The firm reports an impairment loss when the recoverable amount of the cash-generating unit is *less than* the carrying value of the cash-generating unit, including goodwill. If the impairment loss is *greater than* the amount of reported goodwill, the firm first reduces goodwill and then prorates the remaining loss to the unit's other assets based on their carrying value. Goodwill impairment under IFRS is illustrated in Example 12.12.

¹³See IASC, *International Accounting Standard 36*, Paragraph 99 for the specific IFRS conditions.

EXAMPLE 12.12**IFRS Goodwill Impairment: Case 1**

PROBLEM: Now assume that Levi and Peter's Athletic Emporium (LPAE) from Example 12.6 is an IFRS reporter and provided the following information.

CASE 1 – IFRS	
Fair value of the CGU	<u>\$ 1,000</u>
Value in use of the CGU	<u>\$ 650</u>
Book value of net assets of the CGU, excluding goodwill	\$ 500
Add: Book value of Goodwill of the CGU	<u>300</u>
Book value of the CGU, including goodwill	<u>\$ 800</u>

Based on this information, determine whether there is a goodwill impairment loss under IFRS and prepare any required journal entries. Assume that there are no selling costs associated with the sale of the cash-generating unit.

SOLUTION: We solve the problem using the one-step impairment process.

Determine When to Test for Impairment

IFRS requires firms to test for goodwill impairment at least every year.

Impairment Testing

1. **Assess recoverability.** To determine the recoverable amount, we use the greater of the fair value (less costs to sell) of the CGU or value in use of the cash-generating unit. The recoverable amount is \$1,000, the fair value of the cash-generating unit.
2. **Compare the recoverable amount to carrying value.** The recoverable amount of the unit (\$1,000) exceeds its total book value (\$800), which includes goodwill. LPAE does not have an impairment loss under IFRS.

Example 12.13 illustrates a goodwill impairment under IFRS with an impairment loss.

EXAMPLE 12.13**IFRS Goodwill Impairment: Case 2**

PROBLEM: LPAE provided the following information:

CASE 2 – IFRS	
Fair value of the CGU	<u>\$700</u>
Value in use of CGU	<u>\$650</u>
Book value of the CGU, including \$300 goodwill	<u>\$800</u>

Is there a goodwill impairment loss under IFRS? Prepare any required journal entries. Assume there are no disposal costs associated with the sale of the cash-generating unit.

SOLUTION: We once again solve the problem with the IFRS one-step impairment process.

Determine When to Test for Impairment

LPAE must test for goodwill impairment at least every year.

Impairment Testing

1. **Assess recoverability.** The recoverable amount is the greater of the fair value (less costs to sell) or value in use of the cash-generating unit. The recoverable amount is \$700, the fair value of the cash-generating unit.

Continued

2. **Compare the recoverable amount to carrying value.** The recoverable amount of the unit, \$700, is less than its carrying value, \$800, indicating there is an impairment loss. The impairment loss is \$100 (carrying value of \$800 less the \$700 fair value).

LPAE recognizes the impairment loss by making the following journal entry:

Account	Date of Adjustment	
Impairment Loss on Goodwill	100	
Goodwill		100

Under IFRS, if the impairment loss is greater than the carrying value (book value) of goodwill, the firm reduces the value of other assets of the unit on a prorated basis. Example 12.14 illustrates this scenario.

EXAMPLE 12.14 IFRS Goodwill Impairment: Case 3

PROBLEM: LPAE has a cash-generating unit with a recoverable amount of \$400 and a carrying value of \$800, which includes goodwill carried at \$300. The other assets of the unit are inventory reported at \$50 and equipment reported at \$450. Should LPAE record a goodwill impairment loss under IFRS? Prepare any required journal entries.

SOLUTION: We solve the problem next.

Determine When to Test for Impairment

LPAE must test for goodwill impairment at least every year.

Impairment Testing

1. **Assess recoverability.** *The recoverable amount of the unit is given to be \$400.*
2. **Compare the recoverable amount to carrying value.** Because the \$400 recoverable amount of the unit is less than its carrying value of \$800, there is an impairment loss. The impairment loss is \$400, computed as follows:

CASE 3 – IFRS	
Recoverable amount of the CGU	\$ 400
Less: Book value of the CGU, including goodwill	<u>(800)</u>
Impairment loss	<u>\$ (400)</u>

3. The \$400 impairment loss is \$100 greater than the amount of goodwill, \$300. To record the impairment loss, LPAE reduces the value of the unit's other assets (other than goodwill) by the additional \$100 loss. It prorates \$10 [$\$50/(\$450 + \$50) \times \100] to inventory and the remaining \$90 [$\$450/(\$450 + \$50) \times \100] to equipment. The journal entry is as follows:

Account	Date of Adjustment	
Impairment Loss	400	
Goodwill		300
Inventory		10
Equipment		90

Exhibit 12.9 illustrates the process for determining impairment losses on goodwill under IFRS.

EXHIBIT 12.9 Determining Impairment Losses on Goodwill: IFRS

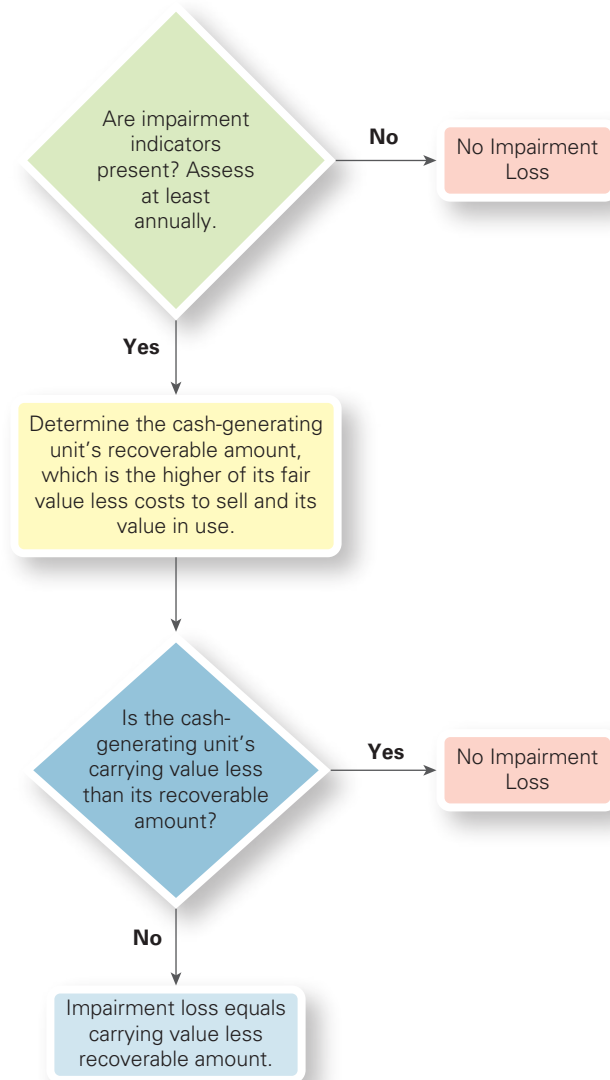

Exhibit 12.10 shows the goodwill impairment testing requirements under U.S. GAAP and IFRS side by side.

EXHIBIT 12.10 Summary of Impairment Testing for Goodwill

U.S. GAAP		IFRS	
When to Test for Impairment			
Firms may opt to:		At least annually	
<ul style="list-style-type: none"> Make a qualitative evaluation annually to determine whether it is more likely than not that a reporting unit's goodwill is impaired. If it is more likely than not, then a quantitative assessment of impairment must be conducted. <p>—or—</p> <ul style="list-style-type: none"> Conduct a quantitative test for goodwill at least annually. 			
Impairment Test			
1. Compare the carrying value to the fair value	<p>Compare the carrying value of reporting unit (including goodwill) to the fair value of the reporting unit (including goodwill).</p> <p>If carrying value is less than the fair value, no impairment.</p> <p>If carrying value is greater than the fair value, impairment loss is the difference between the carrying value and the fair value.</p> <p>Impairment loss is limited to the carrying value of goodwill.</p>	1. Determine the recoverable amount	Determine the cash-generating unit's recoverable amount, which is the greater of its fair value less costs to sell and its value in use.
		2. Compare the recoverable amount to carrying value	<p>Compare the cash-generating unit's carrying value (including goodwill) to its recoverable amount (from 1 above).</p> <p>If carrying value is less than the recoverable amount, no impairment.</p> <p>If carrying value is greater than the recoverable amount, impairment loss is the difference between the carrying value of the cash-generating unit (including goodwill) and the recoverable amount of the cash-generating unit (including goodwill).</p> <p>Goodwill is first reduced to zero and then the remaining loss is prorated to the unit's other assets.</p>

- 7** Detail required disclosures for impaired assets.

Required Disclosures for Asset Impairments

In this section, we detail the required disclosures under U.S. GAAP and IFRS for long-term asset impairments.

Impaired Asset Disclosure Requirements

A firm recognizing an impairment loss on its financial statements should disclose:

- The asset or asset group that was impaired
- The events and circumstances that led to the recognition of the impairment (based on the impairment indicators)
- The amount of the impairment loss in the notes to the financial statements (if the firm does not separately disclose this amount on the income statement)
- The method or methods used to estimate the fair value of the asset

As introduced earlier, Exhibit 12.2 illustrates *BlackBerry's* impairment accounting policies. Exhibit 12.11 presents excerpts from the *Yahoo's* fiscal 2016 financial statements illustrating its disclosures related to the impairments of certain intangible assets. Note that the total impairments of \$88 million, \$4,476 million, and \$482 million in the years ended December 31, 2014, 2015, and 2016, respectively, are reported as line items on the income statement. Additional explanation is provided in the financial statement notes. We analyze these disclosures in more detail in the Financial Statement Analysis section later in the chapter.

EXHIBIT 12.11 Impairment Disclosures, *Yahoo Inc.*, Annual Report, December 31, 2016

[Excerpt from Income Statement]

For the years ended December 31 (in thousands)	2014	2015	2016
(in thousands, except per share amounts)			
Revenue	\$ 4,618,133	\$ 4,968,301	\$ 5,169,135
Operating expenses:			
Cost of revenue-traffic acquisition costs	217,531	877,514	1,650,786
Cost of revenue-other	1,169,844	1,200,234	1,068,108
Sales and marketing	1,084,438	1,080,718	881,521
Product development	1,156,386	1,177,923	1,055,462
General and administrative	686,272	687,804	650,708
Amortization of intangibles	66,750	79,042	58,302
Gain on sale of patents and land	(97,894)	(11,100)	(121,559)
Asset impairment charge	-	44,381	-
Goodwill impairment charge	88,414	4,460,837	394,901
Intangible assets impairment charge	-	15,423	87,335
Restructuring charges, net	103,450	104,019	88,629
Total operating expenses	4,475,191	9,716,795	5,814,193
Income (loss) from operations	\$ 142,942	(\$4,748,494)	(\$645,058)

Note 5 Goodwill

The changes in the carrying amount of goodwill for the years ended December 31, 2015 and 2016 were as follows (in thousands):

	Americas(1)	EMEA(2)	Asia Pacific(3)	Total
Net balance as of January 1, 2015	\$ 4,322,219	\$532,469	\$ 297,882	\$ 5,152,570
Acquisitions and related adjustments	130,450	21,606	-	152,056
Goodwill impairment charge	(3,929,576)	(531,261)	-	(4,460,837)
Foreign currency translation adjustments	(4,207)	(22,814)	(8,654)	(35,675)
Net balance as of December 31, 2015	\$518,886	\$ 0	\$ 289,228	\$ 808,114
Goodwill impairment charge	(394,901)	-	-	(394,901)
Foreign currency translation adjustments	-	-	2,596	2,596
Net balance as of December 31, 2016	\$ 123,985	\$ -	\$ 291,824	\$ 415,809

1. Gross goodwill balances for the Americas segment were \$4.3 billion as of January 1, 2015 and \$4.4 billion as of December 31, 2016. The Americas segment includes accumulated impairment losses of \$4.3 billion as of December 31, 2016.
2. Gross goodwill balances for the EMEA segment were \$1.2 billion as of January 1, 2015 and December 31, 2016. The EMEA segment includes accumulated impairment losses of \$630 million as of January 1, 2016, and \$1.2 billion as of December 31, 2016.
3. Gross goodwill balances for the Asia Pacific segment were \$457 million as of January 1, 2015 and \$451 million as of December 31, 2016. The Asia Pacific segment includes accumulated impairment losses of \$159 million as of January 1, 2015 and December 31, 2016.

2016 Impairment Testing

Interim Test.

After recording the goodwill impairment charge for Tumblr during the fourth quarter of 2015, the fair value of the Tumblr reporting unit approximated its carrying value. As such, any significant unfavorable changes in the forecast would result in the fair value being less than the carrying value. During the second quarter of 2016, the Company determined that there were indicators present to suggest that it was more likely than not that the fair value of the Tumblr reporting unit was less than its carrying amount. The significant changes for the Tumblr reporting unit subsequent to the annual goodwill impairment test performed as of October 31, 2015 included a decline in the 2016 and beyond forecasted revenue, operating income and cash flows.

Annual Test.

As of October 31, 2016, the Company conducted its annual impairment test and no additional impairment was identified.

2015 Impairment Testing

In 2015, the estimated fair values of the reporting units for all reporting units identified, except for Tumblr and Latin America, were estimated using a combination of a market approach and an income approach, giving equal weighting to each. This combination is deemed to be the most indicative of the reporting units' estimated fair value in an orderly transaction between market participants and is consistent with the methodology used for the goodwill impairment test in prior years. For the Tumblr reporting unit, the fair value was estimated using an income approach which was deemed to be the most indicative of fair value in an orderly transaction between market participants. For the Latin America reporting unit, the fair value was estimated using the market approach as the income approach yielded negative cash flows and was not deemed to be comparable. The forecast and related assumptions were derived from the most recent annual financial forecast for which the planning process commenced in the fourth quarter of 2015. The estimated fair values of the Company's Taiwan, Hong Kong, and Australia & New Zealand reporting units exceeded their estimated carrying values and therefore goodwill in those reporting units was not impaired. In 2015, the carrying value exceeded the fair value for the following reporting units: U.S. & Canada, Europe, Tumblr and Latin America. . . . The Company recorded goodwill impairment charges of \$3,692 million, \$531 million, \$230 million and \$8 million, associated with the U.S. & Canada, Europe, Tumblr, and Latin America reporting units, respectively, for the year ended December 31, 2015. The impairments were a result of a combination of factors, including a sustained decrease in the Company's market capitalization in fourth quarter of 2015 and lower estimated projected revenue and profitability in the near term. The lower estimated projected cash flows and higher discount rates were used to estimate the fair value of each reporting unit affected by such changes.

2014 Impairment Testing

In 2014, as a result of the annual goodwill impairment test, the Company concluded that the carrying value of the Middle East reporting unit, included in the EMEA reportable segment, and the carrying value of the India & Southeast Asia reporting unit included in the Asia Pacific reportable segment both exceeded their respective fair values. . . . Accordingly, the Company recorded a goodwill impairment charge related to the Middle East and India & Southeast Asia reporting units of \$79 million and \$9 million, respectively, during the quarter ended December 31, 2014 for the difference between the carrying value of the goodwill in the reporting unit and its implied fair value with no goodwill remaining in either reporting unit. The impairment resulted from a decline in business conditions in the Middle East and India & Southeast Asia during the latter half of 2014.

Note 6 Intangibles Assets, Net

	Gross Carrying	Accumulated	Impairment	
December 31, 2015 (in thousands)	Amount	Amortization(*)	Charge	Net
Customer, affiliate, and advertiser related relationships	\$355,568	\$(135,513)		\$220,055
Developed technology and patents	170,289	(83,380)		86,909
Trade names, trademarks, and domain names	67,119	(26,814)	-	40,305
Total intangible assets, net	<u>\$592,976</u>	<u>\$(245,707)</u>	<u>-</u>	<u>\$347,269</u>
December 31, 2016				
Customer, affiliate, and advertiser related relationships	\$350,896	\$(181,451)	\$(66,680)	\$102,765
Developed technology and patents	128,732	(81,489)	-	47,243
Trade names, trademarks, and domain names	66,631	(34,340)	(20,655)	11,636
Total intangible assets, net	<u>\$546,259</u>	<u>\$(297,280)</u>	<u>\$(87,335)</u>	<u>\$161,644</u>

*Cumulative foreign currency translation adjustments, reflecting movement in the currencies of the underlying entities, totaled approximately \$18 million and \$17 million for the years ended as of December 31, 2015 and 2016, respectively.

Definite-lived intangible assets are carried at cost and are amortized over their estimated useful lives, generally on a straight-line basis, as follows:

- Customer, affiliate, and advertiser related relationships—1 to 6 years;
- Developed technology and patents—3 to 6 years; and
- Trade names, trademarks, and domain names—3 to 7 years.

The Company recognized amortization expense for intangible assets of \$132 million, \$137 million, and \$100 million for 2014, 2015, and 2016, respectively, including \$65 million, \$58 million, and \$42 million, respectively, included in cost of revenue-other. Based on the current amount of intangibles subject to amortization, the estimated amortization expense for each of the succeeding years is as follows: 2017: \$76 million; 2018: \$55 million; 2019: \$30 million; and 2020 and after: \$1 million.

Intangibles Impairment Testing

The Company reviews identifiable intangible assets to be held and used for impairment whenever events or changes in circumstances indicate that the carrying value of the assets may not be recoverable. Determination of recoverability is based on the lowest level of identifiable estimated undiscounted cash flows resulting from use of the asset and its eventual disposition. Intangible assets with indefinite useful lives are not amortized but are reviewed for impairment whenever events or changes in circumstances indicate that it is more likely than not that the fair value is less than its carrying amount. If the Company determines that an intangible asset with an indefinite life is more likely than not impaired, a quantitative test comparing the fair value of the indefinite-lived purchased

2016 Testing. During the second quarter of 2016, the Company reviewed its Tumblr asset group for impairment as there were events and changes in circumstances that indicated that the carrying value of the long-lived assets may not be recoverable. As a result, the Company performed a quantitative test comparing the fair value of the Tumblr long-lived assets with the carrying amounts and recorded a partial impairment charge of \$87 million associated with its definite-lived intangible assets, which were included within customer, affiliate, and advertiser related relationships and trade names, trademarks, and domain names in the Americas segment. In the fourth quarter of 2016, the Company reviewed its definite-lived intangible assets for impairment. No impairment was identified for definite-lived intangibles.

2015 Testing. In the fourth quarter of 2015, the Company reviewed both definite-lived and indefinite-lived intangible assets for impairment. No impairment was identified for definite-lived intangibles. For indefinite-lived intangibles, the Company performed a quantitative test comparing the fair value of the indefinite-lived intangible assets with their carrying amount and recorded an impairment charge of \$15 million related to certain indefinite-lived intangible assets in the EMEA segment. As a result, the entire carrying value of the indefinite-lived intangible assets was fully impaired as of December 31, 2015.

Source: Yahoo Inc., Annual Report, December 31, 2016. <http://files.shareholder.com/downloads/YHOO/4381508767x0xS1193125-17-65791/1011006/filing.pdf>

Impaired Asset Disclosure Requirements: IFRS

IFRS disclosure requirements are identical to U.S. GAAP with one exception. IFRS also requires disclosure of whether the recoverable amount was fair value less costs to sell or value in use.

Because IFRS allows recoveries of impairment losses, it requires the following additional disclosures by segment:

1. The events and circumstances that led to the recognition of the impairment loss reversal
2. The amount of any impairment loss reversal in income or other comprehensive income
3. The amount of any impairment loss the firm reported in other comprehensive income for assets that it has previously revalued

- 8 Illustrate the accounting for long-term operating assets held for sale or disposal and describe the required disclosures for these assets.

Long-Term Operating Assets Held for Sale or Disposal

Finally, we address departures from historical cost accounting for long-term operating assets classified as held for sale or disposal. The accounting for assets held for sale or disposal under U.S. GAAP and IFRS is substantially converged.¹⁴ The concepts and judgments that underlie the accounting treatment of assets held for sale are the same as those involved in the accounting treatment of impairments for long-term operating assets.

Recording Long-Term Operating Assets Held for Sale or Disposal

A company selling or disposing of an asset measures the asset at the lower of cost (carrying value) or net realizable value (fair value less selling costs). If a write-down is necessary, then the loss is equal to the difference between the carrying value of the asset and its fair value net of selling costs. If the company writes down the asset in one period and still holds the asset in the next period, then the company can report an increase in value in the subsequent period if the fair value net of selling costs has increased. However, because the asset is held at the lower of cost or fair value less selling costs, the write-up could never result in a carrying value greater than the carrying value of the asset before the write-down or impairment.¹⁵ Exhibit 12.12 illustrates the process of determining a loss on assets held for sale or disposal.

Companies do not depreciate or amortize long-term operating assets while holding them for sale or disposal because they are reporting them at the lower of cost or fair value less selling costs. Companies report the asset as a separate line item on the balance sheet, if material in amount. Accounting for a long-term operating asset is illustrated in Example 12.15.

EXAMPLE 12.15

Long-Term Operating Asset Held for Disposal

PROBLEM: On December 31, 2018, ALR classified one of its plant assets, land, as held for sale. The carrying value of the land as of that date was \$2,000,000. The fair value less selling costs on that date was \$1,800,000. As of December 31, 2019, the company had not sold the asset, but ALR still classified it as held for sale. The fair value net of selling costs as of December 31, 2019, was \$1,950,000. Based on this information, indicate how ALR should report the asset on its December 31, 2018, and December 31, 2019, balance sheets. Prepare any journal entries required.

SOLUTION: ALR makes two journal entries on December 31, 2018. The first is to reclassify the land as held for sale as follows:

Accounts	December 31, 2018
Land Held for Sale	2,000,000
Land	2,000,000

Then, ALR makes a journal entry to write down the asset as follows:

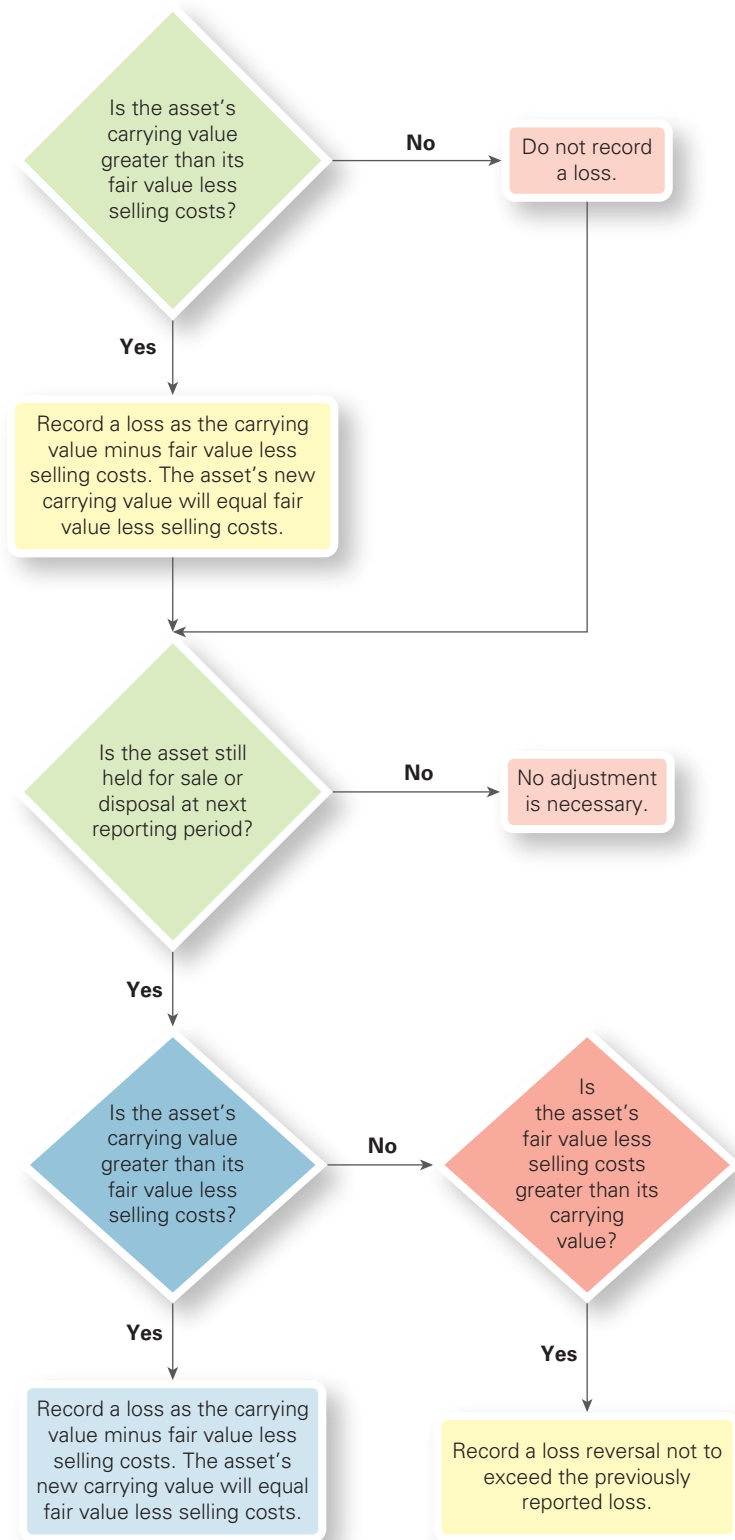

Accounts	December 31, 2018
Loss on Land Held for Sale	200,000
Land Held for Sale	200,000

ALR will report the land at \$1,800,000, in a separate line on the December 31, 2018, balance sheet, if material in amount. If the plant asset were a depreciable asset, the plant asset would not be depreciated while holding it for disposal.

¹⁴Under U.S. GAAP, accounting for long-term operating asset impairments and accounting for assets held for sale or disposal are both included in the same set of standards. Under IFRS, a separate standard addresses the accounting for assets held for sale, IASB, *International Financial Reporting Standard 5*, "Non-current Assets Held for Sale and Discontinued Operations" (London, UK: International Accounting Standards Board, Revised).

¹⁵This accounting is very similar to the lower-of-cost-or-market rule for inventory.

EXHIBIT 12.12 Determining Loss on Assets Held for Sale or Disposal

The journal entry to record the market recovery as of December 31, 2019, is as follows.

<i>Accounts</i>	<i>December 31, 2019</i>
Land Held for Sale	150,000
Gain on Land Held for Sale	150,000

On the balance sheet at December 31, 2019, ALR will report the land at \$1,950,000 on a separate line, if material in amount.

Example 12.16 illustrates that a gain is allowed on the change in the fair value of assets held for disposal. However, the recovery is limited by the carrying value of the asset as of the date it was classified held for sale.

EXAMPLE 12.16 Long-Term Operating Asset Held for Disposal

PROBLEM: On December 31, 2018, ALR, Inc. classified one of its plant assets (land) as held for sale. The carrying value of the land as of that date was \$2,000,000. The fair value less selling costs on that date was \$1,800,000. As of December 31, 2019, the company had not sold the asset, so it was still classified as held for sale. The fair value net of selling costs as of December 31, 2019, was \$2,050,000. Based on this information, indicate how ALR should report the asset on the December 31, 2018, and December 31, 2019, balance sheets. Prepare any journal entries required.

SOLUTION: ALR makes two journal entries on December 31, 2018. First, ALR reclassifies the land as held for sale as follows.

<i>Accounts</i>	<i>December 31, 2018</i>
Land Held for Sale	2,000,000
Land	2,000,000

Then ALR writes down the asset as follows:

<i>Accounts</i>	<i>December 31, 2018</i>
Loss on Land Held for Sale	200,000
Land Held for Sale	200,000

ALR will report the land at \$1,800,000 in a separate line on the December 31, 2018, balance sheet, if material in amount.

Given the fair value net of selling costs on December 31, 2019, of \$2,050,000, ALR will write up the asset but only to the original carrying value as of the date it classified the asset as held for sale. Thus, the reversal of the impairment loss is limited to \$200,000, bringing the asset's value back to \$2,000,000. The journal entry follows:

<i>Accounts</i>	<i>December 31, 2019</i>
Land Held for Sale	200,000
Gain on Land Held for Sale	200,000

On the balance sheet at December 31, 2019, ALR will report the land at \$2,000,000 on a separate line of the statement, if material in amount.

Interview

JACK MARKEY
ASSISTANT
CONTROLLER,
EISAI US, NEW YORK,
NEW YORK »

Jack E. Markey

Jack Markey is Assistant Controller at Eisai US, a pharmaceutical company. He serves on the AICPA Financial Reporting Executive Committee.

- 1 Is a balance sheet more informative for financial statement users if long-term operating assets are stated at fair value rather than at historical cost?

A fair value measurement of long-term operating assets (LTOAs) varies depending on the type of asset, how it is used, the market participants, the asset's highest and best use, and the variables used to compute the asset's fair value (projected cash flows, discount rates, disposal costs, appraised values, etc.). While I favor a mixed attribute model that blends fair value and historical cost, some situations—such as impairments—call for measuring LTOAs at fair value.

While IFRS permits an entity to measure its LTOAs at fair value, the question then becomes what defines a “reliable measurement?” A major concern is that fair value measurement could be the highest possible selling price of the asset—irrespective of its existing use. That can result in a disconnect between the asset's true value and its intended use.

- 2 How does a revaluation differ from an impairment for long-term operating assets?

An impairment is often caused by an unanticipated event and results in adjusting book value downward. As such, fair value measurements can consider such factors as distressed sales, the entity's liquidity needs, and market volatility. A revaluation applies more of a mark-to-market model and is typically a structured process. This includes regular reassessment of fair value using valuation techniques and measurement models or updated reports from appraisers. As such, its costs might outweigh the benefits.

- 3 In your opinion, should impairment losses be reflected in current earnings or in other comprehensive income within the stockholders' equity section of the balance sheet?

An impairment loss on a long-lived asset should always be reflected in current earnings. In the absence of an impairment loss, the asset's depreciation or amortization is still reported

in earnings. One could argue that the recognition of an impairment loss is a one-time acceleration or “catch-up” of depreciation or amortization that recovers the cost of the asset. If the impairment loss is deferred in Accumulated OCI, the question is what is the appropriate time and circumstances to reclassify the deferred cost into earnings.

- 4 Given that impairment losses are one-time, non-cash events, many financial statement users may discount the importance of such losses when making future cash-flow projections. Do you agree with this assessment?

It would be a mistake to disregard the importance of impairment losses. Many financial analysts, loan officers, credit rating agencies, and sophisticated investors attempt to model an entity's “cash earnings,” often starting with GAAP-based financial statements and working their way back to a cash-based model. By stripping out one-time non-cash events such as impairment losses, analysts supposedly make better earnings forecasts. However, the recognition of an impairment loss indicates that something changed or went wrong within a specific part of the business or management did not foresee an event or condition that led to the impairment charge. Sometimes an impairment may be an early warning for additional problems.

- 5 What types of judgments do managers make when assessing impairment indicators?

In addition to the impairment indicators within ASC 360-10-35-21, other significant factors in determining whether an impairment exists include:

- How long the asset may be held for sale
- Macroeconomic conditions and the expected time frame to recovery
- Deterioration in market conditions specific to the particular industry
- Cash burn rate and availability of other liquidity sources
- Entity-specific events or circumstances such as changes in management or the core business model, loss of major customer or supplier, and litigation
- Technological obsolescence of the entity's products and/or services and its investment in R&D and new product development.

Discussion Questions

1. Jack Markey indicates that firms currently follow appropriate accounting procedure by reporting impairment losses in current earnings. Provide justification for his assertion and indicate when it may be appropriate to report an unrealized gain or loss in other comprehensive income (OCI).
2. Plant assets are not revalued under U.S. GAAP but revaluation is an option under IFRS. What are some of the benefits of revaluation from the standpoint of a financial statement user?

Required Disclosures of Long-Term Operating Assets Held for Disposal

Companies must disclose the following items when classifying assets as held for sale:

1. The description of the facts and circumstances that led to the expected disposal as well as the expected manner and timing of the disposal
2. The carrying values of the major classes of assets and liabilities included as part of the disposal group (reported either on the face of the financial statements or in the note disclosures)
3. The gain or loss included in net income due to a write-down or write-up (reported either on the face of the income statement or in the note disclosures)
4. The segment, if applicable, that includes the disposal group

FINANCIAL STATEMENT ANALYSIS

Long-Term Operating Assets with Departures from Historical Cost

The quality of earnings is an important issue when analyzing financial statements—and is particularly challenging with long-lived asset impairments and gains or losses on assets held for sale. As noted in Chapter 5, earnings quality captures the degree to which reported income provides financial statement users with useful information in predicting future firm performance.

Permanent earnings—earnings that are likely to continue in the future—are likely to be good indicators of future performance. Impairments are usually viewed as one-time charges unlikely to continue in the future. Therefore, impairment losses are usually not a good predictor of future earnings. However, impairment losses can have implications for future earnings. An impaired asset is no longer likely to generate the originally expected cash flows and future earnings. If assets are impaired, then future earnings are likely to be lower. Similarly, when long-lived assets are held for disposal (or disposed of), future earnings will be lower because the firm is no longer using these productive assets.

In examining impairment charges, a financial statement user should understand and do the following:

- Determine whether the firm has any impaired long-lived assets. If so, determine which assets and the amount of the impairment.
- Identify where impairment losses are reported in the financial statements, such as net income or other comprehensive income. If impairment losses are included in net income, identify the line item in which they are reported.
- Assess performance with and without the impairment losses.

Example 12.17 illustrates the effect of long-lived asset impairments on financial statement analysis.

EXAMPLE 12.17

Financial Statement Analysis of Long-Lived Assets: Departures from Historical Cost

PROBLEM: *Yahoo Inc.*, the digital information company, reported impairments of long-lived intangible assets of \$88 million, \$4,476 million, and \$482 million in the years ended December 31, 2014, 2015, and 2016, respectively. You are interested in further examining these and any other impairment losses at *Yahoo* and have identified the following financial statement excerpts to further analyze. Refer to these financial statements excerpts in Exhibit 12.11 to answer the questions on the next page:

Required »

- What types of intangible assets does **Yahoo** report? If **Yahoo**'s total assets were \$45,203,966 thousand and \$48,083,079 thousand at December 31, 2015, and December 31, 2016, respectively, how significant are intangible assets to **Yahoo**?
- What is the total amount of impairment losses **Yahoo** reports in the years ended December 31, 2014, 2015, and 2016? To what types of assets do the impairment losses relate?
- To what reporting unit(s) does **Yahoo**'s goodwill impairment loss relate? What was the percentage decline in goodwill due to the impairment loss by reporting segment in 2015, and 2016? Use the beginning balance of goodwill in each year.
- What is the amount of impairment losses on intangible assets other than goodwill that **Yahoo** reports for the years ended December 31, 2015, and 2016? To what type of intangible asset do the losses relate?
- What would operating income be in 2014, 2015, and 2016 if the impairment losses were excluded? Compare operating income excluding impairment losses to reported operating income for 2014, 2015, and 2016. Comment on how the inclusion or exclusion of impairment losses affects any trend in operating income.

SOLUTIONS:

- Yahoo** reports intangible assets of customer, affiliate, and advertiser related relationships, developed technology, patents, trade names, trademarks, domain names, and goodwill.

(in thousands)	December 31, 2015	December 31, 2016
Goodwill	\$ 808,114	\$ 415,809
Intangible Assets, Net	347,269	161,664
Total Intangible Assets	<u>\$ 1,155,383</u>	<u>\$ 577,473</u>
Total Assets	<u>\$ 45,203,966</u>	<u>\$ 48,083,079</u>
Percent	<u>2.6%</u>	<u>1.2%</u>

Yahoo's intangible assets compose 2.6% and 1.2% of its total assets at December 31, 2015, and December 31, 2016, respectively. From December 31, 2015, to December 31, 2016, the percent dropped which could be due to intangible asset impairments.

- On the income statement, we find the total impairment losses and the types of assets impaired in the financial statement notes:

For the Years Ended December (in thousands)	2014	2015	2016
Asset impairment charge	\$ -	\$ 44,381	\$ -
Goodwill impairment charge	88,414	4,460,837	394,901
Intangible assets impairment charge	-	15,423	87,335
Impairment losses	<u>\$88,414</u>	<u>\$4,520,641</u>	<u>\$482,236</u>

The impairment losses relate to goodwill, intangible assets, and originally developed and acquired content.

- Yahoo**'s goodwill impairment loss of \$3,929,576 thousand for the year ended December 31, 2015, is related to its Americas reportable segment. **Yahoo**'s goodwill impairment loss of \$394,901 thousand for the year ended December 31, 2016, is related to its Americas reportable segment. The goodwill impairment loss of \$531,261 thousand for the year ended December 31, 2015 is due to the EMEA segment. The beginning balance of goodwill in these reportable segments and the decrease due to the impairment losses is presented in the following table.

Financial Statement Analysis, continued

(in thousands)	2015		2016
	Americas	EMEA	Americas
Goodwill, beginning balance	\$4,322,219	\$532,469	\$518,886
Impairment loss	(3,929,576)	(531,261)	(394,901)
Percent decrease due to impairment	(90.9%)	(99.8%)	(76.1%)

- d. In 2016, the remaining amount of *Yahoo's* impairment loss on intangible assets is due to the impairment of the customer, affiliate, and advertiser related relationships of \$66,680 thousand and trade names, trademarks, and domain names of \$20,655 thousand.
- e. The comparison of the percent change in operating income with and without the impairment losses follow.

Reported**For the Years Ended December 31
(in thousands)**

	2014	2015	2016
Operating income	\$142,942	\$(4,748,494)	\$(645,058)
Adjusted to Exclude Long-lived Asset Impairment Losses			
Operating Income	\$142,942	\$(4,748,494)	\$(645,058)
Add back impairment losses from part (b)	88,414	4,520,641	482,236
Adjusted operating income	\$231,356	\$ (227,853)	\$(162,822)

Analyzing *Yahoo's* operating income without the impairment losses, we note that the company would have still reported operating losses in 2015 and 2016. Therefore, the other components of operating income contribute to the decline in operating income in 2015 and 2016. These other factors should be given more weight in an analysis because, unlike the impairment losses, the other revenue and expense components are part of the continuing operations of the company.

Summary by Learning Objectives

Below we summarize the main points by learning objective. Throughout the chapter, we discuss the accounting and reporting of U.S. GAAP and IFRS side-by-side. The table below also highlights the major similarities and differences between the standards.

- 1 Specify the categories of long-term operating assets tested for impairment.

Summary	Similarities and Differences between U.S. GAAP and IFRS
<p>Three categories of long-term operating assets are tested for impairment:</p> <ol style="list-style-type: none"> 1. Property, plant, and equipment and finite-life intangible assets 2. Indefinite-Life intangible assets 3. Goodwill 	<p>Similar under U.S. GAAP and IFRS.</p>

Summary by Learning Objectives, continued

<p>2 Describe and demonstrate the accounting for impairments of property, plant, and equipment and intangible assets with finite lives under U.S. GAAP.</p>	
<p style="text-align: center;">Summary</p>	<p style="text-align: center;">Similarities and Differences between U.S. GAAP and IFRS</p>
<p>Accounting for impairments includes assessing when to test for impairment and computing any impairment loss when impairment indicators are present.</p> <p>Determine whether to recognize an impairment loss using a two-step procedure:</p> <p>Step 1. Assess recoverability by determining whether the asset's carrying value is less than the sum of the future undiscounted cash flows. If no, move to Step 2. If yes, stop.</p> <p>Step 2. If required, compare the carrying value to the fair value. If carrying value is less than fair value, there is no impairment. If carrying value is greater than fair value, impairment loss is the difference between the carrying value and the fair value.</p>	<p>► Significant differences are summarized in Learning Objective 5.</p>
<p>3 Explain and illustrate accounting for impairments of intangible assets with indefinite lives under U.S. GAAP.</p>	
<p style="text-align: center;">Summary</p>	<p style="text-align: center;">Similarities and Differences between U.S. GAAP and IFRS</p>
<p>Accounting for impairments includes assessing when to test for impairment with a qualitative evaluation annually and computing any impairment loss. If it is more likely than not that an asset is impaired, then the firm must conduct a quantitative assessment of impairment. Alternatively, the firm can conduct a quantitative test at least annually.</p> <p>To determine whether to recognize an impairment loss, compare the asset's carrying value to fair value.</p> <p>If the carrying value is less than fair value, there is no impairment. If the carrying value is greater than fair value, the impairment loss is the difference between the carrying value and the fair value.</p>	<p>► Significant differences are summarized in Learning Objective 5.</p>
<p>4 Explain and illustrate the accounting for goodwill impairments under U.S. GAAP.</p>	
<p style="text-align: center;">Summary</p>	<p style="text-align: center;">Similarities and Differences between U.S. GAAP and IFRS</p>
<p>Accounting for impairments includes assessing when to test for impairment and computing any impairment loss. A firm can make a qualitative evaluation annually. If it is more likely than not that the goodwill is impaired, then the firm must conduct a quantitative assessment of impairment. Alternatively, the firm can conduct a quantitative test at least annually.</p> <p>Determine whether to recognize an impairment loss, using a one-step procedure:</p> <p>Compare the reporting unit's (RU's) carrying value with goodwill to its fair value with goodwill. If the carrying value is greater, then the impairment loss equals the carrying value of the reporting unit less the fair value of the reporting unit.</p> <p>The impairment loss is limited to the carrying value of goodwill.</p>	<p>► Significant differences are summarized in Learning Objective 6.</p>

Summary by Learning Objectives, continued

- 5** Describe and demonstrate the accounting for impairments of property, plant, and equipment, finite-life intangible assets, and indefinite-life intangible assets other than goodwill under IFRS.

Summary	Similarities and Differences between U.S. GAAP and IFRS
See Learning Objectives 2 and 3 for summary of U.S. GAAP.	<p>► Accounting for impairments includes assessing when to test for impairment and computing any impairment loss. Under IFRS, assess existence of impairment indicators annually. However, for indefinite-life intangible assets, IFRS requires an annual test even in the absence of indicators.</p> <p>Determine whether to recognize an impairment loss using a one-step procedure with two parts:</p> <p>Part 1. Determine the recoverable amount, which is the greater of fair value less costs to sell and its value in use.</p> <p>Part 2. Compare the carrying value to recoverable amount. If the carrying value is less than the recoverable amount, no impairment. If carrying value is greater than the recoverable amount, the impairment loss is the difference between the carrying value and the recoverable amount.</p> <p>Impairment losses can be reversed if the asset's value recovers.</p>

- 6** Explain and illustrate the accounting for goodwill impairments under IFRS.

Summary	Similarities and Differences between U.S. GAAP and IFRS
See Learning Objective 4 for summary of U.S. GAAP.	<p>► Accounting for impairments includes assessing when to test for impairment and computing any impairment loss. Under IFRS, test for goodwill impairments at least annually. The test may be waived if certain conditions are met.</p> <p>Determine whether to recognize an impairment loss using a one-step procedure with two parts:</p> <p>Part 1. Determine the cash-generating unit's recoverable amount, which is the greater of its fair value less costs to sell and its value in use.</p> <p>Part 2. Compare the cash-generating unit's carrying value (including goodwill) to its recoverable amount. If the carrying value is less than the recoverable amount, there is no impairment.</p> <p>If the carrying value is greater than the recoverable amount, the impairment loss is the difference between the carrying value of the cash-generating unit (including goodwill) and the recoverable amount of the cash-generating unit (including goodwill).</p> <p>Goodwill is first reduced to zero and then the remaining loss is prorated to the unit's other assets.</p> <p>The specific procedures are summarized in Exhibit 12.9.</p>

- 7** Detail required disclosures for impaired assets.

Summary	Similarities and Differences between U.S. GAAP and IFRS
<p>Disclosures include:</p> <ol style="list-style-type: none"> 1. Asset or asset group that was impaired 2. Events and circumstances that led to the recognition of the impairment 3. Amount of the impairment loss in the notes to the financial statements 4. Method or methods used to estimate the fair value of the asset 	<p>► In addition to the disclosures required by U.S. GAAP, IFRS requires disclosure of whether the recoverable amount was measured as fair value less costs to sell or value in use as well as additional disclosures by segment.</p>

Summary by Learning Objectives, continued

<p>8 Illustrate the accounting for long-term operating assets held for sale or disposal and describe the required disclosures for these assets.</p>	
Summary	Similarities and Differences between U.S. GAAP and IFRS
<p>Firms record long-term operating assets held for disposal at the lower of cost (carrying value) or fair value less selling costs. These assets are not depreciated.</p>	<p>Similar under U.S. GAAP and IFRS.</p>

MyLab Accounting

Go to <http://www.pearson.com/mylab/accounting> for the following Questions, Multiple-Choice Questions, Brief Exercises, Exercises, and Problems. They are available with immediate grading, explanations of correct and incorrect answers, and interactive media that acts as your own online tutor

12 Long-Term Operating Assets: Departures from Historical Cost

Questions

- 1 2 3 4** **Q12-1.** Is the impairment test for tangible, long-term operating assets identical to the impairment test for intangible assets? Explain.
- 2** **Q12-2.** Can firms group all property, plant, and equipment for purposes of performing an impairment test? Explain.
- 1 2 3 4** **Q12-3.** Does recognizing an impairment loss on a long-term operating asset have the same effect on the financial statements as recording depreciation expense and amortization expense? Explain.
- 2 3 4** **Q12-4.** Is an annual impairment test required for all long-term operating assets? Explain.
- 2 3 4** **Q12-5.** Do firms follow the same steps for impairment testing of finite- and indefinite-life intangible assets? Explain.
- 2 3 4** **Q12-6.** When measuring an impairment loss for a long-term operating asset, must firms determine the fair value using a discounted cash-flow model? Explain.
- 3** **Q12-7.** After recording an impairment of an indefinite-life operating asset, can a firm recover the impairment loss in subsequent accounting periods? Explain.
- 4** **Q12-8.** Are firms required to test goodwill acquired in a business combination for impairment on an annual basis? Explain.
- 5 6** **Q12-9.** Under IFRS, if a firm recovers an impairment loss on a long-term operating asset, does it report the asset at its current fair value? Explain.
- 5 6** **Q12-10.** Under IFRS, when do firms test plant assets and finite-life intangible assets for impairment?
- A** **Q12-11.** Under IFRS, when revaluing a plant asset to fair value, do firms include all gains and losses in net income? Explain.
- A** **Q12-12.** Under IFRS, when a firm sells a plant asset that it revalued to fair value, what is the gain or loss on the sale?

Multiple-Choice Questions

<p>In partnership with:</p> 	<p>Becker CPA Exam Review multiple-choice questions are available in MyLab Accounting.</p>
---	---

- 2** **MC12-1.** Sumrall Corporation owns machinery that was purchased 20 years ago. The machinery, which originally cost \$2,000,000, has been depreciated using the straight-line method using a 40-year useful life and no salvage value and has a current carrying amount of \$1,000,000 and a current fair value of \$800,000. Sumrall estimates that the machinery has a remaining useful life of 20 years and will provide net cash inflow of \$45,000 per year. Sumrall should record an impairment loss associated with the machinery of:
 - a. \$0 since there is no impairment
 - b. \$150,000
 - c. \$100,000
 - d. \$200,000

- 2 MC12-2.** On December 31, Year 1, Brown Brothers purchased machine A for \$770,000 and machine B for \$300,000. The machines are depreciated on the straight-line basis over 10 years with no salvage value. Brown reviews its assets for impairment annually. While doing the **U.S. GAAP** impairment analysis at year-end of Year 6, Brown determines that the expected future cash flows are \$70,000 per year from machine A and \$40,000 per year from machine B over the remaining lives of the assets. At December 31, Year 6, the fair values of machines A and B are \$300,000 and \$180,000, respectively. What amount of impairment loss should Brown report on its Year 6 income statement under **U.S. GAAP**?
- a. \$85,000 b. \$35,000 c. \$50,000 d. \$0
- 2 MC12-3.** On December 31, an entity analyzed a finite life trademark with a net carrying value of \$750,000 for impairment. The entity determined the following:
- | | |
|--------------------------------|-----------|
| Fair value | \$700,000 |
| Undiscounted future cash flows | \$740,000 |
- What is the impairment loss that will be reported on the December 31 income statement under **U.S. GAAP**?
- a. \$0 b. \$10,000 c. \$40,000 d. \$50,000
- 4 MC12-4.** On December 31, Star Corp. had a reporting unit that had a book value of \$950,000, including goodwill of \$130,000. As part of the company's annual review of goodwill impairment, Star determined that the fair value of the reporting unit was \$890,000. Star assigned \$840,000 of the reporting unit's fair value to its assets and liabilities other than goodwill. What is the goodwill impairment loss to be reported on December 31 under **U.S. GAAP**?
- a. \$50,000 b. \$60,000 c. \$80,000 d. \$110,000
- 5 MC12-5.** Sumrall Corporation owns machinery that was purchased 20 years ago. The machinery, which originally cost \$2,000,000, has been depreciated using the straight-line method using a 40-year useful life and no salvage value and has a current carrying amount of \$1,000,000 and a current fair value of \$800,000. Sumrall estimates that it would incur selling costs of \$10,000 if it sold the machine and that the present value of the future cash flows from the machine is \$820,000. Under **IFRS**, Sumrall should record an impairment loss associated with the machinery of:
- a. \$0 b. \$180,000 c. \$200,000 d. \$210,000
- 5 MC12-6.** On December 31, an entity analyzed a finite life trademark with a net carrying value of \$750,000 for impairment. The entity determined the following:
- | | |
|------------------------------------|------------|
| Fair value (less costs to sell) | \$ 700,000 |
| Present value of future cash flows | 710,000 |
- What is the impairment loss that will be reported on the December 31 income statement under **IFRS**?
- a. \$0 b. \$10,000 c. \$40,000 d. \$50,000

Brief Exercises

- 2 BE12-1. Tangible Asset Groups.** Almonzo's Flower Box, Inc. operates a floral delivery service. The company has three delivery trucks. It recently signed a contract to make deliveries for two local florists. The delivery route for one of the florists has been unprofitable. Are the three trucks considered an asset group for purposes of conducting an impairment test? Assume that all three trucks are used for both florists.
- 2 BE12-2. Tangible Asset Impairment.** Fillepeel Manufacturing, Inc. has only one plant asset used in production. The asset had a cost of \$500,000 and has been depreciated for 2 full years since the date of acquisition. This accounting resulted in a total accumulated depreciation of \$200,000. The firm expects the asset to be productive for an additional 3 years and projects the asset's future cash flows to be \$120,000 per year. Information about the company's products indicates that the asset might be impaired. Should the firm record an impairment loss for the current year? (Provide supporting computations.)
- 2 BE12-3. Tangible Asset Impairment.** Tank Top Menswear, Ltd. reported net plant and equipment of \$1,600,000. These assets cost \$2,500,000 with accumulated depreciation taken to date of \$900,000. Based on recently assessed negative evidence, Tank Top's management concluded that its plant assets might be impaired. Tank Top estimates total expected future cash flows from the use of the assets as only \$1,300,000 and appraises the fair value of the assets at \$1,000,000. Are the company's assets impaired? If there is an impairment loss, prepare the journal entry necessary to record the impairment.
- 2 BE12-4. Finite-Life Intangible Asset Impairment.** Fredrick Wilson Company determined that one of its finite-life intangible assets is impaired. The asset's net carrying value on the date of the impairment is \$905,000. Fredrick Wilson does not use a separate accumulated amortization account. In order to estimate fair value,

Fredrick Wilson must use the discounted cash-flow model. The company projected the asset's future cash flows as follows.

Future Period	Cash-Flow Projection
Year 1	\$400,000
Year 2	250,000
Year 3	140,000
Year 4	60,000
Total	<u>\$850,000</u>

Assuming a discount rate of 8%, prepare the journal entry to record the impairment loss (show all supporting computations).

- 3 **BE12-5. Indefinite-Life Intangible Asset Impairment.** Genius Auto Malls recently conducted its annual impairment review of the value of its trademark (an indefinite-life intangible asset), which it currently carries at \$2,500,000. Evidence indicates that the trademark may be impaired. Genius estimates the future cash flows related to the trademark for the next 5 years as follows:

Future Period	Cash-Flow Projection
Year 1	\$ 800,000
Year 2	700,000
Year 3	460,000
Year 4	140,000
Year 5	100,000
Total	<u>\$2,200,000</u>

The company estimates that the fair value of the trademark is \$1,700,000. Determine whether the trademark is impaired. If so, what is the amount of the impairment loss?

- 4 **BE12-6. Goodwill Impairment.** Events and circumstances indicate the need for Lenny Schaeffer Bakeries to undertake quantitative testing of goodwill. The current carrying value of the reported goodwill for the reporting unit is \$800,000. The goodwill pertains to the reporting unit. The book value of the net assets of the reporting unit, excluding goodwill, is equal to \$1,200,000. The fair value of the reporting unit including goodwill is \$2,200,000. Determine whether Schaeffer's goodwill is impaired.
- 4 **BE12-7. Goodwill Impairment.** Local Craft Designs, Inc. reported goodwill at \$600,000 related to its Central Avenue Division. The fair value of Central Avenue is \$2,500,000. The carrying value of Central Avenue's net assets, excluding goodwill, is reported at \$2,100,000 and appraised at \$2,310,000. Determine whether goodwill is impaired and prepare any journal entry necessary to record the impairment loss.
- 5 **BE12-8. Tangible Asset Groups, IFRS.** Almonzo's Flower Box, Inc., an IFRS reporter, operates a floral delivery service. The company has three delivery trucks. It recently signed a contract to make deliveries for two local florists. The delivery route for one of the florists has been unprofitable. Should it consider the three trucks an asset group for purposes of conducting an impairment test? Assume all three trucks are used for both florists.
- 5 **BE12-9. Tangible Asset Impairment, IFRS.** Fillepeel Manufacturing, Inc., an IFRS reporter, has only one plant asset used in production. The asset had a cost of \$500,000 and was depreciated for 2 full years since the date of acquisition. This accounting resulted in a total accumulated depreciation of \$200,000. The firm expects the asset to be productive for an additional 3 years. The asset's value in use is \$223,000, and its fair value less costs to sell is \$309,000. Information about the company's products indicates that the asset might be impaired. Should the firm record an impairment loss for the current year? (Provide supporting computations.)
- 5 **BE12-10. Tangible Asset Impairment, IFRS.** Tank Top Menswear, Ltd., an IFRS reporter, reported net plant and equipment of \$1,600,000. These assets cost \$2,500,000 with accumulated depreciation taken to date of \$900,000. Based on recently assessed negative evidence, Tank Top's management concluded that its plant assets might be impaired. Tank Top estimates that the value in use is \$1,087,000, based on discounted expected future cash flows from the use of the assets. The fair value of the assets less costs to sell is \$1,000,000. Are the company's assets impaired? If there is an impairment loss, prepare the journal entry necessary to record the impairment.
- 5 **BE12-11. Impairment Reversal, IFRS.** Perlu Products, an IFRS reporter, reported an impairment loss of \$65,000 for one of its plant assets on December 31, 2018. At December 31, 2019, the asset's recoverable amount increased by \$90,000. The current carrying value is \$100,000 less than it would have been if the asset had not been impaired. The recoverable amount does not exceed the original carrying value net of accumulated depreciation as if the asset was not impaired. Can Perlu record a recovery? Prepare the journal entry to record the recovery if it is permitted.

- 5 BE12-12. Finite-Life Intangible Asset Impairment, IFRS.** Fredrick Wilson Company, an IFRS reporter, determined that one of its finite-life intangible assets is impaired. The asset's net carrying value on the date of the impairment is \$905,000. Fredrick Wilson does not use a separate accumulated amortization account. To measure the impairment loss, the company projected the asset's future cash flows as follows:

Future Period	Cash-Flow Projection
Year 1	\$400,000
Year 2	250,000
Year 3	140,000
Year 4	60,000
Total	<u>\$850,000</u>

The selling price in the market, less costs to sell, for similar assets is \$720,000.

Assuming a discount rate of 8%, prepare the journal entry to record the impairment loss (show all supporting computations).

- 6 BE12-13. Indefinite-Life Intangible Asset Impairment, IFRS.** Genius Auto Malls, an IFRS reporter, recently conducted its annual impairment review of the value of its trademark (an indefinite-life intangible), which it currently carries at \$2,500,000. Evidence exists that the trademark may be impaired. Genius estimates the future cash flows related to the trademark for the next 5 years as follows:

Future Period	Cash-Flow Projection
Year 1	\$ 800,000
Year 2	700,000
Year 3	460,000
Year 4	140,000
Year 5	100,000
Total	<u>\$2,200,000</u>
Present value of cash flows	<u>\$1,987,722</u>

The company estimated that the fair value less costs to sell the trademark is \$1,700,000. Determine whether the trademark is impaired. If so, what is the amount of the impairment loss?

- 6 BE12-14. Goodwill Impairment, IFRS.** Lenny Schaeffer Bakeries, an IFRS reporter, is required to test goodwill for impairment each year. The current carrying value of its reported goodwill is \$800,000. The goodwill pertains to the cash-generating unit. The book value of the net assets of the cash-generating unit, excluding goodwill, is equal to \$1,200,000. The fair value of the cash-generating unit (less costs to sell) is \$2,200,000. Its value in use is \$2,150,000. Determine whether Schaeffer's goodwill is impaired.
- 6 BE12-15. Goodwill Impairment, IFRS.** Local Craft Designs, Inc., an IFRS reporter, reported goodwill at \$600,000 related to its Central Avenue Division. The fair value less costs to sell Central Avenue is \$2,500,000. Its value in use is \$2,550,000. The firm reports Central Avenue's carrying value of the net assets, excluding goodwill, at \$2,100,000. Determine whether goodwill is impaired and prepare any journal entry necessary to record the impairment loss.
- 7 BE12-16. Tangible Asset Impairment, Disclosure.** Airwave Corporation was required to write down one of its plant assets by \$1,650,000 on December 31 of the current year because the asset's technology has been rendered obsolete. It estimated the fair value of the asset using a discounted cash-flow model. It projected future cash flows for the next 5 years and used a 9% cost of capital for this purpose. Prepare the footnote disclosure for the impairment loss.
- 7 BE12-17. Tangible Asset Impairment, Disclosure, IFRS.** Airwave Corporation, an IFRS reporter, was required to write down one of its plant assets by \$1,650,000 on December 31 of the current year because the asset's technology was rendered obsolete. It used a discounted cash-flow model to estimate the asset's value in use. It projected future cash flows for the next 5 years and used a 9% cost of capital for this purpose. The value in use was greater than the estimated fair value less selling costs. Prepare the footnote disclosure for the impairment loss.
- 8 BE12-18. Tangible Asset Held for Disposal.** Perlu Products reported a write-down loss of \$65,000 for one of its plant assets on December 31, 2018. The asset is currently held for disposal. At December 31, 2019, the fair value of the asset increased by \$90,000. Can Perlu record a recovery? Prepare the journal entry to record the recovery if it is permitted.
- 8 BE12-19. Tangible Asset Held for Disposal, IFRS.** Perlu Products, an IFRS reporter, reported a write-down loss of \$65,000 for one of its plant assets on December 31, 2018. The asset is currently held for disposal. At December 31, 2019, the fair value of the asset increased by \$90,000. Can Perlu record a recovery? Prepare the journal entry to record the recovery if it is permitted.

- A
BE12-20. Asset Revaluation, Upwards, IFRS. Esta Company, an IFRS reporter, has opted to revalue land. The land originally cost €2,000,000 on January 1. At the end of the year, the land is appraised at €2,200,000. Determine the amount of gain or loss on the asset revaluation and indicate where to report this information on the consolidated financial statements.
- A
BE12-21. Asset Revaluation, Downward, IFRS. Esta Company, an IFRS reporter, has opted to revalue land. The land originally cost €2,000,000 on January 1. At the end of the year, the land is appraised at €1,800,000. Determine the amount of gain or loss on the asset revaluation and indicate where to report this information on the consolidated financial statements.
- A
BE12-22. Sale of Revalued Assets, IFRS. Blanc Corporation sold a piece of land for \$620,000. The land originally cost \$450,000, but Blanc revalued it to \$600,000 last year.
 - a. What is the gain or loss on the sale?
 - b. What are the journal entries to record the sale?
- A
BE12-23. Sale of Revalued Assets, IFRS. Verde Corporation sold a piece of land for \$720,000. The land originally cost \$810,000, but 2 years ago Verde had revalued it to \$700,000. What is the gain or loss on the sale? What is the journal entry to record the sale?

Exercises

- 2
E12-1. Tangible Asset Impairment. Henne Optical Corporation reported the following information regarding long-term operating assets for its Lens Manufacturing Operations:

Description	Carrying Value	Estimated Fair Value
Factory building (used in several segments)	\$10,000,000	
Less: Accumulated depreciation	(4,500,000)	
Net book value	<u>\$ 5,500,000</u>	<u>\$ 8,900,000</u>
Land	<u>\$ 7,000,000</u>	<u>\$14,000,000</u>
Lens manufacturing equipment	\$ 2,100,000	
Less: Accumulated depreciation	(600,000)	
Net book value	<u>\$ 1,500,000</u>	<u>\$ 1,100,000</u>
Lens polishing equipment	\$ 3,000,000	
Less: Accumulated depreciation	(1,200,000)	
Net book value	<u>\$ 1,800,000</u>	<u>\$ 1,625,000</u>
General factory equipment (used in several segments)	\$ 6,500,000	
Less: Accumulated depreciation	(4,000,000)	
Net book value	<u>\$ 2,500,000</u>	<u>\$ 2,400,000</u>
Delivery trucks (used in several segments)	\$ 1,750,000	
Less: Accumulated depreciation	(300,000)	
Net book value	<u>\$ 1,450,000</u>	<u>\$ 1,125,000</u>
Total net fixed assets	<u>\$19,750,000</u>	

Recent advances in technology have rendered the company's lens manufacturing operations nearly obsolete. Management projects the following future cash flows for its lens manufacturing operations.

Future Period	Cash-Flow Projection
Year 1	\$1,200,000
Year 2	750,000
Year 3	400,000
Year 4	350,000
Year 5	300,000
Total	<u>\$3,000,000</u>

Required »

- Determine the asset group for purposes of impairment testing and justify your decision.
- Compute the impairment loss for the asset group identified in part (a) for the current year, if any.
- Prepare the journal entry to record the impairment loss, if needed.

2

E12-2. Tangible Asset Impairment Loss. Use the same information from E12-1 except now assume the following cash-flow projections:

Future Period	Cash-Flow Projection
Year 1	\$1,450,000
Year 2	850,000
Year 3	400,000
Year 4	400,000
Year 5	<u>250,000</u>
Total	<u>\$3,350,000</u>

Required »

- Compute the impairment loss for the current year, if any.
- Prepare the journal entry to record the impairment loss, if needed.

2

E12-3. Tangible Asset Impairment. Derrick's Domino Manufacturing Company learned that one of its cutting machines is obsolete. Although the company will continue to use this machinery in the future, management believes that an impairment write-down is required. The following information relates to the cutting machine:

Description	Cutting Machine
Cost	\$3,200,000
Accumulated depreciation (up to the date of the impairment test)	\$1,280,000
Total estimated future cash flows	\$1,225,000
Total discounted future cash flows	\$1,060,000
Estimated fair value	\$1,050,000
Costs to sell	\$ 4,000
Remaining useful life from the impairment date	6 years

The firm estimates that the machine has a useful life of 10 years and it has used it for 4 years. It has no salvage value.

Required »

- Prepare the journal entry required to record the impairment loss.
- Assuming that Derrick's uses the straight-line method with no residual value, prepare the journal entry to record the revised depreciation expense for the first year immediately following the impairment.
- Assume that 2 years following the impairment write-down, the fair value of the asset falls to \$725,000. The sum of the undiscounted future cash flows is \$745,000. What is the carrying value of the asset at this time? Prepare any journal entry necessary to reflect the change in fair value.

2 3

E12-4. Finite-Life and Indefinite-Life Intangible Assets Impairment. SMC Research Associates reports the following intangible assets on its December 31 balance sheet:

Intangible Asset	Net Carrying Value	Remaining Life
Franchise	\$ 850,000	5 years
Patent	400,000	3 years
Trade name	<u>3,950,000</u>	N / A
Total	<u>\$5,200,000</u>	

It does not use a separate accumulated amortization account for the intangible assets (i.e., it deducts the amount of amortization directly from the intangible asset account).

Management provided the following information related to intangible assets it obtained during the current year:

- Franchise. Due to current market conditions, products sold under the franchise have experienced significant sales declines from possible obsolescence.
- Patent. SMC is currently involved in litigation that will determine whether the company has the exclusive right to sell the patented product. Legal counsel informed SMC that the value of the patent will likely be reduced.
- Trade name. The company is required to test for impairment of its indefinite-life intangible assets annually.

SMC's cost of capital is 6%. Management estimates the following future cash flows to be generated over the next 5 years from the use of its intangible assets:

Future Period	Franchise	Patent	Trade Name
Year 1	\$300,000	\$280,000	\$ 800,000
Year 2	220,000	90,000	610,000
Year 3	110,000	10,000	590,000
Year 4	45,000	0	510,000
Year 5	25,000	0	365,000
Total	<u>\$700,000</u>	<u>\$380,000</u>	<u>\$2,875,000</u>

Required »

- Compute the impairment loss (if any) for each intangible asset.
- Prepare the journal entry necessary to record the impairment loss.
- Assuming that SMC amortizes its finite-life intangible assets using the straight-line method with no scrap value, prepare the journal entry to record the annual amortization for the first year subsequent to the impairment write-down.

4

E12-5. Goodwill Impairment. Brigatti Company pays \$1,560,000 to acquire 100% of the common stock of Cornish Incorporated. It assumes that Cornish's plant assets (such as the factory building and land) are undervalued by \$40,000. The historical cost of the net assets acquired, excluding goodwill, is equal to \$1,500,000. Cornish will be held as a division of Brigatti. The following information is available 1 year after the acquisition of the subsidiary company (i.e., the reporting unit):

Description	Debit	Credit
Cash	\$ 200,000	
Inventory	300,000	
Property, plant, and equipment, net	1,500,000	
Goodwill	20,000	
Current liabilities		\$ 400,000
Common stock – no par		340,000
Retained earnings		1,280,000
Totals	<u>\$2,020,000</u>	<u>\$2,020,000</u>

Brigatti estimated the fair (appraisal) value of the division's net assets (excluding goodwill) 1 year after the date of acquisition at \$1,605,000.

Required »

- Compute goodwill recorded on the date of acquisition.
- Determine whether goodwill is impaired assuming that the fair value of the Cornish Division with goodwill 1 year after acquisition is equal to \$2,000,000. Provide the impairment journal entry, if needed.
- Determine whether goodwill is impaired assuming that the fair value of the Cornish Division with goodwill 1 year after acquisition is equal to \$1,608,000. Prepare the impairment journal entry, if needed.

5

E12-6. Tangible Asset Impairment Loss, IFRS. Use the same information from E12-1 but now assume that Henne Optical Corporation is an IFRS reporter. Henne Optical's discount rate is 5% and costs to sell any equipment are zero.

Required »

- Determine the asset group for purposes of impairment testing and justify your decision.
- Compute the impairment loss for the asset group identified in (a) for the current year, if any.
- Prepare the journal entry to record the impairment loss, if needed.

- 5** **E12-7. Tangible Asset Impairment, Potential Reversal, IFRS.** Use the same information from E12-3 but now assume that Derrick's Domino Manufacturing Company is an IFRS reporter.

Required »

- Prepare the journal entry required to record the impairment loss.
- Assuming that Derrick's uses the straight-line method with no residual value, prepare the journal entry to record the revised depreciation expense for the first year immediately following the impairment.
- Assume that 2 years following the impairment write-down, the fair value (less the costs to sell) and value in use of the asset falls to \$725,000. Prepare any journal entry necessary to reflect the change in fair value.

- 5** **E12-8. Finite- and Indefinite-Life Intangible Assets Impairment, IFRS.** Use the same information from E12-4 but now treat SMC Research Associates as an IFRS reporter.

Required »

- Compute the impairment loss (if any) for each intangible asset.
- Prepare the journal entry necessary to record the impairment loss.
- Assuming that SMC amortizes its finite-life intangible assets by using the straight-line method with no scrap value, prepare the journal entry to record the annual amortization for the first year subsequent to the impairment write-down.

- 6** **E12-9. Goodwill Impairment, IFRS.** Use the same information from E12-5 but now assume that Brigatti Company is an IFRS reporter and that Cornish Division is a cash-generating unit. Assume that costs to sell the unit are zero.

Required »

- Determine whether goodwill is impaired assuming that the fair value of the Cornish Division with goodwill 1 year after acquisition is equal to \$2,000,000 and its value in use 1 year after acquisition was \$1,712,000. Provide the impairment journal entry, if necessary.
- Determine whether goodwill is impaired assuming that the fair value of the Cornish Division with goodwill 1 year after acquisition is equal to \$1,608,000 and value in use 1 year after acquisition was \$1,612,000. Provide the impairment journal entry, if necessary.

- 8** **E12-10. Assets Held for Disposal.** Hattie Corporation recently decided to dispose of a significant portion of its plant assets. The assets to be held for disposal are summarized here:

Description	Machinery*	Equipment**
Cost	\$696,000	\$1,550,000
Accumulated depreciation	(348,000)	(620,000)
Net book value at year end	<u>\$348,000</u>	<u>\$ 930,000</u>

* Machinery is depreciated by the straight-line method, assuming a 6-year life with no scrap value. The asset was acquired 3 years ago.

** Equipment is depreciated by the straight-line method, assuming a 10-year life with no scrap value. The asset was acquired 4 years ago.

At the time the decision was made to dispose of the assets, the book values of the assets approximated their fair values. Assume that costs to sell the assets are zero. When the assets were held for disposal, the following changes in fair value occurred:

Subsequent Year	Machinery	Equipment
End of Year 1 fair value	\$200,000	\$900,000
End of Year 2 fair value	\$215,000	950,000

Prepare any journal entries necessary to account for the changes in fair value for Years 1 and 2.

- A** **E12-11. Asset Revaluation, Upwards, IFRS.** Sousa Company revalues equipment with a carrying value of €1,100,000 to its fair value of €1,400,000. The original cost of the equipment is €1,600,000 and accumulated depreciation is €500,000.

Required »

- What is the revaluation surplus or unrealized loss?
- Where does the firm report the revaluation surplus or unrealized loss in the financial statements?
- Provide the journal entries to record the revaluation (assume that Sousa eliminates all prior accumulated depreciation and adjusts the historical cost to fair value)

A

E12-12. Asset Revaluation, Downwards, IFRS. Lousa Company revalues its equipment with a carrying value of €1,100,000 to its fair value of €950,000. The original cost of the equipment is €1,500,000 and accumulated depreciation is €400,000.

Required »

- What is the revaluation surplus or unrealized loss?
- Where does the firm report the revaluation surplus or unrealized loss in the financial statements?
- Provide the journal entries to record the revaluation (assume that Lousa eliminates all prior accumulated depreciation and adjusts the historical cost to fair value).

Problems

2

P12-1. Tangible Asset Impairment. Chrispian Cookies, Inc. is reviewing all available information regarding the future use of its baking equipment, which it intends to use for the foreseeable future. The information indicates that this equipment may be obsolete and could be impaired. Chrispian acquired the equipment 3 years ago at a cost of \$9,000,000 and depreciated it using the straight-line method with an estimated residual value of \$1,800,000 and an 8-year useful life. At the end of the third year, management estimates the following cash flows from the use of the asset:

Future Period	Cash-Flow Projection
Year 1	\$ 1,800,000
Year 2	1,600,000
Year 3	980,000
Year 4	890,000
Year 5	730,000
Total	<u>\$6,000,000</u>

The asset is highly specialized and is not traded in an active market. As a result, the fair value of the asset must be estimated. Chrispian’s cost of capital is 6%.

Required »

- Conduct an impairment test for Chrispian’s baking equipment.
- Prepare the journal entry to record any impairment loss indicated.
- Compute the amount of the revised depreciation expense at the end of the next year. Assume that management now estimates that there will be no residual value at the end of the asset’s life.
- The estimated fair value at the end of the next year is \$4,400,000. The sum of the undiscounted future cash flows exceeds the asset’s carrying value. Compare the carrying value of the asset to its fair value. Explain how to treat the difference between the asset’s carrying value and fair value.

2

P12-2. Tangible Asset Impairment. Cupcakes-R-Us, Inc. is reviewing all available information regarding the future use of its baking equipment, which it intends to use for the foreseeable future. The company has observed a decline in the demand for its products. The information also indicates that this equipment may be obsolete and could be impaired. Cupcakes-R-Us acquired the equipment 2 years ago at a cost of \$500,000 and depreciated it using the straight-line method with an estimated residual value of \$10,000 and a 7-year useful life. At the end of the second year, management estimates the following cash flows from the use of the asset:

Future Period	Cash-Flow Projection—	
	Estimate 1	Estimate 2
Year 1	\$120,000	\$ 120,000
Year 2	100,000	100,000
Year 3	70,000	80,000
Year 4	35,000	35,000
Year 5	30,000	30,000
Total	<u>\$355,000</u>	<u>\$365,000</u>

Required »

- Compute the carrying value of Cupcakes-R-Us’s equipment.
- Compute the present value of expected cash flows under Estimate 1 and Estimate 2. Assume that the cost of capital is 8%. For each estimate, is the present value of estimated future cash flows higher or lower than the equipment’s carrying value?
- Conduct the impairment tests for Cupcakes-R-Us under Estimate 1 and Estimate 2. If required, prepare the journal entry to record any impairment loss.

- 2** **P12-3. Tangible Asset Impairment.** Using the same information from P12-2, assume that Cupcakes-R-Us determines that the likelihood of the expected future cash flows under Estimate 1 is 70% and 30% under Estimate 2.

Required »

- Compute the carrying value of Cupcakes-R-Us's equipment.
- Compute the expected cash flows given the likelihood of Estimate 1 and Estimate 2. What is the present value of the expected cash flows?
- Conduct the impairment tests for Cupcakes-R-Us using the results from part (b). If required, prepare the journal entry to record any impairment loss.

- 2 3** **P12-4. Finite- and Indefinite-Life Intangible Assets Impairment.** PCG, Ltd. is in the process of assessing the valuation of its intangible assets. At the end of the current year, management reported the following intangible assets:

Description	Trademark	Franchise	Permit
Cost	\$600,000	\$530,000	\$180,000
Accumulated amortization	(0)	(212,000)	(0)
Net book value at year-end	<u>\$600,000</u>	<u>\$318,000</u>	<u>\$180,000</u>

The firm acquired the franchise 2 years ago and estimates that it has a 5-year useful life with no residual value. PCG uses the straight-line depreciation method. The permit is renewable every three years for an indefinite period of time. PCG management is concerned about the value of its franchise. The products sold under the franchise agreement have been experiencing sales declines over the past 2 years, prompting the company to test for impairment. It classifies the trademark and the renewable permit as indefinite-life intangible assets and must test for impairment on an annual basis. Management is unable to determine fair values from the market for the intangibles but provides the following cash-flow projections related to each of its intangible assets:

Future Period	Trademark	Franchise	Permit
Year 1	\$300,000	\$200,000	\$ 60,000
Year 2	260,000	80,000	43,000
Year 3	150,000	20,000	32,000
Year 4	40,000	0	29,000
Year 5	<u>20,000</u>	<u>0</u>	<u>18,000</u>
Total	<u>\$770,000</u>	<u>\$300,000</u>	<u>\$182,000</u>

The company's cost of capital is 5%.

Required »

- Conduct an impairment test for PCG's intangible assets.
- Prepare the journal entries required to record the impairment loss, if any.
- Compute the amount of the annual amortization for the franchise for years subsequent to the impairment test.

- 2 3 4** **P12-5. Goodwill Impairment, Tangible Fixed Assets, and Finite-Life Intangible Assets' Impairments.** Green River Company acquired 100% of the voting stock of the AutoStyle Group on January 1 of the current year for a total acquisition cost of \$250,000. The trial balance of AutoStyle on the date of acquisition follows.

