<u>\$202,090</u>

The Indirect Statement of Cash Flows: IFRS. IFRS does not specify the income level to use as the first line in the reconciliation of income to operating cash flows. As a result, a company can begin the reconciliation with net income or operating income.²⁸

Reporting Cash Flows from Operating Activities: Direct Method

Under the direct method, companies report actual cash inflows and outflows in the operating section of the statement of cash flows by converting each income statement line item from the accrual basis to the cash basis.

Cash Collected from Customers

To compute cash collected from customers, examine the activity in accounts receivable, which increases with sales revenue and decreases with collections.

Accounts Receivable		
<i>From Balance Sheet</i>	Beginning Balance	Cash Collected <i>Computed</i>
<i>From Income Statement</i>	Sales Revenue	
<i>From Balance Sheet</i>	Ending Balance	

This approach focuses on the change in the receivables balance. An increase in accounts receivable indicates that the firm has recorded more revenue than the amount of cash it received. A decrease in accounts receivable indicates that it has recorded less revenue than the amount of cash received.

Cash Collected from Customers:

Sales Revenue
Less: Increase in Net Accounts Receivable

OR

Add: Decrease in Net Accounts Receivable
Cash Collected from Customers

²⁸We provide an in-depth discussion of this difference in the preparation of the statement of cash flows in Chapter 22.

Cash Paid for Merchandise

The computation of cash paid for merchandise requires two steps. First, determine the purchases on an accrual basis. Second, determine how much cash the firm spent on these purchases.

To determine the purchases on an accrual basis, examine the activity in inventory.

		Inventory			
<i>From Balance Sheet</i>		Beginning Balance			
<i>Computed</i>	→	Purchases	Cost of Goods Sold		<i>From Income Statement</i>
<i>From Balance Sheet</i>		Ending Balance			

Next, review the activity in accounts payable because purchases are usually made on account. Use the purchases computed above to obtain cash paid for merchandise.

		Accounts Payable			
		Beginning Balance			<i>From Balance Sheet</i>
<i>Computed</i>	→	Cash Paid	Purchases		<i>From Inventory</i>
		Ending Balance			<i>From Balance Sheet</i>

The beginning and ending balances are obtained from the balance sheet, and cost of goods sold is reported on the income statement.

Again, we focus on the changes in the balance sheet accounts to determine the cash flow related to acquiring merchandise. If inventory increases, purchases are higher than cost of goods sold. If inventory decreases, purchases are lower than cost of goods sold. In other words, a decrease in inventory indicates that some of the units sold this year were purchased and possibly paid for in prior years.

An increase in accounts payable represents invoices for inventory not paid in the current year. A decrease in accounts payable represents invoices for inventory paid for in the current year but not purchased in the current year.

Cash Paid for Merchandise:

Cost of Goods Sold

Add: Increase in Inventory

OR

Less: Decrease in Inventory

Purchases on the Accrual Basis

Less: Increase in Accounts Payable

OR

Add: Decrease in Accounts Payable

Cash Paid for Merchandise

Cash Paid to Employees and Cash Paid for Other Accrued Expenses, Including Interest and Taxes

To compute cash paid for accrued expenses, examine the activity in related payable accounts, which increases with the expense and decreases with the cash paid. Let's use cash paid to employees and wages payable as an example:

		Wages Payable			
		Beginning Balance			<i>From Balance Sheet</i>
<i>Computed</i>	→	Cash Paid	Wage Expense		<i>From Income Statement</i>
		Ending Balance			<i>From Balance Sheet</i>

Focusing on the change in the payables balance, note that:

- An increase in the payable indicates that the firm has recorded more expense under the accrual system than the amount of cash paid out.
- A decrease in the payable indicates that the firm has recorded less expense under the accrual system than the amount of cash paid out.

Following are the computations of cash paid for wages and other accrued expenses, interest, and income taxes.²⁹

Cash Paid to Employees for Wages and Other Accrued Expenses

Wage Expense

Add: Decrease in Wages Payable

OR

Less: Increase in Wages Payable

Cash Paid to Employees for Wages

Cash Paid for Interest:

Interest Expense

Add: Decrease in Interest Payable

OR

Less: Increase in Interest Payable

Cash Paid for Interest

Cash Paid for Income Taxes:

Income Tax Expense

Add: Decrease in Income Taxes Payable

OR

Less: Increase in Income Taxes Payable

Cash Paid for Income Taxes

Cash Paid for Other Operating Costs, Including Insurance and Other Prepaid Expenses

To compute cash paid for insurance and other prepaid expenses, we review the activity in the related prepaid asset account, which increases with cash paid and decreases with the expense.

Prepaid Insurance		
<i>From Balance Sheet</i>	Beginning Balance	
<i>Computed</i>	Cash Paid	Insurance Expense <i>From Income Statement</i>
<i>From Balance Sheet</i>	<u>Ending Balance</u>	

We use the changes in the prepaid balances to determine the amount and direction of cash flow related to prepaid insurance. A decrease in prepaid expenses represents a cash outflow made in a previous period that is reflected as expense on the income statement in the current period. Thus, subtract it from the accrual-basis expense to arrive at cash paid for operating expenses.

An increase in prepaid expenses is a cash outflow that appears on the balance sheet and does not affect net income. However, because the firm paid cash as part of operations, add the increase in prepaid expense to the accrual-basis expense to adjust to the amount of cash paid for operating expenses.

²⁹This formula for income taxes paid is simplified because it does not consider balances in the deferred tax accounts.

Cash Paid for Insurance and Other Prepaid Expenses:

Insurance Expense
 Add: Increase in Prepaid Insurance

OR

Less: Decrease in Prepaid Insurance
Cash Paid for Insurance

EXAMPLE 6A.2**Operating Cash Flows: Direct Method**

PROBLEM: Aries Endoscope, Inc. presents the following income statement and select balance sheet accounts. Prepare the operating cash flows section of the cash flow statement using the direct method.

Aries Endoscope, Inc.
Statement of Net Income
For the Current Year Ended

Sales Revenue	\$1,345,000
Cost of Goods Sold	<u>852,000</u>
Gross Profit	493,000
Wage Expense	54,000
General and Administrative Expenses	112,000
Depreciation Expense	<u>27,000</u>
Operating Income	300,000
Interest Expense	<u>10,000</u>
Income before Taxes	290,000
Income Tax Expense	<u>87,000</u>
Net Income	<u>\$ 203,000</u>

Select Balance Sheet Accounts

Account	Beginning	Ending
Accounts Receivable	\$ 20,000	\$ 15,250
Inventory	543,400	575,300
Prepaid Expenses	12,450	10,590
Accounts Payable	55,670	52,000
Wages Payable	5,400	6,700
Interest Payable	2,250	2,000

SOLUTION: Under the direct method, we compute each line item separately, as follows.

Cash Received from Customers

Sales Revenue	\$1,345,000
Add: Decrease in Accounts Receivable	<u>4,750</u>
Cash Received from Customers	<u>\$1,349,750</u>

Cash Paid for Merchandise

Cost of Goods Sold	\$ 852,000
Add: Increase in Inventory	<u>31,900</u>
Accrual Basis Purchases	883,900
Add: Decrease in Accounts Payable	<u>3,670</u>
Cash Paid for Merchandise	<u>\$ 887,570</u>

Cash Paid to Employees	
Wage Expense	\$ 54,000
Deduct: Increase in Wages Payable	<u>(1,300)</u>
Cash Paid to Employees	<u>\$ 52,700</u>
Cash Paid to Other Suppliers	
General and Administrative Expenses	\$ 112,000
Deduct: Decrease in Prepaid Expenses	<u>(1,860)</u>
Cash Paid to Other Suppliers	<u>\$ 110,140</u>
Interest Paid	
Interest Expense	\$ 10,000
Add: Decrease in Interest Payable	<u>250</u>
Interest Paid	<u>\$ 10,250</u>

Aries has no taxes payable. Therefore, taxes paid must equal tax expense. The operating activities section of the cash flow statement is as follows:

Operating Activities	
Cash Collected from Customers	\$1,349,750
Cash Paid for Merchandise	(887,570)
Cash Paid to Other Suppliers	(110,140)
Cash Paid to Employees	(52,700)
Cash Paid for Interest	(10,250)
Cash Paid for Income Taxes	<u>(87,000)</u>
Net Cash Provided by Operating Activities	<u>\$ 202,090</u>

Notice that the net cash provided by operating activities under the direct approach (\$202,090) is the same as the net cash provided by operating activities under the indirect approach in Example 6A.1.

Reporting Cash Flows from Investing and Financing Activities

As discussed in the text, the statement of cash flows also includes a section showing the cash flows related to investing activities and a section showing the cash flows related to financing activities. Cash flows from investing activities relate to the acquisition and disposition of productive property, investments in debt and equity securities, and making and collecting loans. Financing activities involve the cash receipts and payments from debt and equity financing.

EXAMPLE 6A.3 Investing and Financing Activities

PROBLEM: Consider Aries Endoscope, Inc. from Example 6A.2. In addition to the information presented in that example, Aries also received and paid the following amounts:

Description	Cash Inflow (Outflow)
Cash receipt from sale of property, plant, and equipment	\$50,000
Cash payment for acquisition of investment securities	(20,000)
Cash receipt from loan from bank	60,000
Cash payments for repayment of loan amounts	(10,000)

Aries Endoscope had a beginning cash balance of \$120,000 and an ending cash balance of \$402,090. Prepare the statement of cash flows (using the direct method for the operating activities section) for Aries Endoscope, Inc.

SOLUTION: We have already prepared the operating section of the cash flow statement. We include the cash receipt from the sale of property, plant, and equipment and the cash payment for the acquisition of investment securities in the investing activities section. We include all cash transactions related to the loans in the financing activities section.

Aries Endoscope statement of cash flows is as follows:

Aries Endoscope, Inc.	
Statement of Cash Flows	
for the Current Year Ended	
Operating Activities:	
Cash Collected from Customers	\$1,349,750
Cash Paid for Merchandise	(887,570)
Cash Paid to Other Suppliers	(110,140)
Cash Paid to Employees	(52,700)
Cash Paid for Interest	(10,250)
Cash Paid for Income Taxes	<u>(87,000)</u>
Net Cash Provided by Operating Activities	\$ 202,090
Investing Activities:	
Sold Property, Plant, and Equipment	\$ 50,000
Acquired Investment Securities	<u>(20,000)</u>
Net Cash Provided by Investing Activities	\$ 30,000
Financing Activities:	
Issued Loan	\$ 60,000
Repaid Loan	<u>(10,000)</u>
Net Cash Provided by Financing Activities	\$ 50,000
Increase in Cash for the Year	\$ 282,090
Beginning Cash Balance	<u>120,000</u>
Ending Cash Balance	<u>\$ 402,090</u>

APPENDIX B

Liquidity and Solvency Analysis

We introduced the importance and usefulness of ratio analysis in Chapter 5. We now continue the discussion with a focus on the key balance sheet ratios of liquidity and solvency and link these concepts through *DuPont Analysis*.

Liquidity

Recall that liquidity measures a company's ability to meet current obligations from short-term resources. Specifically, it measures how quickly a company can convert assets into cash with minimal risk of loss in order to meet its current obligations. Generally, the more liquid a company's assets, the more likely it is that the company can meet its current obligations as they come due. There are two key measures of liquidity:

1. *Working Capital*
2. *Current Ratio*

Working Capital

Working capital is equal to current assets minus current liabilities.

$$\text{Working Capital} = \text{Current Assets} - \text{Current Liabilities} \quad (6B.1)$$

When current assets are higher than current liabilities, this indicates that a company has sufficient current resources to meet its current obligations as they come due. Working capital is expressed in dollars and can vary with company size or growth. For example, the working capital of a large company will likely be higher than that of a small company simply due to the size difference. Therefore, it is important to be able to express working capital in a ratio.

Current Ratio

In contrast to working capital, the **current ratio**, also known as the working capital ratio, expresses liquidity as the ratio of current assets to current liabilities:

$$\text{Current Ratio} = \frac{\text{Current Assets}}{\text{Current Liabilities}} \quad (6B.2)$$

The numerator represents cash and the other current assets the firm expects to convert into cash within one year or operating cycle, whichever is longer. These resources are available to liquidate the short-term obligations due during the same period as the denominator. The current ratio indicates the proportion of current assets to each dollar of current liabilities. A current ratio higher than 1 typically means a company has sufficient current resources to meet its current obligations as they come due.

In practice, too much working capital or too high a current ratio can indicate that a company is forgoing profitable investment opportunities. A complete interpretation of the current ratio requires knowledge of trends and the industry in which the firm operates.

EXAMPLE 6B.1 Liquidity Analysis of *Johnson & Johnson Company* and *Pfizer*

PROBLEM: Using information from the 2016 balance sheets of *Johnson & Johnson* and *Pfizer*, answer the following questions about each company's liquidity.

- a. Compute each company's working capital.
- b. Compute each company's current ratio.

- c. Based on total assets, which company is larger?
 d. Comment on what the working capital and current ratio indicate about each company. Comment on the effect of the size of the companies in this comparison.

Fiscal year 2016 (in millions)	Johnson & Johnson	Pfizer
Total assets	\$141,208	\$171,615
Current assets	65,032	38,949
Current liabilities	26,287	31,115

SOLUTION:

(a) and (b). The table below computes the working capital and current ratio for each company.

Liquidity Measure	Johnson & Johnson	Pfizer
Working Capital = Current Assets – Current Liabilities	$\$65,032 - \$26,287 = \$38,745$	$\$38,949 - \$31,115 = \$7,834$
Current Ratio = Current Assets/Current Liabilities	$\frac{\$65,032}{\$26,287} = 2.47$	$\frac{\$38,949}{\$31,115} = 1.25$

- c. Based on total assets, **Pfizer** is the larger company, with about 1.22 ($\$171,615/\$141,208$) times the total assets of **Johnson & Johnson**.
 d. Both **Johnson & Johnson** and **Pfizer** have positive working capital and a current ratio more than 1. These measures indicate both companies are in a strong liquidity position. **Johnson & Johnson's** working capital is higher than **Pfizer's**. Because **Pfizer** is the larger company, it is surprising that its working capital is not higher. However, **Johnson & Johnson's** current ratio (2.47) is almost double that of **Pfizer's** (1.25).

Solvency

Solvency measures a company's ability to meet its long-term obligations as they come due. A company can finance its operations with debt or equity. When a company decides to use debt, it has to repay the amount borrowed and generally make periodic interest payments. Both creditors and investors need to assess the company's ability to pay off its long-term obligations when due. Creditors are concerned about timely repayment; investors are interested in sharing profits and securing assets in liquidation as the residual claimants. Firms must pay principal and interest on debt before equity investors share in firm profits. If a company has too much debt, there is a risk that the firm will not be able to repay its debt and be forced to declare bankruptcy.

Two common measures of solvency are:

1. *Debt-to-equity ratio*
2. *Interest coverage*

Debt-to-Equity Ratio

Leverage is an indicator of the relative size of financing from creditors versus financing from owners. The **debt-to-equity ratio** is a measure of leverage computed as:

$$\text{Debt-to-Equity Ratio} = \frac{\text{Total Liabilities}}{\text{Total Stockholders' Equity}} \quad (6B.3)$$

A company with high debt must devote significant resources to making interest and principal payments. When operations are strong and the economy is growing, a company is generally able

to make its debt payments. However, if sales decline or an economic recession occurs, the company may struggle to make debt payments. Generally, a high debt-to-equity ratio indicates lower solvency and a greater risk of default.

Interest Coverage Ratio

The **interest coverage ratio** measures a company's ability to make payments on, or service, its debt by computing the amount of interest payments that it can make from its operating earnings.³⁰ Operating earnings are earnings before interest expense and tax expense.³¹ Adding both interest expense and tax expense back to net income provides a measure of income that is available to service debt. The interest coverage ratio equation is:

$$\text{Interest Coverage Ratio} = \frac{\text{Net Income} + \text{Interest Expense} + \text{Tax Expense}}{\text{Interest Payments}} \quad (6B.4)$$

The ratio indicates how many times a company can cover its interest charges before taxes. A high interest coverage ratio indicates that a company is able to service its debt—that is, the company has high solvency.

EXAMPLE 6B.2

Solvency Analysis of *Johnson & Johnson Company*, 2016 and 2015

PROBLEM: Using the following information from *Johnson & Johnson's* 2016 annual report, compute the debt-to-equity ratio and interest coverage ratio for 2015 and 2016. What does each measure indicate about *Johnson & Johnson's* solvency? What do the measures taken together indicate about *Johnson & Johnson's* solvency?

<i>(all dollars in millions)</i>		
Balance Sheets (excerpts)	2016	2015
Total liabilities	\$70,790	\$62,261
Total stockholders' equity	\$70,418	\$69,752
Statement of Earnings (excerpts)	2016	2015
Sales to customers	\$71,890	\$70,074
Interest expense	726	552
Provision for taxes on income	3,263	3,787
Net earnings	\$16,540	\$15,409
Statement of Cash Flows (excerpts)	2016	2015
Interest Paid	\$ 730	\$ 617

SOLUTION: The table on the next page provides the computations of *Johnson & Johnson's* debt-to-equity ratio and interest coverage ratio for 2016 and 2015.

Johnson & Johnson's debt-to-equity ratio of 0.893 in 2015 is below 1, indicating that the company obtains more of its financing from shareholders than from creditors. In 2016, its debt-to-equity ratio is 1.005 indicating that the company obtains more of its financing from creditors than from shareholders. The ratio has increased from 2015 to 2016, implying a decrease in solvency.

The interest coverage ratio, which is 32.006 in 2015 and 28.122 in 2016, is higher than 1, indicating that *Johnson & Johnson* is able to service its debt from current operations. However, the ratio has decreased from 2015 to 2016, also suggesting a decrease in solvency.

³⁰This ratio is also called the *times interest earned ratio*.

³¹Operating earnings are also known as *earnings before interest and taxes* or *EBIT*.

Overall, this ratio analysis suggests that *Johnson & Johnson* is in a strong position to meet its long-term obligations.

Solvency Measure	2016	2015
Debt-to-Equity Ratio = $\frac{\text{Total Liabilities}}{\text{Total Stockholders' equity}}$	$\frac{\$70,790}{\$70,418} = 1.005$	$\frac{\$62,261}{\$69,752} = 0.893$
Interest Coverage Ratio = $\frac{\text{Net Income} + \text{Interest Expense} + \text{Tax Expense}}{\text{Interest Payments}}$	$\frac{\$16,540 + \$726 + \$3,263}{\$730} = 28.122$	$\frac{\$15,409 + \$552 + \$3,787}{\$617} = 32.006$

Exhibit 6B.1 summarizes the liquidity and solvency ratios.

EXHIBIT 6B.1 Liquidity and Solvency Ratios

Area	Definition	Ratios	Desirable Characteristics	Pitfalls
Liquidity	A company's ability to meet short-term obligations from short-term resources	Working Capital = Current Assets – Current Liabilities	Current assets higher than current liabilities	Cannot compare across companies because of differences in size.
		Current Ratio = Current Assets/Current Liabilities	Ratio of 1 or higher	If the ratio is too high, the company may be forgoing more profitable investment opportunities. Includes assets that are not as liquid, such as inventory.
Solvency	A company's ability to meet long-term obligations as they come due	Debt-to-Equity Ratio = $\frac{\text{Total Liabilities}}{\text{Total Stockholders' Equity}}$	Lower ratio is preferred to higher	U.S. companies generally range between 0.8 and 1.2.
		Interest Coverage Ratio = $\frac{\text{Net Income} + \text{Interest Expense} + \text{Tax Expense}}{\text{Interest Payments}}$	Higher ratio is preferred to lower	Net income can include non-recurring items

DuPont Analysis

Profitability enables a company to generate a return for its shareholders. Specifically, the return on equity (ROE) ratio measures the return on shareholders' investment in the company. This return is enhanced by effective use of available resources to increase revenue.

DuPont Analysis is a financial statement analysis tool that separates ROE into components to analyze a company's sources of profitability. We focus on the form of the DuPont Analysis that indicates how a company uses debt financing to increase its return to shareholders.³²

We begin with ROE, which is net income divided by average stockholders' equity:

$$\text{ROE} = \frac{\text{Net Income}}{\text{Average Stockholders' Equity}} \quad (6B.5)$$

³²In subsequent chapters, we discuss other forms of the DuPont Analysis to further analyze additional aspects of profitability.

We expand the ratio by dividing net income by average total assets and multiplying by average total assets divided by average stockholders' equity:

$$\text{ROE} = \frac{\text{Net Income}}{\text{Average Total Assets}} \times \frac{\text{Average Total Assets}}{\text{Average Stockholders' Equity}} \quad (6B.6)$$

As noted in Chapter 5, net income divided by average total assets is return on assets (ROA). The second part, average total assets divided by average stockholders' equity, is another leverage ratio, called financial leverage. The lower the ratio, the lower the financing from debt. A higher ratio indicates more debt financing and higher leverage. ROE is also expressed as follows:

$$\text{ROE} = \text{Return on Assets} \times \text{Financial Leverage} \quad (6B.7)$$

From Equation 6B.7, observe that a company with a high ROA can generate a high ROE. High financial leverage also increases ROE. Exhibit 6B.2 illustrates the effect of financial leverage on return on equity. When ROA is constant, a company can increase its ROE by increasing its financial leverage.

EXHIBIT 6B.2 Effect of Financial Leverage on Return on Equity

	Return on Assets	Financial Leverage	Return on Equity
Lower Financial Leverage	10%	0.80	8%
	10%	0.90	9%
	10%	1.00	10%
	10%	1.10	11%
Higher Financial Leverage	10%	1.20	12%

Therefore, shareholders can benefit from increased profitability when a company uses debt financing. However, too much debt can increase a company's risk of bankruptcy.

EXAMPLE 6B.3

DuPont Analysis of *Johnson & Johnson Company*, 2016 and 2015

PROBLEM: In Chapter 5, we computed *Johnson & Johnson's* return on equity (ROE) as 23.6% and 21.9% in 2016 and 2015, respectively. Use the DuPont analysis to determine whether this increase in ROE is due to a change in return on assets or financial leverage. The following information is relevant:

(in millions)	2016	2015
Net Income	\$ 16,540	\$ 15,409
Average Total Assets	\$ 137,310	\$131,885
Average Stockholders' Equity	\$ 70,085	\$ 70,451

SOLUTION: Using Equation 6B.6, we compute ROE using the DuPont Analysis as follows:

$$\text{ROE} = \frac{\text{Net Income}}{\text{Average Total Assets}} \times \frac{\text{Average Total Assets}}{\text{Average Stockholders' Equity}}$$

2016	2015
$\text{ROE} = \frac{\$16,540}{\$137,310} \times \frac{\$137,310}{\$70,085}$	$\text{ROE} = \frac{\$15,409}{\$131,885} \times \frac{\$131,885}{\$70,451}$
$= 12.05\% \times 1.959$	$= 11.68\% \times 1.872$
$= 23.6\%$	$= 21.9\%$

Separating ROE into ROA and financial leverage indicates that *Johnson & Johnson's* ROA increased to 12.05% in 2016 from 11.68% in 2015, representing an approximate 3.2% increase from the prior year [(12.05% - 11.68%)/11.68%]. The company's financial leverage also increased to 1.959 in 2016 from 1.872 in 2015. This is approximately a 4.6% increase from the prior year [(1.959 - 1.872)/1.872]. The increase in financial leverage and increase in ROA suggest that *Johnson & Johnson's* increase in ROE is due both to the increasing ROA and financial leverage.

Accounting and the Time Value of Money

LEARNING OBJECTIVES

- 1 Explain the time value of money concept, including the calculations of simple and compound interest; define the effective interest rate.
- 2 Compute solutions to future value and present value of single-sum problems.
- 3 Compute solutions to future value of ordinary annuity and annuity due problems.
- 4 Compute solutions to present value of ordinary annuity and annuity due problems.
- 5 Compute solutions to future value and present value of deferred annuity problems.
- 6 Apply time value of money concepts to accounting applications involving determining the present value of expected cash flows and valuing bonds.

Introduction

TO DETERMINE THE VALUE of money you have in the bank today, you simply check the account balance. Yet how would you determine the amount of money you need to save each year in order to purchase a new car in the future? You first need to determine when you want to buy the car. Then, you have to decide when you will start saving. You will also have to estimate how much interest your savings will earn based on the interest rate on your savings account. After you make these estimates, mathematical techniques involving the *time value of money* enable you to compute the total amount you must save to purchase the car.

Companies use time value of money techniques in a variety of areas—from capital budgeting to assessing financing needs to determining pension obligations. Consider *Adidas*, the German sports footwear, apparel, and accessories company. In its 2016 annual report, *Adidas* stated that it used *present value* techniques to evaluate returns on planned capital expenditures. In its footnotes to the financial statements, *Adidas* disclosed that it used present values in accounting for receivables, leases, pensions, and asset impairments. For example, *Adidas* reports its receivables and other financial assets at fair value, estimating the fair value as the present value of future cash flows. In financial reporting, time value of money concepts are critical to understanding these areas and others such as long-term liabilities and the valuation of certain types of financial instruments.

This chapter discusses the fundamental concepts needed to work with the time value of money throughout the remainder of this text. We begin with the basics of the time value of money, including *simple* and *compound interest*. We then illustrate several problems involving the *future* and *present values* of a single sum. Next, we cover problems involving the future and present values of *ordinary annuities* and *annuities due*. Finally, we discuss more complex areas such as deferred annuities before highlighting selected accounting applications of the time value of money. ☞

Iain Masterton/Alamy Stock Photo

- 1 Explain the time value of money concept, including the calculations of simple and compound interest; define the effective interest rate.

Time Value of Money Basic Concepts

The **time value of money** concept means that a dollar received today is worth more than a dollar received at some time in the future. This statement is true because a dollar received today can be invested to provide a return. For example, if you invest \$1,000 in a savings account today and the savings account yields 2% annually, then you will have \$1,020 one year from today. The \$20 earned on the initial investment is your **interest**, the return on money over time.

Time Value of Money in Accounting

The time value of money concept is critical in several areas of accounting, particularly when valuing many of the assets and liabilities reported in the financial statements. For example, measuring assets and liabilities at fair value may require time value of money computations. Time value of money concepts determine the asset's value today based on the future cash flows it will generate. To illustrate, consider a company that leases equipment to a customer. In return, the customer pays the company periodic cash payments in the future for the use of the leased equipment. The value of the net investment in the lease today can be measured using the future cash flows the company will receive and time value of money concepts.

The same approach applies to determining the fair value of a liability. For example, a pension liability today can be measured using time value of money concepts and the future cash outflows a company promises to make to its employees when they retire. The future cash flows depend on many estimates and assumptions such as when the employee will retire, how long the employee will live after retirement, and the inflation rate.

The measurements of many financial statement items such as leases, pensions, and bonds payable are based on estimates of future cash flows and time value of money computations. Exhibit 7.1 illustrates several financial statement items and the type of future cash flows used to measure them.

EXHIBIT 7.1 Examples of Financial Statement Items Measured at the Present Value of Future Cash Flows

Financial Statement Item	Type of Future Cash Flow
Notes Receivable	A company makes a loan today and receives periodic interest payments and a principal payment at the note maturity.
Net Investment in Lease	A company provides the use of a product or property and receives periodic payments from the party to whom it gives the use of the product or property.
Warranty Liability	A company sells some products and promises to maintain, repair, or replace the products, which represent estimated future cash outflows.
Bond Payable	A company receives cash today and promises to make periodic interest payments over time and a principal payment at the bond's maturity.
Leases Obligation	A company receives the use of a product or property and promises to make periodic payments to the party from whom it obtained the use of the product or property.
Pension Obligation	A company promises to pay employees a certain amount after they retire.

We begin our discussion of the time value of money by distinguishing between two types of interest—*simple* and *compound*.

Simple Interest

The term *simple interest* means that interest is computed on only the principal (the initial amount) but is not computed on any interest earned and left on deposit. Thus, **simple interest** is the initial investment multiplied by the stated interest rate for a single period and the amount of time (in terms of the number of periods) the investment is held.

$$\text{Simple Interest} = \text{Principal} \times \text{Interest Rate} \times \text{Time} \quad (7.1)$$

EXAMPLE 7.1 Simple Interest

PROBLEM: Solitude Company borrows \$60,000 for 3 years with a stated annual rate of 5%. What is the interest expense incurred by Solitude, assuming that interest is computed as simple interest?

SOLUTION: We use Equation 7.1 to compute the simple interest expense.

$$\begin{aligned} \text{Interest} &= \text{Principal} \times \text{Interest Rate} \times \text{Time} \\ \$9,000 &= \$60,000 \times 5\% \times 3 \text{ years} \end{aligned}$$

Solitude will pay \$3,000 per year in interest for a total of \$9,000 at the end of the loan term.

Compound Interest

Interest computed on both the principal and the interest left on deposit is referred to as **compound interest**. Any interest earned is then immediately included in the computation of the next period's interest. The compounding period can be over any time period such as a quarter or a day.

Exhibit 7.2 provides a graphical depiction of compound interest. Assume you invest \$100 today for 10 years at an annual interest rate of 10%. Today (Year 0) you have \$100. After the first year, you have the original \$100 plus an additional \$10 ($\$100 \times 10\%$) of interest. So, you now have \$110 on deposit.

During the second year, that \$110 also earns 10% interest or \$11 ($\$110 \times 10\%$). At the end of the second year, your deposit is valued at \$121 ($\$100 + \$10 + \11). This pattern continues until the tenth year, when you have a total of \$259, which consists of your original deposit or principal of \$100 plus \$100 of interest earned on the principal ($\$100 \times 10\% \times 10$ years) and \$59 of interest earned on the interest left on deposit. If this investment earned only simple interest, your total value at the end of the tenth year would be \$200. That is, interest would be earned only on the principal ($\$100 = \$100 \times 10\% \times 10$ years), not on the interest left on deposit. Therefore, compounding increases your return by \$59 and increases your *effective interest rate*.

EXHIBIT 7.2 Compound Interest

An illustration of compound interest with annual compounding is presented in Example 7.2.

EXAMPLE 7.2 Compound Interest with Annual Compounding

PROBLEM: Solitude Company borrowed \$60,000 for 3 years at a 5% interest rate with interest compounded annually. Solitude will repay the entire amount (principal plus interest) at the end of the 3-year period. Thus, it is not paying any interest until the end of the 3 years. How much interest will it pay? Compare this amount of interest to the amount computed in Example 7.1 using the simple interest computation.

SOLUTION: We begin by computing the interest incurred in the first year, which is \$3,000 ($\$60,000 \times 5\%$). We then add this amount to the principal to compute the next period's interest of \$3,150 ($\$63,000 \times 5\%$). We add this amount to the principal plus interest balance at the beginning of the period to get a principal plus interest balance of \$66,150 at the end of the second period. Interest in the third period is then \$3,308 ($\$66,150 \times 5\%$), resulting in a principal plus interest balance at the end of 3 years of \$69,458.

Year	Annual Interest	Amount Left on Deposit
1	$\$60,000 \times 5\% \times 1 = \$3,000$	$\$60,000 + \$3,000 = \$63,000$
2	$\$63,000 \times 5\% \times 1 = \$3,150$	$\$63,000 + \$3,150 = \$66,150$
3	$\$66,150 \times 5\% \times 1 = \$3,308$	$\$66,150 + \$3,308 = \$69,458$

Assuming annual compounding, the total interest is equal to \$9,458 ($\$3,000 + \$3,150 + \$3,308$). This total interest is \$458 higher than the \$9,000 simple interest incurred over the same 3-year period in Example 7.1.

As Example 7.2 shows, if interest is compounded, the total amount of interest earned or paid is higher than if simple interest is used. Likewise, the more frequently the interest is compounded, the more interest is earned. If, for example, interest is compounded monthly, then the computed interest is higher than if interest is compounded annually.

Effective Interest Rates

Many investments earn interest compounded daily (for example, bank accounts). Daily compounding increases the interest earned on the investment. Note that interest rates are always stated as an annual amount. When interest is compounded more than once per year, we determine the interest rate used in computations by dividing the annual rate by the number of compounding periods in a year. If interest is compounded more than once a year, then the **effective interest rate**, which is the amount of interest actually earned, will be higher than the stated interest rate. Example 7.3 illustrates computing an effective interest rate.

EXAMPLE 7.3 Effective Interest Rates

PROBLEM: Crowded Company invested \$1,000 for 1 year at a stated rate of 10%. Interest is compounded semiannually. What interest rate is used for the computations? What is the effective interest rate?

SOLUTION: The interest rate used is 5%, which is the stated interest rate of 10% divided by 2 because interest is compounded semiannually. Interest for the first half of the year is \$50 ($\$1,000 \times 5\%$). Interest for the second half of the year is \$52.50 ($\$1,050 \times 5\%$). Thus, total interest is \$102.50, resulting in an effective interest rate of 10.25% ($\$102.50/\$1,000$). Here, the stated rate of interest is 10%, but the effective interest rate is 10.25%. If interest was compounded annually, then your total interest would be equal to \$100 ($\$1,000 \times 10\%$). In this case, the stated and the effective interest rates are the same and are equal to 10% ($\$100/\$1,000$). This example illustrates that more frequent compounding increases the effective interest rate.

Types of Time Value of Money Problems

The first step in most business decision models is to identify the value of the cash flows to be received or paid at two different, terminal time periods. The cash flow values at these two terminal time periods are the *present value* and the *future value*:

1. The **present value** (PV) is the value today of a cash flow or a series of cash flows to be received or paid in the future.
2. The **future value** (FV) is the value at some specified point in the future of a cash flow or a series of cash flows to be paid or received between the current date and the specified point in the future.

A business problem can involve having knowledge of either the PV or the FV and solving for the other using the interest rate and the time period. The process of moving from the PV to the FV is known as **compounding**. The process of moving from the FV to the PV is known as **discounting**. The time period begins at time (t) zero, and ends at some future time (t), which we represent with a capital T. Exhibit 7.3 presents the distinction between compounding and discounting using a timeline.

EXHIBIT 7.3 Compounding and Discounting

In analyzing the time value of money, there are two types of cash flows to identify: single cash flows and *annuities*. An **annuity** is a series of periodic payments or receipts of equal amounts that occur at equal time intervals between each cash flow.

Annuity payments can occur at the beginning or the end of a period. When payments take place at the beginning of the period, the series of cash flows is called an **annuity due** or an **annuity in advance**. Rent is an example of a payment made at the beginning of a period. If the payments occur at the end of the period, the series of periodic payments is known as an **ordinary annuity** or an **annuity in arrears**. Interest paid at the end of the month on a bank deposit is an illustration of an ordinary annuity.

- ② Compute solutions to future value and present value of single-sum problems.

Single-Sum Problems

We begin our discussion by illustrating applications of compounding and discounting a single sum, usually known as an amount of \$1. There are four important variables in a single-sum problem:

1. Present value (*PV*)
2. Future value (*FV*)
3. Interest rate per compounding period (*I/Y*)
4. Time period or number of compounding periods (*N*)

If you know any three of these variables, you can solve for the fourth one. The **interest rate per compounding period** is the annual interest rate (*I*) divided by the number of times per year that interest compounds (*Y*). For example, if you are earning 8% interest compounded quarterly, then the interest rate per compounding period is 2% (i.e., 8%/4 quarters). The **number of compounding periods** (*N*) is the number of times per year that interest compounds multiplied by the total number of years for which a present or future value is computed. For example, if you are holding a 5-year note receivable that pays interest quarterly, then there are 20 compounding periods (i.e., 5 years × 4 quarters).

We begin by solving for the future value and illustrating various techniques to solve each problem. There are a number of techniques available to solve time value of money problems, such as financial calculators, smart phones, and spreadsheets. We illustrate four methods in this chapter:¹

1. The Formula Solution
2. The Factor Table Solution
3. The Spreadsheet Application Solution
4. The Financial Calculator Solution

Future Value of a Single Sum

For the future value of a single sum, we know the present value of the single cash flow, the interest rate, and the number of periods—and we need to compute the future value. Consider a single bank deposit with \$100 left on deposit for 1 year at an 8% rate of interest, as depicted in Exhibit 7.4.

EXHIBIT 7.4 Future Value of a Single Sum

Formula Solution. To compute the future value of a single sum, we compute interest one period at a time and determine the new principal plus interest balance at the end of each period, as in Example 7.2. However, this approach is quite burdensome, particularly for problems involving many periods. A less cumbersome approach is to restate the problem using the time value of money variables defined in the previous section using the following formula:

$$FV = PV \times (1 + I/Y)^N \quad (7.2)$$

where PV is the present value, FV is the future value, I/Y is the interest rate per compounding period, and N is the number of compounding periods. Note that the future value (FV) is directly related to the rate of interest, I/Y , and the period of time, N .

We illustrate annual compounding in Example 7.4.

EXAMPLE 7.4 Future Value of a Single Sum: Annual Compounding

PROBLEM: Solitude Company invested \$10,000 for 10 years at 8% with interest compounded annually. Solitude will receive the entire amount (principal plus interest) at the end of the 10-year period. What is the future value of this single sum using the formula approach?

SOLUTION: We use Equation 7.2 to solve for the future value.

$$\begin{aligned} FV &= PV \times (1 + I/Y)^N \\ FV &= \$10,000 \times (1 + .08)^{10} \\ FV &= \$10,000 \times 2.1589 \\ FV &= \$21,589 \end{aligned}$$

The future value of this single-sum investment is \$21,589.

Example 7.5 illustrates a more complex problem.

¹Note that in all time value of money problems, different approaches may give you slightly different answers due to rounding.

EXAMPLE 7.5 Future Value of a Single Sum: Formula Approach

PROBLEM: Solitude Company invested \$10,000 in a 10-year investment with a stated rate of 8%. Interest is compounded quarterly. Determine the future value of this investment using the formula approach.

SOLUTION: We use Equation 7.2 to solve for the future value. The present value is \$10,000. The relevant interest rate is 2%, which is the stated rate of 8% divided by 4 because there are 4 periods per year. The number of compounding periods is 40 (10 years \times 4 periods per year).

$$\begin{aligned} FV &= PV \times (1 + I/Y)^N \\ FV &= \$10,000 \times (1 + .02)^{40} \\ FV &= \$10,000 \times 2.20804 \\ FV &= \$22,080.40 \end{aligned}$$

The future value of the 10-year investment is \$22,080.40.

Factor Table Solution. We can also solve future value problems using *factor* tables. A **factor** is a number derived from a combination of an interest rate and compounding period that can be multiplied by an amount to obtain the value needed. Instead of using the formula, the factor is a short-cut to compute the needed value. To illustrate, let's develop the future value of 1 dollar (\$1) compounding factors using the future value formula from Equation 7.2. If $N = 40$, $I/Y = 2\%$, and $PV = \$1$ as in Example 7.5, then the future value is:

$$\begin{aligned} FV &= PV \times (1 + I/Y)^N && (7.2) \\ 2.20804 &= 1 \times (1 + .02)^{40} \end{aligned}$$

With a deposit of \$1, the *FV* after 40 periods when the interest rate is 2% is equal to \$2.21 (rounded), as obtained above.

Table 7A.1 in Appendix A presents the complete set of compound interest factors for future value of \$1 factors for solving future value problems. Rows of the table represent the number of compounding periods. Columns have the interest rate per compounding period. The amount presented in the cell for each row and column is computed from Equation 7.2: It is the factor for a future value of \$1 for the given interest rate and number of periods. In the excerpt in Exhibit 7.5, we use the 2% column and then search down to the 40-period row to locate the factor 2.20804 that we derived above using the formula.

EXHIBIT 7.5 Select Future Value of \$1 Factors

FV = PV \times FACTOR_{7A.1}						
Periods	1%	2%	3%	4%	5%	6%
1	1.01000	1.02000	1.03000	1.04000	1.05000	1.06000
2	1.02010	1.04040	1.06090	1.08160	1.10250	1.12360
3	1.03030	1.06121	1.09273	1.12486	1.15763	1.19102
4	1.04060	1.08243	1.12551	1.16986	1.21551	1.26248
5	1.05101	1.10408	1.15927	1.21665	1.27628	1.33823
10	1.10462	1.21899	1.34392	1.48024	1.62889	1.79085
20	1.22019	1.48595	1.80611	2.19112	2.65330	3.20714
25	1.28243	1.64061	2.09378	2.66584	3.38635	4.29187
30	1.34785	1.81136	2.42726	3.24340	4.32194	5.74349
35	1.41660	1.99989	2.81386	3.94609	5.51602	7.68609
40	1.48886	2.20804	3.26204	4.80102	7.03999	10.28572

The factors in Table 7A.1 illustrate that the future value is directly related to N and I/Y .

We can now use the factors from Table 7A.1 in Equation 7.3 to solve single-sum future value problems:

$$FV = PV \times \text{FACTOR}_{7A.1} \quad (7.3)$$

where $\text{FACTOR}_{7A.1}$ refers to the factor that can be found in Table 7A.1.

To solve for the future value, find the factor that is in the row for the number of compounding periods and the column for the interest rate per compounding period. Multiply this factor times the present value to obtain the future value. Example 7.6 demonstrates the table approach.

EXAMPLE 7.6 Future Value of a Single Sum: Table Approach

PROBLEM: Solitude Company invested \$10,000 in a 10-year investment with a stated rate of 8%. Interest is compounding quarterly. Determine the future value of this investment using the table approach.

SOLUTION: We use Equation 7.3 to solve for the future value. The present value is \$10,000. The relevant interest rate is 2%, which is the stated rate of 8% divided by 4 because there are 4 periods per year. The number of compounding periods is 40 (10 years \times 4 periods per year). In Table 7A.1, look across columns to find the interest rate of 2% and then go down the rows to find 40 number of periods. The factor in this cell is 2.20804.

$$\begin{aligned} FV &= PV \times \text{FACTOR}_{7A.1} \\ FV &= \$10,000 \times 2.20804 \\ FV &= \$22,080.40 \end{aligned}$$

The future value of the 10-year investment is \$22,080.40.

Spreadsheet Solution. A spreadsheet application such as Microsoft Excel is another way to solve future value problems. The future value function in a spreadsheet cell follows:

$$= \text{FV}(I/Y, N, \text{PMT}, \text{PV}, \text{type})$$

The FV function requires inputting the following variables:

I/Y = interest rate per compounding period

N = number of compounding periods

PMT = amount of periodic payments

PV = present value of single sum

type = 0 if payments are due at the end of the period (ordinary annuity) and 1 if payments are due at the beginning of the period (annuity due)

For the future value of a single sum, we put a 0 in the third position because there are no periodic payments. Because the type defaults to 0, we do not need to include the last variable because we do not have an annuity problem. In the spreadsheet examples, we use the convention of designating borrowing or receiving payments as cash inflows and lending or investing money as cash outflows. In the time value of money spreadsheet computations, cash inflows are positive values and cash outflows are negative values. Example 7.7 illustrates the spreadsheet approach.

EXAMPLE 7.7 Future Value of a Single Sum: Spreadsheet Approach

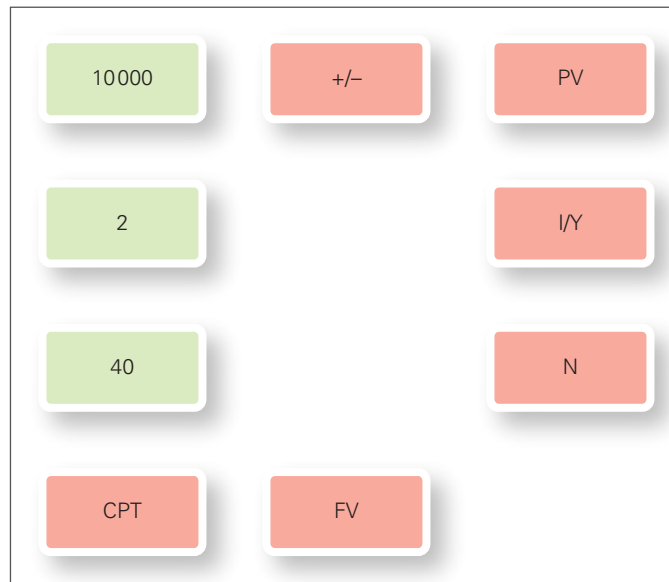

PROBLEM: Solitude Company invested \$10,000 in a 10-year investment with a stated rate of 8%. Interest is compounding quarterly. Determine the future value of this investment using the spreadsheet approach.

SOLUTION: We input $N = 40$ (4 periods per year for 10 years), $I/Y = 2\%$ (8% per year with interest compounding 4 times per year), $PV = -10,000$, and $PMT = 0$ because there are no payments in a single-sum problem.

	N	I/Y	PV	PMT	FV	Excel Formula
Given	40	2.00%	-10,000	0		
Solve for FV					22,080.40	=FV(0.02,40,0,-10000)

The future value is computed in the spreadsheet as \$22,080.40.

Financial Calculator Solution. Finally, we illustrate solving future value problems with a financial calculator. To solve the problem in Example 7.7, enter the following keystrokes.²

These keystrokes correspond to an outflow of \$10,000 today at a 2% interest rate per compounding period and 40 compounding periods. The calculator provides the solution of \$22,080.40.

Present Value of a Single Sum

The present value of a single sum is another common time value of money problem found in practice. In this type of problem, we know the future value of the single cash flow, the interest rate, and the number of periods and we need to compute the present value. As an example, assume that you are offered an opportunity to receive \$108 at the end of 1 year. You could earn a rate of return of 8% on your next-best alternative investment. How much are you willing to invest today to have the opportunity to receive \$108 at the end of 1 year? Exhibit 7.6 graphically analyzes this problem.

²We use Texas Instruments BA II Plus to illustrate keystrokes. Most financial calculators are similar.

As with single-sum future value problems, present value problem solutions may use a formula, table, a spreadsheet, or a financial calculator.

Formula Solution. The present value formula is an algebraic manipulation of Equation 7.2. That is, we start with the equation for the FV of a single sum:

$$FV = PV \times (1 + I/Y)^N \quad (7.2)$$

where PV is the present value, FV is the future value, I/Y is the interest rate per compounding period, and N is the number of compounding periods.

Then we can solve for the PV by dividing both sides of the equation by $(1 + I/Y)^N$.

The resulting formula for the present value is presented in Equation 7.4:

$$PV = FV \times 1/(1 + I/Y)^N \quad (7.4)$$

where PV is the present value, FV is the future value, I/Y is the interest rate per compounding period, and N is the number of compounding periods.

The equation for the PV of a single sum indicates that it is directly related to the FV and it is inversely related to N and I/Y . The formula approach is shown in Example 7.8.

EXAMPLE 7.8 Present Value of a Single Sum: Formula Approach

PROBLEM: Purple and Orange Fashion Designs, Inc. (P&OFD) has more cash than it currently needs for operations. Accordingly, it is considering investing in a piece of land that it believes it can sell in 5 years for \$175,000. The relevant interest rate is 12% with monthly compounding. What should P&OFD pay for this land today (specifically, what is the present value of this investment)?

SOLUTION: We use Equation 7.4 to solve for the present value. The future value is \$175,000. The relevant interest rate is 1%, which is the stated rate of 12% divided by 12 because there are 12 periods per year. The number of compounding periods is 60 (5 years \times 12 periods per year).

$$\begin{aligned} PV &= FV \times 1/(1 + I/Y)^N \\ PV &= \$175,000 \times 1/(1.01)^{60} \\ PV &= \$175,000 \times 1/1.8167 \\ PV &= \$175,000 \times 0.55045 \\ PV &= \$96,328.75 \end{aligned}$$

The present value of the land investment is \$96,328.75.

Factor Table Solution. Table 7A.2 presents the factors for solving present value problems. Similar to Table 7A.1, the number of compounding periods is found in rows of the table. Columns have the interest rate per period. The amount presented in the cell for each row and column is computed from the interest component of Equation 7.4. It is the factor for the present value of \$1 for the given interest rate and number of periods. Equation 7.5 solves single-sum present value problems using the factors in Table 7A.2.

$$PV = FV \times \text{FACTOR}_{7A.2} \quad (7.5)$$

Refer to the factor that is in the row for the number of compounding periods and the column for the interest rate per compounding period. For example, referring to the excerpt in Exhibit 7.7, the factor for a 3% interest rate and 10 periods is 0.74409.

EXHIBIT 7.7 Select Present Value of \$1 Factors

PV = FV × FACTOR_{7A.2}				
Periods	1%	2%	3%	4%
1	0.99010	0.98039	0.97087	0.96154
2	0.98030	0.96117	0.94260	0.92456
3	0.97059	0.94232	0.91514	0.88900
4	0.96098	0.92385	0.88849	0.85480
5	0.95147	0.90573	0.86261	0.82193
10	0.90529	0.82035	0.74409	0.67556
20	0.81954	0.67297	0.55368	0.45639
25	0.77977	0.60953	0.47761	0.37512
30	0.74192	0.55207	0.41199	0.30832
35	0.70591	0.50003	0.35538	0.25342
40	0.67165	0.45289	0.30656	0.20829
45	0.63905	0.41020	0.26444	0.17120
50	0.60804	0.37153	0.22811	0.14071
60	0.55045	0.30478	0.16973	0.09506

The factors in Table 7A.2 indicate that the PV is inversely related to N and I/Y. Example 7.9 illustrates the table approach.

EXAMPLE 7.9 Present Value of a Single Sum: Table Approach

PROBLEM: Purple and Orange Fashion Designs, Inc. (P&OFD) has more cash than it currently needs for operations. Accordingly, it is considering investing in a piece of land that it believes it can sell in 5 years for \$175,000. The relevant interest rate is 12% with monthly compounding. What should P&OFD pay for this land (specifically, what is the present value of this investment)?

SOLUTION: We use Equation 7.5 to solve for the present value. The future value is \$175,000. The relevant interest rate is 1%, which is the stated rate of 12% divided by 12 because there are 12 periods per year. The number of compounding periods is 60 (5 years × 12 periods per year). In Table 7A.2, look across the columns to find the interest rate of 1% and then go down the rows to find 60 number of periods. The factor in this cell is 0.55045.

$$\begin{aligned} PV &= FV \times \text{FACTOR}_{7A.2} \\ PV &= \$175,000 \times 0.55045 \\ FV &= \$96,328.75 \end{aligned}$$

The present value of the land investment is \$96,328.75.

Spreadsheet Solution. Spreadsheet applications such as Microsoft Excel provide a present value function in a spreadsheet cell as follows:

$$= \text{PV}(I/Y, N, \text{PMT}, FV, \text{type})$$

The PV function requires inputting the following variables:

I/Y = interest rate per compounding period

N = number of compounding periods

PMT = amount of periodic payments

FV = future value of single sum

type = 0 if payments are due at the end of the period and 1 if payments are due at the beginning of the period

For the present value of a single sum, we put a 0 in the third position because there are no periodic payments. Because the type defaults to 0, we do not need to include the last variable because this is not an annuity problem.

EXAMPLE 7.10

Present Value of a Single Sum: Spreadsheet Approach

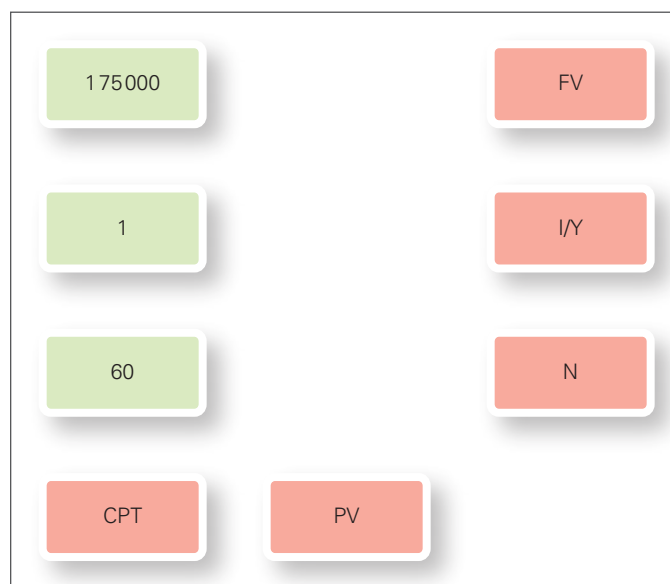

PROBLEM: Purple and Orange Fashion Designs, Inc. (P&OFD) has more cash than it currently needs for operations. Accordingly, it is considering investing in a piece of land that it believes it can sell in 5 years for \$175,000. The relevant interest rate is 12% with monthly compounding. What should P&OFD pay for this land (specifically, what is the present value of this investment)?

SOLUTION: We input $N = 60$ (12 periods per year for 5 years), $I/Y = 1\%$ (12% per year with interest compounding 12 times per year), $FV = 175,000$, and $PMT = 0$ because there are no payments in a single-sum problem.

	N	I/Y	PV	PMT	FV	Excel Formula
Given	60	1.00%		0	175,000	
Solve for PV			-96,328.68			=PV(0.01,60,0,175000)

The present value is computed in the spreadsheet as \$(96,328.68).

Financial Calculator Solution. Finally, present value problems can be solved using a financial calculator. To solve the problem in Example 7.10, enter the following keystrokes.

These keystrokes correspond to an inflow of \$175,000 in 5 years at a 1% interest rate per compounding period and 60 compounding periods. The calculator shows the present value is \$(96,328.68).

Other Single-Sum Problems

As we have discussed, there are four variables in the single-sum problems. Typically, problems either solve for the present value or future value, as discussed above. However, at times the present and future values are known factors and solutions require solving for either the interest rate for the compounding period or the number of compounding periods.

Solving for the Interest Rate. We illustrate solving for the interest rate when we have the other three variables—FV, PV, and N.

To solve for the interest rate with a formula, we rearrange the variables in Equation 7.2 to arrive at Equation 7.6:

$$FV = PV \times (1 + I/Y)^N \quad (7.2)$$

$$FV/PV = (1 + I/Y)^N$$

$$(FV/PV)^{1/N} = 1 + I/Y$$

$$I/Y = (FV/PV)^{1/N} - 1 \quad (7.6)$$

EXAMPLE 7.11

Solving for the Interest Rate in a Single-Sum Problem

PROBLEM: LJ Enterprises borrowed \$5,000 from its bank. LJ will repay \$6,083 in 5 years. What interest rate did LJ incur on this loan, assuming annual compounding?

SOLUTION: The future value (FV) is \$6,083, the present value (PV) is \$5,000, and the number of compounding periods is five. We use Equation 7.6 to solve this problem as follows:

$$I/Y = (FV/PV)^{1/N} - 1$$

$$I/Y = (\$6,083/\$5,000)^{1/5} - 1$$

$$I/Y = 1.04 - 1 = 4\%$$

LJ is borrowing at a 4% interest rate.

To use the factor tables, start on the inside cells of the table. Referring to Table 7A.1, we know from Equation 7.3 that the FV equals the PV times the Table 7A.1 factor.

$$FV = PV \times \text{FACTOR}_{7A.1} \quad (7.3)$$

To solve for the interest rate, we rearrange as follows:

$$FV/PV = \text{FACTOR}_{7A.1} \quad (7.7)$$

Thus, solving for the interest rate involves:

1. Computing the left-hand side of the equation by dividing future value by present value.
2. Searching for the interest rate in the row corresponding to the number of compounding periods.³

³Finding a factor in the table will depend on interest rates and the number of periods presented. If a factor is not found in a table, use another approach such as the formula or spreadsheet.

EXAMPLE 7.12 Solving for the Interest Rate in a Single-Sum Problem

PROBLEM: LJ Enterprises borrowed \$5,000 from its bank. LJ will repay \$6,083 in 5 years. What interest rate did LJ incur on this loan, assuming annual compounding? Prepare the solution with factor tables.

SOLUTION: We use Equation 7.7 to solve this problem. The future value (FV) is \$6,083, the present value (PV) is \$5,000, and the number of compounding periods is 5.

$$\begin{aligned} FV/PV &= \text{FACTOR}_{7A.1} \\ 6,083/5,000 &= 1.2166 \end{aligned}$$

The factor is 1.2166, and we know there are 5 compounding periods. We then search in Table 7A.1 for future value of \$1 factors along the row for 5 compounding periods until we find the factor as illustrated here.

TABLE 7A.1 Future Value of \$1

FV = PV × FACTOR _{7A.1}					
Periods	1%	2%	3%	4%	5%
1	1.01000	1.02000	1.03000	1.04000	1.05000
2	1.02010	1.04040	1.06090	1.08160	1.10250
3	1.03030	1.06121	1.09273	1.12486	1.15763
4	1.04060	1.08243	1.12551	1.16986	1.21551
5	1.05101	1.10408	1.15927	1.21665	1.27628
6	1.06152	1.12616	1.19405	1.26532	1.34010
7	1.07214	1.14869	1.22987	1.31593	1.40710
8	1.08286	1.17166	1.26677	1.36857	1.47746
9	1.09369	1.19509	1.30477	1.42331	1.55133
10	1.10462	1.21899	1.34392	1.48024	1.62889

In this case, factor 1.21665 is in the 4% column. Thus, the interest rate is about 4%.

We solve for the interest rate variable, I/Y, using the RATE function in a spreadsheet cell as follows:

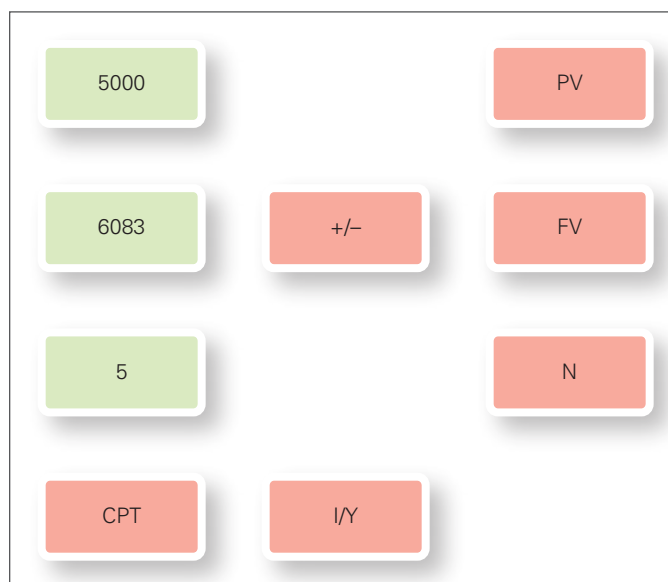

$$= \text{RATE}(N, \text{PMT}, \text{PV}, \text{FV}, \text{type})$$

All variables are previously defined. To solve the problem in Example 7.12, enter the following amounts in each cell.

	N	I/Y	PV	PMT	FV	Excel Formula
Given	5		5,000	0	-6,083	
Solve for I/Y		4.00%				=RATE(5,0,5000,-6083,0)

The spreadsheet provides the solution, 4.00%.

We can solve interest rate problems using a financial calculator. To solve the problem in Example 7.12, enter the following keystrokes.

The calculator shows the interest rate is 4%.

Solving for the Number of Periods. We illustrate solving for the number of periods when we have the other three variables—FV, PV, and I/Y.

To solve for the number of periods, we can once again rearrange Equation 7.2 to arrive at Equation 7.8.

$$FV = PV \times (1 + I/Y)^N \quad (7.2)$$

$$(FV/PV) = (1 + I/Y)^N$$

$$\ln(FV/PV) = N \times \ln(1 + I/Y)$$

$$N = \ln(FV/PV)/\ln(1 + I/Y) \quad (7.8)$$

EXAMPLE 7.13

Solving for the Number of Compounding Periods in a Single-Sum Problem

PROBLEM: LJ Enterprises borrowed \$5,000 from its bank at a 4% annual interest rate and will repay \$6,083. Assume annual compounding. When will LJ repay the loan?

SOLUTION: We use Equation 7.8 to solve this problem. The future value (FV) is \$6,083, the present value (PV) is \$5,000, and the interest rate is 4%.

$$N = \ln(FV/PV)/\ln(1 + I/Y)$$

$$N = \ln(6,083/5,000)/\ln(1.04)$$

$$N = 0.1960601/0.0392207$$

$$N = 5 \text{ years}$$

LJ will repay the loan in approximately 5 years.

Alternatively, to use the factor tables, start on the inside of the table, once again using Equation 7.7. To solve for the number of compounding periods:

1. Compute the left-hand side of the equation by dividing future value by present value.
2. Search for the number of compounding periods in the column corresponding to the interest rate.⁴

EXAMPLE 7.14 Solving for the Number of Compounding Periods in a Single-Sum Problem

PROBLEM: LJ borrows \$5,000 at a 4% annual interest rate and will repay \$6,083. When will LJ repay the loan?

SOLUTION: We use Equation 7.7 to solve this problem. The future value (FV) is \$6,083, the present value (PV) is \$5,000, and the interest rate is 4%.

$$\begin{aligned} \text{FV/PV} &= \text{FACTOR}_{7A.1} \\ 6,083/5,000 &= 1.2166 \end{aligned}$$

Given that the factor is 1.2166 and we know the interest rate is 4%, search in the future value of \$1 factors in Table 7A.1 along the column for a 4% interest rate to find the factor.

TABLE 7A.1 Future Value of \$1

FV = PV × FACTOR_{7A.1}					
Periods	1%	2%	3%	4%	5%
1	1.01000	1.02000	1.03000	1.04000	1.05000
2	1.02010	1.04040	1.06090	1.08160	1.10250
3	1.03030	1.06121	1.09273	1.12486	1.15763
4	1.04060	1.08243	1.12551	1.16986	1.21551
5	1.05101	1.10408	1.15927	1.21665	1.27628
6	1.06152	1.12616	1.19405	1.26532	1.34010
7	1.07214	1.14869	1.22987	1.31593	1.40710
8	1.08286	1.17166	1.26677	1.36857	1.47746
9	1.09369	1.19509	1.30477	1.42331	1.55133
10	1.10462	1.21899	1.34392	1.48024	1.62889

The factor is 1.21665 in the 5 compounding periods row. Thus, LJ will be repaid in approximately 5 periods because the factor we solved for (1.2166) is close to the factor in the table of 1.21665.

We solve for the number of periods, N , using the NPER function in a spreadsheet cell as follows:

$$= \text{NPER}(I/Y, \text{PMT}, \text{PV}, \text{FV}, \text{type})$$

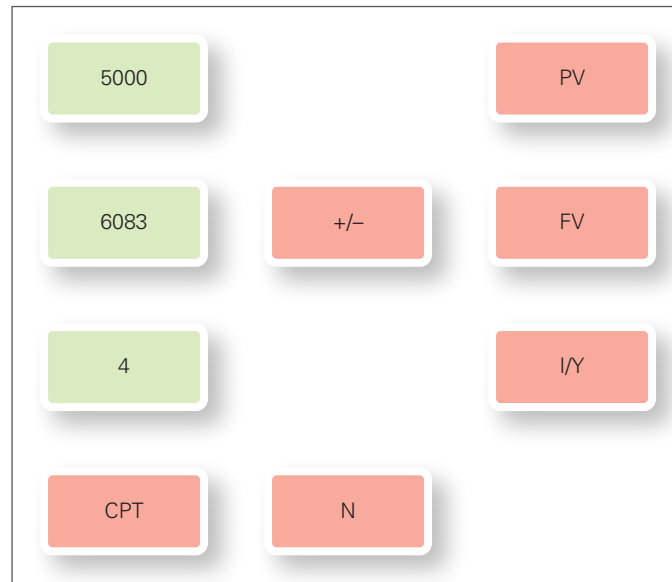

⁴Finding a factor in the table will depend on interest rates and numbers of periods presented. If a factor is not found in a table, use another approach such as the formula or spreadsheet.

All variables are previously defined. To solve the problem in Example 7.14, enter the following amounts in each cell.

	N	I/Y	PV	PMT	FV	Excel Formula
Given		4.00%	5,000	0	-6,083	
Solve for N	5.00					=NPER(0.04,0,5000,-6083,0)

The spreadsheet provides the solution, which approximates 5 periods.

A number of compounding period problems can be solved using a financial calculator. To solve the problem in Example 7.14, enter the following keystrokes.

These keystrokes correspond to an inflow of \$5,000 today and an outflow of \$6,083 at a 4% interest rate per compounding period. Thus, the number of periods is 5.

- 3 Compute solutions to future value of ordinary annuity and annuity due problems.

Annuities

As stated earlier in the chapter, an annuity is a series of periodic payments or receipts of equal amounts that occur at equal time intervals between each cash flow. For example, the monthly payments on a car loan are an annuity. The equal cash flows are referred to as **payments** (PMT). There are two types of annuities: an *ordinary annuity* and an *annuity due*.

An **ordinary annuity** is an annuity where the cash flows occur at the end of the interest period. An **annuity due** is an annuity where the cash flows occur at the beginning of the interest period.

Annuity problems can have five variables:

1. Present value (*PV*)
2. Future value (*FV*)
3. Interest rate per compounding period (*I/Y*)
4. Number of compounding periods (*N*)
5. Payments (*PMT*)

We begin our discussion with the computations of the future value of ordinary annuities.

Future Value of Ordinary Annuities

In a future value of an ordinary annuity problem, the payments, the interest rate, and the number of compounding periods are known and we compute the future value. Again, payments occur at the end of the period for an ordinary annuity. For example, assume that an undergraduate accounting student wants to accumulate a sum of money to pay for a master's program to earn the 150 credit hours required for accounting certification. The student will make \$10,000 deposits at the end of each year for 3 years and the interest rate is 10%, as depicted by Exhibit 7.8. Interest is compounded annually.

EXHIBIT 7.8 Future Value of an Ordinary Annuity

The third payment does not earn any interest. The first payment is on deposit and accumulates interest for two periods, and the second payment accumulates interest for only a single period. The third payment is made at the end and does not accumulate interest. To solve this problem, we can compound each cash flow as three separate single-sum problems as shown in the following table.

Payment	End of Period	Amount	FACTOR _{7A.1}	Future Value	Number of Compounding Periods
1 st	1	\$10,000	1.21	\$12,100	2
2 nd	2	10,000	1.10	11,000	1
3 rd	3	10,000	1.00	10,000	0
Total		<u>\$30,000</u>	<u>3.31</u>	<u>\$33,100</u>	

The future value of this annuity is therefore \$33,100. The difference between the sum of the cash flows (\$30,000) and the future value of the cash flows (\$33,100) represents the interest earned on the investment, \$3,100.

This approach of turning an annuity into a series of single-sum problems is too cumbersome for most annuity problems. Techniques involving a formula, table, spreadsheet, or financial calculator are efficient ways of solving future value of ordinary annuity problems.

Formula Solution. The formula for a future value of an ordinary annuity problem is as follows:

$$FV_{OA} = PMT \times [(1 + I/Y)^N - 1]/I/Y \quad (7.9)$$

Where FV_{OA} is the future value of an ordinary annuity, I/Y is the interest rate per compounding period, N is the number of compounding periods, and PMT is the amount of the equal cash flows.

EXAMPLE 7.15**Future Value of an Ordinary Annuity: Formula Approach**

PROBLEM: Magoli Company deposits \$100,000 every quarter in a savings account (beginning at the end of the current quarter) for the next 4 years so that it can purchase a specialized piece of machinery at the end of the 4 years. The interest rate is 12%. How much money will Magoli have at the end of the 4 years?

SOLUTION: We use Equation 7.9 to solve for the future value. There are 16 compounding periods (4 years \times 4 periods per year) and the interest rate is 3% (12%/4 periods per year).

$$FV_{OA} = PMT \times [(1 + I/Y)^N - 1]/I/Y$$

$$FV_{OA} = \$100,000 \times [1.03^{16} - 1]/0.03$$

$$FV_{OA} = \$100,000 \times [0.604706]/0.03$$

$$FV_{OA} = \$100,000 \times 20.15688$$

$$FV_{OA} = \$2,015,688$$

Magoli will have \$2,015,688 at the end of the 4 years. Note that the sum of the nominal cash flows is equal to \$1,600,000 (\$100,000 \times 4 quarters \times 4 years). Therefore, the interest earned over the life of this investment is \$415,688 (\$2,015,688 $-$ \$1,600,000).

Factor Tables Solution. Table 7A.3 presents the factors for solving future value of an ordinary annuity problems. The amount presented in the cell for each row and column is computed from the interest component in Equation 7.9: It is the factor that is the future value of a \$1 annuity for the given interest rate and number of periods. Equation 7.10 solves future value of ordinary annuity problems using the factors in Table 7A.3.

$$FV_{OA} = PMT \times \text{FACTOR}_{7A.3} \quad (7.10)$$

We use the factor that is in the row for the number of compounding periods and the column for the interest rate per compounding period. For example, from Exhibit 7.9, the factor for a 5% interest rate and a 7-year period is 8.14201.

EXHIBIT 7.9 Select Future Value of Ordinary Annuity Factors

FV = PMT \times FACTOR _{7A.3}						
Periods	1%	2%	3%	4%	5%	6%
1	1.00000	1.00000	1.00000	1.00000	1.00000	1.00000
2	2.01000	2.02000	2.03000	2.04000	2.05000	2.06000
3	3.03010	3.06040	3.09090	3.12160	3.15250	3.18360
4	4.06040	4.12161	4.18363	4.24646	4.31013	4.37462
5	5.10101	5.20404	5.30914	5.41632	5.52563	5.63709
6	6.15202	6.30812	6.46841	6.63298	6.80191	6.97532
7	7.21354	7.43428	7.66246	7.89829	8.14201	8.39384
8	8.28567	8.58297	8.89234	9.21423	9.54911	9.89747
9	9.36853	9.75463	10.15911	10.58280	11.02656	11.49132
10	10.46221	10.94972	11.46388	12.00611	12.57789	13.18079

EXAMPLE 7.16 Future Value of an Ordinary Annuity: Table Approach

PROBLEM: Magoli Company deposits \$100,000 every quarter in a savings account (beginning at the end of the current quarter) for the next 4 years so that it can purchase a specialized piece of machinery at the end of the 4 years. The interest rate is 12%. How much money will Magoli have at the end of the 4 years?

SOLUTION: We use Equation 7.10 to solve for the future value. There are 16 compounding periods (4 years \times 4 periods per year) and the interest rate is 3% (12%/4 periods per year). In Table 7A.3, look across the columns to find the interest rate of 3% and then go down the rows to find 16 number of periods. The factor in this cell is 20.15688.

$$FV_{OA} = PMT \times \text{FACTOR}_{7A.3}$$

$$FV_{OA} = \$100,000 \times 20.15688$$

$$FV_{OA} = 2,015,688$$

Magoli will have \$2,015,688 at the end of the four years.

Spreadsheet Solution. To calculate the future value of an ordinary annuity using a spreadsheet application such as Microsoft Excel, input the following variables into a spreadsheet cell:

$$= \text{FV}(I/Y, N, PMT, PV, \text{type})$$

I/Y = interest rate per compounding period

N = number of compounding periods

PMT = amount of periodic payments

PV = present value equals 0 as computing the future value of a series of payments.

type = 0 if payments are due at the end of the period and 1 if payments are due at the beginning of the period

For the future value of an ordinary annuity, do not input a variable into the fifth position, because it is assumed to be zero. Because the *type* defaults to 0, do not include the last variable when the payment occurs at the end of each period.

EXAMPLE 7.17 Future Value of an Ordinary Annuity: Spreadsheet Approach

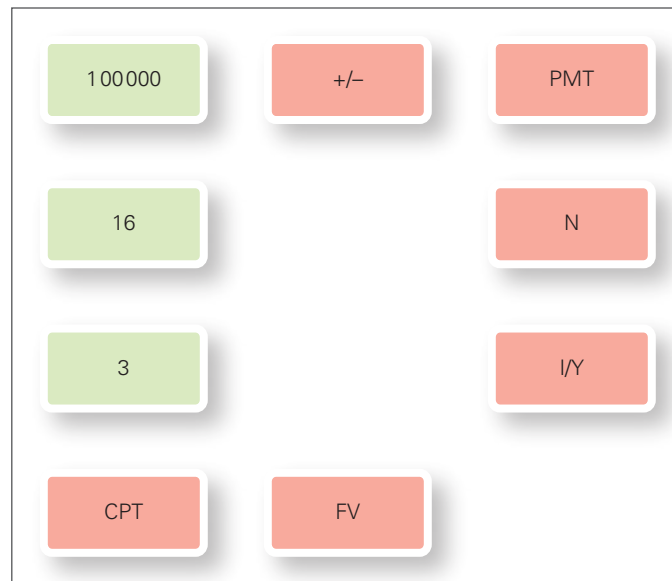

PROBLEM: Magoli Company deposits \$100,000 every quarter in a savings account (beginning at the end of the current quarter) for the next four years so that it can purchase a specialized piece of machinery at the end of the 4 years. The interest rate is 12%. How much money will Magoli have at the end of the 4 years?

SOLUTION: We input *N* = 16 (4 periods per year for 4 years), *I/Y* = 3% (12% per year with interest compounding 4 times per year), *PV* = 0, and *PMT* = -100,000.

	<i>N</i>	<i>I/Y</i>	<i>PV</i>	<i>PMT</i>	<i>FV</i>	Excel Formula
Given	16	3.00%	0	-100,000		
Solve for FV					2,015,688.13	=FV(0.03,16,-100000,0)

The future value is computed in the spreadsheet as \$2,015,688.13.

Financial Calculator Solution. Finally, we solve for the future value of an ordinary annuity using a financial calculator. To solve the problem in Example 7.17, enter the following keystrokes. Note that the default mode for the calculator is “end mode,” or it is set to compute an ordinary annuity with cash flows occurring at the end of each period.

These keystrokes correspond to an outflow of \$100,000 for 16 compounding periods at a 3% interest rate per compounding period. From the calculator, Magoli will have \$2,015,688.13.

Future Value of an Annuity Due

Future values of annuities due differ from future values of ordinary annuities because the payments occur at the *beginning* of the period instead of the end of the period.

For example, assume that an undergraduate accounting student wants to accumulate a sum of money to pay for a master’s program to earn the 150 credit hours required for accounting certification. Rather than investing a single amount today that will grow to a future value, she decides to invest \$10,000 a year over the next three years in a savings account paying 10% interest compounded annually. She decides to make the first payment to the bank immediately (specifically, at the beginning of the year). How much will she have available in her account at the end of three years?

Let’s compare this annuity due with the ordinary annuity we discussed in the previous section. In the previous section, the student made the deposits at the end of each year; thus, the problem was an ordinary annuity. However, if the student makes the payment at the beginning of each year, it is an annuity due.

The timeline depicts a future value for an annuity due with the payments occurring at the beginning of each period. Note that there are three deposits with three compounding periods. That is, each cash flow earns interest.

Now compare the annuity due to the ordinary annuity depicted on the following page. There are still three deposits, but now there are only two compounding periods. That is, the last deposit does not earn interest. As a result, the future value of an annuity due is more valuable than a future value of an ordinary annuity.

The timeline for the annuity due indicates that there are three cash flows and all three earn interest for at least one period. We can compute the future value using a series of single-sum problems as presented in the following table.

Payment	End of Period	Amount	FACTOR _{7A,1}	Future Value	Number of Compounding Periods
1st	1	\$10,000	1.331	\$13,310	3
2nd	2	10,000	1.210	12,100	2
3rd	3	10,000	1.100	11,000	1
Total		<u>\$30,000</u>	<u>3.641</u>	<u>\$36,410</u>	

The accumulated value of the annuity due is therefore \$36,410. The difference between the sum of the nominal cash flows (\$30,000) and the future value of the future cash flows (\$36,410) represents the interest earned on the investment, \$6,410.

As with ordinary annuities, solving for a future value of an annuity due as a series of single-sum problems is inefficient. Thus, to determine the future value of an annuity due, use a formula, table, spreadsheet, or financial calculator.

Formula Solution. Equation 7.11 shows the formula for a future value of an annuity due problem:

$$FV_{AD} = PMT \times \{[(1 + I/Y)^N - 1]/I/Y\} \times (1 + I/Y) \quad (7.11)$$

Where FV_{AD} is the future value of an annuity due, I/Y is the interest rate per compounding period, N is the number of compounding periods, and PMT is the amount of the equal cash flows.

EXAMPLE 7.18

Future Value of an Annuity Due: Formula Approach

PROBLEM: Magoli Company deposits \$100,000 at the beginning of every quarter in a savings account for the next 4 years so that it can purchase a specialized piece of machinery at the end of the 4 years. The interest rate is 12%. How much money will Magoli have at the end of the 4 years?

SOLUTION: We use Equation 7.11 to solve for the future value. The annuity payment of \$100,000 is an annuity due because it is made at the beginning of the compounding period. There are 16 compounding periods (4 years \times 4 periods per year) and the interest rate is 3% (12%/4 periods per year).

$$\begin{aligned} FV_{AD} &= PMT \times \{[(1 + I/Y)^N - 1]/I/Y\} \times (1 + I/Y) \\ FV_{AD} &= \$100,000 \times \{[1.03^{16} - 1]/0.03\} \times 1.03 \\ FV_{AD} &= \$100,000 \times \{0.604706/0.03\} \times 1.03 \\ FV_{AD} &= \$100,000 \times 20.7615727 \\ FV_{AD} &= \$2,076,157.27 \end{aligned}$$

Magoli Company will have \$2,076,157.27 at the end of the 4 years. Note that the sum of the nominal cash flows is equal to \$1,600,000 ($\$100,000 \times 4 \text{ quarters} \times 4 \text{ years}$). Therefore, the interest earned over the life of this investment is \$476,157.27 ($\$2,076,157.27 - \$1,600,000$).

In comparison to the ordinary annuity case, the company has only \$2,015,688 at the end of the 4 years and earns \$415,688 in interest. This makes the annuity in advance more valuable than an ordinary annuity.

Factor Table Solution. Table 7A.4 presents the factors for solving future value of annuity due problems. We use Equation 7.12 to solve future value of annuity due problems using the factors in Table 7A.4.

$$FV_{AD} = PMT \times \text{FACTOR}_{7A.4} \quad (7.12)$$

The pertinent factor is in the row for the number of compounding periods and the column for the interest rate per compounding period. For example, Exhibit 7.10 presents the factor of 6.89829 for a 4% interest rate over 6 periods.

EXHIBIT 7.10 Select Future Value of Annuity Due Factors

FV = PMT × FACTOR_{7A.4}					
Periods	1%	2%	3%	4%	5%
1	1.01000	1.02000	1.03000	1.04000	1.05000
2	2.03010	2.06040	2.09090	2.12160	2.15250
3	3.06040	3.12161	3.18363	3.24646	3.31013
4	4.10101	4.20404	4.30914	4.41632	4.52563
5	5.15202	5.30812	5.46841	5.63298	5.80191
6	6.21354	6.43428	6.66246	6.89829	7.14201
7	7.28567	7.58297	7.89234	8.21423	8.54911
8	8.36853	8.75463	9.15911	9.58280	10.02656

10	10.56683	11.16872	11.80780	12.48635	13.20679
11	11.68250	12.41209	13.19203	14.02581	14.91713
12	12.80933	13.68033	14.61779	15.62684	16.71298
13	13.94742	14.97394	16.08632	17.29191	18.59863
14	15.09690	16.29342	17.59891	19.02359	20.57856
15	16.25786	17.63929	19.15688	20.82453	22.65749
16	17.43044	19.01207	20.76159	22.69751	24.84037
17	18.61475	20.41231	22.41444	24.64541	27.13238
18	19.81090	21.84056	24.11687	26.67123	29.53900
19	21.01900	23.29737	25.87037	28.77808	32.06595
20	22.23919	24.78332	27.67649	30.96920	34.71925

EXAMPLE 7.19 Future Value of an Annuity Due: Table Approach

PROBLEM: Magoli Company deposits \$100,000 every quarter in a savings account (with the first payment occurring at the beginning of the quarter) for the next 4 years so that it can purchase a specialized piece of machinery at the end of the 4 years. The interest rate is 12%. How much money will Magoli have at the end of the 4 years?

SOLUTION: We use Equation 7.12 to solve for the future value. There are 16 compounding periods (4 years \times 4 periods per year) and the interest rate is 3% (12%/4 periods per year). In Table 7A.4, look across the columns to find the interest rate of 3% and then go down the rows to find 16 number of periods. The factor in this cell is 20.76159.

$$\begin{aligned} FV_{AD} &= PMT \times \text{FACTOR}_{7A.4} \\ FV_{AD} &= \$100,000 \times 20.76159 \\ FV_{AD} &= 2,076,159 \end{aligned}$$

Magoli Company will have \$2,076,159 at the end of the four years.

Spreadsheet Solution. To solve for the future value of an annuity due with a spreadsheet application such as Microsoft Excel, input the following variables into a spreadsheet cell:

$$= \text{FV}(I/Y, N, PMT, PV, \text{type})$$

I/Y = interest rate per compounding period

N = number of compounding periods

PMT = amount of periodic payments

PV = present value equals 0 as computing the future value of a series of payments

type = 0 if payments are due at the end of the period and 1 if payments are due at the beginning of the period

For the future value of an annuity due, we put a 1 in the fifth position because the payments occur at the beginning of each period.

EXAMPLE 7.20 Future Value of an Annuity Due: Spreadsheet Approach

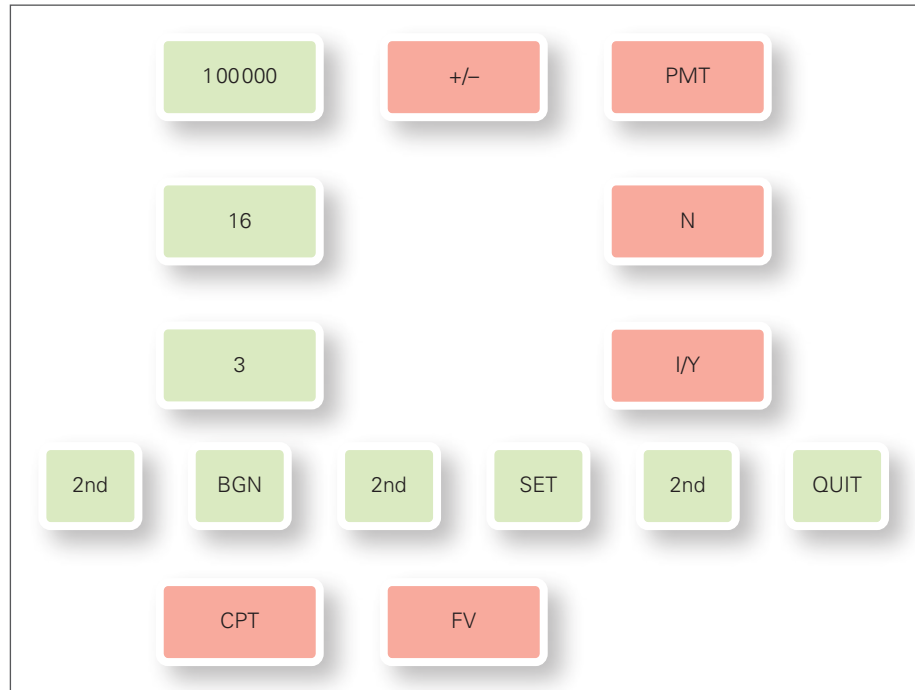

PROBLEM: Magoli Company deposits \$100,000 every quarter in a savings account (with the first payment occurring at the beginning of the quarter) for the next 4 years so that it can purchase a specialized piece of machinery at the end of the four years. The interest rate is 12%. How much money will Magoli have at the end of the 4 years?

SOLUTION: We input $N = 16$ (4 periods per year for 4 years), $I/Y = 3\%$ (12% per year with interest compounding 4 times per year), $PV = 0$, $PMT = -100,000$, and $\text{type} = 1$.

	N	I/Y	PV	PMT	FV	Excel Formula
Given	16	3.00%	0	-100,000		
Solve for FV					2,076,158.77	=FV(0.03,16,-100000,0,1)

The future value is computed in the spreadsheet as \$2,076,158.77.

Financial Calculator Solution. Finally, future value of annuity due problems can be solved using a financial calculator. To solve the problem in Example 7.20, enter the following keystrokes.

The calculator shows the future value of the annuity due is \$2,076,158.77. These keystrokes correspond to an outflow of \$100,000 for 16 compounding periods at a 3% interest rate per compounding period. The fourth row of keystrokes adjusts the calculator settings to “beginning mode” because this is an annuity due with the payments occurring at the beginning of the period as opposed to an ordinary annuity (the default mode) where the payments occur at the end of the period.

- 4 Compute solutions to present value of ordinary annuity and annuity due problems.

Present Value of Ordinary Annuities

In a present value of an ordinary annuity problem (cash flows occur at the end of the period), we know the payments, the interest rate, and the number of compounding periods, and we are asked to compute the present value. For example, assume that you have the opportunity to receive \$100 at the end of each of the next three years. Given an interest rate of 8%, how much would you be willing to pay for this investment today? Exhibit 7.11 depicts this scenario graphically.

EXHIBIT 7.11 Present Value of an Ordinary Annuity

We can solve this problem using a series of single-sum problems as shown in the table on the next page by computing the present value for each of the \$100 payments. The present value for the first, second, and third payments, respectively, is \$92.59, \$85.73, and \$79.38. We add these three present values together to get a total present value of \$257.70.

Payment	End of Period	Amount	FACTOR _{7A.2}	Present Value	Number of Compounding Periods
1st	1	\$100	0.92593	\$ 92.59	1
2nd	2	100	0.85734	85.73	2
3rd	3	100	0.79383	79.38	3
Total		<u>\$300</u>	<u>2.57710</u>	<u>\$257.70</u>	

The difference between the sum of the nominal cash flows (\$300) and the present value of the future cash flows (\$257.70) represents the interest of \$42.30 earned on the investment. By using the present value of \$1 factors from Table 7A.2 (excerpted next), we can also determine that you would be willing to pay no more than \$257.70.

TABLE 7A.2 Present Value of \$1 (Excerpt)

PV = FV × FACTOR _{7A.2}						
Periods	1%	2%	4%	6%	8%	10%
1	0.99010	0.98039	0.96154	0.94340	0.92593	0.90909
2	0.98030	0.96117	0.92456	0.89000	0.85734	0.82645
3	0.97059	0.94232	0.88900	0.83962	0.79383	0.75131
4	0.96098	0.92385	0.85480	0.79209	0.73503	0.68301
5	0.95147	0.90573	0.82193	0.74726	0.68058	0.62092

Although present value of ordinary annuity problems can be solved using a series of single-sum problems, it is more efficient to solve using a formula, table, spreadsheet, or financial calculator.

Formula Solution. Equation 7.13 is the formula for a present value of an ordinary annuity problem:

$$PV_{OA} = PMT \times [(1 - (1/(1 + I/Y)^N))/I/Y] \quad (7.13)$$

where PV_{OA} is the present value of an ordinary annuity, I/Y is the interest rate per compounding period, N is the number of compounding periods, and PMT is the amount of the equal cash flows.

EXAMPLE 7.21

Present Value of an Ordinary Annuity: Formula Approach

PROBLEM: SAO, Inc. will receive \$10,000 semiannually for the next 10 years with the first amount received at the end of the first semiannual period. The interest rate is 10%. What is this stream of future cash flows worth today?

SOLUTION: We use Equation 7.13 to solve for the present value. The annuity payment of \$10,000 is an ordinary annuity because it is received at the end of each compounding period. There are 20 compounding periods (10 years × 2 periods per year), and the interest rate is 5% per compounding period (10%/2 periods per year).

$$PV_{OA} = PMT \times [(1 - (1/(1 + I/Y)^N))/I/Y]$$

$$PV_{OA} = \$10,000 \times [(1 - (1/(1.05)^{20}))/0.05]$$

$$PV_{OA} = \$10,000 \times [(1 - 0.37689)/0.05]$$

$$PV_{OA} = \$10,000 \times 12.4622$$

$$PV_{OA} = \$124,622$$

Today's value of this stream of future cash flows is \$124,622.

Factor Table Solution. Table 7A.5 presents the factors for solving present value of ordinary annuity problems. Equation 7.14 solves present value of ordinary annuity problems using the factors in Table 7A.5.

$$PV_{OA} = PMT \times \text{FACTOR}_{7A.5} \quad (7.14)$$

Refer to the factor that is in the row for the number of compounding periods and the column for the interest rate per compounding period. For example, referring to Exhibit 7.12, the factor associated with four periods and a 2% interest rate is 3.80773.

EXHIBIT 7.12 Select Present Value of Ordinary Annuity Factors

PV = PMT × FACTOR _{7A.5}						
Periods	1%	2%	3%	4%	5%	6%
1	0.99010	0.98039	0.97087	0.96154	0.95238	0.94340
2	1.97040	1.94156	1.91347	1.88609	1.85941	1.83339
3	2.94099	2.88388	2.82861	2.77509	2.72325	2.67301
4	3.90197	3.80773	3.71710	3.62990	3.54595	3.46511
5	4.85343	4.71346	4.57971	4.45182	4.32948	4.21236
10	9.47130	8.98259	8.53020	8.11090	7.72173	7.36009
15	13.86505	12.84926	11.93794	11.11839	10.37966	9.71225
20	18.04555	16.35143	14.87747	13.59033	12.46221	11.46992

EXAMPLE 7.22

Present Value of an Ordinary Annuity: Table Approach

PROBLEM: SAO, Inc. will receive \$10,000 semiannually for the next 10 years with the first amount received at the end of the first semiannual period. The interest rate is 10%. What is this stream of future cash flows worth today?

SOLUTION: We use the factors from Table 7A.5 to solve for the present value. The annuity payment of \$10,000 is an ordinary annuity because it is received at the end of each discounting period. There are 20 discounting periods (10 years × 2 periods per year), and the interest rate is 5% per discounting period (10%/2 periods per year).

$$\begin{aligned} PV_{OA} &= PMT \times \text{FACTOR}_{7A.5} \\ PV_{OA} &= \$10,000 \times 12.46221 \\ PV_{OA} &= \$124,622 \end{aligned}$$

The stream of future cash flows is worth \$124,622 today.

Spreadsheet Solution. To solve the present value of ordinary annuity problems with a spreadsheet application such as Microsoft Excel, input the following variables into a spreadsheet cell:

$$= \text{PV}(I/Y, N, PMT, FV, \text{type})$$

I/Y = interest rate per compounding period

N = number of compounding periods

PMT = amount of periodic payments

FV = future value, equals 0 as computing the present value of a series of payments

type = 0 if payments are due at the end of the period and 1 if payments are due at the beginning of the period

For the present value of an ordinary annuity, do not input a variable into the fifth position because if it is omitted, it is assumed to be zero. Because the type defaults to 0, do not include the last variable when the payment occurs at the end of each period.

EXAMPLE 7.23 Present Value of an Ordinary Annuity: Spreadsheet Approach

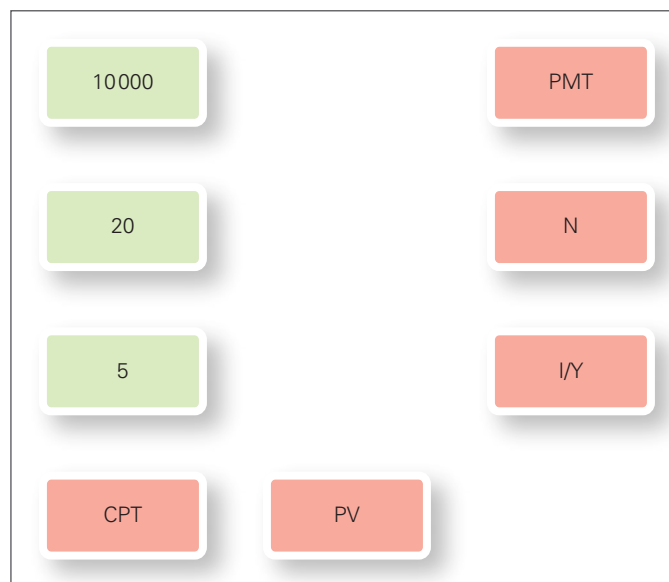

PROBLEM: SAO, Inc. will receive \$10,000 every 6 months for the next 10 years with the first amount received in 6 months. Its interest rate is 10%. What is this stream of cash flows worth today?

SOLUTION: We input $N = 20$ (2 periods per year for 10 years), $I/Y = 5\%$ (10% per year with interest compounding 2 times per year), $FV = 0$, and $PMT = 10,000$.

	N	I/Y	PV	PMT	FV	Excel Formula
Given	20	5.00%		10,000	0	
Solve for PV			-124,622.10			=PV(0.05,20,10000,0)

The present value is computed in the spreadsheet as \$(124,622.10).

Financial Calculator Solution. Finally, present value of an ordinary annuity problems can be solved using a financial calculator. To solve the problem in Example 7.23, enter the following keystrokes.

The calculator shows the present value of the annuity is \$(124,622.10). These keystrokes correspond to an inflow of \$10,000 for 20 compounding periods at a 5% interest rate per compounding period. Note that the calculator defaults to “end mode” for an ordinary annuity because the cash flows occur at the end of each period.

Present Value of an Annuity Due

Present values of annuities due differ from present values of ordinary annuities because the payments occur at the beginning of the period instead of the end of the period. For example, assume that you have the opportunity to receive \$100 for the next three years with the first payment occurring today. Given an interest rate of 8%, how much would you be willing to pay for this investment today?

Let’s compare this annuity due with the ordinary annuity we discussed in the previous section. In the previous section, the payments occurred at the end of each period and, thus, the problem was an ordinary annuity. However, if the payments are made at the beginning of each period, it is an annuity due.

The following timeline depicts a present value for an annuity due with the payments occurring at the beginning of each period. There are three deposits with only two discount periods. The first cash flow is not discounted and is valued at \$100 because it is received today.

Now compare the annuity due to the ordinary annuity depicted in the following timeline. There are still three deposits, but there are three discount periods. Unlike the annuity due, we have to wait until the end of the period for the first cash flow. As a result, the present value of an annuity due is more valuable than a present value of an ordinary annuity.

We can solve this problem using a series of single-sum problems as shown in the following table.

Payment	Beginning of Period	Amount	FACTOR _{7A.2}	Present Value	Number of Compounding Periods
1st	1	\$100	1.00000	\$100.00	0
2nd	2	100	0.92593	92.59	1
3rd	3	100	0.85734	85.73	2
Total		<u>\$300</u>	<u>2.78327</u>	<u>\$278.32</u>	

By using the present value of \$1 factors from Table 7A.2 excerpted next, we can determine that you would be willing to pay no more than \$278.32.

TABLE 7A.2 Present Value of \$1 (Excerpt)

PV = FV × FACTOR _{7A.2}						
Periods	1%	2%	4%	6%	8%	10%
1	0.99010	0.98039	0.96154	0.94340	0.92593	0.90909
2	0.98030	0.96117	0.92456	0.89000	0.85734	0.82645
3	0.97059	0.94232	0.88900	0.83962	0.79383	0.75131
4	0.96098	0.92385	0.85480	0.79209	0.73503	0.68301
5	0.95147	0.90573	0.82193	0.74726	0.68058	0.62092

The annuity due is more valuable than the ordinary annuity by \$20.62 (i.e., \$278.32 – \$257.70). What causes this difference? The first payment of an annuity due is not discounted whereas all payments are discounted with the ordinary annuity. The difference between the sum of the nominal cash flows (\$300) and the present value of the future cash flows (\$278.32) represents the interest of \$21.68 earned on the investment.

A series of single-sum problems can be used to solve these types of problems, but it is most efficient to solve present value of annuity due problems using a formula, table, spreadsheet, or financial calculator.

Formula Solution. Equation 7.15 is the formula for a present value of an annuity due:

$$PV_{AD} = PMT \times [(1 - (1/(1 + I/Y)^N))/I/Y] \times (1 + I/Y) \quad (7.15)$$

where PV_{AD} is the present value of an annuity due, I/Y is the interest rate per compounding period, N is the number of compounding periods, and PMT is the amount of the equal cash flows.

EXAMPLE 7.24 Present Value of an Annuity Due: Formula Approach

PROBLEM: SAO, Inc. will receive \$10,000 semiannually for the next 10 years with the first amount received at the beginning of the first semiannual period. The interest rate is 10%. What is this stream of future cash flows worth today?

SOLUTION: We use Equation 7.15 to solve for the present value. The cash receipt of \$10,000 is an annuity due because it is received at the beginning of each period. There are 20 discounting periods (10 years \times 2 periods per year), and the interest rate is 5% per discounting period (10%/2 periods per year).

$$\begin{aligned} PV_{AD} &= PMT \times [(1 - (1/(1 + I/Y)^N))/I/Y] \times (1 + I/Y) \\ PV_{AD} &= \$10,000 \times [(1 - (1/(1.05)^{20}))/0.05] \times 1.05 \\ PV_{AD} &= \$10,000 \times [(1 - 0.37689)/0.05] \times 1.05 \\ PV_{AD} &= \$10,000 \times 12.4622 \times 1.05 \\ PV_{AD} &= \$10,000 \times 13.0853 \\ PV_{AD} &= \$130,853 \end{aligned}$$

Today's valuation of this stream of future cash flows is \$130,853.

Factor Table Solution. Table 7A.6 presents the factors used to solve present value of annuity due problems. We use Equation 7.16 to solve present value of annuity due problems using the factors in Table 7A.6.

$$PV_{AD} = PMT \times \text{FACTOR}_{7A.6} \quad (7.16)$$

Refer to the factor in the row for the number of compounding periods and the column for the interest rate per compounding period. In Exhibit 7.13, the factor for a 6% interest rate over 9 periods is 7.20979.

EXHIBIT 7.13 Select Present Value of Annuity Due Factors

PV = PMT \times FACTOR _{7A.6}						
Periods	1%	2%	3%	4%	5%	6%
1	1.00000	1.00000	1.00000	1.00000	1.00000	1.00000
2	1.99010	1.98039	1.97087	1.96154	1.95238	1.94340
3	2.97040	2.94156	2.91347	2.88609	2.85941	2.83339
4	3.94099	3.88388	3.82861	3.77509	3.72325	3.67301
5	4.90197	4.80773	4.71710	4.62990	4.54595	4.46511
6	5.85343	5.71346	5.57971	5.45182	5.32948	5.21236
7	6.79548	6.60143	6.41719	6.24214	6.07569	5.91732
8	7.72819	7.47199	7.23028	7.00205	6.78637	6.58238
9	8.65168	8.32548	8.01969	7.73274	7.46321	7.20979
10	9.56602	9.16224	8.78611	8.43533	8.10782	7.80169
20	18.22601	16.67846	15.32380	14.13394	13.08532	12.15812

EXAMPLE 7.25**Present Value of an Annuity Due: Table Approach**

PROBLEM: SAO, Inc. will receive \$10,000 semiannually for the next 10 years with the first amount received at the beginning of the first semiannual period. The interest rate is 10%. What is this stream of future cash flows worth today?

SOLUTION: We use Equation 7.16 to solve for the present value. The cash receipt of \$10,000 is an annuity due because it is received at the beginning of each period. There are 20 discounting periods (10 years \times 2 periods per year) and the interest rate is 5% per discounting period (10%/2 periods per year).

$$PV_{AD} = PMT \times \text{FACTOR}_{7A.6}$$

$$PV_{AD} = \$10,000 \times 13.08532$$

$$PV_{AD} = \$130,853.20$$

Today's value of this stream of future cash flows is \$130,853.20.

Spreadsheet Solution. To solve present value of annuity due problems with a spreadsheet application such as Microsoft Excel, input the following variables into a spreadsheet cell:

$$= \text{PV}(I/Y, N, PMT, FV, \text{type})$$

I/Y = interest rate per compounding period

N = number of compounding periods

PMT = amount of periodic payments

FV = future value equals 0

type = 0 if payments are due at the end of the period and 1 if payments are due at the beginning of the period

For the present value of an annuity due, we put a 1 in the fifth position because the payments occur at the beginning of each period. We input a variable of 0 into the fourth position because this is not a future value problem.

EXAMPLE 7.26**Present Value of an Annuity Due: Spreadsheet Approach**

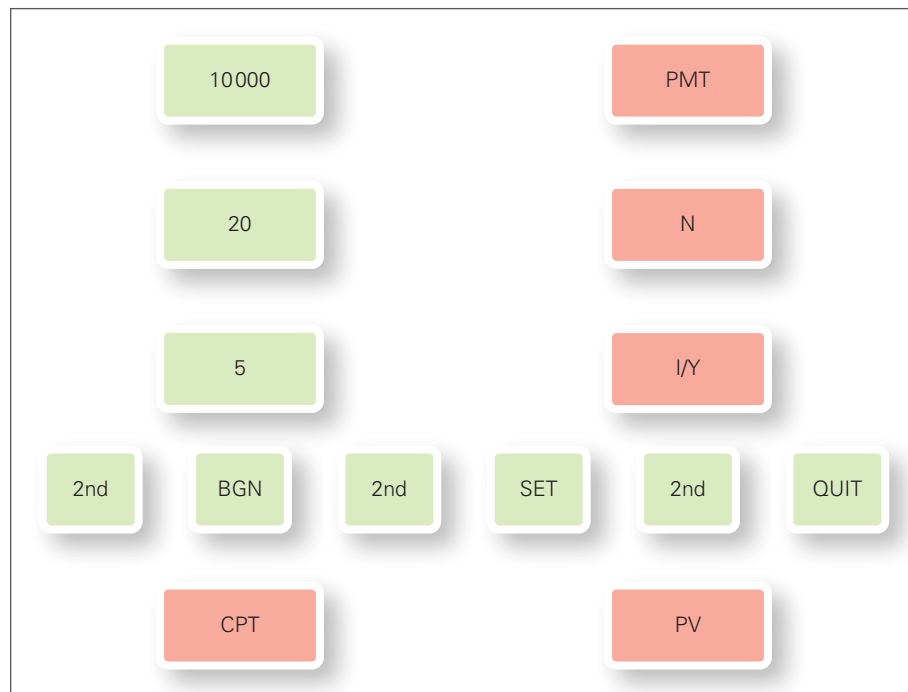

PROBLEM: SAO, Inc. will receive \$10,000 semiannually for the next 10 years with the first amount received at the beginning of the first semiannual period. The interest rate is 10%. What is this stream of future cash flows worth today?

SOLUTION: We input $N = 20$ (2 periods per year for 10 years), $I/Y = 5\%$ per discount period (10% per year with interest discounted 2 times per year), $FV = 0$, $PMT = 10,000$, and $\text{type} = 1$.

	N	I/Y	PV	PMT	FV	Excel Formula
Given	20	5.00%		10,000	0	
Solve for PV			-130,853.21			=PV(0.05,20,10000,0,1)

The present value is computed in the spreadsheet as \$(130,853.21).

Financial Calculator Solution. Finally, present value of annuity due problems can be solved using a financial calculator. To solve the problem in Example 7.26, enter the following keystrokes.

The calculator shows the present value of the annuity due is \$(130,853.21). These keystrokes correspond to an inflow of \$10,000 for 20 compounding periods at a 5% interest rate per compounding period. The fourth row of keystrokes adjusts the variables to “beginning mode” because this is an annuity due as opposed to an ordinary annuity.

Other Annuity Problems

In the preceding annuity problems, we knew the interest rate, the payments, and the number of compounding periods and solved for either the present value or future value. However, there are times when you will be asked to solve for the interest rate, payments, or number of periods. We discuss these scenarios for ordinary annuities next.⁵

Solving for the Interest Rate. To solve for the interest rate in an ordinary annuity problem, we could use Equation 7.13 and solve for I/Y , but that is complex. Therefore, we present the other solution approaches.

Using the factor tables, start on the inside of the table. Referring to the present value of an ordinary annuity factors in Table 7A.5, we know from Equation 7.14 that the PV_{OA} equals the PMT times the Table 7A.5 factor. We can rearrange as follows:

$$PV_{OA}/PMT = \text{FACTOR}_{7A.5} \quad (7.17)$$

Thus, we compute the left-hand side of the equation and search for the interest rate in the row corresponding to the number of compounding periods.⁶

⁵We discuss only ordinary annuities in this section, but it is straightforward to extrapolate these procedures to the annuity due case.

⁶Finding a factor in the table will depend on interest rates and the number of periods presented. If a factor is not found in a table, use another approach such as the formula or spreadsheet.

EXAMPLE 7.27**Solving for the Interest Rate in an Ordinary Annuity Problem**

PROBLEM: You have just won your state's big lottery, the Mega Power Pick-6! The jackpot is \$250,000,000. You have the option of receiving a check for \$12,500,000 at the end of each of the next 20 years. You would receive the first check in a year. The state lottery commission also allows you the option of receiving a one-time payment of \$155,777,629 when you turn in the winning ticket. What interest rate is the state lottery commission using to determine the one-time payment?

SOLUTION: We know that the present value of the series of 20 cash payments of \$12,500,000 over the next 20 years is \$155,777,629. To solve for the interest rate, we use Equation 7.17.

$$PV_{OA}/PMT = \text{FACTOR}_{7A.5}$$

$$\$155,777,629/\$12,500,000 = 12.46221$$

The factor is 12.46221 and there are 20 compounding periods. We then search in Table 7A.5 (excerpted as follows) along the row for 20 compounding periods until we find the factor 12.46221 in the 5% column. Thus, the state lottery commission is using a 5% interest rate annually to determine the one-time payment.

TABLE 7A.5 Present Value of an Ordinary Annuity (Excerpt)

PV = PMT × FACTOR_{7A.5}					
Periods	1%	2%	3%	4%	5%
1	0.99010	0.98039	0.97087	0.96154	0.95238
2	1.97040	1.94156	1.91347	1.88609	1.85941
3	2.94099	2.88388	2.82861	2.77509	2.72325
4	3.90197	3.80773	3.71710	3.62990	3.54595
5	4.85343	4.71346	4.57971	4.45182	4.32948
6	5.79548	5.60143	5.41719	5.24214	5.07569
7	6.72819	6.47199	6.23028	6.00205	5.78637
8	7.65168	7.32548	7.01969	6.73274	6.46321
9	8.56602	8.16224	7.78611	7.43533	7.10782
10	9.47130	8.98259	8.53020	8.11090	7.72173
11	10.36763	9.78685	9.25262	8.76048	8.30641
12	11.25508	10.57534	9.95400	9.38507	8.86325
13	12.13374	11.34837	10.63496	9.98565	9.39357
14	13.00370	12.10625	11.29607	10.56312	9.89864
15	13.86505	12.84926	11.93794	11.11839	10.37966
16	14.71787	13.57771	12.56110	11.65230	10.83777
17	15.56225	14.29187	13.16612	12.16567	11.27407
18	16.39827	14.99203	13.75351	12.65930	11.68959
19	17.22601	15.67846	14.32380	13.13394	12.08532
20	18.04555	16.35143	14.87747	13.59033	12.46221

We solve for the interest rate variable, I/Y , using the RATE function in a spreadsheet cell as follows:

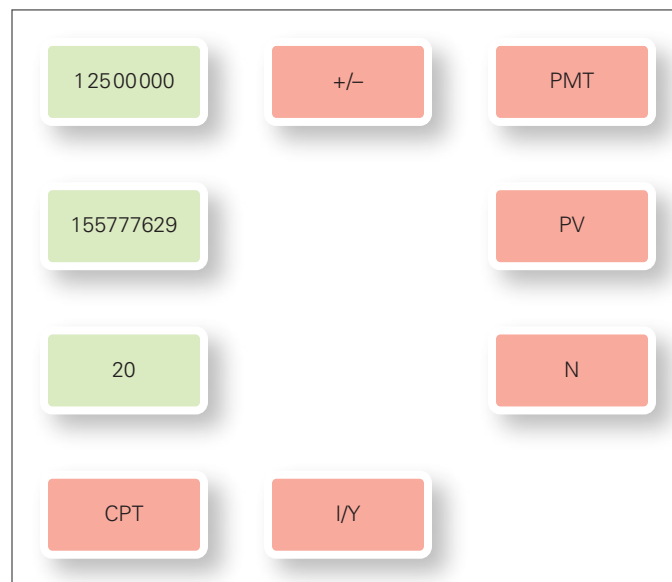

$$= \text{RATE}(N, \text{PMT}, \text{PV}, \text{FV}, \text{type})$$

All variables are previously defined. To solve the problem in Example 7.27, enter the following amounts in each cell.

	N	I/Y	PV	PMT	FV	Excel Formula
Given	20		155,777,629	-12,500,000	0	
Solve for I/Y		5.00%				=RATE(20,-12500000,155777629,0,0)

The spreadsheet provides the solution, 5.00%.

We can also solve for the interest rate in an ordinary annuity problem using a financial calculator. To solve the problem in Example 7.27, enter the following keystrokes.

These keystrokes correspond to an annuity with 20 payments of \$12,500,000 and a present value of \$155,777,629. The calculator provides the solution of 5%.

Solving for the Number of Compounding Periods. Problems may also require solving for the number of compounding periods. Again, we can use the present value of an ordinary annuity factors in Table 7A.5 to solve by using Equation 7.17 to determine the factor and then finding the corresponding number of periods in the factor table.

EXAMPLE 7.28

Solving for the Number of Periods in an Ordinary Annuity Problem

PROBLEM: KW Enterprises borrows \$202,772 at an interest rate of 8% today and will repay this amount by making semiannual payments of \$25,000. Payments begin at the end of six months. How long will it take for KW to pay off the loan?

SOLUTION: The present value of the series of semiannual cash payments at 8% annual interest is \$202,772. To solve for how long it will take KW to pay off the loan, we use Equation 7.17 to determine the table factor.

$$\begin{aligned} \text{PV}_{\text{OA}}/\text{PMT} &= \text{FACTOR}_{7\text{A.5}} \\ \$202,772/\$25,000 &= 8.11088 \end{aligned}$$

The factor is 8.11088, and the interest rate over the semiannual compounding period is 4%. We then search in Table 7A.5 (excerpted on next page) along the 4% column until we find the factor in the row corresponding to 10 periods. Thus, the loan will be paid off in 10 periods, or 5 years.

TABLE 7A.5 Present Value of an Ordinary Annuity (Excerpt)

PV = PMT × FACTOR_{7A.5}					
Periods	1%	2%	3%	4%	5%
1	0.99010	0.98039	0.97087	0.96154	0.95238
2	1.97040	1.94156	1.91347	1.88609	1.85941
3	2.94099	2.88388	2.82861	2.77509	2.72325
4	3.90197	3.80773	3.71710	3.62990	3.54595
5	4.85343	4.71346	4.57971	4.45182	4.32948
6	5.79548	5.60143	5.41719	5.24214	5.07569
7	6.72819	6.47199	6.23028	6.00205	5.78637
8	7.65168	7.32548	7.01969	6.73274	6.46321
9	8.56602	8.16224	7.78611	7.43533	7.10782
10	9.47130	8.98259	8.53020	8.11090	7.72173

We solve for the number of periods, N, using the NPER function in a spreadsheet cell as follows:

$$= \text{NPER}(I/Y, \text{PMT}, \text{PV}, \text{FV}, \text{type})$$

All variables are previously defined. To solve the problem in Example 7.28, enter the following amounts in each cell.

	N	I/Y	PV	PMT	FV	Excel Formula
Given		4.00%	202,772	-25,000	0	
Solve for N	10					=NPER(0.04, -25000, 202772, 0)

The spreadsheet provides the solution, 10 periods.

Financial calculators also facilitate solving for the number of compounding periods. To solve the problem in Example 7.28, enter the following keystrokes.

The calculator shows that the number of compounding periods is 10. These keystrokes correspond to an ordinary annuity with payments of \$25,000 at a 4% interest rate per compounding period and a present value of \$202,772.

Solving for the Payment Amount. Finally, problems may require solving for the amount of the payments.

We will use the present value of ordinary annuity factors in Table 7A.5 to solve for the payment because we know from Equation 7.14 that the PV_{OA} equals the PMT times the Table 7A.5 factor. We can rearrange as follows:

$$PMT = PV_{OA}/FACTOR_{7A.5} \quad (7.18)$$

and use Equation 7.18 to solve for the payment amount.

EXAMPLE 7.29

Solving for the Payment Amount in an Ordinary Annuity Problem

PROBLEM: KW Enterprises borrows \$202,772 at an interest rate of 8% today and will repay this amount by making 10 semiannual payments. Payments begin in six months. What is the amount of the payments that KW will need to make?

SOLUTION: The present value of the series of 10 semiannual cash payments at 8% annual interest over 5 years is \$202,772. To solve for the payment amount, we use Equation 7.18.

$$PMT = PV_{OA}/FACTOR_{7A.5}$$

$$PMT = \$202,772/8.11090$$

$$PMT = \$24,999.94$$

KW will need to make \$24,999.94 payments.

TABLE 7A.5 Present Value of Ordinary Annuity (Excerpt)

PV = PMT × FACTOR_{7A.5}					
Periods	1%	2%	3%	4%	5%
1	0.99010	0.98039	0.97087	0.96154	0.95238
2	1.97040	1.94156	1.91347	1.88609	1.85941
3	2.94099	2.88388	2.82861	2.77509	2.72325
4	3.90197	3.80773	3.71710	3.62990	3.54595
5	4.85343	4.71346	4.57971	4.45182	4.32948
6	5.79548	5.60143	5.41719	5.24214	5.07569
7	6.72819	6.47199	6.23028	6.00205	5.78637
8	7.65168	7.32548	7.01969	6.73274	6.46321
9	8.56602	8.16224	7.78611	7.43533	7.10782
10	9.47130	8.98259	8.53020	8.11090	7.72173

We solve for the payment amount, PMT , using the PMT function in a spreadsheet cell as follows:

$$= PMT(I/Y,N,PV,FV,type)$$

All variables are previously defined. To solve the problem in Example 7.29, enter the following amounts in each cell.

	N	I/Y	PV	PMT	FV	Excel Formula
Given	10	4.00%	202,772		0	
Solve for PMT				(24,999.95)		=PMT(0.04,10,202772,0,0)

The spreadsheet provides the solution, \$(24,999.95).

To solve the problem in Example 7.29 with a financial calculator, enter the following keystrokes.

The calculator provides the payment amount of \$(24,999.95). These keystrokes correspond to an annuity with 10 payments at a 4% interest rate per compounding period and a present value of \$202,772.

- 5 Compute solutions to future value and present value of deferred annuity problems.

Deferred Annuities

A **deferred annuity** results from a variety of contracts whose payments or receipts are delayed until a future period. For example, a company may receive annual payments of \$50,000 for five years, but the payments will not begin until three years from today. Deferred annuities may require calculating the present value or the future value.

Future Value of a Deferred Ordinary Annuity

Computing the future value of a deferred ordinary annuity involves using any of the same methods as when we compute the future value of an ordinary annuity with one difference: We will discount the cash flows only for the number of periods in which the payments occur, not the total period. This is due to the fact that we do not include the deferral period.

EXAMPLE 7.30

Future Value of a Deferred Ordinary Annuity

PROBLEM: Short Stack Pancake Company has budgeted \$370,000 to build a new factory 10 years from today. Short Stack will finance the project by making seven annual deposits of \$45,000 into a savings fund at the end of each year that commences at the end of Year 4. The company’s interest rate is 6%. Prepare a timeline that depicts this time value of money problem. Will Short Stack have sufficient funds to pay for the \$370,000 factory at the end of the 10-year period?

Continued

SOLUTION: We prepare the timeline as follows. Note that there are three deferral periods in which there are no deposits made into the fund. The deposits begin in Year 4 and end in Year 10, so there are seven deposits in total.

We then compute the future value of the annuity using the future value of an ordinary annuity factors from Table 7A.3 with an interest rate of 6% and seven periods.

$$FV_{OA} = \$45,000 \times \text{FACTOR}_{7A.3}$$

$$FV_{OA} = \$45,000 \times 8.39384$$

$$FV_{OA} = \$377,722.80$$

Thus, the company will have sufficient funds to pay for the \$370,000 factory at the end of Year 10. Alternatively, we can use a financial calculator, a spreadsheet, or the formula.

Present Value of a Deferred Ordinary Annuity

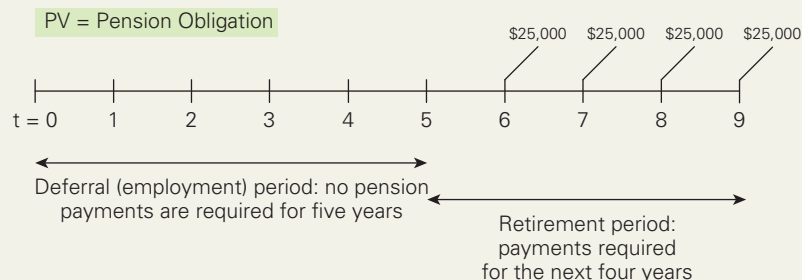

One alternative method to compute the present value of a deferred ordinary annuity is to determine the present value of the cash flows over the period in which the cash flows occur. This present value is then considered as a lump-sum receipt (FV) received at the end of the deferral period. Discount this FV back to time period 0 to determine the present value of the deferred ordinary annuity.

EXAMPLE 7.31

Present Value of a Deferred Ordinary Annuity

PROBLEM: Barone Contracting Corporation (BCC) is required to pay the pension of one of its unionized employees. According to the terms of the union contract, the employee will retire in 5 years. The employee will receive \$25,000 at the end of the consecutive 4 years following retirement. BCC's relevant interest rate is 3%. Prepare a timeline for this problem, and compute the pension obligation that BCC has incurred today.

SOLUTION: This series of cash payments is a deferred annuity with annual compounding. The deferral period consists of the 5 years prior to retirement, and the payment period is 4 years following the employee's retirement date. The timeline follows:

Computing the present value of an ordinary annuity of \$25,000 for four payments at an interest rate of 3% gives us the value of the ordinary annuity stream at the beginning of Period 5 in the timeline above. We can use any of the available methods for computing the present value of an ordinary annuity; we will use the table approach here with an interest rate of 3% and 4 periods.

$$PV_{OA} = PMT \times \text{FACTOR}_{7A,5}$$

$$PV_{OA} = \$25,000 \times 3.71710$$

$$PV_{OA} = \$92,927.50$$

This step gives us the value as of time Period 5. This amount (\$92,927.50) is now considered a future value of an amount of \$1 to be received 5 years from now. We discount \$92,927.50 back to the present to estimate BCC's pension obligation. We then must discount this single sum back 5 periods at 3%.

$$PV = FV \times \text{FACTOR}_{7A,2}$$

$$PV = 92,927.50 \times .86261$$

$$PV = 80,160.19$$

BCC has therefore incurred a pension obligation of \$80,160.19 today.

- ⑥ Apply time value of money concepts to accounting applications involving determining the present value of expected cash flows and valuing bonds.

Time Value of Money Accounting Applications

We summarized several examples of the use of time value of money concepts in accounting. Now that we have discussed time value of money tools, we return to two basic accounting applications in more detail: the present value of expected cash flows and bond valuation.

THE CONCEPTUAL FRAMEWORK CONNECTION Present Value of Expected Cash Flows

In the conceptual framework, the FASB describes five different methods that can be used to measure assets and liabilities: historical cost, current cost, current market value, net realizable value, and present value of future cash flows. The measurement of asset and liabilities—that is, the amount at which they are reported on the balance sheet—is extremely important in accounting. Because one of the commonly used measures is the present (or discounted) value of future cash flows, time value of money concepts are quite important.

We use present value techniques to measure both assets and liabilities. Assets such as notes receivable; investments in debt and equity securities; property, plant and equipment; and intangible assets may be measured using a discounted future cash flows approach. Likewise, liabilities such as notes payable and bonds payable utilize a present value of future cash flows approach.

Interview

PETER BICHÉ
CHIEF FINANCIAL
OFFICER, MONUMENTAL
SPORTS & ENTERTAINMENT
WASHINGTON, DC»

Peter Biché

As CFO of Monumental Sports & Entertainment, Peter Biché oversees the financial operations of the Washington Capitals (hockey), Washington Wizards (basketball), and Washington Mystics (women's basketball) teams, the Verizon Center, George Mason University's Patriot Center, and the Kettler Capitals Iceplex.

- 1 What are the most common applications of time value of money models used in accounting by your franchise?

In the past, a common application of the time value of money (TVM) in the sports industry was for deferred compensation built into player and staff (e.g., general manager, coach) contracts, using a relatively straightforward net present value calculation to compare the costs and benefits of alternative payment plans. We now rarely enter into deferred payment or front-loaded agreements with either players or our team executives, both by our choice and that of the athlete/staff member. For our teams, collective bargaining agreements and salary cap restrictions have significantly reduced the appeal of such arrangements. Most players and staff realize that tying future payments to a team introduces an element of credit risk (for example, the significant amount the Pittsburgh Penguins owed Mario Lemieux under a deferred-compensation agreement and the team's later bankruptcy). Most players now have relatively sophisticated financial advisors and can arrange a "deferred" payment plan through other means.

The current exception is signing bonuses (up-front payments) with certain athletes. These tend to be relatively small compared to the overall size of the player contract; other considerations such as the player's cash flow needs and commitment to the player take precedence. An athlete might defer the receipt of a payment for several reasons, including if the team agreed to make a sufficiently larger payment or series of payments at a later date or if there were tax advantages (i.e., deferring the payment of taxes to a later date) to doing so. Both of these use time value of money calculations. We also consider time value issues in multi-year business agreements with our suite tenants, corporate sponsors, and media partners.

- 2 Describe some significant judgments involved when the team estimates the future cash flows used in a time value of money application.

The judgments considered depend on and vary dramatically based on the type of agreement we are entering into. For example, when negotiating a player contract, we compare the upfront payment versus the net present value of the deferred payments and the expected player performance in later years. While not time value of money related, we also consider the payments' impact on the team's current and future salary cap position.

With a capital investment, judgment factors include the potential for increased revenues and the payback period (how long it takes to recover our investment) compared to alternative investments or other requirements. For alternative investments, we modify the discount rate depending on the risk of our target investment and the alternatives. Typically, these investments would include either future revenue generation upside or cost savings. For business agreements, we factor the amount of royalties for merchandising, endorsements, and broadcast revenues into our future revenues and outflows.

- 3 How do you apply time value of money to capital investments, such as upgrading or renovating a sports venue?

Often a capital investment will generate returns to us (increased revenues and/or decreased costs). For example, if we want to increase ticket revenues by adding luxury boxes or upgrade the food concession facilities, we weigh the expected amount and timing of the returns (higher ticket revenues or concession commissions) against the initial capital outlay for the renovation to determine the attractiveness of the investment. Using time value of money calculations, we compare the costs and benefits to find the difference between the cash inflows and cash outflows for the potential investment. In addition, in an even modestly inflationary environment, we must consider the potential for rising costs if we advance or defer an investment and factor that risk into our analysis by modifying the discount rate.

Discussion Questions

1. Assume that you have been offered an executive position with a major corporation. The company gives you two compensation options: deferred compensation or advance payment. How would you decide which option to select? (Include illustrations to support your response.)
2. In his interview, Peter Biché defines the payback period as the amount of time it takes for a project to recover an investment. How is the payback period computed and what are its advantages and disadvantages?

Present Value of Future Cash Flows

A common method of measuring assets is the present value of expected future cash flows. For example, notes receivable are reported on the balance sheet at the present value of future cash flows, using the market rate of interest as the discount rate in the present value computations. The face value of the note does not matter. The amount reported on the balance sheet is always equal to the present value of the future cash flows.

EXAMPLE 7.32

Present Value of Expected Cash Flows

PROBLEM: Metatech, Inc. accepts a \$2,000,000 note on January 1 issued by Totot Corporation. Specifically, Totot will issue a non-interest-bearing note with \$2,000,000 due in 10 years in exchange for cash. The current market rate is 10%. Interest is compounded annually. Metatech is a calendar-year firm that prepares financial statements annually. At what amount will Metatech report the notes receivable on January 1?

SOLUTION: We will compute the present value of a lump sum. There are no interest payments because this is a non-interest-bearing note. The interest rate is 10% and there are 10 compounding periods. The future value is the \$2,000,000 that Metatech will receive in 10 years.

We can use any method to compute this present value. For simplicity, we will show the formula and the spreadsheet approaches.

$$\begin{aligned} PV &= FV \times 1/(1 + I/Y)^N \\ PV &= \$2,000,000 \times 1/(1.10)^{10} \\ PV &= \$2,000,000 \times 1/2.593742 \\ PV &= \$2,000,000 \times 0.3855434 \\ PV &= \$771,087 \end{aligned}$$

The present value of the note receivable is \$771,087.

If we use the spreadsheet method, we also get a present value of \$771,087.

	N	I/Y	PV	PMT	FV	Excel Formula
Given	10	10.00%		0	2,000,000	
Solve for PV			(771,087)			=PV(0.1,10,0,2000000)

Computing Bond Issue Proceeds

A common application of time value of money concepts is determining the amount of cash received when a company issues a bond to raise capital. With a bond, a company receives cash from a lender today, usually in return for the commitment to pay a fixed amount back at a certain future date when the bond matures, called the *face value*. The company typically also promises to pay periodic interest payments at fixed amounts until that date. The interest payment is based on an interest rate the company agrees to when it issues the bond. We discuss bonds in detail in a later chapter. Here we focus on using the time value of money to determine how much cash a company will receive when it issues a bond.

To determine the amount of cash received, we take the present value of the future cash outflows on the bond. The present value combines the present value of an amount paid when the bond matures and the present value of periodic interest payments. The interest rate used to discount these cash flows is the interest rate at which the company borrows the cash, the market interest rate.

EXAMPLE 7.33 Bond Issue Proceeds

PROBLEM: On January 1, 2016, the Auto-Stop Corporation issued bonds in the amount of \$10,000 that will be paid in 3 years. Interest of \$400 is payable semiannually each January 1 and July 1 with the first interest payment at the end of the period, on July 1 of the current year. Draw a time line of the bond's cash outflows. If the market rate of interest is 10%, what is the amount of the bond issue proceeds (cash received) when Auto-Stop Corporation issued the bonds?

SOLUTION: To determine the bond issue proceeds, we take the sum of:

- The present value of the future cash outflows of \$10,000 in 3 years discounted at the market interest rate of 10%. This is the present value of a single sum.
- The present value of the six interest payments (2 per year times 3 years) of \$400 each at the market rate of interest. This is the present value of an ordinary annuity.

The following timeline depicts the bond's cash outflows.

For simplicity, we present the solution using the table approach. All PV factors use the semiannual market rate because the bonds are priced at the market interest rate. Therefore, $I/Y = 5\%$ ($10\%/2$), and $N = 6$ (3 years \times 2). For the \$10,000 face value payment, we take the present value of a single sum:

$$\begin{aligned} PV &= FV \times \text{FACTOR}_{7A.2} \\ PV &= \$10,000 \times 0.74622 \\ FV &= \$7,462.20 \end{aligned}$$

For the interest payments of \$400, we take the present value of an ordinary annuity:

$$\begin{aligned} PV_{OA} &= FV \times \text{FACTOR}_{7A.5} \\ PV_{OA} &= \$400 \times 5.07569 \\ PV_{OA} &= \$2,030.28 \end{aligned}$$

Therefore, the bond issue proceeds (cash received) is \$9,492.48.

Cash Flows	Present Value
Face Value	\$ 7,462.20
Interest Payment	+ 2,030.28
Bond Issue Proceeds (Cash Received)	<u>\$ 9,492.48</u>

Exhibit 7.14 summarizes the different types of time value of money problems and related solution techniques from throughout the chapter.

EXHIBIT 7.14 Summary of Time Value of Money Problems

Type of Problem	Formula	Table	Spreadsheet Formula
Future Value of a Single Sum	$FV = PV \times (1 + I/Y)^N$	7A.1	= FV(I/Y,N,0,PV)
Present Value of a Single Sum	$PV = FV \times 1/(1 + I/Y)^N$	7A.2	= PV(I/Y,N,0,FV)
Future Value of an Ordinary Annuity	$FV_{OA} = PMT \times [(1 + I/Y)^N - 1]/I/Y$	7A.3	= FV(I/Y,N,PMT)
Future Value of an Annuity Due	$FV_{AD} = PMT \times \{[(1 + I/Y)^N - 1]/I/Y\} \times (1 + I/Y)$	7A.4	= FV(I/Y,N,PMT,0,1)
Present Value of an Ordinary Annuity	$PV_{OA} = PMT \times [1 - (1/(1 + I/Y)^N)]/I/Y$	7A.5	= PV(I/Y,N,PMT)
Present Value of an Annuity Due	$PV_{AD} = PMT \times [1 - (1/(1 + I/Y)^N)]/I/Y \times (1 + I/Y)$	7A.6	= PV(I/Y,N,PMT,0,1)

Summary by Learning Objectives

In the following, we summarize the main points by learning objective. Throughout the chapter, we discuss the accounting and reporting of U.S. GAAP and IFRS. The following table highlights the major similarities and differences between the standards.

1 Explain the time value of money concept, including the calculations of simple and compound interest; define the effective interest rate.	
Summary	Similarities and Differences between U.S. GAAP and IFRS
<p>The time value of money concept means that a dollar today is worth more than a dollar at some time in the future because a dollar invested today will grow to a larger amount.</p> <p>Simple interest is computed on the initial amount but is not computed on any interest earned.</p> <p>Compound interest is computed on both the principal and the interest left on deposit.</p> <p>The effective interest rate is the amount of interest actually earned or incurred. It will be higher than the stated interest rate if interest is compounded more than one time a year.</p>	Similar under U.S. GAAP and IFRS.
2 Compute solutions to future value and present value of single-sum problems.	
Summary	Similarities and Differences between U.S. GAAP and IFRS
<p>The future value is the value at a future point in time. The present value is the value at the current point in time.</p> <p>There are four variables of importance in a single-sum problem:</p> <ol style="list-style-type: none"> 1. Present value (<i>PV</i>) 2. Future value (<i>FV</i>) 3. Interest rate per compounding period (<i>I/Y</i>) 4. Time period or number of compounding periods (<i>N</i>) <p>If we know three of these variables, we are able to compute the fourth.</p> <p>A formula, factor table, spreadsheet, or financial calculator can be used to compute the future values and present values.</p>	Similar under U.S. GAAP and IFRS.

Summary by Learning Objectives, continued

3 Compute solutions to future value of ordinary annuity and annuity due problems.

Summary	Similarities and Differences between U.S. GAAP and IFRS
<p>An annuity is a series of periodic payments or receipts of equal amounts that occur at equal time intervals between each cash flow. The equal cash flows are referred to as payments (PMT).</p> <p>There are two types of annuities:</p> <ul style="list-style-type: none"> • An ordinary annuity is an annuity when the cash flows occur at the end of the interest period. • An annuity due is an annuity when the cash flows occur at the beginning of the interest period. <p>The future value of an annuity is the amount that the series of payments will be valued at some future period.</p> <p>A formula, factor table, spreadsheet, or financial calculator can be used to compute the future value of an annuity.</p>	Similar under U.S. GAAP and IFRS.

4 Compute solutions to present value of ordinary annuity and annuity due problems.

Summary	Similarities and Differences between U.S. GAAP and IFRS
<p>The present value of an annuity is the amount that the series of payments is valued at in the current period.</p> <p>A formula, factor table, spreadsheet, or financial calculator can be used to compute the present value of an annuity.</p>	Similar under U.S. GAAP and IFRS.

5 Compute solutions to future value and present value of deferred annuity problems.

Summary	Similarities and Differences between U.S. GAAP and IFRS
<p>A deferred annuity is when payments or receipts are delayed until a future period.</p>	Similar under U.S. GAAP and IFRS.

6 Apply time value of money concepts to accounting applications involving determining the present value of expected cash flows and valuing bonds.

Summary	Similarities and Differences between U.S. GAAP and IFRS
<p>A common method of measuring assets is the present value of expected future cash flows. For example, notes receivable are reported on the balance sheet at the present value of future cash flows, using the market rate of interest as the discount rate.</p> <p>To determine bond issue proceeds, take the present value of the future cash outflows on the bond, the sum of:</p> <ul style="list-style-type: none"> • Amount paid when the bond matures (face value) and • Periodic interest payments. <p>Use the market interest rate to discount the cash flows.</p>	Similar under U.S. GAAP and IFRS.

MyLab Accounting

Go to <http://www.pearson.com/mylab/accounting> for the following Questions, Multiple-Choice Questions, Brief Exercises, Exercises, and Problems. They are available with immediate grading, explanations of correct and incorrect answers, and interactive media that acts as your own online tutor.

7 Accounting and the Time Value of Money

For the time value of money end-of-chapter exercises and problems, solutions can be computed using formulas, factor tables, a spreadsheet, or a financial calculator.

Questions

- ① Q7-1. What is interest? Explain.
- ① Q7-2. Will an investor earn more if interest is compounded semiannually or if the investment pays only simple interest? Explain.
- ① Q7-3. If interest is compounded more than once a year, will the effective interest rate be higher than the annual stated interest rate? Explain.
- ② Q7-4. What is the relation between the present value of an investment and time and interest rate? Explain.
- ②④ Q7-5. Can an ordinary annuity table be used to determine the present value of a three-year investment that pays \$100 in the first year, \$150 in the second, and \$200 in the last year of the contract? Explain.
- ③ Q7-6. Is it possible to convert the future value of an ordinary annuity table to the future value of an annuity due table? Explain.
- ④ Q7-7. Is the present value of an ordinary annuity more valuable than an annuity due? Explain.
- ④ Q7-8. Is it possible to convert a present value of an ordinary annuity table to the present value of an annuity due table? Explain.

Brief Exercises

- ① BE7-1. **Simple Interest.** Assume Shafer Corporation borrowed \$100,000 for two years with a stated interest rate of 5%. Interest is not compounded. What is the total interest expense?
- ① BE7-2. **Compound Interest.** Assume Shafer Corporation borrowed \$100,000 for two years with a stated interest rate of 5%. Interest is compounded annually. What is the total interest expense?
- ② BE7-3. **Future Value of a Single Sum.** You decide to deposit \$500 at a local bank for one year at a 6% rate of interest. What is the future value of your investment? Draw a timeline to illustrate the problem.
- ② BE7-4. **Future Value of a Single Sum, Compound Interest.** You decide to deposit \$500 at a local bank for three years at a 6% rate of interest. What is the future value of your investment? Draw a timeline to illustrate the problem. Interest is compounded annually.
- ② BE7-5. **Present Value of a Single Sum.** You have been offered an opportunity to receive \$1,500 at the end of one year. You can earn an 8% rate of return on your next-best alternative investment. How much are you willing to invest/deposit today ($t = 0$) to have the opportunity to receive \$1,500 at the end of one year given that your interest rate is 8%? Draw a timeline to illustrate the problem.
- ② BE7-6. **Present Value of a Single Sum, Compound Interest.** You have been offered an opportunity to receive \$1,500 at the end of two years. You can earn an 8% rate of return on your next-best alternative investment. How much are you willing to invest/deposit today ($t = 0$) to have the opportunity to receive \$1,500 at the end of two years, given that your interest rate is 8%? Draw a timeline to illustrate the problem. Interest is compounded annually.
- ② BE7-7. **Future Value of a Single Sum, Compound Interest.** Adam Levine invested \$100,000 in a fund that earns 8% annual interest compounded annually. How much will his investment be worth in five years? Draw a timeline to illustrate the problem.
- ② BE7-8. **Future Value of a Single Sum, Compound Interest Semiannually.** Blake Shelton decides to invest \$50,000 in a fund that will earn 8% annual interest compounded *semiannually*. How much will his investment be worth in three years? Draw a timeline to illustrate the problem.
- ② BE7-9. **Present Value of a Single Sum, Compounded Interest Quarterly.** A student needs to have \$80,000 in four years. What amount must she invest today if her investment earns 12% annual interest compounded quarterly? Draw a timeline to illustrate the problem.
- ② BE7-10. **Present Value of a Single Sum, Calculating Annual Interest Rate.** Kenney Chesney decides to invest \$43,630 today because he would like to build a guitar factory for \$100,000 in 17 years. Interest is compounded annually. What annual interest rate must he receive to reach the required amount?

- 2 **BE7-11. Present Value of a Single Sum, Calculating Time Period.** Christina Aguilera decides to invest \$352,480 today in a fund that will earn 6% annual interest compounded annually. How many years will it take her to earn \$500,000?
- 3 **BE7-12. Future Value of an Ordinary Annuity.** An undergraduate student decides to make \$5,000 deposits in a fund each year over the next four years to accumulate enough money to pay for a master's program. The fund will earn 10% annual interest compounded annually. If the first payment occurs at *year-end*, what amount will be in the fund after four years? Draw a timeline to illustrate the problem.
- 3 **BE7-13. Future Value of an Annuity Due.** Mariah Carey invests \$20,000 each year in a fund that earns 8% annual interest compounded annually. If the first payment into the fund occurs *at the beginning of the year*, what amount will be in the fund after eight years? Draw a timeline to illustrate the problem.
- 3 **BE7-14. Future Value of an Ordinary Annuity: Calculating Payments.** Assume that you need to have \$25,000 in four years. How much must you invest at the *end* of each year to reach your goal? You will earn 8% interest compounded annually. Draw a timeline to illustrate the problem.
- 4 **BE7-15. Present Value of an Ordinary Annuity.** CB Corporation hopes to withdraw \$10,000 at the *end* of each year for six years from a fund that earns 5% interest. How much should the corporation invest today? Draw a timeline to illustrate the problem. Interest is compounded annually.
- 4 **BE7-16. Present Value of an Annuity Due, Semiannual Compounding Interest.** Genius LLP must withdraw \$50,000 at the *beginning* of each semiannual period for the next eight years to satisfy its employee pension obligation. Assuming 10% interest with *semiannual* compounding, how much should the corporation invest today? Draw a timeline to illustrate the problem.
- 4 **BE7-17. Present Value of an Ordinary Annuity, Calculating Interest Rate.** Cee Lo Green decides to borrow \$100,000. In order to settle this loan, he plans to make 10 payments of \$13,586.79 at the end of each year. Interest is compounded annually. What is the interest rate on this loan?

Exercises

- 3 4 **E7-1. Ordinary Annuity, Annuity Due, Using Interest Tables.** Indicate which rate and time period you would use in order to select the correct interest factor for the following situations. In addition, indicate the interest factor that would be used.

a. Using PV of an Ordinary Annuity of \$1 Table 7A.5:

Annual Rate	Time Period	Compounded Interest
4%	10	Annually
8%	8	Semiannually
12%	5	Quarterly

b. Using FV of an Annuity Due of \$1 Table 7A.4:

Annual Rate	Time Period	Compounded Interest
3%	7	Annually
10%	9	Semiannually
16%	4	Quarterly

- 1 **E7-2 Simple and Compound Interest.** A recent college graduate decides to invest the \$8,000 he received for his college graduation in a fund earning 12% annual interest for four years. At the end of the four-year period, he expects to withdraw the money to purchase a reasonably priced used car. Answer the following questions:
- What amount would the graduate withdraw after four years, if the investment earns *simple interest*?
 - What amount would the graduate withdraw after four years if interest is compounded *annually*?
 - What amount would the graduate withdraw after four years if interest is compounded *semiannually*?
 - What amount would the graduate withdraw after four years if interest is compounded *quarterly*?
- 2 **E7-3. Future Value and Present Value of a Single Sum.** Using the present value and future value tables, a financial calculator, or a spreadsheet, answer the following questions.
- \$200,000 is to be received five years from today. What is the PV of this cash flow if 6% interest is compounded *annually*?
 - \$200,000 is to be received five years from today. What is the PV of this cash flow if 6% interest is compounded *semiannually*?
 - \$100,000 is left on deposit for three years. What is the FV of this investment if 6% interest is compounded *semiannually*?
 - \$100,000 is left on deposit for three years. What is the FV of this investment if 6% interest is compounded *quarterly*?

- 3 4** **E7-4. Future Value and Present Value of Annuities.** Using the present value and future value tables, a financial calculator, or a spreadsheet, answer the following questions.
- \$8,000 is to be deposited at the *end* of each year for the next five years. What is the FV of this investment if 8% interest is compounded *annually*?
 - \$8,000 is to be deposited at the *beginning* of each semiannual period for the next five years. What is the FV of this investment if 8% interest is compounded *semiannually*?
 - \$5,000 is to be received at the *end* of each year for the next six years. What is the PV of this investment if 10% interest is compounded *annually*?
 - \$5,000 is to be received at the *beginning* of each semiannual period for the next six years. What is the PV of this investment if 10% interest is compounded *semiannually*?
- 3 5** **E7-5. Future Value of an Ordinary Annuity, Future Value of Annuity Due, Deferred Annuity.** Using the appropriate future value table, compute the future value of the following amounts received:
- \$10,000 received at the *end* of each year for five years compounded annually at 10%.
 - \$3,000 received at the *beginning* of each year for eight years compounded annually at 7%.
 - \$15,000 received at the *end* of the fifth, sixth, seventh, and eighth years at 12% compounded annually.
- 4 5** **E7-6. Present Value of Ordinary Annuity, Present Value of Annuity Due, Deferred Annuity.** Using the appropriate PV table, compute the present value of the following amounts:
- \$25,000 payable at the *end* of each year for 10 years with 6% interest compounded *annually*.
 - \$15,000 receivable at the *beginning* of each semiannual period for five years with 6% interest compounded *semiannually*.
 - \$5,000 payable at the *beginning* of the seventh, eighth, and ninth years at 7% compounded annually.
- 4 5** **E7-7. Present Value of Ordinary Annuity, Deferred Annuity.** Calculate the present value of each of the following cash flows at 8% using interest tables, a financial calculator, or a spreadsheet:
- \$15,000 is to be received at the end of each of the next six *semiannual* interest periods plus \$20,000 to be received at the end of each of the next four *semiannual* interest periods after that. Interest is compounded *semiannually*.
 - There are no cash flows to be received at the end of the first eight *semiannual* periods. However, \$24,000 is to be received at the end of the next six *semiannual* periods after that (this is known as a *deferred annuity with semiannual compounding*).
- 3 5** **E7-8. Future Value of an Ordinary Annuity, Future Value of an Annuity Due, Deferred Annuity.** Calculate the future value of each of the following cash flows using a 5% interest rate:
- Proven Co. agreed to finance a project by making eight annual deposits of \$20,000 at the *end* of each year. The deposits will commence three years from today. Interest is compounded annually. Will the company have enough funds to finance the project, which is estimated to cost \$200,000?
 - Proven Co. agreed to finance a project by making eight annual deposits of \$20,000 at the *beginning* of each year. The deposits will commence three years from today. Interest is compounded annually. Will the company have enough funds to finance the project, which is estimated to cost \$200,000?
- 2** **E7-9. Single Sum, Solving for Other Variables.** Two independent situations follow. Solve for the appropriate variable.
- Nardo Co. wants to purchase a piece of heavy equipment in seven years for \$751,815. The corporation currently has \$500,000 to invest for this purpose. Determine the rate of return (assuming annual compounding) required to accumulate sufficient funds to acquire the equipment at the end of the seven-year period.
 - Apollo Inc. decides to pay a one-time bonus of \$59,702.50 to its vice president, who is expected to retire within the next few years. Apollo can invest \$50,000 at 3% compounded annually. How many years will it take to have the \$59,702.50 to pay the bonus?
- 2 3 4** **E7-10. Ordinary Annuity, Solve for Interest Rate, Financial Calculator.** Two independent situations follow. Interest is compounded annually. Solve for the appropriate interest rate using a financial calculator or a spreadsheet.
- A college student wishes to purchase a new car. In order to pay for the vehicle, he borrows \$15,000 from his parents today (beginning of the current year). Starting at the end of the current year, he must make 15 equal annual payments of \$1,200 each. What interest rate is the student paying his parents?
 - A finance professor wishes to invest \$50,000 at the end of this year. He wants his investment to grow to \$200,000 in 20 years. At what interest rate must the professor invest to reach his goal?
- 2 4** **E7-11. Present Value, Note Payable Prices.** Wiz Khalifa would like to invest in an \$80,000 face value note payable. The note has a 12-year term and pays 10% annual interest, at the end of each year. Interest is compounded annually.
- What would he pay for the note if he wanted the note to yield 10%?
 - What would he pay for the note if he wanted the note to yield 12%?
 - What would he pay for the note if he wanted the note to yield 20%?

- 5** E7-12. **Future Value of a Deferred Annuity.** Lenny Shafer Bakery and Co. budgeted \$350,000 to build a factory 10 years from today. Shafer will finance the project by making six equal annual deposits of \$50,000 at the *end* of each year commencing four years from today. The company can invest in a financial instrument earning 5%. Interest is compounded annually. Will Shafer have sufficient funds to pay for the \$350,000 factory at the end of the 10-year period?
- 5** E7-13. **Present Value of a Deferred Annuity.** Onix Corporation is required to pay the pension cost of one of its unionized employees. According to the terms of the union contract, the employee will retire in eight years and receive \$20,000 at the end of the three consecutive years following retirement. Interest is compounded annually. Compute the pension obligation that Onix has incurred today if the discount rate is 4%.
- 2 4** E7-14. **Present Value of an Ordinary Annuity, Present Value of Annuity Due, Best Alternative.** Bella D'oro wants to open a new factory in New Jersey. The company can either purchase or lease the factory. There are three options available for Bella D'oro:
1. Purchase a factory with a useful life of 20 years today for \$500,000 in cash. This factory has no additional space for rent.
 2. Lease a factory with annual lease payments of \$50,000 for 20 years. Payments are made at the *beginning* of each year.
 3. Purchase a factory with a useful life of 20 years today for \$550,000. In addition, the company can rent some additional space for annual rent of \$5,000. Assume Bella D'oro would receive the rental payments at the end of each year.
- Interest is compounded annually. Which option should Bella D'oro choose given a 10% interest rate?
- 4** E7-15. **Present Value, Present Value of an Annuity Due, Pension Obligation.** Dave the Lying King Inc., a mattress manufacturer, decides to participate in a pension plan commencing on January 1, 2018. The plan requires a pension payment each year following retirement. An actuary provides the following information: On average, employees will retire in 12 years, their expected life following retirement is 8 years, and the required payment made at the end of each year after retirement is \$800,000. The interest rate is 6% compounded annually. What is the PV of the pension liability the company should report on its balance sheet?
- 2 4 5** E7-16. **Future Value, Present Value, Deferred Annuity, Debt Retirement.** Ne-Yo borrowed \$500,000 to build a recording studio in his home. The total amount of the debt along with 8% annual interest must be repaid in 15 years. He decides to invest in a debt sinking fund that will be used to retire the debt. The fund earns 10% interest and requires him to pay an equal amount each year (end of each year) starting in Year 5 and lasting through maturity. Interest is compounded annually. What amount must Ne-Yo contribute each year in order to successfully retire the debt in 15 years?
- 2 3** E7-17. **Future Value of an Annuity Due, Decision Making.** JayZ reports outstanding debt on his balance sheet of \$250,603. He has two options to settle the debt: He can either pay \$650,000 at maturity in 10 years, or he can make annual payments of \$38,500 for 10 years. Payments are due at the *beginning* of each year. Interest is compounded annually. If JayZ is given an interest rate of 10%, which option should he select?
- 2 3** E7-18. **Future Value of an Ordinary Annuity, Decision Making.** Assume the same facts as E7-17, except that JayZ is required to make the annual payments at the *end* of the year. Would his decision be the same?
- 6** E7-19. **Expected Cash Flows.** Jannie Company estimates two scenarios of possible future accounts receivable uncollectibles and the probability of each not being collected in the next year. The risk-free rate is 4%. For each of the scenarios, compute the expected cash flow value based on the probabilities given. Compare the expected cash flows on each case.

Scenario 1		Scenario 2	
Estimated Loss	Probability	Estimated Loss	Probability
\$52,000	20%	\$52,000	30%
55,000	25%	55,000	25%
60,000	25%	60,000	25%
65,000	30%	65,000	20%

- 6** E7-20. **Expected Cash Flows.** Build-It-Big Company estimates two scenarios of possible future notes receivable uncollectibles and the probability of each not being collected in the next year. The risk-free rate is 5%. For each of the scenarios, compute the expected cash flow value based on the probabilities given. Compare the expected cash flows on each case.

Scenario 1		Scenario 2	
Estimated Loss	Probability	Estimated Loss	Probability
\$ 45,000	20%	\$ 45,000	5%
130,000	75%	130,000	75%
1,250,000	5%	1,250,000	20%

- 6** **E7-21. Bond Issue Proceeds.** Determine the bond issue proceeds for each of the following bonds payable. All bonds are issued on January 1, 2019.
- Solmark Corporation issued bonds in the amount of \$150,000 that will be paid in five years. Interest of \$15,000 is payable annually each December 31 with the first interest payment at the end of the year on December 31, 2019. If the market rate of interest is 8%, what is the amount of the bond issue proceeds?
 - Meltech Corporation issued bonds in the amount of \$800,000 that will be paid in 10 years. Interest of \$24,000 is payable semiannually each June 30 and December 31 with the first interest payment at the end of the period on June 30, 2019. If the market rate of interest is 8%, what is the amount of the bond issue proceeds?
- 6** **E7-22. Bond Issue Proceeds.** Determine the bond issue proceeds for each of the following bonds payable. All bonds are issued on January 1, 2019.
- Belmark Corporation issued bonds in the amount of \$1,250,000 that will be paid in 10 years. Interest of \$18,750 is payable semiannually each June 30 and December 31 with the first interest payment at the end of the first period on June 30, 2019. If the market rate of interest is 4%, what is the amount of the bond issue proceeds?
 - Tomtech Corporation issued bonds in the amount of \$4,000,000 that will be paid in eight years. Interest of \$160,000 is payable semiannually each June 30 and December 31 with the first interest payment at the end of the first period on June 30, 2019. If the market rate of interest is 6%, what is the amount of the bond issue proceeds?

Problems

- 3 4** **P7-1. Present Value of an Ordinary Annuity, Future Value of an Ordinary Annuity.** FA Manufacturers must make several investment decisions related to its business operations. Interest is compounded annually. Analyze the following independent situations to help FA make a profitable investment.
- FA Manufacturers reported a \$150,000 debt that matures in eight years. In order to accumulate sufficient funds to pay for the debt, the company decided to make eight equal annual payments into a fund paying 5% interest. What amount must FA Manufacturers deposit into the fund at the *end* of each year so that the company will be able to liquidate its debt?
 - On January 1, 2019, FA Manufacturers decided to purchase a piece of heavy machinery. FA agreed to pay \$50,000 on the date of purchase and would like to pay the remaining balance with six annual installments of \$20,000 commencing at the end of 2019. Given an interest rate of 8%, what value should FA give to the machinery?
 - FA purchased a new machine and wants to pay for it using five equal annual installments of \$40,000. The payments start in one year. Given an interest rate of 10%, at what amount should FA value the machine?
- 2 4** **P7-2. Present Value, Present Value of an Ordinary Annuity, Analysis of Alternatives.** Boyne Painting Contractors needs to purchase a new truck. The owner is considering two different truck models that are currently on the market. Boyne's two alternatives are presented here:
- Truck A: Boyne can purchase Truck A for \$45,000. The truck has a useful life of 12 years and will require annual maintenance costs of \$1,500 each year. Boyne expects to sell the truck for \$7,000 after 12 years.
- Truck B: Boyne can purchase Truck B for \$40,000. This truck also has a useful life of 12 years but will have no scrap value. It will require maintenance costs every four years as follows:
- | | |
|----------|---------|
| Year 4: | \$3,000 |
| Year 8: | \$6,000 |
| Year 12: | \$8,000 |
- Which truck should Boyne purchase given an interest rate of 6% compounded annually? Assume that maintenance costs will be paid at year-end.
- 2 4** **P7-3. Present Value, Present Value of an Annuity Due, Analysis of Alternatives.** Charlie Sheen hits the \$500,000 jackpot at the Palms Casino in Las Vegas. The casino gives him two options for collecting his winnings:
- Option A: Sheen can take all of his winnings today. They will be taxed by the federal government at 40%.
- Option B: Sheen can receive his winnings on an installment plan. He would receive 15 annual payments of \$40,000 beginning today. Each payment will be taxed at a rate of 20%.
- Given an interest rate of 7% compounded annually, which option should Sheen choose?

- 2 3 4** P7-4. **Future Value, Present Value of an Ordinary Annuity, Solving for Other Variables.** Answer the following independent questions:
- You borrowed \$15,000 from a friend and promised to repay the loan in seven equal annual installments. Installments begin at the end of the first year. What are the annual payments required to pay back your friend, who would like to earn 4% annual interest compounded annually?
 - Stillwell Corporation has an outstanding debt of \$89,800. Assume no interest will accrue on the debt. It has \$50,000 to invest in a fund earning 5% interest compounded annually. How many years will it take Stillwell to earn enough money to pay back the debt?
 - Zenith & Co. purchases jewelry from a supplier for \$60,020.50. Zenith uses a note to pay for the jewelry that requires the company to make seven annual payments of \$10,000. Payments begin at the end of the first year. What interest rate is used in this agreement?
 - Your parents wish to accumulate \$200,000 to purchase a summerhouse on the Jersey Shore in 10 years. They would like to make deposits into a fund earning 8% interest compounded semiannually. Deposits begin at the end of the first semi-annual period. Determine the semiannual deposits required to purchase the home.
- 4 5** P7-5. **Present Value of an Ordinary Annuity, Deferred Annuity.** A 50-year-old employee of IQ Entertainment was asked to select one of three potential early retirement packages.
 Package A: \$60,000 received today.
 Package B: \$10,000 to be received each year for the next eight years.
 Package C: \$40,000 received today and \$5,000 per year for five years beginning at age 55.
 Which retirement package should the employee select if he can invest funds at 5% compounded annually, assuming all retirement payments are received at the *beginning* of the year?
- 4 5** P7-6. **Present Value of an Annuity Due, Deferred Annuities.** Assuming the same facts as P7-5, how would the employee's decision change if all retirement payments are received at the *end* of the year?
- 4 5** P7-7. **Present Value of an Ordinary Annuity, Deferred Annuities.** Norton Dog Care Co. wants to finance a new animal shelter by making eight annual deposits into a fund earning 7% compounded annually. The first four deposits are \$20,000 each and will be paid at the *end* of the next four years. The last four deposits are \$30,000 each and will be paid at the *end* of the last four years. What is the cost of the new animal shelter?
- 4 5** P7-8. **Present Value of an Annuity Due, Deferred Annuities.** Norton Dog Care Co. wants to finance a new animal shelter by making eight annual deposits into a fund earning 7% compounded annually. The first four deposits are to be \$20,000 each and will be paid at the *beginning* of the next four years. The last four deposits are to be \$30,000 each and will be paid at the *beginning* of the last four years. What is the cost of the new animal shelter?
- 2 4** P7-9. **Present Value of an Ordinary Annuity, Present Value of an Annuity Due, Lease Payments.** Carfly Barbers decides to lease a second barbershop. The barbershop has a cash price of \$200,000. If Carfly borrowed money to purchase the shop, it would incur a 9% interest rate compounded annually. Answer the following questions:
- What are the lease payments if the agreement requires eight annual payments beginning *today*?
 - What are the lease payments if the agreement requires eight annual payments beginning *one year* from the agreement date?
 - What are the lease payments if the agreement requires eight annual payments beginning *today* and Carfly will be able to buy the barbershop at the end of the eight-year lease paying a \$30,000 residual value? (*Hint:* Subtract the PV of the \$30,000 residual value from the cash price of the barbershop to determine the payments using present value tables.)
- 3 4 5** P7-10. **Future Value of an Ordinary Annuity, Deferred Annuity.** Carfly Barbers wants to have \$200,000 in 10 years to build a second barbershop 10 years from today. Commencing two years from today, Carfly will make eight annual deposits of \$18,000 at the end of each year. Alternatively, the company can invest in a financial instrument earning 9% compounded annually.
 Answer the following questions:
- Will Carfly have sufficient funds to pay for the \$200,000 barbershop at the end of the 10-year period if the deposits are made at the *end* of the year?
 - Will Carfly have sufficient funds to pay for the \$200,000 barbershop at the end of the 10-year period if the deposits are made at the *beginning* of each year?
- 2 4** P7-11. **Present Value, Present Value of an Ordinary Annuity, Present Value of an Annuity Due, Lease Payments/Various Compounding Periods.** Carfly Barbers decides to lease another barbershop for a 10-year period. The barbershop has a cash price of \$200,000. If Carfly borrowed money to purchase the shop, it would have had to pay 12% interest. Answer the following questions:
- What are the required payments if the lease agreement requires *annual* payments beginning *one year from today*?
 - What are the required payments if the lease agreement requires *semiannual* payments beginning *six months from the agreement date*?
 - What are the required payments if the lease agreement requires *quarterly* payments beginning *today*?

- 2 4** **P7-12. Present Value of an Ordinary Annuity, Purchase or Lease Analysis.** Fata Food Emporium decides to obtain a new refrigerator to store its meat and produce. The refrigerator has a 15-year useful life and can be sold for \$15,000 at the end of its useful life. Fata has two options:
- Purchase the Refrigerator:** Purchase the refrigerator in cash for \$100,000. Fata would have to pay all maintenance/insurance costs, which would be \$3,000 per year.
 - Lease the Refrigerator:** Lease the refrigerator for a 15-year period. Annual lease payments amount to \$15,000 with the first payment beginning at the *end* of the year. The seller will pay maintenance and insurance costs, and Fata will return the refrigerator to the seller after 15 years.
- Assuming that maintenance and insurance costs are paid at year-end and an interest rate of 10% compounded annually, which option should Fata choose?

- 2 4 6** **P7-13. Present Value, Present Value of an Ordinary Annuity, Investment Analysis.** Jewels Hair Design Studios would like to purchase another hair salon that is being sold in a neighboring town for \$500,000. Assume cash flows occur at the end of the year. Based on past volume of sales, Jewels estimates the net cash flows that would be generated by the salon:

Years	Cash Flows
1-3	\$60,000
4	70,000
5	80,000
6	60,000

After six years, Jewels can sell the salon for \$300,000. If the interest rate on this investment is 8% compounded annually, should Jewels purchase the salon?

- 6** **P7-14. Expected Cash Flows.** Hiteck Electronics sells a diagnostic machine to a hospital with a four-year payment plan. The company would like to estimate the bad debt allowance needed to cover the notes outstanding over the next four years. Estimated lost cash flows and the probability of occurrence for each of the next four years are summarized in the following schedule. The risk-free rate is 8%.

Year	Projected Cash Flow Loss from Uncollected Notes	Probability of Loss Occurring
2019	\$ 8,000	90%
	18,000	10%
2020	\$10,000	15%
	22,000	70%
	45,000	15%
2021	\$ 6,000	85%
	14,000	15%
2022	\$26,000	50%
	35,000	50%

What is the estimated bad debt allowance at December 31, 2018?

- 6** **P7-15. Bond Issue Proceeds.** Make-It-Big Corporation is planning to build a new factory costing \$2,000,000. On January 1, 2019, Make-It-Big plans to issue bonds in the amount of \$1,800,000 that will be paid in five years. Interest of \$45,000 will be paid semiannually each January 1 and July 1 with the first interest payment at the end of the period on July 1, 2019.

Required »

- If the market rate of interest is 6%, will Make-It-Big raise enough to build the factory?
- If the market rate of interest is 2%, will Make-It-Big raise enough to build the factory?

Revenue Recognition

LEARNING OBJECTIVES

- 1 Understand basic revenue recognition and measurement issues.
- 2 Explain how to identify a contract with a customer.
- 3 Identify the separate performance obligations in a contract, including determining whether there are distinct goods or services.
- 4 Explain how to determine the transaction price in recognizing revenue.
- 5 Demonstrate allocating the transaction price to performance obligations when recognizing revenue.
- 6 Assess whether to recognize revenue when, or as, each performance obligation is satisfied.
- 7 Describe the accounting for long-term contracts, including implementing the percentage-of-completion method and the completed-contract method.
- 8 Describe and demonstrate the accounting for special issues in revenue recognition, including right-to-return sales, consignment sales, principal-agent sales, bill-and-hold arrangements, and channel stuffing.
- 9 Detail required disclosures related to revenue recognition.

Introduction

REVENUE IS THE FIRST LINE item on any company's income statement. Depending on the nature of a company's business, revenue may be called sales revenue, rental revenue, royalty revenue, investment revenue, or service revenue. Some revenues are accounted for easily, such as *Target* recording sales revenue for a customer purchase. Other sales transactions are more complex due to timing issues related to when the company should recognize the revenue.

When to record revenue is an important issue in many companies. Consider the purchase of a Kindle from *Amazon*. A Kindle buyer typically receives the device, wireless access, and software upgrades. That is, the buyer pays one sales price and receives multiple items. What does *Amazon* record as a sale—the sale of the Kindle, the wireless service, the software upgrades, or the sum of all three? In practice, *Amazon* allocates the sales price to these three items, recording the revenue for each item in different time periods based on when it transfers the good or service. That is, the seller recognizes the revenue related to the device, which is a substantial portion of the sales price on the date of the delivery. *Amazon* then recognizes revenues related to wireless access and software upgrades as it provides the services over the average life of the device.

In this chapter, we discuss revenue recognition and the primary accounting issues of determining the timing and amount of revenue recognition. Usually, a company recognizes revenue when it delivers a good or provides a service. Sometimes a company recognizes revenue before the delivery of a good, such as with long-term construction contracts. We also discuss these scenarios and other more complex revenue recognition cases. The revenue recognition standard is fully converged between U.S. GAAP and IFRS. <<

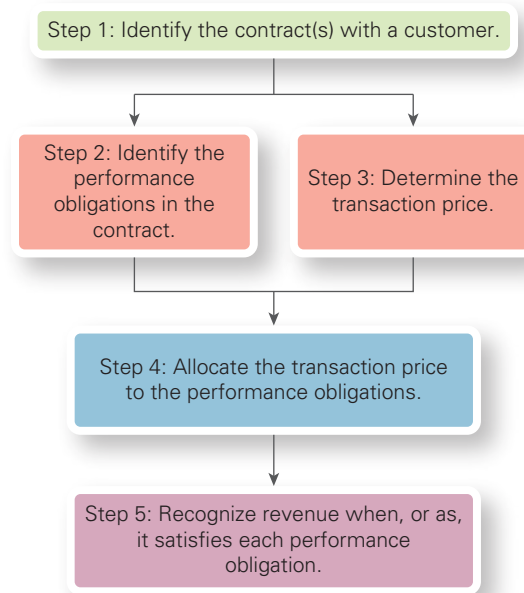

- 1 Understand basic revenue recognition and measurement issues.

Revenue Recognition Overview

Revenue recognition involves issues dealing with both timing (i.e., when revenue is recognized) and measurement (i.e., how much revenue is recognized). With regard to timing, the fundamental principle of revenue recognition is that a company should recognize revenue when it transfers *control* of an asset (either a good or service) to the customer. With regard to measurement, the fundamental principle is that a company should recognize the amount of revenue that it expects to be entitled to receive in exchange for the goods or services. Finally, the company recognizes revenue as it satisfies each performance obligation.

In order to accomplish these objectives of revenue recognition, companies must follow five steps. These five steps are outlined in Exhibit 8.1.

EXHIBIT 8.1 Overview of Five Steps in Revenue Recognition

The seller must meet the Step 1 requirement, to identify the contract, in order to continue with the revenue recognition process. Once the contract is identified, the seller must identify both the separate performance obligations (Step 2) and the transaction price (Step 3) in order to continue with Step 4. Step 4 takes the transaction price that is determined in Step 3 and allocates it to the separate performance obligations that are identified in Step 2. Once the seller has identified the separate performance obligations and has a price attached to each, it determines the appropriate timing for the recognition of revenue for each performance obligation separately. Example 8.1 provides a simplified illustration of the five-step approach to provide a conceptual understanding of the steps.

EXAMPLE 8.1 Simplified Example of the Five Steps

PROBLEM: Access Unlimited (AU) sells smartphones and phone service. AU sells phones for \$350 each and 12-month service plans for \$40 a month. The phones cost AU \$150 each. AU also bundles the phones with a 12-month service plan for \$750. On January 1, a customer signs a contract with AU to purchase the bundle with the service plan starting immediately. The customer pays in full, and receives the phone on January 1. AU uses the perpetual inventory method. AU prepares financial statements on a quarterly basis. When does AU recognize revenue, and what is the amount of revenue to be recognized?

SOLUTION: In Step 1, AU identifies the contract with the customer. It separates the transaction into two separate performance obligations—the smartphone and the service plan in Step 2. Regarding Step 3, the transaction price is \$750.

To complete Step 4, AU will allocate the \$750 between the phone and the service plan on a relative sales value basis. (We cover this approach in more detail in our discussion of Step 4). The combination of the separate selling prices for the phone (\$350) and service plan (\$480) is \$830. The phone constitutes 42.2% of the total price ($\$350/\830), and the service plan is 57.8% of the total price ($\$480/\830). Thus, AU allocates 42.2% of the transaction price of \$750, or \$316.50, to the phone and 57.8% of the transaction price of \$750, or \$433.50, to the service plan.

To complete Step 5, AU will recognize the \$316.50 revenue for the phone when the phone is delivered to the customer. It will recognize the \$433.50 revenue for the plan over the 12-month service period.

Thus, on January 1, AU will record the cash receipt. Because it delivered the phone on that day, it will record \$316.50 of revenue and will record cost of goods sold and reduce its phone inventory.

<i>Account</i>	<i>January 1</i>
Cash	750.00
Unearned Revenue	433.50
Sales Revenue	316.50
Cost of Goods Sold	150.00
Inventory	150.00

AU will recognize \$108.38 ($\$433.50/4$ quarters) service revenue over each of the following four quarters.

<i>Account</i>	<i>March 31, June 30, September 30, and December 31</i>
Unearned Revenue	108.38
Service Revenue	108.38

THE CONCEPTUAL FRAMEWORK CONNECTION

Revenue Recognition

The revenue recognition standards discussed in this chapter are new and are effective for public companies with fiscal years beginning after December 15, 2017. They are not completely aligned with the conceptual framework. That is, the revenue recognition standards indicate that the overarching principle of revenue recognition is the notion of the transfer of control of the goods or services. In contrast, the current conceptual framework does not mention transfer of control but rather states that a company recognizes revenue when it meets two conditions:

1. The revenue has been earned, and
2. The revenue is realized or realizable.

Although transfer of control often occurs simultaneously with the culmination of the earning process, there are scenarios in which they do not happen at the same time. How then can the standards and the conceptual framework that both come from the FASB conflict? As we discussed in Chapter 2, the FASB is currently in the process of rewriting the conceptual framework. We expect that the FASB will align the conceptual framework with the new standard when it rewrites the framework.

Next, we cover each of the five steps in the revenue recognition process in depth. Note that we do not actually record a journal entry until the fifth step. The point of the five-step approach is to determine when to recognize revenue and how much revenue to recognize. Thus, we will not know the proper journal entry to record the sale until we complete the entire process.

- ② Explain how to identify a contract with a customer.

Step 1: Identify the Contract(s) with a Customer

The first step in the revenue recognition process is to identify the *contract*, or *contracts* with the customer. A **contract** is an agreement between two or more parties that creates enforceable rights and obligations.¹

Contract Criteria

If the seller meets the following five criteria related to the contract, then it continues through the remaining four steps to determine the timing and measurement of revenue recognition.

1. All parties to the contract have agreed to the contract and are committed to performing under the contract. The approval by the parties can be in writing, provided orally, or implied by an entity's customary business practices.
2. Each party's rights with respect to the goods or services that are being transferred are identifiable.
3. The payment terms for the goods or services that are being transferred are identifiable.
4. The contract has **commercial substance**, meaning that the risk, timing, or amount of the entity's future cash flows is expected to change as a result of the contract.
5. It is probable that the seller will collect the consideration to which it is entitled in exchange for the goods or services. To assess the probability of collection, the seller considers the customer's ability and intention to pay this specific amount of consideration when it is due.

For purposes of the fifth criterion, U.S. GAAP defines probable as "likely to occur." The seller assesses collectability on the expected consideration (the estimated transaction price), not the contract price. For example, if the seller intends to offer a **price concession**, which is a reduction in the contract price, then the estimated transaction price will be less than the contract price.

Also related to the fifth criterion, the company should consider only the amount that is at risk of not being collected, which may be less than the entire consideration. For example, if the customer is required to pay a portion of the consideration before delivery, then the seller would consider only the probability of collecting the amounts due after delivery. Or, if the seller is contractually allowed to stop transferring goods or services should the customer fail to pay, then only the consideration related to the goods or services that would be delivered is considered. Exhibit 8.2 summarizes the five criteria to identify a contract with customers.

EXHIBIT 8.2 Five Criteria to Identify Contracts with Customers

1. All parties agree to the contract and commit to performing.
2. Each party's rights are identifiable.
3. Payment terms are identifiable.
4. The contract has commercial substance.
5. Collection of consideration is probable.

Example 8.2 illustrates the collectability assessment.

¹FASB ASC 606-10-20 – Revenue from Contracts with Customers – Overall – Glossary.

EXAMPLE 8.2 Collectability Assessment

PROBLEM: JC Enterprises manufactures designer cases for tablets and is attempting to enter a new market with its product. To implement this strategy, JC sells 5,000 units to a retailer for a contract price of \$75 each. JC is aware that this retailer is struggling financially but is willing to enter into the contract because of its desire to penetrate a new market. Due to the financial instability of its customer, JC believes that it will need to provide a 20% price concession. Does this agreement meet the fifth criterion to determine the existence of a contract?

SOLUTION: Yes, this agreement meets the definition of a contract. Even though it is not probable that JC will receive the full contract price of \$375,000 (5,000 units at \$75 each), it is probable that JC will collect a portion of the contract price for a transaction price of \$300,000 (80% × \$375,000).

Failure to Meet Contract Criteria

If a seller does not satisfy all of the five Step 1 criteria, then it should recognize revenue when it has received the consideration and when one or more of the following have occurred:

1. The seller has no remaining obligations to transfer goods or services and substantially all (or all) of the consideration has been received by the seller and is nonrefundable, or
2. The contract has been terminated and any consideration already received from the customer is nonrefundable, or
3. The seller has transferred control of the goods or services, is no longer transferring the goods or services, has no obligation to transfer additional goods or services, and the consideration received is nonrefundable.

If the seller receives cash before the appropriate time to recognize revenue, it should report the consideration as a liability. In addition, the seller should not remove the inventory from its balance sheet. Example 8.3 provides an illustration of the accounting treatment for a transaction in which the five criteria are not met.

EXAMPLE 8.3 Five Criteria Not Met

PROBLEM: SBA Inc., a retail developer, sells a building to Margots Corporation on September 30, 2018. The contract price is \$5 million. Margots pays SBA 10% of the contract price on September 30. The remaining 90% will be paid over the following five years with \$225,000 due each quarter. The first payment is due on December 31, 2018. The payments are nonrefundable. If Margots defaults, then SBA keeps the payments that it has received up to that point but is not entitled to further compensation. In addition, the building will revert back to SBA.

Margots intends to open a hotel in the building. However, the building is not located in an attractive area. SBA is aware that Margots will have only adequate resources to make the required payments if the hotel is profitable. Accordingly, on September 30, SBA concludes that it is not probable that it will collect the transaction price.

Margots remits the \$500,000 deposit and the first two required quarterly payments of \$225,000 each to SBA on December 31, 2018, and March 31, 2019, respectively. On June 30, 2019, Margots does not make the required payment and terminates the contract. What are the required journal entries for SBA Inc. from September 30, 2018, through June 30, 2019?

SOLUTION: Because SBA does not consider it probable that it will collect the transaction price from the buyer, this arrangement does not meet the definition of a contract and thus must be accounted for under the alternative method. SBA will not recognize revenue until June 30, 2019,

(continued)

when the contract has been terminated and all consideration it has received to date is nonrefundable. In addition, on September 30, 2018, SBA will not derecognize the building. The journal entries follow.

Account	September 30, 2018	
Cash	500,000	
Unearned Revenue		500,000

Account	December 31, 2018	
Cash	225,000	
Unearned Revenue		225,000

Account	March 31, 2019	
Cash	225,000	
Unearned Revenue		225,000

Account	June 30, 2019	
Unearned Revenue	950,000	
Revenue		950,000

Multiple Contracts

It is not uncommon for vendors to enter into multiple contracts with the same customer. Under certain circumstances, the seller should combine these contracts and account for them as a single contract. Specifically, if one of the following criteria is met, the seller should combine multiple individual contracts into a single contract for purposes of determining the timing and measurement of revenue:

1. The contracts are negotiated as a package and have a single commercial objective.
2. The amount of consideration to be received by the seller related to one contract depends on the price or performance of another contract.
3. The goods or services promised in the separate contracts are all part of one *performance obligation*.²

Identify the Contract(s) with Customers: IFRS

When identifying a contract with a customer, IFRS differs from U.S. GAAP in two ways. First, IFRS defines probable as “more likely than not” whereas U.S. GAAP defines probable as “likely to occur” in the fifth criterion that assesses collectability. “More likely than not” implies a probability of more than 50%. “Likely to occur” implies a probability threshold significantly higher than 50%. Although U.S. GAAP does not precisely define “likely to occur,” it is often interpreted to be somewhere around 70 or 75%. Thus, U.S. GAAP sets a higher threshold for the assessment of collectability than IFRS. For example, Turro Company makes a sale to Milano Corporation, and Turro determines the probability of collection is 55%. Under IFRS, the 55% probability suggests that it is “more likely than not” that Turro will collect from Milano. Under U.S. GAAP, a probability of 55% does not meet the “likely to occur” threshold. Therefore, the collectability criterion will be met under IFRS but not U.S. GAAP.

If the revenue recognition standard is converged, why is there a different interpretation of probable? The difference is because the FASB and IASB decided to set the threshold at a level consistent with their previous revenue recognition standards and based on the interpretations of “probable” under each set of standards.

²We discuss performance obligations in our presentation of Step 2.

The second difference is in determining when to recognize revenue when the five criteria for a contract are not met. IFRS does not explicitly include the third condition that the seller has transferred control of the goods or services, is no longer transferring the goods or services, has no obligation to transfer additional goods or services, and the consideration received is nonrefundable. The FASB added this condition to clarify when to recognize revenue. The IASB did not believe this clarification was needed because the first two conditions should cover these cases. The IASB noted that contracts often specify that a company has the right to terminate a contract if a customer is not paying. However, for any goods or services already transferred, the company has a right to collect payment.

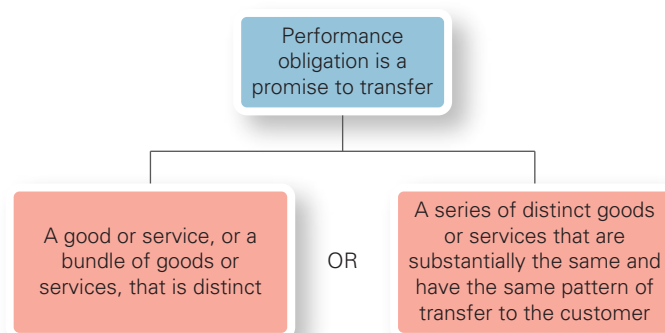

- ③ Identify the separate performance obligations in a contract, including determining whether there are distinct goods or services.

Step 2: Identify the Performance Obligations in the Contract

A seller needs to identify the various *performance obligations* in a contract to allocate the transaction price to these different performance obligations and to recognize revenue when or as it satisfies each individual one. Conceptually, a **performance obligation** is a promise to transfer a good or service that is distinct. As shown in Exhibit 8.3, a performance obligation is either:

- A promise to transfer a good or service, or a bundle of goods or services, that is distinct, or
- A promise to transfer a series of distinct goods or services that are substantially the same and have the same pattern of transfer to the customer.³

EXHIBIT 8.3 Performance Obligation

The determination of separate performance obligations starts with identifying the promised goods and services. After identifying the goods or services in the contract, the seller must determine which goods and services are distinct. The notion of “distinct” goods and services is critical to determining separate performance obligations. To be distinct, a good or service must meet two conditions:

1. The customer can benefit from the good or service on its own or in conjunction with other *readily available resources* to the customer, and
2. The promise of the seller to deliver that good or service is separately identifiable from other promises in the contract.

It is often clear that a customer can benefit from the product or service on its own (or in conjunction with other assets). At other times, this determination requires more judgment. If the good or service can be used, consumed, or sold for a nontrivial amount, then it passes the test of being distinct. A good or service is also distinct if the customer can benefit from it in conjunction

³A series of goods or services that have the same pattern of transfer if the performance obligation is satisfied over time per FASB ASC 606-10-25-27 and the same method would be used to measure the entity’s progress toward satisfaction of the performance obligation according to paragraphs 31 and 32 of FASB ASC 606-10-25. See paragraphs 14 and 15 of FASB ASC 606-10-25 for a discussion of the identification of performance obligations.

with other *readily available resources*. Another resource is considered to be a **readily available resource** if it is sold separately by the seller or another entity, or if the customer already has obtained it from the seller or in some other transaction. For example, consider a set of earbuds packaged with a mobile phone. Because the earbuds can be sold separately and can be used with other electronic devices, the earbuds are a readily available resource.

A promise to deliver a good or service is separately identifiable if it is not highly dependent or interrelated to another promise in the contract to deliver another good or service. Judgment may be involved in the determination of whether the promise to deliver the good or service is separate from other promises. For example, consider a lawn care company that mows the lawn and then blows clippings off the sidewalk and driveway. Blowing the clipping is highly dependent on having the lawn mowed. Without mowing the lawn, there would be no clippings to blow away. So, blowing the clippings is not separately identifiable from the promise to mow the lawn.

At times a seller may provide a “free” good or service with the contract, such as in the telecommunications industry where entities offer free mobile phones with a service agreement. These goods and services should be considered as possible performance obligations even though they are identified in the contract as being free of charge.

Also, the promised good or service does not have to be explicitly identified in the contract. If the customer has a valid expectation that the seller will provide the good or service, then this item should also be assessed as a possible performance obligation.

An entity should aggregate the goods or services promised in a contract until it identifies a bundle of goods or services that is distinct and thus defined as a separate performance obligation. There may be only one performance obligation identifiable in a contract. Example 8.4 illustrates how to identify separate performance obligations.

EXAMPLE 8.4 **Separate Performance Obligations**

PROBLEM: CRED Corp. contracts with a customer to license and install payroll application software. In addition to the software license, CRED Corp. will provide installation services as part of this contract. The installation service could be performed by other entities because CRED does not customize the software. Identify the separate performance obligations in this contract.

SOLUTION: CRED promises both the software license and installation service. To determine whether these are separate performance obligations, CRED needs to assess whether they meet the two conditions for being distinct. First, CRED assesses whether the customer can benefit from the good or service on its own or in conjunction with other assets that are readily available to the customer. The software license provides a benefit on a standalone basis because it is not dependent upon installation by CRED because the software can be installed by another entity. Therefore, the software license and the installation are not interdependent.

CRED next must assess the second condition of whether its promise to deliver each of these two goods and services is separately identifiable from the other promise in the contract. In this case, because the installation service does not modify the software and could be performed by another entity, the software and installation service are separately identifiable in the contract.

Thus, the software license and the installation service are distinct goods and services and the contract contains two performance obligations.

Modification of this contract will result in a different outcome as seen in Example 8.5.

EXAMPLE 8.5 One Performance Obligation

PROBLEM: CRED Corp. contracts with a customer to license and install a payroll software application. In addition to the software license, CRED Corp. will provide installation services as part of this contract. The installation service customizes the software to integrate with other systems that the customer is currently using. Identify the separate performance obligations in this contract.

SOLUTION: Because the installation service will modify the software and the software cannot be used until it is installed, the software and installation service are interdependent and are not separately identifiable in the contract. Therefore, the second condition for being distinct is not met: The promise to deliver the software is not separately identifiable from the promise to install. Thus, the contract contains only one performance obligation—the software license and the installation service combined.

- 4 Explain how to determine the transaction price in recognizing revenue.

Step 3: Determine the Transaction Price

The third step in the revenue recognition process is to determine the *transaction price*. The **transaction price** is the amount of consideration that the entity expects to be entitled to as a result of providing goods or services to the customer. The transaction price is not necessarily the price stated in the contract—rather, it is the amount the seller *expects* to receive. The transaction price does not include amounts collected that will be remitted to third parties (such as sales tax).

The transaction price is the amount that an entity will ultimately recognize as revenue. Measuring the transaction price can be quite simple in some cases. For example, assume a customer shopping at a retail store selects and pays \$100 cash for a new dress. The transaction price is \$100. However, with complex transactions, determining the transaction price is involved. Sellers consider the effects of a number of different factors when determining the transaction price, including:

1. *Variable consideration* and constraining estimates of variable consideration
2. Any significant financing component in the contract
3. Noncash consideration
4. Consideration payable to a customer

We discuss each of these factors in the following sections.

Variable Consideration and Constraining Estimates of Variable Consideration

Variable consideration is when the payment received for providing a good or service is not a fixed amount. The amount of consideration may vary from a fixed amount due to price concessions, performance bonuses or penalties, discounts, refunds, rebates, and incentives. Elements of variable consideration may be stated explicitly or implicitly in the contract. For example, a discount for early payment typically offered by a seller is considered an element of variable consideration, even though it may not be specified explicitly in the contract.

If variable consideration is included in the contract, then the entity must estimate the consideration that it expects to receive using one of two acceptable approaches: the *expected-value approach* or the *most-likely-amount approach*. The entity should use the approach that provides the best estimate of the amount of consideration it will receive.

Expected-Value Approach. To compute the expected transaction amount under the **expected-value approach**, the entity sums the probability-weighted amounts in a range of possible consideration amounts. This method is best suited when the entity has a large number of contracts with similar characteristics. This approach is illustrated in Example 8.6.

EXAMPLE 8.6 Estimating Variable Consideration: Expected-Value Approach

PROBLEM: Binco Brass Corp. (BBC) is a wholesaler that sells musical instruments to retailers. On February 1 of the current year, BBC contracts with Music Extravaganza, Inc. (MEI) to sell 1,000 trumpets to MEI with delivery scheduled for the month of February. The contract price is \$500 per trumpet. However, the contract includes the possibility of a volume discount if total annual purchases exceed a given amount. These discounts are as follows:

If Total Sales Equal or Exceed	Discount Percentage
\$1,000,000	1%
\$2,000,000	2%
\$5,000,000	5%

These discounts are retroactive—once a volume trigger is met, BBC refunds to MEI amounts on previous purchases. BBC believes that it is 15% likely that it will not contract with MEI again this year. BBC believes the following probability estimates are accurate:

Total Sales	Probability
\$ 500,000	15%
\$1,000,000	60%
\$2,000,000	20%
\$5,000,000	5%

Using the expected-value approach, what is the estimate of the consideration amount in this contract?

SOLUTION: In order to determine the transaction price for the contract to sell 1,000 trumpets, BBC sums the probability-weighted amounts in the range of possible consideration amounts. That is, for every possible outcome, BBC multiplies the total consideration for the 1,000 trumpets at \$500 each, \$500,000, times the probability. It then sums these amounts to arrive at the total consideration amount.

Total Annual Sales	Discount Percentage	Consideration Amount for the 1,000 Trumpets	Probability	Expected Consideration
\$ 500,000	0%	\$500,000	15%	\$ 75,000
\$1,000,000	1%	495,000	60%	297,000
\$2,000,000	2%	490,000	20%	98,000
\$5,000,000	5%	475,000	5%	23,750
				<u>\$493,750</u>

Thus, BBC estimates the transaction price as \$493,750 for the February 1 sale of 1,000 trumpets. In other words, BBC estimates the discount that MEI will ultimately receive on the 1,000 trumpets to be \$6,250.

Most-Likely-Amount Approach. The **most-likely-amount approach** uses the single most likely amount in a range of possible consideration amounts as the estimate. This approach is best suited when there are only two possible outcomes. Example 8.7 illustrates estimating variable consideration under the most likely amount approach.

EXAMPLE 8.7**Estimating Variable Consideration: Most-Likely-Amount Approach**

PROBLEM: Consider BBC Corp. and MEI from the previous example. Using the most-likely-amount approach, what is the estimate of the consideration amount in this contract?

SOLUTION: BBC uses the estimated consideration amount that is associated with the highest probability assessment. In this case, BBC assesses that it is 60% likely that the total sales volume with MEI will be between \$1 and \$2 million. In this case, BBC estimates the consideration amount as \$495,000 for the February 1 sale of 1,000 trumpets.

Total Annual Sales	Discount Percentage	Consideration Amount for the 1,000 Trumpets	Probability
\$ 500,000	0%	\$500,000	15%
\$1,000,000	1%	495,000	60%
\$2,000,000	2%	490,000	20%
\$5,000,000	5%	475,000	5%

Constraining Estimates of Variable Consideration. Entities must also assess the contract to determine if there are any constraints to variable consideration. For the entity to include variable consideration in the estimated transaction price (and thus the amount of revenue recognized), it has to conclude that it is probable that a significant revenue reversal will not occur in future periods. “Probable” is generally interpreted as 70 to 75%. This assessment requires the use of a cumulative probability level to determine if the definition of probable (likely to occur) is met. Example 8.8 provides a case with a constraining estimate of variable consideration.

EXAMPLE 8.8**Constraining Estimate of Variable Consideration**

PROBLEM: CallTech Company provides call center services for various software companies. CallTech entered into a contract with a customer in which CallTech will receive a fixed amount equal to \$3,000,000 under a one-year contract. In addition, CallTech is eligible for bonus payments if the average annual customer wait time is less than a target number of minutes. The bonus schedule, along with CallTech’s probability assessments for each bonus, follow.

Bonus Payment	Average Customer Wait Time	Probability Assessment
\$ 0	Over 4 minutes	5%
250,000	Over 3 minutes but 4 minutes or less	20%
500,000	Over 2 minutes but 3 minutes or less	20%
750,000	2 minutes or less	55%
		<u>100%</u>

At what amount should CallTech measure the transaction price for this contract, assuming it uses the most-likely-amount approach for measuring variable consideration?

SOLUTION: The \$3,000,000 is part of the transaction price. Next, CallTech will estimate the variable consideration. Because it assesses a 55% probability that its average annual customer wait time will be 2 minutes or less, the estimate of variable consideration is \$750,000.

However, CallTech must assess the constraint on variable consideration. CallTech must determine the probability that it will have to reverse any of the \$750,000 revenue. It is

(continued)

45% (5% + 20% + 20%) probable that it will receive a bonus of less than \$750,000 (and thus reverse part of the \$750,000 revenue.) Thus, there is a 55% probability that it will not have to reverse revenue. A probability of 55% is not considered probable (i.e., “likely to occur”), and thus the variable consideration is constrained. Next, CallTech assesses a cumulative probability of 75% (55% + 20%) that it will receive at least \$500,000 for call times less than three minutes. Because a cumulative probability of 75% would generally meet the definition of probable (i.e., likely to occur), CallTech will estimate the constrained variable consideration at \$500,000 per year. Thus, the estimated transaction price for the one-year contract is \$3,500,000 (\$3,000,000 fixed amount plus \$500,000 for the variable component).

Variable Consideration and Constraining Estimates of Variable Consideration: IFRS. In estimating the constraint on variable consideration, U.S. GAAP uses the term “probable,” whereas IFRS uses the term “highly probable.” The definitions of “probable” under U.S. GAAP and “highly probable” under IFRS are essentially the same.

Significant Financing Component

In contracts when delivery of the goods or services occurs in advance of the payment, the seller is providing financing to the buyer. Alternatively, in contracts when delivery occurs well after payment, the buyer is providing financing to the seller. When the time lapse between payment and delivery is more than one year, entities are required to separate the revenue generated from the contract from the financing component if the financing component is significant at the individual contract level.

The rationale is that the seller should recognize revenue at the amount that properly reflects the price that a buyer would pay if payment occurred on the same date as delivery. In determining whether a significant financing component exists, the entity considers three factors:

1. The difference between the contract price and the cash selling price of the goods or services.
2. The length of time between delivery and payment.
3. The prevailing interest rate in the market.

Once an entity concludes that there is a significant financing component, it determines the transaction price by using the time value of money:

- If the delivery occurs *before* payment, the entity discounts the promised consideration amount back to the present value, using the same discount rate it would use if it entered into a separate financing arrangement.
- If the delivery occurs *after* the payment, the entity determines the future value of the payment, using the same discount rate it would use if it entered into a separate financing arrangement.

The entity ultimately recognizes the transaction price as sales or service revenue and records the difference between the total contract price and the present or future value as interest revenue if the payment occurs after delivery or interest expense if the payment occurs before delivery.

We present an example of a contract with a significant financing component in Example 8.9.

EXAMPLE 8.9 Significant Financing Component—Delivery before Payment

PROBLEM: KMR Enterprises enters into a sales contract with a new customer. Delivery occurs at the date of contract inception. However, payment of the contract price of \$1 million will not occur until two years later. The interest rate charged in similar arrangements in the industry is 10%. Does a significant financing component exist? If so, what amount should KMR record as sales revenue and what amount should KMR record as interest revenue?

SOLUTION: Because there is a time lapse of two years between delivery and payment and the interest rate is 10%, a significant financing component exists. To compute the transaction price (the amount that will ultimately be recognized as sales revenue), KMR must discount the \$1 million future value to the present value using a 10% interest rate. We calculate a present value of \$826,446 as follows.

	N	I/Y	PV	PMT	FV	Excel Formula
Given	2	10.00%		0	1,000,000	
Solve for PV			(826,446)			=PV(0.1,2,0,1000000)

Thus, KMR ultimately records \$826,446 of sales revenue at the date of delivery and \$173,554 (\$1,000,000 less \$826,446) of interest revenue over the two-year period.

Example 8.10 provides an illustration of a scenario in which the delivery occurs after the payment.

EXAMPLE 8.10 Significant Financing Component—Delivery after Payment

PROBLEM: KMR Enterprises enters into a sales contract with a new customer. Payment of the contract price of \$1 million occurs at the date of contract inception. However, delivery of the product will not occur until two years later. The interest rate charged in similar arrangements in the industry is 10%. Does a significant financing component exist? If so, what amount should KMR record as sales revenue and what amount should KMR record as interest expense?

SOLUTION: Because there is a time lapse of two years between delivery and payment and the interest rate is 10%, a significant financing component exists. To compute the transaction price (the amount that will ultimately be recognized as sales revenue), KMR must compute the future value of the \$1 million using a 10% interest rate. We compute the future value of \$1,210,000 as follows:

	N	I/Y	PV	PMT	FV	Excel Formula
Given	2	10.00%	1,000,000	0		
Solve for FV					(1,210,000)	=FV(0.1,2,0,1000000)

Thus, KMR ultimately records \$1,210,000 of sales revenue at the date of delivery and \$210,000 (\$1,210,000 less \$1,000,000) of interest expense.

Noncash Consideration

In some contracts, instead of paying cash for the good or service, customers compensate the seller with goods, services, or other noncash items, such as shares of stock in the customer's corporation. In this case, the transaction price should be measured at the fair value at contract inception of the noncash consideration received by the seller. If the seller cannot reasonably estimate the fair value of the noncash consideration received, then she should measure the transaction price at the standalone selling price of the goods or services promised to the customer. Example 8.11 demonstrates accounting for noncash consideration.

EXAMPLE 8.11 Noncash Consideration

PROBLEM: TrueTech provides laptop-related maintenance services to Shemco. In exchange, TrueTech received 100 shares of Shemco no-par common stock. Determine the transaction price in the contract for the following scenarios: (a) 100 shares of Shemco's stock is traded on an active market for \$55,000. The standalone value of the maintenance services is \$56,000. (b) Shemco is privately held, making it difficult to estimate the fair value of the shares given in exchange for the maintenance services.

SOLUTION: In scenario (a) in which Shemco's stock is publicly traded, the transaction price is the fair value of the noncash consideration (the fair value of the stock). Thus, the transaction price is \$55,000.

In scenario (b) in which the stock is not publicly traded and, therefore, does not have a reasonably estimable fair value, TrueTech determines the transaction price as the standalone value of the services provided. The transaction price is \$56,000.

Consideration Payable to a Customer

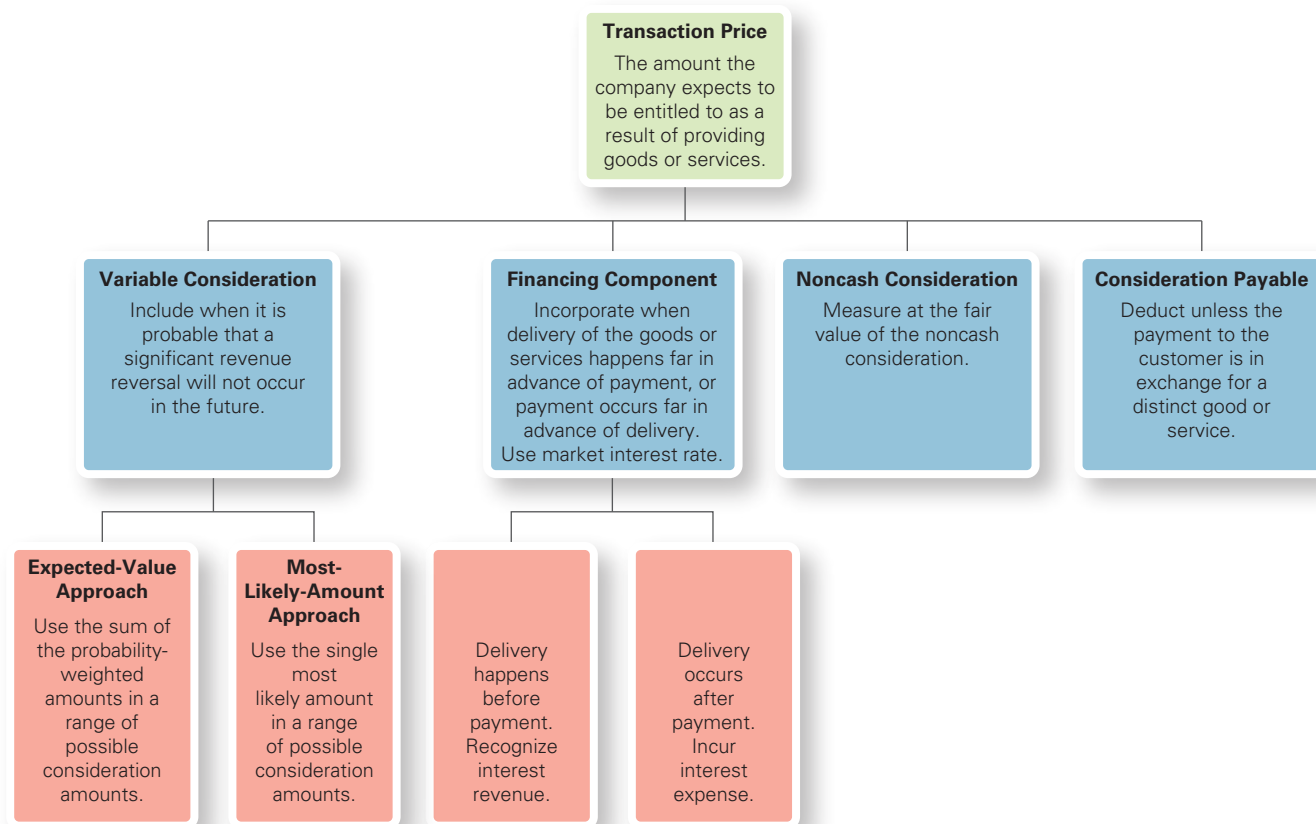

At times, a seller makes payments to a customer if the seller is providing incentives to entice the buyer to purchase, or continue to purchase, its goods. Unless the payment to the customer is in exchange for a distinct good or service transferred to the seller, the seller should deduct the amount of the consideration payable to the customer from the transaction price. Example 8.12 demonstrates this accounting treatment.

EXAMPLE 8.12 Consideration Payable to a Customer

PROBLEM: Clever Company enters into a contract with a customer in which it promises to deliver products for a price of \$10 million. The contract also stipulates a slotting fee of \$250,000 that Clever Company will pay to the buyer. Manufacturers commonly pay a slotting fee to retailers to have their goods displayed prominently in the retailers' stores. What is the transaction price in this contract?

SOLUTION: In this case, the slotting fees are not a distinct good or service that is provided to Clever Company. Thus, Clever Company should treat the slotting fee as a reduction in the transaction price as opposed to a fee that would be expensed. The transaction price for the contract is \$9,750,000 (\$10,000,000 less \$250,000).

Exhibit 8.4 summarizes determining the transaction price.

EXHIBIT 8.4 Determining the Transaction Price

- 5 Demonstrate allocating the transaction price to performance obligations when recognizing revenue.

Step 4: Allocate the Transaction Price to the Performance Obligations

The next step in the revenue recognition process is allocating the transaction price determined in Step 3 to the performance obligations determined in Step 2. If the determination from Step 2 is that there is only one performance obligation, then Step 4 is not required.

Standalone Selling Price

To allocate the transaction price, the entity first determines the standalone selling price of the goods or services related to each performance obligation. Then, if the sum of the standalone selling prices is higher than the transaction price, the seller typically allocates the discount to separate performance obligations on the basis of the relative standalone selling prices.

The standalone selling price of each performance obligation is the price the seller would charge for the same goods or services if it sold them on a standalone basis to similar customers under similar circumstances. Companies can often determine the standalone selling price using this method because they typically sell their goods or services on a standalone basis.

However, in practice the seller sometimes does not sell the same goods or services separately. In this case, the seller must estimate the standalone selling price. The authoritative literature does not stipulate an exact method but states that the company should use a method that maximizes the use of observable inputs. Whatever method the entity chooses for estimating the standalone selling price, it should use the same method consistently in similar circumstances.

Standalone Selling Price Estimation Methods

Although the authoritative literature does not specify a particular method, it does provide three suggestions suitable to determine a standalone selling price specific to a good or service: the *adjusted market assessment approach*, the *expected-cost-plus-a-margin approach*, and the *residual approach*.

1. The **adjusted market assessment approach** focuses on the amount that the seller believes that customers are willing to pay for the good or service by evaluating the market. This approach might include using prices from the seller's competitors and adjusting those prices as necessary.
2. The **expected-cost-plus-a-margin approach** focuses on internal factors by forecasting the costs associated with providing the goods or services and adding an appropriate profit margin.
3. The **residual approach** allows an entity to estimate one or more, but not all, of the standalone selling prices and then allocate the remainder of the transaction price, or the residual amount, to the goods or services for which it does not have a standalone selling price estimate.

Specifically, when using the residual approach, the entity estimates the residual standalone selling price by subtracting the standalone selling prices of the goods or services that underlie the other performance obligations from the total transaction price.

Once the entity has estimated all of the standalone selling prices, it allocates any discount (that is, any amount by which the sum of the standalone selling prices is higher than the transaction price) to separate performance obligations on the basis of relative standalone selling prices. In other words, the entity allocates the transaction price to each separate performance obligation based on the proportion of the standalone selling price of each performance obligation to the sum of the standalone selling prices of all of the performance obligations in the contract. Example 8.13 illustrates the three approaches.

EXAMPLE 8.13

Allocation of the Transaction Price to the Separate Performance Obligations

PROBLEM: Bord Industries enters into a contract with a customer to sell three products for a total transaction price of \$650,000. Each product is appropriately classified as a separate performance obligation. Bord Industries sells products A and B only on an individual basis, so it must estimate the standalone selling price for product C. Information related to these three products is provided in the following table.

Product	Standalone Selling Price	Market Competitor Prices	Forecasted Cost
A	\$175,000	\$ 133,000	\$ 120,000
B	300,000	312,000	250,000
C	Not available	<u>200,000</u>	<u>130,000</u>
Total		<u>\$645,000</u>	<u>\$500,000</u>

How should Bord Industries allocate the transaction price to the three products under each of the following three approaches: (a) the adjusted market assessment approach, (b) the expected-cost-plus-a-margin approach, and (c) the residual approach?

SOLUTIONS: We illustrate each method separately.

- Adjusted market assessment approach** Bord Industries should estimate the standalone selling prices based on the prices that the customers in the market would be willing to pay, such as competitor prices, and then allocate on a relative basis as follows:

Product	Market Competitor Prices	Percentage of Total	Estimated Standalone Selling Price
A	\$ 133,000	20.62%	\$134,030
B	312,000	48.37	314,405
C	200,000	31.01	201,565
Total	<u>\$ 645,000</u>	<u>100.00%</u>	<u>\$650,000</u>

The percentage column is computed as the market competitor price for the individual product divided by the total market competitor prices for all three products. The allocated transaction price for each product is the percentage for that product times the total transaction price.

- b. **Expected-cost-plus-a-margin approach** Bord Industries should estimate the stand-alone selling prices based on forecasted cost with an appropriate margin. Given a total cost of \$500,000 and a total transaction price of \$650,000, an appropriate margin would be 30% $((\$650,000 - \$500,000) / \$500,000)$. Thus, to determine the allocated transaction price for each product, multiply the forecasted cost for each product by 1.30.

Product	Forecasted Cost	Estimated Standalone Selling Price
A	\$120,000	\$156,000
B	250,000	325,000
C	130,000	169,000
Total	<u>\$500,000</u>	<u>\$650,000</u>

- c. **Residual approach** Using the residual approach, Bord Industries estimates the stand-alone selling price for product C by deducting the available standalone selling prices for products A and B from the total transaction price, which results in a residual amount of \$175,000 for Product C.

Product	Estimated Standalone Selling Price
Transaction Price	\$ 650,000
A	(175,000)
B	<u>(300,000)</u>
C	<u>\$ 175,000</u>

Standalone Selling Price Exceptions

Whereas the general rule is that the transaction price should be allocated to the performance obligations based on the relative standalone selling prices, there are two possible exceptions.

- When the contract includes variable consideration.
- When the discount is not related to all of the contract's performance obligations.

Related to the first exception, the seller should allocate variable consideration to one or more, but not all, performance obligations if two criteria are met:

1. The terms of the variable amount relate to one or more, but not all, of the specific performance obligations.
2. Allocating the variable amount entirely to one or more, but not all, of the specific performance obligations is consistent with the objective of performing the allocation in a way that reflects a reasonable allocation of the transaction price on the basis of the standalone selling prices.

Example 8.14 demonstrates a situation in which variable consideration is allocated entirely to one performance obligation.

EXAMPLE 8.14 **Allocation of Variable Consideration: Allocated to One Performance Obligation**

PROBLEM: Franklin Inventors sells two of its patents in a contract with a retailer that sells toys and other children's products. The first is a patent for a super absorbent diaper and the second is a patent for a new digital toy. Franklin determines that each of these patents comprises a separate performance obligation. The estimated standalone selling prices are \$5 million for the diaper patent and \$2 million for the digital toy patent. The stated price in the contract for the diaper patent is a fixed payment of \$5 million. The stated price for the digital toy patent is 5% of the customer's future sales of the toys. Franklin estimates the variable consideration for this patent to be \$2 million. What amount of the transaction price should Franklin allocate to each performance obligation?

SOLUTION: The variable consideration in this example is the 5% of the customer's future sales of the toys related to the toy patent. Franklin meets the two criteria to allocate the variable consideration to just one performance obligation. The variable consideration relates only to the toy patent. Allocating the \$2 million entirely to the toy patent is consistent with the objective of a reasonable allocation based on standalone selling prices because the \$2 million is equal to the standalone selling price of the patent and therefore considered reasonable variable consideration. Thus, Franklin allocates \$5 million of the transaction price to the diaper patent. Franklin allocates the variable consideration solely to the digital patent.

Example 8.15 illustrates a contract whose variable consideration cannot be allocated to just one performance obligation.

EXAMPLE 8.15 **Allocation of Variable Consideration: Allocated to All Performance Obligations**

PROBLEM: Franklin Inventors sells two of its patents in a contract with a retailer that sells toys and other children's products. The first is a patent for a super absorbent diaper and the second is a patent for a new digital toy. Franklin determines that each of these patents comprises a separate performance obligation. The estimated standalone selling prices are \$5 million for the diaper patent and \$2 million for the digital toy patent. The stated price in the contract for the diaper patent is a fixed payment of \$3.8 million. The price stated for the digital toy patent is 8% of the customer's future sales of the toys. Franklin estimates the variable consideration for this patent as \$3.2 million. During the current year, the customer has sales related to the toy patent of \$12.5 million, resulting in a \$1 million payment to Franklin Inventors and a total consideration of \$4.8 million. What amount of the transaction price should Franklin allocate to each performance obligation?

SOLUTION: The variable consideration in this example is the 8% of the customer's future sales of the toys related to the toy patent. Franklin does not meet the two criteria to allocate the variable consideration to only one performance obligation. Although the variable consideration relates only to the toy patent, allocating all of the variable consideration to the toy patent would not satisfy the objective that the allocation reflect a reasonable allocation based on standalone selling prices because the variable consideration of \$3.2 million is significantly higher than the standalone selling price of \$2 million. Thus, Franklin allocates both the fixed and variable consideration to the two patents on a relative standalone selling price basis.

Patent	Standalone Selling Price (a)	Percentage Standalone Selling Price to Total Price (b)	Allocation of Fixed Consideration (c) = Fixed Consideration × (b)	Allocation of Current Year Variable Consideration (d) = Variable Consideration × (b)	Total Consideration (e) = (c) + (d)
Diaper	\$5 million	71.43%	\$2,714,340	\$ 714,300	\$3,428,640
Toy	2 million	28.57%	1,085,660	285,700	1,371,360
	<u>\$7 million</u>	<u>100.00%</u>	<u>\$3,800,000</u>	<u>\$1,000,000</u>	<u>\$4,800,000</u>

The second exception to the relative standalone selling price allocation method involves the allocation of a discount measured as the difference between the sum of the standalone selling prices and the transaction price. Typically, any discount should be allocated proportionately to the performance obligations based on the relative standalone selling prices. However, if an entity determines that the discount is not related to all of the performance obligations, it should allocate only the discount to the performance obligations to which it relates. Specifically, if the following three criteria are met, then the seller should allocate the discount to one or more, but not all, of the performance obligations.

1. The entity regularly sells the goods/services in the contract on a standalone basis.
2. The entity regularly sells a bundle of some of these goods/services at a discount to the sum of the standalone selling prices of the separate goods/services.
3. The discount in the bundle of goods/services described in (2) is basically the same as the discount in this contract.

Example 8.16 provides an illustration of a discount that is not proportionally allocated to the performance obligations (that is, the discount does not relate to all performance obligations).

EXAMPLE 8.16 Allocation of a Discount

PROBLEM: GW Company is a wholesaler that sells hockey equipment. It regularly sells the following products separately at the following standalone selling prices:

Equipment	Standalone Selling Price
Sticks	\$100
Helmets	75
Skates	300

GW also regularly bundles helmets and skates together for \$350. GW signs a contract with Hockey Equipment Retailers to sell 100 sticks, helmets, and skates for \$45,000. GW determines that each product is a separate performance obligation. How should GW allocate the transaction price to each product?

SOLUTION: The contract contains a \$2,500 discount because the sum of the standalone selling price is \$47,500 [(\$100 per stick + \$75 per helmet + \$300 per skates) × 100], and the transaction price is \$45,000. Because GW regularly sells the three products on a standalone basis and the bundled helmets and skates for \$350, it can determine that the discount on the bundled helmets and skates is \$25 [(\$75 per helmet + \$300 per skates) – \$350 bundled price]. The bundled discount totaling \$2,500 (\$25 bundled discount × 100) is equal to the discount in the contract, so GW should allocate the contract discount only to the helmets and skates.

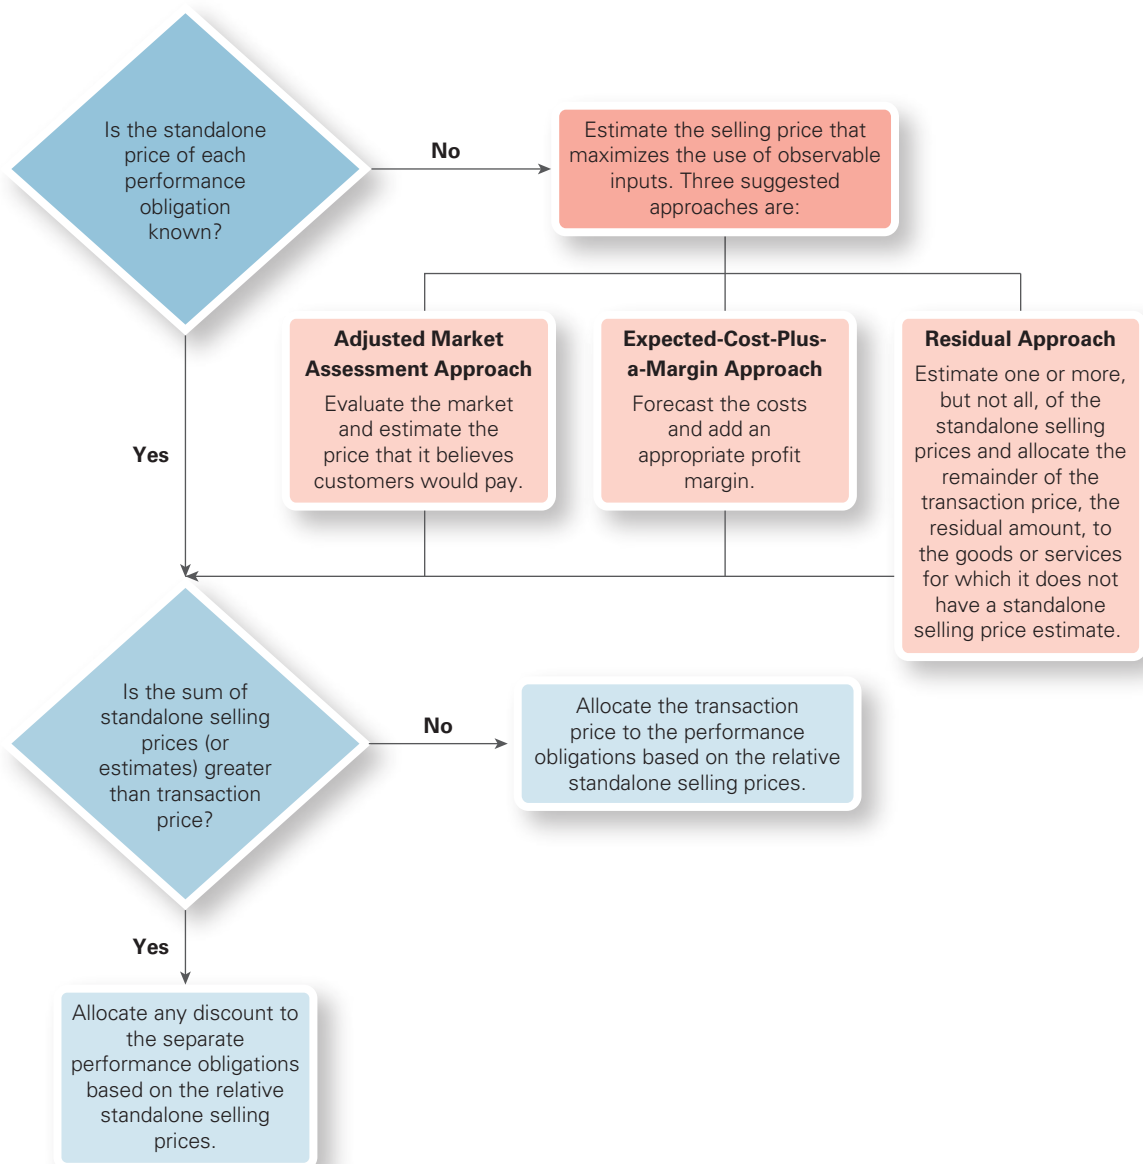

(continued)

Thus, GW allocates \$10,000 (100 sticks × \$100) to the sticks. GW determines the allocation of the remaining \$35,000 to the helmets and skates on a proportional basis.

Equipment	Standalone Selling Price	Percentage	Allocation of Transaction Price
Helmets	\$ 75	20%	\$ 7,000
Skates	<u>300</u>	<u>80%</u>	<u>28,000</u>
	<u>\$375</u>	<u>100%</u>	<u>\$35,000</u>

Exhibit 8.5 provides a summary of allocating the transaction price.

EXHIBIT 8.5 Allocating the Transaction Price

- 6 Assess whether to recognize revenue when, or as, each performance obligation is satisfied.

Step 5: Recognize Revenue When, or As, Each Performance Obligation Is Satisfied

Companies determine when to recognize revenue in Step 5 based on when the goods or services are transferred to the customer. A good or service is transferred when the customer obtains *control*. A customer has **control** of the asset if it has the ability to direct the use of the asset and receives all (or substantially all) of the remaining benefits of owning the asset.

Transfer over Time

Goods and services may be transferred to the customer over time or at a point in time. If the goods or services are transferred over time, then the seller recognizes revenue over that time period. However, if the goods or services are transferred to the customer at a point in time, then the seller recognizes the revenue at that point in time. Companies must determine whether the goods/services are transferred over time or as of a point in time at the inception of the contract.

Goods or services are transferred over time if the seller meets any one of the following three criteria:

1. The customer receives and consumes the benefits of the goods or services simultaneously (for example, health club memberships and magazine subscriptions).
2. The customer controls the asset as the seller creates it or enhances it over time (for example, software updates).
3. The asset the seller is creating does not have an alternative use to the seller, and the seller has an enforceable right to payment for the performance completed to date.

If a good or service is transferred over time, then the seller recognizes revenue over that same time period, based on the progress that it has made toward completion. However, if the seller does not have a reasonable way to measure its progress toward completion, then it should not recognize *any* revenue until it can reasonably estimate progress. Progress toward completion can be measured using either output methods or input methods. Examples of output methods include units produced or delivered, progress such as floors or miles completed, and time elapsed. Examples of input methods include labor hours expended, machine hours used, and costs incurred.

Example 8.17 illustrates transferring services over time because the customer receives and consumes the benefit simultaneously.

EXAMPLE 8.17

Transfer over Time: Simultaneous Receipt and Consumption of Benefit

PROBLEM: H&L Health Clubs sells annual memberships for \$120 each. On January 1, the company sold 100 memberships and received cash. H&L prepares financial statements on a quarterly basis. What journal entries should H&L record during the current year?

SOLUTION: In this case, H&L's customers simultaneously receive and consume the benefits of the membership. Thus, H&L should recognize the revenue over the membership period. H&L initially records the memberships as unearned revenue, but it recognizes one-fourth of the revenue at the end of each quarter.

Account	January 1
Cash	12,000
Unearned Revenue	12,000

Account	March 31, June 30, September 30, and December 31
Unearned Revenue	3,000
Sales Revenue	3,000

Example 8.18 illustrates a scenario in which the seller recognizes revenue over the service period and the contract meets the second criteria to recognize revenue. Here the customer controls the asset as the seller creates or enhances the item over time.

EXAMPLE 8.18 **Transfer over Time: Customer Controls the Asset as the Seller Creates It**

PROBLEM: Rand Technology engages in a contract with the federal government to create an IT system for a transaction price of \$12 million. Rand receives \$2 million from the government at contract inception and the other \$10 million upon completion of the project. The government stipulates in the contract that it controls the system during its creation. Rand Technology measures its progress toward completion using labor hours incurred. It estimates that the project will require 25,000 labor hours. During the current year of the contract, Rand spent 15,000 labor hours. During the following year, Rand spent another 10,000 labor hours to finish the project. What journal entries should Rand make over the life of this contract?

SOLUTION: Because Rand's customer controls the IT system as Rand is creating it, Rand can recognize revenue over the service period. Rand recognizes 60% of the revenue in the current year and the remaining 40% in the following year. Rand computes the 60% as 15,000 labor hours divided by the total labor hours of 25,000. The 40% is 10,000 labor hours divided by the total labor hours of 25,000. Computations are presented in the following table.

Year	Labor Hours (a)	Percentage Labor Hours to Total (b)	Revenue (c) = Total Revenue × (b)
1	15,000	60%	\$ 7,200,000
2	10,000	40%	4,800,000
Total	25,000	100%	\$12,000,000

The journal entry at the contract initiation follows.

Account	At Contract Inception
Cash	2,000,000
Unearned Revenue	2,000,000

At the end of the current year, Rand records the following entry to recognize the \$7,200,000 revenue earned, reduce the unearned revenue by \$2,000,000, and debit accounts receivable for the \$5,200,000 uncollected balance due for the current year.

Account	Current Year
Unearned Revenue	2,000,000
Accounts Receivable	5,200,000
Service Revenue	7,200,000

At the end of the second year, the following entry records the \$4,800,000 revenue earned, the \$10,000,000 cash collection and the reduction of the accounts receivable.

Account	Following Year
Cash	10,000,000
Accounts Receivable	5,200,000
Service Revenue	4,800,000

Transfer at a Point in Time

If the seller does not meet the three criteria to recognize revenue over time, then she assumes that the goods or services are transferred at a point in time. It is often straightforward to determine when control is transferred. For example, consider a retailer that sells computers. Control is transferred when a customer purchases a computer at the retailer, takes delivery at the register, and pays for a computer at the point of sale. However, other times it is more difficult to make this determination. In these cases, the entity should consider a number of indicators of the transfer of control to the customer:

1. The seller has a present right to payment for the asset.
2. The customer has legal title to the asset.
3. The seller has transferred physical possession of the asset.
4. The customer has the significant risks and rewards of ownership of the asset.
5. The customer has accepted the asset.

These five conditions indicate that control may have transferred, but any one of them does not determine whether control has actually passed to the customer. The entity should consider all of the facts and circumstances to make this determination. Example 8.19 provides an illustration of goods transferred as of a point in time.

EXAMPLE 8.19

Goods Transferred at a Point in Time

PROBLEM: On April 13, a customer purchased four trees from Hannah Greenhouses for \$1,000 on credit. The customer takes immediate delivery of the trees at the greenhouse. The trees cost the greenhouse \$650. The company uses the perpetual inventory method. What are the necessary journal entries on April 13 to record the sale and the cost of goods sold?

SOLUTION: Hannah records the accounts receivable and revenue of \$1,000 on April 13 because it has transferred control of the trees to the customer.

Account	April 13
Accounts Receivable	1,000
Sales Revenue	1,000

The company also records the \$650 reduction in inventory and an increase in cost of goods sold for the same amount.

Account	April 13
Cost of Goods Sold	650
Inventory	650

Exhibit 8.6 summarizes determining when to recognize revenue.

Summary of the Five-Step Revenue Recognition Process

Now that we have discussed each of the five steps in detail, we illustrate an application in a comprehensive example. Exhibit 8.7 presents a summary of the revenue recognition process in graphical form as a guide for this analysis.

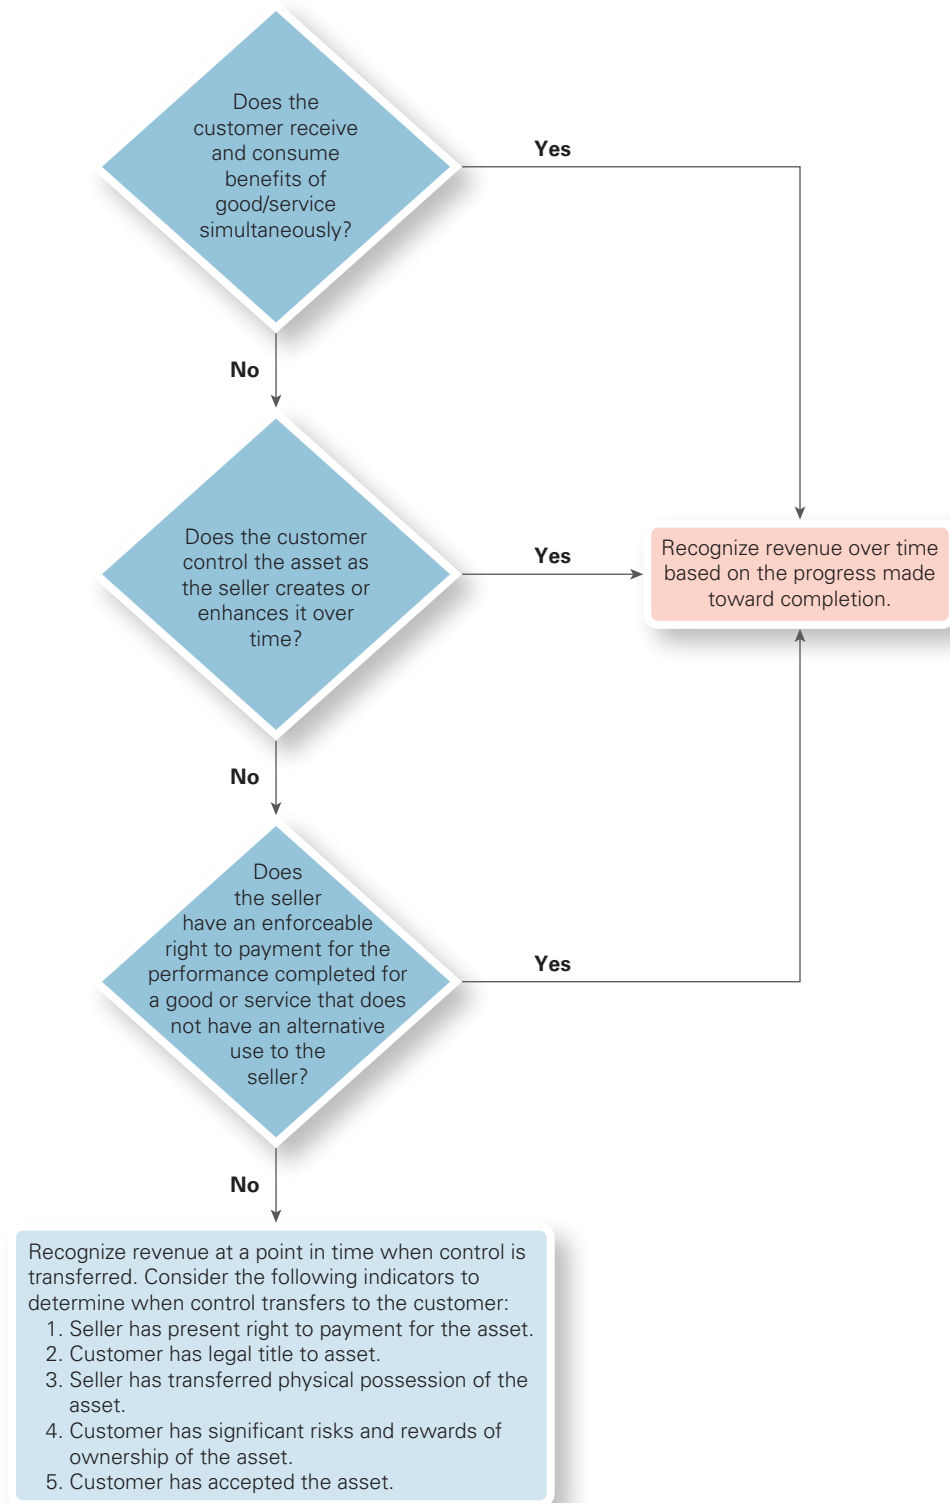

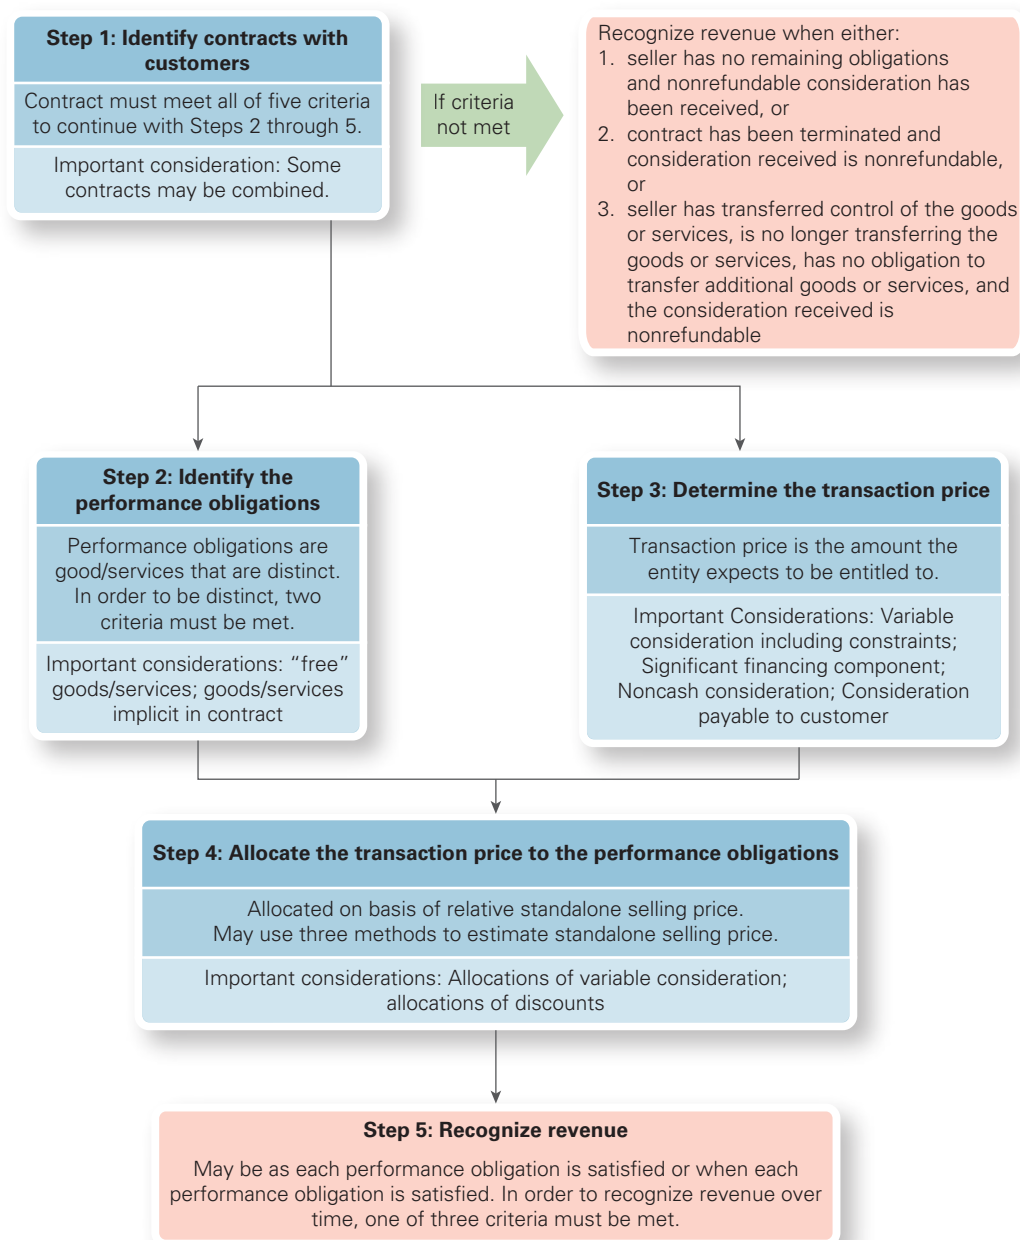

EXHIBIT 8.6 Determining When to Recognize Revenue

EXHIBIT 8.7 Summary of Five Steps in Revenue Recognition**JUDGMENTS IN ACCOUNTING:
Revenue Recognition**

Companies use extensive judgment when implementing the five steps in the revenue recognition process. When identifying the contract, companies make judgments as to whether it is probable that they will collect the consideration. This may be particularly challenging when an entity may expect to receive partial payment. Is the difference between full payment and the partial payment simply a price concession that affects the transaction price? Or does the lack of a full payment indicate that the transaction price is not collectable? In addition, the determination of whether contracts should be combined may be a matter of judgment.

With regard to the second step, entities may need to exercise judgment to determine if goods or services are distinct. Will a customer benefit from the product or service on a

standalone basis? In addition, there may also be judgment involved in determining whether the promise to deliver the good or service is separate from other promises.

In the third step, the amount of variable consideration is often an estimate. Using either the expected-value approach or most-likely-amount approach, entities must estimate their anticipated probabilities. Measuring the financing component also involves estimation of an appropriate discount rate.

The allocation of the transaction price to the performance obligation often requires the seller to estimate a standalone selling price. Finally, depending on the circumstances, the determination of whether the performance obligation is satisfied at a point in time or over time can require judgment.

Example 8.20 summarizes the five-step revenue recognition process with a comprehensive illustration.

EXAMPLE 8.20 Comprehensive Example

PROBLEM: On February 1, 2018, Tide Technologies (TT) and Fab, Inc. signed a written contract that stipulates that TT will deliver specific hardware to Fab and also install and customize software for this hardware. The customized software is highly specific to Fab and would require extensive alterations if used by another entity. Fab is in good financial health and is purchasing the hardware and software to enhance the efficiency of its operations. Both companies use the perpetual inventory system.

The terms of the contract stipulate that Fab will make a \$10,000,000 payment to TT at the date of contract inception. TT will then have two years or 24 months (until February 1, 2020) to deliver the hardware and install and customize the software. Furthermore, TT has an enforceable right to keep any payments related to performance to date based on time elapsed. That is, after each month, TT has the right not to refund 1/24 of the payment.

In addition, the contract specifies a bonus/penalty scheme related to the timing of the software customization. If TT completes the project before two years, it will receive a bonus. However, if it completes the project late, it will incur a penalty. The specific amounts, along with TT's probability assessments, are presented next.

Time Period	Bonus (Penalty)	Probability
3 months early	\$300,000	7%
2 months early	200,000	40%
1 month early	100,000	30%
On time	0	20%
1 month late	(100,000)	2%
2 months late	(200,000)	1%
3 months late	(300,000)	0%

TT routinely sells the hardware on a standalone basis for \$4,000,000. The cost to TT of the hardware is \$2,500,000. It does not sell the software and customization on a standalone basis and is not aware of any similar arrangements offered by its competitors. TT anticipates that its costs associated with the software are \$2,000,000 and the costs associated with the installation are \$4,500,000.

TT delivers the hardware to Fab on December 31, 2019. At this time, Fab accepts the hardware and legal title passes. TT completes the installation on January 2, 2020.

TT has a normal profit margin of 10% and an interest rate of 8%. It allocates interest expense on a straight-line basis. It is a calendar-year company that prepares financial statements annually. It uses time elapsed as its measure of progress for performance obligations that are satisfied over time. It uses the most-likely-amount approach when estimating variable consideration. Perform the five steps in the revenue recognition process. Provide necessary journal entries. You do not need to record costs related to software and installation.

SOLUTION: The five steps of revenue recognition for this contract are analyzed below.

Step 1: Identify the contract

In the first step, TT needs to assess whether this arrangement qualifies as a contract. TT determines whether the contract meets all five of the criteria as follows:

Step 1 Criteria to Identify the Contract	Met?	Explanation
1. All parties to the contract have agreed to the contract and are committed to performing under the contract.	Yes	Both parties signed the contract.
2. Each party's rights with respect to the goods or services that are being transferred are identifiable.	Yes	The provisions of the contract in terms of the transfer of goods and services and the right to payment are all clearly specified.
3. The payment terms for the goods or services that are being transferred are identifiable.	Yes	The up-front payment and bonus/penalty scheme are clearly identified.
4. The contract has commercial substance.	Yes	TT will have increased cash inflows due to the contract and Fab will have decreased cash outflows due to increased efficiencies.
5. It is probable that the seller will collect the consideration to which it is entitled in exchange for the goods or services.	Yes	Fab is in good financial health, so there are no foreseen problems.

Step 2: Identify the performance obligations

The next step is to determine how many performance obligations are included in the contract. There are possibly three: the hardware, software, and installation. However, because the installation involves a significant amount of customization that is useful only to Fab, the software and installation together are one performance obligation. These two items are not distinct from one another and are considered to be interdependent because the installation significantly modifies the software. Thus, this contract contains two performance obligations: the hardware and the combined software/installation.

Step 3: Determine the transaction price

In this case, the stated contract price is \$10,000,000. However, the bonus/penalty scheme is an element of variable consideration. In addition, because TT receives the payment two years before the contract will be completed, a significant financing component exists.

With respect to the variable consideration, the most likely amount is a bonus of \$200,000 (40% likely).

Time Period	Bonus (Penalty)	Probability	Cumulative Probability
3 months early	\$300,000	7%	7%
2 months early	200,000	40%	47%
1 month early	100,000	30%	77%
On time	0	20%	97%
1 month late	(100,000)	2%	99%
2 months late	(200,000)	1%	100%
3 months late	(300,000)	0%	100%

However, this estimate is constrained. Using a cumulative probability measure, TT is 47% likely to receive a bonus of \$200,000 or more. But this means that if it records revenue of \$200,000, it is only 47% likely that a revenue reversal will not occur and 47% does not qualify as probable. Thus, TT reports variable consideration of \$100,000, which is 77% likely on a cumulative probability basis.

In addition, TT considers the financing component. In this case, it is the future value of the consideration. The future value, and thus transaction price, of the \$10,000,000 payment is \$11,664,000.

(continued)

	N	I/Y	PV	PMT	FV	Excel Formula
Given	2	8.00%	10,000,000	0		
Solve for FV					(11,664,000)	=FV(0.08,2,0,10000000)

Because TT will not receive the estimated bonus until the end of the contract, there is no financing component related to it. Thus, the variable consideration amount is \$100,000.

Step 4: Allocate the transaction price to the performance obligations

Next, TT allocates the transaction price to the hardware and software/installation performance obligations. The hardware has a standalone selling price of \$4 million. TT can estimate the standalone selling price of the software/installation using the expected cost-plus-a-margin approach. The expected cost of this performance obligation is \$6,500,000 (\$2,000,000 for the software and \$4,500,000 for the installation). Because TT has a profit margin of 10%, it computes the standalone selling price of the software/installation as \$7,150,000 (\$6,500,000 × 110%).

In addition, TT must determine how to allocate the variable consideration. Because it applies to only the software/installation performance obligation and allocating it to the software/installation performance obligation is still consistent with the objective of relative standalone selling price allocations, TT allocates the variable consideration exclusively to software/installation.

TT allocates the transaction price as follows:

Performance Obligation	Standalone Selling Price (a)	Percentage of Total (b)	Transaction Price (c)	Allocated Transaction Price—excluding Variable Consideration (d) = (c) × (b)	Allocated Variable Consideration (e)	Total Allocation (d) + (e)
Hardware	\$ 4,000,000	35.87%	\$11,664,000	\$ 4,183,877		\$ 4,183,877
Software/Installation	<u>7,150,000</u>	<u>64.13%</u>	11,664,000	<u>7,480,123</u>	<u>\$100,000</u>	<u>7,580,123</u>
TOTAL	<u>\$11,150,000</u>	<u>100.00%</u>		<u>\$11,664,000</u>	<u>\$100,000</u>	<u>\$11,764,000</u>

Step 5: Recognize revenue

TT recognizes revenue for the hardware at the point in time it is delivered. Thus, it will recognize \$4,183,877 in revenue on December 31, 2019.

Because the software/installation does not have an alternative use to TT, it recognizes revenue for this performance obligation over time as it performs the installation. As stated in the problem, TT uses a time-elapsing method based on the number of months. Thus, TT recognizes 11/24th of the \$7,580,123 in 2018, 12/24th in 2019, and 1/24th in 2020.

TT recognizes total interest expense of \$1,664,000, which is the difference between the total transaction price of \$11,764,000 and the combined estimated payments of \$10,100,000. Because TT recognizes interest expense on a straight-line basis, it recognizes 11/24th of the \$1,664,000 in 2018, 12/24th in 2019, and 1/24th in 2020.

On February 1, 2018, at the inception of the contract, TT increases cash by \$10 million to record the payment from Fab. TT cannot yet recognize revenue so it credits unearned revenue.

Account	February 1, 2018
Cash	10,000,000
Unearned Revenue	10,000,000

On December 31, 2018, TT recognizes service revenue for the year (\$7,580,123 × 11/24) and interest expense (\$1,664,000 × 11/24). The offset to these two transactions is unearned revenue.

Account	December 31, 2018
Unearned Revenue	2,711,556
Interest Expense	762,667
Service Revenue	3,474,223

On December 31, 2019, TT recognizes the appropriate amount of service revenue for the year ($\$7,580,123 \times 12/24$) and interest expense ($\$1,664,000 \times 12/24$). In addition, it recognizes the $\$4,183,877$ sales revenue related to the hardware because it is delivered as well as the $\$2,500,000$ cost of the hardware. The offset to these transactions is unearned revenue.

Account	December 31, 2019	
Unearned Revenue	7,141,939	
Interest Expense	832,000	
Sales Revenue		4,183,877
Service Revenue		3,790,062
Cost of Goods Sold	2,500,000	
Inventory		2,500,000

On January 2, 2020, TT records the receipt of the $\$100,000$ bonus payment. It credits service revenue for that amount.

Account	January 2, 2020	
Cash	100,000	
Service Revenue		100,000

Finally, on January 31, TT recognizes the remaining service revenue and interest expense and amortizes the remaining unearned revenue.

Account	January 31, 2020	
Unearned Revenue	146,505	
Interest Expense	69,333	
Service Revenue		215,838

- 7 Describe the accounting for long-term contracts, including implementing the percentage-of-completion method and the completed-contract method.

Accounting for Long-Term Contracts

Long-term contracts are a type of transaction for which firms report revenue, costs, and gross profit over time as opposed to at a point in time. They are prevalent in industries such as communications, homebuilding, software development, aircraft, shipbuilding, and construction. Consider a company that enters into a contract to manufacture or build a product for the customer when the manufacturing process will take a period of time substantially longer than a year. If the firm recognized revenue at a point of time, it would not recognize the revenue (and associated gross profit) attributable to the long-term contract until it completed the product and delivered it to the customer. However, as we discuss next, this approach may not provide the most accurate presentation of the company's financial position and economic performance.

There are two accounting methods for revenue recognition for long-term contracts: the *percentage-of-completion method* and the *completed-contract method*. Total revenue and costs for a long-term contract are the same under both methods. The difference between the two approaches is the timing of revenue and gross profit recognition on the contract: The **percentage-of-completion method** recognizes gross profit over the production period whereas the **completed-contract method** recognizes gross profit only at the end of the contract.

An entity should use the percentage-of-completion method when it meets one of the three criteria for goods and services transferred over time (discussed earlier for transfer of control to the customer), and it can reasonably measure its progress toward completion. If these conditions are met, the financial statements are more accurately presented under the percentage-of-completion method because the entity's economic activities are reported on the income statement. If the contract does not meet any of the three criteria or if the entity cannot reasonably measure progress toward completion, then it uses the completed-contract method. For example, *General Electric Company* will use the completed-contract method to account for the revenue from the production of commercial airplane engines because contracts do not transfer control during the manufacturing process.⁴ We discuss each of these methods next.

⁴http://www.ge.com/ar2016/assets/pdf/GE_AR16.pdf

THE CONCEPTUAL FRAMEWORK CONNECTION

Revenue Recognition for Long-Term Contracts

Relevance and faithful representation are the two fundamental qualitative characteristics of financial reporting that make information useful. To be relevant, information should have predictive value—that is, the information is an input that should help predict future outcomes. Assume a company is engaged in a 10-year project for which it does not recognize any revenues or costs until completion. Waiting until completion to recognize any revenue could be misleading because the income statement will not report any activity for the first nine years.

Now consider the case in which *Boeing* needs five years to develop a new passenger jet. Using point-of-sale accounting would delay revenue and expense recognition until *Boeing* manufactures and delivers the jet to the customer. If this were *Boeing's* only project in process, the income statement would show no activity in the first four years and recognize the full amount of the transaction in the fifth year. The resulting volatile trend in earnings would distort operating results and not faithfully represent the underlying economic event.

Percentage-of-Completion Method

In this section, we discuss accounting for contracts under the *percentage-of-completion method*. We begin with a discussion of estimating the percentage of completion of a long-term contract. Then, we explain the accounting procedures and introduce accounts specific to accounting for long-term contracts.

Determining the Estimated Percentage of Completion. As discussed earlier in the chapter, firms can estimate the degree of completion by using input measures (for example, costs incurred and direct labor hours used), output measures (for example, miles of highway and the number of cell towers installed), or engineering estimates.

Input Measures. A common method used in practice, the **cost-to-cost approach**, estimates the cumulative percentage of completion by dividing the total cost incurred to date by total estimated costs as follows:

$$\text{Cumulative Percentage Complete} = \frac{\text{Total Costs Incurred to Date}}{\text{Estimated Total Cost of the Project}} \quad (8.1)$$

The estimated total cost of the project equals the total actual costs incurred to date plus the estimated costs to complete the project. The estimated total cost of the project is likely to change throughout the contract period. This does not create a problem because the ratio is computed each period using the current costs to date and estimated total cost.

Determination of Revenue, Costs, and Gross Profit under the Percentage-of-Completion Method. Under the percentage-of-completion method, firms recognize revenues based on the project's stage of completion. Specifically, firms recognize revenue, costs, and gross profit in each year by:

1. Computing cumulative revenue by multiplying the total estimated contract revenue times the percentage complete. Revenue for the current period is cumulative revenue less revenue recognized in all prior periods.
2. Recording actual costs for the current period as incurred.⁵
3. Computing gross profit for the year as the revenue recognized in the current period in (1) less the costs recognized in the period in (2).

If the reported costs exceed the reported revenues in a given year for an otherwise profitable contract, then the gross profit is negative. In this case, the firm credits construction in progress in the journal entry made to record revenues, costs, and gross profit.

Example 8.21 illustrates the computation of revenue and gross profit under the cost-to-cost approach.

⁵This is simplified somewhat. Some costs will actually be capitalized and amortized in a systematic basis consistent with the transfer of the good or service to the customer.

EXAMPLE 8.21**Percentage-of-Completion Method: Cost-to-Cost Approach**

PROBLEM: Natalie Networks Incorporated (NNI) accepts a fixed-fee contract to develop and implement a communications network for Summit Sound Systems. NNI accepts a fixed fee of \$18,600 and must complete the project within three years. NNI uses the percentage-of-completion method of accounting to determine the percent complete using the cost-to-cost approach. Costs incurred and estimated total costs are summarized in the following table:

	2018	2019	2020
Actual costs incurred during the year	\$ 3,000	\$ 1,500	\$10,000
Actual costs incurred in previous years	0	3,000	4,500
Estimated costs to complete	12,000	5,500	0
Estimated total costs	<u>\$15,000</u>	<u>\$10,000</u>	<u>\$14,500</u>

Determine the amount of gross profit that NNI will report in each of the three years.

SOLUTION: Under the percentage-of-completion method, costs for the period are the actual construction costs incurred. In 2018, actual construction costs are \$3,000. The cumulative percent complete is 20% computed as \$3,000 actual construction costs divided by \$15,000 estimated total costs. Because 20% is completed in 2018, 20% of the estimated revenue is recognized in 2018. Thus, NNI reports \$3,720 ($\$18,600 \times 20\%$) of revenue in 2018 and actual costs of \$3,000. It reports gross profit of \$720 (\$3,720 less \$3,000).

The 2019 actual construction costs of \$1,500 added to the \$3,000 construction costs incurred in prior years results in \$4,500 of cumulative construction costs through 2019. Because the estimated costs to complete are \$5,500, the estimated total costs are \$10,000 (\$4,500 actual constructions costs through 2019 plus the \$5,500 estimated costs to complete). The cumulative percent complete in 2019 is 45% computed as \$4,500 actual construction costs divided by \$10,000 estimated total costs. The cumulative revenue recognized through 2019 is \$8,370 ($\$18,600 \times 45\%$). Because \$3,720 of revenue was recognized in 2018, NNI recognizes \$4,650 in 2019. It recognizes actual costs of \$1,500 and gross profit of \$3,150 (\$4,650 less \$1,500).

In the final year of the contract, NNI incurs \$10,000 in actual costs, bringing the cumulative construction costs incurred to \$14,500. The contract is now 100% complete so that the remaining \$10,230 of revenue is recognized ($\$18,600$ total contract price less the cumulative revenue recognized to date of \$8,370). The year's gross profit recognized is \$230 ($\$10,230$ current year revenue – \$10,000 actual costs for the year).