Description	Debit	Credit
Investment securities – held to maturity	\$ 30,000	
Plant and equipment – net	195,000	
Intangible assets – net	70,000	
Long-term debt		\$ 115,000
Contributed capital		60,000
Retained earnings		<u>120,000</u>
Totals	<u>\$295,000</u>	<u>\$295,000</u>

The AutoStyle Group acquired the intangible assets 3 years ago. It amortizes the assets using the straight-line method with no estimated residual value. The appraisal of the subsidiary's net assets on the date of acquisition indicated that the following adjustments were required:

Description	Book Value	Fair Value	Adjustment
Plant and equipment – net	\$195,000	\$210,000	\$15,000
Customer list	0	50,000	50,000
Long-term debt	(115,000)	(120,000)	(5,000)
Total net assets	<u>\$ 80,000</u>	<u>\$140,000</u>	<u>\$60,000</u>

On December 31 (1 year after the acquisition), Green River's management conducted its annual impairment test for goodwill. Management has also assessed recent events and determined that it should review its plant and equipment and finite-life intangible assets for possible impairment. Management determines AutoStyle to be the reporting unit, which is also the cash-generating unit. Management estimated that the fair value of the unit (AutoStyle) with goodwill 1 year after the acquisition was \$300,000; its value in use was \$310,000; and the costs to sell were \$20,000. The net assets of the unit, excluding goodwill, were appraised at \$294,000. Assume that annual depreciation is \$5,000, annual amortization for the customer list is \$1,000, and the annual amortization for the other intangible assets is \$3,500. Green River uses separate accounts for accumulated depreciation and accumulated amortization. Treat the customer list as a finite-life intangible asset.

Management is unable to determine fair values for the reporting unit's assets, but it estimates the following future cash flows for each of the unit's assets with the exception of goodwill. Assume that Green River's cost of capital is 5%.

Future Period	Plant and Equipment	Finite-Life Intangible Assets	Customer List
Year 1	\$ 51,500	\$11,000	\$16,800
Year 2	40,000	10,000	14,200
Year 3	20,500	8,900	10,600
Year 4	14,000	7,700	9,500
Year 5	0	6,500	8,800
Year 6	0	6,000	5,100
Year 7	0	3,900	3,000
Total	<u>\$126,000</u>	<u>\$54,000</u>	<u>\$68,000</u>

Required »

- Compute the amount of goodwill to be recorded on the date of acquisition.
- Conduct the impairment test for goodwill at the end of the year, 1 year after the acquisition. Assume no changes in the reporting unit's assets and liabilities except for depreciation and amortization.
- Conduct the impairment tests indicated for assets other than goodwill at the end of the year, 1 year after the acquisition.
- Prepare the journal entries required to record any impairment losses computed in parts (b) and (c).

5

P12-6. Tangible Asset Impairment, Potential Reversal, IFRS. Use the same information from P12-1 with three modifications:

- Chrispian Cookies, Inc. is an IFRS reporter.
- Similar baking equipment could be sold for \$5,100,000.
- Chrispian estimates that costs to sell the baking equipment are \$5,000.

Required »

- Conduct an impairment test for Chrispian's baking equipment.
- Prepare the journal entry to record any impairment loss indicated.
- Compute the amount of the revised depreciation expense at the end of the next year. Assume that management now estimates that there will be no residual value at the end of the asset's life.
- Prepare any journal entry necessary if the estimated fair value less costs to sell at the end of the next year is \$5,400,000 and its value in use is \$4,900,000.

- 5** **P12-7. Finite-Life and Indefinite-Life Intangible Assets Impairment, IFRS.** Peter Gordon, Ltd., an IFRS reporter, is in the process of assessing the valuation of its intangible assets. At the end of the current year, management reported the following intangible assets:

Description	Trademark	Franchise	Permit
Cost	\$600,000	\$530,000	\$180,000
Accumulated amortization	(0)	(212,000)	(0)
Net book value at year end	<u>\$600,000</u>	<u>\$318,000</u>	<u>\$180,000</u>

The firm acquired the franchise 2 years ago and estimates that it has a 5-year useful life with no residual value. The permit is renewable every 3 years for an indefinite period of time. Peter Gordon's management is concerned about the value of its franchise. Sales of the products sold under the franchise agreement have declined over the past 2 years, prompting the company to test for impairment. The firm classifies the trademark and the renewable permit as indefinite-life intangible assets and is required to test them for impairment on an annual basis. Management provides the following estimates related to each of its intangible assets:

	Trademark	Franchise	Permit
Fair value	\$560,000	\$290,000	\$181,000
Costs to sell	7,000	5,000	2,000
Fair value less costs to sell	553,000	285,000	179,000
Value in use	580,000	280,000	185,000

Required »

- Conduct an impairment test for Peter Gordon's intangible assets.
- Prepare the journal entries required to record the impairment loss, if any.
- Compute the amount of the annual amortization for the franchise for years subsequent to the impairment test.

- 5 6** **P12-8. Goodwill Impairment, Tangible and Finite-Life and Indefinite-Life Assets Impairments, IFRS.** Use the same information from P12-5 and the following additional information, now assuming that Green River Company is an IFRS reporter.

The following are estimates of current fair values less costs to sell:

	Plant and Equipment	Finite-Life Intangible Assets	Customer List
Current selling price (less costs to sell)	\$134,000	\$43,600	\$55,700

Required »

- Compute the amount of goodwill to be recorded on the date of acquisition.
- Conduct the impairment test for goodwill at the end of the year, 1 year after the acquisition. Assume no changes in the cash-generating unit's assets and liabilities during the year except for depreciation and amortization.
- Conduct the impairment tests indicated for assets other than goodwill at the end of the year, 1 year after the acquisition.
- Prepare the journal entries required to record any impairment losses computed in parts (b) and (c).

- A** **P12-9. Comprehensive Asset Revaluation Problem (Initial Upward Revaluation, Accumulated Depreciation Elimination Method), IFRS.** Hampton Plc. revalues equipment with a carrying value of £715,000 to its fair value of £750,000. The original cost of the equipment was £1,000,000. Hampton uses straight-line depreciation. The equipment has a 10-year useful life and scrap value of £50,000. Assume that Hampton eliminates all prior accumulated depreciation and adjusts the historical cost to fair value.

Required »

- What is the revaluation surplus or unrealized loss?
- Where does the firm report the revaluation surplus or unrealized loss in the financial statements?
- What are the journal entries to record the revaluation?
- What is the depreciation expense on the equipment after the revaluation?
- Hampton chooses to take any revaluation surplus to retained earnings over the equipment's remaining useful life. What is the amount of the surplus, if any, taken to retained earnings in the year following the revaluation?

- f. If Hampton sells the equipment at the end of the third year after revaluation for £405,000, what are the journal entries?
- g. Now assume Hampton holds the equipment at the beginning of the fourth year following revaluation and revalues the equipment again when its fair value is £380,000. What are the journal entries to record the revaluation? Where does the firm report the revaluation surplus or unrealized loss in the financial statements? Ignore part (f).

A

P12-10. Comprehensive Asset Revaluation Problem (Initial Downward Revaluation, Accumulated Depreciation Elimination Method), IFRS. Essex Plc. is revaluing equipment with a carrying value of £715,000 to its fair value of £673,000. The original cost of the equipment was £1,000,000. The equipment has a 10-year useful life and scrap value of £50,000. Essex uses straight-line depreciation. Assume that Essex eliminates all prior accumulated depreciation and adjusts the historical cost to fair value.

Required »

- What is the revaluation surplus or unrealized loss?
- Where does the firm report the revaluation surplus or unrealized loss in the financial statements?
- What are the journal entries to record the revaluation?
- What is the depreciation expense on the equipment after the revaluation?
- Essex chooses to take any revaluation surplus to retained earnings over the equipment's remaining useful life. What is the amount of the surplus, if any, taken to retained earnings in the year after revaluation?
- If Essex sells the equipment at the end of the third year after revaluation for £415,000, what is the journal entry?
- Now assume that Essex holds the equipment. At the beginning of the fourth year after revaluation, Essex revalues its equipment again when the fair value is £425,000. What are the journal entries to record the revaluation? Where does the firm report the revaluation surplus or unrealized loss in the financial statements? Ignore part (f).

A

P12-11. Sale of Revalued Property Plant and Equipment, IFRS. The Taurus Group sold a piece of equipment on December 30 of the current year for \$250,000 when the equipment's carrying value was \$290,000. Three years ago, the equipment had been revalued to \$500,000. At the time of the revaluation, Taurus eliminated all prior accumulated depreciation. It reports a revaluation surplus of \$22,000 related to the equipment in accumulated other comprehensive income. Prepare the journal entry required to record the sale of the asset.

CASES

Judgment Cases

Judgment Case 1: Impairments of PPE under IFRS

Refer to the information in Surfing the Standards Case 1 later in the chapter to answer the following questions.

- Prepare the calculation of the impairment loss.
- What items included in the case itself involved issues of judgment? (Include only those that are ultimately relevant in determining the impairment loss.)
- What judgments/decisions did you still need to make? Why did you make the particular decisions in your responses?

Judgment Case 2: Property, Plant and Equipment: Impairment¹⁶

Background

Toyda, Inc. (Toyda) is one of the world's leading car manufacturers. It sells cars exclusively in the United States. In recent years, Toyda has begun producing electric cars as well as specialized equipment that is used to charge electric cars. Management of Toyda had been very optimistic about this recent venture. For internal purposes, Toyda projected a growth rate of 40% for the electric car production and for the production of the

¹⁶Reprinted from the Ernst & Young Academic Resource Center with permission of the Ernst & Young Foundation.

specialized equipment. Management believes that these estimates were conservative. Currently, Toyda is the only U.S. carmaker that is producing electric cars.

In December 2015, a number of oil reserves were discovered in Alaska. These oil reserves are much more significant than any reserves that currently exist. U.S. consumers are euphoric over these discoveries. Accordingly, many automobile manufacturing companies and industry and government analysts believe that the demand for electric cars will decrease substantially.

While the CEO is exceedingly worried about this new turn of events, she is not really worried about the financial statements for the December 31, 2015 year-end. Because Toyda is still in the early stages of producing and selling electric cars, most of the company's current net income is attributable to traditional cars. The current consensus analyst forecast for net income per share is \$10.25, which equates to \$30.0 million of net income. Although Toyda has not yet finalized its financial statements for 2015, the draft income statement provided to the CEO on February 1, 2016, showed net income of \$35 million, an effective tax rate of 20%, and total assets of \$500.0 million. Toyda is audited annually.

The CFO at Toyda has been consulting with external valuation specialists since early December to determine if there is a need to impair one or both production facilities. Toyda is not considering a potential sale or an alternative use of its production facilities. The valuation specialists have extensive experience with the global automotive industry, including the electric car industry in Europe. The valuation specialists issued their report on February 3, 2016. The report included an analysis of expected growth rates based on available market data, industry trends, historical results, and other pertinent data. The report indicated that Toyda will be able to maintain its expected growth rates for two more years, until the newly discovered oil reserves are ready to begin production. Beginning in 2018, Toyda would expect growth rates between 15% and 19% for the specialized equipment facility and the car production facility. The valuation specialists anticipate that Toyda will be able to dispose of the production facility for electric cars in 20 years, with proceeds of \$500,000. Likewise, the production facility for the specialized equipment could be disposed of in 10 years with proceeds of \$10,000. The valuation specialists also believe that the highest and best use of the facility is its current use and an expected present value technique (i.e., expected cash flows) would be the most appropriate method to make a fair value determination. The CFO has been heavily involved in the preparation and review of the valuation specialists' report, and she believes it is a balanced and fair assessment.

The table below provides data on the two facilities.

Asset Group: Production Facilities	Carrying Value December 31, 2015	Remaining Life in Years	Actual Data					
			Operating Cash Flows			Operating Income		
			2013	2014	2015	2013	2014	2015
Electric cars	\$25,000,000	20	\$45,000	\$77,000	\$98,000	\$32,000	\$43,000	\$57,000
Electric car chargers	4,000,000	10	5,000	19,000	25,000	(8,000)	(15,000)	(12,000)

The following table provides the annual yield on the risk-free rate expected over the next 20 years obtained from the U.S. Department of the Treasury. The CFO has engaged in discussions with investment bankers to determine what the appropriate risk premium would be for these facilities (analyzed and supported based on market data available for comparable companies). Based on these discussions, she believes that a risk premium of 8% to 12% should be added to the risk-free rate to reflect a current discount rate.

Year	1	2	3	4	5	6	7	8	9	10	11	12	13	14	15	16	17	18	19	20
Yield (%)*	0.12	0.27	0.40	0.62	0.89	1.12	1.41	1.67	1.81	1.97	2.05	2.11	2.25	2.32	2.45	2.50	2.59	2.62	2.65	2.67

*This represents the annual yield to maturity for each time period. Thus, for example, an investment held for 10 years would yield a 1.97% return per year.

As the junior accountant, the CFO has asked you to provide her an analysis of the need for an impairment of the production facilities and the amount of impairment loss to be recorded, if any.

Required »

For December 31, 2015, using your judgment, perform an analysis of the need for an impairment of the production facilities and the amount of impairment loss to be recorded, if any. In performing your analysis, you should use an Excel spreadsheet to support any calculations. Document your judgment to provide to the

CFO (not to exceed three pages). Be sure to include specific references to the applicable guidance and quote the applicable guidance. Also attach your Excel spreadsheet with your calculations.

Judgment Case 3: Goodwill Impairment¹⁷

Background

AKS Company's common shares are publicly traded and it files with the SEC. AKS has a single reporting unit, which sells high-end consumer electronics. AKS has a March 31 fiscal year-end.

Fiscal 2021 data

On April 1, 2020, AKS acquired a competitor, BMN, for \$20.0 million. The purchase price was approximately 10 times BMN's projected fiscal 2022 income. After completing the purchase price allocation, the goodwill from this acquisition was recorded at \$10.0 million.

In compliance with ASC 350, AKS was required to perform a goodwill impairment test. The goodwill impairment test identifies potential impairment by comparing the fair value of a reporting unit with its carrying amount, including goodwill. AKS decided they would perform this test annually in January. The company determined that there was one reporting unit (AKS in total) at which the goodwill would be tested for impairment.

In January 2021, as directed by the CFO, the controller of AKS initiated the process to determine whether there was any impairment of the goodwill. Because this was a new process, the controller decided to hire a certified specialist in the valuation business to prepare the valuation. Below is information available regarding the valuation process:

- The valuation specialist used the income approach using a discounted cash flow model to derive the fair value.
- The weighted-average cost of capital (WACC) to AKS was 7%.
- Revenue growth attributed to BMN in the cash flow model was 10% in fiscal 2022 and 15% in fiscal 2023.
- Income projections prepared as part of the acquisition work indicated expected growth in AKS' consolidated income of 10%, to \$22.0 million, in fiscal 2022 and 15%, to \$25.3 million, in fiscal 2023 from BMN.
- Expenses other than for cost of goods sold were budgeted to remain flat for the next two years.

Based on the valuation, the fair value of the reporting unit exceeded its carrying amount by 20%. AKS concluded that based on this quantitative analysis; there was no goodwill impairment in fiscal 2021.

Fiscal 2022 data

In January 2017, ASU 2017-04, *Intangibles – Goodwill and Other (Topic 350) – Simplifying the Test for Goodwill Impairment*, was issued. This ASU was issued in response to concerns about the cost and complexity of performing the two step goodwill impairment test. Topic 350 still provides management the option to first assess qualitative factors to make a determination of whether it is more likely than not that the fair value of a reporting unit is less than its carrying amount. If, after a full qualitative assessment, an entity determines it is more likely than not that the fair value of a reporting unit is more than its carrying amount, then performing the quantitative assessment is unnecessary.

In January 2022, you have assumed the role of the controller. You are now responsible for performing the annual impairment testing for goodwill. The CFO believes that there is no impairment issue given that a valuation was just performed in the prior year, which indicated a fair value 20% over carrying value and also because the fiscal results for 2022 have remained stable so far. He has advised you to take advantage of the option to use the qualitative approach in an effort to eliminate the \$100,000 appraisal fee incurred in the prior year. The CFO believes this approach will be simple and should reduce the accounting department's workload.

You had discussions with the AKS executive team early this month and have gained the following insights:

- The BMN acquisition has been successful and there are no intentions to sell any portion of the business. The BMN management team remains intact and is still operating under a non-compete agreement for another year. The executive team for AKS is also expected to remain consistent.
- The price of AKS' stock has been stable this year and is not expected to change significantly in the fourth quarter. The stock prices of AKS' public competitors have also been fairly stable.

¹⁷Reprinted from the Ernst & Young Academic Resource Center with permission of the Ernst & Young Foundation.

At December 31, 2021, AKS had total assets of \$100 million and net equity of \$10.0 million. The following additional financial information is based on actual results for the first three quarters of fiscal 2022, ended December 31, 2021, and projected results for the fourth quarter ended March 31, 2022. Auditors of AKS have performed reviews of quarterly results to date for fiscal 2022. There have been no restatements.

- Revenues are projected to increase by 18%. This increase is primarily driven by the acquisition of BMN (approximately 11% of the increase); the addition of three large customers, which were taken away from competitors (approximately 5% of the increase); and the balance is the result of increased demand for AKS' products.
- The demand for AKS' products was very strong in the first six months. During the second half of the year, the economy softened and the demand for AKS' products began to drop. The forecasted decrease in units sold for the last six months is estimated to be 3% to 4%.
- In the fourth quarter, AKS began offering pricing concessions to maintain sales. The price concessions offered so far in the fourth quarter have been in the range of 2% to 3%, and have helped mitigate the decline in units sold.
- Income for the year is forecasted to be \$24.0 million.
- The WACC for AKS is expected to remain at 7%.
- Expenses other than for cost of goods sold increased by 1%.
- The S&P 500 index has dropped 5% since the prior year. The S&P index for public companies within AKS' industry are down on average 1%.

Required »

- a. For fiscal 2022, perform the qualitative assessment.
- b. Document your judgment related to the qualitative assessment in a draft memorandum format that you will provide to the CFO (not to exceed three pages). Be sure to include specific references and quotes to applicable guidance.

Financial Statement Analysis Case

Financial Statement Analysis Case 1: Long-Lived Asset Impairments

BlackBerry Limited, the smartphone manufacturer, reported a \$2,748 million impairment loss on its income statement during the year ended March 1, 2014. You are interested in further examining this and any other impairment losses at **BlackBerry** and have identified the financial statement excerpts on the following pages to further analyze. Refer to these financial statements excerpts and Exhibit 12.2 in the text to answer the following questions:

Required »

- a. What types of long-lived assets does **BlackBerry** report? What is the dollar amount and percent change in total and by each type of long-lived asset from March 2, 2013, to March 1, 2014? What are long-lived assets in total and by type as a percent of total assets at March 1, 2014, and March 2, 2013?
- b. What is the total amount of impairment losses **BlackBerry** reported in the years ended March 1, 2014, March 2, 2013, and March 3, 2012? To what types of assets do the impairment losses relate?
- c. What is the amount of impairment losses on intangible assets that **BlackBerry** reported for the years ended March 1, 2014, March 2, 2013, and March 3, 2012? To what type of intangible asset do the losses relate?
- d. Compute the percent change in operating income for all years. What would the percent change in operating income be excluding the impairment losses? Comment on how the inclusion or exclusion of impairment losses affects the percentage change in operating income and the trend in operating income.

5. Consolidated Balance Sheets Details

Impairment of long-lived assets

During fiscal 2014, the Company recorded the LLA Impairment Charge of approximately \$2.7 billion, of which \$852 million of the charge was applicable to property, plant, and equipment and \$1.9 billion was applicable to intangible assets.

Intangible assets, net

Intangible assets were comprised of the following:

	At March 1, 2014		
	Cost	Accumulated Amortization	Net Book Value
Acquired technology	\$ 387	\$ 284	\$ 103
Intellectual property	2,176	855	1,321
	<u>\$2,563</u>	<u>\$1,139</u>	<u>\$1,424</u>
	At March 2, 2013		
	Cost	Accumulated Amortization	Net Book Value
Acquired technology	\$ 432	\$ 257	\$ 175
Intellectual property	4,382	1,127	3,255
	<u>\$4,814</u>	<u>\$1,384</u>	<u>\$3,430</u>

During fiscal 2014, the additions to intangible assets primarily consisted of payments relating to amended or renewed licensing agreements, as well as agreements with third parties for the use of intellectual property, software, messaging services and other BlackBerry related features.

Surfing the Standards Cases

Surfing the Standards Case 1: Impairments of PPE under IFRS

A&N, Inc. is a manufacturer and retailer of specialized office equipment. It currently operates in two countries, both of which follow IFRS for their financial reporting. For the sake of simplicity, assume that both countries have the same currency, the dollar. During its annual impairment assessment of PPE, A&N determined that one of its factories presents with various impairment indicators. Facts related to this factory follow:

1. The estimated future life of the factory is 20 to 25 years, and it has a current carrying value of \$1,200,000.
2. A&N has no sales agreement for the factory, nor does an active market exist. It did sell a similar factory several years ago in another country for \$1,000,000. The costs to sell the factory were \$67,000.
3. A&N has a similar factory in the other country in which it currently operates. Due to differences in the market for their products in the two countries, the cash flow streams will not be similar.
4. The table on the next page presents the projected cash inflows for the factory based on the most recent budgets approved by management.
5. Although management can demonstrate that its short-term projects tend to be reasonably accurate, there is some uncertainty as to the projected cash flows. Management assesses that there is a range on either side of the projected cash inflows: The cash inflows could be as much as 10% lower than projected or 5% greater than projected. While the most likely amount is included in the following schedule presented, the probabilities associated with each amount are unknown.
6. The table on the next page also presents the total projected cash outflows for overhead as well as specific projected outflows for maintenance of the factory. Generally, 25% of overhead is allocable to the use of the factory.
7. The increase in projected cash inflows in Year 4 is related to a planned overhaul of the factory. The estimated cash outflow for the overhaul is \$50,000 (which is included in the table's Other Projected Cash Outflows column). The anticipated increase in cash inflow is \$10,000 a year.
8. The cash-flow amounts presented are net of the corporate tax rate of 20%.
9. A&N anticipates a steady long-term growth rate of 3%. Its historical growth rate has been 0.5%.
10. Management anticipates that it will ultimately sell the factory for \$1,000,000 because that is the amount of the last factory sale and that disposal costs will be similar to those incurred for the last sale. Because this anticipated sale is far off in time, the confidence range on this transaction is 50% less and 25%

greater than these estimates. Although management finds it 60% likely that it will obtain the sales price of \$1,000,000 (and disposal costs of \$67,000), the firm believes that the bottom of the range and the top of the range are each 20% likely.

11. All cash flows are presented in nominal terms as opposed to real terms.
12. A&N's pre-tax weighted cost of capital is currently 8%. Management expects this amount to increase in Year 4 to 9% due to a change in the term structure of interest rates. These rates include an expectation for general inflation.
13. The operations in the particular country in which this factory is located are a bit riskier due to political unrest than in the other country in which A&N operates. Management believes that this increased risk would translate into a 1% increase in the appropriate discount rate for the factory itself.

Read IAS 36, *Impairment of Assets*, paragraphs 18 through 57 as well as paragraphs A1 through A21 in its Appendix A. Provide answers to the following questions based upon this reading.

1. Because the determination of the amount of the impairment loss involves the use of the fair value (net of disposal costs), does A&N have to use the \$933,000 net selling price of its other factory to approximate the fair value less disposal costs even though this number may not be very solid?
2. What adjustments does management need to make to the projected cash inflows presented in the following table in order to reflect projected cash inflows that are consistent with the requirements in IAS 36 for determining value in use?
3. What adjustment does management need to make to the projected cash outflows presented in the following table in order to reflect projected cash outflows that are consistent with the requirement in IAS 36 for determining value in use?
4. How should A&N include the expectations about the anticipated sale of the factory in the computation of value in use?
5. What discount rate should A&N use to compute value in use?

Original Projections by Management

Year	Projected Cash Inflows	Total Projected Overhead	Other Projected Cash Outflows	Total Cash Outflows
1	\$70,000	\$8,000	\$2,500	\$10,500
2	\$73,000	\$8,040	\$2,500	\$10,540
3	\$72,000	\$8,080	\$2,500	\$10,580

22	\$138,839	\$8,883	\$2,500	\$11,383
23	\$143,004	\$8,928	\$2,500	\$11,428
24	\$147,295	\$8,972	\$2,500	\$11,472
25	\$151,713	\$9,017	\$2,500	\$11,517

Surfing the Standards Case 2: Goodwill Impairment in Private Companies

Kraker, Inc. is a calendar-year private company that is not required to register with the SEC. It operates five different restaurant chains, two of which are fast-food chains and three of which provide higher-end dining experiences. On January 2, 2017, Kraker engaged in a business combination that resulted in its recording goodwill of \$1 million. At that time, Kraker made the accounting policy elective provided in ASC 350-20-15-4 to utilize the accounting alternative. Kraker also elected to test for goodwill impairment at the entity level and estimated the useful life of the goodwill to be 10 years. Kraker does not utilize the option to do a qualitative assessment of goodwill as part of its impairment testing.

During 2019, there was a general downturn in the economy. Although the downturn did not have a significant effect on the fast-food chains, the revenues, net income, and cash flows from the three higher-end chains have declined dramatically. Thus, the financial performance of the firm as a whole has experienced a significant downturn.

The carrying value of the net assets of Kraker, excluding goodwill, is \$15 million as of December 31, 2019. The fair value of the entity (including goodwill) is \$14.8 million as of December 31, 2019.

Prepare a memo to the file related to Kraker's goodwill as of December 31, 2019. Use the Codification for support.

Basis for Conclusions Cases

Basis for Conclusions Case 1: Property, Plant, and Equipment Subsequent Measurement

Consider the Basis for Conclusions in IAS 16, Property, Plant and Equipment (particularly paragraph BC25) as well as the legacy U.K. standard on tangible fixed assets Financial Reporting Standard (FRS) 15 (particularly Appendix IV, paragraphs 17 and 29 through 34).

Both **IFRS** and legacy **U.K. GAAP** allow firms to revalue PPE, whereas **U.S. GAAP** does not.

Required »

- Does either the discussion in IAS 16 or in FRS 15 provide any insight as to why PPE revaluations were/are allowed?
- Why, according to FRS 15, are upward revaluations treated differently than downward revaluations with respect to where firms report the unrealized gains and losses in the financial statements?

Basis for Conclusions Case 2: Intangible Assets – Subsequent Measurement

Under certain circumstances, **IFRS** allows some intangible assets to be revalued, whereas **U.S. GAAP** does not allow revaluation. Read the Basis for Conclusions in IAS 38, *Intangible Assets*, particularly paragraphs BC76 and BC77. Does the IASB provide any insight as to why it decided to allow the revaluation of some intangible assets?

Basis for Conclusions Case 3: Goodwill Impairment for Private Companies

FASB issued ASU 2014-02 in January 2014 to allow private companies an alternative to testing goodwill for impairment.

- Please provide a discussion of why FASB issued the standard.
- What are the primary differences in this standard for private companies and the accounting for goodwill impairments for public companies?
- Explain why FASB chose to allow each of these differences.

APPENDIX A

Revaluation Model in IFRS Accounting for Certain Long-Term Operating Assets

In this appendix, we address the *revaluation* of certain long-term operating assets as an alternative to historical cost methods available under IFRS. A **revaluation** occurs when a company reports a long-term asset at its fair value rather than its historical cost. Thus, the revaluation can increase or decrease the carrying value of an asset:

1. If an asset's fair value is *more than* its carrying value, the firm increases the carrying value of the asset.
2. If an asset's fair value is *less than* its carrying value, the firm decreases the carrying value of the asset.

Under the revaluation model, a company can choose to report a class of property, plant, or equipment or an intangible asset at its fair value rather than reporting it based on historical cost. IFRS allows (but does not require) the revaluation model; it is not permissible under U.S. GAAP.¹⁸

To illustrate, assume that a company owns a commercial building that it holds for rental purposes. The local economy is now booming, and several major employers have moved into the area. Demand for office space is high, and the company is able to increase rent, generating higher expected future cash flows from the use of the building. Revaluation accounting permits a write-up of the building's carrying value to reflect the increased economic value.

THE CONCEPTUAL FRAMEWORK CONNECTION: Revaluation

Measuring an asset at current fair value versus cost involves a trade-off between relevance and faithful representation. The cost basis provides a high level of faithful representation—it represents the price paid to acquire the asset. However, it is not necessarily very relevant. The current fair value better reflects the future economic benefits that the asset will provide to the company relative to the cost basis. For example, assume that a company reports land acquired 50 years ago on its balance sheet. The original cost of the land was \$100,000, and the current fair value is \$500,000. Under the historical cost approach, the company will report the land at \$100,000 whereas under a fair value approach, the company would report it at \$500,000. Whereas the \$100,000 amount is a faithful representation of the historical cost, it is not particularly relevant for financial statement users' decision making. However, the \$500,000 amount, while relevant, may not be a highly faithful representation of fair value because the fair value may be difficult to measure.

Managers must also keep in mind the cost-benefit constraint. Ideally, managers would obtain a professional appraisal for each asset for the periodic assessments of valuation. The costs related to periodic assessments of the valuation of certain types of property, plant, and equipment and intangible assets could be prohibitive.

The Revaluation Model

There are four steps involved in revaluing long-term operating assets under IFRS:

1. Measure the fair value.
2. Record the revaluation.
3. Compute the revised depreciation expense.
4. Determine the treatment of the revaluation surplus, if any.

¹⁸AICPA, *IFRS Financial Statements: Best Practices in Presentation and Disclosure 2 – 012* reports that 7.4% of companies included in its survey of 175 companies revalue at least one asset class.

Measure Fair Value

A firm must be able to measure the fair value of the asset—property, plant, and equipment or intangible assets—to implement the revaluation model. Fair value is the amount at which knowledgeable and willing parties would exchange for an asset in an arm's-length transaction. The fair value is usually determined by an appraisal based on market values and current market conditions. To revalue property, plant, and equipment, IFRS requires that a company can reliably measure fair value; for an intangible asset, IFRS requires that an active market exists for that intangible. Perhaps due to this active market restriction, firms rarely, if ever, revalue intangible assets under IFRS.¹⁹ Consequently, we address only property, plant, and equipment.

How does a firm determine the fair value of property, plant, and equipment for revaluation purposes when there is no active market? Consider a highly specialized piece of equipment with no active market. In such cases, the firm estimates fair value using projected income or replacement cost.

A company revaluing assets makes revaluations when the asset's carrying amount differs materially from its current fair value at the end of the reporting period. If a company chooses to revalue one asset, then it must revalue every other asset in that class.²⁰ After determining the fair value, the company reports the asset at its fair value on the date of the revaluation. Under the **accumulated depreciation elimination method**, a company eliminates all prior accumulated depreciation and adjusts the historical cost of the asset to fair value.²¹

Record the Revaluation

The firm recognizes the difference between the revalued amount and carrying value either in net income or in other comprehensive income. The choice depends on the revaluation's impact on the asset's carrying value:

1. If the revaluation initially *increases* the asset's carrying value, the firm records the difference between the carrying value and the fair value (the unrealized gain) in the **revaluation surplus** account, a specific account in other comprehensive income (OCI) in the statement of comprehensive income. If the asset's fair value decreases in subsequent accounting periods, the firm reduces the revaluation surplus. If the decrease is more than the amount of the revaluation surplus, the firm reports the excess as an unrealized loss on the income statement. It cannot reduce the revaluation surplus below zero (that is, there cannot be a debit balance).
2. If the revaluation initially *decreases* the asset's carrying value, the firm reports the difference between the carrying value and fair value as an unrealized loss on the income statement. If the asset's fair value increases in subsequent accounting periods, the firm reports the unrealized gain on the income statement, but only to the extent of previously recognized losses. If the unrealized gain exceeds the previously recognized losses, then the excess is credited to the revaluation surplus.

Compute New Depreciation Expense

After recording the revaluation, the firm must recalculate subsequent depreciation based on the revised carrying value of the asset. The company then carries the asset on the balance sheet at the revalued amount less accumulated depreciation.

¹⁹AICPA, IFRS *Financial Statements: Best Practices in Presentation and Disclosure* – 2012 reports that of 175 companies surveyed, none revalued intangible assets.

²⁰IFRS does not define a class of assets in this context.

²¹Another way to record a revaluation adjusts the gross carrying amount. For example, the gross carrying amount may be restated based on observable market data or it may be restated proportionately to the change in the carrying amount. The accumulated depreciation is then adjusted to equal the difference between the gross carrying amount and the carrying amount of the asset. The new carrying value of the asset and depreciation expense after the revaluation will be the same as under the accumulated depreciation elimination method.

Determine Treatment of Revaluation Surplus, if Any

A company has two options when accounting for the revaluation surplus:

1. Reclassify the revaluation surplus into retained earnings over the asset’s remaining useful life: The amount reclassified to retained earnings is the difference between the original depreciation expense and the new depreciation expense. Selecting this option decreases the revaluation surplus with a debit and increases retained earnings with a credit.
2. Retain the balance of the revaluation surplus until the asset is sold: If the company sells or abandons the asset, it may debit any balance in the revaluation surplus and close to retained earnings (i.e., credit or increase retained earnings).

The company may choose either of these options.

Exhibit 12A.1 summarizes the initial and subsequent accounting treatment of upward and downward revaluations.

EXHIBIT 12A.1 Subsequent Accounting Treatment: Upward and Downward Revaluations

Revaluation	Upward Revaluation	Downward Revaluation
Initial revaluation	Credit to equity (revaluation surplus in other comprehensive income) <i>See Example 12A.1</i>	Debit to unrealized loss, reported on the income statement <i>See Example 12A.3</i>
Subsequent revaluation	(When credit balance in revaluation surplus)	(When no revaluation surplus)
Upward	Credit to equity (revaluation surplus in other comprehensive income) <i>Similar to Example 12A.1</i>	Credit to unrealized gain reported on income statement up to the amount of any unrealized loss previously reported. Then, credit to equity (revaluation surplus in other comprehensive income). <i>See Example 12A.4</i>
Downward	Debit equity up to the amount of the revaluation surplus (in other comprehensive income) then debit unrealized loss reported on the income statement. <i>See Example 12A.2</i>	Debit to unrealized loss, reported on the income statement. <i>Similar to Example 12A.3</i>

We provide examples of each of these scenarios starting with Example 12A.1 that illustrates an initial upward revaluation.

EXAMPLE 12A.1

Initial Upward Revaluation: IFRS

PROBLEM: After 3 full years of use, the Rite-Up Company revalues equipment with a carrying value of €980,000 to its fair value of €1,200,000 using the accumulated depreciation elimination method. The original cost of the equipment is €1,400,000 and the equipment has a useful life of 10 years with no scrap value. Rite-Up depreciates under the straight-line method. Therefore, the annual depreciation expense is €140,000 per year (€1,400,000 / 10 years). The accumulated depreciation up to the date of the revaluation is €420,000 (€140,000 × 3 years).

Use the four-step process to address the following questions. What is the new carrying value of the asset? What is the increase or decrease in the carrying value of the asset, and where does Rite-Up report any unrealized gain or loss in the financial statements? What is the new annual depreciation expense after the revaluation? What amount would Rite-Up transfer from any revaluation surplus to retained earnings?

Continued

SOLUTION: We use the four-step revaluation model to illustrate the solution to the problem.

Step 1. Measure the fair value. The fair value is given at €1,200,000, which will be the new carrying value of the asset.

Step 2. Record the revaluation. The revaluation of the asset increases its carrying value by €220,000 (the fair value of €1,200,000 less the carrying value of €980,000). Because this initial revaluation increases the asset value, Rite-Up reports the revaluation surplus as other comprehensive income on the statement of comprehensive income and accumulated other comprehensive income in the stockholders' equity section of the statement of financial position (balance sheet). The balance in the revaluation surplus is €220,000 after the first revaluation.

Under the accumulated depreciation elimination method, Rite-Up must first eliminate all prior accumulated depreciation. The elimination of the accumulated depreciation account results in an asset balance of €980,000 solely in the equipment account. Then, Rite-Up increases the value of the equipment by €220,000 to its fair value. The balance in the equipment account is then equal to its fair value of €1,200,000. We summarize these adjustments in the following table.

Summary: Initial Upward Revaluation Accumulated Depreciation Elimination Method			
	Equipment	Accumulated Depreciation	Net Carrying Value
Beginning balance	€1,400,000	€ 0	€1,400,000
Accumulated depreciation	<u>0</u>	<u>420,000</u>	<u>(420,000)</u>
Balance before revaluation	1,400,000	420,000	980,000
Accumulated depreciation elimination	<u>(420,000)</u>	<u>(420,000)</u>	<u>0</u>
Balance	980,000	0	980,000
Initial revaluation	<u>220,000</u>	<u>0</u>	<u>220,000</u>
Balance after revaluation	<u>€1,200,000</u>	<u>€ 0</u>	<u>€1,200,000</u>

The journal entries are:

Account	End of Year, Current Year	
Accumulated Depreciation – Equipment	420,000	
Equipment		420,000
Equipment	220,000	
Revaluation Surplus – Equipment (OCI)		220,000

Step 3. Compute new depreciation. The original life was 10 years, but 3 years have already passed. Consequently, the new annual depreciation expense will be €171,429, which is the new carrying value of €1,200,000 divided by 7 years.

Account	End of Year, Each Year after Revaluation	
Depreciation Expense – Equipment	171,429	
Accumulated Depreciation – Equipment		171,429

Step 4. Determine treatment of revaluation surplus, if any. Rite-Up chooses to transfer the revaluation surplus to retained earnings. It will reduce the surplus by €31,429, the difference between the new depreciation expense of €171,429 and the original depreciation expense of €140,000. The journal entry is as follows:

Account	End of Year, Each Year after Revaluation	
Revaluation Surplus – Equipment (OCI)	31,429	
Retained Earnings		31,429

Example 12A.2 is an extension of Example 12A.1 that illustrates a subsequent revaluation.

EXAMPLE 12A.2

Subsequent Revaluation after an Initial Upward Revaluation: IFRS

PROBLEM: It is 2 years later, and Rite-Up Company from Example 12A.1 is revaluing its equipment again. The fair value is €600,000. The revaluation surplus account in stockholders' equity reflects a balance of €157,142 [$€220,000 - (€31,429 \times 2 \text{ years})$]. The accumulated depreciation is now €342,858 (i.e., revised depreciation expense of €171,429 multiplied by 2 years). Determine the increase or decrease in the carrying value of the asset and indicate where Rite-Up should report any unrealized gain or loss in the financial statements.

SOLUTION: With a subsequent revaluation, we typically follow the same four-step process. However, this problem asks us to perform only Steps 1 and 2.

Step 1. Measure the fair value. The fair value is given to be €600,000.

Step 2. Record the revaluation. With the accumulated depreciation elimination method, Rite-Up must first eliminate the balance in accumulated depreciation. After 2 years, that balance is now equal to €342,858 (i.e., the recomputed annual depreciation of $€171,429 \times 2 \text{ years}$). Rite-Up also decreases the value of the equipment by €257,142 to its fair value of €600,000. Of the €257,142 decrease, it applies €157,142 against the €157,142 credit balance in the revaluation surplus. The remaining €100,000 (i.e., $€257,142 - €157,142$) is an unrealized loss that Rite-Up includes in net income.

The following table summarizes the effect of the second revaluation under the accumulated depreciation elimination method.

Summary: Subsequent Revaluation			
	Equipment	Accumulated Depreciation	Net Carrying Value
Beginning balance	€1,200,000	€ 0	€1,200,000
Accumulated depreciation	<u>0</u>	<u>342,858</u>	<u>(342,858)</u>
Balance before revaluation	1,200,000	342,858	857,142
Accumulated depreciation elimination	<u>(342,858)</u>	<u>(342,858)</u>	<u>0</u>
Balance	857,142	0	857,142
Subsequent revaluation	<u>(257,142)</u>	<u>0</u>	<u>(257,142)</u>
Balance after revaluation	<u>€ 600,000</u>	<u>€ 0</u>	<u>€ 600,000</u>

Continued

The journal entry to eliminate the accumulated depreciation is as follows:

<i>Account</i>	<i>End of Year, Current Year</i>	
Accumulated Depreciation – Equipment	342,858	
Equipment		342,858

The journal entry to decrease the equipment follows:

<i>Account</i>	<i>End of Year, Current Year</i>	
Revaluation Surplus – Equipment (OCI)	157,142	
Unrealized Loss – Equipment (NI)	100,000	
Equipment		257,142

The next series of examples illustrate initial downward revaluations followed by subsequent revaluations. Example 12A.3 illustrates an initial downward revaluation.

EXAMPLE 12A.3

Initial Downward Revaluation: IFRS

PROBLEM: After 3 full years of use, the Rite-Down Company revalues equipment with a carrying value of €980,000 to its fair value of €900,000 using the accumulated depreciation elimination method. The original cost of the equipment is €1,400,000 and the equipment has a useful life of 10 years with no scrap value. Rite-Down depreciates under the straight-line method. Therefore, the annual depreciation expense is €140,000 per year ($€1,400,000 / 10$ years). The accumulated depreciation up to the date of the revaluation is €420,000 ($€140,000 \times 3$ years).

Use the four-step revaluation process to address the following questions: What is the new carrying value of the asset? What is the increase or decrease in the carrying value of the asset and where will Rite-Down report any unrealized gain or loss in the financial statements? What is the new annual depreciation expense after revaluation? What amount would Rite-Down transfer from any revaluation surplus to retained earnings?

SOLUTION: We use the four-step revaluation model to illustrate the solution.

Step 1. **Measure the fair value.** The fair value is given to be €900,000, which will be the new carrying value.

Step 2. **Record the revaluation.** The downward revaluation is equal to €80,000 (carrying value of €980,000 less the fair value of €900,000). Because this initial revaluation of the asset decreases the asset value, Rite-Down includes the unrealized loss on the revaluation in net income.

With the accumulated depreciation elimination method, Rite-Down eliminates all prior accumulated depreciation, resulting in an asset balance of €980,000 solely in the equipment account. Rite-Down also decreases the value of the equipment's net carrying value by €80,000. The balance in the equipment account is then equal to the fair value of €900,000. As noted in the table on the next page, the asset's cost is reduced by a total of €500,000. We summarize the effects of the initial revaluation using the accumulated depreciation elimination method in the table on the next page.

Summary: Initial Downward Revaluation: Accumulated Depreciation Elimination Method

	Equipment	Accumulated Depreciation	Net Carrying Value
Beginning balance	€1,400,000	€ 0	€1,400,000
Accumulated depreciation	<u>0</u>	<u>420,000</u>	<u>(420,000)</u>
Balance before revaluation	1,400,000	420,000	980,000
Accumulated depreciation elimination	<u>(420,000)</u>	<u>(420,000)</u>	<u>0</u>
Balance	980,000	0	980,000
Initial revaluation	<u>(80,000)</u>	<u>0</u>	<u>(80,000)</u>
Balance after revaluation	<u>€ 900,000</u>	<u>€ 0</u>	<u>€ 900,000</u>

The journal entry to eliminate the accumulated depreciation follows:

Account	End of Year, Current Year
Accumulated Depreciation – Equipment	420,000
Equipment	420,000

The journal entry to decrease the equipment follows:

Account	End of Year, Current Year
Unrealized Loss – Equipment (NI)	80,000
Equipment	80,000

Step 3. Compute new depreciation. The original life was 10 years, but 3 years have already passed. Consequently, the new annual depreciation expense will be €128,571, which is €900,000 divided by 7 years.

Account	End of Year, Each Year after Revaluation
Depreciation Expense – Equipment	128,571
Accumulated Depreciation – Equipment	128,571

Step 4. Determine treatment of revaluation surplus, if any. There is no surplus.

Example 12A.4 builds on Example 12A.3 to illustrate a subsequent revaluation.

EXAMPLE 12A.4

Subsequent Revaluation after an Initial Downward Revaluation: IFRS

PROBLEM: The Rite-Down Company from Example 12A.3 is responsible for monitoring fair values for its assets in subsequent accounting periods and must revalue in cases when there is a significant difference between the asset’s carrying value and its fair value. The company revalued its equipment again 2 years later when its fair value is €725,000. The balance in the accumulated depreciation account is €257,142 (i.e., the recomputed annual depreciation of €128,571 × 2 years). What are the entries to reflect the revaluation on the company’s financial statements?

Continued

SOLUTION: With a subsequent revaluation, we typically follow the same four-step procedure. However, we need to perform only steps 1 and 2 in this illustration.

Step 1. **Measure the fair value.** The fair value is given at €725,000.

Step 2. **Record the revaluation.** Under the accumulated depreciation elimination method, Rite-Down first eliminates the balance in accumulated depreciation. The balance in the accumulated depreciation account is €257,142, which is two times the recomputed annual depreciation of €128,571. The carrying value of the equipment was €900,000 after the initial revaluation, so the current carrying value is €642,858 (€900,000 – €257,142 in accumulated depreciation). Rite-Down now increases the value of the equipment by €82,142 to its fair value of €725,000. Because it originally recorded a loss of €80,000 for this asset, it reports €80,000 of the unrealized gain in net income. Rite-Down includes the remaining or excess gain of €2,142 in other comprehensive income by crediting the revaluation surplus account.

We summarize the effects of the subsequent revaluation using the accumulated depreciation elimination method in the following table.

Summary: Subsequent Revaluation – Accumulated Depreciation Elimination Method			
	Equipment	Accumulated Depreciation	Net Carrying Value
Balance after revaluation	€900,000	€ 0	€900,000
Accumulated depreciation	<u>0</u>	<u>257,142</u>	<u>(257,142)</u>
Balance before revaluation	900,000	257,142	642,858
Accumulated depreciation elimination	<u>(257,142)</u>	<u>(257,142)</u>	<u>0</u>
Balance	642,858	0	642,858
Subsequent revaluation	<u>82,142</u>	<u>0</u>	<u>82,142</u>
Balance after revaluation	<u>€725,000</u>	<u>€ 0</u>	<u>€ 725,000</u>

The journal entries are:

Account	End of Year, Current Year	
Accumulated Depreciation – Equipment	257,142	
Equipment		257,142
Equipment	82,142	
Unrealized Gain – Equipment (NI)		80,000
Revaluation Surplus – Equipment (OCI)		2,142

Derecognition after a Revaluation

Under IFRS, if a company is derecognizing an asset that it has revalued upward, then it should eliminate both the asset's net carrying value (cost less accumulated depreciation) and the balance in revaluation surplus that relates to that asset. The related revaluation surplus account should be eliminated against retained earnings. An example of the derecognition of a revalued asset is provided in Example 12A.5.

EXAMPLE 12A.5**Derecognition of Previously Revalued Asset: IFRS**

PROBLEM: On May 31, 2018, J Franz Company sold a piece of equipment for \$410,000. After bringing the depreciation up to date, the carrying value of the equipment was \$400,000. Specifically, the asset had an original cost of \$545,000 and the accumulated depreciation balance up to the date of the sale was \$145,000. The related revaluation surplus account balance was \$53,000. What are the entries to account for the derecognition of the equipment given a balance in the revaluation surplus?

SOLUTION: First, we remove the revaluation surplus account from the books by debiting the account for \$53,000 and crediting retained earnings as follows:

<i>Account</i>	<i>May 31, 2018</i>
Revaluation Surplus – Equipment	53,000
Retained Earnings	53,000

The gain on the sale of the equipment is \$10,000, which we compute as the \$410,000 cash proceeds less the \$400,000 net book value. The journal entry required to record the sale follows:

<i>Account</i>	<i>May 31, 2018</i>
Cash	410,000
Accumulated Depreciation – Equipment	145,000
Equipment	545,000
Gain on Sale of Equipment	10,000

JUDGMENTS IN ACCOUNTING

Revaluation under IFRS

The revaluation of long-term operating assets involves judgment regarding whether to revalue various assets. Managers must think carefully about the trade-off between relevance and faithful representation when choosing a measurement method (that is, to revalue or report at historical cost). Financial statement users should examine the company's accounting policies to determine whether the company has revalued any of its noncurrent assets.

Companies that report under IFRS and choose to revalue their PPE or intangible assets also exercise judgment in the determination of fair value. The fair value of certain assets—for example, investments in securities for which there is a liquid market and quoted market prices—are readily available and objective. In contrast, the fair value of long-term operating assets, particularly intangible assets, can be highly subjective. Thus, management must exercise discretion in determining the value to report on the balance sheet.

To illustrate, consider the Rite-Down Company presented in Example 12A.3. In that example, we were given the carrying value of €980,000 and the fair value of €900,000. As a result, the unrealized loss included in net income was €80,000 (€980,000 carrying value – the €900,000 fair value). But how did management measure fair value in the case of PPE? Sometimes, there is a market price available for that exact piece of equipment—of identical age and same condition. For instance, if the asset in question were a car, then blue book values are available that would provide a close estimate of fair value. However, what if the equipment is not as generic as a car? In fact, what if it is a specialized piece of equipment? In such cases, the estimate of fair value involves a great deal of subjectivity. For Rite-Down, if the fair value was €880,000 instead of €900,000, the unrealized loss included in net income would be €100,000, as opposed to €80,000.

Required Disclosures for Revaluation of Long-Term Operating Assets

Under IFRS, if a company reports any class of PPE at revalued amounts, it must include changes in asset values in the reconciliation of the beginning to ending balances. IFRS requires additional disclosures relating to revaluations, including:

1. The date of the revaluation
2. Whether an independent appraiser was involved
3. The methods and significant assumptions used in estimating fair values
4. The extent to which the company determined fair values directly in an observable, active market; used recent market transactions on arm's length terms; or estimated using other valuation techniques

For each class of revalued asset, the company must report the carrying amount it would have reported as if it had carried the assets under the historical cost model. Finally, companies must disclose the revaluation surplus.

Exhibit 12A.2 contains excerpts from the significant accounting policies and the property, plant, and equipment footnotes of *Sasini Limited*, a major tea and coffee producer based in Kenya that reports under IFRS. These disclosures illustrate the accounting policies and disclosures for asset revaluations. *Sasini* revalues assets using market values obtained from independent appraisers. At the end of fiscal 2016, net revaluations in 2016 increased the value of its property by 5,517 million Kenyan shillings, representing about 66% of total shareholders' equity.

EXHIBIT 12A.2 Revaluation Accounting Policy, *Sasini Limited*, Financial Statement, September 30, 2016

NOTE 3: Significant Accounting Policies (excerpt)

(g) *Property, plant, & equipment and depreciation*

Property, plant, and equipment are measured at cost or revalued amounts less accumulated depreciation and any impairment losses. Cost includes expenditures that are directly attributable to the acquisition of the asset.

Revaluation increases arising on the revaluations are recognised in other comprehensive income and accumulated in the revaluation reserve in equity, except to the extent that it reverses a revaluation decrease for the same asset previously recognised as an expense, in which case the increase is credited to profit or loss to the extent of the decrease previously charged. A decrease in carrying amount arising out of revaluation is charged as an expense to the extent that it exceeds the balance, if any, held in the revaluation reserve relating to a previous revaluation of that asset.

An annual transfer from the asset revaluation reserve to retained earnings is made for the difference between depreciation based on the revalued amount of the asset and the original cost. Additionally, accumulated depreciation at the revaluation date is eliminated against the gross carrying amount of the asset and the net amount is restated to the revalued amount of the asset. Upon disposal, any surplus remaining in the revaluation reserve relating to the particular asset being sold is transferred to retained earnings.

Revaluations are done with sufficient regularity to ensure that the carrying amount does not differ materially from that which would be determined using fair value at the end of the reporting period.

.....

NOTE 18: Property, Plant, and Equipment (excerpt)

The Group's building and freehold land was revalued on 30 September 2014 by Knight Frank Valuers Limited, a firm of registered independent valuers, on the market value existing use basis.

The Group's plant, equipment, machinery, furniture and fittings were revalued on 30 September 2016 by Knight Frank Valuers Limited, registered valuers, on the market value existing use basis.

The carrying values of the property, plant, and equipment were adjusted to the revaluations and the resultant surplus and deferred tax effect, was recognised in other comprehensive income and accumulated in equity as at that date.

13

Operating Liabilities and Contingencies

LEARNING OBJECTIVES

- 1 Define and demonstrate accounting for operating liabilities, including accounts payable, trade notes payable, unearned revenues, gift cards, deposits, sales taxes payable, and compensated absences.
- 2 Discuss and illustrate the accounting for asset retirement obligations and required disclosures.
- 3 Describe the accounting for gain and loss contingencies, including recognition and disclosures related to loss contingencies.
- 4 Demonstrate the accounting for common loss contingencies involving litigation, warranties, and premiums.

Introduction

MANUFACTURERS AND RETAILERS depend on suppliers for the materials and inventory needed to produce and sell their goods. Consider *GameStop Corporation*, a Fortune-500 company known as the world's largest video game and software retailer with over 6,500 retail stores worldwide. *GameStop* sells many popular products such as *Microsoft's* Xbox One, *Nintendo's* Wii, and *Sony's* PlayStation. Manufacturers often target

John Greim/Contributor/Getty Images

new releases of these game systems for the winter holiday season—and gaming devotees will line up for special deals and first access to newly released systems. When supplier delays cause these video game systems to be out of stock or available in limited quantity, resellers such as *GameStop* may experience lost sales. For this reason, *GameStop's* 2016 annual report discloses that overall sales of video game systems or game software could be reduced if any supplier issues occur such as delivery delays or insufficient quantities.

Businesses also rely on supplier relationships for short-term financing through accounts payable. Instead of using cash to pay *Microsoft* for Xbox inventory, *GameStop* can delay the cash payment until it receives the inventory and sells it to its customers. *GameStop's* 2016 annual report notes that it depends significantly upon such supplier business arrangements, including payment terms, competitive prices, return policies, and advertising allowances. These arrangements provide short-term financing, allowing *GameStop* to offer products to customers at competitive prices. *GameStop's* balance sheet shows the extent to which it relies on suppliers for credit: at the end of fiscal 2016, *GameStop's* accounts payable of \$616.6 million was one of its largest liabilities, representing about 35% of current liabilities and 23% of total liabilities.

In this chapter, we focus on accounting for the complexities of business-supplier relationships. We begin with the general *operating liabilities* that companies rely on to conduct day-to-day functions and to finance growth in sales and profits. We then discuss a unique operating liability—*asset retirement obligations*. Accounting for operating liabilities and asset retirement obligations is similar under U.S. GAAP and IFRS.

Finally, we examine accounting for *contingencies*, which are potential obligations that the entity may or may not have to pay in the future. Because of the uncertainties related to the amount and probability of incurring an obligation, companies need to determine whether to report contingencies as liabilities. The determination of a contingent liability differs under U.S. GAAP and IFRS. <<

- 1 Define and demonstrate accounting for operating liabilities, including accounts payable, trade notes payable, unearned revenues, gift cards, deposits, sales taxes payable, and compensated absences.

Operating Liabilities

The conceptual framework defines **liabilities** as “probable future sacrifices of economic benefits arising from present obligations of a particular entity to transfer assets or provide services to other entities in the future as a result of past transactions or events.”¹ This definition includes three characteristics:

1. The entity will probably need to make a future sacrifice to satisfy the obligation (for example, disburse cash).
2. The entity has little or no option to avoid a future sacrifice.
3. The transaction or event giving rise to the obligation has already occurred.

Operating liabilities are obligations arising from the firm’s primary business operations, including short-term obligations such as accounts payable, trade notes payable, accrued liabilities such as advance collections, sales and payroll taxes payable, and income tax payable. We discuss operating liabilities in this chapter and financing liabilities in the chapter that follows.

We begin with the following operating liabilities:

- Accounts payable and trade notes payable
- Unearned revenues
- Gift cards
- Deposits
- Sales taxes payable
- Income taxes payable
- Compensated absences

We cover payroll taxes payable in the Appendix A to this chapter.

Accounts Payable and Trade Notes Payable

Accounts payable are amounts owed for goods, supplies, or services purchased on open account, meaning that the invoice is the only formal documentation for the credit agreement. **Trade notes payable** are formal, written promises to pay a certain sum of money on a specified date in the future that arise from the purchase of goods, supplies, or services. Trade notes payable typically specify a stated rate of interest. Firms usually classify both accounts payable and trade notes payable as current liabilities because these obligations are generally due within 1 year (or one operating cycle, if longer).

Companies usually recognize both types of payables when title passes. Example 13.1 illustrates the acquisition of inventory with an open accounts payable.

EXAMPLE 13.1

Accounts Payable

PROBLEM: On May 5, Ivan Brick Company orders 1,000 pallets of red bricks at a cost of \$245 per pallet from Yang Grew Foundries on an open account. The shipping terms are f.o.b. destination. Ivan Brick receives the bricks on May 12. It uses the perpetual inventory method. Prepare the journal entry to record the receipt of the bricks.

SOLUTION: Ivan Brick records the following journal entry on May 12, which is the date that the goods are received and title passes to the buyer.

Account	May 12
Inventory (1,000 × \$245)	245,000
Accounts Payable	245,000

¹FASB, Statement of *Financial Accounting Concepts* No. 6, “Elements of Financial Statements,” Paragraph 35.

The accounting for trade notes payable is very similar with the exception that notes payable generally involve interest as Example 13.2 illustrates.

EXAMPLE 13.2 Trade Notes Payable

PROBLEM: Templeton Graphics, Inc. purchased production materials on October 1 of the current year using a trade note payable for \$10,000. The 4-month note is due on February 1 of the following fiscal year. The short-term note carries a 6% annual interest rate. Templeton's fiscal year-end is December 31. Prepare the journal entries required to record the notes payable transaction for both the current and the following year.

SOLUTION: Templeton makes the following journal entry on the date that it signs the note.

Account	October 1, Current Year	
Raw Materials Inventory	10,000	
Notes Payable		10,000

Three months' interest has accrued by December 31 and Templeton must record the \$150 interest expense ($\$10,000 \times 6\% \times 3/12$) and the liability for unpaid interest. The year-end adjusting entry for the accrued interest follows.

Account	December 31, Current Year	
Interest Expense	150	
Interest Payable		150

Templeton pays the interest in the following year on the due date of the note. The total interest due is \$200 ($\$10,000 \times 6\% \times 4/12$). Of the \$200 total interest, \$150 was incurred in the prior year, and the \$50 balance is expensed on the due date of February 1 of the following year ($\$10,000 \times 6\% \times 1/12$). The entry to pay the principal and interest due on February 1 follows.

Account	February 1, Following Year	
Notes Payable	10,000	
Interest Payable	150	
Interest Expense	50	
Cash		10,200

Unearned Revenues

Unearned revenues (also known as deferred credits or deferred revenues) are advance collections from customers for goods and services to be provided at some future date. The liability arises from the obligation to deliver goods or provide the agreed-upon services. The seller recognizes revenue when it delivers the goods or provides the service. In some cases, such as insurance premiums collected in advance, the seller earns revenue evenly over the term of the contract based on the passage of time. In other cases, revenue recognition is tied to actual delivery. For example, **GameStop Corporation** initially reports subscriptions to the company's PowerUp Rewards loyalty program and magazines as unearned revenues. **GameStop** then recognizes subscription revenue on a straight-line basis over the subscription period as the magazines are delivered.

Unearned revenues are most often classified as a current liability. When **Delta Air Lines, Inc.**, sells air travel tickets to its customers, **Delta** initially records an unearned revenue, called air traffic liability. **Delta** recognizes revenue when it provides transportation to the customers. Because the travel is expected to be taken within the next 12 months, **Delta** reports its air traffic liability as a current liability. At the end of 2016, **Delta** reported an air traffic liability of \$4,626 million, or about 30% of its current liabilities. However, if the company did not expect to deliver the good or service until after 1 year (or operating cycle, if longer), it would then classify the

unearned revenue as a noncurrent liability. Unearned revenues may be divided into a current and a noncurrent portion, if appropriate.

Example 13.3 illustrates unearned revenues related to the advance collection of insurance premiums.

EXAMPLE 13.3 Unearned Revenues

PROBLEM: Midwest Insurance collects \$36,000 for a 3-year casualty policy on June 1 of the current year. Coverage begins on June 1. Midwest has a December 31 year-end. Prepare the journal entries for the current year. What is the balance in the unearned revenue account at December 31 of the current year? What does Midwest report as a current liability on the balance sheet at December 31 of the current year?

SOLUTION: Midwest Insurance makes the following journal entry on the date it collects the insurance premium.

Account	June 1, Current Year	
Cash	36,000	
Unearned Revenue		36,000

Because the insurance coverage is based on time, Midwest earns revenue evenly over the life of the policy. Specifically, Midwest will recognize \$1,000 in revenue each month (i.e., \$36,000 / 36 months). At the end of the fiscal year, Midwest will have earned 7 months of insurance premiums, or \$7,000 (\$1,000 per month \times 7 months) based on the time period for which it has provided coverage. The adjusting entry to record the income earned in the current period follows.

Account	December 31, Current Year	
Unearned Revenue	7,000	
Insurance Revenue		7,000

The t-account for unearned revenue is presented next.

Unearned Revenue		
	36,000	June 1
December 31	7,000	
	<u>29,000</u>	Ending Balance

On December 31, the balance in the unearned revenue account is \$29,000 (\$36,000 collected in advance less the \$7,000 earned). Of this \$29,000, the current liability is \$12,000 (\$1,000 \times 12 months), representing the insurance coverage to be provided to the customer over the next 12 months. The remaining \$17,000 (\$29,000 $-$ \$12,000) is a noncurrent liability because the insurance coverage will be provided in a period longer than 1 year from the balance sheet date.

Gift Cards

Although used for decades, *gift cards* have become quite popular in recent years. A **gift card** is a certificate allowing the holder to receive goods or services of a specified value from the issuer. Customers appreciate gift cards for their convenience, and companies benefit from the sale of gift cards when receiving cash upon issuance. In addition, gift card recipients often spend more than the gift card amount, resulting in an increased sales volume for the company. Finally, a percentage of the company's total gift card sales referred to as **breakage** is never redeemed.

Initial Sale and Redemption. The accounting for the initial sale and the redemption of the gift card is straightforward. The company:

1. Records the transaction as unearned revenue when issuing the gift card by debiting cash and crediting a liability for the unearned revenue on the date it sells the cards.
2. Maintains a liability on the balance sheet until the gift card is redeemed and then recognizes sales revenue earned upon redemption with a corresponding reduction of the liability.

For example, at the end of fiscal 2016, the *Target Corporation* reported a gift card liability of \$693 million, or about 5.5% of its current liabilities.² When gift cards are redeemed, *Target* debits the unearned revenue and credits sales revenue. Example 13.4 illustrates accounting for gift cards.

EXAMPLE 13.4

Gift Card Sale and Redemption

PROBLEM: Rohl's Department Stores, Inc. records \$120,000 in gift card sales and receives cash in Year 1. Customers used 25% of the gift cards to purchase merchandise in Year 2. Cost of sales is 40% of total sales. Rohl's uses the perpetual inventory system. Record the sale and redemption of the gift cards in Years 1 and 2, respectively.

SOLUTION: In the year of the sale, Rohl's records cash and the unearned revenue for \$120,000.

<i>Account</i>	<i>At Time of Sale of Gift Cards – Year 1</i>	
Cash	120,000	
Unearned Revenue – Gift Cards		120,000

The gift cards are partially redeemed in the second year and, as a result, the company recognizes \$30,000 of revenue ($\$120,000 \times 25\%$). The journal entry follows.

<i>Account</i>	<i>At Time of Redemption – Year 2</i>	
Unearned Revenue – Gift Cards	30,000	
Sales Revenue		30,000

Rohl's also recognizes cost of goods sold of \$12,000 ($\$30,000 \times 40\%$) at the point the cards are redeemed and sales revenue is recorded.

<i>Account</i>	<i>At Time of Redemption – Year 2</i>	
Cost of Goods Sold	12,000	
Inventory		12,000

Breakage. Breakage introduces complexity in accounting for gift cards. Given that not all gift cards will be redeemed, when can the company remove the liability from its books and recognize revenue? If the company expects to be entitled to a breakage amount and it can be estimated, then it should use the *proportional method* to account for breakage. Otherwise, it should use the *remote method*.

The **remote method** requires the seller to reliably estimate the amount of breakage. The company recognizes revenue from gift card breakage and removes the liability for the advance collection (unearned revenue) only when the probability of redemption becomes remote. For example, *Lululemon Athletica Inc.*, the athletic apparel company, sells gift cards that generally do not have expiration dates. *Lululemon* recognizes revenue from gift cards when either the customer redeems the gift card or the likelihood of the customer redeeming the gift card is

²Source: Annual financial statement, footnote 18. <https://www.sec.gov/Archives/edgar/data/27419/000002741917000008/tgt-20170128x10k.htm#s1B7D75BDA162E9BAE0AD72260A437BA8>

remote. *Lululemon* estimates gift card breakage based on historical redemption patterns. In fiscal 2016, *Lululemon* recognized \$4.5 million of revenue from unredeemed gift cards.³

Under the **proportional method**, breakage revenue is recognized ratably as actual card redemptions occur. To use this method, the company must have reliable estimates of breakage and the time period of actual gift card redemption. The proportional method requires the company to pool together all gift cards sold over a certain time period. The company estimates the breakage percentage of these cards as well as the time period over which these cards will be redeemed. The company then recognizes the estimated breakage revenue (and derecognizes the liability) over the estimated time period of redemption. For example, *Target Corporation* sells gift cards that do not expire. *Target* estimates breakage in proportion to actual gift card redemptions based on historical redemption rates.⁴ The proportional method is shown in Example 13.5.

EXAMPLE 13.5 Breakage: Proportional Method

PROBLEM: Elliot Electronics Company offers gift cards to its customers. Elliot reported \$400,000 in gift card sales in Year 1, and received cash. The company reliably estimates the amount of breakage at 15% and the time period of redemption as 2 years. Elliot uses the proportional method to account for breakage. Customers redeemed \$180,000 in gift cards in Year 1. Elliot's cost of goods sold percentage is 35%. Elliot uses the perpetual inventory system. Provide the journal entries for Year 1.

SOLUTION: In Year 1, Elliot records the cash received and the performance obligation to redeem the gift cards (i.e., unearned revenue).

Account	Sale of Gift Cards
Cash	400,000
Unearned Revenue – Gift Cards	400,000

Elliot also records the redemption of \$180,000 of gift cards.

Account	Redemption of Gift Cards
Unearned Revenue – Gift Cards	180,000
Sales Revenue	180,000

Elliot also records the related cost of goods sold of \$63,000 ($\$180,000 \times 35\%$).

Account	Redemption of Gift Cards
Cost of Goods Sold	63,000
Inventory	63,000

In addition, Elliot recognizes a proportion of breakage revenue. It estimates total breakage as \$60,000 ($\$400,000 \times 15\%$). Because 53% [$\$180,000 / (\$400,000 - \$60,000)$] of the estimated cards to be redeemed were redeemed in Year 1, Elliot recognizes 53% of the estimated breakage revenue in Year 1 for a total of \$31,800 ($\$60,000 \times 53\%$).

Account	December 31, Year 1
Unearned Revenue – Gift Cards	31,800
Breakage Revenue	31,800

⁴Source: Annual, financial statement footnote 2. <https://www.sec.gov/Archives/edgar/data/27419/000002741917000008/tgt-20170128x10k.htm#s1B7D75BDA162E9BAE0AD72260A437BA8>

Deposits

Businesses often require buyers to pay a **deposit** for goods or services, which is an amount a buyer remits to a seller that will be returned to the buyer at some point in time when a specific event occurs. For example, deposits are often required by companies (such as chemicals manufacturers) that deliver their products in returnable containers. If the containers are not returned, the company keeps the deposit and the customer forfeits that amount. In leasing arrangements, most apartment owners require a security deposit from tenants that the landlord will return to the tenant when the apartment is vacated. If the apartment is damaged, then the landlord will deduct the cost of repairs from the deposit and return the balance to the tenant. The tenant forfeits the amount of the deposit retained.

When an entity receives the deposit, it credits a liability account. The accounting for deposits depends upon the amount the entity returns upon completion of the transaction:

1. **Returns the entire deposit.** The entity simply debits the same liability account and credits cash.
2. **Returns part of the deposit.** The entity debits the entire liability account, and the credit will depend upon the reason for the forfeiture of the deposit.
3. **Deposits are not returned.** The entity credits a revenue account and debits the liability account. If repairs to the property are required such as rental property, the entity credits cash as repairs are made.

Example 13.6 demonstrates accounting for deposits.

EXAMPLE 13.6

Deposits

PROBLEM: Stubben Chemicals collected a \$500 deposit for 10 containers used to deliver inventory to a major pharmaceutical company. The cost of each container is \$40. The company uses the perpetual inventory method. What journal entries are required if the containers are returned to Stubben? What journal entries are required if the containers are damaged and the customer forfeits the deposit?

SOLUTION: Stubben reports the \$500 deposit as a liability when it delivers the inventory to the customer.

<i>Account</i>	<i>Inventory Delivered to the Customer</i>	
Cash	500	
Deposit Liability		500

If the containers are returned to Stubben and the deposit is refunded to the customer, then Stubben will make the following journal entry.

<i>Account</i>	<i>Containers Returned</i>	
Deposit Liability	500	
Cash		500

If the customer damages the containers and does not return them to Stubben, then Stubben removes the liability and recognizes revenue and the cost of sales related to the containers.

<i>Account</i>	<i>Containers Not Returned</i>	
Deposit Liability	500	
Container Sales Revenue		500

The cost of each container is \$40, so with 10 not being returned and the deposit forfeited, the total cost of sales is \$400 (10 × \$40).

<i>Account</i>	<i>Containers Not Returned</i>	
Cost of Goods Sold	400	
Container Inventory		400

Sales Taxes Payable

Sales taxes payable is a liability (typically classified as current) resulting from the seller's obligation to collect sales taxes from customers and remit these taxes to the appropriate taxing jurisdiction. Sales taxes are not an expense for the seller. The company acts as a conduit for the government by simply collecting and remitting the tax. The seller collects sales taxes from customers when making sales and incurs the obligation to remit the tax to the government. The seller credits a sales tax payable account when the taxes are collected from the customer and derecognizes this liability when it remits the sales tax to the government as illustrated in Example 13.7.

EXAMPLE 13.7 Sales Taxes Payable

PROBLEM: Gobble Stores operates in Chester County. The state sales tax rate is 8.375%. The company sells \$180,000 in merchandise for the month of March. The company uses a periodic inventory system. How much sales tax did Gobble collect and what is the journal entry to record the sale and the remittance to the state government?

SOLUTION: Gobble collected \$15,075 in sales taxes (i.e., $\$180,000 \times 8.375\%$). Gobble's customers paid a total of \$195,075, which is the sum of the merchandise sales value plus the sales taxes (i.e., $\$180,000 + \$15,075$). The company makes the following journal entry to record its March sales.

<i>Account</i>	<i>March 31</i>
Cash (or Accounts Receivable)	195,075
Sales	180,000
Sales Tax Payable	15,075

The entry to remit the sale taxes collected to the appropriate government agency follows.

<i>Account</i>	<i>March 31</i>
Sales Tax Payable	15,075
Cash	15,075

Income Taxes Payable

Most countries impose a tax on corporate income. In addition, most states within the United States also impose an additional income tax, and some local governmental units may impose a separate income tax. These jurisdictional taxes result in a liability (typically classified as current) on corporate balance sheets. The tax payable that a company reports on its balance sheet represents the amount that is owed to the governmental units.⁵

Compensated Absences

Compensated absences are employer-paid time off for vacation, illness, holidays, military service, jury duty, and maternity leave. Employees accrue these benefits over time as they work and get paid when they take the time off in the future.⁶

An employer must meet four criteria to report an expense and accrue a liability for future paid absences:

1. The obligation for future payment is a result of services already performed by the employee.
2. The benefits to be paid either vest or accumulate.
3. The future payment must be probable.
4. The future payment must be reasonably estimable.

⁵We discuss the computation of taxes payable in depth in Chapter 17.

⁶For the relevant authoritative literature for this topic, see FASB ASC 710-10-25 – *Compensation – General – Overall – Recognition* for U.S. GAAP and IASC, *International Accounting Standard 19*, “Employee Benefits,” (London, UK: International Accounting Standards Committee, Revised), Paragraphs 8-16 for IFRS.

Vested versus Accumulated Benefits. Accounting for compensated absences depends on whether the benefits *vest* or *accumulate*. **Vested rights** exist whenever an employer has the obligation to make compensation payments if it terminates the employee. So, with vested compensated absences, rights to the benefits are not dependent on future employment. That is, firms pay vested compensation benefits even if they terminate the employee. As a result, vested compensation benefits should be accrued.

Accumulated rights permit an employee to carry forward unused benefits to future periods. So, employees can carry accumulated compensated absences forward past the current period in which they are earned and use them in future periods. In contrast, employees cannot carry non-accumulated compensated absences forward beyond the current period.

If the benefits accumulate but are not vested, then the accounting treatment must address the probability of payment. Assume the likelihood that the company will pay the benefits is low or very uncertain. Because the accumulated compensated absences do not meet the definition of a liability of being a probable future sacrifice, the firm would not accrue them.

With non-vested accumulated compensated absences, accountants must consider the employer's prior practices. Does the employer permit employees to accumulate sick days when they are not used? If so, a customary practice would justify the accrual of compensation expense. Accountants may also adjust the amount accrued for estimated forfeitures because these benefits are not vested and may not be fully utilized. Absences due to holidays, military leave, maternity leave, and time off for jury duty typically do not accumulate and should not be accrued.

Current versus Estimated Future Compensation Rates. After determining that a compensated absence should be accrued, the company next determines the rate of compensation to use: current or future rates. Typically, companies measure the obligation at the current rate rather than estimating the future salary or wage rate expected to be in effect when the employee uses the compensated absence. This approach is theoretically correct when the future rate is uncertain. However, when future rates are known, as in the case of a union contract signed with increased wage rates beginning in the next period, the employer should use the future wage rates in the accrual. If compensation rates change in the period of actual payment, the company debits the difference between the new, higher rate and the lower, accrued rate to compensation expense in the year it pays the compensated absence.

Accrual of Sick Days. As noted earlier, the accrual of non-vested sick days is not mandatory due to the high degree of uncertainty of incurring the obligation. Future sick day payment is dependent on illness, which fortunately is not a certain event. Again, accountants must consider customary practices used in corporations. For example, many companies pay the accumulation of sick days upon retirement. Some employers convert sick days into personal days if the employer specifies a fixed number of sick days to be awarded regardless of illness. In these cases, the company measures and accrues the compensated absences in the year the employee earns them.

Accounting for compensated absences is shown in Example 13.8.

EXAMPLE 13.8

Accounting for Compensated Absences

PROBLEM: Alberto Motors, Inc. employs 1,000 hourly employees. During the current year, employees earned 2,250 weeks of vacation, but 400 employees elected to carryover a total of 850 vacation weeks to the following year. Employees took the remaining 1,400 weeks of vacation during the current year.

Alberto typically follows a policy that all accumulated vacation days are lost by the employee either upon termination or at retirement. Using an average wage rate of \$900 per week, prepare the journal entries required to record Alberto's vacation accrual.

SOLUTION: Alberto records the compensation expense of \$1,260,000 related to the 1,400 vacation weeks (at \$900 per week) taken during the current year as follows:

<i>Account</i>	<i>Current Year</i>
Vacation Wage Expense	1,260,000
Cash	1,260,000

To record the compensation expense related to the 850 vacation weeks carried over to future periods, Alberto records vacation wage expense of \$765,000 (850×900) in the current year.

<i>Account</i>	<i>Current Year</i>
Vacation Wage Expense	765,000
Liability for Compensated Absences	765,000

Alberto makes the next entry in the following year when employees take the vacation days:

<i>Account</i>	<i>Following Year</i>
Liability for Compensated Absences	765,000
Cash	765,000

A company can also base the accrual on its experience regarding the amount of vacation employees actually take. If the employer compensates employees for weeks taken, its accrual is generally based on the likelihood that the vacation time is taken. As Example 13.9 demonstrates, both the liability and expense change when assuming that some vacation time is not used.

EXAMPLE 13.9 Accounting for Compensated Absences with Partial Accrual

PROBLEM: Using the information for Alberto Motors, Inc. from the previous example, now assume that experience indicates that employees do not take 20% of accrued vacations. What is the journal entry to record the vacation accrual?

SOLUTION: The entry to accrue vacation pay would include a debit to wage expense and a credit to liability for compensated absences only for the portion expected to be paid. We estimate the amount as the number of weeks of vacation times the pay per week multiplied by the probability that the vacation will be taken. So, in this case, the expense and liability are \$612,000 ($850 \text{ weeks} \times \$900 \text{ per week} \times 80\%$).

<i>Account</i>	<i>Current Year</i>
Vacation Wage Expense	612,000
Liability for Compensated Absences	612,000

Differences in Actual and Estimated Wage Rates. In the year when employees take the vacation time related to the accrued vacation liability, net earnings is typically not affected. That is, the company debits the expense in the prior year when employees provide services. An exception occurs when the actual wage rate in effect when the compensation is paid differs from the estimated rate used to accrue the compensated absence. In this case, the company reports the difference between the actual and estimated wage rates as an increase in compensation expense in the period when the compensated absence is taken. Example 13.10 illustrates accounting for differences in actual and estimated wage rates.

EXAMPLE 13.10**Differences in Actual and Estimated Wage Rates**

PROBLEM: When Alberto Motors Inc.'s employees from Example 13.8 take the carried-over vacation days, the actual wage rate is \$950, not the estimated \$900 we used in the prior-year accrual. Recalculate the liability for compensated absences based on this information and prepare the journal entry to pay the accrued liability and to recognize the wage rate increase.

SOLUTION: Alberto Motors should charge the excess to expense in the year the employees take the vacations. The following journal entry assumes the wage rate increased by \$50:

Account	Following Year
Vacation Wage Expense [850 weeks × (\$950 – \$900)]	42,500
Liability for Compensated Absences	765,000
Cash	807,500

Compensated Absences: IFRS. Accounting for compensation absences is similar under IFRS except that IFRS specifies that firms should recognize the expense based on the expected cost to the entity. Thus, if the company can estimate future compensation rates, it will record the liability and expense based on the future rates. This difference can result in a higher liability under IFRS than under U.S. GAAP when a current cost estimate is used.

Footnote Disclosures: Operating Liabilities

On the balance sheet, companies generally provide totals of accounts payable and accrued liabilities. In the footnote disclosures, companies may provide additional detail on the specific types of operating liabilities. Exhibit 13.1 presents *Target's* footnote disclosure of accrued and other current liabilities from its 2016 annual report. Accrued and other current liabilities include liabilities such as wages and benefits, taxes payable, and gift card liability. The accounts payable of \$7,252 million plus accrued and other current liabilities of \$3,737 million represent about 42% of *Target's* total liabilities at January 28, 2017.

EXHIBIT 13.1 Disclosure of Accrued and Other Current Liabilities, *Target Corporation*, Financial Statements, January 28, 2017

NOTE 18: Accrued and Other Current Liabilities

Accrued and Other Current Liabilities (millions)	January 28, 2017	January 30, 2016
Wages and benefits	\$ 812	\$ 884
Gift card liability, net of estimated breakage	693	644
Real estate, sales and other taxes payable	571	574
Dividends payable	334	337
Straight-line rent accrual ^(a)	271	262
Income tax payable	158	502
Workers' compensation and general liability ^(b)	141	146
Interest payable	71	76
Other	686	811
Total	\$ 3,737	\$ 4,236

^(a) Straight-line rent accrual represents the amount of rent expense recorded that exceeds cash payments remitted in connection with operating leases.

^(b) We retain a substantial portion of the risk related to general liability and workers' compensation claims. Liabilities associated with these losses include estimates of both claims filed and losses incurred but not yet reported. We estimate our ultimate cost based on analysis of historical data and actuarial estimates. General liability and workers' compensation liabilities are recorded at our estimate of their net present value.

- 2 Discuss and illustrate the accounting for asset retirement obligations and required disclosures.

Asset Retirement Obligations

Asset retirement obligations (AROs) are long-term legal obligations to dismantle and scrap assets or to restore property used for business purposes. For example, companies may be obligated to restore property by dismantling oil and gas facilities, decommissioning nuclear power plants, and closing mining operations and landfills.⁷

Accounting for Asset Retirement Obligations

Accounting for an ARO requires estimating the fair value that the company would have to pay to retire the asset in today's market.⁸ Whereas the amount may appear to be straightforward to estimate, AROs are often related to very specific, unique assets. As a result, developing an ARO estimate may involve a substantial amount of judgment.

A company recognizes the amount of the ARO as a liability and records *accretion expense* over the life of the obligation using the effective interest rate method of amortization.⁹ **Accretion expense** is the expense, reported in operating income, resulting from the increase in the carrying amount of the liability. Companies capitalize the ARO liability amount as part of the initial carrying amount of the related asset: It is not a separate asset because there is no future economic benefit associated with the cost itself. The total cost of the related asset is increased by the ARO because of the requirement to restore the property upon project completion. A company depreciates the total cost of the asset, including the capitalized amount for the ARO, over its life. For example, in its 2016 financial statement, **Ford Company** disclosed that it reported asset retirement obligations of \$186 million in its other liabilities.

When retiring the asset, the company incurs the anticipated environmental remediation costs. If the actual costs are less than the balance in the ARO account, then the company will record a gain. If the actual costs are greater than the balance in the ARO account, the company will record a loss. Example 13.11 illustrates accounting for AROs.

EXAMPLE 13.11

Asset Retirement Obligations

PROBLEM: FuelCo built a gas station with underground tanks and put them in service on January 1, 2019, at a cost of \$500,000. The company estimates that the fuel tanks will have a useful life of 15 years and that the fair value of the costs to remove the fuel tanks will be \$75,000 at the end of 15 years. Further, the company assumes a 10% discount rate and depreciates the fuel tanks using the straight-line method with no residual value. In the fifteenth year, FuelCo closes the gas station, incurring environmental remediation costs of \$77,000. What is the amount of the ARO that the company should recognize in the current year? What are the necessary journal entries for 2019? What are the necessary journal entries to remove the gas station from FuelCo's books?

SOLUTION: FuelCo initially records the liability for the asset retirement at its present value and adds this same amount to the carrying value of the asset. During the life of the asset, FuelCo will record depreciation expense as well as accrue accretion expense on the obligation. When it closes the gas station, FuelCo will remove the asset and liability from its books and record any gain or loss, as necessary.

⁷For most of the relevant authoritative literature for this topic, see FASB ASC 410 – *Asset Retirement and Environmental Obligations* for U.S. GAAP. Under IFRS, reference to asset retirement obligations is made in IAS 16, *Accounting for Property, Plant and Equipment*, and further guidance is given in IFRIC 1, *Changes in Existing Decommissioning, Restoration and Similar Liabilities*, and IFRIC 5, *Rights to Interests Arising from Decommissioning, Restoration and Environmental Funds*.

⁸The FASB ASC 820 hierarchy is used to measure fair value and rank the reliability of fair value estimates from quoted market prices, market comparables, and management estimates and assumptions (e.g., discounted cash flow analysis).

⁹Accretion expense functions in the same way as interest expense.

We estimate the fair value of the ARO as the present value of the future removal costs. The present value of \$75,000 in 15 years at a 10% discount rate is \$17,954:

	N	I/Y	PV	PMT	FV	Excel Formula
Given	15	10.00%		0	-75,000	
Solve for PV			17,954			= PV(0.1, 15, 0, -75000)

The journal entry at the completion of construction is as follows:

Account	January 1, 2019
Gas Station	517,954
Asset Retirement Obligation	17,954
Cash	500,000

Each year, FuelCo will record depreciation of \$34,530 (\$517,954 / 15 years) as well as accretion expense on the obligation.

Account	December 31, 2019
Depreciation Expense – Gas Station	34,530
Accumulated Depreciation – Gas Station	34,530

The first year's accretion expense is \$1,795 (\$17,954 × 10%).

Account	December 31, 2019
Accretion Expense	1,795
Asset Retirement Obligation	1,795

After these entries are made, the new ARO balance is \$19,749 (\$17,954 + \$1,795).

In the second year through fifteenth year, FuelCo will again record depreciation and accretion expenses. Thus, by the end of the gas station's life, the balance in the ARO account will be \$75,000 (the future value of the present value of \$17,954) and the balance in the accumulated depreciation account will be \$517,954 (\$34,530 × 15 years, including rounding of \$4).

FuelCo is responsible for removing the fuel tanks. The total costs of removal are \$77,000 and, as a result, the company incurs a \$2,000 loss to settle the ARO (i.e., \$75,000 – \$77,000) because it costs more to liquidate the obligation than its carrying value. When FuelCo closes the site, the company must remove balances related to the gas station and record the settlement of the ARO as follows:

Account	End of 15th Year
Accumulated Depreciation – Gas Station	517,954
Gas Station	517,954

Account	End of 15th Year
Asset Retirement Obligation	75,000
Loss on Settlement of Asset Retirement Obligation	2,000
Cash	77,000

Footnote Disclosures: Asset Retirement Obligations

An entity is required to disclose all of the following information about its asset retirement obligations:

1. A general description of the asset retirement obligations and the associated long-lived assets.
2. The fair value of assets that are legally restricted for purposes of settling asset retirement obligations.

3. A reconciliation of the beginning and ending aggregate carrying amount of asset retirement obligations showing separately the changes attributable to the following components when there is a significant change in any of them during the reporting period:

- Liabilities incurred in the current period
- Liabilities settled in the current period
- Accretion expense
- Revisions in estimated cash flows

If a company cannot reasonably estimate the fair value of an asset retirement obligation, it must disclose this fact and the reasons why it cannot make a reliable estimate.

Exhibit 13.2 illustrates *Ford Motor Company's* disclosure of its ARO for its long-lived assets, such as buildings. *Ford's* AROs relate to the estimated costs for asbestos abatement and the removal of other regulated building materials. Notice that *Ford* includes the estimated ARO in the carrying value of its assets and reports a related liability.

EXHIBIT 13.2 Disclosure of Asset Retirement Obligations, *Ford Motor Company*, Financial Statements, December 31, 2016

[Excerpt from Ford Motor Company's 2016 Annual Report]

NOTE 11: Net Property and Lease Commitments:

Conditional Asset Retirement Obligations

Conditional asset retirement obligations relate to legal obligations associated with the retirement, abandonment, or disposal of tangible long-lived assets. Estimates of the fair value liabilities for our conditional asset retirement obligations that are recorded in *Other liabilities and deferred revenue* in the non-current liabilities section of our consolidated balance sheet at December 31 were as follows (in millions):

	December 31, 2015	December 31, 2016
Beginning balance	\$228	\$216
Liabilities settled	(6)	(2)
Revisions to estimates	(6)	(28)
Ending balance	<u>\$216</u>	<u>\$186</u>

Asset Retirement Obligations: IFRS

Accounting for AROs under IFRS differs in three main ways from U.S. GAAP:

- An obligation to restore property can be a legal obligation similar to U.S. GAAP accounting or an economic obligation. Therefore, AROs may be reported more frequently under IFRS.
- The obligation is estimated based on the costs rather than fair value of dismantling and removing any items or restoring the site.
- Estimated costs are discounted using a pre-tax interest rate and the risks specific to the liability. So, the analyses do not require the company to perform other detailed calculations on taxes. A pre-tax interest rate is higher than an after-tax interest rate, so the present value of the obligation would be lower. The accretion expense is referred to as interest expense.

Under IFRS, AROs are considered loss contingencies, which we discuss next.

- 3 Describe the accounting for gain and loss contingencies, including recognition and disclosures related to loss contingencies.

Gain and Loss Contingencies

Typically, companies are certain about the future amounts and timing of the cash disbursements required to liquidate their obligations. However, with *contingencies*, the amount and timing of future obligations are uncertain. A **contingency** is an existing condition, situation, or set of circumstances involving uncertainty that will ultimately be resolved when one or more future events occur or fail to occur.¹⁰

Although *loss contingencies* are most common, a *gain contingency* is also possible. We discuss both gain and loss contingencies in the remaining sections of this chapter.¹¹

The recognition of a contingent gain results in the recognition of an asset as well as the recognition of a gain (or revenue). Thus, by recording a contingent gain, a company recognizes revenue before it is realized. Firms typically disclose contingent gains in the footnotes only when there is high certainty of realization. As a result, contingent gains are often not recognized or disclosed in the financial statements due to conservatism.¹²

Gain Contingency

A **gain contingency** is an existing condition, situation, or set of circumstances involving uncertainty as to possible gain to an entity that will ultimately be resolved when one or more future events occur or fail to occur.¹³ A company serving as the plaintiff in a lawsuit that could receive a judgment in its favor is an example of a gain contingency. A gain contingency is often referred to as a *contingent asset* because recognition of a gain contingency results in an increase in an asset account.¹⁴

Loss Contingency

A **loss contingency** is an existing condition, situation, or set of circumstances involving uncertainty as to possible loss to an entity that will ultimately be resolved when one or more future events occur or fail to occur.¹⁵ Examples include a company that is a defendant in a pending lawsuit as well as warranties, premiums, coupons, and environmental remediation liabilities. A loss contingency is also referred to as a *contingent liability*. Recognition of a contingent liability either increases an obligation or reduces the carrying value of an asset.

While loss contingencies are a type of liability, they differ from other liabilities because they involve a substantial degree of uncertainty. Consider a company facing pending litigation. The event that gave rise to the liability has already occurred, but until the lawsuit is resolved, there is uncertainty as to the amount, timing, and the requirement to pay damages. That is, it is uncertain whether the company will be required to disburse any amounts and the amount of this payment.

¹⁰These elements are similar under U.S. GAAP, FASB ASC 450-10-20 – *Contingencies – Overall – Glossary*, and IFRS, IASC, *International Accounting Standard 37*, “Provisions, Contingent Liabilities and Contingent Assets” (London, UK: International Accounting Standards Committee, Revised), Paragraph 10.

¹¹For most of the relevant authoritative literature for this topic, see FASB ASC 450 – *Contingencies* for U.S. GAAP and IASC, *International Accounting Standard 37* for IFRS.

¹²An exception to this is certain income tax contingencies, such as net operating loss carryforwards and other income tax credit carryforwards. In these cases, companies typically recognize a tax asset and decrease income tax expense. Accruals and disclosures for income tax impacts of carryforwards are frequently reported by companies. We discuss this topic in greater detail in Chapter 17.

¹³FASB ASC 450-10-20.

¹⁴Tax loss carryforwards are another type of gain contingency discussed in Chapter 17.

¹⁵FASB ASC 450-10-20.

THE CONCEPTUAL FRAMEWORK CONNECTION

Loss Contingencies

Should a company report a loss contingency on the balance sheet? Specifically, is a contingent liability an actual obligation? The conceptual framework is a useful reference point for answering these questions. The three characteristics of a liability defined in the conceptual framework and noted earlier in the chapter are:

1. The entity will probably be required to make a future sacrifice to satisfy the obligation (for example, to disburse cash).
2. The entity has little or no option to avoid a future sacrifice.
3. The transaction or event giving rise to the obligation has already occurred.

In the case of loss contingencies, the second and third characteristics are met. The entity may indeed have no choice but to make a future sacrifice, and the event giving rise to the contingency has already occurred. The first condition is most difficult to measure and recognize because liabilities involve *probable* future sacrifices. Thus, the ability to recognize the contingency depends on the likelihood of required future disbursements. That is, the company must determine how “probable” is the need to make future payments and accrue a loss contingency only in cases when it is fairly certain that it will make a future sacrifice. In cases where it is not likely that the company will be required to make a future sacrifice, it will not accrue the contingency. Clearly, there is a significant degree of uncertainty regarding the decision whether or not to accrue the contingency.

Exhibit 13.3 presents the results of a survey of 500 U.S. companies. It demonstrates that loss contingencies are disclosed far more often than are gain contingencies.¹⁶

EXHIBIT 13.3 Percentage of Companies Reporting Contingencies

Source: AICPA, *U.S. GAAP Financial Statements: Best Practices in Presentation and Disclosure* – 2012 (New York, New York: AICPA, 2012).

Recognition and Measurement of Loss Contingencies

The criteria for determining how to treat a loss contingency are based on two factors:

1. The probability that the company will ultimately incur a loss.
2. The ability to reasonably estimate the amount of the potential loss.

The loss contingency must relate to an event that occurred in either the current or prior periods.

¹⁶The exhibit excludes contingencies related to income taxes. These types of gain contingencies are frequently disclosed by companies.

To assess whether a company will ultimately incur a loss, management must assess the likelihood of occurrence. That is, management must determine whether the loss *is probable, remote, or reasonably possible*:

- **Probable.** If the loss is likely to occur, it is considered probable. U.S. GAAP does not specify a probability level at which the loss becomes probable. However, “likely to occur” is a significantly higher threshold than “more likely than not.”
- **Remote.** The probability of occurrence is only slight.
- **Reasonably possible.** The probability of occurrence is less than likely but more than remote.

A company is able to make a reasonable estimate when it can measure the potential loss. Reasonable estimation can be a single-point estimate or a range of possible estimates.

Accounting for Loss Contingencies

Based on the company’s assessment of the probability of a loss and its ability to reasonably estimate the amount, there are three possible accounting alternatives for contingencies:

1. **Accrue a loss contingency.** Recognize the event in the current financial statements with adequate footnote disclosure.
2. **Disclose a loss contingency.** Include a footnote disclosure, but do not accrue the contingency.
3. **Do not recognize or disclose a contingency.** Do not accrue the contingency, and do not disclose the contingency in the footnotes.

We will discuss each of these three accounting alternatives in detail.

Accrue a Loss Contingency. A company records (accrues) the contingent loss only if, prior to issuing financial statements, it meets the following two conditions:

1. There is evidence that it is probable that the company has incurred a liability (or an asset has been impaired) as of the date of the financial statements.
2. The company can reasonably estimate the amount of the loss.

Often management can estimate a range for the loss but cannot identify a single most likely outcome within that range. In this case, it accrues the minimum point of the range. Companies can also discount contingent liabilities to their present value when the amount of the liability and the timing of the payments are fixed or reliably determinable.

Disclose a Loss Contingency. A company is generally required to disclose a loss contingency even if it does not meet the two criteria required to accrue the loss.

Disclosure of the loss contingency is required in two cases:

1. If a loss is probable but not reasonably estimable.
2. The loss is reasonably possible even if the amount is not reasonably estimable.

Do Not Recognize or Disclose a Loss Contingency. Firms do not disclose (or record) an estimated loss if the probability of occurrence is remote. However, to provide financial statement users with complete information, a company might make some disclosure of the event. For example, a footnote can include a description of the event and a statement that the company does not expect the loss to have a material effect on the financial statements.

Exhibit 13.4 summarizes the accounting and disclosures requirements for loss contingencies.

EXHIBIT 13.4 Loss Contingency Accounting and Disclosures

Probability of the Occurrence	Amount of the Loss	
	Can Be Reasonably Estimated	Cannot Be Reasonably Estimated
Probable	Liability accrued with adequate footnote disclosure	Footnote disclosure only
Reasonably possible	Footnote disclosure only	Footnote disclosure only
Remote	No footnote disclosure required	No footnote disclosure required

Accounting for Contingencies: IFRS

The terminology used for contingencies is somewhat different under IFRS than under U.S. GAAP. Under IFRS, a contingency is called a **provision** when a company reports it as an obligation or an asset. The terms *contingent loss* and *contingent gain* refer to uncertainties only that a firm discloses, not recognizes.¹⁷ Despite the difference in terminology, the accounting for loss contingencies under IFRS is similar to U.S. GAAP, except for the following three differences:

- **Definition of probable.** Where U.S. GAAP defines probable as “likely,” IFRS defines probable as “more likely than not,” which is greater than 50% probable. Thus, some contingencies that would not be reported on the balance sheet under U.S. GAAP will be reported under IFRS.
- **Estimate in a range.** When a company can estimate a range for the loss, but cannot identify a single most-likely outcome within that range, IFRS requires that it accrue the midpoint of the range rather than the minimum as under U.S. GAAP.
- **Discounting.** IFRS reporters take into account the time value of money when evaluating contingent liabilities and discount the liability, when material. Recall that U.S. GAAP reporters can discount contingent liabilities to their present value when the amount of the liability and the timing of the payments are fixed or reliably determinable.

EXHIBIT 13.5 U.S. GAAP versus IFRS: Accounting for Loss Contingencies

	Definition of Probable	Estimate in a Range	Discounting
U.S. GAAP	Likely to occur	Minimum in range	Generally not measured at present value, but discounting is not prohibited.
IFRS	More likely than not, which is 50% or more	Midpoint in range	Measure the liability at its present value, if material.

Exhibit 13.5 summarizes the key significant differences between U.S. GAAP and IFRS in accounting for contingencies.

Under IFRS, unless the possibility of loss is remote, a company discloses the contingency. As with U.S. GAAP, an IFRS reporter’s footnote disclosure should include a description of the nature of the contingency and an estimate of the possible loss, an estimated range of the loss, or a statement that it cannot make an estimate of the loss.

- 4 Demonstrate the accounting for common loss contingencies involving litigation, warranties, and premiums.

Loss Contingencies: Litigation, Warranties, and Premiums

Now that we have a basic understanding of loss contingencies, we will examine some common examples: accounting for litigation, *warranties*, and *premiums*.

Accounting for Litigation

It is common for companies to record or disclose a loss contingency related to litigation. For example, **DuPont**, the large chemical company, agreed in 2017 to settle for \$671 million a lawsuit related to litigation alleging health problems after a chemical used to make Teflon got into drinking water. At the end of 2016, **DuPont** had accrued a contingent liability of \$117 million related to this litigation.

The rules for litigation-related loss contingencies are the same as for other contingencies. That is, a company accrues the contingent litigation liability only when, prior to issuing financial statements, there is evidence that it is probable that it has incurred a liability as of the date of the financial statements and, in addition, the company can reasonably estimate the amount of the loss.

¹⁷ IASC, *International Accounting Standard 37*, “Provisions, Contingent Liabilities and Contingent Assets.”

In order to accrue the liability, the event(s) giving rise to the lawsuit must have occurred before the company's year-end. However, it is not necessary for the company to be aware of the pending litigation at year-end—yet it must be aware of the litigation before issuing the financial statements. Example 13.12 illustrates accounting for a loss contingency.

EXAMPLE 13.12 **Accrual of a Loss Contingency**

PROBLEM: In June of 2018, a customer at Oh So Good Restaurant slipped on a wet floor and broke a hip. The customer sued the corporation in July 2018. The company's attorneys believe that it is 99% likely that Oh So Good will lose this case and estimate that the loss will range between \$500,000 and \$800,000. There is no best estimate in this range of possible losses. What is the journal entry to record the contingent liability on the December 31 financial statements?

SOLUTION: Oh So Good will record a contingent liability of the \$500,000 minimum point in the range. Thus, the journal entry is as follows:

<i>Account</i>	<i>December 31, 2018</i>
Litigation Loss	500,000
Contingent Litigation Liability	500,000

Oh So Good must disclose details regarding the potential loss due to litigation in the footnotes to the financial statements.

It was probable that the loss would occur in Example 13.12. If the loss is not probable, then it cannot be accrued but can be disclosed in the footnotes to the financial statements as Example 13.13 illustrates.

EXAMPLE 13.13 **Disclosure or Accrual of a Loss Contingency**

PROBLEM: In June 2018, a customer at Oh So Good Restaurant slipped on a wet floor and broke a hip. The customer sued the corporation in July, 2018. The company's attorneys believe that it is 55% likely that Oh So Good will lose this case. Management concludes that the 55% likelihood of incurring the loss is less than probable. The attorneys estimate that the loss will range between \$500,000 and \$800,000. There is no best estimate in this range of possible losses. How should Oh So Good report the loss contingency in its financial statements?

SOLUTION: Oh So Good will not record a contingent liability because the 55% likelihood of incurring the loss is less than probable. While the 55% is not probable, it is reasonably possible. Therefore, Oh So Good must disclose details regarding the potential loss due to litigation in the footnotes to the financial statements. An example of this footnote might read as follows:

Note 5: Litigation

The company is currently the defendant in a lawsuit for an injury claim by one of our customers. Based on consultation with legal counsel, we believe that it is not likely that we will be found responsible for such a claim. However, the range of possible losses is between \$500,000 and \$800,000.

Accounting for Litigation: IFRS

IFRS reporters follow the same rules for litigation-related loss contingencies as for other contingencies as summarized in Exhibit 13.5. Example 13.14 applies the IFRS criteria to determine the accounting for the lawsuits from Examples 13.12 and 13.13.

EXAMPLE 13.14**Accrual of a Loss Contingency: IFRS**

PROBLEM: A customer at Oh So Good Restaurant slipped on a wet floor and broke a hip in June 2018. The customer sued the corporation in July 2018. The attorneys estimate that the loss will range between \$500,000 and \$800,000. There is no best estimate in this range of possible losses. What is the journal entry to record the contingent liability under IFRS in the December 31 financial statements if the company's attorneys believe that it is 99% likely that Oh So Good will lose this case? What is the journal entry to record the contingent liability under IFRS in the December 31 financial statements if the company's attorneys believe that it is 55% likely that Oh So Good will lose this case?

SOLUTION: Oh So Good will record a contingent liability under IFRS under both the 99% and 55% likely scenarios as both probabilities are greater than 50%. Under IFRS, it will record the midpoint in the range. The midpoint is \$650,000, computed as $(\$500,000 + \$800,000)/2$. Thus, the journal entry under both scenarios is as follows:

Account	December 31, 2018
Litigation Loss	650,000
Litigation Provision	650,000

Oh So Good must disclose details regarding the potential loss due to litigation in the footnotes to the financial statements under IFRS.

Accounting for Warranty Costs

A **warranty** is a company's promise or guarantee to repair or replace any defective goods for a specified period of time after the date of purchase. There are two types of warranties: *assurance-type warranties* and *service-type warranties*. An **assurance-type warranty** (also referred to as a *base warranty*) does not provide an additional good or service to the customer. The seller is merely providing a guarantee of quality. A **service-type warranty** (also referred to as an *extended warranty*) exists if the customer has the option to purchase the warranty separately or if the warranty provides a service to the customer beyond the period covered by the assurance-type warranty.

At times, it is difficult to determine whether a warranty is an assurance-type or a service-type warranty. Accordingly, the authoritative literature provides three factors that companies should consider when making this determination:

1. If the warranty is required by law, it is more likely to be an assurance-type warranty because such laws exist to protect customers from purchasing defective products.
2. Warranties that cover longer time periods are more likely to be service-type warranties because they are more likely to provide a service beyond a guarantee of quality.
3. If the nature of the promised tasks entails specific tasks to provide assurance that a product complies with certain standards, then it is more likely that the warranty is an assurance-type warranty.

We discuss the accounting treatment for each type of warranty.

Assurance-Type Warranty. An assurance-type warranty is the manufacturer's promise to repair or replace the product free of charge to the customer if product failure occurs within a specified period of time (such as 1 year from the date of purchase). For example, **Ford Motor Company** offers warranties on its cars. During 2016, **Ford** reported warranty expense of \$3,686 million and made warranty claim payments of \$3,286 million. At the end of 2016, **Ford's** warranty liability was \$4,960 million, or about 11.8% of current liabilities in its automotive segment.

The repair costs covered by the seller's warranty include both parts and labor. The time period for coverage under an assurance-type warranty depends on the type of product. For instance, the typical laptop computer warranty is usually for a 1-year period whereas an automobile warranty is usually for 3 years or a mileage limit, whichever comes first.

Ideally, firms account for assurance-type warranties by using an accrual-basis approach. With the accrual-basis approach, the firm matches the cost of providing the warranty with sales revenue. Specifically, the firm expenses the estimated expenditures related to providing the repairs or product replacement in the year of the sale and accrues the estimated liability for repair costs in the year of the sale. Customer claims under warranty (in the year the actual repair takes place) satisfy the liability without charging any additional expenses. So, the firm recognizes the expense in the year of the sale, not in the year the repairs take place. Example 13.15 shows the accrual-basis approach.

EXAMPLE 13.15**Assurance-Type Warranty: Accrual-Basis Approach**

PROBLEM: Lark Associates manufactures and distributes component parts for car audio systems. Lark's assurance-type warranty covers all repair costs, including parts and labor, for 2 years after the date of sale. During the current year, Lark sold \$4,000,000 of component parts to several manufacturers of car audio systems. Ignore cost of goods sold. The company estimates that warranty costs will be 4% of sales. Lark did not make any repairs in the year of the sale. However, during the following year, the company incurred \$56,000 in warranty claims. The repair costs include \$32,000 in parts and \$24,000 in labor (unpaid). Lark uses the accrual basis to account for its assurance-type warranty costs. What journal entries are necessary to record these transactions?

SOLUTION: Under the accrual method, Lark records an estimated warranty expense of \$160,000 ($\$4,000,000 \times 4\%$) in the year of sale. In this way, Lark matches the warranty expense with revenue in the year of the sale. There is no additional warranty expense recognized when the actual repairs take place. When the products are repaired, Lark credits any cash disbursed, parts used, labor incurred, and such, and debits the warranty liability account. That is, the actual repair represents the performance required to liquidate the warranty obligation.

Lark makes the following entries in the year of the sale and in the period in which it makes the actual repairs.

<i>Account</i>	<i>Year of the Sale</i>	
Cash (or Accounts Receivable)	4,000,000	
Sales Revenue		4,000,000
Warranty Expense	160,000	
Contingent Warranty Liability		160,000

<i>Account</i>	<i>Year of Actual Repair</i>	
Contingent Warranty Liability	56,000	
Parts Inventory		32,000
Wages Payable		24,000

Companies use the cash-basis approach to account for assurance-type warranties when the amount of the repair cost is not subject to reasonable estimation. Under the cash-basis approach, companies charge warranty costs to expense only in the period when the related repairs take place (that is, not in the year of the sale). In addition, companies do not record any liability for future repairs using a cash basis. This approach is theoretically deficient because it fails to report cost and revenues in the year of the sale. An example of the cash-basis approach is provided in Example 13.16.

EXAMPLE 13.16**Base Warranty: Cash-Basis Approach**

PROBLEM: Lark Associates manufactures and distributes component parts for car audio systems. Lark's assurance-type warranty covers all repair costs, including parts and labor, for 2 years after the date of sale. During the current year, Lark sold \$4,000,000 of component

Continued

parts to several manufacturers of car audio systems. Ignore cost of goods sold. The company cannot estimate the future warranty costs. Lark did not make any repairs in the year of the sale. However, during the following year, the company incurred \$56,000 in actual warranty claims. The repair costs included \$32,000 in parts and \$24,000 in labor (unpaid). Lark uses the cash-basis to account for its assurance-type warranty costs. What are the necessary journal entries related to these transactions?

SOLUTION: Lark does not make any journal entries for the warranties in the year of sale under the cash-basis approach and instead only records the sale as follows:

Account	Year of Sale
Cash (or Accounts Receivable)	4,000,000
Sales Revenue	4,000,000

Lark makes the following entry in the year of the actual repairs:

Account	Year of Actual Repair
Warranty Expense	56,000
Parts Inventory	32,000
Wages Payable	24,000

Note that Lark charges the expense in a year subsequent to the sale and fails to match the warranty costs with current period sales revenue.

Service-Type Warranty. A service-type warranty is essentially an insurance policy that covers the repair of the product purchased for a period beyond the assurance-type warranty time limit. The service-type warranty is often sold separately from the product. The time period for service-type warranties varies greatly because they are product and provider specific.

When a company sells the warranty contract, it accounts for the warranty as an advance collection and records a liability for unearned revenue.¹⁸ As time passes and warranty coverage is provided, the company earns the revenue and records it on the income statement. Companies usually amortize the unearned revenue for service-type warranty contracts by using the straight-line method unless some other pattern of revenue recognition is considered more appropriate under the circumstances. For example, *GameStop Corporation* sells product replacement plans, a service-type warranty. *GameStop* recognizes revenue on the product replacement plans on a straight-line basis over the coverage period. Example 13.17 demonstrates the accounting for a service-type warranty.

EXAMPLE 13.17 Service-Type Warranty

PROBLEM: Good Buys, Inc. offers a 1-year assurance-type warranty on each television sold. The company also sells a 3-year service-type warranty contract for its televisions. On January 1, 2019, Good Buys sold \$300,000 of service-type warranties and received cash. The service-type warranty contracts are effective immediately and cover the period from January 1, 2019, through December 31, 2021. Good Buys incurred costs of \$78,000 in 2020 related to the warranties; \$50,000 of this cost was for parts, and the remaining \$28,000 was for labor (unpaid). Provide the necessary journal entries to account for the service-type warranty contract over the January 1, 2019, through December 31, 2021, period.

¹⁸If the warranty is sold in a package with the product, then the warranty is considered a separate performance obligation and a portion of the transaction price is allocated to the warranty based on the standalone selling prices of the product and the warranty. See Chapter 8 for more discussion of the allocation of a transaction price to separate performance obligations.

SOLUTION: At the time of sale, Good Buys records the sale of service-type warranty contracts as unearned revenue. The journal entry is as follows:

Account	January 1, 2019	
Cash	300,000	
Unearned Warranty Revenue		300,000

Once the warranty period begins (January 1, 2019), Good Buys recognizes one-third of the unearned revenue as revenue earned each year. Revenue recognition is based on the warranty coverage provided. Thus, Good Buys makes the following adjusting journal entry at the end of each year in 2019 through 2021.

Account	December 31, 2019, 2020, and 2021	
Unearned Warranty Revenue	100,000	
Warranty Revenue		100,000

Finally, Good Buys records the actual expenses incurred in 2020. Note that unlike the assurance-type warranty, costs incurred under a service-type warranty contract are charged to warranty expense because an estimated contingent liability is not established in the year of the sale.

Account	During 2020	
Warranty Expense	78,000	
Parts Inventory		50,000
Wages Payable		28,000

Warranty Accounting in Practice. If you had a choice between two alternative products, one with a warranty and another without, which one would you buy? Most people would prefer to purchase the warranty-backed product. As a result, offering assurance-type warranty coverage increases product sales. For example, to increase sales volume, automobile manufacturers extend the period of warranty coverage they offer. An increased warranty coverage period can be as effective a sales incentive as lower interest rates or cash rebates.

As noted earlier, the cash-basis approach is theoretically deficient because it does not address the effect of an assurance-type warranty on increasing sales volume. That is, it mismatches costs and revenue by recording the warranty expense in a period other than the year of the sale. Because the warranty increases sales, the seller should recognize the expense of providing that warranty in the year of sale. The matching principle supports this approach in the same way that a company recognizes the bad debt expense in the year of the sale under the allowance method. The theoretical deficiencies of the cash-basis approach make the accrual-basis approach preferable in practice.

Exhibit 13.6 illustrates a disclosure from *Deere & Company*, the manufacturer of agricultural machinery, of the warranty coverage it offers on its products. Notice *Deere's* 2016 reconciliation of warranty liability with an ending balance of \$1,226 million of which \$447 million is related to service-type warranties (referred to as extended warranties in the disclosure).

Accounting for Premiums

Loss contingencies also result when companies offer *premiums* to stimulate sales. **Premiums** are promotional items such as toys, t-shirts, coffee mugs, or other collectables featuring a brand name that a company offers to buyers of specific products. Typically, the buyer will need to mail in box tops or redeem codes online to obtain the premium.¹⁹ Using the accrual basis of accounting, firms account for premiums in the same way as other contingency liabilities. That is, they estimate the

¹⁹Companies may also offer coupons or cash rebates. Customers can redeem coupons when purchasing the product and thus receive a discount on the selling price. In some cases, a company may use mail-in rebates. Customers must mail in a copy of the sales receipt and a rebate form to receive cash back on the purchase. Cash rebates are cash awards that companies offer to buyers of certain products.

EXHIBIT 13.6 Warranty Disclosure, *Deere & Company*, Financial Statements, October 31, 2016

[Excerpt from *Deere & Company's* 2016 Annual Report]

NOTE 22: Commitments and Contingencies

The company generally determines its warranty liability by applying historical claims rate experience to the estimated amount of equipment that has been sold and is still under warranty based on dealer inventories and retail sales. The historical claims rate is primarily determined by a review of five-year claims costs and current quality developments.

The premiums for the company's extended warranties are primarily recognized in income in proportion to the costs expected to be incurred over the contract period. The unamortized extended warranty premiums (deferred revenue) included in the following table totaled \$447 million and \$454 million at October 31, 2016 and 2015, respectively.

A reconciliation of the changes in the warranty liability and unearned premiums in millions of dollars follows:

	Warranty Liability/ Unearned Premiums	
	2016	2015
Beginning of year balance	\$ 1,261	\$1,234
Payments	(783)	(779)
Amortization of premiums received	(202)	(161)
Accruals for warranties	758	810
Premiums received	181	209
Foreign exchange	11	(52)
End of year balance	<u>\$1,226</u>	<u>\$1,261</u>

Source: Financial Statements from Deere & Company's 2016 Annual Report. https://s2.q4cdn.com/329009547/files/doc_financials/annual_reports/2016/2016_John-Deere-Annual-Report.pdf

costs associated with the incentive plans and record these costs along with the contingent liability related to the future obligation in the accounting period when the sales revenue is recognized. An example is *Johnson & Johnson's* reported promotion expense of \$1,908 million and an accrued promotions liability in its consumer segment of \$358 million at the end of 2016. Accounting for premiums is illustrated in Example 13.18.

EXAMPLE 13.18 Accounting for Premiums

PROBLEM: Full of Sugar, Inc. offered its customers a free toy dog in exchange for 10 box tops from its cereal. During 2018, Full of Sugar purchased 15,000 stuffed dogs at \$2 each and sold 1 million boxes of cereal at \$4 each. The company recorded cereal inventory at a cost of \$3 per box. Full of Sugar did not receive any box tops during 2018, but the company anticipated that 20% of its consumers would redeem box tops. In 2019, consumers mailed 120,000 box tops to Full of Sugar for redemption. The company uses the perpetual inventory system. Provide all necessary journal entries for these transactions.

SOLUTION: In the current year, Full of Sugar needs to record the cereal sales as well as the purchase of the stuffed dog inventory. The company records revenue of \$4,000,000 ($\$4 \times 1,000,000$ boxes) and cost of goods sold of \$3,000,000 ($\$3 \times 1,000,000$ boxes).

Account	Year of the Sale (2018)
Cash (or Accounts Receivable)	4,000,000
Sales Revenue	4,000,000

Account	Year of the Sale (2018)
Cost of Goods Sold	3,000,000
Cereal Inventory	3,000,000

It records the purchase of the stuffed dog inventory of \$30,000 ($\$2 \times 15,000$ units).

Account	Year of the Sale (2018)
Stuffed Dog Inventory	30,000
Cash (or Accounts Payable)	30,000

It also accrues the contingent liability related to this premium offer. We compute the premium liability and expense as follows:

Boxes of cereal sold	1,000,000
Expected redemption	20%
Estimate of box tops redeemed	200,000
Number of box tops per dog	$\div 10$
Estimated stuffed dogs required	20,000
Cost per stuffed dog	$\times \$2$
Contingency to be Accrued	<u>\$40,000</u>

Account	Year of the Sale (2018)
Premium Expense	40,000
Contingent Premium Liability	40,000

In 2019, Full of Sugar records the redemption of the 120,000 box tops. Because customers were required to send in 10 box tops for each stuffed dog, Full of Sugar will ship and deliver 12,000 stuffed dogs (120,000 box tops / 10 box tops per premium) at a cost of \$2 per dog.

Account	2019
Contingent Premium Liability	24,000
Stuffed Dog Inventory	24,000

Kellogg Company, the leading cereal maker, discussed the estimates required in accounting for premiums (promotional expenditures) in its 2016 annual report as shown in Exhibit 13.7. **Kellogg** also commented on the size of the premiums (0.4% of net sales, or about \$52 million) and potential effect of changes in these estimates.

EXHIBIT 13.7 Disclosure of Estimates Required in Accounting for Premiums, **Kellogg Company**, Financial Statements, December 31, 2016

Promotional Expenditures

Our promotional activities are conducted either through the retail trade or directly with consumers and include activities such as in-store displays and events, feature price discounts, consumer coupons, contests, and loyalty programs. The costs of these activities are generally recognized at the time the related revenue is recorded, which normally precedes the actual cash expenditure. The recognition of these costs therefore requires management judgment regarding the volume of promotional offers that will be redeemed by either the retail trade or consumer. These estimates are made using various techniques including historical data on performance of similar promotional programs. Differences between estimated expense and actual redemptions are normally insignificant and recognized as a change in management estimate in a subsequent period. On a full-year basis, these subsequent period adjustments represent approximately 0.4% of our company's net sales. However, our company's total promotional expenditures (including amounts classified as a revenue reduction) are significant, so it is likely our results would be materially different if different assumptions or conditions were to prevail.

Source: Financial Statements from Kellogg Company's Annual Report, December 31, 2016. <http://investor.kelloggs.com/~media/Files/K/Kellogg-IR/Annual%20Reports/kellogg-2016-ar-10-k.pdf>

JUDGMENTS IN ACCOUNTING For Contingencies

Proper accounting for contingencies involves a significant amount of judgment skills. In a survey of 175 companies, 46% reported making estimates and using judgment in reporting their contingent liabilities.²⁰

U.S. GAAP does not define “probable,” lending additional complexity to the issue. Therefore, management, with the help of attorneys, must assess both the probability of a future disbursement and whether that probability qualifies as “probable.” Making a quantitative assessment of an event that may or may not occur in the future is more art than science. Contingencies such as warranties are fairly easy to estimate. A future disbursement will be necessary and past product performance serves as a guide. However, a potential loss involving litigation is far less clear. Whereas attorneys may be able to assess the probability of the potential loss, the ultimate outcome of many lawsuits is quite difficult to predict.

Once management has assessed that a future obligation is probable, they must estimate the amount of the potential loss. In many cases, the estimate is very subjective—and the amounts in consideration can be substantial. As an example, consider the 2016 annual report from *DuPont*, the large chemical company. *DuPont’s* disclosure related to litigation contingencies is four pages long. The company reports on litigation and contingent liabilities accrued including the \$117 million related to a chemical used at various sites including one in West Virginia. In early 2017, *DuPont* settled related lawsuits in West Virginia and Ohio for \$671 million. Exhibit 13.8 presents an excerpt from *DuPont’s* footnote disclosure on its contingencies in its 2016 financial statements.

EXHIBIT 13.8 Contingencies, Commitments, and Guarantees Disclosure, *DuPont*, Financial Statements, December 31, 2016

NOTE 15: Commitments and Contingencies

The company is subject to various legal proceedings arising out of the normal course of its business including product liability, intellectual property, commercial, environmental and antitrust lawsuits. It is not possible to predict the outcome of these various proceedings. Although considerable uncertainty exists, management does not anticipate that the ultimate disposition of these matters will have a material adverse effect on the company’s results of operations, consolidated financial position or liquidity. However, the ultimate liabilities could be material to results of operations in the period recognized.

PFOA

DuPont used PFOA (collectively, perfluorooctanoic acids and its salts, including the ammonium salt), as a processing aid to manufacture some fluoropolymer resins at various sites around the world including its Washington Works plant in West Virginia. At December 31, 2016, DuPont has an accrual balance of \$117 related to the PFOA matters. . . .

Interview

CATHY ENGELBERT
CHAIRMAN AND CEO,
DELOITTE & TOUCHE LLP»

Catherine Engelbert

Cathy Engelbert is Chairman and Chief Executive Officer of Deloitte & Touche LLP, the U.S. accounting, auditing, and risk advisory subsidiary of Deloitte LLP. She leads the Audit practice. During her 28-year career, including the past 16 years as a partner, she has a distinguished record working with several of Deloitte's largest and most complex global clients. She has served as the lead partner at several large global life sciences companies.*

- 1** What are some of the most critical issues facing an auditor when assessing the likelihood of a loss contingency?

Some critical issues that are inherent to the assessment of loss contingencies relate to the evaluation of the available audit evidence and include:

1. Evaluating whether management's controls, policies, and procedures are sufficient to identify, evaluate, and account for litigation, claims, and assessments.
2. Understanding and testing the assumptions management uses to evaluate the likelihood and amount of a loss contingency.
3. Evaluating limitations in legal responses, including the potential to limit the scope of the audit.
4. Determining whether management has the ability to assess the likelihood of a loss contingency.

- 2** What common cost elements are included in the amount of a loss contingency to either accrue or disclose?

As an example, consider litigation, a common form of loss contingency. The primary cost element is the probable payment(s) required to settle the litigation. The legal fees that an entity has incurred or are likely to incur are an additional cost component. Companies should disclose their policy for accruing legal costs—and should identify whether they record legal costs “as incurred” or within the overall accrual for the related loss contingency, as well as where they classified these costs in the statement of operations.

*As used in this document, “Deloitte” means Deloitte & Touche LLP, a subsidiary of Deloitte LLP. Please see www.deloitte.com/us/about for a detailed description of the legal structure of Deloitte LLP and its subsidiaries. Certain services may not be available to attest clients under the rules and regulations of public accounting. Member of Deloitte Touche Tohmatsu Limited.

- 3** What types of estimates determine whether the estimated loss or range of possible losses is reasonable?

The types of estimates that determine a reasonable estimate of loss, or range of loss, are based on the facts and circumstances surrounding the loss contingency. However, the Codification provides a framework of factors to consider, including:

- The nature of the litigation, claim, or assessment
- The progress of the matter
- The opinions or views of legal counsel and other advisers
- The experience of the entity in similar cases
- The experience of other entities
- Any decision of the entity's management as to how the entity intends to respond to the lawsuit, claim, or assessment

- 4** What specific factors can a client use to justify its decision not to disclose an amount for a loss contingency or range of losses?

For a loss contingency, the Codification requires an entity to disclose an estimate of the possible loss, or range of loss, or to provide a statement that such an estimate cannot be made, which may lead the staff of the U.S. Securities and Exchange Commission (SEC) to request supplemental information. The inability to determine a possible loss, or range of loss, is based on the specific facts and circumstances surrounding the contingency. For example, an entity might cite early-stage litigation as a significant factor for concluding that it cannot determine a loss for disclosure. The SEC considers the case facts and circumstances.

- 5** Under what circumstances can a client disclose a gain contingency?

Many factors, including judgment, fact, and circumstance assessment, help determine whether an entity discloses a gain contingency. The Codification states that “adequate disclosure shall be made of a contingency that might result in a gain, but care shall be exercised to avoid misleading implications as to the likelihood of realization.” (ASC 450-30-50-1) In addition, the resolution of a gain contingency after the balance sheet date, but before issuance of the financial statements, should be considered a non-recognized subsequent event that may need to be disclosed.

Discussion Questions

1. Cathy Engelbert indicates several issues that auditors face when assessing the probability of a contingent loss and a range of possible losses. Discuss the ways in which U.S. GAAP and IFRS estimates of contingent losses can differ.
2. Cathy Engelbert mentions several circumstances that could result in the disclosure of a gain contingency. Discuss the advantages and disadvantages of disclosing gain contingencies for a financial statement user.

Required Disclosures for Contingencies

We discuss the required disclosures for contingencies in this section of the chapter.

Loss Contingency Accruals. A company that accrues a loss contingency should disclose the nature of the accrual. In some circumstances, it may be necessary for the entity to disclose the amount accrued to avoid misleading financial statement users. The firm must also include a disclosure indicating that it is at least reasonably possible that the estimate of the probable liability could change in the near term.

Unrecognized Contingencies. A company must disclose a contingency if it is at least reasonably possible that it may have incurred a loss (or an additional loss) that did not meet the conditions for the recognition of a loss contingency (i.e., both probable and subject to reasonable estimation). In other words, contingencies should not be accrued but should be disclosed if they are either (1) probable, but not estimable, or (2) reasonably possible. Exhibit 13.4 summarized the accrual and disclosure scenarios for contingent losses.

The disclosure should include:

1. The nature of the contingency
2. An estimate of the possible loss or range of loss or a statement that such an estimate cannot be made

Companies should disclose any loss contingency that is probable or reasonably possible but is not accrued because they cannot reasonably estimate the amount of loss.

In general, disclosure is not required for a loss contingency involving an unasserted claim if the potential claimant has not made the company aware of the possible claim. However, if it is probable that a claim will be asserted or there is a reasonable possibility that the outcome will be unfavorable, then the contingency should be disclosed.

Gain Contingencies. When the probability of occurrence is nearly certain, companies typically disclose a gain contingency in order to avoid any misleading implications as to the likelihood of realization.

Required Disclosures for Contingencies: IFRS

Under IFRS, companies must also disclose the following for each type of contingency accrued:

- The carrying amount at the beginning and end of the year
- Additional amounts expensed during the year
- Amounts used during the year
- Unused amounts reversed during the year
- Any increase during the year in the discounted amount due to passage of time and the effect of any change in the discount rate

FINANCIAL STATEMENT ANALYSIS

More on Liquidity

We introduced the importance and usefulness of liquidity analysis in Appendix B of Chapter 6. Liquidity is a company's ability to meet current obligations from short-term resources. We now extend the discussion with a focus on refinements of key balance sheet liquidity ratios.

In Chapter 6, we indicated that working capital and the current ratio are two basic measures of liquidity. Working capital is current assets less current liabilities. The higher the working capital, the more current resources the firm has to meet its current obligations as they come due. The current ratio is current assets divided by current liabilities.

Using total current assets in these measures assumes that firms can quickly convert all current assets to pay obligations when due. In practice, this is not always feasible. For example, inventory is a current asset that must be sold before the firm collects cash. Further, firms often sell inventory on account, so the accounts receivable would also have to be collected. Three additional liquidity ratios address this limitation:

1. *Quick or acid test ratio*
2. *Cash ratio*
3. *Defensive interval ratio*

The **quick or acid test ratio** modifies the current ratio by including only the current assets that the firm expects to convert into cash quickly. As a result, the numerator normally includes only cash and cash equivalents, short-term marketable securities, and accounts receivable.

Quick or Acid Test Ratio =

$$\frac{\text{Cash and Cash Equivalent} + \text{Short-term Marketable Securities} + \text{Accounts Receivable}}{\text{Current Liabilities}} \quad (13.1)$$

The quick ratio is always lower than the current ratio. Similar to the current ratio, a quick ratio of more than 1 typically indicates that a company has sufficient resources to meet its current obligations. If the ratio is too high, however, the company might be holding too much cash or short-term securities and forgoing more profitable investment opportunities.

The cash ratio includes only cash and cash equivalents and highly liquid short-term marketable securities in the numerator. It is a conservative measure of liquidity, representing a company's ability to immediately meet current obligations.

$$\text{Cash Ratio} = \frac{\text{Cash and Cash Equivalents} + \text{Short-term Marketable Securities}}{\text{Current Liabilities}} \quad (13.2)$$

A high cash ratio indicates great liquidity. Short-term marketable securities are measured at fair value. If a company maintains relatively constant levels of cash and cash equivalents and current liabilities, changes in the fair value of the marketable securities could cause this ratio to vary. For example, if the stock markets are performing poorly and security values decline, then the cash ratio will be lower.

Finally, the **defensive interval ratio** gauges liquidity based on current resources available to meet current cash expenditures.

Defensive Interval Ratio =

$$\frac{\text{Cash and Cash Equivalents} + \text{Short-term Marketable Securities} + \text{Accounts Receivable}}{\text{Daily Cash Expenditures}} \quad (13.3)$$

Financial Statement Analysis, continued

$$\frac{\text{Daily Cash Expenditures} = \text{Cost of Goods Sold} + \text{Selling, General, and Administrative Expenses} + \text{Research and Development Expenses} - \text{Depreciation and Amortization Expense}}{\text{Number of Days in Period}} \quad (13.4)$$

The defensive interval ratio measures the number of days a company can operate without receiving additional cash inflows. Daily cash expenditures is the total cash expenditures for a period divided by the number of days in the period. To estimate daily cash expenditures, first sum the income statement expenses: cost of goods sold; selling, general, and administrative expenses; and research and development expenses. From this sum, then subtract any noncash expenses included such as depreciation and amortization. The longer a company can operate given its current resources, the more liquid it is.

When using any ratio—including current liabilities—beware of the existence of contingent liabilities. Depending on the probability, ability to estimate a contingent liability, and expected payment timeframe, a contingent liability may or may not be included in current liabilities. Financial statements users can also consider contingencies that are disclosed but not reported on the balance sheet in analyzing a company's liquidity. A liquidity analysis of *Johnson & Johnson* is shown in Example 13.19.

EXAMPLE 13.19 Liquidity Analysis of *Johnson & Johnson*

PROBLEM: Using information from *Johnson & Johnson's* 2015 and 2016 financial statements, answer the following questions about the company's liquidity.

- Compute *Johnson & Johnson's* quick ratio for each year.
- Compute *Johnson & Johnson's* cash ratio for each year.
- Compute *Johnson & Johnson's* defensive interval ratio for each year.
- Comment on changes in *Johnson & Johnson's* liquidity from 2015 to 2016 based on the ratios computed.

<i>Johnson & Johnson</i>			
Fiscal Year (in millions)	2015	2016	Percent Change
Total assets	\$133,411	\$141,208	5.8%
Cash and cash equivalents	13,732	18,972	38.2
Short-term marketable securities	24,644	22,935	(6.9)
Accounts receivable	10,734	11,699	9.0
Current assets	60,210	65,032	8.0
Current liabilities	27,747	26,287	(5.3)
Cost of goods sold	21,536	21,685	0.7
Selling, general, and administrative expenses	21,203	19,945	(5.9)
Research and development expense	9,046	9,095	0.5
Depreciation and amortization	3,746	3,754	0.2
Working capital	32,463	38,745	19.4
Current ratio	2.17	2.47	13.8

SOLUTION:

(a), (b), and (c). The table on the next page computes ratios for *Johnson & Johnson* for each year.

Financial Statement Analysis, continued

Liquidity Measure		2015	2016
Quick Ratio = $\frac{\text{Cash and Cash Equivalents} + \text{Short-Term Marketable Securities} + \text{Accounts Receivable}}{\text{Current Liabilities}}$	(13.1)	1.77 = \$13,732 + \$24,644 + \$10,734 \$27,747	2.04 = \$18,972 + \$22,935 + \$11,699 \$26,287
Cash Ratio = $\frac{\text{Cash and Cash Equivalents} + \text{Short-Term Marketable Securities}}{\text{Current Liabilities}}$	(13.2)	1.38 = \$13,732 + \$24,644 \$27,747	1.59 = \$18,972 + \$22,935 \$26,287
Defensive Interval Ratio = $\frac{\text{Cash and Cash Equivalents} + \text{Short-Term Marketable Securities} + \text{Accounts Receivable}}{\text{Daily Cash Expenditures}}$	(13.3)	373.15 = \$13,732 + \$24,644 + \$10,734 \$131.61	416.55 = \$18,972 + \$22,935 + \$11,699 \$128.69
Daily Cash Expenditures = $\frac{\text{Cost of Goods Sold} + \text{Selling, General, and Administrative Expenses} + \text{Research and Development Expenses} - \text{Depreciation and Amortization Expense}}{\text{Number of Days in Period}}$	(13.4)	\$131.61 = \$21,536 + \$21,203 + \$9,046 - \$3,746 365	\$128.69 = \$21,685 + \$19,945 + \$9,095 - \$3,754 365

d. All three ratios have increased from 2015 to 2016, indicating increased liquidity. The increases are likely attributable to the 38.2% increase in cash and cash equivalents.

Examining each ratio also indicates strong liquidity overall. The quick ratio is 2.04 in 2016. The cash ratio is higher than 1, which indicates that **Johnson & Johnson** has enough cash and cash equivalents plus short-term marketable securities to pay off all current liabilities immediately. However, the likelihood of having to pay off all current liabilities immediately is very low. Finally, **Johnson & Johnson's** defensive interval ratio indicates that the company has over 416 days of current resources available to cover daily cash expenditures.

Source: Financial statements from Johnson & Johnson Company's Annual Report, 2015, 2016.

Summary by Learning Objectives

Below we summarize the main points by learning objective. Throughout the chapter, we discuss the accounting and reporting of U.S. GAAP and IFRS side-by-side. The table below also highlights the major similarities and differences between the standards.

Summary by Learning Objectives, continued

1 Define and demonstrate accounting for operating liabilities, including accounts payable, trade notes payable, unearned revenues, gift cards, deposits, sales taxes payable, and compensated absences.

Summary	Similarities and Differences between U.S. GAAP and IFRS
<p>Companies initially record current liabilities at the amounts owed for goods or services.</p> <p>Accounts payable are amounts owed to suppliers.</p> <p>Trade notes payable are formal, written promises to pay a certain sum of money on a specified date in the future. These arise from the purchase of goods, supplies, or services and usually accrue interest.</p> <p>Unearned revenues are payments received in advance of a company providing some good or service. Companies will earn the unearned revenues when they provide the goods or services.</p> <p>A gift card is a certificate allowing the holder to receive goods or services of a specified value from the issuer. The seller debits cash and credits a liability for the unearned revenue when selling the cards. When redeemed, it debits the unearned revenue and credits sales revenue. Breakage is the percentage of the gift card sales not redeemed. Companies should recognize breakage using the proportional method. If the entity is unable to estimate the breakage amount, the remote method is used.</p> <p>A company collects sales taxes on sales and remits them to taxing authorities. Sales taxes are not a seller's expense.</p> <p>Deposits are amounts a buyer pays that will be paid back at the point in time a specific event occurs. For instance, a company can require a deposit to be held against some potential future loss or damage. All or part can be repaid, depending on the need to pay for any loss or damage.</p> <p>Compensated absences are employer-paid time off for vacation, illness, holidays, military service, jury duty, and maternity leave. They can be vested or unvested. Accumulated compensated absences carry over into future periods; non-accumulated ones do not. Four common conditions exist that dictate whether an employer reports an expense and accrues a liability for future paid absences:</p> <ol style="list-style-type: none"> 1. The obligation for future payment is a result of services already performed by the employee. 2. The benefits to be paid either vest or accumulate. 3. The future payment must be probable. 4. The future payment must be reasonably estimable. <p>The compensation expense is adjusted for changes in estimates when they are made.</p>	<p>Similar under U.S. GAAP and IFRS except for compensated absences.</p> <p>➤ Should recognize expense for compensated absences based on expected future cost.</p>

2 Discuss and illustrate the accounting for asset retirement obligations and required disclosures.

Summary	Similarities and Differences between U.S. GAAP and IFRS
<p>Asset retirement obligations (AROs) are long-term legal obligations to dismantle and scrap assets or restore property used for business purposes. When acquiring an asset, a company estimates the ARO liability as the discounted fair value it will have to pay to retire the asset. The present value amount increases the reported asset. Over the life of the ARO, the company accrues accretion expense and increases the liability to its fair value when disposing the asset.</p> <p>An entity is required to disclose all of the following information about its asset retirement obligations:</p> <ol style="list-style-type: none"> a. A general description of the asset retirement obligations and the associated long-lived assets. b. The fair value of assets that are legally restricted for purposes of settling asset retirement obligations. c. A reconciliation of the beginning and ending aggregate carrying amount of asset retirement obligations. 	<p>➤ Similar under U.S. GAAP and IFRS except for the following:</p> <ul style="list-style-type: none"> • An obligation to restore property can be a legal or economic obligation. • The obligation is estimated based on the costs, rather than fair value of dismantling and removing the asset, or restoring the site. • Estimated costs are discounted using a pre-tax interest rate and the risks specific to the liability. • The accretion expense is referred to as interest expense.

Summary by Learning Objectives, continued

3 Describe the accounting for gain and loss contingencies, including recognition and disclosures related to loss contingencies.	
Summary	Similarities and Differences between U.S. GAAP and IFRS
<p>A contingency has three key elements:</p> <ol style="list-style-type: none"> 1. It is an existing condition, situation, or set of circumstances. 2. It involves uncertainty as to possible gain (gain contingency) or loss (loss contingency). 3. The uncertainty will ultimately be resolved when one or more future events occur or fail to occur. <p>Gain contingencies are not recognized in the financial statements and are disclosed only in the footnotes when there is high certainty of realization in the future.</p> <p>Loss contingency accounting centers on two issues:</p> <ol style="list-style-type: none"> 1. The probability that the company will ultimately incur a loss. 2. Whether the company can reasonably estimate the amount of the potential loss. <p>To assess whether the company will ultimately incur a loss, it determines whether the loss is <i>probable</i>, <i>reasonably possible</i>, or <i>remote</i>:</p> <ul style="list-style-type: none"> • Probable: likely to occur. • Remote: the probability of occurrence is only slight. • Reasonably possible: the probability of occurrence is less than likely but more than remote. <p>When a loss contingency is both probable and can be reasonably estimated, companies accrue it as a liability.</p> <p>When a loss contingency is either probable or can be reasonably estimated, companies disclose it in a footnote.</p> <p>Firms disclose the nature of a loss contingency accrual and in some circumstances the amount accrued to avoid misleading financial statement users.</p> <p>The firm must disclose that it is at least reasonably possible that the entity's estimate of its probable liability could change in the near term.</p> <p>Firms must disclose unrecognized contingencies if there is at least a reasonable possibility that it incurred a loss (or an additional loss) and did not make an accrual for a loss contingency because the following conditions for recognition were not met:</p> <ol style="list-style-type: none"> a. No evidence that it is probable that the company incurred a liability. b. An estimate of the possible loss or range of loss or a statement that such an estimate cannot be made. <p>Companies make adequate disclosure of a contingency that might result in a gain if there is a high certainty of realization.</p>	<p>► Similar under U.S. GAAP and IFRS except for areas noted below.</p> <p>IFRS terminology is somewhat different. Under IFRS, a contingency is called a provision when a company reports it as an obligation or an asset. The terms contingent loss and contingent gain refer only to uncertainties that a firm discloses, not recognizes.</p> <p>Under U.S. GAAP, probable is defined as "likely." Under IFRS, probable is defined as "more likely than not," which is greater than 50% probable.</p> <p>In the case of a range of estimates under U.S. GAAP, a company accrues the minimum point of the range. Under IFRS, it accrues the midpoint of the range.</p> <p>Under U.S. GAAP, companies can discount contingent liabilities when the amount of the liability and the timing of the payments are fixed or reliably determinable. Under IFRS, contingent liabilities should take into account the time value of money and be discounted, when material.</p> <p>Under IFRS companies additionally disclose for each accrued contingency:</p> <ul style="list-style-type: none"> • The carrying amount at the beginning and end of the year • Additional provisions • Amounts used • Unused amounts reversed • The increase during the year in the discounted amount due to the passage of time and the effect of any change in the discount rate

Summary by Learning Objectives, continued

4 Demonstrate the accounting for common loss contingencies involving litigation, warranties, and premiums.	
Summary	Similarities and Differences between U.S. GAAP and IFRS
<p>For pending litigation, follow the guidance for a loss contingency discussed in Learning Objective 3.</p> <p>A warranty is a promise or guarantee to repair or replace any defective goods for a specified period of time. Warranties can be of two types: an assurance-type warranty or a service-type warranty.</p> <p>The assurance-type warranty comes with the product and provides the promise to repair or replace the product without additional cost. When the liability is probable and companies can estimate expenses under the warranty, companies use the accrual-basis approach, which reports warranty expense and accrues warranty liability in the year of the sale. If the liability is not probable or accountants cannot estimate expenses, companies use the cash-basis approach, which expenses warranty costs when incurred.</p> <p>A service-type warranty is sold separately from the sale of the product. When selling a service-type warranty contract, the firm records a liability for unearned revenue. As time passes, the firm earns the unearned revenue.</p> <p>Companies estimate the cost of premiums—such as cash rebates, goods, or coupons—and report a liability.</p>	<p>Similar under U.S. GAAP and IFRS except for areas discussed in Learning Objective 3.</p>

MyLab Accounting

Go to <http://www.pearson.com/mylab/accounting> for the following Questions, Multiple-Choice Questions, Brief Exercises, Exercises, and Problems. They are available with immediate grading, explanations of correct and incorrect answers, and interactive media that acts as your own online tutor.

13 Operating Liabilities and Contingencies

Questions

- 1 Q13-1. When is a liability classified as current?
- 1 Q13-2. How are unearned revenues classified?
- 1 Q13-3. Are advance collections from customers considered liabilities? Explain.
- 1 Q13-4. Do sellers recognize sales taxes as expenses on their income statement? Explain.
- 1 Q13-5. Why are all compensated absences accrued as long as the obligation for future payment is due to services already performed by the employee and the benefits to be paid vest?
- 1 Q13-6. Are there any significant differences in accounting for compensated absences if the rights to the future benefits are vested versus accumulated? Explain.
- 1 Q13-7. How do companies accrue compensated absences?
- 3 Q13-8. What is a gain contingency? Is it accrued and recorded in the financial statements? Explain.
- 3 Q13-9. Do firms always accrue and record loss contingencies in the financial statements? Explain.
- 3 Q13-10. Under IFRS, do firms always accrue and record loss contingencies in the financial statements? Explain.
- 3 Q13-11. If the probability of a loss contingency is remote, is it necessary for a firm to accrue or disclose it? Explain.
- 3 Q13-12. What must firms use when estimating the amount of a loss contingency in a range of estimates to report in the financial statements?

- 3 **Q13-13.** Under IFRS, what must firms use when estimating the amount of a loss contingency in a range of estimates to report in the financial statements?
- 4 **Q13-14.** Are all warranty costs accounted for under the accrual basis of accounting? Explain.
- 2 **Q13-15.** When does a company record an asset retirement obligation?
- A **Q13-16.** Does an employer recognize payroll taxes as expenses on its income statement? Explain.

Multiple-Choice Questions

In partnership with:

Becker CPA Exam Review multiple-choice questions are available in **MyLab Accounting**.

- 3 4 **MC13-1.** In June, Year 1, Westchase Corporation became involved in product litigation. As a result of this litigation, it is probable that Westchase will have to pay \$900,000. In August, a competitor commenced a suit against Westchase alleging violation of antitrust laws seeking damages of \$100,000,000. Westchase denies the allegations, and the likelihood that it will pay any damages is remote. In September, Harris County brought action against Westchase for \$9,000,000 for polluting. It is reasonably possible that Harris County will be successful, but the amount of damages Westchase will have to pay is not reasonably determinable. Westchase's tax rate is 40%. What amount, if any, should be accrued by a charge to income in Year 1?
 - a. \$109,900,000 b. \$109,000,000 c. \$9,900,000 d. \$900,000
- 3 4 **MC13-2.** Far Out Producers is involved in two product liability lawsuits and a third lawsuit that the company brought against a competitor for patent infringement. At December 31, Year 1, the company's attorneys informed management of the following:
 - It is probable that Far Out will lose one of the product liability lawsuits, although the actual settlement could be as low as \$800,000 and as high as \$2,000,000.
 - It is possible that the company could lose \$1,000,000 in the second product liability lawsuit.
 - It is probable that Far Out will win \$500,000 in the patent infringement case.

What should Far Out report on its December 31, Year 1, balance sheet for these contingencies?

 - a. \$300,000 contingent liability b. \$800,000 contingent liability
 - c. \$1,800,000 contingent liability d. \$3,000,000 contingent liability
- 4 **MC13-3.** Specialty Appliances and More, Inc. (SAM) has a 3-year warranty on its solar refrigerators for defects. Warranty costs are estimated at 2% of sales in Year 1 (the year of the sale) and 5% of sales in each of the following 2 years. The warranty expires at the end of the third year. Annual sales and actual warranty repair costs were as follows:

	Sales	Actual Warranty Cost
Year 1	\$ 275,000	\$ 27,500
Year 2	350,000	17,500
Year 3	<u>425,000</u>	<u>30,000</u>
	<u>\$1,050,000</u>	<u>\$75,000</u>

- What total amount should SAM record as warranty expense in the first 3 years?
- a. \$51,000 b. \$75,000 c. \$93,000 d. \$126,000
- A **MC13-4.** Medical Services Inc. allows employees at the end of the year to carry forward up to 40 hours of paid time off at their current salary. James is a full-time employee who has unused vacation time of 80 hours, and Marcia, also a full-time employee, has unused vacation time of 48 hours. How much should Medical Services Inc. record as a liability for the unpaid vacation time at the end of the year?

Employee	Hourly Rate
James	\$14.00
Marcia	16.00

a. \$1,200 b. \$1,328 c. \$1,760 d. \$1,888

Brief Exercises

- 1 **BE13-1. Trade Notes Payables.** On February 1, Seville Sales, Inc. purchased inventory costing \$450,000 using a 6-month trade note payable. The note carries an annual interest rate of 9%. Seville has a December 31 year-end. Prepare the journal entries required. The company uses the perpetual inventory system. What is interest expense during the current year?
- 1 **BE13-2. Unearned Revenues.** On June 1 of the current year, Tedesco Publishers collected \$432,000 for 4-year online subscriptions to its *Houston Style Magazine*. Tedesco has a December 31 year-end. Prepare the journal entries required on the date Tedesco collects the subscriptions and at year-end. What revenue is earned in the current year? What is the balance in the unearned revenue account at December 31 of the current year?
- 1 **BE13-3. Unearned Revenues.** GoSnow Inc. provides snow removal services for its customers in the months of November, December, January, February, and March. On November 1, GoSnow's customers prepay a \$315 fee for the winter; the company currently has 116 customers. GoSnow recognizes revenue evenly over the months it provides the snow removal services. If GoSnow's year-end is December 31, what is the balance in unearned revenues at December 31? Prepare the journal entries required on the date GoSnow collects the fees and at year-end.
- 1 **BE13-4. Gift Cards.** Coral Boutique sold \$1,400 of gift cards and received cash on May 25. On June 29, customers redeemed \$800 of the gift cards, purchasing merchandise that cost Coral \$425. The store uses a perpetual inventory system. Prepare the journal entries to record the activities related to the gift cards.
- 1 **BE13-5. Accounting for Deposits.** Evergreen Waste Company provides weekly trash collection services to small companies. Evergreen collected a \$1,000 deposit from each of 12 new customers for large trash dumpsters. The cost of each dumpster is \$700. The company uses a perpetual inventory system. What journal entries are required when 10 dumpsters are returned to Evergreen? What journal entries are required if two of the dumpsters are damaged and the customer forfeits the deposit?
- 1 **BE13-6. Sales Taxes Payable.** Roth Tile and Carpets, Incorporated operates in Blue Bay, Wisconsin, where sales taxes are 6% of sales. Roth's sales this month amounted to \$2,560,500. The company uses a periodic inventory system. Prepare the journal entry to record sales for the current month.
- 1 **BE13-7. Sales Taxes Payable.** Kloth Fabric Store operates in Philadelphia, Pennsylvania, where sales taxes are 7% of sales. Kloth collected \$27,860 on sales made this month, including the sales price and sales taxes. The company uses a periodic inventory system. Prepare the journal entry to record sales for the current month. What is the amount of sales taxes Kloth will remit to taxing authorities?
- 1 **BE13-8. Compensated Absences, Journal Entries.** Magro Machinery allows its employees 10 paid sick days per year. If the employees do not take the sick days in any given year, the days accumulate. If an employee either leaves or is terminated, he or she will be paid in cash for the sick days. During the current year, 20 employees took all 10 sick days, and 5 employees did not use any of their days. The current wage rate for all of Magro's employees is \$200 per day. Prepare the journal entry to record compensated absences for the current year.
- 1 **BE13-9. Compensated Absences, Journal Entries.** Colorado Closets, Inc. employs 50 employees earning an average of \$1,000 per week. The company awards each employee two weeks of vacation per year. Vacation days neither accumulate nor vest if not taken in the year earned. During the current year, 45 of Colorado's employees took their 2 full weeks while the other 5 employees were unable to take any vacation this year. Prepare the journal entry necessary to record Colorado's vacation pay.
- 1 **BE13-10. Compensated Absences, Journal Entries.** The employees of Wilson Lumber are allowed to take 5 sick days per year. The sick days vest and are paid at the current rate of \$150 per day. Wilson employs 70 employees. Employees took 80% of the sick days in the current year and carried over the remainder of the days to take next year. Prepare the journal entry necessary in the next year to record the payment of the sick days carried over assuming that the wage rate increases to \$165 per day.
- 2 **BE13-11. Asset Retirement Obligation at Acquisition.** On January 1, Pollison Energy Group, Inc. acquired an oil processing plant at a total cost of \$13,560,000 and paid cash. The estimated cost to dismantle the plant and restore the property at the end of the plant's 10-year life is \$2,100,000. Pollison's cost of capital is 5%. Pollison depreciates the asset over its useful life by using the straight-line method with no salvage value. Prepare the journal entries required to record the acquisition of the plant asset.
- 2 **BE13-12. Asset Retirement Obligation Subsequent to Acquisition.** Using the information provided in BE13-11, prepare the journal entries to record the first year's depreciation and accretion accrual.

BE13-13. Asset Retirement Obligation, Disposal. Buckner Chemical Products reported the following information on its latest balance sheet dated December 31 of the current year. The relevant t-accounts follow.

	Plant Asset		Accumulated Depreciation – Plant Asset
Cost	12,000		
ARO	3,000		4,500
	15,000		4,500

Asset Retirement Obligation		
	3,000	Beginning
	900	Accretion
	3,900	

On January 1 of the following year, Buckner sold the plant asset for \$9,000 and incurred \$6,200 in disposal costs. Prepare the journal entries required to record the disposal of the asset and the settlement of the asset retirement obligation.

- 3 4** **BE13-14. Accrual of a Loss Contingency.** In August 2018, a customer at TU Bank slipped on a wet floor and broke an arm. The customer sued the bank in September 2018. As of TU Bank's December 31 year-end, the company's attorneys believe that it is 80% likely that TU will lose this case. The attorneys estimate that the loss will range between \$200,000 and \$350,000. What is the journal entry?
- 3 4** **BE13-15. Accrual of a Loss Contingency, IFRS.** Use the information from BE13-14 and now assume that TU Bank is an IFRS reporter. What is the journal entry under IFRS?
- 4** **BE13-16. Warranty Liability, Assurance-Type Warranty, Cash Basis.** Landau Manufacturing Company manufactures and distributes small power tools. Landau offers an assurance-type warranty that covers all repair costs, including parts and labor, for 2 years after the date of sale. During the current year, the company sold \$8,000,000 in power tools to major retail stores. The company estimates that warranty costs will be 6% of sales. Landau made no repairs in the year of the sale. However, during the following year, the company incurred \$182,000 in actual warranty claims. The repair costs included \$132,000 in parts and \$50,000 in labor (unpaid). Prepare the journal entries necessary to record the base warranty in the year of the sale and the actual repairs incurred during the following year assuming that Landau uses the cash basis.
- 4** **BE13-17. Warranty Liability, Assurance-Type Warranty, Accrual-Basis Approach.** Using the information provided in BE13-16, prepare the journal entries necessary to record the assurance-type warranty in the year of the sale and the actual repairs incurred during the following year assuming that Landau uses the accrual basis.
- 4** **BE13-18. Warranty Liability, Assurance-Type Warranty, Service-Type Warranty.** Michael and Sons, Ltd. sells lawn and garden products for home use. The company offers an assurance-type warranty that covers all repair costs, including parts and labor, for 1 year after the date of sale of lawn tractors. Michael also sells a service-type warranty contract that covers all parts and labor for 5 years after the date of sale of lawn tractors. In the year in which it sold the products, the company sold 8,000 service-type warranties at a price of \$175 per contract and received cash. Michael and Sons sold the contracts at the end of the year and did not recognize warranty revenue in the year of the sale. Michael and Sons did not make any actual repairs in the year of the sale during the base warranty period. During the following year, the company incurred \$98,100 in actual warranty claims that are now covered only under the service-type warranty contract. The repair costs included \$61,000 in parts and \$37,100 in labor (unpaid). Prepare the journal entries required to record the effects of offering the service-type warranty contract in the year of the sale and during the following year.
- A** **BE13-19. Payroll Taxes Payable.** Romero Brothers Contracting reports a \$1,200,000 biweekly payroll. Romero and its employees must pay Social Security (federal insurance contribution act (or FICA) taxes, and none of the employees has exceeded the wage base for FICA taxes or the minimum amount that triggers the additional Medicare tax. Income taxes withheld average 30% for federal and 8% for state and local taxes. The state unemployment tax rate is 5.4%, but Romero gets an experience credit of 4%. The state unemployment wage base is \$7,000 per employee. Only \$100,000 of the total payroll applies to wages that fall under this cap. Prepare the journal entries required to record the biweekly salary accrual and payment. Also record the journal entry for payroll tax expense.