Estimated Total Costs	2018	2019	2020
Actual construction costs incurred during the year	\$ 3,000	\$ 1,500	\$ 10,000
Construction costs incurred in prior years	0	3,000	4,500
Cumulative construction costs incurred to date	\$ 3,000	\$ 4,500	\$ 14,500
Estimated costs to complete	12,000	5,500	0
Estimated total costs	<u>\$15,000</u>	<u>\$10,000</u>	<u>\$ 14,500</u>
Percent Complete			
Actual (cumulative) costs incurred to date	\$ 3,000	\$ 4,500	\$ 14,500
Estimated total costs	\$15,000	\$10,000	\$ 14,500
Cumulative percent complete	<u>20.00%</u>	<u>45.00%</u>	<u>100.00%</u>
Revenue and Gross Profit Recognition			
Contract price	\$18,600	\$18,600	\$ 18,600
Times: Percent complete	20.00%	45.00%	100.00%
Cumulative revenue	\$ 3,720	\$ 8,370	\$ 18,600
Revenue recognized in prior years	0	3,720	8,370
Current year revenue	\$ 3,720	\$ 4,650	\$ 10,230
Less: Actual costs	3,000	1,500	10,000
Gross profit recognized in the current year	<u>\$ 720</u>	<u>\$ 3,150</u>	<u>\$ 230</u>

Output Measures. In addition to the cost-to-cost approach, which is an input measure of the degree of completion, firms also use output measures in practice. Output measure examples include miles of highway completed or square footage completed of a building. Example 8.22 illustrates the use of an output measure to estimate the percent completed.

Percentage-of-Completion Method Accounting Procedures As a company constructs an asset, it accumulates resources used in construction such as raw materials in an inventory account called **construction in progress (CIP)**. Long-term construction contracts usually allow a company, also called a contractor, to bill the customer periodically over the contract term. When a company bills the customer, it increases accounts receivable with a debit. The credit is to an account called *billings on construction in progress*. **Billings on construction in progress** is a contra account to the construction-in-progress account and reduces the net carrying value of the asset, CIP. In effect, this entry offsets the physical asset in the CIP (inventory) with a financial asset in billings on CIP (accounts receivable). Using the contra account avoids double counting the total asset value.

As discussed, revenue is based on the progress to date (that is, the percentage of the project that has been completed). Unique to accounting for long-term construction contracts, revenue from long-term contracts is credited, the construction costs account is debited, and the debit to the CIP account is the difference between the revenue and the construction cost (the gross profit). At the end of the project, the company removes the CIP account from the books with a credit and removes the billings on construction in progress account with a debit.

At each balance sheet date, the company reports the balance of accounts receivable and the net amount of the CIP and billings on CIP. If the CIP amount is higher than the billings account, the net amount is an asset called **costs and recognized profits in excess of billings**. If, however, the amount in the billings account is higher than in the CIP account, then the net amount is a liability called **billings in excess of costs and recognized profits**.

The measurement of the net asset or net liability position of each contract has implications for financial statement users:

- If the company reports a net asset position, the contract has unbilled receivables. That is, the contractor has an asset, giving the firm the right to bill the buyer for work performed.
- If the company reports a significant amount of unbilled receivables, the buyer may have little capital at risk and can easily abandon the project.
- If the company reports a significant net liability position, this implies that the contractor has received cash in advance and has the obligation to perform on the contract. However, if the contractor expends cash received for alternative uses, there may be insufficient resources to complete the project.

To summarize, the percentage-of-completion method involves the following accounting procedures:

1. Accumulate resources used in construction such as raw materials by increasing an asset (inventory), construction in progress (CIP).
2. When the contractor sends bills to the customer, increase accounts receivable with a debit and increase billings on CIP with a credit.
3. When the contractor receives cash from the customer, increase cash with a debit and decrease accounts receivable with a credit.
4. Recognize the revenue and the associated costs each year, basing the amount of revenue in a given year on the progress to date (that is, the percentage of the project that has been completed). Credit revenue from long-term contracts, debit the construction costs, and debit the difference between the revenue and the cost of the construction (the gross profit) to the CIP account.
5. At each balance sheet date, report the net amount of the CIP and billings on CIP on the balance sheet. An asset, costs and recognized profits in excess of billings, is reported if the CIP is higher than the billings on CIP. A liability, billings in excess of costs and recognized profits, is reported if the billings on construction in progress amount is higher than the CIP. At the end of the project, remove the CIP account from the books with a credit and remove the billings on construction in progress account with a debit.

As discussed, the company estimates revenue on the contract based on progress toward completion. Example 8.22 illustrates the percentage-of-completion method showing all journal entries.

EXAMPLE 8.22 Percentage-of-Completion Method: Output Measure

PROBLEM: Bronco Builders accepts a contract with Steib Stores to construct a strip mall on Route 3 on January 2, 2018. The builder accepts a fixed fee of \$9,300,000 and must complete the project within three years. Costs incurred, estimated total costs, billings, and cash collections are summarized in the following table:

	2018	2019	2020
Actual construction costs incurred during the year	\$1,500,000	\$7,000,000	\$ 500,000
Estimated costs to complete	7,200,000	400,000	0
Progress billings made during the year	4,000,000	3,000,000	2,300,000
Cash collections during the year	3,100,000	3,100,000	3,100,000

The arrangement meets the criteria for recognizing revenue over time, and Bronco Builders uses the percentage-of-completion method of accounting. It determines percent complete using the percentage of the square feet that it has completed. The strip mall will be a total of 40,000 square feet. The following table summarizes the square footage completed each year:

	2018	2019	2020
Cumulative square feet completed	10,000	28,000	40,000

Prepare the journal entries for the three years of the contract and post the journal entries to the appropriate t-accounts. Also prepare a partial income statement and balance sheet for the three years.

SOLUTION: Each year, Bronco follows the percentage-of-completion method procedures by recording:

- Actual construction costs each year with a debit to construction in progress.
- Billings with a debit to accounts receivable and a credit to billings on construction in progress.
- Cash collections with a debit to cash and a credit to accounts receivable.

The journal entries with explanations for these steps follow:

Account	2018		2019		2020	
	Debit	Credit	Debit	Credit	Debit	Credit
Construction in Progress	1,500,000		7,000,000		500,000	
Cash, Materials Inventory, Supplies Inventory, etc.		1,500,000		7,000,000		500,000
To record construction costs						
Accounts Receivable	4,000,000		3,000,000		2,300,000	
Billings on Construction in Progress		4,000,000		3,000,000		2,300,000
To record billings						
Cash	3,100,000		3,100,000		3,100,000	
Accounts Receivable		3,100,000		3,100,000		3,100,000
To record cash collections						

(continued)

Each year, Bronco must also report revenue, costs, and gross profit on the contract. To determine these amounts, we must first compute the percent completed each year based on the ratio of square feet completed to total square feet.

	2018	2019	2020
Cumulative square feet completed	10,000	28,000	40,000
Total square feet	<u>40,000</u>	<u>40,000</u>	<u>40,000</u>
Percent complete	<u>25%</u>	<u>70%</u>	<u>100%</u>

We then use the percent complete to compute the revenue and cost for each year.

	2018	2019	2020
Estimated total revenue	\$9,300,000	\$ 9,300,000	\$9,300,000
Percent complete (from above)	25%	70%	100%
Cumulative revenue	\$2,325,000	\$ 6,510,000	\$9,300,000
Revenue recognized in prior years	<u>0</u>	<u>2,325,000</u>	<u>6,510,000</u>
Current year revenue	\$2,325,000	\$ 4,185,000	\$2,790,000
Less: Actual costs	<u>1,500,000</u>	<u>7,000,000</u>	<u>500,000</u>
Gross profit (loss) recognized in the current year	<u>\$ 825,000</u>	<u>\$ (2,815,000)</u>	<u>\$2,290,000</u>

The journal entries to record the revenue, costs, and gross profit are presented next followed by the t-accounts.

Account	2018		2019		2020	
	Debit	Credit	Debit	Credit	Debit	Credit
Construction Costs	1,500,000		7,000,000		500,000	
Construction in Progress	825,000			2,815,000	2,290,000	
Revenue on Long-term Contract		2,325,000		4,185,000		2,790,000
To record revenue, costs and gross profit						
Billings on Construction in Progress					9,300,000	
Construction in Progress						9,300,000
To close completed contract						

Construction in Progress	
2018 Construction Costs	1,500,000
2018 Gross Profit	825,000
2018 Balance	2,325,000
2019 Construction Costs	7,000,000
	2,815,000
2019 Balance	6,510,000
2020 Construction Costs	500,000
2020 Gross Profit	2,290,000
2020 Balance	9,300,000
	9,300,000
Final 2020 Balance	<u>0</u>

**Billings on Construction
in Progress**

	4,000,000	2018 Billing
	3,000,000	2019 Billing
	7,000,000	2019 Balance
	2,300,000	2020 Billing
	9,300,000	2020 Balance
Close	9,300,000	
	<u>0</u>	Final 2020 Balance

Accounts Receivable

2018 Billing	4,000,000	3,100,000	2018 Collections
2018 Balance	900,000		
2019 Billing	3,000,000	3,100,000	2019 Collections
2019 Balance	800,000		
2020 Billing	2,300,000	3,100,000	2020 Collections
2020 Balance	<u>0</u>		

The partial income statement at the end of each year follows. The income statement includes the revenues, costs, and gross profits we just computed.

	2018	2019	2020
Revenue from Long-Term Contracts	\$ 2,325,000	\$ 4,185,000	\$ 2,790,000
Costs of Construction	<u>1,500,000</u>	<u>7,000,000</u>	<u>500,000</u>
Gross Profit	<u>\$ 825,000</u>	<u>\$(2,815,000)</u>	<u>\$ 2,290,000</u>

The total profit recognized over the life of the contract is \$300,000, which is equal to the total contract price of \$9,300,000 less the total costs of \$9,000,000.

At year end, the balance sheet reports the assets and liabilities associated with the long-term contract. Prior to closing out the contract, the net asset (liability) related to the costs and billings of the contract are as follows:

	2018	2019	2020
Construction in Progress	\$ 2,325,000	\$ 6,510,000	\$ 9,300,000
Billings on Construction in Progress	<u>4,000,000</u>	<u>7,000,000</u>	<u>9,300,000</u>
Net Asset (Liability)	<u>\$ (1,675,000)</u>	<u>\$ (490,000)</u>	<u>\$ 0</u>

	2018	2019	2020
Assets:			
Accounts Receivable	\$ 900,000	\$ 800,000	\$ 0
Costs and Recognized Profits in Excess of Billings			0
Liabilities:			
Billings in Excess of Costs and Recognized Profits	\$ 1,675,000	\$ 490,000	\$ 0

Completed-Contract Method

Companies use the completed-contract method only when they do not meet the criteria required to use percentage-of-completion. The timing of revenue and gross profit recognition is the key to the completed-contract and percentage-of-completion methods. Under the completed-contract

method, a company recognizes revenue each year equal to the actual costs incurred. Thus, the company reports zero gross profit until the project is complete. At the conclusion of the project, the total gross profit is recognized.⁶ The completed-contract approach involves the following accounting procedures:

1. Accumulate construction costs by debiting an asset (inventory) account called construction in progress (CIP).
2. Increase accounts receivable with a debit and increase with a credit the account billings on CIP when the contractor bills the customer.
3. Increase cash with a debit and decrease accounts receivable with a credit when the contractor receives cash from the customer.
4. Recognize the actual costs incurred and the same amount of revenue each year. Credit revenue from long-term contracts and debit the construction costs. Record the total gross profit only at the conclusion of the project.
5. Report the net amount of the CIP and billings on CIP on the balance sheet at each balance sheet date. An asset, costs in excess of billings, is reported if the CIP is higher than the billings on CIP. A liability, billings in excess of costs, is reported if the billings on CIP are higher than the CIP. At the end of the project, remove from the books the CIP account with a credit and the billings on construction in progress account with a debit.

The completed-contract method accounting procedures in Steps 1, 2, 3, and 5 are the same as the percentage-of-completion method. The timing of revenue and gross profit recognition in Step 4 is the key difference between the completed-contract and percentage-of-completion methods. Example 8.23 illustrates the completed-contract method.

EXAMPLE 8.23 Completed-Contract Approach

PROBLEM: Bronco Builders accepted a contract with Steib Stores to construct a strip mall on Route 3 on January 2, 2018. The builder accepted a fixed fee of \$9,300,000 and must complete the project within three years. Costs incurred, billings, and cash collections are summarized in the following table. The arrangement does not meet any of the three criteria necessary to recognize revenue over time, so Bronco Builders uses the completed-contract method of revenue recognition. Prepare the t-accounts and journal entries for the three years of the contract. Also prepare a partial income statement and balance sheet for the three years.

	2018	2019	2020
Actual construction costs incurred during the year	\$1,500,000	\$7,000,000	\$ 500,000
Progress billings made during the year	4,000,000	3,000,000	2,300,000
Cash collections during the year	3,100,000	3,100,000	3,100,000

SOLUTION: Each year, Bronco follows the completed-contract approach procedures by recording:

- Actual construction costs each year with a debit to construction in progress.
- Billings with a debit to accounts receivable and a credit to billings on construction in progress.
- Cash collections with a debit to cash and a credit to accounts receivable.
- Revenues and costs based on the amount of actual costs incurred.

⁶This approach is slightly different than the U.S. GAAP revenue recognition rules that were effective prior to December 15, 2017. The completed-contract approach used previously did not recognize any costs or revenues until the completion of the project. However, FASB ASC 606-10-25-37 states that revenue should be recognized to the extent of the costs incurred. Also, this new approach is simplified somewhat. Some costs will actually be capitalized and amortized in a systematic basis consistent with the transfer of the good or service to the customer.

We record the gross profit for the entire project in 2020 when Bronco completes the project. The revenue for the project is \$9,300,000 as agreed on by the buyer and seller. The costs were \$9,000,000, leaving a gross profit (debited to construction in progress) of \$300,000 in the final year of the project. Finally, we close the billings on construction in progress and construction in progress accounts.

The journal entries and t-accounts are below.

Account	2018		2019		2020	
	Debit	Credit	Debit	Credit	Debit	Credit
Construction in Progress	1,500,000		7,000,000		500,000	
Cash, Materials Inventory, Supplies Inventory, etc.		1,500,000		7,000,000		500,000
To record construction costs						
Accounts Receivable	4,000,000		3,000,000		2,300,000	
Billings on Construction in Progress		4,000,000		3,000,000		2,300,000
To record billings						
Cash	3,100,000		3,100,000		3,100,000	
Accounts Receivable		3,100,000		3,100,000		3,100,000
To record cash collections						
Construction in Progress					300,000	
Construction Costs	1,500,000		7,000,000		500,000	
Revenue on Long-Term Contract		1,500,000		7,000,000		800,000
To record revenue and costs (and gross profit in 2020)						
Billings on Construction in Progress					9,300,000	
Construction in Progress						9,300,000
To close completed contract						

Construction in Progress

2018 Construction Costs	1,500,000	
2019 Construction Costs	7,000,000	
2019 Balance	8,500,000	
2020 Construction Costs	500,000	
2020 Gross Profit	300,000	
2020 Balance	9,300,000	
		9,300,000 Close
Final 2020 Balance	<u>0</u>	

Billings on Construction in Progress

	4,000,000	2018 Billing
	3,000,000	2019 Billing
	7,000,000	2019 Balance
	2,300,000	2020 Billing
	9,300,000	2020 Balance
Close	9,300,000	
	<u>0</u>	Final 2020 Balance

(continued)

Accounts Receivable			
2018 Billing	4,000,000	3,100,000	2018 Collections
2018 Balance	900,000		
2019 Billing	3,000,000	3,100,000	2019 Collections
2019 Balance	800,000		
2020 Billing	2,300,000	3,100,000	2020 Collections
2020 Balance	<u>0</u>		

The partial income statement for each year follows. As is always the case under the completed-contract method, revenue equals costs of construction and the income statement includes zero gross profit for the long-term contract until the year the project is completed. In 2020, the final year, Bronco reports the actual costs incurred of \$500,000 and the remaining revenues of \$800,000. Thus, Bronco has reported total revenues of \$9,300,000 and the total costs of \$9,000,000 for the contract.

	2018	2019	2020
Revenue from Long-Term Contracts	\$ 1,500,000	\$7,000,000	\$800,000
Costs of Construction	<u>1,500,000</u>	<u>7,000,000</u>	<u>500,000</u>
Gross Profit	<u>\$ 0</u>	<u>\$ 0</u>	<u>\$300,000</u>

At year end, the balance sheet reports the assets and liabilities associated with the long-term contract. Prior to closing out the contract, we compute the net asset (liability) related to the costs and billings of the contract as follows:

	2018	2019	2020
Construction in Progress	\$ 1,500,000	\$8,500,000	\$ 9,300,000
Billings on Construction in Progress	<u>4,000,000</u>	<u>7,000,000</u>	<u>9,300,000</u>
Net Asset (Liability)	<u>\$(2,500,000)</u>	<u>\$1,500,000</u>	<u>\$ 0</u>

	2018	2019	2020
Assets:			
Accounts Receivable	\$ 900,000	\$ 800,000	\$ 0
Costs in Excess of Billings		1,500,000	
Liabilities:			
Billings in Excess of Costs	\$ 2,500,000	\$ 0	\$ 0

- 8 Describe and demonstrate the accounting for special issues in revenue recognition, including right-to-return sales, consignment sales, principal-agent sales, bill-and-hold arrangements, and channel stuffing.

Special Issues in Revenue Recognition

We next discuss various special issues in revenue recognition including *right-to-return sales*, *consignment sales*, *principal-agent transactions*, *bill-and-hold transactions*, and *channel stuffing*.⁷

Right-to-Return Sales

When a company makes a **right-to-return sale**, it is providing customers with the ability to return a product that has been transferred to them. The seller is obligated to accept the returned product if the buyer chooses to return it. The right of return does not represent a separate performance obligation but rather is a component of variable consideration affecting the transaction price. The entity recognizes the amount of expected returns as a refund liability, which represents its obligation to the customer to stand ready to receive the returned product and refund the customer's

⁷Warranties are covered in Chapter 13.

consideration (or provide the customer with a credit or a different product). The seller does not recognize revenue for the amount of expected returns until the amounts are no longer subject to the constraint, such as at the end of the return period. In addition to recording a refund liability, the seller must reduce the cost of goods sold by the amount of costs attributable to the products that it expects will be returned. However, the seller should continue to reduce the inventory by the full amount of the cost of sales. The seller recognizes the offset as an asset that it records separately from inventory. Example 8.24 illustrates accounting for a sale with the right of return.

EXAMPLE 8.24 Revenue Recognition with Right of Return

PROBLEM: On December 3, Haxbo, Inc. sold merchandise costing \$100,000 to a customer for \$140,000 cash and anticipated that 10% of the merchandise would be returned. On December 28, Haxbo refunded \$10,000 for the return of a portion of the merchandise. The cost of the merchandise returned is \$7,143. Assume Haxbo uses the perpetual inventory system. What is the journal entry to record the sale and the sales return?

SOLUTION: On December 3, Haxbo records the sale at 90% of \$140,000 and a refund liability for the 10% expected returns.

<i>Account</i>	<i>December 3</i>	
Cash	140,000	
Refund Liability		14,000
Sales Revenue		126,000

Haxbo also records the cost of goods sold at 90% of \$100,000 and records a separate inventory asset for the 10% expected return.

<i>Account</i>	<i>December 3</i>	
Cost of Goods Sold	90,000	
Other Assets – Estimated Returns	10,000	
Inventory		100,000

On December 28, Haxbo records the sales return by debiting the refund liability and crediting cash.

<i>Account</i>	<i>December 28</i>	
Refund Liability	10,000	
Cash		10,000

In addition, Haxbo will increase inventory and decrease the estimated return inventory account for \$7,143.

<i>Account</i>	<i>December 28</i>	
Inventory	7,143	
Other Assets – Estimated Returns		7,143

Consignment Sales

A **consignment sale** is an arrangement in which a seller (referred to as the consignor) delivers goods to a third party (the consignee), who sells the goods to the customer. A consignment sale is an example of a **principal-agent arrangement** in which one party (the agent) acts on behalf

of another party (the principal). In this case, the consignor is the principal and the consignee is the agent.

Consignment sales—for goods such as books, furniture, musical instruments, toys, automobiles, and sporting goods—are quite common in practice. For example, a retailer of musical instruments can hold a piano from a manufacturer that it will sell on a consignment basis. eBay drop-off sites make use of consignment sales.

Determining whether a particular arrangement is a consignment arrangement is based on whether the seller passes control to the other party. If so, then it is a normal sale. If not, then it qualifies as a consignment arrangement. The authoritative literature provides three indicators that an arrangement is a consignment arrangement.

1. The seller controls the product until a specified event occurs, such as the sale to the ultimate consumer.
2. The seller can require that the product be returned to it or sent to another third party.
3. The third party does not have an unconditional obligation to pay for the product.

The parties must use judgment to determine whether control has passed based on these indicators. If an arrangement is classified as a consignment arrangement, the consignee does not record the inventory on its books, and the consignor does not record revenue when the goods are delivered. Rather, on the delivery date, the consignor credits inventory and debits inventory on consignment, and the consignee makes no entry. The consignor records revenue, along with the commission expense and receivable or cash, upon notification that the consignee has sold the inventory. The consignor will also record cost of goods sold and remove the inventory on consignment from its books. When the consignee sells the inventory, it records commissions revenue and an amount that is due to the consignor for the sale. Example 8.25 illustrates recording consignment sales.

EXAMPLE 8.25 Consignment Sales

PROBLEM: Wessel Guitars delivers its products to small musical instrument retailers on consignment. Wessel shipped four guitars with a total cost of \$10,000 to Barchester Music Center on February 18 of the current year. Barchester accepted the guitars on consignment. The guitars have a combined retail selling price of \$16,000. If Barchester sells the guitars, it will be paid a 20% commission on the total retail price of the products. Barchester sold all four guitars on April 20 for cash. It notified Wessel of the sale and remitted the cash, net of the 20% commission, on April 21. Both companies use the perpetual inventory method. Prepare the journal entries for Wessel and for Barchester to record the consignment transactions.

SOLUTION: Wessel Guitars, the consignor, uses a special inventory account to record the inventory out on consignment. Wessel reclassifies the amount of inventory consigned from its regular inventory account to an account called inventory on consignment. The reclassification entry is made on February 18, the date of delivery.

Account	February 18	
Inventory on Consignment	10,000	
Inventory		10,000

Wessel waits until April 21 to record revenue and the commission expense because this is the date of notification that the consignee sold the inventory.

Account	April 21	
Cash	12,800	
Sales Commission Expense (20% × \$16,000)	3,200	
Sales Revenue		16,000

Wessel also records the cost of goods sold on the date of notification, April 21.

Account	April 21	
Cost of Goods Sold	10,000	
Inventory on Consignment		10,000

Barchester does not make any entry when it receives the inventory. When it sells the inventory on April 20, it records the cash and a liability to the consignor as well as its commission earned.

Account	April 20	
Cash	16,000	
Due to Consignor		12,800
Commissions Revenue		3,200

On April 21, it records the remittance of the cash to Wessel.

Account	April 21	
Due to Consignor	12,800	
Cash		12,800

Other Principal-Agent Transactions

Other common principal-agent transactions—such as travel agency transactions, transactions related to advertisements and mailing lists, and auction transactions—require special accounting. For example, a travel agent can arrange airline tickets, hotel reservations, and car rentals, or travelers can make these arrangements online using a service such as *Priceline.com*. Whether the arrangements are made in person or online, the agent will recognize some amount of revenue.

To illustrate, let's assume that a travel agent books a flight for a client. Conceptually, there are two options for recognizing the revenue:

1. Record the total amount of the ticket (the gross amount) as revenue and recognize the cost of sales for the amount remitted to the airline. The **gross revenue reporting approach** records the gross amount as revenue and the amount remitted to the supplier of the product in cost of revenues.
2. Record only the net fee—that is, the amount billed to the customer less the amount paid to the airline for the tickets. The **net revenue reporting approach** records only the net amount in revenue.

An entity determines which of these methods to use based on whether it is the principal or the agent in the transaction. If the entity obtains control of the product before passing it to the consumer, it is the principal and should use the gross revenue reporting approach. If it never obtains control, then it is the agent and should use the net revenue reporting approach. For example, *Priceline.com Incorporated*, the online travel company, uses both methods depending on the types of transactions. For transactions in which *Priceline* is the seller of record—that is, it selects suppliers and determines the price it will accept from the customer—it uses the gross revenue reporting approach. In transactions in which customers purchase hotel room reservations or rental car reservations directly from suppliers at disclosed contractual rates, *Priceline* recognizes revenue using the net revenue reporting approach.

Gross profit is the same under the gross and net methods—so is the approach used important to the financial statement user? Because companies are often evaluated, at least partially, on their revenues, the implications of the two different approaches can be significant, as illustrated in Example 8.26.

EXAMPLE 8.26 Principal-Agent Arrangement

PROBLEM: Youflywithme.com reports the following income statement information for the current year. All sales result from principal-agent transactions. Compare the financial statement presentation under the gross revenue and net revenue reporting approaches.

Youflywithme.com Incorporated	
Statement of Net Income	
For the Year Ended December 31	
Revenues	\$ 500,000
Cost of Revenues	<u>380,000</u>
Gross Profit (Loss)	<u>\$ 120,000</u>

SOLUTION: The following analysis compares the financial statement presentation under the gross revenue reporting and the net revenue reporting approaches.

	Gross Method	Net Method
Revenues	\$ 500,000	\$ 120,000
Cost of Revenues	<u>(380,000)</u>	<u>0</u>
Gross Profit	<u>\$ 120,000</u>	<u>\$ 120,000</u>

The amount of gross profit recognized is the same under either approach. However, reported revenues are significantly higher using the gross method as compared to the net method. If Youflywithme.com controls the product and is the seller of record, then the gross method is correct. If the company acts as an agent for the seller, it must use the net method.

Bill-and-Hold Arrangements

Bill-and-hold arrangements are transactions in which a buyer accepts title and billings but delays the physical receipt of the goods. The buyer may request a delay in delivery for several reasons: a temporary shortage of warehouse space, current excess inventory levels, a significant backlog in the production cycle, or the construction of a new facility.

If the seller has transferred control of the goods to the buyer, then the seller can recognize revenue at the point of sale. The seller determines if it has transferred control by considering the normal indicators of control discussed earlier in the chapter. In addition, the seller must meet all of the following four criteria to claim that it has transferred control to the buyer:

1. The reason for the bill-and-hold must be substantive. An example of this would be that the customer requested the bill-and-hold arrangement.
2. The product must be separately identified as belonging to the customer.
3. The product must be ready for physical transfer to the customer.
4. The seller cannot have the ability to use the product in any way, including delivering it to another customer.

If the seller meets all four of these conditions, it can recognize revenue at the time of sale; otherwise, the seller must wait until it meets the conditions or it delivers the goods to the buyer.

Broadwind Energy, Inc., an alternative energy company, was accused in 2015 of accelerating \$3 million in revenues through improper bill-and-hold arrangements. Broadwind shipped products at the end of the month, knowing customers would not accept them until the next month or period. If **Broadwind** had not misstated its revenue, it would have been at risk of violating its debt covenants.⁸

⁸<https://www.sec.gov/litigation/complaints/2015/comp-pr2015-24.pdf>.

Channel Stuffing

Companies often engage in *channel stuffing* selling practices designed to accelerate revenue recognition. **Channel stuffing** (also referred to as **trade loading**) is a practice in which a company induces wholesale distributors to buy more inventory than they can sell in the current period, thus “stuffing” the distribution channel with increased discounts or liberal return policies. If the distributors cannot sell the inventory in the next period, they return the goods to the seller.

Channel stuffing inflates sales in the current period, thus making the seller’s financial statements look better. Although this technique allows an entity to recognize increased sales in the current period, it reduces the sales in the next period or increases sale returns significantly.⁹ For example, in 2015, **Diageo PLC**, a large U.K. beverage company, was investigated for shipping excess inventory to distributors to increase sales to boost the company’s results.¹⁰ Channel stuffing caused a buildup of the customers’ inventory levels that posed risks to the company’s future sales and earnings.

Firms should not recognize revenue from a channel stuffing arrangement because the risks and rewards of ownership have not passed to the buyer given the buyer’s ability to return the product. Also, the SEC has explicitly stated that a significant increase in the amount of inventory in the distribution channel is a factor that precludes the ability of the seller to make a reliable estimate of returns, meaning the seller should not recognize the revenue.¹¹

9 Detail required disclosures related to revenue recognition.

Disclosures Related to Revenue Recognition

Companies provide extensive revenue recognition disclosures for financial statements users to understand the nature, amount, timing, and uncertainty of revenue and cash flows arising from contracts with customers. Specifically, companies provide both qualitative and quantitative information in two main areas:

- Contracts with customers.
- Significant judgments made, and changes in judgments in applying, the revenue recognition standards.

We discuss each of the two areas next. Additionally, companies must disclose any assets recognized from the costs to obtain or fulfill a contract with a customer.

Contracts with Customers

Companies disclose revenue recognized from a contract with customers separately from other sources of revenue.

Disaggregation of Revenue. Companies provide a detailed disaggregation of their revenues into categories such as revenues by type of goods or services, geographical region, market type of customer, or contract duration. Companies are permitted to choose the approach for disaggregating revenues based on the information about revenue they have presented for other purposes, including earnings releases, annual reports, or investor presentations. Companies should also consider presenting information consistent with what managers regularly review to evaluate the performance of operating segments.

Contract Balances. Quantitative information includes the beginning and ending balances of receivables and unearned revenue from contracts with customers and significant changes in these accounts. Any revenue recognized in the period that was included in the beginning unearned revenue balance should be reported. Further, companies should disclose revenue recognized in the period from performance obligations satisfied (or previously satisfied) in previous periods, such as changes in transaction price. Companies must explain how the timing of satisfaction of their performance obligations relates to the typical timing of payment. In turn, companies should

⁹Sales in the next period may not be affected if channel stuffing can be repeated in the following year.

¹⁰<https://www.wsj.com/articles/sec-investigating-smirnoff-maker-diageo-1437678975>

¹¹See Securities and Exchange Commission, SAB Topic 13.A.4.b.

discuss how the timing of satisfaction of their performance obligations affect the contract asset and contract liability balances.

Performance Obligations. Companies provide information about performance obligations in contracts with customers, including descriptions of:

- When the company typically satisfies its performance obligations (for example, upon shipment, upon delivery, or as services are rendered, including when performance obligations are satisfied in a bill-and-hold arrangement).
- The significant payment terms, when payment is due, whether there is variable consideration and if it is constrained, whether there is a significant financing component.
- The nature of goods or services that the entity has promised to transfer, highlighting any performance obligations to arrange for another party to transfer goods or services (an entity or acting as an agent).
- Obligations for return, refunds, or similar obligations.
- Types of warranties and related obligations.

Transaction Price Allocated to the Remaining Performance Obligations.

Companies disclose the total amount of transaction prices related to any performance obligations that are unsatisfied (or partially satisfied) at the end of the period. Companies also explain when they expect to recognize the amount as revenue. As a practical matter, companies need not provide disclosure if the performance obligation is part of a contract that has an original expected duration of one year or less or there is a right to consideration based on the value of performance to date. Example 8.27 illustrates disclosure of the transaction price allocated to the remaining performance obligations.

EXAMPLE 8.27 Required Disclosures

PROBLEM: On September 1, 2018, Shiney Company enters into two contracts with separate customers to provide services. Each contract has a two-year non-cancellable term. Shiney considers the guidance in each contract to be included in the disclosure of the transaction price allocated to the remaining performance obligations at December 31, 2018.

Contract A. Cleaning services are to be provided over the next two years typically at least once per month. For services provided, the customer pays Shiney an hourly rate of \$50.

Contract B. Cleaning services and lawn services are to be provided only as and when needed with a maximum of four visits per month over the next two years. The customer pays Shiney a fixed price of \$500 per month for both services. Shiney measures its progress toward complete satisfaction of the performance obligation using the passage of time.

Determine the required disclosures related to the remaining performance obligations in Contract A and Contract B.

SOLUTION: Related to Contract A: Because Shiney bills a fixed amount for each hour of service, it has a right to invoice the customer in the amount corresponding directly with the value of its performance completed to date. Consequently, Shiney has no disclosure as a practical matter because it has the right to consideration based on the value of its performance to date.

Related to Contract B: Shiney discloses the amount of the transaction that has not yet been recognized as revenue in a table that illustrates when the company expects to recognize the revenue. The information for Contract B included in the overall disclosure is as follows:

	2019	2020	Total
Revenue expected to be recognized on this contract as of December 31, 2018	<u>\$6,000*</u>	<u>\$4,000**</u>	<u>\$10,000</u>
*\$6,000 = \$500 × 12 months estimated			
**\$4,000 = \$500 × 8 months estimated			

Interview

MICHAEL HALL PARTNER, KPMG »

Michael Hall

Michael Hall is a Partner in KPMG's National Office. Prior to that, he was a partner in KPMG's Accounting Advisory Practice. Mr. Hall also spent 11 years in KPMG's Audit Practice.

- 1 Why is revenue so important to financial statement preparers and investors?

Revenue is an important measure of a company's success and trends in performance over time. Investment analysts measure revenue based on different indicators for each industry they follow. Over time, there has been give-and-take in the analysts and financial statement preparers to arrive at a revenue recognition method understandable to the analysts.

- 2 The FASB and the IASB passed new standards for revenue recognition in May 2014. Why was it important to the Boards to significantly change the revenue recognition standards?

Prior to this project, there was no comprehensive revenue recognition standard adaptable across entities, industries, and capital markets. Prior U.S. GAAP was an amalgamation of revenue recognition standards adopted over time and as industries developed. Individual entities may have chosen accounting policies and approaches that differed from their industry peers. For example, applications of revenue recognition guidelines can vary among large aerospace companies because each can make different judgments on when revenue is recognizable.

Industries also formed their own accounting practices. The original principles of revenue recognition were written well before there was a software industry. Software companies had to promote industry-specific standards. Other industries that developed industry-specific standards over time include building and construction, real estate, telecommunications, and asset management. Thus, the FASB and IASB jointly issued new revenue standards that include a five-step model to remove inconsistencies across entities, industries, and capital markets, replacing almost all existing U.S. GAAP and IFRS guidance.

- 3 Under the new rules, companies recognize revenue when the seller has passed control of the goods or services to the buyer. What are the objectives of this standard?

The objectives of the standard include (1) removing inconsistencies and weaknesses in the existing requirements to improve comparability, (2) providing more useful information through disclosure requirements, (3) providing a more robust framework for addressing revenue issues, and (4) simplifying financial statements by providing one revenue framework. The new standard provides a logical set of steps to determine whether revenue should be recognized. The lens of control, under the new rules, is intended to be a precise means of evaluating whether revenue is realized (or realizable) or earned.

- 4 We have seen some notorious frauds related to revenue recognition over the years. Why is revenue a popular place to commit fraud?

Revenue is a common place for fraud because it is a significant measure of a company's success. Fraud relating to revenue recognition can come in two forms—intentional, improper revenue recognition methodology or intentional, improper recording of the transactions. Furthermore, management is often compensated based on the level of sales revenue, which can create an incentive for overstatement.

- 5 What are some areas in revenue recognition that involve judgment?

The intention of the five-step process is to allow companies to use the same framework when making judgments. The new standards don't eliminate all disparities, and we will still have differences in judgments and circumstances. Companies, even in the same industry, have different types of contracts and contract terms.

For example, assume that Company A sells widgets to Company B. Company A charges one price for both the widgets and shipping and handling. Company A generally provides replacements for widgets damaged during the shipping process. A question arises as to how many performance obligations Company A would have relating to this contract. Judgment would be applied because the potential performance obligations would be sales of widgets, delivery, and potential risk of loss coverage. Then Company A would need to determine whether such performance obligations are separate and distinct or could be bundled together for purposes of allocating the transaction price.

Discussion Questions

1. In his interview, Michael Hall indicates that revenue is a common place for fraud because it is a significant measure of a company's success. Briefly describe two U.S. or international accounting fraud cases related to improper revenue recognition.
2. Discuss areas of judgment that may be needed to apply the five steps of revenue recognition.

Significant Judgments in Revenue Recognition

Companies disclose the judgment and changes in judgments made in applying the revenue recognition guidance. Companies provide a description of the timing of satisfaction of performance obligations, including the methods used to recognize revenue and an explanation of why the methods provide a faithful depiction of the transfer of goods or service. Companies also disclose information about the transaction price and the amounts allocated to performance obligations based on:

- Determining the transaction price, including estimating variable consideration, adjustments for time value of money, and measuring noncash consideration.
- Assessing whether an estimate of variable consideration is constrained.
- Allocating the transaction price, including standalone selling prices and variable consideration.
- Measuring obligations for returns, refunds, or other similar obligations.

FINANCIAL STATEMENT ANALYSIS

Comparison of the Percentage-of-Completion and Completed-Contract Methods

In this section, we highlight the financial statement effects of the percentage-of-completion versus the completed-contract methods. The primary criticism of the completed-contract method is that it does not properly measure economic activity. This criticism is avoided under the percentage-of-completion method.

The total revenues and costs for a long-term contract are the same under the completed-contract and percentage-of-completion methods. However, the timing of revenue and gross profit recognition on the contract differs with the methods. The percentage-of-completion method recognizes gross profit over the production period whereas the completed-contract method recognizes gross profit only at the end of the contract. The following tables based on the Bronco Builders illustrations from Examples 8.22 and 8.23 compare the gross profit recognized and the net asset or net liability reported each year under the two revenue recognition methods.

Year	Gross Profit (Loss) Recognized	
	Percentage of Completion	Completed Contract
2018	\$ 825,000	\$ 0
2019	(2,815,000)	0
2020	<u>2,290,000</u>	<u>300,000</u>
Total	<u>\$ 300,000</u>	<u>\$ 300,000</u>

Total gross profit recognized, \$300,000, is the same; only the timing of recognition differs. The percentage-of-completion method best measures economic activity as it reports gross profit as production takes place each year.

Year	Net Asset (Liability) Position	
	Percentage of Completion	Completed Contract
2018	\$(1,675,000)	\$(2,500,000)
2019	(490,000)	1,500,000
2020	0	0

The percentage-of-completion method also best measures the net asset (liability) position of the contractor. The difference in the valuation of the net asset (liability) is due to the recognition of gross profit only under the percentage-of-completion method. Failure to recognize gross profit under the completed-contract method overstates the net liability or understates the net asset. Therefore, financial statement ratios using amounts such as revenue, net income, total assets, liabilities, and equity differ in the two methods.

Financial Statement Analysis, continued

Because the percentage-of-completion method recognizes gross profit over the production process, revenues and net income will typically be higher in early years than under the completed-contract method. Therefore, the profit margin ratio will be higher under the percentage-of-completion method. Under the percentage-of-completion method, assets are generally higher (and liabilities are lower) because the asset construction-in-progress includes a portion of the estimated profits. Equity is also higher under the percentage-of-completion method because profit is recognized. Therefore, the debt-to-equity ratio will generally be lower under the percentage-of-completion method. Exhibit 8.8 summarizes these effects on common ratios.

EXHIBIT 8.8 Select Financial Statement Ratios: Percentage-of-Completion Method versus Completed-Contract Method

Measure	Expectation	Explanation
Profit Margin = $\frac{\text{Net Income}}{\text{Sales}}$	Generally higher under the percentage-of-completion method	Revenues (sales) and gross profit are generally reported earlier with percentage-of-completion. Higher gross profits increase net income. However, it may be lower if there is a loss on the contract.
Debt-to-Equity Ratio = $\frac{\text{Total Liabilities}}{\text{Total Shareholders' Equity}}$	Generally lower under percentage-of-completion method	Liabilities are lower; assets are generally higher because percentage-of-completion includes a portion of estimated profits in construction in progress. Shareholders' Equity is higher when profit is reported. However, the debt-to-equity ratio may be higher if there is a loss on the contract under percentage-of-completion.

Example 8.28 illustrates and compares these financial statement analysis ratios under the percentage-of-completion and completed-contract methods.

EXAMPLE 8.28 Financial Statement Ratios: Percentage-of-Completion and Completed-Contract Methods

PROBLEM: Use the following information related to Bronco Builders based on Examples 8.22 and 8.23 to answer the following questions.

Percentage-of-Completion Method

Income Statement Information	For the Year		
	2018	2019	2020
Revenue from long-term contracts	\$2,325,000	\$ 4,185,000	\$2,790,000
Costs of construction	1,500,000	7,000,000	500,000
Gross profit (loss)	<u>\$ 825,000</u>	<u>\$(2,815,000)</u>	<u>\$2,290,000</u>

Balance Sheet Information	End of Year Balances			
	2017	2018	2019	2020
Assets	\$20,000,000	\$22,500,000	\$18,500,000	\$20,300,000
Liabilities	10,000,000	11,675,000	10,490,000	10,000,000
Equity	10,000,000	10,825,000	8,010,000	10,300,000

(continued)

Financial Statement Analysis, continued

Completed-Contract Method

Income Statement Information	For the Year		
	2018	2019	2020
Revenue from long-term contracts	\$1,500,000	\$7,000,000	\$800,000
Costs of construction	<u>1,500,000</u>	<u>7,000,000</u>	<u>500,000</u>
Gross profit	<u>\$ 0</u>	<u>\$ 0</u>	<u>\$300,000</u>

Balance Sheet Information	End of Year Balances			
	2017	2018	2019	2020
Assets	\$20,000,000	\$22,500,000	\$20,000,000	\$20,300,000
Liabilities	10,000,000	12,500,000	10,000,000	10,000,000
Equity	10,000,000	10,000,000	10,000,000	10,300,000

- Compute the profit margins under the percentage-of-completion and completed-contract methods each year. Comment on the differences.
- Compute the debt-to-equity ratios under the percentage-of-completion and completed-contract methods each year. Comment on the differences.

SOLUTION:

- The profit margins under the percentage-of-completion and completed-contract methods each year are computed as follows.

	2018	2019	2020
Percentage-of-Completion Method			
Profit Margin = $\frac{\text{Net Income}}{\text{Revenues}}$	35.5% = $\frac{\$825,000}{\$2,325,000}$	(67.3)% = $\frac{\$(2,815,000)}{\$4,185,000}$	82.1% = $\frac{\$2,290,000}{\$2,790,000}$
Completed-Contract Method			
Profit Margin = $\frac{\text{Net Income}}{\text{Revenues}}$	0% = $\frac{\$0}{\$1,500,000}$	0% = $\frac{\$0}{\$7,000,000}$	37.5% = $\frac{\$300,000}{\$800,000}$

The profit margin under the completed-contract method is 0% in 2018 and 2019 as expected. Under the percentage-of-completion method, profit margin varies with estimated revenues and gross profit. Note also, under both methods, the profit margin on the contract overall is 3.2% (total net income of \$300,000 divided by total revenues of \$9,300,000).

- The debt-to-equity ratios under the completed-contract and percentage-of-completion methods each year are computed below.

	2018	2019	2020
Percentage-of-Completion Method			
Debt-to-Equity Ratio = $\frac{\text{Total Liabilities}}{\text{Total Shareholders' Equity}}$	1.08 = $\frac{\$11,675,000}{\$10,825,000}$	1.31 = $\frac{\$10,490,000}{\$8,010,000}$	0.97 = $\frac{\$10,000,000}{\$10,300,000}$
Completed-Contract Method			
Debt-to-Equity Ratio = $\frac{\text{Total Liabilities}}{\text{Total Shareholders' Equity}}$	1.25 = $\frac{\$12,500,000}{\$10,000,000}$	1.0 = $\frac{\$10,000,000}{\$10,000,000}$	0.97 = $\frac{\$10,000,000}{\$10,300,000}$

The debt-to-equity ratio is lower in 2018 under the percentage-of-completion method than the completed-contract method, as expected. In 2019, the debt-to-equity ratio is higher under the percentage-of-completion method because a loss is reported. In the last year of the contract, the debt-to-equity ratio is the same under both methods because the same amounts of net income are earned over the life of the contract.

Summary by Learning Objectives

In the following, we summarize the main points by learning objectives. Throughout the chapter, we discuss the accounting and reporting of U.S. GAAP and IFRS side-by-side. The table below also highlights the major similarities and differences between the standards.

1 Understand basic revenue recognition and measurement issues.	
Summary	Similarities and Differences between U.S. GAAP and IFRS
<p>A company should recognize revenue when it transfers control of an asset (either a good or service) to a customer. A company recognizes as revenue the amount it expects to be entitled to receive in exchange for the goods or services. The company recognizes revenue as it satisfies each performance obligation. The five steps in revenue recognition are:</p> <ol style="list-style-type: none"> 1. Identify the contract(s) with a customer. 2. Identify the performance obligations in the contract. 3. Determine the transaction price. 4. Allocate the transaction price to the performance obligations. 5. Recognize revenue when, or as, each performance obligation is satisfied. 	<p>Similar under U.S. GAAP and IFRS.</p>
2 Explain how to identify a contract with a customer.	
Summary	Similarities and Differences between U.S. GAAP and IFRS
<p>A contract is an agreement between two or more parties that creates enforceable rights and obligations. A contract must meet the following five criteria:</p> <ol style="list-style-type: none"> 1. All parties agree to the contract and commit to performing. 2. Each party's rights are identifiable. 3. Payment terms are identifiable. 4. The contract has commercial substance. 5. Collection of consideration is probable. <p>If the five criteria are not met, then the entity recognizes revenue when consideration is received and one of the following occurs:</p> <ol style="list-style-type: none"> 1. The seller has no remaining obligations to transfer goods or services and substantially all (or all) of consideration has been received by the seller and is nonrefundable, or 2. The contract has been terminated and any consideration already received from the customer is nonrefundable, or 3. The seller has transferred control of the goods or services, is no longer transferring the goods or services, has no obligation to transfer additional goods or services, and the consideration received is nonrefundable. <p>When there are multiple contracts, combine individual contracts into a single contract to determine the timing and measurement of revenue if one of the following criteria is met:</p> <ol style="list-style-type: none"> 1. The contracts are negotiated as a package and have a single commercial objective. 2. The amount of consideration to be received by the seller related to one contract depends on the price or performance of another contract. 3. The goods or services promised in the separate contracts are part of one performance obligation. 	<p>► Similar under U.S. GAAP and IFRS except for the following. IFRS defines probable as "more likely than not" whereas U.S. GAAP defines probable as "likely to occur" in the fifth criterion.</p> <p>IFRS does not explicitly include the third condition to evaluate when to recognize revenue when the criteria for a contract are not met.</p>

*Summary by Learning Objectives, continued***3 Identify the separate performance obligations in a contract, including determining whether there are distinct goods or services.**

Summary	Similarities and Differences between U.S. GAAP and IFRS
<p>A performance obligation is either:</p> <ol style="list-style-type: none"> 1. a promise to transfer a good or service, or a bundle of goods or services, that is distinct, or 2. a promise to transfer a series of distinct goods or services that are substantially the same and have the same pattern of transfer to the customer. <p>To be distinct, a good or service must:</p> <ol style="list-style-type: none"> 1. benefit the customer on its own or in conjunction with other resources that are readily available to the customer, and 2. be separately identifiable from other promises in the contract. 	<p>Similar under U.S. GAAP and IFRS.</p>

4 Explain how to determine the transaction price in recognizing revenue.

Summary	Similarities and Differences between U.S. GAAP and IFRS
<p>The transaction price is the amount of consideration the company expects to be entitled to as a result of providing goods or services to the customer. Consider the following when determining the transaction price:</p> <ol style="list-style-type: none"> 1. Variable consideration and constraining estimates of variable consideration 2. Significant financing component in the contract 3. Noncash consideration 4. Consideration payable to a customer <p>Variable consideration occurs when the payment received for providing a good or service is not a fixed amount. Estimate variable consideration using one of two acceptable approaches:</p> <ol style="list-style-type: none"> 1. Expected-value approach uses the sum of the probability-weighted amounts in a range of possible consideration amounts. 2. Most-likely-amount approach uses the single most likely amount in a range of possible consideration amounts. <p>To include variable consideration in the estimated transaction price (and thus revenue), the company has to conclude that it is probable that a significant revenue reversal will not occur in future periods.</p> <p>A significant financing component may occur either when</p> <ul style="list-style-type: none"> • Delivery of the goods or services happens far in advance of payment. In this case, the seller is providing financing to the buyer. • Delivery occurs well after payment. In this case, the buyer is providing financing to the seller. <p>When the time between payment and delivery is more than one year, separate the contract revenue from the financing component, if significant.</p> <p>When the contract includes noncash consideration, measure the transaction price at the fair value at contract inception of the noncash consideration.</p> <p>Consideration payable is deducted from the transaction price unless the payment to the customer is in exchange for a distinct good or service.</p>	<p>► Similar under U.S. GAAP and IFRS except in estimating the constraints on variable consideration. U.S. GAAP uses the term “probable,” whereas IFRS uses the term “highly probable.” The definitions of “probable” under U.S. GAAP and “highly probable” under IFRS are essentially the same.</p>

Summary by Learning Objectives, continued

5 Demonstrate allocating the transaction price to performance obligations when recognizing revenue.	
Summary	Similarities and Differences between U.S. GAAP and IFRS
<p>Determine the standalone selling price of the goods or services that underlie each performance obligation to allocate the transaction price. If the sum of the standalone selling prices is greater than the transaction price, allocate this discount to the separate performance obligations on the basis of the relative standalone selling prices.</p> <p>To determine the standalone selling price of each performance obligation, determine the price the seller would charge for those goods or services if it sold the same goods or services on a standalone basis to similar customers under similar circumstances.</p> <p>When the seller does not sell the same goods or services separately, estimate the selling prices that maximize the use of observable inputs. Three suggested approaches are:</p> <ol style="list-style-type: none"> 1. Adjusted market assessment approach: Evaluate the market and estimate the price that customers would pay. 2. Expected cost plus a margin approach: Forecast costs associated with providing the goods or services and add an appropriate profit margin. 3. Residual approach: Estimate one or more, but not all, of the standalone selling prices and allocate the remainder of the transaction price, or the residual amount, to the goods or services for which it does not have a standalone selling price estimate. 	<p>Similar under U.S. GAAP and IFRS.</p>
6 Assess whether to recognize revenue when, or as, each performance obligation is satisfied.	
Summary	Similarities and Differences between U.S. GAAP and IFRS
<p>Recognize revenue when the goods or services are transferred to the customer. A good or service is transferred when the customer obtains control, the ability to direct the use of the asset, and gets all (or substantially all) of the remaining benefits of owning the asset.</p> <p>Goods and services can be transferred over time or at a point in time. Goods or services are transferred over time if any of the following three criteria are met:</p> <ol style="list-style-type: none"> 1. The customer receives and consumes the benefits of the goods or services simultaneously. 2. The customer controls the asset as the seller creates it or enhances it over time. 3. The asset the seller is creating does not have an alternative use to the seller and the seller has an enforceable right to payment for the performance completed to date. <p>If the transfer is over time, then recognize revenue over that same time period based on the progress that it has made toward completion. If the seller cannot reasonably measure the progress toward completion, then it should recognize revenue when progress is reasonably estimable. Measure progress toward completion using either an output method or input method.</p> <p>If the three criteria to recognize revenue are not met, then assume that the goods or services are transferred at a point in time.</p>	<p>Similar under U.S. GAAP and IFRS.</p>

Summary by Learning Objectives, continued

- 7** Describe the accounting for long-term contracts, including implementing the percentage-of-completion method and the completed-contract method.

Summary	Similarities and Differences between U.S. GAAP and IFRS
<p>Two common methods are percentage-of-completion and completed contract.</p> <p>Use the percentage-of-completion method when the company meets one of the three criteria for transfer of control and can reasonably measure its progress toward completion.</p> <p>If the contract does not meet any of the three criteria or if the entity cannot reasonably measure progress toward completion, then use the completed-contract method.</p> <p>Use the percentage-of-completion method when the company is able to make reliable estimates of the degree of completion and the seller meets one of three criteria necessary for goods transferred over time. Use either an input measure (such as costs) or an output measure (such as miles of road paved) to determine the percentage-of-completion. Recognize both revenues and gross profit based on the project's stage of completion by:</p> <ol style="list-style-type: none"> 1. Computing cumulative revenue by multiplying the total estimated contract revenue times the percentage complete. Revenue for the period is cumulative revenue less revenue recognized in all prior periods. 2. Actual costs will be given for the period in question. 3. Computing gross profit for the year as the revenue recognized in the period in (1) above less the actual costs recognized in the period in (2) above. <p>The steps to implement the percentage-of-completion method are:</p> <ol style="list-style-type: none"> 1. Accumulate construction costs in an asset (inventory) account called construction in progress (CIP). 2. Periodically bill the customer. Debit accounts receivable and credit an account called billings on construction in progress. Billings on construction in progress is a contra account to the construction in progress account. The contra account reduces the net carrying value of the asset, CIP. 3. When cash is received from the customer, increase cash and decrease accounts receivable. 4. Each year, recognize the revenue and the associated gross profit. The amount of gross profit that is recognized in a given year is based on the progress to date. Credit revenue from long-term contracts, debit the cost of construction, and debit the CIP account for the difference between the revenue and the cost of the contract (the gross profit). 5. At the end of the project, remove the CIP account and the billings on construction in progress account from the books. <p>The completed-contract approach involves the following accounting procedures:</p> <ol style="list-style-type: none"> 1. Accumulate construction costs by debiting an asset (inventory) account called construction in progress (CIP). 2. When the contractor sends bills to the customer throughout the project, increase accounts receivable with a debit and increase with a credit the account billings on construction in progress. 3. When the contractor receives cash from the customer, increase cash with a debit and decrease accounts receivable with a credit. 4. Recognize the actual costs incurred and the same amount of revenue each year. Thus, the firm reports no gross profit. Record the total gross profit at the conclusion of the project. 5. At the end of the project, remove from the books the CIP account with a credit and the billings on construction in progress account with a debit. <p>The timing of revenue and gross profit recognition in Step 4 is the key difference between the completed-contract method and percentage-of-completion methods. The income statement reports revenue equal to costs (until the period in which the project is completed).</p>	<p>Similar under U.S. GAAP and IFRS.</p>

Summary by Learning Objectives, continued

- 8** Describe and demonstrate the accounting for special issues in revenue recognition, including right-to-return sales, consignment sales, principal-agent sales, bill-and-hold arrangements, and channel stuffing.

Summary	Similarities and Differences between U.S. GAAP and IFRS
<p>The right of return is a component of variable consideration and thus affects the transaction price. Recognize the amount of expected returns as a refund liability, which represents the seller's obligation to the customer to stand ready to receive the returned product and refund the customer's consideration. Recognize revenue when no longer subject to the constraint, such as at the end of the returns period.</p> <p>A consignment sale is an arrangement in which a seller (the consignor) delivers goods to a third party (the consignee), who attempts to sell the goods to the customer. The consignee does not record sales revenue when the good is sold. Rather, the consignee earns a sales commission fee. The consignor records sales revenue when the consignee sells the goods.</p> <p>There are two approaches to record revenue for arrangements in which an agent is making a sale of a principal's product:</p> <ol style="list-style-type: none"> 1. Gross revenue reporting approach: Agent records the total amount of the item sold as revenue and recognizes the cost of sales for the amount remitted to the principal. 2. Net revenue reporting approach: Only the net fee (the amount billed to the customer less the amount paid to the principal) is recorded. <p>If the company obtains control of the product before passing it to the consumer, it is the principal and should use the gross revenue reporting approach. If the company never obtains control, then it is the agent and should use the net revenue reporting approach.</p> <p>In a bill-and-hold arrangement, a buyer accepts title and billing but delays the physical receipt of the goods. If the seller has transferred control of the goods to the buyer, then the seller can recognize revenue at the point of sale. To determine whether the seller has transferred control, it should consider the normal indicators of control. In addition, the seller must meet all of the following four criteria to claim that it has transferred control to the buyer:</p> <ul style="list-style-type: none"> • The reason for the bill-and-hold must be substantive. • The product must be separately identified as belonging to the customer. • The product must be ready for physical transfer to the customer. • The entity cannot have the ability to use the product in any way, including delivering it to another customer. <p>Channel stuffing (also referred to as <i>trade loading</i>) is a practice in which a seller induces wholesale distributors to buy more inventory than they can sell in the current period. Firms should not recognize revenue from a channel stuffing arrangement because the risks and rewards of ownership have not really passed given the ability of the buyer to return the product.</p>	<p>Similar under U.S. GAAP and IFRS.</p>

Summary by Learning Objectives, continued

9 Detail required disclosures related to revenue recognition.	
Summary	Similarities and Differences between U.S. GAAP and IFRS
<p>Related to contracts with customers, companies must disclose:</p> <ul style="list-style-type: none"> • Disaggregation of revenue. • Contract balances and changes in balances. • Performance obligations. • Transaction price allocated to any remaining performance obligations. <p>Related to significant judgments and changes in judgments made, companies disclose methods for:</p> <ul style="list-style-type: none"> • Determining the transaction price including estimating variable consideration, adjustments for time value of money, measuring noncash consideration. • Assessing constraints on variable consideration. • Allocating the transaction price, including standalone selling prices and variable consideration. • Measuring obligations for returns, refunds, or other similar obligations. 	Similar under U.S. GAAP and IFRS.

MyLab Accounting

Go to <http://www.pearson.com/mylab/accounting> for the following Questions, Multiple-Choice Questions, Brief Exercises, Exercises, and Problems. They are available with immediate grading, explanations of correct and incorrect answers, and interactive media that acts as your own online tutor.

8 Recognition

Questions

- 1 Q8-1. What are the primary issues involved in revenue recognition?
- 1 Q8-2. What is the fundamental principle underlying the timing of revenue recognition?
- 1 Q8-3. What is the fundamental principle underlying the measurement of revenue?
- 1 Q8-4. What are the five basic steps in revenue recognition?
- 2 Q8-5. What is commercial substance?
- 3 Q8-6. How is a performance obligation defined?
- 3 Q8-7. What are the two criteria to define a good or service as distinct?
- 3 Q8-8. What factors may indicate that a promise to deliver a good or service is *not* separate from other promises?
- 4 5 6 Q8-9. What principles regarding timing and measurement determine when, and for how much, firms recognize revenue?
- 4 Q8-10. What is the transaction price in a contract? What factors determine the transaction price?
- 4 Q8-11. What is variable consideration and what factors cause it?
- 4 Q8-12. Describe and contrast the two approaches used to estimate the amount of variable consideration in a contract.

- 4 Q8-13. How does a constraint to variable consideration affect revenue recognition?
- 4 Q8-14. What factors should accountants consider to determine if there is a significant financing component in a contract?
- 4 Q8-15. How does the computation of the financing component differ when delivery is before and after the payment?
- 4 Q8-16. How does a seller account for any consideration paid to a customer?
- 5 Q8-17. What methods allocate the total transaction price to performance obligations?
- 5 Q8-18. What are the two exceptions to the general rule that an entity should allocate the transaction price based on the relative standalone selling prices?
- 6 Q8-19. What are the three criteria required to recognize revenue when goods and services are transferred over time?
- 6 Q8-20. When an entity does not meet the three criteria required to recognize revenue over time, it must determine when the goods and services are transferred to the customer. What are the indicators for determining transfer of control?
- 7 Q8-21. Can firms recognize revenue prior to completion of a long-term contract? Explain.
- 7 Q8-22. Are the percentage-of-completion and completed-contract methods both viable alternatives for a given contract? Explain.
- 7 Q8-23. How does a firm estimate the degree completed under the percentage-of-completion approach?
- 8 Q8-24. Can a firm record inventory out on consignment as revenue when transferred to the consignee? Explain.
- 8 Q8-25. What method do agents in a transaction use to record sales?
- 8 Q8-26. What selling practice do companies fraudulently use to accelerate revenue recognition?
- 9 Q8-27. What qualitative disclosures do the standards require for revenue recognition?

Multiple-Choice Questions

Becker CPA Exam Review multiple-choice questions are available in
 MyLab Accounting.

- 2 MC8-1. All of the following are elements of a contract except:
- The contract has commercial substance.
 - The vendor can identify payment terms for the goods or services.
 - It is not approved by both parties to the agreement.
 - The vendor can identify each party's rights.
- 3 MC8-2. A performance obligation is:
- An enforceable promise in a contract with a customer to transfer a good or service to the customer.
 - An offer to transfer a good or service to the customer.
 - An expectation of a customer for the receipt of a good or service by a vendor.
 - A promise in a contract with a customer to transfer a good or service to the customer.
- 3 MC8-3. Telecom Co. enters into a two-year contract with a customer to provide wireless service (voice and data) for \$40 per month. To induce customers, Telecom Co. provides a free phone. Telecom Co. normally sells the phone on a standalone basis for \$200. Telecom Co. also charges the customer a one-time activation fee of \$35. Which of the following is true?
- The free phone constitutes a marketing expense.
 - The activation fee is a separate performance obligation.
 - There are two distinct performance obligations: the wireless service and the phone.
 - There are two distinct performance obligations: the voice service and the data service.

- 4** **MC8-4.** The transaction price must reflect the time value of money if:
- The vendor expects the period between customer payment and delivery of goods or services will be less than two years.
 - The contract has a financing component that is significant to the contract.
 - The interest rate in the contract is higher than 13%.
 - Consideration would not differ if paid in cash or under normal credit terms.
- 4** **MC8-5.** Items that may cause variable consideration include:
- Discounts.
 - An hourly rate for services.
 - A fixed fee.
 - A retainer.
- 5** **MC8-6.** When allocating the transaction price to separate performance obligations, one must determine the standalone selling price of the goods or services. Which of the following is not an estimation method for determining the standalone selling price?
- Adjusted market assessment.
 - Expected cost plus a margin.
 - Residual approach.
 - Observable prices when goods or services are sold separately.
- 6** **MC8-7.** Which of the following indicators is not considered when determining whether performance obligations are satisfied at a point in time?
- The vendor has a present right to payment for the asset.
 - The customer is likely to reject delivery of the asset.
 - The customer has the significant risks and rewards of ownership of the asset.
 - The customer has legal title to the asset.
- 7** **MC8-8.** During Year 1, Meriwether Construction Company started a construction job with a contract price of \$3,000,000. The job was completed in Year 2, and the company uses the percentage of completion method. The following information is available for Year 1 and Year 2:

	Year 1	Year 2
Cost incurred to date	\$ 500,000	\$2,400,000
Estimated cost to complete	1,500,000	0
Billings to date	300,000	1,800,000
Collections to date	100,000	1,600,000

What amount of gross profit should Meriwether recognize for this job for Year 2?

- a. \$250,000 b. \$1,000,000 c. \$350,000 d. \$600,000
- 8** **MC8-9.** All of the following are indicators that the vendor is acting as an agent instead of as a principal except:
- The other party is primarily responsible for fulfilling the contract.
 - The vendor has latitude in establishing prices for the other party's goods or services.
 - The vendor does not have inventory risk.
 - The vendor's consideration is in the form of a commission.
- 8** **MC8-10.** Assume a retailer sells 10 widgets for \$2,000 each. The widgets cost \$100 and the sale includes a return right for 90 days. The retailer determines that the probability of returns associated with sales of the widgets is 10% based on prior customer behavior. The asset recognized at the point of sale for potential returns should be:
- a. \$100 b. \$900 c. \$1,000 d. \$20,000
- 9** **MC8-11.** Disclosures for annual periods of public companies must include all but which of the following with respect to contracts with customers?
- Identification of the top five largest customers.
 - Disaggregation of reported revenues.
 - Explanations of changes in balances.
 - Information about performance obligations.

Brief Exercises

- 2** **BE8-1. Identify a Contract with a Customer.** Complete the blanks in the five criteria to identify a contract with a customer.
- All parties agree to the _____ and commit to _____.
 - Each party's rights with respect to the goods or service being transferred are _____.
 - Payment terms for the goods or services that are being transferred are _____.
 - The contract has _____, meaning that the risk, timing, or amount of the entity's future cash flows is expected to change as a result of the contract.
 - It is _____ that the seller will _____ the consideration to which it is entitled in exchange for the goods or services.
- 2** **BE8-2. Identify a Contract with a Customer.** Discuss whether the following scenarios would preclude a contract from a customer under the revenue recognition standard.
- Tarik Company is not certain that it can recognize revenue of sales made to a customer because it has no formal written agreement with the customer.
 - Pipes Plumbing provides services to Help-Out Hands, a not-for-profit organization. Pipes gives Help-Out an estimate for the services. After Pipes completes the services, it sends Help-Out an invoice including the statement "No payment required."
- 3** **BE8-3. Identifying Performance Obligations.** Perfect Party Company contracts with a customer to provide its birthday party package, including a cake, balloons, and musical entertainment. In addition, Perfect Party will host the event. Perfect Party offers the musical entertainment only when it also hosts the party. It often sells cakes and balloons separately that it delivers before a party. Identify the separate performance obligations in this contract.
- 3** **BE8-4. Identifying Performance Obligations.** Perfect Party Company contracts with a customer to provide its birthday party package, including a cake, balloons, and musical entertainment. In addition, Perfect Party will host the event. Perfect Party commonly offers the musical entertainment when it hosts the party. However, it will provide the musical entertainment without hosting the party. Perfect Party often sells cakes and balloons separately that it delivers before a party. Identify the separate performance obligations in this contract.
- 4** **BE8-5. Estimating Variable Consideration.** Gear Garage Inc. enters into a contract to provide services totaling \$80,000. The contract includes a potential performance bonus based on when Gear Garage completes the services. Gear Garage estimates the following scenarios for completion. Determine the expected value of the bonus under each scenario. Ignore any constraints on variable consideration.

Complete within	Bonus	Probability		
		Scenario 1	Scenario 2	Scenario 3
3 days	\$10,000	65%	50%	0%
5 days	\$ 6,000	10%	40%	90%
8 days	\$ 2,000	25%	10%	10%

- 4** **BE8-6. Estimating Variable Consideration.** Using the information provided in BE8-5, determine the bonus using the most-likely-amount approach. Ignore any constraints on variable consideration.
- 4** **BE8-7. Estimating Variable Consideration.** Sellet Billboard Company entered into an agreement to display billboard advertising for Highlife Incorporated for 10 months for a \$60,000 fixed fee. The agreement also includes a potential \$6,000 bonus based on certain goals. Sellet estimates that it is 70% likely to receive the entire bonus and 30% likely to receive none of the bonus. What approach should Sellet use to estimate variable consideration? What is the estimate of the consideration amount in this contract?
- 4** **BE8-8. Estimating Variable Consideration.** Sellet Billboard Company entered into an agreement to display billboard advertising for Wynne Incorporated for 10 months for a \$60,000 fixed fee. The agreement also includes a potential bonus based on certain goals. Sellet believes the following probability estimates on receiving a bonus are accurate:

Bonus	Probability
\$8,000	20%
\$6,000	58%
\$4,000	17%
\$2,000	5%

What approach should Sellet use to estimate variable consideration? What is the estimate of the consideration amount in this contract?

- 4** **BE8-9. Significant Financing Component.** Determine the amount and type of financing component in the following contracts.
- Payment of \$1,500,000 occurs two years after delivery when the interest rate is 8%.
 - Payment of \$1,500,000 occurs two years before delivery when the interest rate is 8%.
 - Delivery is three years after payment of \$500,000 when the interest rate is 12%.
 - Delivery is three years before payment of \$500,000 when the interest rate is 12%.

- 5** **BE8-10. Allocation of Transaction Price.** Martin Software Developers, Inc. recently signed a contract for \$1,600,000 to create a registration, grade report, and transcript system for MacFarlane State University. Each part of the system will be delivered separately and must be fully functional upon installation. The standalone sales value of each performance obligation is reported below.

Description	Standalone Selling Prices
Registration System	\$ 500,000
Grade Reporting System	800,000
Transcript System	<u>700,000</u>
Total	<u>\$2,000,000</u>

How should Martin allocate the \$1,600,000 transaction price across the performance obligations?

- 5** **BE8-11. Allocation of Transaction Price.** TGW Construction Company enters into a contract to build an office building and detached parking garage for \$24 million. TGW determines that the building and parking garage represent separate performance obligations. The standalone price of similar structures would be \$21 million for the office building and \$7 million for the parking garage. How should TGW allocate the transaction price?

- 5** **BE8-12. Allocation of Transaction Price.** Sycamore Sidewalk Company enters into a contract with a customer to sell three products for a total transaction price of \$15,000. Information related to these three products is provided in the following table.

Product	Standalone Selling Price
Bricks	\$6,200
Stones	\$8,000
Cement	\$3,000

How should Sycamore Sidewalk Company allocate the transaction price to the three products?

- 5** **BE8-13. Allocation of Transaction Price.** Sycamore enters into a contract with a customer to sell three products for a total transaction price of \$15,000. Each product is appropriately classified as a separate performance obligation. Sycamore only sells products A and B on an individual basis, so it must estimate the standalone selling price for cement. Information related to these three products is provided in the following table.

Product	Standalone Selling Price	Market Competitor Prices	Forecasted Cost
Bricks	\$6,200	\$7,800	\$5,500
Stones	\$8,000	\$8,200	\$5,000
Cement	Not available	\$4,000	\$2,000

How should Sycamore allocate the transaction price to the three products using the adjusted market assessment approach?

- 5** **BE8-14. Allocation of Transaction Price.** Using the information in BE8-13, indicate how Sycamore should allocate the transaction price to the three products using the expected-cost-plus-a-margin approach.

- 5** **BE8-15. Allocation of Transaction Price.** Using the information in BE8-13, indicate how Sycamore should allocate the transaction price to the three products using the residual approach.

- 6** **BE8-16. When to Recognize Revenue.** For each scenario, determine when to recognize revenue.
- Top Notch Processing, Inc. enters into a contract to provide monthly accounting services to a customer for one year.
 - A customer purchased a motorcycle from Bright Star Cycles for \$16,000. The customer takes delivery immediately.

- c. A customer purchased a motorcycle from Revup Cycles for \$18,000. Prior to delivery, Revup performs a custom paint job on the motorcycle that the customer required as a condition of purchase.
- d. Seahawk, Inc. enters into a contract to deliver a customized accounting system to its client for \$600,000. Seahawk estimates that it will take 1,000 labor hours to complete. Before completion, the customer cannot use the system.
- e. Seahawk, Inc. enters into a contract to deliver an accounting system to its client for \$600,000. Seahawk estimates that it will take 1,800 labor hours to complete. The customer has control of the system as it is being created.

- 7** **BE8-17. Percentage-of-Completion Method.** Vermont Cabin Construction Company uses the percentage-of-completion method on a three-year project with the cost-to-cost method of measuring progress. Compute the percent completed and the amount of revenue and gross profit to be recognized for each year based on the following information.

Contract price	<u>\$700,000</u>		
	2018	2019	2020
Actual construction costs incurred during the year	\$140,000	\$130,000	\$160,000
Estimated total costs	\$400,000	\$360,000	\$430,000

- 7** **BE8-18. Percentage-of-Completion Method, Current Year.** Cosmo Computer Consultants (CCC) signed a contract in 2018 to develop a computer network system for Platinum Entertainment. Cosmo uses the percentage-of-completion method and determines its measure of progress using the cost-to-cost approach. The firm provided the following information for 2018.

Contract price	<u>\$85,000</u>
	2018
Actual construction costs incurred during the year	\$12,000
Estimated total costs	60,000
Progress billings made during the year	30,500
Cash collections during the year	25,000

Compute the percentage completed, gross profit recognized, and the amount of the revenue recorded in 2018.

- 7** **BE8-19. Percentage-of-Completion Method, Journal Entries.** Prepare all journal entries necessary to reflect the use of the percentage-of-completion method in 2018 for CCC in BE8-18.

- 7** **BE8-20. Completed-Contract Method, Journal Entries.** Spot-On Contractors, Inc. provided the following information for the current year's construction activity.

Contract price	<u>\$170,000</u>
	2018
Actual construction costs incurred during the year	\$ 24,000
Estimated costs to complete	96,000
Estimated total costs	120,000
Progress billings made during the year	61,000
Cash collections during the year	50,000

Prepare the journal entries required to record Spot-On's construction activity assuming that the company uses the completed-contract method.

- 8** **BE8-21. Sales with the Right of Return.** Botti Incorporated manufactures and sells professional ski equipment. Botti offers a money-back guarantee for one year after the date of purchase. Cash sales for the current year amounted to \$620,000. Botti estimates that 5% of all sales are returned within the one-year period. Cost of goods sold is 75% of sales. The company uses a perpetual inventory system. Record sales and estimated sales returns for the current year.

- 8** **BE8-22. Sales with the Right of Return.** Using the information provided in BE8-21, prepare the journal entry to record \$5,000 of actual sales returns within one year after revenue was recognized by Botti.

- 8 BE8-23. Sales Returns.** Historically, about 5% of the merchandise that Thompson Tools, Inc. sells is returned. In the month of March, Thompson Tools sold merchandise costing \$546,000 to customers for \$712,000. The company uses a perpetual inventory system and all sales are on account. What is the estimated amount of sales returns? What is the journal entry to record this sale and estimated return?
- 8 BE8-24. Sales on Consignment.** Hanna Lighting recently transferred \$60,000 of electrical supplies to Goshen Supermarkets on consignment. The retail price of the supplies is \$81,000. Hanna offers its consignees a 25% fee on the retail price of the inventory sold. Hanna shipped the supplies to Goshen on April 1 and Goshen sold the inventory on June 30. Prepare the journal entries required for Hanna Lighting to record the consignment transaction.

Exercises

- 3 E8-1. Determining Performance Obligations.** Pagit Inc, a software development company, enters into a contract with Plato Company to provide computer and hosting services. Pagit will provide a hosted accounting software system that requires Plato to purchase hardware from Pagit. Plato also purchases other computing services from Pagit to migrate historical data and create interfaces with its other existing management systems. Pagit delivers the hardware first followed by other computing services, and finally the online hosting services.

Required »

- Determine the performance obligations if Pagit commonly sells goods and services separately or as a package.
- Determine the performance obligations if Pagit never sells the hardware separately but always bundles it with hosting services. It does commonly sell the other goods and services separately.

- 3 4 E8-2. Determining Performance Obligations, Estimating Transaction Price.** Shownow Film Company grants a customer the rights to broadcast three films under a single licensing agreement. The arrangement includes a fixed fee of \$90,000. The arrangement provides for an even reduction in the film license fee if the third film is not completed and made available for delivery. Shownow determines that it is 80% likely that it will deliver the third film on time.

Required »

- What are the performance obligations under the licensing agreement?
- What is the transaction price? (Consider any variable consideration.)

- 4 E8-3. Estimating Variable Consideration.** King Rat Pest Control, Incorporated was recently hired to exterminate pests in an office complex for \$300,000. King Rat will receive an additional \$10,000 based on the success of the extermination. The additional \$10,000 will be paid in full if the extermination is fully successful after one month. That amount will be decreased to \$8,000 if the extermination is successful after two months and further reduced to \$5,000 if successful after three months. Based on past experience with similar contracts, King Rat estimates that there is a 20% probability that the process will be successful with the first month, a 75% probability that it will take two months to be successful, and a 5% probability that the process will be effective after three months.

Required »

- Determine the transaction price for this contract using the expected value approach.
- Determine the transaction price for this contract using the most-likely-amount approach

- 4 E8-4. Constraining Estimates of Variable Consideration.** Skivoso Incorporated owns and operates high-priced ski resorts in Europe. Skivoso recently entered into a contract to provide lodging for several corporate events and conferences sponsored by JeffCo for a total fee of \$10,000,000.

JeffCo agreed to additional fees based on conference participant satisfaction surveys. The fee schedule and the related satisfaction survey scores follow.

Additional Fee	Average Score on Participant Satisfaction Survey
\$ 50,000	75%–79%
\$ 300,000	80%–84%
\$ 700,000	85%–89%
\$ 950,000	90%–100%

Using past survey experience, Skivoso estimates the probabilities that it will receive these scores on the JeffCo participant surveys:

Average Score on Participant Satisfaction Survey	Probability Assessment
75%–79%	9%
80%–84%	18%
85%–89%	21%
90%–100%	52%

Required »

Using the most-likely-amount approach for measuring variable consideration, determine the transaction price for this contract.

- 4 **E8-5. Significant Financing Component, Delivery before Payment.** Shifty Beaver Transmission Company enters into a contract with a major U.S. auto manufacturer to design and produce four-speed transmissions for small SUVs. Under the terms of the contract, Shifty Beaver will deliver the transmission immediately, but the auto manufacturers will defer payment for four years, the end of the life of the base warranty. The contract price is \$3,500,000, and the interest rate incurred on similar financing agreements in the industry is 5%.

Required »

- Is there a significant financing component in this contract?
- If there is a significant financing component, determine the amount of sales revenue and interest revenue to be recognized by Shifty Beaver.

- 4 **E8-6. Significant Financing Component: Delivery after Payment.** Smart Cookie Learning Centers enters into a contract to customize and sell its LaLa tutoring software to the Westbro United School District. The contract price is \$6,000,000 and must be paid to Smart Cookie immediately. Under the terms of the contract, Smart Cookie must deliver the software at the end of a two-year period. The interest rate incurred on similar financing agreements in the industry is 8%.

Required »

- Is there a significant financing component in this contract?
- If there is a significant financing component, determine the amount of sales revenue and interest expense to be recognized by Smart Cookie.

- 5 **E8-7. Allocation of Variable Consideration.** Green-Up Inc. contracts with a building manager to provide goods and services to enhance energy efficiency. It offers consulting services, including recommending ways to increase energy efficiency and monitor performance. It also provides items such as thermostats and automatic light switches as part of the contract. Green-Up charges 60% of the reduction in energy usage during the first year as a consulting fee. Green-Up determines that the consulting services compose one performance obligation and the items provided are another performance obligation. The estimated standalone selling prices are \$180,000 for the consulting services and \$100,000 for the items to increase energy efficiency. The stated price in the contract for the items provided is a fixed payment of \$100,000. The price stated for the consulting fees is 60% of the customer's reduction in future energy costs. Green-Up estimates the variable consideration for the consulting services to be \$180,000. What amount of the transaction price should Green-Up allocate to each performance obligation?

- 5 **E8-8. Allocation of Variable Consideration.** Green-Up Inc. contracts with a building manager to provide goods and services to enhance the energy efficiency. It offers consulting services, including recommending ways to increase energy efficiency and monitor performance. It also provides items such as thermostats and automatic light switches as part of the contract. Green-Up charges 60% of the reduction in energy usage during the first year as a consulting fee. Green-Up determines that the consulting services compose one performance obligation and the items provided are another performance obligation. The estimated standalone selling prices are \$180,000 for the consulting services and \$100,000 for the items to increase energy efficiency. The stated price in the contract for the items provided is a fixed payment of \$60,000. The price stated for the consulting fees is 60% of the customer's reduction in future energy costs. Green-Up estimates that the customer will reduce its energy usage by \$500,000. The customer's actual energy reduction is \$550,000. What amount of the transaction price should Green-Up allocate to each performance obligation?

- 5 **E8-9. Allocation of Variable Consideration, Allocation of Discount.** Perfect Party Company contracts with a customer to provide its birthday party package including a cake, balloons, and musical entertainment. It regularly sells the following products separately at the following standalone selling prices.

Item	Standalone Selling Price
Balloons	\$ 70
Cake	40
Musical Entertainment	120
Hosting	100

Perfect Party also regularly bundles musical entertainment and hosting together for \$160. Perfect Party signs a contract with a customer to provide balloons, a cake, musical entertainment and to host a party for \$270. Perfect Party determines that each product is a separate performance obligation. How should Perfect Party allocate the transaction price to each product?

5

E8-10. Allocation of Transaction Price. Gundy Communications Systems signed a contract to develop and install an integrated network for Dwight Auto Dealerships, Inc. in five phases. Each phase is considered a performance obligation. The transaction price, including installation, is \$2,600,000. Each phase is fully functional at the point of delivery. Each of the five phases of the total network products has standalone value as follows:

Network Phase	Standalone Sales Value
Phase 1	\$ 300,000
Phase 2	760,000
Phase 3	560,000
Phase 4	440,000
Phase 5	940,000
Total	<u>\$3,000,000</u>

The contract price is collected in advance, and Phases 1 and 2 are completed during the current year. Gundy expects Phase 3 and 4 to be completed in the next 12 months and Phase 5 in the following year. Ignore implications of any financing component.

Required »

- Prepare the journal entry to record any revenue to be recognized during the current period. Show all supporting computations.
- Prepare disclosures related to any remaining performance obligations at the end of the current year.

6

E8-11. Determination of When to Recognize Revenue. Far Horizons, Inc. sells mobile phones, wireless plans, and service plan packages. Far Horizons packages the following items for sale.

Package	Amount	Description
Phone	\$199.00	Paid when customer purchases the phone.
Wireless Plan per month	40.00	Unlimited calling. Minimum coverage of 12-months. Paid monthly.
Service Plan per month	24.00	12-month coverage. Paid when customer purchases the phone.
Total When Purchased	<u>\$263.00</u>	

Far Horizons has determined that each item is a separate performance obligation. A customer purchases a new phone package on September 1. Explain how and when revenue is recognized. Prepare the journal entries for the month of September, assuming that Far Horizons makes adjusting entries on September 30.

7

E8-12. Percentage-of-Completion Method. Shemsoft Software Technicians recently accepted a contract to develop an inventory management system for Chez and Company. Shemsoft is required to complete the installation of the new inventory management system in two years. Shemsoft provided the following contract information.

Contract price	<u>\$1,500,000</u>	
	2018	2019
Actual construction costs incurred during the year	\$ 255,000	\$ 800,000
Construction costs incurred in prior years	0	255,000
Cumulative construction costs incurred to date	255,000	1,055,000
Estimated costs to complete	382,500	0
Estimated total costs	637,500	1,055,000
Progress billings made during the year	900,000	600,000
Cash collections during the year	750,000	750,000

Prepare the journal entries required for each year of the contract, assuming that Shemsoft uses the percentage-of-completion method and the cost-to-cost approach for measuring progress.

- 7 E8-13. Percentage-of-Completion Method.** Gary Construction Associates accepted a contract to build an office building on January 2, 2018. The company will complete the contract within two years. Gary provided the following information related to the revenue, estimated costs, progress billings, and collections over the two-year period.

Contract price	<u>\$4,000,000</u>	
	2018	2019
Actual construction costs incurred during the year	\$ 2,625,000	\$ 900,000
Construction costs incurred in prior years	0	2,625,000
Cumulative construction costs incurred to date	2,625,000	3,525,000
Estimated costs to complete	875,000	0
Estimated total costs	3,500,000	3,525,000
Progress billings made during the year	2,400,000	1,600,000
Cash collections during the year	2,000,000	2,000,000

Prepare the journal entries for each year to record the contract, assuming that Gary uses the percentage-of-completion method with the cost-to-cost approach to measure progress. Show all supporting computations.

- 7 E8-14. Completed-Contract Method, Journal Entries.** Using the information provided in E8-13, prepare the journal entries for each year to record the contract, assuming that Gary uses the completed-contract method (show all supporting computations).

- 7 E8-15. Percentage-of-Completion Method.** Bailey Builders Corporation accepted a three-year, \$1,000,000 fixed-fee contract to renovate a parking deck. Bailey uses the percentage-of-completion method and the cost-to-cost method of measuring progress. Information related to the construction contract follows.

Contract price	<u>\$1,000,000</u>		
	2018	2019	2020
Actual construction costs incurred during the year	\$350,000	\$ 525,000	\$ 50,000
Construction costs incurred in prior years	0	350,000	875,000
Cumulative construction costs incurred to date	350,000	875,000	925,000
Estimated costs to complete	450,000	25,000	0
Estimated total costs	800,000	900,000	925,000
Progress billings made during the year	500,000	300,000	200,000
Cash collections during the year	400,000	350,000	250,000

Prepare the journal entries required in each year to record the contract. Show all supporting computations.

- 7 E8-16. Completed-Contract Method.** Using the information provided in E8-15, assume that Bailey uses the completed-contract method. Prepare the journal entries required in each year to record the contract (show all supporting computations).

- 8 E8-17. Sales with the Right of Return.** Webster Hall, Inc. is a major publisher of college textbooks. Webster Hall allows college bookstores to return all purchases within two months of delivery. The company shipped \$700,000 in textbooks in December 2019 based on orders for the spring 2020 semester. Webster Hall estimates that 35% of the books will be returned. All shipments were on account and unpaid at the time of returns.

Required »

- a. Prepare the journal entry to record sales and estimated returns for 2019. Ignore cost of goods sold and inventory.
- b. Assume that Webster Hall reports \$189,000 in total sales returns in February 2020. Prepare the journal entry required to record the total sales returns.
- 8 E8-18. Sales Returns.** Historically, about 8% of all the merchandise Asiago, Inc. sells is returned. On January 4, Asiago sold merchandise costing \$40,000 to a customer for \$62,000 on account. On January 17, Asiago refunded \$3,200 for the return of some of the merchandise. On January 28, Asiago sold merchandise costing \$12,000 for \$15,000 on account. Assume the company uses a perpetual inventory system and all accounts are unpaid at the time of returns. Prepare the journal entries to record the sales, estimated returns, and the actual return.

- 8 E8-19. Sales on Consignment.** Ray's Sporting Goods, Inc. shipped aluminum baseball bats on consignment to Martin Stores on April 6, 2019. The total cost of the bats is \$31,000 with a retail value of \$50,000. Martin agrees to accept the consigned merchandise and is eligible to receive a 15% commission on all sales. Martin sells the entire shipment to Anoi College and received cash on May 28, 2019, and notifies Ray's Sporting Goods immediately.

Prepare the journal entries to record the consignment sale transactions on both Ray's and Martin's books.

- 8 E8-20. Other Principal Agent Transactions, Net Revenue Reporting Method.** ATickets.com sells discount airline tickets online. The company orders the tickets after a customer makes a purchase request. Atickets.com earns a flat fee of 25% of the total ticket price. The company sold \$1,000,000 in airline tickets during the current year and had collected \$800,500 as of the end of the year. ATickets.com is an agent in this transaction and thus uses the net revenue reporting method of accounting for sales.

Required »

- Record the sales transactions for the current year.
- Record the cash collections for the current year.
- Record the amount remitted to the airlines.

Problems

- 2 3 4 5 6 P8-1. Comprehensive Revenue Recognition Problem.** Moran Consulting currently provides tax services to Weiss Inc. Weiss engages Moran to advise it on the sale of one of its subsidiaries. Moran Consulting receives a non-refundable, up-front retainer fee of \$100,000. Moran is also entitled to a success fee of 1.5% of the proceeds received when the subsidiary is sold.

Required »

- Should Moran combine the tax services contract with the advisory contract?
- Identify the performance obligations in the advisory contract.
- Determine the transaction price at the inception of the advisory contract.
- Determine the allocation of the transaction price to the performance obligation.
- Determine when to recognize revenue.

- 2 3 4 5 6 P8-2. Comprehensive Revenue Recognition Problem.** On September 1, 2019, Conboy Construction signed a contract with Venuti Enterprises to construct a new corporate headquarters and parking garage on land that Venuti owns. Conboy determines that control of the building is passed to Venuti as it is constructed, but control of the parking garage will transfer when the garage is completed. Venuti will use the garage for its employees and open it for public parking.

The contract price is \$40 million for both the building and the garage, but Venuti includes a price adjustment for early or late completion of the building. For each day before September 1, 2021, that the building is completed, the promised consideration will increase by \$30,000. For each day after September 1, 2021, that the building is incomplete, the promised consideration will be reduced by \$30,000. Conboy considers it 60% likely that it will complete the building seven days early, 15% likely that it will complete the project on time, and 25% likely that the project will be delayed five days. The building is constructed based on Venuti's specifications and would require extensive alterations if used by another entity. The transaction has commercial substance, and Venuti is in good financial health.

The parties have also agreed that the building will be inspected and assigned a green building certification level. If the building achieves the certification level specified in the contract, Conboy will be entitled to a bonus of \$300,000. Conboy has been highly successful in achieving the certification on prior building projects.

The terms of the contract stipulate that Venuti will make a \$40,000,000 payment to Conboy at the completion of the project. Conboy will have two years or 24 months (until September 1, 2021) to complete the project. Furthermore, Conboy has an enforceable right to demand payment related to performance to date based on time elapsed.

Conboy has constructed similar buildings and sold them for \$30 million but does not have experience in garage construction. Conboy is aware of similar garages constructed by its competitors that were sold for \$8 million.

Due to good weather, Conboy is able to complete the building early. Conboy completes the building and garage on August 21, 2021. Venuti receives control and legal title on these dates. The building also receives

the required green building certification on August 21, 2021. Venuti pays Conboy any amounts owned on September 1, 2021.

Conboy has a normal profit margin of 15% and an interest rate of 10%. It allocates interest revenue on a straight-line basis. It is a calendar-year company that prepares financial statements annually. It uses time elapsed as its measure of progress for performance obligations that are satisfied over time.

Required»

Perform the five steps in the revenue recognition process. Provide all necessary journal entries.

2 3 4 5 6

P8-3. Comprehensive Revenue Recognition Problem. Casale Products Corporation manufactures and resurfaces bowling pins for commercial and residential use. On January 2 of the current year, Casale signs a contract with Closmeyer Lanes to be the exclusive supplier of pins for its lanes located throughout the United States. Casale initially agreed to deliver 300,000 pins at a price of \$15 each (i.e., total revenue \$4,500,000). Casale's cost of sales is \$10 per pin. Delivery of the pins is scheduled for December 31.

Under the terms of the agreement, Casale will also provide pin refurbishing services (free of charge) that includes recoating the pins as requested by Closmeyer. Pin refurbishment contracts are provided by Casale to other customers for an annual fee of \$300,000.

Casale offers volume discounts to its customers. For purposes of this contract, volume discounts will be granted to Closmeyer if total sales to the lanes exceed specified amounts. The discount is related to the total sales and services provided. The volume discount schedule for this contract, which includes the expected probability for each sales level, follows.

Sales Level	Volume Discount Offered	Probability of Reaching the Specified Sales Level
\$ 4,500,000	0%	10%
7,000,000	5%	60%
10,000,000	8%	30%

The sales volume discount offer is retroactive in that if a sales level is reached, the refund for the discount is applied to previous sales.

Required»

Perform the five steps in the revenue recognition process, assuming that Casale uses the expected value approach to determine the transaction price and the residual approach to allocate that transaction price. Provide all necessary journal entries to record revenue for the current year.

5

P8-4. Allocation of Transaction Price. On April 7, 2020, McCool Systems signed a contract to develop and install a virtual private network (VPN) for Billy Majors Stores. The transaction price, including installation, is \$580,000. The VPN consists of four components: regional offices, corporate office, retail stores, and remote users (for example, buyers). Each component is fully functional at the point of delivery. Each of the four components of the total network is correctly classified as a performance obligation, and each has standalone fair values as follows:

VPN Component	Standalone Sales Value
Regional offices	\$130,000
Corporate office	270,000
Retail stores	150,000
Remote users	<u>50,000</u>
Total	<u>\$600,000</u>

McCool collects the contract price in advance. McCool completed the regional office and remote user components on December 31, 2020.

Prepare the journal entry to record the contract and to record any revenue to be recognized during the current period. Show all supporting computations.

- 6** **P8-5. Determining When to Recognize Revenue.** Megrew Building Company is developing a multi-unit residential building complex. Kit Collier enters into a binding sales contract with Megrew for a specified unit that is under construction. Each unit is of a similar size and has a similar floor plan, but other characteristics of the units, such as the location of the unit within the complex, are different.

Scenario 1. Collier pays a deposit of \$10,000 that is refundable only if Megrew fails to complete construction of the unit in accordance with the contract. The remainder of the contract price of \$240,000 is payable on completion of the contract when Collier obtains physical possession of the unit. If Collier defaults on the contract before completion of the unit, Megrew has only the right to retain the deposit.

Scenario 2. Collier pays a \$10,000 nonrefundable deposit upon entering into the contract and will make four progress payments during construction of the unit. The contract includes the following other terms:

- Megrew is precluded from being able to transfer the unit to another customer.
- Collier does not have the right to terminate the contract unless Megrew fails to perform as promised.
- If Collier defaults on its obligations by failing to make the promised progress payments, Megrew would have a right to all of the consideration promised in the contract if it completes the construction of the unit. (The courts have previously upheld similar rights that entitle developers to require the customer to perform subject to the entity meeting its obligations under the contract.)

Scenario 3. Use the same facts as in Scenario 2 except that in the event of Collier's default, Megrew can either require Collier to perform as required under the contract or Megrew can cancel the contract, keep the unit under construction, and impose a penalty on Collier.

Required »

For each scenario, determine whether the performance obligation is satisfied over time or at a point in time.

- 7** **P8-6. Percentage-of-Completion Method.** Nance Network Consultants, Incorporated uses the percentage-of-completion method to account for its long-term contracts. It uses the cost-to-cost approach to measure progress. During the current year, Nance signed a contract to develop a computer network for an international accounting firm. Information related to the contract follows.

	<u>\$800,000</u>		
	2018	2019	2020
Contract price			
Actual construction costs incurred during the year	\$ 200,000	\$300,000	\$150,000
Construction costs incurred in prior years	0	200,000	500,000
Cumulative construction costs incurred to date	200,000	500,000	650,000
Estimated costs to complete	400,000	300,000	0
Estimated total costs	600,000	800,000	650,000
Progress billings made during the year	300,000	400,000	100,000
Cash collections during the year	220,000	380,000	200,000

Required »

- a. Compute the percentage-of-completion for each year.
- b. Compute the gross profit and revenue to be recognized each year of the contract.
- c. Prepare the journal entries required for each year of the contract.
- d. Prepare the t-accounts for construction in progress, billings on construction in progress, and accounts receivable.
- e. Determine the net asset (liability) for each year of the contract on December 31.

- 7** **P8-7. Percentage-of-Completion Method.** Bigelow Contractors signed a contract to construct a storage facility for RGN Manufacturing, Inc. The fixed-fee contract specifies that the facility is to be completed in three years. Bigelow uses the percentage-of-completion method (cost-to-cost approach) to account for its construction transactions. Information related to this contract is summarized in the following table.

	<u>\$2,000,000</u>		
	2018	2019	2020
Contract price			
Actual construction costs incurred during the year	\$ 900,000	\$ 300,000	\$ 600,000
Construction costs incurred in prior years	0	900,000	1,200,000
Cumulative construction costs incurred to date	900,000	1,200,000	1,800,000
Estimated costs to complete	600,000	400,000	0
Estimated total costs	1,500,000	1,600,000	1,800,000
Progress billings made during the year	700,000	700,000	600,000
Cash collections during the year	400,000	800,000	800,000

Required »

- Compute the percentage completed for each year.
 - Compute the gross profit and revenue to be recognized each year of the contract.
 - Prepare the journal entries required for each year of the contract.
 - Prepare the t-accounts for construction in progress, billings on construction in progress, and accounts receivable.
 - Determine the net asset (liability) for each year of the contract on December 31.
- 7** **P8-8. Completed-Contract Method.** Repeat the requirements of P8-7 assuming Bigelow Contractors uses the completed-contract method to report its long-term contracts. Additionally, compare the reported gross profit and net asset (liability) position reported under the percentage-of-completion method (from P8-7) and the completed-contract method.
- 7** **P8-9. Percentage-of-Completion Method.** R. Wayne Computer Consultants, Incorporated develops and installs integrated computer systems and networks for large utilities. On January 2, 2018, the company signed a contract to deliver an electricity deployment system for a grid covering three New England states. The contract paid R. Wayne a fixed fee of \$18,000,000. Wayne Computer Consultants uses the percentage-of-completion method (cost-to-cost approach) to report its long-term contracts. Other relevant information related to the contract is presented in the following table.

	<u>\$18,000,000</u>		
	2018	2019	2020
Contract price			
Actual construction costs incurred during the year	\$ 4,500,000	\$ 6,000,000	\$ 5,000,000
Construction costs incurred in prior years	0	\$ 4,500,000	\$10,500,000
Estimated costs to complete	\$10,500,000	\$ 2,625,000	0
Estimated total costs	\$15,000,000	\$13,125,000	\$15,500,000
Progress billings made during the year	\$ 6,600,000	\$ 8,400,000	\$ 3,000,000
Cash collections during the year	\$ 6,000,000	\$ 6,000,000	\$ 6,000,000

Required »

- Compute the gross profit and revenue to be recognized each year of the contract.
- Prepare the journal entries required for each year of the contract.
- Prepare the t-accounts for construction in progress, billings on construction in progress, and accounts receivable.
- Determine the net asset (liability) for each year of the contract on December 31.

- 7 P8-10. Completed-Contract Method.** Repeat the requirements of P8-9 assuming Wayne Computer Consultants uses the completed-contract method to report its long-term contracts.
- 7 P8-11. Completed-Contract Method.** Bernard Brothers Building (BBB) signed a contract for a fixed fee of \$60,000 and used the completed-contract method to account for the contract. BBB provided the following information related to the contract.

Contract price	<u>\$60,000</u>		
	2018	2019	2020
Actual construction costs incurred during the year	\$15,000	\$20,000	\$20,000
Construction costs incurred in prior years	0	15,000	35,000
Cumulative construction costs incurred to date	15,000	35,000	55,000
Estimated costs to complete	5,000	15,000	0
Estimated total costs	20,000	50,000	55,000
Progress billings made during the year	25,000	23,000	12,000
Cash collections during the year	20,000	20,000	20,000

Required »

- Prepare the journal entries required for each year of the contract.
 - Prepare the t-accounts for construction in progress, billings on construction in progress, and accounts receivable.
 - Determine the net asset (liability) for each year of the contract on December 31.
- 8 P8-12. Sales on Consignment.** Pablo Products, Ltd. sells stuffed animals to local convenience stores and small pharmacy chains. All of Pablo's sales are on consignment. The consignee receives a 15% commission for each product sold.

Pablo completed the following consignment-related transactions:

Date	Transaction	Amount
February 2, 2020	Ships merchandise on consignment to Left Aid Pharmacy.	Cost = \$400,000 Retail Value = \$1,000,000
May 15, 2020	Left Aid Pharmacy sells 75% of the consigned inventory for cash.	\$ 750,000
June 1, 2020	Left Aid notifies Pablo about the sale and remits the cash collected to Pablo, net of the 15% commission.	\$ 750,000
January 3, 2021	Left Aid sells the remainder of the consigned merchandise for cash.	\$ 250,000
January 5, 2021	Left Aid notifies Pablo and remits the cash collected net of the 15% commission.	\$ 250,000

Record all journal entries for consignment-related transactions for both the consignor and consignee.

CASES

Judgment Cases

Judgment Case 1: Judgment in Revenue Recognition

Absco, Inc. is a calendar-year-end clothing manufacturer that sells exclusively to retailers. It engages in a large number of contracts with its customers. Following are some specific contract issues that have arisen this year.

1. Absco signed a contract with Socks Are Us to ship 100,000 pairs of socks on December 27. The contract price is \$5 per pair with nonrefundable payment due upon receipt of the socks. Absco immediately delivers the socks to Socks Are Us once the contract is signed by both parties with the socks arriving on December 28. However, Socks Are Us has not remitted payment as of December 31. It is clear to Absco that it will have to offer the customer a price concession in order to receive any payment at all. Absco has not had extensive dealings with Socks Are Us but estimates that it will need to offer a 25% discount. Should Absco recognize any revenue related to this arrangement in the current year? If so, how much?
2. Absco signed a contract with Jeans Are Us to ship 300,000 pair of jeans. The contract price is \$20 per pair. These particular jeans are very fashionable at the current time but are not expected to stay in style for a long period of time. Because they are new, Absco has manufactured only 10,000 pairs. The contract specifies that Absco will immediately ship the 10,000 pairs and will then ship the remaining portions of the 290,000 pairs as soon as possible after a specific number of pairs are requested by Jeans Are Us. If Absco has shipped fewer than 300,000 pairs of jeans by the end of the year, it will ship the remaining jeans to fulfill the contract at the end of one year. Because Jeans Are Us is concerned that the demand for these jeans will be heavy, it has provided an incentive in the contract for Absco to expedite production of the jeans. Jeans Are Us will provide a bonus to Absco if it delivers the jeans within a certain period of time of the request. The percentage bonus is as follows:

Delivered within	Percentage Bonus
1 day of request	5%
3 days of request	4%
5 days of request	3%
10 days of request	2%

Absco has never been involved in a transaction that involves bonuses for delivery expediency. In addition, because of the newness of this particular style of jeans on the market, Jeans Are Us is not able to give Absco any idea of when it will request jeans and how many it will request each time.

Absco uses the expected value method of measuring variable consideration. Accordingly, it has determined that the expected value of the bonus consideration is \$180,000. However, Absco is quite uncertain how quickly it can manufacture these jeans. What is the total transaction price for this contract? You may want to read paragraphs 11 through 13 of ASC 606-10-32. Explain your answer.

Financial Statement Analysis Case

Financial Statement Analysis Case 1: Comparing Percentage-of-Completion and Completed Contract Methods

Use the information related to Bigelow Contractors from P8-7 and P8-8 to answer the following questions. Assume that Bigelow's total assets were \$5,000,000 and its liabilities were \$2,000,000 at the beginning of the year.

- a. Compute net income under the percentage-of-completion and completed-contract methods for each year. (Ignore income taxes.)
- b. Compute the total assets, liabilities, and equity under the percentage-of-completion and completed-contract methods at the end of each year.
- c. Compute the profit margins under the percentage-of-completion and completed-contract methods each year. Comment on the differences.
- d. Compute the debt-to-equity ratios under the percentage-of-completion and completed-contract methods each year. Comment on the differences.

Surfing the Standards Case

Surfing the Standards Case 1: Contract Changes

On January 2, 2018, JCR Jets, a calendar-year company, accepts a contract with a major airline to build four jets. JCR accepts a fixed fee of \$300 million and must complete the project within three years. JCR Jets uses the percentage-of-completion method of accounting. It determines percent complete using the percentage of labor hours incurred relative to expected total labor hours. Management expects that it will take 2 million labor hours to build the three jets. During 2018, JCR incurs actual costs of \$112 million and estimates that it will cost an additional \$160 million to complete the jets. It incurred 800,000 labor hours during 2018.

On January 3, 2019, JCR Jet agrees with its customer to upgrade the jets. The parties agree that the fixed fee for the four jets will now be \$350 million. JCR estimates that this upgrade will require an additional 400,000 labor hours and additional costs of \$40 million.

Provide a written analysis and your conclusions of how JCR should account for this contract upgrade, using the Codification for support. Provide any necessary computations.

Basis for Conclusions Case

Basis for Conclusions Case 1: Control

According to ASC 606, an entity should recognize revenue when goods or services are transferred to a customer. Goods and services are transferred to a customer when the customer obtains control. Refer to the Basis for Conclusions section of ASU 2014-09 to answer the following questions.

1. In considering a control-based model for revenue recognition, FASB could have specified that goods and services are considered to be transferred when the seller gives up control as opposed to when the customer receives control. Are these two concepts always the same? If not, why did FASB choose to specify that the transfer occurs when the customer obtains control?
2. Is the control-based approach to revenue recognition new to ASU 2014-09, or has revenue always been recognized when control is transferred? What other approach(s) did FASB consider, and why did it choose the control model?
3. *Control* is defined by FASB as the ability to direct the use of and obtain substantially all of the remaining benefits from the asset. Briefly, and in your own words, describe and explain each component of this definition.
4. There was some disagreement by respondents to the Exposure Draft of ASU 2014-09 about using the notion of transfer of control to determine when revenue should be recognized. The respondents generally felt that the control model would work well for the sale of goods. However, some respondents felt that this model might not work as well for other types of transactions. What type of transactions were the respondents worried about? Why did they think the control model would not work as well for these transactions? How did these respondents think FASB should address this concern? What did FASB choose to do and why?

9

Short-Term Operating Assets: Cash and Receivables

LEARNING OBJECTIVES

- 1 Define cash and cash equivalents and describe the accounting for restricted cash and compensating balances.
- 2 Demonstrate the initial measurement and accounting for accounts receivable, including volume, trade, and sales discounts.
- 3 Understand the subsequent measurement and accounting for accounts receivable, including establishing an allowance for uncollectible accounts.
- 4 Estimate an allowance for uncollectible accounts using the aging of receivables method and explain the accounting for write-offs and subsequent recoveries.
- 5 Discuss the use of accounts receivable to generate immediate cash—including pledging or assigning, factoring receivables, and securitization—and demonstrate the accounting for these transactions.
- 6 Describe accounting for short-term notes receivable when issued and after issuance.
- 7 Explain the required disclosures for accounts and notes receivable.

Introduction

WOULD A BALANCE SHEET seem complete without cash? Nearly all firms report cash on their balance sheet and view it as a factor in day-to-day operations and growth. However, most companies sell the majority of their goods and services on credit and wait to receive the related cash flows. Why do businesses sell on credit and delay cash collection? The answer is simple: Credit sales increase sales volume, motivating companies to trade off the risk that buyers will not pay against the benefits of increased sales.

Companies do mitigate this risk. For example, *Levi Strauss & Co. (Levi's)*, the global apparel company, analyzes new distributors for creditworthiness before it makes any sales on credit. Some portion of a company's receivables, however, will not be collected. Management must exercise judgment to estimate the losses expected from uncollected accounts receivable. It is impossible, though, to determine the amount of accounts receivable that will ultimately become uncollectible with perfect accuracy.

The financial statements disclose information related to these estimates. *Levi's* net accounts receivable from customers were \$479 million, or about 16.0% of its total assets, at the end of fiscal 2016. *Levi's* estimated that it would not collect about \$12 million, representing roughly 2.4% of accounts receivable, and reduced its accounts receivable by this amount. *Levi's*, like any other company, carefully monitors customers' accounts receivable to improve cash collections and make adjustments to its credit terms and policies.

Cash and receivables are parts of a company's short-term operating assets. As noted in the case of *Levi's*, receivables can make up a significant portion of a company's liquidity position. Receivables require proper credit management to ensure that a company can convert sufficient resources into cash needed to liquidate current obligations when they become due. Companies hold short-term operating assets such as inventory, supplies, and prepaid expenses in order to provide goods and services to customers on a timely basis.

Douglas Isaacson/Alamy Stock Photo

In this chapter, we focus on cash and receivables, addressing two important issues: measurement and classification. Proper measurement and classification of cash and receivables enables a financial statement user to accurately assess a company's short-term liquidity position. Cash typically does not pose a significant measurement issue but may not always be

available for use in the current operating cycle. Receivables involve both measurement (due to the risk of not collecting the cash) and classification issues (due to the timing of the expected collection). Any significant delay in the collection of receivables can adversely affect a company's operating cycle and liquidity position. ◀◀

- ① Define cash and cash equivalents and describe the accounting for restricted cash and compensating balances.

Accounting for Cash and Cash Equivalents

We begin our discussion of accounting for cash by reviewing key terminology and introducing concepts such as restricted cash, *compensating balances*, and required disclosures.¹ We discuss internal controls over cash in the chapter appendix.

Review of Cash and Cash Equivalents

Together, transactions involving cash and cash equivalents are part of the firm's overall cash management activities. Companies add cash equivalents to cash in one line entitled "cash and cash equivalents" on the balance sheet. We introduced the statement of cash flows in Chapter 6. In this chapter, we focus on the definition and measurement of cash.

Cash consists of coins, currency, and bank deposits, as well as negotiable instruments such as checks and money orders. Firms generally classify cash as a current asset unless it is restricted from use in the current operating cycle.

Cash equivalents are short-term, highly liquid investments with original maturities of three months or less; examples include Treasury bills, commercial paper, certificates of deposit, and money market funds. Cash equivalents are cash substitutes that companies can easily convert back into cash if needed in the operating cycle. Original maturity is the length of time from the investment's purchase date to its due date. For example, a three-year Treasury instrument acquired with 2 months remaining until its due date qualifies as a cash equivalent because the company will hold it for less than 3 months.

Bank overdrafts occur if a company writes checks in amounts that exceed the balance in its account. That is, the account has a negative balance. Firms typically report bank overdrafts as current liabilities on the balance sheet rather than as "negative assets." If material, firms also must disclose bank overdrafts in the notes or list them separately on the face of the balance sheet.

Restricted Cash and Compensating Balances

Cash is one of the only assets that typically does not involve any questions as to measurement. However, proper classification can be an issue. Two classifications—*restricted cash* and *compensating cash balances*—limit the use of cash in operations.

Restricted Cash. A company classifies cash as a current asset on the balance sheet unless it is restricted from use in the current operating cycle. Cash balances that may involve restrictions on withdrawal include foreign bank accounts, collateral for certain obligations, or cash held by a third party for a specific purpose.²

¹For most of the relevant authoritative literature for this topic, see FASB ASC 305—*Cash and Cash Equivalents* and ASC 210-10—*Balance Sheet—Overall* for U.S. GAAP and IASC, *International Accounting Standard 7*, "Statement of Cash Flows" (London, UK: International Accounting Standards Committee, Revised) for IFRS.

²Examples include a long-term debt sinking fund when the third party holds cash to make payments on the company's debt or an escrow account when the third party holds cash to pay the company's real estate taxes or make insurance payments.

When cash is legally restricted from use in the current operating cycle, the company reclassifies the restricted amount from the regular cash line item on the balance sheet into **restricted cash** as follows:

1. If the restriction extends *beyond 1 year* from the balance sheet date, classify the restricted funds account as a noncurrent asset and include it in the other assets section of the balance sheet.
2. If the restriction is for *less than 1 year*, classify the restricted funds account as current, but segregate it from the regular cash line item in the current assets section of the balance sheet.

Compensating Balances. **Compensating balances** are minimum cash balances that debtors are required to keep on deposit as support for existing credit agreements that are either part of a contractual agreement or an informal one. Companies classify legally restricted compensating balances as follows:

1. If the balance is held against short-term debt, reclassify the cash held as a separate current asset.
2. If the balance is held against long-term debt, reclassify the amount of cash held as a noncurrent asset on the balance sheet.

In either case, companies cannot combine the legally restricted compensating balances with regular cash on the balance sheet.

If the compensating balances are not part of a contractual agreement, companies must disclose the amounts, terms, and length of the arrangement in the footnotes to the financial statements. However, a classification out of regular cash on the face of the balance sheet is not required.

Regardless of the accounting treatment, a compensating balance requirement increases the entity's effective cost of borrowing. That is, the entity will have less cash to use but is still required to repay the full amount of the loan. For example, assume that a small business borrows \$1,000 at 10% interest. The required cash interest payment is \$100 for the year ($10\% \times \$1,000$). Due to an unsatisfactory credit rating, the creditor requires the business to leave 4% or \$40 of the loan on deposit at the lending institution as security. It must keep \$40 on deposit and can use only \$960 ($\$1,000 - \40). Given that the annual interest payment is \$100 and ignoring the time value of money due to the short-term nature of the loan, the annual cost of borrowing increases from 10% to 10.42% ($\$100/\960).

Cash and Cash Equivalents: IFRS

Under International Financial Reporting Standards (IFRS), bank overdrafts are permitted to be included in cash and cash equivalents as a reduction if the overdraft balance is part of an integrated cash management strategy. This treatment allows for differences in banking systems and practices across countries. For example, banks in some countries may allow companies to have a negative cash balance that is repayable on demand.

Required Disclosures for Restricted Cash and Cash Equivalents

Accounting standards require separate disclosure for cash and cash equivalents that are restricted from withdrawal or use in operations. Companies describe the provisions of any restrictions in a note to the financial statements. Companies disclose informal compensating balance arrangements in the notes to the financial statements. These disclosures must describe the specific arrangements and the amount involved, if determinable, for the most recent audited balance sheet.

In its 2016 financial statements, *Tesla, Inc.*, the electric car designer and manufacturer, included \$106 million of restricted cash in current assets and \$268 million of restricted cash in noncurrent assets on its balance sheet.³ Exhibit 9.1 contains *Tesla, Inc.*'s footnote disclosure discussion of its restricted cash balance.

³Tesla, Inc. reported the amount of restricted cash in note 2 to its financial statements.

EXHIBIT 9.1 Restricted Cash Disclosure, *Tesla, Inc.*, Annual Report, December 31, 2016

Note 2—Summary of Significant Accounting Policies (excerpt)

RESTRICTED CASH AND DEPOSITS

We maintain certain cash amounts restricted as to withdrawal or use. Current and noncurrent restricted cash as of December 31, 2016, and 2015 was comprised primarily of cash as collateral related to our sales to lease partners with a resale value guarantee and for letters of credit including for our real estate leases, and insurance policies. In addition, restricted cash as of December 31, 2016, includes cash received from certain fund investors that had not been released for use by us, cash held to service certain payments under various secured debt facilities, including management fees, principal and interest payments, and balances collateralizing outstanding letters of credit, outstanding credit card borrowing facilities and obligations under certain operating leases.

- 2 Demonstrate the initial measurement and accounting for accounts receivable, including volume, trade, and sales discounts.

Accounting for Accounts Receivable: Initial Measurement

Accounts receivable (also referred to as trade accounts) are amounts due to an entity from its customers or clients that originated from the sale of goods or services. Accounts receivable do not involve signed contracts, and there is generally no interest charged due to their short-term nature.

Companies generally record accounts receivable at the amount of the sale.⁴ The terms of sale—particularly discounts such as *trade discounts*, *volume discounts*, and *sales discounts*—affect the initial measurement of accounts receivable.⁵

Trade Discounts and Volume Discounts

Trade discounts are reductions of the catalog or list price when a company sells to a reseller in the same industry. A **volume discount** reduces the list price for customers purchasing a large quantity of merchandise. Therefore, both trade and volume discounts lower the amount of the sales revenue and impact the amount initially recorded in accounts receivable. Example 9.1 illustrates accounting for volume discounts. Accounting for trade discounts is similar.

EXAMPLE 9.1 Volume Discounts on Accounts Receivables

PROBLEM: KWH, Inc. sells custom-built kitchen island cabinets and offers a 10% discount to its high-volume customers. JSR Construction, Inc. purchased cabinets on account with a list price of \$132,000 and received a 10% volume discount of the purchase price amounting to \$13,200 (i.e., $\$132,000 \times 10\%$). What is the journal entry to record this sale (ignoring the effect on inventory and cost of goods sold)?

SOLUTION: KWH deducts the \$13,200 discount from the list price of \$132,000 to obtain an initial measurement of \$118,800 ($\$132,000 \times 90\%$) for the accounts receivable. Thus, the journal entry to record the accounts receivable is as follows:

<i>Account</i>	<i>Current Year</i>
Accounts Receivable	118,800
Sales Revenue	118,800

⁴Both U.S. GAAP and IFRS allow companies to choose to value most financial assets at fair value. This fair value option is discussed in more detail in Chapter 16.

⁵Sales returns also may impact the initial measurement of accounts receivable. Companies selling products often give the buyer the right to return the product. Returned merchandise is referred to as a sales return. We discuss sales returns in greater depth in Chapter 8.

Sales Discounts

Sales discounts (also called cash discounts) are reductions granted to customers for early cash payment as an incentive to encourage quick invoice payment. Although the seller will collect less total cash, it will have cash earlier for use in current operations. The benefits of improved cash flow and liquidity are greater than the cost of the discount.

Companies usually include sales discounts on customer invoices. A typical sales discount is written as 2/10, n/30, which means the customer will receive a 2% discount if she pays within 10 days of the invoice date; otherwise, the full balance is due within 30 days. *Kellogg Company*, the multinational food company, disclosed in its 2015 financial statements that it generally requires payment for goods sold 11 or 16 days subsequent to the date of invoice as 2/10, n/11, 1/15, or n/16 in the United States, but terms can vary around the world and by business type.⁶ There are two acceptable approaches to recording sales discounts: the *most-likely-amount method* or the *expected-value method*.

Most-Likely-Amount Method. Under the **most-likely-amount method**, a company initially records accounts receivable at the most-likely amount of cash that it will collect from its customer. If the company anticipates that its customer will not take the discount, then it will record the receivable at the full (gross) sales amount (the gross method).

1. If the customer pays *after* the discount period, it pays the full amount. The amount of cash received is the gross amount of the receivable on the books. No further adjustments are needed to reflect the fact that the customer did not take the discount.
2. If the customer pays *within* the discount period, the journal entry must reflect the discount because the company receives less cash than the gross account receivable on the books. The net amount of cash received is the difference between the gross receivable amount and the discount. The sales discount equals the gross amount of the receivable or invoice times the sales discount percentage. The sales discount is recorded in a contra-revenue account, reducing the amount of revenue recorded on the income statement.

If the company anticipates that the customer will take the sales discount, then it initially records sales and accounts receivable at the net amount (the net method).

1. If the customer pays *within* the discount period, then the journal entry measures the amount of cash received as the net amount of the receivable on the books. No additional adjustments are required to reflect the discount taken.
2. If the customer pays *after* the discount period, the company receives more cash than the net carrying value of the receivable. In this case, the credit to accounts receivable is less than the debit to cash. The seller credits the difference to the sales discounts forfeited account, a revenue account. The sales discounts forfeited can be interpreted as interest revenue on extending credit to the customer.

For most companies, recording accounts receivable at the net amount is more appropriate than recording the receivable at the gross amount because their customers usually take the discount. Thus, recording the receivable at the net amount is considered a more reliable measurement of the current asset. Example 9.2 illustrates accounting for sales discounts using the most-likely-amount method.

EXAMPLE 9.2

Sales Discounts on Accounts Receivable Using the Most-Likely-Amount Method

PROBLEM: Clark and Lewis Wholesalers, Inc. sells hiking boots for \$100 per pair. On June 1, the company sold 50 pairs on account to a customer with terms of 2/10, n/30. The customer paid for 20 pairs of boots on June 9 and paid for the remaining 30 pairs on June 29. Provide the necessary journal entries for Clark and Lewis to record these transactions using the most-likely-amount method assuming that the customer will not take the discount. Also, prepare the journal entries assuming that the customer will take the discount. (Ignore the journal entry that would typically be necessary to record the cost of goods sold and the reduction of inventory.) Also provide a comparison of the impact on the income statement for each assumption.

Continued

⁶Source: Kellogg Company's 10-K filing, page 2, <https://www.sec.gov/Archives/edgar/data/55067/000162828016011639/k-2015q410xk.htm>

SOLUTION: First, Clark and Lewis records the sale. Under the gross method, the company records the full \$5,000 of sales revenue (50 pairs of boots \times \$100 per pair).

Under the net method, the company records the amount net of the discount (\$4,900). The net amount is the \$5,000 gross amount (50 pairs of boots \times \$100 per pair) less the discount of \$100 ($\$5,000 \times 2\%$). The journal entries on June 1 are as follows:

<i>Gross Method</i>	<i>Debit</i>	<i>Credit</i>	<i>Net Method</i>	<i>Debit</i>	<i>Credit</i>
Accounts Receivable	5,000		Accounts Receivable	4,900	
Sales		5,000	Sales		4,900

On June 9, Clark and Lewis receives payment of \$1,960 from its customer. The net amount per pair of boots is \$98, which is the gross amount of \$100 less the discount of \$2 per pair (i.e., $2\% \times \$100$). Thus, the customer pays for 20 pairs of boots or \$1,960 (20 pairs of boots \times \$98 per pair). Under the gross method, although Clark and Lewis receives only \$1,960 in cash, we must remove accounts receivable at \$2,000, the gross amount of the sale. We apply the \$40 (i.e., $\$2 \times 20$) to the sales discounts account (a contra-revenue account).

Under the net method, Clark and Lewis originally recorded the accounts receivable at the net amount, so we debit cash and credit accounts receivable for the \$1,960. The journal entries on June 9 when the discount is taken follow.

<i>Gross Method</i>	<i>Debit</i>	<i>Credit</i>	<i>Net Method</i>	<i>Debit</i>	<i>Credit</i>
Cash	1,960		Cash	1,960	
Sales Discounts	40		Accounts Receivable		1,960
Accounts Receivable		2,000			

Finally, on June 29, Clark and Lewis receives payment of \$3,000 for the remaining gross receivable. The customer did not pay within the discount period, so the discount is not taken. Thus, the journal entry for the gross method requires debiting the cash account for the \$3,000 and crediting accounts receivable for the same amount.

Under the net method, the company removes the accounts receivable balance at the net amount of \$2,940 (\$3,000 less a 2% discount of \$60). The \$60 ($\$2 \times 30$ pairs) discount is recorded by crediting the sales discounts forfeited account, which is a revenue account. The journal entries on June 29 when the discount is not taken follow.

<i>Gross Method</i>	<i>Debit</i>	<i>Credit</i>	<i>Net Method</i>	<i>Debit</i>	<i>Credit</i>
Cash	3,000		Cash	3,000	
Accounts Receivable		3,000	Accounts Receivable		2,940
			Sales Discounts Forfeited		60

The total revenue reported is the same for both methods; only the classification on the income statement may differ.

Income Statement Comparison

<i>Gross Method</i>			<i>Net Method</i>	
Sales		\$5,000	Sales	\$4,900
Less: Sales discounts		(40)	Add: Sales discounts forfeited	60
Total Revenue		<u>\$4,960</u>	Total Revenue	<u>\$4,960</u>

Expected-Value Method. Under the **expected-value method**, the entity sums the probability-weighted amounts in a range of possible consideration amounts. For example, if the company thinks it is 30% likely that the customer will take the discount, then it will initially record the accounts receivable at the sum of the gross amount times 70% plus the net amount times 30%. Example 9.3 illustrates accounting for sales discounts using the expected-value method.

EXAMPLE 9.3 Sales Discounts on Accounts Receivable Using the Expected-Value Method

PROBLEM: Clark and Lewis Wholesalers, Inc. sells hiking boots for \$100 per pair. On June 1, the company sold 50 pairs on account to a customer with terms of 2/10, n/30. The customer paid for 20 pairs of boots on June 9 and paid for the remaining 30 pairs on June 29. Provide the necessary journal entries for Clark and Lewis to record these transactions using the expected-value method assuming that Clark and Lewis believe that it is 75% likely that the customer will not take the discount. (Ignore the journal entry that would typically be necessary to record the cost of goods sold and the reduction of inventory.) Also provide a comparison of the impact on the income statement for the expected-value method versus the two scenarios under the most-likely-amount method.

SOLUTION: First, Clark and Lewis records the sale. Under the expected-value method, the company records the full accounts receivable and sales at \$4,975 [$(\$5,000 \times 75\%) + (\$4,900 \times 25\%)$]. This amount is \$99.50 per pair of boots ($\$4,975/50$). The journal entry on June 1 is as follows:

<i>Expected-Value Method</i>	<i>Debit</i>	<i>Credit</i>
Accounts Receivable	4,975	
Sales		4,975

On June 9, Clark and Lewis receives payment of \$1,960 from its customer. The net amount per pair of boots is \$98, which is the gross amount of \$100 less the discount of \$2 per pair (i.e., $2\% \times \$100$). Thus, the customer pays for 20 pairs of boots or \$1,960 (20 pairs of boots \times \$98 per pair). Although Clark and Lewis receives only \$1,960 in cash, we must remove accounts receivable at \$1,990 (20 pairs of boots \times \$99.50 per pair). We apply the \$30 difference to the sales discounts account (a contra-revenue account).

<i>Expected-Value Method</i>	<i>Debit</i>	<i>Credit</i>
Cash	1,960	
Sales Discounts	30	
Accounts Receivable		1,990

Finally, on June 29 Clark and Lewis receives payment of \$3,000 for the remaining gross receivable. The customer did not pay within the discount period, so the discount is not taken. Thus, the company removes the accounts receivable balance at the amount of \$2,985 (30 pairs of boots \times \$99.50 per pair). The \$15 discount is recorded by crediting the sales discounts forfeited account, which is a revenue account. The journal entry on June 29 when the discount is not taken follows.

<i>Expected-Value Method</i>	<i>Debit</i>	<i>Credit</i>
Cash	3,000	
Accounts Receivable		2,985
Sales Discounts Forfeited		15

Continued

The total revenue reported is the same for both the expected-value and mostly-likely-amount methods; only the classification on the income statement may differ.

Income Statement Comparison					
<i>Most-Likely-Amount Method (Gross)</i>		<i>Most-Likely-Amount Method (Net)</i>		<i>Expected-Value Method</i>	
Sales	\$5,000	Sales	\$4,900	Sales	\$4,975
Less: Sales discounts	(40)	Other Revenue: Sales discounts forfeited	60	Less: Sales discounts	(30)
		Total Revenue	\$4,960	Net Sales	\$4,945
Total Revenue	\$4,960			Other Revenue: Sales discounts forfeited	15
		Total Revenue	\$4,960	Total Revenue	\$4,960

- 3 Understand the subsequent measurement and accounting for accounts receivable, including establishing an allowance for uncollectible accounts.

Accounting for Accounts Receivable: Subsequent Measurement

Managers understand that selling their products on credit increases total sales because customers prefer to buy on credit. However, there is the risk that the company will not collect the full amount of the receivables. The uncollectible portion of a company's receivables creates a measurement problem for accountants. Accounts receivable must be reported on the balance sheet at *net realizable value*. The term **net realizable value (NRV)** describes the estimated amount that a company reasonably expects to collect from its customers and is measured as the gross accounts receivable less an estimated allowance for uncollectible accounts (a contra-asset account).

Firms report **bad debt expense** on the income statement to reflect the cost of uncollectible accounts. It is not possible to know which specific accounts will ultimately become uncollectible with certainty. Thus, at the end of each reporting period, management must estimate the NRV of accounts receivable and bad debt expense.

THE CONCEPTUAL FRAMEWORK CONNECTION Accounting for Uncollectible Accounts

A number of concepts in the conceptual framework relate to accounting for uncollectible accounts, including the fundamental characteristics—relevance and faithful representation. Even before knowing which customer will not make payment, a company estimates the amount of receivables that will be uncollectible under accrual accounting. Accountants then record bad debt expense for the year with an adjusting entry. Cash is not affected, but management estimates the amount of the bad debt expense to report on the income statement and the resulting NRV of accounts receivable reported on the balance sheet. The amounts provide predictive value to the users of the financial statements assessing the firm's future cash inflows.

In addition, the accrual of bad debt expense results in a more faithful representation of the financial statements than when using a cash-basis system. A faithful representation of the balance sheet requires consideration of the accounts receivable amounts that will likely not generate a future economic benefit. Likewise, a faithful representation of the income statement requires a reduction in income resulting from bad debts. Management's estimation techniques should match bad debt expense with revenues.⁷

⁷See FASB, *Statement of Financial Accounting Concepts No. 5*, "Recognition and Measurement in Financial Statements of Business Enterprises," Paragraph 86 for a discussion of when the consumption of economic benefits should be recognized.

The Allowance Method

We now focus our presentation on the **allowance method**, which estimates the NRV of accounts receivable and the current period's bad debt expense in the period of the sale. There are two key considerations related to uncollectible accounts:⁸

1. The measurement of accounts receivable on the balance sheet at estimated NRV
2. The inclusion of bad debt expense related to the uncollectible accounts on the income statement in the appropriate period

To illustrate, assume that a company sells a product on credit for \$1,000, but it expects that the customer will ultimately pay only \$900. As a result, the company will:

1. Report accounts receivable on the balance sheet at \$900, computed as follows:

Accounts receivable	\$1,000
Less: Allowance for uncollectible accounts	<u>(100)</u>
NRV of accounts receivable	<u>\$ 900</u>

2. Record revenue of \$1,000 and bad debt expense of \$100 in the same period.

In this way, the allowance method measures the receivable at its NRV and reports the cost of selling on credit with the additional revenue generated from extending credit to customers in the same period.

As noted earlier, companies estimating bad debt expense also create an allowance for uncollectible accounts.⁹ The allowance account is a contra-asset that reduces accounts receivable so that the NRV of accounts receivable is reported on the balance sheet. Example 9.4 illustrates the allowance for uncollectible accounts. In the year in which a company determines that a specific account is uncollectible, it writes off the account receivable against the allowance without a further reduction of earnings.¹⁰

EXAMPLE 9.4 Allowance for Uncollectible Accounts

PROBLEM: American Wholesalers sells cereal to a customer for \$10,000 on account on December 1. The customer has not paid the balance due as of the end of the year. After an analysis of the customer's account, American Wholesalers estimates that the customer will ultimately pay only \$9,000 of the \$10,000 that is due. Prepare the journal entries needed to record these transactions. (Ignore the journal entry that would typically be necessary to record the inventory reduction and the cost of goods sold.)

SOLUTION: The December 1 sale is recorded as follows:

Account	December 1
Accounts Receivable	10,000
Sales Revenue	10,000

American Wholesalers records the estimated allowance for uncollectible accounts and the bad debt expense of \$1,000 on December 31 as follows:

Account	December 31
Bad Debt Expense	1,000
Allowance for Uncollectible Accounts	1,000

Continued

⁸An alternative is to report bad debt expense only during the period when an account is determined to be uncollectible. This approach, known as the direct write-off method, is generally not allowed under GAAP.

⁹We also refer to the allowance for uncollectible accounts as the allowance for bad debts or the allowance for doubtful accounts.

¹⁰We will discuss write-offs later in the chapter.

Consequently, on its December 31 financial statements, American Wholesalers will report \$10,000 of revenue and \$1,000 of bad debt expense on its income statement with a \$9,000 net increase in earnings. On the balance sheet, the company reports the NRV of accounts receivable at \$9,000 (i.e., \$10,000 gross accounts receivable less the \$1,000 allowance for uncollectible accounts).

- 4 Estimate an allowance for uncollectible accounts using the aging of receivables method and explain the accounting for write-offs and subsequent recoveries.

Uncollectible Accounts Estimates

Managers form estimates of the amount expected to be uncollectible using the *aging of accounts receivable method*.

Aging of Accounts Receivable

Under the **aging of accounts receivable method**, a company estimates the allowance for uncollectible accounts using the following steps:

1. Determine the balance in each aging category by separating the accounts receivable balances based on the age of the receivable (i.e., the amount of time that has passed from the original date of sale to the bad debt estimation date).
2. Multiply the balance in each aging category by an estimated percentage of uncollectible accounts for that specific category.
3. Add the subtotals of each aging category to determine the required balance in the allowance for uncollectible accounts.
4. Record the bad debt expense needed to adjust the allowance for uncollectible accounts to the correct balance.

Commonly, a company bases the percentage of uncollectible accounts in each age category on experience in collecting its accounts receivable and existing economic conditions. Percentages usually increase with the time the receivables are outstanding because collection becomes less likely for older balances.

The aging of accounts receivable illustrated in Example 9.5 is considered a balance sheet approach because companies calculate the ending balance in the allowance account directly and focus on the proper measurement of accounts receivable at NRV. The resulting bad debt expense and the matching of that expense to sales revenue are ignored.

EXAMPLE 9.5 Aging of Accounts Receivable Method

PROBLEM: Stafford Corporation provides the following information regarding accounts receivable during 2018, its second year of operations.

Net credit sales during 2018	\$6,525,000
Accounts receivable at December 31, 2018 (end of the year)	1,600,000
Allowance for uncollectible accounts (credit balance), December 31, 2018, unadjusted	120,000

The company performs an aging of accounts receivable in order to estimate its allowance for uncollectible accounts. Stafford uses the following estimated percentages of receivables expected to be uncollectible within each category:

Aging Category	Percentage Estimated to Be Uncollectible
Current	1%
1–30 days past due	5
31–60 days past due	15
61–90 days past due	30
Over 90 days past due	95

Stafford's aged schedule of receivables is as follows:

Stafford Corporation: Aged Schedule of Accounts Receivable						
Customer	Current	Past Due				Totals
		1–30 Days	31–60 Days	61–90 Days	Over 90 Days	
Mills Brothers		\$200,000	\$400,000			\$ 600,000
Star Company	\$200,000					200,000
Vaughn Monroe, Inc.		100,000	200,000			300,000
Prima Products				\$300,000	\$200,000	500,000
Totals	<u>\$200,000</u>	<u>\$300,000</u>	<u>\$600,000</u>	<u>\$300,000</u>	<u>\$200,000</u>	<u>\$1,600,000</u>

What is the journal entry to record the bad debt expense for 2018? What is the NRV of accounts receivable balance at the end of the year?

SOLUTION: First, we compute the required balance in the allowance for uncollectible accounts by multiplying the total accounts receivable amount in each category by the relevant percentage. For example, Stafford has \$200,000 of accounts receivable in the current category. We multiply this balance by the 1% estimated percentage of uncollectible accounts, yielding a \$2,000 allowance. We follow this process for each category of receivable and sum the allowances for each aging category. The complete computation follows.

Stafford Corporation: Aged Schedule of Accounts Receivable						
Customer	Current	Past Due				Totals
		1–30 Days	31–60 Days	61–90 Days	Over 90 Days	
Mills Brothers		\$200,000	\$400,000			\$ 600,000
Star Company	\$200,000					200,000
Vaughn Monroe, Inc.		100,000	200,000			300,000
Prima Products				\$300,000	\$200,000	500,000
Totals	\$200,000	\$300,000	\$600,000	\$300,000	\$200,000	\$1,600,000
% Uncollectible	1%	5%	15%	30%	95%	
Allowance Needed	<u>\$ 2,000</u>	<u>\$ 15,000</u>	<u>\$ 90,000</u>	<u>\$ 90,000</u>	<u>\$190,000</u>	<u>\$ 387,000</u>

Based on the analysis of aging, the required allowance account balance at year-end is \$387,000. The allowance for uncollectible accounts is a permanent account, and the company reported an existing credit balance of \$120,000 at the end of the year. As a result, the company needs to increase the allowance only by the difference of \$267,000 (i.e., \$387,000 – \$120,000). The year-end adjusting entry to record the bad debt expense for 2018 follows.

Account	Year-End
Bad Debt Expense	267,000
Allowance for Uncollectible Accounts	267,000

The balance in the allowance account is now \$387,000 as shown in the following t-account.

Continued

**Allowance for
Uncollectible Accounts**

	120,000	Unadjusted Ending Balance
	267,000	Adjustment
	<u>387,000</u>	Ending Balance

The NRV of accounts receivable at year-end is as follows:

Accounts receivable	\$1,600,000
Less: Allowance for uncollectible accounts	<u>(387,000)</u>
NRV of accounts receivable	<u>\$1,213,000</u>

Using the aging of accounts receivable method, a company directly estimates the ending balance of the allowance account to determine the NRV of accounts receivable. As a result, the amount for the bad debt expense, which is the change in the allowance account, is “forced” to be set equal to the adjustment needed in the allowance account. The aging of accounts receivable method focuses on the proper balance sheet valuation of the NRV of accounts receivable. However, it may report a bad debt expense that does not match with current-period net sales. This issue is heightened when there is an existing debit balance in the allowance account.¹¹ Under the aging of accounts receivable method, an existing debit balance would be added to the required allowance to arrive at the necessary journal entry as shown in Example 9.6.

EXAMPLE 9.6 Aging of Accounts Receivable Method with Debit Allowance Balance

PROBLEM: Stafford Corporation provides the following information regarding accounts receivable during 2018.

Net credit sales during 2018	\$6,525,000
Accounts receivable at December 31, 2018 (end of the year)	1,600,000
Allowance for uncollectible accounts (debit balance), December 31, 2018, unadjusted	155,000

Based on the analysis of aging, the required allowance account balance at year-end is \$387,000. Provide the journal entry to record the bad debt expense for the year.

SOLUTION: Stafford Corporation needs an ending credit balance of \$387,000. Thus, as shown in the following t-account, it needs to credit the allowance for \$542,000.

Allowance for Uncollectible Accounts		
Unadjusted Balance	155,000	
	<u>542,000</u>	Adjustment
	<u>387,000</u>	Ending Balance

¹¹The balance in the allowance account could be a debit due to write-offs (which we discuss in the next section) in excess of amounts previously provided.

The adjusting journal entry follows.

Account	Year-End
Bad Debt Expense	542,000
Allowance for Uncollectible Accounts	542,000

The NRV of accounts receivable at year-end is as follows:

Accounts receivable	\$1,600,000
Less: Allowance for uncollectible accounts	(387,000)
NRV of accounts receivable	<u>\$1,213,000</u>

Note that the bad debt expense increases from \$267,000 to \$542,000 because of the change in assumption regarding the existing balance in the allowance account. Although the NRV of accounts receivable is the same as in Example 9.5, the fact that there is now a debit balance in the allowance account increases the bad debt expense by \$275,000. Once again, the use of the aging of accounts receivable method results in a bad debt expense that is “forced” to be set equal to the adjustment needed in the allowance account.

Companies must disclose the method they use to estimate the allowance for doubtful accounts. Exhibit 9.2 presents an example from *Levi Strauss & Co.* indicating that the company uses an aging of accounts receivable approach combined with other factors.

EXHIBIT 9.2 Accounts Receivable Disclosure, *Levi Strauss & Co.*, Annual Report, November 27, 2016

ACCOUNTS RECEIVABLE, NET

The Company extends credit to its customers that satisfy predefined credit criteria. Accounts receivable are recorded net of an allowance for doubtful accounts. The Company estimates the allowance for doubtful accounts based upon an analysis of the aging of accounts receivable at the date of the consolidated financial statements, assessments of collectability based on historic trends, customer-specific circumstances, and an evaluation of economic conditions.

Source: Levi Strauss & Co. Annual Report, 2016. <https://www.sec.gov/Archives/edgar/data/94845/000009484517000012/a2016yeform10-k.htm>

Uncollectible Account Write-Off

A company *writes off* an account receivable when it no longer expects to collect the amount due from a customer. When it decides to **write off** a specific account, the company reduces or debits the allowance for uncollectible accounts and reduces or credits the accounts receivable.

The write-off under the allowance method has no balance sheet effect related to the NRV of the accounts receivable. There is also no income statement effect from the write-off under the allowance method because the company previously reduced income by the estimated bad debt expense in the year of the sale.

Companies maintain the general ledger account accounts receivable that reflects the amount of the gross accounts receivable reported on the balance sheet. In addition, companies include the specific customer accounts in an accounts receivable subsidiary ledger.

When estimating the NRV of accounts receivable, the company uses the allowance for uncollectible accounts to offset the gross accounts receivable account on the balance sheet as opposed to any specific customer accounts. However, the company removes the individual customer account from the subsidiary ledger when it ultimately writes off the account. The gross accounts receivable and the allowance accounts are also reduced by the amount of the write-off. Example 9.7 provides an example of a write-off.

EXAMPLE 9.7 Write-Off of an Uncollectible Account

PROBLEM: Continuing the Stafford Corporation illustration in Example 9.6, assume that actual bad debts were \$85,000 in 2019. Specifically, on January 2, 2019, Stafford determined that Prima Products is unable to pay a portion of its balance due. Stafford uses the aged balance of accounts receivable to estimate its bad debt expense. What is the journal entry necessary to write off this account? What is the NRV of the accounts receivable before the write-off? What is the NRV of the accounts receivable after the write-off?

SOLUTION: When writing off an uncollectible account, a company will always debit the allowance for uncollectible accounts and credit accounts receivable to remove the amount written off from both accounts. The journal entry is as follows:

<i>Account</i>	<i>January 2, 2019</i>	
Allowance for Uncollectible Accounts	85,000	
Accounts Receivable—Prima Products		85,000

The credit to accounts receivable reduces both the gross accounts receivable account on the balance sheet and the individual customer's account balance.

The NRV is not directly affected by the write-off: The NRV of accounts receivable is \$1,213,000 both before and after the write-off of the actual uncollectible account as illustrated in the following table.

<i>Description</i>	<i>Before Write-Off</i>	<i>Write-Off</i>	<i>After Write-Off</i>
Accounts receivable	\$1,600,000	\$ (85,000)	\$1,515,000
Less: Allowance for uncollectible accounts	<u>(387,000)</u>	<u>85,000</u>	<u>(302,000)</u>
NRV	<u>\$1,213,000</u>	<u>\$ 0</u>	<u>\$1,213,000</u>

Subsequent Recoveries

A company writes off an account receivable when it no longer expects to collect the amount due from a customer. However, the customer legally still owes money to the company and may eventually pay the amount due. A **recovery** occurs when a company receives payment on an account that it had previously written off. There are two steps to account for the subsequent recovery of accounts previously written off against the allowance account:

1. Reinstate the account receivable and restore the allowance account.
2. Record the cash collection.

Example 9.8 illustrates accounting for the recovery of a write-off.

EXAMPLE 9.8 Subsequent Recovery

PROBLEM: Consider the information provided for Stafford Corporation in Example 9.7. Assume that Stafford subsequently collects the \$85,000 due from Prima Products that it has previously written off. What are the required journal entries to record the recovery?

SOLUTION: First, we must reinstate the account receivable and the allowance accounts as follows:

<i>Account</i>	<i>At Recovery</i>	
Accounts Receivable—Prima Products	85,000	
Allowance for Uncollectible Accounts		85,000

This procedure restores the allowance account and reinstates the receivable from Prima Products.

Second, we record the cash collection as follows:

<i>Account</i>	<i>At Recovery</i>
Cash	85,000
Accounts Receivable—Prima Products	85,000

JUDGMENTS IN ACCOUNTING

Subsequent Measurements of Accounts Receivable

Management exercises a great deal of judgment and subjectivity in estimating the bad debt expense and the allowance for uncollectible accounts. In a survey of 175 companies, 40% of them indicated that they make estimates and use judgment in reporting their allowance for uncollectible accounts.¹² For example, as presented in Exhibit 9.3, in its 2016 financial statements, *Thomson Reuters Corporation*, the mass media and information firm, reported that the balance in its allowance account was 6% of its gross receivables. In other words, the company estimated that it would never collect 6% of the amount it is owed. Also, notice that *Thomson* disclosed that changing this estimate by 1% would have a \$14 million impact on pre-tax earnings.

EXHIBIT 9.3 Critical Accounting Estimates and Judgments, *Thomson Reuters Corporation*, December 31, 2016, Financial Statements

NOTE 2: Critical Accounting Estimates and Judgments

The preparation of financial statements requires management to make estimates and judgments about the future. Estimates and judgments are continually evaluated and are based on historical experience and other factors, including expectations of future events that are believed to be reasonable under the circumstances. Accounting estimates will, by definition, seldom equal the actual results. The following discussion sets forth management's:

- most critical estimates and assumptions in determining the value of assets and liabilities; and
- most critical judgments in applying accounting policies.

Critical Accounting Estimates and Assumptions

Allowance for doubtful accounts and sales adjustments

We must make an assessment of whether accounts receivable are collectible from customers. Accordingly, we establish an allowance for estimated losses arising from non-payment and other sales adjustments, taking into consideration customer creditworthiness, current economic trends and past experience. If future collections differ from estimates, future earnings would be affected. At December 31, 2016, the combined allowances were \$87 million, or 6%, of the gross trade accounts receivable balance of approximately \$1.4 billion. An increase to the reserve based on 1% of accounts receivable would have decreased pre-tax earnings by approximately \$14 million for the year ended December 31, 2016.

Source: Thomson Reuters, Inc. <https://annual-report.thomsonreuters.com/downloads/annual-report-2016-thomson-reuters.pdf>, page 81.

No U.S. GAAP or IFRS standards require a specific estimation method. Companies follow both U.S. GAAP and IFRS in using the allowance method, but these standards do not specify *how* to estimate the bad debt expense. Consequently, companies exercise discretion in the specific method used to estimate the bad debt expense, such as the aging of accounts receivable method.

¹²AICPA, *IFRS Accounting Trends and Techniques—2012* (New York, NY: AICPA, 2012).

Management has flexibility in choosing the percentages for aging categories in the aging of accounts receivable method. The bad debt expense accrual leaves a great deal of room for earnings management activities. Consider that Stafford Corporation in Example 9.5 estimated its bad debts as 15% of accounts receivable 31–60 days past due. A decrease of just one percentage point to 14% would result in a \$6,000 decrease in bad debt expense (\$90,000 – \$84,000) and thus a \$6,000 increase in net income.

Both *PepsiCo, Inc.* and *Coca-Cola Company*, two large beverage companies, disclose that they base allowances and bad debt expense on the aging of accounts and prior customer experience. Exhibit 9.4 compares the accounts receivable measurement practices of the two companies. Even though both companies use the same general approach, the allowances vary due to the judgment used in assessing the NRV of accounts receivable as indicated by the percentages used in Exhibit 9.4. *PepsiCo's* 2016 allowance is about 1.0% of gross receivables and *Coca-Cola's* is 10.8%. Of course, the allowances also reflect each company's credit-extension policies.

EXHIBIT 9.4 Accounting Policies for Allowance for Uncollectible Accounts

	<i>PepsiCo, Inc.</i> December 31, 2016	<i>Coca-Cola Company</i>, December 31, 2016
Policy	"We estimate and reserve for our bad debt exposure based on our experience with past due accounts and collectability, the aging of accounts receivable and our analysis of customer data."	"We calculate this allowance based on our history of write-offs, the level of past-due accounts based on the contractual terms of the receivables, and our relationships with, and the economic status of, our bottling partners and customers. We believe our exposure to concentrations of credit risk is limited due to the diverse geographic areas covered by our operations."
(in millions)		
Allowance for Uncollectible Accounts	\$ 37	\$ 466
Gross Accounts Receivable	\$5,709	\$4,322
Percent Allowed For	0.6%	10.8%

Sources: *Pepsico, Inc.* Annual Report, December 2016. <http://www.pepsico.com/Investors/Annual-Reports-and-Proxy-Information> and *Coca-Cola Company's* Annual Report 2016. <http://www.coca-colacompany.com/content/dam/journey/us/en/private/fileassets/pdf/investors/2016-AR-10-K.pdf>

Exhibit 9.4 indicates the impact of estimated bad debt expense on the amount of earnings reported. For example, *Coca-Cola* reported pre-tax income of \$8,136 million in 2016. If the company had estimated the allowance a percentage higher at 11.8% of the \$4,322 receivable balance, then bad debt expense would have been \$44 million higher (\$510 – \$466), reducing pre-tax income by \$44 million, or nearly 0.5% (\$44/\$8,136). Likewise, if *Coca-Cola* had reduced this percentage by 1% to 9.8%, pre-tax income would have increased by \$44 million.

- 5 Discuss the use of accounts receivable to generate immediate cash—including pledging or assigning, factoring receivables, and securitization—and demonstrate the accounting for these transactions.

Financing with Accounts Receivable

In managing short-term operating assets, firms can secure immediate cash from accounts receivable rather than waiting for a customer to remit payment. We address three alternate techniques—*pledging* or *assigning* accounts receivable, *factoring* accounts receivable, and *securitizations*.

A company uses its receivables as collateral for a lending arrangement by *pledging* or *assigning* the receivables. *Factoring* involves selling the receivables to a third party at a discount. *Securitization* involves bundling together and selling an interest in many separate receivables.

Pledging and Assigning Accounts Receivable

Pledging and *assigning* receivables are both forms of collateralized borrowing. When a firm **pledges accounts receivable**, the receivables are collateral for a financing arrangement. When the company **assigns accounts receivable**, specifically designated receivables are collateral for the loan, but the company must use the receipts on collection of the receivables to repay the debt.¹³

When pledging and assigning, the accounts receivable remain on the balance sheet. If the receivables are used as collateral for a short-term loan, they continue to be classified as current assets on the balance sheet. If the liability is long term, then the receivables pledged or assigned are reclassified as noncurrent assets on the balance sheet. Footnotes to the financial statements indicate the contingent liability related to the transfer of the accounts receivable rights to others. Financial statement users should consider the potential adverse effects on liquidity from a default on the debt relating to the receivables pledged or assigned to third parties. Example 9.9 illustrates accounting for assigned accounts receivable.

EXAMPLE 9.9 Assigning Accounts Receivable

PROBLEM: On March 1, Cole Company borrowed \$600,000 from Damone Financing Associates by securing a revolving line of credit at a 6% interest rate. Interest is due and payable at the beginning of each month based on the outstanding balance at the beginning of the prior month. Cole assigned \$680,000 of its accounts receivable as collateral for the lending arrangement. On April 1, Cole collected \$180,000 of the assigned accounts receivable. Prepare the necessary journal entries for these transactions.

SOLUTION: Cole Company makes the following journal entries to record the lending arrangement.

<i>Account</i>	<i>March 1</i>	
Cash	600,000	
Notes Payable		600,000
Assigned Accounts Receivable	680,000	
Accounts Receivable		680,000

Cole Company records the cash collected on the receivables.

<i>Account</i>	<i>April 1</i>	
Cash	180,000	
Assigned Accounts Receivable		180,000

Then, Cole Company remits cash to Damone Financing each month based on the dollar amount of receivables it collects. Thus, on April 1, Cole will pay Damone Financing the \$180,000 plus interest. We compute the interest as \$3,000 ($\$600,000 \text{ loan balance} \times 6\% \times 1/12$).

<i>Account</i>	<i>April 1</i>	
Notes Payable	180,000	
Interest Expense	3,000	
Cash		183,000

¹³These borrowing arrangements are often called asset-based lending. Any type of loan backed by assets can be called an asset-based loan. However, asset-based lending is typically used to describe a borrowing arrangement when the collateral is inventory, accounts receivable, or equipment.

Factoring Accounts Receivable

Factoring accounts receivable occurs when a company sells its accounts receivable to a third party, known as a factor, at a discount. In most factoring arrangements, customers are instructed to pay the factor directly. The factoring company discounts or reduces the amount remitted due to the risk of bad debts and the cost of collection.

Accounting for a factoring transaction depends on whether the arrangement qualifies as a sale and whether the sale includes conditions guaranteeing collection of the receivables.

Sales versus Secured Borrowing. When a company factors its receivables, it must first determine whether the transaction meets the requirements to record the transaction as a sale.

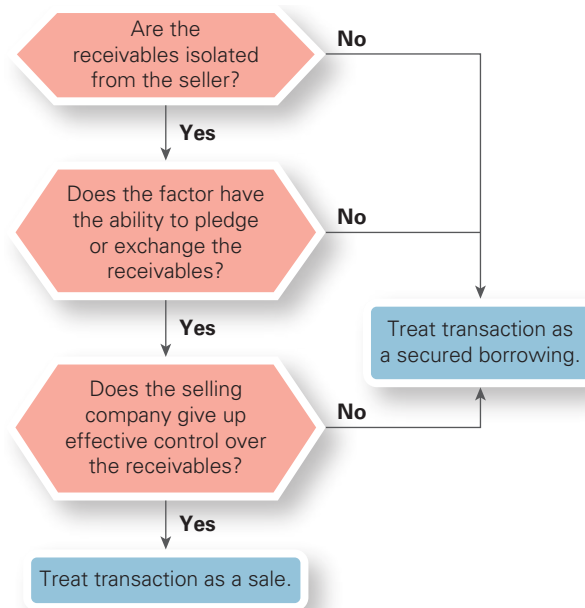

Companies must meet all of the following conditions in order to record the transaction as a sale:¹⁴

1. The receivables are isolated from the selling company. That is, the receivables must be out of the reach of the seller as well as its creditors—even in the case of bankruptcy.
2. The factor has the ability to pledge or exchange the receivables.
3. The selling company does not maintain effective control over the receivables (i.e., there is no continuing involvement by the selling company).

In general, these conditions, summarized in Exhibit 9.5, ensure that the seller does not retain any control of the receivables.

If the company determines that the factoring arrangement is a sale, it derecognizes the receivables (i.e., the company removes the receivables from the balance sheet). If the transaction does not qualify as a sale, the company treats it as a secured borrowing by using the same accounting as if the company had pledged or had assigned the receivables.

EXHIBIT 9.5 Sales versus Secured Borrowing

If a transaction meets the conditions to be recorded as a sale, the accounting depends on whether the receivables are sold with or without a **recourse** provision guaranteeing that they will be collected in the factoring contract.

¹⁴The specific conditions are presented in paragraph 5 of FASB ASC 860-10-40—*Transfers and Servicing – Overall – Derecognition*.

Factoring without Recourse. If the receivables are transferred without a guarantee of collection, the factor assumes the risk of uncollectible accounts and absorbs any credit losses. The customers now pay the buyer or factor. When the seller does not guarantee collectability, the receivables are transferred **without recourse**. When factoring receivables without recourse, the seller company no longer retains any of the risks or rewards of the receivable.

When the sale of accounts receivable is made without recourse, the selling company removes the accounts receivable from its books and records the related gain or loss on the transaction as shown in Example 9.10. The gain or loss is the difference between the proceeds on the sale and the face amount of the receivables factored adjusted for any *hold back*. A **hold back** is an amount of cash that the buyer does not remit to the seller but instead retains as additional security. The seller recognizes the amount of the holdback as a type of receivable on its books. After the receivables are fully collected, the buyer returns the holdback amount to the seller.

EXAMPLE 9.10

Factoring Accounts Receivable without Recourse

PROBLEM: ABJ, Inc. factors \$480,000 of its accounts receivable to S&E Lawrence Factors without recourse. The transaction qualifies as a sale. S&E Lawrence charges a fee equal to 8% of the receivables factored and holds back an additional 3% as security. S&E Lawrence Factors will return the hold back to ABJ in full when it collects the receivables. What is ABJ Inc.'s journal entry to record the transaction?

SOLUTION: ABJ removes \$480,000 of accounts receivable from the books. ABJ receives cash proceeds of \$427,200 on the sale computed as follows:

Accounts receivable	\$480,000
Factoring fee ($\$480,000 \times 8\%$)	(38,400)
Holdback ($\$480,000 \times 3\%$)	(14,400)
Cash proceeds from factor	<u>\$ 427,200</u>

ABJ records the holdback as an asset and records the factoring fee charge as a loss on the sale of receivables. The journal entry is as follows:

Account	Current Year
Cash	427,200
Loss on Sale of Receivables	38,400
Receivable from Factor	14,400
Accounts Receivable	480,000

Factoring with Recourse. When a seller transfers receivables **with recourse**, the seller guarantees that all or part of the receivables transferred will be collected. The selling company assumes the risk of uncollectability and resulting credit losses. The seller separately recognizes any liability created by the guarantee by recording a recourse liability along with an additional estimated loss for possible losses due to the guarantee. The seller estimates the amount of the recourse liability as the amount that the buying company is not expected to collect. Example 9.11 provides an example of accounting for a factoring with recourse.

EXAMPLE 9.11

Factoring Accounts Receivable with Recourse

PROBLEM: ABJ, Inc. factors \$480,000 of its accounts receivable to S&E Lawrence Factors with recourse. The transaction qualifies as a sale. S&E Lawrence charges a fee equal to 6% of the receivables factored and holds back an additional 3% as security. S&E Lawrence Factors will return the hold back to ABJ when it collects the receivables. In addition, the fair value of the recourse liability is estimated at \$10,000. What is ABJ, Inc.'s journal entry to record the transaction?

Continued

SOLUTION: ABJ must remove accounts receivable of \$480,000 from the books. ABJ will also record the \$436,800 cash proceeds received on the sale, computed as follows:

Accounts receivable	\$480,000
Factoring fee (\$480,000 × 6%)	(28,800)
Hold back (\$480,000 × 3%)	<u>(14,400)</u>
Cash collected	<u>\$436,800</u>

ABJ records the \$14,400 hold back as an asset, records the \$10,000 recourse obligation as a liability, and increases the loss on the sale by this same amount. Thus, the total loss is the \$28,800 factoring fee plus the \$10,000 obligation. The journal entry follows:

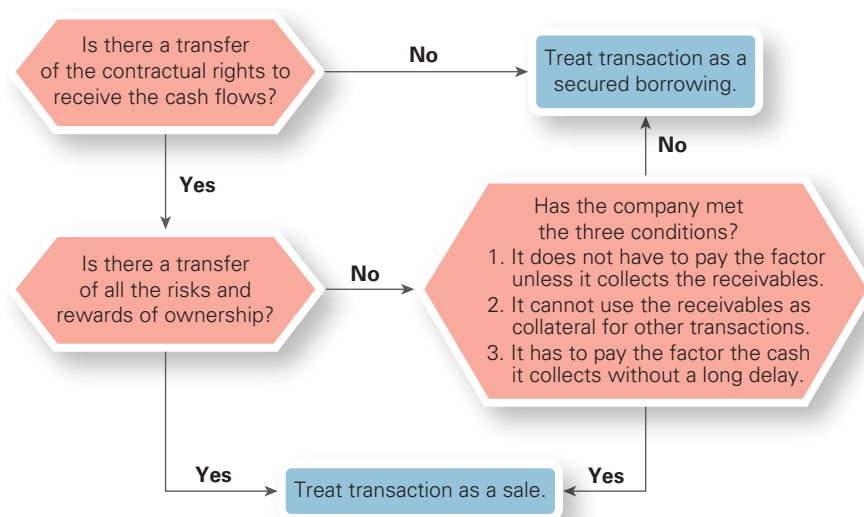

Account	Current Year
Cash	436,800
Loss on Sale of Receivables (\$28,800 Fee + \$10,000 Recourse Obligation)	38,800
Receivable from Factor	14,400
Recourse Obligation	10,000
Accounts Receivable	480,000

Factoring Accounts Receivable: IFRS. IFRS differs from U.S. GAAP by determining whether a factoring arrangement is a sale based on the transfer of contractual rights to the cash flows.¹⁵ When a company transfers the contractual rights to receive the cash flows from the receivables, it assesses whether it has also transferred all the risks and rewards of ownership. If it has, then the transfer is a sale. If the seller retains substantial risks and rewards of owning the receivable, he still may have a sale, but only if he meets three conditions. A company retaining the contractual rights to receive the cash flows must meet three conditions for the transfer to be considered a sale:

1. The company does not have to pay the factor unless it collects the receivables.
2. The company cannot use the receivables as collateral for other transactions.
3. The company has to pay the factor the cash it collects without a long delay.

Exhibit 9.6 provides a flowchart of the sale versus secured borrowing decision under IFRS. Observe that under U.S. GAAP, isolating the receivables and giving up effective control over the

EXHIBIT 9.6 Sales versus Secured Borrowing under IFRS

¹⁵IFRS Requirements for derecognition of financial assets are in Section 3.2 of IASB, *International Financial Reporting Standard 9*, “Financial Instruments” (London, UK: International Accounting Standards Board, 2014, Revised).

receivables are both required for a sale as illustrated in Exhibit 9.5. However, under IFRS, receivables do not have to be isolated and companies do not have to give up effective control as long as they pay out any cash collected on a timely basis to the factor.

Although U.S. GAAP and IFRS use somewhat different criteria in determining whether the transfer is a sale, both standards often arrive at the same conclusion.

At December 31, 2016, *Fiat Chrysler Automobiles N.V.*, a European car manufacturer and IFRS reporter, had transferred without recourse and derecognized €6,573 million of receivables. *Fiat Chrysler* indicates that even though some transactions may be legally viewed as a sale of receivables, it does not substantially transfer the risks and rewards associated with the receivables because of the significant loss guarantees and its continuing exposure. As such, these transactions do not meet the conditions required to record these transactions as sales. The carrying amount of *Fiat Chrysler's* transferred receivables not derecognized and the related liabilities total €410 million.¹⁶

Securitizations

The term **securitization** refers to a financing technique that involves taking many separate, and oftentimes diverse, financial assets and combining them into a single pool or bundle. Investors then purchase interests in the pool of assets rather than buying an individual asset or group of assets.¹⁷

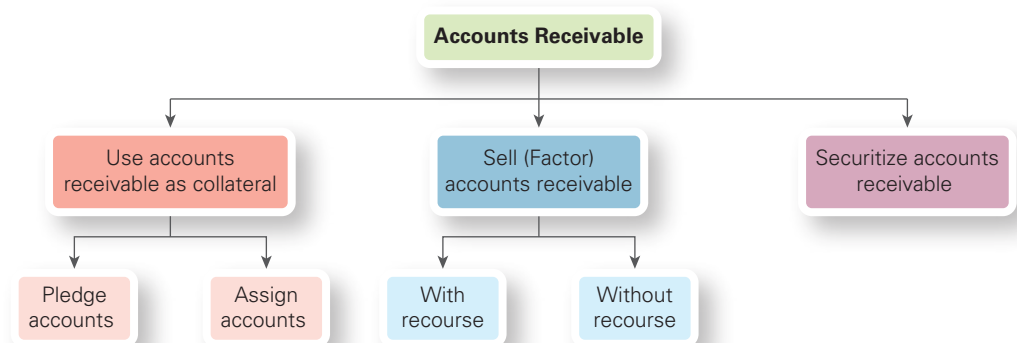

Securitization allows a company to engage in a collateralized borrowing arrangement with a large number of lenders by issuing debt obligations or equity shares rather than attempting to sell each asset. Securitization also allows a company to obtain financing at a lower cost of borrowing. The pooling of many individual assets diversifies the default risk from each individual asset, thereby enhancing an investor's ability to predict the investment's future cash flows, lowering risk, and thereby lowering the required rate of return.

These benefits are possible because a company can select high-quality assets to collateralize the notes or equity shares. For example, a major telecommunications company can bundle the cell phone accounts of subscribers with the highest credit rating to use as collateral for a series of notes payable. The investors purchasing the notes can rely on the collection of the cell phone receivables to pay interest and cover the note principal at maturity. Rather than attempting to sell the receivables to a single factor, the company has effectively sold the receivables to multiple investors, lowering the cost and the concentration of risk. A company can also bundle diverse types of receivables into the securitization transaction. For example, the credit affiliate of an automobile manufacturer can bundle auto loans and lease receivables as security for a note payable.

Securitization can also have drawbacks. Potential investors do not always have detailed knowledge on the original borrowers or their risk of default. Therefore, a company may have to offer the securities at a lower price. Even when a company can securitize its receivables, there is still the risk of non-collection. For example, securitization of mortgage receivables from borrowers with poor credit histories and higher risks of default led to the subprime mortgage crisis of 2007–2010.

Exhibit 9.7 summarizes ways in which a company can use accounts receivable to provide financing.

EXHIBIT 9.7 Financing with Accounts Receivable

¹⁶Source: Fiat Chrysler Automobiles N.V.'s 2016 financial statements. https://www.fcagroup.com/en-US/investor_relations/financial_information_reports/annual_reports/annual_reports/FCA_2016_Annual_Report.pdf

¹⁷Securitized transactions are typically covered in much greater depth in advanced accounting courses.

- 6 Describe accounting for short-term notes receivable when issued and after issuance.

Accounting for Short-Term Notes Receivable

We introduce the key features of *notes receivable* and review the accounting methods used to record notes receivable, which depend on whether the stated interest rate is at or below the market interest rate.¹⁸

Basic Features of Notes Receivable

A **note receivable** is a formal, written promise to receive a fixed sum of money at a specified date (or dates) in the future, usually with a *stated interest rate*. The fixed sum of money that will be received at a specified date in the future is the **face value** of the note receivable. Notes receivable are classified as current or noncurrent on the balance sheet based on the expected collection date. Notes originate from either trade or *nontrade* transactions. **Nontrade notes receivable** include loans made to officers or employees and special financing arrangements with customers or vendors. Notes receivable can be *interest bearing* or *non-interest bearing*—but all notes include an interest element. The holder of an **interest-bearing note** receives periodic interest over the loan term. Conversely, the holder of a **non-interest-bearing note** does not receive periodic interest over the term of the note.

When a company accepts a note in exchange for goods and services, the note may have a *stated rate* of interest, may not specify an interest rate, or may have a *stated rate* of interest that is significantly different than the current *market rate*. The **stated rate** is the interest rate that the holder of the note will receive and is expressed as an annual rate. The **market rate** is the interest rate on a similar investment in the market. Regardless of the note's stated interest rate, companies always report the note receivable at the present value of the future cash flows discounted at the market rate on the balance sheet. Similarly, if the note does not specify an interest rate, the note receivable is reported at the present value of the future cash flows discounted at the market rate. Interest is recorded on the note over its life by the amortization of a discount.¹⁹

Next, we present the accounting for a note receivable with a stated interest rate equal to the market interest rate. Then, we discuss accounting for a note with a stated interest rate that is below the market interest rate.

Stated Interest Rate Equal to the Market Rate

When short-term notes are interest bearing at the current market rate of interest when issued, the face amount of the note is the same as its present value. In this case, the company records the note at its face value and interest accrues over the life of the note as illustrated in Example 9.12.

EXAMPLE 9.12

Note's Stated Rate Equals the Market Rate

PROBLEM: Fitzgerald Associates develops custom computer systems for auto dealers. On March 1, 2018, Fitzgerald installed a \$1,200,000 sales and service system for Mel's Auto Mall. Fitzgerald agreed to accept a 4-month, 7% note with interest due at maturity, June 30, 2018. The current market rate is 7%. Fitzgerald prepares financial statements at the end of every calendar quarter. Prepare all journal entries necessary over the term of the note for Fitzgerald.

SOLUTION: Fitzgerald records sales revenue on the date it installs the computer system and it is fully functional. Therefore, the company records the March 1 sale as follows:

Account	March 1, 2018
Notes Receivable	1,200,000
Sales Revenue	1,200,000

¹⁸In this chapter, we discuss only notes receivable that are used in operations and are usually short term. Commonly, companies hold long-term notes as investments. Accounting for these notes requires the use of time value money concepts and amortization tables. We provide a detailed discussion of this topic in Chapter 16, Investing Assets.

¹⁹Management must assess notes receivable for potential uncollectible notes by following the same procedures used for accounts receivable. Firms may also need to record an impairment of notes receivable or report them at fair value using the fair value option. We address both of these issues in a later chapter.

Fitzgerald accrues interest on the note as of March 31 for the quarterly financial statements by recording interest of \$7,000 for the 1 month that the note was outstanding (i.e., $\$1,200,000 \times 7\% \times 1/12$).

Account	March 31, 2018
Interest Receivable	7,000
Interest Revenue	7,000

When the note is due on June 30, 2018, Fitzgerald will receive four full months' interest. Therefore, the interest received at maturity is \$28,000 (i.e., $\$1,200,000 \times 7\% \times 4/12$). Fitzgerald previously recorded \$7,000 interest revenue for 1 month with the balance of \$21,000 of interest revenue to be recognized this calendar quarter (i.e., $\$1,200,000 \times 7\% \times 3/12$). Fitzgerald collects a total amount of \$1,228,000 from Mel's. Fitzgerald's entry to record the collection of the note plus accrued interest on June 30, 2018, follows.

Account	June 30, 2018
Cash	1,228,000
Interest Receivable	7,000
Interest Revenue	21,000
Note Receivable	1,200,000

No Stated Interest Rate or Stated Interest Rate Less Than the Market Rate

When there is no interest rate stated or the stated interest rate is less than the market interest rate, the face value of a note receivable no longer provides a valid measure of its present value. In this case, a company records the note at its present value rather than its face value. There are two approaches to measure present value:

- If a company receives the note in exchange for goods or services, assume that the note's present value is the fair value of the goods or services provided. Fair value estimates can be based on the value of comparable goods and services or the market value of the note if it is traded.
- If the company cannot determine the fair value of the goods or services, compute present value as the value of the note discounted at the market rate of interest. Here the market rate of interest is known as the imputed rate of interest.

The difference between the face value of the note and the fair value of the goods and services provided or the present value of the note is a **discount**, which represents the deferred interest revenue to be earned over the note's life. The firm initially records deferred interest revenue as a discount on notes receivable (a contra-asset account) and then amortizes the amount to interest revenue over the loan term. Example 9.13 shows accounting for a note with no stated interest rate.

EXAMPLE 9.13

Note with No Stated Interest Rate

PROBLEM: Fitzgerald Associates develops custom computer systems for auto dealers. On June 1, 2018, Fitzgerald installed a \$975,000 sales and service system for Hoola Autos. Fitzgerald agreed to accept a \$1,000,000, 3-month, non-interest-bearing note due on September 1, 2018. Fitzgerald prepares financial statements at the end of every calendar year. Prepare all journal entries necessary for the term of the note for Fitzgerald.

Continued

SOLUTION: Although the face value of the note is \$1,000,000, its present value is less because the amount is not due for 3 months. The system Fitzgerald installed for Hoola Autos has a current selling price of \$975,000. As a result, the company records the note receivable at \$975,000, the fair value of the asset sold. Specifically, Fitzgerald records notes receivable of \$1,000,000 and a discount on notes receivable (contra asset) of \$25,000.

Account	June 1, 2018
Notes Receivable	1,000,000
Discount on Notes Receivable	25,000
Sales Revenue	975,000

On September 1, 2018, Fitzgerald records the collection of the note and recognizes interest revenue by amortizing the deferred interest revenue to income.

Account	September 1, 2018
Cash	1,000,000
Notes Receivable	1,000,000

Account	September 1, 2018
Discount on Notes Receivable	25,000
Interest Revenue	25,000

In this example, Fitzgerald collected the note before the end of its fiscal year. However, if the note is still outstanding when the company prepares financial statements, it must record interest on the loan as shown in Example 9.14.

EXAMPLE 9.14

Note with No Stated Interest and Discount Amortization

PROBLEM: Fitzgerald Associates develops custom computer systems for auto dealers. On November 1, 2018, Fitzgerald installed a \$975,000 sales and service system for Hoola Autos. Fitzgerald agreed to accept a \$1 million 3-month, non-interest-bearing note due on February 1, 2019. Fitzgerald prepares financial statements at the end of every calendar year. Prepare all journal entries necessary for the term of the note for Fitzgerald.

SOLUTION: Although the face value of the note is \$1,000,000, its present value is less because the amount is not due for 3 months. The system Fitzgerald installed for Hoola Autos has a current selling price of \$975,000. As a result, the company records the note receivable at \$975,000, the fair value of the asset sold. Specifically, Fitzgerald records notes receivable of \$1,000,000 and a discount on notes receivable (contra asset) of \$25,000.

Account	November 1, 2018
Notes Receivable	1,000,000
Discount on Notes Receivable	25,000
Sales Revenue	975,000

On December 31, 2018, Fitzgerald must record 2 months of interest revenue. Total interest revenue will be \$25,000 for 3 months, so it will record two-thirds of the total, or \$16,667 ($\$25,000 \times 2/3$).

Account	December 31, 2018
Discount on Notes Receivable	16,667
Interest Revenue	16,667

On February 1, 2019, Fitzgerald records the collection of the note and records interest revenue by amortizing the remaining \$8,333 of deferred interest revenue to income ($\$25,000 \times 1/3$).

Account	February 1, 2019	
Cash	1,000,000	
Notes Receivable		1,000,000
Discount on Notes Receivable	8,333	
Interest Revenue		8,333

Financing with Notes Receivable. In a manner similar to accounts receivable, companies can sell notes receivable to secure immediate cash. A company sells a note receivable by transferring it to another party before the maturity date. Selling a note receivable is typically referred to as **discounting**. The accounting approach for selling or discounting a note receivable is similar to factoring accounts receivable as illustrated in Example 9.15. If the conditions are met to consider the transaction a sale, the company removes the receivable from the books and reports a gain or loss. One difference in accounting for the sale of a note receivable versus an account receivable is that notes receivable earn interest. Therefore, the company must accrue any interest that has been earned but not received as of the time the note is sold.

EXAMPLE 9.15

Discounting Notes Receivable

PROBLEM: On January 1, Horton's Horse Farms (HHF) sold horses in exchange for a 6-month note with an 8% interest rate. On April 1, HHF discounted the \$320,000 note to R&T Factors without recourse. The transaction qualifies as a sale. R&T charges a 10% discount rate. What is HHF's journal entry to record the transaction?

SOLUTION: HHF first must record the interest that has accrued as of April 1 ($\$320,000 \times 8\% \times 3/12$).

Account	April 1	
Interest Receivable	6,400	
Interest Revenue		6,400

HHF then removes the \$320,000 note receivable from the books. HHF receives cash proceeds of \$324,480 on the sale, computed as follows:

Note receivable	\$320,000
Interest received at maturity ($\$320,000 \times 8\% \times 6/12$)	<u>12,800</u>
Cash received at maturity	332,800
Discount fee ($\$332,800 \times 10\% \times 3/12$)	<u>(8,320)</u>
Cash proceeds from factor	<u>\$324,480</u>

HHF removes the note and interest receivable from its books and records the cash proceeds and the loss. The \$1,920 loss is the difference between the cash received and the value of the assets removed from the books: the note receivable and the interest receivable. The journal entry is as follows:

Account	April 1	
Cash	324,480	
Loss on Sale of Receivables	1,920	
Interest Receivable		6,400
Note Receivable		320,000

- 7 Explain the required disclosures for accounts and notes receivable.

Disclosures for Accounts Receivable and Notes Receivable

Companies disclose a summary of significant accounting policies relating to accounts receivable and notes receivable in the notes to the financial statements. The disclosures for receivables include accounting policies and the methodology used to estimate the allowance for uncollectible accounts, such as a description of the elements that influence management's judgment and credit risk. Companies also provide a description of the policy for writing off uncollectible receivables.

Companies commonly report net receivables on the balance sheet and disclose gross receivables and the allowance for uncollectible accounts in the notes to the financial statements. For the allowance, companies disclose activity during the year such as:

1. The allowance balance at the beginning and end of each period
2. Current-period bad debt expense
3. Write-offs charged against the allowance
4. Recoveries of amounts previously written-off

When a company has pledged, assigned, or factored any accounts receivable, it must provide detailed disclosures of the amounts, terms, and collateral. Exhibit 9.8 provides an example of *Kellogg Company's* accounts receivable disclosures. *Kellogg* provides a table showing all its accounts receivables, composed primarily of trade receivables, of \$1,106 million and \$1,169 million in fiscal 2016 and 2015, respectively. Another table provides the changes from the beginning balance to the ending balance for the allowance for doubtful accounts.

EXHIBIT 9.8 Accounts Receivable Disclosures, *Kellogg Company*, Financial Statements, December 31, 2016

NOTE 1: Accounting Policies

Accounts Receivable

Accounts receivable consists principally of trade receivables, which are recorded at the invoiced amount, net of allowances for doubtful accounts and prompt payment discounts. Trade receivables do not bear interest. The allowance for doubtful accounts represents management's estimate of the amount of probable credit losses in existing accounts receivable, as determined from a review of past due balances and other specific account data. Account balances are written off against the allowance when management determines the receivable is uncollectible. As of year-end 2016 and 2015, the Company's off-balance sheet credit exposure related to its customers was insignificant.

NOTE 17

SUPPLEMENTAL FINANCIAL STATEMENT DATA

Consolidated Balance Sheet (millions)	2016	2015
Trade receivables	\$ 1,106	\$ 1,169
Allowance for doubtful accounts	(8)	(8)
Refundable income taxes	24	27
Other receivables	109	156
Accounts receivable, net	\$ 1,231	\$ 1,344

Allowance for doubtful accounts (millions)	2016	2015	2014
Balance at beginning of year	\$ 8	\$ 7	\$ 5
Additions charged to expense	9	4	6
Doubtful accounts charged to reserve	(9)	(3)	(4)
Balance at end of year	\$ 8	\$ 8	\$ 7

FINANCIAL STATEMENT ANALYSIS

Operating Cycle Analysis

Financial statement users consider cash management critical to a company's operations and ability to maintain and grow operations. Analyzing a company's cash management involves answering questions such as:

- How long does it take to collect cash?
- How long does it take to convert inventory to cash?
- How long does it take to make payments?
- Does the company have sufficient cash, or does it need additional financing?

Operating Cycle

The **operating cycle** is the length of time it takes a company to generate cash from its operations, thereby providing answers to the questions of how long it takes a company to collect cash and how long it takes to convert inventory to cash. The following diagram illustrates the operating cycle:

We can use basic financial statement ratios to determine the length of a company's operating cycle. The operating cycle is computed as the number of days between when inventory is acquired and cash is collected on the sale of the inventory:

$$\text{Operating Cycle} = \text{Days Sales Outstanding} + \text{Days Inventory on Hand} \quad (9.1)$$

Financial analysts use the following ratios to compute a company's operating cycle: days sales outstanding and days inventory on hand.

Days Sales Outstanding

To determine the number of days that accounts receivable are outstanding, we start by computing the *accounts receivable turnover ratio*. The **accounts receivable turnover ratio** indicates how many times per year the firm goes from a full receivable balance to complete collection.

$$\text{Accounts Receivable Turnover Ratio} = \frac{\text{Credit Sales}}{\text{Average Accounts Receivable}} \quad (9.2)$$

where

$$\text{Average Accounts Receivable} = \frac{\text{Beginning Accounts Receivable} + \text{Ending Accounts Receivable}}{2} \quad (9.3)$$

The higher the accounts receivable turnover ratio, the more frequently a company collects its receivables. For example, an accounts receivable turnover ratio of 12.0 indicates that a company turns over its receivables 12 times a year, or about once every month. Consider a manufacturer that extends credit and expects payment in 30 days. An accounts receivable turnover ratio of 12.0 would be expected given that there are 12 months in a year and payment is due within 30 days.

The accounts receivable turnover ratio can be used to determine the expected number of days it takes to collect accounts receivable balances. The **days sales outstanding** is the number of days

a company takes to collect its receivables from customers. It is calculated by dividing the number of days in a year, 365, by the number of times accounts receivable turns in a year:

$$\text{Days Sales Outstanding} = \frac{365}{\text{Accounts Receivable Turnover Ratio}} \quad (9.4)$$

This ratio is also called the number of days sales in accounts receivable or the collection interval. If a manufacturer has an accounts receivable turnover of 12.0, its days sales outstanding would be 30.4 days, or about a month.

Days Inventory Is on Hand

To estimate the number of days inventory is on hand, we begin by computing the *inventory turnover ratio*. The **inventory turnover ratio** indicates how many times per year the firm goes from a full inventory balance to selling all its inventory:

$$\text{Inventory Turnover Ratio} = \frac{\text{Cost of Goods Sold}}{\text{Average Inventory}} \quad (9.5)$$

$$\text{Average Inventory} = \frac{\text{Beginning Inventory} + \text{Ending Inventory}}{2} \quad (9.6)$$

The higher the inventory turnover ratio, the more frequently a company sells out its inventory. For example, an inventory turnover ratio of 4.0 indicates that a company turns over its inventory every quarter. Consider a clothing store that sells clothes for each season—winter, spring, summer, and fall. An inventory turnover ratio of 4.0 would be expected given the four seasons of clothing the store sells.

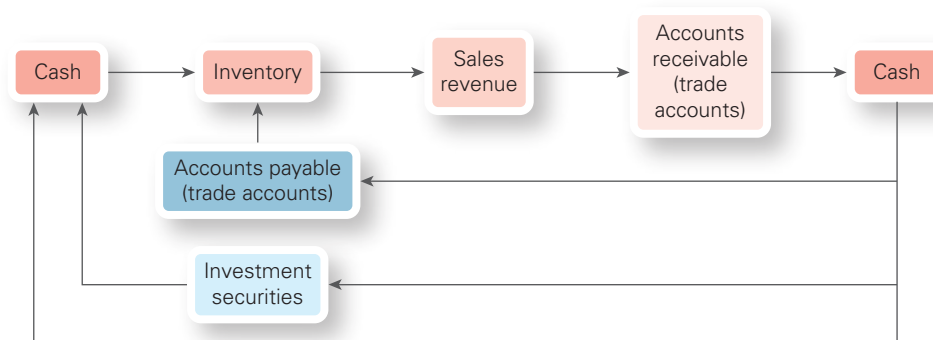

The inventory turnover ratio can be used to determine the expected number of days it takes a company to sell inventory. The **days inventory on hand** is the number of days that the company takes to sell its inventory; it is calculated by dividing the number of days in a year, 365, by the number of times that inventory turns over in a year.

$$\text{Days Inventory on Hand} = \frac{365}{\text{Inventory Turnover Ratio}} \quad (9.7)$$

This ratio is sometimes called the number of days inventory held or the holding interval.

Cash Operating Cycle

To better understand a company's cash needs, the *cash operating cycle* assists a financial analyst in determining a company's ability to pay its suppliers when due. The **cash operating cycle** is the period of time it takes a company to pay its suppliers less the time a company takes to collect cash from sales. The cash operating cycle can help answer the question of whether a company has sufficient cash or needs additional financing. The cash operating cycle is also called the firm's cash-to-cash cycle or cash conversion cycle. The following diagram illustrates the cash operating cycle:

Financial Statement Analysis, continued

Now we need to consider the amount of time the company's suppliers allow it to repay accounts payable. If the accounts payable must be paid before cash is collected, the company may need to borrow or liquidate investments in order to pay the balance due.

The cash operating cycle is computed as:

$$\text{Cash Operating Cycle} = \text{Days Accounts Payable Outstanding} - \text{Operating Cycle} \quad (9.8)$$

A positive cash operating cycle suggests that a company does not need to obtain additional financing to meet its cash needs. That is, excess cash can be used to pay off short-term lines of credit or re-invest in the business. The company is collecting cash sooner than it needs to pay its suppliers. A negative cash operating cycle means a company needs to obtain additional financing. It is collecting cash more slowly than it needs to pay its suppliers. A negative cash operating cycle can indicate that a company has poor cash management or that it is growing. For example, a company with a lenient credit-extension policy could take longer to collect from its customers than to pay its suppliers. Alternatively, if a company is growing, it is likely purchasing more inventory from its suppliers, expecting future sales. Next, we explain the computation of days accounts payable outstanding.²⁰

Days Accounts Payable Outstanding

To estimate the number of days that accounts payable are outstanding, first compute the *accounts payable turnover ratio*. The **accounts payable turnover ratio** indicates the number of times per year a company goes from full accounts payable balances to full repayment:

$$\text{Accounts Payable Turnover Ratio} = \frac{\text{Production or Purchases}}{\text{Average Accounts Payable}} \quad (9.9)$$

When we assume that a company's beginning inventory and ending inventory are approximately the same each year, cost of goods sold can be used as a proxy for purchases or production as illustrated by the following example:

Beginning inventory	\$ 1,000
Add: Purchases or production	<u>600</u>
Cost of goods available for sale	\$ 1,600
Less: Ending inventory	<u>(1,000)</u>
Cost of goods sold	<u>\$ 600</u>

Companies typically use the following ratio to measure accounts payable turnover:

$$\text{Accounts Payable Turnover Ratio} = \frac{\text{Cost of Goods Sold}}{\text{Average Accounts Payable}} \quad (9.10)$$

$$\text{Average Accounts Payable} = \frac{\text{Beginning Accounts Payable} + \text{Ending Accounts Payable}}{2} \quad (9.11)$$

A higher accounts payable turnover ratio indicates that a company is paying off its payables frequently. For example, a company with an accounts payable turnover ratio of 12 pays its suppliers sooner than a company with an accounts payable turnover ratio of 6.

The accounts payable turnover ratio can be used to determine the expected number of days it takes to pay suppliers. The **days accounts payable outstanding**, the number of days a company takes to pay its suppliers, is calculated by dividing the number of days in a year, 365, by the number of times accounts payable turns over in a year:

$$\text{Days Accounts Payable Outstanding} = \frac{365}{\text{Accounts Payable Turnover Ratio}} \quad (9.12)$$

²⁰A further refinement is to examine the days payable for accrued liabilities and related expenses.

Example 9.16 illustrates computations for operating cycle and cash operating cycle.

EXAMPLE 9.16 Operating Cycle and Cash Operating Cycle

PROBLEM: The following information is from the financial statements of *L'Oréal*, the French beauty products company.

Balance Sheet Information			
At December 31 (in million euros)	2016	2015	2014
Accounts Receivable	€3,941.8	€3,627.7	€3,297.8
Inventories	2,698.6	2,440.7	2,262.9
Accounts Payable	4,135.3	3,929.0	3,452.8

Income Statement Information			
For the Year	2016	2015	2014
Sales (all credit)	€25,837.1	€25,257.4	€22,532.0
Cost of Goods Sold	7,341.7	7,277.4	€6,500.7

Source: L'Oréal Group, Annual Report, December 2016. http://www.loreal-finance.com/_docs/0000000136/LOréal_2016_Annual_Report.pdf

Use *L'Oréal's* financial information to answer the following questions:

- What is *L'Oréal's* operating cycle (in days) in 2016 and 2015? Assume that all sales are on credit.
- What is *L'Oréal's* cash operating cycle (in days) in 2016 and 2015?
- Comment on the change in *L'Oréal's* cash operating cycle in 2016 and 2015.

SOLUTIONS:

- L'Oréal's* operating cycle was 181.06 days and 168.19 days in 2016 and 2015, respectively. In 2016, the company's time from holding inventory to collecting cash increased by 12.87 days (181.06 – 168.19).
- L'Oréal's* cash operating cycle was 19.49 days and 17.09 days in 2016 and 2015, respectively. These results imply that the company is in a positive cash position. That is, *L'Oréal* is collecting cash faster than it is paying its suppliers. A positive cash operating cycle suggests that the company does not need to obtain additional financing to meet its cash needs.
- The cash operating cycle increased by 2.4 days (19.49 – 17.09) in 2016. The increase is primarily due to an increase in the operating cycle of 12.87 days (181.06 – 168.19). The operating cycle increased due to increases in both days sales outstanding of 3.37 days (53.44 – 50.07) and days inventory on hand of 9.5 days (127.62 – 118.12). The increase in the cash operating cycle implies that the company was generating cash faster than paying cash to suppliers in 2016 when compared to 2015. We present the computations in the following table.

Financial Statement Analysis, continued

Components (In millions of euros)	2016	2015
Accounts Receivable Turnover Ratio = $\frac{\text{Credit Sales}}{\text{Average Accounts Receivable}}$	$6.83 = \frac{€25,837.1}{€3,784.8}$	$7.29 = \frac{€25,257.4}{€3,462.8}$
Average Accounts Receivable = $\frac{(\text{Beginning Accounts Receivable} + \text{Ending Accounts Receivable})}{2}$	$€3,784.8 = \frac{(€3,627.7 + €3,941.8)}{2}$	$€3,462.8 = \frac{(€3,297.8 + €3,627.7)}{2}$
Days Sales Outstanding = $\frac{365}{\text{Accounts Receivable Turnover Ratio}}$	$53.44 = \frac{365}{6.83}$	$50.07 = \frac{365}{7.29}$
Inventory Turnover Ratio = $\frac{\text{Cost of Goods Sold}}{\text{Average Inventory}}$	$2.86 = \frac{€7,341.7}{€2,569.7}$	$3.09 = \frac{€7,277.4}{€2,351.8}$
Average Inventory = $\frac{(\text{Beginning Inventory} + \text{Ending Inventory})}{2}$	$€2,569.7 = \frac{(€2,440.7 + €2,698.6)}{2}$	$€2,351.8 = \frac{(€2,440.7 + €2,262.9)}{2}$
Days Inventory on Hand = $\frac{365}{\text{Inventory Turnover Ratio}}$	$127.62 = \frac{365}{2.86}$	$118.12 = \frac{365}{3.09}$
Accounts Payable Turnover Ratio = $\frac{\text{Cost of Goods Sold}}{\text{Average Accounts Payable}}$	$1.82 = \frac{€7,341.7}{€4,032.2}$	$1.97 = \frac{€7,277.4}{€3,690.9}$
Average Accounts Payable = $\frac{(\text{Beginning Accounts Payable} + \text{Ending Accounts Payable})}{2}$	$€4,032.2 = \frac{(€3,929.0 + €4,135.3)}{2}$	$€3,690.9 = \frac{(€3,452.8 + €3,929.0)}{2}$
Days Accounts Payable Outstanding = $\frac{365}{\text{Accounts Payable Turnover Ratio}}$	$200.55 = \frac{365}{1.82}$	$185.28 = \frac{365}{1.97}$
Operating Cycle = Days Sales Outstanding + Days Inventory on Hand	$181.06 = 53.44 + 127.62$	$168.19 = 50.07 + 118.12$
Cash Operating Cycle = Days Accounts Payable Outstanding – Operating Cycle	$19.49 = 200.55 - 181.06$	$17.09 = 185.28 - 168.19$

Interview

CHIEF AUDIT OFFICER, MERCK & CO. »

Dalton Smart

Dalton Smart is Chief Audit Officer for Merck & Co., a leading U.S. pharmaceutical company. He leads the company's financial, business integrity assurance and information technology audits, and assurance services.

- 1 How do industry-specific factors come into play in managing Merck's cash and accounts receivable?

Merck is a major international pharmaceutical company that sells its products through pharmaceutical distributors to different channels, including government, public and private health care institutions, and well-established retail pharmacy chains. So, we must look beyond the distributor to the type of end user to evaluate the conversion of receivables to cash. Although they may pay slowly, governments eventually pay their bills; this reliability reduces our credit risk dramatically. Also, pharmaceuticals are a cash-flow-rich industry in contrast to industries such as manufacturing. A manufacturer selling to hundreds or thousands of small customers faces different credit risk worries than Merck, whose customers are large and more centralized. Merck is less concerned about the ability to pay than the timing of receivables.

- 2 What significant judgments does Merck use in granting credit?

We start with the type of customer and the quality of information we receive and then assess the potential customer's credit profile, credit rating, and financial statements. We look differently at government-related payors who pay in due course, such as nationalized health care systems, than we do emerging market customers. It's challenging to get good quality data from emerging market customers to assess credit risk. We rely on various sources to determine the speed at which inventory is being consumed so that we record revenue at a speed consistent with the sales of products to end customers. We also watch such factors as days' sales outstanding (DSO) and inventory levels where rising trends may indicate a longer period to receive cash. Finally, we consider market size, growth rates, and our market growth relative to that of our peers.

- 3 What are the primary factors that Merck considers when estimating the amount needed in the allowance for bad debts?

Consistent with GAAP, Merck applies the allowance method to account for bad debts. Using the allowance method allows us to record revenues and expenses in the same period incurred. There is an inherent risk that customers could default on a payment, so accounts receivable are recorded at their net realizable value. In each monthly accounting period, we calculate the receivable balance and estimate the allowance for bad debt expense. We closely evaluate both a customer's ability to pay, based on financial metrics, and intent to pay, demonstrated through payment history and maintenance of performance ratios. We look for any significant changes in customer circumstances and monitor multiple metrics such as receivable aging and turnover ratios and financial condition changes such as bankruptcy proceedings, litigation, and credit rating downgrades. Once we see gaps in a customer's payment history, we quickly analyze its ability to pay. Then, on a monthly basis, we examine bad debt expense and the number of write-offs as it relates to the overall reasonableness of the allowance for bad debts, adjusting as required.

- 4 What judgment factors does the company use to determine when an account should be written off?

In addition to analyzing ability and intent to pay, we focus on whether we have exhausted all collection efforts, if there are any disputed balances, and if other public information exists about the customer. Another important factor that comes into play is the type of customer. Merck sells mostly to wholesalers, who then sell to the health care industry's end customers—all with different speeds of receivables collection. We take the payment time frame into account, evaluating customers by type.

- 5 Does Merck sell receivables to secure immediate cash?

In certain markets, selling receivables works to Merck's advantage. We know that governmental institutions will eventually pay us, but we may want to collect now rather than wait. Our analysis of whether to sell receivables is a financial decision based on the rate we can receive for those receivables and our cost of capital.

Discussion Questions

1. Dalton Smart mentions that Merck monitors factors such as days sales outstanding (DSO) and inventory levels to assess its ability to collect cash quickly from a potential customer. Discuss the financial ratios that a firm can use to measure the time it will take to collect cash from a potential customer on average.
2. Why would a company be willing to sell its accounts receivable at a discounted amount (i.e., the amount received from the buyer is less than the recorded amount)?

Summary by Learning Objectives

Below we summarize the main points by learning objective. Throughout the chapter, we discuss the accounting and reporting of U.S. GAAP and IFRS side-by-side. The table below also highlights the major similarities and differences between the standards.

1 Define cash and cash equivalents and describe the accounting for restricted cash and compensating balances.	
Summary	Similarities and Differences between U.S. GAAP and IFRS
<p>Cash consists of coins, currency, and bank deposits as well as negotiable instruments such as checks and money orders.</p> <p>Cash equivalents are short-term, highly liquid investments with original maturities of 3 months or less.</p> <p>Companies report restricted cash and compensating balances separately from cash.</p>	Similar under U.S. GAAP and IFRS.
2 Demonstrate the initial measurement and accounting for accounts receivable, including volume, trade, and sales discounts.	
Summary	Similarities and Differences between U.S. GAAP and IFRS
<p>Trade receivables are generally measured at the amount of the sale made.</p> <p>Trade discounts are reductions of the catalog or list price when a company sells to a reseller in the same industry. A volume discount reduces the list price for customers purchasing a large quantity of merchandise.</p> <p>Sales discounts are reductions in the cash received and sales for early payments. A company can use the most-likely-amount or expected-value method to record the receivable initially.</p> <ul style="list-style-type: none"> • Under the most-likely-amount method, a company records the accounts receivable at the gross amount if it anticipates that the company will not take the discount and at the net amount if it anticipates that the customer will take the discount. • Under the expected-value method, the entity sums the probability-weighted amounts in a range of possible consideration amounts to arrive at the initial measurement of accounts receivable. 	Similar under U.S. GAAP and IFRS.
3 Understand the subsequent measurement and accounting for accounts receivable, including establishing an allowance for uncollectible accounts.	
Summary	Similarities and Differences between U.S. GAAP and IFRS
<p>Companies report accounts receivable at their net realizable value (NRV), which is the estimated amount a company reasonably expects to collect from its customers. Uncollectible amounts are estimated and reported in the allowance for uncollectible accounts, a contra asset. Bad debt expense increases the allowance. Write-offs decrease the allowance.</p>	Similar under U.S. GAAP and IFRS.

Summary by Learning Objectives, continued

- 4** Estimate an allowance for uncollectible accounts using the aging of receivables method and explain the accounting for write-offs and subsequent recoveries.

Summary	Similarities and Differences between U.S. GAAP and IFRS
<p>The aging of receivables methods estimates the ending balance of the allowance of uncollectible accounts by dividing accounts receivable into categories by how long they have been past due.</p> <p>When a company determines that a specific account is uncollectible, it writes that account off by reducing accounts receivable and reducing the allowance.</p> <p>If a company subsequently collects a written-off account, it reverses the write-off and records the cash collection.</p>	<p>Similar under U.S. GAAP and IFRS.</p>

- 5** Discuss the use of accounts receivable to generate immediate cash—including pledging or assigning, factoring receivables, and securitization—and demonstrate the accounting for these transactions.

Summary	Similarities and Differences between U.S. GAAP and IFRS
<p>Pledged accounts receivable are collateral for a financing arrangement. Assigned accounts receivable are also collateral, but collection of the receivables is used to pay down the debt. Companies disclose the arrangements in financial statements.</p> <p>Factoring is the sale of accounts receivable. If the seller transfers the receivables without recourse, the buyer assumes the risk of uncollectible accounts and absorbs any credit losses. If the seller transfers the receivables with recourse, the risk of uncollectability and the resulting credit losses remain with the seller.</p> <p>Securitization refers to a financing technique that involves taking many separate, and often diverse, financial assets and combining them into a single pool or bundle.</p>	<p>► While there are some differences in wording, the treatment is generally similar under U.S. GAAP and IFRS except in determining whether a factoring arrangement is a sale. Under IFRS, when a company transfers the contractual rights to receive the cash flows from the receivables, it assesses whether it also transfers all the risks and rewards of ownership. If it has, then the transfer is a sale.</p>

Summary by Learning Objectives, continued

6 Describe accounting for short-term notes receivable when issued and after issuance.	
Summary	Similarities and Differences between U.S. GAAP and IFRS
<p>A note receivable is a formal, written promise to receive a fixed sum of money at a specified date in the future, usually with a stated interest rate. To account for notes, identify the:</p> <ul style="list-style-type: none"> • face value—fixed sum of money that will be received at a specified date in the future • stated rate—interest rate that the holder of the note will receive • market rate—interest rate on a similar investment in the market <p>A company reports a note receivable at the present value of its future cash flows using the market interest rate. Interest is accrued on the note over its life, as appropriate.</p> <p>An interest-bearing note requires periodic interest payments over the loan term. A non-interest-bearing note does not require periodic interest payments over the term of the note.</p> <p>When the stated interest rate is equal to the market rate, the note is recorded at its face value and interest accrues over the life of the note.</p> <p>When the note has no stated rate or the stated interest rate is less than the market rate, two approaches are used to measure present value:</p> <ol style="list-style-type: none"> a. If the note is in exchange for goods or services, the note's present value is the fair value of the goods or services provided. b. If the fair value of the goods or services cannot be determined, compute the present value as the value of the note discounted at the market rate of interest called the <i>imputed rate of interest</i>. <p>Notes receivable can be sold, which is typically referred to as <i>discounting</i>. If the conditions are met to consider the transaction a sale, the receivable is removed from the books and a gain or loss is reported.</p>	<p>Similar under U.S. GAAP and IFRS.</p>

7 Explain the required disclosures for accounts and notes receivable.	
Summary	Similarities and Differences between U.S. GAAP and IFRS
<p>Common disclosures include the total accounts receivable, the allowance, and changes in the allowance. Companies also describe the elements that influence management's judgment and credit risk when estimating the allowance. Other disclosures include the method used to estimate bad debts and the policy for writing off uncollectible receivables.</p>	<p>Similar under U.S. GAAP and IFRS.</p>

MyLab Accounting

Go to <http://www.pearson.com/mylab/accounting> for the following Questions, Multiple-Choice Questions, Brief Exercises, Exercises, and Problems. They are available with immediate grading, explanations of correct and incorrect answers, and interactive media that acts as your own online tutor.

9 Short-Term Operating Assets: Cash and Receivables

Questions

- 1 Q9-1. What are cash equivalents?
- 1 Q9-2. Do companies always classify cash as a current asset on the balance sheet? Explain.
- 1 Q9-3. How is cash held as a compensating balance reported on the balance sheet?
- 2 Q9-4. Do accountants typically measure accounts receivable by discounting them for the time value of money? Explain.
- 4 Q9-5. Under the allowance method, will the actual write-off of an uncollectible account have a net effect on the financial statements? Explain.
- 4 Q9-6. How does an entity record a subsequent recovery of an account previously written off?
- 4 Q9-7. Does the aging of accounts receivable method of estimating the allowance for uncollectible accounts provide a more accurate measurement of net accounts receivable than bad debt expense? Explain.
- 5 Q9-8. What is the difference between pledging accounts receivable and assigning accounts receivable in a secured borrowing transaction?
- 5 Q9-9. How do companies account for receivables that are factored?
- 6 Q9-10. Is the face value of a note receivable exchanged for goods and services always equal to the sales value of the transaction? Explain.
- 6 Q9-11. What do firms use to record the sales value of a transaction when a note receivable has either an unreasonable rate of interest or no interest rate stated?
- A Q9-12. Explain why a company must have highly effective internal controls over cash.

Multiple-Choice Questions

Becker CPA Exam Review multiple-choice questions are available in [MyLab Accounting](#).

- 1 MC9-1. The following are held by YRT Corporation at December 31, Year 1:
- | | |
|---|----------|
| Cash in checking account | \$15,000 |
| Petty cash | 250 |
| Check from customer dated 01/31/Year 2 | 350 |
| 3-month certificate of deposit, due 01/15/Year 2 | 40,000 |
| 12-month certificate of deposit, due 02/28/Year 2 | 36,000 |
| Cash in bond sinking fund account | 60,000 |
- YRT Corporation classifies investments with original maturities of three months or less as cash equivalents. In its December 31, Year 1, balance sheet, what amount should YRT Corporation report as cash and cash equivalents?
- a. \$ 15,250 b. \$ 55,250 c. \$ 55,600 d. \$ 151,250
- 3 4 MC9-2. Fernandez Company had an accounts receivable balance of \$150,000 on December 31, Year 2, and \$175,000 on December 31, Year 3. The company wrote off \$40,000 of accounts receivable during Year 3. Sales for Year 3 totaled \$600,000, and all sales were on account. The amount collected from customers on accounts receivable during Year 3 was:
- a. \$575,000 b. \$531,000 c. \$600,000 d. \$535,000
- 4 MC9-3. On its December 31, Year 2, balance sheet, Red Rock Candle Company reported accounts receivable of \$855,000 net of an allowance for doubtful accounts of \$45,000. On December 31, Year 3, Red Rock's balance sheet showed gross accounts receivable of \$922,000, and Red Rock's income statement reported credit sales of \$3,000,000. During the year, accounts receivable of \$35,000 were written off and \$18,000 were recovered.

Based on past experience, 5% of Red Rock's ending accounts receivable are uncollectible. How much should Red Rock report as bad debt expense on its Year 3 income statement?

- a. \$18,100 b. \$35,000 c. \$46,100 d. \$150,000

- 5** **MC9-4.** Stanberry Company sold \$500,000 of net accounts receivable to Cork Company for \$450,000. The receivables were sold outright on a without recourse basis, and Stanberry Company retained no control over the receivables. The journal entries to record the sale would be which of the following?

a.	Cash	500,000	
	Accounts Receivable (net)		500,000
b.	Cash	450,000	
	Loss on Sale of Accounts Receivable	50,000	
	Accounts Receivable (net)		500,000
c.	Cash	450,000	
	Unrealized Loss on Sale of Accounts Receivable	50,000	
	Accounts Receivable (net)		500,000
d.	Cash	450,000	
	Due from Cork Company	50,000	
	Accounts Receivable (net)		500,000

- 6** **MC9-5.** On November 30, Year 1, Derin Corporation agreed with its customers to change accounts receivable to notes receivable in order to allow a longer payment period. The terms of the notes receivable are that the principal is due on November 30, Year 4, and the interest payments are due annually on November 30 until November 30, Year 4. Derin's customer has made all required payments to date. How should the notes receivable and accrued interest be classified on the balance sheet as of June 30, Year 3?

	Notes Receivable	Accrued Interest
a.	Current	Current
b.	Current	Noncurrent
c.	Noncurrent	Current
d.	Noncurrent	Noncurrent

- 7** **MC9-6.** Which of the following disclosures about accounts receivable are required?
- I. Accounts receivable serving as collateral
 II. The percentage used to calculate allowance for doubtful accounts
 III. Total allowance for doubtful accounts
- a. I only b. I and II c. I and III d. I, II, and III

Brief Exercises

- 2** **BE9-1. Volume Discounts.** Arc Company sells stone garden statues and offers a 6% discount to its high-volume customers. Sunny Garden Center purchased statues on account with a list price of \$54,000 and received a volume discount of 6% of the purchase price. Give the journal entry to record this sale (ignore the effect on inventory and cost of goods sold).
- 2** **BE9-2. Sales Discounts, Most-Likely-Amount Method.** On July 1, Willette Corp. made a sale of \$650,000 to Luc, Inc. on account. Terms of the sale were 2/10, n/30. Luc makes payment on July 9. Willette uses the most-likely-amount method and assumes that the customer will not take the discount when accounting for sales discounts. Ignore cost of goods sold and the reduction of inventory.
- a. Prepare all Willette's journal entries.
 b. What net sales does Willette report?
- 2** **BE9-3. Sales Discounts, Most-Likely-Amount Method.** On July 1, Willette Corp. made a sale of \$650,000 to Luc, Inc. on account. Terms of the sale were 2/10, n/30. Luc makes payment on July 29. Willette uses the most-likely-amount method and assumes that the customer will not take the discount when accounting for sales discounts. Ignore cost of goods sold and the reduction of inventory.
- a. Prepare all Willette's journal entries.
 b. What net sales does Willette report?

- 2 BE9-4. Sales Discounts, Expected-Value Method.** On July 1, Gillette Corp. made a sale of \$650,000 to Huck, Inc. on account. Terms of the sale were 2/5, n/30. Huck makes payment on July 29. Gillette uses the expected-value method assuming that there is an 80% chance that the customer will not take the discount when accounting for sales discounts. Ignore cost of goods sold and the reduction of inventory.
- Prepare all Gillette's journal entries.
 - What net sales does Gillette report?
- 2 BE9-5. Sales Discounts, Most-Likely-Amount Method.** On July 1, Oura Corp. made a sale of \$450,000 to Stratus, Inc. on account. Terms of the sale were 2/10, n/30. Stratus makes payment on July 9. Oura uses the most-likely-amount method and assumes that the customer will take the discount when accounting for sales discounts. Ignore cost of goods sold and the reduction of inventory.
- Prepare all Oura's journal entries.
 - What net sales does Oura report?
- 2 BE9-6. Sales Discounts, Most-Likely-Amount Method.** On July 1, Oura Corp. made a sale of \$450,000 to Stratus, Inc. on account. Terms of the sale were 2/10, n/30. Stratus makes payment on July 29. Oura uses the most-likely-amount method and assumes that the customer will take the discount when accounting for sales discounts. Ignore cost of goods sold and the reduction of inventory.
- Prepare all Oura's journal entries.
 - What net sales does Oura report?
- 4 BE9-7. Allowance for Uncollectible Accounts, Write-Off.** Grotto Products, Inc. reported an opening balance in the allowance for doubtful accounts of \$560,000. During the year, the company determined that a \$23,000 receivable due from Zeer Company was uncollectible. Prepare the journal entry to write off the Zeer account assuming that Grotto uses the allowance method.
- 4 BE9-8. Allowance for Uncollectible Accounts, Write-Off.** Vince Ventures Company reported an opening balance of \$925,000 in its allowance for uncollectible accounts. Vince Ventures determined that a \$57,500 account due from Ric Associates was uncollectible. Prepare the journal entry to write off the Ric account assuming that Vince Ventures uses the allowance method.
- 4 BE9-9. Allowance for Uncollectible Accounts, Recovery.** Ciano Landscaping Company uses the allowance method to account for its uncollectible accounts. Three years ago, it wrote off a \$40,000 account due from Haber Incorporated. Haber paid this account in full on June 30 of the current year. Prepare the journal entries required to record the recovery of the Haber account.
- 4 BE9-10. Bad Debt Expense, Journal Entry.** Paul Anchor, Incorporated estimated that bad debt expense would equal 4% of the ending balance of accounts receivable for the current year. This year's ending balance of accounts receivable amounted to \$2,500,000. There was a \$69,000 credit balance in the allowance for uncollectible accounts prior to the year-end adjustment. Prepare the adjusting journal entry to record bad debt expense for the current year.
- 4 BE9-11. Bad Debt Expense, Journal Entry.** Paul Anchor, Incorporated estimated that bad debt expense would equal 4% of the ending balance of accounts receivable for the current year. This year's ending balance of accounts receivable amounted to \$2,500,000. There was a \$69,000 debit balance in the allowance for uncollectible accounts prior to the year-end adjustment. Prepare the adjusting journal entry to record the bad debt provision for the current year.
- 4 BE9-12. Bad Debt Expense, Aging of Accounts Receivable, Journal Entry.** Burl Brothers provided the following information regarding its accounts receivable at the beginning of the current year:

Accounts receivable	\$1,320,000
Allowance for doubtful accounts	<u>(320,000)</u>
Net realizable value	<u>\$1,000,000</u>

During the year, the company reported net credit sales of \$21,000,000 of which it collected \$9,900,000. The company wrote off \$51,000 of actual bad debts for the year. Burl Brothers estimates the allowance for doubtful accounts at 4% of the ending accounts receivable balance. Prepare the journal entry to record the year-end adjusting entry for the bad debt expense.

- 4 BE9-13. Bad Debt Expense, Aging of Accounts Receivable, Journal Entry.** Using the information provided in BE9-12, prepare the journal entry to record the year-end adjusting entry for the bad debt expense assuming that Burl Brothers recovered \$12,000 of the \$51,000 write-offs during the year.
- 4 BE9-14. Allowance for Uncollectible Accounts, Aging of Accounts Receivable.** Banks Corporation estimates its annual provision for uncollectible accounts by analyzing the aged schedule of accounts receivable.

Banks Corporation: Aged Schedule of Accounts Receivable

	Current	Past Due				Total
		1–30 Days	31–60 Days	61–90 Days	Over 90 Days	
Totals	\$237,000	\$127,400	\$110,000	\$56,000	\$19,600	\$550,000

It is common industry practice to estimate an allowance for uncollectible accounts based on the following estimates

Aging Category	Allowance Provided
Current	2%
1–30 days past due	7
31–60 days past due	20
61–90 days past due	40
Over 90 days past due	100

Prepare the journal entry to record the provision for bad debts assuming that the existing credit balance in the allowance for doubtful accounts is equal to \$23,108.

- 5 **BE9-15. Assigned Receivables.** Kitt Company borrows \$800,000 from Neville Capital by issuing an 8-year (96-month), 12% note payable. Interest is due and payable each month based on the outstanding balance at the beginning of the month. Kitt assigns \$850,000 of its accounts receivable as collateral for the lending arrangement. Prepare the journal entries to record the financing arrangement on Kitt's books.
- 5 **BE9-16. Assigned Receivables.** Using the information provided in BE9-15, assume that during the first month after the financing is completed, Kitt collects \$250,000 of the assigned accounts receivable. Kitt remits this amount to Neville Capital along with the payment of 1 month's interest. Prepare the journal entries to record the cash collection on the receivables and payment to Neville.
- 5 **BE9-17. Factoring Receivables without Recourse.** Nicks Incorporated sells \$2,450,000 of its accounts receivable to Fairfield Factors (FF) without recourse. FF charges a fee equal to 7% of the receivables factored and holds back an additional 4% as security. FF will return the hold back to Nicks when the receivables are collected. Assuming a sale, prepare the journal entry to record Nicks Incorporated's sale of the accounts receivable to FF.
- 5 **BE9-18. Factoring Receivables with Recourse.** Using the information provided in BE9-17, prepare the journal entry to record Nicks Incorporated's sale of accounts receivable to FF assuming that the receivables are factored with recourse and can be reported as a sale. The estimated recourse liability is \$75,500.
- 6 **BE9-19. Notes Receivable.** Welk Associates sold a piece of equipment to Convey Company on June 1, 2016, for \$800,000. Welk agreed to accept a 7-month, 7% note with interest due on its maturity date, December 31, 2016. Welk prepares financial statements only at its calendar year-end. Prepare the journal entries required to record the sale and the full collection at maturity. Ignore cost of goods sold and inventory.
- 6 **BE9-20. Notes Receivable with Year-End Interest Accrual.** Using the information provided in BE9-19, prepare the journal entries to record the sale, the accrued interest revenue, and the full collection at maturity assuming that the sale date was September 1, 2016, and the note was due on March 31, 2017.
- 6 **BE9-21. Notes Receivable with Discount.** Foster Technologies, Inc., provides specialized network solutions for companies in the financial services industry. During the current year, Foster completed a network project for Hextel Communications. The fair value of the project is not determinable. As part of the agreement, on February 1, Foster accepted a \$5,000,000, 6-month, zero-coupon note receivable at a time when the current market rate of interest was 5%. Foster prepares financial statements at its calendar year-end only. Prepare the journal entry to record the transaction and the collection at maturity.
- 7 **BE9-22. Note Disclosure.** Complete the following lettered items representing the disclosures of trade accounts receivables from Cheri Corp.'s notes to the financial statements.

Note 7. Trade Receivables

Year	2017	2016
Trade Receivables	\$3,600	e
Allowance	<u>a</u>	<u>195</u>
Trade Receivables, Net	<u>b</u>	<u>\$3,705</u>
Allowance for Uncollectible Accounts		
January 1	c	\$ 175
Bad Debt Expense	375	f
Write-Off	<u>d</u>	<u>350</u>
December 31	<u>\$ 180</u>	<u>g</u>

- A** **BE9-23. Internal Controls.** Identify whether the following internal control procedures relate to cash receipts or cash disbursements.

Internal Control Procedure	Cash Receipt?	Cash Disbursement?
All payments must be made by check except for immaterial payments made from petty cash.	_____	_____
Checks can be signed only by authorized individuals.	_____	_____
The summary of checks is sent to the employee in charge of preparing the cash receipts journal.	_____	_____
The summary of checks is forwarded to the employee responsible for depositing checks.	_____	_____
Authorization is required prior to preparing a check.	_____	_____
An employee will receive checks, open the envelopes, and prepare a cash receipts summary. The summary should include the customer name, account number, and the amount of the check.	_____	_____

- A** **BE9-24. Internal Control.** Identify and discuss at least four features of an effective system of internal controls over cash receipts and disbursements.

- A** **BE9-25. Bank Reconciliation.** The following information pertains to Silver Key Company. Prepare the bank reconciliation at July 31 by determining the correct balances for both book and bank using the following template. Prepare any required journal entries.

Item	Bank	Silver Key
1. Cash balance per bank, \$9,136	_____	_____
2. Cash balance per books, \$8,490	_____	_____
3. July bank service charge not recorded by the depositor, \$25	_____	_____
4. Deposits in transit, July 31, \$780	_____	_____
5. Error made by Silver Key in recording check 1156 to the utility company for \$245 instead of \$345	_____	_____
6. Outstanding check, July 31, \$1,551	_____	_____
Correct balances	_____	_____

- A** **BE9-26. Bank Reconciliation.** The following information pertains to Pewter Cup Company at August 30. Prepare the bank reconciliation for Pewter Cup by determining the correct balances for both book and bank. Prepare any required journal entries.

- Cash balance per bank, \$769
- August bank service charge not recorded by the depositor, \$24
- Cash balance per books, \$1,243
- Outstanding check, August 30, \$87
- Deposits in transit, August 30, \$547
- Error made by Pewter Cup in recording collection from customer as deposit of \$890 for only \$880.

- A** **BE9-27. Imprest Petty Cash Fund.** Gem Consulting established a \$500 imprest petty cash fund at the beginning of the year. The fund custodian held the cash to be used to pay minor expenditures. During the year, the custodian paid the following expenditures from the petty cash fund:

Meal receipts	\$174
Postage	153
Supplies (used up by end of year)	145
Parking and tolls	23

At the end of the year, \$7 remained in the fund. The custodian took the petty cash receipts to the controller and requested reimbursement. Prepare the journal entries to record the current year's activity in the petty cash fund.

- A** **BE9-28. Imprest Petty Cash Fund.** Round-up Garden Center established a \$200 imprest petty cash fund at the beginning of the year. The fund custodian held the cash to be used to pay minor expenditures. During the year, the following expenditures were paid from the imprest petty cash fund:

Parking and tolls	\$36
Meal receipts	98
Postage	63

At the end of the year, \$2 remained in the fund. The custodian took the petty cash receipts to the controller and requested reimbursement. At that time, the controller increased the imprest petty cash fund to \$250. Prepare the journal entries to record the current year's activity in the petty cash fund.

Exercises

- 1** **E9-1. Restricted Cash and Compensating Balances.** Eaves Elevators Incorporated provided the following information regarding restrictions placed on its use of cash:

Amount of Cash	Type of Restriction	Purpose of the Restriction	Type of Debt
\$128,500	Legally restricted	Compensating balance	Short term
391,450	Legally restricted	Compensating balance	Long term
75,875	Not legally restricted	Insurance obligations	Short term

In addition to these balances, Eaves had \$595,825 of unrestricted cash at the end of the year. Prepare the relevant asset sections to be reported on Eaves' balance sheet at the end of the year.

- 2** **E9-2. Volume Discounts, Sales Discounts.** Sodesta Company offers volume discounts to its customers. Customers buying more than \$100,000 in products receive a 1% discount. Customers buying more than \$200,000 in products receive a 3% discount. Sodesta also offers sales discounts with payment terms of 2/10, n/30. Sodesta uses the most-likely-amount method and assumes that the customer will take the discount to account for the sales discounts. On July 2, Sodesta made sales of \$220,000 on account to Gridar Company. Gridar paid \$150,000 on July 12 and the remaining balance on August 1.

Required »

- What is the volume discount? What is the sales discount? What is the journal entry when the sale is initially recorded on July 2? Ignore the effect on inventory and cost of goods sold.
- What is the journal entry on July 12?
- What is the journal entry on August 1?

- 3 4** **E9-3. Allowance for Uncollectible Accounts, Journal Entries, Write-Off.** Kelly Klothung Designs started the current year with the following account balances related to its customer accounts:

Accounts Receivable	
Beginning Balance	560,000

Allowance for Uncollectible Accounts	
	145,000
	Beginning Balance

Kelly reported credit sales of \$1,211,800 for the current year. The company collected \$56,000 on account and determined that a \$35,000 account due from Cruze Company was uncollectible.

Required »

Prepare the journal entries required for each of the following events:

- Credit sales for the current year. Ignore the effects on cost of goods sold and inventory.
- Cash collections for the year.
- The write-off of the Cruze Company account.
- The current year's provision for bad debts assuming that Kelly estimates bad debts at 15% of ending accounts receivable.

- 4 E9-4. Bad Debt Expense, Aging of Accounts Receivable, Journal Entry.** Giaraldi Garden Products, Inc. developed an aged schedule of accounts receivable at the end of each year.

Giaraldi Garden Products: Aged Schedule of Accounts Receivable

Customer	Current	Past Due				Totals
		1–30 Days	31–60 Days	61–90 Days	Over 90 Days	
Carey Company				\$ 10,000	\$ 34,500	\$ 44,500
Gibson, Ltd.	\$423,000	\$ 27,000				450,000
KW Quarterly		33,000	\$ 67,000		1,500	101,500
Onix Construction			100,000	45,000	90,500	235,500
Carpenter Lumber	<u>387,000</u>	<u>125,000</u>			<u>500</u>	<u>512,500</u>
Totals	<u>\$810,000</u>	<u>\$185,000</u>	<u>\$167,000</u>	<u>\$55,000</u>	<u>\$127,000</u>	<u>\$1,344,000</u>

The company estimated an allowance for uncollectible accounts based on the following estimates:

Aging Category	Allowance Provided
Current	3%
1–30 days past due	6
31–60 days past due	18
61–90 days past due	45
Over 90 days past due	100

Giaraldi reported net credit sales of \$18,500,000 for the current year. We present the company's ending balances of accounts receivable and the allowance for uncollectible accounts:

Accounts Receivable	
Ending Balance	1,344,000

Allowance for Uncollectible Accounts	
130,000	Unadjusted Ending Balance

Required »

- Compute the balance required in the allowance for uncollectible accounts at the end of the year.
- Prepare the journal entry to record the bad debt provision for the current year.
- Independent of your answer to part (b), prepare the journal entry to record the bad debt provision for the current year assuming that the allowance for uncollectible accounts had a \$30,000 debit balance.

- 4 E9-5. Bad Debt Expense, Write-Offs, Journal Entry.** Answer the following questions using the information provided in E9-4.

Required »

Prepare the journal entries required to record each of the following events.

- Giaraldi's credit management decided to write off all accounts that were more than 90 days past due.
- A year after the write-offs recorded in part (a), assume that Onix Construction pays the entire balance due.

- 4 E9-6. Bad Debt Expense, Aging of Accounts Receivable, Journal Entry.** Sammy's Downtown Properties developed an aged schedule of accounts receivable at the end of each year.

Sammy's Downtown Properties: Aged Schedule of Accounts Receivable

Customer	Current	Past Due				Totals
		1–30 Days	31–60 Days	61–90 Days	Over 90 Days	
Crosby Consultants	\$120,000	\$45,000	\$ 3,000			\$168,000
Whitemann Company	4,000		18,500		\$ 68,000	90,500
Lite Laser Products		29,500	45,700	\$13,900	196,900	286,000
Dual Power Industries				31,800	11,100	42,900
Totals	<u>\$124,000</u>	<u>\$74,500</u>	<u>\$67,200</u>	<u>\$45,700</u>	<u>\$276,000</u>	<u>\$587,400</u>

The company estimated an allowance for uncollectible accounts based on the following estimates:

Aging Category	Allowance Provided
Current	4%
1–30 days past due	8
31–60 days past due	10
61–90 days past due	35
Over days past due	50

Sammy's reported net credit sales of \$4,500,000 for the current year. We present the company's ending balances of accounts receivable and the allowance for uncollectible accounts:

Accounts Receivable	
Ending Balance	587,400

Allowance for Uncollectible Accounts	
	120,000
	Unadjusted Ending Balance

Required »

- Compute the balance required in the allowance for uncollectible accounts.
- Prepare the journal entry to record the bad debt provision for the current year.
- Independent of your answer to part (b), prepare the journal entry to record the bad debt provision for the current year assuming that the allowance for uncollectible accounts had a \$7,435 debit balance.
- Using your solution to parts (a) and (b), indicate how Sammy's will report its accounts receivable on the company's year-end balance sheet.

4

E9-7. Bad Debt Expense, Aging of Accounts Receivable, Journal Entry. The Klug Group provided the following analysis of its aged schedule of accounts receivable:

Aging Category	Ending Balance	Percent Estimated Uncollectible
Current	\$300,000	0%
1–30 days past due	620,000	12
31–60 days past due	122,000	25
61–90 days past due	178,500	70
Over 90 days past due	63,000	90

The allowance for uncollectible accounts had a credit balance of \$260,400 at the beginning of the year. During the year, the company wrote off bad debts of \$10,650. Klug's net credit sales were \$2,900,550.

Required »

- a. Prepare all journal entries required to record the bad debt provision for the current year.
- b. Repeat part (a) assuming that the allowance for uncollectible accounts had a debit beginning balance of \$23,545.

4

E9-8. Bad Debt Expense, Percentage of Accounts Receivable, Journal Entry. Using the information provided in E9-7, prepare the journal entries required to record the provision for bad debts for the current year assuming the following.

Required »

Klug estimates its bad debt expense as 4% of ending accounts receivable. For purposes of part (a), assume that there is a \$25,000 credit balance in the allowance account before making any year-end adjustments to this account. For purposes of part (b), assume that there is a \$25,000 debit balance in the allowance account before making any year-end adjustments to this account.

5

E9-9. Assigned Receivables. Michael's Bucket Company borrowed \$350,000 from J.R. Malone Capital by issuing a 4-year (48-month), 7% note payable. Interest is due and payable at the beginning of each month based on the outstanding balance at the beginning of the prior month. Michael's assigns \$420,000 of its accounts receivable as collateral for the lending arrangement. At the beginning of the next month, Michael's collects \$110,000 of the receivables and remits this amount to J.R. Malone plus interest.

Required »

- a. Prepare the journal entries to record the lending arrangement.
- b. Prepare the journal entries to record the collection of the receivables and the payment to J.R. Malone.
- c. Indicate how accounts receivable would be reported on Michael's balance sheet at the end of the year. Assume no additional collections of accounts receivable.

5

E9-10. Assigning Receivables, Factoring Receivables. Sawyer's Fence Company borrowed \$240,000 from Hannibal Capital by issuing a 3-year (36-month), 6% note payable. Sawyer's uses \$270,000 of its accounts receivable as collateral for the lending arrangement, transferring the right to the receivable payments if Sawyer's defaults on the loan. Sawyer's services the accounts receivable, sending bills and collecting the payment from customers. Sawyer's must pay Hannibal \$7,500 at the end of the month regardless of the amount of the receivables it collects. At the end of the first month, Sawyer's has collected \$7,000 of the receivables that are collateral for the loan and pays \$7,500 to Hannibal plus interest.

Required »

- a. Determine whether Sawyer's borrowing from Hannibal would be treated as a borrowing or sale under **U.S. GAAP**. Prepare any journal entries needed at the initiation of the arrangement.
- b. Prepare the journal entries to record the collection of the receivables and the payment to Hannibal.

5

E9-11. Assigning Receivables, Factoring Receivables, IFRS. Use the same information in E9-10 and now assume that Sawyer's Fence Company reports under **IFRS**.

Required »

- a. Determine whether Sawyer's borrowing from Hannibal would be treated as a borrowing or sale under **IFRS**. Prepare any journal entries needed at the initiation of the arrangement.
- b. Prepare the journal entries to record the collection of the receivables and the payment to Hannibal.

5

E9-12. Factoring Receivables with and without Recourse. Krouse Incorporated sold \$1,000,000 of its accounts receivable to Fusilli Factors. Fusilli charges a fee equal to 8% of the receivables factored and holds back an additional 4% as security. Fusilli will return the hold back to Krouse when the receivables are collected. This transaction is to be recorded as a sale.

Required »

- a. Prepare the journal entry required to record the sale of receivables assuming that the receivables are factored without recourse.
- b. Independent of your answer to part (a), prepare the journal entry required to record the sale of the receivables assuming that the receivables are factored with recourse. The recourse liability is estimated at 2% of the receivables factored.

5

E9-13. Factoring Receivables without Recourse, Factoring Receivables with Recourse. Mac Antiques, Inc. sold \$15,780,000 of its accounts receivable to Maximum Cash Capital (MCC). MCC charges a fee equal to 5% of the receivables factored and holds back an additional 2% as security. MCC will return the hold back to Mac when the receivables are collected. This transaction is to be recorded as a sale.

Required »

- a. Prepare the journal entry required to record the sale of receivables assuming that the receivables are factored without recourse.

b. Independent of your answer to part (a), prepare the journal entry required to record the sale of the receivables assuming that the receivables are factored with recourse. The recourse liability is estimated as \$175,000.

- 5** **E9-14. Factoring Receivables without Recourse, Factoring Receivables with Recourse.** On May 1, Onyx, Inc. factored \$600,000 of accounts receivable with Cookie Finance without recourse. Cookie Finance assessed a finance charge of 6% of the total accounts receivable factored and retained an amount equal to 2% (i.e., there is a 2% holdback). Assume that the transaction is a sale.

Required »

- a. Prepare the journal entry required on Onyx's books on May 1.
 b. Now assume that Onyx factors the \$600,000 of accounts receivable with Cookie Finance with recourse. The recourse provision has a fair value of \$10,000. Prepare the journal entry required on Onyx's books on May 1.

- 5** **E9-15. Factoring Receivables with Recourse.** DRB, Inc. enters into an arrangement with Genius Enterprises by which Genius will purchase \$100,000 of DRB's receivables and charge a 6% fee. As part of the agreement, Genius will hold back \$9,000 as additional security. DRB sold the receivable with recourse, and the estimated recourse liability is \$3,000.

Prepare the journal entry to record the agreement assuming that the transaction qualifies as a sale for DRB.

- 6** **E9-16. Notes Receivable with Year-End Interest Accrual, Sale of Notes Receivable.** On May 1, 2018, Lubin's Heavy Equipment sold a piece of equipment to Perry Products, Inc., at a selling price of \$4,850,000. Lubin's agreed to accept a 10-month, 8% note with interest due on its maturity date, March 1, 2019. Lubin's year-end is December 31. Assume that 8% is reasonable when compared to the going market rate of interest for similar financing arrangements.

Required »

Prepare the journal entries to record the following events:

- a. The equipment sale on May 1, 2018. Ignore cost of goods sold and the reduction of inventory.
 b. The year-end interest accrual on December 31, 2018.
 c. The collection of the note receivable on its maturity date of March 1, 2019.
 d. Assume that Lubin's sells the note receivable on January 15, 2019, for \$5,120,000. Record the journal entry for the sale. Assume that the transaction qualifies as a sale.

- A** **E9-17. Bank Reconciliation.** The following information is from the books of SunBright Solar Company for the month of March.

Cash Receipts Journal

Date	Cash Received
March 1	\$ 50,000
3	98,000
10	125,000
14	6,000
19	9,400
28	125,000
30	15,000

Cash Disbursements Journal

Check Number	Cash Payment
1133	\$45,000
1134	16,000
1135	27,500
1136	4,000
1137	150
1138	100
1139	65,000

The balance in SunBright Solar's cash account on March 31 is \$313,850. SunBright Solar received the following bank statement from Jefferson Street Bank for the month of March:

Jefferson Street Bank Checking Account

Account Activity Summary

Beginning balance		\$ 43,200
Deposits and Other Additions		
Deposits		
March 1	\$ 50,000	
3	98,000	
10	125,000	
14	6,000	
19	9,400	
28	125,000	
Interest earned this statement period	320	413,720
Checks Written and Other Subtractions		
Checks		
1133	\$ 45,000	
1134	16,000	
1136	4,000	
1137	150	
1138	100	
Monthly Service Charge	50	(65,300)
Ending Balance on March 31		<u>\$391,620</u>

Prepare the bank reconciliation for SunBright Solar by determining the correct balances for both book and bank. Record all journal entries required to correct SunBright Solar's cash balance.

A

E9-18. Bank Reconciliation. The following information is from the books of Towl Ball Company for the month of April.

Cash Receipts Journal

Date	Cash Received
April 2	\$2,500
5	2,000
9	1,800
11	1,500
14	2,250
17	1,000
23	3,000
30	2,500
30	1,250

Cash Disbursements Journal

Check Number	Cash Payment	Purpose
3449	\$4,000	Payroll
3450	2,850	Suppliers
3451	1,100	Suppliers
3452	56	Postage
3453	27	Supplies
3454	1,450	Utilities
3455	5,400	Payroll
3456	30	Supplies

The balance in Towl Ball's cash account on April 30 is \$16,232. Towl Ball received the following bank statement from Independence Day Bank for the month of April:

**Independence Day Bank
Checking Account**

Account Activity Summary

Beginning balance		\$13,345
Deposits and Other Additions		
Deposits		
April 2	\$2,500	
5	2,000	
9	1,800	
11	1,500	
14	2,250	
17	1,000	
23	3,000	
Interest earned this statement period	<u>28</u>	14,078

3456	30	
Monthly Service Charge	<u>35</u>	<u>(9,621)</u>
Ending Balance on April 30		<u>\$ 17,802</u>

Prepare the bank reconciliation for Towl Ball by determining the correct balances for both book and bank. Record all journal entries required to correct Towl Ball's cash balance. Assume that the correct amount of check 3451 is \$1,200.

Problems

- 3 4** **P9-1. Allowance for Uncollectible Accounts, Journal Entries.** Prepare the journal entries required to record the following transactions on the books of Sullivan Stamping Company (assume that the company uses the allowance method).

Required »

- Writes off an account from Stewart Foods in the amount of \$489,000.
- Records credit sales for the year of \$6,679,000. Ignore cost of goods sold and the reduction of inventory.
- Receives \$107,675 (selling price) of merchandise returned by I-Tel Company that had been purchased on credit and not yet paid for. Ignore cost of goods sold and the increase in inventory.
- Collects \$1,283,500 on account.

- 2** **P9-2. Sales Discounts, Most-Likely-Amount, and Expected-Value Methods Comparison.** Seramin Importers, Inc. sells coffee pots for \$80 each. On November 12, the company sold 35 to a customer on account with terms of 1/15, n/30. The customer paid for 25 of the coffee pots on November 27 and paid for the remaining 10 on December 11.

Required »

- Provide the necessary journal entries for Seramin to record these transactions under both the most-likely-amount and expected-value methods. For the most-likely-amount method, assume both that the customer will take the discount and won't take the discount. For the expected-value approach, assume that the customer is 65% likely to take the discount and ignore any constraints on variable consideration. (Ignore the journal entry that would typically be necessary to record the reduction of inventory and cost of goods sold.) Round to two decimal places.
- Provide a comparison of the impact on the income statement for each method.

- 3 4** **P9-3. Allowance for Uncollectible Accounts, Aging of Accounts Receivable, Write-Off.** The partial balance sheets of Williams Iron Works, Inc. follow:

<i>Description</i>	<i>2019</i>	<i>2018</i>
Accounts Receivable, Net of Allowances for Uncollectible Accounts of \$362,600 and \$225,000 for 2019 and 2018, Respectively	<u>\$8,702,400</u>	<u>\$475,000</u>

Additional Information:

- Net credit sales for 2019 amounted to \$9,350,000.
- Cash collections for 2019 were \$930,000.

Required »

- Determine the amount of accounts receivable written off during 2019.
- Compute the amount of bad debt expense recorded for 2019.

- 4** **P9-4. Bad Debt Expense, Percent of Accounts Receivable.** Paulson Corporation provided the following account analyses for the current year:

Accounts Receivable			
Beginning Balance	3,659,000		
Sales	29,900,500	368,960	Write-Offs
		200,364	Sales Returns
		10,750,642	Collections
Allowance for Uncollectible Accounts			
		1,097,750	Beginning Balance
Write-Offs	368,960		

Required »

Prepare the journal entry to record the bad debt provision at year-end assuming that Paulson estimates its uncollectible accounts at 5% of its ending accounts receivable balance. Round to the nearest dollar.

- 4** **P9-5. Bad Debt Expense, Aging of Accounts Receivable, Write-Offs, Journal Entry.** Cho Sportswear, Ltd. develops an aged schedule of accounts receivable at the end of each year.

Cho Sportswear: Aged Schedule of Accounts Receivable

Customer	Past Due					Totals
	Current	1–30 Days	31–60 Days	61–90 Days	Over 90 Days	
Ryoko Design Associates	\$ 100,000	\$ 23,800				\$ 123,800
Marcy Fashions, Inc.	657,000	198,000	\$ 76,000			931,000
Conroy Clothing				\$ 456,000	\$ 789,412	1,245,412
Lee Womenswear	237,200	10,230	54,570	349,200		651,200
Bauer Brands, Ltd.	100,230	76,770		41,588	19,000	237,588
Totals	<u>\$1,094,430</u>	<u>\$308,800</u>	<u>\$130,570</u>	<u>\$ 846,788</u>	<u>\$808,412</u>	<u>\$3,189,000</u>

The company estimated an allowance for uncollectible accounts based on the following estimates:

Aging Category	Allowance Provided
Current	5%
1–30 days past due	9
31–60 days past due	20
61–90 days past due	55*
Over 90 days past due	80*

*The percentages are applied after a specific review of all accounts in these aging categories.

After a specific review of the company's accounts receivable, Cho's credit manager decided to provide a full allowance against all Bauer Brands' balances that are more than 60 days past due. The percentage allowance is applied to the 61–90 days and over 90 days past due aging categories only after deducting the balances due from Bauer Brands.

Cho reported net credit sales of \$45,000,000 for the current year. We present the company's ending balances of accounts receivable and the allowance for uncollectible accounts:

Accounts Receivable	
Ending Balance	3,189,000

Allowance for Uncollectible Accounts	
	348,810
	Unadjusted Ending Balance

Required »

- Compute the balance required in the allowance for uncollectible accounts at year-end. Round up to the nearest dollar.
- Prepare the journal entry to record the bad debt provision for the current year.
- Independent of your answer to part (b), prepare the journal entry to record the bad debt provision for the current year assuming that the allowance for uncollectible accounts had a \$331,000 debit balance.
- In the following year, Cho's credit management decided to write off all accounts that were over 90 days past due. Prepare the journal entry.
- After the write-offs recorded in part (d), assume that Conroy Clothing pays the entire balance due. Prepare the journal entries required to record the subsequent recovery of the Conroy Clothing receivables.

4 5

P9-6. Bad Debt Expense, Aging of Accounts Receivable, Factoring, Journal Entry. Anche Company has organized its accounts receivable by customer and how long each receivable has been outstanding. Anche records bad debt expense based on an analysis of an aged schedule. The following information is as of the end of the year (December 31):

Customer No.	Total Due	Days Past Due			
		Current	1–30 Days	31–60 Days	Over 60 Days
10901	\$ 70,000	\$ 60,000	\$ 10,000		
10902	60,000	50,000	10,000		
10903	170,000	150,000	20,000		
10904	30,000		20,000	\$ 10,000	
10905	50,000		20,000	10,000	\$20,000
10906	110,000	90,000	20,000		
Totals	<u>\$490,000</u>	<u>\$350,000</u>	<u>\$100,000</u>	<u>\$20,000</u>	<u>\$20,000</u>
% uncollectible		2%	5%	30%	95%

At the beginning of the year, Anche had accounts receivable of \$500,000 and a credit balance of \$30,000 in its allowance for uncollectible accounts. During the year, it wrote off specific accounts receivable in the amount of \$80,000. Assume no recoveries of write-offs during the year.

Required »

- Compute bad debt expense for the year ending December 31 and the net realizable value of Anche's accounts receivable as of December 31.
- Prepare the journal entry to record the bad debt expense for the year.
- Independent of the information used in parts (a) and (b), assume that on January 1 of the current year with the net realizable value of accounts receivable equal to \$470,000, the company decided to factor \$400,000 of accounts receivable to Gustav Factors, Ltd. Gustav retains 6% of the amount factored as a reserve or hold back. Gustav Factors also charged Anche a 4% financing fee (4% of the total factored amount). As a result, only 90% of the proceeds are remitted.
 - Prepare the journal entry to record the factoring of \$400,000 of accounts receivable assuming that Anche sold the receivables without recourse.
 - Prepare the journal entry to record the factoring of \$400,000 of accounts receivable assuming that Anche sold the receivables with recourse and the recourse obligation is estimated to be \$5,000.

4

P9-7. Aging of Accounts Receivable, Write-Offs, Journal Entries. Council Company develops an aged schedule of accounts receivable at the end of each year.

Council Company: Aged Schedule of Accounts Receivable

Customer	Current	Past Due				Totals
		1–30 Days	31–60 Days	61–90 Days	Over 90 Days	
Grey City Products					\$ 82,500	\$ 82,500
Smokey Industries			\$45,780	\$168,900	345,000	559,680
Bleak Enterprises		\$567,000	500			567,500
Drifter Incorporated	\$235,800	34,000	200			270,000
Denti Cosmetic Company	130,700	300	320			131,320
Totals	<u>\$366,500</u>	<u>\$601,300</u>	<u>\$46,800</u>	<u>\$168,900</u>	<u>\$427,500</u>	<u>\$1,611,000</u>

The company estimated an allowance for uncollectible accounts based on the following estimates:

Aging Category	Allowance Provided
Current	5%
1–30 days past due	9%
31–60 days past due	20%
61–90 days past due	55%
Over 90 days past due	100%

Council reported net credit sales of \$20,000,000 for the current year. We present the company's ending balances of accounts receivable and the allowance for uncollectible accounts:

Accounts Receivable	
Ending Balance	1,611,000

Allowance for Uncollectible Accounts	
94,800	Unadjusted Ending Balance

Required »

- Compute the balance required in the allowance for uncollectible accounts.
- Prepare the journal entry to record the bad debt provision for the current year.
- Independent of your answer to part (b), prepare the journal entry to record the bad debt provision for the current year assuming that the allowance for uncollectible accounts had a \$231,000 debit balance.
- Provide the necessary journal entry based on Council's credit management deciding to write off all accounts that were over 90 days past due in the following year.
- Prepare the journal entries required to record the subsequent recovery of Smokey Industries' receivable if, after the write offs recorded in part (d), Smokey Industries pays the entire balance due.

5

P9-8. Assigned Receivables, Pledged Receivables. Softa Company borrows \$850,000 from Deer Financing Associates by securing a revolving line of credit at a 6% interest rate on April 15. Interest is due and payable at the end of each month based on the outstanding balance at the beginning of the month. Softa assigns \$900,000 of its accounts receivable as collateral for the lending arrangement. Assume that accounts receivable are collected at the end of the month and the proceeds are remitted to Deer at the end of the month. The following is a list of payments collected on accounts receivable.

Month	Accounts Receivable Collected
April	\$100,000
May	487,000
June	113,000

Required »

- Compute the balance of notes payable at the end of each month.
- Prepare the necessary journal entries for these transactions.
- If the accounts receivable had been pledged as collateral, what entry would be made at April 15?

- 4 5 P9-9. Aging of Accounts Receivable, Write-Offs, Factoring with Recourse, Journal Entries.** Astro Carpets Incorporated provided the following accounts related to beginning balances in its accounts receivable and allowance accounts for the current year:

Accounts Receivable		
Beginning Balance	5,760,950	

Allowance for Uncollectible Accounts		
	2,498,210	Beginning Balance

Prepare the journal entries to record the following transactions that occurred during the current year. Prepare a schedule for both accounts receivable and the allowance for uncollectible accounts that shows the beginning balances, the various items that change the beginning balance, and the ending balance.

Required »

- a. Credit sales for the year amounted to \$12,346,976. Ignore cost of goods sold and the reduction of inventory.
 - b. Several customers returned merchandise sold on account and unpaid, totaling \$975,613 (retail value). Ignore cost of goods sold and the increase in inventory.
 - c. Astro wrote off \$567,890 of uncollectible accounts from Jones Inc.
 - d. Astro sold \$1,450,000 of its accounts receivable to Siegal Capital with recourse. Siegal charged a fee equal to 8% of the receivables factored and held back an additional 2% as security. Siegal will return the hold back to Astro when the receivables are collected. The estimated recourse liability is \$15,000. This transaction qualifies as a sale.
 - e. The company recovered \$25,675 of accounts receivable written off two years ago from Smith Industries.
 - f. The company recorded the bad debt expense for the year. Astro estimates its uncollectible accounts at 16% of accounts receivable. Round to the nearest dollar.
- 4 5 7 P9-10. Disclosure.** Using the transactions listed in P9-9, prepare a partial balance sheet at December 31 and a partial income statement for the current year.
- 7 P9-11. Accounts Receivable Disclosure.** Using *Kellogg Company's* accounts receivable disclosures from Exhibit 9.8 in the text and the following information, answer the questions.

(in millions)	2016	2015
Net sales	\$13,014	\$13,525
Accounts receivable, net	1,231	1,344
Total assets	15,111	15,251

Source: Kellogg Company. Annual Report, December 2016. <http://investor.kelloggs.com/~media/Files/K/Kellogg-IR/Annual%20Reports/kellogg-2016-ar-10-k.PDF>

Required »

- a. How is the carrying value of accounts receivable determined?
- b. What factors influence management's judgment in its estimate of the amount of collectible receivables?
- c. What is the percent of trade receivables to total assets at the end of 2016 and 2015?
- d. What is the percent of the allowance for uncollectible accounts to total trade receivables in 2016 and 2015? (See Note 19 in 2016 Annual Report.)
- e. What were *Kellogg's* write-offs of accounts receivable in 2016 and 2015? (See Note 19 in 2016 Annual Report.)

CASES

Judgment Cases

Judgment Case 1: Allowance for Doubtful Accounts²¹

Wildcat Sporting Goods (WSG) sells athletic shoes and trendy sports apparel to a variety of sporting goods stores in the Northeast and, in 2011, WSG also began direct Internet sales to consumers. WSG's common shares are publicly traded and WSG has a December 31 year-end. WSG has historically received an unqualified opinion from its audit firm.

Selected financial data is provided below:

	2009	2010	2011	2012
Sales	\$300,000,000	\$360,000,000	\$420,000,000	\$370,000,000
Credit sales	100%	100%	90%	80%
Internet sales	0%	0%	10%	20%
Accounts receivable	\$ 42,000,000	\$ 53,000,000	\$ 48,000,000	\$ 67,000,000
Allowance for doubtful accounts	\$ 4,150,000	\$ 5,000,000	\$ 4,300,000	\$ 16,300,000
Allowance/accounts receivable	9.88%	9.43%	8.96%	24.33%
Total assets	\$200,000,000	\$250,000,000	\$300,000,000	\$320,000,000
Pretax income	\$ 10,000,000	\$ 12,000,000	\$ 15,000,000	\$ 4,000,000*

*2012 pretax income is an estimate

Assume that you are the controller. At year-end, the CFO has asked you to determine the amount of the allowance for doubtful accounts for accounts receivable. The CFO received an accounts receivable allowance analysis (see below) from the new credit manager that estimated an allowance of \$16.3 million, which is up significantly from the prior year. The CFO has asked you to scrutinize the attached analysis, as she expects that the allowance balance should not exceed last year's allowance, given that sales are down approximately 12% from the prior year. The aging in the attached analysis indicates the days outstanding since the original sale (e.g., a 30-day-old receivable would indicate the sale occurred 30 days ago and not that the receivable is 30 days past due). The CFO also mentioned that the company's debt covenants require, among other things, pretax earnings of at least \$10.0 million.

You had discussions with various personnel this month and have gained the following additional insights.

An economic recession caused WSG's sales to decline in 2012. In an effort to improve its sales, WSG extended more generous credit terms to its customers. Beginning in the fourth quarter of 2012, customers were granted an additional 30 days to pay off their debts, so the credit window has been extended from 30 days to 60 days. Days sales outstanding have increased slightly from approximately 44 days in 2011 to 57 days in 2012.

The Internet sales have little credit risk, because the credit card company must approve the charge before any shipments are made. These sales are settled in less than 30 days. The December 31 receivable balances on Internet sales in the 0–30 aging were \$3.0 million and \$6.0 million in 2011 and 2012, respectively.