- A** **BE13-20. Payroll Taxes Payable.** Paragon Stores Company's weekly payroll amounts to \$400,000. Paragon is responsible for paying its share of Social Security tax. The company is also responsible for federal and state unemployment taxes. The state unemployment tax rate is 4.7%, but Paragon receives a 3.7% credit. The state unemployment wage base is \$10,000. No employee has earned over \$7,000 this year. Prepare the employer's entry to record the payroll tax expense incurred. Assume the employees do not exceed the wage base for FICA taxes or meet the minimum amount that triggers the additional Medicare tax.

Exercises

- 1** **E13-1. Trade Notes Payable.** On November 1, Barcelona Sales, Inc. purchased inventory costing \$589,000 using a 5-month trade note payable. The note carries an annual interest rate of 10%. Barcelona has a December 31 year-end. The company uses a perpetual inventory system.
- Required »**
- What is interest expense during the current year? What is the interest expense the following year?
 - Prepare all required journal entries.
- 1** **E13-2. Unearned Revenues.** On May 1 of the current year, Interstate Home and Casualty, Inc. collected \$720,000 for 3-year insurance policies. Coverage begins on May 1. Interstate has a December 31 year-end.
- Required »**
- Prepare the journal entries required on the date that Interstate collects the insurance premiums.
 - Prepare the year-end adjusting entry for the current year.
 - Prepare the journal entries required for the next 3 years.
- 1** **E13-3. Gift Cards.** Diamond Depot sold \$57,000 of gift cards during the current year and received cash. Diamond uses the proportional method for accounting for gift card breakage. Based on historical experience, it estimates a breakage percentage of 12% of its gift card sales. During the year, customers redeemed \$46,300 of gift cards, purchasing inventory costing \$28,000. The company uses a perpetual inventory system.
- Required »**
- Prepare the journal entries required to record the gift card activity.
 - What is the end-of-year liability for gift cards if the liability for them was \$15,500 at the beginning of the year?
- 1** **E13-4. Sales Taxes Payable.** Eaton Technology operates retail stores throughout the tristate area. The company's sales are subject to a 7% sales tax payable to the state and county government. At the end of the current year, Eaton reported accounts receivable of \$5,617,500 for credit sales, which includes the sales value of the merchandise sold plus the sales taxes.
- Required »**
- Prepare the journal entry required to record the sales for the current year. The company uses a periodic inventory system.
 - Prepare the journal entry to record the sales taxes Eaton remitted to the state and county taxing jurisdictions.
- 1** **E13-5. Compensated Absences, Journal Entries.** Bristol Stamping Company provides its 100 employees with a comprehensive benefits package. As part of this package, Bristol allows each of its 100 employees 12 paid sick days per year. The average wage rate for the current year is \$140 per day. If employees do not take the sick days in the current year, the days carry over indefinitely and will be paid to the employee upon termination. Employees took 60% of the days during the current year and carried over the remaining sick days to the next year.
- Required »**
- Prepare the journal entry required to record the sick days for the current year.
 - Prepare the journal entry required to record the payment of the sick days in the following year assuming that employees take all remaining days at that time.
 - Independent of your answers to parts (a) and (b), prepare the journal entry to record the sick days taken in the next year assuming that the wage rate increased to \$147 per day. Employees take all remaining days at that time.

- 2** **E13-6. Asset Retirement Obligation.** On January 1, Evergreen Utilities Company acquired a power plant at a total cost of \$23,500,000 and paid cash. The estimated cost to dismantle the plant and restore the property at the end of the plant's 20-year life is \$4,850,000. Evergreen's cost of capital is 8%. Evergreen will depreciate the asset over its useful life using the straight-line method. The asset has no residual value.
- Required »**
- Prepare the journal entries required to record the acquisition of the plant asset.
 - Prepare the journal entry to record the first year's depreciation and accretion accrual.
 - Prepare the journal entries required to record the disposal of the asset and the settlement of the asset retirement obligation at the end of the fifth year after acquisition. Evergreen sold the asset for \$17,000,000, and the costs of dismantling the plant and restoring the property totaled \$5,400,000.
- 2** **E13-7. Asset Retirement Obligation.** On January 1, Tritrua Auto Company built a new manufacturing facility at a total cost of \$15,000,000 and paid cash. To dismantle the plant and restore the property at the end of the plant's 25-year life, the estimated cost is \$850,000. Tritrua will depreciate the asset over its useful life using the straight-line method. The asset has no residual value. Tritrua's cost of capital is 6%.
- Required »**
- Prepare the journal entries required to record the acquisition of the plant asset.
 - Prepare the journal entry to record the first year's depreciation expense and accretion expense.
 - Prepare the journal entries required to record the disposal of the asset and the settlement of the asset retirement obligation at the end of the seventh year after acquisition. Tritrua sold the asset for \$11,000,000, and the costs of dismantling the plant and restoring the property totaled \$310,000.
- 3 4** **E13-8. Accrual of a Loss Contingency.** In January 2018, a customer filed a lawsuit against Fireen's Boutique. The customer fell on an icy patch in the store's parking lot and broke an ankle in December. Fireen's fiscal year-end is January 31. The company's attorneys believe that it is reasonably possible that Fireen's will lose this case, with a 60% probability. The attorneys estimate that the loss will range between \$400,000 and \$500,000, which is material to Fireen's.
- Required »**
- Explain how the lawsuit should be reported.
 - Prepare any journal entries required.
- 3 4** **E13-9. Accrual of a Loss Contingency, IFRS.** Using the same information from E13-8, assume that Fireen's reports under IFRS.
- Required »**
- Explain how the lawsuit should be reported under IFRS.
 - Prepare any journal entries required.
- 4** **E13-10. Warranty Liability, Assurance-Type Warranty, Accrual- and Cash-Basis Approach.** Cole Electronics, Inc. manufactures and distributes LCD televisions. Every television manufactured by Cole carries an assurance-type warranty covering all parts and labor to protect against defects for a 2-year period. During the current year, Cole's sales amounted to \$10,000,000. Cole estimates that the total costs of providing the assurance-type warranty will be 4% of sales. Actual repair costs for the first year after the sale were \$218,000 with \$150,000 for parts and \$68,000 for labor (paid). During the second year, the company incurred \$230,000 in total repairs with \$148,000 for parts and \$82,000 for labor (paid).
- Required »**
- Prepare the journal entries for each year under the warranty assuming that Cole uses the cash basis.
 - Independent of your answer to part (a), prepare the journal entries required to record the events related to the warranty using the accrual basis.
- 4** **E13-11. Warranty Liability, Service-Type Warranty.** Genius Computers sells computers and offers an assurance-type warranty that covers all repair costs, including parts and labor, for 1 year after the date of purchase. Genius also sells a service-type warranty contract that covers all parts and labor for 3 years after the base warranty expires. The company estimates that the service-type warranty will be used 40% in the first year, 35% in the second, and 25% in the third year of the contract. In the year in which the computers were sold, the company also sold 10,000 service-type warranties at a price of \$200 per contract and received cash. Genius sold the contracts at the end of the year and did not recognize any warranty revenue in the year of the sale. The firm did not make any actual repairs in the year of the sale covered by the assurance-type warranty. During the following year, the company incurred \$45,000 in actual warranty claims that are now covered

only under the service-type warranty contract. The repair costs included \$31,000 in parts and \$14,000 in labor (unpaid).

Prepare the journal entries required to record the effects of offering the service-type warranty contract in the year of the sale and during the following year.

- 4** **E13-12. Accounting for Premiums.** Supergreen Grocers, Inc. offered its customers a free baking pan in exchange for 100 green stickers. Customers earn 1 green sticker for each \$10 of groceries purchased at Supergreen during 2018. During 2018, Supergreen purchased with cash 1,100 baking pans at \$8 each and sold \$3.2 million of groceries. Supergreen expects about 38% of its customers to redeem the stickers. In 2019, consumers redeemed 105,000 stickers. Provide all necessary journal entries related to the baking pan offer.

- A** **E13-13. Payroll Taxes Payable.** Neumann Consulting Group reports a \$1,200,000 biweekly payroll. Payroll income taxes average 20% for federal and 4% for state and local taxes. The company is also responsible for federal and state unemployment taxes. The federal unemployment tax rate is 1.6%. The state unemployment tax rate is 4.4% on a wage base of \$7,000, but Neumann gets a 3.2% credit. Neumann has not paid any employee more than \$7,000. None of the employees has exceeded the income base for FICA tax, nor have any employees earned enough to trigger the additional Medicare tax.

Required »

- Prepare the journal to record the biweekly payroll.
- Prepare the journal entry to pay the liability for accrued salaries.
- Prepare the journal entry necessary to record Neumann's payroll tax expense for the biweekly payroll.

- A** **E13-14. Payroll Taxes Payable, Pay Exceeds Wage Base.** Elyctric Company reports a \$2,850,000 monthly payroll. Payroll income taxes average 20% for federal and 4% for state and local taxes. The company is also responsible for federal and state unemployment taxes. The federal unemployment tax rate is 1.6%. The state unemployment tax rate is 4.4% on a wage base of \$7,000, but Elyctric gets a 3.2% credit. Payroll for employees who have exceeded the \$7,000 wage base was \$2,140,000. Payroll for employees who have exceeded the income base for federal insurance contribution act (FICA) tax is \$247,000. Payroll for employees who have exceeded the minimum amount to be subject to the additional Medicare taxes is \$180,000.

Required »

- Prepare the journal to record the monthly payroll.
- Prepare the journal entry to pay the liability for accrued salaries.
- Prepare the journal entry necessary to record Elyctric payroll tax expense for the monthly payroll.

Problems

- 1** **P13-1. Current Operating Liabilities.** James Stores, Inc. completed the following transactions during the current year, the company's first year of operations. James Stores has a December 31 year-end.

- January 16: Purchased \$546,000 of merchandise inventory from various suppliers on account (no discount for early payment offered).
- February 1: Sold merchandise that cost \$100,000 for \$120,500 on account. The sales tax rate is 8%.
- February 10: Paid half of the January 16 purchases.
- February 16: Paid the remaining balance of accounts payable from the January 16 purchase.
- March 1: Paid the sales taxes recorded on February 1.
- June 1: Sold merchandise that cost \$212,000 for \$300,000 on account. The sales tax rate is 8%.

Required »

- Prepare the journal entries required to record the transactions in the preceding list. Assume that a perpetual inventory system is used.
- Prepare a partial income statement for the current fiscal year.

- 1** **P13-2. Current Operating Liabilities.** Sukulo Stores, Inc. completed the following transactions during the current year, the company's first year of operations. Sukulo Stores has a December 31 year-end.

- September 2: Purchased \$65,000 of merchandise inventory from Texrex Company using a trade note payable. The note is due in 3 months and carries an 8% annual interest rate.
- September 21: Purchased \$391,000 of inventory from various suppliers on account.
- October 12: Sold merchandise that cost \$80,000 for \$128,000 on account.
- October 16: Sold \$4,000 of gift cards and received cash.

5. November 16: Paid for all the items purchased on September 21.
6. December 2: Paid off the trade note payable plus interest.
7. December 15: Redeemed gift cards totaling \$3,500 from customers who purchased merchandise costing \$2,188.
8. December 31: Used the proportional method to account for breakage. Its estimated breakage rate is 8%.

Required »

- a. Prepare the journal entries required to record the transactions in the preceding list. Assume that a perpetual inventory system is used.
- b. Prepare a partial income statement for the current fiscal year.

2

P13-3. Asset Retirement Obligation. On January 1 of the current year, Wright Oil invested \$7,500,000 to construct an offshore oil platform and paid cash. As part of its offshore drilling agreement, Wright is responsible for dismantling and removing the platform at the end of its 15-year useful life. Wright depreciates the platform by using the straight-line method with no residual value expected at the end of its useful life. The asset did not have a reasonably determinable quoted market price, and market comparables are not available. As a result, Wright decided to use a probability-based estimate of the cost of dismantling and removing the platform to estimate the fair value of the retirement obligation. The probability-based estimate employs the expected cash flows needed to comply with the offshore drilling agreement based on costs of dismantling and removal. The estimated values are as follows:

Estimated Future Cash Flows	Probability of Occurrence
\$ 675,000	62%
890,000	30
1,021,100	8

The company's estimated cost of capital is 6%.

Required »

- a. Prepare the journal entries required to record the investment in the offshore oil platform.
- b. Prepare the journal entry to record the first year's depreciation and accretion accrual.
- c. Prepare the journal entries required to record the disposal of the asset and the settlement of the asset retirement obligation at the end of the eighth year after acquisition. Wright sold the asset for \$980,000, and the costs of dismantling and removing the offshore oil platform totaled \$1,200,000.

2

P13-4. Asset Retirement Obligation. On January 1 of the current year, ListenUp Telecommunication invested idle cash of \$12,500,000 in transmission towers and \$9,000,000 in poles and lines to improve service to its customers. ListenUp is responsible for dismantling and removing the towers, poles, and lines at the end of their useful lives under each city's and town's removal and restoration requirements. The towers have a 10-year useful life, and the poles and lines have a 15-year useful life. ListenUp uses the straight-line method for depreciation with no residual value expected at the end of the useful lives of the assets. ListenUp estimates the cost to dismantle and restore property related to the towers at \$950,000.

Even though the poles and line method of transmission has been used for many years, ListenUp is installing these in numerous cities and towns. Recently, cities and towns have been increasing their standards for removal and restoration. Therefore, the costs to remove and restore the poles and lines do not have a reasonably determinable quoted market price, and market comparables are not available. As a result, ListenUp decided to use a probability-based estimate. The probability-based estimate employs the expected cash flows needed for the costs of dismantling and removal. The estimated values are as follows:

Estimated Future Cash Flows	Probability of Occurrence
\$ 50,500	5%
350,000	35
790,000	40
985,000	20

The company's estimated cost of capital is 5%.

Required »

- a. Prepare the journal entries required to record the acquisition of each asset.
- b. Prepare the journal entry to record the first and second year's depreciation and accretion accrual for each asset.
- c. What is the carrying value of each asset at the end of the second year? What is the carrying value of the ARO at the end of the second year?

- 3 4** **P13-5. Contingency Problem.** Exwella Pharmaceuticals, Inc. is involved in various lawsuits regarding product liability, commercial liability, and other matters that arise from time to time in the ordinary course of business. The lawsuits pending at the beginning of the year and those filed in the current years follow.

Pending Lawsuits at the Beginning of the Year

1. Product liability lawsuit related to Nowaya, a pharmaceutical drug, in which claimants seek substantial damages. Exwella's attorneys assess the likelihood of losing the lawsuit as reasonably possible at 60%. At the beginning of the year, the estimated loss ranged from \$500,000 to \$1,500,000. At the end of the year, the attorney's assessment of the loss increased to a range between \$750,000 and \$2,000,000.
2. A personal injury lawsuit in which a claimant seeks substantial damages. Exwella's attorneys assess the likelihood of losing the lawsuit as probable at 95%. At the beginning of the year, Exwella reported a contingent liability of \$750,000 for the lawsuit. At the end of the year, the attorney's assessment of the loss increased to a range between \$900,000 and \$3,000,000.

New Pending Lawsuits

3. A new product liability lawsuit was filed related to the drug Dontacit. Exwella's attorneys assess the likelihood of losing the lawsuit as remote at 10%. The attorney's assessment of the loss increased to a range between \$10,000,000 and \$15,000,000.
4. A new product liability lawsuit was filed related to the drug Noapproval. Exwella's attorneys assess the likelihood of losing the lawsuit as probable. The attorney's assessment of the loss increased to a range between \$2,000,000 and \$4,000,000.

Required »

- a. Explain how each of the lawsuits is accounted for under **U.S. GAAP**.
- b. Prepare any journal entries required at the end of the year.

- 3 4** **P13-6. Contingency Problem, U.S. GAAP, IFRS.** Using the information from P13-5, assume that Exwella Pharmaceuticals, Inc., reports under **IFRS**.

Required »

- a. Explain how each lawsuit is accounted for under **IFRS**. Prepare any journal entries required. Under **IFRS**, Exwella has a contingent liability of \$1,000,000 at the beginning of the year related to Nowaya in P13-5.
- b. Compare the litigation loss and contingency liability at the end of the year under **U.S. GAAP** from P13-5 and **IFRS**.

- 4** **P13-7. Warranty Liability, Assurance-Type and Service-Type Warranties.** Packard Products manufactures wireless routers for home use. The company reported total sales on account of \$11,200,000 during the current year. The cost of the merchandise sold was \$5,000,000. Packard offers an assurance-type warranty that covers all repair costs, including parts and labor, for 1 year after the date of sale. The company estimates that warranty costs will amount to 4% of total sales. In the year in which it sold the products, the company also sold 45,000 service-type warranties at a price of \$85 per contract and received cash. Packard sold the contracts at the end of the year and did not recognize any warranty revenue in the year of the sale. The service-type warranty covers all parts and labor for 3 years after the expiration of the assurance-type warranty. The company estimates that the service-type warranty will be used 70% in the first year of the contract, 18% in the second year, and 12% in the third year. During the year of the sale, customers made warranty claims of \$286,500 against the assurance-type warranty. Of this amount, \$197,500 was paid for parts, and the \$89,000 balance was incurred for labor (unpaid). During the following year, the company incurred \$185,000 in actual warranty claims that are now covered only under the service-type warranty contract. The repair costs included \$101,000 in parts and \$84,000 in labor (unpaid).

Required »

Part 1. Prepare the journal entries required to record the following:

- a. Router sales for the current year. The company uses the perpetual inventory system.
- b. Accrual for the estimated warranty costs for the current year.
- c. Actual repairs for the current year.
- d. Service-type warranty contract sales for the current year.
- e. Recognition of contract revenue for 3 years subsequent to the sale of the service-type contracts.
- f. Actual repairs for the first year under the service-type warranty contracts.

Part 2. How does Packard classify the liability for the assurance-type warranty and the unearned revenue under the service-type warranty contract on the balance sheet at the end of the year in the year of the sale?

Part 3: Record the journal entry necessary to record the estimated liability under the assurance-type warranty for the next year (i.e., the year following the current year), assuming that total sales amounted to \$15,675,000. Assume that no warranty claims were made in Year 2.

A

P13-8. Payroll Taxes Payable. Jackson Corporation employs 45 production workers and pays them all the same salary. Jackson employs 10 administrative staff personnel and pays them all the same salary. The following annual information is available for each employee group.

Description	Production	Administrative
Salaries and wages	\$4,500,000	\$1,050,675
Federal income tax rate	18%	22%
State and local income tax rate	6%	9%
Federal unemployment tax rate – effective	2.5%	2.5%
State unemployment tax – effective (wage cap per employee = \$7,000)	1.5%	1.5%

Required »

- Prepare the journal entry to record the annual payroll.
- Prepare the journal entry to pay the liability for accrued salaries.
- Prepare the journal entry necessary to record Jackson's payroll tax expense for the annual payroll.

**Excel Project**

Autograded Excel Project available in **MyLab Accounting**

CASES**Judgment Cases****Judgment Case 1: Contingencies**

Generics, Inc. is a U.S. GAAP reporter that manufactures and sells generic drugs and has a December 31 year-end. On March 1, 2018, it began selling a drug, Anocyn, which is a generic of Dicial. Dicial was patented by the pharmaceutical company Pharma, Inc. The patent period on Dicial has not expired, but Generics believes that the patent is invalid because the drug currently patented is not sufficiently different from the original drug that Pharma developed, patented, and sold.

As soon as Generics began marketing Anocyn, Pharma sued for patent infringement. As of December 31, 2018 the case was still in the early stages. Generics' attorneys believe that they will likely win the case, yet they cannot provide an estimated asset as of December 31, 2018. By December 31, 2019, the case had progressed. At this point, Generics' attorneys believe that Pharma has a viable case. They can estimate only a very broad range for the potential liability of between \$1 million and \$3 million. By December 31, 2020, the case has gone to court. Now Generics' attorneys believe that it is likely that they will lose the case. They currently estimate the loss at \$4 million.

- Do you think Generics should accrue the contingency, only disclose the contingency, or not report the contingency at all in its December 31, 2018, financial statements?
- How should it report the contingency at December 31, 2019, if at all?
- How should it report the contingency at December 31, 2020, if at all?

Judgment Case 2: Contingencies, IFRS

Use the information in Judgment Case 1 and assume that Generics, Inc. reports under **IFRS**.

- Do you think Generics should accrue the contingency, only disclose the contingency, or not report the contingency at all in its December 31, 2018, financial statements?
- How should it report the contingency at December 31, 2019, if at all?
- How should it report the contingency at December 31, 2020, if at all?

Judgment Case 3: Asset Retirement Obligations

PDC Coal, Inc. received a mining permit to strip mine 1,000 acres of land in West Virginia on January 5 of the current year. Prior to receiving the permit, PDC submitted a legally-binding plan that included a timetable for the full reclamation process. PDC anticipates operating the mine for 5 to 7 years. Once it has closed the mine, PDC will restore the ground to its original contour. It will then reclaim the ground cover and provide reforestation. PDC will also engage in activities designed to minimize the air and water pollution created by the strip mining process. Finally, PDC has committed to a process for restoring the pre-existing wildlife to the area.

PDC makes the following estimates regarding the ultimate cost of the asset retirement obligation.

1. Labor costs related to the reclamation of the soil, ground cover, and reforestation are currently \$20 per hour. However, PDC is certain that the costs will increase between 5 and 15% in the next 5 to 7 years. PDC believes it is most likely that the percentage increase will be somewhere in the middle of this range, but there is some possibility that the increase will be only 5% or as much as 15%.
2. PDC estimates that it will take between 8 and 10 hours per acre related to the soil, ground cover, and tree reclamation. It does not have any better estimates.
3. PDC estimates allocated equipment and overhead costs as 75% of labor costs.
4. PDC estimates that grass seed will cost \$600 per acre and the seedlings will cost \$500 per acre.
5. PDC estimates that it will take between \$400,000 and \$600,000 to reclaim the damages done by the air and water pollution created by the strip mining process. It does not have any better estimates.
6. PDC has not previously made any attempts to restore the wildlife to an area that has been strip mined. Its best guess is that the costs will range from \$150,000 to \$500,000.
7. No significant inflation is anticipated during this time period.
8. All of the reclamation work will be done within 1 year of when the strip mine is closed.

The risk-free rate on January 5 is 2%. If a contractor were going to lock in a price today to provide the reclamation services, it would typically charge a 3% premium.

What amount do you think PDC should recognize related to its asset retirement obligation? Support your answer with computations and explanations. You may find ASC 410-20 – *Asset Retirement and Environmental Obligations* – *Asset Retirement Obligations* helpful.

Financial Statement Analysis Case

You are interested in further analyzing and comparing the liquidity of *Pfizer Inc.*, and *Johnson & Johnson Company*. In an earlier analysis in Appendix B of Chapter 6, you found the current ratios of both companies at the end of fiscal year 2016 were above the threshold of 1 at 1.25 for *Pfizer* and 2.47 for *Johnson & Johnson*. In the Chapter 13 Financial Statement Analysis case, you assessed additional measures of *Johnson & Johnson's* liquidity, which follow. Using information from the 2015 and 2016 financial statements for *Pfizer*, answer the following questions about the company's liquidity and then compare the two companies.

- a. Compute *Pfizer's* quick ratio for each year.
- b. Compute *Pfizer's* cash ratio for each year.
- c. Compute *Pfizer's* defensive interval ratio for each year.
- d. Comment on changes in *Pfizer's* liquidity from 2015 to 2016 based on the ratios computed.
- e. Compare the changes in *Pfizer's* liquidity from 2015 to 2016 to those computed in Example 13.19 in the text for *Johnson & Johnson*. The following tables are included for the comparison.

Pfizer Inc. *

Fiscal Year (in millions)	2015	2016	Percent Change
Total assets	\$167,381	\$171,615	2.5%
Cash and cash equivalents	3,641	2,595	(28.7)
Short-term marketable securities	19,649	15,255	(22.4)
Accounts receivable	8,176	8,225	0.6
Current assets	43,804	38,949	(11.1)
Current liabilities	29,399	31,115	5.8

Pfizer Inc.*

Fiscal Year (in millions)	2015	2016	Percent Change
Cost of goods sold	9,648	12,329	27.8
Sales, marketing and administrative expenses	14,809	14,837	0.2
Research and development expense	7,690	7,872	2.4
Depreciation and amortization	5,157	5,757	11.6
Working capital	14,405	7,834	(45.6)
Current ratio	1.49	1.25	(16.1)

***Source:** Financial data from Pfizer PLC. Annual Reports, 2015, 2016. <http://investor.Pfizer.com/phoenix.zhtml?c=207592&p=irol-reportsannual>

Johnson & Johnson Company**
(from Example 13.19 in text)

	2015	2016	Percent Change
Working capital	\$32,463	\$38,745	19.4%
Current ratio	2.17	2.47	13.8
Quick or acid test ratio	1.77	2.04	15.3
Cash ratio	1.38	1.59	15.2
Defensive interval ratio	373.1	416.6	11.6

** **Source:** Financial data from Johnson & Johnson Company's Annual Reports, 2015, 2016. http://files.shareholder.com/downloads/JNJ/2719746024x0x733042/DDD2ABD5-2CC6-41D2-8ACB-EC2A967727E4/ar2016_JNJ.pdf

Surfing the Standards Cases

Surfing the Standards Case 1: Environmental Remediation Costs

Environmental remediation costs have become increasingly prevalent in the last few decades. Read paragraphs 4 through 7, paragraph 15, and paragraph 25 of ASC 410-30-05. Also read paragraphs 1 through 13 of ASC 410-30-25.

- Briefly explain the following terms:
 - Environmental remediation liability
 - Superfund
 - Potentially responsible parties
- Are environmental remediation liabilities a type of contingent liability?
- Are the rules governing the accrual of environmental remedial liabilities the same as those governing the accrual of other contingent liabilities?
- Based on your review of the literature, respond to the following questions.
 - What factors do firms consider in the estimation of environmental remediation liabilities?
 - What does an entity do if it can only reasonably estimate some of the components of the liability?
 - What should be done if the entity can only estimate a range for the obligation?
 - What should be done if there are uncertainties about the share of the obligation the entity will bear?

Surfing the Standards Case 2: Severance Pay for Factory Workers

The managers of Axbo Company, a private company whose bank requires it to follow U.S. GAAP, have decided to close one of its factories. The managers made this decision on July 16 of the current year and communicated this plan to their workers on August 1. All 200 workers will receive \$1,250 per month for 12 months if they stay at work until the factory closes on March 1 of the following year. The first of these

payments will occur 1 month after the factory closes. The managers estimate that 90% of the workers will remain long enough to receive their severance pay. The workers will receive no additional severance benefits of any kind beyond the severance pay. Axbo uses a 6% discount rate when computing fair values.

The factory closing will not qualify as a discontinued operation, and it is highly unlikely that any changes will be made to the plan. Also, Axbo management has the authority to approve this plan without board approval.

The management of Axbo is unsure how to account for the severance pay, including the impact on the financial statements and when it will show up on the financial statements. They are not concerned with required disclosures. Prepare a memo to the file using the Codification for support.

Basis for Conclusions Cases

Basis for Conclusions Case 1: Provisions and Contingencies¹

Note: In the following exercise, you are required to review the Basis for Conclusions (BCs) for the standard(s) that provide the accounting guidance for this topic. Because the BCs is generally not included in the codification and thus is not authoritative, it will most likely be necessary for you to research it through review of the pre-codified standards. Appropriate references have been provided to allow you to do so. Pre-codified standards are accessible on the FASB website or through the American Accounting Association's Academic Accounting Access program, if your school participates in this program.

Scene 1:

Read IAS 37, paragraphs 10 and 11.

- What makes a provision different from the other types of current liabilities reported on a company's balance sheet?

Scene 2:

Read ASC 450-20-05-01 and ASC 450-20-05-03.

- How do the definitions of a provision under **IFRS** and a contingency under **U.S. GAAP** differ? How do the definitions of provisions and contingencies differ from other liabilities?
- Why is it important that provisions be separately identified in an entity's financial statements rather than being included with other accrued liabilities?

Scene 3:

To determine the proper accounting treatment for contingent liabilities (loss contingencies), both **U.S. GAAP** and **IFRS** require management to assess the likelihood that a contingency will be ultimately paid. Both standards provide guidance to assist management when making these decisions. The interpretation of the guidance and the judgment management uses are very important because they determine how a contingent liability will be presented in the financial statements.

ASC 450-20-20 provides the following definitions:

Probable: The future event or events are likely to occur.

Reasonably possible: The chance of the future event or events occurring is more than remote but less than likely.

Remote: The chance of the future event or events occurring is slight.

IAS 37, paragraph 23, provides two distinctions:

¹Reprinted from the Ernst & Young Academic Resource Center with permission of the Ernst & Young Foundation. Copyright 2014. All rights reserved.

Probable: The event is more likely than not to occur.

Remote (no definition provided.)

- What probabilities (percentages) would you assign to each category under **U.S. GAAP** and **IFRS**?
- Why are probabilities not used in the standards rather than the expressions that are subject to interpretation?
- Do you consider the guidance provided for loss contingencies under **U.S. GAAP** to be rules based or principles based? Why? Is the guidance under **IFRS** more principles based than the **U.S. GAAP** guidance?

Scene 4:

Read IAS 37, paragraph 25, and paragraph 59 in the BCs of SFAS No. 5.

- Both of these paragraphs reflect the views of the different boards with respect to estimating loss contingencies. Do you consider one view to be more liberal than another? Why or why not?

Scene 5:

- Under which standard would you expect to see more disclosure in the financial statements?

Scene 6:

Read SFAS No. 5 BCs, paragraphs 82 through 84 and paragraph IN4 of IAS 37.

- Should the concept of “conservatism” be considered when determining whether to recognize a contingency?
- Are the standards at odds with the concept of conservatism because they do not require contingent losses to be recognized unless they are probable and can be reasonably estimated?
- Should the concept of conservatism be a guiding principle as the boards continue to develop accounting standards?

APPENDIX A

Payroll Taxes Payable

Payroll taxes payable are liabilities that companies incur related to the payment of employee salary and wages. Payroll taxes include:

- Social Security taxes
- Unemployment taxes
- Income taxes withheld

Both employers and employees bear the responsibility for payroll taxes. In addition to an employee's salary, an employer is responsible for paying certain taxes, such as unemployment taxes and a portion of Social Security taxes. These payroll taxes are considered part of the company's wage expense in addition to the employee's salary.

Employees also pay taxes—such as a portion of Social Security and income taxes—that the employer deducts from their gross wages and remits to the appropriate taxing jurisdictions and agencies. That is, the employer collects the tax for the government agencies imposing the tax and has an obligation to remit the amounts withheld but does not incur an expense.

We will discuss each tax separately and then provide a comprehensive payroll example.

Social Security Taxes

Social Security taxes are divided into two parts:

1. Federal insurance contribution act tax (FICA tax)
2. Medicare tax²¹

FICA primarily provides funds for old-age benefits: Employees (and their employers) contribute to the plan when they are working, and then employees receive benefits upon retirement. The tax is 12.4% with half (6.2%) paid by the employer and half (6.2%) paid by the employee.²² Employers remit the full 12.4% of wages to the government up to a maximum *wage base* of \$127,200.²³ A **wage base** is the maximum salary or wages on which taxes are levied; earnings exceeding the wage base are not subject to the tax.

The Medicare tax rate is 2.9%, again split evenly between employee and employer (1.45% each).²⁴ Unlike FICA, Medicare does not have a maximum wage base, so all earnings are fully taxable. In addition to the 2.9% Medicare rate, there is an additional Medicare tax of 0.9% that is paid only by the employee. This rate is effective on all wages over \$200,000 for individuals, \$250,000 for couples filing a joint tax return, and \$125,000 for married couples filing separate returns.

Unemployment Taxes

Employers also pay unemployment taxes, which are levied by the federal and state governments to provide funding for unemployment insurance.

The federal tax, referred to as the Federal Unemployment Tax Act (FUTA), is applicable to most businesses. The rate is 6% on the first \$7,000 paid to each employee during the year. However, the employer receives a credit for up to 5.4% of unemployment taxes paid to the state. So, if an employer pays a state rate of 5.4% or more, it is subject to only a 0.6% FUTA rate (6.0% less 5.4%).

²¹FICA is also referred to as the Old Age, Survivor, and Disability Insurance (OASDI), and Medicare is also referred to as the federal hospital insurance tax.

²²These tax rates are from the U.S. Social Security Administration (<http://www.ssa.gov/oact/progdata/taxRates.html>).

²³This wage base is effective for 2017.

²⁴Ibid 4.

Unemployment tax rates and laws vary by state with state-specific rates and wage ceilings. However, all states provide reductions in the maximum rate based on employer-specific experience. Consider a company that has paid state unemployment taxes for a number of years. The state will grant a reduced rate if the company has only a low number of former employees who have sought unemployment compensation. Even with the reduced state unemployment tax rate, the employer will still get full credit against its FUTA rate at the maximum state rate. To illustrate, assume the maximum state rate is 5.4% and the employer gets an experience-rate reduction of 3%. The company will pay a 2.4% state rate and a 0.6% federal rate (6.0% – 5.4%).

Income Taxes Withheld

Federal laws and most state laws require that employers withhold income taxes from employee paychecks. The amount of withholding is based on a number of factors such as income level, marital status, and number of dependents. The tax is on the employee, not the employer. Again, the employer is merely serving as an intermediary, collecting the tax from the employee and remitting it to the government. Example 13A.1 provides a comprehensive illustration of payroll accounting.

EXAMPLE 13A.1

Comprehensive Payroll Example

PROBLEM: e-Grant, Inc. has a \$400,000 monthly payroll that covers 100 employees who are each paid \$48,000 per year. The company pays each employee \$4,000 (\$400,000 total monthly payroll/100 employees) per month. Information regarding relevant payroll taxes and rates follows:

- Federal payroll income taxes average 21%.
- State and local payroll income taxes average 4%.
- The state in which e-Grant operates has a state unemployment rate of 6% with a wage base of \$7,000. However, the state gives e-Grant an experience credit of 5%.

Compute the amount of taxes that e-Grant will withhold from the employees and the amount of payroll tax expense that the company will incur. What are the journal entries to record the payroll for the first 2 months of the year?

SOLUTION: We begin by computing the taxes that e-Grant will withhold from its employees, as well as the amount for which the company will be responsible to pay. Because the monthly salary is \$4,000 per employee, the FICA wage base will not be reached. Thus, the tax applies to the total payroll of \$400,000. The tax is \$24,800 ($\$400,000 \times 6.2\%$) for both employee and employer each month.

Medicare is always 1.45% of the wage base for both employer and employee. Federal taxes are 21% and state taxes are 4%. The additional Medicare tax does not apply to these employees because their salaries are below the amount at which the additional Medicare becomes applicable.

In the first month, the unemployment wage base has not been reached. However, in the second month, only \$3,000 per employee is subject to the federal and state unemployment taxes because the \$7,000 maximum is reached at this point. Therefore, with 100 employees paid \$4,000 per month, the total unemployment wage base is \$400,000 in the first month but only \$300,000 in the second month.

	First Month	Second Month	Total
Employee 1	\$4,000	\$3,000	\$7,000
Employee 2	4,000	3,000	7,000

The following table presents the tax computations.

	First Month		Second Month	
	Employer	Employee	Employer	Employee
Social Security Taxes:				
FICA				
Wage base	\$ 400,000	\$400,000	\$ 400,000	\$ 400,000
Tax rate	<u>× 6.2%</u>	<u>× 6.2%</u>	<u>× 6.2%</u>	<u>× 6.2%</u>
FICA taxes payable	<u>\$ 24,800</u>	<u>\$ 24,800</u>	<u>\$ 24,800</u>	<u>\$ 24,800</u>
Medicare				
Wage base	\$ 400,000	\$400,000	\$ 400,000	\$ 400,000
Tax rate	<u>× 1.45%</u>	<u>× 1.45%</u>	<u>× 1.45%</u>	<u>× 1.45%</u>
Medicare taxes payable	<u>\$ 5,800</u>	<u>\$ 5,800</u>	<u>\$ 5,800</u>	<u>\$ 5,800</u>
Federal Income Taxes				
Wage base		\$ 400,000		\$ 400,000
Tax rate		<u>× 21%</u>		<u>× 21%</u>
Federal income tax payable		<u>\$ 84,000</u>		<u>\$ 84,000</u>
State Income Taxes				
Wage base		\$ 400,000		\$ 400,000
Tax rate		<u>× 4%</u>		<u>× 4%</u>
State income tax payable		<u>\$ 16,000</u>		<u>\$ 16,000</u>
FUTA				
Wage base	\$ 400,000		\$ 300,000	
Tax rate	<u>× 0.6%</u>		<u>× 0.6%</u>

Wage base	\$ 400,000		\$ 300,000	
Tax rate	<u>× 1%</u>		<u>× 1%</u>	
State unemployment tax payable	<u>\$ 4,000</u>		<u>\$ 3,000</u>	

The journal entry for the payroll taxes for which e-Grant is responsible in the first month follows.

Account	End of First Month
Payroll Tax Expense	37,000
FICA Taxes Payable	24,800
Medicare Taxes Payable	5,800
FUTA Payable	2,400
State Unemployment Tax Payable	4,000

The journal entry for the payroll withholdings from the employees' wages in the first month follows.

Account	End of First Month	
Wage Expense	400,000	
FICA Taxes Payable		24,800
Medicare Taxes Payable		5,800
Federal Income Tax Payable		84,000
State Income Tax Payable		16,000
Cash		269,400

In the second month, the journal entry for the payroll taxes for which e-Grant is responsible follows.

Account	End of Second Month	
Payroll Tax Expense	35,400	
FICA Taxes Payable		24,800
Medicare Taxes Payable		5,800
FUTA Payable		1,800
State Unemployment Tax Payable		3,000

Additionally, in the second month, the journal entry for the payroll withholdings from the employees' wages follows.

Account	End of Second Month	
Wage Expense	400,000	
FICA Taxes Payable		24,800
Medicare Taxes Payable		5,800
Federal Income Tax Payable		84,000
State Income Tax Payable		16,000
Cash		269,400

Financing Liabilities

LEARNING OBJECTIVES

- 1 Describe and illustrate accounting for notes payable.
- 2 Explain the common features of bonds payable and discuss the initial recognition at par value, at a discount, and at a premium.
- 3 Demonstrate accounting for bonds issued at par or at a discount or premium, including computation of the bond issue price, interest expense, and amortization of the discount or premium using the effective interest rate method.
- 4 Explain and illustrate accounting for bonds issued between interest payment dates.
- 5 Discuss and illustrate the accounting for bond issue costs.
- 6 Determine the accounting for bonds payable at early retirement.
- 7 Explain and illustrate the accounting for convertible bonds.
- 8 Describe and illustrate the accounting for warrants, including those that are detachable and nondetachable.
- 9 Explain the reclassification of financing liabilities for current maturities of long-term debt, short-term debt expected to be refinanced, and callable obligations.

- 10 Discuss and illustrate the fair value option in accounting for financing liabilities.
- 11 Detail required disclosures for financing liabilities.

Introduction

COMPANIES SEEK CAPITAL FOR A VARIETY OF PURPOSES: investing in new facilities, replacing existing equipment, acquiring other companies, or funding general business activities. Companies commonly use debt financing to raise capital for these purposes by borrowing cash with the obligation to repay it, usually with interest, at some point in the future. Consider *Tesla, Inc.*, the manufacturer and seller of high-performance fully electric vehicles, and solar and energy storage systems, which reported approximately \$8.1 billion and \$3.1 billion in debt outstanding at the end of its 2016 and 2015 fiscal years, respectively. This outstanding debt represented about 33% of its total assets at the end of fiscal 2016 and 2015. During 2016, *Tesla's* debt increased by more than \$2.8 billion, primarily as the result of issuing bonds to fund its operations and capital expenditures. *Tesla's* debt also increased by about \$3.6 billion when it acquired *SolarCity*. Then in 2016, *Tesla's* debt decreased by about \$1.8 billion because of net repayments.

Companies monitor the amount of debt carried on their balance sheets to ensure that they can repay the debt and have continued access to capital markets in the future. *Tesla's* 2016 annual report explained to investors that its ability to make debt payments depends on its future performance, which is subject to economic, financial, competitive, and other factors beyond its control. *Tesla* cautioned that its business may not continue to generate cash flow from operations in the future sufficient to satisfy its obligations and any future indebtedness it may incur and to make necessary capital expenditures. If *Tesla* is unable to generate such cash flow, it may be required to reduce or delay investments or capital expenditures, sell assets, refinance, or obtain

Xinhua/Alamy

additional equity capital on terms that may be unfavorable. Its ability to refinance existing or future indebtedness will depend on the capital markets and its financial condition at such time. Firms also use long-term debt capital to extinguish short-term liabilities, including accounts payable, accrued liabilities, and short-term notes payable.

In this chapter, we discuss several types of financing liabilities. After discussing notes payable, including installment loans, we address accounting for bonds payable, starting with the straightforward case of issuing a bond at its face value and progressing to the more complex cases of issuing bonds at a

discount or premium. We then explain other issues in accounting for bonds, such as issuing bonds between interest payment dates and the accounting for bond issue costs related to legal fees and banking fees. We complete our discussion of bonds by illustrating the accounting for the early retirement of debt. We also explain accounting for debt with an equity feature, including convertible bonds and bonds issued with warrants. Next, we discuss special issues such as short-term debt expected to be refinanced and debt that becomes callable by the creditor. Before we cover required disclosures, we also revisit the fair value option by applying this methodology to the valuation of liabilities. «

- 1 Describe and illustrate accounting for notes payable.

Notes Payable

Recall that notes payable are formal credit arrangements between a creditor (lender) and a debtor (borrower) that require the payment of a specified face amount, the **principal**, at a fixed maturity date. The principal is also referred to as the face, par, or maturity value of the note. Typically, interest is payable at a specified percentage of the principal balance. Notes payable are most often long term, but entities sometimes use them for short-term borrowing. In this section of the chapter, we discuss both short- and long-term notes payable.

Short-Term Notes Payable

Companies report short-term notes payable on the balance sheet as current liabilities because they are due and payable within 1 year from the balance sheet date or operating cycle, whichever is longer. Short-term notes require the use of current assets or creation of other current liabilities in their liquidation. Companies borrow by issuing short-term notes for several reasons:

1. The short-term debt can fill a temporary gap when cash flows from operations are insufficient to meet current liquidity needs.
2. The term of short-term notes matches well with a firm's operating cycle. That is, companies expect that inventory sales and collection of accounts receivable will generate the cash needed to liquidate the short-term obligations when due.
3. Short-term debt typically carries a lower interest rate than long-term notes and can represent the least costly financing alternative for the firm.
4. Small businesses or firms with low credit ratings may not be able to obtain financing on a long-term basis, making the short-term note the only alternative available to raise capital.

In 2012, because of varying short-term financing needs, **Kellogg** issued \$779 million of notes payable with maturities less than or equal to 90 days and \$724 million of notes payable with maturities greater than 90 days. **Kellogg** also issued \$1,727 million of long-term debt that was primarily notes payable, a portion related to its acquisition of Pringles.

A company typically records a notes payable with a debit to cash and a credit to the appropriate liability account. The company records interest expense by debiting the expense account and crediting cash if it is paying the interest or crediting interest payable if it is accruing it at year-end. When the company pays off the note, it debits the liability and credits cash. Proceeds on issue and repayment of the principal are generally reported as financing activities on the statement of cash flows. Interest payments are classified as cash flows from operating activities. Example 14.1 illustrates accounting for a short-term note.

EXAMPLE 14.1**Short-Term Notes Payable and Accrued Interest**

PROBLEM: Auso Company recently experienced a temporary delay in cash collections and needed to borrow \$100,000 on November 1 of the current year to pay trade accounts payable. The 6-month, 6% note and interest are due on May 1 of the following year. Auso has a December 31 fiscal year-end. What are the required journal entries to record the issuance of the note, accrued interest, and the payment of principal and interest at maturity?

SOLUTION: Auso records the issuance of the note by making the following journal entry:

Account	November 1	
Cash	100,000	
Short-Term Note Payable		100,000

On December 31, Auso must make an adjusting entry to record the accrued interest payable. The monthly interest on the loan is \$500 [$\$100,000 \times (6\%/12)$]. Two months of interest, or \$1,000 ($\500×2 months), has accrued as of December 31. The adjusting journal entry is as follows:

Account	December 31	
Interest Expense	1,000	
Interest Payable		1,000

On May 1, the due date of the note, Auso will record the remaining 4 months of interest expense of \$2,000 ($\500×4 months) and derecognize the note payable and interest payable.

Account	May 1	
Interest Expense	2,000	
Interest Payable	1,000	
Short-Term Note Payable	100,000	
Cash		103,000

Long-Term Notes Payable: Term Loans

Companies report long-term notes payable on the balance sheet as noncurrent liabilities because they are due and payable within a period greater than 1 year from the balance sheet date or operating cycle, whichever is longer. Long-term notes can be *term loans* or *installment loans*.

Term Loan. A **term loan** typically requires the borrower to pay interest each period with the principal due only at maturity. Firms preparing financial statements between interest payment dates accrue interest with a debit to expense and a credit to interest payable as shown in Example 14.2.

EXAMPLE 14.2 **Note Payable: Term Loan**

PROBLEM: Salada Corporation borrowed \$500,000 by issuing a term loan on February 1, 2018. The note agreement specifies that the company will pay interest every 3 months (April 30, July 31, October 31, and January 31) at 10%, and the principal will be due on January 31, 2023. Salada has a December 31 year-end and prepares quarterly financial statements. What journal entries will Salada make on February 1, 2018, at the end of each calendar quarter, at each interest payment, and on January 31, 2023?

SOLUTION: Salada records the long-term note on the date of issuance as follows:

Account	February 1, 2018	
Cash	500,000	
Long-Term Notes Payable		500,000

Salada accrues interest expense at the end of each calendar quarter. Quarterly interest is \$12,500 per quarter ($\$500,000 \times 10\%/4$ quarters). Monthly interest is one-third of this amount, or \$4,167. Thus, on March 31, June 30, September 30, and December 31, Salada will accrue 2 months of interest.

Account	March 31, 2018 (and Every Quarter through December 31, 2022)	
Interest Expense	8,333	
Interest Payable		8,333

At each interest payment date, Salada will record the cash payment of \$12,500, remove the interest payable of \$8,333 because the company no longer owes that interest, and record 1 month of interest expense.

Account	April 30, 2018 (and Every Three-Month Pay- ment through January 31, 2023)	
Interest Expense	4,167	
Interest Payable	8,333	
Cash		12,500

At maturity, Salada pays the note principal and removes it from the balance sheet.

Account	January 31, 2023	
Long-Term Notes Payable	500,000	
Cash		500,000

Long-Term Notes Payable: Installment Loans

An **installment loan** requires a fixed payment each period that includes both principal and interest. Although the payment is the same each period, the amount applied to principal and interest varies. Installment notes are used in auto loans and home mortgages.¹

Computing the required payment involves using the time value of money techniques from Chapter 7 by first computing the payment and then preparing an amortization table to assist in

¹Because installment loans typically require some payments to be made within the next year, a portion of these notes payable will be classified as a current liability. We discuss this classification issue later in the chapter.

preparing the journal entries. The amortization table includes columns for the date, the interest, principal, total payment, and the note’s carrying value. The interest is the beginning note balance multiplied by the periodic interest rate. Interest is recorded as a debit to interest expense. The principal payment, the difference between the total payment and the interest payment, is recorded as a debit to the note payable. The ending balance of the note payable is the beginning balance less the principal payment. Example 14.3 illustrates the accounting for an installment loan.

EXAMPLE 14.3 Note Payable with Amortization Table: Installment Loan

PROBLEM: AS&K, Inc. borrowed \$250,000 by issuing an 8%, 3-year note on January 1, 2018. AS&K must make payments every 6 months, beginning June 30, 2018. The note will be fully paid at maturity on December 31, 2020. AS&K prepares annual financial statements. Prepare the amortization table for this note along with any necessary journal entries. Also prepare the t-account for the notes payable account.

SOLUTION: We first compute the semiannual payment.

	N	I/Y	PV	PMT	FV	Excel Formula
Given	6	4.00%	250,000		0	
Solve for PMT				(47,690)		= PMT(0.04,6,250000,0)

We then prepare the amortization table. Interest for each period is the beginning balance of the note payable times the 4% periodic interest rate. The principal payment is the total payment of \$47,690 less the interest payment. The ending note balance is the beginning balance of the note payable less the principal payment.

Period	Date	Total Payment (a)	Interest Payment (b) = 4% × Prior (d)	Principal Payment (c) = (a) – (b)	Carrying Value (d) = Prior (d) – (c)
					\$250,000
1	June 30, 2018	\$47,690	\$10,000	\$37,690	212,310
2	December 31, 2018	47,690	8,492	39,198	173,112
3	June 30, 2019	47,690	6,924	40,766	132,346
4	December 31, 2019	47,690	5,294	42,396	89,950
5	June 30, 2020	47,690	3,598	44,092	45,858
6	December 31, 2020	47,690	1,832*	45,858*	0

* Adjusted due to rounding errors.

AS&K makes the following journal entry at inception:

Account	January 1, 2018
Cash	250,000
Long-Term Notes Payable	250,000

AS&K uses the information contained in the amortization table to record the semiannual payments. The payments made for an installment loan contain principal plus interest. AS&K makes the following journal entries to record the payments in 2018:

Account	June 30, 2018	December 31, 2018
Interest Expense	10,000	8,492
Long-Term Notes Payable	37,690	39,198
Cash	47,690	47,690

Continued

The journal entries in 2019 follow.

Account	June 30, 2019	December 31, 2019
Interest Expense	6,924	5,294
Long-Term Notes Payable	40,766	42,396
Cash	47,690	47,690

The journal entries in 2020 follow.

Account	June 30, 2020	December 31, 2020
Interest Expense	3,598	1,832
Long-Term Notes Payable	44,092	45,858
Cash	47,690	47,690

The t-account for the notes payable account is as follows:

Long-Term Notes Payable	
January 1, 2018	250,000
June 30, 2018	37,690
December 31, 2018	39,198
June 30, 2019	40,766
December 31, 2019	42,396
June 30, 2020	44,092
December 31, 2020	45,858
	0

The timing of a note payable may be such that the company will need to accrue interest before it prepares financial statements. Example 14.4 modifies Example 14.3 to illustrate an installment loan with a year-end interest accrual.

EXAMPLE 14.4 Note Payable with Amortization Table: Installment Loan with Interest Accrual

PROBLEM: AS&K, Inc. borrowed \$250,000 by issuing an 8%, 3-year note on March 1, 2018. AS&K must make payments every 6 months beginning August 31, 2018. The note will be fully paid at maturity on February 28, 2021. AS&K prepares annual financial statements. Prepare the amortization table for this note. Prepare the journal entries for 2018 and the first interest payment in 2019.

SOLUTION: We computed the total payment amount as \$47,690 in Example 14.3. We can refer to the amortization table from that example and change the dates for the payments.

Date	Total Payment (a)	Interest Payment (b) = 4% × Prior(d)	Principal Payment (c) = (a) – (b)	Carrying Value (d) = Prior (d) – (c)
				\$250,000
August 31, 2018	\$47,690	\$10,000	\$37,690	212,310
February 28, 2019	47,690	8,492	39,198	173,112
August 31, 2019	47,690	6,924	40,766	132,346
February 28, 2020	47,690	5,294	42,396	89,950
August 31, 2020	47,690	3,598	44,092	45,858
February 28, 2021	47,690	1,832*	45,858*	0

* Adjusted due to rounding errors.

Again, AS&K makes the following journal entry at inception:

Account	March 1, 2018
Cash	250,000
Long-Term Notes Payable	250,000

AS&K records the first interest payment using the information in the amortization table.

Account	August 31, 2018
Interest Expense	10,000
Long-Term Notes Payable	37,690
Cash	47,690

Because AS&K prepares financial statements before the next interest payment, we need to accrue interest for 4 months (September through December) at year-end. The total interest for the second period is \$8,492; thus, we accrue 4 / 6 of this, or \$5,661.

Account	December 31, 2018
Interest Expense	5,661
Interest Payable	5,661

On February 28, 2019, AS&K records the second interest payment, removing the interest payable from the year-end accrual.

Account	February 28, 2019
Interest Expense	2,831
Interest Payable	5,661
Long-Term Notes Payable	39,198
Cash	47,690

Long-Term Notes Payable: Stated Rate Less than Market Rate

Companies sometimes borrow with a loan that has no interest rate stated (a non-interest-bearing note) or a stated interest rate that is less than the market interest rate. In this case, the note is measured as the present value of the note discounted at the market rate of interest.

The difference between the *face value* and the present value of the note is called the discount and represents some of the interest expense to be incurred over the life of the note. The company uses the *effective interest method* to subsequently amortize the discount on notes payable (a contra-liability account) to interest expense over the loan term.

There are two primary effects of the discount amortization. Discount amortization:

1. Increases the interest expense so that the corporation's *effective interest rate* is brought up to the higher market rate
2. Reduces the discount and increases the carrying value of the note payable until the carrying value is brought up to its *face value* at the maturity date

Discount amortization is recorded at the end of each period. In reality, the discount is paid only at maturity. However, with accrual accounting, the company must recognize the additional interest each period by amortizing the discount.

The amortization table for below-market-rate installment notes starts with the computation of the present value of the note. The cash payment each period is the *face value* of the note multiplied by the periodic stated interest rate. The interest expense each period is the beginning carrying value of the note multiplied by the periodic historical market rate. The amount of discount that is

amortized each period into interest expense is the difference between the cash interest paid and the computed effective interest expense. Finally, the change in the carrying value of the note payable is the amount of the discount amortization. An example of accounting for a note payable with a stated rate less than the market rate is provided in Example 14.5.

EXAMPLE 14.5 Note Payable with a Stated Rate Less than the Market Rate

PROBLEM: JN Min Corporation, a calendar-year company, borrowed \$1,000,000 on August 15, 2018. The note specifies an 8% interest rate and is due in 3 years. Interest is paid quarterly. The fiscal year ends on December 31. The current market rate is 12%. Interest is compounded quarterly. JN Min prepares quarterly financial statements. Prepare the amortization table for the note and the journal entries for 2018.

SOLUTION: The first step is to compute the present value of the note, which is \$900,460.

	N	I/Y	PV	PMT	FV	Excel Formula
Given	12	3.00%		-20,000	-1,000,000	
Solve for PV			900,460			=PV(0.03,12,-20000,-1000000)

The amortization table follows. We use the stated rate of 2% per quarter to compute the cash interest and the market rate of 3% per quarter to compute the effective interest.

Date	Cash Interest (2%) (a)	Effective Interest (b) = 3% × Prior (d)	Discount Amortized (c) = (b) - (a)	Carrying Value (d) = Prior (d) + (c)
At issuance				\$ 900,460
November 15, 2018	\$20,000	\$27,014	\$7,014	907,474
February 15, 2019	20,000	27,224	7,224	914,698
May 15, 2019	20,000	27,441	7,441	922,139
August 15, 2019	20,000	27,664	7,664	929,803
November 15, 2019	20,000	27,894	7,894	937,697
February 15, 2020	20,000	28,131	8,131	945,828
May 15, 2020	20,000	28,375	8,375	954,203
August 15, 2020	20,000	28,626	8,626	962,829
November 15, 2020	20,000	28,885	8,885	971,714
February 15, 2021	20,000	29,151	9,151	980,865
May 15, 2021	20,000	29,426	9,426	990,291
August 15, 2021	20,000	29,709	9,709	1,000,000

The journal entry to record the note payable and the discount is as follows:

Account	August 15, 2018
Cash	900,460
Discount on Note Payable	99,540
Long-Term Note Payable	1,000,000

At this point, the carrying value of the note payable on the balance sheet is \$900,460, which is the balance in the note payable account (\$1,000,000) less the balance in the discount account (\$99,540).

On September 30, 2018, JN Min prepares financial statements. Thus, it will accrue interest from August 15 through September 30. The interest for the first period is \$27,014 per the amortization table. However, JN Min will accrue interest expense for one-half of that amount. Specifically, the period from August 15 to September 30 is 1.5 months, or exactly one-half of the quarter. As a result, JN Min will amortize one-half of the discount and record interest payable of \$10,000, which is one-half of the anticipated interest payment.

<i>Account</i>	<i>September 30, 2018</i>	
Interest Expense	13,507	
Discount on Note Payable		3,507
Interest Payable		10,000

On November 15, 2018, JN Min makes a \$20,000 interest payment. It records the following journal entry.

<i>Account</i>	<i>November 15, 2018</i>	
Interest Payable	10,000	
Interest Expense	13,507	
Discount on Note Payable		3,507
Cash		20,000

Finally, on December 31, 2018, JN Min will accrue interest for one-half of the second period as follows (November 15 to December 31 is also one and one-half months, representing one-half of a quarter):

<i>Account</i>	<i>December 31, 2018</i>	
Interest Expense	13,612	
Discount on Note Payable		3,612
Interest Payable		10,000

- ② Explain the common features of bonds payable and discuss the initial recognition at par value, at a discount, and at a premium.

Overview of Bonds Payable

A **bond payable** is a debt instrument typically issued for a period greater than a year to raise capital that requires the debtor to repay the principal balance at a specified date in the future, referred to as the maturity date. Bonds usually involve interest payments at fixed time intervals (for example, quarterly).

When a company issues a bond, it becomes the debtor, and the purchaser of the bond is the creditor. Bonds are offered to the public and can usually be traded in the secondary market: A company issues bonds to a large number of lenders in the market, and each lender extends credit to the corporation. This feature contrasts with a note payable where there is one debtor and one creditor that transact directly.

Credit Ratings

Creditors seek a return on each lending arrangement and, as such, are concerned about a debtor's ability to repay principal and interest when due. A company's creditworthiness is determined by many factors, including its profitability, existing level of debt, net asset position, earnings, and cash flows. Yet, it is often difficult and time consuming for an individual investor to assess these factors. Consequently, credit rating agencies such as *Standard & Poor's*

and *Moody's* rate corporate debt by examining a company's creditworthiness and giving an opinion on the company's credit quality. The rating is expressed as a letter grade, such as "AAA" for the companies with a strong capacity to repay their debt. Exhibit 14.1 presents the credit ratings used by *Standard & Poor's* and their general meaning. Other rating agencies use different scales.

EXHIBIT 14.1 *Standard & Poor's* Credit Ratings

The general meaning of our credit rating opinions is summarized below.

AAA	Extremely strong capacity to meet financial commitments. Highest Rating.
AA	Very strong capacity to meet financial commitments.
A	Strong capacity to meet financial commitments, but somewhat susceptible to adverse economic conditions and changes in circumstances.
BBB	Adequate capacity to meet financial commitments, but more subject to adverse economic conditions.
BBB–	Considered lowest investment grade by market participants.
BB+	Considered highest speculative grade by market participants.
BB	Less vulnerable in the near-term but faces major ongoing uncertainties to adverse business, financial and economic conditions.
B	More vulnerable to adverse business, financial and economic conditions but currently has the capacity to meet financial commitments.
CCC	Currently vulnerable and dependent on favorable business, financial and economic conditions to meet financial commitments.
CC	Currently highly vulnerable.
C	Currently highly vulnerable obligations and other defined circumstances.
D	Payment default on financial commitments.

Note: Ratings from "AA" to "CCC" may be modified by the addition of a plus (+) or minus (–) sign to show relative standing within the major rating categories.

The ability to score a high credit rating is important for two reasons:

- The better the credit rating, the easier it is for a company to issue debt.
- Higher credit ratings are usually associated with a lower cost of debt.

In 2016, *Johnson & Johnson*, an S&P 500 pharmaceutical and consumer products company, had a "AAA" debt rating. *Johnson & Johnson* maintained its financial discipline during the global recession in 2007–2009 and held its "AAA" credit rating. As an "AAA"-rated company, it was able to carry out a \$1.1 billion debt offering in 2010 at the lowest interest rate for long-term corporate debt in history at the time.²

Bond Indenture

The **bond indenture** contract between the corporation and the bondholders (represented by a trustee) protects the rights of multiple creditors by outlining the *debt covenants*, enforcement, and the type and terms of the bond.

²See www.investor.jnj.com/2010annualreport/pdf/2010-annual-report.pdf, p. 3. Johnson & Johnson sold \$550 million of 2.95%, 10-year notes, and the same amount of 4.5%, 30-year bonds.

Debt covenants are debt compliance agreements that place restrictions on the corporation to protect the bondholders' interest and ensure that cash is available for repayment of the debt. Common debt covenants include restrictions such as holding *compensating cash balances*, maintaining specified retained earnings levels, maintaining set ratios or working capital levels, and limiting future borrowings or dividend payments. **Compensating cash balances** are restricted deposits that a debtor is required to maintain to support existing lending arrangements.

A **technical default** occurs when a debtor violates one or more terms of its debt covenants. When a debtor misses interest and/or principal payments, it is known as an **actual default**. In the event of either technical or actual default, the bond indenture provides information regarding the enforcement of the contract between the debtor and creditors.

There are numerous types of bonds, such as:

- **Secured bonds**, which use specific assets as collateral
- **Debenture bonds**, which are unsecured bonds (that is, there is no collateral backing)
- **Serial bonds**, which have multiple maturity dates
- **Term bonds**, which have a single maturity date
- **Callable bonds**, which can be called at the corporation's option at specified dates
- **Convertible bonds**, which bondholders may convert into capital stock
- **Bonds with stock warrants attached**, which are bonds that also include long-term options to acquire common stock

Bond indentures detail the terms of the future cash payments to the lender, including:

- **Face value** (also referred to as par value or principal), the amount that the company will pay the bondholder at maturity. Bonds typically have a face value of \$1,000.
- **Stated interest rate** (also referred to as the nominal, coupon, or face rate), the amount of interest that the bond issuer will pay in cash expressed as an annual rate.
- **Interest payment period**, the frequency with which cash interest payments are made to the bondholders. Common interest periods are quarterly, semiannually, and annually.
- **Maturity date**, the specified date when the bond issuer must pay the face value of the bonds to the bondholders.

Bond Pricing

Corporations can issue bonds at:

- Their face value
- A **discount**, a price below face value
- A **premium**, a price above face value

The discount or premium is determined by the difference between the stated or face rate of interest and the current market rate. The bond purchaser makes the investment in order to earn the current *market rate* of interest for an amount of comparable risk. The **market rate**, or **yield**, is the actual return that the investors will receive. We also call the actual return the **effective interest rate**.

Stated Interest Rate versus Market Rate. The market rate often differs from the bond's stated interest rate because of a time lag caused by the delay in issuing bonds while bonds are printed, indentures are prepared, and the bonds are sold to an underwriter. Therefore, whether a company issues bonds at their face value, a discount, or a premium depends on the relation between the bonds' stated interest rate and the market rate of interest for a similar bond.

1. **Bonds issued at par or face value.** When the stated interest rate is equal to the market rate, the bonds will sell at par value. The company is paying the interest rate demanded by the market, so its bonds are equivalent to any other debt security available.

2. **Bonds issued at a discount.** When the stated interest rate is less than the market rate of interest, the bonds will sell at a discount (i.e., the issue price is less than the face value). Investors are demanding a higher rate of interest than the company is offering, so investors will not pay the full face value. When an investor pays an amount less than face value, the effective return for the investor equals the higher market rate. The effective cost of borrowing for the corporation increases because the company has less cash to use and must repay the full amount at maturity. For example, if a corporation sells a \$1,000 par bond with a stated interest rate of 5% for \$900, the corporation receives only \$900 but must repay the \$1,000 at maturity. The \$100 discount represents additional interest resulting in a higher effective cost of borrowing in excess of 5%. The investor's rate of return increases because only \$900 is invested with \$1,000 returned at maturity.
3. **Bonds issued at a premium.** When the stated interest rate is more than the market rate of interest, the company issues the bonds at a premium (i.e., the issue price is greater than the face value). The company is paying a higher rate of interest than investors are demanding, so it will sell the bond for more than its face value. By paying more than face value, the effective return for the investor equals the lower market rate. The effective cost of borrowing for the corporation also decreases because the company has more cash to use over the bond term and has to repay only the face value. For example, if a \$1,000 par bond with a stated interest rate of 5% is sold for \$1,100, the corporation receives \$1,100 but has to repay only \$1,000 at maturity. The additional cash received reduces the effective cost of borrowing to a rate below 5%. The investor also earns less than 5% because he pays \$1,100 but receives only \$1,000 at maturity.

There is an inverse relationship between current market rates and bond prices as illustrated by Exhibit 14.2.

EXHIBIT 14.2 Bond Issues: The Relationship between Stated Rates and Market Rates

Stated rate	=	Market rate	Bonds issued at	Par
Stated rate	<	Market rate	Bonds issued at	Discount
Stated rate	>	Market rate	Bonds issued at	Premium

Bond Price Quotes. Bond prices are often quoted as a percentage of face or par value. The quoted price of a bond issued at par value is 100%. The quote for a bond issued at a discount is less than 100%, and the quote for a bond issued at a premium is greater than 100%.

Exhibit 14.3 presents an excerpt from *Johnson & Johnson's* January 1, 2017, debt footnote disclosure in which it reported \$24,146 million in long-term debt, including \$1,704 million payable currently. Excluding the debt paid or newly issued, when comparing the carrying values of the debt issues from 2015 to 2016, there are only minor differences, indicating that the outstanding debt was issued at close to its face value. The changes in carrying values from 2015 to 2016 indicate that *Johnson & Johnson* issued debt at a discount or premium, and the changes are due to the amortization of discount or premium.

For each bond issue, *Johnson & Johnson* discloses the stated rate at the beginning of each debt issue, the year of maturity, the current carrying value, and the effective interest rate at issuance. For example, the fifth issue listed refers to notes with a stated rate of 1.125%, maturing in 2017. The effective interest rate at issuance was 1.15%.

EXHIBIT 14.3 Long-Term Debt Disclosure, *Johnson & Johnson*, Financial Statement, January 1, 2017

NOTE 7: Borrowings [Excerpt]

- ③ Demonstrate accounting for bonds issued at par or at a discount or premium, including computation of the bond issue price, interest expense, and amortization of the discount or premium using the effective interest rate method.

Accounting for the Initial and Subsequent Measurement of Bonds Payable

We first discuss the accounting for bonds issued at par value followed by accounting for bonds issued at a premium or discount.

Bonds Issued at Par

Accounting for bonds issued at par is straightforward: When issuing the bonds, the corporation increases both the liability account and the cash account. Throughout the life of the bond, the corporation records the interest payments and, if necessary, makes adjusting entries to record interest accruals. At the maturity of the bond, the corporation records the payment of the face value of the bond and removes the liability from its accounts. Example 14.6 illustrates accounting for a bond payable issued at face value.

EXAMPLE 14.6

Accounting for Bond Payable: Face Value

PROBLEM: On January 1, 2018, Ruffin Corporation issued \$40,000 par value, 4%, 4-year bonds that mature on December 31, 2021. Ruffin will pay interest quarterly on March 31, June 30, September 30, and December 31. The company's fiscal year ends on December 31. What is the issue price of this bond assuming that the market rate of interest is 4%? What is the journal entry to record the bond issue? What are the journal entries to record the first year's interest? What entry is made at maturity?

SOLUTION: Because the stated interest rate on the bond equals the market rate when the bonds are issued, Ruffin sells the bonds at the \$40,000 par value.

At maturity, Ruffin will pay bondholders the face value of the bond, \$40,000. Ruffin will also make the interest payment to bondholders every March 31, June 30, September 30, and December 31 over the 4-year period. We calculate the interest payment as:

$$\begin{aligned} \text{Interest Payment} &= \text{Face Value} \times \text{Annual Interest Rate} \times \text{Time Period} \\ &= \$40,000 \times 4\% \times 1/4 = \$400 \end{aligned}$$

The journal entry to record the bond issuance is as follows:

Account	January 1, 2018
Cash	40,000
Bonds Payable	40,000

Interest for the first year is recorded as follows:

Account	March 31, June 30, September 30, and December 31, 2018	
Interest Expense	400	
Cash		400

The entries required at maturity on December 31, 2021, follow. The journal entry to record the last interest payment and interest expense on December 31, 2021, also follows.

Account	December 31, 2021	
Interest Expense	400	
Cash		400

The entry to record the full repayment of principal follows.

Account	December 31, 2021	
Bonds Payable	40,000	
Cash		40,000

Overview of Bonds Payable Issued at a Discount or Premium

A bond's issue price always equals the sum of the present value of the future cash flows related to the bond discounted at the market rate of interest. Specifically, the bond issue price is the sum of:

- The present value of the par value (the present value of an amount of \$1)
- The present value of the interest payments (the present value of an ordinary annuity)

Interest expense, the cost of borrowing for the period, composes both the cash interest payments and the amortization of any bond premium or discount. Because a bond discount occurs when the market interest rate is greater than the stated interest rate, the discount represents *increased* interest expense for the corporation over the life of the bond. In the case of a bond premium, the market interest rate is lower than the stated rate, so the premium represents *decreased* interest expense over the life of the bond.

To summarize, there are two primary effects of amortization.

1. Discount (premium) amortization increases (decreases) the interest expense so that the corporation's effective cost of borrowing is brought up to (brought down to) the higher (lower) market rate.
2. Discount (premium) amortization reduces the discount (premium) and increases (decreases) the carrying value of the bonds until the carrying value is brought up to (brought down to) the par value at the maturity date.

For example, if a company issues bonds with a par value of \$10,000 for \$8,000, it would record a discount of \$2,000. The \$2,000 discount represents an increased interest expense for the corporation over the life of the bond. In other words, the corporation borrows and has the use of \$8,000 today, but it must repay the full \$10,000 at maturity. At maturity, the company reports the bond at its face value.

There are two methods of amortization: the *effective interest method* and the *straight-line method*. We discuss the effective interest method next and the straight-line method in Appendix A.

The Effective Interest Rate Method of Amortization

The **effective interest rate method** computes interest expense by multiplying the *historical market interest rate* by the beginning balance of the debt. The **historical market interest rate** is the market interest rate in effect on the date the bonds are issued determined based on the price received for the bond. The effective interest rate method is theoretically correct for two reasons:

1. The interest expense properly reflects the effective cost of borrowing at the market rate in effect when the company originally issued the debt (i.e., at the historical market rate).
2. At any point in time, the carrying value of the debt is equal to the present value of the remaining future cash flows discounted at the historical market rate of interest.

The cash or coupon interest payments are the face value of the bond multiplied by the stated interest rate. The amount of discount or premium amortized or allocated to each period is the difference between the effective total interest and the cash interest.

The effective interest rate method of amortization equations are:

$$\text{Effective Interest Expense} = \text{Historical Market Rate} \times \text{Carrying Value of the Bond at the Beginning of the Period} \quad (14.1)$$

$$\text{Discount/Premium Amortization} = \text{Effective Interest Expense} - \text{Cash Interest Paid} \quad (14.2)$$

Accounting for Bonds Payable Issued at a Premium

In the case of a premium, the company:

- Records the increase in cash and the increase in the bond payable account when issuing the bonds.
- Credits the bond premium (an adjunct account to the bond payable account).
- Records the interest expense for every interest payment and reduces the bond premium account.

Example 14.7 illustrates issuing bonds at a premium using the effective interest rate method of amortization.

EXAMPLE 14.7

Accounting for Bonds Payable Issued at a Premium: Effective Interest Method

PROBLEM: On January 1, 2018, Ruffin Corporation issued \$40,000 par value, 4%, 4-year bonds that mature on December 31, 2021. Ruffin will pay interest semiannually on June 30 and December 31. The company's fiscal year ends on December 31. What is the issue price of this bond assuming that the market rate of interest is 2%? What is the journal entry to record the issuance? Prepare an amortization table using the effective interest rate method. What journal entries are required to record interest expense for the first year? Prepare the journal entry to record the maturity of the bonds. Prepare the t-accounts for the bond payable and bond premium accounts for the life of the bond.

SOLUTION: Because the stated interest rate is higher than the market rate when the bonds are issued, Ruffin issued the bonds at a premium. The terms to compute the future payments to bondholders are:

- **Face value** = \$40,000
- **Stated annual interest rate** = 4%
- **Historical market annual interest rate** = 2%

- **Interest payment period** = semiannually on June 30 and December 31
- **Maturity date** = December 31, 2021

At maturity, Ruffin will pay bondholders the face value of the bond, \$40,000. Every June 30 and December 31 for 4 years, Ruffin will also make the interest payment to bondholders. We calculate the interest payment as:

$$\begin{aligned} \text{Interest Payment} &= \text{Face Value} \times \text{Annual Interest Rate} \times \text{Time Period} \\ &= \$40,000 \times 4\% \times \frac{1}{2} = \$800 \end{aligned}$$

We next determine the bond issue price, which is equal to the sum of the present value of the future cash flows. The present value includes the maturity amount of \$40,000 as well as the semiannual interest payments of \$800. We use the semiannual market rate of 1% (2% / 2) and N = 8 (4 years × 2).

	N	I/Y	PV	PMT	FV	Excel Formula
Given	8	1.00%		-800	-40,000	
Solve for PV			43,061			= PV(0.01,8,-800,-40000)

The bond issue price is \$43,061 and, thus, the premium is \$3,061 (\$43,061 - \$40,000). The journal entry includes a premium account to record the bond issuance as follows:

Account	Entry at Issuance (January 1, 2018)
Cash	43,061
Bonds Payable	40,000
Premium on Bonds Payable	3,061

We next prepare the amortization table with the effective interest rate method using Equations 14.1 and 14.2 to compute the effective interest expense and the premium amortization, respectively.

Amortization Table under the Effective Interest Rate Method

Date	2% Cash Interest (a)	1% Effective Interest (b) = 1% × Prior (d)	Premium Amortization (c) = (a) - (b)	Carrying Value (d) = Prior (d) - (c)
January 1, 2018				\$43,061
June 30, 2018	\$ 800	\$ 431	\$ 369	42,692
December 31, 2018	800	427	373	42,319
June 30, 2019	800	423	377	41,942
December 31, 2019	800	419	381	41,561
June 30, 2020	800	416	384	41,177
December 31, 2020	800	412	388	40,789
June 30, 2021	800	408	392	40,397
December 31, 2021	800	403*	397*	40,000
TOTALS	<u>\$6,400</u>	<u>\$3,339</u>	<u>\$3,061</u>	

* Adjusted due to rounding errors.

We present the journal entry to record the first semiannual interest payment on June 30, 2018.

Account	June 30, 2018
Interest Expense	431
Premium on Bonds Payable	369
Cash	800

Continued

We present the journal entry to record the second semiannual interest payment on December 31, 2018.

Account	December 31, 2018	
Interest Expense	427	
Premium on Bonds Payable	373	
Cash		800

Note that the cash interest paid exceeds the effective interest. The amount of the premium amortized reduces the carrying value of the debt rather than increasing interest expense.

Ruffin pays for the bonds at maturity and makes the following entry.

Account	December 31, 2021	
Bonds Payable	40,000	
Cash		40,000

The t-accounts for the bond payable and bond premium accounts are as follows:

Bond Payable		Premium on Bond Payable	
January 1, 2018	40,000	January 1, 2018	3,061
		June 30, 2018	369
		December 31, 2018	373
		June 30, 2019	377
		December 31, 2019	381
		June 30, 2020	384
		December 31, 2020	388
		June 30, 2021	392
December 31, 2021	40,000	December 31, 2021	397
Balance	<u>0</u>		<u>0</u>

Accounting for Bonds Payable Issued at a Discount

In the case of a discount, the company:

- Records the increase in cash and the increase in the bond payable account when issuing the bonds
- Debits the bond discount (a contra-account to the bond payable account)
- Records the interest expense for every interest payment and reduces the bond discount account

Example 14.8 illustrates this process.

EXAMPLE 14.8 Accounting for Bonds Payable Issued at a Discount: Effective Interest Method

PROBLEM: On January 1, 2018, Ruffin Corporation issued \$40,000 par value, 4%, 4-year bonds that mature on December 31, 2021. Ruffin will pay interest semiannually on June 30 and December 31. On the date that Ruffin issued the bonds, the market rate of interest was 6%. The company's fiscal year ends on December 31. What is the issue price of this bond? Prepare the journal entry to record the issuance. Prepare an amortization schedule over the 4-year period using the effective interest rate method. Prepare the journal entries to record the interest entries for the first year, the journal entry to record the payment of the bonds at maturity, and the t-accounts for the bond payable and bond discount accounts for the life of the bond.

SOLUTION: Because the stated interest rate was lower than the market rate when Ruffin issued the bonds, the bonds were sold at a discount. The terms to compute the future payments to bondholders are:

- **Face value** = \$40,000
- **Stated annual interest rate** = 4%
- **Historical market annual interest rate** = 6%
- **Interest payment period** = semiannually on June 30 and December 31
- **Maturity date** = December 31, 2021

At maturity, Ruffin will pay bondholders the face value of the bond, \$40,000. Ruffin will also make the interest payment to bondholders semiannually every June 30 and December 31, for the next 4 years. The semiannual interest payment is computed as follows:

$$\begin{aligned} \text{Interest Payment} &= \text{Face Value} \times \text{Annual Interest Rate} \times \text{Time Period} \\ &= \$40,000 \times 4\% \times \frac{1}{2} = \$800 \end{aligned}$$

We next determine the bond issue price. This present value includes both the face amount of \$40,000 and the semiannual interest payments of \$800. We use the semiannual market rate because the bonds are priced to yield the market. Therefore, $I/Y = 3\%$ ($6\%/2$) and $N = 8$ ($4 \text{ years} \times 2$).

	N	I/Y	PV	PMT	FV	Excel Formula
Given	8	3.00%		-800	-40,000	
Solve for PV			37,192			=PV(0.03, 8, -800, -40000)

The bond issue price is \$37,192 and, thus, the discount is \$2,808 ($\$40,000 - \$37,192$). The journal entry to record the bond issuance includes a discount account as follows:

Account	Entry at Issuance (January 1, 2018)
Cash	37,192
Discount on Bonds Payable	2,808
Bonds Payable	40,000

To prepare an amortization table, we start with the bond issue price and use the effective interest rate method. Refer to Equations 14.1 and 14.2 for the effective interest expense and the discount amortization, respectively.

Amortization Table under the Effective Interest Rate Method

Date	2% Cash Interest (a)	3% Effective Interest (b) = 3% × Prior (d)	Discount Amortization (c) = (b) - (a)	Carrying Value (d) = Prior (d) + (c)
January 1, 2018				\$ 37,192
June 30, 2018	\$ 800	\$ 1,116	\$ 316	37,508
December 31, 2018	800	1,125	325	37,833
June 30, 2019	800	1,135	335	38,168
December 31, 2019	800	1,145	345	38,513
June 30, 2020	800	1,155	355	38,868
December 31, 2020	800	1,166	366	39,234
June 30, 2021	800	1,177	377	39,611
December 31, 2021	800	1,189*	389*	40,000
TOTALS	<u>\$6,400</u>	<u>\$9,208</u>	<u>\$2,808</u>	

* Adjusted due to rounding errors.

Continued

Next we present the journal entry to record the first semiannual interest payment during 2018 from the amortization table.

Account	June 30, 2018	
Interest Expense	1,116	
Cash		800
Discount on Bonds Payable		316

The journal entry to record the second semiannual interest payment during 2018 from the amortization table follows.

Account	December 31, 2018	
Interest Expense	1,125	
Cash		800
Discount on Bonds Payable		325

Note that the effective interest expense exceeds the cash interest paid. The difference is the amortization of the bond discount, which increases the carrying value of the debt.

Ruffin pays for the bonds at maturity and makes the following entry.

Account	December 31, 2021	
Bonds Payable	40,000	
Cash		40,000

The t-accounts for the bond payable and bond discount accounts are as follows:

Bond Payable		Discount on Bond Payable	
January 1, 2018	40,000	January 1, 2018	2,808
		June 30, 2018	316
		December 31, 2018	325
		June 30, 2019	335
		December 31, 2019	345
		June 30, 2020	355
		December 31, 2020	366
		June 30, 2021	377
December 31, 2021	40,000	December 31, 2021	389
Balance	<u>0</u>		<u>0</u>

Interest Accrual. Often the cycle of interest payments does not correspond to the issuer's year-end. In that case, the company must accrue interest before preparing financial statements as shown in Example 14.9.

EXAMPLE 14.9

Accounting for Bonds Payable Issued at a Discount: Effective Interest Method with Interest Accrual

PROBLEM: On August 1, 2018, QuarterPound Corporation issued \$100,000 par value, 6%, 3-year bonds that mature on July 31, 2021. QuarterPound will pay interest annually on July 31. On the date that QuarterPound issued the bonds, the market rate of interest was 8%. The company's fiscal year ends December 31. What is the issue price of this bond? Prepare the journal entry to record the issuance. Prepare an amortization schedule over the 3-year period

using the effective interest rate method. Prepare the journal entries to record the bonds through July 31, 2019.

SOLUTION: Because the stated interest rate is lower than the market rate when QuarterPound issued the bonds, the bonds were sold at a discount. The terms to compute the future payments to bondholders are:

- **Face value** = \$100,000
- **Stated annual interest rate** = 6%
- **Historical market annual interest rate** = 8%
- **Interest payment period** = annually on July 31
- **Maturity date** = July 31, 2021

At maturity, QuarterPound will pay bondholders the face value of the bond, \$100,000. QuarterPound will also make the interest payment to bondholders annually every July 31 for the next 3 years. The annual interest payment is computed as follows:

$$\begin{aligned} \text{Interest Payment} &= \text{Face Value} \times \text{Annual Interest Rate} \times \text{Time Period} \\ &= \$100,000 \times 6\% \times 1 = \$6,000 \end{aligned}$$

To determine the bond issue price, take the present value of the face amount and the annual interest payments. We use the annual market rate because the bonds are priced to yield the market. Therefore, I/Y = 8% and N = 3.

	N	I/Y	PV	PMT	FV	Excel Formula
Given	3	8.00%		-6,000	-100,000	
Solve for PV			94,846			= PV(0.08,3,-6000,-100000)

The bond issue price is \$94,846 and, thus, the discount is \$5,154 (\$100,000 – \$94,846). The journal entry to record the bond issuance includes a discount account as follows:

Account	Entry at Issuance
Cash	94,846
Discount on Bonds Payable	5,154
Bonds Payable	100,000

To prepare an amortization table, we start with the bond issue price and use the effective interest rate method. Refer to Equations 14.1 and 14.2 for the effective interest expense and the discount amortization, respectively.

Amortization Table under the Effective Interest Rate Method

Date	6% Cash Interest (a)	8% Effective Interest (b) = 8% × Prior (d)	Discount Amortization (c) = (b) – (a)	Carrying Value (d) = Prior (d) + (c)
At issuance				\$ 94,846
July 31, 2019	\$ 6,000	\$ 7,588	\$1,588	96,434
July 31, 2020	6,000	7,715	1,715	98,149
July 31, 2021	6,000	7,851*	1,851*	100,000
TOTALS	<u>\$18,000</u>	<u>\$23,154</u>	<u>\$5,154</u>	

* Adjusted due to rounding errors.

Because QuarterPound will prepare financial statements on December 31 of each year, it will accrue interest and amortize the discount on that date. On December 31, 2018,

Continued

QuarterPound will record interest expense of \$3,162 for 5 months ($\$7,588 \times 5/12$) and interest payable of \$2,500 for 5 months ($\$6,000 \times 5/12$). The entry will also reduce the discount account by \$662 for 5 months of amortization ($\$1,588 \times 5/12$).

Account	December 31, 2018	
Interest Expense	3,162	
Interest Payable		2,500
Discount on Bonds Payable		662

At the first interest payment on July 31, 2019, QuarterPound will remove the interest payable and record interest expense of \$4,426 for the 7 months in the current year ($\$7,588 \times 7/12$) and amortization of the discount of \$926 for 7 months ($\$1,588 \times 7/12$). It will also record the \$6,000 cash payment.

Account	July 31, 2019	
Interest Expense	4,426	
Interest Payable	2,500	
Discount on Bonds Payable		926
Cash		6,000

Zero-Coupon Bonds. Zero-coupon bonds are bonds that do not pay cash interest because the coupon rate, or stated rate, is zero. Although there is no cash interest, the holder will receive the face value at maturity. The difference between the issue price and the face value represents interest expense over the life of the bond. Zero-coupon bonds are typically issued at significant discounts because the market interest rate is always higher than the zero-coupon rate. Accounting for these bonds is a special case of bonds issued at a discount as shown in Example 14.10.

EXAMPLE 14.10

Accounting for Bonds Payable: Zero-Coupon Bond

PROBLEM: Assume that Ceros Company issued a \$100,000 face value, 5-year, zero-coupon bond on January 1 of the current year. The current market interest rate is 4%. What is the bond issue price? Prepare an amortization table using the effective interest rate method. What are the journal entries to record the issuance and interest for the first year?

SOLUTION: The bond issue price equals the present value of the future cash flows. The only cash flow is the face amount of \$100,000. Compounding is annual; therefore, $I/Y = 4\%$ and $N = 5$.

	N	I/Y	PV	PMT	FV	Excel Formula
Given	5	4.00%		0	-100,000	
Solve for PV			82,193			=PV(0.04,5,0,-100000)

The journal entry to record the bond issuance includes a discount account as follows:

Account	Entry at Issuance	
Cash	82,193	
Discount on Bonds Payable	17,807	
Bonds Payable		100,000

Ceros accrues interest expense of 4% of the carrying value each year. We show the Cash Interest column in the following amortization table to highlight the fact that no interest payments are made and to be consistent with other amortization tables.

Year	0% Cash Interest (a)	4% Effective Interest (b) = 4% × Prior (d)	Discount Amortization (c) = (b) – (a)	Carrying Value (d) = Prior (d) + (c)
At issuance				\$ 82,193
Year 1	\$0	\$3,288	\$3,288	85,481
Year 2	0	3,419	3,419	88,900
Year 3	0	3,556	3,556	92,456
Year 4	0	3,698	3,698	96,154
Year 5	0	3,846	3,846	100,000
	<u>0</u>			
	<u>0</u>			

We present the following journal entry to record the first year's interest expense from line 1 of the amortization table.

Account	December 31
Interest Expense	3,288
Discount on Bonds Payable	3,288

Recording Bonds Payable: IFRS

IFRS prefers using the *net method* to record bonds payable. Under the **net method**, the discount is subtracted from the face value or the premium is added to the face value without using a separate discount or premium account. This method results in the same carrying value for bonds payable as under the U.S. GAAP.

- 4 Explain and illustrate accounting for bonds issued between interest payment dates.

Bonds Issued between Interest Dates

Bonds are not always sold on their interest payment dates; market interest rate fluctuations or a depressed bond market can delay the bond issue. When bonds are sold between interest dates, the buyer must pay the issuer the amount of accrued interest from the prior interest date or date on the bonds to the date of the bond issue. The issuer then returns this amount to the buyer when paying the full interest on the next interest date.

To illustrate, assume that a company sold a bond dated January 1, 2018, on May 1, 2018. The bond pays \$12,000 interest every January 1 and June 30. Because the company sold the bond on May 1, the bondholders have earned only 2 months' interest by the first interest payment on June 30, 2018. However, because of the significant number of bondholders, the company will not allocate interest to individual investors who acquired the bonds on different dates. As an alternative, the company collects the accrued interest on the issue date from the purchaser and then pays the full 6 months' interest on the next interest payment date. The investor will pay the corporation 4 months' interest, or \$8,000, on the date of purchase, May 1 ($\$12,000 \times 4/6$). However, on June 30, the bondholder will receive the full 6 months' interest of \$12,000. As a result, the bondholder earns interest equal to \$4,000, which represents the earnings over the 2 months she held the bond ($\$12,000 \times 2/6$). That is, she paid \$8,000 but received \$12,000 for a net interest income of \$4,000. Example 14.11 illustrates accounting for bonds sold between interest dates at par.

EXAMPLE 14.11**Bonds Sold between Interest Dates at Par**

PROBLEM: Nelson Company issued \$400,000 par value, 5-year, 3% bonds on June 1, 2018. The bonds are dated January 1, 2018, and pay interest semiannually each June 30 and December 31. The bonds are sold at par plus accrued interest because they are sold between interest dates. The company's fiscal year ends on December 31. Prepare the journal entries required to issue the bonds on June 1, 2018, and record the first interest payment on June 30, 2018.

SOLUTION: The semiannual interest is \$6,000 computed as follows:

$$\$400,000 \times 3\% \times \frac{1}{2} = \$6,000$$

On the date of the bond issue, there are 5 months of accrued interest from the date of the bonds (January 1) to the date of sale (June 1). As a result, there is \$5,000 accrued interest on the issue date ($\$6,000 \times 5/6$). The bonds are issued at par plus accrued interest or \$405,000 (\$400,000 par + \$5,000 accrued interest).

<i>Account</i>	<i>June 1, 2018</i>
Cash	405,000
Bonds Payable	400,000
Interest Payable	5,000

Nelson makes the following journal entry on the first interest date:

<i>Account</i>	<i>June 30, 2018</i>
Interest Expense	1,000
Interest Payable	5,000
Cash	6,000

The interest expense for the corporation is \$1,000, or 1 month's interest for the period in which the bond is outstanding (i.e., $\$6,000 \times 1/6$). Although the corporation paid \$6,000 on June 30, it received \$5,000 from the investor on the date of sale.

Example 14.12 illustrates accounting for bonds issued at a discount between interest dates.

EXAMPLE 14.12**Bonds Sold between Interest Dates at a Discount**

PROBLEM: Martino Motors Company issued \$800,000 par value, 6%, 5-year bonds dated January 1, 2018. The bonds pay interest semiannually each June 30 and December 31. Because of an unusual increase in market rates of interest, Martino delayed the bond issue until March 1, 2018, when the market rate of interest was 8%. Determine the bond issue price on March 1, 2018. Prepare an amortization table for the bond issue using the effective interest rate method. Prepare the journal entries required on the date of issue and on the first two interest dates in 2018, June 30 and December 31.

SOLUTION: The bonds are sold between interest dates and, as a result, the buyer will pay the seller the accrued interest from the date of the bonds to the day the bonds are sold. In this case, Martino delayed the bond issue for 2 months (January 1 to March 1).

$$\text{Interest Payment} = \$800,000 \times 6\% \times \frac{1}{2} = \$24,000 \text{ Semiannually}$$

The monthly interest payment is \$4,000 ($\$24,000 / 6$). As a result, the buyer will pay 2 months' interest, or \$8,000, on the date of purchase. Then, on June 30, the first interest

payment date, the buyer will receive the full \$24,000. The difference, \$16,000, is the net interest paid by the corporation for the 4 months the bonds are outstanding (March 1 to June 30).

To determine the bond issue price, we must first compute the value on June 30, 2018, and then discount this amount back to March 1, 2018, the date of issue.

To determine the present value of the bonds on June 30, discount the relevant cash flows for 9 periods. Because June 30 is the first interest period of the 10 semiannual interest periods (5 years × 2), only 9 remain. The semiannual market rate is 4% (8%/2).

	N	I/Y	PV	PMT	FV	Excel Formula
Given	9	4.00%		-24,000	-800,000	
Solve for PV			740,517			=PV(0.04,9,-24000,-800000)

On June 30, the bonds will also pay the investor 4 months' interest, or \$16,000 (\$4,000 × 4 months). Therefore, the total cash flow to be received on June 30 is \$756,517 (\$740,517 + \$16,000). We discount this amount back to the date of issue to determine the selling price. Consider the \$756,517 as a future value and discount it back to March 1, 2018. Treat the 4-month period as a single period to determine an interest rate for it. That rate is 2.667% computed as follows:

$$\text{Interest Rate for a 4-Month Period} = 4\% \times 4 \text{ Months} / 6 \text{ Months} = 2.667\%$$

The present value of the bonds on the date of issue is \$736,865.

	N	I/Y	PV	PMT	FV	Excel Formula
Given	1	2.667%		0	756,517	
Solve for PV			(736,865)			=PV(0.02667,1,0,756517)

The bonds are issued at a discount:

Par value	\$ 800,000
Bond issue price	(736,865)
Discount on bonds payable	<u>\$ 63,135</u>

The buyer will also pay the seller the \$8,000 accrued interest on the date of purchase. So, the total cash received by the corporation on the date of issue is \$744,865 (\$736,865 + \$8,000).

The amortization table for the bond issue follows. Note that Period 1 is a single period from March 1 to June 30.

Date	3% Cash Interest (a)	4% Effective Interest (b) = 4% × Prior (d)	Discount Amortization (c) = (b) - (a)	Carrying Value (d) = Prior (d) + (c)
March 1, 2018				\$736,865
June 30, 2018	\$ 16,000 ^(a)	\$ 19,650 ^(b)	\$ 3,650	740,515
December 31, 2018	24,000	29,621	5,621	746,136
June 30, 2019	24,000	29,845	5,845	751,981
December 31, 2019	24,000	30,079	6,079	758,060
June 30, 2020	24,000	30,322	6,322	764,382
December 31, 2020	24,000	30,575	6,575	770,957
June 30, 2021	24,000	30,838	6,838	777,795
December 31, 2021	24,000	31,112	7,112	784,907
June 30, 2022	24,000	31,396	7,396	792,303
December 31, 2022	<u>24,000</u>	<u>31,697*</u>	<u>7,697*</u>	800,000
TOTAL	<u>\$232,000</u>	<u>\$ 295,135</u>	<u>\$ 63,135</u>	

* Adjusted due to rounding errors.

(a) The first period's interest is for 4 months and is computed as follows: \$24,000 × 4/6 = \$16,000.

(b) The effective interest for the first period is computed as follows: 4% × 4/6 × \$736,865 = \$19,650.

Continued

The remainder of the table is constructed as a normal amortization table. For example, the second interest period is equal to $\$740,515 \times 4\% = \$29,621$.

On the date of the bond issue, there are 2 months' accrued interest from the date of the bonds (January 1) to the date of sale (March 1). As a result, there is \$8,000 accrued interest on the issue date ($\$4,000$ per month \times 2 months). The bonds are issued at a discount plus accrued interest, or \$744,865 ($\$800,000$ par $-$ $\$63,135$ discount $+$ $\$8,000$ accrued interest).

<i>Account</i>	<i>March 1, 2018</i>	
Cash	744,865	
Discount on Bonds Payable	63,135	
Bonds Payable		800,000
Interest Payable		8,000

Martino Motors makes the following journal entry on the first interest period:

<i>Account</i>	<i>June 30, 2018</i>	
Interest Expense	19,650	
Interest Payable	8,000	
Discount on Bonds Payable		3,650
Cash		24,000

Note that the interest expense for the first period (March 1 to June 30) is \$19,650.

Martino Motors makes the following journal entry on the second interest payment date:

<i>Account</i>	<i>December 31, 2018</i>	
Interest Expense	29,621	
Discount on Bonds Payable		5,621
Cash		24,000

- 5 Discuss and illustrate the accounting for bond issue costs.

Bond Issue Costs

When seeking to raise capital via bond issues, companies must consider costs related to printing, accounting fees, legal fees, and underwriting. Under both U.S. GAAP and IFRS, bond issue costs are deducted from the carrying value of the bond payable (by increasing the discount or decreasing the premium) and are included when determining the effective interest rate on the debt. The accounting treatment recognizes that bond issue costs reduce a company's cash proceeds, effectively decreasing the carrying value of the bonds, which means that borrowing costs are higher. Accounting for bond issue costs is illustrated in Example 14.13.

EXAMPLE 14.13

Bond Issue Costs

PROBLEM: On January 1, 2018, Compex Corp. issued \$1,000,000 par value, 6%, 3-year bonds when the market rate of interest was 7%. Interest is payable annually each December 31. Compex incurred bond issue costs of \$24,000. What is the journal entry when Compex issued the bonds? Prepare the amortization table for the bonds.

SOLUTION: Because the stated interest rate is less than the market interest rate, Compex issued the bonds at a discount. The present value of the bonds is \$973,757.

	N	I/Y	PV	PMT	FV	Excel Formula
Given	3	7.00%		-60,000	-1,000,000	
Solve For PV			973,757			=PV(0.07,3,-60000,-1000000)

The bond issue costs increase the discount by an additional \$24,000. Thus, the total discount is the discount attributable to the difference in the stated and effective interest rates (\$26,243) and the issue costs (\$24,000). The journal entry follows:

Account	January 1, 2018
Cash	949,757
Discount on Bonds Payable	50,243
Bonds Payable	1,000,000

	N	I/Y	PV	PMT	FV	Excel Formula
Given	3		949,757	-60,000	-1,000,000	
Solve For RATE		7.9478%				=RATE(3,-60000,949757,-1000000)

We then use the 7.9478% interest rate to prepare the amortization table.

	6.0% Cash Interest (a)	7.9478% Effective Interest (b) = 7.9478% × Prior (d)	Discount Amortization (c) = (b)–(a)	Carrying Value (d) = Prior (d) + (c)
January 1, 2018				\$ 949,757
December 31, 2018	\$ 60,000	\$ 75,485	\$15,485	965,242
December 31, 2019	60,000	76,716	16,716	981,958
December 31, 2020	60,000	78,042*	18,042*	1,000,000
TOTAL	<u>\$180,000</u>	<u>\$230,243</u>	<u>\$50,243</u>	

* Adjusted due to rounding errors.

- 6 Determine the accounting for bonds payable at early retirement.

Early Retirement of Bonds Payable

As noted earlier, derecognition of bonds payable involves removing the debt from an entity's balance sheet. A company derecognizes its debt when it pays the bonds at maturity, retires the debt early (before maturity), restructures an existing debt agreement, or converts the bonds into common or preferred stock. We have illustrated derecognition at maturity several times throughout this chapter. In this section, we examine the accounting for bond derecognition upon early retirement.

Companies often *extinguish* debt before maturity to take advantage of lower market rates of interest. In this case, the debtor retires high-cost debt and replaces or refinances this debt with lower-cost obligations. Alternatively, a company in an excess cash position may lower interest costs by using the excess cash to retire debt. When a company retires bonds early, it is referred to as a **debt extinguishment**. The accounting is more complex for extinguishments than it is for debt derecognized at maturity.³ Debt retirement generally results in a gain or loss on early retirement. A company determines the gain or loss by taking the difference between the net carrying value of the debt and the retirement price as shown in Equation 14.3.

$$\text{Gain (Loss) on Early Extinguishment} = \text{Net Carrying Value of the Debt} - \text{Retirement Price} \quad (14.3)$$

There is a gain if the retirement price is less than the net carrying value and a loss if the company pays more than the net carrying value to retire the debt.

³For most of the relevant authoritative literature for this topic, see FASB ASC 470-50-45, *Debt – Modifications and Extinguishments* for U.S. GAAP and IASB, *International Financial Reporting Standard 7*, “Financial Instruments: Disclosures” (London, UK: International Accounting Standards Board, Revised), Paragraph 10, for IFRS.

Before computing the gain or loss on the early extinguishment, the company must amortize any discount or premium up to the retirement date. It includes any fees incurred in retiring the debt in the computation of the gain or loss. Example 14.14 provides an example of accounting for the early extinguishment of bonds.

EXAMPLE 14.14 Early Extinguishment of Bonds

PROBLEM: As noted in Example 14.8, on January 1, 2018, Ruffin Corporation issued \$40,000 par value, 4%, 4-year bonds that mature on December 31, 2021. The market rate of interest was 6%. Ruffin pays interest semiannually on June 30 and December 31. Assume that Ruffin decides to retire the debt on December 31, 2019, for \$36,000. What gain or loss should Ruffin report in its 2019 financial statements? What is the journal entry to record the derecognition?

SOLUTION: We can use the amortization table in Example 14.8 to determine the present value of \$38,513 for the bonds as of December 31, 2019.

The gain or loss on early retirement is then computed as follows:

Present value at retirement date (net carrying value)	\$ 38,513
Retirement price	<u>(36,000)</u>
Gain on early retirement of debt	<u>\$ 2,513</u>

There is a gain on early retirement because the company paid less than the net carrying value to retire its debt.

Ruffin makes the following journal entry to record the early retirement of debt.

Account	Entry at Early Retirement
Bonds Payable	40,000
Discount on Bonds Payable	1,487
Gain on Early Retirement of Debt	2,513
Cash	36,000

The balance in the discount on bonds payable account is computed as the par value (\$40,000) less the present value of \$38,513.

- 7 Explain and illustrate the accounting for convertible bonds.

Convertible Bonds

Convertible bonds are financial instruments that enable the holder to convert the bonds into a specified number of shares of common stock or preferred shares. When the bondholder elects to convert bonds into common or preferred stock, the company derecognizes the debt. The number of equity shares received on conversion is based on the exchange ratio included in the bond indenture (e.g., each bond converts into 25 shares of common stock). Convertible bonds are one type of **hybrid security**, which is a security that possesses characteristics of both debt and equity.⁴

Corporations issue convertible bonds as a vehicle to ultimately raise equity capital in a practice called back-door equity financing when equity prices are temporarily depressed and the firm needs to raise a required amount of capital. For example, assume that a company needs to raise \$30,000,000 in new financing. If the current market price of the company's equity is \$6 per share, the company would have to issue an additional 5,000,000 shares of stock (i.e., \$30,000,000/\$6 per share = 5,000,000 shares). As an alternative, the company could raise

⁴For most of the relevant authoritative literature for this topic, see FASB ASC 470-20, *Debt with Conversion and Other Options* for U.S. GAAP and IASC, *International Accounting Standard 32*, "Financial Instruments: Presentation," Paragraphs 28–32, for IFRS.

\$30,000,000 by issuing 30,000 of \$1,000 par value convertible bonds with each bond convertible into 45 shares of the company's common stock. If the company's share price increases, bondholders are likely to convert the debt to stock and only 1,350,000 new shares would be issued (i.e., $30,000 \text{ bonds} \times 45 \text{ shares per bond} = 1,350,000 \text{ shares}$).⁵ By raising capital with convertible bonds, the company issues fewer shares of stock and is less likely to significantly dilute its share price and earnings per share.

Convertible bonds are also attractive to investors. That is, in the immediate term, the bondholders get a fixed interest payment. In the long term, bondholders have the potential to convert their investment into an equity investment.

THE CONCEPTUAL FRAMEWORK CONNECTION

Convertible Bonds

Convertible bonds possess characteristics of both debt and equity securities. Should companies classify these financial instruments as debt *or* equity? To examine this question, we refer to the conceptual framework.

Liabilities involve probable future sacrifices of economic benefits. In the case of convertible bonds, there are probable future sacrifices in the form of interest and potentially principal repayment if the bondholders do not convert to equity. Equity is the residual interest in the assets after deducting the liabilities. Specifically, equity represents the ownership interest in the entity. Conceptually, part of the amount paid for a convertible bond is for an equity stake in the firm.

Because of the hybrid nature of convertible bonds, it is not conceptually sound to record a convertible bond entirely as a liability or entirely as equity. Rather, firms should separate the convertible security into two components: debt and equity.

Faithful representation in the conceptual framework requires that financial reporting depict the substance of an economic phenomenon completely, neutrally, and without material error.⁶ Thus, a faithful representation of a convertible bond includes the separation of the issue price into liability and equity.

Accounting for Convertible Bonds

Because of the difficulty of measuring the debt and equity components, U.S. GAAP usually treats an entire convertible bond issue as debt.⁷ The accounting for convertible debt is the same as straight debt. Specifically, companies amortize the convertible bonds throughout their life as if they were not convertible.⁸ The only difference is the accounting at conversion.

When convertible bonds are converted to equity, the company removes the bonds payable along with any unamortized premium or unamortized discount from the balance sheet. The company also recognizes common stock (or preferred stock) and any additional paid-in capital. The company does not record a gain or loss; rather, it includes this amount in additional paid-in capital. There is no gain or loss to recognize because this is a capital transaction—that is, an exchange involving the entity's own equity. Gains and losses by definition are not permitted when the transaction involves the entity's own equity shares.⁹ Example 14.15 illustrates accounting for convertible bonds.

⁵The company usually has a call option attached to convertible debt. With it, the company can call in the debt to force conversion. The call price can be at par or above par. If the call price is above par, the excess over par is known as a call premium.

⁶FASB, *Statement of Financial Accounting Concepts No. 8*, "Chapter 1, The Objective of General Purpose Financial Reporting," and Chapter 3, "Qualitative Characteristics of Useful Financial Information."

⁷An exception to this is when a beneficial conversion option exists. We discuss beneficial conversion options in the next section.

⁸See the Basis for Conclusions cases at the end of the chapter for more discussion of this issue.

⁹This approach is called the book value method. An alternative method known as the market value method values the shares on the bond conversion at the fair value of the shares issued or the bonds converted, whichever is more clearly evident. The difference between the fair value used and the carrying value of the bonds is recorded as a gain or loss on conversion. The conversion is viewed as a constructive early retirement of debt.

EXAMPLE 14.15 Convertible Bonds

PROBLEM: On January 1, 2018, Tarco Company issued \$500,000, par value, 8%, 4-year convertible bonds. Each \$1,000 bond is convertible into 30 shares of Tarco's \$1 par common stock. Tarco received \$572,598 for the bonds when issued; consequently, the effective interest yield is 4%. Interest is payable annually each December 31. The bonds were converted on December 31, 2019, when the carrying value was \$537,722.¹⁰ Assume the bonds do not have a beneficial conversion option. What journal entry does Tarco record at the issue of the bonds? What is the journal entry to record the conversion?

SOLUTION: Tarco records the bonds with a \$72,598 premium. Recording a convertible bond issue is no different from that of the sale of a non-convertible bond. The journal entry is as follows:

Account	January 1, 2018
Cash	572,598
Bonds Payable	500,000
Premium on Bonds Payable	72,598

At conversion, Tarco removes the bonds payable of \$500,000 and the remaining premium account of \$37,722. In addition, there are 500 bonds in this issue ($\$500,000 / \$1,000$ par) so that 15,000 shares will be issued on conversion (i.e., 500 bonds \times 30 shares per bond on conversion). Upon conversion, Tarco credits common stock at par value for \$15,000 (500 bonds \times 30 shares per bond \times \$1 par value per share). The remaining credit will be to additional paid-in-capital. The journal entry is as follows:

Account	December 31, 2019
Bonds Payable	500,000
Premium on Bonds Payable	37,722
Common Stock – Par Value	15,000
Additional Paid-in Capital in Excess of Par – Common	522,722

At the end of fiscal 2016, *Tesla* had convertible notes with a carrying value of \$2.957 billion. *Tesla* estimates that the fair value of the convertible debt would be \$3.206 billion with the difference between the carrying value and fair value primarily attributed to the conversion feature on the debt.

Beneficial Conversion Options

Accounting standards require companies to separate the debt and equity values of convertible bonds if a *beneficial conversion option* exists at issuance. A **beneficial conversion option** is an option to convert the debt to equity that is *in the money*. The conversion option is **in the money** if the market price of the stock exceeds the implied exercise price. At the date of issue, the beneficial conversion option is measured at its **intrinsic value**, the market price of the stock less the implied exercise price. Accounting for bonds issued with a beneficial conversion option is illustrated in Example 14.16.

¹⁰We can compute the effective yield using the internal rate of return function in a spreadsheet. The amortization table is then straightforward based on the stated rate of 8% and a yield of 4%.

EXAMPLE 14.16

Convertible Bonds with Beneficial Conversion Options

PROBLEM: Ayden Alexander Associates (AAA) issues a 10-year, 4%, \$1,000 par value convertible bond at par. The \$1,000 bond converts into 20 shares of \$1 par value common stock at the option of the bondholder beginning 2 years after the date of issue. There are no bond issue costs. Bond interest is paid annually. The market price of the common stock was \$65 per share. Prepare the journal entry to record the issuance of AAA’s convertible debt. Compute the effective interest rate on the bond.

SOLUTION: To determine whether the debt and equity features of this financial instrument can be separated, we must first identify whether the market price of the shares exceeds the implied exercise price of the stock on the commitment date, indicating a beneficial conversion option.

The implied exercise price is the par value of the bond divided by the number of shares to be issued at conversion. In this case, the implied exercise price is \$50 per share (\$1,000/ 20 shares). The market price of the common stock less the exercise price is the intrinsic value of the option, \$15 per share (\$65 – \$50). Because the market price of the stock exceeds the implied exercise price, the bonds are issued with a beneficial conversion option. The value of the beneficial conversion option is \$300 (\$15 intrinsic value × 20 shares). The bond is valued at \$700 (\$1,000 on issue proceeds less \$300 beneficial conversion option).

The journal entry to record the bond issue with a beneficial conversion option follows:

Account	Entry at Issue Date
Cash	1,000
Discount on Bonds Payable	300
Bonds Payable	1,000
Additional Paid-in Capital – Beneficial Conversion Option	300

We compute the effective interest rate or yield as 8.59% using the Excel spreadsheet.

	N	I/Y	PV	PMT	FV	Excel Formula
Given	10		700	-40	-1,000	
Solve for RATE		8.59%				= RATE (10,-40,700,-1000)

Any discount on the bonds is amortized using the effective interest rate. In Example 14.17, the effective interest rate is 8.59%.

When the bonds are converted, the company removes the carrying value of the bonds and the additional paid-in capital related to the beneficial conversion option amount and replaces them with equity. The fair value of the equity issued is not taken into account. Example 14.17 illustrates the accounting at the conversion of the debt to equity.

EXAMPLE 14.17

Convertible Debt at Conversion: Beneficial Conversion Option

PROBLEM: Continuing our previous illustration for Ayden Alexander Associates (AAA), assume that the bond converts after 2 years. The balance of the discount at the date of conversion is \$258. The bond converts into 20 shares of \$1 par value common stock. The balance of additional paid-in capital – beneficial conversion option is \$300. Prepare the journal entry to record the bond conversion.

Continued

SOLUTION: AAA accounts for the bond conversion by removing the carrying value of the bonds and the additional paid-in capital related to the beneficial conversion option and replacing it with the common stock at par and additional paid-in capital. The carrying value of the bonds at the date of conversion is \$742 (\$1,000 face value – \$258 remaining discount). The amount of additional paid-in capital related to the beneficial conversion option is \$300. The carrying value of the new equity issued is equal to the book value of the debt and the additional paid-in capital for the beneficial conversion option, \$1,042 (\$742 + \$300). The common stock par value is \$1 per share and 20 shares are issued, so AAA credits common stock at par \$20.

Account	On the Date of Conversion
Bond Payable	1,000
Additional Paid-in Capital – Beneficial Conversion Option	300
Discount on Bonds Payable	258
Common Stock (at Par)	20
Additional Paid-in Capital in Excess of Par – Common	1,022

Accounting for Convertible Bonds: IFRS

IFRS follows the conceptually sound approach of separately classifying the convertible bond's debt and equity components. Separating, or bifurcating, the convertible bond's debt and equity components is consistent with the conceptual framework definitions of these elements. Whereas U.S. GAAP separates the debt and equity components only for bonds with beneficial conversion options, IFRS requires separating the debt and equity components for all convertible bonds. Additionally, IFRS uses market values to measure the debt component. IFRS determines the debt and equity components as follows:

- The debt component is the present value of future cash flows at the market rate at the time of issuance.
- The equity component is the bond issue price less the amount of the debt component. This amount is recorded in an equity account referred to as other capital reserves.¹¹

Exhibit 14.4 compares accounting for convertible bonds under U.S. GAAP and IFRS.

EXHIBIT 14.4 Comparison of Accounting for Convertible Bonds under U.S. GAAP and IFRS

	U.S. GAAP	IFRS
Separate debt and equity components?	No, except for convertible bonds with a beneficial conversion option.	Yes.
Measuring debt and equity components.	Allocate full amount to debt except for convertible bonds with a beneficial conversion option. The beneficial conversion option is measured at its intrinsic value, the market price of the stock less the implied exercise price.	Measure the debt component as the present value of future cash flows at the market rate at the time of issuance. The equity component is the bond issue price less the amount of the debt component.

Example 14.18 illustrates the issuance and conversion of convertible bonds under IFRS.

¹¹Under IFRS, companies divide bond issue costs into debt and equity based on the initial percentages of the debt and equity components at issuance.

EXAMPLE 14.18**Issuance and Conversion of Convertible Bonds: IFRS**

PROBLEM: Assume now that Tarco is an IFRS reporter. On January 1, 2018, it issued \$500,000 of 8%, 4-year bonds. Interest is payable annually each December 31. The market rate of interest on January 1, 2018, the date of issue, for similar nonconvertible bonds was 6%. Each \$1,000 bond is convertible into 30 shares of Tarco's \$1 par common stock. The company received \$572,598 for the bonds on the issue date. All of the bonds were converted on December 31, 2019, when the carrying value was \$518,334. What journal entries does Tarco record at the issue and conversion of the bonds?

SOLUTION: We begin with the journal entry at issuance. Under IFRS, Tarco must first determine the debt component by computing the present value of all future cash flows at the market rate of interest.

	N	I/Y	PV	PMT	FV	Excel Formula
Given	4	6.00%		-40,000	-500,000	
Solve for PV			534,651			= PV (0.06,4,-40000,-500000)

Tarco records this amount as a liability (\$500,000 as bonds payable and \$34,651 as a premium). The equity component is the difference between the \$572,598 bond issue price and the \$534,651 debt component, or \$37,947. Tarco records the \$37,947 as equity, other capital reserves, as follows:

Account	January 1, 2018
Cash	572,598
Other Capital Reserves	37,947
Bonds Payable	534,651

At conversion, Tarco removes the carrying value of bonds payable and other capital reserves. It replaces the carrying value of the bonds and other capital reserves with the par value and additional paid-in capital of the equity shares issued. On December 31, 2019, the carrying value of the bond payable is \$518,334, which is the present value of remaining cash flows at the 6% market rate.

Account	December 31, 2019
Bonds Payable	518,334
Other Capital Reserves	37,947
Share Capital – Par Value	15,000
Share Premium	541,281

JUDGMENTS IN ACCOUNTING

Convertible Bonds

Convertible bonds have characteristics of both debt and equity, so the ideal accounting would involve splitting the proceeds in some way between debt and equity and reporting both components on the balance sheet. IFRS accounts for convertible bonds this way, even if the bonds do not contain a beneficial conversion option, to present a faithful representation of the financial position of the company.¹²

However, under U.S. GAAP, convertible bonds are not divided into the debt and equity components (unless they have a beneficial conversion option). FASB's approach is not based on conceptual grounds. Rather, FASB is concerned that separating the security into debt and equity components is too complex and difficult to measure.¹³ In other words, FASB chose not to require (or allow) the security to be separated because of the significant judgment involved.

¹²See IASC, *International Accounting Standard 32*, Paragraphs 28 through 32.

¹³See FASB, *Statement of Financial Accounting Standards No. 150*, Paragraph B53.

Because of the current accounting treatment under U.S. GAAP, accounting for convertible bonds without a beneficial conversion option does not require extensive judgment. Companies record the face value as bonds payable and record any difference between the issue price and the face value as a premium or discount. However, under IFRS, significant judgment may be involved. Consider a difference between the issue price and the face value. Is the difference because the market rate for the bonds, exclusive of the conversion option, varies from the stated rate? Or is the difference because the market is paying an extra amount for the conversion option?

The correct market rate is the one a company with an identical credit risk would use to issue identical bonds on the same day. The only difference is that these bonds would not have a conversion feature. Of course, it is highly unlikely that the same firm would go to the market with two bond issues in one day! Thus, management of the issuing firm must make an informed decision as to what the market rate will be. Consider Example 14.18. What if management concluded that the market rate was 7% instead of 6%? In this case, the present value of the bonds would be \$516,936, lower than the amount of \$534,651 from Example 14.18, and the journal entry would be:

<i>Account</i>	<i>January 1, 2018</i>
Cash	572,598
Other Capital Reserves	55,662
Bonds Payable	516,936

Judgments about the market rate affect a company's reported debt. A company concerned about the amount of its debt could select a higher interest rate to report less debt. Unlike many other management decisions, this judgment does not have an immediate impact on income: It simply increases the amount included in other capital reserves and decreases any premium paid, thus reducing the bond's carrying value. However, because companies ultimately amortize the premium paid as a reduction in interest expense, this decision will impact income by making interest expense higher and income lower.

Bayer AG, the German healthcare and agricultural products company, is an example of a company required to estimate the debt and equity components of convertible debt. **Bayer** raised €4,000 million when it issued convertible bonds with a face value of €500 million in fiscal 2016. As an IFRS reporter, **Bayer** separated the debt and equity components of the convertible debt. After adjusting for €48 million bond issue costs and €191 million deferred taxes, **Bayer** estimated the equity related to the conversion features of the bonds at €3,491 million. **Bayer** reported the debt at €652 million, implying that the debt was issued at par. Although IFRS requires that the convertible debt be separated, management uses judgment to estimate the amounts to be reported as debt versus equity.

- 8** Describe and illustrate the accounting for warrants, including those that are detachable and nondetachable.

Bonds with Stock Warrants

Bonds are sometimes issued with **stock warrants**, which are long-term options to acquire a stated number of shares of common stock for a stated price. Stock warrants with bonds may make investing attractive if the interest rate is lower or make borrowing feasible for a company wishing to issue debt.

When firms issue stock warrants with bonds, the warrants can either be *nondetachable* or *detachable*. **Detachable warrants** can be removed by the holder and sold separately on the secondary market whereas **nondetachable warrants** cannot be.

Accounting for Stock Warrants

If the warrants are nondetachable, then the total debt proceeds received are typically assigned to the debt issue and there is no allocation between debt and equity.¹⁴

¹⁴This section assumes that the hybrid instrument does not have an embedded beneficial conversion option.

If the warrants are detachable, then the firm allocates the proceeds to both the debt and equity components using one of the following methods:

- **Proportional method.** Allocate based on the relative fair values of the bond without the warrants and the warrants on a standalone basis at the time of issuance.
- **Incremental (or residual) method.** If the fair value of the bonds or the warrants is not readily determinable, allocate the portion of the proceeds to the instrument based on the readily available fair value and allocate the residual amount to the other instrument.

The issuance of bonds with warrants is illustrated in Example 14.19.

EXAMPLE 14.19

Issuance of Bonds with Stock Warrants

PROBLEM: CPW Company issued 2,000 of its \$1,000 par value bonds for \$1,450, providing total cash proceeds of \$2,900,000. It sold each bond with 40 warrants. Each warrant provides the holder with the right to acquire one share of the company’s \$2 par value, common stock for \$25 per share. CPW has existing bonds outstanding that trade without warrants at \$1,200. Other CPW warrants outstanding trade for \$25 each. What is the journal entry to record the issuance of the 2,000 bonds if the warrants are nondetachable? What is the journal entry to record the issuance of the 2,000 bonds if the warrants are detachable? Finally, what is the journal entry to record the bond issue if the warrants are detachable but do not have a readily determinable fair value?

SOLUTION: If the warrants are nondetachable, then CPW records the entire proceeds as a liability as follows:

<i>Account</i>	<i>At Issuance</i>
Cash	2,900,000
Bonds Payable	2,000,000
Premium on Bonds Payable	900,000

If the warrants are detachable, then CPW allocates the proceeds between debt and equity using the proportional method.

Component	Number of Units	Market Value of Existing Units	Total Market Value	Proportion for Allocation
Bonds	2,000	\$1,200	\$2,400,000	54.55%
Warrants	80,000	25	<u>2,000,000</u>	<u>45.45</u>
			<u>\$4,400,000</u>	<u>100%</u>

Allocation to bonds: $\$2,900,000 \times 54.55\% = \$1,581,950$

Allocation to warrants: $\$2,900,000 \times 45.45\% = \$1,318,050$

The bonds are now issued at a \$418,050 discount (i.e., $\$2,000,000 - \$1,581,950$).

<i>Account</i>	<i>At Issuance</i>
Cash	2,900,000
Discount on Bonds Payable	418,050
Bonds Payable	2,000,000
Additional Paid-in Capital – Stock Warrants	1,318,050

If the warrants are detachable but do not have a readily determinable fair value, then CPW allocates the fair value to the bonds and the residual of the total issue price to the warrants

Continued

using the incremental method. Assuming that the warrants do not have a readily determinable fair value, CPW determines the allocation of the issue price as follows:

Allocation to bonds: $2,000 \times \$1,200 = \$2,400,000$.

Allocation to warrants: $\$2,900,000 - \$2,400,000 = \$500,000$

The bonds are now issued at a \$400,000 premium (i.e., $\$2,400,000 - \$2,000,000$).

<i>Account</i>	<i>At Issuance</i>
Cash	2,900,000
Bonds Payable	2,000,000
Premium on Bonds Payable	400,000
Additional Paid-in Capital – Stock Warrants	500,000

When exercising the warrants, the firm removes the additional paid-in capital-stock warrants account, credits common stock for the par value, and credits the remainder to additional paid-in capital as shown in Example 14.20.

EXAMPLE 14.20

Exercise of Stock Warrants

PROBLEM: CPW Company issued 2,000 of its \$1,000 par value bonds for \$1,450, providing total cash proceeds of \$2,900,000. It sold each bond with 40 detachable warrants. Each warrant provides the holder with the right to acquire one share of the company's \$2 par value, common stock for \$25 per share. CPW has existing bonds outstanding that trade without warrants at \$1,200. There are other CPW warrants outstanding that trade for \$25 each. What is the journal entry to record the exercise of the warrants?

SOLUTION: Based on information in Example 14.19, we know that the balance in the additional paid-in capital account is \$1,318,050. Thus, CPW debits this account for its balance as well as the cash account for the cash proceeds of \$2,000,000 (80,000 warrants \times \$25 exercise price per warrant). It credits the common stock account for the \$2 par value per share multiplied by the 80,000 shares. CPW credits the remainder to additional paid-in capital.

<i>Account</i>	<i>At Exercise</i>
Cash	2,000,000
Additional Paid-in Capital – Stock Warrants	1,318,050
Common Stock	160,000
Additional Paid-in Capital in Excess of Par – Common	3,158,050

Accounting for Stock Warrant: IFRS

Similar to accounting for convertible bonds and consistent with the conceptual framework, IFRS separates the convertible bond's debt and equity components. When *Siemens AG*, the German engineering and electronics company, issued about \$3 billion of bonds with detachable warrants in 2012, it allocated roughly \$21.7 million to the value of the warrants.

- 9 Explain the reclassification of financing liabilities for current maturities of long-term debt, short-term debt expected to be refinanced, and callable obligations.

Reclassifications of Financing Liabilities

There are a number of scenarios under which a company will change the classification of notes and bonds payable between long term and short term.

Current Maturities of Long-Term Debt

When a long-term obligation becomes payable within the next year (or operating cycle, if longer), it meets the definition of a current liability. In this case, the firm will liquidate the long-term obligation through the use of current assets or the creation of other current liabilities. In such cases, the firm reclassifies the obligation from long-term to short-term as illustrated in Example 14.21.

EXAMPLE 14.21

Current Maturity of Long-Term Debt

PROBLEM: Backo, Inc. issued \$750,000 of bonds on December 15, 2018, when the market rate of interest was 5%. The 5-year bonds pay interest annually at 5%. Backo has a December 31 fiscal year-end. Prepare the journal entries to record the issuance of the bonds and the reclassification of the bonds on December 31, 2022.

SOLUTION: Backo's journal entry when issuing the bonds is as follows:

<i>Account</i>	<i>December 15, 2018</i>	
Cash	750,000	
Bonds Payable (long-term)		750,000

On December 31, 2022, the bonds payable are no longer long term because they mature within the next year (December 15, 2023). Thus, Backo must reclassify the bonds from long term to short term.

<i>Account</i>	<i>December 31, 2022</i>	
Bonds Payable (long term)	750,000	
Current Maturities of Bonds Payable		750,000

Short-Term Debt Expected to Be Refinanced

Under certain conditions, a company can reclassify short-term debt as long-term.¹⁵ For example, a company could:

- Reclassify short-term debt expected to be refinanced as long-term debt
- Refinance a short-term note to extend payment due dates or to take advantage of lower interest rates, particularly if cash is needed beyond the original maturity date of the short-term loan

A company would want to reclassify debt as long term to improve its liquidity ratios.

Short-Term Debt Reclassification. A company can reclassify short-term debt as long-term debt if the short-term debt is expected to be (1) extended or replaced by debt that will be due beyond 1 year from the balance sheet date or (2) replaced or refinanced with equity securities.

In either case, the obligation will no longer require the use of current assets or the creation of other current liabilities in its liquidation. Therefore, the obligation no longer meets the definition of

¹⁵For most of the relevant authoritative literature for this topic, see FASB ASC 470-10-45, *Debt—Overall—Other Presentation Matters* for U.S. GAAP and IASC, *International Accounting Standard 1, “Presentation of Financial Statements,”* Paragraphs 72–73, for IFRS.

a current liability so that the firm must reclassify it as long-term debt, providing adequate footnote disclosure with details of the refinancing.¹⁶

U.S. GAAP sets forth two criteria that firms must meet to exclude a short-term obligation from current liabilities and reclassify it as long-term debt:

1. Management must intend to refinance on a long-term basis *and*
2. Management must demonstrate the ability to consummate the refinancing.

Management demonstrates its ability to refinance by either:

1. Completing an actual refinancing during the post-balance sheet period, *or*¹⁷
2. Demonstrating the existence of a firm agreement that permits refinancing on a long-term basis with readily determinable terms.¹⁸

The reclassification of short-term debt is an important issue when preparing the balance sheet. For example, a firm that has short-term debt at the balance sheet date could meet the two criteria to reclassify the debt as long term before issuing the financial statements to the public. If the firm meets the two criteria before the financial statements are issued, it would classify the debt as long term on its balance sheet. An example of the reclassification from short-term to long-term debt is provided in Example 14.22.

EXAMPLE 14.22 **Reclassification from Short-Term to Long-Term Debt**

PROBLEM: Barbero Building Products Company reported a \$478,000 short-term note payable on its December 31, 2018, trial balance. The note is due on March 23, 2019. On February 2, 2019, Barbero extended the term of the loan for \$300,000 of the balance, changing the due date to March 23, 2020. Barbero finalized the loan extension on February 2, 2019, and it is not subject to any modifications. Barbero released financial statements on February 16, 2019. How should Barbero classify the \$478,000 note payable on the December 31, 2018, balance sheet? Provide any necessary journal entries.

SOLUTION: Because the refinancing is for \$300,000, Barbero reclassifies only that amount as long-term debt. Barbero should still classify the remaining \$178,000 as a current liability. Because the refinancing occurs on February 2, 2019, which is during the post-balance sheet period, it can reclassify the short-term debt as long-term debt as of year-end, December 31, 2018. The journal entry for this reclassification follows:

Account	December 31, 2018
Short-Term Notes Payable	300,000
Long-Term Notes Payable	300,000

Short-Term Debt Reclassification: IFRS. Similar to U.S. GAAP, when an IFRS-reporting company completes a refinancing on a long-term basis prior to the financial statement date, it can record the debt as long term under IFRS. Unlike U.S. GAAP, if the company completes the refinancing after the financial statement date, it must report the debt as short-term

¹⁶The firm must first refinance (obtain the additional financing) and then liquidate the short-term obligation. If this sequence of events were reversed, the firm would be using cash from the current operating cycle and the liability would still be classified as current.

¹⁷The post-balance sheet period is the time between the fiscal year-end and the date that the financial statements are issued.

¹⁸An agreement including a material adverse change clause would violate this criterion. A material adverse change clause can be included in lending arrangements to protect the lender against any significant adverse changes in market conditions or the financial position of the borrowing company from the date of the loan commitment until the date the loan is executed. In addition, an agreement including a provision that states that the refinancing is dependent on an increase in income over the subsequent 3 months would violate this agreement.

debt. The IFRS requirement seeks to report the underlying economic condition that exists at the balance sheet date. Even though events after the balance sheet date can occur that then change the classification, IFRS does not allow a future event to change the reporting of a contractual obligation that the company had at a point in time.

However, even if a company has not completed a refinancing before the financial statement date, it can reclassify short-term debt as long term when it both:

- Expects to refinance the debt within the next 12 months, and
- Has the ability to refinance the debt for at least 12 months after the reporting period under an *existing* arrangement to provide refinancing.

If a company expects to refinance the debt, it does not intend to use working capital to pay it off. Importantly, the second condition requires that the company has an existing arrangement under which it can refinance on a long-term basis. That is, the company has a current agreement with the debtholder to refinance and does not have to rely on some future event dependent on a future agreement of a debtholder, which is not certain. When a company has an existing arrangement to provide for refinancing in the next 12 months, it has the ability to defer the payment beyond the short term. Example 14.23 presents a scenario in which the refinancing occurs after the balance sheet date.

EXAMPLE 14.23 **Reclassification from Short-Term to Long-Term Debt: IFRS**

PROBLEM: Now assume that Barbero Building Products Company is an IFRS reporter. Barbero reported a \$478,000 short-term note payable on its December 31, 2018, trial balance. The note is due on March 23, 2019. On February 2, 2019, Barbero extended the term of the loan for \$300,000 of the balance, changing the due date to March 23, 2020. Barbero finalized the loan extension on February 2, 2019, and it is not subject to any modifications. Barbero released financial statements on February 16, 2019. How should Barbero classify the \$478,000 note payable on the December 31, 2018, balance sheet? Provide any necessary journal entries.

SOLUTION: Because the refinancing occurs on February 2, 2019, which is after the balance sheet date, Barbero must report the debt as short-term debt under IFRS. It cannot reclassify to long term.

Example 14.24 presents an example in which the company has the intent and ability to refinance.

EXAMPLE 14.24 **Reclassification from Short-Term to Long-Term Debt: IFRS**

PROBLEM: Barbero Building Products Company, an IFRS reporter, reported a \$478,000 short-term note payable on its December 31, 2018, trial balance. The note is due on March 23, 2019. It expects to refinance the full amount of the note payable and has an existing credit arrangement under which it could refinance on a long-term basis. How should Barbero classify the \$478,000 note payable on the December 31, 2018, balance sheet? Provide any necessary journal entries.

SOLUTION: Because Barbero has the intent and ability to refinance, it can reclassify the short-term debt as long term as of its year-end, December 31, 2018. The journal entry for this reclassification follows:

Account	December 31, 2018
Short-Term Notes Payable	478,000
Long-Term Notes Payable	478,000

Exhibit 14.5 illustrates the classification of short-term debt expected to be refinanced under U.S. GAAP and IFRS.

EXHIBIT 14.5 Short-Term Debt Expected to Be Refinanced

U.S. GAAP		IFRS	
When Refinanced	Classification	When Refinanced	Classification
Before year-end	Long term	Before year-end	Long term
After financial statement date but before financial statements issued	Long term	After financial statement date but before financial statements issued	Short term
Expected after financial statements date when the company both <ul style="list-style-type: none"> Intends to refinance the debt on a long-term basis. Demonstrates the ability to consummate the refinancing with either long-term debt or with equity securities. 	Long term	Expected after financial statements date when the company both <ul style="list-style-type: none"> Expects to refinance the debt within the next 12 months. Has the ability to refinance the debt for at least 12 months after the reporting period under an <i>existing</i> arrangement. 	Long term

Obligations Callable by Creditor

Callable obligations are liabilities for which the creditor can require immediate payment when specified conditions exist. For example, debt can be called at the creditor's option on fixed dates specified in loan agreements.

Reclassification of Obligations Callable by Creditor. Debtors in technical default may be required to reclassify long-term debt as short-term debt in certain situations.¹⁹ Specifically, reclassification should occur if either:

1. The debtor violated a provision of the debt agreement, making the debt callable at the balance sheet date, *or*
2. The debtor violated a debt agreement that, if not addressed within a specified grace period, will make the obligation callable.

The debtor may continue to classify the callable obligation as long term if it meets one of the following conditions:

1. The creditor waives or loses the right to demand payment (for example, the time period to exercise the call expires), *or*
2. The obligation will not become callable because it is probable that the debtor will address the violation within the grace period. For example, the debtor may be able to restore working capital to the level required in the restrictive debt covenant.

A creditor may waive the right to call in a loan that is in technical default if the debtor is otherwise making payments when due and the loan carries an interest rate higher than the current market rate. In addition, the call may result in additional financial distress for the debtor, which in turn may lead to bankruptcy. The event of bankruptcy can reduce the probability of collection for the creditor.

The timing of when the creditor grants a waiver is important. A creditor can grant a waiver until the time the debtor releases the financial statements, allowing the firm to continue classifying the debt as long term. Example 14.25 provides an example when the debtor violates a debt covenant.

¹⁹For the relevant authoritative literature, see FASB ASC 470-10-45, *Debt – Overall – Other Presentation Matters* for U.S. GAAP and IASC, *International Accounting Standard 1*, “Presentation of Financial Statements,” Paragraphs 74–76, for IFRS.

EXAMPLE 14.25**Reclassification of Callable Debt**

PROBLEM: Renee Realty reported a \$560,000 long-term note payable on its year-end balance sheet. As part of the loan agreement, Renee is required to maintain a compensating balance of 10% of the loan principal, or \$56,000. Working capital deficiencies forced Renee to draw down the compensating balance and thereby violate the restrictive debt covenants of the loan agreement. The loan became callable by the creditor on December 31 of the current year. How should Renee classify the \$560,000 note payable on the December 31 balance sheet? Provide any necessary journal entries.

SOLUTION: Assuming that the creditor will not waive his right to call the loan and Renee will not address the violation, Renee must reclassify the debt as short term. The following journal entry is required because the loan is now callable:

<i>Account</i>	<i>December 31</i>	
Long-Term Notes Payable	560,000	
Short-Term Notes Payable		560,000

Classification of Obligations Callable by Creditor: IFRS. When debt is in technical default, IFRS allows debtors to continue classifying the debt as long term only if they receive a waiver prior to year-end. So, if a call is waived after year-end but before the firm issues financial statements, the firm reclassifies the debt as short-term debt. Under U.S. GAAP, however, it would remain as long-term debt. Similar to short-term debt reclassification under refinancing, the IFRS requirement seeks to report the underlying economic condition that exists at the balance sheet date.

- 10 Discuss and illustrate the fair value option in accounting for financing liabilities.

The Fair Value Option to Value Liabilities

Under the **fair value option**, companies can elect to value most types of financial assets and obligations at fair value.²⁰ The fair value option improves financial reporting by enabling entities to offset volatility in reported earnings. Consider a company that has an asset and a liability that are related. If the liability is reported at fair value but the asset is not, the company will report an earnings stream that is more volatile than if both the asset and liability (whose fair values are correlated) are reported at fair value. Electing the fair value option allows management to report both the asset and liability at fair value.²¹

Fair Value Option Accounting at Initial Recognition

A company can choose the fair value option for some liabilities without choosing it for all liabilities. Typically, the company must elect the fair value option at the time it borrows the money or issues the debt. After a company elects the fair value option, it is generally irrevocable.

When electing the fair value option at initial recognition, the company

1. Reports the liability on the balance sheet at fair value
2. Reports unrealized gains and losses not related to changes in instrument-specific credit risk in net income
3. Reports unrealized gains and losses related to changes in the *instrument-specific credit risk* in other comprehensive income. **Instrument-specific credit risk** relates to the risk of the specific security, not general market risk or interest rate risk.

²⁰Most financial instruments are eligible for the fair value option under U.S. GAAP. Paragraphs 4 and 5 of FASB ASC 825-10-15 outline the specific requirements. For example, financial instruments that are not eligible for the fair value option include pension assets and liabilities, obligations related to deferred compensation arrangements, financial assets and liabilities related to leasing transactions, and investments in subsidiaries or variable interest entities that the company is required to consolidate.

²¹For the relevant authoritative literature, see FASB ASC 825-10, IASC, *Financial Instruments – Overall* for U.S. GAAP and IASC, *International Accounting Standard 39*, “Financial Instruments: Recognition and Measurement” for IFRS.

Companies initially measure the liability at its fair value at inception and use a fair value adjustment account when remeasuring the liability to its fair value. Companies net the fair value adjustment account with the liability account and report the net amount on the balance sheet. In Example 14.26, we use the information from Example 14.8 to illustrate the fair value option.

EXAMPLE 14.26 Fair Value Option

PROBLEM: On January 1, 2018, Ruffin Corporation issued \$40,000 of par value, 4%, 4-year bonds that mature on December 31, 2021. The market rate of interest was 6% when Ruffin issued the bonds. The company uses the effective interest method to amortize any bond premium or discount. Interest is payable semiannually each June 30 and December 31. Ruffin elects the fair value option for these bonds and prepares financial statements only annually. Changes in fair value relate only to the change in interest rates. On December 31, 2018, the fair value of the bonds is \$41,325. What is the journal entry to record the fair value?

SOLUTION: As noted in Example 14.8, Ruffin issued the bonds for \$37,192. Our solution to Example 14.8 showed that the carrying value of the bonds on December 31, 2018, is \$37,833. Because the fair value of the debt is greater than its carrying value, Ruffin has an unrealized loss of \$3,492 (\$41,325 fair value – \$37,833 carrying value). Specifically, if the company were to retire its debt today, it would have to pay a fair value that exceeds the carrying value of the debt and incur a loss. The journal entry follows:

Account	December 31, 2018
Unrealized Loss on Bonds Payable – Net Income	3,492
Fair Value Adjustment on Bonds Payable	3,492

Ruffin reports the unrealized holding loss as part of net income because it is the result of the change in interest rates, not a change in instrument-specific credit risk. The company adds the credit balance in the fair value adjustment account to the bonds payable account that it reports on the balance sheet at the gross amount.

Fair Value Option: IFRS

Similar to U.S. GAAP, IFRS allows a company to use the fair value option for liabilities.²² IFRS additionally stipulates that a company can use the fair value option for financial assets when doing so results in more relevant information because either:

- A company has a documented risk management or investment strategy prescribing that it will manage and evaluate its performance on the fair values and changes in fair values of its financial assets and/or liabilities.
- The fair value option ensures consistently measuring liabilities or assets and their associated gains or losses on the same bases. That is, the fair value option eliminates or significantly reduces accounting mismatches from measuring liabilities or assets (and their associated gains and losses) on different bases.

1 Detail required disclosures for financing liabilities.

Disclosures for Financing Liabilities

We conclude the chapter with the disclosure requirements for financing liabilities. Companies disclose a detailed list and description of each significant debt issue, including the:

- Type of borrowing
- Outstanding balance
- Interest rate

²²IFRS requires companies to separate the change in the liabilities' fair value into changes attributable to own credit risk and other changes in fair value. Changes in fair value because of a company's own credit risk generally are presented in other comprehensive income, not net income.

- Payment terms
- Maturity date

Next, we discuss more specific disclosure requirements for certain types of debt.

Short-Term Debt Expected to Be Refinanced

Disclosures for short-term debt expected to be refinanced include a description of the agreement and terms of the new obligation incurred or expected to be incurred or any equity issued or expected to be issued. Firms disclose the conditions and circumstances that avoid calling the debt in a footnote.

Long-Term Debt

Disclosures for long-term debt include the total amount of maturities and any *sinking fund* requirements for each of the next 5 years. A **sinking fund** is cash or other assets held in a separate account that is used to repay debt at maturity. These disclosures provide financial statement users with the expected future cash payments based on current debt commitments. The disclosures also include a description of the rights and privileges of the various classes of outstanding debt securities and any guarantees. *Johnson & Johnson* disclosed the debt payable in each of the next 5 years as shown in Exhibit 14.6. Notice that the majority of the debt is due in more than 5 years, after 2021.

EXHIBIT 14.6 Long-Term Debt Disclosure, *Johnson & Johnson*, Note, January 1, 2017

NOTE 7: Borrowings

Aggregate maturities of long-term obligations commencing in 2017 are:

(Dollars in Millions)					
2017	2018	2019	2020	2021	After 2021
\$1,704	1,561	2,538	629	1,795	15,919

Source: Financial statements from Johnson & Johnson Company's Annual Report, 2016. <http://files.shareholder.com/downloads/JNJ/3809936545x0xS200406-17-6/200406/filing.pdf>

Convertible Debt

Disclosures for debt with conversion and other options include detailed information about the terms of convertible debt instruments and the manner in which convertible securities affect the financial statements.

Separate disclosures are required for the debt and equity components of hybrid securities that are separated on the balance sheet. For the liability component, the entity must disclose the principal amount, the unamortized premium or discount, the net carrying amount of the debt, the number of shares to be delivered upon conversion, the effective interest rate, the cash interest, and the interest adjustment from the premium or discount amortization.

Fair Value Disclosures

For financial liabilities reported at fair value, companies disclose the valuation methods used and any assumptions made to arrive at the fair value. For financial liabilities reported at carrying value, companies provide disclosures of their fair values, including the methods used and assumptions made. We can use these disclosures to further assess the amount of a company's debt.

In Exhibit 14.3, we examined *Johnson & Johnson's* financial statement note disclosure of long-term debt issues. *Johnson & Johnson* discloses the fair value of its debt in footnote 4 to the table in that exhibit, stating that the fair value is higher than the carrying value by \$1.6 billion in 2016 and \$1.7 billion in 2015.

FINANCIAL STATEMENT ANALYSIS

Credit Risk

As discussed earlier in the chapter, credit rating agencies such as Standard & Poor's (S&P) and Moody's rate corporate debt. A company with a high credit rating can usually access credit markets when needed and raise capital at a low cost. Creditors also rely on these ratings when making decisions to invest in a company's debt.

Rating agencies identify key factors that determine a company's creditworthiness, assess these factors for it, and give an opinion on its credit quality. Although these agencies do not reveal the detailed process they use, S&P has periodically provided information about its criteria to rate corporate debt. Among the many factors it considers, S&P assesses a company's business risk and financial risk profile. The assessment of business risk includes analyzing a company's:

- Country risk
- Industry factors
- Competitive position
- Profitability/Peer group comparisons

The assessment of financial risk includes examining a company's

- Governance/Risk tolerance/Financial policies
- Accounting
- Cash flow adequacy
- Capital structure/Asset protection
- Liquidity/Short-term factors

Exhibit 14.7 describes how the assessment of business risk and financial risk map into the credit ratings. For example, a company that has an excellent business risk profile could receive a lower credit rating of "BBB−/BB+" if it is highly leveraged.

EXHIBIT 14.7 Business Risk and Financial Risk in Credit Ratings

Combining the Business and Financial Risk Profiles

Business Risk Profile	Financial Risk Profile					
	1 (minimal)	2 (modest)	3 (intermediate)	4 (significant)	5 (aggressive)	6 (highly leveraged)
1 (excellent)	AAA/AA+	AA	A+/A	A−	BBB	BBB−/BB+
2 (strong)	AA/AA−	A+/A	A−	BBB	BB+	BB
3 (satisfactory)	A/A−	BBB+	BBB/BBB−	BB+	BB	B+
4 (fair)	BBB/BBB−	BBB−	BB+	BB	BB−	B
5 (weak)	BB+	BB+	BB	BB−	B+	B/B
6 (vulnerable)	BB−	BB−	BB−	B+	B	B−

Financial statement analysis provides a key input into assessing financial risk as a primary source of information to analyze a company's financial condition and financial performance. For example, S&P identifies certain "core" ratios, such as funds from operations (FFO) over debt and debt over earnings before interest, taxes, depreciation and amortization (EBITDA), that it uses to assess financial risk as illustrated in Exhibit 14.8.

Financial Statement Analysis, continued

The FFO / debt and debt / EBITDA ratios are indicators of the liquid resources a company has available relative to its debt. S&P gives ranges for each of these ratios. For example, when a company's FFO / debt is greater than 60, its financial risk is considered minimal. These indicators of a company's financial risk can provide contradictory information—but they enhance the credit analyst's determination of overall financial risk.

EXHIBIT 14.8 Select Financial Risk Measures in Credit Ratings

Cash Flow Leverage Analysis Ratios—Standard Volatility [Excerpt]*

	Core Ratios	
	FFO / Debt (%)	Debt/EBITDA(×)
Minimal	60+	Less than 1.5
Modest	45–60	1.5–2
Intermediate	30–45	2–3
Significant	20–30	3–4
Aggressive	12–20	4–5
Highly leveraged	Less than 12	5+

* S&P uses a company's industry and country risk to determine its volatility category as either standard or low. Here we present the ratios for the standard volatility category.

Sources: From Standard & Poor. Copyright © Standard & Poor's Financial Services LLC. Standard & Poor's, Request for Comment: Corporate Criteria, 2013. http://www.standardandpoors.com/spf/upload/Ratings_US/RfC_Corporate_Criteria.pdf

Exhibit 14.9 shows the equations used to compute the FFO / debt and debt / EBITDA ratios and their desirable characteristics.

EXHIBIT 14.9 Select Indicators of Financial Risk

Indicator	Definition	Desirable Characteristics
FFO/Debt	$= \frac{\text{Operating Income from Continuing Operations after Tax} + \text{Depreciation and Amortization} + \text{Deferred Income Tax Expense} + \text{Other Major Recurring Noncash Items}}{\text{Short- and Long-Term Debt}}$	(14.4) Higher ratio is preferred to lower.
Debt/EBITDA	$= \frac{\text{Short- and Long-Term Debt}}{\text{Operating Profits before Interest Income, Interest Expense, Income Taxes} + \text{Depreciation and Amortization} + \text{Asset Impairment}}$	(14.5) Lower ratio is preferred to higher.

Sources: From Standard & Poor. Copyright © Standard & Poor's Financial Services LLC. Standards & Poor's, Corporate Ratings Criteria, 2008. <http://www.standardandpoors.com/ratings/criteria/en/us/?filename=General>
Standard & Poor's, Request for Comment: Corporate Criteria, 2013. http://www.standardandpoors.com/spf/upload/Ratings_US/RfC_Corporate_Criteria.pdf

Credit rating agencies periodically update and change their rating criteria. The analysis of financial risk, however, usually uses financial statement information as a starting point. Sometimes analysts adjust for accounting classifications and choices made by companies. For example, debt might be defined to include a company's pension or lease obligations. Example 14.27 illustrates using these indicators of financial risk.

EXAMPLE 14.27**Credit Ratings**

PROBLEM: In May 2017, *Johnson & Johnson's* credit rating was "AAA." *Teva Pharmaceutical Industries Limited*, a pharmaceutical company based in Israel and a U.S. GAAP reporter, had debt rated as "BBB." From the companies' latest annual financial statements, you locate the information on the following page:

Fiscal 2016 (\$ in millions)	Johnson & Johnson	Teva
Income (loss) from continuing operations after tax	\$16,540	\$ 311
Operating profit (loss) before interest income, interest expense, and income taxes	20,161	2,154
Depreciation and amortization	3,754	1,524
Deferred income tax expense (income)	(341)	15
Asset impairment	283	1,645
Major noncash charges	0	0
Short-Term debt	4,684	3,276
Long-Term debt	22,442	32,524
Equity	70,418	34,993

Compute funds from operations over debt and debt / EBITDA for *Johnson & Johnson* and *Teva*. Using the benchmarks from Exhibit 14.8, assess the financial risk of each company for these indicators. How would you categorize each company's business risk given its credit rating?

SOLUTION: We compute the financial risk for *Johnson & Johnson* as follows:

Ratios	Definition	Johnson & Johnson
Funds from Operations over Debt	$= \frac{\text{Operating Income from Continuing Operations after Tax} + \text{Depreciation and Amortization} + \text{Deferred Income Tax Expense} + \text{Other Major Recurring Noncash Items}}{\text{Short- and Long-Term Debt}}$	$0.746 = \frac{\$16,540 + \$3,754 + \$(-341) + \$283 + 0}{\$4,684 + \$22,442}$
Debt to EBITDA	$= \frac{\text{Short- and Long-Term Debt}}{\text{Operating Profits before Interest Income, Interest Expense, Income Taxes} + \text{Depreciation and Amortization} + \text{Asset Impairment}}$	$1.121 = \frac{\$4,684 + \$22,442}{\$20,161 + \$3,754 + \$283}$

Based on the indicators of financial risk, *Johnson & Johnson's* financial risk is minimal. Its funds from operations over debt, at 74.6, is greater than the minimal benchmark of 60 from Exhibit 14.8, and its debt to EBITDA at 1.121 is less than the 1.5 minimal benchmark. Given that all of *Johnson & Johnson's* indicators indicate minimal financial risk and *Johnson & Johnson's* credit rating is "AAA," its business risk is likely considered excellent based on information in Exhibit 14.7.

Ratios	Definition	Teva
Funds from Operations over Debt	$= \frac{\text{Operating Income from Continuing Operations after Tax} + \text{Depreciation and Amortization} + \text{Deferred Income Tax Expense} + \text{Other Major Recurring Noncash Items}}{\text{Short- and Long-Term Debt}}$	$0.098 = \frac{\$311 + \$1,524 + \$15 + \$1,645 + \$0}{\$3,276 + \$32,534}$
Debt to EBITDA	$= \frac{\text{Short- and Long-Term Debt}}{\text{Operating Profits before Interest Income, Interest Expense, Income Taxes} + \text{Depreciation and Amortization} + \text{Asset Impairment}}$	$6.727 = \frac{\$3,276 + \$32,534}{\$2,154 + \$1,524 + \$1,645}$

Based on the indicators of financial risk, *Teva's* financial risk is highly leveraged. The amount of funds from operations over debt, at 9.8, is below the highly leveraged benchmark of 12 and its Debt / EBITDA at 6.727 is above the highly leveraged benchmark of 5. Given that these indicators of financial leverage are in the highly leveraged range and its credit rating is "BBB," *Teva's* business risk is likely "excellent" based on information in Exhibit 14.7.

Interview

CAROLYN SLASKI
MANAGING PARTNER,
NORTHEAST REGION
ASSURANCE,
ERNST & YOUNG LLP»

Carolyn Slaski

Carolyn Slaski is the Northeast Region Assurance Managing Partner at Ernst & Young LLP responsible for managing all strategic, client service, quality, and operational matters. She works closely with the firm's Assurance Leaders on the ongoing development and execution of the firm's market strategy, client service delivery model, and key matters impacting audit methodology and quality.

- 1 What are the advantages of debt financing over equity financing for your clients? How do capital market conditions affect a corporation's choices?

A company decides to finance with debt versus equity based on a thorough understanding of its business and industry, target capital structure, economic environment, and capital markets. When these conditions call for debt financing, the advantages include lower after-tax capital costs and a more optimal, shareholder-friendly capital structure. An additional benefit of issuing debt is that it generally does not provide the investor with control of the issuer through equity voting rights (e.g., the ability to vote on decisions regarding activities that are significant to the issuer).

- 2 Why is an announcement that a client will issue debt a positive signal regarding its future performance?

Investors interpret debt issuance positively when they believe the underlying business is stable and predictable enough to support regular interest and principal payments. If they view the company as underleveraged, additional debt moves the company to a more optimal capital structure. On the other hand, if investors believe management is allocating too much capital to R&D, capital expenditures, mergers and acquisitions, or excess working capital—or the cost structure is too high—an increase in debt to raise dividends or repurchase shares could be viewed as imposing more discipline on capital allocation processes.

- 3 What are some reasons why a client would elect to retire outstanding debt before maturity?

Companies choose to retire outstanding debt for a number of reasons. They may be able to refinance at a lower interest rate or with less restrictive terms. A company that wishes to rebalance its capital structure may retire debt so that it can issue equity. If a company has a debt obligation that is trading below its face value, it may wish to retire it to receive a tax deduction for the “loss.”

- 4 Are companies electing to use the fair value option to value their debt obligations and, if so, why?

In practice, mainly financial institutions (rather than corporations) have elected the fair value option (FVO) for their debt. This choice may be a result of the limitations of hedge accounting in reducing the volatility of their debt. The FVO addresses both simplification and cost-benefit considerations; for example, accounting for hybrid debt instruments (such as convertible debt) at fair value can eliminate the potential need to separately account for the embedded derivative features from their debt host.

- 5 How does the use of the fair value option to value debt enhance information provided to the users of financial statements?

The FVO reflects economic events in earnings, such as credit quality and interest rates, on a timely basis. It also contributes to simplification of reporting because it negates the need for cumbersome disclosures required for complex financial instruments.