With the exception of a few large customers, the receivables are due from a large group of small, homogenous customers. The estimated allowance for doubtful accounts has been based on general expectations and historical losses for most accounts receivable. The average credit score of customers in 2012 is essentially unchanged from prior years. For those customers with more than a \$500,000 balance, a specific analysis of accounts receivable is performed. Estimates of the allowance for doubtful accounts were a bit less than actual losses in 2009 and 2010, and a bit higher than actual losses in 2011. See the attached allowance analysis.

Approximately 22.4% of the accounts receivable balance at December 31, 2012, is over 91 days old.

Based on a discussion with the Senior VP of Sales, the following is a summary of the major customers with balances over \$500,000.

- Sports World's accounts receivable from 2011 remains outstanding at December 31, 2012. This customer agreed to pay off this balance by paying \$200,000 per month starting in August 2012. The first three monthly payments were made and the balance at December 31, 2012, is \$3.0 million. The payments due in November 2012, December 2012, and January 2013 have not been received. The phone

²¹Reprinted from the Ernst & Young Academic Resource Center with permission of the Ernst & Young Foundation. Copyright 2011. All rights reserved.

calls of the credit manager have not been returned. At December 31, 2011, the receivable was 31 to 60 days old and this receivable was reserved at the same level as other receivables in this aging category.

- A new customer in 2011, Slow Pay, has always paid its bills after it sells the product. At December 31, 2012, Slow Pay has an outstanding balance of \$10.0 million; \$3.0 million is over 120 days old, \$2.0 million is 91 to 120 days old, and \$5.0 million is 31 to 60 days old. Payments continue to be received and all amounts over 120 days old at December 31, 2012, were collected in January 2013. At December 31, 2011, Slow Pay had an outstanding balance of \$4.0 million; \$500,000 was over 120 days old, \$500,000 was 91 to 120 days old, \$2.0 million was 31 to 60 days old, and \$1.0 million was 0 to 30 days old. No reserve was provided for this customer's receivables in 2011 and all amounts were collected in 2012.
- New Wave has an outstanding balance of \$5.0 million at December 31, 2012; \$1.0 million is over 120 days old, \$1.5 million is 91 to 120 days old, and the \$2.5 million balance is 61 to 90 days old. This company was a new start-up in 2012 and, therefore, WSG does not have any credit history for New Wave. WSG has put a hold on additional shipments to New Wave until payments are received. The credit manager said there are rumors that the company might go into bankruptcy. Separately, in December 2012, the Senior VP of Sales spoke to the wealthy owner of New Wave, who personally assured him that New Wave intended to pay its outstanding balance in the coming weeks. In January 2013, the Senior VP of Sales obtained a written personal guarantee of the amounts owed from the owner of New Wave. The personal financial statements of the owner confirmed he has a net worth in excess of \$20.0 million.
- High Flyer has an outstanding balance of \$1.0 million at December 31, 2012: \$500,000 is 61 to 90 days old and the balance is 31 to 60 days old. The owners of High Flyer have just put another company they own in a troubled industry into bankruptcy.
- None of the remaining customer balances is greater than \$500,000 at December 31, 2012.
- At December 31, 2011, the only two customers with balances over \$500,000 were Sports World and Slow Pay. Prior to 2011, the company did not have any customers whose balance exceeded \$500,000 at year-end.

The new credit manager's compensation is, in part, tied to his ability to reduce the write-off rate for sales starting in 2013. Thus, the credit manager has an incentive to justify more significant write-offs in the current year than may be warranted.

Required »

- For December 31, 2012, perform an assessment of the allowance for doubtful accounts receivable.
- Document your judgment in a draft memorandum format that you will provide to the CFO (not to exceed three pages). Use the Codification for support.

Accounts Receivable Allowance Analysis

	0 to 30 Days	31 to 60 Days	61 to 90 Days	91 to 120 Days	Over 120 Days	Total
2009 accounts receivable aging balance	\$30,000,000	\$ 4,000,000	\$ 2,500,000	\$4,000,000	\$ 1,500,000	\$42,000,000

Financial Statement Analysis Case

Financial Statement Analysis Case: *Revlon*

The following information is from the 2016 financial statements of *Revlon*, the beauty products company.

Balance Sheet Information (in million of dollars)*

At December 31	2016	2015	2014
Accounts Receivable	\$ 423.9	\$ 244.9	\$ 238.9
Inventories	424.6	183.8	156.6
Accounts Payable	296.9	201.3	153.5

Income Statement Information

For the year	2016	2015	2014
Sales (all credit)	\$2,334.0	\$1,914.3	\$1,941.0
Cost of Goods Sold	917.1	667.8	668.3

Required »

Use *Revlon's* financial information to answer the following questions:

- What is *Revlon's* operating cycle (in days) in 2016 and 2015? Comment on the change from year to year.
- What is *Revlon's* cash operating cycle (in days) in 2016 and 2015? Comment on the change from year to year.
- Use *Revlon's* financial information to compare the components of *Revlon's* operating cycle and cash operating cycle to *L'Oréal's* for 2016. The following table provides the amounts for *L'Oréal* from worked Example 9.17 in the text.

Component	L'Oréal 2016	Revlon 2016
Accounts receivable turnover ratio	6.83	_____
Days sales outstanding	53.44	_____
Inventory turnover ratio	2.86	_____
Days inventory on hand	127.62	_____
Accounts payable turnover ratio	1.82	_____
Days accounts payable outstanding	200.55	_____
Operating cycle	181.06	_____
Cash operating cycle	19.49	_____

Surfing the Standards Cases

Surfing the Standards Case 1: Transfer of Accounts Receivables

Companies sometimes use accounts receivable as collateral in a secured borrowing or sell them to a factor. The accounting method for these types of transactions is governed by ASC 860—*Transfers and Servicing*. Review all of ASC 860-10 to answer the following questions with a focus on the paragraphs that follow:

- ASC 860-10-05 paragraphs 14–15
- ASC 860-10-40 paragraphs 4–6 (not 6a), 7–11, and 15–27
- ASC 860-10-55 paragraphs 18–18B, 26–32, 34–41, and 45–46

1. List the rules that govern the determination of whether these transactions would be viewed as a sale or as a secured borrowing.
2. Hand Computers, Inc. engages in a transaction to transfer its receivables with recourse to JRMH, Inc. Although Hand does have some continuing involvement with the receivables, it does not maintain any control over them, nor does it place any restrictions on the ability of JRMH to pledge or exchange the receivables. Because Hand does not typically engage in the transfer of its receivables, the company did not think to get a true sale opinion from its attorney. However, the company is not concerned about this oversight because the company's probability of bankruptcy is negligible. Should Hand Computers account for this transfer as a sale or as a secured borrowing? Support your answer with references to the applicable standards.
3. Hand Computers, Inc. engages in a transaction to transfer its receivables with recourse to JRMH, Inc. Hand clearly meets the first and third conditions (the isolation and effective control conditions) in ASC 860-10-40-5 to treat this transaction as a sale. Hand also believes that it meets the second condition. However, a clause in the contract does not allow JRMH to pledge its receivables to three specific competitor companies named in the contract. Hand claims that this clause does not constrain JRMH from pledging its receivables because there are a number of other companies with which it can contract. Should Hand Computers account for this transfer as a sale or as a secured borrowing? Support your answer with specific references to the applicable standards.

Surfing the Standards Case 2: Costs Associated with Receivables

ABC Lending signed a loan agreement with AMRO, Inc. on January 2, 2017. AMRO is borrowing \$500,000 for 10 years with a stated interest rate of 7%. AMRO will make a payment of \$71,188.75 at the end of each year. AMRO paid \$10,000 in points to ABC Lending on January 2, 2017.

In connection with this transaction, ABC Lending paid fees to a third party for loan processing. These fees were 0.5% of the loan balance. ABC Lending also paid a bonus to an employee of 1% of the loan balance. Finally, ABC paid advertising costs of \$1,500 and incurred expenses of \$2,000 related to the preparation of the loan documents.

Prepare a memo to the file regarding the correct accounting treatment for this transaction for ABC Lending. Use the Codification for support.

Basis for Conclusions Case

Basis for Conclusion Case: Transfer of Accounts Receivable

Companies sometimes use accounts receivable as collateral in a secured borrowing or sell them to a factor. The accounting method for these types of transactions is governed by ASC 860—*Transfers and Servicing*, the majority of which derives from SFAS No. 140.

1. Read the Basis for Conclusions, paragraphs 116 and 117 in SFAS No. 140. What issue was the FASB trying to address?
2. Read the Basis for Conclusions, paragraphs 132 through 133, paragraphs 138 through 140, and paragraphs 143 through 146 in SFAS No. 140. What are the two fundamental approaches that the board considered in the treatment of transfers of financial assets? Which did the board choose, and why?

APPENDIX A

Internal Controls over Cash

Internal controls are processes implemented in a company to ensure that key objectives are met, including the objectives of reliable financial reporting, effective and efficient operations, and compliance with regulations. Internal controls over cash must be highly effective because cash is an asset that is highly susceptible to misappropriation.²²

Cash Control Guidelines

An effective system of internal controls over cash receipts and disbursements:

- Clearly establishes responsibilities
- Ensures proper segregation of duties
- Uses documentation to create proper monitoring over cash movement
- Establishes proper physical control over cash
- Includes independent verification of cash transactions (e.g., preparing monthly bank reconciliations)
- Creates proper controls over human resources, such as conducting background checks, bonding employees handling cash, and requiring that all employees take vacation days

Separation of duties is one of the most critical internal controls to deter theft and misappropriation of cash. Any individuals who have physical custody over cash should not also handle accounting records. Specifically, any employees handling cash should not have access to ledger accounts and bank statements and should not be responsible for reconciling the bank statements to the ledger accounts. Similarly, the responsibility for approving, signing, and mailing checks and handling cash disbursement documents and records should be separate functions.

A typical cash receipts process should include the following steps:

1. An employee receives checks, opens the envelopes, and prepares a cash receipts summary. The summary should include the customer name, account number, and the amount of the check.
2. The summary is then forwarded to the employee responsible for depositing checks.
3. The summary is also sent to the employee in charge of preparing the cash receipts journal.

Control procedures to prevent any misappropriation and irregularities in the cash disbursements process include the following:

1. All cash disbursements except for immaterial payments made from petty cash must be made by check.
2. Authorization is required for all cash disbursements prior to preparing a check. The person preparing the check must have all appropriate documentation, including the vendor invoice; the approved purchase order; the receiving report that verifies that the correct items were received and the proper price was charged; and the signed check request.
3. Checks can be signed only by authorized individuals.

The Sarbanes-Oxley Act of 2002 (SOX) requires that publicly traded U.S. companies maintain an effective system of internal controls. SOX also established the Public Company Accounting Oversight Board (PCAOB), which is responsible for establishing generally accepted auditing standards and overseeing assurance functions for publicly traded companies.

Section 404 of SOX requires the documentation and assessment of internal control systems by publicly traded entities. PCAOB Standard No. 5 requires that auditors issue an opinion on the effectiveness of these systems over financial reporting.²³

²²Systems of internal controls will be covered fully in your auditing and accounting information systems courses.

²³Public Company Accounting Oversight Board, *Auditing Standards No. 5*, "An Audit of Internal Control Over Financial Reporting that is Integrated with an Audit of Financial Statements" (Washington, DC: PCAOB, 2007).

Important internal control procedures for cash include the use of *bank reconciliations* and an *imprest petty cash fund*. We discuss both of these next.

Controlling Cash by Use of a Bank Account

Bank accounts provide a company with several important controls over cash because banks have standing procedures to safeguard cash. For example, key documents used by banks to protect depositors' cash include checks, deposit tickets, signature cards, and bank statements.

Bank Reconciliation

Referring to the bank statement, companies prepare a *bank reconciliation* each month. A **bank reconciliation** compares the bank statement to the amount recorded in the company's general ledger cash account. Any differences between the company's books and the bank statement amounts must be reconciled. The bank reconciliation is a significant part of internal controls over cash: If differences cannot be explained, the company will investigate and determine whether any misappropriation has occurred.

There are four common reconciling items:

1. *Deposits in transit*
2. *Outstanding checks*
3. *Bank charges and credits*
4. *Errors*

Deposits in Transit. **Deposits in transit** reflect a timing difference that occurs when a company makes a bank deposit at the end of the current month and the amount of that deposit is recorded in the company's books. However, that deposit may not be recorded by the bank until the following month.

Outstanding Checks. **Outstanding checks** also result from timing differences. The company will deduct checks written on the books, but the checks may not have cleared the bank in time to be reported on the bank statement.

Bank Charges and Credits. **Bank charges** are fees that depositors pay for services such as check printing, safe deposit box rentals, and other services. There are also charges for nonsufficient funds (NSF checks). The company is usually not aware of the amount of these charges until receiving the bank statement. **Bank credits** are deposits of cash such as interest accrued. The company is not notified regarding any interest earned until it receives the bank statement.

Errors. The company may make one or more **errors**, such as incorrectly recording or omitting a check or deposit. The bank may also make an error, but that is far less common.

When a company learns about bank charges and bank credits or company errors in the preparation of its bank reconciliation, it makes any journal entries required to record these in its accounting system.

Format for the Bank Reconciliation

There are two formats used to construct a bank reconciliation:

- Reconcile bank to book or book to bank.
- Reconcile both bank and book balances to the correct cash balance.

The most common approach used in practice is to reconcile both the bank and book balances to the correct cash balance:

1. Start with the bank balance and add any deposits in transit and subtract any outstanding checks to arrive at the correct balance.

2. Begin with the book balance and subtract any bank charges and add any bank credits.
3. Adjust the book balance for any company errors to arrive at the correct cash balance. The corrected bank and book balances should be identical.

After completing the bank reconciliation, the company makes journal entries to reflect accrued interest revenue, other bank credits, and bank charges because these events were not previously recorded on the company's books. Entries are also required to correct any book errors. Example 9A.1 illustrates a reconciliation of both the bank and book balances to the correct amounts.

EXAMPLE 9A.1

Bank Reconciliation

PROBLEM: The following information is from the books of EM Plumbing Corporation for the month of October.

Date	Cash Received
October 2	\$ 5,000
6	7,320
12	6,000
15	900
22	1,230
30	13,500

<i>Cash Disbursements Journal</i>	
Check Number	Cash Payment
2120	\$10,200
2121	6,080
2122	6,500
2123	5,250
2124	3,945
2125	7,355

The balance in EM Plumbing's cash account on October 31 is \$110,500. EM received the bank statement on the following page from Cottage Valley Bank for the month of October:

**Cottage Valley Bank
Checking Account**

Account Activity Summary

Beginning Balance		\$115,880
Deposits and Other Additions		
Deposits*		
October 4	\$ 5,000	
8	7,320	
14	6,000	
20	900	
28	1,230	
Interest Earned This Statement Period	700	21,150
Checks Written and Other Subtractions		
Checks**		
2120	\$10,200	
2121	6,800***	
2123	5,250	
NSF Check	1,000	
Monthly Service Charge	80	(23,330)
Ending Balance on October 31		\$113,700

*Note that the October 30 deposit recorded in the cash receipts journal is not reflected on the bank statement.

**Note that check numbers 2122, 2124, and 2125 were recorded in the cash disbursements journal but have not yet cleared the bank.

***The correct amount of check number 2121 is \$6,800.

The NSF check was received from a customer during the previous month. In addition, EM discovered an error in its cash disbursement journal. Specifically, EM erroneously recorded a cash disbursement for plumbing supplies as \$6,080, but the correct amount of check number 2121 is \$6,800.

Prepare the bank reconciliation for EM Plumbing by determining the correct balances for both book and bank. Record all journal entries required to correct EM Plumbing's cash balance.

SOLUTION: We begin with the balance per the bank of \$113,700 and add the deposits in transit and subtract the outstanding checks. These calculations give the correct cash balance of \$109,400. Next, we begin with the cash balance per the books of \$110,500, add the interest payment, and subtract the NSF check and the service charge. We also adjust for the error in check number 2121. The bank reconciliation is shown on the next page.

Continued

**EM Plumbing Corporation
Bank Reconciliation
October 31**

Cottage Valley Bank Statement:

Balance, October 31		\$113,700
Add: Deposit in transit		<u>13,500</u>
		\$ 127,200
Less: Outstanding checks:		
Check No.		
2122	\$6,500	
2124	3,945	
2125	<u>7,355</u>	<u>(17,800)</u>
Correct bank balance, October 31		<u><u>\$109,400</u></u>

EM Plumbing's Books:

Balance, October 31		\$110,500
Add: Interest earned for the month		<u>700</u>
		\$ 111,200
Less: NSF check		
	\$1,000	
Service charge	80	
Book error—\$6,800 check recorded as \$6,080	<u>720</u>	
		<u>(1,800)</u>
Correct book balance, October 31		<u><u>\$109,400</u></u>

Because the correct bank balance is equal to the correct book balance, the reconciliation is complete.

Finally, we need to make four journal entries for items not yet recorded in the books. EM Plumbing records the \$700 interest revenue:

Account	October 31
Cash	700
Interest Revenue	700

In the second journal entry, EM Plumbing increases accounts receivable by \$1,000 for the amount of the NSF check:

Account	October 31
Accounts Receivable	1,000
Cash	1,000

The third journal entry records the \$80 service charge:

Account	October 31
Miscellaneous Expense	80
Cash	80

EM Plumbing decreases accounts payable to correct the \$720 error related to check 2121 in the fourth journal entry:

Account	October 31
Accounts Payable	720
Cash	720

Petty Cash

Petty cash funds are minor amounts of cash that a company keeps on hand in order to pay for small, miscellaneous expenses such as visitor parking, lunches, and reimbursements for tolls and supplies. It is impractical to issue checks through the company's cash disbursement system to pay for these minor expenses. Therefore, cash is held for these purposes.

An *imprest petty cash system* provides the best internal control over cash on hand. An **imprest petty cash system** involves a cash fund for which a fixed amount of cash is reserved on hand and is then replenished at the end of the period. At any point in time, the sum of cash on hand plus petty cash receipts must equal the fixed amount of the fund. If there is a shortage or overage, the company uses a cash short and over account to record the difference from the imprest amount. Shortage and overage amounts are reported on the income statement as other expenses and revenues, respectively. Example 9A.2 illustrates accounting for an imprest petty cash fund.

EXAMPLE 9A.2

Imprest Petty Cash Fund

PROBLEM: Monochrome Printers established a \$1,000 imprest fund at the beginning of the year. The fund custodian holds the cash to pay minor expenditures. During the year, the following expenditures were paid from the petty cash fund:

Postage	\$560
Parking and tolls	200
Supplies	<u>210</u>
Total petty cash receipts	<u>\$970</u>

At the end of the year, there was \$20 remaining in the fund. The custodian took the petty cash receipts totaling \$970 to the controller and requested reimbursement. Prepare the journal entries to record the current year's activity in the petty cash fund.

SOLUTION: To establish the petty cash fund, we make the following entry:

Accounts	Beginning of the Year
Petty Cash	1,000
Cash	1,000

At the end of the year, there should be \$30 of cash left in the fund (\$1,000 less \$970). Because there is only \$20 left, the fund is short \$10. The journal entry to replenish the fund at the end of the year is as follows:

Accounts	End of the Year
Postage Expense	560
Miscellaneous Expense	200
Supplies Expense	210
Cash Short or Over	10
Cash	980

Notice that the only journal entries to the regular cash account are when Monochrome Printers credits the regular cash account to establish the fund and replenish the fund. The petty cash account is not affected when the fund is replenished.

Short-Term Operating Assets: Inventory

LEARNING OBJECTIVES

- 1 Describe the types of inventory and demonstrate accounting under periodic and perpetual inventory systems.
- 2 Discuss inventory costing, including accounting for goods in transit, consigned goods, costs included in inventory, and purchase discounts.
- 3 Explain the need for inventory cost-flow assumptions and calculate inventory and cost of goods sold under four inventory allocation methods: specific identification; moving average; last-in, first-out (LIFO); and first-in, first-out (FIFO).
- 4 Demonstrate an understanding of and illustrate the accounting for the LIFO reserve, the LIFO effect, and LIFO liquidations. Compute inventory and cost of goods sold using the dollar-value LIFO method.
- 5 Explain the lower-of-cost-or-market (LCM) rule.
- 6 Calculate inventory and cost of goods sold using the retail inventory method.
- 7 Explain the gross profit method of estimating inventory.
- 8 Detail required disclosures for inventory.

Introduction

GO INTO ANY STORE and you will see inventory all around you. Grocery stores are stocked with fresh fruits and vegetables, boxes of cereal, and gallons of milk. Retailers like *Abercrombie & Fitch* and *Old Navy* sell all types of clothing such as pants, shirts, and sweaters. *Best Buy* is stocked with computers, cell phones, and flat-screen televisions. Maintaining sufficient inventory levels is critical to operating a successful business.

Consider *Foot Locker, Inc.*, the world's leading retailer of athletically inspired footwear and apparel. *Foot Locker's* \$1.307 billion inventory represented about 34% of its total assets at the end of 2016. *Foot Locker* seeks to accurately predict the market for the merchandise in its stores as well as its customers' purchasing habits, which enables it to maintain sufficient inventory levels to increase inventory turnover and merchandise flow. If *Foot Locker* accumulates excess inventory, it may be forced to mark down or hold promotional sales to dispose of any excess or slow-moving inventory. Both outcomes could have a materially adverse effect on *Foot Locker's* business, financial condition, and results of operations. By analyzing its market and consumer purchasing habits and maintaining sufficient levels of inventory, *Foot Locker* increased its gross profit percentage by 0.1% from 33.8% in 2015 to 33.9% in 2016.

In this chapter, we discuss key issues in accounting for inventory. Inventory is a short-term operating asset consisting of goods held for resale for a merchandising company and inventories of raw materials, work-in-process, and finished goods for a manufacturing company. As is the case with *Foot Locker*, inventory is typically a significant portion of a company's total current assets. The valuation of inventory affects the company's balance sheet and the cost of goods sold on the income statement.

Patti McConville/Alamy Stock Photo

We first cover the *periodic* and *perpetual* methods a company uses to account for inventory. Then, we address costs to include in inventory and present inventory cost-flow assumptions including *specific identification*, *first-in, first out* (FIFO), *last-in, first-out* (LIFO), and *moving average*. We also consider the issues related to the LIFO cost-flow assumption and the tax and cash flow implications of IFRS not allowing the LIFO

inventory cost-flow assumption. Next, we address specific guidelines for reporting inventory with the *lower-of-cost-or-market rule*, including differences between U.S. GAAP and IFRS. Then, we discuss the *conventional retail inventory method*, a technique that **Foot Locker** uses. Finally, we illustrate estimating ending inventory using the gross profit method and detail required disclosures.¹ ‹‹

- ❶ Describe the types of inventory and demonstrate accounting under periodic and perpetual inventory systems.

Types of Inventory and Inventory Systems

We begin our discussion of inventory measurement with an overview of the inventory classifications and the two types of inventory systems.²

Types of Inventory

Retail, wholesale, and manufacturing firms hold inventory. Retailers and wholesalers typically hold only **merchandise inventory**, which consists of goods purchased to resell without any additional manufacturing. Manufacturing firms generally report three types of inventory based on the stage of the production process:

1. *Raw materials*
2. *Work-in-process*
3. *Finished goods*

Raw materials inventory is composed of inputs that the firm has not yet placed into production. For example, cloth would be included in the raw materials inventory for a clothing manufacturer. The raw materials inventory is increased by purchases and decreased when these items are transferred into *work-in-process inventory*.

Work-in-process inventory, the goods that are currently in the manufacturing process, includes three different types of costs: raw materials, cost of labor, and allocated overhead costs. Overhead includes expenditures made for factory-related costs such as supervisory salaries, utilities, and supplies.

Work-in-process inventory becomes *finished goods* at the end of the production process. **Finished goods inventory** includes those goods for which the manufacturing process is complete. A company charges the value of finished goods to the cost of goods sold account when it sells the inventory. Increases in raw materials and work-in-process inventories are often indicators that a company plans to expand production to meet expected future sales increases.

Exhibit 10.1 summarizes the flow of inventory costs on the balance sheet and income statement from raw materials inventory to work-in-process inventory and finished goods inventory, and finally to cost of goods sold when the inventory is sold.

EXHIBIT 10.1 Cost Flows in a Manufacturing Firm

Inventory Accounts on the Balance Sheet						Income Statement	
Raw Materials Inventory		Work-in-Process Inventory		Finished Goods Inventory		Cost of Goods Sold	
Beg. Balance + Purchases	– Transferred to → Work-in-Process	Beg. Balance + Raw Materials + Labor + Allocated Overhead	– Cost of Units → Completed	Beg. Balance + Cost of Units Completed	– Cost of → Goods Sold	+ Cost of Goods Sold	
<u>End. Balance</u>		<u>End. Balance</u>		<u>End. Balance</u>		<u>End. Balance</u>	

¹We discuss inventory errors in Chapter 21.

²For most of the relevant authoritative literature for this topic, see FASB ASC 330 – *Inventory* for U.S. GAAP and IASC, *International Accounting Standard 2*, “Inventories” (London, UK: International Accounting Standards Committee, Revised) for IFRS.

Exhibit 10.2 shows *Johnson & Johnson's* disclosures by types of inventory from its 2016 annual report. Approximately 61% of *Johnson & Johnson's* inventories are comprised of finished goods, and the other 39% is made up of raw materials and work-in-process.

EXHIBIT 10.2 Types of Inventories, *Johnson & Johnson*, Financial Statements, January 1, 2017

NOTE 3: Inventories

At the end of 2016 and 2015, inventories were composed of:

	2016	2015
	(Dollars in millions)	
Raw materials and supplies	\$ 952	\$ 936
Goods in process	2,185	2,241
Finished goods	<u>5,007</u>	<u>4,876</u>
Total inventories	<u>\$8,144</u>	<u>\$8,053</u>

Source: Johnson & Johnson's 2016 annual report, http://files.shareholder.com/downloads/JNJ/3995555343x0x934262/A4542599-AECD-43F0-9E4C-99CCE31E5C20/JNJ_2017-0310-ar-bookmarked.pdf, page 31.

Inventory Systems

Companies use either a *periodic* or *perpetual* inventory system.

Periodic Inventory System. Under a **periodic system**, a company determines the inventory balance and cost of goods sold at the end of the accounting period. Each time a sale is made, a company does not reduce inventory and increase cost of goods sold. Rather, a company determines them periodically.

The balance sheet includes the opening balance of inventory. Purchases made during the period increase inventory available for sale. Firms net any purchase returns, allowances, and discounts with purchases made. Firms record purchases in a separate purchases account, a temporary account used to accumulate inventory acquisitions during a period that is closed out at the end of the period. The beginning inventory balance plus the net purchases is the cost of goods available for sale—that is, the total amount of inventory that will either be sold during the period or remain in ending inventory.

The ending inventory balance is based on a physical count of the inventory made by going to manufacturing and storage facilities and actually counting the inventory located at these sites. Firms determine the cost of goods sold at the end of the period using the computation illustrated in Exhibit 10.3.

EXHIBIT 10.3 Computation of Cost of Goods Sold: Periodic Inventory System

Cost of Goods Sold Computation	Amount from
Beginning Inventory	Known from prior period
+ <u>Net Purchases</u>	Recorded in Purchases Account, Purchase Returns and Allowances Account, and Purchase Discounts Account
= Cost of Goods Available for Sale	Subtotal
– <u>Ending Inventory</u>	Physically counted
= <u>Cost of Goods Sold</u>	Computed

Example 10.1 illustrates accounting under the periodic inventory system.

EXAMPLE 10.1

Periodic Inventory System

PROBLEM: CCS Quilting Supplies uses a periodic inventory system. On January 1, 2018, CCS's inventory is \$76,000. On March 2, 2018, CCS sells merchandise for \$19,000 on account. On June 10, 2018, CCS purchases additional inventory for \$22,000 on account. CCS sells

Continued

merchandise for \$65,000 on account on August 15, 2018. On December 31, 2018, CCS counts its inventory and determines it has \$34,000 of inventory on hand. What is CCS's cost of goods sold in 2018? Provide all journal entries for 2018.

SOLUTION: Using the equation from Exhibit 10.3, the cost of goods sold is:

	Beginning Inventory	\$ 76,000
+	Net Purchases	+22,000
=	Cost of Goods Available for Sale	\$ 98,000
-	Ending Inventory	-34,000
=	Cost of Goods Sold	\$ 64,000

On March 2, CCS records the \$19,000 sale. Because CCS uses a periodic system, it does not record the reduction of inventory at the time of sale.

Account	March 2, 2018	
Accounts Receivable	19,000	
Sales Revenue		19,000

On June 10, CCS records the \$22,000 purchase into a purchases account.

Account	June 10, 2018	
Purchases	22,000	
Accounts Payable		22,000

On August 15, CCS records the \$65,000 sale. Because CCS uses a periodic system, it does not record the reduction of inventory at the time of sale.

Account	August 15, 2018	
Accounts Receivable	65,000	
Sales Revenue		65,000

Finally, on December 31, CCS counts its inventory and adjusts the balance. Because its inventory decreased from \$76,000 to \$34,000, it credits inventory for \$42,000. In this same entry, it also removes the purchases account. CCS credits the purchases account for its \$22,000 balance and records the cost of goods sold for \$64,000.

Account	December 31, 2018	
Cost of Goods Sold	64,000	
Inventory		42,000
Purchases		22,000

Thus, CCS reports inventory of \$34,000 on the December 31, 2018, balance sheet and cost of goods sold of \$64,000 on the income statement for the year ended December 31, 2018.

Perpetual Inventory System. In practice, technological advances have made the periodic system obsolete and provided the computer software for firms to use a *perpetual system*. Under a **perpetual system**, firms continually update inventory accounts for each purchase and each sale. A perpetual system is superior to a periodic system because it always provides current information about inventory levels, cost of goods sold, and gross profit.

The following t-account shows the activity in a perpetual system of inventory. Inventory increases with net purchases and is reduced when units are sold. The inventory balance is always current.

Inventory	
Beginning Inventory	– Cost of Goods Sold
+ Net Purchases	
<u>Ending Inventory</u>	

At the end of the period, a company performs a physical count of inventory. The company adjusts for the difference between the actual count and the perpetual records resulting from issues such as theft, breakage, and obsolescence. Example 10.2 illustrates accounting under a perpetual inventory system.

EXAMPLE 10.2 Perpetual Inventory System

PROBLEM: Assume that CCS Quilting Supplies from Example 10.1 now uses a perpetual inventory system. CCS reports an inventory balance of \$76,000 on January 1, 2018. On March 2, CCS sells merchandise on account for \$19,000 that cost \$12,000. CCS purchases additional inventory for \$22,000 on account on June 10, 2018. On August 15, 2018, CCS sells merchandise costing \$52,000 for \$65,000 on account. On December 31, 2018, CCS counts its inventory and determines that it has \$34,000 worth of inventory on hand.

- What is CCS's cost of goods sold in 2018? Provide all journal entries for 2018 under a perpetual inventory system.
- Are the ending balances of inventory and cost of goods sold different under the periodic and perpetual systems?
- Now assume that CCS conducts a physical count of inventory and determines that the amount of inventory on hand is \$30,000 as opposed to the \$34,000 current balance. Provide the necessary journal entry for adjustment of the inventory account.

SOLUTION: On March 2, CCS records the sale.

Account	March 2, 2018
Accounts Receivable	19,000
Sales Revenue	19,000

Because CCS uses a perpetual system, it records the reduction of inventory when the sale is made.

Account	March 2, 2018
Cost of Goods Sold	12,000
Inventory	12,000

On June 10, CCS records the \$22,000 purchase directly in the inventory account.

Account	June 10, 2018
Inventory	22,000
Accounts Payable	22,000

On August 15, the company records the sale.

Account	August 15, 2018
Accounts Receivable	65,000
Sales Revenue	65,000

Because CCS uses a perpetual system, it immediately records the reduction of inventory when the sale is made.

Account	August 15, 2018
Cost of Goods Sold	52,000
Inventory	52,000

On December 31, CCS has the correct amount of inventory and cost of goods sold reported. The t-accounts for inventory and cost of goods sold follow:

Inventory			
Beginning Balance	76,000		
		12,000	March 2
June 10	22,000		
		52,000	August 15
Ending Balance	34,000		

Cost of Goods Sold	
Beginning Balance	0
March 2	12,000
August 15	52,000
Ending Balance	64,000

Thus, CCS reports inventory of \$34,000 on the December 31, 2018, balance sheet and reports cost of goods sold of \$64,000 on the income statement for the year ended December 31, 2018. These are the same balances as we computed under the periodic system.

If CCS counted inventory and determined that there was \$30,000, instead of \$34,000, it would record a \$4,000 loss. An adjusting entry is required to credit the inventory account and debit a loss account for \$4,000.

Account	December 31, 2018
Loss on Inventory Shortage	4,000
Inventory	4,000

Inventory			
Beginning Balance	76,000		
		12,000	March 2
June 10	22,000		
		52,000	August 15
Ending Balance	34,000		
		4,000	December 31
Ending Balance (adjusted)	30,000		

- ② Discuss inventory costing, including accounting for goods in transit, consigned goods, costs included in inventory, and purchase discounts.

Inventory Costing: Units and Costs Included

So far, we have focused on the total dollar amount of inventory that the firm reports on its balance sheet. The total dollar amount of inventory is equal to the number of units on hand multiplied by the cost per unit. To illustrate, consider the inventory of sweaters at a clothing store. To assign a value, the firm multiplies the number of sweaters by the cost of each sweater. Although the total inventory value is a straightforward concept, there are four complexities in practice:

1. Determining what goods are included in inventory.
2. Measuring cost per unit.
3. Allocating the cost of the goods purchased or manufactured by the company between the units that remain in inventory at the end of the period and the units that are sold during the period.
4. Accounting for a decrease in the market value of inventory.

We begin by briefly covering the types of goods included in inventory and then address each of the remaining three issues.

Goods Included in Inventory

Ending inventory typically consists of the goods that are in the company's physical possession as well as some *goods in transit* and some goods in consignment arrangements.³

Goods in Transit. **Goods in transit** are items that have left the seller's place of business but have not yet been received by the buyer. If inventory is in transit at the end of the reporting period, does the buyer or the seller report these items in inventory? The answer depends on who has title to the goods:

1. If the goods are shipped **f.o.b. (free on board) shipping point**, then title passes from the seller to the buyer when the goods are shipped. Consequently, the buyer reports the goods in its inventory because the buyer obtains title to the goods as soon as they leave the seller's location.
2. If goods are shipped **f.o.b. destination**, then title passes from the seller to the buyer when the goods are received by the buyer. Thus, the seller reports the goods in its inventory while in transit because the seller remains the owner until the goods arrive at the buyer's destination.

Example 10.3 provides an example of determining the title of goods in transit.

EXAMPLE 10.3

Goods in Transit

PROBLEM: Rock Enterprises has inventory of \$150,000 in its warehouse as of December 31. It also has two shipments that left the supplier's warehouse by December 31 that it expects to receive on January 2. The first shipment of \$15,000 was sold f.o.b. shipping point and the second shipment of \$17,000 was sold f.o.b. destination. What inventory amount should Rock report on its balance sheet as of December 31?

SOLUTION: Rock should report \$165,000 for inventory as of December 31—the \$150,000 of inventory in its possession as well as the \$15,000 of inventory in transit that was sold f.o.b. shipping point—because it obtained title to the goods when they were shipped. Rock will not report the \$17,000 of goods sold f.o.b. destination because it will not take title of those goods until the merchandise arrives at Rock's location.

Consigned Goods. Recall from the revenue recognition chapter that a company enters into a consignment arrangement when one party (the consignee) agrees to sell a product for another party (the consignor) without taking ownership of the merchandise. In this case, although the consignee has physical possession of the inventory, the inventory is reported on the consignor's balance sheet. For example, Electronics Emporium may ship 100 DVD players to LookVideos, Inc. on consignment. In this case, Electronics Emporium is the consignor and LookVideos is the consignee. Although LookVideos has physical possession of the DVD players, it does not report them as part of its inventory. Electronics Emporium will include the DVD players in its inventory because the company still has control of the inventory.

Costs Included in Inventory

Inventory costs reflect the price paid for the goods to be held for resale or the manufacturing costs incurred in producing the units, including materials, labor, and allocated overhead. The costs initially capitalized into inventory also include expenditures such as **freight-in costs**, the transportation costs incurred to bring the inventory to the appropriate location. Other capitalized costs include packaging and handling costs. These reasonable and necessary expenditures are considered to have asset value because they are required to acquire the inventory. **Freight-out costs**, transportation costs incurred by the seller to move the inventory to the buyer, are expensed as a component of selling, general, and administrative expenses when incurred.

³Companies selling products often give the buyer the right to return the product. If the company estimates that returns will be a material amount, then it must record the estimated returns. We discuss sales returns in more depth in Chapter 8.

Although the accounting standards specify general rules, there is a great deal of discretion regarding costs to capitalize in inventory and to expense as incurred. For example, in its significant accounting policies footnote in the 2016 financial statements, **Foot Locker** explained that it capitalized transportation, distribution center, and sourcing costs in merchandise inventories.⁴ The cost of inventory excludes expenditures related to *abnormal costs*. This treatment is based on the theory that abnormal costs are not reasonable and necessary and do not represent asset value. **Abnormal costs** include abnormal spoilage and excess freight, which are costs that exceed the normal costs expected to be incurred.

Purchase Discounts

Finally, inventory costs are reduced by *purchase discounts*. **Purchase discounts** reduce the amount that is due to sellers if the buyer pays within a certain time period. Purchase discounts are related to sales discounts discussed in Chapter 9. The company selling the inventory offers a discount to the buyer. The selling company accounts for the sales discount. The company buying the inventory accounts for the purchase discount. A typical purchase discount is stated as 2/10, n/30, which means the buyer will receive a 2% discount by paying within 10 days; otherwise, the buyer must pay the balance within 30 days. There are two acceptable approaches to recording purchase discounts: the *gross method* and the *net method*.

Gross Method. Under the **gross method**, a company making a purchase initially records the inventory and accounts payable at the full (gross) purchase amount on the invoice.

1. If the buyer pays *after* the discount period, the accounting is simple because the full amount is paid. That is, the amount of cash paid is the gross amount of the payable and inventory on the books.
2. If the buyer pays *within* the discount period, the journal entry must reflect the discount. That is, when a buyer takes a purchase discount, the buyer pays less cash than the gross account payable on the books: The net amount is the difference between the gross amount and the discount. The company still needs to remove the gross amount of the payable because it is no longer owed to the seller, but less cash is needed to liquidate the liability. Under a perpetual system, the buyer credits the inventory account for the difference between the gross payable amount and the net cash paid, reducing the value of the inventory to the net amount.⁵

Net Method. Under the **net method**, the company making the purchase assumes that it will take the discount and initially records the accounts payable and inventory at the net amount.

1. If the buyer pays *within* the discount period, then the journal entry treats the amount of cash paid as the net amount of the payable on the books.
2. If the buyer pays *after* the discount period, the buyer pays more cash than the net payable on the books. The difference is the amount of the discount lost by not paying within the discount period. By not paying on time, the company incurs an additional cost that represents interest accrued on the unpaid balance after the discount period. The buyer debits the difference to interest expense to reflect the fact that this difference is an amount due to the seller for providing financing.

Example 10.4 illustrates accounting for purchase discounts under both the gross and net methods.

⁴Source: <https://www.sec.gov/Archives/edgar/data/850209/000085020917000003/fl-20170128x10k.htm>, page 44.

⁵We discuss only the perpetual system here. However, a company using a periodic system would credit purchase discounts, a contra account to purchases.

EXAMPLE 10.4 Purchase Discounts Using the Gross and Net Methods

PROBLEM: On June 1, Sure Foot Outfitters, Inc. bought 50 pairs of hiking boots for \$100 per pair from a vendor on account with terms of 2/10, n/30. Sure Foot paid for 20 pairs of the boots on June 9 and paid for the remaining 30 pairs on June 29. Provide the necessary journal entries for Sure Foot to record these transactions under both the gross and net methods. Sure Foot uses the perpetual inventory system.

SOLUTION: First, Sure Foot records the purchase. Under the gross method, the company records the full \$5,000 (50 pairs of boots \times \$100 per pair).

Under the net method, the company records \$4,900, which is the \$5,000 gross amount of the invoice (50 pairs of boots \times \$100 per pair) less the \$100 discount amount (\$5,000 \times 2%). The journal entries are as follows:

<i>Gross Method</i>	<i>Debit</i>	<i>Credit</i>	<i>Net Method</i>	<i>Debit</i>	<i>Credit</i>
Inventory	5,000		Inventory	4,900	
Accounts Payable		5,000	Accounts Payable		4,900

Under the gross method, on June 9, Sure Foot makes payment of \$1,960. The net amount per pair of boots is \$98, which is the gross amount of \$100 less the discount amount of \$2 (\$100 \times 2%). The discount is granted because the invoice was paid within the 10-day period. Thus, Sure Foot pays \$1,960 for 20 pairs of boots (20 pairs of boots \times \$98 per pair). Although Sure Foot pays only \$1,960 in cash, we must remove accounts payable at the gross amount of \$2,000 (20 pairs of boots at \$100 per pair) and apply the difference to the inventory account.

Under the net method, Sure Foot originally recorded the accounts payable at the net amount, so we debit accounts payable and credit cash for the \$1,960. The journal entries are as follows:

<i>Gross Method</i>	<i>Debit</i>	<i>Credit</i>	<i>Net Method</i>	<i>Debit</i>	<i>Credit</i>
Accounts Payable	2,000		Accounts Payable	1,960	
Cash		1,960	Cash		1,960
Inventory		40			

Finally, on June 29, Sure Foot makes full payment of \$3,000 for the remaining accounts payable. No discount is applied because Sure Foot did not pay within the discount period. Thus, the journal entry for the gross method requires crediting the cash account for the \$3,000 and including an offsetting entry to accounts payable.

Under the net method, Sure Foot must remove the accounts payable balance at the net amount of \$2,940 (\$3,000 less a 2% discount of \$60). The \$60 difference represents the discount lost by not paying the invoice within the discount period. The discount lost is a debit to interest expense. The journal entries are as follows:

	<i>Debit</i>	<i>Credit</i>	<i>Net Method</i>	<i>Debit</i>	<i>Credit</i>
Accounts Payable	3,000		Accounts Payable	2,940	
Cash		3,000	Interest Expense	60	
			Cash		3,000

In practice, the net method is more appropriate than the gross method because buyers usually take the discount. Thus, recording the payable at the net amount is likely an accurate portrayal of the amount that the buyer will ultimately pay and therefore minimizes the need for adjustments.

JUDGMENTS IN ACCOUNTING

Inventory Costs

Judgment is crucial in determining the initial measurement of inventory. Deciding what costs to include in inventory is often subjective, as indicated by the Codification's statement that "although principles for the determination of inventory costs may be easily stated, their application . . . is difficult because of the variety of considerations in the allocation of costs and charges."⁶ As a simple example, consider the requirement that companies capitalize freight-in costs into the inventory account whereas abnormal freight must be expensed. Deciding what freight cost is normal versus what is abnormal requires subjective judgment. For example, if an auto dealer pays freight for a shipment of vehicles delivered from the factory, it is a normal part of the dealer's business operations. In this case, the freight is considered part of the cost of inventory because it was reasonable and necessary to have the inventory in place and ready for sale. However, if sales begin to slow down and the dealer holds too much inventory, this inventory may have to be shipped to alternate locations. This additional freight may be considered abnormal and expensed because it is not a reasonable and necessary cost and does not represent a part of inventory value.

The decision to use the gross or net method of recording purchase discounts also affects the balance in the inventory account. In Example 10.4, the final balance in the inventory account is \$4,960 using the gross method and \$4,900 using the net method for the same three transactions. Thus, the inventory balance is impacted by management's choice of the method to account for the discount.

- 3 Explain the need for inventory cost-flow assumptions and calculate inventory and cost of goods sold under four inventory allocation methods: specific identification; moving average; last-in, first-out (LIFO); and first-in, first-out (FIFO).

Inventory Cost-Flow Assumptions

A company usually does not track each individual item of inventory in its accounting system as the item is purchased and eventually sold. Rather, a company will choose a **cost-flow assumption** to move the cost of the item from inventory to cost of goods sold in the accounting system.

Consider a store that buys sweaters in different sizes and colors during the year. The cost of each type of sweater varies slightly depending on when it was purchased. If the store does not track each individual sweater, how does the store determine the cost of the sweaters sold and the cost of the sweaters remaining in the store? If the cost of each sweater were always the same, the store would simply multiply the number of sweaters sold and the number of sweaters remaining in ending inventory by the constant cost to determine the cost of goods sold and ending inventory, respectively. But a constant cost is unlikely to occur in practice. Thus, the store must determine which of the sweaters available for sale were sold and which remain in the store.

To make this allocation, the store first determines the cost of the goods that it has available for sale as illustrated in Example 10.5.

EXAMPLE 10.5

Determining the Cost of Goods Available for Sale

PROBLEM: Cowboy Accessories Enterprises began the year with 1,000 cowboy hats in stock with a cost of \$20 per hat. On April 22, the company purchased 200 hats at \$22 each. Cowboy purchased 350 hats at \$25 each on July 2 and acquired an additional 100 hats at \$27 each on November 7 as shown in the following table.

Cowboy Accessories has 400 hats in ending inventory.

Beginning inventory	1,000
April 22 purchase	200
July 2 purchase	350
November 7 purchase	100

⁶See FASB ASC 330-10-30-2, *Inventory – Overall – Initial Measurement*.

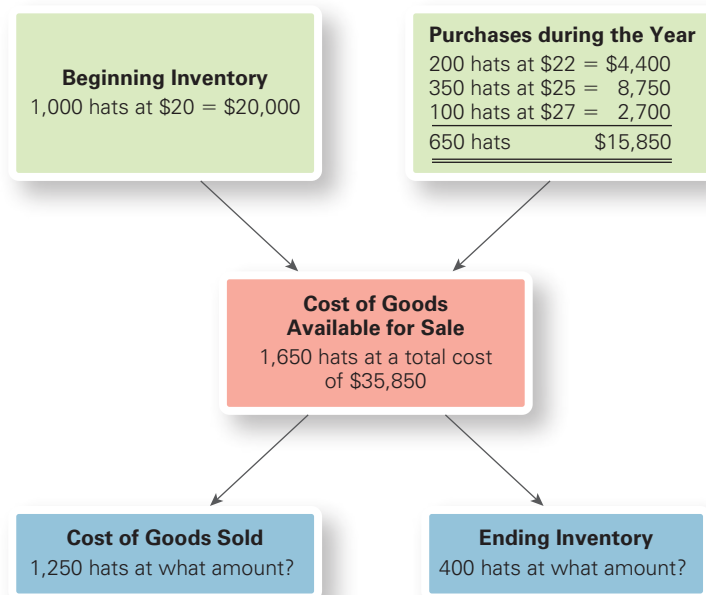

What is Cowboy Accessories' cost of goods available for sale?

SOLUTION: The cost of goods available for sale for the year is \$35,850, which is determined as the cost of the beginning inventory plus all the purchases during the year as follows:

	<u>Units</u>	<u>Price</u>	<u>Total</u>
Beginning inventory	1,000	\$20	\$20,000
April 22 purchase	200	\$22	4,400
July 2 purchase	350	\$25	8,750
November 7 purchase	<u>100</u>	<u>\$27</u>	<u>2,700</u>
Cost of goods available for sale	<u>1,650</u>		<u>\$35,850</u>

Example 10.5 illustrates that allocation complexities result from varying inventory acquisition costs. Cowboy Accessories Enterprises has a total of 1,650 units available for sale with a total cost of \$35,850. Allocating the \$35,850 cost of goods available for sale between cost of goods sold and ending inventory depends on which hats were sold and which hats remain in inventory. Exhibit 10.4 depicts this allocation issue. Beginning inventory of \$20,000 and purchases of \$15,850 contribute to cost of goods available for sale of \$35,850. Cowboy Accessories must allocate this amount between cost of goods sold and ending inventory. That is, it needs to determine the portion of the \$35,850 to include in ending inventory on the balance sheet and how much of the cost of goods available for sale to report as cost of goods sold on the income statement.

EXHIBIT 10.4 The Inventory Allocation Problem

If the cost of hats is constant over time or if Cowboy Accessories can specifically identify the exact cost of the units sold, the allocation is straightforward. However, prices are seldom constant over time, and it is not always practical to specifically identify each unit. In the case of changing prices, firms usually make cost-flow assumptions. Specifically, rather than tracking the cost of each hat purchased and sold, Cowboy can use cost-flow assumptions to allocate the \$35,850 total cost of goods available for sale to the 400 hats in ending inventory and the 1,250 hats sold.

Inventory Allocation Methods

There are four common methods to allocate the cost of goods available for sale between ending inventory and cost of goods sold:

1. **Specific identification method:** The company identifies each unit and tracks the cost associated with that specific unit.
2. **Moving-average method:** The company determines an average cost for the units on hand and applies that average unit cost to the next sale to determine the cost of goods sold.
3. **First-in, first-out (FIFO) method:** The company assigns the most recent costs to ending inventory and the oldest costs to cost of goods sold.
4. **Last-in, first-out (LIFO) method:** The company assigns the oldest costs to ending inventory and the most recent costs to cost of goods sold.

It is important to note that a company does not have to sell its inventory in a pattern that resembles its accounting assumptions. For example, a grocery store is likely to sell gallons of older milk first. Yet, it could choose to use a moving-average cost to determine the cost of goods sold because it is easier to implement. We will examine the four methods in depth using a common example to compare and contrast the financial reporting effects.

Each of two other approaches to inventory allocation—the *retail inventory method* and *gross profit method*—approximates the ending inventory balance reported. We discuss the retail inventory method and the gross profit method later in the chapter.

Specific Identification Method

With the specific identification method, a company identifies each unit and tracks its actual cost as illustrated in Example 10.6. This approach is suitable for companies that sell high-dollar products with low sales volume. For example, a truck dealer can identify a vehicle that was available for sale by referencing its vehicle identification number and determining whether it was sold or is still in ending inventory. The method is impractical, however, for most companies. Imagine a grocery wholesaler using specific identification on each of the products it sells!

EXAMPLE 10.6 Specific Identification Method of Cost Allocation

PROBLEM: Horton Enterprises, a farm equipment retailer, had the following units on hand as of January 1 of the current year.

Item Number	Description	Quantity	Cost per Unit
1167	Horse Trailer	2	\$50,000
2234	Tractor	1	45,000
4423	Hay Baler	1	25,000

During the year, it purchased the following pieces of equipment:

Item Number	Description	Quantity	Cost per Unit
2288	Tractor	1	\$42,000
4467	Hay Baler	1	37,000

During the year, Horton sold all of the units in its beginning inventory except for the Hay Baler (item 4423). It also sold the tractor that was purchased during the year (item 2288). What are Horton's ending inventory and cost of goods sold under the specific identification method?

SOLUTION: Referencing its cost records for each item, Horton computes cost of goods sold and ending inventory as follows:

Item Number	Description	Quantity	Cost per Unit	Cost of Goods Sold	Ending Inventory
1167	Horse Trailer	2	\$50,000	\$100,000	\$ 0
2234	Tractor	1	45,000	45,000	0
2288	Tractor	1	42,000	42,000	0
4423	Hay Baler	1	25,000	0	25,000
4467	Hay Baler	1	37,000	0	37,000
Total				<u>\$ 187,000</u>	<u>\$62,000</u>

Moving-Average Method

The moving-average method determines an average cost for the units on hand and applies that average unit cost to the next sale to determine the cost of goods sold.⁷ The ending inventory is the remaining (unsold) units valued at the average unit cost as shown in Example 10.7. The moving-average method is useful for firms selling a high volume of a homogeneous product (e.g., oil and gas) and is often used for inventory of raw materials and supplies.

EXAMPLE 10.7

Moving-Average Method of Cost Allocation

PROBLEM: Broadway Stores reports the following transactions related to inventory.

Transaction	Units Purchased	Unit Cost	Units Sold	Total Cost
Beginning inventory – 1/1	1,000	\$2.00		\$ 2,000
Purchase – 3/30	6,000	3.00		18,000
Purchase – 4/16	4,000	4.00		16,000
Sale – 5/11			2,000	
Purchase – 6/13	2,000	4.50		9,000
Sale – 7/1			3,500	
Purchase – 10/5	3,000	5.00		15,000

Broadway sells all products at \$7 each. What is Broadway's cost of goods available for sale, cost of goods sold, and ending inventory for the current year using the moving-average method under a perpetual system?

SOLUTION: Under the moving-average method, Broadway determines an average cost for the units. The company computes a new moving-average cost with every purchase by taking the cumulative cost and dividing it by the cumulative units in inventory.

Please refer to the table on the next page. Beginning with 1,000 units in inventory at a cumulative cost of \$2,000, the initial moving-average cost is \$2.00 per unit. We add the 6,000-unit purchase at \$3.00 per unit on March 30 to get cumulative units of 7,000 and a cumulative

Continued

⁷The term moving-average method, is used in a perpetual inventory system. Under a periodic inventory system, this approach is generally referred to as the weighted-average method.

cost of \$20,000. The moving-average cost as of March 30 is \$2.86 (\$20,000 divided by 7,000). Finally, we add the 4,000-unit purchase at \$4.00 per unit and get cumulative units of 11,000 and a cumulative cost of \$36,000. Thus, the moving-average cost as of April 16 is \$3.27 (\$36,000 divided by 11,000).

Because Broadway uses a perpetual inventory system, it records the reduction in inventory and the increase in cost of goods sold on May 11 when it sells 2,000 units. It records the cost of goods sold at the current moving-average cost per unit. On May 11, Broadway sells 2,000 units at a cost of \$3.27 per unit, resulting in a decrease in the inventory account and an increase in the cost of goods sold account of \$6,540.

On June 13, Broadway purchases 2,000 more units at a cost of \$4.50 per unit, which increases the cumulative cost to \$38,460 with cumulative units of 11,000, resulting in a moving-average cost of \$3.50 per unit (\$38,460 divided by 11,000 units). On July 1, Broadway sells 3,500 units and records the cost of these sales at the current moving-average cost of \$3.50 per unit for a total of \$12,250. Finally, Broadway purchases 3,000 more units at a cost of \$5.00 per unit, resulting in an ending inventory of 10,500 units and a cumulative cost of \$41,210—the ending inventory balance. The average cost per unit at the end of the year is then \$3.92 (\$41,210 cumulative cost divided by 10,500 units). These inventory transactions are summarized in the following table.

Transaction	Units Purchased (Sold)	Unit Cost	Cumulative Units	Total Cost	Cost of Goods Sold (Cumulative)	Cumulative Cost (Balance in Inventory Account)	Average Cost per Unit
Beginning inventory	1,000	\$2.00	1,000	\$ 2,000		\$ 2,000	\$2.00
Purchase – 3/30	6,000	3.00	7,000	18,000		20,000	2.86
Purchase – 4/16	4,000	4.00	11,000	16,000		36,000	3.27
Sale – 5/11	(2,000)	3.27	9,000	(6,540)	6,540	29,460	3.27
Purchase – 6/13	2,000	4.50	11,000	9,000		38,460	3.50
Sale – 7/1	(3,500)	3.50	7,500	(12,250)	18,790	26,210	3.50
Purchase – 10/5	3,000	5.00	10,500	15,000		41,210	3.92

The t-accounts for inventory and cost of goods sold are as follows:

Inventory	
Beginning Balance	2,000
March 30	18,000
April 16	16,000
	6,540 May 11
June 13	9,000
	12,250 July 1
October 5	15,000
	<u>41,210</u>
Cost of Goods Sold	
Beginning Balance	0
May 11	6,540
July 1	12,250
	<u>18,790</u>

Therefore, the cost of goods sold for the year is \$18,790. We compute cost of goods available for sale as follows:

Transaction	Units		
	Purchased	Unit Cost	Total Cost
Beginning inventory – 1/1	1,000	\$2.00	\$ 2,000
Purchase – 3/30	6,000	3.00	18,000
Purchase – 4/16	4,000	4.00	16,000
Purchase – 6/13	2,000	4.50	9,000
Purchase – 10/5	3,000	5.00	15,000
Cost of goods available for sale	<u>16,000</u>		<u>\$60,000</u>

Broadway allocates this \$60,000 cost of goods available for sale between ending inventory (\$41,210) and cost of goods sold (\$18,790).

First-In, First-Out Method

The first-in, first-out (FIFO) method assigns the most recent costs to ending inventory and the oldest costs to cost of goods sold. Under a perpetual system, the company records the cost of goods sold at the point of each sale.

FIFO is conceptually sound for firms selling products that can perish or are subject to style changes, obsolescence, or rapid technological changes. The FIFO cost-flow assumption accurately portrays the actual flow of goods in most companies. For example, it is logical that a computer manufacturer will attempt to sell its oldest models first because they will certainly be replaced by units with more advanced technology.⁸ Example 10.8 illustrates the FIFO method.

EXAMPLE 10.8 FIFO Method of Cost Allocation

PROBLEM: Consider Broadway Stores in Example 10.7. What is Broadway's cost of goods sold and ending inventory for the current year using the FIFO method under a perpetual system?

SOLUTION: Under a perpetual FIFO system, Broadway computes and records cost of goods sold at the time of every sale. Broadway made sales on May 11 and July 1. Thus, on May 11, we must determine the cost to allocate to the 2,000 units sold. Beginning with the first goods purchased, the costs allocated will be \$2 for the first 1,000 sold on that day and \$3 for the next 1,000. We assume that 5,000 of the units purchased on March 30 are still in inventory. On July 1, Broadway sells 3,500 more units that we assume come from the March 30 purchase because those are the earliest goods still presumed to be in inventory.

Continued

⁸The allocation between cost of goods sold and ending inventory is the same using either the perpetual or the periodic system for the FIFO method. This is not the case for the LIFO and moving-average cost methods.

Transaction	Units Purchased	Unit Cost	Total Cost	Units Sold	Cost of Goods Sold per Unit	Cost of Goods Sold	Inventory Balance
Beginning inventory	1,000	\$2.00	\$ 2,000				\$ 2,000
Purchase – 3/30	6,000	3.00	18,000				20,000
Purchase – 4/16	4,000	4.00	16,000				36,000
Sale – 5/11				2,000	1,000 @ \$2 1,000 @ \$3	\$ 5,000	31,000
Purchase – 6/13	2,000	4.50	9,000				40,000
Sale – 7/1				3,500	3,500 @ \$3	\$10,500	29,500
Purchase – 10/5	3,000	5.00	15,000				44,500
Goods Available for Sale/Cost of Goods Available for Sale	<u>16,000</u>		<u>\$60,000</u>				
Units Sold/Cost of Goods Sold				<u>5,500</u>		<u>\$15,500</u>	

The preceding table shows that total cost of goods sold for the year is \$15,500. We also compute the goods available for sale and the cost of goods available for sale as 16,000 units and \$60,000, respectively. Because Broadway had 16,000 units available for sale and sold 5,500 units, it reports 10,500 units in ending inventory. Under FIFO, we assume that these units are the last units purchased. We compute ending inventory as \$44,500 as in the following table.

Transaction	Units Purchased	Units in Ending Inventory	Unit Cost	Cost in Ending Inventory
Purchase – 10/5	3,000	3,000	\$5.00	\$15,000
Purchase – 6/13	2,000	2,000	4.50	9,000
Purchase – 4/16	4,000	4,000	4.00	16,000
Purchase – 3/30	6,000	1,500	3.00	4,500
Beginning inventory	1,000	0	2.00	0
Ending inventory		<u>10,500</u>		<u>\$44,500</u>

Inventory			
Beginning Balance	2,000		
March 30	18,000		
April 16	16,000		
		5,000	May 11
June 13	9,000		
		10,500	July 1
October 5	15,000		
Ending Balance	<u>44,500</u>		

Cost of Goods Sold	
Beginning Balance	0
May 11	5,000
July 1	10,500
Ending Balance	<u>15,500</u>

Broadway allocates the \$60,000 cost of goods available for sale between ending inventory (\$44,500) and cost of goods sold (\$15,500).

Last-In, First-Out Method

The last-in, first-out (LIFO) method assigns the oldest costs to ending inventory and the most recent costs to cost of goods sold as illustrated in Example 10.9. LIFO is conceptually sound for any company that accumulates inventory, sells units from its most recent acquisitions, and maintains a base stock (such as a mining company). However, actual inventory management at most firms does not follow this pattern.

EXAMPLE 10.9

LIFO Method of Cost Allocation

PROBLEM: Consider Broadway Stores in Example 10.7. What is Broadway's cost of goods sold and ending inventory for the current year using the LIFO method under a perpetual system?

SOLUTION: Under a perpetual LIFO system, Broadway computes and records cost of goods sold at the time of every sale. Broadway made sales on May 11 and July 1. Thus, on May 11, we will determine what cost to allocate to the 2,000 units sold. Beginning with the last goods purchased on April 16, the costs allocated will be \$4. We assume that 2,000 of the units purchased on April 16 are still in inventory. On July 1, Broadway sells 3,500 units of which 2,000 are assumed to come from the June 13 purchase and 1,500 from the April 16 purchase because those are the most recently purchased goods still assumed to be in inventory.

Transaction	Units Purchased	Unit Cost	Total Cost	Units Sold	Cost of Goods Sold per Unit	Cost of Goods Sold	Inventory Balance
Beginning inventory	1,000	\$2.00	\$ 2,000				\$ 2,000
Purchase – 3/30	6,000	3.00	18,000				20,000
Purchase – 4/16	4,000	4.00	16,000				36,000
Sale – 5/11				2,000	2,000 @ \$4.00	\$ 8,000	28,000
Purchase – 6/13	2,000	4.50	9,000				37,000
Sale – 7/1				3,500	2,000 @ \$4.50 1,500 @ \$4.00	\$15,000	22,000
Purchase – 10/5	3,000	5.00	15,000				37,000
Goods Available for Sale/Cost of Goods Available for Sale	<u>16,000</u>		<u>\$60,000</u>				
Units Sold/Cost of Goods Sold				<u>5,500</u>		<u>\$23,000</u>	

Continued

The table on the prior page indicates that total cost of goods sold for the year is \$23,000. We also compute the goods available for sale and the cost of goods available for sale as 16,000 units and \$60,000, respectively. Because Broadway had 16,000 units available for sale and sold 5,500 units, it reports 10,500 units in ending inventory. Under LIFO, we assume that these units are the first units purchased. We compute ending inventory as \$37,000 as follows.

Earliest items purchased are in inventory→	Transaction	Units Purchased	Units in Ending Inventory	Unit Cost	Cost in Ending Inventory
	Beginning inventory	1,000	1,000	\$2.00	\$ 2,000
	Purchase – 3/30	6,000	6,000	3.00	18,000
	Purchase – 4/16	4,000	500	4.00	2,000
	Purchase – 6/13	2,000	0	4.50	0
	Purchase – 10/5	3,000	<u>3,000</u>	5.00	<u>15,000</u>
	Ending inventory		<u>10,500</u>		<u>\$37,000</u>

Inventory	
Beginning Balance	2,000
March 30	18,000
April 16	16,000
	8,000 May 11
June 13	9,000
	15,000 July 1
October 5	15,000
Ending Balance	<u>37,000</u>

Cost of Goods Sold	
Beginning Balance	0
May 11	8,000
July 1	15,000
Ending Balance	<u>23,000</u>

Broadway allocates its \$60,000 cost of goods available for sale between ending inventory (\$37,000) and cost of goods sold (\$23,000).

Comparison of the Moving-Average, FIFO, and LIFO Methods

Companies typically use either the moving-average cost, FIFO, or LIFO methods for costing inventory. Although the specific identification method is allowed, virtually no firms use it. Exhibit 10.5 presents the percentage of U.S. companies that use the different cost-flow assumptions for at least part of their inventory.⁹ As shown, FIFO is the most popular method.

⁹Note that the percentages do not add to 100% because companies can use different cost assumptions for different inventory items. That is, a company can use more than one cost-flow assumption for its inventory. For example, a company can use FIFO for its merchandise inventory and moving-average cost for miscellaneous inventory such as supplies.

EXHIBIT 10.5 Usage of Cost-Flow Assumptions

Source: Accounting Trends and Techniques—2011 (AICPA, New York, NY)

Examples 10.7, 10.8, and 10.9 demonstrate that the three primary cost-flow assumptions produce different results for the cost of goods sold reported on the income statement and the valuation of inventory on the balance sheet. The different results can have a significant impact on reported income and several key financial ratios.

The cost-flow assumptions affect only the allocation of ending inventory and cost of goods sold: The choice of inventory valuation method does not affect cash flows directly. However, the **IRS LIFO conformity rule** mandates that a company using LIFO for tax purposes must also use it for financial reporting. The effect of inventory valuation methods on cost of goods sold, and thus net income, and the required book-tax conformity for LIFO lead to possible tax and cash-flow consequences. LIFO generally results in a lower income figure in a period of rising inventory costs. Thus, it is advantageous to use LIFO for tax purposes because its use will increase cash flow by decreasing cash paid for income taxes. Investors and other financial statement users understand that even though using LIFO results in lower net income, using LIFO increases the amount of cash that the company retains and can use in operations. Therefore, investors and other financial statement users do not penalize a company for using LIFO and reporting lower net income.

Exhibit 10.6 summarizes the moving-average, FIFO, and LIFO inventory valuation methods illustrated in Examples 10.7, 10.8, and 10.9, providing important insights:

1. In terms of measuring cost of goods sold and ending inventory, the moving-average method falls between the two extreme approaches, LIFO and FIFO.
2. FIFO will result in the *lowest* measurement of cost of goods sold (and thus the highest reported net income) and the *highest* valuation of inventory on the balance sheet as long as the unit cost of inventory is increasing.
3. LIFO will result in the *highest* cost of goods sold (and thus the lowest reported net income) and the *lowest* valuation of inventory on the balance sheet as long as the unit cost of inventory is increasing.

EXHIBIT 10.6 Cost of Goods Sold and Inventory Valuation; Cost-Flow Method Comparison

The relationships and rankings between the LIFO and FIFO methods noted in Exhibit 10.6 hold only if costs are rising for inventory acquisitions and if units in inventory are constant or increasing. If costs are declining, then the comparison is exactly the opposite with LIFO resulting in higher net income and a higher inventory valuation.

Inventory Allocation Methods: IFRS. IFRS does not allow the LIFO approach. International accounting standard setters view LIFO as imposing an unrealistic cost flow assumption that lacks representational faithfulness of inventory flows.¹⁰

The fact that IFRS does not permit the LIFO cost-flow assumption would be a major obstacle for U.S. companies if the United States allowed IFRS. There could be significant cash flow effects for companies currently saving taxes as a result of using LIFO. A company ceasing the use of LIFO is obligated to pay the IRS all the tax savings it received from using LIFO over a four-year period. Consider *Chevron Corporation*, a petroleum company that uses the LIFO cost-flow assumption. By the end of 2016, it had saved more than \$1 billion in taxes by using LIFO.

THE CONCEPTUAL FRAMEWORK CONNECTION

Inventory Valuation Methods

Although U.S. GAAP allows LIFO, many argue that this method is generally not a conceptually sound assumption for the cost flow of inventory. It is rare for a company to sell its most recent purchases before its earlier purchases. A concrete plant might use the most recent cement first because it is on the top of the pile—but in reality, few other types of companies would operate this way. IFRS does not permit the use of LIFO for this reason.

FIFO measures inventory on the balance sheet more accurately than LIFO because it values ending inventory using the most recent purchases and thus more closely reflects current costs. Some argue that LIFO better measures the cost of goods sold because it uses the most recent purchases and thus matches these current costs with current selling prices. However, this benefit is not always achieved with the LIFO method in practice.

In addition to being theoretically deficient, LIFO is the most difficult and costly method to implement in practice. So, why do a significant number of U.S. firms continue to use the LIFO method? The primary reason is that LIFO can provide significant tax benefits for a firm. Before the LIFO conformity rule, many firms adopted LIFO for tax purposes while continuing to use FIFO for financial reporting. This dual approach allowed firms to report higher income to their shareholders while reducing income for tax purposes. Congress believed that this was misleading because if LIFO is used for taxes, then LIFO must be viewed by a company to be the proper valuation of inventory. As a result, the IRS LIFO conformity rule requires that if a company wants to maximize tax benefits (i.e., lower taxable income) by using LIFO for tax purposes, it must also adopt LIFO for financial reporting.

As we will discuss in Chapter 17, inventory valued using the LIFO method is one of the few areas where tax and financial reporting methods are required to conform.

- 4 Demonstrate an understanding of and illustrate the accounting for the LIFO reserve, the LIFO effect, and LIFO liquidations. Compute inventory and cost of goods sold using the dollar-value LIFO method.

The LIFO Cost-Flow Assumption in Detail

The next section of this chapter discusses the issues encountered when using the LIFO method in practice.

The LIFO Reserve and LIFO Effect

Inventory management is important to the operations of a firm, and LIFO does not provide a conceptually sound cost-flow approach to measuring inventory for most companies. Consequently, a firm that reports externally on the LIFO basis will often measure inventory on its trial balance for internal records on another basis, such as FIFO. If costs are increasing, the firm will then use an allowance account, referred to as the **LIFO reserve**, to reduce the inventory to the measurement under LIFO. The balance in the LIFO reserve account is the difference between the inventory measured using FIFO and LIFO. The footnotes to the financial statements disclose the LIFO reserve. Example 10.10 illustrates the conversion from FIFO to LIFO.

¹⁰IASC, *International Accounting Standard 2*, “Inventories,” BC 11, 19.

EXAMPLE 10.10**LIFO Reserve**

PROBLEM: Cosmop Enterprises reports externally using LIFO but keeps its inventory records internally using FIFO. On January 1, its inventory was \$100,000 measured using FIFO and \$92,000 using LIFO. On December 31 of that year, its inventory was \$130,000 using FIFO and \$119,000 using LIFO. During the year, Cosmop recorded cost of goods sold of \$50,000 and purchased new inventory of \$80,000. What is the balance in Cosmop's inventory and LIFO reserve accounts as of January 1? What is the balance in the inventory and LIFO reserve accounts as of December 31? What journal entry is required on December 31 to convert to LIFO? What is the LIFO effect for the year?

SOLUTION: At the beginning of the year, the internal inventory account had a \$100,000 debit balance using FIFO. Cosmop reports inventory valued at \$92,000 under the LIFO method. As a result, the LIFO reserve requires a credit balance of \$8,000 ($\text{FIFO} - \text{LIFO} = \$100,000 - \$92,000$). Thus, Cosmop reports inventory on the balance sheet at the net amount of \$92,000. On December 31, the internal inventory account had a \$130,000 debit balance under FIFO and an inventory measurement of \$119,000 using LIFO. The ending LIFO reserve account requires a credit balance of \$11,000 ($\text{FIFO} - \text{LIFO} = \$130,000 - \$119,000$).

The partial t-account for the inventory account using FIFO and the LIFO reserve is as follows:

Inventory – FIFO			
January 1	100,000		
		50,000	Cost of Goods Sold
Purchases	80,000		
December 31	<u>130,000</u>		

We know that Cosmop has a beginning balance of \$8,000 in the LIFO reserve account and needs an ending balance of \$11,000. Thus, we compute the required adjustment as follows:

Ending LIFO reserve needed	\$11,000
Beginning balance	<u>(8,000)</u>
Adjustment required	<u>\$ 3,000</u>

LIFO Reserve		
	8,000	January 1
	3,000	Year-End Adjustment
	<u>11,000</u>	December 31

The adjusting journal entry that follows records a credit of \$3,000 to the LIFO reserve account that is offset by a debit of \$3,000 to cost of goods sold. The LIFO effect is a decrease to pre-tax income of \$3,000.

Account	Year-End
Cost of Goods Sold	3,000
LIFO Reserve	3,000

The debit to the cost of goods sold increases that account to \$53,000, which reflects the use of the LIFO method (\$50,000 FIFO cost of goods sold + \$3,000 LIFO effect). The LIFO reserve reduces ending inventory to the proper LIFO valuation of \$119,000 (\$130,000 FIFO Inventory – \$11,000 LIFO reserve).

In the process of recording the LIFO reserve account adjustment, the company will also adjust the cost of goods sold account as shown in Example 10.10. The income statement adjustment in the LIFO reserve account is referred to as the **LIFO effect**, which is the change in the LIFO reserve account during the year and its impact on cost of goods sold.

LIFO Liquidations

As noted earlier, if costs are declining, using LIFO will result in lower cost of goods sold and thus higher net income when compared to FIFO. If inventory unit levels are decreasing and costs are increasing, then using LIFO may also result in higher net income than FIFO.

As a company uses LIFO over time, it builds **LIFO layers**, which are annual increases in the quantity of inventory. When inventory levels decline under the LIFO method and costs are increasing, the company sells older low-cost LIFO layers, reducing cost of goods sold and increasing book (and taxable) income. A decrease in inventory layers under the LIFO method is called a **LIFO liquidation** and is illustrated in Example 10.11. Recall that companies choose LIFO to lower their tax bills. Because of the possibility that a LIFO liquidation decreases cost of goods sold and increases taxable income, companies seek to avoid liquidating their LIFO layers.¹¹ For example, *Deere & Company*, the agriculture and construction equipment company, reported a favorable pre-tax income effect from the liquidation of LIFO inventory during 2016 and 2015 of approximately \$4 million and \$22 million, respectively. For *Deere*, the LIFO liquidations were less than a 1% increase in pre-tax income. Exhibit 10.7 presents the disclosure that *Caterpillar Inc.*, another leading manufacturer of construction and mining equipment, provided in its 2013 10-K related to a larger LIFO liquidation that resulted in an increase in net income of \$0.12 per share, or about 2.1%.

EXHIBIT 10.7 Excerpt from Inventory Disclosure, *Caterpillar Inc.*, Annual 10-K Report, December 31, 2013

During 2013 inventory quantities were reduced. This reduction resulted in a liquidation of LIFO inventory layers carried at lower costs prevailing in prior years as compared with current costs. In 2013, the effect of this reduction of inventory decreased cost of goods sold by approximately \$115 million and increased profit by approximately \$81 million or \$0.12 per share.

EXAMPLE 10.11 LIFO Liquidation

PROBLEM: Poppins Products provided you with the following information regarding its 2018 inventory and sales. The company uses a FIFO perpetual inventory management system for internal purposes and employs a LIFO perpetual system for external reporting and tax.

Data for 2018	FIFO		LIFO	
	Unit Cost × Units	Total Cost	Unit Cost × Units	Total Cost
Beginning inventory: January 1, 2018				
Layer from 2016	\$3 × 1,000	= \$3,000	\$1 × 3,000	\$ 3,000
Layer from 2017	\$5 × 3,000	= 15,000	\$3 × 1,000	3,000
Beginning inventory: January 1, 2018*	4,000	\$18,000	4,000	\$ 6,000
Purchases during 2018	\$6 × 1,000	= 6,000	\$6 × 1,000	6,000
Cost of goods available for sale	5,000	\$24,000	5,000	\$12,000
Units sold during 2018	(4,500)		(4,500)	
Ending inventory: December 31, 2018	500		500	

*The beginning LIFO reserve is \$12,000 (FIFO – LIFO = \$18,000 – \$6,000)

- What is Poppins' ending inventory on both a FIFO and a LIFO basis?
- What is the LIFO reserve balance at end of the year?

¹¹A LIFO liquidation will not always result in an increase to net income.

- c. What is the LIFO effect for the year? Typically, the LIFO effect decreases income. Is that the case here?
- d. What is the journal entry to record the LIFO effect?

SOLUTION: Ending inventory and cost of goods sold computed under the FIFO perpetual basis are as follows:

Description	Units	Unit Cost	Total Cost
FIFO Ending Inventory			
Most recent cost	<u>500</u>	\$6	<u>\$ 3,000</u>
FIFO Cost of Goods Sold			
Oldest cost	1,000	\$3	\$ 3,000
Next oldest cost	3,000	5	15,000
Next oldest cost	<u>500</u>	6	<u>3,000</u>
Totals	<u>4,500</u>		<u>\$21,000</u>

Under the LIFO perpetual method, Poppins Products has the following ending inventory and cost of goods sold.

Description	Units	Unit Cost	Total Cost
LIFO Ending Inventory			
Oldest cost	<u>500</u>	\$1	<u>\$ 500</u>
LIFO Cost of Goods Sold			
Most recent cost	1,000	\$6	\$ 6,000
Next most recent cost	1,000	3	3,000
Next most recent cost	<u>2,500</u>	1	<u>2,500</u>
Totals	<u>4,500</u>		<u>\$11,500</u>

The ending LIFO reserve is \$2,500, the difference between ending inventory on a LIFO and FIFO basis (\$3,000 – \$500). The beginning and ending LIFO reserve amounts and the year-end adjustment needed are as follows:

Ending LIFO reserve needed	\$ 2,500
Beginning balance	(12,000)
Adjustment required	<u>\$(9,500)</u>

LIFO Reserve	
January 1, 2018	12,000
Year-End Adjustment	<u>9,500</u>
December 31, 2018	<u>2,500</u>

A decrease in the LIFO reserve (the LIFO effect) will increase Poppins' inventory and reduce cost of sales. The journal entry to record the LIFO effect is a debit of \$9,500 to the LIFO reserve and a credit to the cost of goods sold:

Account	Year-End
LIFO Reserve	9,500
Cost of Goods Sold	9,500

Notice that the journal entry credits cost of goods sold, thus decreasing cost of goods sold and increasing net income. Because Poppins liquidated LIFO layers, its use of LIFO increased net income.

Dollar-Value LIFO

LIFO computations for each individual product can become extremely time consuming when a firm carries a significant number of different products and product lines. Imagine the work involved in computing LIFO layers for a department store with thousands of stock numbers and multiple product lines. When a company considers only one product at a time to compute a LIFO inventory valuation, the LIFO layers associated with it must all be liquidated if that product becomes obsolete.

Techniques to simplify the LIFO computation aggregate inventory items into groups called **pools** and perform the LIFO computations on the inventory pool as opposed to individual items. The most common technique is the **dollar-value LIFO method**, which pools inventory items and uses the dollar as the common unit of measure of the inventory. Because the unit of measure (the dollar) applies to all inventory items, firms can aggregate multiple items into a single LIFO pool. Dollar-value LIFO offers several advantages:

1. Firms account for dollars, not units. Dollars are a common unit of measure regardless of the specific inventory item. Therefore, an extremely diverse inventory can be made homogeneous by restating the physical units into dollars.
2. It avoids problems when there are changes in product mix. When a firm adds or deletes a product or product line, it simply replaces dollars with other dollars (both products are carried at the same common unit of measure).
3. It can minimize the likelihood of liquidation because the removal of one stock number is not going to liquidate an entire cost pool. Again, dollars are replaced by dollars and the units of measure are the same.

Dollar-Value LIFO Computation. The dollar-value LIFO approach involves computing the pool of inventory on the basis of the dollar, not in terms of units. Consequently, when comparing beginning inventory with ending inventory, the firm determines how much of the change is due to changes in price and how much is due to changes in quantity.¹² Computing the LIFO layers indicates the change in quantity.

There are six steps involved in reporting inventory using the dollar-value LIFO approach. To illustrate, consider Lookout, Inc., which has ending inventory in 2018 (computed under FIFO) of \$100,000 and ending inventory in 2019 (under FIFO) of \$120,000. The company first adopts dollar-value LIFO in 2018, which is the base year with a price index of 1.00. The relevant price index for 2019 is 1.15. That is, prices generally increased 15% from 2018 to 2019 for the type of products that Lookout buys and sells. Sometimes indices are expressed as, for example, 1.15 or as 115. Both of these imply a 15% price increase.¹³

The six steps are as follows:

1. **Determine the ending inventory stated in terms of base-year prices.** The **base year** is the first year that the company reports under dollar-value LIFO. In Lookout's case, this is 2018. To determine the ending inventory in terms of base-year prices, a company divides the ending inventory at year-end prices by the cumulative price index. That is, Lookout divides \$120,000 by the 1.15 index and computes the ending inventory at the base-year price to be \$104,348. Ending inventory for 2018 is already at base-year prices of \$100,000.
2. **Determine the increase (or decrease) in quantity at base-year prices.** Lookout's 2019 beginning inventory is at the base-year price of \$100,000 and ending inventory is at the base-year price of \$104,348. The difference measures the increase in quantity. Under dollar-value LIFO, the quantities in the pool are now measured in common units, dollars, and there is no need to track inventory (for LIFO purposes) in terms of physical units. The increase in quantity for Lookout is \$4,348 (\$104,348 less \$100,000) stated in base-year dollar terms.
3. **Determine the increase (or decrease) in quantity at current-year prices.** To determine the increase in quantity at current-year prices, a company takes the increase in the quantity stated in base-year dollars (in the case of Lookout, this was \$4,348) and prices it in terms of current

¹²We use the term *price* to represent the unit cost of inventory.

¹³Companies use indices such as the consumer price index (CPI) and various other industry-specific indices for these computations.

(end-of-year) prices by multiplying it by the cumulative price index. Therefore, Lookout multiplies the \$4,348 by the 1.15 index to determine an increase in quantity at current-year prices of \$5,000.

4. **Add all of the layers together to get the dollar-value LIFO ending inventory.** For Lookout, the layers are as follows:

Year	Layer
2018	\$100,000
2019	5,000
Ending inventory under dollar-value LIFO	<u>\$105,000</u>

The layers under dollar-value LIFO are the increase in quantity at current-year prices.

5. **Calculate the LIFO reserve.** The LIFO reserve is the difference between the inventory balance computed per the internal books and the LIFO inventory balance. In the case of Lookout, the LIFO reserve at the end of 2019 is \$15,000 (\$120,000 FIFO less \$105,000 dollar value LIFO).
6. **Record the journal entry to make the LIFO adjustment.** Because Lookout did not have a LIFO reserve at the end of the prior year, the entry will record the \$15,000 reserve as follows:

Account	2019 Year-End
Cost of Goods Sold	15,000
LIFO Reserve	15,000

The example of Lookout, Inc. was fairly simple because it involved only one year after the initial adoption of dollar-value LIFO. We now turn to a more complex example, again following the six steps. Example 10.12 provides a multi-year illustration of dollar-value LIFO.

EXAMPLE 10.12

Dollar-Value LIFO

PROBLEM: WJS, Inc. uses a perpetual FIFO-based inventory management system, but it reports externally using dollar-value LIFO. WJS reported the following price indices and FIFO inventory at year-end prices. For each year, provide the LIFO ending inventory, the LIFO reserve balance, and the year-end LIFO adjusting entry.

Year	Ending Inventory at Year-End Prices (FIFO)	Cumulative Price Index
2016	\$150,000	1.00
2017	250,000	1.20
2018	260,000	1.25
2019	210,000	1.26

SOLUTION: We will once again work through the six steps. We will work through all years for each step at once. In practice, you will do only one year at a time because you have information for only the current year.

1. **Determine the ending inventory stated in terms of base-year prices.** The base year, the first year that WJS reported under LIFO, is 2016. Note that the cumulative price index in the base year is always 1.00. The ending inventory in terms of base-year prices is the ending inventory at year-end prices divided by the cumulative price index as follows:

Year	Ending Inventory at Year-End Prices (FIFO)	Cumulative Price Index	Ending Inventory at Base-Year Price
2016	\$150,000	1.00	\$150,000
2017	250,000	1.20	208,333
2018	260,000	1.25	208,000
2019	210,000	1.26	166,667

Continued

2. **Determine the increase (or decrease) in quantity at base-year prices.** To determine the increase in quantity at base-year prices, we compute the change from year to year as follows:

Year	Ending Inventory at Year-End Prices	Cumulative Price Index	Ending Inventory at Base-Year Prices	Change in Quantity at Base-Year Prices	Increase in LIFO layers or Decrease of LIFO layers?
2016	\$150,000	1.00	\$150,000	\$0	
2017	250,000	1.20	208,333	\$58,333 = \$208,333 – \$150,000	Increase
2018	260,000	1.25	208,000	\$(333) = \$208,000 – \$208,333	Decrease
2019	210,000	1.26	166,667	\$(41,333) = \$166,667 – \$208,000	Decrease

Next, we will complete steps 3 through 6 together for each year.

3. **Determine the increase (or decrease) in quantity at current-year prices.**
4. **Add all of the layers together to get the dollar-value LIFO ending inventory.**
5. **Calculate the LIFO reserve.**
6. **Record the journal entry to make the LIFO adjustment.**

The increase in quantity at current-year prices is the increase in the quantity stated in dollars priced in terms of base-year prices multiplied by the cumulative price index. We summarize the FIFO inventory and LIFO inventory and compute the LIFO reserve as the difference.

Next, we build our LIFO layers one year at a time as follows:

2017: The 2017 layer is the increase in inventory at base-year prices \$(58,333) multiplied by the cumulative price index in 2017 (1.20), yielding a LIFO layer of \$70,000 for 2017. Again, keep in mind that under dollar-value LIFO, the LIFO layer is the increase in quantity stated at current (i.e., end-of-year) prices.

We add the layers together to determine the LIFO ending inventory of \$220,000.

	Base-Year Prices	Index	Current-Year Prices
2016 layer and ending balance	\$150,000	1.00	\$150,000
2017 layer	58,333	1.20	70,000
2017 ending balance	<u>\$208,333</u>		<u>\$220,000</u>

We now compute the LIFO reserve balance by summarizing the FIFO inventory and LIFO inventory as follows and computing the LIFO reserve as the difference:

Year (a)	Ending Inventory at Year-End Prices (FIFO) (b)	Ending Inventory at Dollar-Value LIFO (c)	LIFO Reserve Balance (Cumulative Balance Sheet Effect) (d) = (b) – (c)	Change in the LIFO Reserve (Specific LIFO Income Statement Effect) (e) = (d) – Prior (d)
2016	\$150,000	\$150,000	\$ 0	\$ 0
2017	250,000	220,000	30,000	30,000

WJS begins in 2017 with a zero balance in the LIFO reserve account. Thus, in order to have a \$30,000 credit balance in the LIFO reserve, it makes the following journal entry:

Account	2017 Year-End	
Cost of Goods Sold	30,000	
LIFO Reserve		30,000

2018: The computations for 2018 are complex because WJS decreased part of its 2017 layer. We know this because the change in ending inventory at base-year prices was negative (i.e., a decrease in inventory). Thus, WJS has to remove \$333 at base-year prices from its 2017 layer. It then recalculates the adjusted 2017 LIFO layer (at 2017 prices) as \$69,600. Because it liquidated part of a layer in 2018, it does not build a 2018 layer. Adding up the LIFO layers, WJS has \$219,600 in ending inventory under dollar-value LIFO for 2018.

	Base-Year Prices	Index	Current-Year Prices (at Dollar-Value LIFO)
2016 Beginning inventory	\$150,000	1.00	\$150,000
2017 layer	58,333	1.20	70,000
2018 layer liquidation	(333)	1.20	(400)
2017 adjusted layer	58,000	1.20	69,600
2018 ending inventory	<u>\$208,000</u>		<u>\$219,600</u>

Liquidating a layer *does not* result in a change to prior inventory balances, so the 2017 inventory of \$220,000 does not change. However, the liquidation of a prior layer is priced at the index for that year, meaning that a company liquidates LIFO layers in LIFO order.

We now compute the LIFO reserve balance by summarizing the FIFO inventory and LIFO inventory as follows and computing the LIFO reserve as the difference:

Year (a)	Ending Inventory at Year-End Prices (FIFO) (b)	Ending Inventory at Dollar-Value LIFO (c)	LIFO Reserve Balance (Cumulative Balance Sheet Effect) (d) = (b) – (c)	Change in the LIFO Reserve (Specific LIFO Income Statement Effect) (e) = (d) – Prior (d)
2016	\$150,000	\$150,000	\$ 0	\$ 0
2017	250,000	220,000	30,000	30,000
2018	260,000	219,600	40,400	10,400

We begin in 2018 with a credit balance of \$30,000 in the LIFO reserve account. Thus, in order to end up with a \$40,400 credit balance, WJS makes the following journal entry:

Account	2018 Year-End	
Cost of Goods Sold	10,400	
LIFO Reserve		10,400

2019: In 2019, there is a decrease in inventory at base-year prices of \$41,333, signaling a layer liquidation. Thus, WJS has to remove \$41,333 at base-year prices from the 2017 layer. It then recalculates the adjusted 2017 LIFO layer (at 2017 prices) as \$20,000. Because WJS liquidated a partial layer in 2018 and 2019, it has not built a 2018 or 2019

Continued

layer. Adding up the LIFO layers, there is \$170,000 in ending inventory under dollar-value LIFO for 2019.

	Base-Year Prices	Index	Current-Year Prices (at Dollar-Value LIFO)
2016 Beginning inventory	\$150,000	1.00	\$150,000
2017 layer	58,333	1.20	70,000
2018 layer liquidation	(333)	1.20	(400)
2017 adjusted layer	58,000		69,600
2019 layer liquidation	(41,333)	1.20	(49,600)
2017 adjusted layer	16,667	1.20	20,000
2019 ending inventory	<u>\$166,667</u>		<u>\$170,000</u>

We now compute the LIFO reserve balance by summarizing the FIFO inventory and LIFO inventory as follows and computing the LIFO reserve as the difference:

Year (a)	Ending Inventory at Year-End Prices (FIFO) (b)	Ending Inventory at Dollar-Value LIFO (c)	LIFO Reserve Balance (Cumulative Balance Sheet Effect) (d) = (b) – (c)	Change in the LIFO Reserve (Specific LIFO Income Statement Effect) (e) = (d) – Prior (d)
2016	\$150,000	\$150,000	\$ 0	\$ 0
2017	250,000	220,000	30,000	30,000
2018	260,000	219,600	40,400	10,400
2019	210,000	170,000	40,000	(400)

We begin in 2019 with a credit balance of \$40,400 in the LIFO reserve account. Thus, in order to report with a \$40,000 credit balance, WJS makes the following journal entry:

Account	2019 Year-End	
LIFO Reserve	400	
Cost of Goods Sold		400

In 2019, WJS had a significant decrease in inventory. Consequently, the LIFO effect in 2019 was an increase in income of \$400 as opposed to the more common decrease in income expected under LIFO.

JUDGMENTS IN ACCOUNTING

The LIFO Effect

Management determines the cost-flow assumption that the company uses in the financial statements. To allow comparability, firms generally do not change methods. Other than the tax effects, the choice of method does not impact cash flows. That is, whether a company uses LIFO or FIFO has no bearing on what its suppliers will charge it for the inventory nor what it will charge its customers when it sells the inventory. Choosing LIFO or FIFO is just an internal accounting decision. Yet, because each method results in different measurements of ending inventory on the balance sheet and cost of goods sold on the income statement, this decision can be quite critical. Management and financial statement users must have a thorough understanding of the impact of the different methods.

Consider the disclosure in Exhibit 10.8 included in the 10-K filed by **Deere & Company** for the year ended October 31, 2016.

EXHIBIT 10.8 Inventory Disclosure from *Deere & Company*, Annual Report, October 31, 2016**NOTE 15: Inventories**

Most inventories owned by Deere & Company and its U.S. equipment subsidiaries are valued at cost, on the “last-in, first-out” (LIFO) basis. Remaining inventories are generally valued at the lower of cost, on the “first-in, first-out” (FIFO) basis, or market. The value of gross inventories on the LIFO basis represented 61 percent and 66 percent of worldwide gross inventories at FIFO value at October 31, 2016 and 2015, respectively. The pretax favorable income effects from the liquidation of LIFO inventory during 2016 and 2015 were approximately \$4 million and \$22 million, respectively. If all inventories had been valued on a FIFO basis, estimated inventories by major classification at October 31 in millions of dollars would have been as follows:

	2016	2015
Raw materials and supplies	\$1,369	\$1,559
Work-in-process	453	450
Finished goods and parts	2,976	3,234
Total FIFO value	4,798	5,243
Less adjustment to LIFO value	1,457	1,426
Inventories	<u>\$3,341</u>	<u>\$3,817</u>

Source: Deere & Company. https://s2.q4cdn.com/329009547/files/doc_financials/annual_reports/2016/2016_John-Deere-Annual-Report.pdf

In its October 31, 2016, balance sheet, *Deere & Company* reported an inventory valuation of \$3,341 million on a LIFO basis. If it had reported under FIFO, inventory would have been \$4,798 million, which is a 44% increase. This substantial difference results solely because of a management decision. The LIFO effect of \$31 million for the 2016 year is the difference in the beginning and ending LIFO reserve balances, \$1,426 less \$1,457 (called the “adjustment to LIFO value” in the footnote).

Again, this large effect on income is due to management’s accounting choice of inventory cost-flow assumptions. It is not uncommon for there to be a significant impact on income related to this choice.

- 5 Explain the lower-of-cost-or-market rule.

The Lower-of-Cost-or-Market Rule

After a company has established its method for valuing inventory, it must monitor its inventory over time for business planning and financial reporting purposes to assess its future revenue-generating ability. The **lower-of-cost-or-market rule** requires that if a measure of the market value of inventory falls below its cost basis (as determined by an inventory allocation method), then the company must report inventory at the lower of its cost or market value. Specifically, when the market value of inventory falls below its cost, a company:

1. Reports the difference between the cost basis and the market-based measure as a loss on the income statement (indirect method) or an increase to cost of goods sold (direct method).
2. Carries the inventory at the lower amount on the balance sheet.

For example, technology companies often have short product life cycles that can lead to rapid obsolescence and price erosion. If a company builds its inventories during periods of anticipated growth and that growth does not materialize, the result may be excess or obsolete inventory. For example, *BlackBerry Limited*, the manufacturer of *BlackBerry* smartphones, had to write down inventory by about \$1.6 billion in fiscal 2013 when it experienced lower-than-anticipated future demand for certain products. In fiscal 2014 and 2015, BlackBerry recorded additional inventory write-downs of \$95 million and \$36 million, respectively.¹⁴

THE CONCEPTUAL FRAMEWORK CONNECTION

Lower of Cost or Market

The conceptual framework defines assets as probable future economic benefits obtained or controlled by a particular company as a result of past transactions or events. The portion of the definition requiring that an asset provide probable future economic benefits is critical to understanding the lower-of-cost-or-market rule. The most relevant inventory method better measures the future economic benefits. If the expected economic benefits are less than the amount that the firm is currently reporting in inventory, then the firm should reduce the amount on the balance sheet.

At times, measuring an asset's value at other than historical cost involves a trade-off between the two fundamental characteristics in the conceptual framework—namely, relevance and faithful representation. When a firm writes down an asset, it must determine a new carrying amount based upon its expectation of future economic benefits. For some assets (such as property, plant, and equipment), the measurement of future economic benefits can be quite subjective and thus not reliable. Fortunately, for most types of inventory, the assessment of a market value is highly reliable because most inventory items are frequently bought and sold in the marketplace.

Lower-of-Cost-or-Market Rule Method

Implementation of the lower-of-cost-or-market rule involves three steps:

1. Determine the market value of inventory.
2. Compare the market value measure to cost as determined using an inventory allocation method.
3. Record the write-down, if necessary.

We discuss each of these steps in turn.

Determination of Market Value. The method that firms use to determine market value depends on their inventory cost-flow assumption. Having two methods complicates the determination of market value and results in inconsistent measures of market value.

Cost-Flow Assumptions Other than LIFO or Retail Inventory. Firms determine market value at *net realizable value (NRV)* if they use a method other than LIFO or the retail inventory method (which we discuss later in the chapter). **Net realizable value (NRV)** is the item's selling price less the cost of disposal. Disposal costs include packaging, shipping, and commissions. Disposal costs are also referred to as the costs of completion and sale.

LIFO or Retail Inventory Cost-Flow Assumption. Firms that use LIFO or the retail inventory method to measure the cost of inventory measure the market value as the amount at which they could currently purchase or reproduce the inventory, known as the **current replacement cost (CRC)**.¹⁵ However, there are two boundaries on the use of CRC:

1. The CRC cannot exceed a **ceiling** equal to NRV. The ceiling prevents overvaluing inventory or using a value above the amount that the firm reasonably expects to realize in cash from the disposal of the item.
2. The CRC cannot fall below a **floor** value of **net realizable value less a normal profit margin (NRV – NP)**. The floor prevents undervaluation of inventory. For example, firms may undervalue inventory and report a large loss on their income statements if they are taking a *big bath*. A big bath occurs when a firm frontloads expenses and losses in one year so that it can look much better, comparatively, in future years. The NRV – NP valuation is the lowest measure of market value at which the firm can carry inventory on its balance sheet.

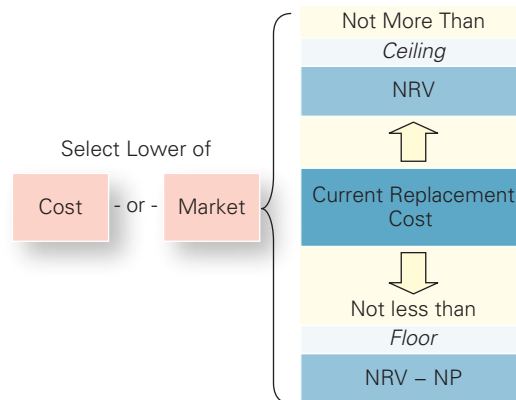

¹⁵The lower-of-cost-or-market test is excluded from the fair value measurement provisions of FASB ASC 820. As a result, fair value is not an exit price in the valuation of inventory.

These two boundaries lead us to the three scenarios for computing a measure of market value.

- Scenario 1: CRC lies between NRV and $\text{NRV} - \text{NP}$. Market is measured as CRC.
- Scenario 2: CRC lies above the ceiling, NRV. Market is measured as the NRV.
- Scenario 3: CRC lies below $\text{NRV} - \text{NP}$. Market is measured as the $\text{NRV} - \text{NP}$.

Exhibit 10.9 illustrates the lower-of-cost-or-market rule in valuing inventory.

EXHIBIT 10.9 Lower-of-Cost-or-Market; Inventory Valuation for LIFO or Retail Inventory Method

LIFO and retail method firms compare the NRV, CRC, and $\text{NRV} - \text{NP}$ for each item in inventory to determine that item's market value as illustrated in Example 10.13.

EXAMPLE 10.13

Determination of Market Value

PROBLEM: Jarrod Clothing Wholesalers, Inc. provided you with the following information regarding inventory as of December 31, 2018:

Item (a)	Cost (b)	Selling Price (c)	Dis- posal Costs (d)	Normal Profit Margin (e)	NRV (Ceiling) (f) = (c) - (d)	NRV - NP (Floor) (g) = (f) - (e)	CRC (h)
Shorts – men	\$10,000	\$36,000	\$16,000	\$8,000	\$20,000	\$12,000	\$15,000
Jeans – men	20,000	23,000	4,000	2,000	19,000	17,000	18,000
Shirts & blouses	5,000	6,000	3,000	1,000	3,000	2,000	4,000
Skirts	8,000	20,000	5,000	4,000	15,000	11,000	12,000
Jeans – women	15,000	43,000	31,000	1,000	12,000	11,000	9,000

1. Determine the market value that Jarrod will use in its lower-of-cost-or-market rule calculations for each inventory item assuming that Jarrod computes inventory cost using the FIFO method.
2. Determine the market value that Jarrod will use in its lower-of-cost-or-market rule calculations for each inventory item assuming that Jarrod computes inventory cost using the LIFO method.

SOLUTION: If Jarrod uses the FIFO method for computing inventory cost, then the market value of each item is simply equal to its NRV.

Item	Cost	NRV	Market Value
Shorts – men	\$10,000	\$20,000	\$20,000
Jeans – men	20,000	19,000	19,000
Shirts & blouses	5,000	3,000	3,000
Skirts	8,000	15,000	15,000
Jeans – women	15,000	12,000	12,000

Continued

If Jarrod uses LIFO for computing inventory cost, then the computations become more complex. The default market value is the CRC unless it is higher than the NRV ceiling or lower than the NRV – NP floor. The CRCs of the men’s shorts, men’s jeans, and skirts inventory items all fall between the NRV and NRV – NP, so Jarrod assigns the CRC as the market value for these items. The CRC for the shirts and blouses is above the NRV ceiling, so we use the NRV. The CRC for the women’s jeans is below the NRV – NP floor, so we use the NRV – NP. The far-right column of the following table shows the resulting market value from this analysis:

<u>Item</u>	<u>Cost</u>	<u>NRV</u>	<u>CRC</u>	<u>NRV – NP</u>	<u>Market Value</u>
Shorts – men	\$10,000	\$20,000	\$15,000	\$12,000	\$15,000
Jeans – men	20,000	19,000	18,000	17,000	18,000
Shirts & blouses	5,000	3,000	4,000	2,000	3,000
Skirts	8,000	15,000	12,000	11,000	12,000
Jeans – women	15,000	12,000	9,000	11,000	11,000

Comparing Cost to Market. After determining the market value of the inventory, firms must compare this amount to the cost basis of the inventory determined using an inventory allocation method. This comparison is done the same way, no matter what costing method a firm uses.

Firms can apply the lower-of-cost-or-market rule for inventory to the aggregate inventory, groups of inventory, or individual items in inventory. U.S. GAAP does not specify a preference among these three approaches except that a company should use the approach that best measures income. The individual-item approach is the most common in practice and the most conservative because it results in the largest write-down. Any grouping approach, called a group by group approach, will minimize the amount of the loss as higher market values of some items above cost will offset cases where market is lower than cost. Applying LCM to aggregate inventory, then, results in the lowest loss.

Companies must justify the grouping choice (for example, into product lines or total inventory) based on economic reality or marketing techniques used to distribute a company’s products. For example, assume a computer company adds a free printer with the purchase of every laptop computer. Does this mean that the printer has a zero market value and should be completely written off under the LCM rule? The logical approach is to combine the printer and the laptop computer as a single product group and compare the market value of the group to its combined cost. The marketing technique used by the entity typically determines the grouping of products for purposes of the LCM test. Other examples of logical product groups include printers and toner cartridges, razors and blades, and mechanical pencils and lead refills.

If the market value is below the cost basis, the write-down amount is the difference between the two amounts. Example 10.14 provides an illustration of accounting for inventory write-downs.

EXAMPLE 10.14

Computation of Inventory Write-Down

PROBLEM: Continuing with Jarrod Clothing Wholesalers from Example 10.13 and assuming that Jarrod determines inventory cost using the LIFO method, determine the necessary write-down under the assumption that Jarrod uses (1) an individual-item approach, (2) a group approach with men’s and women’s groups, and (3) an aggregate approach.

SOLUTION: Under an individual-item approach, Jarrod compares cost and market on an item-by-item basis as shown in the following table, leading to the lower-of-cost-or-market rule inventory valuation of \$50,000. Because the cost basis is \$58,000, Jarrod records an \$8,000 write-down.

Item	Cost	Market Value	Lower of Cost or Market
Shorts – men	\$10,000	\$15,000	\$10,000
Jeans – men	20,000	18,000	18,000
Shirts & blouses	5,000	3,000	3,000
Skirts	8,000	12,000	8,000
Jeans – women	<u>15,000</u>	11,000	<u>11,000</u>
TOTAL	<u>\$58,000</u>		<u>\$50,000</u>

Refer to the following table. Under the product-line approach, Jarrod first computes the cost and market values by group (men's and women's in this case) and then compares these numbers to arrive at the lower-of-cost-or-market rule inventory valuation of \$56,000. Because the cost basis is \$58,000, Jarrod records a write-down of \$2,000.

Item	Cost	Market Value	Group Cost	Group Market Value	Lower of Cost or Market
Shorts – men	\$10,000	\$15,000			
Jeans – men	<u>20,000</u>	<u>18,000</u>			
MEN'S TOTAL			\$30,000	\$33,000	\$30,000
Shirts & blouses	\$ 5,000	\$ 3,000			
Skirts	8,000	12,000			
Jeans – women	<u>15,000</u>	<u>11,000</u>			
WOMEN'S TOTAL			\$28,000	\$26,000	<u>\$26,000</u>
TOTAL	<u>\$58,000</u>				<u>\$56,000</u>

Under the aggregate approach shown in the following table, Jarrod computes total cost (\$58,000) and total market value (\$59,000) and compares the two. Because cost is lower than market, Jarrod does not need to make a lower-of-cost-or-market rule adjustment.

Item	Cost	Market Value	Lower of Cost or Market
Shorts – men	\$10,000	\$15,000	
Jeans – men	20,000	18,000	
Shirts & blouses	5,000	3,000	
Skirts	8,000	12,000	
Jeans – women	<u>15,000</u>	<u>11,000</u>	
TOTAL	<u>\$58,000</u>	<u>\$59,000</u>	<u>\$58,000</u>

Recording the Write-Down. Firms can use two methods to write down inventory to market if needed:

1. The **direct method** writes off the loss directly to the inventory account and records that loss in the cost of goods sold reported on the income statement.
2. The **indirect method** reports the loss as a separate line item on the income statement within income from continuing operations and reduces the inventory account by the use of an allowance account.¹⁶ Under the indirect method, when the firm increases the allowance, it reports a loss. When it decreases the allowance, the firm records income.

¹⁶The direct method is also known as the *cost of goods sold method*, and the indirect method is also known as the *loss method*.

If the write-down is significant, then the indirect method is preferred because it discloses the loss separately from the cost of goods that were actually sold. When a loss is disclosed as an individual line item on the income statement, the financial statement user can easily identify that the loss has taken place and determine its magnitude. The direct method includes the loss in cost of goods sold and therefore is not as transparent to the financial statement user. Recording a write-down is illustrated in Example 10.15.

EXAMPLE 10.15 Recording the Lower-of-Cost-or-Market Rule Write-Down

PROBLEM: Continuing with Example 10.14, assume that Jarrod uses the individual item approach for computing the necessary lower-of-cost-or-market rule adjustment and that Jarrod had a beginning allowance balance of zero.

- What is the journal entry to record the write-down under the direct method?
- What is the journal entry to record the write-down under the indirect method?

SOLUTION:

- Direct Method:** The direct method writes inventory down directly and records the loss in cost of goods sold. Thus, the entry to record the write-down from a cost basis of \$58,000 to the lower-of-cost-or-market rule basis of \$50,000 is as follows:

Account	December 31, 2018	
Cost of Goods Sold	8,000	
Inventory		8,000

- Indirect Method:** The indirect method records the loss on inventory write-down as a separate line item on the income statement and reduces inventory with an allowance account.

Account	December 31, 2018	
Loss on Inventory Write-Down	8,000	
Allowance to Reduce Inventory to Market		8,000

The indirect method can result in a loss amount that is misleading in subsequent years. Because the allowance account is a permanent account, the write-down (and thus the amount of the loss on the inventory write-down) is “forced” to arrive at the correct balance in the allowance account. Example 10.16 illustrates the use of the allowance account in subsequent years.

EXAMPLE 10.16 Recording the Lower-of-Cost-or-Market Rule Write-Down in Subsequent Years

PROBLEM: Continuing the Jarrod Clothing Wholesalers example, assume that in 2019, Jarrod sold all of its beginning inventory having a cost basis of \$58,000 and lower-of-cost-or-market rule basis of \$50,000. As of December 31, 2019, it had inventory with a cost basis of \$120,000. Jarrod computed a lower-of-cost-or-market rule valuation of \$108,000.

Using the direct method, what is the write-down journal entry and what is the impact on net income for 2019 and inventory valuation for inventory transactions during 2019? What value does Jarrod report for inventory on the balance sheet at December 31, 2019, under the direct method? Answer these same questions assuming that the indirect method is used.

SOLUTION: Under the direct method, Jarrod records the \$12,000 ($\$120,000 - \$108,000$) write-down directly to cost of goods sold and inventory.

Account	December 31, 2019	
Cost of Goods Sold	12,000	
Inventory		12,000

The total cost of goods sold will be \$62,000, which is the \$50,000 recorded throughout the year as Jarrod sold inventory with a cost basis of \$50,000 plus the \$12,000 write-down. Jarrod reported inventory on the balance sheet of \$108,000, which is the cost basis of \$120,000 less the lower-of-cost-or-market adjustment of \$12,000 made at year-end.

Impact on Balance Sheet:	
Inventory at cost	\$120,000
Write-Down to market	<u>(12,000)</u>
Inventory valuation on balance sheet	<u>\$108,000</u>

Impact on Income Statement:	
Cost of Goods Sold (from Sales)	\$50,000
Write-Down to Market	<u>12,000</u>
Total impact on cost of goods sold and income statement	<u>\$62,000</u>

Under the indirect method, Jarrod adjusts its inventory allowance account so that the ending balance is \$12,000. The beginning balance of the allowance account is \$8,000 and an allowance of \$12,000 is needed at the end of the year.

The computation of the year-end adjustment to the allowance account follows:

Ending allowance needed	\$12,000
Beginning balance	<u>(8,000)</u>
Adjustment required	<u>\$ 4,000</u>

The t-account for the allowance account is as follows:

	Allowance to Reduce Inventory to Market
January 1, 2019	8,000
Year-End Adjustment	<u>4,000</u>
December 31, 2019	<u>12,000</u>

Thus, Jarrod credits the allowance account for \$4,000 and charges the loss to a separate line item on the income statement as follows:

Account	December 31, 2019
Loss on Inventory Write-Down	4,000
Allowance to Reduce Inventory to Market	4,000

The value of inventory Jarrod reports on the balance sheet is the \$120,000 less the \$12,000 allowance balance, or \$108,000. Jarrod's beginning inventory at cost was \$58,000. All of the beginning inventory is sold, therefore the impact on the income statement is the \$58,000 reported in cost of goods sold plus the \$4,000 loss reported at year-end for a total of \$62,000. Jarrod's cost of goods sold does not change under the indirect method. Therefore, its gross profit is higher under the indirect method.

Impact on Balance Sheet	
Inventory at cost	\$120,000
Allowance to reduce inventory to market	<u>(12,000)</u>
Inventory valuation on balance sheet	<u>\$108,000</u>

Impact on Income Statement:	
Cost of goods sold (from sales)	\$ 58,000
Loss on inventory write-down	<u>4,000</u>
Total impact on income statement	<u>\$ 62,000</u>

As illustrated by Example 10.16, the direct and indirect methods have the same overall impact on the financial statements. However, the line-item placement of the inventory-related expenses and losses on the income statement differs for the two methods. If management prefers to reflect a higher gross profit ratio, it will use the indirect method.

Lower-of-Cost-or-Market Rule: IFRS

IFRS-reporting firms always measure the market value as net realizable value (NRV) under the lower-of-cost-or-market rule. NRV, the estimated selling price less the estimated costs of completion and sale, is the same value under IFRS and U.S. GAAP. Unlike U.S. GAAP, IFRS does not use a different approach to measure market, depending on the inventory costing method.

Determination of Market Value and Cost Comparison. IFRS-reporting firms determine whether a write-down is necessary by comparing the historical cost to the NRV.

Similar to U.S. GAAP, IFRS reporters typically determine the lower-of-cost-or-market value on an individual-item basis but may also use a group basis. It is generally not acceptable, however, to write inventories down based on aggregate inventory. Unlike U.S. GAAP, IFRS inventory write-downs can be reversed later if the value increases.

The various lower-of-cost-or-market tests can lead to differences in the amount of inventory and write-down under IFRS and U.S. GAAP, particularly when U.S. GAAP firms use the LIFO or retail inventory methods for inventory costing.

Reversal of Inventory Write-Downs. Firms can reverse an IFRS inventory write-down when there is clear evidence of an increase in net realizable value. For example, consider inventory that a firm wrote down because its selling price declined. If the inventory is still on hand when its selling price increases, the company will write up the inventory to its new net realizable value. The reversal will increase both inventory and reported income. The amount of the reversal is limited to the amount of the original write-down. We illustrate write-down reversals in Example 10.17.

EXAMPLE 10.17

Reversal of Inventory Write-Down under IFRS

PROBLEM: Zodeo Company, an IFRS reporter, installs swimming pools. At the end of 2018, it made a \$5,000 lower-of-cost-or-market adjustment on its inventory group of prefabricated swimming pools because of low demand and decreased selling prices. At the time, the NRV of the inventory group was \$45,000. This year, demand and prices have increased. The new NRV of the inventory group is \$48,000. What journal entry is required to record the reversal of the write-down on December 31, 2019?

SOLUTION: Zodeo will record a reversal of \$3,000 because the net realizable value of the inventory increased by \$3,000 (\$48,000 new NRV less \$45,000 prior NRV) and the increase in value falls within the write-up limitation of \$5,000 (the amount of the original write-down). Thus, Zodeo debits the allowance account and credits the recovery of inventory write-down account for \$3,000 as follows:

Account	December 31, 2019
Allowance to Reduce Inventory to Market	3,000
Recovery of Inventory Write-Down	3,000

JUDGMENTS IN ACCOUNTING

The Lower-of-Cost-or-Market Rule

There are several estimates involved in the lower-of-cost-or-market rule computations, although in many cases these judgments are less subjective than in other areas of financial reporting. In a survey of 175 companies, 22% reported making estimates and using significant judgment in reporting their inventory.¹⁷

Determining NRV, CRC, and the normal profit margin requires judgment. In certain scenarios, these measurements will be clear. For example, imagine a grocery store determining these values for a box of Cheerios. None of these measures should be difficult to determine: The sales price and replacement cost are readily available, and the store should have a long history related to the normal profit margin. However, in the case of a heavy equipment dealer, these values may be much more difficult to estimate for a piece of custom-made equipment.

Exhibit 10.10 presents a disclosure from *Clicks Group Limited*, a health- and beauty-focused retail and supply group. *Clicks Group* reported that it performs estimates and judgments related to the determination of the net realizable value of inventory that have a significant risk of resulting in material adjustment to the carrying amount of inventory.

EXHIBIT 10.10 Critical Accounting Estimates and Judgments Note Excerpt, *Clicks Group Limited*, Financial Statements, August 31, 2016

Significant Accounting Estimates and Judgments

Estimates and judgments that have a significant risk of causing a material adjustment to the carrying amounts of assets and liabilities within the next financial year are outlined below and disclosed in the relevant notes to the financial statements.

Allowance for Net Realizable Value of Inventories

The group evaluates its inventory to ensure that it is carried at the lower of cost or net realizable value. Provision is made against slow moving, obsolete, and damaged inventories. Damaged inventories are identified and written down through the inventory counting procedures conducted within each business. Allowance for slow moving and obsolete inventories is assessed by each business as part of its ongoing financial reporting. Obsolescence is assessed based on comparison of the level of inventory holding to the projected likely future sales using factors existing at the reporting date.

Source: Clicks Group Limited. http://www.clicksgroup.co.za/IRDownloads/IntegratedAnnualReport2016/Clicks_AFS_2016.pdf, page 15.

In applying the lower-of-cost-or-market rule adjustment, management exercises judgment in choosing an individual, product line, or aggregate basis to which the rule will be applied. In Example 10.14, the inventory valuation ranged from \$50,000 to \$58,000 solely because a different basis was used in applying the lower-of-cost-or-market rule.

Interview

BARBARA J. WIGHT
CHIEF FINANCIAL OFFICER
TAYLOR GUITARS »

Barbara J. Wight

Barbara Wight is Chief Financial Officer at Taylor Guitars, an industry-leading guitar manufacturer whose instruments are played by leading musicians worldwide. She directs all financial, information technology, and legal affairs on behalf of the company and oversees various aspects of operations management, multinational manufacturing, acquisitions, and international compliance.

- 1 What are the primary factors considered by management when selecting an inventory valuation method? Which method does Taylor use?

Taylor uses the FIFO methodology. GAAP does not require that our valuation methodology match the flow of our inventory; however, in our case, FIFO does closely approximate the actual physical flow of our goods. Our primary raw material is wood, and it must be aged and dried before we use it to build a guitar. Therefore, we are always using the oldest wood first.

In addition, our business is not as susceptible to inflation as other businesses might be. For example, the price of the wood we purchase is directly related to supply and demand at a given point in time, and the sales price of our finished guitars is relatively stable over time. Therefore, LIFO would not necessarily provide us a sustainable, consistent tax advantage.

Taylor's inventories (both finished goods and raw materials) are stated at standard cost, which is determined based on expected labor, overhead, and material costs and approximates the lower of actual cost (first-in, first-out) or market.

- 2 Why would a business use more than one inventory valuation method for its inventory?

Businesses may use more than one inventory valuation method if they have foreign operations because LIFO is not permitted under IFRS. So companies that use LIFO for U.S. operations would use FIFO for international units. Businesses might also apply different methodologies to different types of inventory or different business segments. For example, if a company's different business segments have different underlying raw

material market deliveries, it might want to use LIFO for materials subject to inflation and FIFO for materials whose pricing is stable or even in decline.

- 3 Describe the most common components included in the unit cost of inventory at Taylor.

Taylor states inventories at standard cost based on the expected raw material costs, labor, and overhead. Our primary raw material is wood.

At the beginning of each year, Taylor determines how many total labor hours it will need to build the forecasted number of guitars and allocates overhead (and labor) to each guitar based on the calculated overhead and labor rate. The overhead rate times the number of labor hours per guitar equals overhead applied to each guitar unit. Taylor drives production based on a hybrid model; we build to order and to a sales forecast of specific models to ensure that high-turnover models are in stock at all times.

- 4 What are the most significant judgments employed in the decision to write inventory down to market when applying the lower-of-cost-or-market rule?

The most significant judgments are the replacement cost, expected selling price, cost of completion and/or disposal, and normal profit. After appropriately calculating these items, we apply the lower-of-cost-or-market rule. Another area that requires judgment is the determination of whether to calculate the lower-of-cost-or-market rule based on total inventory in question, the inventory category, or on an item-by-item basis. The latter is the most conservative approach.

Each quarter Taylor reviews inventory for slow-moving or obsolete items to establish an excess and obsolete (E&O) inventory reserve balance. Finished goods are typically not reserved against and written off. If a guitar model is deemed to be subnormal, or if it is determined that a model needs to be reengineered to improve the quality to the customer, we write off these specifically identified models.

- 5 Does Taylor use estimated inventory techniques for financial reporting? Why or why not?

One estimated inventory technique is related to how we value our raw wood. It is not practical (and nearly impossible) to accurately and consistently measure raw wood when it is brought in directly from the forest. So, we have a standard process for estimating the value, which has been accepted by our auditing firm.

Discussion Questions

1. Discuss why LIFO is not permitted under IFRS.
2. Although Taylor Guitars makes limited use of estimating inventory, describe some of the reasons why a company may elect to estimate ending inventory and whether it may report estimated inventory on external financial statements.

- 6 Calculate inventory and cost of goods sold using the retail inventory method.

The Retail Inventory Method

In addition to the inventory allocation methods we have discussed, companies may use the *conventional retail inventory method* to determine the valuation of inventory reported on the balance sheet. The **conventional retail inventory method** approximates the cost of ending inventory balance by taking into consideration the requirement that firms report inventory at lower of cost or market based on the relationship between cost and selling price. Before we cover the conventional retail method, we will discuss the basic retail method and some retail method terminology.

Basic Retail Method

Large retail firms such as *Target* and *Walmart* cannot track the costs of each sale of inventory. Instead, these companies may use the basic retail method by maintaining information on:

- Beginning inventory and purchases in terms of cost to the company.
- Beginning inventory and purchases in terms of the sales price (retail values).
- Net sales at retail.

The basic retail method does not, however, track information on sales at cost. To estimate both ending inventory at cost and cost of goods sold, the company:

1. Computes its cost-to-retail ratio by dividing the goods available for sale at cost by the goods available for sale at retail.¹⁸
2. Applies this ratio to ending inventory at retail to obtain ending inventory at cost.
3. Subtracts the computed ending inventory at cost from the cost of goods available for sale to arrive at cost of goods sold.

Example 10.18 illustrates the basic retail method.

EXAMPLE 10.18

Basic Retail Method

PROBLEM: Boxer Sales Corporation provided the following information on its beginning inventory and purchases for the year:

	<u>Cost</u>	<u>Retail</u>
Beginning inventory	\$ 23,400	\$ 39,000
Purchases	106,400	156,000

In addition, it recorded sales (at retail) of \$160,000. What ending inventory and cost of goods sold will Boxer record under the basic retail method?

SOLUTION: Boxer Sales first computes its cost-to-retail ratio using the goods available for sale. The cost of goods available for sale is \$129,800, and the retail value of goods available for sale is \$195,000.

	<u>Cost</u>	<u>Retail</u>	<u>Cost-to-Retail Ratio</u>
Beginning inventory	\$ 23,400	\$ 39,000	
Purchases	106,400	156,000	
Goods available for sale	<u>\$129,800</u>	<u>\$195,000</u>	67%

Continued

¹⁸Variations in the composition of the cost-to-retail ratio will approximate different inventory methods. The retail method can produce results that approximate FIFO, LIFO, average-cost, and lower-of-cost-or-market methods. Our focus is on the conventional retail method (which approximates LCM). We discuss the LIFO retail inventory method in Appendix A.

The cost-to-retail ratio is 67% (\$129,800 divided by \$195,000). Because the company had retail sales of \$160,000, Boxer's ending inventory at retail is \$35,000. Applying the 67% cost-to-retail ratio, the ending inventory at cost is \$23,450 ($\$35,000 \times 67\%$). Subtracting the ending inventory at cost from the cost of goods available for sale leads to a cost of goods sold of \$106,350, as illustrated next.

	<u>Cost</u>	<u>Retail</u>
Beginning inventory	\$ 23,400	\$ 39,000
Purchases	<u>106,400</u>	<u>156,000</u>
Goods available for sale	\$129,800	\$195,000
Sales		<u>(160,000)</u>
Ending inventory – retail		\$ 35,000
Cost-to-retail ratio		<u>× 67%</u>
Ending inventory – cost	<u>23,450</u>	
Cost of goods sold	<u>\$106,350</u>	

In its 2016 annual report, *Foot Locker* explained that it uses the retail inventory method due to its practicality. *Foot Locker* groups its inventory into departments and determines cost by applying a cost-to-retail percentage across groupings of similar items, known as departments. The company then applies the cost-to-retail percentage to ending inventory at its retail value to determine the cost of ending inventory on a department basis.¹⁹

Retail Method Terminology

Retail selling prices typically fluctuate throughout the year. Therefore, companies must also account for *markups* and *markdowns* of selling price when implementing the retail method as shown in Example 10.19.