- 6 Ernst & Young is an international accounting firm. How do U.S. accounting standards differ from those issued under IFRS with respect to the separation of the debt and equity features of hybrid debt securities?

Both sets of accounting standards require identification of the same hybrid instrument's contractual features for analysis, although frequently there will be differences in the resulting classification. Under U.S. GAAP, the mind-set is more “instrument based,” whereas IFRS is more “feature based.” IFRS concentrates more on the substance rather than legal form of the instrument.

Discussion Questions

1. Explain how the use of the fair value option for investments in debt securities can mitigate volatility in reported earnings caused by measuring related assets and liabilities differently without applying complex hedge accounting provisions.
2. Discuss the benefits to financial statement users when accountants separate the debt and equity features of hybrid debt securities.

Summary by Learning Objectives

Below we summarize the main points by learning objective. Throughout the chapter, we discuss the accounting and reporting of U.S. GAAP and IFRS side by side. The table below also highlights the major similarities and differences between the standards.

1 Describe and illustrate accounting for notes payable.	
Summary	Similarities and Differences between U.S. GAAP and IFRS
<p>Notes payable are initially recognized at their fair value. Most notes include specified principal amount, specified interest rate, and maturity date.</p> <p>Short-term (long-term) notes payable are current (noncurrent) liabilities because they are due and payable within 1 year (within a period greater than 1 year) from the balance sheet date or operating cycle, whichever is longer.</p> <p>Interest expense is the carrying value of the note payable times the interest rate.</p> <p>An installment note requires a fixed payment each period that includes both principal and interest. The interest portion of the payment is the note balance at the beginning of the period times the interest rate. The principal portion of the payment is the total payment less the interest portion.</p> <p>When a loan has no interest rate stated (a non-interest-bearing note) or the stated interest rate is less than the market interest rate, the present value is measured as the value of the note discounted at the market rate of interest.</p>	<p>Similar under U.S. GAAP and IFRS.</p>

2 Explain the common features of bonds payable and discuss the initial recognition at par value, at a discount, and at a premium.	
Summary	Similarities and Differences between U.S. GAAP and IFRS
<p>Bonds payable are contractual obligations under which a company commonly pays a face value at maturity and periodic interest payments until maturity.</p> <p>Bonds are issued at:</p> <ul style="list-style-type: none"> • Par value when the stated interest rate on the bond equals the market rate. • A discount when the stated interest rate is lower than the market rate. • A premium when the stated rate is greater than the market rate. <p>Credit rating agencies help creditors and investors assess a company's credit quality. The better the credit rating, the stronger is a company's capacity to repay its debt.</p>	<p>Similar under U.S. GAAP and IFRS.</p>

Summary by Learning Objectives, continued

3 Demonstrate accounting for bonds issued at par or at a discount or premium, including computation of the bond issue price, interest expense, and amortization of the discount or premium using the effective interest rate method.	
Summary	Similarities and Differences between U.S. GAAP and IFRS
<p>Bonds payable issued at par are recorded at their face value. Interest expense is incurred over the periods that a bond is outstanding at the bond's stated (coupon) rate.</p> <p>The bond issue price is the present value of future cash flows. For bonds that make interest payments, the future cash flows are:</p> <ul style="list-style-type: none"> • The periodic interest payments. • The principal payment at maturity. <p>Firms use the market rate to discount the cash flows.</p> <p>Bonds are carried at the present value after issuance. Any bond discount or premium is amortized over the life of the bond.</p> <p>Under the effective interest rate method, interest expense is the carrying value of the bond at the beginning of the period times the market interest rate. The computation is:</p> <p>Equation (14.1):</p> $\text{Effective Interest Expense} = \text{Historical Market Rate} \times \text{Carrying Value of Bond at the Beginning of the Period}$ <p>The discount or premium amortization under the effective interest rate method is:</p> <p>Equation (14.2):</p> $\text{Discount/Premium Amortization} = \text{Effective Interest Expense} - \text{Cash Interest Paid}$ <p>A zero-coupon bonds whose stated rate is zero and no interest is paid to bondholders is a special case of bonds issued at a discount.</p>	<p>► Similar under U.S. GAAP and IFRS except that IFRS prefers the net method to record bonds on initial recognition.</p>

4 Explain and illustrate accounting for bonds issued between interest payment dates.	
Summary	Similarities and Differences between U.S. GAAP and IFRS
<p>When bonds are issued between interest payment dates, the purchasers pay any interest accrued.</p>	<p>Similar under U.S. GAAP and IFRS.</p>

5 Discuss and illustrate the accounting for bond issue costs.	
Summary	Similarities and Differences between U.S. GAAP and IFRS
<p>Bond issue costs reduce the carrying value of the bond and require that a new effective interest rate be computed.</p>	<p>Similar under U.S. GAAP and IFRS.</p>

Summary by Learning Objectives, continued

6 Determine the accounting for bonds payable at early retirement.	
Summary	Similarities and Differences between U.S. GAAP and IFRS
<p>Mature bonds are retired when the company pays the principal payment to the bondholders.</p> <p>If a bond is paid off before maturity, a company recognizes a gain or loss on early extinguishment.</p> <p>Equation (14.3):</p> $\text{Gain (Loss) on Early Extinguishment} = \text{Net Carrying Value of the Debt} - \text{Retirement Price}$	<p>Similar under U.S. GAAP and IFRS.</p>
7 Explain and illustrate the accounting for convertible bonds.	
Summary	Similarities and Differences between U.S. GAAP and IFRS
<p>Convertible bonds are financial instruments that enable the holder to convert the bonds into a specified number of shares of common stock or preferred shares.</p> <p>Even though convertible bonds contain debt and equity components, they are accounted for as debt under U.S. GAAP.</p> <p>At conversion, the company removes the bonds payable along with any unamortized premium or unamortized discount from the balance sheet. The company also recognizes stock and any additional paid-in capital for the amount of the derecognized bond.</p> <p>If a beneficial conversion option exists at bond issuance, it is measured at its intrinsic value on the date of issue and reported as equity, additional paid-in capital. When the bonds are converted, the carrying value of the bonds and the additional paid-in capital related to the beneficial conversion option amount are removed and replaced with equity.</p>	<p>► Under IFRS, the debt and equity components of convertible debt are accounted for separately. The debt component is the present value of the bond's future cash flows at the market rate. The equity component is the issue price less the debt component.</p> <p>At conversion, the company removes the bonds payable, any unamortized premium or discount, and the equity recorded at issuance.</p>
8 Describe and illustrate the accounting for warrants, including those that are detachable and nondetachable.	
Summary	Similarities and Differences between U.S. GAAP and IFRS
<p>Warrants are long-term options to acquire a stated number of shares of common stock for a stated price. Stock warrants may be issued with bonds and can either be:</p> <ul style="list-style-type: none"> • Detachable: Removable by the holder and sellable separately on the secondary market. • Nondetachable: Not separable from the bond. <p>For nondetachable warrants, the total debt proceeds are typically assigned to the debt issue.</p> <p>For detachable warrants, the proceeds are allocated to the debt and equity components using one of the following methods:</p> <ul style="list-style-type: none"> • Proportional method: When fair values of both the bonds and warrants are known, the allocation is on the relative fair values. • Incremental (or residual) method: If the fair value of the bonds or the warrants is not readily determinable, allocate the portion of the proceeds to the instrument with the readily available fair value and allocate the residual amount to the other instrument. 	<p>► Under IFRS, the debt and equity components are accounted for separately. The debt component is the present value of the bond's future cash flows at the market rate. The equity component is the issue price less the debt component.</p>

Summary by Learning Objectives, continued

9 Explain the reclassification of financing liabilities for current maturities of long-term debt, short-term debt expected to be refinanced, and callable obligations.	
Summary	Similarities and Differences between U.S. GAAP and IFRS
<p>The portion of a long-term obligation that becomes payable within the next year (or operating cycle, if longer) is reclassified to current liabilities.</p> <p>Short-term debt expected to be refinanced on a long-term basis can be classified as noncurrent debt when management intends and has the ability to refinance.</p> <p>Long-term debt may be reclassified to short-term debt when the creditor can call the debt, usually because of the violation of a provision of the debt agreement. If a creditor waives the provision or offers a grace period, the debt may remain classified as long term.</p>	<p>➤ Similar under U.S. GAAP and IFRS except when callable debt can remain classified as long-term debt. Under U.S. GAAP, a creditor can grant a waiver until the time the financial statements are released to be able to continue to classify the debt as long term. IFRS allows long-term debt to continue to be classified as long term if a waiver is received prior to year-end.</p> <p>Short-term debt expected to be refinanced can be classified as noncurrent debt when management intends and has the discretion to refinance the debt for at least 12 months after the reporting period under an existing arrangement to provide refinancing.</p>

10 Discuss and illustrate the fair value option in accounting for financing liabilities.	
Summary	Similarities and Differences between U.S. GAAP and IFRS
<p>Companies can choose to report their financial liabilities at fair value subsequent to initial recognition.</p> <p>Changes in fair value unrelated to instrument-specific risk are taken to net income. Changes in fair value related to changes in the instrument-specific credit risk are taken to other comprehensive income.</p>	<p>➤ Similar under U.S. GAAP and IFRS except that IFRS is more restrictive than U.S. GAAP regarding when a company can choose the fair value option. Under IFRS, a company can choose the fair value option in one of two circumstances:</p> <ul style="list-style-type: none"> • When the information presented is more relevant. • When fair value consistently measures liabilities or assets and gains or losses on them on the same bases.

11 Detail required disclosures for financing liabilities.	
Summary	Similarities and Differences between U.S. GAAP and IFRS
<p>Companies disclose a detailed list and description of each significant debt issue, including the:</p> <ul style="list-style-type: none"> • Type of borrowing • Outstanding balance • Interest rate • Payment terms • Maturity date <p>Other specific disclosures depend on the type of debt.</p>	<p>Similar under U.S. GAAP and IFRS.</p>

MyLab Accounting

Go to <http://www.pearson.com/mylab/accounting> for the following Questions, Multiple-Choice Questions, Brief Exercises, Exercises, and Problems. They are available with immediate grading, explanations of correct and incorrect answers, and interactive media that acts as your own online tutor.

14 Financing Liabilities

Questions

- 1 2** Q14-1. What conditions or terms does a note payable contain?
- 2** Q14-2. If the market rate of interest exceeds the face or stated rate on a long-term debt obligation, will the company issue the debt at a discount or premium? Explain.
- 5** Q14-3. What is included in bond issue costs and how should a company account for them?
- 3** Q14-4. What method of amortization must companies use to amortize a bond discount or premium when reporting?
- 3** Q14-5. When a bond is issued at a discount, will its periodic interest expense be greater or less than the interest payment? Explain.
- 6** Q14-6. If a company opts to retire debt before maturity, will it report a gain or loss in net income? Explain.
- 7** Q14-7. What is convertible debt and how do firms account for it?
- 7** Q14-8. Under IFRS, how do firms account for convertible debt?
- 8** Q14-9. Debt issued with warrants is considered a hybrid security that possesses both debt and equity characteristics. Will accountants always separate the total proceeds into debt and equity on the balance sheet? Explain.
- 9** Q14-10. Can companies reclassify short-term debt expected to be refinanced on a long-term basis after the balance sheet date as long-term debt? Explain.
- 9** Q14-11. Under IFRS, can companies reclassify short-term debt expected to be refinanced on a long-term basis during the post-balance sheet period as long-term debt? Explain.
- 9** Q14-12. Do companies always reclassify long-term debt that becomes callable by the creditor as a short-term obligation? Explain.
- 10** Q14-13. Can a company choose the fair value option for any long-term financial liability? Explain.
- 10** Q14-14. Can a company choose the fair value option for any long-term financial liability under IFRS? Explain.
- 10** Q14-15. If a company elects the fair value option for long-term liabilities, can it report unrealized gains and losses in other comprehensive income? Explain.
- 11** Q14-16. Does a company have to disclose the total amount of debt that matures each year for all long-term debt? Explain.

Multiple-Choice Questions

Becker CPA Exam Review multiple-choice questions are available in
MyLab Accounting.

- 1** MC14-1. During the fourth quarter ended December 31, Year 1, Lighting Fixtures Inc. (LFI) had average outstanding revolving bank loans of \$1.2 million. Assume that the quarterly interest charges associated with these loans was \$7,500. If LFI makes the interest payment to the banks on January 15, Year 2, what is the journal entry (if any) made by the company on December 31 to reflect this information?
- | | | |
|--------------------------------|-------|-------|
| a. Accrued Interest Payable | 7,500 | |
| Interest Expense | | 7,500 |
| b. Interest Expense | 7,500 | |
| Accrued Interest Payable | | 7,500 |
| c. Interest Expense | 7,500 | |
| Loan Payable | | 7,500 |
| d. No journal entry necessary. | | |
- 3** MC14-2. On July 1, Year 1, Cobb Company issued 9% bonds in the face amount of \$1,000,000 that mature in 10 years. The bonds were issued for \$939,000 to yield 10%, resulting in a bond discount of \$61,000. Cobb uses the effective interest method of amortizing bond discount. Interest is payable annually on June 30.

At June 30, Year 3, Cobb's unamortized bond discount should be:

- a. \$52,810 b. \$57,100 c. \$48,800 d. \$43,000

- 3 MC14-3.** On July 1, Year 1, Planet Corporation sold Ken Company 10-year, 8% bonds with a face amount of \$500,000 for \$520,000. The market rate was 6%. The bonds pay interest semiannually on June 30 and December 31. For the 6 months ended December 31, Year 1, what amount should Planet report as bond interest expense and long-term liability in the balance sheet and income statement for Year 1?

Balance Sheet	Income Statement
a. \$511,200	\$31,200
b. \$500,000	\$20,000
c. \$504,400	\$ 4,400
d. \$515,600	\$15,600

- 3 MC14-4.** On November 1, Year 1, Dixon Corporation issued \$800,000 of its 10-year, 8% term bonds dated October 1, Year 1. The bonds were sold to yield 10% with total proceeds of \$700,000 plus accrued interest. Interest is paid every April 1 and October 1. What amount should Dixon report for interest payable in its December 31, Year 1, balance sheet?

- a. \$17,500 b. \$16,000 c. \$11,667 d. \$10,667

- 3 MC14-5.** On January 1, Year 1, Congo.com issued \$1,000,000 of its 10-year, 9% bonds (interest paid annually) to yield 8%. The present value of \$1 at 9% for 10 years is 0.4224, and the present value of an ordinary annuity of \$1 at 9% for 10 years is 6.4177. The present value of \$1 at 8% for 10 years is 0.4632, and the present value of an ordinary annuity of \$1 at 8% for 10 years is 6.7101. Which of the following is closest to the selling price of the bond?

- a. \$920,000 b. \$1,000,000 c. \$1,040,800 d. \$1,067,100

- 6 MC14-6.** Clothes Horse Corp. (CHC) issued \$500,000 bonds due in 10 years on January 1, Year 1, at a premium for \$567,105. On January 1, Year 6, when the carrying value of the bond was \$539,940, CHC redeemed the bonds at 102. What amount of gain should CHC record related to the redemption?

- a. \$10,000 b. \$29,940 c. \$39,940 d. \$0

- 7 MC14-7.** Walco Manufacturing Inc. holds 500 convertible bonds from Indwell Semiconductor that it purchased on January 1, Year 1, for \$518,110. The face amount of each bond is \$1,000. Each bond is convertible into one share of Indwell common stock. The par value of Indwell's stock is \$55. On January 2, Year 1, Walco converted half of the bonds to common stock. Indwell uses the book value method to record the conversion. In the journal entry to record the conversion, what amount will Indwell debit to the premium on bond payable?

- a. \$0 b. \$9,055 c. \$13,750 d. \$18,110

- 7 MC14-8.** On July 1, Year 1, after recording interest and amortization, Wake Company's shareholders converted \$1,000,000 of its 10% convertible bonds into 50,000 shares of its \$1 par value common stock. On the conversion date, the carrying amount of the bonds was \$1,500,000, the market value of the bonds was \$1,400,000, and Wake's common stock was publicly trading at \$40 per share. Assume there is no beneficial conversion option. Using the book value method, what amount of additional paid-in capital should Wake record as a result of the conversion?

- a. \$500,000 b. \$1,500,000 c. \$1,950,000 d. \$1,450,000

- 8 MC14-9.** On December 30, Year 1, Wayne Corporation issued 1,000 of its 10-year, 8%, \$1,000 face value bonds with detachable stock warrants at par. Each bond carried a detachable warrant for one share of Wayne's common stock at a specified option price of \$25 per share. Immediately after issuance, the market value of the bonds without the warrants was \$1,080,000, and the market value of the warrants was \$120,000. In its December 31, Year 1 balance sheet, what amount should Wayne report as bonds payable?

- a. \$1,080,000 b. \$1,000,000 c. \$900,000 d. \$1,200,000

- 8 MC14-10.** Use the information provided in MC14-9 except that immediately after issuance, the market value of each warrant was \$120. In its December 31, Year 1, balance sheet, what amount should Wayne report as the book value of bonds payable?

- a. \$880,000 b. \$900,000 c. \$1,000,000 d. \$1,120,000

- 5 MC14-11.** On June 30 of the current year, Huff Corp. issued 1,000 of its 8%, \$1,000 bonds at 99. The bonds were issued through an underwriter to whom Huff paid bond issue costs of \$35,000. On June 30 of the current year, Huff should report the bond liability on its balance sheet at:

- a. \$955,000 b. \$965,000 c. \$990,000 d. \$1,000,000

Brief Exercises

- 1 **BE14-1. Notes Payable.** Scudder Products, Inc. borrowed \$600,000 by issuing a 6-month note on September 1 of the current fiscal year. The note is due on March 1 of the following fiscal year. The short-term note carries a 5% annual interest rate with interest due at maturity. The company's fiscal year ends on December 31. Prepare the journal entries on September 1 and December 31 of the current year.
- 1 **BE14-2. Notes Payable.** Using the information provided in BE14-1, prepare the journal entry required to record Scudder's full payment of the note at maturity.
- 1 **BE14-3. Long-Term Notes Payable.** Andy Corporation borrowed \$1,500,000 on January 1, 2016. The note agreement specifies that it will pay interest quarterly at 8% on March 31, June 30, September 30 and December 31. The principal will be due on December 31, 2021. The company's fiscal year ends on December 31. What journal entry will Andy Corporation make on January 1, 2016? What journal entry will Andy Corporation make at the end of each quarter? What journal entries will Andy Corporation make on December 31, 2021?
- 1 **BE14-4. Short-Term Notes Payable.** Sallie Corporation borrowed \$700,000 on November 1, 2016. The note agreement specifies that it will pay interest quarterly at 6% and the principal will be due on October 31, 2017. The company's fiscal year ends December 31. What journal entry will Sallie make on November 1, 2016? What journal entry will Sallie make on December 31, 2016?
- 1 **BE14-5. Installment Loans, Long Term.** For each case, provide the missing information. Assume that payments occur at the end of each period.

	(1)	(2)	(3)	(4)
Amount borrowed	(a)	\$675,000	\$456,000	\$750,000
Interest rate	4%	4%	6%	12%
Number of periodic payments per year	4	2	1	4
Maturity (in years)	10	10	(c)	4
Periodic payment	\$10,354.90	(b)	\$81,685.57	(d)

- 1 **BE14-6. Installment Loans, Long Term.** Ironbound, Inc. borrows \$150,000 by issuing a 12%, 4-year note on January 1, 2016. Ironbound must make payments of principal and interest every 3 months, beginning March 31, 2016. The note will be fully paid at maturity on December 31, 2019. The company's fiscal year ends on December 31. Prepare the journal entries at January 1, 2016, and March 31, 2016.
- 2 **BE14-7. Bond Terminology.** Match each term with its definition or explanation. Terms can be used more than once.

Term	Definition/Explanation
a. Face value	_____ Frequency with which cash interest payments are made to the bondholders
b. Premium	_____ Nominal rate
c. Maturity date	_____ Principal
d. Discount	_____ Occurs when a bond issue is priced below par value
e. Interest payment period	_____ Occurs when the effective interest rate is higher than the stated interest rate
f. Stated interest rate	_____ Par value
g. Market rate	_____ Occurs when a bond issue is priced above par value
	_____ Amount of interest that the bond issuer will pay in cash expressed as an annual rate
	_____ Occurs when the effective interest rate is lower than the stated interest rate
	_____ Face rate
	_____ Actual return that the investors will receive
	_____ Specified date when the bond issuer must pay the face value of the bonds to the bondholders
	_____ Coupon rate
	_____ The amount that the company will pay the bondholder at maturity

- 2** **BE14-8. Bond Pricing.** Fill in the missing items for each of the cases below:

	(1)	(2)	(3)	(4)
Face value	\$100,000	(d)	\$250,000	\$1,980,000
Stated rate	5%	5%	6%	(i)
Interest payment period	Quarterly	Semiannually	Quarterly	Quarterly
Interest payment	(a)	\$13,250	\$3,750	\$34,650
Maturity (in years)	10 years	5 years	3 years	4 years
Market rate	4%	(e)	8%	4%
Bond issue price	(b)	(f)	(g)	(j)
(Discount) / Premium	(c)	(\$19,216)	(h)	(k)

- 3** **BE14-9. Bond Issue Price.** Jorge Corporation issued \$100,000 par value, 6%, 4-year bonds (i.e., there were 100 of \$1,000 par value bonds in the issue). Interest is payable semiannually each January 1 and July 1 with the first interest payment due at the end of the period on July 1. Determine the issue price of the bonds if the market rate of interest is 8%.
- 3** **BE14-10. Bond Issue Price.** Using the information from BE14-9, determine the issue price of the bonds assuming that the market rate of interest is 4%.
- 3 5** **BE14-11. Bond Issue, Bond Issue Costs.** On January 1, Plum Company issued \$800,000 par value, 8%, 5-year bonds (i.e., there were 800 of \$1,000 par value bonds in the issue). Interest is payable semiannually each January 1 and July 1 with the first interest payment due at the end of the period on July 1. Plum paid \$9,000 in underwriting fees. Determine the issue price of the bonds with a 12% market rate of interest and prepare the journal entry to record the bond issue.
- 3 5** **BE14-12. Bond Issue, Bond Issue Costs.** Using the information from BE14-11, determine the issue price of the bonds assuming that the market rate of interest is 6%, and prepare the journal entry to record the bond issue.
- 3 5** **BE14-13. Bond Issue, Bond Issue Costs.** West Fork Corporation issued \$100,000 par value, 6%, 4-year bonds (i.e., there were 100 of \$1,000 par value bonds in the issue). Interest is payable annually with the first interest payment made at the end of the period. West Fork paid \$1,800 in underwriting fees. Determine the issue price of the bonds assuming that the market rate of interest is 8%. Prepare the journal entry to record the bond issue.
- 3** **BE14-14. Bond Issue, Effective Interest Rate Method, Amortization Table.** On January 1, 2018, Stark Incorporated issued \$1,500,000 par value, 5%, 7-year bonds (i.e., there were 1,500 of \$1,000 par value bonds in the issue). Interest is payable semiannually each January 1 and July 1 with the first interest payment due at the end of the period on July 1. Determine the issue price of the bonds based on an 8% market rate of interest. Prepare the amortization table for the first 2 years assuming that Stark uses the effective interest rate method.
- A** **BE14-15. Bond Issue, Straight Interest Rate Method, Amortization Table.** Using the information provided in BE14-14, prepare the amortization table for the first 2 years assuming that Stark uses the straight-line method.
- 3** **BE14-16. Bond Issue, Effective Interest Rate Method, Amortization Table.** Using the information provided in BE14-14, determine the issue price of the bonds assuming that the market rate of interest is 4%, and prepare the amortization table for the first 2 years assuming that Stark uses the effective interest rate method.
- A** **BE14-17. Bond Issue, Straight Interest Rate Method, Amortization Table.** Using the information provided in BE14-14, prepare the amortization table for the first 2 years assuming that Stark uses the straight-line method.
- 3** **BE14-18. Bonds Retired at Maturity.** Balsam Associates issued \$600,000 par value, 10-year bonds on January 1, 2018, with a 2% stated interest rate. It will make interest payments semiannually each June 30 and December 31 with the first interest payment at the end of the period on June 30, 2018. The market rate of interest on the date of the bond issue was 4%. On what date do the bonds mature? Prepare the journal entry when the bonds mature (you do not need to include an entry for the interest payment).

- 4 BE14-19. Bonds Issued between Interest Payment Dates.** For each of the following scenarios, compute the accrued interest and cash received when the bond is issued.

Scenario	1	2	3	4
Face value	\$850,000	\$250,000	\$650,000	\$350,000
Stated interest rate	5%	3%	5%	6%
Interest payments	Semiannually	Quarterly	Semiannually	Quarterly
Interest payment date	July 1	March 31	January 1	June 30
Issue date	September 30	May 1	May 1	August 31
Bond issue proceeds	\$863,200	\$197,500	\$623,000	\$357,000
Accrued interest	_____	_____	_____	_____
Cash received	_____	_____	_____	_____

- 6 BE14-20. Early Bond Retirement.** On January 1, Todd Manufacturing issued \$4,500,000 par value 8%, 5-year bonds (i.e., there were 4,500 of \$1,000 par value bonds in the issue). Interest is payable semiannually each January 1 and July 1 with the first interest payment due at the end of the period on July 1. The market rate of interest was 10% on the date that Todd issued the bonds. Todd retired the bonds at \$4,000,000 with an open market purchase at the end of the first year. Prepare the journal entry to record the derecognition of the obligation. Todd uses the effective interest rate method.
- 6 BE14-21. Early Bond Retirement.** Dott Manufacturing retired its \$6,000,000 par value, 7%, 10-year bonds early on February 28, 2018, for \$6,720,408, including accrued interest of \$70,000. The carrying value of the bonds at retirement was \$6,330,956. What is the gain or loss on early retirement? Prepare the journal entry to record the derecognition of the obligation.
- 7 BE14-22. Convertible Bonds.** Lee Equipment Company issued 200 of 8-year, 6% convertible bonds for \$227,200. Each bond had a par value of \$1,000. Each \$1,000 bond converts into eight shares of \$1 par value common stock at the option of the bondholder beginning 2 years after the date of issue. The market price of the common stock on the commitment date was equal to \$120 per share, and the market rate of interest was 6% at issuance. Prepare the journal entry to record the bond issue.
- 7 BE14-23. Convertible Bonds, Conversion.** Using the information from BE14-22, prepare the journal entry to record the bond conversion assuming that the balance of the unamortized premium on the date of conversion is \$14,660.
- 7 BE14-24. Convertible Bonds, IFRS.** Using the information from BE14-22, prepare the journal entry to record the bond issue assuming that Lee Equipment Company is an IFRS reporter.
- 7 BE14-25. Convertible Bonds, Conversion, IFRS.** Using the information from BE14-22, prepare the journal entry to record the bond conversion assuming that Lee Equipment Company is an IFRS reporter.
- 7 BE14-26. Convertible Bonds.** Walsh Beverages has outstanding convertible debt with a book value of \$325,700 at the end of the current year. The bonds have a total par value of \$300,000 and an unamortized premium of \$25,700. Each \$1,000 bond is convertible into 20 shares of \$1 par value common stock. Prepare the journal entry required to record the bond conversion. Assume the bonds do not have a beneficial conversion option.
- 7 BE14-27. Convertible Bonds Beneficial Conversion Option.** Determine whether each of the following convertible bonds has a beneficial conversion option. Each bond has a \$1,000 face value and is issued at par.
- Eight-year, 5% convertible bond converts to 50 shares of common stock. The market price of the common stock is \$23 per share.
 - Five-year, 8% convertible bond converts to 100 shares of common stock. The market price of the common stock is \$11 per share.
 - Five-year, 8% convertible bond converts to 25 shares of common stock. The market price of the common stock is \$38 per share.
- 8 BE14-28. Warrants.** Crow Company issued 6,000 of its \$1,000 par value bonds for \$1,580, providing total cash proceeds of \$9,480,000. The market price of Crow's common shares on the date that it issued the bonds was \$20 per share. It sold the bonds with 240,000 detachable warrants to acquire 240,000 shares of the company's \$1 par value common stock for \$20 per share. That is, each bond carried 40 warrants \times 6,000 bonds = 240,000 shares. Crow had existing bonds outstanding that trade without warrants at \$1,310. There were other Crow Company warrants outstanding that traded for \$20 each. Prepare the journal entry to record the issuance of the bonds assuming that the proportional method is used.
- 8 BE14-29. Warrants.** Using the information provided in BE14-28, prepare the journal entry to record the issuance of the bonds assuming that the incremental method is used and the market value of the warrants is not reasonably determinable.

- 9 **BE14-30. Short-Term Debt Expected to Be Refinanced, U.S. GAAP.** Saxon Woods, Inc. has a fiscal year-end of December 31, 2017. The company reported \$124,500 in short-term notes payable due on April 1, 2018, on its year-end balance sheet. Saxon Woods extended the due date for this debt to January 31, 2019, during the post-balance sheet period. The bank agreed to extend the debt term for \$100,000 of the total amount of the loan; \$24,500 is due on its original due date. Prepare the journal entry required on December 31, 2017, to reflect the refinancing agreement under **U.S. GAAP**.
- 9 **BE14-31. Short-Term Debt Expected to Be Refinanced, IFRS.** Using the information provided in BE14-30, prepare the journal entry required on December 31, 2017, to reflect the refinancing agreement under **IFRS**.
- 9 **BE14-32. Callable Debt, U.S. GAAP.** Braylon Brands, Inc. borrowed \$2,000,000 from Home Town Bank. The note payable had a term of 5 years and carried a 6% coupon interest. Because of an inadequate credit score, Braylon Brands agreed to several restrictive debt covenants. The debt agreement requires the company to maintain a 3-to-1 working capital ratio. Home Town Bank's review of the company's year-end financial statements indicated that Braylon achieved a working capital ratio of only 2 to 1. As a result, Home Town Bank will call in the loan within 3 months of the balance sheet date. Prepare the journal entry to record the call on the debtor's financial statements under **U.S. GAAP**.
- 9 **BE14-33. Callable Debt, IFRS.** Using the information provided in BE14-32, prepare the journal entry to record the effect of the call on the debtor's financial statements under **IFRS**.
- 9 **BE14-34. Callable Debt, U.S. GAAP.** Megga Brands, Inc. borrowed \$1,500,000 from Telcity Bank. The note payable has a term of 15 years and carries a 4% coupon interest. Because it had an inadequate credit score, Megga Brands agreed to several restrictive debt covenants. The debt agreement requires the company to maintain a compensating balance of \$150,000. On December 15, Megga was forced to draw down on the compensating balance to meet working capital requirements. The loan became callable by Telcity on December 31 of the current year. On January 15, Telcity granted Megga a waiver and opted not to call its debt. Megga will release its annual financial statements to shareholders on February 15. How should Megga classify the \$1,500,000 note payable on the December 31 balance sheet? Provide any necessary journal entries under **U.S. GAAP**.
- 9 **BE14-35. Callable Debt, IFRS.** Using the information provided in BE14-34, how should Megga classify the \$1,500,000 note payable on the December 31 balance sheet under **IFRS**? Provide any necessary journal entries.
- 10 **BE14-36. Fair Value Option.** Saratoga Company issued bonds with a face value of \$200,000 on January 1, 2018, for \$202,716. Saratoga uses the fair value option to measure the bonds. At the end of 2018, the carrying value of the bonds is \$201,403, and their fair value is \$203,780. The change in fair value relates to a change in interest rate. What is the entry to record the fair value adjustment?
- 10 **BE14-37. Fair Value Option.** Saratoga Company issued bonds with a face value of \$300,000 on January 1, 2018, for \$306,000. Saratoga uses the fair value option to measure the bonds. At the end of 2018, the carrying value of the bonds is \$304,702 and their fair value is \$301,600. Half of the fair value change relates to instrument-specific credit risk. What is the entry to record the fair value adjustment?
- 11 **BE14-38. Financial Statement Disclosure.** Use the following excerpt from the financial statements of Fixet Company's debt footnote (from Fixet Company's 2018 annual report) to answer these questions:
- At December 31, 2018, what is the amount of the current portion of long-term debt?
 - How much debt will mature over the next 5 years?
 - What would be the difference in liabilities if Fixet reported the debt at fair values?

Fixet Company

Note 9—Long-Term Debt [Excerpt]

Long-term debt net of unamortized premiums and discounts and swap fair value adjustments is comprised of the following:

In millions of U.S. dollars	December 31, 2018
5.66% Corporate bond, payable July 23, 2020	\$ 27.0
5.4% Corporate bond, payable August 7, 2020	16.1
4.7% Corporate bond, payable October 1, 2021	50.0
5.15% Corporate bond, payable December 15, 2023	110.4
4.3% Japanese yen note, payable June 26, 2025	117.7
1.52125% Japanese yen note, payable February 14, 2020	55.1
Total	376.3
Less current maturities	7.4
Non-Current Portion	<u>\$368.9</u>

The scheduled maturity of long-term debt in each of the years ending December 31, 2019, through 2023, is \$7.4 million, \$172.1 million, \$57.4 million, \$47.4 million, and \$7.3 million at face value, respectively.

The Company's long-term debt is recorded at adjusted cost, net of amortized premiums and discounts. The fair value of long-term debt is estimated based upon quoted prices for similar instruments. The fair value of the Company's long-term debt, including the current portion, was approximately \$403 million at December 31, 2018.

Source: Financial statements from Fixet Company's 2018 annual report.

Exercises

- 1** **E14-1. Notes Payable.** Gardiner Manufacturing, Inc. borrowed \$950,000 by issuing an 8-month note on July 1 of the current year. The note is due on March 1 of the following fiscal year. The short-term note carries a 6% annual interest rate with interest due at maturity. The company's fiscal year ends on December 31.
- Required »**
- Prepare the journal entry to record the issuance of the note payable.
 - Prepare the journal entry required at year-end to record the interest accrual.
 - Prepare the journal entry to record the payment of the note at maturity.
- 1** **E14-2. Note Payable with Amortization Table.** EA&Y, Inc. borrowed \$350,000 on January 1, 2018, with a 6% interest rate. It will make a payment of \$101,007 annually (beginning December 31, 2018) until the note is paid off on December 31, 2021. The company's fiscal year ends on December 31. The payment includes interest and principal.
- Required »**
- Prepare the journal entry to record the issuance of the note payable.
 - Prepare the amortization table for the note.
 - What is the journal entry at December 31, 2018?
- 1** **E14-3. Installment Loans, Long-Term.** Broad Street Company borrows \$975,050 by issuing an 8%, 7-year note on January 1, 2018. Broad Street must make payments of principal and interest every 6 months beginning June 30, 2018. The note will be fully paid at maturity on December 31, 2024. The company's fiscal year ends on December 31.
- Required »**
- Prepare the journal entry to record the issuance of the note payable.
 - Prepare an amortization table.
 - Prepare the journal entry to record payments for the first year.
 - What is the amount of the note payable on the balance sheet at December 31, 2018? What is the interest expense for the year?
- 1** **E14-4. Note Payable with Amortization Table.** On March 31, 2018, Vine Company issued a \$487,000, 2%, 3-year note payable when the market rate was 8%. Interest is due on each March 31, beginning March 31, 2019. The company's fiscal year ends on December 31.
- Required »**
- Prepare the journal entry to record the issuance of the note payable.
 - Prepare an amortization table.
 - Prepare the journal entry to record interest expense at December 31, 2018.
 - Prepare the journal entry required on March 31, 2019.
- 3** **E14-5. Bond Issue, Interest Payments, Effective Interest Rate Method, Amortization Table.** On January 1, 2018, Mill Road Corporation issued \$300,000 par value, 5%, 5-year bonds. Interest is payable semiannually each January 1 and July 1 with the first interest payment due at the end of the period on July 1, 2018. The market rate of interest on the date of the bond issue was 8%. The company's fiscal year ends on December 31.
- Required »**
- Determine the issue price of the debt.
 - Prepare the amortization table for the bond issue assuming that Mill Road uses the effective interest rate method of amortization.
 - Prepare the journal entries to record the bond issue, the first interest entry, and payment of the bonds at maturity. Assume that the company uses a premium or discount account if needed.
- 3** **E14-6. Bond Issue, Interest Payments, Effective Interest Rate Method, Amortization Table.** On January 1, 2018, the Landon Capital Partners issued \$600,000 par value, 6%, 6-year bonds. Interest is payable semiannually

each January 1 and July 1 with the first interest payment due at the end of the period on July 1, 2018. The market rate of interest on the date of the bond issue was 4%.

Required »

- Determine the issue price of the debt.
- Prepare the amortization table for the bond issue assuming that Landon uses the effective interest rate method of amortization.
- Prepare the journal entries to record the bond issue, the first interest entry, and payment of the bonds at maturity. Assume that the company uses a premium or discount account, if needed.

- 3** **E14-7. Zero-Coupon Bond Issue, Interest Payments, Effective Interest Rate Method.** On January 1, 2018, McMillan Corporation issued \$100,000 par value, 5-year, zero-coupon bonds. The market rate of interest on the date of the bond issue was 6%. The company's fiscal year ends on December 31.

Required »

- Determine the issue price of the debt.
- Prepare the amortization table for the bond issue assuming that McMillan uses the effective interest rate method of amortization.
- Prepare the journal entries to record the bond issue, the amortization entry on December 31, 2018, and payment of the bonds at maturity. Assume that the company uses a premium or discount account if needed.

- 3** **E14-8. Bond Issue, Interest Payments, Effective Interest Rate Method.** On January 1, 2018, Faxico, Inc. issued \$4,500,000 par value, 8%, 5-year bonds. Interest is payable semiannually each January 1 and July 1 with the first interest payment due at the end of the period on July 1, 2018. The market rate of interest on the date of the bond issue was 10%.

Required »

- Determine the issue price of the debt.
- Prepare the amortization table for the bond issue assuming that the effective interest rate method of amortization is used.
- Prepare the journal entries to record the bond issue and the first interest entry. Assume that the company uses a premium or discount account if needed.

- 4** **E14-9. Bond Sold between Interest Payment Dates, Sold at Par.** Takedo Company issued \$600,000 par value, 10-year, 5% bonds on February 1, 2018. The bonds are dated January 1, 2018, and pay interest quarterly each March 31, June 30, September 30, and December 31. The bonds are sold at par plus accrued interest because the bonds are sold between interest dates. Prepare the journal entries required to issue the bonds on February 1, 2018, and record the first interest payment on March 31.

- 4** **E14-10. Bond Sold between Interest Payment Dates, Sold at Discount.** Briscoe Company issued \$700,000 par value, 5-year, 4% bonds on April 30, 2018. The bonds are dated January 1, 2018, and pay interest semiannually on June 30 and December 31. The bonds are sold at \$703,455, including accrued interest, because they are sold between interest dates. Prepare the journal entries required to issue the bonds on April 30, 2018, and record the first interest payment on June 30, 2018. The market rate of interest on the date of sale of the bonds was 4.2%.

- 4** **E14-11. Bond Sold between Interest Payment Dates, Sold at Premium.** Teter Company issued \$700,000 par value, 5-year, 3% bonds on November 30, 2018. The bonds are dated July 1, 2018, and pay interest semiannually on June 30 and December 31. The bonds are sold at \$723,807, including accrued interest, because they are sold between interest dates. The market rate of interest on the date of sale was 2.5%. Prepare the journal entries required to issue the bonds on November 30, 2018, and record the first interest payment on December 31, 2018.

- 6** **E14-12. Early Bond Retirement, Effective Interest Rate Method.** On January 1, 2018, Faxico, Inc. issued \$4,500,000 par value 8%, 5-year bonds. Interest is payable semiannually on January 1 and July 1 with the first interest payment on July 1, 2018. The market rate of interest on the date of the bond issue was 10%. Faxico retired the debt early at the end of the third year for \$4,000,000.

Required »

- Determine the carrying value of the bond at retirement.
- Prepare the journal entry to record the early retirement of the debt at the end of the third year.

- 7** **E14-13. Convertible Bonds, Conversion.** On January 1, 2018, Mobile Technology, Incorporated issued \$850,000 of \$1,000 par value, 6%, 6-year bonds. Interest is payable semiannually each January 1 and July 1 with the first interest payment due at the end of the period on July 1, 2018. The market rate of interest for similar non-convertible bonds on the date of the bond issue was 10%. However, because these bonds are

convertible, the effective rate is 8%. Each bond is convertible into 20 shares of Mobile Technology's \$2 par value common stock. Assume there is no beneficial conversion option.

Required »

- Determine the issue price of the debt.
- Prepare the amortization table for the bond issue assuming that Mobile Technology uses the effective interest rate method of amortization.
- Prepare the journal entry when Mobile Technology issued the bonds.
- Prepare the journal entry to record the first interest payment.
- The bonds converted on January 1, 2021. Prepare the journal entry to record the bond conversion.

- 7 E14-14. Convertible Bonds, Conversion.** Using the information provided in E14-13, complete the following requirements assuming that the effective rate of interest for convertible bonds is 4% on the date of issue.

Required »

- Determine the issue price of the debt.
- Prepare the amortization table for the bond issue assuming that Mobile Technology uses the effective interest rate method of amortization.
- Prepare the journal entry when Mobile Technology issued the bonds.
- Prepare the journal entry to record the first interest payment.
- The bonds converted on January 1, 2021. Prepare the journal entry to record the bond conversion.

- 7 E14-15. Convertible Bonds, Conversion, IFRS.** Using the information provided in E14-13, complete the following requirements assuming that Mobile Technology reports under IFRS.

Required »

- Determine the present value of bond cash flows.
- Prepare the amortization table for the bond issue assuming that Mobile Technology uses the effective interest rate method of amortization.
- Prepare the journal entry when the bonds are issued.
- The bonds converted on January 1, 2021. Prepare the journal entry to record the bond conversion.

- 7 E14-16. Convertible Bonds Beneficial Conversion Option.** Marly, Inc., issues 1,000 of 6-year, 3% convertible bonds at par of \$1,000. Each \$1,000 bond converts into 10 shares of no-par value common stock at the option of the bondholder beginning 3 years after the date of issue. There were no bond issue costs. The market price of the common stock when the bonds are issued is \$116 per share. Interest is paid annually. Prepare the journal entry to record the issuance of Marly's convertible debt. What is the effective interest rate on the bonds?

- 7 E14-17. Convertible Bonds Beneficial Conversion Option, Conversion.** Use the information from E14-16 and assume that all bonds convert after 3 years. The carrying value of the bonds at the conversion date is \$913,000. Prepare the journal entry at conversion.

- 8 E14-18. Warrants.** Randolph Company issued 4,500 of its \$1,000 par value bonds for \$1,440, providing total cash proceeds of \$6,480,000. There are no bond issue costs. The market price of Randolph's common shares on the date that the bonds were issued was \$40 per share. The bonds were sold with 90,000 warrants to acquire 90,000 shares of the company's \$1 par value common stock for \$50 per share. That is, each bond carries 20 warrants. Randolph has existing bonds outstanding that currently trade without warrants at \$1,160. There are other Randolph warrants outstanding that trade for \$35 each. Assume that the fair value of the bonds is more reliable than the market value of the warrants.

Required »

- Prepare the journal entry to record issuance of the bonds assuming that the warrants are nondetachable.
- Prepare the journal entry to record the issuance of the bonds assuming that the warrants are detachable using the proportional method.
- Prepare the journal entry to record the issuance of the bonds assuming that the warrants are detachable using the incremental method.
- Assuming that the incremental method is used, prepare the journal entry required to record the exercise of all warrants.

- 8 E14-19. Warrants.** DHC Associates issued 2,100 of its \$1,000, 8%, 5-year par value bonds. There are no bond issue costs. Interest is paid annually. The market rate on the date of issue was 9%. The market price of DHC common shares on the date that the bonds are issued is \$50 per share. The bonds were sold with 50,000 warrants to acquire 50,000 shares of the company's \$1 par value common stock for \$40 per share. That is, each bond carries 25 warrants. DHC has existing bonds outstanding that trade without warrants at \$920. There are other DHC warrants outstanding that trade for \$40 each.

Required »

- Determine the issue price of the bonds.

- b. Prepare the journal entry to record issuance of the bonds assuming that the warrants are nondetachable.
- c. Prepare the journal entry to record the issuance of the bonds assuming that the warrants are detachable using the proportional method.
- d. Prepare the journal entry to record the issuance of the bonds assuming that the warrants are detachable using the incremental method. Assume that the fair value of the bonds is more reliable.
- e. Assuming that the incremental method is used, prepare the journal entry required to record the exercise of all warrants.

10 E14-20. Fair Value Option. On January 1, 2018, McMillan Corporation issued \$86,000 par value, 6-year bonds with a 0% stated interest rate. The discount on the bonds is amortized annually each December 31. The market rate of interest on the date of the bond issue was 3.25%. Fair value changes are not the result of instrument-specific credit risk. The amortization table for the bond follows. Assume that McMillan elected the fair value option on the date of issue.

Amortization Table under Effective Interest Rate Method

Period	0% Cash Interest	3.25% Effective Interest	Discount Amortization	Carrying Value	Fair Value
0				\$70,984	\$70,984
1	0	\$ 2,307	\$ 2,307	73,291	72,500
2	0	2,382	2,382	75,673	76,817
3	0	2,459	2,459	78,132	78,002
4	0	2,539	2,539	80,671	80,880
5	0	2,622	2,622	83,293	83,325
6	0	2,707	2,707	86,000	86,000
Total	<u>\$0</u>	<u>\$15,016</u>	<u>\$15,016</u>		

Required »

Prepare the entry required to adjust the balance of the debt to fair value at the end of the first, second, and third years.

10 E14-21. Fair Value Option. On January 1, 2018, Sohape Corporation issued \$100,000 par value, 5-year bonds with a 3% stated interest rate. Interest is paid annually each December 31. The market rate of interest on the date of the bond issue was 2.5%. The amortization table for the bond follows. Assume that Sohape elected the fair value option on the date of issue. Fair value changes are not the result of instrument-specific credit risk.

Amortization Table under Effective Interest Rate Method

Period	3% Cash Interest	2.50% Effective Interest	Premium Amortization	Carrying Value	Fair Value
0				\$102,323	\$102,323
1	\$ 3,000	\$ 2,558	\$ 442	101,881	102,970
2	3,000	2,547	453	101,428	102,160
3	3,000	2,536	464	100,964	102,099
4	3,000	2,524	476	100,488	102,067
5	3,000	2,512	488	100,000	100,000
Total	<u>\$15,000</u>	<u>\$12,677</u>	<u>\$2,323</u>		

Required »

Prepare the entry required to adjust the balance of the debt to fair value at the end of the first, second, and third years.

Problems

1 P14-1. Long-Term Notes Payable with Amortization Table. On January 1, 2017, Antonia Lee Stores, Inc., borrowed \$700,000 and immediately received the full amount. The note carried a 7% interest rate and requires annual payments of \$146,857 beginning on December 31, 2017. The note matures on December 31, 2022. The company’s fiscal year ends on December 31. The payment includes interest and principal.

Required »

- Prepare the journal entry to record the issuance of the note payable.
- Prepare the amortization table for the note.
- Prepare the journal entry required to record the first payment on December 31, 2017.
- What is the balance of the note on December 31, 2021, after the payment?
- Prepare the journal entry to record the payment of the note at maturity.

- 1** **P14-2. Long-Term Notes Payable, Semiannual Interest, Amortization Table.** On January 1, 2018, Priolo Builders Company borrowed \$650,000 by issuing 4%, 5-year notes. The full amount of the cash was received immediately. Under the terms of the loan agreement, Priolo must make principal and interest payments every 6 months, beginning June 30, 2018. The note matures on December 31, 2022. The company's fiscal year ends on December 31.

Required »

- Prepare the journal entry to record the issuance of the note payable.
- Determine the annual payment required under the loan agreement.
- Prepare an amortization table.
- Prepare the journal entry to record payments for the first year.
- What is the amount of the note payable on the balance sheet at December 31, 2020, after the semiannual payment? What is the interest expense for the year?
- Prepare the journal entry to record the final payment at maturity.

- 1** **P14-3. Note Payable Issued at a Discount with Amortization Table.** On September 30, 2018, Laurino Landscaping Company issued a 6-year, 3%, \$800,000 note payable. The note was issued on a date when the market rate was 5%. Interest at 3% is due annually every September 30, beginning September 30, 2019. The full amount of the principal amount is due and payable at maturity. The company's fiscal year ends on December 31.

Required »

- Determine the present value of the note and the discount on the note payable.
- Prepare the journal entry to record the issuance of the note payable.
- Prepare an amortization table.
- Prepare the journal entry to record an accrued interest expense on December 31, 2018.
- Prepare the journal entry required on September 30, 2019.
- Prepare the journal entries required at maturity.

- 3 5 6** **P14-4. Bond Issue, Zero-Coupon Bond, Effective Interest Rate Method, Early Retirement, Bond Issue Costs.** Freiberg Associates issued \$700,000 par value, 4-year, zero-coupon bonds on January 1, 2018. The market rate of interest on the date of the bond issue was 4%. Bond issue costs are \$3,600. The company's fiscal year ends on December 31.

Required

- Determine the issue price of the debt.
- Find the effective interest rate after considering bond issue costs. Prepare the amortization table for the bond issue assuming that Freiberg uses the effective interest rate method of amortization.
- Prepare the journal entries to record the bond issue and the entry on December 31, 2018. Assume that the company uses a discount or premium account if needed.
- Describe the income statement, balance sheet, and cash flow statement effects in 2018 of the bond issue and the amortization of discount.
- The bonds are retired early on November 30, 2019, for \$655,000. Prepare the journal entry.

- 3 5** **P14-5. Bond Issue, Interest Payments, Effective Interest Rate Method, Bond Issue Costs.** On January 1, 2018, Tara Clothing Corporation issued \$900,000 par value, 5%, 6-year bonds. Interest is payable semiannually each January 1 and July 1 with the first interest payment due at the end of the period on July 1, 2018. The market rate of interest on the date of the bond issue was 8%. Bond issue costs are \$72,725. The company's fiscal year ends on December 31.

Required »

- Determine the issue price of the debt and the amount of the bond discount or premium.
- Find the effective interest rate after considering bond issue costs. Prepare the amortization table for the bond issue assuming that Tara uses the effective interest rate method of amortization.
- Prepare the journal entries necessary to account for the bonds for the first year (January 1, 2018, through January 1, 2019). Assume that the company uses a premium or discount account if needed.
- Prepare the journal entries to record the interest accrual and amortization for year three.
- Prepare the journal entry to record payment of the bonds at maturity.

- 3 6** **P14-6. Bond Issue, Interest Payments, Effective Interest Rate Method, Early Retirement.** On January 1, 2018, Organic Products issued \$1,200,000 par value, 7%, 5-year bonds. Interest is payable semiannually at the end of the period. The market rate of interest on the date of the bond issue was 6%.
- Required »**
- Determine the issue price of the debt.
 - Prepare the amortization table for the bond issue assuming that Organic Products uses the effective interest rate method of amortization.
 - Prepare the journal entry to record the bond issue. Assume that the company uses a premium or discount account if needed.
 - Prepare the journal entry to record the early retirement of the bonds at the end of the third year (December 31, 2020) for \$1,265,000.
- 4 6** **P14-7. Bonds Sold between Interest Dates at a Discount, Bond Issue Proceeds, Retirement.** Summa Manufacturing Company issued \$900,000 par value, 5%, 5-year bonds dated January 1, 2018. The bonds pay interest semiannually each June 30 and December 31. Summa issued the bonds on April 30, 2018, when the market rate of interest was 6%.
- Determine the bond issue price including accrued interest on April 30, 2018.
 - Prepare an amortization table for the bond issue using the effective interest rate method.
 - Prepare the journal entries required on the date of issue and on the first two interest dates in 2018, June 30, and December 31.
 - The bonds are retired on June 30, 2020, for \$891,000. Prepare the journal entries at retirement.
- 4 5** **P14-8. Bonds Sold between Interest Dates at a Discount, Bond Issue Costs, IFRS.** Tyka Manufacturing Company, an **IFRS** reporter, issued \$900,000 par value, 5%, 5-year bonds dated January 1, 2018. The bonds pay interest semiannually each June 30 and December 31. Tyka received cash of \$863,825 when the bonds were issued, excluding accrued interest and bond issue costs, on April 30, 2018, to yield an effective interest rate of 7.742%. Bond issue costs were \$59,000.
- Required »**
- Discuss the treatment of bond issue costs under **IFRS**. What is the discount or premium on the bond?
 - Prepare an amortization table for the bond issue using the effective interest rate method.
 - Prepare the journal entries required on the date of issue and on the first two interest dates in 2018 of June 30 and December 31.
- 7** **P14-9. Convertible Bonds, Conversion.** On January 1, 2018, Super View Video, Incorporated issued \$1,550,000 of \$1,000 par value, 8%, 6-year bonds. Interest is payable semiannually each January 1 and July 1 with the first interest payment due at the end of the period on July 1, 2018. The market rate of interest for similar non-convertible bonds on the date of the bond issue was 10%. The bonds were sold for \$1,704,287, yielding an effective rate of 6%. Each bond is convertible into 20 shares of Super View's \$1 par value common stock. Assume that there is no beneficial conversion option.
- Required »**
- Prepare the amortization table for the bond issue assuming that Super View uses the effective interest rate method of amortization.
 - Prepare the journal entry to record the bond issue.
 - Prepare the journal entry to record the first interest payment.
 - The bonds converted on January 1, 2021. Prepare the journal entry to record the bond conversion.
- 7** **P14-10. Convertible Bonds, Conversion, IFRS.** Using the information provided in P14-9, complete the following requirements assuming that Super View Video is an **IFRS** reporter.
- Required »**
- Prepare the journal entry to record the bond issue.
 - Prepare the amortization table.
 - Prepare the journal entry to record the first interest payment.
 - The bonds converted on January 1, 2021. Prepare the journal entry to record the bond conversion.
- 5 7** **P14-11. Convertible Bonds, Bond Issue Costs, Conversion.** On January 1, 2018, Mesa Machinery Corporation issued 75 of 12-year, 12% convertible bonds at par. Each bond had a par value of \$1,000 and pays interest annually on December 31. Because the bonds were issued at par, the yield on the bond is also equal to 12%. Each \$1,000 bond converts into 25 shares of \$1 par value common stock at the option of the bondholder beginning 2 years after the date of issue. Bond issue costs are \$480. The market price of the common stock on the issue date was equal to \$60 per share. Any discount is amortized using the effective interest rate method.

Required »

- Prepare the journal entry to record the bond issuance.
- Find the effective rate of interest after considering bond issue costs. Prepare the amortization table using the new effective rate of interest and the effective interest rate method.
- Prepare the journal entries to record the interest payment for the first 3 years.
- Prepare the entry to record the bond conversion assuming that all bonds convert at the end of the third year.

8

P14-12. Warrants. Davis Company issued 11,250 of its \$1,000 par value bonds for \$1,310, providing total cash proceeds of \$14,737,500. Davis did not incur any bond issue costs. Bond interest is paid annually. The market price of Davis's common shares on the date that the bonds were issued was \$125 per share. The bonds were sold with 22,000 warrants to acquire 22,000 shares of the company's \$1 par value common stock for \$125 per share. Davis has existing bonds outstanding that trade without warrants at \$1,200. There are other Davis warrants outstanding that trade for \$87.50 each. The market value of the company's bonds is considered more reliable than the trading price of the warrants.

Required »

- Prepare the journal entry to record issuance of the bonds assuming that the warrants are nondetachable.
- Prepare the journal entry to record the issuance of the bonds assuming that the warrants are detachable using the proportional method.
- Prepare the journal entry to record the issuance of the bonds assuming that the warrants are detachable using the incremental method.
- Assuming that the proportional method is used, prepare the journal entry required to record the exercise of all warrants.
- Assuming that the incremental method is used, prepare the journal entry required to record the exercise of all warrants.

8

P14-13. Warrants. Tutte Company issued 3,000 of its 9%, 5-year, \$1,000 par value bonds. Bond interest is paid annually on December 31. The market rate on the date of issue was 15%. The market price of Tutte common shares on the date that the bonds were issued was \$60 per share. The bonds were sold with 18,000 warrants to acquire 18,000 shares of the company's \$1 par value common stock for \$60 per share. Tutte has existing bonds outstanding that trade without warrants at \$750. There are other Tutte warrants outstanding that trade for \$60 each. The market value of the warrants is considered to be more reliable than the fair value of the company's outstanding bonds.

Required »

- Determine the issue price of the bonds.
- Prepare the journal entry to record issuance of the bonds assuming that the warrants are nondetachable.
- Prepare the journal entry to record the issuance of the bonds assuming that the warrants are detachable using the proportional method.
- Prepare the journal entry to record the issuance of the bonds assuming that the warrants are detachable using the incremental method.
- Assuming that the proportional method is used, prepare the journal entry required to record the exercise of all warrants.
- Assuming that the incremental method is used, prepare the journal entry required to record the exercise of all warrants.
- Compare the financial statement effects of the bonds and detachable warrants using the proportional versus the incremental methods.

CASES

Judgment Cases

Judgment Case 1: Debt or Equity²³

Background

Companies normally obtain financing for operations from three sources:

1. Borrowing funds (debt)
2. Issuing shares (equity)
3. Using internally generated capital (from retained profits)

Sometimes, deciding how to present and classify these sources of financing in the financial statements is easily determined. For example, common stock is considered equity and issued bonds are considered debt. However, certain instruments have mixed attributes of debt and equity. Consider the following examples:

- Preferred stock
- Redeemable preferred stock
- Convertible bonds
- Bonds with detachable warrants

Required »

- a. Establish a list of criteria that differentiate debt from equity (e.g., debt pays interest whereas equity pays dividends). For purposes of this part, assume that the debt is a secured loan and that the equity is common stock.
- b. For each of the four instruments noted above, make a list of debt and equity attributes.
- c. For each of the four instruments, discuss and provide your opinion about which instruments should be classified (for financial statement presentation purposes) as a long-term liability and which should be classified as equity. Indicate whether you believe this classification is really important and give your opinion as to why or why not. You may want to obtain copies of the FASB's 2007 Preliminary Views, *Financial Instruments with Characteristics of Equity* and the IASB's 2008 *Discussion Paper, Financial Instruments with Characteristics of Equity*.

Judgment Case 2: Jillian Limited: The Debt Equity Dilemma²⁴

Background

Jillian Limited (JL) issued a financial instrument with the following terms:

- A face value of \$100.
- Not secured by any assets of the entity (unsecured).
- Redeemable in cash at the option of the issuer.
- Pays 5% of face value annually.
- The 5% doubles in five years (to 10%) if the financial instrument is not redeemed. In 10 years, the annual payments double again if not redeemed by that time.

Other information to consider:

- Current interest rates are 4%. Rates are expected to remain stable or decline in the short to midterm.
- JL currently has a loan outstanding with the bank. Under the terms of the loan agreements, the debt-to-equity ratio may not exceed 2:1. Currently, before accounting for the new instrument, the debt-to-equity ratio is 2:1.

Required »

- a. Discuss how JL should account for the financial instrument on the balance sheet (debt or equity) assuming that that JL reports under **U.S. GAAP**.

²⁴Reprinted from the Ernst & Young Academic Resource Center with permission of the Ernst & Young Foundation. Copyright 2014. All rights reserved.

Judgment Case 3: Jillian Limited: The Debt Equity Dilemma: IFRS²⁵

Background

Jillian Limited (JL) issued a financial instrument with the following terms:

- A face value of \$100.
- Not secured by any assets of the entity (unsecured).
- Redeemable in cash at the option of the issuer.
- Pays 5% of face value annually.
- The 5% doubles in five years (to 10%) if the financial instrument is not redeemed. In 10 years, the annual payments double again if not redeemed by that time.

Other information to consider:

- Current interest rates are 4%. Rates are expected to remain stable or decline in the short to midterm.
- JL currently has a loan outstanding with the bank. Under the terms of the loan agreements, the debt-to-equity ratio may not exceed 2:1. Currently, before accounting for the new instrument, the debt-to-equity ratio is 2:1.

Required »

Discuss how JL should account for the financial instrument on the balance sheet (debt or equity) assuming that JL reports under IFRS. Discuss any ramifications of this classification.

Financial Statement Analysis Case

Financial Statement Analyses Case: Credit Ratings

Grifols, S.A. is a Spanish pharmaceutical company focusing on the development, manufacturing, and sale of therapeutic products. At the end of 2016, *Grifols* was rated “BB” by Standard & Poor’s and considered to have a stable business risk profile.

<i>Grifols, S.A.</i> (€ in thousands)	December 31	
	2016	2015
Operating income from continuing operations after tax	€ 544,543	€ 531,441
Operating profits before interest income, interest expense, and income taxes	939,408	970,370
Depreciation and amortization	201,869	189,755
Deferred income tax expense	(40,161)	24,357
Asset impairment	(88)	125
Major noncash charges (gains)	(1,218)	37,221
Short-term debt	230,065	262,497
Long-term debt	4,712,071	4,597,654
Equity	3,727,978	3,301,390

Source: Financial statements taken from <https://www.grifols.com/documents/10192/23539299/cons-2016-en/8f9148c9-dc4f-490a-8866-bf2044cb9e8b> and <http://www.grifols.com/documents/10192/243545/ia-2013-en/7e4105bb-2bd2-4459-9e89-73350789a4f3>, <http://www.grifols.com/documents/10192/30795/cons-2012-en/8e6ff3ad-41e3-4985-9010-a5dc7c6d2ec4>

Required »

- What is a credit rating and why would a potential investor in bonds be interested in a company’s credit rating?
- What factors does a credit rating agency consider in rating a company?
- Compute funds from operations over debt and debt to EBITDA for 2015 and 2016 using the selected financial statement information.
- Using the benchmarks from Exhibit 14.8, assess the financial risk of the company using these indicators. Assess its financial risk profile at the end of 2016. How does the financial risk in 2016 compare to that in 2015?

Surfing the Standards Cases

Surfing the Standards Case 1: Fair Value Option Disclosures

Under U.S. GAAP, firms may choose to report most financial assets and financial liabilities at fair value, using the fair value option. The rules related to the fair value option are included in ASC 825-10 *Financial*

²⁵Reprinted from the Ernst & Young Academic Resource Center with permission of the Ernst & Young Foundation. Copyright 2014. All rights reserved.

Instruments—Overall. When an entity chooses the fair value option for a financial instrument, a number of disclosures are required.

1. What are the principal objectives of these disclosures?
2. What are the expectant results of the disclosures?

Surfing the Standards Case 2: Bonds with Detachable Warrants

Companies sometimes issue bonds with detachable warrants entitling the bondholder to buy the stock of the company at a fixed price. The U.S. GAAP rules related to the issue of these bonds are included in ASC 470-20, *Debt with Conversion and Other Options*. Read paragraphs 2 and 3 of section 5, paragraphs 2 and 3 of section 25, and paragraphs 1 and 2 of section 30.

1. Why do companies sometimes issue bonds with detachable warrants?
2. Does U.S. GAAP treat bonds with detachable warrants as debt or equity?
3. How are the proceeds of the issue allocated to the financial statement components?

Doxy, Inc. issued \$1,000,000 par value, 5%, 10-year bonds with detachable warrants on April 1 for \$1,100,000. (April 1 is also the commitment date.) Interest is payable quarterly at the end of each quarter. Doxy can reliably determine that the market rate of interest that would be applicable to the bond issue without warrants is 6%. It can also reliably determine that the fair value of the warrants, if they were detached from the bonds, would be \$200,000.

4. Provide the journal entry to record the issuance on April 1.
5. Provide the journal entry to record the first interest payment on June 30.

Basis for Conclusions Cases

Basis for Conclusions Case 1: Long-Term Debt Violation at the Balance Sheet Date²⁶

Note: In the following exercise, you are required to review the Basis for Conclusions (BCs) for the standard(s) that provide the accounting guidance for this topic. As the BCs are generally not included in the codification and thus are not authoritative, it will most likely be necessary for you to research them through review of the pre-codified standards. Appropriate references have been provided to allow you to do so. Pre-codified standards are accessible on the FASB website or through the American Accounting Association's Academic Accounting Access program, if your school participates in this program.

Scene 1

At December 31, 2012, the Gray Mountain Company (GMC), a rain-making eco-friendly company, has a five-year note payable to a large bank. The underlying note agreement contains certain restrictive covenants (minimum capital requirements, total debt-to-equity ratio, working capital ratio, and minimum cash balance requirements) that could accelerate the immediate payment of the debt if GMC does not meet these covenants each quarter-end (March 31, June 30, September 30, and December 31). GMC was not in compliance with two of the ratios at December 31, 2012, but received a waiver from the bank for these two debt covenant violations on January 31, 2013, which was retroactive to December 31, 2012, and through January 1, 2014.

Please read the following:

FASB ASC 470-10-45-13 through 21 and Statement of Financial Accounting Standards No. 6, *Classification of Short Term Debt Obligations Expected to be Refinanced*, paragraphs 1 through 6 and Appendix A—Basis for Conclusion, paragraphs 18 through 31.

International Accounting Standard 1, *Presentation of Financial Statements*, paragraphs 69, 71, 74, and 75 and the BCs in IAS 1, paragraphs BC 39 through BC 48.

- Determine how the debt would be classified in GMC's balance sheet at December 31, 2012, under both U.S. GAAP and IFRS.
- Discuss and articulate the rationale and thought that the FASB and IASB went through in reaching their decisions in the accounting for debt balance sheet classification if a debt covenant violation was cured near the balance sheet date.

APPENDIX A

The Straight-Line Method of Amortization

The *straight-line method* of amortization can be used when the results are not significantly different from the effective interest rate method. The **straight-line method** amortizes a constant amount of discount or premium each period, leading to a constant interest expense.

$$\begin{aligned} & \text{Straight-Line Discount or Premium Amortization} \\ & = (\text{Discount or Premium}) / \text{Number of Interest Payments} \end{aligned} \quad (14A.1)$$

The straight-line method is theoretically deficient because it results in a variable cost of borrowing and the carrying value of the debt is not equal to the present value of the remaining cash flows discounted at the historical market rate.

Example 14A.1 presents an illustration of the straight-line method of amortization for a bond issued at a discount.

EXAMPLE 14A.1 Straight-Line Bond Discount Amortization

PROBLEM: Consider Ruffin Corporation from Example 14.8. On January 1, 2018, Ruffin Corporation issued \$40,000 par value, 4%, 4-year bonds that mature on December 31, 2021. The market rate on the date of issue is 6%. Ruffin will pay interest semiannually on June 30 and December 31. Prepare the journal entry on January 1, 2018. Prepare an amortization schedule over the 4-year period using the straight-line method of amortization. Prepare the journal entries for June 30 and December 31, 2018. Prepare the t-accounts for the bond payable and bond discount accounts. Compare the interest expense computed under the straight-line method and the effective interest rate method from Example 14.8.

SOLUTION: Because the stated interest rate is lower than the market rate when Ruffin issued the bonds, the bonds were issued at a discount. The terms to compute the future payments to bondholders are:

- **Face value** = \$40,000
- **Stated annual interest rate** = 4%
- **Historical market annual interest rate** = 6%
- **Interest payment period** = semiannually on June 30 and December 31
- **Maturity date** = December 31, 2021

At maturity, Ruffin will pay bondholders the face value of the bond, \$40,000. Ruffin will also make the interest payment to bondholders semiannually every June 30 and December 31 for the next 4 years. The semiannual interest payment is computed as follows:

$$\begin{aligned} \text{Interest Payment} & = \text{Face Value} \times \text{Annual Interest Rate} \times \text{Time Period} \\ & = \$40,000 \times 4\% \times \frac{1}{2} = \$800 \end{aligned}$$

We next determine the bond issue price. This present value includes both the face amount of \$40,000 and the semiannual interest payments of \$800. We use the semiannual market rate because the bonds are priced to yield the market. Therefore, $I/Y = 3\%$ ($6\%/2$) and $N = 8$ ($4 \text{ years} \times 2$).

	N	I/Y	PV	PMT	FV	Excel Formula
Given	8	3.00%		-800	-40,000	
Solve for PV			37,192			=PV(0.03,8,-800,-40000)

The bond issue price is \$37,192; thus, the discount is \$2,808 (\$40,000 – \$37,192). The journal entry to record the bond issuance includes a discount account as follows:

Account	January 1, 2018	
Cash	37,192	
Discount on Bonds Payable	2,808	
Bonds Payable – Face Value		40,000

Under the straight-line method, we divide the discount by the number of interest payments to compute amortization each period. For this bond, Ruffin makes eight interest payments (4 years × 2 semiannual interest payments per year). So, using Equation 14A.1, the discount amortization for each of the eight semiannual periods is \$351 (\$2,808 discount / 8 interest payments). This amortization is the same over the life of the bond. The \$1,151 interest expense each period is the sum of the cash interest (\$800) plus the discount amortization (\$351).

Amortization Table under the Straight-Line Method

Date	2% Cash Interest (a)	Straight-Line Interest (b) = (a) + (c)	Discount Amortization Initial Discount / Number of Periods (c)	Carrying Value (d) = (a) + (b)
				\$37,192
June 30, 2018	\$ 800	\$ 1,151	\$ 351	37,543
December 31, 2018	800	1,151	351	37,894
June 30, 2019	800	1,151	351	38,245
December 31, 2019	800	1,151	351	38,596
June 30, 2020	800	1,151	351	38,947
December 31, 2020	800	1,151	351	39,298
June 30, 2021	800	1,151	351	39,649
December 31, 2021	800	1,151	351	40,000
TOTALS	<u>\$6,400</u>	<u>\$9,208</u>	<u>\$2,808</u>	

We present the journal entry to record the first semiannual interest payment during 2018 with a discount account.

Account	June 30, 2018	
Interest Expense	1,151	
Cash		800
Discount on Bonds Payable		351

The journal entry to record the second semiannual interest payment during 2018 with a discount account follows.

Account	December 31, 2018	
Interest Expense	1,151	
Cash		800
Discount on Bonds Payable		351

In the amortization table, the interest expense and the discount amortization are the same each 6-month period.

The t-accounts for the bond payable and bond discount accounts are as follows:

Bond Payable		Discount on Bond Payable	
January 1, 2018	40,000	January 1, 2018	2,808
		June 30, 2018	351
		December 31, 2018	351
		June 30, 2019	351
		December 31, 2019	351
		June 30, 2020	351
		December 31, 2020	351
		June 30, 2021	351
December 31, 2021	40,000	December 31, 2021	351
Balance	<u>0</u>		<u>0</u>

We next compare the interest expense computed under the effective interest rate method from Example 14.8 and the straight-line method. In the early (later) periods, the interest expense is higher (lower) under the straight-line method.

Period	Interest Expense under the Straight- Line Method from This Example	Interest Expense under the Effective Interest Method from Example 14.8	Difference [Straight Line Greater than (Less than) the Effec- tive Interest Method]
June 30, 2018	\$1,151	\$ 1,116	\$ 35
December 31, 2018	1,151	1,125	26
June 30, 2019	1,151	1,135	16
December 31, 2019	1,151	1,145	6
June 30, 2020	1,151	1,155	(4)
December 31, 2020	1,151	1,166	(15)
June 30, 2021	1,151	1,177	(26)
December 31, 2021	<u>1,151</u>	<u>1,189</u>	<u>(38)</u>
TOTALS	<u>\$9,208</u>	<u>\$9,208</u>	<u>\$ 0</u>

The total interest expense over the life of the bond is the same under both the effective interest method and the straight-line method: Only the timing of when interest expense is reported differs.

Exhibit 14A.1 presents a graph of the difference in interest expense for Ruffin under the straight-line (Example 14A.1) and the effective interest rate (Example 14.8) methods. These interest expense differences also lead to differences in the effective interest rates computed from the amounts presented in the amortization tables and financial statements. Computing the interest rate each period as the reported interest expense divided by the beginning outstanding balance of debt yields a constant interest rate of 3% in each of 6 months under the effective interest rate method. This constant rate represents the actual interest rate incurred on the debt.

Under the straight-line-method, the interest rate varies. In the first period, it is 3.09% (\$1,151 / \$37,192). In the second period, the computed interest rate is 3.07% (\$1,151 / \$37,543). These interest rates under the straight-line method are only approximations of the actual interest rates and decline as the carrying value of the debt increases in the later years of the bond term.

EXHIBIT 14A.1 Comparison of Computed Interest Rate under the Straight-Line Method and the Effective Interest Rate Method

Straight-Line Amortization: IFRS

IFRS does not allow the use of the straight-line method. Both [U.S. GAAP](#) and [IFRS](#) typically require the effective interest method of amortization. However, under [U.S. GAAP](#), the straight-line method is permitted if the results are not significantly different from the effective interest rate method.

Accounting for Stockholders' Equity

LEARNING OBJECTIVES

- 1 Describe stockholders' equity and its main components.
- 2 Explain and illustrate the accounting for common stock, including share issuance, issue costs, and stock splits.
- 3 Record treasury stock transactions, including repurchases, reissuance under the cost method, and retirement.
- 4 Describe preferred stock and its features; demonstrate the accounting for issuance, dividends, and consideration of potential debt features of preferred stock.
- 5 Explain the accounting for retained earnings, including dividends and prior-period adjustments.
- 6 Describe the components of other comprehensive income and accumulated other comprehensive income.
- 7 Detail required disclosures for stockholders' equity.

Introduction

RAISING CAPITAL IN PUBLIC EQUITY MARKETS for the first time via an initial public offering (IPO) is a major

milestone for a company. In recent years, several U.S. Internet companies—*Facebook*, *Snap*, and *trivago*—deliberated the pros, cons, and potential timing for their IPOs. A company decides to go public for many reasons: to raise capital for business expansion, provide liquidity for current owners, or initiate the possibility for raising future equity capital. *Facebook Inc.*, the Internet social networking company, went public in May 2012, selling stock at \$38 per share. It sold about 180 million shares valued at approximately \$6.76 billion to new investors in its IPO and used this capital to fund expansion and growth. Another \$9.1 million was allocated to the company's other pre-IPO shareholders who sold about 241 million of their shares in the public market on the IPO date. At the end of 2016, a share of *Facebook*'s stock was priced at about \$115 per share.

Raising capital by issuing shares is a type of a transaction that a company can engage in with its owners. In this chapter, we focus on accounting for *stockholders' equity*, the owners' interest in the company. As the company operates and generates earnings, net income increases equity. A company can also decide to distribute dividends to owners or repurchase shares in the capital markets. We discuss accounting for these equity transactions, the types of equity securities a company can issue, and the presentation of equity and changes in equity that assist investors in their assessment of a company's performance. ◀◀

Shannon Stapleton/Thomson Reuters (Markets) LLC

- 1 Describe stockholders' equity and its main components.

Overview of Stockholders' Equity

Stockholders' equity (also referred to as shareholders' equity) is the sum of all residual claims against the net assets of the firm and is measured as the difference in the assets and the liabilities of the entity. Stockholders' equity is also called the **net assets** or the book value of the firm. It represents the interests held by the owners. Shareholders can assert their claims only after the company has satisfied the senior claims of creditors. Thus, stockholders' equity is a claim against net assets, not a claim against any specific asset(s).¹

Components of Stockholders' Equity

Stockholders' equity has three major components that we will examine in detail in the remaining sections of the chapter:

1. *Contributed capital*
2. *Retained earnings*
3. *Accumulated other comprehensive income*

We begin our discussion with an overview of these three major components.

Contributed Capital. **Contributed capital** includes the amounts paid in by *common* and *preferred* shareholders. **Common shareholders** are the residual claimants of the firm who receive dividend distributions after the company has paid all other providers of capital their return on investment. Common shareholders can be individuals, other corporations, or institutions (such as mutual funds). **Preferred shareholders** are investors holding shares in a company that have preferential rights over common shares. We discuss a number of types of preferred shares later in the chapter.

Contributed capital includes the *par value* of common and preferred shares as well as *additional paid-in capital in excess of par or stated value*. The face or stated value on the share certificate is its **par value**, which is an arbitrary value that corporate organizers assigned to each class of stock. **Additional paid-in capital in excess of par or stated value** represents the amounts that common and preferred shareholders contribute in excess of the par or stated value. For example, if Farnon Company issued 1,000 shares of its \$2 par value common stock for \$10 per share, it would record \$2,000 in the common stock account at par and record the excess over par (\$8,000) as additional paid-in capital in excess of par.

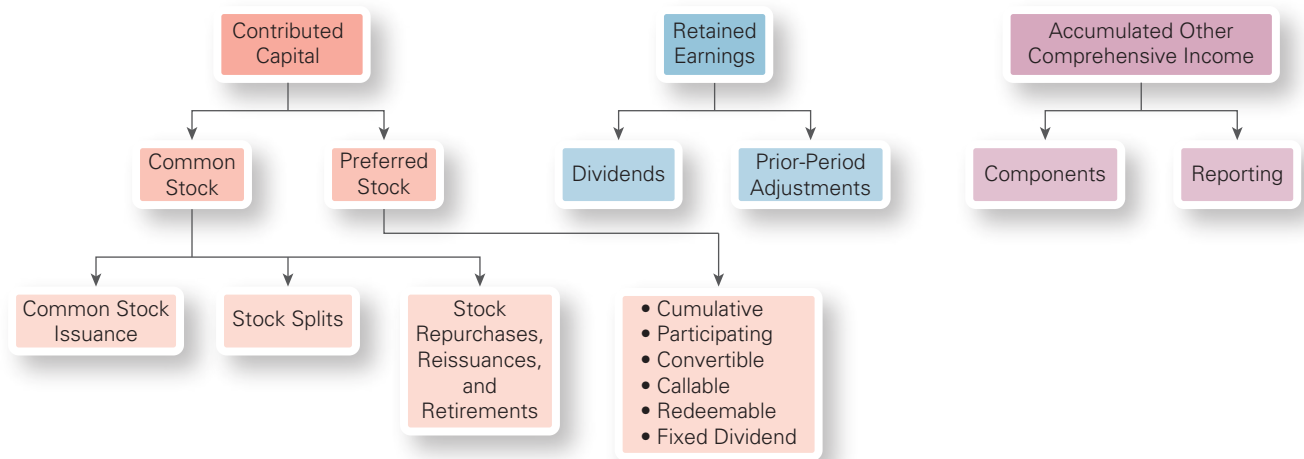

Retained Earnings. **Retained earnings** are a firm's cumulative earnings or losses that it has not distributed as dividends. Events other than dividends, net income, or net loss can also impact retained earnings.² However, as discussed later in the chapter, net income or loss less dividends declared account for the majority of changes in retained earnings.

Accumulated Other Comprehensive Income. **Accumulated other comprehensive income** includes the cumulative amount of items such as unrealized gains and losses on available-for-sale debt investment securities, foreign currency translation adjustments, and certain pension cost adjustments. Recall from Chapter 5 these items are reported in other comprehensive income, not net income.

Exhibit 15.1 on the next page presents an overview of the topics that we cover in this chapter.

¹For most of the relevant authoritative literature for this topic, see FASB ASC 505—*Equity* for U.S. GAAP and IASC, *International Accounting Standard 1*, "Presentation of Financial Statements" (London, UK: International Accounting Standards Committee, Revised, 2016), for IFRS.

²As discussed in a subsequent section of this chapter, treasury stock transactions and prior-period adjustments also affect retained earnings.

EXHIBIT 15.1 Overview of Stockholders' Equity Coverage

Stockholders' Equity Terminology: IFRS. IFRS uses different terminology than U.S. GAAP to refer to the stockholders' equity components as indicated in Exhibit 15.2.

EXHIBIT 15.2 Stockholders' Equity Terminology: U.S. GAAP and IFRS

U.S. GAAP	IFRS
Contributed capital, paid-in capital, common stock	Share capital
Additional paid-in capital	Share premium
Retained earnings	Retained profit, accumulated profit and loss
Accumulated other comprehensive income	Reserves, other reserves

- 2 Explain and illustrate the accounting for common stock, including share issuance, issue costs, and stock splits.

Accounting for Common Stock

We begin our discussion of the components of stockholders' equity by discussing key terms and relevant legal issues surrounding common stock and outlining the accounting for common stock issuances and stock splits.³

Overview of Common Stock

Several terms are important to understand when discussing common stock: *authorized*, *issued*, *unissued*, *treasury*, and *outstanding shares*.⁴

- **Authorized shares** refer to the total number of shares that the firm can legally issue. Typically, the attorney general in the state of incorporation approves the authorization. The firm includes the number of authorized shares in the articles of incorporation filed with the state.
- **Issued shares** refer to the number of shares sold or otherwise distributed to shareholders.
- **Unissued shares** are shares authorized but not issued.

³This section discusses the issuance of common stock in the primary market. That is, we address only transactions involving the initial sale or issuance of common stock to the market. We illustrate transactions involving two market participants (secondary market transactions) in the chapter on accounting for investments.

⁴These terms are the same for common and preferred shares.

- **Treasury shares** are the corporation's own shares that it repurchased and holds for some future use (for example, to be distributed to satisfy the terms of an employee stock option plan). Reacquired shares can also be retired rather than held in the treasury.
- **Outstanding shares** refer to the number of shares still in the hands of the stockholders and are computed as issued shares less treasury shares. Financial statistics such as earnings per share and book value per share use the number of outstanding shares for calculation purposes. In addition, cash dividends are paid only on outstanding shares, and only outstanding shares have voting rights.

Example 15.1 illustrates the relationship between these common stock terms.

EXAMPLE 15.1 Common Stock Terminology

PROBLEM: Retgo Corporation presents the following information in the footnotes to the financial statements:

Authorized shares	75,000
Issued shares	58,000
Shares held in the treasury	16,000

How many shares are outstanding? How many shares are unissued?

SOLUTION: Retgo has 42,000 shares outstanding—the 58,000 issued shares less 16,000 treasury shares. It has 17,000 shares unissued—the 75,000 authorized shares less 58,000 issued.

Legal Issues: Par and Stated Values

Several legal requirements impact the accounting for common stock. When a corporation is formed, the organizers designate the stock's par value, usually setting an immaterial amount such as 1 cent per share. The concept of par value dates back to when all firms were required to maintain a minimum amount of capital that they could not distribute to shareholders. Maintaining assets equal to the par value of its shares protected creditors in the event of liquidation. So, an original purchaser of the company's shares could be liable for any amounts contributed below par value in the event of corporate liquidation.

Although many states have repealed the minimum legal capital laws and permit the issuance of no-par stock, other states still require some form of legal capital. For example, legal capital can be par value, the total proceeds on original issue, or the **stated value**, which is an amount specified by the board of directors.⁵ In states requiring legal capital, a firm cannot distribute the amount designated as legal capital until it has settled all prior creditor claims.

Although the designation of par values is no longer required in some states, many currently outstanding common shares that were issued in previous years have a par value associated with them. As a result, firms continue to allocate the proceeds from a stock issuance to the stock's par value and any additional capital paid-in.

Accounting for Common Stock Issuances

While firms normally issue common stock for cash, it can also be issued for noncash consideration. We discuss the accounting for both types of issuances on the next page.⁶

⁵A stated value can be designated for no-par stock by resolution of the board of directors. The stated value is not as formal as par value and can be changed with another resolution by the board of directors. A change in stated value does not require shareholder approval and filings with the state as would be the case if par value were changed. Stated value functions in the same way as par value when accounting for the issuance of new equity shares.

⁶Firms can also issue common stock for stock subscriptions that are arrangements under which the corporation and future shareholders enter into a contract by which the corporation agrees to issue a fixed number of shares at a future specified date in exchange for a fixed or specified price.

Common Stock Issued for Cash. When issuing stock for cash, firms allocate the total proceeds to the par or stated value and the additional paid-in capital (that is, the amount paid in excess of par or stated value). If the shares have no par or stated value, firms record the total proceeds in the common stock account. For instance, *Snap Inc.* sold 160.3 million new shares of \$0.00001 par value common stock for \$17 per share at its initial public offering. *Snap* therefore allocated \$1,603 (160.3 million shares times \$0.00001 par value) to par value.⁷ The remaining amount increased additional paid-in capital. Example 15.2 illustrates accounting for the issuance of common stock with no par value.

EXAMPLE 15.2**Common Stock (with No Par Value) Issued for Cash**

PROBLEM: Piper Products decided to raise additional financing by issuing common stock. The company received \$4,000 in exchange for 1,000 shares of its no-par stock. What is the necessary journal entry to record this transaction?

SOLUTION: Because Piper's shares have no par value, it records the issuance of capital stock entirely in the common stock account.

<i>Account</i>	<i>Current Year</i>
Cash	4,000
Common Stock – No Par	4,000

Next, let's assume that Piper's common stock has a par value in Example 15.3.

EXAMPLE 15.3**Common Stock (with Par Value) Issued for Cash**

PROBLEM: Piper Products decided to raise additional financing by issuing common stock. The company received \$4,000 in exchange for 1,000 shares of \$1 par value common stock. What is the necessary journal entry to record this transaction?

SOLUTION: Piper allocates the \$4,000 total cash proceeds to the par value and the additional paid-in capital in excess of par – common. The 1,000 shares have a total par value of \$1,000 ($\$1 \times 1,000$ shares), and the additional paid-in capital in excess of par – common is \$3,000. The following journal entry records the stock issue.

<i>Account</i>	<i>Current Year</i>
Cash	4,000
Common Stock – \$1 par	1,000
Additional Paid-in Capital in Excess of Par – Common	3,000

Piper would make the same entry if the shares had a \$1 stated value.

Stock Issue Costs. In order to issue stock, companies typically incur costs related to legal and underwriting fees. Attorneys assist in the filing process with the SEC and the state of incorporation. Companies pay underwriting fees to investment banks or other financial institutions for the risk assumed by purchasing the securities directly from the issuing corporation. The underwriter buys the shares from the issuer net of the fee and then sells the shares in the market.

⁷Snap Inc. reports its financial statements in thousands of dollars. Therefore, it showed \$2,000 allocated to the par value of common stock, which is the \$0.00001 par value times 160.3 million shares rounded to the nearest thousand.

Firms treat these issue costs as a reduction of additional paid-in capital in excess of par. *Facebook*'s fees were about \$81 million on its initial stock issue. The firm sold its shares in the market for \$6.84 billion; the fees of \$81 million reduced *Facebook*'s proceeds to \$6.76 billion. Therefore, *Facebook* increased its equity by the \$6.76 billion net proceeds. Accounting for stock issue costs is illustrated in Example 15.4.

EXAMPLE 15.4 Common Stock Issue Costs

PROBLEM: Piper Products decided to raise additional financing by issuing common stock. The company received \$4,000 in exchange for 1,000 shares of \$1 par value common stock. Piper paid an underwriter \$200 in stock issue costs. What is the necessary journal entry to record this transaction?

SOLUTION: The \$200 of issue costs reduces Piper's cash received from the sale of the stock. Thus, it records the cash received at the net amount of \$3,800, which is the \$4,000 total proceeds less the \$200 stock issue costs. The issue costs also reduce the additional paid-in capital in excess of par—common by \$200. The journal entry follows.

<i>Account</i>	<i>Current Year</i>	
Cash	3,800	
Common Stock – \$1 par		1,000
Additional Paid-in Capital in Excess of Par – Common		2,800

Common Stock Issued for Noncash Consideration. Firms also issue common stock in exchange for noncash consideration. For example, an attorney could exchange legal services for common stock of the corporation that is receiving the service. In this case, how does the corporation determine the value of the shares issued to pay for the noncash consideration it receives in exchange?

Theoretically, the corporation should value the goods and services received at the fair value of the consideration given up in the exchange. The value given in exchange would be the fair value of the stock issued in the transaction that the firm “gave up” (its cost) to acquire the goods or services. In other words, the fair value of the shares issued is the cost of the goods and services received in exchange. Therefore, the corporation records the noncash assets or services at the fair value of the stock issued in the exchange. However, if the stock does not have a reliable fair value, the corporation uses the fair value of the consideration received—that is, the goods or services received—to value the shares issued. Example 15.5 provides an example of issuing common stock for noncash consideration.

EXAMPLE 15.5 Common Stock Issued for Noncash Consideration

PROBLEM: Bordeaux Pharmaceuticals issues common stock in exchange for legal services received. The common stock has a fair value of \$2,000 and a par value of \$600. What is the necessary journal entry to record this transaction?

SOLUTION: Because the fair value of the stock is known, Bordeaux debits the noncash consideration for \$2,000. It allocates the credit to the equity accounts of \$2,000 to common stock for \$600 par value and to \$1,400 additional paid-in capital in excess of par – common for the remainder (\$2,000 – \$600). The journal entry follows.

<i>Account</i>	<i>Current Year</i>	
Legal Fees Expense	2,000	
Common Stock		600
Additional Paid-in Capital in Excess of Par – Common		1,400

The determination of fair value in a transaction exchanging common stock for noncash consideration involves management's judgment. In some cases, the fair value of the stock or the non-cash consideration is apparent. However, in many situations it is not. For example, if the company issuing the stock is not publicly traded, the fair value of the stock may not be easily and reliably determined. Then we use the fair value of the services provided. If the services are provided on a regular basis, such as legal services, then the fair value is probably easy to determine by using the rate charged to other clients of the law firm. However, if the services provided are more customized, it may be difficult to determine a fair value. In these cases, management exercises judgment to determine an appropriate fair value at which to record the transaction.

Stock Splits

A **stock split** results in a proportionate increase in the number of equity shares and a proportionate decrease in the share's par value per share if the shares have a par value. For example, in a 2-for-1 split, a company gives an additional share of stock to a shareholder for each share held. If a shareholder held 100 shares of \$2 par value stock before a split, after the split, the shareholder would have 200 shares of \$1 par value stock. That is, the shareholder now has two shares after the split for every one share held before. When *Netflix, Inc.*, the worldwide Internet television network, split its common stock 7 for 1, its number of shares increased seven times to about 426.3 million from 60.6 million.⁸ Exhibit 15.3 presents a timeline depicting a 2-for-1 stock split.

EXHIBIT 15.3 Stock Split Timeline

Before the Stock Split	After the Stock Split
100 shares × \$ 2 par value per share <u>\$200</u> total par value	200 shares × \$ 1 par value per share <u>\$200</u> total par value

A company typically issues a stock split when it believes that its shares are trading at a price that is too high to attract a wider ownership base. Absent other reasons for the stock price to move, a 2-for-1 split would cause the new stock price to be one-half of the pre-split price.⁹ For example, if one share of a company's stock was trading for \$150 per share before a 2-for-1 split, then after the split, two shares will trade at \$75 per share (\$150 / 2 shares). Note that the shareholder, now owning two shares, still holds stock valued at \$150. The day before the *Netflix* 7-for-1 stock split, its stock was trading at \$702.60 per share. The day of the split, *Netflix* stock opened trading at about one-seventh the price per share at \$99.97 per share. A *Netflix* stockholder who held one share of stock before the split was holding seven shares of stock after the split with a total value of \$699.79.¹⁰ The total value is slightly lower likely due to new information about the company's future performance being priced.

A stock split affects the disclosures for stockholders' equity, but the firm does not record anything in the accounts. A memorandum (verbal) entry can be entered into the journal to note the stock split and the changes to the number of shares and par value per share. As noted earlier, if the stock has a par value, there is also a proportionate decrease in the par value of the stock at the individual share level. Example 15.6 illustrates the effects of a stock split on the number of shares outstanding, par value, and the book value of equity.

⁸Netflix stock split was effective on July 15, 2015.

⁹Note that management's decision to enact a stock split itself provides information to the market, thus typically causing a movement in stock price.

¹⁰A reverse stock split is used to increase share prices. For example, a 1-for-2 reverse split requires the investor to surrender two shares of common stock for one share of the new common equity security. An investor who originally paid \$1,250 per share for the two shares would now have one share with a cost of \$2,500. Companies may use a reverse stock split to raise the market price of their shares to avoid being delisted from a stock exchange or removed from a stock index. A reverse split can also be used to raise stock prices to avoid the market perception that the company's shares are "cheap" or "penny" stock.

EXAMPLE 15.6 Stock Split

PROBLEM: ASG Corporation issued 400,000 shares of \$2 par value stock. The book value of ASG's common stockholders' equity is equal to \$60 million. ASG implements a 2-for-1 stock split. What is the total number of shares outstanding after the stock split? What is the par value per share after the split? What is the book value of equity after the split?

SOLUTION: After the stock split, the total number of shares outstanding is 800,000, or 400,000 shares before the split times 2. The new par value is \$1 per share, or \$2 per share before the split divided by 2. There would be no change in the total book value of the firm. However, the stock split reduced the book value per share proportionately. Before the split, the book value per share is \$150 per share ($\$60,000,000 / 400,000$ shares), which is reduced to \$75 per share after the split. We summarize the effects of the stock split as follows:

Description	Before the 2-for-1 Split	After the 2-for-1 Split
Shares outstanding	400,000 shares	800,000 shares
Total par value	\$ 800,000	\$ 800,000
Par value per share	2	1
Total book value	60,000,000	60,000,000
Book value per share	150	75

- ③ Record treasury stock transactions, including repurchases, reissuance under the cost method, and retirement.

Accounting for Share Repurchase Transactions

Share repurchase transactions also impact stockholders' equity. When a company repurchases its shares, the company can hold these shares in treasury for future use or it can retire the shares. A treasury share is a corporation's own stock that is authorized, issued, and previously outstanding that the corporation buys back. Treasury shares are still considered issued shares. Retired shares are similar except that these shares are no longer considered issued, a topic we will revisit later in the chapter.

THE CONCEPTUAL FRAMEWORK CONNECTION Share Repurchase Transactions

The stockholders' equity topics in this chapter relate to FASB's conceptual framework's definitions of financial statement elements. Equity is "the residual interest in the assets of an entity that remains after deducting its liabilities."¹¹ The conceptual framework identifies investments by owners and distributions to owners as transactions that impact the equity of the firm directly. As a result, when a company purchases and sells treasury shares for amounts above and below cost, it does not report these "gains" and "losses" on the income statement. Rather, it reports them in the stockholders' equity section of the balance sheet because they are considered capital transactions.

Purpose of Share Repurchases

Usually, corporations intend to reissue treasury shares for some specific purpose. Some of the purposes of purchasing treasury shares follow.

- Treasury shares are used in stock option plans, stock bonus plans, and employee stock purchase plans.
- Treasury shares are used in exchange for another firm's voting shares in a merger or acquisition.
- Repurchase transactions are used to support the market price of the stock. By buying shares back from the market, there are fewer shares outstanding, raising the price per share and the earnings per share.
- Repurchase transactions are used to prevent takeover attempts. When shares are repurchased, the market price of the stock rises, increasing the cost of a takeover. In addition, if a sufficient number of shares are reacquired, major shareholders may have enough voting rights to control the corporation and directly prevent a takeover.

¹¹FASB, *Statement of Financial Accounting Concepts No. 6*, "Elements of Financial Statements" (Norwalk, CT: FASB, 1985).

- Repurchase transactions distribute cash to shareholders without formally increasing the cash dividend. A formal dividend increase would have to be continued in the future to avoid adverse stock price effects from the market's negative reaction to a cut in dividends. Rather than increasing dividends, a company can use share repurchases to distribute cash to shareholders.

For example, *Microsoft Corporation* uses share repurchases to obtain shares to be issued to satisfy stock option plan requirements and to distribute cash to shareholders. In fiscal 2016, *Microsoft* purchased 294 million of its shares for \$14.8 billion.

Accounting for Treasury Stock Transactions

Firms typically record treasury stock in a contra-stockholders' equity account and report treasury stock as a reduction of total stockholders' equity on the balance sheet. As noted earlier, the treasury shares reduce the number of shares outstanding. In addition, treasury shares do not have voting rights and cannot receive cash dividends. However, treasury shares do split and can receive stock dividends in some states.

The two methods of accounting for treasury stock are the *cost method* and the *par value method*. The **cost method** records the acquisition of treasury shares at the cost of the repurchased shares. The **par value method** records the acquisition at the par value of the repurchased shares. The cost method is the most popular method used in practice and will be covered in this chapter.¹²

Cost Method: Acquisition of Treasury Shares. Under the cost method, when a firm repurchases shares, it debits the treasury stock account for the cost of the repurchased shares. The repurchase of shares does not change the common stock account or the additional paid-in capital in excess of par – common account. The repurchased shares are still considered issued, but they are no longer outstanding.

Cost Method: Reissuance of Treasury Shares. A firm holding treasury stock usually reissues these shares at a selling price that is different from the acquisition cost. If the company sells the treasury shares at a price above cost, it classifies the excess over cost as additional paid-in capital from treasury stock transactions. Although this excess is similar to a gain, it should not be reported on the income statement because it results from a capital transaction.

To illustrate, we begin with a hypothetical example involving a company transacting with only one shareholder in Example 15.7.

EXAMPLE 15.7

Acquisition and Sale of Treasury Stock above Cost

PROBLEM: Small Corp. repurchases shares from a shareholder for \$1,000. Three months later, the shareholder buys the same shares back at \$1,100. What journal entries are required to record these transactions?

SOLUTION: The journal entry on the date of acquisition records the shares at cost in the treasury stock account.

Account	Date of Acquisition
Treasury Stock	1,000
Cash	1,000

The journal entry to record the resale of the stock removes the treasury stock account and records the excess of the sales price over the cost in the additional paid-in capital from treasury stock transactions account.

Continued

¹²AICPA, *U.S. GAAP Financial Statements Best Practices in Presentation and Disclosure – 2012* (New York, NY: AICPA, 2012) reports that less than 2% of companies that have treasury stock use the par value method. Note that the par value method is nearly identical to accounting for share retirements, which we cover in the next section.

<i>Account</i>	<i>Date of Reissue</i>	
Cash	1,100	
Treasury Stock		1,000
Additional Paid-in Capital from Treasury Stock Transactions		100

At the end of 3 months, the shareholder owns the same number of shares held prior to these transactions but paid \$100 more. This \$100 is simply additional paid-in-capital provided to Small Corp. by its shareholder and is not accounted for as a gain on sale.

Below-Cost Treasury Stock Reissue. Firms can also reissue treasury shares at a price that is below cost. In this case, the firm first reduces additional paid-in capital from treasury stock transactions by the amount that is below cost. If the firm has no additional paid-in capital from treasury stock transactions or its balance is less than the amount below cost, the remaining amount reduces retained earnings. This treatment is logical because additional paid-in capital cannot have a negative (or debit) balance. Although similar to a loss, this accounting does not affect the income statement because it results from a capital transaction as illustrated in Example 15.8. In substance, the difference between the cost and the reissue price is a cash distribution to stockholders similar to a dividend.

EXAMPLE 15.8 Sale of Treasury Stock below Cost

PROBLEM: Consider Small Corp. from Example 15.7. Now assume that at the end of 3 months, the shareholder buys the same shares back at \$800. Small Corp. has a zero balance in its additional paid-in capital from treasury stock transactions account. What is the journal entry to record this transaction?

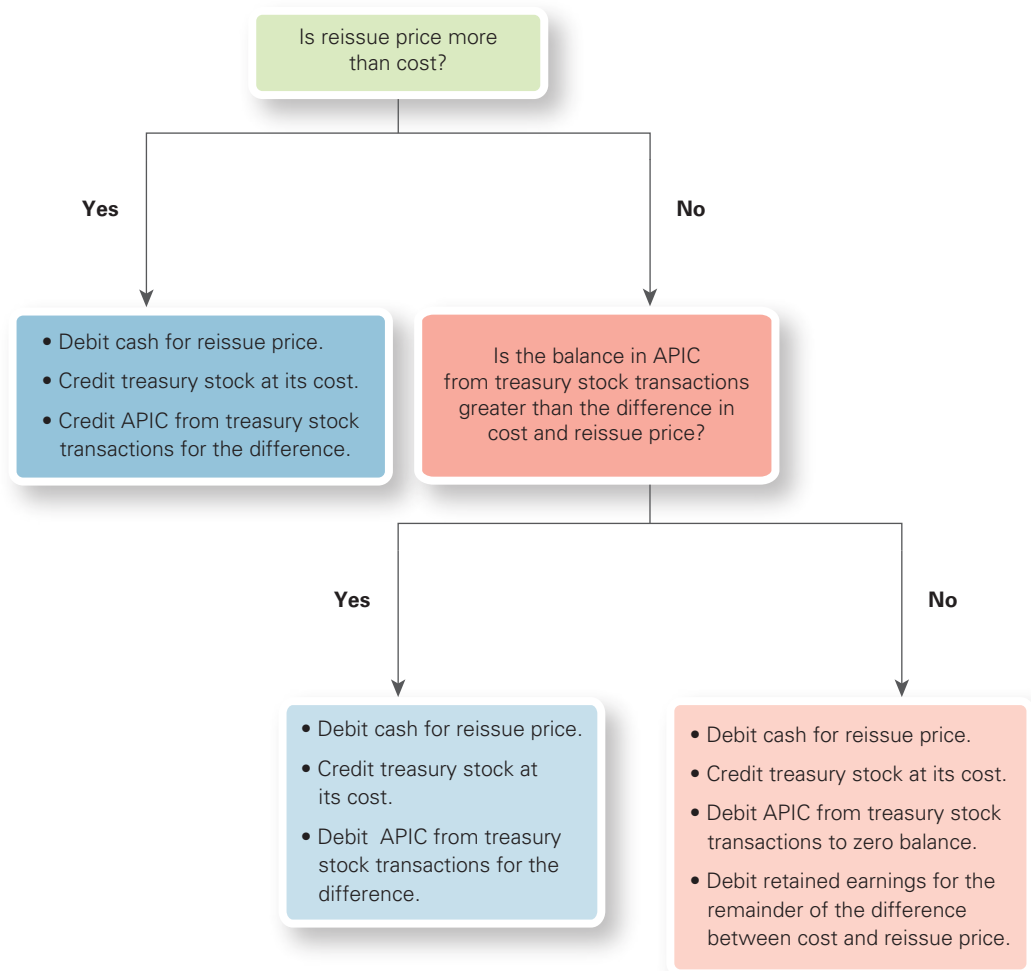

SOLUTION: The journal entry to record the resale of the stock reduces treasury stock by its cost and records the excess of the cost over the resale price as a reduction to the retained earnings account.

<i>Account</i>	<i>Date of Reissue</i>	
Cash	800	
Retained Earnings	200	
Treasury Stock		1,000

At the end of 3 months, the shareholder owns the same number of shares held prior to these transactions but now has \$200 in additional cash. This transaction is essentially a distribution to the shareholder.

Exhibit 15.4 outlines the process for accounting for the reissuance of treasury stock.

EXHIBIT 15.4 Accounting for the Reissuance of Treasury Stock

Example 15.9 provides a comprehensive illustration of accounting for treasury stock transactions under the cost method.

EXAMPLE 15.9 Comprehensive Illustration: Treasury Stock

PROBLEM: On February 16, Hollie Home Goods, Incorporated (HHG) acquired 5,000 shares of its own shares at a cost of \$40 per share. On April 29, HHG sold 2,000 of the 5,000 shares of its treasury stock for \$65 per share. On June 4, HHG sold the remaining 3,000 shares of treasury stock for \$10 per share. What are the necessary journal entries to record these transactions?

SOLUTION: At acquisition, HHG records the shares at cost ($5,000 \times \$40$) as shown in the following entry.

Account	February 16
Treasury Stock	200,000
Cash	200,000

Continued

On April 29, HHG sells the 2,000 shares for \$130,000 ($2,000 \times \65). The cost of these shares was \$80,000 ($2,000 \times \40). Because HHG sold the shares for \$50,000 above cost [$2,000 \text{ shares} \times (\$65 - \$40)$], we increase additional paid-in capital from treasury stock transactions.

Account	April 29
Cash	130,000
Treasury Stock	80,000
Additional Paid-in Capital from Treasury Stock Transactions	50,000

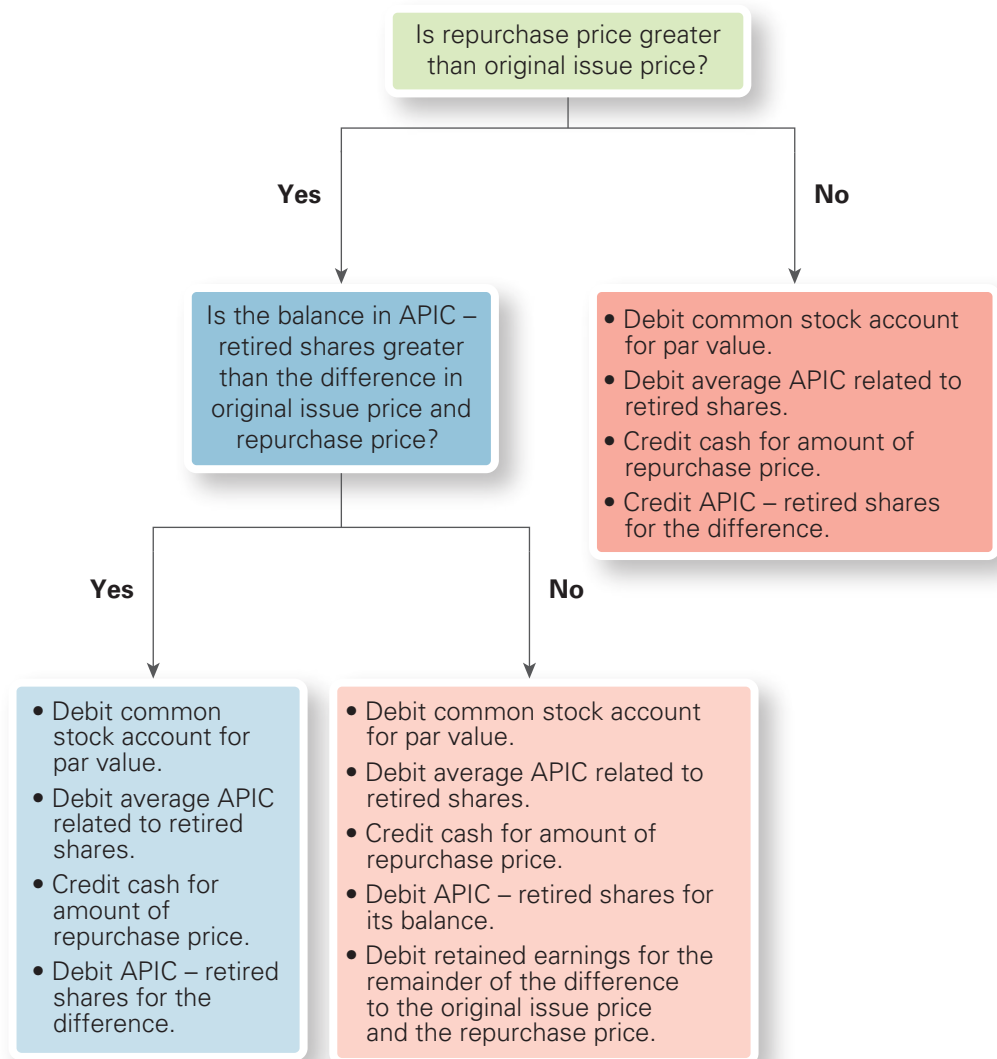

On June 4, HHG sold the remaining 3,000 shares for \$30,000 ($3,000 \times \10). The cost of these shares was \$120,000 ($3,000 \times \40). Because HHG sold the shares for \$90,000 below cost [$3,000 \times (\$10 - \$40)$], we first reduce additional paid-in capital from treasury stock transactions and then, if needed, retained earnings. The balance in the additional paid-in capital from treasury stock transactions is only \$50,000, so we first reduce this account to zero. Next, the \$40,000 remainder decreases retained earnings. The journal entry is as follows:

Account	June 4
Cash	30,000
Additional Paid-in Capital from Treasury Stock Transactions	50,000
Retained Earnings	40,000
Treasury Stock (3,000 shares at \$40 cost)	120,000

Accounting for Share Retirements

Firms may choose to retire their treasury shares. In this case, the shares are still considered authorized but now are classified as unissued. A firm accounts for a share retirement as if it were a final settlement with the original investors by removing the number of common shares retired from the accounts at par and eliminating the average additional paid-in capital related to the retired shares from the balance sheet. The sum of the par value and the average additional paid-in capital represents the original issue proceeds.

If the repurchase price is less than the original amount paid in, the firm credits the difference to additional paid-in capital – retired shares. Conversely, if the repurchase price is greater than the original issue's proceeds, the firm debits additional paid-in capital – retired shares. If this account is reduced to zero, the firm debits the remainder to retained earnings. For example, *Papa John's International*, the worldwide pizza company, retired \$530.1 million of stock it held as treasury stock during fiscal 2013. *Papa John's* decreased common stock at par by \$0.3 million, additional paid-in-capital in excess of par by \$156.4 million, and retained earnings by \$373.4 million. The debit to retained earnings indicates that the repurchase price was greater than the original proceeds and that there is an insufficient balance in additional paid-in capital – retired shares. Exhibit 15.5 outlines the process for accounting for share retirements.

EXHIBIT 15.5 Accounting for Share Retirements

Although the amount paid below (above) the original issue proceeds is similar to a gain (loss), these amounts are generated from capital transactions and, as a result, firms do not report them on the income statement. Rather, the amount paid above or below the original issue proceeds flows through the stockholders' equity section of the balance sheet. Example 15.10 illustrates accounting for share retirements.

EXAMPLE 15.10**Retired Shares**

PROBLEM: Neon Rainbow Company provides the following information regarding its most recent balance sheet.

Stockholders' Equity	
Common stock, \$2 par value, 500,000 shares authorized, 172,500 shares issued and outstanding	\$ 345,000
Additional paid-in capital in excess of par – common	1,207,500
Additional paid-in capital – retired shares	98,500
Retained earnings	<u>1,249,000</u>
Total stockholders' equity	<u>\$2,900,000</u>

Continued

Neon Rainbow acquired 20,000 shares of common stock in the open market at \$15 per share and retired the shares. What is the journal entry to record this transaction?

SOLUTION: The common shares have a \$2 par value and a \$7 average additional paid-in capital value (i.e., \$1,207,500 / 172,500 shares). So, we measure the original issue proceeds as \$9 per share (i.e., \$2 par value per share plus \$7 average additional paid-in-capital per share). Note that Neon Rainbow currently has a balance of \$98,500 in additional paid-in capital – retired shares.

In order to record this transaction, we remove the 20,000 shares from the common stock account at \$2 par value per share as well as the average additional paid-in capital in excess of par at \$7 per share. There is a \$120,000 “loss” on the retirement because the company paid \$300,000 to retire shares that generated only \$180,000 in cash at the time they were originally issued. Because the amount below cost is generated in a capital transaction, we cannot record the “loss” on the income statement. Rather, the amount below cost must be reported in the stockholders’ equity section of the balance sheet. Therefore, we first use the “loss” to reduce the balance of additional paid-in capital—retired shares (\$98,500) and charge the \$21,500 remainder (\$120,000 – \$98,500) to retained earnings.

<i>Account</i>	<i>Date of Repurchase</i>
Common Stock	40,000
Additional Paid-in Capital in Excess of Par – Common	140,000
Additional Paid-in Capital – Retired Shares	98,500
Retained Earnings	21,500
Cash	300,000

- 4 Describe preferred stock and its features; demonstrate the accounting for issuance, dividends, and consideration of potential debt features of preferred stock.

Accounting for Preferred Stock

Preferred stock is an equity security that has two common preferences over common stock. Specifically, preferred stock has priority over common shares in terms of receiving dividends and the right to claim assets in the event of liquidation. Most preferred stock is nonvoting. In this section, we examine the features of preferred stock, also called preferred shares, and discuss the accounting for this class of equity security.

THE CONCEPTUAL FRAMEWORK CONNECTION Preferred Stock

The distinction between debt and equity is an important concept underlying the accounting for preferred stock. The codification defines debt as “. . . a contractual obligation to pay money on demand or on fixed or determinable dates. . . .”¹³ However, hybrid securities that are financial instruments with characteristics of both debt and equity exist in practice but do not fit this formal definition of debt. For example, consider preferred shares, which are legally equity but offer the holder a fixed dividend, similar to debt interest. Are the preferred shares equity or a liability considering that these securities typically require payment of a fixed amount of dividends? As discussed later, this differentiation can often be quite complex. U.S. GAAP and IFRS offer differing interpretations regarding the proper classification of certain types of preferred shares on the balance sheet.

Overview of Preferred Stock

With a dividend preference, the firm must pay preferred shareholders before declaring any dividends to common shareholders. However, preferred shareholders have no right to dividends if the firm does not declare dividends for a given period. There is never a legal liability for the corporation to pay dividends unless the board of directors declares a dividend.

¹³From ASC Glossary, Financial Accounting Standards Board.

Preferred Stock versus Debt Financing. As noted earlier, preferred stock is generally nonvoting and pays a fixed dividend. The fixed dividend payment and the absence of voting rights make preferred shares similar to debt securities. Preferred stock provides certain advantages over debt and common equity financing for a corporation:

- Corporations that are held by only a few shareholders commonly issue nonvoting preferred shares to raise private equity capital without giving up control of the corporation.
- Preferred stock is less risky than debt for an issuing corporation because the corporation is not required to issue dividends to preferred shareholders, but interest payments to debt holders are mandatory to avoid default.

Nonetheless, preferred stock is not always advantageous with respect to taxation. Dividends paid to preferred shareholders are generally not tax deductible whereas debt interest is tax deductible for the corporation. Thus, corporations lose a valuable tax deduction when they issue preferred shares instead of debt.

Preferred Stock Par Values. Preferred stock par values can be significant, such as \$100 par value per share. The par values are higher than those used for common shares because firms usually pay preferred dividends as a fixed percentage of par value. For example, a 5% preferred share with a \$100 par value would pay an annual dividend of \$5. What if a preferred stock has no par value? Dividends in this case would be a fixed dollar amount per share. In the example above, no-par preferred shares could state a dividend as \$5 per share.

Accounting for the issuance of preferred stock is the same as accounting for common stock. Here, the firm separates the total cash proceeds received on issuance of preferred stock to par value and additional paid-in capital in excess of par – preferred as shown in Example 15.11.

EXAMPLE 15.11

Preferred Stock Issuance and Dividends

PROBLEM: On January 1, 2018, Koro Company issued 1,000 shares of 6%, \$100 par value preferred stock for \$130,000. The board of directors declared dividends on December 30, 2018. Koro paid the dividends on January 30, 2019. What journal entries are necessary to record these transactions?

SOLUTION: At the date of issuance, Koro records the preferred stock in equity in the same manner as a common stock issuance. That is, the company separates the total proceeds received to par value and additional paid-in capital in excess of par – preferred. The journal entry is as follows:

<i>Account</i>	<i>January 1, 2018</i>	
Cash	130,000	
Preferred Stock – 6%, \$100 Par		100,000
Additional Paid-in Capital in Excess of Par – Preferred		30,000

The dividend is 6% of the preferred stock par value or \$6,000 ($6\% \times \$100,000$ par value). The journal entries to record the declaration and payment of the dividends are as follows:

<i>Account</i>	<i>December 30, 2018</i>	
Dividends – Preferred	6,000	
Dividends Payable – Preferred		6,000

<i>Account</i>	<i>January 30, 2019</i>	
Dividends Payable – Preferred	6,000	
Cash		6,000

Features of Preferred Shares

Preferred stock may possess a number of different features. The most common features include the following:

- *Cumulative*
- *Participating*
- *Convertible*
- *Callable*
- *Redeemable*
- *Fixed dividend*

We discuss each of these features next.

Cumulative Preferred Shares. Cumulative preferred shares contain a provision stipulating that if the board of directors does not declare a dividend, the dividends accumulate. The accumulated dividends are referred to as **dividends in arrears**. The firm cannot pay dividends to common shareholders until it has paid all preferred dividends in arrears plus the current-year preferred dividends. However, corporations do not include dividends in arrears as a liability on the balance sheet because the dividends become a legal liability of the corporation only when they are declared. Because a corporation must pay dividends in arrears before paying dividends on common shares, it must disclose any arrearage in the financial statements. This important disclosure enables the common stockholders and potential investors in common stock to determine that they will not be entitled to dividends until all dividends in arrears are distributed to the preferred shareholders. Example 15.12 illustrates accounting for cumulative preferred shares.

EXAMPLE 15.12

Cumulative Preferred Shares

PROBLEM: On January 1, 2017, Koro Company issued 1,000 shares of 6%, \$100 par value, cumulative preferred stock for \$130,000. The board of directors did not declare dividends on these shares until December 16, 2021, at which time it declared dividends of \$30 per share. Therefore, dividends in arrears had accumulated since 2017. Koro paid the dividends in arrears and the regular preferred dividend for the current year on January 10, 2022. What journal entries and footnote disclosures are necessary to record these transactions?

SOLUTION: At the date of issuance, Koro records the preferred shares in equity in the same manner as a common share issuance. The journal entry is as follows:

Account	January 1, 2017	
Cash	130,000	
Preferred Stock – 6%, \$100 Par		100,000
Additional Paid-in Capital in Excess of Par – Preferred		30,000

Every year that the board of directors does not declare a dividend, the amount of dividends in arrears increases by \$6 per share, or a total of \$6,000 per year. Thus, Koro reports dividends in arrears in its footnote disclosures as follows:

Year	Dividends in Arrears Reported (Cumulative)
2017	\$ 6,000
2018	12,000
2019	18,000
2020	24,000

In 2021, Koro cannot distribute common dividends and the regular preferred dividend of \$6 per share until it pays the \$24,000 of dividends in arrears. Koro must disclose this fact to current and potential investors. Again, the amount of dividends in arrears is not a legal liability until the board of directors declares dividends. The current-year preferred dividend is \$6,000 so that the total dividend distribution is \$30,000 in 2021, the \$24,000 dividends in arrears plus the \$6,000 current-year dividend.

The journal entries to record the declaration and payment of the dividends are as follows:

Account	December 16, 2021	
Dividends – Preferred	30,000	
Dividends Payable – Preferred		30,000

Account	January 10, 2022	
Dividends Payable – Preferred	30,000	
Cash		30,000

Participating Preferred Shares. Participating preferred shares contain a provision requiring preferred shareholders to share ratably in distributions with common shareholders. The additional dividends distributed from the participation occur most often when dividends to common shareholders exceed the percentage stated for the preferred shares.¹⁴ For example, assume that a company has 6% participating preferred shares. If the company pays common shareholders dividends that are 8% of common par value, it must also distribute an additional dividend to the preferred shareholders equal to 2% of preferred par.

Convertible Preferred Shares. Convertible preferred shares allow the shareholder to convert its shares to common shares at a predetermined rate or exchange ratio. Convertible preferred shareholders carry the same preferences as non-convertible preferred stock; however, they may also convert to common shares. The conversion feature enables preferred shareholders that convert to common stock to participate in voting rights, not to be limited to the fixed dividend return of preferred shares.

U.S. GAAP accounts for the issuance of convertible shares in the same way as non-convertible preferred shares. Accounting for convertible preferred shares is illustrated in Example 15.13.

EXAMPLE 15.13

Convertible Preferred Shares

PROBLEM: On January 1, 2017, Koro Company issued 1,000 shares of \$70 par value, convertible preferred shares for \$100,000. Each preferred share is convertible into one share of \$1 par common stock. On June 15, 2019, all preferred shareholders converted their shares into common stock. What are the necessary journal entries to record these transactions?

SOLUTION: We treat the preferred share issuance as any issue of equity shares by separating the proceeds to par value of \$70,000 ($\$100,000 \times \70 par value per share) and to additional paid-in capital in excess of par – preferred of \$30,000 ($\$100,000 - \$70,000$ preferred stock at par).

Account	January 1, 2017	
Cash	100,000	
Convertible Preferred Stock – Par		70,000
Additional Paid-in Capital in Excess of Par – Preferred		30,000

Continued

¹⁴There are other types of participation provisions. For example, preferred shares can be partially or fully participating. Partial participation places a ceiling on the amount of sharing whereas full participation allows the preferred stock to share an equal percentage of par value with common stock. Alternatively, preferred shares can receive their fixed dividend and then share the remaining dividend amount with common shareholders based on the ratio of par value or some other allocation method.

When the shares are converted, Koro removes the accounts related to the preferred shares and credits the common stock account for par value and additional paid-in capital in excess of par – common for the remainder.

Account	June 15, 2019	
Convertible Preferred Stock	70,000	
Additional Paid-in Capital in Excess of Par – Preferred	30,000	
Common Stock – Par		1,000
Additional Paid-in Capital in Excess of Par – Common		99,000

The debits to the convertible preferred stock and additional paid-in-capital in excess of par-preferred accounts remove the book value of the preferred shares whereas the credits to common stock and the additional paid-in-capital in excess of par – common represent the transfer of the preferred book value into the common stock accounts.

Immediately prior to its initial public offering, preferred shareholders at *LinkedIn* converted about 45.6 million preferred shares carried at \$103,827,000 to common shares. *LinkedIn* decreased preferred stock by \$103,827,000 and increased its common stock par value by \$5,000 with the remaining \$103,822,000 increasing additional paid-in capital.

Callable Preferred Shares. **Callable preferred shares** are shares for which the issuing entity has the right to call (in essence, buy back) the shares at a specified price and future date. Firms account for callable preferred shares in the same way as they do non-callable preferred shares. When the firm calls the shares, it must pay any dividends in arrears to the preferred shareholders. The company has the right to call the shares, so callable preferred shares are classified as equity. That is, because the payment is under the control of the issuing corporation, callable preferred shares are not classified as debt. Accounting for callable preferred shares is illustrated in Example 15.14.

EXAMPLE 15.14 Callable Preferred Shares

PROBLEM: On January 1, 2018, Koro Company issued 1,000 shares of \$70 par callable preferred shares for \$100,000. According to the preferred share agreement, Koro has the right to call these preferred shares on January 1, 2020, for \$100 per share. On January 1, 2020, Koro calls the shares. What are the necessary journal entries to record these transactions?

SOLUTION: Koro records the preferred share as a regular issue of shares by separating the proceeds to par value and additional paid-in capital in excess of par – preferred.

Account	January 1, 2018	
Cash	100,000	
Preferred Stock – Par		70,000
Additional Paid-in Capital in Excess of Par – Preferred		30,000

When Koro calls the shares, it removes the accounts related to the preferred shares and credits cash for the \$100,000 paid to call the shares.

Account	January 1, 2020	
Preferred Stock – Par	70,000	
Additional Paid-in Capital in Excess of Par – Preferred	30,000	
Cash		100,000

Mandatorily Redeemable Preferred Shares. Shareholders can redeem **redeemable preferred shares** at certain dates or upon the occurrence of certain events. Redeemable preferred shares can be *mandatorily redeemable* or *non-mandatorily redeemable*. **Mandatorily redeemable preferred shares** are preferred shares for which redemption is certain at a specified price on a specified date. The certain event that causes mandatory redemption can be the passage of time or the occurrence of a specific event, such as the death of a corporate officer.

U.S. GAAP treats mandatorily redeemable shares as a liability. The definition of a liability is a probable future sacrifice of economic benefits arising from present obligations of a particular entity to transfer assets or provide services to other entities in the future as a result of past transactions or events. Mandatorily redeemable shares contain a contractual obligation to disburse cash resulting from the right of the holder to demand payment and the fact that the exercise of that right is certain to occur. The requirement to disburse cash is outside the control of the issuing corporation, making these securities debt, not equity. Example 15.15 illustrates accounting for mandatorily redeemable preferred shares.

EXAMPLE 15.15

Mandatorily Redeemable Preferred Shares

PROBLEM: Tortoise Company issues 5,000 shares of \$80 par preferred stock for \$420,000. Tortoise must buy back the preferred stock in 5 years. Should Tortoise classify this preferred stock as a liability or equity? What is the required journal entry?

SOLUTION: Tortoise classifies this preferred stock as a liability because it contains a contractual obligation to disburse cash.

<i>Account</i>	<i>At Issuance</i>
Cash	420,000
Obligation Related to Mandatorily Redeemable Preferred Shares	420,000

Non-mandatorily redeemable preferred shares are preferred shares that can be redeemed at the option of the shareholder, but that option may not be exercised with certainty. For example, in the case of non-mandatorily redeemable preferred shares with an option to convert into common stock, the preferred shareholders may convert into common stock before the possible redemption dates. U.S. GAAP reports non-mandatorily redeemable preferred shares as equity because the preferred shares may not be redeemed as illustrated in Example 15.16.

EXAMPLE 15.16

Non-Mandatorily Redeemable Preferred Shares

PROBLEM: Porpoise Company issues 7,000 shares of \$60 par preferred stock for \$450,000. It is not required to buy back the preferred stock. However, the preferred stock includes a redemption feature that gives the holder the option to redeem the shares for cash at specified dates. Should Porpoise classify this preferred stock as a liability or equity?

SOLUTION: Because the preferred shares give the holder the option to redeem, they are not mandatorily redeemable. Therefore, Porpoise classifies the preferred stock as equity.

Fixed-Dividend Preferred Shares. **Fixed-dividend preferred shares** are preferred shares whose dividend is fixed and payment is required. The fixed dividend is a contractual obligation to pay cash (or some other asset) to the holder. Even though fixed-dividend preferred shares have characteristics of both debt and equity, firms do not separately evaluate the accounting for the shares and dividends: The entire proceeds are treated as equity at issuance. Dividends are a reduction of equity. Example 15.17 illustrates accounting for fixed-dividend preferred shares.

EXAMPLE 15.17 Fixed-Dividend Preferred Shares

PROBLEM: Doug Hunt Company issued \$10,000,000 of preferred stock at par on January 1, 2018. The preferred stock has a 6% fixed annual cash dividend and no maturity date. Doug Hunt can repay the preferred shares at any time. The current market interest rate is 6%. What is the journal entry when the firm issues the preferred shares?

SOLUTION: Because Doug Hunt can repay the preferred shares at any time, the preferred shares are not mandatorily redeemable. Therefore, Doug Hunt classifies the entire proceeds as equity with the following journal entry.

Account	January 1, 2018	
Cash	10,000,000	
Preferred Stock (Equity)		10,000,000

Accounting for Preferred Shares: IFRS. U.S. GAAP and IFRS account for certain types of preferred stock differently. The differences primarily relate to preferred stock with features of equity and debt. Under IFRS, firms separate the debt features and report them as a liability. We discuss the areas of differences next.

1. *Convertible preferred shares.* IFRS classification depends on the terms of the conversion feature. If there is a fixed number of shares to be delivered upon conversion, the shares are classified as equity. Otherwise, the shares are classified as debt.
2. *Non-Mandatorily redeemable preferred shares.* Under IFRS, when the preferred stockholder has the option to require redemption, the firm reports redeemable preferred shares as a liability. Here, the company may not be able to avoid paying cash, so it reports the preferred stock as a liability. In this case, the possible requirement to distribute cash is not under the control of the issuing corporation.
3. *Fixed-Dividend preferred shares.* Under IFRS, the shares are classified as a liability because there is a contractual obligation and a fixed payment is required.

Example 15.18 illustrates accounting for non- mandatorily redeemable preferred shares under IFRS.

EXAMPLE 15.18 Non-Mandatorily Redeemable Preferred Shares—IFRS

PROBLEM: Porpoise Company issues 7,000 shares of \$60 par preferred stock for \$450,000. Porpoise is not required to buy back the preferred stock. However, the preferred stock includes a redemption feature that gives the holder the option to redeem the shares for cash at specified dates. Should Porpoise classify this preferred stock as a liability or equity under IFRS?

SOLUTION: IFRS classifies the preferred stock as a liability because Porpoise has a contractual obligation to pay cash upon the shareholders' request. Although not mandatorily redeemable, the company is obligated by contract to pay cash at the shareholders' option.

TD Bank, a Canadian bank and IFRS reporter, has issued both mandatorily and non-mandatorily redeemable preferred stock. **TD Bank** reported a 27 million Canadian dollar (CAD) liability for the mandatorily redeemable preferred stock that is convertible at the holder's option on its fiscal 2013 balance sheet. **TD Bank** also reported CAD\$3,395 million of preferred stock in equity related to its preferred stock that is not mandatorily redeemable or convertible.

Exhibit 15.6 on the next page summarizes the various features of preferred stock and accounting for them under U.S. GAAP and IFRS.

EXHIBIT 15.6 Features of Preferred Stock and Accounting: U.S. GAAP and IFRS

Type of Preferred Shares	Description	Accounting under	
		U.S. GAAP	IFRS
Cumulative	Preferred shares with a provision stipulating that if the board of directors does not declare a dividend, the dividends accumulate.	Track the amount of dividends in arrears. Any dividend declared first goes to reduce the amount of dividends in arrears.	Similar to U.S. GAAP.
Participating	Preferred shares with a provision requiring that preferred shareholders share ratably in distributions with common shareholders.	Any dividend declared first goes ratably to preferred shareholders.	Similar to U.S. GAAP.
Convertible preferred shares	These preferred shares allow shareholders to convert their shares to common shares at a predetermined rate or exchange ratio.	Classified as equity.	If there are a fixed number of shares to be delivered, classify as equity. Otherwise, classify as debt.
Callable preferred shares	Preferred shares for which the issuing entity has the right to call (buy back) the shares at a specified price and future date.	Classified as equity.	Similar to U.S. GAAP.
Mandatorily redeemable	Preferred shares that shareholders will redeem at certain dates or upon the occurrence of certain events.	Classified as liability.	Similar to U.S. GAAP.
Non-Mandatorily redeemable	Preferred shares that can be redeemed at the option of the shareholder. That option may not be exercised with certainty.	Classified as equity.	Classified as liability when the holder has the option to redeem the shares.
Fixed-Dividend preferred shares	Preferred shares with the dividend fixed and the payment required.	Classified as equity.	Classified as liability.

- 5 Explain the accounting for retained earnings, including dividends and prior-period adjustments.

Accounting for Retained Earnings

We now address retained earnings, the second component of stockholders' equity, which represents the cumulative earnings of the firm that it has not distributed as dividends. Thus, retained earnings are amounts *earned* by the firm, as opposed to contributed capital, which are amounts *invested* by the equity holders of the firm.

Net income (loss) and dividends are the most common events that affect retained earnings. However, other transactions, such as the sale of treasury stock below cost, can affect retained earnings. In this section, we discuss the impact of accounting for dividends on retained earnings. In addition, we discuss *prior-period adjustments*, which affect retained earnings and current-period income and dividends.

Types of Dividends

Dividends represent a return to shareholders on their investment in the corporation. **Cash dividends**, distributions that firms make to the shareholders in cash, are the most common type of dividend. However, there are other types of dividends, namely *stock dividends*, *property dividends*, and *liquidating dividends*.

- **Stock dividends** are distributions in the form of the firm's own equity shares.
- **Property dividends** are distributions of any asset other than cash (e.g., inventory or investments in shares of other entities) that firms make. Cash, stock, and property dividends are all distributed from retained earnings.
- **Liquidating dividends** are any distribution that the firm pays from contributed capital instead of retained earnings.

Because of the rarity in practice of property and liquidating dividends, we focus on cash and stock dividends in this chapter.¹⁵

¹⁵Of 500 surveyed companies, only 1 distributed property dividends, and 2 distributed stock dividends. From AICPA, *U.S. GAAP Financial Statements Best Practices in Presentation and Disclosure – 2012* (New York, NY: AICPA, 2012).

Accounting for Cash Dividends

There are four key dates involved with a cash dividend:

1. *Declaration date*
2. *Record date*
3. *Ex-Dividend date*
4. *Payment date*

On the **declaration date**, the date on which the board of directors declares the dividend and the firm records a legal liability for the dividend, the company records the dividend with a debit to the dividends account and a credit to dividends payable. The dividends account is closed to the retained earnings account at the end of the period when the company prepares financial statements. On the **record date**, the firm determines the registered stockholders, and only these stockholders receive the cash dividend. No formal accounting entry is made on the date of record.

The **ex-dividend date**, which is determined by the relevant stock exchange once the company has announced the record date, is generally set as 2 business days before the record date. An investor who purchases the stock on its ex-dividend date or after will not receive the dividend. This 2-day difference between record date and ex-dividend date allows time for stock transactions to clear and settle. Again, no formal accounting entry is made on the ex-dividend date. Finally, the **payment date** is the date that the firm actually distributes the dividend. The company removes the dividends payable account from the books at this time and credits cash for the amount of the payment. Example 15.19 illustrates accounting for a cash dividend.

EXAMPLE 15.19 Cash Dividend

PROBLEM: Collins, Inc. declared a cash dividend of \$3,000 on June 1, 2018. It sets the record date as June 17, 2018, the ex-dividend date as June 15, 2018, and the payment date as July 7, 2018. What journal entries are necessary to record this dividend?

The timeline related to the cash dividend declaration and payment follows.

Date of Declaration June 1, 2018	Ex-dividend Date June 15, 2018	Date of Record June 17, 2018	Payment Date July 7, 2018
Legal liability incurred	Stock bought on this date or later will not receive the dividend	Ownership determined at the close of business	Liability paid

SOLUTION: On the declaration date, Collins must record a liability for the dividend because it is then legally obligated to distribute the \$3,000 amount to shareholders. Collins reduces retained earnings by this amount via the dividends – common account because firms distribute all dividends (except liquidating dividends) from retained earnings. The journal entry is as follows:

Account	June 1, 2018
Dividends – Common	3,000
Dividends Payable	3,000

There are no formal accounting entries on the date of record and the ex-dividend date. On the date of payment, Collins records the dividend payment in the same way as the payment of other liabilities by debiting the payable and crediting cash.

Account	July 7, 2018
Dividends Payable	3,000
Cash	3,000

Johnson & Johnson regularly pays quarterly cash dividends. In the third quarter on October 20, 2016, its board declared dividends of \$0.80 per share. The ex-dividend date was November 18, and date of record was November 22. **Johnson & Johnson** paid the dividend on December 6.¹⁶ In fiscal 2016, **Johnson & Johnson** paid cash dividends of \$3.15 per share totaling \$7.8 billion.

Accounting for Stock Dividends

Instead of a cash dividend, a company may declare a stock dividend to provide a return to shareholders. Stock dividends can also be used to supplement a cash dividend without increasing cash dividends. Unlike cash dividends, when a board of directors declares a stock dividend, it is not under any legal obligation to distribute the dividend. Thus, firms do not increase a liability account when declaring a stock dividend.

Stock dividends affect the components of stockholders' equity but do not change the total equity balance. Retained earnings are decreased and contributed capital is increased by the amount of the stock dividend. Thus, the stock dividend permanently capitalizes retained earnings by transferring amounts from retained earnings to contributed capital. The amount of the transfer from retained earnings to contributed capital depends on the size of the dividend.

Small (Ordinary) Stock Dividend. A stock dividend is considered a **small stock dividend** if the number of shares issued does not exceed 20% to 25% of the previously outstanding shares. Unless there is evidence to the contrary, the accountant assumes that a dividend of this size would not have a material, negative effect on the market price per share of the stock when the additional shares are distributed. Accounting for small stock dividends involves the following steps:

1. Value the dividend at the market price at the date of declaration.
2. On the date of declaration, increase the dividends account by the dividend at market value, which will ultimately be closed to retained earnings.
3. Increase the common stock dividends distributable account for the par value of the stock dividend. This account is a capital stock account.
4. Increase the additional paid-in-capital in excess of par – common account for the difference between the market value and the par value of the stock to be distributed.
5. When the dividend is distributed, remove the common stock dividends distributable account with a debit and credit the common stock account.

At the end of the period, the dividends account is closed to retained earnings. An example of accounting for a small stock dividend is provided in Example 15.20.

EXAMPLE 15.20

Small Stock Dividend

PROBLEM: Wallace Company reported the following stockholders' equity section in its most recent balance sheet.

Stockholders' Equity	Balance
Common Stock (\$1 par, 2,000,000 shares authorized, 1,345,000 shares issued, 1,300,000 shares outstanding)	\$ 1,345,000
Additional Paid-in Capital in Excess of Par – Common	<u>12,105,000</u>
Total Contributed Capital	\$13,450,000
Retained Earnings	<u>12,550,000</u>
Total Contributed Capital and Retained Earnings	\$26,000,000
Less: Cost of Treasury Stock (45,000 shares)	<u>(1,800,000)</u>
Total Stockholders' Equity	<u>\$24,200,000</u>

Wallace Company declared a stock dividend of 195,000 shares on a date when the firm's common stock was selling for \$15 per share. The shares issued to satisfy the stock dividend

Continued

¹⁶See <http://www.investor.jnj.com/divhistory.cfm> for Johnson & Johnson's dividend history.

are newly issued shares, not treasury shares, and the treasury shareholders are not entitled to the stock dividend. Provide the journal entries at the declaration date and the issue date. Prepare the stockholders' equity section of the balance sheet after the issuance of the dividend.

SOLUTION: Wallace accounts for this stock dividend as a small dividend because it is 15% of outstanding shares computed as follows.

Common shares issued	1,345,000
Less: Treasury shares	<u>(45,000)</u>
Common shares outstanding	<u>1,300,000</u>
Shares issued	195,000
Divided by: Common shares outstanding	<u>1,300,000</u>
Percentage	<u>15%</u>

Thus, Wallace will transfer the \$2,925,000 market value of the stock (195,000 shares × \$15 per share) from retained earnings to contributed capital. Wallace makes the following journal entries to account for the stock dividend. Keep in mind that the dividends account will be closed to retained earnings at year-end.

Account	Date of Declaration
Dividends	2,925,000
Common Stock Dividends Distributable	195,000
Additional Paid-in-Capital in Excess of Par – Common	2,730,000

On the distribution date, Wallace makes the following entry:

Account	Date of Distribution
Common Stock Dividends Distributable	195,000
Common Stock – Par	195,000

The stockholders' equity section after the declaration and issuance of the small stock dividend follows.

Stockholders' Equity	Balance
Common Stock (\$1 par, 2,000,000 shares authorized, 1,540,000 shares issued, and 1,495,000 shares outstanding)*	\$ 1,540,000
Additional Paid-in Capital in Excess of Par – Common**	<u>14,835,000</u>
Total Contributed Capital	\$ 16,375,000
Retained Earnings***	<u>9,625,000</u>
Total Contributed Capital and Retained Earnings	26,000,000
Less: Cost of Treasury Stock (45,000 shares)	<u>(1,800,000)</u>
Total Stockholders' Equity	<u>\$24,200,000</u>

*Common stock increased by \$195,000.

**Additional paid-in capital increased by \$2,730,000.

***Retained earnings decreased by \$2,925,000.

Large Stock Dividend. A stock dividend is considered a **large stock dividend** if the number of shares issued is more than 20% to 25% of the previously outstanding shares. Unless there is evidence to the contrary, the accountant assumes that a dividend of this size would materially reduce the market price per share of the stock when the additional shares are distributed. Therefore, the value given to the shareholder is not known, but the dividend cannot be accounted for at below minimum legal capital. As a result, the dividend is accounted for at the par value of the stock.¹⁷

¹⁷Large stock dividends are sometimes accounted for as a stock split. For example, a 50% stock dividend would be treated the same as a 3-for-2 split.

Accounting for large-stock dividends involves the following steps:

1. When declaring a large stock dividend, debit dividends for the par value of the stock.
2. Credit common stock dividends distributable, an equity account, for the par value of the stock.
3. When distributing the stock dividend, reduce the common stock dividends distributable and increase common stock at par.

As dividends are closed out to retained earnings, a large stock dividend also permanently transfers retained earnings to contributed capital. Example 15.15 shows the accounting for a large stock dividend.

EXAMPLE 15.21 Large Stock Dividend

PROBLEM: Wallace Company reported the following stockholders' equity section in its most recent balance sheet.

Stockholders' Equity	Balance
Common Stock (\$1 par, 2,000,000 shares authorized, 1,345,000 shares issued, 1,300,000 shares outstanding)	\$ 1,345,000
Additional Paid-in Capital in Excess of Par – Common	12,105,000
Total Contributed Capital	\$13,450,000
Retained Earnings	12,550,000
Total Contributed Capital and Retained Earnings	\$26,000,000
Less: Cost of Treasury Stock (45,000 shares)	(1,800,000)
Total Stockholders' Equity	<u>\$24,200,000</u>

Wallace Company declared a stock dividend of 390,000 shares on a date when the firm's common stock was selling for \$15 per share. The shares issued to satisfy the stock dividend are newly issued shares, not treasury shares, and the treasury shares are not entitled to the stock dividend. Provide the journal entries at the declaration date and the issue date. Prepare the stockholders' equity section of the balance sheet after the issuance of the dividend.

SOLUTION: Wallace accounts for this stock dividend as a large dividend because it is 30% of outstanding shares.

Common shares issued	1,345,000
Less: Treasury shares	(45,000)
Common shares outstanding	<u>1,300,000</u>
Shares issued	390,000
Divided by: Common shares outstanding	<u>1,300,000</u>
Percentage	<u>30%</u>

Thus, Wallace will transfer the \$390,000 par value of the stock (390,000 shares × \$1 par value per share) to common stock at par. Wallace makes the following journal entries to account for the stock dividend. Keep in mind that the dividends account will be closed to retained earnings at year-end.

Account	Date of Declaration
Dividends	390,000
Common Stock Dividends Distributable	390,000

Continued

Account	Date of Distribution
Common Stock Dividends Distributable	390,000
Common Stock – Par	390,000

The stockholders' equity section after the declaration and issuance of the large stock dividend follows.

Stockholders' Equity	Balance
Common Stock (\$1 par, 2,000,000 shares authorized, 1,735,000 shares issued, 1,690,000 shares outstanding)*	\$ 1,735,000
Additional Paid-in Capital in Excess of Par – Common	12,105,000
Total Contributed Capital	\$13,840,000
Retained Earnings**	12,160,000
Total Contributed Capital and Retained Earnings	\$26,000,000
Less: Cost of Treasury Stock (45,000 shares)	(1,800,000)
Total Stockholders' Equity	<u>\$24,200,000</u>

*Common stock increased by \$390,000.

**Retained earnings decreased by \$390,000.

JUDGMENTS IN ACCOUNTING

Stock Dividends

Because FASB does not specify an exact percentage cutoff to distinguish small stock dividends from large stock dividends, there is some room for judgment in accounting for stock dividends. The difference in accounting for small stock dividends and large stock dividends affects the balance in the retained earnings account and, thus, investors may be influenced by the accounting treatment. In addition, possible violation of restrictive debt covenants can occur if retained earnings fall below a specified level, resulting in technical default.

Consider Wallace Company from Examples 15.20 and 15.21. Assume the stock dividends in Examples 15.20 and 15.21 did not occur. Now assume that Wallace Company declared a stock dividend of 300,000 shares, which represents 23% of the current outstanding shares. If Wallace accounts for this transaction as a small stock dividend, it makes the following entries:

Account	Date of Declaration
Dividends	4,500,000
Common Stock Dividends Distributable	300,000
Additional Paid-in Capital in Excess of Par – Common	4,200,000

Account	Date of Distribution
Common Stock Dividends Distributable	300,000
Common Stock – Par	300,000

Thus, after closing its books, Wallace will have a retained earnings balance of \$8,050,000 (\$12,550,000 beginning balance less dividends of \$4,500,000).

If Wallace accounts for the transaction as a large stock dividend, it will make the following entries:

Account	Date of Declaration
Dividends	300,000
Common Stock Dividends Distributable	300,000

<i>Account</i>	<i>Date of Distribution</i>
Common Stock Dividends Distributable	300,000
Common Stock – Par	300,000

Thus, after closing its books, Wallace will have a retained earnings balance of \$12,250,000 (\$12,550,000 beginning balance less dividends of \$300,000). Consequently, Wallace reports a retained earnings balance that is \$4,200,000 larger under the large dividend approach than under the small dividend approach. This difference is substantial because this involves only a financial reporting choice, not a difference in the underlying transaction.

Prior-Period Adjustments

From time to time, companies uncover errors in their financial statements. If the company discovers the error *before* releasing the financial statements, the correction is straightforward: The company makes the correction prior to release of the financial statements. However, if a company finds an error *after* releasing the financial statements, it must determine whether corrections to past years' financial statements are necessary. This correction of prior-period financial statements is called a **prior-period adjustment**.

Firms are only required to report material errors that would influence the economic decisions of financial statements users. Errors corrected using a prior-period adjustment include mathematical mistakes and incorrect application of accounting standards.¹⁸ For instance, a company could make a mathematical error in the calculation of its bad debt expense.

The accounting method used to correct an error depends on when the firm made the error. Companies commonly report 1 or 2 years of prior years' financial statements to enhance comparability. For example, in the 2019 annual report, a company provides income statements for 2019, 2018, and 2017 and balance sheets for 2019 and 2018. If the error was made in one of these prior-year financial statements (2018 or 2017) that are presented with the current-year financial statements, the firm retroactively changes relevant financial statement line items and includes a disclosure in the footnotes explaining the error in the 2019 annual report. A **retroactive adjustment** correctly recognizes, measures, and provides disclosures as if the error never occurred. Correcting financial statements in this way is also referred to as a restatement.

If the error occurred in any year that is not included in the comparative statements in the annual report, the firm makes a prior-period adjustment by:

1. Correcting the appropriate balance sheet accounts in the earliest balance sheet presented.
2. Reporting any income effects in retained earnings, net of tax, as of the beginning of the first period presented in the comparative statements.
3. Reporting correct balance sheet amounts in the current and all future periods.

For example, assume that a company discovers in 2019 that it failed to record depreciation expense on its trucks in 2016. To make the prior-period adjustment in 2019, the company reports comparative balance sheets for 2018 and 2019. So, it adjusts the 2018 beginning balances of its fixed assets and retained earnings, which will then affect the beginning balances of these accounts for fiscal 2019.

Stein Mart, Inc., a large U.S. retailer, made a prior-period adjustment for errors made with regard to inventory markdowns, leasehold improvement costs, compensated absences (paid vacation), and other items in fiscal 2012. **Stein Mart** reported 3 years of income and changes in stockholders' equity, so it adjusted fiscal 2010 and 2011 income and the beginning retained earnings of fiscal 2010. The prior-period adjustment decreased 2010 beginning retained earnings by \$17 million, or about 9%. The adjustment increased **Stein Mart's** 2010 and 2011 earnings by \$0.1 million and \$7.9 million, respectively. Example 15.22 illustrates accounting for a prior-period adjustment.

¹⁸For the relevant authoritative literature for prior-period adjustments, see FASB ASC 250, *Accounting Changes and Error Corrections* for U.S. GAAP and IASC, *International Accounting Standard 8*, "Accounting Policies, Changes in Accounting Estimates and Errors" (London, UK: International Accounting Standards Committee, Revised, 20XX) for IFRS.

EXAMPLE 15.22 Prior-Period Adjustment

PROBLEM: As Merrilee Fashions was preparing its 2018 financial statements, it discovered an error in its 2015 financial statements: Merrilee had not recorded a \$50,000 sale on both its books and tax returns. As a result, the firm understated sales and accounts receivable in 2015. Merrilee never collected the receivable but is seeking payment from the customer. Merrilee has a constant tax rate of 40% and reports 3 years of comparative income statements and 2 years of comparative balance sheets with its financial reports. What is the necessary journal entry to record the prior-period adjustment, and how should Merrilee report its accounts receivable and retained earnings balances in these financial statements?

SOLUTION: The effect on 2015 income would have been \$30,000 higher had Merrilee discovered the error in that year. The \$30,000 net income effect consists of the \$50,000 increase in income due to the sales revenue less the related tax expense of \$20,000 (\$50,000 times 40%). Consequently, Merrilee records a prior-period adjustment increasing retained earnings by \$30,000. It also increases accounts receivable by \$50,000. Finally, it records the \$20,000 of taxes owed to the government related to the sales revenue when filing amended tax returns.

The journal entry to record the prior-period adjustment on December 31, 2018, follows.

Account	December 31, 2018	
Accounts Receivable	50,000	
Retained Earnings – Prior-Period Adjustment		30,000
Income Tax Payable		20,000

Merrilee will report these adjustments in the opening balances on the first balance sheet it presents, the December 31, 2017 balance sheet.

- 6 Describe the components of other comprehensive income and accumulated other comprehensive income.

Accounting for Other Comprehensive Income

Firms do not include the effects of certain events and transactions in net income. For example, unrealized gains and losses on adjusting the carrying value of debt investments to fair value are not always reported in net income. Because some changes in equity bypass net income, companies report **comprehensive income**, which is a measure of changes in a company's equity that result from recognized transactions and all economic events of the period other than transactions with owners.¹⁹ Reporting comprehensive income assists investors, creditors, and others in assessing a company's activities and the timing and magnitude of a company's future cash flows.²⁰

Components of Comprehensive Income

Comprehensive income includes all changes in equity during a period from all sources except those resulting from investments by owners and distributions to owners. Comprehensive income is composed of two major components: net income and other comprehensive income. Other comprehensive income (OCI) is the portion of comprehensive income that is not included in net income. The elements of net income are revenues, expenses, gains, and losses.

The primary elements of OCI are:

- Unrealized gains and losses from the available-for-sale portfolio of debt investment securities and derivatives classified as cash flow hedges²¹

¹⁹For the relevant authoritative literature for U.S. GAAP, see FASB ASC 220, *Comprehensive Income*. For IFRS, IASC, *International Accounting Standard 1*, "Presentation of Financial Statements" (London, UK: International Accounting Standards Committee, Revised, 2016) is the relevant authoritative literature.

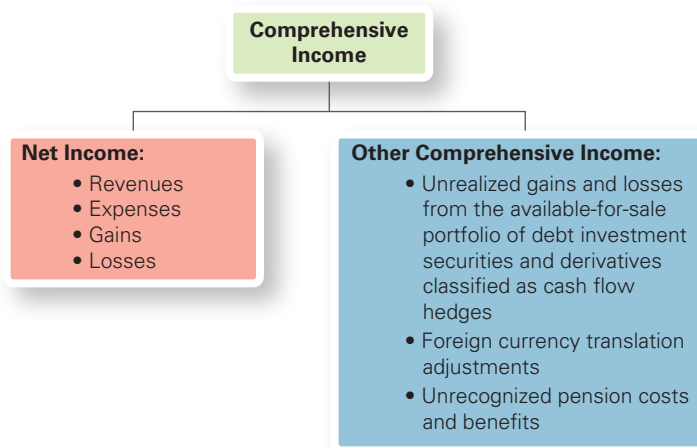

²⁰We also discuss other comprehensive income in Chapter 5.

²¹We cover investment securities in more detail in Chapter 16.

- Foreign currency translation adjustments
- Unrecognized pension costs and benefits²²

Exhibit 15.7 presents graphically the components of comprehensive income.

EXHIBIT 15.7 Components of Comprehensive Income

THE CONCEPTUAL FRAMEWORK CONNECTION

Other Comprehensive Income

The elements of other comprehensive income create changes in equity that are not related to investor transactions. Why, then, do firms not report them on the income statement? There is no clear conceptual reason for reporting certain transactions in other comprehensive income. There are three reasons, however, that support the presentation of other comprehensive income separate from net income:

1. OCI items have a low probability of cash flow realization in the short term and therefore should not be included in net income. Including these items would further remove net income from the underlying cash flows of the firm.
2. The temporary nature of OCI items would create earnings volatility (when these temporary events reverse) if included in net income.
3. OCI events are not part of normal business operations, so they should not be included in net income.

Reporting Other Comprehensive Income

A company has two options for reporting OCI:

1. Include components of OCI after net income on one continuous statement summing to comprehensive income. The statement is the statement of comprehensive income.
2. Present a separate statement of other comprehensive income that begins with net income on the first line and details the components of OCI. This approach results in presenting two statements, one displaying the details of net income and the other displaying the details of other comprehensive income. The statements are the statement of net income and the statement of comprehensive income.

Facebook, Inc., the online social media company, uses the second approach, as illustrated in Exhibit 15.8. In 2016, **Facebook's** comprehensive income was \$248 million lower than its net income because of other comprehensive income items.

²²We cover pensions in more detail in Chapter 19.