- An **initial markup** is the difference between the selling price that the company originally sells the product for and the cost of the product.
- An **additional markup** is the amount by which the firm increases the selling price above the original selling price.
- A **markdown** is the amount by which the firm decreases the original selling price.
- A **markup cancellation** is the amount by which the firm reduces an additional markup but not below the original selling price.
- A **markdown cancellation** is the amount by which the firm reduces a markdown and increases the selling price but not to exceed the original selling price.

EXAMPLE 10.19 Markup and Markdown Terminology

PROBLEM: Holiday Town, Inc. has one product in inventory with an original selling price of \$100. The product was initially selling so well that Holiday Town increased the selling price to \$110. However, the company carried excess inventory levels and needed to sell more units. To increase sales, Holiday Town decreased the selling price to \$108. Later it reduced the price to \$97. Finally, Holiday Town increased the selling price to \$98. Identify the additional markups, markdowns, markup cancellations, and markdown cancellations in these events.

¹⁹Source: <https://www.sec.gov/Archives/edgar/data/850209/000085020917000003/fl-20170128x10k.htm>

SOLUTION: The following table presents the prices changes and descriptions.

Selling Price	Increase (Decrease) in Selling Price	Description
\$100		Original selling price
110	\$10	Additional markup
108	(2)	Markup cancellation
97	(11)	\$8 markup cancellation
		\$3 markdown
98	1	Markdown cancellation

The first price change from \$100 to \$110 is a \$10 additional markup. When Holiday Town subsequently lowered the price to \$108, there was a markup cancellation of \$2. Subsequently, it reduced the price by \$11 from \$108 to \$97. Because Holiday Town initially had an additional markup of \$10 and has already “used up” \$2 of this, the first \$8 of the \$11 price reduction is a markup cancellation, but the remaining \$3 price reduction is a markdown. The final \$1 increase in price is a markdown cancellation.

The Conventional Retail Inventory Method

The basic retail method includes both net markups and net markdowns in the cost-to-retail ratio. The most common retail inventory method, the conventional retail inventory method (also referred to as the approximate LCM method) approximates the lower-of-cost-or-market rule by including net markups but not net markdowns in the cost-to-retail ratio. By including net markups but not net markdowns, the denominator of the cost-to-retail ratio increases, which reduces the ratio. The reduced cost-to-retail ratio results in a lower reported ending inventory. Under the conventional retail method illustrated in Example 10.20, firms deduct net markdowns directly from retail inventory as a write-down reflecting the inventory’s loss of utility.

EXAMPLE 10.20

The Conventional Retail Inventory Method

PROBLEM: The Boxer Sales Corporation provided the following data related to its inventory at the end of the current year:

Description	Cost	Retail
Beginning inventory	\$ 23,400	\$ 39,000
Purchases	106,400	156,000
Additional markups		13,000
Markup cancellations		4,000
Markdowns		15,600
Markdown cancellations		2,600
Sales		160,000

- What is Boxer Sales’ ending inventory and cost of goods sold under the conventional retail method?
- What is Boxer Sales’ ending inventory and cost of goods sold under the basic retail method?
- Which method provides the lower ending inventory value consistent with the lower-of-cost-or-market method?

Continued

SOLUTION:

- a. Under the conventional retail method, we include only markups (no markdowns) in Boxer Sales' cost-to-retail percentage to determine ending inventory and cost of goods sold. To arrive at the cost-to-retail ratio, we add beginning inventory, purchases, and markups in terms of both cost and retail and then compute the ratio. We subtract the retail markdowns to arrive at retail goods available for sale. We subtract the sales at retail from the retail value of goods available for sale to arrive at ending inventory at retail. We then apply the cost-to-retail ratio to get the ending inventory at lower of cost or market.

Description	Cost	Retail	Cost-to-Retail Ratio
Beginning inventory	\$ 23,400	\$ 39,000	
Purchases	106,400	156,000	
Net markups (\$13,000 – \$4,000)	0	9,000	
Subtotal	<u>\$129,800</u>	<u>\$204,000</u>	
Cost-to-retail ratio: \$129,800 / \$204,000			63.63%
Net markdowns (\$15,600 – \$2,600)	0	(13,000)	
Goods available for sale	\$129,800	\$191,000	
Less: Sales at retail		(160,000)	
Ending inventory at retail		<u>\$ 31,000</u>	
Ending inventory at lower of cost or market (\$31,000 × 63.63%)	<u>\$ 19,725</u>		
Cost of goods sold	<u>\$ 110,075</u>		

- b. Under the basic retail method, ending inventory and cost of goods sold are computed as follows.

Description	Cost	Retail	Cost-to-Retail Ratio
Beginning inventory	\$ 23,400	\$ 39,000	
Purchases	106,400	156,000	
Net markups (\$13,000 – \$4,000)	0	9,000	
Net markdowns (\$15,600 – \$2,600)	0	(13,000)	
Goods available for sale	\$129,800	\$191,000	
Cost-to-retail ratio: \$129,800 / \$191,000			67.96%
Less: Sales at retail		(160,000)	
Ending inventory at retail		<u>\$ 31,000</u>	
Ending inventory at cost (\$31,000 × 67.96%)	<u>\$ 21,068</u>		
Cost of goods sold	<u>\$108,732</u>		

- c. The conventional retail method results in an ending inventory that is less than the basic retail inventory method, thus approximating LCM.

- 7 Explain the gross profit method of estimating inventory.

Gross Profit Method of Estimating Inventory

The **gross profit method** provides an approximation of the ending inventory balance. Whereas companies perform a physical count of inventory at the end of each fiscal year, there may be circumstances under which a company needs to estimate ending inventory for other purposes, including:

- To determine the balances of ending inventory and cost of goods sold for interim periods without performing a physical inventory count.
- To determine the cost of inventory that has been lost, stolen, or destroyed.
- In auditors' testing of the overall reasonableness of inventory amounts reported by clients.
- For budgeting and forecasting purposes.

Applying the gross profit method involves the following steps:

1. Compute cost of goods available for sale from the inventory records.
2. Determine a historical gross profit percentage based on historical sales and cost of goods sold data. The gross profit percentage is computed as follows:

$$\text{Gross Profit Percentage} = (\text{Net Sales} - \text{Cost of Goods Sold}) / \text{Net sales} \quad (10.1)$$

3. Estimate cost of goods sold as follows:

$$\text{Estimated Cost of Goods Sold} = \text{Net Sales} \times (1 - \text{Gross Profit Percentage}) \quad (10.2)$$

4. Compute estimated ending inventory as follows:

$$\begin{aligned} \text{Estimated Ending Inventory} \\ = \text{Cost of Goods Available for Sale} - \text{Estimated Cost of Goods Sold} \end{aligned} \quad (10.3)$$

Example 10.21 provides an example of the gross profit method.

EXAMPLE 10.21

Gross Profit Method

PROBLEM: In the current year, Boyer Company experienced a major casualty loss due to the destruction of its warehouse and entire inventory by a hurricane. The company began the year with inventory of \$800,000. There were net purchases of \$4,000,000 and net sales of \$5,000,000 during the year prior to the casualty. The company's historical gross profit percentage has averaged 30% over the last 5 years. Estimate the inventory on hand on the date of the casualty.

SOLUTION: We first compute the cost of goods available for sale as follows:

Beginning inventory	\$ 800,000
Plus: Net purchases	<u>4,000,000</u>
Cost of goods available for sale	<u>\$4,800,000</u>

We know that the average gross profit percentage is 30%. We estimate the cost of goods sold as follows:

Net sales	\$5,000,000
× (1 - Gross profit percentage)	<u>70%</u>
Estimated cost of goods sold	<u>\$3,500,000</u>

We then estimate ending inventory as follows:

Cost of goods available for sale	\$4,800,000
Less: Estimated cost of goods sold	<u>3,500,000</u>
Estimated ending inventory	<u>\$1,300,000</u>

- 8 Detail required disclosures for inventory.

Inventory Disclosures

In the financial statement and footnotes, inventory disclosures include:

- Accounting policies, including the measurement basis upon which amounts are stated with costing methods such as FIFO or LIFO.
- Carrying amounts by type of inventory such as raw materials or finished goods.
- Any inventory financing arrangements.
- Carrying amount of inventories carried at less than cost and the amount of write-downs recognized as expense.
- The use of the LIFO costing method when applicable, including the LIFO reserve (or replacement cost of inventory used to compute the reserve) and effects of any LIFO liquidations.

Exhibit 10.11 illustrates inventory disclosures for *Foot Locker, Inc.* from its 2016 annual report. Note 1 indicates that *Foot Locker* uses both the LIFO and FIFO cost-flow methods. It uses LIFO primarily in the United States and FIFO outside the United States. The numeric details of inventory accounted for under LIFO and FIFO are included in Note 6. Because the LIFO value of inventory approximates its FIFO cost, *Foot Locker* does not report a LIFO reserve.

EXHIBIT 10.11 Inventory Disclosures, *Foot Locker, Inc.*, Financial Statements, January 28, 2017

From Financial Statement Notes:

NOTE 1: Summary of Significant Accounting Policies

Merchandise Inventories and Cost of Sales

Merchandise inventories for the Company's Athletic Stores are valued at the lower of cost or market using the retail inventory method. Cost for retail stores is determined on the last-in, first-out ("LIFO") basis for domestic inventories and on the first-in, first-out ("FIFO") basis for international inventories. Merchandise inventories of the Direct-to-Customers business are valued at the lower of cost or market using weighted-average cost, which approximates FIFO.

The retail inventory method is commonly used by retail companies to value inventories at cost and calculate gross margins due to its practicality. Under the retail inventory method, cost is determined by applying a cost-to-retail percentage across groupings of similar items, known as departments. The cost-to-retail percentage is applied to ending inventory at its current owned retail valuation to determine the cost of ending inventory on a department basis. The Company provides reserves based on current selling prices when the inventory has not been marked down to market. . . .

NOTE 5: Merchandise Inventories

	2016	2015
	(in millions)	
LIFO inventories	\$ 861	\$ 847
FIFO inventories	446	438
Total merchandise inventories	<u>\$1,307</u>	<u>\$1,285</u>

The value of the Company's LIFO inventories, as calculated on a LIFO basis, approximates their value as calculated on a FIFO basis.

Source: Foot Locker, Inc. January 28, 2017 Financial Statement. <https://www.sec.gov/Archives/edgar/data/850209/000085020917000003/fl-20170128x10k.htm>, pages 44 and 52.

Inventory Disclosures: IFRS. IFRS inventory disclosures are similar to those required under U.S. GAAP. Additionally, IFRS requires firms to report the amount of any LCM reversals.

FINANCIAL STATEMENT ANALYSIS

Conversion from LIFO to FIFO

A company's cost-flow assumption choice impacts the amounts of reported inventory, cost of goods sold, and net income. When costs are increasing and inventory unit levels are stable or increasing, a company will report:

- Higher inventory under FIFO than LIFO.
- Higher cost of goods sold under LIFO than FIFO.
- Lower net income under LIFO than FIFO.

For financial statement users, comparing companies that use different cost-flow assumptions can be difficult. By referencing a company's disclosure of its LIFO reserve, however, users can convert inventory and cost of goods sold (COGS) amounts to FIFO in order to make useful comparisons across companies. Specifically, financial statement users can convert the inventory valuation from LIFO to FIFO on the balance sheet. Similarly, firms can use the change in the LIFO reserve or the LIFO effect to convert the income statement cost of goods sold from LIFO to FIFO.

As previously discussed, the LIFO reserve is the difference between inventory valued under FIFO versus LIFO:

$$\text{LIFO Reserve} = \text{FIFO Inventory Balance} - \text{LIFO Inventory Balance} \quad (10.4)$$

The change in the LIFO reserve, referred to as the *LIFO effect*, is the impact on cost of goods sold. An increase (credit) in the LIFO reserve results in a debit (increase) to COGS whereas a decrease (debit) in the LIFO reserve results in a credit (decrease) to COGS.

$$\text{Change in LIFO Reserve} = \text{Ending LIFO Reserve} - \text{Beginning LIFO Reserve} \quad (10.5)$$

If the LIFO reserve increases during the year, COGS will be higher under LIFO than FIFO. The adjustment to increase the LIFO reserve is a credit whereas COGS is debited. An increasing LIFO reserve leads to higher COGS and lower income and taxes.

If the LIFO reserve decreases during the year, COGS will be lower under LIFO than FIFO. The adjustment to decrease the LIFO reserve requires a debit to the reserve account and a credit to COGS. A decreasing LIFO reserve will result in lower COGS and higher income and taxes. The following t-account illustrates the described adjustments to the LIFO reserve.

LIFO Reserve	
	Beginning balance
Debit adjustment decreases COGS	Credit adjustment increases COGS
	Ending balance

When the LIFO reserve is increasing, the change in the LIFO reserve multiplied by the company's tax rate estimates the amount of taxes saved during the year by using LIFO. The cumulative balance of the LIFO reserve multiplied by the tax rate estimates the amount of taxes the company has saved over time by using LIFO.

$$\text{Taxes Saved} = \text{LIFO Reserve} \times \text{Tax Rate} \quad (10.6)$$

The discussion of the cash operating cycle introduced the inventory turnover ratio and days inventory on hand. Example 10.22 examines the effect of a company's choice of a cost-flow assumption on financial statement analysis indicators.

EXAMPLE 10.22 LIFO to FIFO Conversion²⁰

PROBLEM: *Hershey Company* reported the information in Exhibit 10.12 about inventory in its 2016 financial statements and footnotes. Hershey uses LIFO for the majority of its U.S. inventories. During 2016, its cost of goods sold was \$4,282,290, and its net sales were \$7,440,181. Use this information to answer the following questions:

- What is the value of *Hershey's* ending inventory at December 31, 2016, under LIFO? Determine the LIFO reserve balance at the end of 2016 and 2015.
- If *Hershey* used the FIFO cost-flow assumption to account for its entire inventory, what would the inventory balance be at December 31, 2016, and December 31, 2015?
- What would *Hershey's* cost of goods sold under FIFO have been in 2016?
- Would *Hershey's* gross profit, taxes, and net income in 2016 have been higher or lower under FIFO?
- If *Hershey's* tax rate is 35%, how much has the use of LIFO saved it in taxes paid over time?
- Compare *Hershey's* gross profit percentage, inventory turnover ratio, and days in inventory on hand under LIFO versus FIFO in 2016.

EXHIBIT 10.12 Inventory Disclosure, *The Hershey Company*, Financial Statements, December 31, 2016

Excerpt from Note 16

NOTE 16: Supplemental Balance Sheet Information

Inventories

The components of certain Consolidated Balance Sheet accounts are as follows:

December 31,	2016	2015
In thousands of dollars		
Raw materials	\$315,239	\$353,451
Goods in process	88,490	67,745
Finished goods	<u>528,587</u>	<u>534,983</u>
Inventories at FIFO	932,316	956,179
Adjustment to LIFO	<u>(186,638)</u>	<u>(205,209)</u>
Total inventories	<u>\$745,678</u>	<u>\$750,970</u>

Source: Securities and Exchange Commission. <http://phx.corporate-ir.net/phoenix.zhtml?c=115590&p=irol-sec>, page 91.

SOLUTION:

- Note 16 indicates that *Hershey* uses LIFO for a significant portion of its inventory. Its inventory is \$745,678 and \$750,970 under LIFO at the end of 2016 and 2015, respectively.

The LIFO reserve, called the Adjustment to LIFO in Exhibit 10.12, at the end of 2016 and 2015 is \$186,638 and \$205,209, respectively.

²⁰All numbers used in this illustration are in thousands.

Financial Statement Analysis, continued

- b. The amount of inventory before the LIFO reserve is the FIFO inventory of \$932,316 and \$956,179 at the end of 2016 and 2015, respectively.
- c. The difference in cost of goods sold under LIFO and FIFO for 2016 is \$18,571, computed as follows:

(In Thousands)	
Ending LIFO reserve needed	\$(186,638)
Beginning balance	<u>(205,209)</u>
Decrease in LIFO reserve	<u>\$ (18,571)</u>

This adjustment will result in a debit or reduction in the LIFO reserve account and lower cost of goods sold under LIFO as compared to the FIFO method.

LIFO Reserve	
January 1	205,209
Year-End Adjustment	18,571
December 31	<u>186,638</u>

This decrease in the LIFO reserve of \$18,571 corresponds to an increase in cost of goods sold of \$18,571 under FIFO versus LIFO.

(In Thousands)	
LIFO cost of goods sold	\$4,282,290 ← from income statement
Add: Decrease in LIFO reserve	<u>18,571</u>
FIFO cost of goods sold	<u>\$4,300,861</u>

- d. FIFO cost of goods sold (\$4,300,861) is higher than LIFO cost of goods sold (\$4,282,290), indicating gross profit, taxes, and net income would have been lower under FIFO than LIFO.
- e. Even though *Hershey's* net income and taxes would be higher in fiscal 2016 under LIFO, over time, Hershey's has saved approximately \$65,323 in taxes by using LIFO through the end of 2016.

$$\begin{aligned} \text{Taxes Saved} &= \text{LIFO Reserve} \times \text{Tax Rate} \\ \$65,323 &= \$186,638 \times 35\% \end{aligned} \quad (10.6)$$

- f. Under LIFO and FIFO, the gross profit and gross profit percentage are as follows:

(In Thousands)	LIFO	FIFO
Net sales	\$7,440,181	\$ 7,440,181
Cost of sales	<u>4,282,290</u>	<u>4,300,861</u>
Gross profit	<u>\$3,157,891</u>	<u>\$3,139,320</u>
Gross profit percentage	<u>42.4%</u>	<u>42.2%</u>

Under FIFO, the gross profit and gross profit percentage are lower as expected given the decrease in the LIFO reserve.

Under LIFO, *Hershey's* inventory turnover would be 5.72, which is higher than the 4.55 under FIFO. The average inventory under LIFO is much lower than the average inventory

Continued

Financial Statement Analysis, continued

under FIFO, resulting in a higher inventory turnover ratio under LIFO than FIFO. The number of days inventory on hand under LIFO would be only 63.8, compared to 80.2 under FIFO.

Ratio	LIFO	FIFO
Inventory Turnover Ratio = $\frac{\text{Cost of Goods Sold}}{\text{Average Inventory}}$	5.72 = $\frac{\$4,282,290}{\$748,324}$	4.55 = $\frac{\$4,300,861}{\$944,248}$
Average Inventory = $\frac{\text{Beginning Inventory} + \text{Ending Inventory}}{2}$	\$748,324 = $\frac{(\$750,970 + \$745,678)}{2}$	\$944,248 = $\frac{(\$956,179 + \$932,316)}{2}$
Days Inventory on Hand = $\frac{365}{\text{Inventory Turnover Ratio}}$	63.8 = $\frac{365}{5.72}$	80.2 = $\frac{365}{4.55}$

Summary by Learning Objectives

In the following, we summarize the main points by learning objective. Throughout the chapter, we discuss the accounting and reporting of U.S. GAAP and IFRS side-by-side. The following table also highlights the major similarities and differences in the standards.

1 Describe the types of inventory and demonstrate accounting under periodic and perpetual inventory systems.	
Summary	Similarities and Differences between U.S. GAAP and IFRS
<p>Merchandise inventory and manufacturing inventory are the two types of inventory. Manufacturing inventory includes:</p> <ol style="list-style-type: none"> 1. Raw materials 2. Work-in-process 3. Finished goods <p>There are two types of inventory systems:</p> <ol style="list-style-type: none"> 1. Periodic: The ending inventory balance and cost of goods sold are determined at the end of each accounting period. 2. Perpetual: Inventory accounts are continually updated for purchases. The cost of goods sold is recorded after each sale. 	<p>Similar under U.S. GAAP and IFRS.</p>

*Summary by Learning Objectives, continued***2** Discuss inventory costing, including accounting for goods in transit, consigned goods, costs included in inventory, and purchase discounts.

Summary	Similarities and Differences between U.S. GAAP and IFRS
<p>Goods in transit are items that have left the seller's place of business but have not yet been received by the buyer.</p> <p>F.o.b. (free on board) shipping point means that title passes to the buyer when the goods are shipped. The seller does not include these goods in inventory after shipment.</p> <p>F.o.b. destination means that title passes to the buyer when the goods are received. The goods remain in the seller's inventory until they arrive at the buyer's destination.</p> <p>A consignment arrangement occurs when one party (the consignee) agrees to sell a product for another party (the consignor) without taking ownership of the merchandise.</p> <p>Freight-in transportation costs are incurred in order to bring the inventory to the appropriate location and are included in the cost of inventory. Freight-out costs consist of transportation costs incurred to move the inventory to the buyer. Freight-out costs are expensed as incurred.</p> <p>Purchase discounts are reductions that companies receive from sellers if they pay for purchases within a certain time period. There are two methods to account for a purchase discount:</p> <ol style="list-style-type: none"> 1. Gross method: The company initially records the inventory and accounts payable at the full (gross) purchase amount. 2. Net method: The company assumes that it will take the discount and initially records the accounts payable and inventory at the net amount. 	<p>Similar under U.S. GAAP and IFRS.</p>

3 Explain the need for inventory cost-flow assumptions and calculate inventory and cost of goods sold under four inventory allocation methods: specific identification; moving average; last-in, first-out (LIFO); and first-in, first-out (FIFO).

Summary	Similarities and Differences between U.S. GAAP and IFRS
<p>Cost-flow assumptions are needed because inventory costs are tracked separately from the physical flow of inventory.</p> <p>There are four common inventory allocation methods:</p> <ol style="list-style-type: none"> 1. Specific identification method: The company identifies each unit and keeps track of the cost of each one. 2. Moving-average method: The company determines an average cost for the units on hand and applies that average unit cost to the next sale to determine the cost of goods sold. 3. First-in, first-out (FIFO) method: The company assigns the most recent inventory costs to ending inventory and the oldest costs to cost of goods sold. 4. Last-in, first-out (LIFO) method: The company assigns the oldest inventory costs to ending inventory and the most recent costs to cost of goods sold. 	<p>► Similar under U.S. GAAP and IFRS except that IFRS does not allow the use of the LIFO method.</p>

*Summary by Learning Objectives, continued***4** Demonstrate an understanding of and illustrate the accounting for the LIFO reserve, the LIFO effect, and LIFO liquidations. Compute inventory and cost of goods sold using the dollar-value LIFO method.

Summary	Similarities and Differences between U.S. GAAP and IFRS
<p>The LIFO reserve account is the difference between the inventory balance measured using FIFO and LIFO. The LIFO effect is the change in the LIFO reserve account during the year and is the impact on cost of goods sold.</p> <p>As a company uses LIFO over time, it builds LIFO layers, which are increases in the quantity of inventory. When inventory levels decline under the LIFO method and costs are increasing, the company sells the older low-cost LIFO layers, reducing cost of goods sold and increasing book (and taxable) income. A LIFO liquidation is a decrease in inventory layers under the LIFO method.</p> <p>Under the dollar-value LIFO method, firms pool inventory items and the common unit of measure of the inventory is the dollar.</p> <p>The six steps in dollar-value LIFO accounting are to:</p> <ol style="list-style-type: none"> 1. Determine the ending inventory stated in terms of base-year prices 2. Determine the increase (or decrease) in quantity at base-year prices 3. Determine the increase (or decrease) in quantity at current-year prices 4. Add all of the layers together to find the dollar-value LIFO ending inventory 5. Calculate the LIFO reserve 6. Record the journal entry to make the LIFO adjustments 	<p>► Not applicable to IFRS because IFRS does not allow the use of the LIFO method.</p>

5 Explain the lower-of-cost-or-market rule.

Summary	Similarities and Differences between U.S. GAAP and IFRS
<p>Under U.S. GAAP, the measurement of the market value depends on what method is used for inventory costing. If the costing method is anything other than LIFO or the retail inventory method, market is measured at the net realizable value (NRV).</p> <p>If the costing method is LIFO or the retail inventory method, market is measured as the amount at which the inventory could currently be purchased or reproduced, known as the current replacement cost (CRC).</p> <p>The CRC cannot exceed a ceiling that is equal to NRV. NRV is the item's selling price less the cost of disposal.</p> <p>CRC cannot fall below a floor value and net realizable value less a normal profit margin (NRV – NP).</p> <p>To calculate a write-down:</p> <ol style="list-style-type: none"> 1. Determine the market value of the inventory 2. Compare the market value to cost 3. Record the write-down if market value is less than cost 	<p>► Under IFRS, the market value in the lower-of-cost-or-market rule is always measured as net realizable value (NRV). Under IFRS, reversals of write-downs are permitted up to the original cost.</p>

Summary by Learning Objectives, continued

6 Calculate inventory and cost of goods sold using the retail inventory method.	
Summary	Similarities and Differences between U.S. GAAP and IFRS
<p>The conventional retail inventory method is an allowed approximation of ending inventory that takes into consideration the requirement that inventory be reported at the lower of cost or market.</p> <ul style="list-style-type: none"> • An initial markup is the difference between the selling price at which the company originally sells the product and the cost paid for the product. • An additional markup is any amount by which the company increases the selling price above the original selling price. • A markdown is the amount by which the company decreases the original selling price. • A markup cancellation is the amount by which a company reduces an additional markup but not below the original selling price. • A markdown cancellation is the amount by which a company reduces a markdown and increases the selling price but not to exceed the original selling price. <p>The conventional retail method approximates the lower-of-cost-or-market rule by including net markups but not markdowns in the cost-to-retail ratio. Net markdowns are deducted from the retail inventory as a write-down reflecting the inventory's loss of utility. Not deducting the net markdowns from the denominator of the cost-to-retail ratio lowers the ratio compared to the presence of markdowns in the calculation, resulting in a lower reported ending inventory.</p>	<p>Similar under U.S. GAAP and IFRS.</p>
7 Explain the gross profit method of estimating inventory.	
Summary	Similarities and Differences between U.S. GAAP and IFRS
<p>The gross profit method estimates ending inventory as cost of goods available for sale less estimated cost of goods sold. Estimated cost of goods sold is based on sales to date multiplied by 1 minus the estimated gross profit percentage.</p>	<p>Similar under U.S. GAAP and IFRS.</p>
8 Detail required disclosures for inventory.	
Summary	Similarities and Differences between U.S. GAAP and IFRS
<p>Required inventory disclosures include:</p> <ul style="list-style-type: none"> • Accounting policies, including the company's inventory costing method and measurement basis • Carrying amounts by type • Inventory financing arrangements • Carrying amount of inventories carried at an amount less than cost and the amount of write-downs recognized as expense • The use of the LIFO costing method when applicable, including the LIFO reserve (or replacement cost of inventory used to compute the reserve) and effects of any LIFO liquidations 	<p>► Similar under U.S. GAAP and IFRS except that IFRS requires firms to report the amount of write-down reversals. Reversals of write-downs are not allowed under U.S. GAAP.</p>

MyLab Accounting

Go to <http://www.pearson.com/mylab/accounting> for the following Questions, Multiple-Choice Questions, Brief Exercises, Exercises, and Problems. They are available with immediate grading, explanations of correct and incorrect answers, and interactive media that acts as your own online tutor.

10 Short-Term Operating Assets—Inventory

Questions

- ① Q10-1. How is inventory tracked under a perpetual inventory system?
- ① Q10-2. What is the difference between merchandise inventory and manufacturing inventory?
- ② Q10-3. What costs should be included in the unit cost of an item of inventory?
- ③ Q10-4. When does the inventory allocation problem arise?
- ③ Q10-5. Explain the difference between the FIFO method of inventory valuation and the LIFO method. Which of these methods best approximates the physical flow of units for most companies? Explain.
- ③ Q10-6. Which method of inventory results in an inventory valuation that reflects current costs and provides the best matching of costs with revenues? Explain.
- ③ ④ Q10-7. If unit costs are rising and inventory levels are constant or increasing, which method of inventory valuation will result in the lowest net income? Why?
- ④ Q10-8. How can financial statements be converted from the LIFO basis to the FIFO basis of inventory valuation and vice versa?
- ④ Q10-9. Explain the unit of measure under the dollar-value LIFO method of inventory valuation.
- ⑤ Q10-10. What do firms use as the market value when applying the lower-of-cost-or-market (LCM) rule? Are there any limits on the use of this value? Explain.
- ⑤ Q10-11. Do **U.S. GAAP** and **IFRS** treat inventory write-downs the same way? Explain.
- ⑤ Q10-12. Under **IFRS**, how do firms determine lower-of-cost-or-market rule adjustments?
- ⑥ Q10-13. How does the conventional retail method approximate the lower-of-cost-or-market valuation? What is the impact on ending inventory?
- ⑦ Q10-14. Why would a company use the gross profit method to estimate ending inventory?
- ⑧ Q10-15. How are required LIFO disclosures used to compute inventory balances and cost of goods sold under the FIFO cost flow?
- Ⓐ Q10-16. How does a company build LIFO layers under the LIFO retail inventory method?

Multiple-Choice Questions

Becker CPA Exam Review multiple-choice questions are available in **MyLab Accounting**.

- ④ MC10-1. Giddens Company adopted the dollar-value LIFO inventory method on December 31, Year 1. On December 31, Year 1, Giddens' inventory was in a single inventory pool and was valued at \$400,000 under the dollar-value LIFO method. Inventory data for Year 2 are as follows:

12/31 Year 2 inventory at year-end prices	\$550,000
Price index at 12/31 Year 2 (base year Year 1)	110

Giddens' inventory at dollar-value LIFO at December 31, Year 2 is:

- a. \$440,000 b. \$510,000 c. \$500,000 d. \$550,000

- 3 **MC10-2.** The Loyd Company had 150 units of product Omega on hand at December 1, Year 1, costing \$400 each. Purchases of product Omega during December were as follows:

Date	Units	Unit Cost
December 7	100	\$440
December 14	200	\$460
December 29	300	\$500

Sales during December were 500 units on December 30. Assume that a perpetual inventory system is used. The cost of inventory at December 31, Year 1, under the LIFO method would be:

- a. \$100,000 b. \$104,000 c. \$75,000 d. \$125,000
- 5 **MC10-3.** Simmons, Inc. uses the lower-of-cost-or-market method to value its inventory that is accounted for using the LIFO method. Data regarding an item in its inventory is as follows:

Cost	\$26
Replacement cost	20
Selling price	30
Cost of completion and disposal	2
Normal profit margin	7

What is the lower of cost or market for this item?

- a. \$21 b. \$20 c. \$28 d. \$26
- 5 **MC10-4.** Simmons, Inc. uses the lower-of-cost-or-market method to value its inventory that is accounted for using the FIFO method. Data regarding an item in its inventory is as follows:

Cost	\$26
Replacement cost	20
Selling price	30
Cost of completion and disposal	2
Normal profit margin	7

What is the lower-of-cost-or-market method for this item?

- a. \$18 b. \$26 c. \$28 d. \$30
- 3 **MC10-5.** The Loyd Company had 150 units of product Omega on hand at December 1, Year 1, costing \$400 each. Purchases of product Omega during December were as follows:

Date	Units	Unit Cost
December 7	100	\$440
December 14	200	460
December 29	300	500

Sales during December were 500 units on December 30. Assume that a perpetual inventory system is used. The cost of inventory at December 31, Year 1, under the FIFO method would be closest to:

- a. \$100,000 b. \$104,000 c. \$115,000 d. \$125,000
- 3 **MC10-6.** The Loyd Company had 150 units of product Omega on hand at December 1, Year 1, costing \$400 each. Purchases of product Omega during December were as follows:

Date	Units	Unit Cost
December 7	100	\$440
December 14	200	460
December 29	300	500

Sales during December were 500 units on December 30. Assume that a perpetual inventory system is used. Round per unit costs to two decimal places. The cost of inventory at December 31, Year 1, under the moving-average method would be closest to:

- a. \$100,000 b. \$104,000 c. \$115,000 d. \$125,000

- 6 MC10-7.** On March 1, Year 1, LuxWear Inc. had beginning inventory and purchases at cost of \$50,000 and \$20,000, respectively. The beginning inventory and purchases had a retail value of \$75,000 and \$30,000, respectively. The company had sales of \$60,000, as well as markups of \$6,000 and markdowns of \$10,000. What would LuxWear report as the lower of cost or market for its ending inventory on March 31, Year 1, using the conventional (LCM) retail method? (Round the cost-to-retail ratio to two decimal places.)
- a. \$25,830 b. \$27,470 c. \$28,290 d. \$41,000

Brief Exercises

- 1 BE10-1. Types of Manufacturing Inventory.** Complete the following inventory disclosure:
At the end of 2019 and 2018, inventories were composed of:

	2019	2018
Raw materials and supplies	\$2,206	\$ b.
Goods in process	a.	2,320
Finished goods	<u>3,566</u>	<u>3,490</u>
Total inventories	<u>\$8,537</u>	<u>\$7,883</u>

- 1 BE10-2. Periodic Inventory System.** Emmy Company uses a periodic inventory system. On December 31, 2018, Emmy counts its inventory and determines that it has \$72,000 of inventory on hand. On December 31, 2017, inventory was \$106,000. Emmy made inventory purchases totaling \$78,000 during the year. What is Emmy's cost of goods sold in 2018?
- 2 BE10-3. Purchase Discounts Using the Gross Method.** On October 16, Sueco Retailers bought 80 parkas on account at \$75 each. Terms of the purchase were 2/10, n/30. It paid for 60 parkas on October 25 and paid for the remaining 20 parkas on November 15. If Sueco uses the gross method to account for its inventory purchases, what is its cash payment and reduction of inventory on October 25? What is the amount of accounts payable after the October 25 payment? Assume that the perpetual inventory system is used.
- 2 BE10-4. Purchase Discounts Using the Net Method.** Use the same information for BE10-3 but assume that Sueco Retailers uses the net method to account for its inventory purchases. What is its cash payment and reduction of inventory on October 25? What is the amount of accounts payable after the October 25 payment? Assume that the perpetual inventory system is used.
- 3 BE10-5. FIFO, Perpetual Basis.** Spider Incorporated provided the following information regarding its inventory for the current year.

Transaction	Units	Sales in Units	Unit Cost	Total Cost
Beginning inventory 1/1	3,500		\$50	\$ 175,000
Purchases				
March 30	5,000		65	325,000
July 15	<u>1,000</u>		72	<u>72,000</u>
September 1		6,100		
Total available for sale	9,500			<u>\$572,000</u>
Units sold September 1	<u>(6,100)</u>			
Ending inventory	<u>3,400</u>			

Determine Spider's ending inventory and cost of goods sold under the FIFO perpetual basis.

- 3 BE10-6. LIFO, Perpetual Basis.** Using the information provided in BE10-5, assume that Spider uses the LIFO method. Determine Spider's ending inventory and cost of goods sold under the LIFO perpetual basis.
- 3 BE10-7. Moving-Average Method, Perpetual Basis.** Perry Manufacturing Company provided the following information regarding its inventory transactions for the current year.

Transaction	Units	Sales in Units	Unit Cost	Total Cost
Beginning inventory 1/1	8,000		\$16	\$128,000
Purchases and Sales				
February 8	4,000		21	84,000
June 24	1,800		23	41,400
Subtotal	13,800			\$253,400
September 18		5,500		
December 24	3,000		26	78,000
Total available for sale	16,800			\$331,400
Units sold September 18	(5,500)			
Ending inventory	11,300			

Determine the ending inventory and cost of goods sold that Perry should report assuming that the firm uses the moving-average cost method (perpetual basis). Round per unit cost to two decimal places.

4 8

BE10-8. LIFO Reserve. Best Stores is considering a change in its inventory valuation method. The company currently uses the FIFO method and may want to change to the LIFO method. Inventory information for the current year follows.

Description	FIFO Cost	LIFO Cost
Beginning inventory: January 1	\$11,800	\$ 9,600
Ending inventory: December 31	\$14,100	\$11,150

Cost of goods sold under the LIFO basis is \$34,500 for the current year.

Best Stores would like to use LIFO for tax purposes but wants to be sure that its shareholders will be able to convert the LIFO financial statements to a FIFO basis. Provide Best Stores with an illustration of how financial statement users can convert LIFO to the FIFO basis.

3

BE10-9. LIFO, Perpetual Basis. Source Enterprises reports the following inventory information for the current year.

LIFO Inventory		
Description	Unit Cost × Units	Total Cost
Beginning inventory: January 1		
First layer	\$ 9 × 800	\$ 7,200
Second layer	\$13 × 1,100	14,300
Total beginning inventory	1,900	\$21,500
Purchases or production:		
August 31	\$ 16 × 700	11,200
Cost of goods available for sale	2,600	\$32,700
Units sold on December 1 at \$9.60	(2,300)	
Ending inventory: December 31	300	

Compute the ending inventory and the cost of goods sold under the LIFO perpetual basis.

4

BE10-10. LIFO Liquidation. Using the information provided in BE10-9, determine whether there is a LIFO liquidation.

4

BE10-11. Dollar-Value LIFO. Todgren Incorporated adopted the dollar-value LIFO method last year. Last year's ending inventory was \$56,400 with a price index of 1.0. The ending inventory for the current year at year-end (FIFO) costs is \$96,000 and the price index is 1.2. Based on this information, compute Todgren's ending inventory for the current year on a dollar-value LIFO basis.

4

BE10-12. Dollar-Value LIFO, Conversion to FIFO. Using the information provided in BE10-11, prepare the journal entry required to adjust Todgren's ending inventory from a FIFO to a dollar-value LIFO basis.

5

BE10-13. Lower of Cost or Market. Count Clothing Company manufactures two types of raincoats—Regular and Stain Resistant. Information related to both products is presented in the following table.

Group	Current Replacement Cost	Selling Price	Disposal Costs	Normal Profit Margin	Cost
Regular	\$120	\$190	\$20	\$70	\$118
Stain Resistant	230	250	26	45	240

Determine the ending inventory value per unit and the amount of any write-downs per unit using the lower-of-cost-or-market rule assuming that Count Clothing uses the LIFO costing method and the group-by-group approach to LCM.

- 5 **BE10-14. Lower of Cost or Market.** Using the information in BE10-13, prepare the journal entry to record the write-down to market for the Stain Resistant model under both the direct and indirect methods. Assume that Count Clothing has 3,500 units of the Stain Resistant model in stock.
- 5 **BE10-15. Lower of Cost or Market, IFRS.** Using the information in BE10-13, now assume that Count Clothing is an IFRS reporter. Determine the ending inventory value per unit and the amount of any write-downs per unit using the lower-of-cost-or-market rule assuming that Count Clothing uses the group-by-group approach to LCM. Assume the company uses FIFO.
- 5 **BE10-16. Lower of Cost or Market, IFRS.** Using the information in BE10-15, prepare the journal entry to record the write-down to market for the Stain Resistant model under both the direct and indirect methods. Assume that Count Clothing has 3,500 units of the Stain Resistant model in stock. Assume the company uses FIFO.
- 5 **BE10-17. Lower of Cost or Market, Reversal, IFRS.** Using the facts in BE10-15, assume that Count Clothing has 2,000 units of its Stain Resistant model in stock a year later when the net realizable value has increased to \$230. What is the reversal of the inventory write-down, if any? Assume the company uses FIFO.
- 5 **BE10-18. Lower of Cost or Market.** Sarat Boot Company manufactures two types of boots—rain boots and snow boots. Information related to both products is presented in the following table.

Group	Current Replacement Cost	Selling Price	Disposal Costs	Normal Profit Margin	Cost
Rain	\$70	\$ 95	\$24	\$12	\$60
Snow	84	110	24	15	93

Determine the ending inventory value per unit using the lower-of-cost-or-market rule assuming that Sarat Boot uses LIFO for costing purposes and the group-by-group approach to LCM.

- 5 **BE10-19. Lower of Cost or Market.** Using the information in BE10-18, now assume that Sarat Boot uses FIFO for inventory costing purposes. Determine the ending inventory value per unit using the lower-of-cost-or-market rule assuming that Sarat Boot uses the group-by-group approach to LCM.
- 5 **BE10-20. Lower of Cost or Market, IFRS.** Using the information in BE10-18, now assume that Sarat Boot is an IFRS reporter. Determine the ending inventory value per unit using the lower-of-cost-or-market rule assuming that Sarat Boot uses the group-by-group approach to LCM. Assume the company uses FIFO.
- 6 **BE10-21. Conventional Retail Inventory Method.** Big B Stores uses the conventional retail method to value its ending inventory. The following information relates to Big B's inventory at both cost and retail for the current year.

Description	Cost	Retail
Beginning inventory	\$ 55,000	\$ 78,500
Purchases	245,000	325,000
Additional markups		24,000
Markup cancellations		7,000
Markdowns		12,000
Markdown cancellations		3,500
Sales		400,000

Compute Big B's ending inventory for the current year using the conventional retail method (round all percentages to two decimal places).

- 7** **BE10-22. Gross Profit Method.** Sammi Company needs to determine the amount of inventory in its warehouse at the time that an earthquake destroyed it. Sammi's gross profit percentage averaged 28% over the last three years. Sammi began the current year with inventory of \$657,400. Its net purchases were \$3,498,000 and net sales were \$4,336,000 during the year before the earthquake occurred. Use the gross profit method to estimate the inventory on hand on the date of the earthquake.
- 7** **BE10-23. Gross Profit Method.** A tornado severely damaged one of Down Town Dig's retail clothing stores, destroying all the inventory in the store. Down Town Dig's ending store inventory last year was \$109,500. Its net purchases were \$672,600, and net sales were \$1,279,800 during the year prior to the tornado. Down Town Dig used the gross profit method to determine that it had \$218,988 of the inventory on hand on the date the tornado hit. What is its historical gross profit percentage?
- A** **BE10-24. LIFO Retail Inventory Method.** Complete the following table to find the ending inventory under the Dollar Value LIFO Retail Inventory Method. Round percentages to two decimal places.

Base-Year price index	1.00		
Current year price index	1.06		
	Cost	Retail	Cost-to-Retail Ratio
Beginning inventory	\$ 15,000	\$ 25,000	A
Purchases	83,000	123,000	
Net markups		6,500	
Net markdowns		B	
Current year layer	C	119,500	D
Goods available for sale	E	F	
Less: Sales		114,000	
Ending inventory at retail		G	
Ending Inventory at Base-Year Prices = Ending Inventory at Retail / Price Index	H	J	
	I		

- A** **BE10-25. LIFO Retail Inventory Method.** Complete the following table to find the ending inventory under the Dollar Value LIFO retail inventory method. Round percentages to two decimal places.

Base-year price index	1.00		
Current-Year price index	1.03		
	Cost	Retail	Cost-to-Retail Ratio
Beginning inventory	A	\$ 36,400	74.18%
Purchases	102,000	117,110	
Net markups		B	
Net markdowns		(3,600)	
Current year layer	C	132,910	D
Goods available for sale	E	F	
Less: Sales		156,000	
Ending inventory at retail		G	
Ending Inventory at Base-year Prices = Ending Inventory at Retail / Price Index	H	J	
	I		

Exercises

3

E10-1. Moving Average, FIFO, LIFO. Arthur Lloyd Associates provided the following information regarding its inventory for the current year, its second year of operations.

Transaction	Units	Sales in Units	Unit Cost	Total Cost
Beginning inventory 1/1	10,000		\$18	\$ 180,000
Purchases				
February 8	23,000		20	460,000
March 15	<u>18,600</u>		22	<u>409,200</u>
Subtotal	51,600			\$1,049,200
Units sold – April 2 at \$41		49,500		
April 30	37,000		28	1,036,000
July 15	<u>12,400</u>		31	<u>384,400</u>
Subtotal	101,000			\$2,469,600
Units sold – September 1 at \$47		26,000		
November 9	<u>34,500</u>		29	<u>1,000,500</u>
Total available for sale	135,500			<u>\$3,470,100</u>
Total units sold	<u>(75,500)</u>			
Ending inventory	<u>60,000</u>			

Required »

Compute Arthur Lloyd's ending inventory and cost of goods sold under each of the following cost-flow methods assuming that the company uses a perpetual inventory system (round your answer for cost per unit to two decimal places):

- a. Moving Average b. FIFO c. LIFO

3

E10-2. Moving Average, FIFO, LIFO, Presentation, and Disclosures. Answer the following questions using the information provided in E10-1:

Required »

- Prepare a partial income statement and balance sheet for Arthur Lloyd under each of the inventory valuation methods.
- Assume that the company reported current assets (without inventory) of \$2,890,000 at the beginning of the year and \$2,100,000 at the end of the year. Also assume that it reports current liabilities of \$2,000,150 and \$2,450,000 at the beginning and end of the year, respectively. Compute the current ratio and inventory turnover ratio under each of the inventory valuation methods. The inventory turnover ratio is required only for the end of the period.

3

E10-3. Moving Average, FIFO, LIFO. Zoola, Inc. provided the following information regarding its inventory for the current year, its second year of operations.

Transaction	Units	Unit Cost
Beginning inventory 1/1	3,000	\$17.00
Purchases, January 23	4,500	16.00
Purchases, February 14	1,200	16.50
Purchases, March 17	2,300	17.00
Units sold – April 13 at \$20	9,600	
Purchases, May 5	5,600	15.00
Purchases, July 4	3,200	16.00
Units sold – October 31 at \$19	8,700	
Purchases, November 22	1,400	15.00

Compute Zoola's ending inventory and cost of goods sold under each of the following cost-flow methods assuming that the company uses a perpetual inventory system (round your answer for cost per unit to two decimal places):

Required »

- a. Moving Average b. FIFO c. LIFO

3

E10-4. Moving Average, FIFO, LIFO, Presentation and Disclosures. Answer the following questions using the information provided in E10-3:

Required »

- a. Prepare a partial income statement and balance sheet for Zoola, Inc. under each of the inventory valuation methods.
- b. Assume that the company reported current assets (without inventory) of \$469,801 at the beginning of the year and \$480,976 at the end of the year. Also assume that it reports current liabilities of \$403,568 and \$423,571 at the beginning and end of the year, respectively. Compute the current ratio and inventory turnover ratio under each of the inventory valuation methods. The inventory turnover ratio is required only for the end of the period.

3 4 8

E10-5. LIFO, Conversion to FIFO. Inventory transactions for Jack Franklin Stores are summarized in the following table. The company uses the LIFO perpetual method for both financial and tax reporting.

Transaction	Units	Sales in Units	Unit Cost	Total Cost
Beginning inventory: January 1				
Oldest cost	2,000		\$ 5	\$ 10,000
Next oldest cost	1,750		8	14,000
Total beginning inventory	3,750			\$ 24,000
Purchases				
January 20	5,000		9	45,000
February 18	12,500		11	137,500
Subtotal	21,250			\$206,500
Units sold on May 1 at \$18		19,000		
July 28	18,750		10	187,500
Total available for sale	40,000			<u>\$394,000</u>
Total units sold	(19,000)			
Ending inventory	<u>21,000</u>			

The inventory footnote from Jack Franklin Stores' annual report indicates that the difference between the LIFO costs and the current (FIFO) costs of inventory is equal to \$0 and \$12,750 at the beginning and end of the year, respectively.

Required »

- a. Determine the ending inventory and cost of goods sold for the current year.
- b. Use the footnote information provided in the question to convert the beginning and ending inventories from a LIFO to a FIFO basis.
- c. Convert the cost of goods sold for the current year from the LIFO to the FIFO basis.
- d. Compare the inventory turnover ratio for the current year computed under the two methods of inventory valuation.

- 3 8** **E10-6. LIFO.** Burke Company uses the LIFO perpetual method for financial reporting and tax purposes. A summary of Burke's inventory for the current year follows.

Description	LIFO Inventory			Units Sold
	Units	Unit Cost	Total Cost	
Beginning inventory: January 1				
First layer	10,000	\$3.10	\$ 31,000	
Second layer	6,000	3.90	23,400	
Total beginning inventory	16,000		\$ 54,400	
Units sold on February 20 at \$7.05				14,000
Purchases or production:				
March 31	2,000	5.10	10,200	
July 15	8,500	5.60	47,600	
Units sold on December 1 at \$7.25				11,000
Cost of goods available for sale	26,500		\$112,200	
Total units sold	(25,000)			
Ending inventory: December 31	1,500			

Required »

- Compute the ending inventory and cost of goods sold for the current year.
- Prepare a partial income statement showing the gross profit for the current year.

- 4** **E10-7. Dollar-Value LIFO, LIFO Reserve.** Total Color, Inc. manufactures and distributes house paints. Total Color uses the dollar-value LIFO method. Information for 2018, 2019, and 2020 is presented in the following table.

Year	Inventory – FIFO
2018 – Base year	\$356,000
2019	\$379,700
2020	\$414,000

The cumulative price indices for 2018, 2019, and 2020, respectively are 1.0000, 1.0230, and 1.0537.

Required »

- Compute the company's ending inventory using dollar-value LIFO for each year. Round to the nearest dollar.
- Prepare the journal entry required to adjust the LIFO reserve for each year.

- 4** **E10-8. Dollar-Value LIFO, LIFO Reserve.** CWB Teleconcepts, Inc. manufactures and distributes three models of handheld devices: the Flame, the Globe, and the HD3. CWB uses the dollar-value LIFO method. Information for 2018, 2019, and 2020 is presented in the following table.

Description	Base Year: 2018		2019		2020	
	Units	Total FIFO Cost	Units	Total FIFO Cost	Units	Total FIFO Cost
Flame	5,000	\$450,000	7,000	\$658,000	4,000	\$392,000
Globe	6,000	660,000	5,000	580,000	3,000	375,000
HD3	3,000	450,000	5,000	800,000	1,000	170,000

The cumulative price indices for 2018, 2019, and 2020, respectively are 1.00, 1.056, and 1.1155.

Required »

- Compute the company's ending inventory using dollar-value LIFO for each year. Treat the three models as one group. Round to the nearest dollar.
- Prepare the journal entry required to adjust the LIFO reserve for each year.

- 4** **E10-9. Dollar-Value LIFO, No Liquidation.** Joe the Grocer Markets, Inc. (JTGM) adopted the dollar-value LIFO inventory method using 2018 as the base year. JTGM uses FIFO for its internal books. Information related to its inventory is presented in the following table:

Year	Ending Inventory at End-of-Year Prices per Internal Books	Cumulative Price Index
2018	\$ 870,000	100
2019	980,000	102
2020	1,050,000	103

Required »

- Compute JTGM's ending inventory under the dollar-value LIFO method for the years 2018 through 2020.
- Prepare the journal entries for 2019 and 2020 to adjust inventory to the dollar-value LIFO basis.
- Determine the ending balance of the LIFO reserve for 2019 and 2020.

- 4** **E10-10. Dollar-Value LIFO, LIFO Liquidation.** Nicky Bisco Products adopted the dollar-value LIFO method using 2018 as the base year for financial reporting purposes. It uses FIFO for its internal books. Information related to Bisco's inventory follows:

Year	Ending Inventory at End-of-Year Prices per Internal Books	Cumulative Price Index
2018	\$495,000	100
2019	588,000	110
2020	612,000	112

Required »

- Compute Bisco's ending inventory under the dollar-value LIFO method for the years 2018 through 2020.
- Prepare the journal entries for 2019 and 2020 to adjust inventory to the dollar-value LIFO basis.
- Determine the ending balance of the LIFO reserve for 2019 and 2020.

- 5** **E10-11. Lower of Cost or Market.** All-Kinds-of-Cases Company sells cases for smart phones and notepad computers. The company uses the LIFO method for costing inventory. All-Kinds-of-Cases groups inventory by the device manufacturer for which the case is made in its LCM computations. All-Kinds-of-Cases provided the following information regarding inventory at the end of the current year.

Group No.	Manufacturer	CRC	No. of Units	SP	Disposal	NPM	Cost
Smart phone case	General Tech	\$ 8	450	\$14	\$1	\$ 6	\$ 5
Notepad case	General Tech	14	300	35	2	18	16
Smart phone case	Pacific Base	5	750	8	2	4	7
Notepad case	Pacific Base	12	520	32	2	15	14

Definitions:

CRC = Current Replacement Cost

SP = Selling Price

DISPOSAL = Costs of Completion and Disposal

NPM = Normal Profit Margin

Required »

- Conduct a lower-of-cost-or-market test for All-Kinds-of-Cases assuming that it uses the total inventory approach for LCM computations.
- Conduct a lower-of-cost-or-market test for All-Kinds-of-Cases assuming that it uses the individual-item approach for LCM computations.
- Conduct a lower-of-cost-or-market test for All-Kinds-of-Cases assuming that it uses the group-by-group approach for LCM computations.
- Prepare the journal entry needed to adjust All-Kinds-of-Cases's inventory to a lower-of-cost-or-market (LCM) basis assuming that LCM is applied to total inventory groups. All-Kinds-of-Cases uses the indirect approach to record any adjustments to LCM.

- 5** **E10-12. Lower of Cost or Market, IFRS.** Use the same information in E10-11 now assuming that All-Kinds-of-Cases Company is an IFRS reporter. Assume the company uses FIFO.

Required »

- Conduct a lower-of-cost-or-market test for All-Kinds-of-Cases assuming that it uses the individual-item approach for LCM computations.
- Conduct a lower-of-cost-or-market test for All-Kinds-of-Cases assuming that it uses the group-by-group approach for LCM computations.
- Prepare the journal entry needed to adjust All-Kinds-of-Cases's inventory to a lower-of-cost-or-market (LCM) basis assuming that LCM is applied to individual items. All-Kinds-of-Cases uses the indirect approach to record any adjustments to LCM.

- 5** **E10-13. Lower of Cost or Market.** Printmaster Distributors Company sells laser printers and replacement toner cartridges. Printmaster uses FIFO for inventory costing. It sells two models—black and color laser printers. The black printers and black toner cartridges are in Group 100 and the color printer and color toner cartridges are in Group 200. Printmaster provided the following information regarding inventory at the end of the current year.

Group No.	Model No.	CRC	No. of Units	SP	Disposal	NPM	Cost
No. 100 Black Laser Printer	LP100	\$175	2,000	\$210	\$20	\$35	\$170
No. 100 Black Toner	BT100	40	1,500	55	10	16	48
No. 200 Color Laser Printer	CP200	200	3,400	235	25	20	185
No. 200 Color Toner	CT200	65	2,750	145	15	25	55

Definitions:

CRC	=	Current Replacement Cost
SP	=	Selling Price
Disposal	=	Costs of Completion and Disposal
NPM	=	Normal Profit Margin

Required »

- Conduct a lower-of-cost-or-market test for Printmaster assuming that it uses the total inventory approach for LCM computations.
- Conduct a lower-of-cost-or-market test for Printmaster assuming that it uses the individual-item approach for LCM computations.
- Conduct a lower-of-cost-or-market test for Printmaster assuming that it uses the group-by-group approach for LCM computations.
- Prepare the journal entry needed to adjust Printmaster's inventory to a lower-of-cost-or-market (LCM) basis assuming that LCM is applied to individual items. Printmaster uses the indirect approach to record any adjustments to LCM.

- 5** **E10-14. Lower of Cost or Market.** Use the information in E10-13 but now assume that Printmaster Distributors Company measures inventory cost using the LIFO method.

Required »

- Conduct a lower-of-cost-or-market test for Printmaster assuming that it uses the total inventory approach for LCM computations.
- Conduct a lower-of-cost-or-market test for Printmaster assuming that it uses the individual-item approach for LCM computations.
- Conduct a lower-of-cost-or-market test for Printmaster assuming that it uses the group-by-group approach for LCM computations.
- Prepare the journal entry needed to adjust Printmaster's inventory to a lower-of-cost-or-market (LCM) basis assuming that LCM is applied to product groups. Printmaster uses the indirect approach to record any adjustments to LCM.

- 5** **E10-15. Lower of Cost or Market, Reversal, IFRS.** Use the same information in E10-13 but now assume that Printmaster Distributors Company is an IFRS reporter.

Required »

- Conduct a lower-of-cost-or-market test for Printmaster assuming that it uses the individual-item approach for LCM computations.

- b. Conduct a lower-of-cost-or-market test for Printmaster assuming that it uses the group-by-group approach for LCM computations.
- c. Prepare the journal entry needed to adjust Printmaster's inventory to a lower-of-cost-or-market (LCM) basis assuming that LCM is applied to individual items. Printmaster uses the indirect approach to record any adjustments to LCM.
- d. Assume that in the following year Printmaster has 1,000 units of BT100 Black Toner still in its inventory. The selling price has increased to \$58 dollars. Prepare the journal entry needed to adjust Printmaster's inventory for any reversal of its lower-of-cost-or-market adjustment.

6

E10-16. Conventional Retail Inventory Method. Melvin Corporation uses the conventional retail method for financial reporting. The company's inventory records are summarized as follows.

Description	Cost	Retail
Beginning inventory	\$ 700,000	\$1,015,000
Purchases	1,320,000	1,857,500
Additional markups		72,000
Markup cancellations		12,000
Markdowns		18,500
Markdown cancellations		3,000
Sales		2,740,500

Estimate Melvin's ending inventory using the conventional retail method. (Round percentages to two decimal places.)

7

E10-17. Gross Profit Method. A tsunami destroyed Kyoto Company's warehouse and all of its inventory. Kyoto's prior-year balance sheet reported ending inventory totaling \$5,097. Kyoto's management believes that last year's gross profit percentage is a good estimate of the gross profit in the current year. Kyoto's sales last year were \$48,540 and its cost of goods sold was \$27,490. Before the tsunami, Kyoto's net sales were \$28,903, and Kyoto purchased \$18,005 of inventory. Of the inventory purchased, \$45 had not yet been delivered to Kyoto. Round percentages to one decimal place. Use the gross profit method to determine the following:

Required »

- a. What is Kyoto's historical gross profit percentage?
- b. What is Kyoto's estimated cost of goods sold?
- c. What is Kyoto's estimated gross profit?
- d. What is Kyoto's estimated ending inventory?

7

E10-18. Gross Profit Method. A flood destroyed Addio Company's warehouse and all of its inventory. Addio will use the gross profit method to determine its inventory in the warehouse at the time. Addio's management believes that the average of the last two years' gross profit percentage is a good estimate of the gross profit in the current year. Sales last year were \$7,128 and \$6,789 in the year before. Its cost of goods sold was \$4,946 last year and \$4,580 the year before. Addio's prior-year balance sheet reported ending inventory of \$437. Before the flood, net sales were \$5,702. Addio purchased \$3,715 of inventory. Round percentages to one decimal place. Use the gross profit method to determine the following:

Required »

- a. What is Addio's historical gross profit percentage?
- b. What is Addio's estimated cost of goods sold?
- c. What is Addio's estimated gross profit?
- d. What is Addio's estimated ending inventory?

A

E10-19. LIFO Retail Inventory Method. Zimma, Inc. uses the LIFO retail inventory method for costing inventory. It has beginning inventory at a cost of \$23,000 and at a cost-to-retail ratio of 58%. During the year, Zimma purchased goods with a cost basis of \$78,400 and a retail value of \$132,881. It had net markups of \$2,400 and net markdowns of \$8,900. Zimma has net sales of \$124,000. What is Zimma's ending inventory using the LIFO retail method? Round percentages to two decimal places.

A

E10-20. LIFO Retail Inventory Method. Kiresch, Inc. uses the LIFO retail inventory method for costing inventory. It has beginning inventory at a cost of \$57,000 and retail value of \$95,000. During the year, Kiresch purchased goods with a cost basis of \$136,700 and a retail value of \$220,484. It had net markups of \$6,700 and net markdowns of \$15,400. Kiresch has net sales of \$266,400. What is Kiresch's ending inventory using the LIFO retail method? Round percentages to two decimal places.

A

E10-21. Dollar-Value LIFO Retail Inventory Method. Zorinak, Inc. uses the dollar-value LIFO retail inventory method for costing inventory. It has beginning inventory costing \$154,000 at a cost-to-retail ratio of 72%. During the year, Zorinak purchased goods with a cost basis of \$770,000 and a retail value of \$1,100,000. It had net markups of \$33,000 and net markdowns of \$49,500. Zorinak sold 80% of its goods available for sale during the year. The current-year price index is 1.03. What is Zorinak's ending inventory at cost and retail using the dollar-value LIFO retail method? Round percentages to two decimal places.

Problems

3

P10-1. Moving Average, FIFO, LIFO. Morocco Imports provided the following information regarding its inventory for the current year, its second year of operations.

Transaction	Units	Sales in Units	Unit Cost	Total Cost
Beginning inventory January 1	35,000		\$3.50	\$ 122,500
Purchases				
February 8	45,500		3.60	163,800
March 15	100,250		3.80	380,950
April 10	62,000		4.10	254,200
Subtotal	242,750			\$ 921,450
Units sold April 22 at \$12		155,000		
May 9	81,000		4.35	352,350
June 19	28,000		4.56	127,680
Subtotal	351,750			\$1,401,480
Units sold August 11 at \$14		115,500		
September 20	15,000		4.75	71,250
October 30	41,000		4.85	198,850
November 17	8,000		4.90	39,200
Subtotal	415,750			\$1,710,780
Units sold December 21 at \$16		21,500		
Total available for sale	415,750			
Total units sold	(292,000)			
Ending inventory	123,750			

Compute Morocco's ending inventory and cost of goods sold under each of the following cost-flow assumptions assuming a perpetual inventory system. (Round your answer for cost per unit to two decimal places.)

Required »

- a. Moving Average b. FIFO c. LIFO

3

P10-2. Moving Average, FIFO, LIFO. Use the information provided in P10-1 for Morocco Imports. For each of the three cost-flow assumptions (moving-average, FIFO, and LIFO methods):

Required »

- a. Prepare a partial income statement up to the cost of goods sold section.
b. Compute the gross profit percentage.
c. Comment on the ranking of the gross profit percentages.

3 4

P10-3. LIFO, Conversion to FIFO. The Outsider Company, Inc. provided the following information regarding its inventory for the year ended December 31, 2019. It made all of the purchases before it had any sales transactions for the year.

Description	LIFO		FIFO	
Beginning inventory:	8,000 @ \$6	\$ 48,000	4,000 @ \$7	\$ 28,000
January 1, 2019	8,000 @ \$7	56,000	12,000 @ \$8	96,000
Total beginning inventory	16,000 units	\$ 104,000	16,000 units	\$124,000
Purchases	14,000 @ \$9	126,000	14,000 @ \$9	126,000
Cost of goods available	30,000 units	\$ 230,000	30,000 units	\$250,000
Ending inventory	6,000 @ \$6	36,000	6,000 @ \$9	54,000
Cost of goods sold	24,000 units	\$ 194,000	24,000 units	\$196,000

Required »

- Compute the LIFO reserve at the beginning of the year (i.e., at December 31, 2018).
- Compute the LIFO reserve at the end of the year (i.e., at December 31, 2019).
- Illustrate how the firm can use the LIFO reserve to convert ending inventory from the LIFO to the FIFO basis for both years (i.e., 2018 and 2019).
- Illustrate how the firm can use the LIFO reserve to convert the LIFO cost of goods sold to the FIFO cost of goods sold for 2019.
- Describe the conditions that indicate that there is a LIFO liquidation for 2019.

4

P10-4. Dollar-Value LIFO. The Happenings Company adopted the dollar-value LIFO inventory method on December 31, 2017, when the price index was 1.00. Ending inventory on the date that it adopted dollar-value LIFO follows.

Item	Number of Units	Total FIFO Cost
MAS1840	280	\$ 840
JAS2307	850	<u>5,950</u>
TOTAL		<u>\$6,790</u>

Information related to the year-end prices for the two years after the adoption of dollar-value LIFO is summarized in the following table.

Description	December 31	
	2018	2019
Year-end prices (FIFO) – MAS1840 inventory	\$ 2,100	\$ 2,639
Year-end prices (FIFO) – JAS2307 inventory	10,080	16,800

The cumulative price index for 2018 is 1.3385, and the cumulative price index for 2019 is 1.4399. Treat both models as one group.

Required »

- Calculate the ending inventory for 2018 at dollar-value LIFO and determine the LIFO reserve needed, if any. Prepare the journal entry to record the LIFO reserve.
- Calculate the ending inventory for 2019 at dollar-value LIFO and determine the LIFO reserve needed, if any. Prepare the journal entry to record the LIFO reserve.

4

P10-5. Dollar-Value LIFO, No Liquidation. Nat's Toy Stores Limited adopted the dollar-value LIFO inventory method using 2017 as the base year. The cumulative price index for 2018 through 2021 was 1.01, 1.03, 1.04 and 1.06, respectively. Ending inventory according to Nat's Toy Stores' trial balance, using FIFO, is presented in the following table:

Year	Ending Inventory per the Trial Balance
2017	\$ 860,000
2018	1,100,000
2019	1,313,000
2020	1,420,000
2021	1,510,000

Required »

- Compute Nat's ending inventory under the dollar-value LIFO method for the years 2017 through 2021.
- Prepare the journal entries for 2018 through 2021 to adjust inventory to the dollar-value LIFO basis.
- Determine the ending balance of the LIFO reserve for 2018 through 2021.

4

P10-6. Dollar-Value LIFO, LIFO Liquidation. The following information was provided by Capri Company:

Year	Ending Inventory at Average Cost	Cumulative Price Index
2014	\$530,000	100
2015	620,000	105
2016	610,000	110
2017	485,000	111
2018	620,000	115

Capri adopted the dollar-value LIFO method using 2014 as the base year.

Required »

- Compute Capri's ending inventory under the dollar-value LIFO method for the years 2014 through 2018.
- Prepare the journal entries for 2015 through 2018 to adjust inventory to the dollar-value LIFO basis.
- Determine the ending balance of the LIFO reserve for 2015 through 2018.

4

P10-7. Dollar-Value LIFO, LIFO Liquidation. Silvio's Taverns, Inc. adopted the dollar-value LIFO Method in 2015. Information related to Silvio's inventory follows:

Year	Ending Inventory at	
	End-of-Year Prices per FIFO	Cumulative Price Index
2015	\$505,000	100
2016	612,000	103
2017	645,000	108
2018	487,000	112
2019	610,000	119

Required »

- Compute Silvio's ending inventory under the dollar-value LIFO method for the years 2015 through 2019.
- Prepare the journal entries for 2016 through 2019 to adjust inventory to the dollar-value LIFO basis.
- Determine the ending balance of the LIFO reserve for 2016 through 2019.

5

P10-8. Lower of Cost or Market. Framingdale Factories, Inc. manufactures low-cost furniture. The company produces three sizes of wardrobes 4 foot (S), 6 foot (M), and 8 foot (L). Framingdale provided the following data:

Description	4 Foot (S)	6 Foot (M)	8 Foot (L)
Selling price	\$100	\$120	\$145
FIFO cost	84	94	150
Current replacement cost	72	88	125
Disposal cost	22	25	20
Normal profit (% of selling price)	20%	25%	30%
Units in ending inventory	1,000	2,100	900

Required »

- Determine the inventory carrying value with the lower-of-cost-or-market rule using the individual-item basis.
- Prepare the journal entry to record any write-down required using the indirect method.
- Determine the inventory carrying value with the lower-of-cost-or-market rule using the total inventory basis.
- Prepare the journal entry to record any write-down using the direct method.

5

P10-9. Lower of Cost or Market. O'Sullivan Corporation provided the following information regarding its ending inventory for the current year. O'Sullivan manufactures three types of athletic shoes. Selling costs are 10% of the selling price. The company values its ending inventory at the lower of LIFO cost or market. There are 1,000 units of each product in inventory.

Product	LIFO Cost	Current Replacement Cost	Selling Price	Normal Profit Margin*
Assurant	\$210	\$225	\$260	30%
Biglow	250	220	280	20%
Cartata	170	140	200	15%

*As a percentage of selling price

Required »

- Compute the amount of write-down, if any, on both an individual and a total inventory basis.
- Prepare any journal entries necessary to reflect the inventory at lower of cost or market assuming that O'Sullivan uses the indirect method.

c. Repeat requirement (b) assuming that O'Sullivan uses the direct method to record any required write-down to lower of cost or market.

6

P10-10. Conventional Retail Inventory Method. John Stevens Corporation uses the conventional retail method for financial reporting. The company's inventory records are summarized here.

Description	Cost	Retail
Beginning inventory	\$ 20,000	\$ 56,000
Purchases	144,500	198,400
Additional markups		9,000
Markup cancellations		3,000
Markdowns		5,000
Markdown cancellations		1,500
Sales		235,700

Estimate John Stevens' ending inventory using the conventional retail inventory method. (Round percentages to two decimal places.)

7

P10-11. Conventional Retail Inventory Method. On January 1, 2017, Goodbye Electronics Outlets adopted the conventional retail method of accounting for its merchandise inventory.

	Cost	Retail
Inventory, 1/1/2017	\$ 45,730	\$ 68,000
Markdowns		17,850
Additional markups		28,500
Markdown cancellations		6,500
Markup cancellations		3,500
Net purchases	155,500	190,000
Sales		195,500

Determine the company's ending inventory under the conventional retail method. (Round percentages to two decimal places.)

7

P10-12. Gross Profit Method. In 2018, Sawyer Company experienced a major casualty loss. The roof of its warehouse collapsed in an ice storm and destroyed its entire inventory. The company began the year with inventory of \$598. It made purchases of \$2,400 but returned \$24 worth of merchandise. Sales prior to the ice storm were \$3,945. Sawyer must use the gross profit method to determine inventory on hand on the date of the casualty. Round percentages to one decimal place. The following is an excerpt of its income statement for the last three years.

	2015	2016	2017
Net Sales	\$3,404	\$3,540	\$3,735
Cost of Goods Sold	1,401	1,365	1,424
General and Administrative Expense	243	259	262
Depreciation Expense	302	315	320
Operating Income	\$1,458	\$1,601	\$1,729

Required »

- Assume that Sawyer uses the most recent three years of net sales and cost of goods sold to determine its historical gross profit. What are estimated cost of goods sold, estimated gross profit, and estimated ending inventory?
- Assume that Sawyer uses the most recent two years of net sales and cost of goods sold to determine its historical gross profit. What are estimated cost of goods sold, estimated gross profit, and estimated ending inventory?
- Comment on the differences in estimated cost of goods sold, estimated gross profit, and estimated ending inventory from parts (a) and (b).

- 6 A** **P10-13. Basic Retail Inventory Method and Conventional Retail Inventory Methods.** The Monte Sales Company provided the following data related to its inventory at the end of the current year. Round percentages to two decimal places.

Description	Cost	Retail
Beginning inventory	\$ 21,800	\$ 45,000
Purchases	112,500	132,000
Additional markups		21,000
Markup cancellations		4,200
Markdowns		15,800
Markdown cancellations		2,800
Sales		165,000

Required »

- What are Monte's ending inventory and cost of goods sold under the conventional retail method?
- What are Monte's ending inventory and cost of goods sold under the basic retail method?
- Which method provides the lower ending inventory value consistent with the lower-of-cost-or-market method?

- 6 A** **P10-14. Basic Retail Inventory Method and Conventional Retail Inventory Methods.** The Johnny Fruit Company provided the following data related to its inventory at the end of the current year. Round percentages to two decimal places.

Description	Cost	Retail
Beginning inventory	\$ 17,800	\$ 28,000
Purchases	123,400	213,000
Additional markups		24,000
Markup cancellations		3,200
Markdowns		19,200
Markdown cancellations		2,200
Sales		200,000

Required »

- What are Johnny Fruit's ending inventory and cost of goods sold under the conventional retail method?
- What are Johnny Fruit's ending inventory and cost of goods sold under the basic retail method?
- Which method provides the lower ending inventory value consistent with the lower-of-cost-or-market method?

- 6** **P10-15. Conventional Retail Inventory Method (LCM).** The Tally Billiard Supply Corporation provided the following data related to its inventory at the end of the current year:

Description	Cost	Retail
Beginning inventory	\$ 8,500	\$ 38,000
Purchases	153,200	132,000
Additional markups		13,000
Markup cancellations		3,000
Markdowns		14,800
Markdown cancellations		2,700
Sales		146,000

What are Tally Corporation's ending inventory and cost of goods sold under the conventional retail method? Round percentages to two decimal places.

A

P10-16. Conventional Retail Inventory Method, Lower of Cost or Market. The Wallace Weed Corporation provided the following data related to its inventory at the end of the current year:

Description	Cost	Retail
Beginning inventory	\$18,700	\$38,000
Purchases	99,400	142,000
Additional markups		12,000
Markup cancellations		4,000
Markdowns		17,800
Markdown cancellations		7,600
Sales		158,000

Required »

- What is Wallace Weed's ending inventory and cost of goods sold under the conventional retail method? Round percentages to two decimal places.
- What is the cost to retail ratio under the basic retail method.

Autograded Excel Project available in **MyLab Accounting**

CASES**Judgment Cases****Judgment Case 1: The Choice to Use LIFO**

The *Kroger Co.* reported cash income taxes paid of \$557 million for the year ended January 28, 2017 (fiscal year 2016). In addition, it reported the following:

THE KROGER CO. CONSOLIDATED BALANCE SHEETS		
(In millions)	January 28, 2017	January 30, 2016
ASSETS		
Current assets		
Cash and temporary cash investments	\$ 322	\$ 277
Store deposits in-transit	910	923
Receivables	1,649	1,734
FIFO inventory	7,852	7,440
LIFO reserve	(1,291)	(1,272)
Prepaid and other current assets	898	790
Total current assets	10,340	9,892
Property, plant and equipment, net	21,016	19,619
Intangibles, net	1,153	1,053
Goodwill	3,031	2,724
Other assets	965	609
Total Assets	<u>\$36,505</u>	<u>\$33,897</u>

**THE KROGER CO.
CONSOLIDATED STATEMENTS OF OPERATIONS**

Years Ended January 28, 2017, January 30, 2016, and January 1, 2015

(In millions)	2016 (52 weeks)	2015 (52 weeks)	2014 (52 weeks)
Earnings before income tax expense	\$2,914	\$3,094	\$2,649
Income tax expense*	<u>957</u>	<u>1,045</u>	<u>902</u>
Net earnings including noncontrolling interests	<u>\$1,957</u>	<u>\$2,049</u>	<u>\$1,747</u>

*Cash paid for income taxes in 2016 \$557

Source: The Kroger Co. <http://ir.kroger.com/Doc/Index?did=40034683>

- What is the LIFO reserve for **Kroger** as of January 28, 2017? January 30, 2016?
- What is the impact of **Kroger's** decision to use LIFO on its January 28, 2017 balance sheet in terms of the effect on inventory, current assets, and total assets?
- What is the amount of the LIFO effect for **Kroger** for the year ended January 28, 2017?
- What is the impact of **Kroger's** decision to use LIFO on its income statement for the year ended January 28, 2017, in terms of earnings before taxes?
- What is the impact of **Kroger's** decision to use LIFO on its cash taxes paid for the year ending January 28, 2017, assuming an effective tax rate of 35%?

Judgment Case 2: Inventory Costing

BBS is a calendar-year corporation that manufactures baseballs. BBS produced 9.5 million baseballs in 20×7 and incurred fixed production overhead costs of \$2 million. In the past 5 years, it has produced the following number of baseballs:

20×2	9.7 million
20×3	9.7 million
20×4	9.1 million
20×5	10.1 million
20×6	10.1 million

The decline in production in 20×4 was due to an employee strike.

Read ASC 330-10-30 and determine what amount of fixed production overhead costs should be allocated to inventory and what amount should be included in current-period expenses. Outline your thought process as well as the judgment(s) you made in reaching this conclusion.

Judgment Case 3: Lower of Cost or Market

KR Automotives is a calendar-year car dealer that sells cars made by Hoyta. KR uses LIFO and calculates the lower of cost or market using an individual-item basis. The CFO of KR believes that KR will need to write-down its inventory of one particular car.

The Kaminator has historically sold very well at KR. In fact, in recent years, it has sold above its sticker price of \$34,000 because of the high demand for the car. The average selling price of the Kaminator in 2014 was \$35,000 and the average selling price in 2015 was \$36,000. However, in late 2016, a rival car manufacturer produced a car, the Crumbder, that is very similar to the Kaminator. However, the competitor's car received significantly higher ratings from consumer organizations that rate cars for safety and gas mileage among other things. In addition, the Crumbder was rated as a "recommended best buy." Crumbder's entry on the market significantly reduced sales of the Kaminator; sales in December 2016, after the release of the Crumbder, averaged \$27,000. The sales force at KR Automotives is convinced that the sales will stagnate even more in 2017.

The CEO of KR is trying to determine what to do with the 200 Kaminators that were left on the lot on December 31, 2016. He has come up with four possibilities:

- Keep the cars on the lot and try to sell them to retail customers. The sales force is very uncertain what price at which they could ultimately sell these cars. In a similar situation 10 years ago, KR sold the older cars for 25% below sticker.

2. Sell the cars to dealers overseas. One overseas dealer has already offered to buy 20 Kaminators for \$19,000 each. This dealer indicated that it may be willing to buy more, depending upon how well the 20 sell.
3. Sell the cars to a used car lot at a much reduced price, likely around 40% below sticker.
4. Put the cars up for auction. KR has not tried this before and has no history of how the cars might sell. There is some limited evidence that indicates that excited buyers might buy the car for sticker price.

The current selling costs are \$500 per car and KR uses a 15% profit margin in its LCM computations. KR paid \$23,000 per car for the Kaminators that are on the lot. The replacement cost of these cars is \$20,000 per car.

What is the most appropriate write-down amount, if any, for the Kaminators? Outline your thought process as well as the judgment(s) you made in reaching this conclusion.

Financial Statement Analysis Cases

Case 1: LIFO to FIFO Conversion and Comparison of Companies

Kimberly-Clark Corporation and *Procter & Gamble* Company reported the following information about inventory in their financial statements and footnotes. Use this information to answer the following questions:

- a. What cost-flow assumption(s) does *Kimberly-Clark* use?
- b. What is *Kimberly-Clark's* LIFO reserve at the end of 2014, 2015, and 2016?
- c. If *Kimberly-Clark* used the FIFO cost-flow assumption to account for all of its inventory, what would its balance of ending inventory be in 2014, 2015, and 2016?
- d. What would *Kimberly-Clark's* cost of goods under FIFO have been in 2015 and 2016?
- e. Would *Kimberly-Clark's* gross profit, taxes, and net income have been higher or lower under FIFO in 2015 and 2016?
- f. Compare *Kimberly-Clark's* gross profit percentage, inventory turnover ratio, and days in inventory on hand under LIFO versus FIFO for 2015 and 2016.
- g. What cost-flow assumption(s) does *Procter & Gamble* use?
- h. For fiscal 2016, compare *Procter & Gamble's* inventory turnover ratio and days in inventory on hand to those of *Kimberly-Clark* under FIFO from part (f).

Kimberly-Clark Corporation

KIMBERLY-CLARK CORPORATION AND SUBSIDIARIES CONSOLIDATED INCOME STATEMENT			
(Millions of dollars)	Years Ended December 31		
	2016	2015	2014
Net Sales	\$18,202	\$18,591	\$19,724
Cost of products sold	<u>11,551</u>	<u>11,967</u>	<u>13,041</u>
Gross Profit	\$ 6,651	\$ 6,624	\$ 6,683

NOTE 1: Accounting Policies (excerpt)

Inventories and Distribution Costs

Most U.S. inventories are valued at the lower of cost, using the Last-In, First-Out (LIFO) method, or market. The balance of the U.S. inventories and inventories of consolidated operations outside the U.S. are valued at the lower of cost, using either the First-In, First-Out (FIFO) or moving-average cost methods, or market. Net realizable value is the estimated selling prices in the ordinary course of business, less reasonably predictable costs of completion, disposal, and transportation. Distribution costs are classified as cost of products sold.

Excerpt from 2016 Annual Report, *Kimberly-Clark Corporation*

NOTE 17: Supplemental Data

Summary of Inventories (modified) At the lower of cost, determined on the FIFO or moving-average cost methods, or market (Millions of dollars)	December 31		
	2016	2015	2014
Raw materials	\$ 329	\$ 397	\$ 426
Goods in process	203	203	215
Finished goods	1,030	1,214	1,183
Other	280	278	288
Inventories at FIFO	1,842	2,092	2,112
Adjustment to LIFO	(163)	(183)	(220)

Note 1: Summary of Significant Accounting Policies (excerpt)

Inventory Valuation

Inventories are valued at the lower of cost or market value. Product-related inventories are primarily maintained on the first-in, first-out method. The cost of spare part inventories is maintained using the average-cost method.

Case 2: Analysis of Inventory Disclosures

PROBLEM: Selected disclosures related to *Foot Locker* Company's inventory follow. Use these disclosures to answer the following questions:

- What percentage of inventory at the end of 2016 is accounted for under each cost-flow assumption that *Foot Locker* uses?
- Why would *Foot Locker* use LIFO for domestic U.S. inventories but FIFO for international inventories?
- How does *Foot Locker* apply the retail inventory method?
- What types of costs are included in the cost of sales?
- Why does *Foot Locker* not report a LIFO reserve?
- What is *Foot Locker's* gross profit percentage in 2014, 2015, and 2016?
- What is *Foot Locker's* inventory turnover ratio and days inventory on hand in 2016?

Foot Locker, Inc.
Consolidated Statements of Operations

	2016	2015	2014
	(in millions)		
Sales	\$7,766	\$7,412	\$7,151
Cost of sales	5,130	4,907	4,777

From Financial Statement Notes:

NOTE 1: Summary of Significant Accounting Policies (excerpt)

Merchandise Inventories and Cost of Sales

Merchandise inventories for the Company's Athletic Stores are valued at the lower of cost or market using the retail inventory method. Cost for retail stores is determined on the last-in, first-out ("LIFO") basis for domestic inventories and on the first-in, first-out ("FIFO") basis for international inventories. Merchandise inventories of the Direct-to-Customers business are valued at the lower of cost or market using weighted-average cost, which approximates FIFO.

The retail inventory method is commonly used by retail companies to value inventories at cost and calculate gross margins due to its practicality. Under the retail inventory method, cost is determined by applying a cost-to-retail percentage across groupings of similar items, known as departments. The cost-to-retail percentage is applied to ending inventory at its current owned retail valuation to determine the cost of ending inventory on a department basis. The Company provides reserves based on current selling prices when the inventory has not been marked down to market.

Transportation, distribution center, and sourcing costs are capitalized in merchandise inventories. The Company expenses the freight associated with transfers between its store locations in the period incurred. The Company maintains an accrual for shrinkage based on historical rates.

Cost of sales is composed of the cost of merchandise, as well as occupancy, buyers' compensation, and shipping and handling costs. The cost of merchandise is recorded net of amounts received from suppliers for damaged product returns, markdown allowances, and volume rebates, as well as cooperative advertising reimbursements received in excess of specific, incremental advertising expenses. Occupancy includes the amortization of amounts received from landlords for tenant improvements.

NOTE 5: Merchandise Inventories

	2016	2015
	(in millions)	
LIFO inventories	\$ 861	\$ 847
FIFO inventories	446	438
Total merchandise inventories	<u>\$1,307</u>	<u>\$1,285</u>

The value of the Company's LIFO inventories, as calculated on a LIFO basis, approximates their value as calculated on a FIFO basis.

Surfing the Standards Cases

Surfing the Standards Case 1: Inventory in the Agriculture Industry²¹

Tarheel Farm, Inc. (TFI) is a North Carolina corporation involved in agricultural production and has an October 31 fiscal year-end. It is not publicly traded, but it is required to prepare annual financial statements complying with U.S. GAAP for its bank. TFI typically produces four products: beef cattle, corn, winter wheat, and sugar beets. All four of these products have a life cycle of less than 1 year. The following information is available as of October 31:

²¹Reprinted from the Ernst & Young Academic Resource Center with permission of the Ernst & Young Foundation. Copyright 2014. All rights reserved.

- TFI had 400 acres of field corn planted. The corn will not be harvested until next month. The accumulated cost of the corn is \$95,000. The estimated selling costs are \$4,500. The current market value of land is \$5,000 per acre. Although there is no current market value available for land growing a corn crop on it, TFI is certain that this land would sell for more than \$2,200,000.
- TFI had 6,000 bushels of winter wheat harvested and stored in its grain bins. The accumulated cost of the wheat is \$27,000. The current market price at the local elevator is \$6.10 per bushel. The market price of wheat has increased 10 cents per bushel since the wheat was harvested. The transportation costs from the farm to the elevator are about 5 cents per bushel.
- TFI has a herd of cattle, including heifers and steers, that have not yet been weaned. TFI does not anticipate keeping any of the heifers for its breeding herd. The accumulated cost of the heifers and steers is \$50,000. The expected selling costs are \$2,000. The replacement cost and selling price for these heifers and steers is \$70,000.
- Finally, TFI has 200 tons of sugar beets harvested. The accumulated costs are \$25 per ton. TFI anticipates selling costs of \$3 per ton. Due to the rarity of the production of sugar beets in North Carolina, there is no local market for sugar beets. TFI sold a few tons of sugar beets two months ago for \$50 a ton; however, the market is not stable at this time.

Prepare a memo to the file regarding the valuation of TFI's products at year-end. Support your conclusions using the Codification.

Surfing the Standards Case 2: Inventory in the Agriculture Industry – IFRS²²

Tarheel Farm, Inc. (TFI) is a North Carolina corporation involved in agricultural production and has an October 31 fiscal year-end. It is not publicly traded, but it is required to prepare annual IFRS-complying financial statements for its bank. TFI typically produces four products: beef cattle, corn, winter wheat, and sugar beets. All four of these products have a life cycle of less than 1 year. The following information is available as of October 31:

- TFI had 400 acres of field corn planted. The corn will not be harvested until next month. The accumulated cost of the corn is \$95,000. The estimated selling costs are \$4,500. The current market value of land is \$5,000 per acre. Although there is no current market value available for land growing a corn crop on it, TFI is certain that this land would sell for more than \$2,200,000.
- TFI had 6,000 bushels of winter wheat harvested and stored in its grain bins. The accumulated cost of the wheat is \$27,000. The current market price at the local elevator is \$6.10 per bushel. The market price of wheat has increased 10 cents per bushel since the wheat was harvested. The transportation costs from the farm to the elevator are about 5 cents per bushel.
- TFI has a herd of cattle, including heifers and steers, that have not yet been weaned. TFI does not anticipate keeping any of the heifers for its breeding herd. The accumulated cost of the heifers and steers is \$50,000. The expected selling costs are \$2,000. The replacement cost and selling price for these heifers and steers is \$70,000.
- Finally, TFI has 200 tons of sugar beets harvested. The accumulated costs are \$25 per ton. TFI anticipates selling costs of \$3 per ton. Due to the rarity of the production of sugar beets in North Carolina, there is no local market for sugar beets. TFI sold a few tons of sugar beets two months ago for \$50 a ton; however, the market is not stable at this time.

Prepare a memo to the file regarding the valuation of TFI's products at year-end. Support your conclusions using references to IFRS.

Surfing the Standards Case 3: Time Shares

Treasure Island Corporation (TIC) sells time shares in luxury oceanfront cottages. During the year ended December 31, 2017, TIC completed a project consisting of 100 cottages in a particularly scenic portion of Hawaii. The project cost TIC \$110.24 million. During the current year, TIC sold 1,924 weekly time shares in the cottages for \$40,000 each.

TIC's sales policy requires a 20% down payment, so TIC received \$8,000 for each time share this year. Because TIC's customers consist of only the most wealthy individuals, TIC does not anticipate any uncollectible accounts. Customers that purchased time shares will not make any more payments this year. TIC uses the full accrual method for revenue recognition purposes.

²²Reprinted from the Ernst & Young Academic Resource Center with permission of the Ernst & Young Foundation. Copyright 2014. All rights reserved.

Prepare a memo for the file discussing how to account for this transaction. Include a discussion of what the account balances should be related to this transaction. (Ignore any interest on the amounts due from customers.) Support your conclusions using the Codification.

Surfing the Standards Case 4: Lower of Cost or Market

More Toys, Inc., a toy retailer that has a calendar year-end and prepares interim financial statements quarterly. As of March 31, 20X4, More Toys has 10,000 Gabriella dolls in stock. The Gabriella dolls are from a recent movie that was showing in the theatres. The dolls cost More Toys, Inc. \$20 each, and the replacement cost for each doll is also \$20.

The average selling price for the dolls in the fourth quarter of 20X3 was \$24. However, due to the fact that the movie was no longer showing in theatres, children were not as interested in the doll. In response, More Toys reduced the price of the dolls and is now selling them for \$18 each. More Toys has decided to take the dolls off the shelves and keep them until the third quarter of 20X4 when the movie will begin streaming on Webpix. The management of More Toys believes that they can then sell the Gabriella dolls for \$22 per doll.

Should More Toys record a lower-of-cost-or-market write-down for its Gabriella dolls on its March 31, 20X4, interim financial statements? Support your answer using the Codification.

Basis for Conclusions Cases

Basis for Conclusions Case 1: The Use of LIFO, IFRS

Although U.S. GAAP allows LIFO inventory costing, IFRS does not. Read paragraphs BC9 through BC21 of IASC, *International Accounting Standard 2*, “Inventories.”

- Why did the IASB decide not to allow the use of LIFO?
- Explain why you agree or disagree with the IASB’s reasoning.

Basis for Conclusions Case 2: The Lower of Cost or Market – U.S. GAAP, IFRS²³

Scene 1

Both IFRS and U.S. GAAP require that firms report inventory at the lower of cost or market. What is the basic principle/characteristic behind this standard that results in this “lower” reporting approach (asset write-down)?

Scene 2

Read the objectives for IFRS (IASB, *International Accounting Standard 2*, paragraph 1) and U.S. GAAP (FASB ASC 330-10-10-1).

Based upon what is stated in these objectives, which set of standards is more concerned with the balance sheet presentation of inventories?

Scene 3

Do you think that the reversal of a write-down of inventory does a better job of accurately reflecting the information related to inventory on the balance sheet or on the income statement?

Is the fact that U.S. GAAP disallows the reversal and IFRS allows the reversal consistent with the objectives?

Scene 4

Currently, IFRS is more likely than U.S. GAAP to report assets at fair value (e.g., property, plant, and equipment can be revalued under IFRS but not U.S. GAAP.)

Is the IFRS requirement that prior inventory write-downs be reversed a different way of saying that inventory should be reported at market value under IFRS?

²³Reprinted from the Ernst & Young Academic Resource Center with permission of the Ernst & Young Foundation. Copyright 2014. All rights reserved.

Scene 5

While neither IASC, *International Accounting Standard 2* nor FASB ASC 330 provides the reasoning for why the reversal of inventory write-downs is allowed or not allowed, the issues surrounding the reversal of write-downs for long-lived assets should be quite similar. Read the basis of conclusions under U.S. GAAP (FASB, *Statement of Financial Accounting Standards No. 144*, paragraph B53) and under **IFRS** (IASB, *International Accounting Standard 36*, paragraphs BCZ 182 through BCZ 186) that provide a discussion of the reasons the Boards made the decisions that they did.

What are the reasons that one might oppose reversals? What are the reasons that one might support reversals?

Scene 6

Do you believe that companies should be allowed/required to reverse prior inventory write-downs if the market value of the inventory increases in periods subsequent to the initial write-down?

APPENDIX A

LIFO Retail Inventory Method

We discussed both the LIFO method and the retail method earlier in the chapter. Some companies combine these methods to determine the cost basis of their inventory. The LIFO retail method uses cost-to-retail ratios to build the LIFO layers.

Basic LIFO Retail Inventory Method

The first step under the LIFO retail inventory method is computing two cost-to-retail ratios: The first layer is based on beginning inventory, and the second layer is based on the change in the ending inventory at retail. Each year after that, the company builds a new layer based on the change in inventory during the year, including net markups and net markdowns in the inventory layer each year.

Layers are built by multiplying the layer of ending inventory at retail by the appropriate cost-to-retail ratio. The layers at cost are then summed to arrive at ending inventory. Example 10A.1 illustrates this method.

EXAMPLE 10A.1

LIFO Retail Inventory Method

PROBLEM: Absco, Inc. uses the LIFO retail inventory method for inventory costing. It has beginning inventory at a cost of \$18,000 with a retail value of \$30,000. During the year, Absco purchased goods with a cost basis of \$82,000 and a retail basis of \$120,000. It had net markups of \$5,000 and net markdowns of \$10,000. Absco has net sales of \$105,000. What is the cost of Absco's ending inventory using the LIFO retail inventory method?

SOLUTION: We begin by computing the cost-to-retail ratio of 60% ($\$18,000/\$30,000$) for the beginning inventory layer. We then compute the current-year layer cost-to-retail ratio using the current-year cost (\$82,000) and retail value (\$115,000) of 71.30% ($\$82,000/\$115,000$). The retail value includes net markups and net markdowns. We compute goods available for sale by summing beginning inventory and net purchases. We arrive at ending inventory at retail by subtracting sales from goods available for sale at retail.

	Cost	Retail	Cost-to-Retail Ratio
Beginning inventory	\$ 18,000	\$ 30,000	60.00%
Purchases	82,000	120,000	
Net markups		5,000	
Net markdowns		(10,000)	
Current year layer	82,000	115,000	71.30%
Goods available for sale	\$100,000	145,000	
Sales		(105,000)	
Ending inventory at retail		\$ 40,000	

We convert ending inventory at retail to ending inventory at cost using the cost-to-retail ratios. Beginning inventory at retail was \$30,000 and ending inventory at retail was \$40,000. Thus, the increase (new layer) at retail is \$10,000.

Continued

	<u>Ending Inventory at Retail</u>	<u>Ratio</u>	<u>Ending Inventory at LIFO Cost</u>
Beginning inventory	\$30,000	60.00%	\$18,000
Increase	<u>10,000</u>	71.30%	<u>7,130</u>
Ending inventory	<u>\$40,000</u>		<u>\$25,130</u>

We compute the beginning layer at cost of \$18,000 ($\$30,000 \times 60\%$) and the current year's layer at cost of \$7,130 ($\$10,000 \times 71.3\%$). This sums to an ending inventory of \$25,130 at LIFO cost.

Dollar-Value LIFO Retail Inventory Method

The LIFO retail method implicitly assumes that price levels do not change during the year. In other words, any increase in inventory at retail is assumed to be due to an increase in quantity. However, this is typically not a valid assumption. The dollar-value LIFO retail method relaxes this assumption by adjusting for any changes in the price of goods.

The computations for the dollar-value LIFO retail method are similar to the LIFO retail method:

1. Compute a cost-to-retail ratio for both beginning inventory and the change in the ending inventory at retail.
2. Include net markups and net markdowns in the inventory layer each year.

Before building the layers, ending inventory at retail is adjusted to base-year prices. We then use the cost-to-retail ratio and the price index to build the layer. Example 10A.2 illustrates this method using the facts from Example 10A.1 except that we will now assume that there has been a price-level increase.

EXAMPLE 10A.2 Dollar-Value LIFO Retail Inventory Method

PROBLEM: Absco, Inc. uses the dollar-value LIFO retail inventory method for inventory costing. It has beginning inventory at a cost of \$18,000 with a retail value of \$30,000. During the year, Absco purchased goods with a cost basis of \$82,000 and a retail basis of \$120,000. It had net markups of \$5,000 and net markdowns of \$10,000. Absco has net sales of \$105,000. The price index for the current year is 1.10. Absco adopted the dollar-value LIFO retail method at the end of the prior year, which is designated as the base year with a price index of 1.00. What is the cost of Absco's ending inventory using the dollar-value LIFO retail inventory method?

SOLUTION: We begin by computing the cost-to-retail ratio of 60% ($\$18,000/\$30,000$) for the beginning inventory layer. We then compute the current-year layer cost-to-retail ratio using the current-year cost (\$82,000) and retail value (\$115,000) of 71.30% ($\$82,000/\$115,000$). The retail value includes net markups and net markdowns. We compute goods available for sale by summing beginning inventory and net purchases. We arrive at ending inventory at retail by subtracting sales from goods available for sale at retail.

	<u>Cost</u>	<u>Retail</u>	<u>Cost-to-Retail Ratio</u>
Beginning inventory	\$ 18,000	\$ 30,000	60.00%
Purchases	82,000	120,000	
Net markups		5,000	
Net markdowns		(10,000)	
Current-year layer	<u>82,000</u>	<u>115,000</u>	71.30%
Goods available for sale	\$100,000	145,000	
Sales		(105,000)	
Ending inventory at retail		<u>\$ 40,000</u>	

We then adjust ending inventory at retail to base-year prices by dividing by the price index.

$$\begin{aligned}
 \text{Ending Inventory at Base-Year Prices} &= \text{Ending Inventory at Retail/Price Index} \\
 &= \$40,000/1.10 \\
 &= \$36,364
 \end{aligned}$$

We can now build the layers in terms of base-year prices. Ending inventory at base-year prices is \$36,364, and beginning inventory at base-year prices is \$30,000. Thus, the current year layer is \$6,364. We multiply these layers by their respective cost-to-retail ratios and price indices to arrive at the layers of ending inventory at dollar-value LIFO cost. This sums to an ending inventory cost of \$22,991.

	<u>Ending Inventory at Base-Year Prices</u>	<u>Ratio</u>	<u>Price Index</u>	<u>Ending Inventory at LIFO Cost</u>
Beginning inventory	\$30,000	60.0%	1.00	\$18,000
Increase	<u>6,364</u>	71.3%	1.10	<u>4,991</u>
Ending inventory	<u>\$36,364</u>			<u>\$22,991</u>

Long-Term Operating Assets: Acquisition, Cost Allocation, and Derecognition

LEARNING OBJECTIVES

- 1 Identify the types of property, plant, and equipment and determine the initial measurement of each; apply the definition of an asset to the decision to expense or capitalize an expenditure.
- 2 Demonstrate the accounting for property, plant, and equipment subsequent to acquisition, including subsequent expenditures and depreciation.
- 3 Determine and illustrate the appropriate accounting for asset derecognition of property, plant, and equipment, including sales and abandonments.
- 4 Identify required disclosures for property, plant, and equipment.
- 5 Specify the characteristics and types of intangible assets.
- 6 Determine and illustrate the initial measurement of different types of intangible assets, including internally generated intangibles, intangibles acquired individually or in a group, intangibles acquired in a business combination, and research and development costs.
- 7 Demonstrate accounting for intangible assets subsequent to acquisition, including amortization and derecognition.
- 8 Detail required disclosures for intangible assets.

Introduction

EVEN IN TODAY'S HIGH-TECH, wireless communication-dependent economy, a company's long-term operating assets remain critical to its success. Companies require these economic resources to achieve their primary business purposes and generate income and cash flows for an extended period of time. Long-term operating assets—which consist of *tangible fixed assets* (also referred to as *property, plant, and equipment*), *natural resources*, and *intangible assets*—typically have a significant impact on a firm's financial statements. In 2016, companies in the S&P 500 Index reported that, on average, 25% of their total assets were tangible fixed assets and 24% were intangible assets. Depreciation and amortization averaged 7.9% of sales.¹

For communications giant *AT&T Inc.*, long-term operating assets represented approximately 87% of total assets on December 31, 2016. *AT&T* operates in both wireless and wired-line communications such as voice and data services, handheld devices, and telephone and cable connections. On the balance sheet at December 31, 2016, *AT&T's* tangible fixed assets were 36% of all its long-term operating assets; *AT&T's* intangible assets made up the remaining 64%.

AT&T's tangible fixed assets are its “bricks-and-mortar” assets, including buildings, equipment, cables, and wires. When was your last dropped cell phone call or the realization that you were in a no-service area? In the competitive communications environment, *AT&T* must continually invest in state-of-the-art technology and equipment: Retaining customers requires maintaining the physical capacity to provide services, superior call quality, and extensive coverage. Intangible assets—such as licenses from the FCC to operate wireless systems on certain radio frequencies and *AT&T's* trade name—are key resources that have no physical substance. Other intangibles are difficult to

¹Based on authors' analysis of companies in S&P 500 index for the year-ending in 2016.

measure, such as a superior management team and an innovative business strategy, so *AT&T* does not report them as assets.

In this chapter, we discuss the characteristics and types of long-term operating assets, including initial measurement at acquisition, accounting in subsequent accounting periods, disposal and derecognition, and disclosure requirements. We

begin our presentation of long-term operating assets with an analysis of property, plant, and equipment and conclude with a discussion of accounting and reporting issues related to intangible assets. Accounting and reporting under U.S. GAAP and IFRS are very similar with just a few differences that we will highlight throughout the chapter. ◀◀

- 1 Identify the types of property, plant, and equipment and determine the initial measurement of each; apply the definition of an asset to the decision to expense or capitalize an expenditure.

Initial Measurement of Property, Plant, and Equipment

Property, plant, and equipment (PPE) also referred to as tangible fixed assets, are assets used in the production of goods and services that the firm sells in order to generate operating income and cash flow. PPE assets are:

1. Tangible in nature
2. Expected to be used for more than 1 year (or more than one operating cycle, whichever is longer)
3. Used in the production and sale of other assets, for rental to others or for administrative purposes

PPE includes land and land improvements; buildings, machinery, and equipment; and furniture and fixtures.² PPE also includes natural resources covered in Appendix B. In this section, we will examine how firms report PPE in practice beginning with the measurement of PPE on the date of acquisition.

THE CONCEPTUAL FRAMEWORK CONNECTION Property, Plant, and Equipment Measurement

Firms measure PPE by determining the amounts to record as an asset or to expense immediately. **Capitalization** is the process of recording an expenditure as an asset. A **capital expenditure** is a cost recorded by a company as an asset rather than an expense. In the U.S. GAAP Conceptual Framework, the definition of an asset includes three essential characteristics:³

1. It represents probable future economic benefits.
2. The firm can obtain the benefit of the asset and can also control others' access to it.
3. The transaction or other event giving rise to the entity's right to the benefit or control of the benefit has already occurred.

Firms also require reliable measurement methods to record a cost as an asset.⁴

Identifying an asset involves differentiating between costs with probable future economic benefits and costs that have expired without the ability to generate revenue in subsequent accounting periods. Typically, this distinction is straightforward in practice. For instance, weekly salaries are expensed immediately because they represent payment for past services without future benefit. As another example, assume that a company purchases a new factory building and expects to use the building to provide future economic benefits. It is fairly certain that the company will indeed realize future benefits from the building, so it will capitalize the cost.

²For most of the relevant authoritative literature for this topic, see FASB ASC 360 – *Property, Plant, and Equipment* for U.S. GAAP and IASC, *International Accounting Standard 16*, “Property, Plant, and Equipment” (London, UK: International Accounting Standards Committee, Revised) for IFRS.

³FASB, *Statement of Financial Accounting Concepts No. 6*, “Elements of Financial Statements,” Paragraph 26.

⁴FASB, *Statement of Financial Accounting Concepts No. 5*, “Recognition and Measurement in Financial Statements of Business Enterprises,” Paragraph 65.

In other cases, it is difficult to assess the probable future benefits from corporate expenditures. For example, expenditures for advertising or research also have future economic benefits—but these benefits can be difficult to quantify. To illustrate, in 2016, *Cisco Systems, Inc.*, which designs and manufactures networking and other products related to communications and information technology, spent \$186 million on advertising and \$6.3 billion in research and development. Yet, because of the uncertainty of realizing those future benefits, *Cisco* expensed these costs as opposed to capitalizing them as assets. That is, these expenditures did not meet the first characteristic of an asset in that the future economic benefits were not probable.

Firms must also consider the cost-benefit trade-off and materiality when measuring PPE. Assume that a firm expects that a \$50 expenditure will provide a future economic benefit. The firm can measure the expenditure reliably and the expenditure meets the other characteristics of an asset, so it seems the firm should record it as an asset. However, \$50 is an immaterial amount that will not provide useful information to financial statement users. Consequently, the firm would simply record the outlay as an expense to avoid bookkeeping costs because the additional cost of maintaining depreciation records for the \$50 expenditure exceeds the expected benefit.

Capitalizing or expensing an expenditure for a fixed asset affects the financial statements differently. When a firm expenses an item, earnings are reduced for the full amount in the first year. When a firm capitalizes an expenditure, assets increase and earnings are reduced only for the depreciation expense in the first year. Therefore, firms may prefer to capitalize expenditures whenever possible in order to avoid the larger decrease in earnings in the first year. Of course, future earnings will decrease but by a lower amount than expensing immediately.

Overview of Initial Measurement

A company determines the amount to capitalize as PPE as the costs that are reasonable and necessary to bring the asset to the location and condition required for its intended use. Consequently, costs such as installation, delivery, special wiring, interest from the financing of constructed assets, closing costs, and sales tax are included in the initial measurement of PPE.

Not all fixed assets are capitalized. In practice, firms develop a **capitalization policy** for PPE, which typically sets guidelines based on the type and/or the magnitude of the cost of the asset acquired. A materiality threshold for capitalization specifies that the firm immediately expense an asset that falls below a predetermined fixed dollar limit (e.g., \$1,000) rather than capitalize it as an asset. For example, *Ford Motor Company's* 2012 annual report noted that it capitalized new assets that it expected to use for more than 1 year with acquisition costs greater than \$2,500.

Firms typically have several subcategories of PPE.

PPE Categories

Land. The cost of land generally includes the purchase price, development costs, legal fees, closing costs, delinquent property taxes, the costs of grading and clearing the land, and a portion of the interest costs incurred during the development process. In addition, firms consider the cost to remove an old structure, net of any proceeds on the sale of scrap materials, as part of the land's acquisition cost because these costs are required to bring the land to the condition necessary for its intended use.

Land Improvements. Firms capitalize land improvements—which include landscaping costs, lighting, fence installations, lawn sprinkler systems, and driveway construction—in a separate land improvements account. A separate account is needed because land improvements are subject to depreciation whereas land is not.

Machinery and Equipment. The cost of machinery and equipment includes the acquisition cost (including any sales tax) plus the cost of shipping, installation, and testing. These costs include any special wiring or modifications to existing structures required to install the asset. Firms expense any costs incurred to repair any damage experienced during installation because these costs have no future economic benefit.

Buildings. The cost of buildings includes any acquisition or construction costs as well as legal and closing costs similar to those incurred in the acquisition of land. In addition, firms may capitalize interest on financing employed during the construction period as part of the building under construction.

Example 11.1 illustrates the allocation of expenditures to assets or expenses.

EXAMPLE 11.1 Allocation of Expenditures to an Asset or an Expense

PROBLEM: Langford, LTD. acquired an assembly machine at an invoice cost of \$280,000 during the current year. The delivery cost was \$900, and installation costs amounted to \$1,890. The machine required a separate electrical line that cost \$1,000 to install. During the installation, a negligent employee damaged an exterior wall attached to the assembly shop. The company paid \$1,210 to repair the wall. What is the acquisition cost of the assembly machine? Prepare the journal entries to properly account for the expenditures made assuming that Langford paid cash for all expenditures.

SOLUTION: The first step in the solution is to determine the total cost of the machine. The acquisition cost of the assembly machine is as follows:

Invoice price	\$280,000
Delivery charges	900
Installation cost	1,890
Electrical fees	<u>1,000</u>
Total cost	<u>\$283,790</u>

These costs are reasonable and necessary for the asset to be in its existing condition and location and ready for its intended use.

Langford expenses the \$1,210 cost to repair the wall as incurred because it is not necessary for the assembly machine to be in place and ready for production. The repair costs do not have any future economic benefit and do not meet the definition of an asset.

Langford makes the following journal entries on the date of acquisition:

<i>Account</i>	<i>Current Year</i>
Assembly Machine	283,790
Cash	283,790

<i>Account</i>	<i>Current Year</i>
Repair Expense	1,210
Cash	1,210

In a **nonmonetary exchange**, a company acquires an asset by exchanging another asset with the seller rather than paying cash. Nonmonetary exchanges are an infrequent way to acquire PPE and are discussed in Appendix A.

Initial Measurement of Basket Purchases

In a **basket purchase**, a firm acquires two or more fixed assets together for a single purchase price. How does a firm assign the lump-sum expenditure to the individual assets acquired? The valuation of assets acquired in a basket purchase includes both **homogeneous assets**, assets that are the same, and **heterogeneous assets**, assets that are dissimilar from one another.

Basket Purchase: Homogeneous Assets. When a firm acquires homogeneous assets, it records the PPE at cost and includes it on the balance sheet, assigning an equal amount to each asset. For example, if a firm acquires five identical laptop computers at a total cost of \$5,250, it

would value each laptop at \$1,050 (i.e., \$5,250 / 5) and report the total cost of \$5,250 in the office equipment account on the balance sheet.

Basket Purchase: Heterogeneous Assets. In basket purchases involving heterogeneous assets, the firm must properly allocate the total cost to the individual accounts to be reported on the balance sheet (e.g., manufacturing equipment, building, land, and inventory). To illustrate, assume that a firm pays one price for a piece of land that has four buildings on it. At what amounts does the firm initially record the land and each of the four buildings? The **relative fair value method** allocates the total purchase cost to the individual assets acquired in a single transaction by assigning the total cost incurred based on the percentage that each asset’s fair value bears to the total fair value of all the assets purchased as illustrated in Example 11.2.

EXAMPLE 11.2 The Relative Fair Value Method for Basket Purchases

PROBLEM: During the current year, Great Belton Company acquired a manufacturing facility at a total acquisition cost of \$4,000,000. The acquisition included the factory building, land, and all existing equipment in the facility. The firm estimates the fair value of the assets if acquired separately at a total of \$4,300,000 with the fair value of the factory building at \$2,150,000, the fair value of the land at \$860,000, and the fair value of the equipment at \$1,290,000. Determine the capitalized cost of each asset using the relative fair value method and prepare the necessary journal entry to record the acquisition assuming that Great Belton paid cash for the facility.

SOLUTION: To properly value each asset, Great Belton must allocate the total acquisition cost to each account based on relative fair values.

The percentage of fair value for each asset is the fair value for the asset divided by the total fair value of all the assets purchased. For example, the percentage of total fair value for the factory building is 50% (\$2,150,000 / \$4,300,000). To determine the allocation, we multiply each individual asset’s percentage of total fair value by the total cost of the manufacturing facility. For example, the allocated cost of the factory building is 50% × \$4,000,000 = \$2,000,000. The table below shows the fair value of the individual assets acquired and the resulting allocation.

Asset Type	Fair Value	Percentage of Total Fair Value (a)	Total Cost of Manufacturing Facility (b)	Allocation to Specific Balance Sheet Accounts (a) × (b)
Factory building	\$2,150,000	50%	\$4,000,000	\$2,000,000
Land	860,000	20%	4,000,000	800,000
Equipment	1,290,000	30%	4,000,000	1,200,000
Total	<u>\$4,300,000</u>	<u>100%</u>		<u>\$4,000,000</u>

The acquisition date journal entry follows:

Account	Current Year
Factory Building	2,000,000
Land	800,000
Equipment	1,200,000
Cash	4,000,000

Initial Measurement with Deferred Payment Arrangements

Firms can acquire PPE by making an immediate cash payment, financing the acquisition by issuing a *note payable*, or some combination of the two. The payment method used impacts the amount of PPE the firm records.

Notes payable are formal credit arrangements between a creditor (lender) and a debtor (borrower) requiring the payment of a stated face amount on a specified maturity date. In a straight-forward notes payable issue, the face value of an interest-bearing note is equal to the cash price (i.e., the fair value) of the asset. In this case, for the initial measurement, the firm debits the asset and credits the note payable for that amount. The firm recognizes interest expense each period on the unpaid balance of the debt and pays the debt in full at maturity.

Asset Valuation: Determinable Market Value. In most cases, accounting for deferred payment arrangements are straightforward as noted previously. However, there can be complications in practice. For instance, how do we record the asset when the face amount of a note does not reasonably represent the present value of the consideration given or received in the exchange—that is, today’s cash price? The accountant must then determine the proper valuation of the asset. For example, notes payable are sometimes issued with a zero interest rate stated or at a stated rate that is significantly below the market rate of interest. If the asset’s fair value is readily determinable or if the note is traded, the firm records the acquired asset at the fair value of the consideration given (the note) or the fair value of the consideration received (the asset), whichever value is more clearly evident. The difference between the face amount of the note and fair value of the property (or the note) is called the discount and represents the amount of interest to be deferred over the loan term. The discount on notes payable, a contra-liability account, reduces the face value of the note payable to its present value. The firm reports the note payable’s carrying value—its par or face value less the balance of the unamortized discount—on the balance sheet. Example 11.3 illustrates how we determine an asset’s value when the market value is readily determinable.

EXAMPLE 11.3

Asset Valuation: Determinable Market Value

PROBLEM: Smithfield Metals, Inc. acquired a new piece of factory equipment by issuing a zero-interest rate note with a face value of \$120,000. The equipment has a reliable fair value of \$100,000. What journal entry is necessary to record the asset acquisition?

SOLUTION: Smithfield records the asset at its fair value of \$100,000 and a note payable at the face value of \$120,000. It also records a \$20,000 discount on notes payable, a contra-liability account, which represents the interest deferred over the term of the loan.

<i>Account</i>	<i>Year of Acquisition</i>
Factory Equipment	100,000
Discount on Notes Payable	20,000
Notes Payable	120,000

At the date of acquisition, the balance sheet will report the carrying value of notes payable at \$100,000 (Face Value – Discount = \$120,000 – \$20,000).

Asset Valuation: Nondeterminable Market Value. How does the firm value an asset that does not have a comparable market value—for instance, custom machinery, an antique car, or a rare painting—and the note is not publicly traded? When the fair values of the asset or the note are not clearly evident, the firm must compute the present value of the note as an estimate of the asset’s fair value. The firm computes the fair value of the asset by discounting the note payable at an implied or **imputed rate of interest** reflecting the market rate of interest that a borrower would incur today under similar terms and conditions. After determining the present value of the note payable, the firm allocates the face value of the note between the asset’s

acquisition cost (which equals the present value of the note payable) and the discount, which represents the deferred interest expense (i.e., finance charges).

When using the effective interest rate method of amortization, the carrying value of the note payable will always equal the present value of the remaining cash flows discounted at the historical market rate as illustrated in Example 11.4.⁵

EXAMPLE 11.4

Asset Valuation: Nondeterminable Market Value

PROBLEM: JBS, Inc. contracts to buy a specialized machine to crush and sort plastic, glass, and aluminum cans and bottles for recycling. It agrees to make a one-time payment of \$310,000 to the manufacturer at the end of 4 years and signs a zero coupon note payable with a face value of \$310,000. What journal entry is necessary to record the asset acquisition? Assume that the market rate of interest is 6%.

SOLUTION: The face value of the note payable is \$310,000. No interest payments are made on the note. If the market rate of interest is 6%, the present value of the note payable is \$245,549, as shown in the following spreadsheet solution.

	N	I / Y	PV	PMT	FV	Excel Formula
Given	4	6.00%		0	-310,000	
Solve for PV			245,549			= PV(0.06,4,0-310000)

Thus, JBS records the acquisition cost of the machine at \$245,549. The deferred interest is \$64,451 (the face value of the note payable of \$310,000 less the present value of the note payable \$245,549). The net liability is \$245,549, which is the note payable balance less the discount balance.

<i>Account</i>	<i>Date of Acquisition</i>
Equipment	245,549
Discount on Notes Payable	64,451
Notes Payable	310,000

Separating the asset value from the finance charges is critical for proper expense classification on the income statement. Depreciation affects operating income whereas interest expense is a non-operating expense. Ignoring taxes, combining the finance charge with the acquisition cost overstates the asset's carrying value on the balance sheet. Improper measurement of the asset's cost and the finance charge will also overstate depreciation expense and interest expense on the income statement. Based on the purchase in Example 11.4, the interest expense on the note payable in the first year would be \$14,733 (\$245,549 times 6%) and depreciation expense for the equipment would be \$61,387 (\$245,549 divided by 4 years) if the equipment has a 4-year useful life and no residual value. However, if the asset value and finance charges were not separated, the interest expense on the note payable in the first year would be \$18,600 (\$310,000 times 6%), and depreciation expense for the equipment would be \$77,500 (\$310,000 divided by 4 years).

Interest Capitalization

A company constructing a long-term operating asset such as a new manufacturing facility may need to finance the costs of construction. When financing by issuing debt, the company must determine whether to add interest costs to the cost of the asset (that is, to capitalize) or to expense the interest costs as incurred. In other words, accountants must determine whether interest is a cost of a constructed plant asset or if it is a financing cost.

⁵We discuss accounting for long-term debt in more detail in Chapter 14.

To properly value the cost of a constructed plant asset, firms capitalize material interest charges incurred in the construction of certain assets. The amount of interest capitalized is the lesser of actual interest incurred and *avoidable interest*. **Avoidable interest** is the interest amount that the firm could have avoided if it had not borrowed funds to construct the plant asset.

There are four major considerations in the application of interest capitalization requirements:

1. Assets that qualify for interest capitalization
2. Expenditures on which the firm should compute interest
3. Rate of interest
4. Period of capitalization

Because capitalized interest increases an asset's cost, depreciation expense on the asset will be higher in the future. However, interest expense is lower in the construction period.

Qualifying Assets. Firms should capitalize interest for assets constructed or otherwise produced for the firm's own use (for example, a public utility's self-constructed power plant). Qualifying assets include assets constructed by others for the firm's use when deposits and progress payments have been made. The manufacture of inventory or other routine production are not qualifying assets. Firms should also capitalize interest on assets intended for sale or lease that they construct or otherwise produce as discrete projects (for example, office buildings and land purchased for development).

Expenditures. As construction occurs, a company records its expenditures in a noncurrent asset account (construction in progress) and computes interest on the *weighted-average accumulated expenditures* for the accounting period in which it is calculating interest capitalization. The **weighted-average accumulated expenditures** are the construction expenditures weighted by the portion of the year that the expenditure is outstanding until the project is complete or the end of the year if the project is not complete. Example 11.5 illustrates calculating the weighted-average accumulated expenditures.

EXAMPLE 11.5 Weighted-Average Accumulated Expenditures

PROBLEM: Hipmo, Inc. is constructing a plant for its use in operations. During the first year of construction, the firm incurred expenditures equal to \$3,000,000. It paid the \$3,000,000 in four equal installments of \$750,000 at the end of each quarter. Compute the weighted-average accumulated expenditures. The plant is not complete at the end of the first year.

SOLUTION: To compute the weighted-average accumulated expenditures, we weight each expenditure by the period of time outstanding in a year.

Date	Actual Expenditures	Weighted-Average Accumulated Expenditures
March 31	$\$750,000 \times 9/12$	\$ 562,500
June 30	$750,000 \times 6/12$	375,000
September 30	$750,000 \times 3/12$	187,500
December 31	$750,000 \times 0/12$	0
Total		<u>\$1,125,000</u>

The computations indicate that if Hipmo used \$750,000 to repay debt each quarter rather than to construct the asset, the company would have saved interest computed on a weighted-average balance of \$1,125,000.

Rate of Interest. Firms use two separate interest rates to determine the amount of interest to capitalize.

1. The interest rate incurred on specific borrowings applies to the portion of the weighted-average accumulated expenditures that is *less than or equal to* the amount borrowed specifically to finance the construction of the asset.
2. The weighted-average interest rate on all other general outstanding debt during the period applies to the amount of the weighted-average accumulated expenditures that is *greater* than the amount borrowed specifically to finance the construction of the asset.⁶

Example 11.6 provides an example of the interest rate to use.

EXAMPLE 11.6

Rate of Interest

PROBLEM: Hipmo, Inc. is constructing a plant for its use in operations. It has weighted-average accumulated expenditures of \$1,125,000. It borrowed \$900,000 at a 9% interest rate specifically to finance the plant construction. In addition, it has three other general outstanding debt issues that have been outstanding as of the beginning of the year.

Principal	Interest Rate
\$500,000	10%
275,000	8%
120,000	11%

What rate of interest should Hipmo use to compute the amount of capitalized interest?

SOLUTION: Hipmo will use the 9% rate for all expenditures less than or equal to the \$900,000 specific borrowing. It will compute a weighted-average interest rate for the remaining general outstanding debt to apply to the excess weighted-average accumulated expenditure of \$225,000 (\$1,125,000 less \$900,000). The weighted-average interest rate is:

Principal	Interest Rate	Actual Interest
\$500,000	10%	\$50,000
275,000	8%	22,000
120,000	11%	13,200
<u>\$895,000</u>		<u>\$85,200</u>

$$\text{Weighted-Average Interest Rate} = \frac{\text{Total Interest}}{\text{Total Principal}} = \frac{\$85,200}{\$895,000} = 9.52\%$$

The company will use the 9.52% weighted-average interest rate on indirect debt to compute interest on the excess weighted-average accumulated expenditure of \$225,000.

Period of Capitalization. Firms capitalize interest from the time of the initial expenditure to the time the asset is ready for its intended use. When construction is completed but the asset is held idle—envison protesters blocking the operation of a nuclear power plant—the firm must charge interest incurred after the completion of construction to expense.

Computation of Capitalized Interest. Firms compute the amount of avoidable interest as the weighted-average accumulated expenditures times the appropriate interest rate. If the

⁶Specific debt and general outstanding debt are also known as direct and indirect debt, respectively.

computed avoidable interest exceeds the actual interest for the year, the firm capitalizes only the actual interest incurred. In other words, it capitalizes the lesser of the actual interest or the avoidable interest as illustrated in Example 11.7.

How does the firm account for any interest revenue it earns? Companies often invest excess borrowed funds, particularly at the beginning of a construction project, in short-term interest-bearing investments that earn interest revenue. Companies report interest revenue separately rather than netting this interest revenue with their interest costs.

EXAMPLE 11.7 Interest Capitalization with No General Outstanding Debt

PROBLEM: On January 1, 2018, Ryder Retail Associates began constructing its own warehouse. The total estimated cost of the project is \$10,000,000. Ryder's year-end is December 31. During the year, it made the following payments to the contractor:

2018 Date	Amount of Payment
February 1	\$2,400,000
April 1	100,000
July 1	1,450,000
October 1	250,000
December 1	<u>3,000,000</u>
Total Expenditures	<u>\$ 7,200,000</u>

Ryder borrowed specifically for this project by issuing a \$3,500,000, 10% note at SwoboBank on January 1, 2018. Interest is due on December 31. The firm has no other outstanding debt. During the year, Ryder Retail invested the funds and earned interest revenue of \$6,000. The project will be completed in 2019. Compute the amount of interest that Ryder should capitalize. Prepare all necessary journal entries.

SOLUTION: On January 1, Ryder borrows money for the project as follows:

Account	January 1, 2018
Cash	3,500,000
Note Payable	3,500,000

Each time Ryder makes a payment, the company debits a noncurrent asset account, construction in progress, and credits cash. For example, the journal entry for the first payment on February 1 follows:

Account	February 1, 2018
Construction in Progress	2,400,000
Cash	2,400,000

The weighted-average accumulated expenditures for the period are computed next. The weights are the number of months from the date of the expenditure to year-end.

2018 Date	Amount of Payment	Weight	Weighted-Average Accumulated Expenditures
February 1	\$2,400,000	× 11/12	\$2,200,000
April 1	100,000	× 9/12	75,000
July 1	1,450,000	× 6/12	725,000
October 1	250,000	× 3/12	62,500
December 1	<u>3,000,000</u>	× 1/12	<u>250,000</u>
Total	<u>\$ 7,200,000</u>		<u>\$3,312,500</u>

The weighted-average accumulated expenditures (\$3,312,500) are less than the amount of the specific borrowing (\$3,500,000) for the construction. As a result, to calculate avoidable interest, we multiply the amount of the weighted-average accumulated expenditures by the interest rate on the specific borrowing. The avoidable interest is \$331,250, calculated as $\$3,312,500 \times 10\%$.

The actual interest paid for the year is \$350,000 (i.e., $10\% \times \$3,500,000$). The interest to be capitalized is the lower of the actual interest or the avoidable interest. So, the interest capitalized is \$331,250. The interest expense reported on the income statement is the difference between the interest paid and the interest capitalized.

Account	December 31, 2018	
Construction in Progress	331,250	
Interest Expense	18,750	
Cash		350,000

The entry to record interest earned on the borrowed funds follows.

Account	December 31, 2018	
Cash	6,000	
Interest Revenue		6,000

Example 11.8 illustrates the calculation of interest capitalization with general outstanding debt.

EXAMPLE 11.8

Interest Capitalization with General Outstanding Debt

PROBLEM: On January 1, 2018, Snyder Retail Associates began constructing its own warehouse. The total estimated cost of the project is \$10,000,000. Snyder's year-end is December 31. The project will be completed in 2019. During the year, Snyder made the following payments to the contractor:

2018 Date	Amount of Payment
February 1	\$2,400,000
April 1	100,000
July 1	1,450,000
October 1	250,000
December 1	<u>3,000,000</u>
Total expenditures	<u>\$ 7,200,000</u>

Snyder borrowed specifically for this project by issuing a \$3,000,000, 10% note at SwoboBank on January 1, 2018. Interest is due December 31 of each year. During the year, Snyder invested the funds and earned interest revenue of \$6,000. Snyder also reports the following general debt with interest due December 31 of each year. All debt has been outstanding as of the beginning of the year.

Interest Rate	Amount
8%	\$ 700,000
12%	<u>8,550,000</u>
Total	<u>\$9,250,000</u>

Continued

Compute the amount of interest that Snyder should capitalize. Prepare all necessary journal entries. Prepare the construction in progress t-account.

SOLUTION: Snyder borrows money for the project as seen here:

Account	January 1, 2018	
Cash	3,000,000	
Note Payable		3,000,000

Each time that Snyder makes a payment, the company debits a noncurrent asset account, construction in progress, and credits cash. For example, the journal entry for the first payment on February 1 follows:

Account	February 1, 2018	
Construction in Progress	2,400,000	
Cash		2,400,000

The weighted-average accumulated expenditures for the period are computed in the following table. The weights are the number of months from the date of the expenditure to year-end.

2018 Date	Amount of Payment	Weight	Weighted-Average Accumulated Expenditures
February 1	\$2,400,000	× 11/12	\$2,200,000
April 1	100,000	× 9/12	75,000
July 1	1,450,000	× 6/12	725,000
October 1	250,000	× 3/12	62,500
December 1	3,000,000	× 1/12	250,000
Total	<u>\$7,200,000</u>		<u>\$3,312,500</u>

The weighted-average accumulated expenditures of \$3,312,500 exceed the amount of specific debt of \$3,000,000 by \$312,500. As a result, Snyder must compute the weighted-average interest rate on the general outstanding debt.

Debt Type	Principal	Rate	Actual Interest
Specific	<u>\$3,000,000</u>	× 10%	<u>\$ 300,000</u>
General outstanding	\$ 700,000	× 8%	\$ 56,000
General outstanding	8,550,000	× 12%	1,026,000
Total general debt	<u>\$9,250,000</u>		<u>\$1,082,000</u>

The weighted-average interest rate is 11.7% computed as \$1,082,000 / \$9,250,000. The total actual interest incurred for the year is equal to \$1,382,000. The actual total interest incurred is the sum of interest on the specific debt or \$300,000 plus the interest on the general debt of \$1,082,000. We compute the amount of avoidable interest in the following table.⁷

Debt Type	Weighted-Average Accumulated Expenditures	Rate	Avoidable Interest
Specific	\$3,000,000	× 10.0%	\$300,000
General	312,500	× 11.7%	36,563
Totals	<u>\$3,312,500</u>		<u>\$336,563</u>

⁷In practice, some companies have been using a single weighted-average interest rate on all outstanding debt. In this case, the weighted-average interest rate on all debt is 11.28% (\$1,382,000 / \$12,250,000) and avoidable interest is computed as follows: \$3,312,500 × 11.28% = \$373,650.

The maximum interest that Snyder can capitalize is equal to \$1,382,000, the actual interest for the year. Because the \$336,563 avoidable interest is lower than the maximum interest, Snyder will capitalize the avoidable interest in 2018.

Interest expense reported on the income statement is the difference between the total interest incurred and the amount capitalized. In this case, the interest expense on the income statement is \$1,045,437 (i.e., \$1,382,000 – \$336,563).

Snyder makes the following journal entry assuming that it pays interest only at the end of the year.

Account	December 31, 2018	
Construction in Progress	336,563	
Interest Expense	1,045,437	
Cash		1,382,000

The entry to record interest earned on the borrowed funds follows:

Account	December 31, 2018	
Cash	6,000	
Interest Revenue		6,000

After recording all payments to the contractor and the interest capitalized for the year, the construction in progress account is \$7,536,563. This balance is equal to the total accumulated expenditures (i.e., \$7,200,000) plus the capitalized interest. The construction in progress account follows.⁸

	Construction in Progress	
February 1, 2018	2,400,000	
April 1, 2018	100,000	
July 1, 2018	1,450,000	
October 1, 2018	250,000	
December 1, 2018	3,000,000	
Subtotal	7,200,000	
Capitalized Interest	336,563	
December 31, 2018	<u>7,536,563</u>	

The company will transfer the balance of construction in progress to the appropriate account in property, plant, and equipment upon completion of the project.

Constructed Assets and Overhead Costs. When a company constructs an asset, it may contribute certain portions of the labor and material toward the completion of the project. For example, a company incurs costs to pay the builders and buy the concrete and steel needed to construct a new headquarters. Firms capitalize direct materials used and direct labor hours expended on the project as part of the acquisition cost of the asset.

Indirect overhead costs (for example, general supervisory salaries and depreciation) are generally accounted for using *full-cost accounting*. Under **full-cost accounting**, the firm allocates a proportionate share of all indirect cost incurred by the company to the construction project.

IFRS Interest Capitalization. Accounting for interest capitalization under IFRS is similar to the U.S. GAAP process for all areas discussed:

1. Assets that qualify for interest capitalization
2. Expenditures on which firms should compute interest
3. Rate of interest
4. Period of capitalization

⁸Note that if a project extends over multiple periods, then the beginning balance of construction in progress is included in the weighted-average accumulated expenditure and weighted as of the beginning of the year.

There are two main differences in U.S. GAAP and IFRS related to the capitalization of interest for specific borrowings. First, IFRS-reporting firms capitalize all borrowing costs related to a loan obtained specifically to acquire or construct the asset because the debt is used directly to finance the construction. Unlike U.S. GAAP, there is no need to use the weighted-average accumulated expenditures to determine interest to capitalize for specific borrowing. The weighted-average accumulated expenditures are used only to determine interest to capitalize for general debt. Second, income from the temporary investment of specific borrowings reduces capitalized borrowing costs.

In Examples 11.9 and 11.10, we revisit the scenarios in Examples 11.7 and 11.8 using IFRS.

EXAMPLE 11.9 IFRS Interest Capitalization with No General Outstanding Debt

PROBLEM: On January 1, 2018, Ryder Retail Associates, an IFRS reporter, began constructing its own warehouse. The total estimated cost of the project is \$10,000,000. Ryder's year-end is December 31. During the year, Ryder made the following payments to the contractor:

2018 Date	Amount of Payment
February 1	\$2,400,000
April 1	100,000
July 1	1,450,000
October 1	250,000
December 1	3,000,000
Total expenditures	<u>\$ 7,200,000</u>

Ryder borrowed specifically for this project by issuing a \$3,500,000, 10% note at SwoboBank on January 1, 2018. Interest is due December 31 of each year. Ryder has no other outstanding debt. During the year, Ryder invested the funds and earned interest revenue of \$6,000. The project will be completed in 2019. Compute the amount of interest that Ryder should capitalize. Prepare all necessary journal entries.

SOLUTION: Ryder borrows money for the project as seen next:

Account	January 1, 2018
Cash	3,500,000
Note Payable	3,500,000

Each time Ryder makes a payment, the company debits a noncurrent asset account, construction in progress, and credits cash. The journal entry for the first payment follows.

Account	February 1, 2018
Construction in Progress	2,400,000
Cash	2,400,000

Under IFRS, reporting firms capitalize all borrowing costs related to the debt incurred specifically to acquire the asset. Therefore, capitalized interest is based on the specific debt balance of \$3,500,000. The amount of interest capitalized is \$350,000, or $10\% \times \$3,500,000$. Because the avoidable interest equals actual interest of \$350,000, there is no interest expense. However, IFRS requires that firms net any income earned on the funds obtained from the construction loan, if invested, against the interest expense. During the year, Ryder earned \$6,000 of interest income. So, Ryder can capitalize interest of \$344,000 (\$350,000 less \$6,000).

Account	December 31, 2018
Construction in Progress	344,000
Cash	344,000

For Example 11.10, notice that the capitalized interest under IFRS is lower than under U.S. GAAP due to the different treatment of specific debt and netting interest earned on borrowed funds.

EXAMPLE 11.10**IFRS Interest Capitalization with General Outstanding Debt**

PROBLEM: Assume that Snyder Retail Associates in Example 11.8 is an IFRS reporter. Compute the amount of interest that Snyder should capitalize. Prepare all necessary journal entries. Prepare the construction in progress t-account.

SOLUTION: Snyder borrows money for the project as seen here:

<i>Account</i>	<i>January 1, 2018</i>	
Cash	3,000,000	
Note Payable		3,000,000

Each time Snyder makes a payment, the company debits a noncurrent asset account, construction in progress, and credits cash. The journal entry for the first payment follows.

<i>Account</i>	<i>February 1, 2018</i>	
Construction in Progress	2,400,000	
Cash		2,400,000

We must calculate the weighted-average accumulated expenditures. The weights are the number of months from the date of the expenditure to year-end.

2018 Date	Amount of Payment	Weight	Weighted-Average Accumulated Expenditures
February 1	\$2,400,000	× 11/12	\$2,200,000
April 1	100,000	× 9/12	75,000
July 1	1,450,000	× 6/12	725,000
October 1	250,000	× 3/12	62,500
December 1	<u>3,000,000</u>	× 1/12	<u>250,000</u>
Total	<u>\$ 7,200,000</u>		<u>\$3,312,500</u>

The weighted-average accumulated expenditures of \$3,312,500 exceed the amount of specific debt of \$3,000,000 by \$312,500. As a result, Snyder must compute the weighted-average interest rate on the outstanding general debt.

Debt Type	Principal	Rate	Actual Interest
Specific	<u>\$3,000,000</u>	10%	<u>\$ 300,000</u>
General outstanding	\$ 700,000	8%	\$ 56,000
General outstanding	<u>8,550,000</u>	12%	<u>1,026,000</u>
Total general debt	<u>\$9,250,000</u>		<u>\$1,082,000</u>

The weighted-average interest rate is 11.7% computed as \$1,082,000 / \$9,250,000. The total actual interest incurred for the year is equal to \$1,382,000. The actual total interest incurred is the sum of interest on the specific debt, or \$300,000, plus the interest on the general debt of \$1,082,000. We compute the amount of avoidable interest in the following table.

Continued

Debt Type	Weighted-Average Accumulated Expenditures	Rate	Avoidable Interest
Specific	\$3,000,000	10.0%	\$300,000
General	312,500	11.7%	<u>36,563</u>
Total			<u>\$336,563</u>

Because the \$336,563 (\$300,000 plus \$36,563) is lower than total interest expense during the year, Snyder capitalizes this amount in 2018. Under IFRS, the \$6,000 of interest earned on the borrowed funds is offset against the amount capitalized. Therefore, the amount of interest capitalized is \$330,563, or (\$336,563 – \$6,000).

Interest expense reported on the income statement is the difference between the net interest expense incurred and the interest capitalized. The net interest expense incurred equals the total actual interest minus the interest revenue earned on excess construction funds. In this case, the interest expense on the income statement is \$1,045,437 (i.e., \$1,376,000 – \$330,563).

Slyder makes the following journal entry assuming that it pays interest only at the end of the year.

Account	December 31, 2018
Construction in Progress	330,563
Interest Expense	1,045,437
Cash*	1,376,000

*The credit to cash represents Net Interest Expense Incurred = Interest Expense – Interest Revenue (\$1,382,000 – \$6,000 = \$1,376,000).

After recording all payments to the contractor and the interest capitalized for the year, the construction in progress account would be equal to \$7,530,563. This balance is equal to the total accumulated expenditures (i.e., \$7,200,000) plus the capitalized interest. The construction in progress account follows.

Construction in Progress	
February 1, 2018	2,400,000
April 1, 2018	100,000
July 1, 2018	1,450,000
October 1, 2018	250,000
December 1, 2018	3,000,000
Subtotal	<u>7,200,000</u>
Capitalized Interest	330,563
December 31, 2018	<u>\$7,530,563</u>

The company will transfer the balance of construction in progress to the appropriate account in property, plant, and equipment upon completion of the project.

Exhibit 11.1 provides a comparison of the requirements for interest capitalization under U.S. GAAP and IFRS.

EXHIBIT 11.1 Comparison of Requirements for Interest Capitalization under U.S. GAAP and IFRS

Requirement	U.S. GAAP	IFRS
Assets that qualify for interest capitalization	Assets constructed or otherwise produced for the firm's own use. Qualifying assets include assets constructed by others for the firm's use when deposits and progress payments have been made.	Similar to U.S. GAAP.
Expenditures on which the firm should compute interest	Weighted-average accumulated expenditures for the accounting period in which it is calculating interest capitalization.	Similar to U.S. GAAP.
Rate/amount of interest to use in the computation	Two interest rates are used to determine the amount of interest to capitalize. <ol style="list-style-type: none"> For specific borrowings: The interest rate incurred on specific borrowings applies to the portion of the weighted-average accumulated expenditures that is less than or equal to the amount of the specific borrowing. For general debt: The weighted-average interest rate of all other outstanding debt during the period applies to the amount of the weighted-average accumulated expenditures that is greater than the amount borrowed specifically to finance the construction of the asset. 	<p>► The two interest rates are applied differently under IFRS:</p> <ol style="list-style-type: none"> For specific borrowings: All borrowing costs related to a loan obtained specifically to acquire or construct the asset are capitalized. For general debt: Firms use the weighted-average accumulated expenditures to determine interest to capitalize. <p>Additionally, income from the temporary investment of specific borrowings reduces capitalized borrowing costs.</p>
Period of capitalization	From the time of the initial expenditure to the time the asset is ready for its intended use.	Similar to U.S. GAAP.

JUDGMENTS IN ACCOUNTING:

The Initial Measurement of Property, Plant, and Equipment

Managers exercise judgment with the initial measurement of PPE when deciding whether to expense or capitalize an expenditure. Based on the definition of an asset and other authoritative guidance, firms capitalize the costs related to activities required to bring the asset to the condition and location necessary for use. For example, when a company buys a computer, it receives an invoice including the purchase price, taxes, and shipping charges. All of these costs are required to bring the asset to the condition and location necessary for use—so the firm capitalizes all the costs on the invoice as acquisition costs of the computer.

Now assume that a computer technician spends 3 hours setting up the computer at a user's desk, including adding a printer, a monitor, and all cables. Should the firm capitalize the cost associated with the technician's time as a cost related to an activity required to bring the asset to a condition and location necessary for use? Based on the authoritative literature, the technician's time seems to be a required activity. However, in practice, few companies track the technician's time and capitalize it. Tracking systems are costly, and the benefits of capitalizing the additional cost are viewed as immaterial. Contrast this decision to the purchase of major manufacturing equipment. Installation and testing is often lengthy and costly, so a company will monitor these costs and capitalize them.

The decision to expense or capitalize an expenditure can have significant effects on published financial statements—and many significant accounting failures have involved inappropriate cost capitalization. In a flagrant case of fraudulently capitalizing expenditures that it should have expensed, *Waste Management, Inc.* misstated its financial statements for the period from 1992 through 1997 by improperly capitalizing and deferring operating expenses. By deferring the recognition of these expenses, *Waste Management* significantly overstated its assets and increased its operating income. The 1997 cumulative earnings restatement amounted to \$1.4 billion, covering the 1992 to 1997 period.

With basket purchases, the firm allocates one purchase price to specific assets based on fair values. For some assets, markets may not exist or are not active. When fair values for specific assets are not available, allocations for basket purchases are not possible. Standard setters have not provided extensive rules in this area. Companies often set policies on asset capitalization after considering materiality and cost-benefit criteria. Management must use judgment in forming and applying a capitalization policy, and auditors are required to exercise their professional judgment in assessing the appropriateness of managements' decisions.

- ② Demonstrate the accounting for property, plant, and equipment subsequent to acquisition, including subsequent expenditures and depreciation.

Subsequent Measurement of Property, Plant, and Equipment

Accounting for long-term operating assets extends beyond acquisition. New machinery must be maintained, *depreciated* over time, or impaired if its value falls. Several events and transactions affect long-term fixed assets after acquisition, including subsequent expenditures related to the fixed assets, depreciation, and impairments. Impairments, discussed in Chapter 12, are decreases in an asset's carrying value whenever the asset no longer provides the future benefits expected. In this section, we discuss the accounting for subsequent expenditures and depreciation and how they affect measuring the carrying value of the asset.

Subsequent Expenditures

Firms either capitalize or expense expenditures made after acquisition of a fixed asset. Again, the decision to capitalize or expense these costs depends on the definition of an asset.

Firms expense noncapital expenditures, such as ordinary repairs, which are expenditures to maintain the operating efficiency immediately of an asset that do not extend its original useful life. For example, *AT&T's* 2016 annual report disclosed that it charged the cost of maintenance and repairs of property, plant, and equipment to operating expenses. Most ordinary repairs are relatively small expenditures that recur on a regular basis, such as a periodic oil change for a vehicle. An oil change does not increase the life of the asset beyond the original estimate, and it does not enhance its output. If an expenditure provides future economic benefit and, therefore, qualifies as an asset (i.e., it is a capital expenditure), the firm capitalizes the cost by adding the cost of the expenditure to the carrying value of the long-term fixed asset. Examples of capital expenditures are major overhauls of existing property, plant, and equipment; extraordinary repairs; and plant expansion. Adding an additional floor to a factory building or installing a refrigeration system in a delivery van would qualify as a capital expenditure. Example 11.11 illustrates accounting for subsequent expenditures.

EXAMPLE 11.11 Subsequent Expenditures

PROBLEM: Cunningham Bakeries needs new racks and a refrigeration unit in its existing delivery van to begin delivering ice cream cakes. It paid the total cost of the asset modification, \$15,000, in cash. In addition, Cunningham took its delivery van in for service and paid \$60 cash for an oil change and tire rotation. What journal entries are needed to record these two transactions?

SOLUTION: Because the \$15,000 expenditure increased delivery capacity and productivity and thus changed the asset's revenue-generating ability, Cunningham will consider it a capital expenditure. The journal entry to record the capital expenditure is:⁹

<i>Account</i>	<i>Current Year</i>
Delivery Van	15,000
Cash	15,000

The cost of the oil change and tire rotation is not a capital expenditure, so Cunningham will expense the \$60 immediately. The journal entry to record the event is:

<i>Account</i>	<i>Current Year</i>
Repairs and Maintenance Expense	60
Cash	60

Depreciation of Tangible Fixed Assets

A company's allocation of the initial cost of the asset to future periods of expected benefit from use of the asset is a critically important aspect of accounting for PPE. **Depreciation** is the systematic and rational allocation of the cost of a long-term plant asset to expense over the asset's expected useful life. As the asset is depreciated, the firm reports depreciation expense on the income statement and reduces the carrying value of the asset on the balance sheet. We will discuss the depreciation process in detail, including the pertinent judgments and methods employed.

THE CONCEPTUAL FRAMEWORK CONNECTION The Cost Allocation Process

Depreciation is a process of allocating costs to the periods in which the benefits are consumed. Depreciation is therefore consistent with the conceptual framework's guidance for expense recognition.

Firms use tangible fixed assets in the revenue-generating process over an extended period of time. Thus, the loss of asset value through utilization meets the definition of an expense. Similarly, as firms use tangible fixed assets, the future economic benefits they provide to the company generally decline. Consequently, in the cost-allocation process, accountants use depreciation to adjust the acquisition cost of tangible fixed assets to reflect their use.

To illustrate, assume that a florist purchased a delivery truck for \$21,000 that he expects to use evenly over 7 years. At the end of the 7 years, he will take the truck to the junk yard. (The truck will have no residual or scrap value.) The florist records the truck as an asset with an acquisition cost of \$21,000. Every year for the next 7 years, the florist will reduce the carrying value of the truck by \$3,000 ($\$21,000 / 7$ years) and report \$3,000 in depreciation expense to the income statement. Consequently, at the end of the 7 years, the carrying value of the truck will be zero and the asset will be scrapped at no gain or loss.

Land is not depreciated because it typically has an unlimited life—generally, it is not consumed in operations. Accordingly, per the conceptual framework, it would not be appropriate to allocate the cost of land over time.

⁹If an expenditure is viewed as extending the useful life of an asset rather than increasing output or capacity, some companies will debit accumulated depreciation instead of the asset account. The asset's book value is the same whether we debit accumulated depreciation or debit the asset account directly.

Overview of the Depreciation Process for Property, Plant, and Equipment.

Allocating the cost of a fixed asset through depreciation requires that management estimate the asset's useful life and its *scrap value* and choose the depreciation method.

1. **Estimate useful life.** Management consider a number of different factors in estimating the productive life of a fixed asset. For example, managers may consider experience using this type of asset in prior years, relevant industry practice, maintenance policy, specific firm usage versus normal usage, and the possibility of obsolescence. Useful life varies by type of asset. For instance, *AT&T* depreciates its buildings and improvements over 2 to 44 years; office equipment over 3 to 10 years; and cable, wiring, and conduits over 15 to 50 years.
2. **Estimate scrap value.** The **scrap value** (also referred to as residual or salvage value) is the amount the firm expects to realize on disposal of the fixed asset at the end of its productive service to the firm. The scrap value reduces the depreciable base of the asset, so the firm depreciates only the cost less scrap value over the life of the asset. Scrap values are designed to minimize or avoid any gain or loss on disposal. For example, assume that a company sells its fleet of service vans every 5 years. If the dealership allows a trade-in value equal to 10% of original cost, then there is a 10% residual value. If the company depreciates the vans using a 10% residual value, there would never be a gain or loss on the disposal. Management estimates scrap values based on their experience or relevant industry practice. For example, management teams that estimate residual values for fixed assets used in high-tech industries typically assume a zero scrap value due to rapid advances in technology that cause a minimal residual value in a short period of time. As a result, the cost of estimating scrap values is not worth the benefit.
3. **Select depreciation method.** Management also decides which depreciation method to use for the company's fixed assets. The goal is to select a depreciation method reflecting the pattern that most closely articulates with the revenue generated from the use of the asset. Recall that the conceptual framework directs firms to recognize expenses when they consume benefits in revenue-generating activities.

Depreciation Guidelines. Depreciation expense is an end-of-period adjustment that firms include on the income statement in the computation of operating income. Firms generally report depreciation expense as part of selling, general, and administrative expenses.¹⁰

On the balance sheet, firms reduce the tangible fixed asset by increasing **accumulated depreciation**, a contra-asset account that represents the total depreciation taken over the life of the asset. Firms subtract accumulated depreciation from the original cost of the fixed asset and report **net book value (NBV)**, also referred to as **net fixed assets (NFA)**, in the noncurrent asset section of the balance sheet. The following t-accounts illustrate the changes in the asset's cost and accumulated depreciation accounts.

Fixed Asset Cost		Accumulated Depreciation	
Beginning Balance			Beginning Balance
+ Purchases	– Disposals	– Disposals	+ Depreciation Expense
+ Subsequent Capital Expenditures			
<u>Ending Balance</u>			<u>Ending Balance</u>

Initially, the most objective information regarding a fixed asset's value is its cost. As a result, the accountant preserves the record of historical cost and records the estimated depreciation in the separate accumulated depreciation account. For financial statement purposes, firms report the net book value as a single line item.

Depreciation Methods. Rather than requiring a particular method of depreciation, U.S. GAAP simply states that the method of depreciation should result in a systematic allocation of

¹⁰For manufacturing firms, depreciation may be included in part of manufacturing overhead (i.e., in inventory as a product cost and charged to cost of sales when sold).

the cost of the asset. Thus, firms employ a number of different depreciation methods in practice. We will focus our presentation on the three most common allocation methods:

1. *Straight-line method*
2. *Units-of-output method*
3. *Double-declining balance approach*¹¹

These three methods are used by the vast majority of firms. Note that in recent years, U.S. firms depreciated over 90% of tangible fixed assets using the straight-line method.¹²

1. **Straight-Line (SL) method.** The **straight-line method** applies a constant rate of depreciation against a constant depreciable cost. The firm determines the rate of depreciation by dividing 1 by the useful life of the asset. Depreciable base (also referred to as depreciable cost) is equal to acquisition cost less estimated scrap value. Depreciation expense is the depreciable base divided by the useful life or the depreciable base multiplied by the straight-line rate as shown in the following equation and illustrated in Example 11.12.

$$\text{Depreciable Base} = \text{Acquisition Cost} - \text{Scrap Value} \quad (11.1)$$

$$\text{Straight-Line Depreciation Expense} = \text{Depreciable Base} / \text{Useful Life} \quad (11.2)$$

or

$$\text{Straight-Line Rate} = 1 / \text{Useful Life} \quad (11.3)$$

$$\text{Straight-Line Depreciation Expense} = \text{Depreciable Base} \times \text{Straight-Line Rate} \quad (11.4)$$

EXAMPLE 11.12 Straight-Line Depreciation

PROBLEM: On January 1, Naylor Company acquired a piece of heavy equipment at a total cost of \$670,000. The firm estimates that the asset will have a useful life of 5 years and expects a \$70,000 scrap value at the end of its useful life. Compute the annual depreciation for Naylor over the life of the asset using the straight-line method and prepare the journal entry that Naylor will record at the end of the first year.

SOLUTION: Using the data provided, Naylor Company’s straight-line depreciation is as follows:

$$\text{Depreciation Expense} = \frac{\text{Depreciable Base}}{\text{Useful Life}} = \frac{\$670,000 - \$70,000}{5 \text{ Years}} = \underline{\underline{\$120,000/\text{Year}}}$$

or

$$\begin{aligned} \text{Straight-Line Rate} &= 1/5 \text{ years} = 20\% \\ \text{Depreciation Expense} &= \text{Depreciable Base} \times \text{Straight-Line Rate} \\ &= (\$670,000 - \$70,000) \times 20\% \\ &= \underline{\underline{\$120,000/\text{year}}} \end{aligned}$$

The journal entry at the end of the first year is:

Account	End of First Year
Depreciation Expense—Equipment	\$120,000
Accumulated Depreciation—Equipment	\$120,000

¹¹Alternative depreciation methods include the sum-of-the-years digits approach, the 150% declining balance method, group methods, and composite methods.

¹²See surveys reported in AICPA, *Accounting Trends and Techniques—2012* (New York, NY: AICPA, 2012).

2. **Units-of-Output method.** The **units-of-output method** derives a rate of depreciation per unit produced and applies that rate against the actual number of units produced each period. For example, the number of miles driven could be used to depreciate a delivery truck. Depreciation expense is the depreciable base divided by the estimated total units of output times the actual number of units produced each period. The depreciable base is cost less estimated scrap value.

$$\text{Depreciation Rate per Unit} = \frac{\text{Depreciable Base}}{\text{Estimated Total Units of Output}} \quad (11.5)$$

$$\text{Units-of-Output Depreciation Expense} = \text{Depreciation Rate per Unit} \times \text{Actual Units Produced} \quad (11.6)$$

or

$$\text{Units-of-Output Depreciation Expense} = \text{Depreciable Base} \times \frac{\text{Actual Units of Output}}{\text{Estimated Total Units of Output}} \quad (11.7)$$

Example 11.13 illustrates the units-of-output depreciation method.

EXAMPLE 11.13 Units-of-Output Depreciation

PROBLEM: On January 1, Naylor Company acquired a piece of heavy equipment at a total cost of \$670,000. The firm estimates that the asset will have a useful life of 100,000 units of output and expects a \$70,000 residual value at the end of its useful life. The company manufactures 30,000, 45,000, and 25,000 units in the first, second, and third year of use, respectively. Compute the annual depreciation for Naylor over the life of the asset using the units-of-output method and prepare the journal entry that Naylor will record at the end of the first year.

SOLUTION: The depreciation rate per unit of output is \$6 per unit as computed here:

$$\text{Depreciable Base/Estimated Total Units of Output} = \$600,000/100,000 = \$6 \text{ per Unit}$$

$$\text{Depreciation Expense} = \$6 \text{ per Unit} \times \text{Actual Units Produced}$$

The depreciation schedule is as follows:

Year	Units of Output Produced	Depreciable Base / Estimated Total Units of Output	Depreciation Expense
1	30,000	\$6	\$180,000
2	45,000	\$6	270,000
3	25,000	\$6	150,000
Total	100,000		\$600,000

The journal entry at the end of the first year is:

Account	End of First Year
Depreciation Expense—Equipment	180,000
Accumulated Depreciation—Equipment	180,000

3. **Double-Declining balance (DDB) method. Decreasing-charge methods** are depreciation methods that take more depreciation in the early years than in the late years of the asset's useful life. Acceleration of depreciation charges is based on the premise that an asset is often most productive in its early years of service. Thus, decreasing-charge methods match higher depreciation expense with higher related revenues in the early years of the asset's life and match lower depreciation charges against lower related revenues in the later years. Accelerated depreciation generally results in constant total annual usage costs (depreciation expense and repair and maintenance expense) charged against income over the life of the asset. In the early

years of the asset’s life, there are high depreciation expenses but low repair and maintenance expenses. When the asset is older, there are high repair and maintenance expenses and low depreciation expenses. Thus, the decreasing-charge methods of depreciation result in a fairly constant level of asset utilization costs over the asset’s useful life.

Exhibit 11.2 illustrates a decreasing-charge method of depreciation expense and repair and maintenance costs for a fixed asset with a 5-year useful life. Depreciation expense is higher than repair and maintenance expense in Years 1 and 2 when the asset is most productive. Depreciation expense declines in Years 4 and 5 when the asset is less productive and needs more repairs and maintenance. In this example, the total expenses related to the asset (depreciation and repair and maintenance) decline as the asset’s useful life decreases and productivity declines.

EXHIBIT 11.2 Fixed Asset Utilization Costs

**Decreasing-Charge Method of Depreciation Expense,
Repair and Maintenance Expense and Total Expenses
over an Asset’s Useful Life**

The **double-declining balance (DDB) method** is a decreasing-charge method that applies a constant rate of depreciation against a declining net book value (defined as cost less accumulated depreciation). The constant rate used in declining balance methods is a multiple of the straight-line rate. Note that the asset’s net book value is the depreciable base for DDB, not the cost less scrap value. Therefore, DDB does not subtract the scrap value from the depreciable base before computing the annual depreciation expense. Firms compute the DDB rate as twice the straight-line rate—hence the term “double” in the title of the method.¹³

$$\text{DDB Rate} = 2 \times \text{Straight-Line Rate} \tag{11.8}$$

or

$$\text{DDB Rate} = 2 \times 1/\text{Useful Life} \tag{11.9}$$

$$\text{DDB Depreciation Expense} = \text{Net Book Value at Beginning of Period} \times \text{DDB Rate} \tag{11.10}$$

¹³The DDB approach is one of several declining-balance methods. For example, with the “150% declining balance,” the constant rate is 1½ times the straight-line rate.

With the DDB approach, the ending net book value is not always equal to the planned scrap value. In this case, the firm reduces the depreciation expense in the last year to the necessary amount to arrive at an ending book value equal to the scrap value. The DDB depreciation method is illustrated in Example 11.14.

EXAMPLE 11.14 Double-Declining Balance Depreciation

PROBLEM: On January 1, Naylor Company acquired a piece of heavy equipment at a total cost of \$670,000. The firm estimates that the asset will have a useful life of 5 years and expects a \$70,000 residual value at the end of its useful life. Prepare the depreciation schedule for Naylor over the life of the asset using the DDB and prepare the journal entry that Naylor will record at the end of the first year.

SOLUTION: The DDB rate is as follows:

$$\text{Straight-Line Rate} = 1/\text{Useful Life} = 1/5 \text{ Years} = 20\% \text{ DDB Rate} = 2 \times 20\% = 40\%$$

Double-Declining Balance Method Depreciation Schedule for Naylor Company

Year	Beginning Net Book Value (a)	DDB % (b)	Depreciation Expense (c) = (a) × (b)	End-of-Year Accumulated Depreciation (d) = (c) + Prior Year (d)	End-of-Year Net Book Value (e) = Cost – (d)
1	\$670,000	40%	\$268,000	\$268,000	\$402,000
2	402,000	40%	160,800	428,800	241,200
3	241,200	40%	96,480	525,280	144,720
4	144,720	40%	57,888	583,168	86,832
5	86,832		16,832*	600,000	70,000

*Depreciation expense needed to have the ending net book value equal to the \$70,000 planned scrap value.

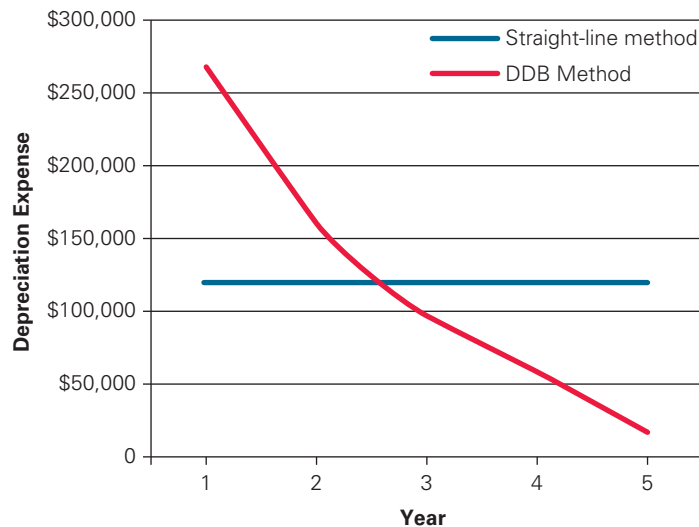

At the end of Year 5, the equipment's net book value is \$70,000, its residual value.

The journal entry at the end of the first year is:

Account	End of First Year
Depreciation Expense—Equipment	268,000
Accumulated Depreciation—Equipment	268,000

Exhibit 11.3 compares the straight-line and DDB methods graphically.

EXHIBIT 11.3 Comparison of Depreciation Methods

In Example 11.12, we determined that the straight-line method results in a constant \$120,000 depreciation expense per year in the Naylor Company example. In contrast, the DDB method results in Naylor depreciating \$268,000 and \$160,800 in Years 1 and 2, respectively. The differences begin to reverse in Year 3 when the straight-line depreciation expense of \$120,000 exceeds the DDB depreciation expense of \$96,480.

Partial-Year Depreciation. The depreciation examples thus far have assumed that firms purchased PPE at the beginning of the year. In reality, though, firms purchase PPE throughout the year. If a calendar-year firm purchased a piece of equipment on August 14, it would be inappropriate for the firm to record a full year’s depreciation expense. Computing the depreciation based on the number of days the firm held the asset in the year could be a time-consuming approach that costs more than the benefits derived.

In practice, firms employ a large variety of methods to compute partial-year depreciation that assume the firm purchased the asset at certain fixed points during the year. For example, with a **half-year convention**, the firm records a half year of depreciation for an asset acquired during the year of purchase (the assumption is that the firm acquired the asset at the midpoint of the year). The company also records a half-year’s depreciation in the final year of the asset’s life. For example, for an asset with a 5-year life purchased on May 1, the firm takes a half year of depreciation in Year 1 and Year 6.

Other approaches assume that the firm acquired the asset at the beginning or the middle of the month it was placed in service. Partial-year depreciation using the straight-line method is shown in Example 11.15.

EXAMPLE 11.15

Partial-Year Depreciation: Straight-Line Method

PROBLEM: On May 8, the Naylor Company (a calendar-year firm) acquired a piece of heavy equipment at a total cost of \$670,000. Naylor estimates that the asset has a useful life of 5 years. Naylor expects a \$70,000 scrap value at the end of its useful life. The company uses a simplifying assumption that all assets are placed in service on the first day of the month in which they were actually placed into service. What is the depreciation expense in the first year using the straight-line method? What is the depreciation schedule using the straight-line method?

SOLUTION: Under Naylor’s simplifying assumption, we account for the asset as if it were acquired on May 1. First, we need to calculate depreciation expense for a full year under the straight-line method:

$$\begin{aligned} \text{Depreciation Expense} &= \frac{\text{Cost} - \text{Scrap Value}}{\text{Useful Life}} \\ &= \frac{\$670,000 - \$70,000}{5 \text{ Years}} = \underline{\underline{\$120,000/\text{Year}}} \end{aligned}$$

Second, we develop the depreciation schedule using the straight-line method, applying the partial-period assumption in the first and last years of the asset’s useful life. Thus, in the first year, depreciation expense is the full-year amount times 8/12 because we are assuming that Naylor holds the asset for 8 months in the first year. So, the first year’s depreciation expense is \$80,000.

In the last year, depreciation expense is the full-year amount times 4/12 because we are assuming that Naylor holds the asset for 4 months in the last year. In the last year, depreciation expense is \$40,000. The depreciation schedule is shown below:

Year	Depreciation Expense	Original Cost	End-of-Year Accumulated Depreciation	End-of-Year Net Book Value
1	$\$120,000 \times 8/12 = \$ 80,000$	\$670,000	\$ 80,000	\$590,000
2	120,000	670,000	200,000	470,000
3	120,000	670,000	320,000	350,000
4	120,000	670,000	440,000	230,000
5	120,000	670,000	560,000	110,000
6	$\$120,000 \times 4/12 = \underline{40,000}$	670,000	600,000	70,000
Total	<u>\$600,000</u>			

Companies that use the double-declining balance method also use partial-year depreciation by allocating the first year's annual DDB depreciation expense on a proportional basis. Example 11.16 illustrates the partial-year depreciation using the double-declining balance method.

EXAMPLE 11.16**Partial-Year Depreciation: Double-Declining Balance (DDB) Method**

PROBLEM: On May 8, the Naylor Company (a calendar-year firm) acquires a piece of heavy equipment at a total cost of \$670,000. Naylor estimates that the asset has a useful life of 5 years. Naylor expects a \$70,000 scrap value at the end of its useful life. The company uses a simplifying assumption that all assets are placed in service on the first day of the month in which they were actually placed into service. What is the depreciation schedule using the DDB method?

SOLUTION: Under Naylor's simplifying assumption, we account for the asset as if it were acquired on May 1. So, we allocate 8/12 of the full first-year DDB depreciation expense to the first year. The following table shows that the first year's depreciation expense is \$178,667. We then use the 40% rate for the following years. Depreciation expense in Year 5 is reduced in order to bring the end-of-year net book value to \$70,000, the original estimated scrap value.

Year	Beginning Net Book Value (NBV)	DDB %	Depreciation Expense (Income Statement)	End-of-Year Accumulated Depreciation	End-of-Year Net Book Value (NBV)
1	\$670,000	40% × 8/12	\$178,667	\$178,667	\$491,333
2	491,333	40%	196,533	375,200	294,800
3	294,800	40%	117,920	493,120	176,880
4	176,880	40%	70,752	563,872	106,128
5	106,128		36,128*	600,000	70,000

*Depreciation expense needed to have the ending net book value equal to the \$70,000 planned scrap value.

IFRS Component Depreciation. IFRS requires that firms separately depreciate each part or component of a fixed asset that is significant in relation to the asset's total cost. For example, the purchase of a building would involve a number of different components, such as the foundation and frame, heating and air conditioning systems, and other non-weight-bearing parts. After the firm identifies the components, the methodology to depreciate is identical to our prior discussion.

Although U.S. GAAP allows the components-based approach, it does not require it. Consequently, most firms that report under U.S. GAAP do not separate their depreciable assets into components. Example 11.17 illustrates the component depreciation method.

EXAMPLE 11.17**IFRS Component Depreciation Expense**

PROBLEM: FastAir Corporation, an IFRS reporter, identified three major components of its new airplane purchased on January 1 for \$10,000,000. It allocates \$5,000,000 of the cost to the airframe, \$4,000,000 to engines, and \$1,000,000 to the interior. The airframe has a useful life of 20 years and \$500,000 salvage value. The engines have a 16-year useful life and \$200,000 salvage value. The interior has a 5-year useful life and no salvage value. FastAir uses the straight-line method for all components. What is the annual depreciation expense for the first year?

SOLUTION: Annual depreciation expense for the first year is \$662,500. For each component, we calculate annual depreciation expense as the component cost less component salvage value divided by component useful life.

Component	Component Cost	Salvage Value	Depreciable Base	Useful Life (in Years)	Annual Depreciation Expense
Airframe	\$ 5,000,000	\$500,000	\$4,500,000	20	\$225,000
Engines	4,000,000	200,000	3,800,000	16	237,500
Interior	1,000,000		1,000,000	5	200,000
Total	<u>\$10,000,000</u>				<u>\$662,500</u>

- ③ Determine and illustrate the appropriate accounting for asset derecognition of property, plant, and equipment, including sales and abandonments.

Derecognition of Property, Plant, and Equipment

Companies remove or derecognize tangible fixed assets from their accounts when they sell or abandon items of PPE.¹⁴ Derecognition requires that the firm remove all related accounts from the ledger, including the asset's cost and its accumulated depreciation. Before removing the asset from the ledger, the firm must bring the accumulated depreciation up to date at the time of derecognition. Because firms generally make an entry for depreciation expense and accumulated depreciation only when the financial statements are prepared, the firm must recognize any depreciation expense related to the use of the asset from the last financial statement date until the date of derecognition.

Asset Derecognition: Sale

When a firm sells or abandons an asset, it recognizes a gain or loss on the income statement measured as the difference between any cash proceeds received and the carrying value of the asset as illustrated in Example 11.18.

EXAMPLE 11.18

Sale of a Tangible Fixed Asset

PROBLEM: On May 31, 2018, J. Franz Company sold a piece of machinery it had purchased on January 1, 2011, with an original cost of \$355,000. The asset had a useful life of 15 years and a scrap value of \$67,000. It sold the asset for \$265,000 in cash. Franz recorded depreciation through December 31, 2017, using the straight-line method. What was the carrying value of the asset on the date of sale? What is the gain or loss on disposal? Record the journal entry for the sale.

SOLUTION: To properly calculate the gain or loss on disposal, we need to determine the carrying value of the asset when it was sold. The depreciable base equals \$288,000 (\$355,000 original cost less \$67,000 estimated scrap value), and the asset had a useful life of 15 years. Thus, the annual depreciation expense for the machinery is \$19,200 ($\$288,000 / 15$). Because Franz had held the asset for 7 years as of December 31, 2017, the accumulated depreciation as of the end of 2017 is \$134,400 ($\$19,200 \times 7$ years).

We also need to include depreciation expense for the five months in 2018; monthly depreciation is \$1,600 ($\$19,200 / 12$). Thus, the additional depreciation up to the date of disposal is \$8,000 ($\$1,600 \times 5$ months), and the accumulated depreciation up to the date of the disposal is \$142,400 (i.e., $\$134,400 + \$8,000$). The journal entry to update the depreciation for the current year follows:

Account	May 31, 2018
Depreciation Expense—Machinery	8,000
Accumulated Depreciation—Machinery	8,000

¹⁴Companies may also derecognize property, plant, and equipment due to an involuntary conversion, which is the disposal of an asset due to an unexpected event (e.g., a loss due to a fire). Involuntary conversions are not discussed in this chapter.

The carrying value of the asset on the date of the sale is \$212,600 (cost of \$355,000 less accumulated depreciation of \$142,400). There is a gain on disposal of \$52,400 (sales proceeds of \$265,000 less the asset's carrying value of \$212,600).

Because Franz no longer owns the equipment, it removes the balances in all accounts related to the machinery—the machinery and accumulated depreciation accounts. The journal entry to record the sale is as follows:

<i>Account</i>	<i>May 31, 2018</i>
Cash	265,000
Accumulated Depreciation—Machinery	142,400
Machinery	355,000
Gain on Sale of Machinery	52,400

Asset Derecognition: Abandonment

When an asset reaches the end of its productive life or is rendered obsolete, a company may choose to scrap or abandon it. In this case, the company will not receive any significant amount of cash—and it may incur some disposal costs. If the firm does not receive any cash, the loss on abandonment is equal to the asset's net book value on the date of the disposal. Example 11.19 illustrates accounting for the abandonment of operating assets.

EXAMPLE 11.19 Abandonment of Operating Assets

PROBLEM: On May 31, 2018, J. Franz Company decided to scrap a piece of machinery that had an original cost of \$355,000 and accumulated depreciation (brought up to the date of the disposal) of \$142,400. Therefore, the net book value of the asset is \$212,600 (i.e., \$355,000 – \$142,400) on the disposal date. The company is required to pay \$3,000 to have the asset picked up and taken to a city warehouse for proper disposal. What is the gain or loss on abandonment? Record the journal entry for the sale.

SOLUTION: There is a loss on the abandonment of \$212,600, which is equal to the carrying value of the machinery. Because Franz no longer has the equipment, it removes the balances in all accounts related to the machinery—the machinery and accumulated depreciation accounts. The company will also recognize the disposal costs as a miscellaneous expense. The journal entry to record the abandonment is as follows:¹⁵

<i>Account</i>	<i>May 31, 2018</i>
Miscellaneous Expense	3,000
Accumulated Depreciation—Machinery	142,400
Loss on Abandonment of Machinery	212,600
Cash	3,000
Machinery	355,000

- 4 Identify required disclosures for property, plant, and equipment.

Disclosures of Property, Plant, and Equipment

Companies commonly report the carrying value of property, plant, and equipment in total or by major class of long-term assets on the balance sheet. Companies are also required to disclose:

- The balances of depreciable assets by major classes at the end of the fiscal year, either on the face of the financial statements or in the footnotes. A major class can be defined either by nature or function of the long-term assets.

¹⁵Alternatively, Franz could add the disposal costs to the loss on abandonment, bringing the total loss to \$215,600.

- The accumulated depreciation on property, plant, and equipment at the end of the fiscal year by major class or in total.
- A general description of the method or methods used in computing depreciation with respect to major classes of depreciable assets.
- The amount of depreciation expense for the period.

Exhibit 11.4 presents a sample fixed asset footnote from *AT&T Inc.*'s 2016 annual report. Typically, companies will report the method of depreciation in the accounting policies footnote (Note 1). *AT&T* uses the straight-line method, which is the most common method used in practice. The majority of information related to PPE is in a separate footnote (Note 6) in which the company discloses depreciation expense, the balances of depreciable assets by major classes, and the accumulated depreciation on its property, plant, and equipment.

EXHIBIT 11.4 Fixed Asset Accounting Disclosures, *AT&T Inc.* Annual Report, December 31, 2016

NOTE 1: Significant Accounting Policies (Excerpt)

Property, Plant and Equipment Property, plant, and equipment is stated at cost, except for assets acquired using acquisition accounting, which are initially recorded at fair value (see Note 6). . . . The cost of additions and substantial improvements to property, plant, and equipment is capitalized and includes internal compensation costs for these projects The cost of maintenance and repairs of property, plant, and equipment is charged to operating expenses. Property, plant, and equipment costs are depreciated using straight-line methods over their estimated economic lives. Certain subsidiaries follow composite group depreciation methodology. Accordingly, when a portion of their depreciable property, plant, and equipment is retired in the ordinary course of business, the gross book value is reclassified to accumulated depreciation, and no gain or loss is recognized on the disposition of these assets.

NOTE 6: Property, Plant, and Equipment (Excerpt)

Property, plant, and equipment is summarized as follows at December 31:

	Lives (years)	2016	2015
Land	–	\$ 1,643	\$ 1,638
Buildings and improvements	2–44	35,036	33,784
Central office equipment ¹	3–10	92,954	93,643
Cable, wiring and conduit	15–50	79,279	75,784
Satellites	12–15	2,710	2,088
Other equipment	2–23	88,436	81,972
Software	3–5	14,472	11,347
Under construction	–	5,118	5,971
		<u>319,648</u>	<u>306,227</u>
Accumulated depreciation and amortization		<u>(194,749)</u>	<u>(181,777)</u>
Property, plant, and equipment – Net		<u>\$ 124,899</u>	<u>\$124,450</u>

¹ Includes certain network software.

Our depreciation expense was \$20,661 in 2016, \$19,289 in 2015, and \$17,773 in 2014. Depreciation expense included amortization of software totaling \$2,362 in 2016, \$2,660 in 2015, and \$1,504 in 2014.

IFRS Disclosures

IFRS disclosure requirements, while similar, are more comprehensive than U.S. GAAP. For each class of property, plant, and equipment, a company must disclose the historical cost and its accumulated depreciation at the beginning and the end of the period. The company is required to provide a reconciliation of the carrying amount at the beginning of the period to the end of the period. Companies must also disclose the depreciation method and useful lives (or equivalently, the depreciation rate).¹⁶

¹⁶A similar footnote is required in the Form 10-K under SEC reporting guidelines.

- 5 Specify the characteristics and types of intangible assets.

Intangible Assets: Characteristics and Types

The second major long-term operating asset class is *intangible assets*. **Intangible assets** are assets without physical substance that have economic value because of the contractual or legal rights they confer upon the holder. There are two general classes of intangible assets—*finite-life* (also referred to as definite-life) intangible assets and *indefinite-life intangible assets*. The indefinite-life intangible category includes *goodwill* along with other intangible assets such as trademarks and renewable licenses.¹⁷

Finite-Life Intangible Assets

Finite-life intangible assets are intangible assets that can be individually identified and have limited useful lives. There are six main types of finite-life intangible assets: patents, copyrights, leaseholds, leasehold improvements, customer lists, and limited-term franchises. Due to their limited useful lives, finite-life intangible assets are subject to amortization.

Patents. A **patent** grants the holder an exclusive right to use a formula, product, or process for a fixed period of time, usually 20 years. In the United States, the federal government grants exclusive rights through the U.S. Patent and Trademark Office. For example, Qualcomm holds patents on 4G technology.

Copyrights. A **copyright** is an exclusive right to reproduce and sell an original work—including books, musical scores, advertisements, other works of art, and computer programs—for the creator's life plus 70 years. The federal government grants copyrights.

Leaseholds. A **leasehold** is the right to use a specific piece of property for a fixed period of time in exchange for a certain payment. In order to lease several floors of a large office building in a major city, the owner of the property may require a significant up-front payment before the monthly lease payments begin. The leasehold represents a down payment on the lease and reduces the amount of the monthly rental fee required each period. The cash payment serves as a prepayment of rent: It does not transfer ownership, but it is a requisite payment to complete a lease contract.

Leasehold Improvements. **Leasehold improvements** are permanent betterments made to leased property. Examples include construction of offices, conference rooms, and training facilities in a leased building. Upon termination of the lease, these improvements revert to the owner of the building. As a result, the company leasing the building has the right only to use the improvements: The building owner retains the legal right of ownership of the tangible property.¹⁸

Customer Lists. A **customer list** consists of information about customers such as their names and contact information. It may be in the form of a database that includes other information about the customers such as their order history and demographic information. Examples of customer lists include depositors at a commercial bank, a CPA firm's clients, and investors engaging in transactions with a broker-dealer. Compiling customer lists is much simpler than valuing them given that there are no reliable markets to determine a value. Because an asset must be measured reliably to be reported on the balance sheet, firms often do not record customer lists as assets. In a business combination, the acquiring company may be willing to pay for the customer list. The merger transaction then provides a value for customer lists to report on the balance sheet. For example, *AT&T* reported customer lists and customer relationships from large acquisitions such as *DIRECTV* and *BellSouth*. A customer list is classified as a finite-life intangible asset when the firm expects the relationships to terminate within a specified period of time. Otherwise, it is classified as an indefinite-life intangible asset.

¹⁷For most of the relevant literature for this topic, see FASB ASC 350 – *Intangibles – Goodwill and Other* and in FASB ASC 805 – *Business Combinations* for U.S. GAAP and IASC, *International Accounting Standard 38*, “Intangible Assets” (London, UK: International Accounting Standards Committee, Revised) and IASB, *International Financial Reporting Standard 3*, “Business Combinations” (London, UK: International Accounting Standards Board, Revised) for IFRS.

¹⁸Companies will sometimes classify leasehold improvements as property, plant, and equipment.

Franchises. A **franchise** (for example, a *McDonald's* restaurant) represents the right or privilege to sell a product or deliver a service of another entity, such as a business or government. The owner of the product or service (the franchisor) enters into a contractual relationship with another person or business (the franchisee) that gives the franchisee the right to conduct business under the franchisor's name in exchange for a fee. The contractual relationship can be limited by time or may be continually renewable. A limited-term franchise agreement is considered a finite-life intangible asset.

Indefinite-Life Intangibles Other than Goodwill

An **indefinite-life intangible asset** has no identifiable legal, regulatory, contractual, or competitive factors that limit the asset's revenue-generating term. As a result, indefinite-life intangible assets are not subject to amortization unless managers determine a finite life in a subsequent accounting period. There are three main categories of indefinite-life intangible assets: customer lists (discussed in the previous section), renewable licenses and permits, and trademarks and trade names. (We discuss *goodwill* separately in the following section.)

Renewable Licenses and Permits. **Renewable indefinite-life intangible assets** are assets subject to renewal on a regular basis whose renewal is reasonably certain, such as renewable broadcast licenses and taxi medallions. *AT&T* must renew its Federal Communications Commission (FCC) licenses for certain radio frequencies periodically, generally every 10 years. Renewal is reasonably certain, so *AT&T* classifies these licenses as an indefinite-life intangible asset that is not subject to amortization. If the firm does not expect a renewal to occur, it treats a license as a finite-life intangible asset.

Trademarks and Trade Names. A **trademark** (the *Nike* swoosh, for example) or **trade name** represents a firm's product or service; the firm has the legal right to protect the trademark and trade name from any unauthorized use by outside parties. This indefinite-life intangible asset can consist of a design, a trade name, a logo, or a symbol. The federal government grants a registered trademark for 10 years initially with an indefinite number of future renewals for 10-year periods. For *AT&T*, trade names made up about 11% of its intangible assets other than goodwill at December 31, 2016.

Goodwill

Goodwill is an intangible asset created by factors that are typically difficult to identify and measure. For instance, a firm can generate goodwill from its product quality, reputation, ability to generate earnings above the industry average, the quality of its management, preferred physical location, or employee training programs. Because these factors are difficult to reliably measure, accounting standards allow firms to record goodwill as an asset only when a firm is acquired. When one firm buys another firm, the purchase price may be higher than the fair value of the acquired net assets, that is, its assets minus its liabilities. The premium paid at acquisition is **goodwill**, an indefinite-life intangible asset. The purchase transaction provides a reliable measurement of goodwill to report as an asset on the consolidated balance sheet. Because goodwill is tied to the specific business operations acquired and exists as long as these operations continue, it is not subject to amortization.

Initial Measurement of Intangible Assets

In this section, we discuss accounting for the initial measurement of an intangible asset beginning with the conceptual framework as a reference point. We discuss the initial measurement of intangible assets according to the method by which they are acquired:

- Internally generated intangibles
- Intangibles acquired individually or with a group of assets
- Intangibles acquired in a business acquisition
- Goodwill
- Research and development costs

- 6 Determine and illustrate the initial measurement of different types of intangible assets, including internally generated intangibles, intangibles acquired individually or in a group, intangibles acquired in a business combination, and research and development costs.

To determine whether expenditures incurred to generate an intangible asset qualify for asset recognition, firms (1) assess whether there is an identifiable asset that will generate probable future economic benefits and (2), if so, determine whether they can reliably measure that asset's value.

THE CONCEPTUAL FRAMEWORK CONNECTION

Intangible Asset Measurement

The most important concept underlying the initial valuation of an intangible asset is whether the firm can reliably measure its value. Many firms' measurements of internal expenditures for intangible assets are not faithful representations and thus are not recorded as an asset. For example, many businesses consider their brand names to be assets. However, the value of a brand name is difficult to measure, so brand names are typically not recorded as assets unless purchased externally, for example, as part of a merger or acquisition (i.e., a business combination).¹⁹

When determining what constitutes an asset, firms must differentiate between costs with probable future economic benefits—the first characteristic of an asset—and costs that have expired without the ability to generate revenue in subsequent accounting periods. Many expenditures, such as those for advertising or research, may have future economic benefits. Yet, because of the uncertainty of those future benefits, firms expense rather than capitalize these expenditures.

Internally Generated Intangibles

It can be difficult to identify and value future related economic benefits for internally generated intangible assets. As a result of this uncertainty, companies generally do not record most expenditures for internally generated intangibles as assets, instead expensing them as incurred. In such cases, firms can recognize some direct costs, including legal fees, as the intangible asset. For example, a company may sue another company for infringing on its patent by using the technology protected by patent without permission. For example, *Apple* sued *Samsung*, alleging that *Samsung's* smartphones and tablets copied patented features in the iPhone and iPad. To successfully defend a patent, a company usually incurs legal fees. The company can capitalize legal fees from successfully defending a patent because the patent will generate probable future economic benefits. In contrast, if the patent is not successfully defended, no asset is recorded.

Intangibles Acquired Individually or with a Group of Assets

Companies can purchase intangible assets from an outside party either individually or as a group of assets. The firm recognizes acquired intangibles as assets because they will likely generate future economic benefits and their values are reliably measureable at cost.

When purchasing a group of intangible assets in a basket purchase, a company allocates the cost to the individual assets based on their relative fair values. This approach is identical to our earlier discussion of a basket purchase of PPE.

Intangibles Acquired in a Business Acquisition

When a company purchases another company, it measures all assets and liabilities acquired, including any intangible assets, at fair value. Accountants report these intangible assets at fair value on the consolidated balance sheet because they were acquired and measured in an objective transaction.

Goodwill

Goodwill is an intangible asset with an indefinite life. As discussed earlier, firms include goodwill on the balance sheet only when it is purchased in a business acquisition. Due to the difficulties in identifying and measuring purchased goodwill, firms generally compute it as a residual—specifically, the

¹⁹The direct costs associated with developing brand names, such as legal fees, can be capitalized. However, these costs are typically a very small percentage of the value of the brand name.

acquisition cost of a business in excess of the fair values of the identifiable net assets acquired (including identifiable intangible assets):

	Acquisition cost
Less:	<u>Fair value of identifiable net assets acquired</u>
Equals:	<u>Goodwill</u>

The acquiring company records goodwill and all other assets and liabilities acquired at their fair values. For instance, *AT&T* recorded goodwill of \$34.7 billion when it purchased the *DIRECTV* in 2015. *AT&T* paid \$47.4 billion for *DIRECTV* when the fair value of its net assets other than goodwill was \$12.7 billion. Example 11.20 illustrates how goodwill is determined when one firm acquires another.

EXAMPLE 11.20

Goodwill Acquired in a Business Acquisition

PROBLEM: Buy Company exchanges \$140,000 (market value) of its no-par value common stock to acquire 100% of the common stock of Sell Company. Sell Company reports total assets of \$500,000 consisting of \$40,000 cash, \$160,000 inventory, and a \$300,000 factory building. Sell Company reports liabilities of \$420,000 consisting of \$180,000 accounts payable and \$240,000 long-term debt. Therefore, the historical cost of the net assets acquired is equal to \$80,000 (\$500,000 – \$420,000). An appraisal of Sell Company’s assets and liabilities indicated that Sell Company’s factory building, part of its PPE, is undervalued by \$40,000. The book values of all other assets and liabilities approximate their fair values. What is the fair value of the identifiable net assets Buy acquires from Sell? What is the amount of goodwill on Buy’s acquisition of Sell? What is the journal entry to record Buy Company’s purchase of Sell Company?

SOLUTION: The fair value of Sell’s identifiable net assets is the difference between the fair value of all its assets and the fair value of all its liabilities. The fair value of the identifiable net assets Buy acquires is equal to \$120,000, which is the fair value of its assets of \$540,000 less the fair value of liabilities of \$420,000.

	Book Value	Fair Value
Cash	\$ 40,000	\$ 40,000
Inventory	160,000	160,000
Property, Plant, and Equipment	<u>300,000</u>	<u>340,000</u>
Total Assets	<u>\$500,000</u>	<u>\$540,000</u>
Accounts Payable	<u>\$180,000</u>	<u>\$180,000</u>
Long-Term Debt	<u>240,000</u>	<u>240,000</u>
Total Liabilities	<u>\$420,000</u>	<u>\$420,000</u>
Net Assets	<u>\$ 80,000</u>	<u>\$120,000</u>

Goodwill is \$20,000, as computed next.

Calculation of Goodwill		
	Acquisition cost	\$140,000
Less:	<u>Fair value of the identifiable net assets acquired</u>	<u>(120,000)</u>
Equals:	Goodwill	<u>\$ 20,000</u>

Continued

Buy Company prepares the following journal entry to record the purchase of Sell Company:

Account	Acquisition Date	
Cash	40,000	
Inventory	160,000	
Factory Building	340,000	
Goodwill	20,000	
Accounts Payable		180,000
Long-Term Debt		240,000
Common Stock		140,000

Bargain Purchase. A company makes a **bargain purchase** when the fair value of the identifiable net assets in an acquisition exceeds the purchase price, meaning that the buying entity acquired the company for less than its fair value. That is, instead of paying more than the fair value of a company's identifiable net assets and creating goodwill, the price paid for the acquired company is less than the sum of the fair value of each of the identifiable assets less the fair value of liabilities.

A bargain purchase usually occurs when stock prices are depressed. With undervalued share prices, the acquiring company may be able to pay less than the fair values of the net assets acquired. The acquiring firm reports the gain from the bargain purchase as income from continuing operations on the income statement—specifically, it is recognized as an unusual or infrequent item (other gain). For example, *Retrophin, Inc.*, a biopharmaceutical company specializing in treatments for rare diseases, recorded an \$88.5 million gain when it acquired Cholbaum, a treatment for disorders due to enzyme defects and its pediatric applications, from *Asklepion Pharmaceuticals, LLC*, in 2015. *Retrophin* paid *Asklepion* \$91.5 million, acquired the fair value of Cholbaum's net assets of \$180.0 million, and recorded a gain on the bargain purchase.

Research and Development Costs

Research and development (R&D) is one of the most important investments for industries such as pharmaceuticals and information technology. R&D activity includes laboratory research designed to discover new knowledge, to test to determine process alternatives, to modify product or process design, and to engage in conceptual formulation and design of product or process alternatives. There is a distinction between research- and development-phase costs:

- *Research-phase activities* include an original and planned investigation undertaken with the prospect of gaining new scientific or technical knowledge and understanding.
- *Development-phase expenditures* relate to the application of research findings or other knowledge to a plan or design for the production of new or substantially improved materials, devices, products, processes, systems, or services before the start of commercial production or use.

R&D activity excludes quality control, troubleshooting, and routine and ongoing initiatives designed to refine existing products or processes and the adaptation of existing capabilities.

A company undertakes R&D activities to create new products or processes to generate future revenues. For example, *Eli Lilly and Company*, a large pharmaceutical manufacturer, disclosed in the management discussion and analysis of its 2016 10-K that it “invest[s] heavily in research and development because we believe it is critical to our long-term competitiveness.” It further details its research and development activities, including a focused explanation of the “Phases of New Drug Development,” identified as Discovery Research Phase, Early Development Phase, Product Phase, and Submission Phase (*Eli Lilly and Company*, Financial Reports, December 2016). Over the last 3 years, *Lilly's* research and development costs averaged about 24% of its sales.

Accounting for Research and Development Costs. Firms must expense almost all R&D costs as incurred.²⁰ Does the fact that firms expense R&D costs immediately mean that these expenditures have no future economic benefit? R&D expenditures often have a future benefit, but it is difficult to identify and measure. For example, what is the future economic benefit of a patented product? Which R&D costs are going to result in successful products, and which costs will become worthless? Using a cost-benefit justification, standard setters ultimately took the position that almost all R&D expenditures should be expensed as incurred. Expensing all R&D costs, however, potentially understates assets and income. Example 11.21 provides an example of accounting for research and development costs.

EXAMPLE 11.21 Research and Development Costs

PROBLEM: Morrow Pharmaceuticals, Inc. provided you the following information regarding current-year expenditures in its research facility.

Expenditures	Amount
Testing materials used in experimentation	\$ 123,000
Salaries of laboratory technicians	434,800
General-purpose testing equipment (acquired on January 1 of the current year: 10-year life)	768,510
Consultant fees for process improvements	33,090
Total expenditures for the current year	<u>\$1,359,400</u>

What is the R&D expense? Record all journal entries for the expenditures. Assume that the expenditures are paid in cash.

SOLUTION: Morrow is required to expense the testing materials used, salaries incurred, and the consulting fees paid. However, it can use the general-purpose testing equipment in the laboratory for an extended period of time for several alternative experiments. As a result, Morrow should capitalize and depreciate the equipment over 10 years. Morrow will charge the current-year depreciation and subsequent-period depreciation of this testing equipment to R&D expense.

To record the R&D expense for the year, we include all laboratory expenditures except for the equipment cost. These expenditures include the cost of the materials (\$123,000), the salaries (\$434,800), and the consultant fees (\$33,090) for a total R&D expense of \$590,890. The journal entries required to record Morrow’s R&D activities for the current year are:

Account	Current Year
Research and Development Expense	590,890
Cash	590,890

We capitalize the equipment, which has alternative future uses, as follows:

Account	January 1, Current Year
Testing Equipment	768,510
Cash	768,510

Continued

²⁰In limited cases, firms can capitalize some R&D costs. R&D costs that are reimbursed under contract (i.e., sold to another firm or through customer-funded R&D) would be capitalized as a receivable or accumulated in an inventory account if reimbursed. Firms can also capitalize R&D equipment and buildings with alternative future uses. In addition, firms can capitalize the cost of R&D in a patent account if the research was purchased from an outside research firm. Finally, certain internally generated software development costs can be capitalized after the company establishes technological feasibility and the software is sold, leased, or marketed to third parties (external users).

We then depreciate the equipment as follows:

Account	December 31, Current Year
Research and Development Expense	76,851
Accumulated Depreciation—Testing Equipment	76,851

IFRS Research and Development Cost Accounting. IFRS requires that firms expense costs during a research phase but allows firms to capitalize development-phase costs under certain conditions. Under IFRS, a firm can capitalize development-phase expenditures if it can demonstrate all of the following:²¹

1. The technical feasibility of completing the intangible asset so that it will be available for use or sale
2. Its intention to complete the intangible asset and use or sell it
3. Its ability to use or sell the intangible asset
4. How the intangible asset will generate probable future economic benefits
5. The availability of adequate technical, financial, and other resources to complete the development and to use or sell the intangible asset
6. Its ability to measure reliably the expenditure attributable to the intangible asset during its development

Demonstrating all six conditions increases the likelihood that the expenditures will provide future economic benefit. For example, in its accounting policy for intangible assets in its 2016 financial statements, *Telefonaktiebolaget LM Ericsson*, the Swedish telecommunications company, stated that it capitalizes costs incurred for the development of products when it has established technical and economic feasibility. Its capitalized expenses are mainly generated internally and include direct labor and directly attributable overhead costs. It then amortizes the capitalized development costs when the product is available for general release. During 2016, *Ericsson* capitalized 4.5 million Swedish Krona (SEK) of development costs, representing about 2% of sales. At the end of the year, it reported an intangible asset related to development costs of 8.1 million SEK, or about 2.9% of total assets. Example 11.22 illustrates accounting for research and development costs under IFRS.

EXAMPLE 11.22

IFRS Research and Development Costs

PROBLEM: Morrow Pharmaceuticals, Inc. provided you the following information regarding current-year expenditures in its research facility.

Account	Amount
Testing materials used in experimentation	\$ 123,000
Salaries of laboratory technicians	434,800
General-purpose testing equipment (acquired on January 1 of the current year; 10-year life)	768,510
Consultant fees for process improvements	33,090
Total Expenditures for the Current Year	<u>\$1,359,400</u>

What is the R&D expense under IFRS? Record all journal entries required for these expenditures. Assume that all expenditures are paid in cash. Assume that development-phase expenditures meet all of the conditions for capitalization and have a useful life of 3 years.

SOLUTION: In the research facility, the cost of the materials (\$123,000) and the salaries (\$434,800) are not specifically related to development-phase activities. Therefore, these costs, totaling \$557,800, are expensed.

²¹IASC, *International Accounting Standard 38*, “Intangible Assets” (London, UK: International Accounting Standards Committee, Revised).

<i>Account</i>	<i>Current Year</i>
Research and Development Expense	557,800
Cash	557,800

The testing equipment is used for general purposes and so has alternative uses. Therefore, we capitalize the equipment as follows:

<i>Account</i>	<i>January 1, Current Year</i>
Testing Equipment	768,510
Cash	768,510

We also depreciate the equipment over 10 years, as follows:

<i>Account</i>	<i>December 31, Current Year</i>
Research and Development Expense	76,851
Accumulated Depreciation—Testing Equipment	76,851

Under IFRS, we consider the process improvements a development-phase activity and capitalize them as a development asset:

<i>Account</i>	<i>January 1, Current Year</i>
Development Asset	33,090
Cash	33,090

We then amortize the development asset over 3 years:

<i>Account</i>	<i>December 31, Current Year</i>
Amortization Expense—Development Asset	11,030
Accumulated Amortization—Development Asset	11,030

Acquired In-Process Research and Development Costs. Acquiring firms must account for R&D costs purchased in business combination transactions. **Acquired in-process R&D** is an asset obtained in a business combination representing the fair value assigned to in-progress research and development projects that are not yet commercially viable. Companies account for acquired in-process R&D as follows:

1. Record acquired in-process R&D as an indefinite-life intangible asset until the project is completed.
2. If the project is successful, record the intangible asset and amortize it.
3. Write off against earnings if the project is found to be without value in a subsequent period.

All additional R&D expenditures incurred to complete the project follow the accounting for internally generated R&D discussed earlier and are expensed as incurred.²²

For instance, *Eli Lilly and Company* reported in its 2016 financial statements that it capitalized in-process research and development assets acquired as part of the acquisition of a business. *Lilly* reported in-process research and development assets of \$180.2 million and \$177.6 million at December 31, 2016, and 2015, respectively.

²²An exception to this rule is for technology projects for which technological feasibility has been achieved. In such case, the allocated cost is capitalized and amortized.

JUDGMENTS IN ACCOUNTING

The Measurement of Intangible Assets

Assessing the certainty of future economic benefits involves judgment. If a firm deems the benefits to be probable, it capitalizes the expenditures in an intangible asset account. However, if the benefits are not probable, the firm expenses them as incurred. This assessment can be quite difficult in many instances; as a result, accounting standards limit the types of intangible assets that firms can capitalize.

For example, consider the planned development of a portable charging unit designed to recharge electric cars. This product will be fairly expensive for the ultimate consumer. In order for the costs incurred to acquire this patent provide future economic benefits, electric cars must become more popular and consumers must be willing to pay a substantial cost for the benefit of having access to a portable charger. Management must forecast the demand for electric vehicles as well as the prices that the market will be willing to pay for the charger before recording the costs incurred as an intangible asset.

- 7 Demonstrate accounting for intangible assets subsequent to acquisition, including amortization and derecognition.

Subsequent Measurement and Derecognition of Intangible Assets

Several factors affect the carrying value of intangible assets, including subsequent expenditures. Firms very rarely capitalize subsequent expenditures related to intangible assets as an asset.²³ The majority of subsequent expenditures related to an intangible asset simply maintain the existing future economic benefits as opposed to enhancing future economic benefits and are expensed as incurred.

Amortization is the systematic and rational allocation of the cost of a finite-life intangible asset to expense over the asset's expected useful life or legal life, whichever is shorter. Firms report amortization expense on the income statement and reduce the carrying value of the finite-life intangible asset on the balance sheet.

THE CONCEPTUAL FRAMEWORK CONNECTION

The Cost-Allocation Process

The conceptual framework treats the principles of cost allocation of finite-life intangible assets and tangible fixed assets in the same way. Finite-life intangible assets consumed in the revenue-generating process over their useful lives meet the definition of an expense. Likewise, as the firm uses these assets, their future economic benefits generally decline. The carrying amount of these assets is reduced to reflect this decline in value and provide an accurate report of total assets on the balance sheet.

As previously discussed, firms do not depreciate land because it has an unlimited life. The same concept applies to certain intangible assets. Specifically, because goodwill as well as the other indefinite-life intangibles have an unlimited life, they are not subject to amortization.

Amortization Method

Only finite-life intangible assets are subject to amortization: Firms do not amortize goodwill and other indefinite-life intangible assets. Firms may include estimated residual values in the computations, although they are rarely used in practice.

To determine estimated useful lives of finite-life intangible assets, firms consider legal, regulatory, contractual, and competitive factors. The expected period of economic benefit of the asset must take into account the effects of obsolescence, demand, and technological advances. Current

²³Expenditures related to legal fees incurred to successfully defend a patent, copyright, or trademark are typically capitalized into the intangible assets.

accounting standards do not specify either a method of amortization to use or a limit on the useful life. The period of amortization should be either the useful life or legal life, whichever is shorter.

For example, assume that a leading computer manufacturer was granted a patent for a new computer chip with a legal life of 20 years. However, the economic life of the computer chip is only 3 years due to technological advances and the certain obsolescence of the product. As a result, the patent amortization cannot exceed 3 years. Also consider the case of leasehold improvements that will last 10 years but the related lease is only for a 6-year period. The firm must amortize the leasehold improvements over the 6-year lease term, the legal life, because it is shorter than the economic life of the improvement.

The method of amortization should reflect the pattern in which the firm utilizes the asset's economic benefits. If the firm cannot reasonably estimate a revenue stream, it should use the straight-line method. As is the case with PPE, most companies utilize the straight-line method to amortize their finite-life intangible assets. Amortization of finite-life intangible assets is shown in Example 11.23.

EXAMPLE 11.23

Amortization of Finite-Life Intangible Assets

PROBLEM: JJ Inc. currently leases an office building. It initiated the original 20-year lease 15 years ago, so 5 years remain on the lease. On January 1, JJ paid \$20,000 to install a new heating and cooling system with a 10-year estimated useful life that it expects to use ratably over the remaining term of the lease. What is the journal entry to record the expenditure? How much amortization will JJ report and for how many years? What is the journal entry for the first year?

SOLUTION: The \$20,000 expenditure is for a leasehold improvement, a finite-life intangible asset. The journal entry to record the expenditure made in the current period follows:

<i>Account</i>	<i>January 1</i>
Leasehold Improvements	20,000
Cash	20,000

We compute the amortization on a straight-line basis because JJ expects the usage of the system to occur ratably. The useful life is 5 years, the remaining life of the lease. Thus, amortization each year is \$4,000 (i.e., \$20,000 / 5 years). The journal entry made at the end of the current period is as follows:

<i>Account</i>	<i>December 31</i>
Amortization Expense	4,000
Leasehold Improvements	4,000

Note that the credit in this journal entry is made to the finite-life intangible asset directly. Alternatively, JJ could have credited a contra account, accumulated amortization.

Derecognition of Intangible Assets

Firms remove intangible assets from their books upon disposal or when they expect no further economic benefits from the use of the assets. If the firm sells an intangible asset, it recognizes a gain or loss on the income statement, measured as the difference between the sales proceeds and the carrying value of the asset.

Interview

STEPHEN J. COSGROVE
FORMER VICE PRESIDENT,
CORPORATE CONTROLLER,
AND CHIEF ACCOUNTING OFFICER
JOHNSON & JOHNSON,
NEW BRUNSWICK, NJ»

Stephen J. Cosgrove

Stephen J. Cosgrove is the Former Vice President, Corporate Controller, and Chief Accounting Officer of Johnson & Johnson, a leading manufacturer of pharmaceuticals, medical devices, and consumer products. He has served on the Financial Accounting Standards Advisory Council and is currently a member of the Financial Executives International Committee on Corporate Reporting.

- 1 Why are intangible assets one of the most important economic resources on Johnson & Johnson's balance sheet, and why should students understand how to report these assets?

Intangible assets comprise approximately 30% of total assets on the Johnson & Johnson balance sheet. These assets are important economic resources, capable of generating future value for shareholders. They include the goodwill associated with various acquisitions, intellectual knowledge, brand names—Neutrogena[®], Listerine[®], Acuvue[®], and Zyrtec[®], to name a few—and the acquired in-process research and development projects that are vital to generating future value. Intangible assets on Johnson & Johnson's balance sheet are often the direct result of acquisitions such as the recent acquisition of Synthes Holdings, AG.

Students who understand how to measure, value, and report intangible assets will be positioned to assist their future employers to communicate the value of these assets to the investor community and customers as well as comply with accounting and tax regulations.

- 2 How do you measure the economic benefits of an intangible asset?

Johnson & Johnson uses the direct or indirect contribution to cash flows to measure the economic benefits of our intangible assets. We make risk-adjusted estimates of the present value of the forecasted streams of revenues associated with each asset.

- 3 In-Process Research and Development (R&D) is recorded as an asset upon acquisition of another company. How does a company like Johnson & Johnson measure the potential success of a research and development project?

In-Process R&D assets have a wide range of risk of success associated with individual projects or potential products. In

particular, the probability of success of an early-stage pharmaceutical compound can be extremely low. This risk is taken into account when determining the value of each potential opportunity. Factors used to determine risk include success of similar compounds or products, results of clinical studies, and how far a project has progressed through the regulatory process. Ultimate product approval and introduction to the marketplace determine whether the associated intangible asset is amortized over the remaining useful life or expensed if unapproved or abandoned.

- 4 What factors do you consider when looking for a possible impairment of a capitalized indefinite-life intangible asset?

Johnson & Johnson performs intangible asset reviews on an ongoing basis, especially if any significant factor changes. Some of the factors we consider are management intentions as to the use and funding of the assets, whether there have been any significant changes in the assumptions used in the initial valuation, and any delays in clinical trials or product launches. Other common triggers include a significant decrease in the market price of the asset or losses associated with the use of the asset.

- 5 Under current U.S. GAAP, firms capitalize a portion of software development costs as an intangible asset while expensing all internally generated research and development costs. Can you justify this divergence in practice?

Johnson & Johnson capitalizes certain internal costs associated with software development, such as coding and testing costs incurred during the projects' application development phase. These software development costs meet the essential characteristics of an asset, because they have probable future economic benefit. For Johnson & Johnson these costs are typically not significant and generally incurred quickly, and the time between capitalization and potential write-off tends to be short.

The opposite is true for internally developed R&D such as the costs of discovery, testing, and developing new products. All internal research and development costs are expensed as incurred. R&D costs can span several years, the costs can be significant, and the probability of successful approval of any one project is low based on industry history. These costs do not meet the definition of an asset, primarily due to the uncertainty of receiving future benefits.

Discussion Questions

1. What are some of the judgments used in estimating the future economic benefit (specifically, measuring the value) of intangible assets?
2. Compare and contrast the accounting for research and development expenditures under U.S. GAAP and IFRS, including the rationale used to justify each accounting treatment. (Do not address in-process R&D.)

- 8 Detail required disclosures for intangible assets.

Disclosures of Intangible Assets

U.S. GAAP requires significant disclosures for intangible assets by major class of intangibles such as brand names, licenses and franchises, copyrights, patents, and development costs. These disclosures include:

- Amounts of assets with an indefinite and finite useful lives
- If the asset has a finite useful life, whether to use the useful life or the legal life
- The amortization methods used for intangible assets with finite useful lives
- The gross carrying amount and any accumulated amortization at the beginning and end of the period
- The aggregate amortization expense for the current period as well as the estimated aggregate amortization expense for each of the next 5 years
- Any goodwill and the changes in the carrying amount of the goodwill, including goodwill acquired, goodwill impaired, and the goodwill that was included in a disposal of a reporting unit for each period presented.²⁴

We present a sample of an intangible assets footnote from *AT&T Inc.*'s 2016 annual report in Exhibit 11.5. In Note 1, *AT&T* indicated that it amortizes customer lists and relationships using an accelerated (sum-of-the-months-digits) method that reflects the expectation that higher revenues will be generated earlier in the relationships with customers. *AT&T* uses the straight-line method for other finite-life intangibles.

In Note 7, *AT&T* provides a tabular reconciliation of the changes in goodwill balances. Increases in goodwill are due to acquisitions in both years. Notice that *AT&T* acquired \$35,517 million and \$481 million of the total goodwill in 2015 and 2016, respectively. Decreases are primarily due to the sale of businesses and impairments. *AT&T* also includes the gross carrying value (acquisition cost) and accumulated amortization balances for each class of finite-life intangibles (primarily customer lists and relationships). Finally, note that the carrying value of indefinite-life intangibles other than goodwill includes licenses and trade names.

EXHIBIT 11.5 Intangible Asset Disclosures, *AT&T Inc.*, Annual Report, December 31, 2016

NOTE 1: Significant Accounting Policies

Goodwill and Other Intangible Assets AT&T has five major classes of intangible assets: goodwill; licenses, which include Federal Communications Commission (FCC) licenses and other wireless licenses and orbital slots; other indefinite-lived intangible assets, primarily made up of the AT&T and international DIRECTV trade names including SKY; customer lists and various other finite-lived intangible assets (see Note 7).

Goodwill represents the excess of consideration paid over the fair value of net assets acquired in business combinations. Wireless licenses (including FCC licenses) provide us with the exclusive right to utilize certain radio frequency spectrum to provide wireless communications services. While FCC licenses are issued for a fixed period of time (generally 10 years), renewals of FCC licenses have occurred routinely and at nominal cost. Moreover, we have determined that there are currently no legal, regulatory, contractual, competitive, economic or other factors that limit the useful lives of our wireless licenses. Orbital slots represent the space in which we operate the broadcast satellites that support our digital video entertainment service offerings. Similar to our wireless licenses, there are no factors that limit the useful lives of our orbital slots. We acquired the rights to the AT&T and other trade names in previous acquisitions. We have the effective ability to retain these exclusive rights permanently at a nominal cost.

...

Intangible assets that have finite useful lives are amortized over their useful lives (see Note 7). Customer lists and relationships are amortized using primarily the sum-of-the-months-digits method of amortization over the period in which those relationships are expected to contribute to our future cash flows. The remaining finite-lived intangible assets are generally amortized using the straight-line method.

Continued

²⁴Accounting for goodwill impairment is discussed in Chapter 12.

NOTE 7: GOODWILL AND OTHER INTANGIBLE ASSETS

The following table sets forth the changes in the carrying amounts of goodwill by segment, which is the same as reporting unit for Business Solutions, Entertainment Group and Consumer Mobility. The International segment has three reporting units: Mexico Wireless, Brazil, and PanAmericana.

	Business Solutions	Entertainment Group	Consumer Mobility	International	Wireless	Wireline	Total
Balance as of December 31, 2014	\$ —	\$ —	\$ —	\$ —	\$36,469	\$ 33,223	\$ 69,692

IFRS Intangible Asset Disclosure

IFRS requires that a company disclose significant classes of intangible assets. Firms must distinguish between internally generated intangible assets and other intangible assets, including the historical cost and accumulated amortization at the beginning and the end of the period. Further, the company must provide a reconciliation of the carrying amount at the beginning of the period to the end of the period.

For each class, the company should also identify whether the useful lives are indefinite or finite and, if finite, the useful lives and amortization methods used.

FINANCIAL STATEMENT ANALYSIS

Long-Term Fixed Assets

Long-term operating assets generate income and cash flows over many years, making them some of the most significant assets for many companies. Consequently, it is important to understand and analyze a company's investments in long-term fixed assets. In this section, we focus on the analysis of long-term fixed assets.²⁵

Analyzing long-term fixed assets requires applying techniques discussed in earlier chapters, such as assessing the percent of long-term fixed assets to total assets or determining the change in long-term fixed assets during the year. Specific ratios for long-term fixed assets include:

- *Average age*
- *Average remaining life*
- *Fixed asset turnover*

The average age and average remaining life of long-term fixed assets provide information useful in evaluating a company's current long-term fixed assets and the need for potential future investments. If a company has older assets, it will likely need to invest to replace them in the near future. Investments in long-term fixed assets decrease future investing cash flows. If the company does not continue to invest in its income-generating assets, then net income and cash flow could decrease in the future.

New fixed assets likely employ the most recent technology and are more efficient than older assets. Consequently, a company with new assets may have a competitive advantage compared to another company that has not invested in new assets. Therefore, it is important for the statement user to be able to estimate the age of a company's plant assets and approximate when replacement becomes necessary.

The *average age* and *average remaining life* provide complementary indicators of a fixed asset's age. The **average age** of a company's assets is computed as the amount of accumulated depreciation divided by depreciation expense. The **average remaining life** is computed as the balance of ending net fixed assets divided by depreciation expense.

$$\text{Average Age} = \frac{\text{Accumulated Depreciation}}{\text{Depreciation Expense}} \quad (11.11)$$

and

$$\text{Average Remaining Life} = \frac{\text{Ending Net Fixed Assets}}{\text{Depreciation Expense}} \quad (11.12)$$

These ratios enable comparisons of a company to itself over time, comparisons of two competing companies, or comparisons of a company to its industry. We can also compare the average age to the average remaining life. A higher average age compared to the average remaining life indicates that more of an asset's productive capacity has been used up than is left to use, suggesting a need to re-invest in long-term fixed assets in the near future.

The *fixed asset turnover ratio* reveals how well a company is using its fixed assets to generate revenues. The **fixed asset turnover ratio** is computed as total revenues divided by a company's average net fixed assets. The ratio provides the amount of revenues generated for each dollar of investment in fixed assets.

$$\text{Fixed Asset Turnover Ratio} = \frac{\text{Total Revenues}}{\text{Average Net Fixed Assets}} \quad (11.13)$$

²⁵ The main financial statement analysis issue related to intangible assets is potential impairment, which we discuss in the next chapter.

Average net fixed assets is used as the base in the denominator under the assumption that the firm earns revenues evenly over the year on the fixed assets it employs. Firms compute average net fixed assets as:

$$\text{Average Net Fixed Assets} = \frac{\text{Beginning Net Fixed Assets} + \text{Ending Net Fixed Assets}}{2} \quad (11.14)$$

A high fixed asset turnover ratio indicates that a company is generating a large amount of revenue for each dollar invested in fixed assets.

There are a number of caveats when using the long-term fixed asset ratios:

1. The age ratios focus on depreciable assets. Net fixed assets, then, should exclude land and construction in process. Fixed asset turnover can include or exclude land and construction in process, so it is important to note whether they are included.
2. Long-term fixed assets are composed of different types of assets, often with different useful lives. However, most companies disclose total depreciation expense, accumulated depreciation, and net fixed assets. Thus, we can analyze only the total amounts. Asset composition changes could lead to differences in the ratios.

Example 11.24 illustrates using these financial statement analysis tools to analyze long-lived assets.

EXAMPLE 11.24 Financial Statement Analysis of Long-Term Fixed Assets

PROBLEM: Use *AT&T's* disclosures in Exhibit 11.4 and the following additional information to answer the following questions on *AT&T's* long-term fixed assets.

(Dollars in Millions)	2016	2015
Average net fixed assets	\$124,675	\$118,674
Total assets	403,821	402,672
Total revenues	163,786	146,801

- a. What is the percent of *AT&T's* long-term fixed tangible assets to total assets in 2016 and 2015? In the definition of long-term fixed tangible assets, include the total of *AT&T's* property, plant, and equipment (PPE) – net. Comment on any changes from year to year.
- b. Compute average age and average remaining life for 2016 and 2015. Comment on any changes from year to year.
- c. Compute fixed asset turnover in 2016 and 2015. In the definition of long-term fixed tangible assets (fixed assets), include the total of *AT&T's* property, plant, and equipment (PPE) – net. Comment on any changes from year to year.

SOLUTION:

- a. We compute the percent of long-term fixed tangible assets to total assets as follows:

(Dollars in Millions)	2016	2015
PPE – Net	\$124,899	\$124,450
Total assets	403,821	402,672
Percent PPE – Net to total assets	30.9%	30.9%

The percent of long-term fixed tangible assets to total assets is 30.9% each year.

Financial Statement Analysis, continued

b. We compute average asset age and remaining life as follows:

Average Age:

(Dollars in Millions)	2016	2015
Accumulated Depreciation	\$194,749	\$181,777
divided by Depreciation Expense	<u>÷ 20,661</u>	<u>÷ 19,289</u>
Average age (in years)	<u>9.4</u>	<u>9.4</u>

Average Remaining Life:

	2016	2015
PPE – Cost	\$ 319,648	\$306,227
Less: Land	(1,643)	(1,638)
Less: Construction	<u>(5,118)</u>	<u>(5,971)</u>
Subtotal	\$ 312,887	\$298,618
Less: Accumulated depreciation	<u>(194,749)</u>	<u>(181,777)</u>
PPE (excluding land and construction) – Net	\$118,138	\$116,841
divided by Depreciation Expense	<u>÷ 20,661</u>	<u>÷ 19,289</u>
Average remaining life (in years)	<u>5.7</u>	<u>6.1</u>

The average age of 9.4 years remained the same in 2016 and 2015. The average remaining life decreased to 5.7 in 2016 from 6.1 in 2015. Also note that the average age is higher than the average remaining life, indicating that more of the assets' productive capacity has been used up than is left to use.

c. We compute the fixed asset turnover ratios as follows:

	2016	2015
Total Revenues	\$163,786	\$ 146,801
divided by Average Net Fixed Assets	<u>÷ \$124,675</u>	<u>÷ \$ 118,674</u>
Fixed asset turnover	<u>1.31</u>	<u>1.24</u>

The fixed asset turnover ratios indicate that *AT&T* generates \$1.31 in revenues for each dollar invested in fixed assets in 2016. The fixed asset turnover ratio increased slightly from 2015 to 2016, indicating that fixed assets are generating increased revenue.

Summary by Learning Objectives

Below we summarize this chapter's main points by learning objective. Throughout the chapter, we discuss the accounting and reporting of U.S. GAAP and IFRS side-by-side. The table below also highlights the major similarities and differences between the standards.

Summary by Learning Objectives, continued

1 Identify the types of property, plant, and equipment and determine the initial measurement of each; apply the definition of an asset to the decision to expense or capitalize an expenditure.	
Summary	Similarities and Differences between U.S. GAAP and IFRS
<p>There are three necessary characteristics for property, plant, and equipment:</p> <ol style="list-style-type: none">1. Asset is tangible.2. Asset is expected to be used for more than 1 year (or more than one operating cycle).3. Asset is used in the production and sale of other assets, for rental to others, or for administrative purposes. <p>Types of PPE include land, plant, equipment, and buildings.</p> <p>Acquisition cost includes the costs necessary to bring the asset to the location and condition for its intended use.</p> <p>If an expenditure is not necessary to bring the asset to this location and condition, the firm should include the expenditure in expenses.</p> <p>Firms can capitalize interest as part of the acquisition cost on assets constructed or otherwise produced for the firm's own use.</p> <p>The amount of interest capitalized is based on the weighted-average accumulated expenditures for the accounting period.</p> <p>Two interest rates are used to determine the amount of interest to capitalize.</p> <ol style="list-style-type: none">1. For specific borrowings: The interest rate incurred on specific borrowings.2. For general debt: The weighted average interest rate of all other outstanding debt during the period applies to the amount of the weighted-average accumulated expenditures that is higher than the amount borrowed specifically to finance the construction of the asset. <p>Interest costs can be capitalized from the time of the initial expenditure to the time the asset is ready for its intended use.</p> <p>Income from the temporary investment of specific borrowings does not reduce capitalized interest.</p>	<p>➤ Similar under U.S. GAAP and IFRS except for the following items relating to interest capitalization.</p> <p>The two interest rates are applied differently under IFRS:</p> <ol style="list-style-type: none">1. For specific borrowings, all borrowing costs related to a loan obtained specifically to acquire or construct the asset are capitalized.2. For general debt, firms use the weighted-average accumulated expenditures to determine interest to capitalize. <p>Additionally, income from the temporary investment of specific borrowings reduces capitalized borrowing costs.</p>

2 Demonstrate the accounting for property, plant, and equipment subsequent to acquisition, including subsequent expenditures and depreciation.	
Summary	Similarities and Differences between U.S. GAAP and IFRS
<p>Depreciation is the systematic and rational allocation of the cost of a long-term plant asset to expense over the asset's expected useful life. Companies choose a useful life, scrap value, and depreciation method. Common depreciation methods include:</p> <ul style="list-style-type: none">• Straight-line – depreciation expense is determined as the asset's depreciable base (cost less salvage value) over its useful life.• Units-of-output – depreciation expense is the depreciable base (cost less salvage value) divided by the estimated total units of output times the actual number of units produced each period.• Double-declining balance – depreciation expense is determined as a constant rate against a declining net book value. The constant rate used in the double- declining balance method is two times the straight-line rate. <p>Companies capitalize subsequent expenditures that provide probable future benefit. Other expenditures are included in net income for the current period.</p>	<p>➤ Similar under U.S. GAAP and IFRS except that IFRS requires firms to apply depreciation to components.</p>

Summary by Learning Objectives, continued

<p>3 Determine and illustrate the appropriate accounting for asset derecognition of property, plant, and equipment, including sales and abandonments.</p>	
<p>Summary</p>	<p>Similarities and Differences between U.S. GAAP and IFRS</p>
<p>Companies recognize a gain or loss on the income statement upon sale or abandonment of long-term operating assets. The gain or loss is measured as the difference between sales proceeds received and the carrying value of the asset.</p>	<p>Similar under U.S. GAAP and IFRS.</p>

<p>4 Identify required disclosures for property, plant, and equipment.</p>	
<p>Summary</p>	<p>Similarities and Differences between U.S. GAAP and IFRS</p>
<p>Common disclosures include:</p> <ol style="list-style-type: none"> 1. Balances of depreciable assets by major classes at end of fiscal year 2. Accumulated depreciation on property, plant, and equipment at end of fiscal year 3. A general description of the method or methods the firm used in computing depreciation 4. The amount of depreciation expense for the period 	<p>➤ Similar under U.S. GAAP and IFRS except that IFRS has more detailed disclosure requirements, such as reconciliations of beginning to ending account balances.</p>

<p>5 Specify the characteristics and types of intangible assets.</p>	
<p>Summary</p>	<p>Similarities and Differences between U.S. GAAP and IFRS</p>
<p>The two general classes of intangible assets are finite life (also referred to as definite life) and indefinite life. Goodwill is an indefinite-life asset.</p>	<p>Similar under U.S. GAAP and IFRS.</p>

<p>6 Determine and illustrate the initial measurement of different types of intangible assets, including internally generated intangibles, intangibles acquired individually or in a group, intangibles acquired in a business combination, and research and development costs.</p>	
<p>Summary</p>	<p>Similarities and Differences between U.S. GAAP and IFRS</p>
<p>Intangible assets can be internally generated, acquired individually or with a group of other assets, or acquired in a business acquisition.</p> <p>Initial measurement depends on how the firm acquired the intangible asset. For internally generated intangibles, the firm recognizes only expenditures such as direct costs for legal fees as intangible assets. For acquired intangibles through an asset purchase or business acquisition, the firm capitalizes the intangible.</p>	<p>➤ Similar under U.S. GAAP and IFRS except that U.S. GAAP requires all research and development costs to be expensed. IFRS requires development phase costs to be capitalized.</p>

Summary by Learning Objectives, continued

7 Demonstrate accounting for intangible assets subsequent to acquisition, including amortization and derecognition.	
Summary	Similarities and Differences between U.S. GAAP and IFRS
<p>Finite-life intangibles are subject to amortization, similar to depreciation of tangible long-term assets. The most common amortization method is straight line.</p> <p>Companies recognize a gain or loss on the income statement upon disposal of an intangible asset. The gain or loss is measured as the difference between sales proceeds received and the carrying value of the asset.</p>	<p>Similar under U.S. GAAP and IFRS.</p>

8 Detail required disclosures for intangible assets.	
Summary	Similarities and Differences between U.S. GAAP and IFRS
<p>Common disclosures include:</p> <ol style="list-style-type: none"> 1. Amounts of indefinite-life and finite-life intangible assets 2. For intangible assets subject to amortization, the average amortization period in total and by major intangible asset class 3. The carrying amount in total and for each major intangible class at beginning and end of period 4. The aggregate amortization expense for the current period as well as the estimated aggregate amortization expense for each of the next 5 years 5. Changes in the carrying amount of goodwill, including goodwill acquired, goodwill impaired, and goodwill that was included in a disposal 6. Accumulated amortization in total and for each major asset class at beginning and end of period 7. Amortization methods used for finite-life intangible assets 	<p>► Similar under U.S. GAAP and IFRS except that IFRS has more detailed disclosure requirements, such as reconciliations of beginning to ending account balances.</p>

MyLab Accounting

Go to <http://www.pearson.com/mylab/accounting> for the following Questions, Multiple-Choice Questions, Brief Exercises, Exercises, and Problems. They are available with immediate grading, explanations of correct and incorrect answers, and interactive media that acts as your own online tutor.

11 Long-Term Operating Assets: Acquisition, Cost Allocation, and Derecognition

Questions

- 1 Q11-1. Is an asset required to have a finite life to be classified as a long-term operating asset?
- 1 Q11-2. Do managers capitalize expenditures that they believe have future economic benefits? Why or why not?
- 1 Q11-3. What should the total acquisition cost of a long-lived operating asset include?
- 1 Q11-4. What is included in an asset's acquisition cost?
- 1 Q11-5. Will the expense/capitalization choice impact asset valuation, income measurement, and total cash flows?
- 1 Q11-6. Can firms combine the cost of acquiring land and land improvements in a single "land" account on the balance sheet? Explain.
- 1 Q11-7. Should firms value multiple assets acquired in a lump-sum purchase separately? Explain.
- 1 Q11-8. For a long-lived operating asset acquired by issuing a note payable, do firms measure the initial carrying value of the asset by the face value of the note? Explain.
- 1 Q11-9. Does a firm acquiring a long-lived operating asset by issuing a note payable record the finance charges and asset value separately? Explain.
- 1 Q11-10. Does a firm always measure the amount of interest capitalized by multiplying the weighted-average accumulated expenditures by the firm's weighted-average interest rate? Explain.
- 1 Q11-11. What is the maximum amount of interest to be capitalized?
- 1 Q11-12. What is the maximum amount of interest to be capitalized under IFRS?
- 1 Q11-13. If borrowed funds are idle and invested in income-generating investments, is interest to be capitalized reduced by the amount of interest earned?
- 1 Q11-14. Under IFRS, if borrowed funds are idle and invested in income-generating investments, can firms reduce interest to be capitalized by the amount of interest earned?
- 1 Q11-15. Do assets under construction for a company's own use qualify for interest cost capitalization? Explain.
- 2 Q11-16. Do firms expense all costs incurred after the acquisition of a long-lived operating asset? Why or why not?
- 2 Q11-17. After a firm determines an asset's useful life and salvage value, can they be changed? Explain.
- 2 Q11-18. What is the carrying value of a long-lived asset?
- 2 Q11-19. When using the double-declining balance depreciation method, will the ending net book value of a plant asset equal the planned scrap value? Explain.
- 2 Q11-20. Under IFRS, when depreciating an asset, do managers have to estimate the useful life and salvage value for all components of the asset? Explain.
- 3 Q11-21. Will a firm recognize a loss on the income statement if a plant asset is either abandoned or damaged by a casualty?
- 3 Q11-22. How do you calculate a gain or loss on the sale of a plant asset?
- 5 Q11-23. Does an intangible asset have a finite or indefinite life? Explain.
- 5 Q11-24. Why is the leasehold account an intangible asset?
- 5 Q11-25. Distinguish between a tangible and an intangible asset.
- 5 Q11-26. Differentiate between a leasehold and a leasehold improvement.
- 5 Q11-27. What is an indefinite-life intangible asset?
- 5 Q11-28. What is a finite-life intangible asset?
- 5 Q11-29. What is the intangible-asset goodwill?
- 6 Q11-30. How can intangible assets pose some significant valuation problems? Does the determination of useful life for an intangible asset pose a valuation problem? Explain.
- 6 Q11-31. Do firms initially record internally created intangibles at cost?
- 6 Q11-32. How do firms record the gain from a bargain purchase?
- 6 Q11-33. What is goodwill and how is it recorded?
- 6 Q11-34. When can a company report goodwill?
- 6 Q11-35. When can a company capitalize research and development costs?

- 6 Q11-36. What is acquired in-process research and development and how is it recorded?
- 7 Q11-37. How do companies select the method of amortization for finite-life intangible assets?
- 7 Q11-38. Does legal life take precedence over the economic life when amortizing a finite-life intangible asset? Explain.
- 7 Q11-39. Do all intangible assets require amortization? Why or why not?
- 8 Q11-40. Are all intangibles reported in a single line on the balance sheet? Explain.
- A Q11-41. In a nonmonetary exchange, does a firm record the new asset acquired at the book value of the asset given up in the transaction? Explain.
- A Q11-42. When can a firm recognize a gain on a nonmonetary exchange?
- A Q11-43. When can an IFRS-reporting firm recognize a gain on a nonmonetary exchange?
- B Q11-44. How does a company record natural resources?
- B Q11-45. Explain the accounting for exploration costs associated with natural resources.

Multiple-Choice Questions

Becker CPA Exam Review multiple-choice questions are available in **MyLab Accounting**.

- 1 MC11-1. On June 30, Year 1, Bluebird Inc. purchased a \$750,000 tract of land for a new regional office. Costs related to purchasing the property and preparing the land for construction included:
- | | |
|--------------------------------------|-----------|
| Legal fees | \$ 32,000 |
| Title guarantee insurance | 15,000 |
| Cost to clear timber from land | 18,000 |
| Proceeds from sale of timber | 7,000 |
| Excavation costs for office building | 20,000 |
- In its December 30, Year 1, balance sheet, Boyd should report a balance in the land account of:
- a. \$797,000 b. \$808,000 c. \$815,000 d. \$828,000
- 1 MC11-2. On January 1, Year 1, Bluebird Inc. borrowed \$10 million at a rate of 9% for 5 years and began construction of its new regional office building. Bluebird has no other debt. During Year 1, Bluebird's weighted-average accumulated construction expenditures totaled \$3,750,000. What should Bluebird report as interest expense on its income statement for Year 1?
- a. \$337,500 b. \$500,000 c. \$562,500 d. \$900,000
- 2 MC11-3. Lavery Company purchased a machine that was installed and placed in service on July 1, Year 1, at a cost of \$240,000. Salvage value was estimated at \$40,000. The machine is being depreciated over 10 years by the double-declining balance method. For the year ended December 31, Year 2, what amount should Lavery report as depreciation expense?
- a. \$48,000 b. \$38,400 c. \$32,000 d. \$43,200
- 3 MC11-4. Visual Graphics Company sold a printing press for \$74,000 on the last day of the reporting period. The printing press had a gross and net amount of \$100,000 and \$65,000, respectively, reflected on the balance sheet at that date. Which of the following is the journal entry made by the company to reflect this asset sale?
- | | | | |
|----|--------------------------|--------|---------|
| a. | Cash | 74,000 | |
| | Printing Equipment | | 65,000 |
| | Gain on Sale | | 9,000 |
| b. | Cash | 74,000 | |
| | Accumulated Depreciation | 35,000 | |
| | Printing Equipment | | 100,000 |
| | Gain on Sale | | 9,000 |
| c. | Cash | 74,000 | |
| | Printing Equipment | | 65,000 |
| | Gain on Sale | | 9,000 |
| d. | Accumulated Depreciation | 65,000 | |
| | Printing Equipment | | 35,000 |
| | Gain on Sale | | 30,000 |

- 6 MC11-5.** Holly Company incurred research and development costs in Year 1 as follows:
- | | |
|--|------------|
| Equipment acquired for use in various R&D projects | \$ 400,000 |
| Depreciation on the above equipment | 60,000 |
| Materials used | 100,000 |
| Compensation costs of personnel | 200,000 |
| Fees to outside consulting firms | 70,000 |
| Indirect costs appropriately allocated | 100,000 |
- The total research and development expense in Holly's Year 1 income statement under **U.S. GAAP** should be:
- a. \$930,000 b. \$870,000 c. \$530,000 d. \$470,000
- 6 MC11-6.** Hi-Tech Corp. spent \$300,000 on research and development to generate new product lines. Only one of the five product lines resulted in a patented item, and the remaining four were considered unsuccessful. Under **U.S. GAAP**, how much of the \$300,000 should be recognized as an expense?
- a. \$300,000 b. \$240,000 c. \$60,000 d. \$0
- 6 MC11-7.** Hi-Tech Corp. spent \$300,000 on research and development to generate new product lines. Only one of the five product lines resulted in a patented item; the remaining four were considered unsuccessful. The cost of the product that was successfully patented included \$30,000 in research costs and \$40,000 in development costs. Under **IFRS**, how much of the \$300,000 should be recognized as an expense?
- a. \$300,000 b. \$270,000 c. \$260,000 d. \$230,000
- A MC11-8.** Pate paid \$50,000 and gave a plot of undeveloped land with a carrying amount of \$320,000 and a fair value of \$450,000 to Bizzell Co. in exchange for a plot of undeveloped land with a fair value of \$500,000. The land was carried on Bizzell's books at \$350,000. The exchange is one that has commercial substance under **U.S. GAAP**. At what amount is the land received from Pate recorded on Bizzell's books?
- a. \$370,000 b. \$320,000 c. \$500,000 d. \$450,000

Brief Exercises

- 1 BE11-1. Determining Acquisition Cost.** Haply, Inc. incurred the following expenditures when acquiring a new assembly machine:
- | | |
|-------------------|-----------|
| Price | \$175,000 |
| Sales tax | 10,500 |
| Delivery charges | 1,000 |
| Installation cost | 2,500 |
- Additionally, Haply sold its old assembly machine for \$500. What is the acquisition cost of the new assembly machine?
- 1 BE11-2. Determining Acquisition Cost.** Tarpley, Inc. acquired land for \$400,000. The closing costs amounted to \$11,000, and the firm paid \$7,250 for the current period's property taxes at the end of the year. Tarpley plans to build a new storage facility on the land costing \$2,350,000. To prepare for construction on the new facility, Tarpley removed an old storage building at a cost of \$23,000 and acquired building permits for \$2,500. What is the acquisition cost of the land?
- 1 BE11-3. Determining Acquisition Cost in a Basket Purchase.** Holman Enterprises acquired three different pieces of furniture and equipment for its newly renovated office. The bulk purchase from Wonder Technologies, Inc. included the following assets and corresponding retail prices: office furniture, \$1,800; an integrated telephone system, \$3,700; and a desktop computer system, \$4,500. Wonder charged a bulk price of \$6,000. Determine the value assigned to each asset.
- 1 BE11-4. Determining Acquisition Cost for an Asset Acquired in Exchange for a Note Payable.** Assume that Springfield Foods, Inc. acquired a custom-made refrigeration system by issuing a \$1,500,000, 10-year, non-interest-bearing note payable at a time when the market interest rate for similar debt instruments was 5%. The asset and the note do not have a readily determinable fair value. Prepare the journal entry required to record Springfield's purchase of the refrigeration system.

- 1 **BE11-5. Capitalization of Interest, Specific Debt.** Mariah Corporation is constructing a new wind power-generating facility. Construction began on January 2 and was completed on December 31 of the current year. Mariah made the following expenditures during the year:

Date	Amount
January 2	\$ 500,000
August 1	400,000
October 1	1,200,000
December 1	100,000

To specifically finance the project, Mariah issued \$2,200,000 of 2-year, 8% notes payable on January 2. Interest is payable annually on December 31 each year. It earned interest income of \$3,000 from investing the proceeds of the note during the year. What amount of interest can Mariah capitalize during the year?

- 1 **BE11-6. Capitalization of Interest, Specific Debt, IFRS.** Repeat BE11-5 assuming that Mariah Corporation reports under IFRS.
- 2 **BE11-7. Determining Acquisition Cost, Repairs, and Maintenance.** Circle City Transportation made the following expenditures for its fleet during the current year: oil changes, \$2,000; filter changes, \$5,000; tire rotations, \$3,000; engine overhauls, \$15,000; and retrofitting vehicles to function as party buses, \$40,000. Prepare the journal entry or entries necessary to record Circle's activities. Assume that all expenditures are paid in cash. Assume that the overhauls extend the assets' lives.
- 2 **BE11-8. Determining Acquisition Cost, Repairs, and Maintenance.** Flowers Corp. owns a delivery truck it acquired for \$57,000 last year. During the current year, it added shelving, costing \$2,800, to the truck to expand its delivery capacity. It also purchased a new set of tires costing \$1,200 and seat covers (replaced annually) for \$110. Which current-year costs are capitalized? Which current-year costs are expensed?
- 2 **BE11-9. Depreciation, Straight-Line Method.** Hermit Associates acquired a machine on January 1 at a cost of \$250,000. Hermit estimates that the machine has a useful life of 10 years and a \$50,000 residual value. Compute the depreciation expense for the first 2 years and determine the net book value at the end of the second year assuming that the straight-line method is used.
- 2 **BE11-10. Depreciation, Units-of-Output Method.** Using the data from BE11-9, compute the depreciation expense for the first 2 years and determine the net book value at the end of the second year (assume that Hermit Associates uses the units-of-output depreciation method). The machine's total output is expected to be 100,000 units. Actual output during Year 1 was 12,000 units. Actual output during Year 2 was 8,000 units.
- 2 **BE11-11. Depreciation, Double-Declining Balance Method.** Using the data from BE11-9, compute the depreciation expense for the first 2 years and determine the net book value at the end of the second year assuming that Hermit Associates uses the double-declining balance method.
- 2 **BE11-12. Depreciation, Straight-Line Method, Component Method, IFRS.** Using the data from BE11-9, compute the depreciation for the first 2 years and determine the net book value at the end of the second year assuming that Hermit Associates is an IFRS reporter that identifies the casing and engine as significant components of the machine. Attribute \$100,000 of the cost to the casing, which has an estimated useful life of 12 years and a \$30,000 residual value. Attribute the remaining \$150,000 cost to the engine, which Hermit estimates to have a useful life of 8 years and a \$20,000 residual value. Assume that the straight-line method is used.
- 2 **BE11-13. Depreciation, Straight-Line Method, Partial Year.** Kobas Kookies, Inc. acquired an oven for its baking operations on June 10 of the current year at a total cost of \$384,000. It estimates that the oven has a 16-year useful life with no scrap value. Assume that Kobas uses the half-month convention by which depreciation expense is taken for one-half of the month regardless of when the asset is purchased during the month. The firm's year-end is December 31. Compute the depreciation expense for the first 2 years using the straight-line method.
- 3 **BE11-14. Derecognition Due to Abandonment.** Greene Corp. updated its fleet of trucks, scrapping old gas-guzzling trucks for new hybrid vehicles. It took its old trucks to the scrap yard and received \$0. The fleet of trucks scrapped originally cost \$190,000 and their current carrying value is \$24,000. What is the entry to record the abandonment?

- 5 6 BE11-15. Types of Intangibles.** For each intangible asset listed below, identify whether it is typically a finite-life intangible asset, an indefinite-life intangible asset, or other.

Intangible Asset	Finite-Life, Indefinite-Life, or Other
Advertising	_____
Copyrights	_____
Customer lists	_____
Development costs	_____
Leasehold improvements	_____
Leaseholds	_____
Limited-Term franchises	_____
Patents	_____
Renewable licenses (broadcasting)	_____
Renewable permits	_____
Research costs	_____
Trade names	_____
Trademarks	_____

- 6 BE11-16. Intangibles Acquired in a Group.** Chalko Candy Corporation purchased the trademark for the popular Yummm Candy Bar from the YumYum Company. At the same time, Chalko also purchased YumYum’s customer list. Chalko paid the total purchase price of \$750,000 in cash. Chalko’s valuation consultants independently estimate the value of the trademark to be \$312,000 and customer list to be \$468,000. What is the journal entry to record the purchase?
- 6 BE11-17. Acquired Goodwill.** On January 1, Buckingham Brothers acquired 100% of Julian Systems for \$12,000,000. The book value of Julian’s net assets on the date of acquisition was \$7,000,000. However, a detailed appraisal of Julian’s net assets revealed that its net assets were undervalued by \$1,000,000. Determine the amount of goodwill or gain from a bargain purchase to be recorded on the acquisition and indicate where it should be reported on the consolidated financial statements.
- 6 BE11-18. Bargain Purchase.** Repeat the requirements of BE11-17 assuming that the acquisition cost was \$7,000,000.
- 6 BE11-19. Research and Development Expenditures.** Dimension Pharmaceuticals paid cash for the following to fund its research activities: testing materials and supplies, \$600,000; research consultants, \$100,000; planning and design consultants, \$135,000; and general-purpose laboratory equipment, \$950,000. The equipment has a 10-year useful life and no residual value. Prepare the journal entry required to record Dimension’s research expenditures for the year. The equipment was acquired on January 1.
- 6 BE11-20. Research and Development Expenditures, IFRS.** Use the same information in BE11-19 and assume that Dimension Pharmaceuticals is an IFRS reporter. Prepare the journal entry required to record Dimension’s research expenditures for the year. Assume that projects developed by planning and design consultants meet conditions for capitalization. The equipment was acquired on January 1.
- 7 BE11-21. Leasehold Improvements.** At the beginning of its fiscal year, Beau Co. leased office space for a 20-year period. Prior to occupying the office, Beau needed to make renovations costing \$750,000 with an expected useful life of 15 years. The renovations are to be recorded as leasehold improvements. Assuming that Beau uses the straight-line method, prepare the journal entry to record the first year’s amortization.

Exercises

- 1 E11-1. Determining Acquisition Cost.** St. Charles Flooring Company recently purchased a new tile-cutting machine with an invoice price of \$215,500. The cost of delivery was \$2,000, and installation amounted to \$3,550. To test the machine, St. Charles cut 100 tiles that cost \$4.50 each. The testing process lasted 2 hours and involved three employees who earn \$20 per hour. Management removed the employees from their regular production shifts to engage in the testing. The company held training sessions costing \$6,000 for all employees after installing the machine.

Required »

- Determine the cost of the machine and any expenses incurred during the acquisition.
- Prepare the journal entries necessary to record the amount of costs capitalized and the costs charged to expense related to the acquisition. Assume that all expenditures were made in cash.

1

E11-2. Determining Acquisition Cost. On January 2 of the current year, Vaughn, Inc. acquired land for \$2,000,000 to be used to construct a new service and repair center. The closing costs amounted to \$110,000, and Vaughn paid \$20,000 for the current period's property taxes. There was an existing structure on the land that had been abandoned for several years. Vaughn agreed to remove the building and dispose of any scrap materials. The demolition cost was \$67,000, and the company was required to pay \$13,800 to remove the debris. Vaughn was able to sell scrap materials for \$4,500.

Required »

- Determine the cost of the land and any expenses incurred during the acquisition.
- Prepare the journal entries necessary to record the amount of costs capitalized and the costs charged to expense related to the property's acquisition. Assume that all expenditures were made in cash.

1 2

E11-3. Determining Acquisition Cost in a Basket Purchase, Depreciation. Sonata Manufacturing Corporation decided to expand its operations and open a new facility in Illinois. Rather than constructing a new plant, Sonata negotiated a contract to purchase an existing facility from a former competitor for a total cost of \$5,000,000. The facility included the land, building, machinery and equipment, inventory, and manufacturing supplies. The former competitor was closing its operations and decided to sell the facility at a reduced price as reflected in the fair values of the individual assets acquired.

Description	Fair Value
Building	\$3,200,000
Land	1,600,000
Machinery and equipment	864,000
Inventory	183,500
Manufacturing supplies	52,500
Total	<u>\$5,900,000</u>

The building has a remaining useful life of 20 years, and Sonata expects the machinery and equipment to be productive for an additional 5 years from the date of acquisition. Sonata uses the straight-line method and does not use residual values when computing depreciation. Sonata accounts for inventory under the FIFO basis and expenses the supplies as consumed in operations.

During the first year after the acquisition, the company sold all inventory acquired for \$220,000 in cash and used 60% of the supplies in the production process. Assume that Sonata uses a perpetual inventory system.

Required »

- Determine the proper allocation of the purchase cost to each of the assets acquired. Round all calculations to two decimal places.
- Prepare the journal entries necessary to record the acquisition of the assets. Assume that all expenditures were made in cash.
- Prepare the journal entries necessary to record the depreciation of the building and the machinery and equipment, the sale of inventory, and the use of the manufacturing supplies. Assume that assets were acquired on January 1.

1

E11-4. Acquiring an Asset with a Note Payable (Deferred Payment Arrangements). On December 31, 2018, the Clearwater Corporation acquired a custom-made plant asset by issuing a promissory note with a face value of \$750,000, a due date of December 31, 2023, and a stated (coupon) rate of interest of 2%. Interest is compounded annually and is payable at the end on each year. The fair value of the customized asset is not readily determinable and the note receivable is not publicly traded. Given the company's incremental borrowing rate and current market conditions, the imputed rate of interest for the note is estimated as 6%.

Determine the present value of the note and prepare the journal entry to record the transaction for Clearwater Corporation.

1

E11-5. Acquiring an Asset with a Zero Coupon Note Payable (Deferred Payment Arrangements). Quartech Enterprises manufactures and distributes thermostats for major kitchen appliances. At the beginning of the current year, Quartech decided to expand its operations by acquiring a metal soldering machine. The machine is to be produced by the manufacturer according to Quartech's specifications and does not have a market

outside of this transaction. To finance this purchase, the manufacturer provided Quarteck credit and asked the company to issue a 5-year, \$800,000 non-interest-bearing note payable. If Quarteck borrowed the funds from a commercial bank, it would have incurred a 4% interest rate.

Required »

- a. Determine the proper valuation of the machine.
- b. Prepare the journal entry to record the acquisition.

1

E11-6. Capitalization of Interest, Specific and General Debt, Journal Entries. Rolling Blackout Power Company constructed a new power plant to supply energy to the Northeast Electrical Grid. The construction began on January 2 and ended on December 31 of the current year. On the date of completion, the plant had a total cost of \$8,500,000. The weighted-average accumulated expenditures for the year were \$4,250,000.

The company had the following debt outstanding for the entire year:

Debt Instrument and Purpose	Amount
8% note payable: Used to finance the power plant construction project	\$2,000,000
12% bond payable: Used to finance maintenance of local transmitters	\$1,800,000
13% note payable: Used to finance construction of corporate headquarters	\$4,200,000

Required »

- a. Compute the amount of interest to be capitalized for the current year.
- b. Compute the amount of interest to be expensed in the current year.
- c. Prepare the journal entry to record the cash interest payments for the current year. Assume that all interest is paid at the end of the year and any interest capitalized is debited to the construction in progress account.

1

E11-7. Capitalization of Interest, Specific and General Debt, Journal Entries, IFRS. How would the solution to E11-6 change if Rolling Blackout Power Company was an IFRS reporter and earned \$11,000 interest income on investing the excess funds from the construction loan during the year? Prepare the journal entry to record the cash interest payments for the current year.

1

E11-8. Capitalization of Interest, Specific and General Debt, Computing Weighted-Average Accumulated Expenditures, Journal Entries. Yawyag Corporation engaged Sir Peter, Inc. to design and construct a manufacturing facility. Construction began on January 2 and was completed on December 31 of the current year. The following payments were made to the contractor during the year:

Date	Amount
January 2	\$2,400,000
August 1	1,800,000
October 1	3,600,000
December 1	1,200,000

To specifically finance the project, Yawyag issued \$2,800,000 of 3-year, 5% notes payable on January 2. Interest is payable annually on December 31 each year. Prior to the commencement of the latest construction project, Yawyag had other debt in its capital structure. All general debt is outstanding as of the beginning of the current year. The general debt consists of \$5,000,000 par value, 6% bonds payable, and a \$1,000,000, 9% note payable. Both debt instruments require annual interest payments each December 31.

Required »

- a. Compute the weighted-average accumulated expenditures for the current year.
- b. Compute the amount of avoidable interest and actual interest cost for the current year.
- c. Indicate the amount of total interest to be capitalized and the amount of interest to expense for the year.
- d. Prepare the journal entry to record the December 31 interest payments. Assume that the interest is paid in cash and that any interest capitalized is recorded in the Construction in Progress account.

1

E11-9. Capitalization of Interest, Specific and General Debt, Computing Weighted-Average Accumulated Expenditures, Journal Entries. Assume that the project in E11-8 was not completed in Year 1. Yawyag was required to make two additional payments to the contractor in Year 2: \$900,000 on April 1 and \$1,800,000

on August 1 of Year 2. On January 2 of Year 2, Yawyag was required to take out a \$2,400,000, 9% line of credit to help finance its operating cycle. The plant was completed on October 1.

Required »

- Compute the weighted-average accumulated expenditures for the current year.
- Compute the amount of avoidable interest and actual interest cost for the current year.
- Indicate the amount of total interest to be capitalized and the amount of interest to expense for the year.
- Prepare the journal entry to record the December 31 interest payments. Assume that the interest is paid in cash and that any interest capitalized is recorded in the construction in progress account.

- 1** **E11-10. Capitalization of Interest, Specific and General Debt, Computing Weighted-Average Accumulated Expenditures, Journal Entries, IFRS.** Assume that the Yawyag Corporation in E11-8 is an IFRS reporter and complete the following:

Required »

- Compute the weighted-average accumulated expenditures for the current year.
- Compute the amount of interest related to the construction project and actual interest cost for the current year.
- Indicate the amount of total interest to be capitalized and the amount of interest expense for the year.
- Prepare the journal entry to record the December 31 interest payment. Assume that the interest is paid in cash and that any interest capitalized is recorded in the construction in progress account.

- 2** **E11-11. Expensing versus Capitalizing Expenditures—Analysis and Journal Entries.** Clave Building Products, Inc. conducts regularly scheduled maintenance of its machinery and equipment every Friday afternoon. The cost of maintenance for the current year amounted to \$345,000. The regular maintenance revealed the need to conduct a major overhaul on one of Clave's older pieces of equipment. The firm completed the overhaul this year at a cost of \$16,000. In addition, the company installed a new roof on its factory at a total cost of \$59,000. Due to increased demand for its products, Clave decided to expand one of its loading docks. The cost of the factory expansion was \$187,000. The new roof and overhaul extended the assets' useful lives. Prepare the journal entry (entries) required to record those transactions. Assume that Clave paid for all expenditures in cash.

- 2** **E11-12. Expensing versus Capitalizing Expenditures—Analysis and Journal Entries, IFRS.** Avery Air, Plc, a UK company, conducts regularly scheduled maintenance and improvement of its fleet of airplanes. During the year, it replaced engines at a cost of £2,900,000, upgraded airplane interiors at a cost of £610,000, and spent £1,300,000 on normal repairs and upkeep, including instrument repair and replacement. The new engines will increase an airplane's useful life by 5 years. The new interiors will be used for 3 years before being replaced. Avery depreciates each major airplane component separately. Prepare the journal entry (entries) required to record those transactions. Assume that all expenditures are paid in cash.

- 2 3** **E11-13. Depreciation Methods, Disposal.** Kurtis Koal Company, Inc. purchased a new mining machine at a total cost of \$900,000 on the first day of its fiscal year. The firm estimates that the machine has a useful life of 6 years or 6,000,000 tons of coal and a residual value of \$60,000 at the end of its useful life. The following schedule indicates the actual number of tons of coal mined with the machine per year:

Year	Tons of Coal
1	700,000
2	1,400,000
3	1,600,000
4	1,000,000
5	750,000
6	550,000

Required »

Prepare the depreciation schedules for the machine assuming that Kurtis Koal used the following methods (each case is independent):

- Straight-line method.
- Units-of-output method.
- Double-declining balance method. (Adjust the depreciation expense in the last year to the necessary amount to arrive at an ending book value equal to the scrap value.)
- Kurtis Koal sells the mining machine for \$450,000 at the end of Year 3. What is the gain or loss on sale under each of the depreciation methods in parts (a)–(c)?

- 2 3** **E11-14. Depreciation Methods, Disposal, IFRS.** Repeat the requirements in E11-13 assuming that Kurtis Koal Company, Inc. is an **IFRS** reporter and the mining machine has two components: casing and engine. The amount allocated to the engine is \$800,000. The engine has a 6-year useful life and \$60,000 salvage value. The amount allocated to the casing is \$100,000. The casing has a 10-year useful life and no salvage value. The straight-line method is used.

Required »

- Prepare the depreciation schedule for the machine.
- Kurtis Koal sells the mining machine for \$450,000 at the end of Year 3. What is the gain or loss on the sale?

- 2 3** **E11-15. Depreciation Methods, Partial-Year Depreciation.** Repeat the requirements in E11-13 assuming that Kurtis Koal Company, Inc. acquired the asset on August 1 of the current year.

- 2 3** **E11-16. Depreciation Methods, Partial-Year Depreciation, IFRS.** Repeat the requirements in E11-14 assuming that Kurtis Koal Company, Inc. acquired the asset on August 1 of the current year. Use partial-year depreciation without adopting any of the acceptable conventions that simplify the computation.

- 2 3** **E11-17. Depreciation Methods.** Ace Manufacturing, Inc. purchased a new piece of manufacturing equipment at a total acquisition cost of \$3,000,000 on January 4 of the current year. The firm estimates that the equipment has a useful life of 10 years or 13,250,000 units of output and a residual value of \$350,000 at the end of its useful life. The following schedule indicates the actual number of units output with the machine per year:

Year	Units of Output	Year	Units of Output
1	1,600,000	6	1,300,000
2	1,600,000	7	1,200,000
3	1,500,000	8	1,200,000
4	1,500,000	9	1,100,000
5	1,300,000	10	1,100,000

Required »

Prepare the depreciation schedules for the manufacturing equipment assuming that Ace used the following methods (each case is independent):

- Straight-line method.
- Units-of-output method.
- Double-declining balance method. (Reduce the depreciation expense in the last year to the necessary amount to arrive at an ending book value equal to the scrap value.)
- Ace sells the manufacturing equipment at the end of Year 5 for \$1,465,000. What is the gain or loss on sale under each of the depreciation methods in parts (a)–(c)?

- 2 3** **E11-18. Depreciation Methods, IFRS.** Repeat the requirements in E11-17 assuming that Ace is an **IFRS** reporter and the manufacturing equipment has two components: computer controls and engine. The amount allocated to the computer controls is \$500,000. The computer controls have a 5-year useful life and \$0 salvage value. The amount allocated to the engine, which has a 10-year useful life and \$250,000 salvage value, is \$2,500,000. The straight-line method is used.

Required »

- Prepare the depreciation schedule for the manufacturing equipment.
- Ace sells the manufacturing equipment for \$1,465,000 at the end of Year 5. What is the gain or loss on the sale?

- 2 3** **E11-19. Depreciation Methods, Partial-Year Depreciation.** Repeat the requirements in E11-17 assuming that Ace acquired the asset on July 14 of the current year. Use partial-year depreciation assuming that the manufacturing equipment was acquired at the beginning of the month to simplify the computation.

- 2 3** **E11-20. Depreciation Methods, Partial-Year Depreciation, IFRS.** Repeat the requirements in E11-18 assuming that Ace acquired the asset on July 14 of the current year. Use partial-year depreciation assuming that the manufacturing equipment was acquired at the beginning of the month to simplify the computation.

- 2 3** **E11-21. Partial-Year Depreciation, Sale of Property, Plant, and Equipment.** The Gemini Group sold one of its plant assets on August 1 of the current year for \$200,000. The asset had an original cost of \$500,000 and an estimated residual value of \$80,000. The firm used the straight-line method of depreciation assuming an estimated useful life of 8 years. The asset was in service for 5 years as of January 1 of the current year.

Required »

- Prepare the journal entry required to record the depreciation for the current year.
- Prepare the journal entry required to record the sale of the asset.

2 3

E11-22. Partial-Year Depreciation, Sale of Property, Plant, and Equipment. The Aries Group sold one of its plant assets on April 1 of the current year for \$250,000. The asset had an original cost of \$500,000 and an estimated residual value of \$80,000. Aries used the straight-line method of depreciation assuming an estimated useful life of 8 years. The asset was in service for 5 years as of January 1 of the current year.

Required »

- Prepare the journal entry required to record the depreciation for the current year.
- Prepare the journal entry required to record the sale of the asset.

4

E11-23. Disclosure of Property, Plant, and Equipment. Use the information in E11-13, part (a) to prepare the required footnote disclosure for Kurtis Koal Company, Inc.'s property, plant, and equipment for Years 1 and 2, including a statement of its accounting policy and a table with account balances.

4

E11-24. Disclosure of Property, Plant, and Equipment, IFRS. Use the information in E11-14, part (a) to prepare the required footnote disclosure under **IFRS** for Kurtis Koal Company, Inc.'s property, plant, and equipment for Years 1 and 2, including a statement of its accounting policy and a table with account balances.

6

E11-25. Goodwill Computation. On January 2, 2019, Bubba and Company paid \$5,000,000 in cash to acquire 100% of the Cire Company's voting common stock. Cire's balance sheet on that date showed the following balances in its accounts:

**Cire Company
Balance Sheet
December 31, 2018**

Plant and Equipment	\$5,574,900
Mortgage Payable	\$4,324,900
Stockholders' Equity	1,250,000
Total	\$5,574,900

The appraised value of Cire's net assets was \$1,400,000 greater than its book value on the date of acquisition.

Required »

- Compute the amount of goodwill to be recorded on the date of acquisition.
- How is goodwill accounted for subsequent to the date of acquisition?

6

E11-26. Research and Development Activities. During the current year, Carlson Industries, Inc. conducted significant research activities related to the development of a new computer chip. Carlson had the following costs:

Description	Amount
Diagnostic equipment (5-year life, \$10,000 residual value, S-L method, purchased January 1)	\$ 500,000
Salaries of laboratory technicians	325,000
Testing materials used in experimentation	137,500
Supplies used in the testing process	23,500
Salary for engineer in the design phase of production	87,000
Depreciation expense on research facilities	8,000
Total cost of research activities	\$1,081,000

Prepare all journal entries required to record Carlson's R&D activities for the current year.

6

E11-27. Research and Development Activities, IFRS. Repeat the requirements in E11-26 assuming that Carlson reports under **IFRS**. Assume that all the conditions to capitalize development costs have been met and the project is completed on January 1. Capitalized development costs are amortized over 4 years. What is the difference between the research and development expense under **U.S. GAAP** compared to the expense under **IFRS**?

- 6 7** **E11-28. Goodwill Computation, Acquisition of Intangibles, Amortization.** Alto Devices acquires Medifast, a small start-up company, by paying \$2,170,000 in cash on January 2. Following are the book values and fair values of Medifast on the date of acquisition.

Medifast	Book Value	Fair Value
Cash	\$ 36,000	\$ 36,000
Receivables	100,437	100,400
Manufacturing equipment	640,275	654,234
Patents (remaining life 10 years)	60,000	854,000
Trademarks	14,652	187,450
Payables	58,902	58,902

Required »

- What is the amount of goodwill acquired?
 - What intangible assets are acquired? Which of the intangibles have an indefinite life? Which will be amortized? What will the amortization expense be in the year after acquisition?
- A** **E11-29. Exchange of Assets with and without Commercial Substance, Journal Entries.** On January 2, 2018, Temptations Corporation paid \$31,500 in cash and exchanged a chocolate mixing machine, which had a fair value of \$437,500 and a book value of \$500,000 (\$1,135,000 historical cost – \$635,000 accumulated depreciation brought up to the date of the transaction) for another chocolate mixing machine from Rascals Candy, Inc. The new mixing machine had a fair value of \$469,000 and a book value of \$380,000 (\$1,500,000 – \$1,120,000).
- Required »**
- Record the journal entry on the books of Temptations Corporation to record the exchange assuming that the transaction altered the economic positions of the parties.
 - Assume that the fair value of the old machine is now estimated at \$562,500 and that that new mixing machine had been appraised at \$594,000. In addition, the exchange will not materially change the economic positions of the parties to the transaction. Record the journal entry on the books of Temptations Corporation to record the exchange of the machines. All other information remains the same as in part (a).
 - Repeat part (b) on the books of Rascals Candy, Inc.
- A** **E11-30. Exchange of Assets without Commercial Substance, Journal Entries, IFRS.** Assume that Rascals Candy, Inc. reports under IFRS. Repeat the requirement of E11-29, part (c).
- A** **E11-31. Exchange of Plant Assets, Depreciation Adjustment, Journal Entries.** You have been asked to account for a plant asset exchange on the books of the Ecara Video Game Company. On January 1, 2013, Ecara acquired a plastic extruding machine at a cost of \$260,000. This machine had an original estimated useful life of 10 years and a scrap value of \$20,000. The machine was depreciated using the straight-line method. On August 1, 2018, Ecara exchanged the old machine for a similar asset with a market value of \$157,250. Ecara also received cash of \$27,750. The estimated fair value of the old machine is \$185,000. The old machine was depreciated up to December 31, 2017.
- Required »**
- Determine the gain or loss to be recognized on the exchange for Ecara assuming that the exchange has commercial substance after bringing the accumulated depreciation up to the date of the transaction.
 - Prepare all journal entries required on August 1, 2018, for Ecara.
 - Prepare the journal entry for Ecara to record the exchange as if the exchange had lacked commercial substance.
- A** **E11-32. Exchange of Plant Assets, Journal Entries, IFRS.** Assume that the Ecara Video Game Company reports under IFRS. Repeat the requirement of E11-31, part (c).
- A** **E11-33. Exchange with Commercial Substance.** Mercurial Company traded its cutting equipment for the newer air-cooled equipment manufactured by Broad Street Corporation. The air-cooled equipment will increase Mercurial's productivity. The old equipment had a book value of \$140,000 (cost of \$700,000 less accumulated depreciation of \$560,000). Assume that the accumulated depreciation is brought up to the date of the exchange. The old equipment was recently appraised at fair value of \$210,000. Mercurial paid Broad Street \$602,000 in cash. The new air-cooled equipment had a fair value of \$812,000.

Prepare the journal entry to record the exchange on the books of Mercurial Company.

- A** **E11-34. Exchange Lacks Commercial Substance, Cash Paid.** Doris Company traded a tract of land to Rick's Real Estate for a similar tract of land with no significant effect on future cash flows. The old land had a carrying value of \$6,500,000. The land was appraised for \$9,000,000. As part of the exchange, Doris paid \$3,500,000 in cash. Prepare the journal entry to record the land exchange on the books of Doris Company.
- A** **E11-35. Exchange with Commercial Substance: Gain Case.** Clayton Company exchanged a used machine with a book value of \$26,000 (cost \$54,000 less \$28,000 accumulated depreciation) and cash of \$8,000 for a delivery truck. The machine is estimated to have a fair market value of \$36,000. The cash flows related to the truck will be different from the cash flows generated from the use of the machine. Prepare the journal entry to record the exchange on the books of Clayton Company.
- A** **E11-36. Exchange with Commercial Substance: Loss Case.** Clarke Company traded a used mixing machine for a new model. The used machine has a book value of \$11,000 (cost \$32,000 less \$21,000 accumulated depreciation) and a fair market value of \$8,000. The new mixing machine has a list price or fair value of \$31,000, the seller has allowed a trade-in allowance of \$8,000 on the old machine, and Clarke paid the balance, \$23,000 (\$31,000 - \$8,000), in cash. Prepare the journal entry required to record the exchange on the books of Clarke Company. Assume that the exchange has commercial substance.
- A** **E11-37. Exchange Lacking Commercial Substance, Cash Paid.** Brown Company contracts with Sebastian Company to exchange refrigerated trucks. Brown Company will trade three SMC trucks for four DROF trucks owned by Sebastian Company. The trucks are approximately the same age and have the same remaining useful lives. The fair value of the SMC trucks is \$51,000 with a book value of \$38,000 (cost \$65,000 - \$27,000 accumulated depreciation). The DROF trucks have a fair value of \$66,000, and Brown Company gives \$15,000 in cash (paid) in addition to the SMC trucks. Record the transaction on the books of the Brown Company. Assume that the exchange does not have commercial substance.
- A** **E11-38. Exchanges Lacking Commercial Substance, Cash Received.** Brown Company contracts with Sebastian Company to exchange refrigerated trucks. Brown Company will trade three SMC trucks for four DROF trucks owned by Sebastian Company. The DROF refrigerated trucks have a cost of \$100,000 and accumulated depreciation up to the date of the exchange of \$52,000. The trucks are approximately the same age and have the same remaining useful lives. The fair value of the SMC trucks is \$51,000 with a book value of \$38,000 (cost \$65,000 less \$27,000 accumulated depreciation). The DROF trucks have a fair value of \$66,000, and Brown Company gives \$15,000 in cash (paid) in addition to the SMC trucks. Prepare the journal entry to record the exchange on the books of the Sebastian Company. Assume that the exchange does not have commercial substance.
- A** **E11-39. Exchanges Lacking Commercial Substance, Cash Received, IFRS.** Assume that Sebastian Company from E11-38 reports under IFRS. Prepare the journal entry to record the exchange on the books of Sebastian Company.
- B** **E11-40. Accounting for Natural Resources, Full-Cost Method.** Ferro Fuel Company (FFC) acquired a tract of land to be used for oil and gas exploration at the beginning of the current year. FFC paid \$500,000 to acquire the land, paid \$325,000 in development costs, and incurred \$130,000 in exploration and evaluation costs for nonproducing wells and \$200,000 for a producing well. The asset retirement obligation is estimated at \$100,000. The producing well is expected to generate 1,000,000 barrels of oil over its useful life. Assume that all expenditures are paid in cash.

Required »

- Determine the total cost of the natural resource under the full-cost method.
 - Prepare the journal entries to record the acquisition of the natural resource.
 - Record the depletion of the natural resource at the end of the first year assuming that 145,000 barrels of oil were produced during the first year of operations. Depletion is recorded under the units-of-output method.
- B** **E11-41. Accounting for Natural Resources, Full-Cost Method.** Repeat the requirements in E11-40 assuming that FFC uses the successful-efforts method.
- B** **E11-42. Accounting for Natural Resources, Full-Cost Method, Successful-Efforts Method.** Spill Oil Corporation drilled 10 oil wells at the beginning of the current year. The total exploration costs associated with this oil and gas activity amounted to \$8,500,000. Only six of the wells were producing; the remaining wells are dry or nonproductive assets. It is estimated that the six successful wells will produce 17,000,000 barrels of oil over their estimated useful life. Assume that all expenditures are paid in cash.

Required »

- a. Prepare the journal entry to record the exploration costs assuming that the company uses the full-cost method.
- b. Prepare the journal entry to record the exploration costs assuming that the company uses the successful-efforts method.
- c. Assuming that 2,000,000 barrels of oil were produced during the current year, prepare the journal entry to record the depletion expense under the units-of-output approach (no residual value) assuming that:
 - i. The full-cost method is used.
 - ii. The successful-efforts method is used.

Problems

1

P11-1. Note Payable Exchanged for a Plant Asset (Deferred Payment Arrangement). Hoppie Products signed a contract with Coleman Manufacturing to design, develop, and produce a specialized plastic molding machine for its factory operations. The machine is not currently sold to the public. Hoppie issued a 3%, 8-year, \$690,000 note payable to Coleman to pay for the machine. If Hoppie were required to borrow at a commercial bank to finance the acquisition, it would have incurred the current market rate of 6%. Assume that all transactions occurred at the beginning of the current fiscal year (January 1). Interest is paid at the end of each year.

Required »

- a. Prepare the journal entry required to record the asset acquisition.
- b. Prepare the amortization table for the note payable.
- c. Record the interest expense for the first 2 years.
- d. Indicate the effects of these transactions (i.e., the asset acquisition and the interest payment and amortization of discount) on the current year-end balance sheet (ignore cash effects), income statement, and cash flow statement under the direct and indirect methods.
- e. Independent of parts (a)–(d), assume that the molding machine is sold to the general public on a regular basis and has a fair value of \$560,000. Prepare the journal entry to record the acquisition of the machine from Coleman.

1

P11-2. Capitalization of Interest, Specific and General Debt, Computing Weighted-Average Accumulated Expenditures, U.S. GAAP. On January 1, 2018, Union Power and Light commenced construction of a new generating plant to serve the northeast corridor of the state. The total cost of the project is \$4,100,000, and it will be completed on June 1, 2019. Scheduled payments to contractors are summarized in the following table.

Date	Amount Paid
January 1, 2018	\$ 950,000
April 1, 2018	300,000
July 1, 2018	<u>1,200,000</u>
Total 2018	<u>\$2,450,000</u>
February 1, 2019	\$1,150,000
April 1, 2019	<u>500,000</u>
Total 2019	<u>\$1,650,000</u>
Total expenditures	<u>\$4,100,000</u>

To finance the project, Union Power obtained a bank loan on January 1, 2018, for \$1,800,000 at 10% interest. Union's other general (or indirect) outstanding debt during 2018 and 2019 includes the following:

General Debt	Amount
7% note	\$1,000,000
9% note	3,500,000
6% bonds	<u>2,000,000</u>
Total	<u>\$6,500,000</u>

All debt was issued at par and is outstanding for the full year. Interest for all debt is paid on December 31.

Required »

- Determine the amount of interest to be capitalized and expensed by Union Power Company for both 2018 and 2019.
- Prepare all journal entries required.
- Determine the final valuation of the power plant.

1 2

P11-3. Acquisition Costs with Multiple Assets. Mund Manufacturing, Inc. started operations at the beginning of the current fiscal year. The following transactions took place during the year. Assume that the transactions are cash transactions unless indicated as a nonmonetary event.

- Acquired land at a cost of \$5,000,000. In addition, legal fees, closing costs, and delinquent property taxes amounted to \$35,000.
- Paid current-period property taxes on the land, \$23,000.
- Removed existing structure on the land at a cost of \$68,000 and sold scrap materials for \$6,800.
- Paid \$320,000 for landscaping, lighting, fencing, and driveways.
- Constructed a factory building at a cost of \$35,000,000.
- Acquired factory equipment at a cost of \$985,000. Paid \$35,000 for delivery and installation. Installed additional electrical circuits to run two of the machines at a cost of \$55,000.
- Damaged the loading dock during the installation of one piece of equipment; repair cost amounted to \$18,500.
- Acquired three delivery trucks by signing a 5-year note at the dealership with 0% financing. The total market value of the trucks amounted to \$121,080. The note carried a face value of \$195,000. The current market rate of interest on similar financing is 10%. Trucks are acquired on January 1.
- Adjusted the entry for interest expense (amortizing discount) at the end of the year.
- Adjusted depreciation at the end of the year: All assets are depreciated on a straight-line basis with no residual values using a half-year convention taking a half-year depreciation in the year of acquisition and a half-year in the last year of the asset's life. The estimated useful lives are as follows:
 - Buildings, 30 years
 - Equipment, 10 years
 - Vehicles, 8 years
 - Land improvements, 5 years

Required »

- Prepare the journal entries to record each of the transactions.
- Indicate the effects of these transactions on the current year-end income statement, balance sheet (exclude effects on the cash balance), and cash flow statement under both the direct and indirect methods.

2

P11-4. Depreciation Methods and Depreciation Schedules. On January 1 of the current year, Minguss Manufacturing Company purchased a metal cutting and polishing machine at a cost of \$4,000,000. The installation and delivery costs amounted to \$250,000. The firm expects the machine to be productive for a total of 5 years and a residual value of \$500,000 at the end of the asset's useful life.

Required »

Prepare the depreciation schedules for the machine assuming that the following methods were used (each case is independent):

- Straight-line method.
- Double-declining balance method (DDB). (Reduce the depreciation expense in the last year to the necessary amount to arrive at an ending book value equal to the scrap value.)

2

P11-5. Depreciation and Asset Use, Analysis. Jack Pinno, Vice President of Production at Greco Corporation, is considering changing the company's capital acquisition and use policy. Greco's policy has been to use equipment through its useful life and then to scrap it. Greco uses straight-line depreciation. Pinno has noticed that repair and downtime of equipment dramatically increases in the last few years of the equipment's life, leading to lost sales and higher production costs. He is proposing to use the equipment for a shorter period and then sell it in the used equipment market. He would like to better understand the financial statement effects of changing the policy. He has asked you to analyze the following information and financial statement effects in net income and cash flows. What would your analysis provide?

	Current	Proposed
Estimated cost	\$10,000	\$10,000
Salvage value	0	\$3,000 (based on current price for similar used equipment)
Useful life	10 years	7 years
Annual repairs and maintenance		
Years 1–2	\$ 250	\$ 250
Years 3–7	325	325
Years 8–10	625	

23

P11-6. Disposals of Long-Term Operating Assets—Analysis, Depreciation, and Journal Information related to the long-term operating assets of Rivera Retail Distributors, Inc. at December 31, 2018, is as follows:

Balance Sheet Category	Cost	Accumulated Depreciation Through 12/31/2018	Estimated Useful Life (Years)	Estimated Residual Value	Depreciation Method
Equipment	\$ 500,000	\$ 180,000	10	\$ 50,000	Double-declining balance
Machinery	345,500	170,000	8	5,500	Straight line
Vehicles	127,900	75,000	5	2,900	Straight line
Leasehold Improvements	65,400	21,800	3	0	Straight line
Building	12,000,000	3,252,000	20	1,500,000	Straight line
Land	4,560,000	N/A	N/A	N/A	N/A

The fiscal year-end of the company is December 31. The following events occurred during 2019:

- On February 1, Rivera sold the vehicles to Wholesale Produce, Inc. for \$15,000.
- On March 31, all of Rivera's equipment and machinery was destroyed by a fire in one of its facilities.
- On May 1, the equipment was replaced at a cost of \$625,000, and the machinery cost the company \$420,000 to replace. The estimated useful lives and residual values remained the same as specified for the original machinery and equipment. The company paid cash for the new assets.

Required »

- Prepare the journal entries required to record each of those events and to record depreciation expense at the end of the year.
- Determine the ending net book value of Rivera's long-term operating assets on its December 31, 2019, balance sheet. Show the balance for each asset individually and in total.

6

P11-7. Goodwill and Bargain Purchase Computations. The trial balance for the Dark Horse Company follows:

Description	Debit	Credit
Cash	\$ 30,000	
Inventory	100,000	
Property, plant, and equipment – Net	370,000	
Current liabilities		\$ 50,000
Common stock – No par		150,000
Retained earnings		300,000
Totals	<u>\$500,000</u>	<u>\$500,000</u>

Assume that MPL, Inc. offers to acquire Dark Horse at a purchase price of \$650,000. A study of Dark Horse's assets revealed that the inventory had a fair market value of \$180,000 and the plant assets were undervalued by \$50,000.

Required »

- Given this set of assumptions, calculate the amount of goodwill or bargain purchase gain to be recorded on the acquisition.
- Assume now that MPL, Inc. offers to acquire Dark Horse at a purchase price of \$250,000. Determine the amount of goodwill or bargain purchase gain.
- Indicate how to account for goodwill and any gain from a bargain purchase in the financial statements.

67

P11-8. Research and Development Expenditures, Amortization. Greene Motors, Ltd. recently entered the automobile industry by introducing its first fully electric vehicle, the Bolt. The Bolt is the first of many planned vehicles that Greene will produce. In order to expand its product line, Greene requires a state-of-the-art testing facility and a new research and development laboratory. The following transactions are related to Greene's research and development activities.

- Constructed a new testing facility at a cost of \$14,000,000. The facility is estimated to have a 20-year economic life and a \$4,000,000 residual value at the end of that time. The facility will be depreciated using the straight-line method.

Within the new facility, Greene made the following expenditures to conduct its research and development (R&D) activities:

2. Purchased R&D equipment for \$568,000. The equipment has a 5-year life and no residual value. The equipment will be depreciated using the straight-line method.
3. Acquired testing materials and supplies at a cost of \$125,000. Research projects consumed 70% of the materials and supplies in the current year.
4. Developed a prototype for a new battery, the Powerizer. The prototype cost \$265,700 for development and testing.
5. Paid \$168,500 in salaries and wages for testing activities.
6. Obtained a patent for the Powerizer. The patent application and legal fees to successfully defend the patent amounted to \$560,000. The economic life of the patent is 7 years.
7. Acquired Bizet Automotive Suppliers, Inc. at the beginning of the current year. As part of the transaction, Greene acquired in-process R&D for \$356,700. Subsequent R&D expenditures for these projects amounted to \$120,000. The acquired projects continue in development for 2 more years.
8. Recorded all required depreciation and amortization at the end of the year.

Required »

- a. Prepare the journal entries to record each of the transactions assuming that all purchases were made with cash. Assume that the transactions occurred on January 1.
- b. Indicate the effects of these transactions on the current year-end balance sheet (excluding the effects on the cash balance), income statement, and cash flow statement under the direct and indirect methods.

6 7

P11-9. Research and Development Activities, Amortization, IFRS. Repeat the requirements in P11-8 assuming that Greene Motors, Ltd. reports under **IFRS**. Assume that all the conditions to capitalize development costs have been met. Any development costs are amortized over 3 years. What is the difference between the research and development expense under **U.S. GAAP** compared to **IFRS**?

6 7

P11-10. Intangible Assets, Amortization. Hein Technologies conducted the following cash transactions on January 1.

1. Paid \$712,000 to fund internal research designed to develop a new digital scanner. The company expects the useful life to be 3 years.
2. Patented a product based on internal research that could be sold to consumers. Before applying for the patent, incurred additional costs of \$200,000 to complete product development ensuring that the product was technologically feasible. Paid \$13,800 for patent filing costs and legal fees to successfully defend the patent. The company expects the new technology will be profitable for a 3-year period.
3. Leased three floors of office space. The lease was secured by making an advance payment of \$300,000. The lease is a 10-year lease with no renewal options.
4. Paid \$560,000 to renovate the leased property to prepare the leased floors for intended use. The useful life of the renovations is estimated at 10 years.
5. Paid \$45,000 to acquire a franchise to distribute ICC external hard drives for a 9-year period.

Required »

- a. Prepare the journal entries to record each of the transactions.
- b. Assume that Hein acquired Dolan Development last year. Hein recorded the following intangible assets on the date of acquisition:
 - Goodwill, \$1,500,000
 - Dolan Development trademark, \$600,000
 - Renewable licenses, \$56,000
 Prepare the year-end adjusting entries required for each of Hein's intangible assets. Assume that the straight-line method is used and a full year's amortization is taken in the year of acquisition.
- c. Indicate the effects of these transactions on the current year-end income statement, balance sheet (excluding the effect on the cash balance), and cash flow statement using the direct and the indirect methods.

6 7

P11-11. Intangible Assets, Amortization, IFRS. Repeat the requirements in P11-10 assuming that Hein Technologies reports under **IFRS**. Assume that all the conditions to capitalize development costs have been met. What is the difference between the research and development expense under **U.S. GAAP** compared to that expense under **IFRS**?

Autograded Excel Project available in **MyLab Accounting**

CASES

Judgment Cases

Judgment Case 1: Property, Plant, and Equipment: Initial Measurement

Bookstores International, a bookstore chain, has been quite successful over the past few decades and is now in expansion mode. It typically approaches opening a new bookstore by first determining the general geographic location for a new store and then identifying three to five possible locations within the broader geographic selection. It then hires two consultants: One consultant performs feasibility studies on the three to five locations, and the other consultant develops detailed building plans, including an assessment of potential building costs, for each of the selected sites. Because the plans for the various sites are not completely independent of each other, the consultant simply charges one fee for the plans for an entire geographic location selection. Based upon the results of the feasibility studies and the predicted building costs, the management of Bookstores International then selects a site and begins the construction process.

Should the fees paid to the consultants be capitalized as part of the new building, or should they be expensed? Support your determination with research at ASC 360-10-30 (*Property, Plant, and Equipment – Overall-Initial Measurement*) and ASC 720-15 (*Other Expenses – Start-Up Costs*).

Judgment Case 2: Intangibles Assets: Subsequent Measurement

Tolls R Us is a company whose primary business activity is operating toll roads. Tolls R Us receives licenses from the government to operate the toll roads that are typically expensed for a specified period of time. The company routinely projects the anticipated tolls per year that it will be able to charge over the period of the license as well as its projected per car toll increases. Often, due to expected growth, the company projects an increasing usage of the toll road over time. These projections have proven to be reliable in the past. What method should Tolls R Us use to amortize the cost of these licenses? Justify your answer.

Financial Statement Analysis Case

Financial Statement Analysis of Long-Term Fixed Assets

Kellogg Company and *Kraft Heinz Company, Inc.* are two companies operating in the packaged food industry. You have noticed their products in numerous grocery and convenience stores and are interested in their production process. Your first step is to analyze the information on their productive capacity. Examine the fixed asset disclosures in the two companies' financial statements to address the following issues:

- What categories of tangible long-lived assets does each company report? What is the useful life of each category? Compare the categories and useful lives disclosed by each company.
- For each company, what is the percent of long-lived tangible assets to total assets in 2016 and 2015? In the definition of long-lived tangible assets, include the total of property, plant, and equipment (PPE) – net. Comment on any differences between the two companies.
- Compute average age and average remaining life for 2016 and 2015. Comment on any differences between the two companies.
- Compute the fixed asset turnover in 2016. In the definition of long-lived tangible assets (fixed assets), include the total property, plant, and equipment (PPE) – net. Comment on any differences between the two companies.

Kellogg Company

NOTE 1: Accounting Policies

Property

The Company's property consists mainly of plants and equipment used for manufacturing activities. These assets are recorded at cost and depreciated over estimated useful lives using straight-line methods for financial reporting and accelerated methods, where permitted, for tax reporting. Major property categories are depreciated over various periods as follows (in years): manufacturing machinery and equipment 5–30; office equipment 4–5; computer equipment and capitalized software 3–7; building components 15–25; building structures 50. Cost includes interest associated with significant capital projects. . . .

NOTE 19: Supplemental Financial Statement Data

	2016	2015
Land	\$ 131	\$ 142
Buildings	2,020	2,076
Machinery and equipment	5,646	5,617
Capitalized software	366	328
Construction in progress	686	694
Accumulated depreciation	<u>(5,280)</u>	<u>(5,236)</u>
Property, net	<u>\$ 3,569</u>	<u>\$ 3,621</u>

Additional financial statement information:

(dollars in millions)	2016	2015
Revenues	\$ 13,014	\$ 13,525
Depreciation Expense	\$ 510	\$ 526
Total Assets	\$ 15,111	\$ 15,251
Average Net Fixed Assets	\$ 3,595	\$ 3,695

Kraft Heinz Company, Inc.**NOTE 1: Summary of Significant Accounting Policies (excerpt)**

Property, Plant and Equipment:

Property, plant, and equipment are stated at historical cost and depreciated by the straight-line method over the estimated useful lives of the assets. Machinery and equipment are depreciated over periods ranging from 3 to 20 years and buildings and improvements over periods up to 40 years. . . .

NOTE 5: Property, Plant, and Equipment**Property, Plant, and Equipment**

Property, plant, and equipment at December 31, 2016 and January 3, 2016 were (in millions):

(in millions)	December 31, 2016	January 3, 2016
Land	\$ 264	\$ 297
Buildings and improvements	1,884	1,700
Machinery and equipment	4,770	4,432
Construction in progress	<u>1,600</u>	<u>1,001</u>
	8,518	7,430
Accumulated depreciation	<u>(1,830)</u>	<u>(906)</u>
Property, plant, and equipment, net	<u>\$ 6,688</u>	<u>\$6,524</u>

Additional financial statement information:

(dollars in millions)	2016	2015
Revenues	\$ 26,487	\$ 18,338
Depreciation Expense	\$ 1,337	\$ 740
Total Assets	\$120,480	\$122,973
Average Net Fixed Assets	\$ 6,606	\$ 4,445

Source: Kraft Heinz Company, SEC Filing, 2016. <https://www.sec.gov/Archives/edgar/data/1637459/000163745917000007/khc201610k.htm>

Surfing the Standards Cases

Surfing the Standards Case 1: Nonmonetary Exchanges

On rare occasions, a company will acquire property, plant, or equipment in a nonmonetary exchange in which two entities exchange one nonmonetary asset for another nonmonetary asset.

Read sections 5, 20, and 30 of ASC 845-10. Describe the accounting treatment for a nonmonetary exchange that has commercial substance. Apply the accounting to the following two independent scenarios:

Scenario 1. ALR Sporting Goods, Inc. has four basketball goals it uses for demonstrations. The goals were originally purchased for \$750 each. Accumulated depreciation on the four goals is \$300. ALR transacts with NPR Sporting Goods, Inc. and exchanges these four goals for one football goalpost. The fair value of each basketball goal is now \$700 each. In addition to trading the four basketball goals, ALR pays \$500 (net present value—NPR) in cash. What is the journal entry for ALR? Assume that the exchange has commercial substance.

Scenario 2. Assume that instead of ALR trading its basketball goals, the company gives NPR 100 shares of its common stock. The stock has a par value of \$10 per share and is currently trading at \$35 per share. What is the journal entry for ALR?

Surfing the Standards Case 2: Involuntary Conversion

Ed's Market Company (EMC) grows and sells fresh fruits and vegetables. EMC experienced three different unfortunate events in the current year.

1. In February, the government acquired 20 acres from EMC in an eminent domain case. EMC was carrying the land on its balance sheet at \$6,000. The government paid EMC \$10,000. EMC purchased an additional 20 acres of land on the other side of its farm for \$25,000 in June to compensate for this loss.
2. In July, a fire destroyed one of EMC's barns. The barn had an original cost of \$200,000 and accumulated depreciation of \$120,000. EMC expected to receive \$50,000 in insurance money. EMC received insurance proceeds of \$50,000 in November.
3. In December, one of EMC's tractors was stolen. The original cost of the tractor was \$45,000 and the accumulated depreciation was \$42,500. The tractor was insured, but as of December 31, it had not been determined exactly how much the insurance company would pay EMC, although it is likely to be around \$5,000.

Prepare a memo to the file using the Codification for support. Include any necessary journal entries in the conclusion section of the memo.

Surfing the Standards Case 3: Involuntary Conversion, IFRS

Ed's Market Company (EMC) grows and sells fresh fruits and vegetables. EMC is an IFRS reporter. EMC experienced three different unfortunate events in the current year.

1. In February, the government acquired 20 acres from EMC in an eminent domain case. EMC was carrying the land on its balance sheet at \$6,000. The government paid EMC \$10,000. EMC purchased an additional 20 acres of land on the other side of its farm for \$25,000 in June to compensate for this loss.
2. In July, a fire destroyed one of EMC's barns. The barn had an original cost of \$200,000 and accumulated depreciation of \$120,000. EMC expected to receive \$50,000 in insurance money. EMC received insurance proceeds of \$50,000 in November.
3. In December, one of EMC's tractors was stolen. The original cost of the tractor was \$45,000 and the accumulated depreciation was \$42,500. The tractor was insured, but as of December 31, it was not determined exactly how much the insurance company would pay EMC, although it is likely to be around \$5,000.

Prepare a memo to the file using the international standards for support. Include any necessary journal entries in the conclusion section of the memo.

Surfing the Standards Case 4: Software Development Costs

Companies sometimes develop software for either external use (for example, to sell to customers) or for internal use. Should a company expense or capitalize software for internal use? **U.S. GAAP** provides specific guidance regarding software and, furthermore, has separate guidance for software developed for internal use versus software developed for external use.

- a. Does **U.S. GAAP** require that software development costs related to external-use software be expensed or capitalized? Please explain. Use the Codification for support.
- b. Does **U.S. GAAP** require that software development costs related to internal-use software be expensed or capitalized? Please explain. Use the Codification for support.

Surfing the Standards Case 5: Software Development Costs, IFRS

Assume the same information for Case 4. **IFRS** does not provide specific rules for software; the accounting for software development costs falls under the general guidance for intangible assets.

Does **IFRS** require that software development costs be expensed or capitalized? Please explain. Use the international authoritative literature for support.

Basis for Conclusions Cases

Basis for Conclusions Case 1: Property, Plant, and Equipment: Subsequent Measurement, IFRS

Consider the Basis for Conclusions in IAS 16, Property, Plant, and Equipment (particularly paragraphs BC26 and BC27). What is the principle underlying component depreciation under **IFRS**? Although **U.S. GAAP** does not contain a basis for conclusions for the topic of property, plant, and equipment, what is the most likely principle that would underlie the decision not to require component depreciation?

Basis for Conclusions Case 2: Intangible Assets – Subsequent Measurement

What are the general rules related to the amortization of intangible assets? Read the basis for conclusions in SFAS No. 142, particularly paragraphs B49 through B53. What were the amortization rules for intangibles prior to the passage of SFAS No. 142? In the 1999 Exposure Draft for SFAS No. 142, FASB had suggested that 20 years be a presumptive maximum. That is, a life longer than 20 years could be used only if the longer life is based on legal life or exchangeability of the asset. What did the board conclude with regard to this issue, and why did it reach that conclusion?

APPENDIX A

Nonmonetary Exchanges

In a nonmonetary exchange, a company acquires an asset by exchanging another asset with the seller rather than paying cash. In these exchanges, accountants must determine the proper measurement of the new asset received and the amount of gain or loss (if any) to record. Factors in making these determinations include:

1. Does the transaction have commercial substance?
2. Was cash received on the trade?
3. Did the transaction result in a gain or a loss?

A nonmonetary exchange transaction has **commercial substance** if the future cash flows change as a result of the transaction—that is, if the economic positions of the parties to the transaction change. Commercial substance can result if the exchange involves either similar assets (one truck is exchanged for another) or dissimilar assets (land is exchanged for a building).

There are three possible valuation bases for nonmonetary exchanges, depending on whether the transaction possesses commercial substance, if cash is received, and if a gain or loss results.

Exchanges with Commercial Substance

Firms recognize all gains and losses—computed as the difference between the carrying value and the fair value of the asset given up—on an exchange with commercial substance. The firm records the new asset at fair value of the assets given in the exchange, which is the fair value of the asset given up plus cash paid or minus cash received. If the fair value of the assets given in exchange is not readily determinable, then the fair value of the assets received is used to measure the transaction. Example 11A.1 illustrates accounting for a gain on a nonmonetary exchange with commercial substance.

EXAMPLE 11A.1

Gain on Exchange with Commercial Substance

PROBLEM: Trogg Construction Company exchanged a core drill for a backhoe acquired from Metro Cities Equipment Associates. Trogg also received a cash consideration of \$130,000. It expects the future cash flows to change as a result of this transaction and, therefore, the exchange has commercial substance.

The carrying value and fair value of the core drill and backhoe at the date of the exchange are as follows:

Asset	Cost	Accumulated Depreciation	Carrying Value	Fair Value
Core drill (asset given up)	\$630,000	\$110,000	\$520,000	\$530,000
Backhoe (asset received)	525,000	165,000	360,000	400,000

Prepare the journal entry to record the transaction for Trogg.

SOLUTION: We value the backhoe (the new asset) at the fair value of the consideration given in the exchange minus the cash received. The new asset's value is equal to the fair value of the old asset given up less the cash received (i.e., $\$530,000 - \$130,000 = \$400,000$). Trogg will recognize any gain or loss on the exchange because the transaction has commercial substance. In this case, there is a \$10,000 gain measured as the difference between the fair value and the carrying value of the asset given up in the exchange (i.e., $\$530,000 - \$520,000 = \$10,000$).

Continued

The entry to record the transaction by Trogg is as follows:

Account	Date of the Exchange	
Equipment – Backhoe (New)	400,000	
Accumulated Depreciation – Core Drill (Old)	110,000	
Cash	130,000	
Equipment – Core Drill (Old)		630,000
Gain on Exchange of Equipment		10,000

Example 11A.2 illustrates accounting for a loss on a nonmonetary exchange with commercial substance.

EXAMPLE 11A.2

Loss on Exchange with Commercial Substance

PROBLEM: Trogg Construction Company exchanged a core drill for a backhoe acquired from Metro Cities Equipment Associates. Trogg Construction Company also received a cash consideration of \$130,000. Trogg expects the future cash flows to change as a result of this transaction and, therefore, the exchange has commercial substance.

The carrying value and fair value of the core drill and backhoe at the date of the exchange are as follows:

Asset	Cost	Accumulated Depreciation	Carrying Value	Fair Value
Core drill (asset given up)	\$660,000	\$110,000	\$550,000	\$530,000
Backhoe (asset received)	525,000	165,000	360,000	400,000

Prepare the journal entry for Trogg to record the transaction.

SOLUTION: We value the backhoe (the new asset) at the fair value of the consideration given in the exchange minus the cash received. The new asset's value is equal to the fair value of the old asset given up less the cash received (i.e., $\$530,000 - \$130,000 = \$400,000$). Trogg will recognize any gain or loss on the exchange because the transaction has commercial substance. In this case, there is a \$20,000 loss measured as the difference between the fair value and the carrying value of the asset given up in the exchange (i.e., $\$530,000 - \$550,000 = \$20,000$).

The entry to record the transaction is as follows:

Account	Date of the Exchange	
Equipment – Backhoe (New)	400,000	
Accumulated Depreciation – Core Drill (Old)	110,000	
Cash	130,000	
Loss on Exchange of Equipment	20,000	
Equipment – Core Drill (Old)		660,000

Exchanges without Commercial Substance and No Cash Received

If the exchange lacks commercial substance and no cash is received, firms defer any gain by adjusting the carrying value of the new asset. However, due to conservatism, firms must recognize all losses immediately, similar to a transaction with commercial substance as shown in Example 11A.3.

EXAMPLE 11A.3

Gain on Exchange without Commercial Substance and No Cash Received

PROBLEM: Sam's Taxi Company exchanged a fleet of Toyota vehicles for an equal-size fleet of Nissan vehicles from Dave Transportation Group. Sam's Taxi does not expect the future cash flows to change significantly as a result of this exchange and, therefore, the transaction lacks commercial substance. The carrying value and fair value of each fleet of vehicles on the date of the exchange are as follows:

Asset	Cost	Accumulated Depreciation	Carrying Value	Fair Value
Toyota fleet (assets given up)	\$1,090,000	\$510,000	\$580,000	\$695,000
Nissan fleet (assets received)	980,000	290,000	690,000	695,000

Prepare the journal entry to record the exchange transaction for Sam's Taxi Company.

SOLUTION: The gain on the transaction is \$115,000, which is the fair value of \$695,000 less the carrying value of \$580,000 of the Toyota fleet given up by Sam's Taxi Company. However, because the transaction lacks commercial substance and Sam's Taxi Company does not receive any cash, no gain is recognized. We record the new automobiles at the carrying value of the assets given up.

Account	Date of the Exchange
Automobiles (Nissan fleet – new)	580,000
Accumulated Depreciation—Automobiles (Toyota fleet – old)	510,000
Automobiles (Toyota fleet – old)	1,090,000

Exchanges without Commercial Substance and Cash Received

Firms recognize total or partial gains in a transaction lacking commercial substance if cash is received. If cash is received, the transaction is considered a partial sale with all or a portion of the gain recognized in income. The partial gain recognized is equal to:

$$\begin{aligned} \text{Percent of Gain Recognized} &= \text{Cash Received} / \text{Total Consideration Received} \\ &= \text{Cash Received} / (\text{Cash Received} + \text{FMV of the Asset Received}) \end{aligned}$$

If the percent of the gain recognized is 25% or more, the firm recognizes the total gain even if the transaction lacks commercial substance. If cash is more than 25% of the entire value exchanged, the firm considers the asset to be effectively sold for cash and thus recognizes the full gain. Example 11A.4 illustrates accounting for a gain on a nonmonetary exchange without commercial substance where cash is received.

EXAMPLE 11A.4**Gain on Exchange without Commercial Substance and Cash Received**

PROBLEM: Sam's Taxi Company exchanged a fleet of Toyota vehicles for an equal-sized fleet of Nissan vehicles from the Dave Transportation Group. The carrying value and fair value of each fleet of vehicles on the date of the exchange are as follows:

Asset	Cost	Accumulated Depreciation	Carrying Value	Fair Value
Toyota fleet (assets given up)	\$1,090,000	\$510,000	\$580,000	\$795,000
Nissan fleet (assets received)	980,000	290,000	690,000	715,500

Sam's Taxi received cash of \$79,500 and the Nissan fleet in exchange for the Toyota fleet. Sam's Taxi does not expect the future cash flows to change significantly as a result of this exchange and, therefore, the transaction lacks commercial substance.

Prepare the journal entry to record the exchange transaction for Sam's Taxi Company.

SOLUTION: The total potential gain is equal to \$215,000:

$$\begin{aligned} \text{Fair Value of the Asset Given Up} - \text{Carrying Value of the Asset Given Up} \\ = \$795,000 - \$580,000 = \$215,000 \end{aligned}$$

The percentage of gain to recognize is as follows:

$$\begin{aligned} \text{Percent of Gain Recognized} &= \text{Cash Received} / \text{Total Consideration Received} \\ &= \text{Cash Received} / (\text{Cash Received} + \text{FMV of the Assets Received}) = \$79,500 / (\$79,500 + \$715,500) \\ &= \underline{10.0\%} \end{aligned}$$

We then compute the portion of the gain recognized and the portion deferred:

$$\begin{aligned} \text{Partial Gain Recognized} &= \$215,000 \times 10.0\% = \underline{\$21,500} \\ \text{Deferred Gain} &= \$215,000 - \$21,500 = \underline{\$193,500} \end{aligned}$$

Given that the transaction lacks commercial substance, the initial carrying value of the Nissan fleet on Sam's financial statements is the carrying amount of the asset given up (i.e., the Toyota fleet) adjusted by deducting any cash received or adding any cash paid. We add the amount of the recognized gain to the carrying value of the new asset (\$580,000 - \$79,500 + \$21,500 = \$522,000). Alternatively, we can reduce the fair value of the asset received by the amount of the deferred gain (\$715,500 - \$193,500 = \$522,000). Note that the deferred gain reduces the carrying value of the new asset received. This lower carrying value reduces future depreciation charges and in effect spreads the gain recognition over the life of the new asset. This gain is deferred to future accounting periods through lower depreciation charges.

The entry recorded by Sam's Taxi is as follows:

Account	Date of the Exchange
Automobiles (Nissan fleet - new)	522,000
Accumulated Depreciation- Automobiles (Toyota fleet - old)	510,000
Cash	79,500
Automobiles (Toyota fleet - old)	1,090,000
Gain on Exchange of Automobiles	21,500

IFRS Accounting for Nonmonetary Exchanges

IFRS accounting for nonmonetary exchanges depends on whether an exchange has commercial substance or lacks commercial substance. Therefore, accounting for nonmonetary exchanges under IFRS is similar to the process under U.S. GAAP for the following cases discussed earlier:

- Exchanges with commercial substance
- Exchanges without commercial substance and no cash received

Under IFRS, if an exchange lacks commercial substance, the accounting is the same whether or not the firm receives cash. Consequently, firms cannot recognize any gain on exchanges that lack commercial substance even if cash is received. Firms recognize losses immediately. Example 11A.5 illustrates accounting for a gain on a nonmonetary exchange without commercial substance where cash is received under IFRS.

EXAMPLE 11A.5

Gain on Exchange without Commercial Substance and Cash Received: IFRS

PROBLEM: Sam's Taxi Company from Example 11A.4 reports under IFRS. Prepare the journal entry to record the exchange transaction.

SOLUTION: Because the transaction is without commercial substance, Sam's Taxi cannot recognize a gain even if cash is received.

Given that the transaction lacks commercial substance, the initial carrying value of the Nissan fleet on Sam's financial statements is the carrying amount of the asset given up (i.e., the Toyota fleet) adjusted by deducting any cash received or adding any cash paid. The initial carrying value of the Nissan fleet is \$500,500 (\$580,000 – \$79,500). Alternatively, we can reduce the fair value of the asset received by the amount of the deferred gain (\$715,500 – \$215,000 = \$500,500). Note that the deferred gain reduces the carrying value of the new asset received. This lower carrying value reduces future depreciation charges and in effect spreads the gain recognition over the life of the new asset. This gain is deferred to future accounting periods through lower depreciation charges.

The entry recorded by Sam's Taxi is as follows:

<i>Account</i>	<i>Date of the Exchange</i>
Automobiles (Nissan fleet – new)	500,500
Accumulated Depreciation—Automobiles (Toyota fleet – old)	510,000
Cash	79,500
Automobiles (Toyota fleet– old)	1,090,000

Exhibit 11A.1 compares U.S. GAAP to IFRS in accounting for nonmonetary exchanges.

EXHIBIT 11A.1 Comparison of Accounting for Nonmonetary Exchanges under U.S. GAAP and IFRS

Type	U.S. GAAP	IFRS
Exchanges with Commercial Substance		
<ul style="list-style-type: none"> • Gain or • Loss 	A firm recognizes all gains and losses immediately. The gain or loss is the difference between the carrying value of the asset given up and the fair value of the asset given up.	Similar to U.S. GAAP.
Exchanges without Commercial Substance		
<ul style="list-style-type: none"> • Gain – no cash received 	If no cash is received, the carrying value of the new asset is the carrying value of the asset given up plus the cash paid. The firm defers any gain.	Similar to U.S. GAAP.
<ul style="list-style-type: none"> • Gain – cash received 	<p>If cash is received, the firm recognizes total or partial gains. The partial gain recognized is equal to:</p> <p>Percent of Gain Recognized</p> $= \frac{\text{Cash Received}}{\text{Total Consideration Received}}$ $= \frac{\text{Cash Received}}{(\text{Cash Received} + \text{FMV of the Asset Received})}$ <p>If the percent of the gain recognized is 25% or more, the firm recognizes the total gain even if the transaction lacks commercial substance.</p>	IFRS does not permit the recognition of a gain even when cash is received. The carrying value of the new asset is the carrying value of the asset given up less cash received plus cash paid, if any.
<ul style="list-style-type: none"> • Loss 	The firm recognizes losses immediately.	Similar to U.S. GAAP.

APPENDIX B

Natural Resources

Natural resources, another category of long-term operating assets, include oil and gas deposits, timberlands, coal and other mineral deposits. Natural resources are initially recorded at cost and then *depleted* over their economic lives. The process of allocating the cost of the natural resource over its useful life is referred to as **depletion**, similar to depreciation for tangible long-lived assets.

Costs Included in Natural Resources

The cost of a natural resource consists of four elements.

1. **Acquisition costs.** The acquisition cost is the price paid to obtain the property or the right to search and explore, including acquisitions accounted for as capitalized leases. Acquisition costs are typically capitalized initially, but not depleted until the exploration is completed. If exploration efforts are successful, the acquisition cost is included in the cost basis of the natural resource and thus depleted over the economic life of the natural resource. However, if exploration efforts are unsuccessful, the company will write off the acquisition cost as a loss.
2. **Exploration and evaluation costs.** Exploration and evaluation costs are costs incurred to find and determine the technical feasibility and commercial viability of extracting the resource. For example, the costs associated with drilling for oil and gas are exploration costs. These costs are either expensed immediately or capitalized into the cost basis of the natural resource, as we discuss later.

3. **Development costs.** *Development costs* include intangible costs (such as grading the land and digging tunnels and shafts) as well as tangible costs (such as heavy equipment needed to extract the natural resource). The intangible and tangible costs are included in the cost basis of the natural resource and are depleted.

If equipment can be moved to other locations, then it is depreciated separately over its useful life. For instance, a piece of drilling equipment used in multiple locations can be accounted for with other property, plant, and equipment and depreciated separately from the depletion process for the natural resource. If the equipment is not movable, such as offshore oil rigs, then the cost is included in the cost basis of the natural resource and is depleted.

4. **Restoration costs.** Companies may incur substantial costs, referred to as **restoration costs**, to return property to its original condition after the removal of the natural resource. An example would be the costs to restore property used in mining. The fair value of these costs is capitalized into the cost basis of the natural resource and depleted. We discuss these costs, sometimes also referred to as asset retirement obligations, in more depth in Chapter 13.

Exploration Costs

The *full-cost method* and the *successful-efforts method* are two methods of accounting for exploration costs in the oil and gas industry.

The **full-cost method** capitalizes all costs associated with both successful and unsuccessful exploration costs into the natural resource. The full-cost method is justified by considering that the costs of exploring and drilling dry wells are necessary to discover producing wells, so the costs of exploring both successful and unsuccessful wells are spread over the successful wells.

The **successful-efforts method** capitalizes only those costs associated with exploring and developing successful wells and expenses the costs associated with dry wells. The justification for the use of the successful-efforts method is that dry wells do not generate oil and gas and provide no future economic benefit to the company. Therefore, these costs do not meet the definition of an asset and are expensed at the point the well is determined to be nonproductive.

Depletion

As is the case with property, plant, and equipment, companies expense the cost of the natural resource over its economic life.

Depletion is typically computed using the units-of-output method. To determine depletion expense, we first compute the expected depletion cost per unit of output as the cost basis of the natural resource less salvage value (depletion base) divided by the estimated total units of output. The depletion expense is then computed as the units produced during the current period times the rate of depletion per unit.

$$\text{Rate of Depletion per Unit} = \text{Depletion Base} / \text{Estimated Total Units of Output} \quad (11B.1)$$

$$\text{Depletion Expense} = (\text{Actual Units of Output} \times \text{Rate of Depletion per Unit}) \quad (11B.2)$$

Example 11B.1 illustrates accounting for natural resources under the full-cost and successful-efforts methods.

EXAMPLE 11B.1 Natural Resources

PROBLEM: On January 1, Percy Petroleum Company (PPC) purchased land for \$500,000 to use to explore for oil. On January 1, it purchased heavy equipment costing \$55,000 that can be moved from one location to another and has a 10-year expected life with no residual value. PPC also incurred a cost of \$150,000 for a non-movable oil rig. PPC incurred \$60,000 in exploration and evaluation costs for both productive and dry wells. Producing wells cost the firm \$20,000 and the remainder was a result of exploration costs incurred for nonproducing wells.

The successful oil wells are expected to produce 10,000 barrels of oil. No residual value is expected. PPC uses the units-of-output depletion method and the straight-line depreciation method. A total of 2,000 barrels of oil were produced during the current year. Categorize each expenditure into a cost related to acquisition, exploration and evaluation, or development. Assume that PPC pays cash for all expenditures. Provide the journal entries required under both the full-cost and the successful-efforts methods.

SOLUTION: Expenditures categorized by the cost of natural resources:

- Purchase of land for \$500,000 – acquisition cost
- Purchase of heavy equipment for \$55,000 – development cost; reclassified as PPE
- Purchase of non-movable oil rig for \$150,000 – development cost
- Incur exploration costs of \$60,000 – exploration costs

Full-Cost Method. Under the full-cost method, PPC will capitalize costs of \$710,000, which includes the purchase price for the land (\$500,000), the cost of the non-movable oil rig (\$150,000), and all of the exploration costs (\$60,000) into the natural resource, oil, and gas deposit. PPC will capitalize the \$55,000 paid for the heavy equipment into the equipment account, classified as property, plant, and equipment.

Account	January 1
Oil and Gas Deposit	710,000
Cash	710,000

Account	January 1
Equipment	55,000
Cash	55,000

PPC computes depletion expense and depreciation expense as follows:

$$\text{Rate of Depletion per Unit} = \text{Depletion Base} / \text{Estimated Total Units of Output} \quad (11B.1)$$

$$\$71 \text{ per Unit} = \$710,000 / 10,000 \text{ Units}$$

$$\text{Depletion Expense} = \text{Actual Units of Output} \times \text{Rate of Depletion per Unit} \quad (11B.2)$$

$$\text{Depletion Expense} = \$142,000 = 2,000 \text{ Units} \times \$71 \text{ per Unit}$$

Alternatively, depletion expense can be computed as follows:

$$\text{Depletion Expense} = \frac{2,000 \text{ Actual Units of Output} \times \$710,000 \text{ Depletion Base}}{10,000 \text{ Estimated Total Units of Output}} = \$142,000$$

$$\text{Depreciation Expense} = \$55,000 \text{ Depreciable Base} / 10 \text{ Years} = \$5,500$$

The journal entries for depletion expense and depreciation expense are as follows:

Account	December 31	
Depletion Expense—Oil and Gas Deposit	142,000	
Oil and Gas Deposit (or Accumulated Depletion)		142,000
Depreciation Expense—Equipment	5,500	
Accumulated Depreciation—Equipment		5,500

Successful-Efforts Method. The answer is similar under the successful-efforts method except that only the \$20,000 exploration costs related to the successful well are capitalized. The remaining \$40,000 is expensed immediately. The journal entries are as follows:

Account	January 1	
Oil and Gas Deposit	670,000	
Unsuccessful Exploration Costs	40,000	
Cash		710,000

Account	January 1	
Equipment	55,000	
Cash		55,000

PPC computes depletion expense and depreciation expense as follows:

$$\text{Rate of Depletion per Unit} = \text{Depletion Base} / \text{Estimated Total Units of Output} \quad (11B.1)$$

$$\$67 \text{ per Unit} = \$670,000 / 10,000 \text{ Units}$$

$$\text{Depletion Expense} = \text{Actual Units of Output} \times \text{Rate of Depletion per Unit} \quad (11B.2)$$

$$\$134,000 = 2,000 \text{ Units} \times \$67 \text{ per Unit}$$

$$\text{Depreciation Expense} = \$55,000 \text{ Depreciable Base} / 10 \text{ Years} = \$5,500$$

Account	December 31	
Depletion Expense—Oil and Gas Deposit	134,000	
Oil and Gas Deposit (or Accumulated Depletion)		134,000
Depreciation Expense—Equipment	5,500	
Accumulated Depreciation—Equipment		5,500

IFRS Costs Included in Natural Resources

Accounting for natural resources is similar to accounting for other tangible and intangible assets under IFRS.²⁶

Compared to U.S. GAAP, however, the following three items related to accounting for natural resources differ:

- IFRS permits the full-cost method during the exploration and evaluation phase. Most companies classify long-lived tangible assets in either of these phases as property, plant, and equipment.
- IFRS requires *impairment testing* for exploration and evaluation assets rather than depletion. (We discuss impairment accounting in the next chapter.)
- IFRS allows companies to retain the policies for the capitalization of exploration and evaluation costs they used before the IFRS accounting standard for natural resources became effective. Therefore, even though IFRS recommends a certain accounting treatment for exploration and evaluation costs, they can be expensed as incurred or capitalized depending on the company's prior policy.

An additional distinction is the determination of the treatment of exploration and evaluation expenditures under IFRS. A company has to determine the “unit” to which these costs should be allocated. For example, in the oil and gas industry, the unit to which exploration and evaluation costs are to be allocated could be an individual well. Within the mining industry, a common approach is to allocate exploration and evaluation costs between areas of interest, primarily different geological areas that are examined and tracked separately.

²⁶Accounting for natural resources is found in IASB, *International Financial Reporting Standard 6*, “Exploration for and Evaluation of Mineral Resources” (London, UK: International Accounting Standards Board, Revised), which became effective for years beginning January 1, 2006.

12

Long-Term Operating Assets: Departures from Historical Cost

LEARNING OBJECTIVES

- 1 Specify the categories of long-term operating assets tested for impairment.
- 2 Describe and demonstrate the accounting for impairments of property, plant, and equipment and intangible assets with finite lives under U.S. GAAP.
- 3 Explain and illustrate accounting for impairments of intangible assets with indefinite lives under U.S. GAAP.
- 4 Explain and illustrate the accounting for goodwill impairments under U.S. GAAP.
- 5 Describe and demonstrate the accounting for impairments of property, plant, and equipment, finite-life intangible assets, and indefinite-life intangible assets other than goodwill under IFRS.
- 6 Explain and illustrate the accounting for goodwill impairments under IFRS.
- 7 Detail required disclosures for impaired assets.
- 8 Illustrate the accounting for long-term operating assets held for sale or disposal and describe the required disclosures for these assets.

Introduction

WHEN IS AN ASSET NOT AN ASSET? The question sounds contradictory, but the answer is simple: when it no longer provides a future economic benefit. A company investing in long-lived assets such as buildings and equipment expects them to generate future sales and future cash flows. Consider **BlackBerry Limited**, the manufacturer of **BlackBerry** smart phones. After investing heavily in only one type of smart phone technology, **BlackBerry** lost significant market share to other manufacturers, such as **Apple** and **Samsung**, that moved to touch-screen technology.

When business conditions deteriorate, a company must determine whether the carrying values of its assets continue to reflect the future economic benefits of its resources. When the demand for **BlackBerry** smart phones declined, the company questioned its ability to generate sufficient cash flows to fully recover the current carrying value of its assets. **BlackBerry** reported significant *impairment* losses of \$2.7 million in 2013.

What happens if the conditions change and the impairment losses reverse? Assume, for example, that sales subsequently increase and future cash-flow predictions are positive. The accounting method for reversing impairment losses depends on whether a company uses IFRS or U.S. GAAP.

In Chapter 11, we discussed the historical cost model of accounting for long-term operating assets. In this chapter, we examine two departures from historical cost accounting: *impairments* and long-term operating assets held for sale. In Appendix A, we also discuss *revaluations under IFRS*, which occur when a company reports a long-term asset at its fair value rather than its historical cost. With both impairments and revaluations, the economic value of a long-term asset differs from its depreciated historical cost (carrying value). For each topic, we will examine the accounting under U.S. GAAP and then IFRS, highlighting differences in the standards and the key judgments managers make.◀◀

- 1 Specify the categories of long-term operating assets tested for impairment.

Overview: Impairment of Long-Term Operating Assets

An **impairment** occurs when an asset's total future cash-generating ability falls below its carrying value. To illustrate, suppose you own a commercial building with office space that you rent. The local economy is in a downturn because a major manufacturer closed its factory. To avoid vacancies, you must decrease the rent charged to tenants. The decreased rental income causes future cash flows related to the building to decline. Therefore, the economic value of the building is impaired.

When a long-term operating asset's future economic value is impaired, the firm:

1. Recognizes the decline in value as a loss on the income statement in the period that it determines the impairment occurred.
2. Reduces the asset's carrying value on the balance sheet because its economic value has declined.

The impairment loss is a noncash expense that has no impact on the statement of cash flows.

THE CONCEPTUAL FRAMEWORK CONNECTION Accounting for Impaired Long-Term Operating Assets

Several concepts underlie the accounting treatment of impairments—the most critical being the need for accounting information to be relevant and asset values (dollar amounts) to be representationally faithful. An asset involves probable future economic benefits, so a firm should measure these benefits using a relevant amount. If the expected economic benefits are less than the asset's carrying value reported on the balance sheet, the firm should reduce the asset's carrying value.

Measuring an impaired asset at a value other than historical cost may involve a trade-off between relevance and faithful representation. When an asset is impaired, the firm must determine a new carrying amount based upon its expectation of future economic benefits. The estimate of expected future benefits can be quite subjective, meaning that an asset balance may not faithfully represent the economic position of the firm with a high degree of accuracy. For example, in order to measure future benefits, a manager may need to estimate the future cash flows expected over the remainder of an asset's 20-year life. The manager's assessment of cash flows 20 years from now is undoubtedly quite subjective.

Although this is a trade-off between relevance and faithful representation, when in doubt, firms should err on the side of not overstating net income and assets. Thus, companies are required to write down assets with reduced future economic benefits.

Categories and Steps Associated with the Impairment of Long-Term Operating Assets

The method of accounting for the impairment of long-term operating assets depends upon the type of asset. We will discuss the following types of assets and their specific treatment in the following sections:¹

- Property, plant, and equipment and finite-life intangible assets
- Indefinite-Life intangible assets
- Goodwill

¹The authoritative literature for U.S. GAAP is in three subtopics in the codification: FASB ASC 360-10 – *Property, Plant, and Equipment – Overall*, FASB ASC 350-20 – *Intangibles – Goodwill and Others – Goodwill*, and FASB ASC 350-30 – *Intangibles – Goodwill and Others – General Intangibles Other than Goodwill*.

The key steps related to accounting for impairments of long-term operating assets include the following:

- Asset grouping
- When to test for impairment
- Impairment test
- Measurement subsequent to impairment

We will discuss each of these steps for each type of long-term operating asset.

- ② Describe and demonstrate the accounting for impairments of property, plant, and equipment and intangible assets with finite lives under U.S. GAAP.

Accounting for Impairments: Property, Plant, and Equipment and Finite-Life Intangible Assets

The accounting procedures for the determination of impairment are identical for property, plant, and equipment and finite-life intangible assets.

Asset Grouping

Before testing assets for impairment, a firm must determine whether to assess them as individual assets or in asset groups. An **asset grouping** is the lowest level of identifiable and independent cash flows. So, if cash flows are identifiable and independent for an individual asset such as a delivery truck, the firm can test the delivery truck for impairment. Alternatively, if the delivery truck is part of a fleet of a store's delivery trucks, the delivery fleet could be considered an asset group. The rationale is that the cash flows from an individual truck are dependent on the cash flows from the other trucks in the fleet. Example 12.1 illustrates asset groups.

EXAMPLE 12.1

Asset Group

PROBLEM: Booth Brothers Corporation operates concession stands in several sports and performance venues. It supplies the stands with equipment such as cash registers, refrigerators and freezers, stovetops, and frying machines. Currently, Booth has 14 concession contracts with over 100 stands. Booth Brothers determines that the cash flows from two of the five stands at the Tiger Town Sports Arena are operating at a significant loss and that it will not be able to recover the carrying amounts of the equipment installed in those two stands. The other three stands are profitable individually, and when combining all five stands, they report a net profit. Should Booth Brothers assess impairment for each individual stand? Alternatively, should Booth assess the possible impairment for all stands as a group?

SOLUTION: Booth Brothers has contracted with the arena to provide five stands. Overall, the five stands are profitable. The cash flows generated from the contract and the three profitable stands are not independent of the cash flows of the unprofitable stands. Consequently, Booth Brothers should assess impairment at the group level—combining all five stands relating to the Tiger Town Sports Arena contract.

When to Test for Impairment

After identifying the asset group, the firm then determines if impairment testing is required. If impairment testing is required, it then performs a two-step test to determine whether there is an impairment. If there is an impairment, the firm then computes the amount of the loss.²

²For the remainder of this chapter, we will often refer to the individual asset, but this may also be an asset group.

Firms conduct an impairment test whenever events and circumstances referred to as **impairment indicators** indicate that an asset may be impaired. Exhibit 12.1 outlines FASB's recommended impairment indicators.

EXHIBIT 12.1 Impairment Indicators

- a. A significant decrease in the market price of a long-lived asset (asset group)
- b. A significant adverse change in the extent or manner in which a long-lived asset (asset group) is being used or in its physical condition.
- c. A significant adverse change in legal factors or in the business climate that could affect the value of a long-lived asset (asset group), including an adverse action or assessment by a regulator
- d. An accumulation of costs significantly in excess of the amount originally expected for the acquisition or construction of a long-lived asset (asset group)
- e. A current-period operating or cash-flow loss combined with a history of operating or cash-flow losses or a projection or forecast that demonstrates continuing losses associated with the use of a long-lived asset (asset group)
- f. A current expectation that, more likely than not, a long-lived asset (asset group) will be sold or otherwise disposed of significantly before the end of its previously estimated useful life. The term more likely than not refers to a level of likelihood that is more than 50%

Firms develop their own impairment indicators based on the guidelines in Exhibit 12.1. Exhibit 12.2 provides **BlackBerry's** disclosure of the impairment indicators it employs in its annual report that led to its \$2.7 billion impairment loss in 2013.

EXHIBIT 12.2 Disclosure of Impairment Loss Indicators, **BlackBerry Limited**, Financial Statements, March 1, 2014

The Company reviews long-lived assets ("LLA") such as property, plant, and equipment and intangible assets with finite useful lives for impairment whenever events or changes in circumstances indicate that the carrying amount of the asset or asset group may not be recoverable. These events and circumstances may include significant decreases in the market price of an asset or asset group, significant changes in the extent or manner in which an asset or asset group is being used by the Company or in its physical condition, a significant change in legal factors or in the business climate, a history or forecast of future operating or cash flow losses, significant disposal activity, a significant decline in the Company's share price, a significant decline in revenues or adverse changes in the economic environment.

Example 12.2 provides an example of assessing impairment indicators.

EXAMPLE 12.2

Assessment of Impairment Indicators

PROBLEM: Viva Enterprises provided you with the following information with respect to its tangible and intangible assets on December 31, 2018.

	Plant and Equipment Asset Group	Radio Broadcast License
Cost	\$4,200,000	\$780,000
Accumulated depreciation / Amortization	(2,100,000)	(273,000)
Net book value	<u>\$2,100,000</u>	<u>\$ 507,000</u>

Viva acquired a 10-year term radio broadcast license on July 1, 2015. Viva used the straight-line method of amortization with no residual value expected. The broadcast license is for a fixed term and there is no evidence that ensures renewal, so Viva classified it as a finite-life intangible asset. Viva acquired the plant and equipment on January 1, 2016, and estimated its total useful life as 6 years. The company used the straight-line method of depreciation and amortization with no residual value expected.

During 2018, management reviewed several events and circumstances.

1. Viva uses the plant and equipment to manufacture products that have experienced significant declines in sales. Management expects that the demand for these products will continue to decline for the foreseeable future, resulting in a decline in the value of the company's plant assets.
2. Expanded satellite radio subscriptions, Internet broadcasts, and the use of iPod players have caused the company's radio advertising revenues to decline substantially over the past year.

Do these events and circumstances constitute impairment indicators? Based on this information, will Viva need to determine if there is an impairment loss?

SOLUTION: Based on the decline in demand for the company's products and radio revenues, Viva must proceed with the impairment process for both assets.

Two-Step Impairment Test

If impairment indicators suggest that an asset might be impaired, the firm then performs a two-step test to determine if there is an impairment loss and, if so, the amount of the impairment loss. The two steps are:

1. Assess recoverability
2. Compare the carrying value to fair value, if required³

Assess Recoverability. If the impairment indicators suggest an impairment of a long-term operating asset, the firm assesses the asset's *recoverability*. In general, the **recoverability** of an asset refers to the firm's ability to recover the asset's carrying value based on the sum of the undiscounted cash flows from the use and disposal of the asset:

1. If the sum of the undiscounted future cash flows is less than the carrying value of the asset, then the asset is impaired and the company must measure the impairment loss.
2. If the sum of the undiscounted future cash flows exceeds the carrying value of the asset, then the asset is not impaired.

Because **BlackBerry** indicates its testing sequence in its footnote on significant accounting policies, it first determines whether the carrying value of the asset is recoverable. **BlackBerry** also notes that it considers the company as one asset group. Example 12.3 illustrates determining recoverability of assets.

EXAMPLE 12.3

Determine Recoverability of the Assets

PROBLEM: On December 31, 2018, as determined in Example 12.2, the management of Viva Enterprises needs to estimate the expected future cash flows to be generated from the use of the assets over their remaining useful lives. Again, there are no expected residual values—so the only cash flows expected are related to the use of the assets. The company's cost of capital is 5%. In addition, estimated disposal costs are insignificant. The projected future undiscounted cash flows, projected future discounted cash flows, and fair values are listed on the next page.

Continued

³This part of the test is commonly referred to as the "fair value test."

	Plant and Equipment Asset Group	Broadcast License
Cost	\$4,200,000	\$780,000
Less: Accumulated depreciation / Amortization	<u>(2,100,000)</u>	<u>(273,000)</u>
Carrying value	<u>\$2,100,000</u>	<u>\$ 507,000</u>
Future cash flows (occurring at the end of each year)		
	Remaining Life	Year
	1	2019
	2	2020
	3	2021
	4	2022
	5	2023
	6	2024
	7	2025
Total undiscounted future cash flows	<u>\$1,380,000</u>	<u>\$540,000</u>
Total discounted future cash flows at 5%	<u>\$1,262,499</u>	<u>\$478,964</u>
Fair value	<u>\$1,200,000</u>	<u>\$455,000</u>

Based on this information, determine the recoverability of these assets.

SOLUTION: The determination of recoverability is computed as follows.

Step	Plant & Equipment	Broadcast License
Step 1. Assess recoverability	Undiscounted future cash flows of \$1,380,000 are less than carrying value of \$2,100,000, so go to Step 2. The asset group is impaired.	Undiscounted future cash flows of \$540,000 are greater than carrying value of \$507,000, so stop. The asset is not impaired.
Step 2. Compare the carrying value to fair value, if required.	<i>Required: See Example 12.4 on next page</i>	Not required.

Determine Any Impairment Loss. When the asset's carrying value is more than its fair value, a company reports an **impairment loss** calculated as the carrying value less the fair value. The asset's fair value is the amount that the asset holder will receive from the sale of an asset in a current transaction between willing parties. Because the definition of fair value is based on selling an asset, it is often called an exit price.

Quoted prices in active markets are the best evidence of fair value. If market prices are not available (which is frequently the case), then accountants base fair value estimates on the best information available or use valuation techniques such as market comparables, review of recent transactions, and discounted cash-flow valuation.⁴ In the absence of market prices, we use discounted future cash flows in this chapter.

When recording the impairment loss, the firm eliminates the balance in the accumulated depreciation (or accumulated amortization) account and reduces the asset account. Specifically, it recognizes the impairment loss by:

1. Debiting the loss
2. Debiting the accumulated depreciation or accumulated amortization for its entire balance
3. Crediting the asset account for the sum of the loss and the accumulated depreciation or accumulated amortization

⁴We covered the fair value hierarchy in more depth in Chapter 2.

These steps ensure that the asset's carrying value reflects its fair value. That is, after recognizing the impairment, the firm carries the asset at its fair value with no accumulated depreciation or amortization. There is a new basis of accounting as if the asset were just acquired. Calculating an impairment loss is illustrated in Example 12.4.

EXAMPLE 12.4 Calculating the Impairment Loss

PROBLEM: Continuing Example 12.3, Viva Enterprises must measure its impairment loss for plant and equipment. Determine the impairment loss and the revised annual depreciation expense. Prepare any necessary journal entries to record the impairment.

SOLUTION: Viva measures the impairment loss by comparing the fair value of the asset to its carrying value. If the fair value of Viva's assets is less than their carrying value, Viva will record an impairment loss. We have already determined that no impairment is necessary for the broadcast license. Thus, we compute a loss for only the plant and equipment.

The loss for the plant and equipment follows:

Fair value	\$1,200,000
Less: Carrying Value	(2,100,000)
Impairment loss	<u>\$ (900,000)</u>

The journal entry is:

<i>Accounts</i>	<i>December 31, 2018</i>
Accumulated Depreciation—Plant and Equipment	2,100,000
Impairment Loss on Plant and Equipment	900,000
Plant and Equipment	3,000,000

The t-accounts for the asset and related accumulated depreciation are as follows:

Plant and Equipment	
Beginning Balance	4,200,000
	3,000,000
Ending Balance (at fair value)	<u>1,200,000</u>

Impairment

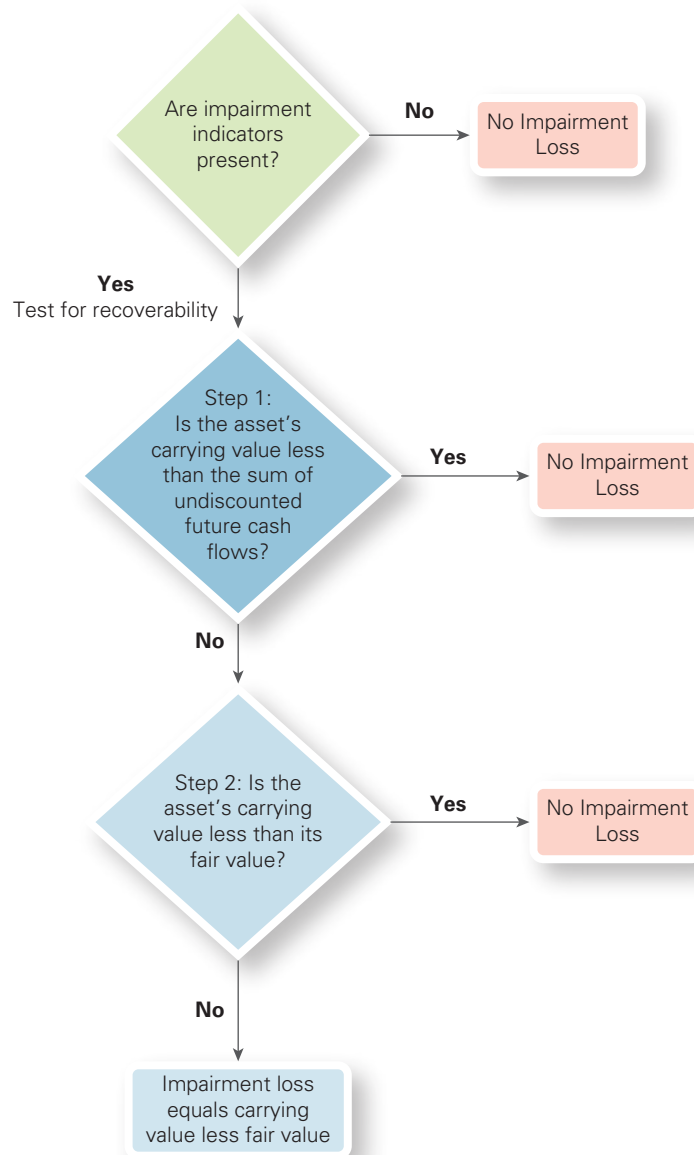

Accumulated Depreciation— Plant and Equipment	
	2,100,000
Impairment	2,100,000
Ending Balance	<u>0</u>

Beginning Balance

The new cost basis for depreciation is the fair value of \$1,200,000. Viva will depreciate this amount on a straight-line basis over the remaining 3-year useful life with no salvage value. This calculation results in an annual depreciation expense of \$400,000 per year [i.e. $(\$1,200,000 - 0)/3$ years].

Exhibit 12.3 illustrates the process for determining impairment losses for property, plant, and equipment and finite-life intangible assets.

EXHIBIT 12.3 Determining Impairment Losses on Property, Plant, and Equipment and Finite-Life Intangible Assets

Measurement Subsequent to Impairment

After a write-down, conditions could change and the asset's future cash-generating ability could recover. In this case, the asset's fair value may be higher than its carrying value after the impairment. However, once an impairment loss is taken, U.S. GAAP does not permit subsequent reversals of write-downs for long-term operating assets held for use in operations. For example, if the fair value of Viva's plant and equipment from Example 12.4 increased by \$400,000 to \$1,600,000 from \$1,200,000 after the impairment, Viva cannot write up the carrying value. Whereas the \$1,600,000 fair value may be relevant, allowing impairment reversals questions the reliability of the initial impairment loss and provides an opportunity for managers to opportunistically increase

earnings. As noted earlier, the revised carrying value after the write-down becomes the new cost for subsequent depreciation and amortization.

- ③ Explain and illustrate accounting for impairments of intangible assets with indefinite lives under U.S. GAAP.

Accounting for Impairments: Indefinite-Life Intangible Assets

We now address impairment testing for indefinite-life intangible assets following the same key steps.

Asset Grouping

U.S. GAAP stipulates that firms combine indefinite-life intangibles into an asset grouping if they are operated as a single asset and thus are not separable from each other.

When to Test for Impairment

The firm must consider the possibility of impairment of its indefinite-life intangible assets annually. Firms are allowed two options:

1. Assess qualitative factors annually to determine whether it is necessary to perform the quantitative impairment test. Indefinite-life intangibles are tested annually as opposed to when indicators exist because they are not amortized and thus are more likely to be overstated. If it is “more likely than not” that the asset is impaired, the firm then proceeds to conduct a quantitative assessment of impairment.⁵ Qualitative factors could include changes in technology and the marketplace such as consumers preferring touch-screen phones, changes in economic factors such as interest rates that effect present value calculations, or an adverse legal ruling restricting a company’s activities.
2. Perform an annual impairment test. The impairment indicators are the same as those identified in Exhibit 12.1.

One-Step Impairment Test

The fair value test determines the impairment loss for an indefinite-life intangible asset as the amount by which the carrying value of the asset exceeds the fair value of the asset.

There is no recoverability test based on future undiscounted cash flows for indefinite-life intangible assets. Many indefinite-life intangible assets easily meet the recoverability test because their cash flows extend many years into the future. The impairment of an indefinite-life intangible asset is illustrated in Example 12.5.

EXAMPLE 12.5

Impairment of an Indefinite-Life Intangible Asset

PROBLEM: Continuing the Viva Enterprises illustration, assume now that the radio broadcast license is renewable at the end of each 10-year term and management has provided evidence that approval of the renewal is highly probable. In this case, the broadcast license qualifies as an indefinite-life intangible asset and is not subject to amortization. Therefore, the firm carries the broadcast license at its original cost of \$780,000.

On December 31, 2018, the company noted substantial declines in radio advertising revenues over the past year due to expanded satellite radio subscriptions, Internet broadcasts, and the use of iPod players. Based on the required annual review and consideration of the available impairment indicators, management believes that it is more likely than not that the

Continued

⁵“More likely than not” is measured as a more than 50% chance.

broadcast license may be impaired. Therefore, the company must test the broadcast license for impairment. Similar broadcast licenses have been sold in auctions for \$672,000.

Assuming that renewal of the broadcast license is probable for this indefinite-life intangible asset, analyze the accounting for impairment and prepare the journal entries.

SOLUTION: We will address each phase of impairment testing.

Determine When to Test for Impairment

The broadcast license is an indefinite-life intangible asset. Because management believes it is more likely than not that the license is impaired, there is qualitative evidence that the asset is impaired and Viva will conduct a quantitative impairment test.

Determine the Impairment Loss, if Any

To determine the impairment loss, we must compare the carrying value to the fair value.

Carrying value	\$ 780,000
Less: Fair value	(672,000)
Impairment loss	<u>\$(108,000)</u>

The following journal entry records the impairment loss. This entry differs from the one used to write down a finite-life intangible asset in that there is no accumulated amortization for indefinite-life intangible assets.

Accounts	December 31, 2018	
Impairment Loss on Broadcast License	108,000	
Renewable Broadcast License		108,000

The t-account for the broadcast license is as follows:

	Renewable Broadcast License	
Beginning Balance	780,000	
Ending Balance (at fair value)	<u>672,000</u>	108,000 Impairment

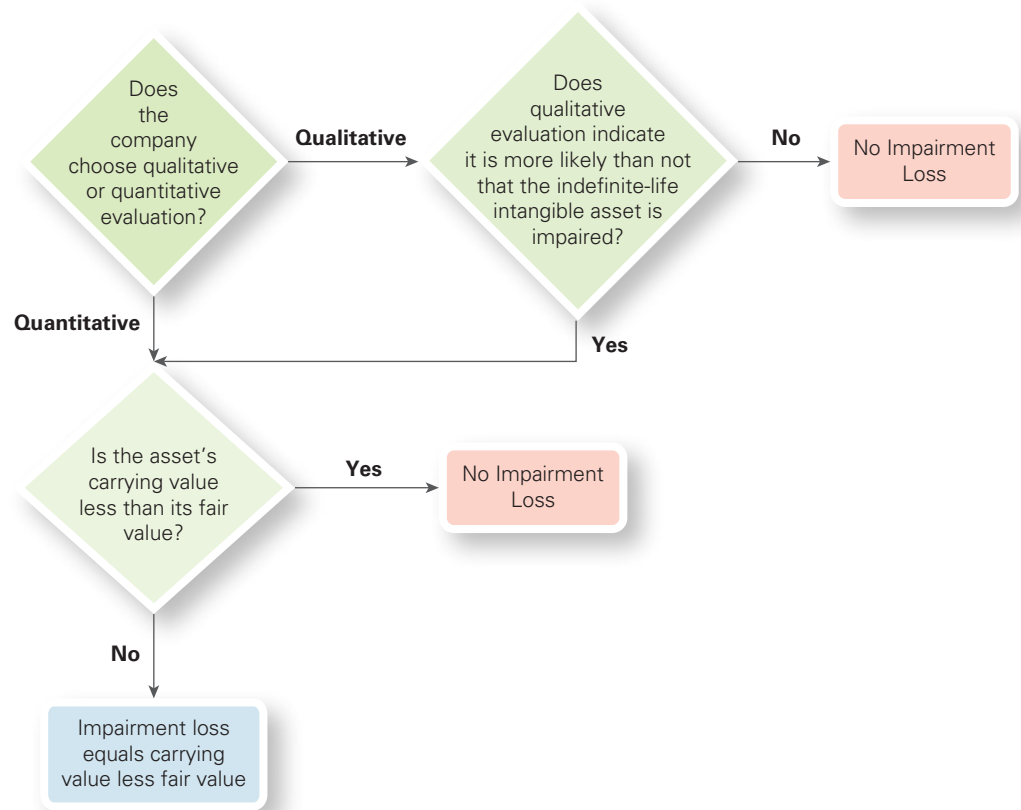

The \$672,000 ending balance is Viva's new basis of reporting for the broadcast license.

Exhibit 12.4 illustrates the process for determining impairment losses for indefinite-life intangible assets.

Measurement Subsequent to Impairment

Similar to accounting for impairment losses on property, plant, and equipment and finite-life intangible assets, U.S. GAAP does not permit subsequent reversals of impairment losses. After the write-down, the firm reports the asset at its revised carrying value.

EXHIBIT 12.4 Determining Impairment Losses on Indefinite-Life Intangible Assets

- 4 Explain and illustrate the accounting for goodwill impairments under U.S. GAAP.

Accounting for Impairments: Goodwill

Impairment testing for goodwill is significantly different from the impairment tests we have discussed thus far. As noted in Chapter 11, goodwill is a unique asset that is not separable from the entity as a whole. Because a firm cannot separate goodwill from a specific set of net assets, it cannot associate goodwill with a specific stream of cash flows as we did for tangible fixed assets and other intangible assets that have value in use.

Asset Grouping

Firms associate goodwill with the group of net assets in the **reporting unit (RU)**, which is an *operating segment* or one level below an *operating segment*. The Codification defines an **operating segment** as a component of a public entity with the following three characteristics:

1. It engages in business activities from which it may earn revenues and incur expenses.
2. The entity's chief decision maker regularly reviews the performance of the segment.
3. The segment's discrete financial information is available.⁶

⁶See FASB ASC 280-10-50-1 for the complete definition.

When to Test for Impairment

Because goodwill is not subject to amortization and has an uncertain value, U.S. GAAP allows companies either to:

- Make a qualitative evaluation annually to determine whether it is more likely than not that a reporting unit's goodwill is impaired. If it is more likely than not that goodwill is impaired, then a firm must conduct a quantitative assessment of impairment.
- Conduct a quantitative test for the impairment of goodwill at least annually.

Annual goodwill impairment testing is very complex, time consuming, and expensive. Therefore, it may be difficult to justify from a cost-benefit perspective. As a result, U.S. GAAP permits the qualitative evaluation option.

The annual impairment assessment need not be performed at fiscal year-ends. Instead, a firm can perform the fair value measurement for each unit at any time during the fiscal year as long as it uses that measurement date consistently from year to year. A firm can also use different measurement dates for different reporting units.

One-Step Impairment Test

After identifying the reporting unit, the firm compares the fair value of a reporting unit (which includes any goodwill) to the carrying value of the reporting unit, including goodwill. The fair value of the reporting unit is the valuation of the entity as if the company were to be sold in a business combination. If the fair value is less than the carrying value of the reporting unit, then the impairment loss is equal to the difference between the carrying value (including goodwill) and the fair value (including goodwill) of the reporting unit. However, the impairment loss is limited to the carrying value of the goodwill.

Example 12.6 illustrates goodwill impairment testing.

EXAMPLE 12.6 Goodwill Impairment Test: Case 1

PROBLEM: Levi and Peter's Athletic Emporium (LPAE) provided the following information.

Case 1

Fair value of the reporting unit, including goodwill	<u>\$ 1,000</u>
Fair value of the net assets, excluding goodwill	<u>\$ 900</u>
Book value of net assets, excluding goodwill	\$ 800
Add: Book value of goodwill	<u>300</u>
Book value of the reporting unit, including goodwill	<u>\$ 1,100</u>

The qualitative assessment of goodwill is completed and it is more likely than not that goodwill is impaired. Determine whether LPAE needs to record a goodwill impairment loss and prepare any required journal entries.

SOLUTION: We solve the problem based on the following impairment analysis.

Determine When to Test for Impairment

It is more likely than not that LPAE's goodwill is impaired, so we will perform the quantitative test.

One-Step Impairment Test

We compare the fair value of the reporting unit (including goodwill) to its carrying value (including goodwill). The fair value of \$1,000 is less than the \$1,100 carrying value; thus

LPAE will recognize an impairment loss of \$100, which is the difference between the carrying value and fair value. LPAE will make the following journal entry:

Account	Date of Adjustment
Impairment Loss on Goodwill	100
Goodwill	100

Example 12.7 illustrates goodwill impairment testing when the impairment loss is limited by the carrying value of the goodwill.

EXAMPLE 12.7

Goodwill Impairment Test: Case 2

PROBLEM: Now assume that LPAE provides the following information.

Case 2

Fair value of the reporting unit, including goodwill	<u>\$500</u>
Fair value of the net assets, excluding goodwill	<u>\$400</u>
Book value of net assets, excluding goodwill	\$600
Add: Book value of goodwill	<u>300</u>
Book value of the reporting unit, including goodwill	<u>\$900</u>

Note that LPAE performs the quantitative test on at least an annual basis. The qualitative assessment of goodwill reveals that it is more likely than not that the goodwill is impaired.

Is there a goodwill impairment loss? Prepare any required journal entries.

SOLUTION: We solve the problem based on the following impairment analysis.

Determine When to Test for Impairment

It is more likely than not that LPAE's goodwill is impaired, so we will perform the quantitative test.

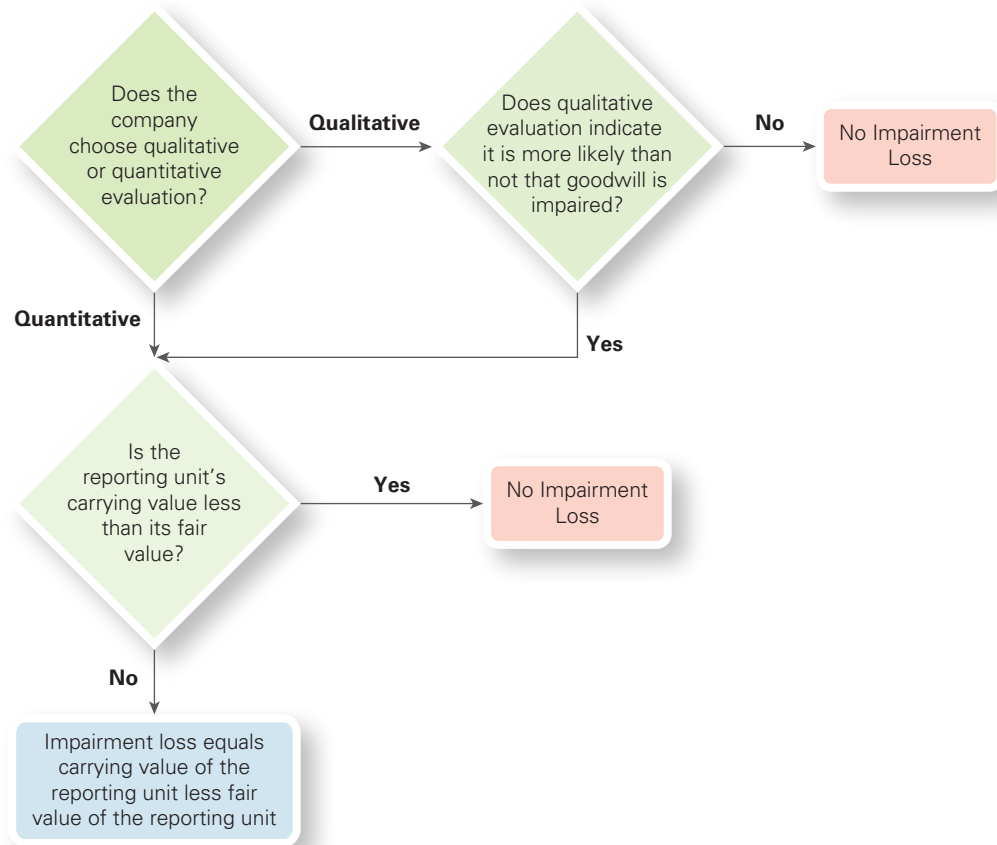

One-Step Impairment Test

We compare the fair value of the reporting unit (including goodwill) to the book value of the reporting unit (including goodwill). Because the carrying value of \$900 is more than the fair value of \$500, LPAE will recognize an impairment loss. However, it will not recognize the entire \$400 difference because the loss is limited to the carrying value of the goodwill. LPAE recognized the impairment loss by making the following journal entry:

Account	Date of Adjustment
Impairment Loss on Goodwill	300
Goodwill	300

Exhibit 12.5 illustrates the process for determining impairment losses on goodwill.

EXHIBIT 12.5 Determining Impairment Losses on Goodwill

Measurement Subsequent to Impairment

U.S. GAAP does not permit subsequent reversals of goodwill impairment losses. After the write-down, the firm reports goodwill at its revised carrying value.

JUDGMENTS IN ACCOUNTING For Impaired Long-Term Operating Assets

Managers employ a significant amount of judgment in impairment testing, particularly when determining the inputs used in the impairment process. In fact, in a survey of 175 companies, 51% of these companies reported making estimates and using judgment in estimating their impairments of PPE, if any.⁷ Impairment testing is the number one area in the survey where significant judgment is exercised: Seventy-nine percent of companies reported the use of significant judgment in determining their impairments of intangible assets.

Firms determine a new carrying value for an impaired asset based upon an expectation of future economic benefits. But how do they arrive at this new estimate? Common sources include market values of similar assets or a computation of the present value of the future cash flows. In either case, these estimates will often involve a great deal of subjectivity given that the inputs in these computations are based on management judgment.

⁷AICPA, *IFRS Financial Statements: Best Practices in Presentation and Disclosure—2012* (New York, NY: AICPA, 2012).

Consider the facts presented in Example 12.3 related to the possible impairment of the broadcast license (nonrenewable). The carrying value, future cash flows, and fair value were given as follows:

			<u>Broadcast License</u>
Carrying Value			\$507,000
Future Cash Flows			
<u>Remaining Life</u>	<u>Year</u>		
1	2019	\$185,000	
2	2020	115,000	
3	2021	100,000	
4	2022	80,000	
5	2023	40,000	
6	2024	20,000	
7	2025	<u>0</u>	
Total undiscounted future cash flows		<u>\$540,000</u>	
Total discounted future cash flows at 5%		<u>\$478,964</u>	
Fair value		<u>\$455,000</u>	

We originally concluded that there was no impairment of the broadcast license because the sum of the undiscounted future cash flows was greater than the carrying value. However, Viva's management estimated the future cash flows. How likely is it that management can accurately estimate the cash flows for a broadcast license for the next 6.5 years? Management may be inclined to bias the estimated cash flows in a particular direction either because it would prefer not to record an impairment loss or because it is generally positive about prospects for the company.

Assume that Viva estimated 2019 cash flows at \$165,000 (instead of \$185,000) and 2020 cash flows at \$100,000 (instead of \$115,000). The total undiscounted future cash flows would then be \$505,000, which is less than the carrying value of \$507,000. Viva would then have to move to Step 2 of the impairment test for this finite-life intangible assets. Now, Viva would determine an impairment loss of \$52,000, which is the carrying value of \$507,000 less the fair value of \$455,000.

This illustration shows that the judgment used in estimating future cash flows can make a significant difference in the calculation of impairment losses. Also note that the fair value of an asset is not always reasonably determinable—and fair value estimates and appraisals involve a great deal of judgment.

For example, *TrueBlue, Inc.*, a management staffing and outsourcing company, recorded impairment losses on goodwill and intangible assets of \$104 million in 2016 resulting in an operating loss of \$17 million. If the company had not reported impairment losses, operating income would have been approximately \$87 million. *TrueBlue* provides a discussion of the many judgments that the company made in order to estimate the impairment. In this discussion of goodwill impairment, *TrueBlue* comments “this analysis requires significant estimates and judgments, including estimation of future cash flows, which is dependent on internal forecasts, estimation of the long-term rate of growth for our business, estimation of the useful life over which cash flows will occur, and determination of our weighted average cost of capital, which is risk-adjusted to reflect the specific risk profile of the reporting unit being tested.”

- 5 Describe and demonstrate the accounting for impairments of property, plant, and equipment, finite-life intangible assets, and indefinite-life intangible assets other than goodwill under IFRS.

Accounting for Impairments: Property, Plant, and Equipment, Finite-Life Intangible Assets and Indefinite-Life Intangible Assets: IFRS

We next discuss accounting for impairments under IFRS for long-lived assets other than goodwill. Unlike U.S. GAAP, IFRS impairment testing is similar for all types of long-lived assets other than goodwill. Therefore, we discuss impairments of property, plant, and equipment, finite-life intangible assets, and indefinite-life intangible assets together, and then address goodwill impairment.

Asset Grouping

Asset grouping is similar under U.S. GAAP and IFRS, although there may be some differences in practice. For example, under IFRS, firms will first base impairment on the individual asset. If a firm cannot estimate the recoverable amount of the individual asset, then it groups assets. Under IFRS, the asset group is called a **cash-generating unit (CGU)**, which is the smallest identifiable group of assets that generates cash inflows that are largely independent of the cash inflows from other assets or groups of assets.⁸

When to Test for Impairment

Under IFRS, firms must review the impairment indicators every year to determine whether an impairment test is needed. Similar to U.S. GAAP, a company assesses whether the indicators exist by considering both external factors (such as market interest rates, economic environment, technological breakthrough, or a decline in market capitalization) and internal factors (such as the evidence of obsolescence and restructuring activities in the entity).⁹

Additionally, IFRS requires an annual test for indefinite-life intangibles even in the absence of indicators. For indefinite-life intangible assets, the existence of impairment indicators can prompt more frequent testing. Why are impairment tests more frequent for indefinite-life intangible assets than for PPE and finite-life intangible assets? Because indefinite-life intangible assets are not amortized, there is more risk that firms will overvalue them than with plant and equipment or finite-life intangible assets, which firms carry at net book value.

Impairment Test

IFRS uses a one-step impairment test that has two parts.

- Part 1: Determine the asset's recoverable amount
- Part 2: Compare the asset's recoverable amount to its carrying value

The asset's recoverable amount is the greater of

1. The asset's estimated fair value less costs to sell, or
2. Its **value in use**, the present value of the future cash flows the firm expects to derive from an asset.

Firms then compare the recoverable amount to the carrying value of the asset:

1. If the recoverable amount is *less than* the carrying value of the asset, then the entity is required to measure the impairment loss.
2. If the recoverable amount is *greater than* the carrying value of the asset, then there is no impairment loss.

Under IFRS, the impairment loss is simply the difference between the recoverable amount and carrying value of the asset.¹⁰

⁸From IASC, *International Accounting Standard 36*, "Impairment of Assets" (London, UK: International Accounting Standards Board, Revised), Paragraph 6.

⁹From IASC, *International Accounting Standard 36*, Paragraph 6.

¹⁰If assets have been revalued under IFRS, the impairment is treated as a revaluation decrease. We discuss revaluations in Appendix A.

GlaxoSmithKline plc, a large IFRS-reporting pharmaceutical company based in the United Kingdom, discussed recoverability and estimates used in determining value in use in its significant accounting policies footnote, as shown in Exhibit 12.6.

EXHIBIT 12.6 Impairment Accounting Policy, *GlaxoSmithKline plc*, December 31, 2013, Financial Statements

IMPAIRMENT OF NON-CURRENT ASSETS

The impairment losses principally arise from decisions to rationalise facilities and are calculated based on either fair value less costs of disposal or value in use. The fair value less costs of disposal valuation methodology uses significant inputs which are not based on observable market data, These calculations determine the net present value of the projected risk-adjusted, post-tax cash flows of the relevant asset or cash generating unit, applying a discount rate of the Group post-tax weighted average cost of capital (WACC) of 7%, adjusted where appropriate for relevant specific risks. For value in use calculations, where an impairment is indicated and a pre-tax cash-flow calculation is expected to give a materially different result, the test would be re-performed using pre-tax cash flows and a pre-tax discount rate. The Group WACC is equivalent to a pre-tax discount rate of approximately 10%. The impairment losses have been charged to cost of sales £32 million (2012 – £25 million), R&D £14 million (2012 – £9 million) and SG&A £78 million (2012 – £24 million), and include £62 million (2012 – £7 million) arising from the major restructuring programmes.

Source: <http://www.gsk.com/content/dam/gsk/globals/documents/pdf/Annual-Report-2013.pdf>

The journal entry to record the impairment loss is the same format under both U.S. GAAP and IFRS. When recording the impairment loss, the firm eliminates the balance in the accumulated depreciation or accumulated amortization account and then reduces the asset account. The asset account will reflect its recoverable amount (which is the higher of fair value less costs to sell or value in use). At the date of impairment, the firm records the asset at its recoverable amount. The recoverable amount becomes the new cost of the asset as if it were just acquired, and is subject to depreciation or amortization. Example 12.8 illustrates the impairment calculation under IFRS.

EXAMPLE 12.8

Impairment Calculation: IFRS

PROBLEM: Use the data presented in Example 12.3 and assume that Viva is an IFRS reporter. Based on this information, determine whether these assets are impaired and, if so, compute an impairment loss. Assume no disposal costs.

SOLUTION: We apply the IFRS one-step impairment test as follows.

	Plant and Equipment	Broadcast License
1. Determine recoverable amount as the greater of fair value less costs to sell (d) or value in use (c).	Value in use is greater, so recoverable amount is \$1,262,499.	Value in use is greater, so recoverable amount is \$478,964.
2. Compare carrying value (a) to recoverable amount.	Carrying value greater than recoverable amount. (a) > (c) \$2,100,000 > \$1,262,499 <i>Impairment loss is \$(837,501).</i>	Carrying value greater than recoverable amount. (a) > (c) \$507,000 > \$478,964 <i>Impairment loss is \$(28,036).</i>

PLANT AND EQUIPMENT Under IFRS, plant assets are impaired whenever their recoverable amount is less than the carrying value. Here the plant and equipment’s recoverable amount of \$1,262,499 is the value in use, which is lower than the plant asset’s carrying value (\$2,100,000). The impairment loss for the plant and equipment is \$837,501.

Continued

Recoverable amount (value in use)	\$1,262,499
Less: Carrying value	(2,100,000)
Impairment loss	<u>\$ (837,501)</u>

Accounts	December 31, 2018	
Accumulated Depreciation – Plant and Equipment	2,100,000	
Impairment Loss on Plant and Equipment	837,501	
Plant and Equipment		2,937,501

The t-accounts for the asset and related accumulated depreciation are as follows:

Plant and Equipment		
Beginning Balance	4,200,000	
		2,937,501 Impairment
Ending Balance (at value in use)	<u>1,262,499</u>	

Accumulated Depreciation – Plant and Equipment		
		2,100,000 Beginning Balance
Impairment	2,100,000	
Ending Balance	<u>0</u>	

The new cost for depreciation is the value in use of \$1,262,499. Viva will depreciate this amount on a straight-line basis over the remaining three-year useful life with no salvage value. This procedure results in an annual depreciation expense of \$420,833 per year (i.e., [$\$1,262,499 - 0$]/3 years).

BROADCAST LICENSE The recoverable amount determined under IFRS for the broadcast license also indicates an impairment loss because its recoverable amount (\$478,964) is less than the carrying value (\$507,000). For the broadcast license, the recoverable amount is the value in use.

Recoverable amount (value in use)	\$ 478,964
Less: Carrying value	(507,000)
Impairment loss	<u>\$ (28,036)</u>

Accounts	December 31, 2018	
Accumulated Amortization – Broadcast License	273,000	
Impairment Loss on Broadcast License	28,036	
Broadcast License		301,036

The t-accounts for the asset and related accumulated amortization are as follows:

Broadcast License		
Beginning Balance	780,000	
		301,036 Impairment
Ending Balance (at value in use)	<u>478,964</u>	

Accumulated Amortization— Broadcast License	
	273,000
Impairment	273,000
Ending Balance	0

Beginning Balance

The new cost for amortization is the value in use of \$478,964. Viva will amortize this amount on a straight-line basis over the remaining 6.5 years of useful life with no salvage value. This procedure results in an annual amortization expense of \$73,687 per year (i.e., [$\$478,964 - 0$]/6.5 years).

Example 12.9 illustrates the case of an impairment of an indefinite-life intangible asset.

EXAMPLE 12.9

Impairment of an Indefinite-Life Intangible Asset: IFRS

PROBLEM: Continuing our Viva Enterprises illustration, assume that the radio broadcast license is renewable at the end of each 10-year term and management provided evidence that approval of the renewal is highly likely. The broadcast license qualifies as an indefinite-life intangible asset and is not subject to amortization. Therefore, the firm carries the broadcast license at its original cost of \$780,000.

On December 31, 2018, the company noted substantial declines in radio advertising revenues since the past year due to expanded satellite radio subscriptions, Internet broadcasts, and the use of iPod players. Based on the required annual review and consideration of the available impairment indicators, management believes that it should review the broadcast license for impairment. Similar broadcast licenses have been sold in auctions for \$672,000. Management estimates the present value of the future cash flows to be \$693,000.¹¹

Assuming that renewal of the broadcast license is probable for this indefinite-life intangible asset, analyze the accounting for impairment under IFRS and prepare the journal entries. Assume no disposal costs.

SOLUTION: We solve the problem as follows.

Determine When to Test for Impairment

The broadcast license is an indefinite-life intangible asset that Viva must review for impairment on an annual basis under IFRS. In addition, based on the declining radio advertising revenues, the value of Viva’s broadcast license may be impaired.

Impairment Test

The following is the determination of impairment under IFRS.

Broadcast License – Indefinite Life	
1. Determine recoverable amount as the greater of fair value less costs to sell or value in use.	Value in use of \$693,000 is greater than the \$672,000, so recoverable amount is \$693,000.
2. Compare carrying value to recoverable amount.	Carrying value of \$780,000 is greater than recoverable amount of \$693,000. Impairment loss is \$(87,000).

Continued

¹¹This present value estimation is greater than the estimate in Example 12.3 because we are now assuming that the asset has an indefinite life.

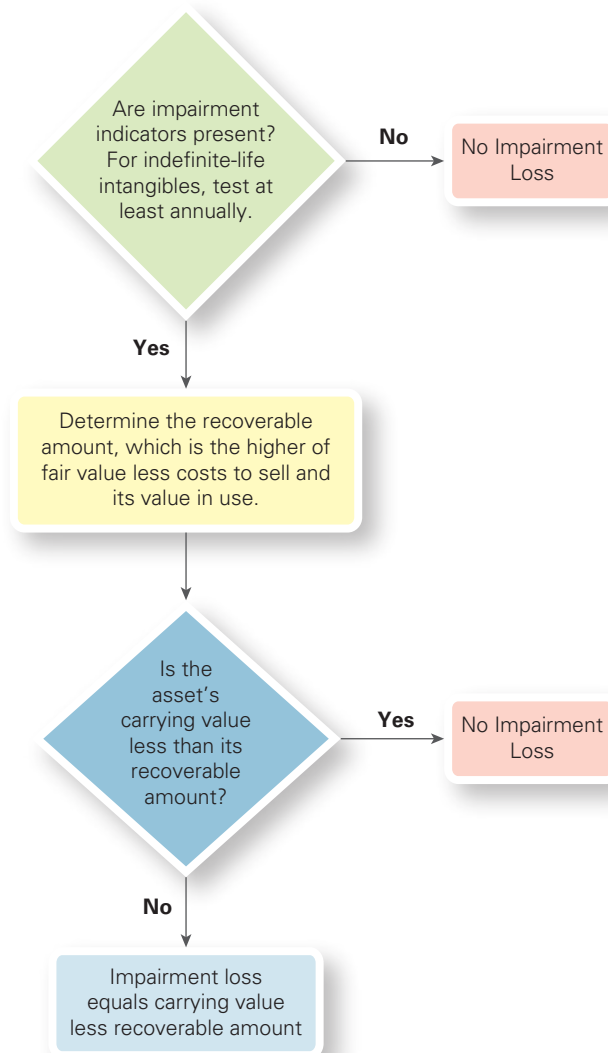

To record the impairment loss under IFRS, Viva makes the following journal entry:

Accounts	December 31, 2018
Impairment Loss on Broadcast License	87,000
Renewable Broadcast License	87,000

The balance of \$693,000 is Viva's new basis of reporting for the broadcast license.

Exhibit 12.7 illustrates the process for determining impairment losses on property, plant, and equipment, finite-life intangible assets, and indefinite-life intangible assets under IFRS.

EXHIBIT 12.7 Determining Impairment Losses on Property, Plant, and Equipment, Finite-Life Intangible Assets and Indefinite-Life Intangible Assets: IFRS

Measurement Subsequent to Impairment. In contrast to U.S. GAAP, IFRS allows firms to reverse impairment loss write-downs on property, plant, and equipment as well as finite-life intangible assets. If the asset's future cash-generating ability improves and its fair value increases, IFRS views the fair value as relevant and reliable information. There are two important constraints:

1. The amount of the write-up (reversal) is limited to the amount of the original impairment loss. The reversal cannot exceed the original impairment loss.
2. The reversal cannot result in a company reporting a value that is higher than what it would be reporting if the asset had never been impaired.

Firms report a reversal of an impairment loss in income.¹² For example, *GlaxoSmithKline*, a UK IFRS reporter, reported impairment losses of £289 million and reversals of impairment losses of £97 million on its property, plant, and equipment and intangibles assets in 2016. Impairment reversal is illustrated in Example 12.10.

EXAMPLE 12.10

Impairment Reversal: IFRS Write-Up Limited to Amount of Impairment Loss

PROBLEM: Referring to Example 12.8, assume now that Viva's management found evidence of a reversal of the impairment loss 2 years after it impaired the broadcast license. The value in use of the broadcast license is \$340,000 and its fair value is now \$350,000. The recoverable amount is the greater of these amounts, which is \$350,000. Determine whether Viva can reverse the impairment loss under IFRS and, if so, indicate the maximum amount of the reversal. What is the journal entry to record the reversal? Assume there are no disposal costs.

SOLUTION: We need to compare the current carrying value to the recoverable amount.

Broadcast License	Carrying Value Based on Cost, Adjusted for Impairment
Cost, adjusted for impairment in 2018	\$478,964
Less: Accumulated amortization since 2018*	(147,374)
Carrying value (a)	<u>\$331,590</u>
Fair value	<u>\$350,000</u>
Value in use	<u>\$340,000</u>
Recoverable amount (greater of fair value or value in use) (b)	<u>\$350,000</u>
Potential reversal of impairment loss (b) – (a)	<u>\$ 18,410</u>

*\$478,964/6.5 years = \$73,687 per year × 2 years

Determining the maximum amount of the reversal that Viva can report in income requires two steps:

Step 1. Verify that the amount of the reversal is less than the original impairment loss: The \$18,410 reversal is less than the original impairment loss of \$28,036.

Step 2. Verify that the newly calculated recoverable amount (\$350,000) does not exceed what the original carrying amount, net of amortization, would have been if the license had not been impaired initially. We compute this maximum amount as follows:

Broadcast License	Carrying Value Based on Original Cost
Original Cost	\$ 780,000
Less: Accumulated amortization	(429,000)
Carrying value based on original cost	<u>\$ 351,000</u>

Continued

¹²For assets revalued under IFRS, we treat an impairment reversal as an increase in a revaluation. We discuss revaluations in Appendix A.

The accumulated amortization is the original cost divided by the 10-year life multiplied by 5.5 years $[(\$780,000/10) \times 5.5]$. Note that 5.5 years is the total amount of time that has passed since Viva put the broadcast license into use. Because the recoverable amount of \$350,000 does not exceed the carrying value (\$351,000), based on the original cost less accumulated amortization, Viva can report the impairment reversal of \$18,410 in income. The journal entry and t-accounts are as follows:

Accounts	December 31, 2020
Accumulated Amortization – Broadcast License	147,374
Broadcast License	128,964
Gain on Reversal of Impairment Loss of Broadcast License	18,410

Broadcast License		
Beginning Balance	478,964	
		128,964 Impairment
Ending Balance (at fair value)	<u>350,000</u>	
Accumulated Amortization – Broadcast License		
		147,374 Beginning Balance
Impairment	147,374	
Ending Balance	<u>0</u>	

Example 12.11 illustrates an impairment reversal that is limited to the value that the company would be reporting if the asset had never been impaired.

EXAMPLE 12.11

Impairment Reversal: IFRS Write-Up Limited to Amount of Original Carrying Amount Net of Amortization

PROBLEM: Refer to Example 12.10. Assume that the fair value of Viva's broadcast license is \$355,000, instead of \$350,000. Thus, the recoverable amount is \$355,000, and the potential impairment reversal is \$23,410 (Fair value – Carrying value = \$355,000 – \$331,590). Determine whether Viva can reverse the impairment loss under IFRS and, if so, the maximum amount of the reversal. What is the journal entry to record the reversal?

SOLUTION: The \$23,410 reversal is less than the original impairment loss of \$28,036. However, the recoverable amount of \$355,000 exceeds the amount that the original carrying amount, net of amortization, would have been in the absence of an impairment. This amount, as we computed in Example 12.10, is \$351,000. Thus, the impairment reversal can bring the balance for the broadcast license back up only to \$351,000. The impairment reversal is therefore equal to \$19,410 and is included in net income. The calculation is $\$23,410 - \$4,000 = \$19,410$. The \$4,000 deduction represents $\$355,000 - \$351,000$. The journal entry and t-accounts are as follows:

Accounts	December 31, 2020
Accumulated Amortization – Broadcast License	147,374
Broadcast License	127,964
Gain on Reversal of Impairment Loss of Broadcast License	19,410

Broadcast License		
Beginning Balance	478,964	
		127,964 Impairment
Ending Balance (carrying value based on original cost if no impairment)	<u>351,000</u>	
Accumulated Amortization— Broadcast License		
		147,374 Beginning Balance
Impairment	147,374	
Ending Balance	<u>0</u>	

Notice that after the reversal entry, the carrying value of the broadcast license is equal to what the carrying value would be if Viva had never recorded an impairment (and subsequent reversal).

Exhibit 12.8 shows the impairment testing requirements for long-lived assets other than goodwill under U.S. GAAP and IFRS side by side.

EXHIBIT 12.8 Summary of Impairment Testing for Property, Plant, and Equipment, Finite-Life Intangible Assets, and Indefinite-Life Intangible Assets

U.S. GAAP		IFRS	
Property, Plant, and Equipment and Finite-Life Intangible Assets		Property, Plant, and Equipment, Finite-Life Intangible Assets, and Indefinite-Life Intangible Assets	
When to Test for Impairment			
When indicators are present		Firms may opt to: (1) Perform an annual qualitative evaluation to determine whether it is more likely than not that the indefinite-life intangible is impaired. If so, the firm conducts a quantitative assessment of impairment. (2) Conduct a quantitative test at least annually.	Assess existence of impairment indicators annually. For indefinite-life intangibles, test at least annually, even in the absence of indicators.
Impairment Test			
1. Assess recoverability	Determine whether the asset's carrying value is less than the sum of the future undiscounted cash flows. If no, move to Step 2. If yes, stop.	Compare the carrying value to fair value. If carrying value is less than fair value, no impairment.	1. Determine recoverable amount
2. Compare the carrying value to the fair value (if required)	Compare the carrying value to the fair value. If carrying value is less than fair value, no impairment. If carrying value is greater than fair value, impairment loss is the difference between the carrying value and the fair value.	Compare the carrying value to fair value. If carrying value is greater than fair value, impairment loss is the difference between the carrying value and the fair value.	2. Compare recoverable amount to carrying value
			Determine the recoverable amount, which is the greater of fair value less costs to sell and its value in use. Then, move to 2. Compare the carrying value to recoverable amount (from 1 above) If carrying value is less than the recoverable amount, no impairment. If carrying value is greater than the recoverable amount, the impairment loss is the difference between the carrying value and the recoverable amount.

Continued

U.S. GAAP		IFRS
Property, Plant, and Equipment and Finite-Life Intangible Assets	Indefinite-Life Intangible Assets	Property, Plant, and Equipment, Finite-Life Intangible Assets, and Indefinite-Life Intangible Assets
Loss Reversal (Recovery of Value)		
Not allowed	Not allowed	Allowed up to amount of the original impairment loss. New recoverable amount cannot exceed what the carrying value based on original cost would have been had there not been an impairment.

- 6 Explain and illustrate the accounting for goodwill impairments under IFRS.

Accounting for Impairments: Goodwill under IFRS

Next, we address accounting for goodwill impairments under IFRS focusing on differences in asset groupings, deciding when to test for impairment, and determining the impairment loss, if any.

Asset Grouping

IFRS associates goodwill with a cash-generating unit (CGU), which is the smallest identifiable group of assets that generates cash inflows that are largely independent of the cash inflows from other assets or groups of assets. After identifying the cash-generating unit, the firm determines the amount of any goodwill impairment.

When to Test for Impairment

IFRS requires an impairment test for goodwill at least annually. The firm can perform the fair value measurement for each unit at any time during the fiscal year as long as it uses the measurement date consistently from year to year. A firm can also use different measurement dates for different units.

IFRS indicates conditions under which a firm may waive the annual goodwill impairment test and instead utilize the prior year's test.¹³ In general, these conditions ensure that the makeup of the cash-generating unit has not changed substantially and that the prior test for impairment resulted in a considerable margin between the recoverable amount of the cash-generating unit and the carrying value of the cash-generating unit.

Impairment Test

IFRS uses a one-step impairment test that has two parts to assess goodwill impairment: Part 1—Determine the recoverable amount of the CGU, and Part 2—Compare the recoverable amount of the CGU to the carrying value of the CGU including goodwill.

The firm determines the recoverable amount of a CGU and then compares it with the carrying value of the cash-generating unit, including goodwill. The recoverable amount of the cash-generating unit is the greater of the fair value (less selling costs) of the CGU or the value in use of the cash-generating unit.