EXHIBIT 15.8 Statement of Comprehensive Income, *Facebook, Inc.*, Financial Statements, December 31, 2016

Facebook, Inc.			
Consolidated Statements of Comprehensive Income			
<i>(In millions)</i>			
	Year Ended December 31		
	2016	2015	2014
Net income	\$10,217	\$3,688	\$2,940
Other comprehensive income (loss):			
Change in foreign currency translation adjustment, net of tax	(152)	(202)	(239)
Change in unrealized gain/loss on available-for-sale investments, net of tax	(96)	(25)	(3)
Comprehensive income	<u>\$ 9,969</u>	<u>\$3,461</u>	<u>\$2,698</u>

Accumulated Other Comprehensive Income

Accumulated other comprehensive income, the aggregation of OCI over the years, is the third component of stockholders' equity. Firms report accumulated other comprehensive income on the balance sheet in the stockholders' equity section, along with contributed capital and retained earnings.

- 7 Detail required disclosures for stockholders' equity.

Stockholders' Equity Disclosures

For stockholders' equity required disclosures, companies commonly report the classes of stock, any par values, and the number of shares authorized, issued, and outstanding in the equity section of the balance sheet.

Exhibit 15.9 presents an excerpt from *Facebook's* 2016 statement of stockholders' equity. Note that the columns across the top include both the number of shares and amounts for common stock. Other columns are additional paid-in capital, accumulated other comprehensive income, retained earnings, and the total stockholders' equity column. Down the rows, there are several issuances of common stock during the year, increasing the number of shares and amount of additional paid-in capital. During 2016, *Facebook* issued 3 million shares of common stock when stock options were exercised for employee services and compensation. The loss from other comprehensive income of \$248 million decreased accumulated other comprehensive income. Net income of \$10,217 million increased retained earnings. The cumulative-effect adjustment relates to the adoption of a new accounting update, which we discuss in Chapter 21.

In the notes to the financial statements, companies provide details about the rights and privileges of each class of capital stock. The notes also detail terms and provisions of callable, convertible, and redeemable securities; stock options; and other contingent shares or potentially dilutive securities. Information regarding potentially dilutive securities is essential to current and potential investors because the issuance of additional shares on conversion will reduce the ownership share of current equity holders and dilute EPS.

We summarize the common disclosure requirements by the type of security in the following sections.

Rights and Privileges of Classes of Stock

The disclosures for stockholders' equity must include the pertinent rights and privileges of the various securities outstanding. Examples of disclosed information are dividend and liquidation preferences, participation rights, call prices and dates, conversion or exercise prices or rates and pertinent dates, sinking-fund requirements,²³ unusual voting rights, and significant terms of contracts to issue additional shares. An entity must also disclose the number of shares issued upon conversion, exercise, or satisfaction of required conditions.

²³A sinking fund is a separate account consisting of cash and other liquid assets used to repay debt or redeemable preferred stock when they are due.

Interview

ROBERT LAUX NORTH AMERICAN LEAD INTERNATIONAL INTEGRATED REPORTING COUNCIL»

Robert Laux

Robert Laux is the North American Lead for the International Integrated Reporting Council (IIRC). The IIRC is a global coalition of regulators, investors, companies, standard setters, the accounting profession and NGOs promoting communication about value creation as the next step in the evolution of corporate reporting.

- 1 Why are the extensive disclosures for stockholders' equity important for the financial statement user?

The detailed stockholders' equity disclosures provide critical information, in particular returns to stockholders, that may not be readily apparent from other financial information such as the income statement, balance sheet, or statement of cash flows. For instance, the stockholders' equity statement clearly shows the amount of dividends that have been paid and the amount of stock repurchased, both of which are returns to stockholders. In addition, detailed disclosures also give users information on how a company may be diluting stockholders' interests, either by issuing additional stock or providing stock-based compensation to employees. They also provide users important information on Board of Director-approved stock repurchase plans and how much of the authorized amount is still available for stock repurchases.

- 2 What is the most common method of accounting for stock repurchases, and what accounts for its popularity?

Under ASC 505, Equity, a corporation has two alternatives to account for stock retirements or repurchases. It may allocate an excess of repurchase price over par or stated value between additional paid-in capital and retained earnings, or it may charge the excess entirely to retained earnings. While practice is mixed, many companies allocate the excess of repurchase price between additional paid-in capital and retained earnings. This approach accurately reflects return of capital to stockholders. The amount allocated to additional paid-in capital reflects the additional paid-in capital originally received when the shares were sold, while the remainder of the repurchase price depicts the return of retained earnings to stockholders.

- 3 What common items do firms include in other comprehensive income on its financial statements? How does disclosing the

components of accumulated other comprehensive income assist financial statement users in assessing an entity's financial position, operating results, and cash flows?

Common items included in other comprehensive include unrealized gains/(losses) on derivatives, unrealized gains/(losses) on investments, translation adjustments and actuarial gains and losses. The unrealized gains/(losses) on derivatives include gains/(losses) on cash flow hedges. The unrealized gains/(losses) on investments are from the impact of market movements on certain securities. Translation adjustments arise from remeasurement of foreign subsidiaries from their functional currency to the U.S. dollar. Certain actuarial gains and losses from pension plans are charged directly to other comprehensive income. In general, the disclosing of the components of accumulated other comprehensive income assist financial statement users understand the impact of certain changes in fair value that are not included in the calculation of net income.

- 4 Why do corporations decide to acquire and/or retire their own shares?

Corporations repurchase shares to provide a return to investors and also to reduce weighted-average shares outstanding. It is important to note that some companies have a broad-based employee stock compensation plan with a large amount of stock awarded to employees as part of their compensation. In order to avoid a transfer of wealth from shareholders to employees, a company may have an aggressive stock repurchase plan that offsets the impact of issuing shares to employees as part of their compensation.

- 5 Under what circumstances would an entity implement a share split or reverse share split?

Opinions differ on whether share splits (or reverse share splits) really produce any economic affects. If a company's stock price reached a certain level, the company may consider a stock split in the belief that a lower stock price may attract more individuals to their stock.

Discussion Questions

1. Robert Laux indicated that items included in other comprehensive income enables financial statement users to understand the impact of certain changes in fair value that are not included in the computation of net income. Discuss the usefulness of including other comprehensive income (OCI) in the financial statements by elaborating on Robert Laux's assessment.
2. Robert Laux stated that corporations repurchase shares to provide a return to investors, to reduce the weighted-average number of shares outstanding, or for use in employee compensation plans. Elaborate on these uses and discuss some other reasons why an entity will repurchase its own shares.

Preferred Shares and Liquidation Preferences

A company with preferred shares (or other senior equity securities) outstanding that has a preference in involuntary liquidation considerably in excess of the par or stated value of the shares must disclose the liquidation preference of the stock.²⁴ In addition, an entity must disclose both of the following either on the face of the statement of financial position or in the notes to the financial statements:

- The aggregate or per share amounts at which preferred stock may be called or are subject to redemption through sinking-fund operations or otherwise.
- The aggregate and per share amounts of dividends in arrears on cumulative preferred shares.

Convertible Equity Securities

The company must provide adequate disclosure regarding the significant terms of the conversion features of a contingently convertible security. This information enables financial statement users to understand the circumstances of the contingency and the potential impact of conversion. The disclosures include all of the following:

1. Events or changes in circumstances that would cause the contingency to be met
2. Any significant features necessary to understand the conversion rights and the timing of those rights (e.g., the periods in which the contingency might be met and the securities that may be converted if the contingency is met)
3. The conversion price and the number of shares into which a security is potentially convertible
4. Events or changes in circumstances, if any, that could adjust or change the contingency, conversion price, or number of shares, including significant terms of those changes
5. The manner of settlement upon conversion and any alternative settlement methods (e.g., cash, shares, or a combination)

Redeemable Preferred Shares

If a company issues redeemable preferred stock, it must disclose the amount of redemption requirements, separately by issue or combined, for all issues of capital stock that are redeemable at fixed or determinable prices on fixed or determinable dates in each of the 5 years following the date of the latest statement of financial position presented.

Changes in Stockholders' Equity Accounts

A company must disclose changes in the separate accounts comprising stockholders' equity (in addition to retained earnings) and of the changes in the number of shares of equity securities. As we discussed in Chapter 5, firms can present the disclosure of these changes in a separate statement of stockholders' equity or in the notes to the basic financial statements.

Disclosures: IFRS

Most disclosure requirements under U.S. GAAP and IFRS are similar. Additionally, IFRS requires a company to disclose information that enables users to assess its objectives, policies, and processes for managing capital. In the United States, the SEC has similar requirements for publicly traded companies.

²⁴When preferred shares have a liquidation premium, in the event of liquidation, the preferred shareholder is entitled to par plus an amount over par after creditors are paid but before any distributions are made to common shares. So, preferred shares with \$100 par value may have a liquidation preference, and each share would receive \$110 in liquidation after all creditor claims have been satisfied. The \$10 difference is called the liquidation premium (\$110 – \$100).

FINANCIAL STATEMENT ANALYSIS

Valuation Ratios

Stockholders' equity represents an accounting measure of owners' interest in a company. The valuation of stockholders' equity—total assets less total liabilities—depends on how each asset and each liability is measured on the balance sheet. For example, the carrying value of a building purchased 20 years ago would generally be lower than its fair value today. Because of conventions such as historical cost accounting, the total amount of stockholders' equity on the balance sheet is often not representative of the value of the company to its stockholders.

Another measure of owners' interest in a company is its *market value*. The total **market value** of a company (also called market capitalization) whose stock is traded on a public stock exchange is the number of common shares outstanding multiplied by the price per share at which the stock is currently trading. Investors continually assess a company's expected profitability to determine its market value. As their assessment changes with new or updated information, the company's market value also changes. For example, when a pharmaceutical company receives regulatory approval to sell a new drug, the company's future sales will likely increase. Investors will incorporate the news of the drug approval and increasing future sales by raising the company's market value.

Investors also rely on accounting information in determining a company's market value. Common valuation ratios such as the *price-to-earnings (P/E) ratio* and *price-to-book (P/B) ratio* are also useful in making investment decisions and comparing companies.

The **P/E ratio** expresses the relationship between the company's market value and its net income as shown in the following equation.²⁵

$$\text{Price to Earnings Ratio (P/E)} = \frac{\text{Market Value of Common Stock}}{\text{Net Income}} \quad (15.1)$$

The P/E ratio indicates how much an investor is willing to pay for a company per dollar of its earnings. In general, the higher the P/E ratio, the greater the expectation of a company's future profitability. For example, a P/E ratio of 15 indicates an investor is valuing the company at 15 times its net income. For a given amount of earnings, a P/E ratio of 15 implies that a company's future profitability is expected to be better than a company with a P/E ratio of 10.

Because the P/E ratio has net income in the denominator, this ratio can be sensitive to one-time items such as impairments or gains on the disposal of a business. Therefore, when a company has unusually high or low net income, the P/E ratio is not as useful a valuation ratio. For example, if a company has a large impairment leading to unusually low net income, its P/E ratio will be high simply because of the low net income amount in the denominator of the ratio.

The P/B ratio expresses the company's market value to its book value as shown in the following equation:

$$\text{Price-to-Book (P/B) Ratio} = \frac{\text{Market Value of Common Stock}}{\text{Book Value of Common Stockholders' Equity}} \quad (15.2)$$

A benchmark for a P/B ratio is 1.

- A P/B ratio of 1 indicates that the market is valuing a company's net assets 1 for 1.
- A P/B ratio greater than 1 indicates that the market is valuing a company at more than its book value.
- A P/B ratio greater than 1 indicates that the market expects strong future profitability and growth.

Companies that have unrecorded intangible assets such as brands or customer relationships would likely have a P/B ratio greater than 1. However, P/B ratios are generally somewhat greater than 1 because of the use of historical cost accounting. For example, under historical cost accounting, the value of a long-lived asset such as land is often less than its current market value at any point in time.

A P/B ratio lower than 1 can occur for three main reasons:

1. The market believes the asset values are overstated.
2. A company has off-balance sheet liabilities such as leases.
3. The company is earning a very low return on its assets.

²⁵The P/E ratio is also computed as price per share divided by earnings per share.

Financial Statement Analysis, continued

Because book value is usually more stable than net income, the P/B ratio can be useful in evaluating a company when its earnings are volatile.

Exhibit 15.10 summarizes the computation of each valuation ratio, desirable characteristics, and pitfalls when assessing these ratios.

EXHIBIT 15.10 Summary of Valuation Ratios

Ratio	Desirable Characteristics	Pitfalls
Price to Earnings (P/E) Ratio = $\frac{\text{Market Value of Common Stock}}{\text{Net Income}}$	Higher P/E ratio indicates higher expected profitability.	When net income is unusually high or low, the P/E ratio is not as useful.
Price to Book (P/B) Ratio = $\frac{\text{Market Value of Common Stock}}{\text{Book Value of Common Stockholders' Equity}}$	Higher P/B ratio indicates higher expected profitability and growth.	P/B ratios are often higher when a company has unrecorded intangibles.

Example 15.23 illustrates financial statement analysis using the valuation ratios.

EXAMPLE 15.23 Valuation Ratios

PROBLEM: The following table presents net income for the year, book value of total stockholders' equity, and market value of total stockholders' equity at the end of each fiscal year for five global pharmaceutical companies. Using this information, complete the following items.

- Compute the price-to-earnings (P/E) ratios and price-to-book (P/B) ratios for each company for each year.
- Compute an average price-earnings (P/E) ratio and price-to-book (P/B) ratio for all the companies in each year.
- Comment on each company's P/E ratio over time. Are there any unusually high or low P/E ratios? If so, why? Comment on the average over time.
- Why would the P/B ratios in the pharmaceutical industry generally be greater than 1? Comment on each company's P/B ratio over time. Comment on the average over time.

		Fiscal Year		
Company and Location	Measure (U.S. dollars in millions)	2014	2015	2016
Johnson & Johnson – U.S.	Net income	\$ 16,323	\$ 15,409	\$ 16,540
	Book value of common stockholders' equity	69,752	71,150	70,418
	Market value of common stock	292,703	284,220	313,432
Merck & Co – U.S.	Net income	11,920	4,442	3,920
	Book value of common stockholders' equity	48,647	44,676	40,088
	Market value of common stock	161,901	147,555	162,313
Pfizer Inc. – U.S.	Net income	9,135	6,960	7,215
	Book value of common stockholders' equity	71,301	64,720	59,544
	Market value of common stock	196,265	199,281	197,100

Continued

Company and Location	Measure (U.S. dollars in millions)	Fiscal Year		
		2014	2015	2016
Sanofi – France	Net Income	\$ 5,354	\$ 4,660	\$ 4,957
	Book value of common stockholders' equity	68,620	63,272	60,762
	Market value of common stock	122,438	115,546	104,491
Novartis AG – Switzerland	Net Income	10,210	17,783	6,712
	Book value of common stockholders' equity	70,766	77,046	74,832
	Market value of common stock	252,441	234,710	190,852

SOLUTION: The following table shows the P/E and P/B ratios for each company and each year.

	Fiscal Year		
	2014	2015	2016
P/E Ratios			
Johnson & Johnson	17.93	18.45	18.95
Merck & Co	13.58	33.22	41.41
Pfizer Inc.	21.48	28.63	27.32
Sanofi	22.87	24.80	21.08
Novartis AG	24.72	13.20	28.43
Average	20.12	23.66	27.44
P/B Ratios			
Johnson & Johnson	4.20	3.99	4.45
Merck & Co	3.33	3.30	4.05
Pfizer Inc.	2.75	3.08	3.31
Sanofi	1.78	1.83	1.72
Novartis AG	3.57	3.05	2.55
Average	3.13	3.05	3.22

Johnson & Johnson's and **Merck's** P/E ratios are increasing over time, indicating that the market expects continued high profitability. **Pfizer's** and **Sanofi's** P/E ratios increased from 2014 to 2015 and then decreased in 2016. **Novartis'** P/E ratio decreased in 2015, likely because of high net income in 2015. The average P/E ratios for the group of companies increased from 2014 to 2016, indicating an increase in expected industry profitability.

P/B ratios in the pharmaceutical industry are greater than 1, likely because of unrecorded intangible assets such as drug patents, brands, or customer relationships. The P/B ratios for **Johnson & Johnson**, **Merck**, and **Pfizer** increased from 2014 to 2016, indicating expected future profitability and growth. The increase in the average P/B ratios from 2014 to 2016 suggests high future profitability and growth. **Johnson & Johnson's** and **Merck's** P/B ratios exceeded the average in all years.

Summary by Learning Objectives

In the following, we summarize the main points by learning objective. Throughout the chapter, we discuss the accounting and reporting of U.S. GAAP and IFRS side by side. The following table also highlights the major similarities and differences between the standards.

1 Describe stockholders' equity and its main components.	
Summary	Similarities and Differences between U.S. GAAP and IFRS
<p>Stockholders' equity represents the residual claims against the assets of the firm. It has three main components:</p> <ol style="list-style-type: none"> 1. Contributed capital: Amounts paid in by common and preferred stockholders. It is often separated into a par value and additional paid-in capital in excess of par. 2. Retained earnings: Cumulative earnings of the firm that have not been distributed as dividends. 3. Accumulated other comprehensive income: Includes unrealized gains and losses on debt investment securities, foreign currency translation adjustments, and certain pension cost adjustments. 	<p>► Similar under U.S. GAAP and IFRS except for some differences in terminology:</p> <ol style="list-style-type: none"> 1. Share capital and share premium are commonly used terms for par value and additional paid-in capital. 2. Accumulated profit and loss is used instead of retained earnings. 3. Reserves and other reserves are used instead of accumulated other comprehensive income.
2 Explain and illustrate the accounting for common stock, including share issuance, issue costs, and stock splits.	
Summary	Similarities and Differences between U.S. GAAP and IFRS
<p>Firms report common stock at the amount paid in by owners. The capital raised is recorded as par value, if any is specified, and additional paid-in capital in excess of par – common.</p> <p>Issue costs reduce additional paid-in capital in excess of par.</p> <p>Stock splits proportionately change any par value. No journal entry is required for recording stock splits.</p>	<p>Similar under U.S. GAAP and IFRS.</p>
3 Record treasury stock transactions, including repurchases, reissuance under the cost method, and retirement.	
Summary	Similarities and Differences between U.S. GAAP and IFRS
<p>Treasury stock is a reduction of equity that firms record at cost. When reissued above cost, additional paid-in capital from treasury stock transactions increases by the amount above cost. When reissued below cost, additional paid-in capital from treasury stock transactions decreases by the amount below cost. If there is no additional paid-in capital from treasury stock or paid-in capital from treasury stock is reduced to zero, retained earnings is reduced by the remainder of the amount sold below cost. When retiring treasury stock, firms remove the number of common shares retired from the accounts at par and reduce the average additional paid-in capital in excess of par – common.</p>	<p>Similar under U.S. GAAP and IFRS.</p>

*Summary by Learning Objectives, continued***4** Describe preferred stock and its features; demonstrate the accounting for issuance, dividends, and consideration of potential debt features of preferred stock.

Summary	Similarities and Differences between U.S. GAAP and IFRS
<p>Common features of preferred stock include cumulative, participating, convertible, callable, redeemable, and fixed dividends.</p> <p>Preferred stock is reported at the amount paid in by stockholders. The capital raised is recorded as par value, if any is specified, and additional paid-in capital in excess of par – preferred.</p> <p>Dividends are recorded when declared. Cumulative preferred dividends in arrears, if any, are disclosed.</p> <p>Mandatorily redeemable preferred stock is reported as a liability.</p>	<p>➤ Similar under U.S. GAAP and IFRS except that (1) on convertible preferred stock, the classification as debt or equity depends on the terms of the conversion feature under IFRS, (2) non-mandatorily redeemable preferred stock when the holder has the option to redeem is reported as equity under U.S. GAAP and a liability under IFRS, and (3) IFRS reports preferred stock with fixed dividends as a liability, not equity.</p>

5 Explain the accounting for retained earnings, including dividends and prior-period adjustments.

Summary	Similarities and Differences between U.S. GAAP and IFRS
<p>Retained earnings increases (decreases) with net income (loss).</p> <p>Dividends decrease retained earnings when declared.</p> <p>Prior-period adjustments are corrections of errors made in years before the current-year financial statements. Firms correct the beginning amounts in the balance sheet for the earliest year presented.</p>	<p>Similar under U.S. GAAP and IFRS.</p>

6 Describe the components of other comprehensive income and accumulated other comprehensive income.

Summary	Similarities and Differences between U.S. GAAP and IFRS
<p>Other comprehensive income includes income items that bypass the income statement: unrealized gains and losses from the available-for-sale portfolio of debt investment securities and derivatives classified as cash flow hedges, foreign currency translation adjustments, and unrecognized pension costs and benefits.</p> <p>Comprehensive income is net income plus other comprehensive income. Other comprehensive income can be shown on the income statement after net income or in a separate statement of comprehensive income.</p> <p>Firms report other comprehensive income in accumulated other comprehensive income in stockholders' equity.</p>	<p>Similar under U.S. GAAP and IFRS.</p>

Summary by Learning Objectives, continued

7 Detail required disclosures for stockholders' equity.	
Summary	Similarities and Differences between U.S. GAAP and IFRS
Disclosures for stockholders' equity include details on the rights and privileges of each class of capital stock and details on terms and provisions of callable, convertible, and redeemable securities, stock options, and other contingent shares or potentially dilutive securities.	► Similar under U.S. GAAP and IFRS. Under IFRS, additional disclosures are required regarding the management of capital.

MyLab Accounting

Go to <http://www.pearson.com/mylab/accounting> for the following Questions, Multiple-Choice Questions, Brief Exercises, Exercises, and Problems. They are available with immediate grading, explanations of correct and incorrect answers, and interactive media that acts as your own online tutor.

15 Accounting for Stockholders' Equity

Questions

- 1 Q15-1. What is stockholders' equity?
- 1 Q15-2. What are the retained earnings of a firm?
- 2 Q15-3. Do firms capitalize stock issue costs as intangible assets on the balance sheet? Explain.
- 2 Q15-4. How do firms measure the value of the shares issued in a nonmonetary exchange?
- 3 Q15-5. Does an entity have to legally dissolve treasury stock shortly after acquiring the shares? Explain.
- 3 Q15-6. What are the two available methods used to account for treasury stock transactions? Explain each method.
- 4 Q15-7. Are preferred shares hybrid financial instruments? Explain.
- 4 Q15-8. Is mandatorily redeemable preferred stock classified as equity? Explain.
- 4 Q15-9. Does IFRS classify mandatorily redeemable preferred stock as equity? Explain.
- 4 Q15-10. Is non-mandatorily redeemable preferred stock classified as equity? Explain.
- 4 Q15-11. Are dividends in arrears on cumulative preferred shares a legal liability of the corporation? Explain.
- 5 Q15-12. Do firms often use stock dividends to avoid providing a cash return to shareholders? Explain.
- 5 Q15-13. How do firms record prior-period adjustments?
- 6 Q15-14. What is included in other comprehensive income?
- 6 Q15-15. Is a specific format required for reporting comprehensive income? Explain.
- 7 Q15-16. Do current accounting standards require extensive shareholders' equity disclosures? Explain.

Multiple Choice Questions

Becker CPA Exam Review multiple-choice questions are available in **MyLab Accounting**.

- 5 MC15-1.** Boone Corporation's outstanding capital stock on December 15 consisted of the following:
- 30,000 shares of 5% cumulative preferred stock, par value \$10 per share, fully participating as to dividends. No dividends were in arrears.
 - 200,000 shares of common stock, par value \$1 per share.
- On December 15, Boone declared dividends of \$100,000. What was the amount of dividends payable to Boone's common stockholders?
- a. \$10,000 b. \$34,000 c. \$47,500 d. \$40,000

- 3 MC15-2.** At its date of incorporation, McCarty Company issued 100,000 shares of its \$10 par common stock at \$11 per share. During the current year, McCarty acquired 30,000 shares of its common stock at \$16 per share and accounted for them using the cost method. Subsequently, these shares were reissued at a price of \$12 per share. There have been no other issuances or acquisitions of its own common stock. What effect does the reissuance of the stock have on the following accounts?

Retained Earnings	Additional Paid-in Capital
a. Decrease	Decrease
b. No effect	Decrease
c. Decrease	No effect
d. No effect	No effect

- 7 MC15-3.** On September 1, Year 1, Royal Corp., a newly formed company, had the following stock issued and outstanding:
- Common stock, no par, \$1 stated value, 5,000 shares originally issued for \$15 per share.
 - Preferred stock, \$10 par value, 1,500 shares originally issued for \$25 per share.
- Royal's September 1, Year 1, statement of stockholders' equity should report:

Common Stock	Preferred Stock	Additional Paid-in Capital
a. \$5,000	\$15,000	\$92,500
b. \$5,000	\$37,500	\$70,000
c. \$75,000	\$37,500	\$ 0
d. \$75,000	\$15,000	\$22,500

- 4 MC15-4.** Classic Cars Corp. has 50,000 shares of \$10 par common stock and 20,000 shares of \$15 par fully participating 10% cumulative preferred stock. If the company declares cash dividends of \$100,000 during the current year and there are no dividends in arrears, what will be the total dividend payment to preferred shareholders?
- a. \$37,500 b. \$42,500 c. \$57,500 d. \$62,500
- 3 MC15-5.** On January 1, Year 1, Black Dog Corp. began operations and issued 30,000 shares of \$5 par common stock for \$9 per share. On June 30, the company bought back 10,000 shares for \$8 per share. Then, on September 15, the company resold 5,000 shares for \$12 per share. What amount of total additional paid-in capital should Black Dog report on its December 31, Year 1, balance sheet if Black Dog uses the cost method to account for its treasury stock?
- a. \$20,000 b. \$120,000 c. \$140,000 d. \$165,000
- 5 MC15-6.** Backdoor Inc. had 200,000 shares of \$5 par common stock outstanding. The company declared a stock dividend of 30,000 shares when the market price was \$25. By how much did additional paid-in capital increase when the dividend was declared?
- a. \$0 b. \$600,000 c. \$150,000 d. \$750,000

- 5 **MC15-7.** Backdoor Inc. had 200,000 shares of \$5 par common stock outstanding. The company declared a stock dividend of 100,000 shares when the market price was \$25. By how much did additional paid-in capital increase when the dividend was distributed to the shareholders?
 a. \$0 b. \$500,000 c. \$1,000,000 d. \$2,500,000

Brief Exercises

- 1 **BE15-1. Stockholders' Equity.** ABC Toy Company earned \$357 million of net income in 2019 and paid \$45 million in dividends. It issued no new stock. Complete the stockholders' equity section for ABC Toy Company:

	December 31	
(in millions)	2018	2019
Common Stock, Par Value	\$ 100	C
Additional Paid-in Capital in Excess of Par – Common	1,245	D
Retained Earnings	A	1,104
Accumulated other comprehensive income (loss)	B	53
Total Stockholders' Equity	\$1,717	E

- 1 **BE15-2. Stockholders' Equity Terminology, U.S. GAAP, IFRS.** Match the **U.S. GAAP** term with the **IFRS** term. There may be more than one match, and responses may be repeated.

U.S. GAAP

- A. Contributed capital
- B. Additional paid-in capital
- C. Retained earnings
- D. Accumulated other comprehensive income
- E. Common stock

IFRS

- Reserves
- Accumulated profit and loss
- Share premium
- Other reserves
- Share capital

Answer

- 2 **BE15-3. Common Stock Issuance, No Par Value.** Perdido Products, Inc. issues 2,500 shares of its no-par common stock. The issue price of the stock is \$24 per share. Prepare the journal entry required to record the issuance of the shares.
- 2 **BE15-4. Common Stock Issuance, Stated Value.** Perdido Products, Inc. issued 2,500 shares of its common stock. The common stock has a stated value of \$10 per share and was issued at \$24 per share. Prepare the journal entry required to record the issuance of the shares.
- 2 **BE15-5. Common Stock Issuance, Par Value.** At the beginning of the current year, Niles Corporation issued 1,600 shares of its own \$2 par value common stock for \$19 per share. Prepare the journal entry required to record the issuance of the shares.
- 2 **BE15-6. Common Stock Issuance, Par Value, Issue Costs.** Carlos Company decided to raise additional capital in the equity market. It engaged an underwriter to float a new common share issue. The issue consisted of 5,000 shares of \$3 par value common stock. Carlos paid the underwriter 2% of the total issue price and issued the shares at \$16 per share. Prepare the journal entry required to record the issuance of the shares assuming that the stock issue costs are not capitalized.

- 2 BE15-7. Common Stock Issuance, Exchange for Services.** Wonder Spring Water Company recently employed a consultant to revise its production and distribution procedures. In order to compensate the consultant, Wonder issued 1,000 shares of its \$1 par value common stock. Those shares are not publicly traded, but the board of directors has estimated their value at \$45 per share. The consulting firm billed other clients \$34,500 for similar services in recent transactions. Prepare the journal entry required to record the transaction.
- 2 BE15-8. Stock Split.** Assume that Cornish Corporation has 2,500,000 shares of \$3 par value common stock issued and outstanding. The company is authorized to issue 10 million shares. Due to increased share prices, the corporation decided to implement a 2-for-1 stock split. Prepare the journal entries required on the declaration and distribution of the stock split.
- 3 BE15-9. Treasury Stock Transactions.** Ginger Spice Distributors acquired 14,500 shares of its own common shares at a cost of \$64 per share. After 6 months, Ginger sold half of the shares in the open market at \$70 per share. Prepare the journal entries to record the acquisition and sale of the treasury shares.
- 3 BE15-10. Treasury Stock Transactions.** On March 15, Chief Company acquired 20,000 shares of its own \$2 par value common shares at a cost of \$17 per share. Chief had originally issued the shares at \$12 per share. On July 5, Chief sold 7,000 of the shares in the open market at \$20 per share. On October 19, Chief sold the remaining shares at \$8. Prepare the journal entries to record the acquisition and sale of the treasury shares.
- 3 BE15-11. Treasury Stock Transactions, Retirement.** Using the information provided in BE15-10, assume that Chief Company retired all of the shares on July 5 (rather than holding shares in the treasury and reissuing them). Prepare the journal entries to record the acquisition and retirement of the treasury shares. Assume that the par value of additional paid-in capital – retired shares is \$0.
- 5 BE15-12. Dividends.** Sterzel Company declared its quarterly cash dividend on March 31 of the current year. The dividend of \$.75 per share was to be paid on May 1 to the shareholders of record as of April 18. The company reported 120,000 shares issued with 15,500 shares held in the treasury. Prepare the journal entries required to record the cash dividend for the quarter on the dates of declaration, record, and payment.
- 5 BE15-13. Prior-Period Adjustment.** In its audit of Oz Lollypop Company, Able and Ready, CPAs, discovered in 2018 that the firm had not recorded a \$975,000 expense in 2014 (for both book and tax purposes). Oz never paid this amount due on the invoice it received. Assuming a constant tax rate of 35%, prepare the journal entry required to record the correction of the error.
- 5 BE15-14. Prior-Period Adjustment.** Using the information provided in BE15-13 and the following stockholders' equity section of Oz Lollypop Company, adjust the balance sheet for the correction of the error.

Stockholders' Equity

Contributed Capital	
Common Stock, at par	\$ 1,000,000
Additional Paid-in Capital in Excess of Par – Common	15,500,000
Total Contributed Capital	\$ 16,500,000
Retained Earnings	\$ 32,797,400
Total Stockholders' Equity	\$ 49,297,400
Additional information:	
Retained earnings on 1/1/2018 as previously reported	\$23,670,000
Net income for the year ended 12/31/2018	9,452,000
Dividends declared for year ended 12/31/2018	324,600

Exercises

- 2 E15-1. Common Stock Issuance, Stated Value, Issue Costs.** Pergolesi Products, Inc. recently issued 5,000 shares of no-par common stock. The shares carry a \$2 per share stated value. The market price of the shares on the date of issue was \$35 per share. The company paid \$12,000 in underwriting fees to issue the shares. Prepare the entry to record the new stock issue.

- 2** **E15-2. Common Stock Issuance, Par Value, Issue Costs, Disclosure.** Advanced Computer Systems reported the following shareholders' equity section as of the beginning of the current year:

Stockholders' Equity	
Contributed Capital:	
Common Stock, \$.50 par value, 850,000 shares authorized, 225,000 shares issued, and 201,375 shares outstanding	\$ 112,500
Additional Paid-in Capital in Excess of Par – Common	<u>9,900,000</u>
Total Contributed Capital	<u>\$ 10,012,500</u>
Retained Earnings	\$20,346,563
Accumulated Other Comprehensive Income (Loss)	(453,800)
Less: Treasury Stock (23,625 common shares at cost)	<u>(945,000)</u>
Total Stockholders' Equity	<u>\$28,960,263</u>

Advanced Computer issued 125,000 shares of its \$.50 par common stock during the year. The market price of the shares on the date of issue was \$51 per share. The company paid \$88,000 in underwriting fees to issue the shares. Advanced reported \$6,789,000 in net income for the year and declared and paid dividends of \$4 per share at year-end.

Required »

- a. Prepare the entry to record the new stock issue.
 - b. Prepare the journal entries required to record the declaration and payment of the cash dividend.
 - c. Prepare the stockholders' equity section of the balance sheet at the end of the year.
- 2** **E15-3. Common Stock Issuance, Exchange for Goods, Par Value, Issue Costs.** Liberty Associates recently hired Gervin Brothers to develop an online sales system for its consumer products division. The customized online system does not have a readily determinable market value. Gervin wanted to be paid in Liberty common shares. As a result, Gervin accepted 10,000 shares of Liberty Associates' \$8 par value common shares. On the date the online system was fully functional, the contract was satisfied and Liberty issued the shares to Gervin. Liberty shares were not publicly traded but were valued at \$132 per share on that date by an investment bank. Because the shares are privately placed, there are no stock issue costs. Prepare the journal entry to record the development of the online system.
- 2** **E15-4. Common Stock Issuance, Exchange for Goods, Par Value, Issue Costs.** Using the information provided in E15-3, prepare the journal entry to record the acquisition of the new computer system assuming that the system is a standardized product with a current retail value of \$1,470,000.
- 3 5 7** **E15-5. Treasury Stock Transactions, Disclosure.** The following shareholders' equity section was taken from the books of Aubry Corporation at the beginning of the current year:

Common Stock, \$10 par value, 1,000,000 shares authorized, 98,950 shares issued and outstanding	\$ 989,500
Additional Paid-in Capital in Excess of Par – Common	120,000
Additional Paid-in Capital from Treasury Stock Transactions	0
Retained Earnings	1,545,000

Required »

- a. Prepare the journal entries required to record each of the following events:
 - Aubry acquired 15,000 shares of common stock to be held in the treasury at a cost of \$16 per share.
 - Aubry sold 4,800 shares of treasury stock at \$19 per share.
 - Aubry sold 7,200 shares of treasury stock at \$8 per share.
 - Aubry reported a net loss of \$367,540 for the year.
 - The company declared and paid a \$2 per share cash dividend at year-end.
- b. Prepare the shareholders' equity section at the end of the year.

3 7 E15-6. **Treasury Stock Transactions, Retirement, Disclosure.** Using the information provided in E15-5, prepare the journal entries to record the acquisition of the treasury stock assuming that it is immediately retired. Also, prepare the journal entries to record the loss and the dividend transactions as well as the shareholders' equity section of the balance sheet at the end of the year. Round per share prices to four decimal places.

3 7 E15-7. **Treasury Stock Transactions, Disclosure.** The stockholders' equity section of DRB plc's balance sheet at December 31, 2018, was as follows:

Common Stock – \$3 par (2,000,000 shares authorized, 1,000,000 shares issued and outstanding)	\$ 3,000,000
Additional Paid-in Capital in Excess of Par – Common	7,000,000
Retained Earnings	<u>24,700,000</u>
Total Stockholders' Equity	<u>\$34,700,000</u>

Required »

- Prepare the journal entry required on January 9, 2019, if on that date DRB repurchased 50,000 shares of treasury stock for \$750,000.
- On March 23, 2019, DRB sold 10,000 of the treasury shares for \$36 per share. Prepare the journal entry to record this transaction.
- Prepare the journal entry required on June 30, 2019, assuming that the firm sold 30,000 of the treasury shares for \$25 per share.
- Prepare the stockholders' equity section of DRB's balance sheet on December 31, 2019, assuming that the company reported net income of \$16,000,000 and declared and paid a cash dividend of \$1.75 per share at year-end.

3 E15-8. **Treasury Stock Transactions.** Several years ago, Indirect Bookie Company issued 10,000 shares of \$2 par value common stock for \$24 per share. Since that time, the company entered into several treasury stock transactions. Assume that additional paid-in capital from treasury stock transactions is zero.

Required »

Record the following treasury stock transactions using the cost method.

- Purchased 5,000 shares of common shares as treasury stock at \$28.
- Sold 2,000 shares of treasury stock for a total of \$42,000.
- Sold the remaining 3,000 shares of treasury stock for a total \$90,000.

3 E15-9. **Treasury Stock Transactions.** Samuel Company has the following accounts in its shareholders' equity section at the beginning of the current year:

Common Stock (\$1 par, 1,000,000 shares authorized, 600,000 shares issued and outstanding)	\$ 600,000
Additional Paid-in Capital in Excess of Par – Common	1,800,000
Retained Earnings	2,000,000

Required »

Prepare the journal entries required to record the following share buyback transactions assuming that Samuel Company holds the shares in the treasury using the cost method:

- Reacquired 20,000 shares to hold as treasury stock, paying \$8.25 per share.
- Sold 10,000 of the shares for \$11.50 per share.
- Reissued the remaining 10,000 shares for \$4.10 per share.

3 E15-10. **Treasury Stock Transactions, Retirement.** Repeat the requirements of E15-9 and assume that the shares are retired rather than held in the treasury.

3 5 7 E15-11. **Treasury Stock Transactions, Dividends, Disclosure.** The stockholders' equity section of Bellwood Brands' 2017 balance sheet follows:

Stockholders' Equity

Common Stock – no par, 100,000 shares authorized, 1,000 shares issued and outstanding	\$ 90,000
Retained Earnings	360,000
Less: Cost of Treasury Stock	<u>0</u>
Total Stockholders' Equity	<u>\$450,000</u>

During 2018, Bellwood completed the following transactions:

- November 9: Purchased 200 shares of its own stock to be held in the treasury. The cost was \$90 per share.
- November 17: Declared and paid a cash dividend of \$5 per share.
- November 30: Sold 100 treasury shares for \$80 per share.
- December 31: Reported \$50,000 net income for the year.

Required »

- a. Prepare the journal entries necessary to record those transactions.
- b. Based on the information provided, prepare the statement of stockholders' equity and the stockholders' equity section of the balance sheet for Bellwood Brands at December 31, 2018.

3 5

E15-12. Treasury Stock Transactions, Dividends. Pavane Company recorded the original issuance of its \$10 par value common shares as follows:

Account	Debit	Credit
Cash	8,750,000	
Common Stock		1,950,000
Additional Paid-in Capital in Excess of Par – Common		6,800,000

Required »

Provide the journal entries for the following transactions.

- a. Pavane bought 95,000 shares of common stock as treasury shares at \$55. It used the cost method to account for treasury transactions.
- b. Pavane declared a \$5 per share cash dividend.
- c. Pavane sold 22,000 shares of treasury stock at \$76.
- d. Pavane sold 61,500 treasury shares at \$38.
- e. Pavane paid the cash dividend.

4 7

E15-13. Preferred Stock Issuance, Dividends, Disclosure. Rory Storm Roofing and Siding, Inc. reported the following shareholders' equity section as of the beginning of the current year:

Stockholders' Equity

Contributed Capital:

Common Stock, \$2 par value, 2,350,000 shares authorized and 745,000 shares issued, and 691,500 shares outstanding	\$ 1,490,000
Additional Paid-in Capital in Excess of Par – Common	<u>20,115,000</u>
Total Contributed Capital	\$21,605,000

Retained Earnings \$ 7,658,450

Accumulated Other Comprehensive Income (Loss) 897,945

Less: Treasury Stock (53,500 common shares at cost) (1,070,000)

Total Stockholders' Equity \$29,091,395

Rory Storm also issued 823,000 shares of its \$5 par value preferred stock. There is a 6% dividend rate on the preferred shares that Rory Storm issued at \$11 per share. The company paid \$180,000 in underwriting fees to issue the shares. It reported \$2,633,000 in net income for the year and declared and paid dividends of \$1 per share on its common shares and 6% of par for the preferred shares. The company has 1,000,000 shares authorized for preferred stock.

Required »

- a. Prepare the journal entry required to record the preferred stock issue.
- b. Prepare the journal entries required to record the declaration and payment of the cash dividends.
- c. Prepare the stockholders' equity section of the balance sheet at the end of the year.

4

E15-14. Callable Preferred Shares. On January 1, 2018, Gato Company issued 1,000 shares of \$80 par callable preferred shares for \$200,000. Gato can call these preferred shares on January 1, 2019, for \$200 per share. On June 1, 2019, Gato calls the shares.

Required »

- What is the journal entry to record the issuance of the preferred shares?
- What is the journal entry when Gato calls the preferred shares?

- 4** **E15-15. Fixed Dividend Preferred Shares.** Fontlyn Inc. issued \$20 million of \$10 par preferred stock on February 1, 2018. The company issued 1 million shares. The preferred stock has a 4% fixed annual cash dividend and no maturity date. Assume that the holder of the preferred shares has the option to require redemption.
- How would Fontlyn account for the preferred stock dividends?
 - What is the journal entry when the firm issued the preferred shares?

- 4** **E15-16. Fixed Dividend Preferred Shares, IFRS.** Use the same information from E15-15, assume that Fontlyn is an IFRS reporter. Prepare the journal entry for Fontlyn's issue of the preferred shares.

- 5 7** **E15-17. Dividends, Disclosure.** Dentquity Corporation has the following capital structure at the beginning of the current year:

8% Preferred Stock, \$10 par value, 520,000 shares authorized, issued, and outstanding	\$ 5,200,000
Common Stock, \$4 par value, 1,870,000 shares authorized, 625,000 shares issued and outstanding	2,500,000
Additional Paid-in Capital in Excess of Par – Common	<u>4,000,000</u>
Total Contributed Capital	\$11,700,000
Retained Earnings	<u>912,050</u>
Total Stockholders' Equity	<u>\$12,612,050</u>

Required »

- Prepare the journal entries (including closing entries) to record each of the following transactions affecting shareholders' equity during the current year. There are separate accounts for dividends payable for common stock and preferred stock. Assume that there are no preferred dividends in arrears.
 - Declared a total cash dividend of \$880,000 on common and preferred stock.
 - Had net income for the year of \$40,000.
- Prepare the stockholders' equity section of the balance sheet at the end of the current year.

- 5** **E15-18. Prior-Period Adjustment.** In 2018, Meg Inc. discovered an error in its 2015 financial statements. The firm recorded \$11,000,000 of depreciation expense on its equipment instead of recording \$10,000,000. Meg has a constant tax rate of 40% and reports 3 years of comparative income statements and 2 years of comparative balance sheets with its financial reports. Assume that Meg uses the same depreciation method for tax and financial reporting. Retained earnings and accumulated depreciation as of December 31, 2017, were \$12,075,000 and \$5,400,000, respectively.

Required »

- What is the necessary journal entry to record the prior-period adjustment?
- How would Meg report its accumulated depreciation and retained earnings balances in the restated balance sheet dated December 31, 2017?

- 5** **E15-19. Prior-Period Adjustment.** In 2018, Thom Inc. discovered an error in its 2015 financial statements. The firm recorded \$8,500,000 of depreciation expense on its equipment instead of recording \$9,500,000. Thom has a constant tax rate of 40% and reports 3 years of comparative income statements and 2 years of comparative balance sheets with its financial reports. Assume that Thom uses the same depreciation method for tax and financial reporting. Retained earnings and accumulated depreciation as of December 31, 2017, were \$12,075,000 and \$4,600,000, respectively.

Required »

- What is the necessary journal entry to record the prior-period adjustment?
- How would Thom report its accumulated depreciation and retained earnings balances in the restated balance sheet dated December 31, 2017?

- 6** **E15-20. Other Comprehensive Income.** Needle Corporation reported net income of \$176,000 for the current year. It had unrealized gains on available-for-sale debt investment securities of \$5,000 after tax and a foreign currency translation loss of \$8,000 after tax. The beginning balance of its accumulated other comprehensive income was a credit of \$100.

Required »

- What is other comprehensive income for the current year?
- What is comprehensive income for the current year?
- What is the ending balance of accumulated other comprehensive income?

- 6 E15-21. Other Comprehensive Income.** Saddle Corporation reported comprehensive income of \$14,000 for the current year. It had unrealized losses on available-for-sale debt investment securities of \$750 after tax and a foreign currency translation gain of \$3,500 after tax. The beginning balance of its accumulated other comprehensive income was a debit of \$2,000.

Required »

- What is other comprehensive income for the current year?
- What is net income for the current year?
- What is the ending balance of accumulated other comprehensive income?

- 7 E15-22. Disclosure.** On January 1, 2018, Queens Company reported the following stockholders' equity:

Common Stock, \$5 par (300,000 shares authorized, 100,000 shares issued and outstanding)	\$ 500,000
Additional Paid-in Capital in Excess of Par – Common	200,000
Retained Earnings	<u>700,000</u>
Total Stockholders' Equity	<u>\$1,400,000</u>

On January 4, the company purchased 10,000 shares of its own stock at \$25 per share to be held as treasury stock. On June 30, the company declared a \$2 per share cash dividend to be paid on July 7. Net income for the year ended December 31 amounted to \$280,000.

Prepare the stockholders' equity section of Queens Company's balance sheet at December 31, 2018.

Problems

- 2 P15-1. Common Stock Issuance, No Par Value, Stock Split, Disclosure.** The stockholders' equity section of Five Voices Music, Inc.'s balance sheet at December 31, 2017, follows:

Stockholders' Equity

Common Stock – no par, 10,000 shares authorized, 1,000 shares issued and outstanding	\$ 90,000
Retained Earnings	<u>360,000</u>
Total Stockholders' Equity	<u>\$450,000</u>

During 2018, Five Voices Music completed the following transactions:

- May 24: Issued 200 no-par common shares for cash amounting to \$16,000.
- December 1: Implemented a 2-for-1 stock split.
- December 31: Announced net income of \$50,000 for the year ended December 31, 2018.

Based on the information provided, prepare the stockholders' equity section for Five Voices Music at December 31, 2018.

- 2 3 4 5 7 P15-2. Common Stock Issuance, Treasury Stock, Dividends, Disclosure.** Sanmartini Van Lines, Ltd. began operations at the beginning of the current year and engaged in the following transactions affecting the stockholders' equity section of its current balance sheet. The company has 1,000,000 shares authorized for each common and preferred stock.

1. Issued 500,000 shares of its \$2 par value common stock at \$64 per share. The underwriter charged a 1% fee for issuing the shares.
2. Issued 100,000 shares of \$4.50 par value, 7% preferred stock at \$120 per share. These shares were privately placed and Sanmartini did not pay any stock issue costs.
3. Purchased 120,000 shares of common stock at \$70 per share.
4. Declared a \$75,000 dividend for the first half of the year. (The declarations should be recorded separately for the common and the preferred shares.)
5. Sold 45,000 of the treasury shares at \$60 per share.

6. Paid the cash dividends.
7. Declared a \$75,000 cash dividend for the second half of the year. (The declarations should be recorded separately for the common and the preferred shares.)
8. Reported net income of \$9,879,455 for the current year.
9. Closed out all dividends accounts.

Required »

- a. Prepare all journal entries required to record those transactions.
- b. Construct the shareholders' equity section for the year-end balance sheet and the relevant t-accounts.

2 3 4 5 7 P15-3. Common Stock Issuance, Preferred Stock Issuance, Convertible Stock Issuance, Retirement, Dividends, Disclosure. Shore Town Suites, Ltd. began operations at the beginning of the current year and engaged in the following transactions affecting the stockholders' equity section of its current balance sheet. The company has 1,000,000 shares authorized for each common and preferred stock.

1. Issued 200,000 shares of its \$1 par value common stock at \$26 per share. The underwriter charged a 1% fee for issuing the shares.
2. Issued 100,000 shares of its \$1 par value common stock to a major investor who contributed a new headquarters building to Shore Town. At the time, Shore Town's stock price was \$27 per share.
3. Issued 10,000 shares of 2%, \$28 par value, convertible preferred shares for \$290,000. Each preferred share is convertible into one share of \$1 par common stock.
4. Purchased 12,000 shares of common stock at \$28 per share and immediately retired the shares.
5. Declared a \$82,000 dividend for the year. (The declarations should be recorded separately for the common and the preferred shares.)
6. Paid the cash dividends.
7. Issued 5,000 shares of \$30 par value, 5% mandatorily redeemable preferred stock for \$200,000.
8. Related to Transaction 3, all preferred shareholders converted their shares into common stock.
9. Reported net income of \$865,300 for the current year.
10. Closed out all dividends accounts.

Required »

- a. Prepare all journal entries required to record those transactions.
- b. Construct the shareholders' equity section for the year-end balance sheet and the relevant t-accounts.

2 3 4 5 6 7 P15-4. Common Stock Issuance, Treasury Stock, Preferred Stock, Dividends, Comprehensive Income, Disclosure. Castleline, Inc. reported the following shareholders' equity section as of the beginning of the current year:

Stockholders' Equity**Contributed Capital:**

Common Stock, \$1 par value, 3,850,000 shares authorized, 905,000 shares issued, and 821,500 shares outstanding	\$ 905,000
---	------------

Additional Paid-in Capital in Excess of Par – Common	22,625,000
--	------------

Total Contributed Capital	<u>\$ 23,530,000</u>
---------------------------	----------------------

Retained Earnings	\$ 8,957,450
--------------------------	--------------

Accumulated Other Comprehensive Income	1,057,600
---	-----------

Less: Treasury Stock (83,500 common shares at cost)	<u>(1,670,000)</u>
---	--------------------

Total Stockholders' Equity	<u>\$ 31,875,050</u>
-----------------------------------	----------------------

During the current year, Castleline engaged in the following transactions affecting the stockholders' equity section of its current balance sheet.

1. Issued 400,000 shares of its \$1 par value common stock at \$31 per share. The underwriter charged a 3% fee for issuing the shares. The stock issue costs are not capitalized.
2. Issued 500,000 shares of \$10 par value 6% preferred stock (2,550,000 authorized) at \$40 per share. These shares were privately placed and Castleline did not pay stock issue costs.
3. Purchased 220,000 shares of common stock at \$32 per share.
4. Declared a \$450,000 dividend for the first half of the year. (The declarations should be recorded separately for the common and the preferred shares.)
5. Sold 105,000 of the treasury shares at \$44 per share. (The 83,500 treasury shares on hand at the beginning of the year are considered sold first. The company paid \$20 per share for these shares of treasury stock).
6. Paid the cash dividends.

7. Reported net income of \$3,180,500 for the current year.
8. In addition to the net income, Castleline incurred an \$801,000 unrealized loss on an available-for-sale debt investment.
9. Declared a \$450,000 cash dividend for the second half of the year. (The declarations should be recorded separately for the common and the preferred shares.)
10. Closed out all dividends and other comprehensive income accounts.

Required »

- a. Prepare all journal entries required to record those transactions.
- b. Construct the shareholders' equity section for the year-end balance sheet and the relevant t-accounts.

- 3 5 6 7** P15-5. **Common Stock Issuance, Treasury Stock, Dividends, Comprehensive Income, Disclosure.** The stockholders' equity section of Siri Stores, Inc.'s balance sheet at December 31, 2017, follows:

Stockholders' Equity

Common Stock: no-par, \$3 stated value, 80,000 shares authorized, 50,000 shares issued, and 40,500 shares outstanding	\$ 150,000
Additional Paid-in Capital in Excess of Stated Value – Common	300,000
Retained Earnings	940,000
Less: Cost of Treasury Stock (9,500 shares)	<u>(199,500)</u>
Total Stockholders' Equity	<u>\$1,190,500</u>

During 2018, Siri completed the following transactions:

- November 9: Purchased 3,000 shares of its own stock to be held in the treasury. The cost per share was \$21.
- November 17: Declared and paid a cash dividend of \$6 per share.
- November 30: Sold 1,800 treasury shares for \$15 per share. Assume FIFO is used.
- December 31: Declared and paid a cash dividend of \$6 per share.
- December 31: Wrote down an available-for-sale debt investment by \$23,500.
- December 31: Reported \$50,000 net income for the year and closed net income, other comprehensive income, and dividend accounts.

Required »

- a. Prepare the journal entries required to reflect those transactions.
- b. Based on the information provided, prepare the stockholders' equity section for Siri at December 31, 2018, and the relevant t-accounts.

- 2 3 5 6** P15-6. **Common Stock Issuance, Treasury Stock, Dividends, Comprehensive Income.** Royal Hill Companies provided the following information regarding its stockholders' equity section of the balance sheet for the 3-year period ending December 31, 2018.

Stockholders' equity:

(In millions, except for share amounts)	2018	2017	2016
Common Stock, no par value	\$ 229.20	\$ 229.20	\$ 229.20
Additional Paid-in Capital from Treasury Stock Transactions	99.24	99.24	119.09
Retained Earnings	2,089.68	1,809.72	2,217.50
Accumulated Other Comprehensive Income (Loss) – Unrealized Debt Investment Gain (Loss)	(0.24)	(0.36)	0
Treasury Stock, at Cost; 56,071,000 and 32,835,000 shares, in 2018 and 2017 respectively	<u>(1,717.92)</u>	<u>(1,031.28)</u>	<u>(1,237.97)</u>
Total Stockholders' Equity	<u>\$ 699.96</u>	<u>\$1,106.52</u>	<u>\$1,327.82</u>

Required »

Prepare the summary journal entries for 2017 and 2018 to reflect the changes in the shareholders' equity accounts included in the statement provided above. Royal Hill did not pay any dividends in these years and made no prior-period adjustments. Assume that the treasury stock transactions did not affect retained earnings.

- 2 3 5** P15-7. Information from the shareholders' equity footnote for Mendes Manufacturing follows.

Additional Paid-in Capital from Treasury Stock Transactions	2018	2017	2016
Balance at January 1	\$ 20,996	\$ 20,746	\$ 20,032
Increase in equity on treasury stock sales	5,538	250	714
Decrease in equity on treasury stock sales	0	0	0
Balance at December 31	<u>\$ 26,534</u>	<u>\$20,996</u>	<u>\$20,746</u>
Retained Earnings	2018	2017	2016
Balance at January 1	\$ 99,823	\$ 90,851	\$ 82,570
Net earnings	20,183	18,283	17,000
Dividends	(10,313)	(9,311)	(8,719)
Balance at December 31	<u>\$109,693</u>	<u>\$99,823</u>	<u>\$90,851</u>
Common Stock Held in Treasury	2018	2017	2016
Balance at January 1	\$ 29,516	\$ 31,952	\$ 32,299
Purchases	2,270	1,412	3,421
Sales	(16,472)	(3,848)	(3,768)
Balance at December 31	<u>\$ 15,314</u>	<u>\$29,516</u>	<u>\$31,952</u>

Required »

Prepare the journal entries for 2017 and 2018 to reflect the treasury stock transactions included in the preceding footnote information.

- 4** P15-8. **Preferred Stock Issuance, Dividends in Arrears.** On January 1, 2016, Pollo Company issued 1,000 shares of 4%, \$100 par cumulative preferred stock for \$110,000. On December 26, 2017, the board of directors declared dividends of \$6,000, which were paid on December 31, 2017. The board of directors did not declare dividends again until December 24, 2020, at which time they declared dividends of \$20,000. Pollo paid the dividends on December 27, 2020. Any dividends declared beyond what is due to the preferred stockholders go to the common stockholders.

Required »

- What is the journal entry to record the issuance of preferred stock?
- What is the journal entry to record the declaration and payment of stock dividends in 2017? What footnote disclosures are necessary for dividends in arrears in fiscal year 2017?
- What footnote disclosures are necessary for dividends in arrears in fiscal year 2019?
- What is the journal entry to record the declaration and payment of stock dividends in 2020?

- 5** P15-9. **Prior-Period Adjustment.** When preparing its financial statements at the end of 2018, Thorn Retail Inc. discovered an error in accounting for inventory. When Thorn started to purchase merchandise from a new supplier, it expensed all transportation costs rather than capitalizing them as a cost of the inventory. It estimated that a portion of the transportation costs was erroneously expensed in 2017 and 2018. Transportation costs were \$326,367 and \$333,784 in fiscal 2017 and 2018, respectively. The company expensed all of the transportation costs in the year incurred when it should have capitalized a portion of the costs as ending inventory. Thorn determined that 90% of the inventory purchased in 2017 was sold in 2017 and 92% of the inventory purchased in 2018 was sold in 2018. Assume that all inventory on hand at the beginning of the year is sold during the year. Assume no tax implications. Round to the nearest dollar. The information from Thorn's financial statements before any adjustment follows:

Not Restated	2016	2017	2018
Net income	\$ 250,000	\$ 287,000	\$ 302,000
Cost of goods sold	5,006,000	5,320,000	5,575,360
Inventory, 12/31	470,564	256,684	267,324
Retained earnings, 12/31	4,750,103	5,008,403	5,021,903

Required »

- Would net income have been higher or lower in 2017 and by how much? What will Thorn report as net income in 2018?
- What would Thorn report as its inventory and retained earnings balances at the beginning of 2018 and at December 31, 2018?
- Prepare the retained earnings portion of the statement of stockholders' equity for 2018.
- What is the necessary journal entry to record the prior-period adjustment in 2018?

CASES

Judgment Cases

Judgment Case 1: Treasury Stock

TUFA, Inc. is a calendar-year, nonpublic company that follows [U.S. GAAP](#). TUFA uses the cost method to account for repurchases of treasury stock. Recently, TUFA repurchased 10,000 shares of its common stock from a key shareholder at \$55 per share. This particular shareholder had initiated a lawsuit against TUFA. Thus, a settlement of this lawsuit was included in the repurchase agreement. Because TUFA is not publicly traded, it does not have an established market price. It repurchased shares last year at \$35 per share. However, TUFA has increased performance each year for the past 5 years in terms of operating cash flow and earnings. Net income last year was \$1.67 per share. This year it was \$2 per share.

Provide the journal entry(ies) that TUFA should make when it reacquires the shares. Use the Codification to provide support for your response.

Judgment Case 2: Impact of Judgment in Accounting for Stock Dividends

On June 6, 2012, *Universal Bioenergy, Inc.* declared a 20% stock dividend. Because it is a 20% dividend, it had the flexibility to account for this as a small or large stock dividend. Its common stock was trading at \$0.01 per share at that time. Excerpts from its 10-K follow the questions.

1. What journal entry did *Universal Bioenergy* record on June 6? What journal entry did it record on July 20? Did *Universal Bioenergy* account for this stock dividend as a small or large stock dividend? You may find ASC 505-20-30-5 helpful in understanding this entity's approach.
2. What would be the impact on the accounts if *Universal Bioenergy* did not use the alternative treatment permitted for closely held entities?

What would be the impact on the accounts if *Universal Bioenergy* did not use the alternative treatment permitted for closely held entities and chose a different basic treatment? That is, if the company recorded it as a small stock dividend, how would the accounts change?

Discussion of the stock dividend included in ITEM 1 in the 10-K

*Approval of Stock Dividend**

On June 6, 2012, our Board of Directors passed a resolution and declared a stock dividend to distribute to all registered shareholders of record on or before July 13, 2012, on a 10 for 2 basis. On July 20, 2012, our transfer agent issued 78,161,209 shares of common stock to all registered shareholders of record in accordance with the resolution and declaration.

Excerpt from the notes to the financial statements follow:

NOTE 4: Equity

On December 26, 2012, the Company amended its Articles of Incorporation, and increased the authorized shares of common stock from 1,000,000,000 to 3,000,000,000 shares at \$.001 par value. There are 673,521,813 shares of common stock issued and outstanding as of December 30, 2012.

On June 6, 2012, our Board of Directors passed a resolution and declared a stock dividend to distribute to all registered shareholders of record on, or before, July 13, 2012, on a 10 for 2 basis. On July 20, 2012, our transfer agent issued 78,161,209 shares of common stock to all registered shareholders of record in accordance with the resolution and declaration.

The Company has authorized a total of 10,000,000 shares of Preferred Stock with a par value of \$.001 per share. On September 29, 2008, the Company authorized 100,000 Series A Preferred shares and 232,080 Series B Preferred Shares of stock. As of December 31, 2012, there were no Series A preferred shares issued and outstanding, and a total of 232,080 Series B preferred shares issued and outstanding.

Financial Statement Analysis Case

With declining demand and sales, the last several years have been challenging in the global auto industry. You are interested in better understanding the performance and valuation of major global companies in the industry. The following table presents net income for the year and shareholders' equity and market value at the end of each fiscal year for four global auto companies.

Company	Measure (U.S. dollars in millions)	Fiscal Year		
		2014	2015	2016
Ford Motor Company – U.S.	Net income	\$ 1,231	\$ 7,373	\$ 4,596
	Book value of common stockholders' equity	24,438	28,642	29,170
	Market value of common stock	58,556	54,920	47,342
General Motors Company – U.S.	Net income	3,949	9,687	9,427
	Book value of common stockholders' equity	35,457	39,871	43,836
	Market value of common stock	56,090	52,926	53,199
Honda Motor Company – Japan	Net income	6,074	4,241	3,059
	Book value of common stockholders' equity	61,600	59,184	60,032
	Market value of common stock	64,003	58,863	49,632
Daimler AG – Germany	Net income	8,940	9,157	8,975
	Book value of common stockholders' equity	53,250	58,218	61,000
	Market value of common stock	89,984	90,215	79,641

Required »

- Comment on changes in net income and book values of each year.
- Compute the price-earnings (P/E) ratios and price-to-book (P/B) ratios for each year.
- Compute an average of price-earnings (P/E) ratios and price-to-book (P/B) ratios for each year.
- Comment on the companies' P/E ratios over time. Are there any unusually high or low P/E ratios? If so, why? Comment on the average over time.
- Why would the P/B ratios in the automotive industry generally be higher than 1? Are there any unusually high or low P/B ratios? If so, why? Comment on the companies P/B ratios over time. Comment on the average over time.
- Compare the average P/E and P/B ratios for the pharmaceutical companies from Example 15.23 in the text with those in the auto industry.

Surfing the Standards Cases

Surfing the Standards Case 1: Preferred Dividends

Toofles Company, a publicly traded entity, issued nonredeemable preferred stock on January 1, 2018. Toofles issued 1,000 shares of \$100 par value shares for \$82,425. On January 1, 2015, the market rate of interest for preferred stock with the same characteristics was 6%. The preferred shares will not pay any dividends in 2015 or 2016. In 2017, they will pay 1% of par. In 2018, they will pay 3% of par. In 2019 and thereafter, the shares will pay 6% of par.

Management would like to know how to account for these shares both at issuance and thereafter. Prepare a memo to the file using the Codification for support. Include any relevant journal entries. Assume that dividend payments occur at the end of the year.

Basis for Conclusions Cases

Basis for Conclusions Case 1: Bifurcation²⁶

Many financial instruments include characteristics of both a liability and equity. Read ASC 480-10-15, paragraphs 3 and 4, and ASC 480-10-25, paragraph 1. Also read International Accounting Standard 32, paragraphs 28 through 32. In addition, read the relevant paragraphs in the Basis for Conclusions in Statement of Financial Accounting Standards No. 150, paragraphs B50 through B54, as well as the relevant paragraphs in the Basis for Conclusions in International Accounting Standard 32, paragraphs BC22 through BC31.

- How does **U.S. GAAP** treat these instruments? How does **IFRS** treat these instruments?
- Provide a discussion of the rationale each standard-setting body used to arrive at their conclusions.
- Based on the thoughts of the boards, it appears that there is a trade-off with respect to the bifurcation decision. What is this trade-off and which view do you prefer?

Basis for Conclusions Case 2: Capital Structure Disclosures

In January 1996, FASB issued an exposure draft of a standard that would address both the computation of earnings per share and the disclosure of information about a firm's capital structure. However, the board divided these topics into two standards. *Statement of Financial Accounting Standards No. 128* was issued to address earnings per share issues and *Statement of Financial Accounting Standards No. 129* was issued to address information related to the capital structure of firms. Read *Statement of Financial Accounting Standards No. 129* and answer the following questions.

Required »

- Why did FASB decide to split the exposure draft into two final standards?
- Why did FASB make SFAS No. 129 applicable to nonpublic entities?
- Why did FASB include securities that do not impact the computation of earnings per share in these disclosure requirements?

Investments in Financial Assets

LEARNING OBJECTIVES

- 1 Describe debt and equity investments, the two main types of investment securities that companies hold, and the key issues in accounting for them, including cost and fair value accounting.
- 2 Describe and illustrate accounting for investments in debt securities—including held-to-maturity, trading, and available-for-sale securities—at initial recognition and subsequent to acquisition.
- 3 Discuss and demonstrate accounting for investments in equity securities when the investor has no significant influence at initial recognition and subsequent to acquisition, including accounting for investments without readily determinable fair values.
- 4 Explain and illustrate accounting for investments in equity securities when the investor has significant influence over the investee company.
- 5 Explain and demonstrate the accounting for long-term notes receivable.

- 6 Discuss and illustrate the fair value option in accounting for investments in financial assets.
- 7 Detail required disclosures for investments in financial assets.

Introduction

COMPANIES HOLD INVESTMENTS IN FINANCIAL ASSETS for many reasons, such as facilitating liquidity, earning investment income and/or realizing capital gains, or forming strategic alliances with other companies. To facilitate liquidity, a company holds investments on a temporary basis and sells them when it needs cash in the operating cycle. In other cases, the company may hold the investment as a source of ongoing dividend and interest income. Selling an investment may also yield a capital gain.

Financial service entities such as banks and insurance companies usually hold a large amount of investments from which they intend to earn investment income and/or realize capital gains. For example, about one-third of *Citigroup Inc.*'s \$1,792 billion of assets at the end of 2016 were investment securities. *Citigroup* actively intended to trade about 41% of its investment assets and held the rest to generate investment income.

To form a strategic alliance with another company, an entity purchases a sufficient number of voting shares, thereby enabling it to exert significant influence over the other company. Consider *Starbucks Corporation*, a premier roaster, marketer, and retailer of specialty coffee operating in over 75 countries. *Starbucks*' products are available to consumers throughout the world through its own stores or through a network of affiliated companies. *Starbucks* owns most of its U.S. retail stores and is a major investor in the companies that operate other stores, primarily outside of the United States. *Starbucks* maximizes the strength and efficiency of its worldwide distribution and marketing capabilities by making significant investments in the equity of

Tim Graham/Alamy Stock Photo

companies operating in China, Japan, Korea, and Taiwan that represented about 3% of its total assets at the end of 2016. *Starbucks* exercises significant influence over the operating and financial policies of these affiliate companies. *Starbucks* holds other investments in corporate bonds and government securities, comprising about 8% of its total assets, to fund domestic and international operations, provide liquidity, or earn a return.

In this chapter, we cover accounting for different types of debt and equity securities. We first discuss debt investments. In the accounting and valuation for these investments, we demonstrate the importance of understanding whether the company intends to hold a debt investment until maturity, whether it intends to actively trade the securities, or whether it is holding

these securities as a source of liquidity to sell if cash is needed in the operating cycle. This section is followed by a discussion about equity investments when the investor does not have significant influence over the investee. Accounting for equity investments when a company has significant influence over the investee is covered next. We also discuss long-term notes receivable and explain the fair value option. We conclude the chapter with an overview of required disclosures. We discuss the impairment of investment assets in Appendix A.

Throughout the chapter, we also discuss differences in accounting for investments under U.S. GAAP and IFRS, including the accounting for different types of investments in debt and equity securities as well as impairment testing. ◀◀

- 1 Describe debt and equity investments, the two main types of investment securities that companies hold, and the key issues in accounting for them, including cost and fair value accounting.

Overview of Investments in Debt and Equity

Firms measure some investments in financial assets at cost, some at amortized cost, and some at fair value. For those measured at fair value, firms must report unrealized gains and losses in either net income or other comprehensive income. Each different type of investment in a financial asset may be accounted for differently.

We begin our discussion of the different types of investments held by companies and each type's accounting treatment with an introduction to investments in debt and equity securities.

Investments in Debt Securities

Debt securities are investments in the notes or bonds payable issued by another company. A bond, or promissory note, is a form of borrowing by which a company raises capital today in exchange for a contractual obligation to pay bondholders (the lenders) the principal amount (face value) and interest in the future. Corporations invest in bonds in order to receive periodic interest payments and a final payment of the principal amount (face value). Firms usually issue bonds with a face value (also referred to as *par value*) indicating the amount that the issuer will pay the bondholder at maturity. Bonds also typically have a stated interest rate, which determines the amount of interest that bondholders will receive in cash. Bonds are usually sold in an issue (for example, a \$5,000,000 bond issue consists of 5,000 of \$1,000 par value bonds).

Bonds can be purchased at their par value, at a discount (a price below par), or at a premium (a price above par). In all cases, bonds are priced such that their *yield* will be the same as the market rate of interest, which is also called the *effective interest rate*, for a similar amount of risk. **Yield** is the actual return that the investors will receive.

Investments in Equity Securities

Investments in equity securities are investments in the common or preferred shares of another company. The investor (the party purchasing the equity security) may receive returns in the form of dividends, which are distributions (most often cash) that the investee (the party that issued the equity security) pays to the investor. In addition, the investor could eventually sell the investment for an amount higher than its purchase price and earn a gain on disposal.

THE CONCEPTUAL FRAMEWORK CONNECTION: Fair Value versus Cost

When a company purchases an investment, it typically reports the investment at its cost on the date of acquisition. Several questions arise after the date of acquisition.

- If the value of the investment changes, should the company continue to report the asset at its cost, similar to land, or should it report the asset at its current fair value?
- If a company uses fair value to measure the investment, how does the company obtain the fair value, and what if there is no readily available fair value?
- If a company uses fair value to measure the investment, should it report the change in fair value in net income or in other comprehensive income?

The answers to these questions are not always clear. In fact, accounting standard setters have debated the issue of fair value versus cost for decades. Firms measured assets on the balance sheet at cost almost exclusively 25 years ago. In today's mixed-attribute balance sheets, firms report some items—such as certain investments—at fair value and other items—such as land—at cost.

The standard setters' requirements for cost or fair value accounting involve a trade-off between the two fundamental qualitative characteristics in the conceptual framework: relevance and faithful representation. The cost-basis method of valuation clearly provides a faithful representation of an asset's value. That is, it represents what it is intended to represent with a very high degree of accuracy. However, it is often not very relevant. Fair value is highly relevant in that it reflects the future economic benefits associated with the asset. However, in many cases, the fair value is subjective and thus may not provide a faithful representation.

To illustrate, assume that ReadWrite Corporation purchased an equity investment in MathSkills', Inc. 20 years ago for \$100,000. MathSkills' equity shares are not publicly traded, but management estimates a fair value of \$900,000. The \$100,000 acquisition price faithfully represents the cost. The \$900,000 fair value may be a good estimation of the fair value, but it is only an estimate. Thus, it is not as faithfully representative as the cost basis. However, the \$900,000 is much more relevant for decision-making purposes than the cost basis of \$100,000 because if management decides to sell the investment, the amount received on the sale will be closer to \$900,000 than to the original cost of \$100,000.

The fair values of publicly traded financial assets provide representational faithfulness in addition to being relevant because these amounts result from objectively determined quoted market prices. In fact, the first balance sheet items that the FASB required firms to report at fair value were debt investments and equity investments with readily determinable fair values.

Key Questions for Investments in Debt and Equity Securities

Accounting for investments in debt and equity securities involves addressing four key questions:

1. Is the investment a debt security or an equity security?
2. If the investment is a debt security, how long does management intend to hold the investment?
3. If the investment is an equity security, how much control does the investor have over the investee company?
4. If the investment is an equity security, is the fair value readily determinable?

Although the answer to the first question of whether an investment is a debt or equity security is straightforward, it is important because companies account for equity security investments differently than debt security investments. We discuss the second question on classification of debt securities based on management intent in the next section and cover the last two questions later in the chapter.

- ② Describe and illustrate accounting for investments in debt securities—including held-to-maturity, trading, and available-for-sale securities—at initial recognition and subsequent to acquisition.

Investments in Debt Securities

Companies classify and account for debt securities in one of three ways, depending on management intent and ability to hold the investments.¹

Classification of Debt Securities

Accounting for debt securities depends on management's reason for purchasing the securities. Management classifies debt securities into one of three portfolio categories at acquisition: *held-to-maturity securities*, *trading securities*, and *available-for-sale securities*.

1. **Held-to-maturity securities.** A company classifies a debt security as a **held-to-maturity investment** if it has both the positive intent and ability to hold a debt investment until it matures. Positive intent is not just the absence of the intent to sell: The company must actually plan on holding the debt security to maturity. If the company's intent to hold the instrument is uncertain, then it should not classify the security as held to maturity.
2. **Trading securities.** A **trading security** is a debt investment that a company intends to hold only for the short term.² A company generally classifies securities as trading when it plans to actively buy and sell securities with the objective of generating a gain on the sale.
3. **Available-for-sale securities.** If a debt security is not classified as held to maturity or trading, then it is classified as an **available-for-sale security**.

Investments in debt securities commonly change in fair value. The portfolio classification determines:

- The valuation of the security on the balance sheet (at amortized cost or fair value)
- If carried at fair value, where changes in fair value are reported (in earnings or other comprehensive income)

If the company actually sells the securities, then the change in fair value results in a **realized gain or loss**. If the company holds the securities, then the change in fair value is an **unrealized gain or loss**.

Management may transfer securities from one category to another. We discuss portfolio transfers later in the chapter.

Held-to-Maturity Debt Securities

Initial Valuation of Held-to-Maturity Debt Securities. Companies record held-to-maturity (HTM) debt security investments at cost when purchased. The process for determining a HTM debt security's purchase price is identical to determining the initial price of a bond.³ A bond's purchase price will always equal the present value of the cash flows related to the bond, discounted at the market rate of interest. Thus, the bond's purchase price is equal to the sum of the present value of the face or par value (the present value of a lump sum) plus the present value of the interest payments (the present value of an ordinary annuity). When the purchase price is less than the face value, the company purchases the bonds at a discount. When the purchase price is greater than face value, the company purchases the bonds at a premium. When the company purchases bonds, it typically does not record separate accounts for the bond discount or premium. Rather, the company records the asset at the purchase price—the face value of the bond, net of the discount or premium.

¹For the relevant authoritative literature, see FASB ASC 320–10 – *Investments – Debt Securities – Overall* for U.S. GAAP and IASB, *International Financial Reporting Standard 9*, “Financial Instruments” (London, UK: International Accounting Standards Board, 2014).

²FASB ASC 320-10, *Investments – Debt Securities – Overall* defines trading securities more thoroughly as follows. “Securities that are bought and held principally for the purpose of selling them in the near term and therefore held for only a short period of time. Trading generally reflects active and frequent buying and selling, and trading securities are generally used with the objective of generating profits on short-term differences in price.”

³We cover the treatment of a bond issue from the issuer's perspective in Chapter 14.

Examples 16.1 and 16.2 illustrate the computation of the purchase price of a bond. First, we examine the case of a bond purchased at a discount.

EXAMPLE 16.1 Determining the Purchase Price of a Bond—Discount

PROBLEM: On January 1, 2018, the Coley Corporation purchased \$400,000 par value 4% bonds that mature on December 31, 2021. The company has the positive intent and ability to hold the bonds until they mature. The market rate of interest was 6% when Coley purchased the bonds. Coley receives interest on the bonds semiannually each June 30 and December 31. What future cash inflows will Coley receive on this investment? What is the purchase price of the bonds? Did Coley purchase the bonds at a discount or premium? Prepare the journal entry to record the acquisition of the bonds.

SOLUTION: We know that Coley will receive semi-annual interest payments on the bonds and payment of the face value (\$400,000) when the bonds mature. Each semi-annual receipt is \$8,000, computed as follows:

$$\$400,000 \times 4\% \times 1/2 = \$8,000$$

The bond purchase price is equal to the present value of the future cash flows. This present value includes the face value of \$400,000 as well as the semi-annual interest payments. All present value inputs are at the semi-annual market rate because the bonds are priced to yield the market. Therefore, $I/Y = 3\%$, $(6\%/2)$, and $N = 8$ (4 years \times 2).

	N	I/Y	PV	PMT	FV	Excel Formula
Given	8	3.00%		8,000	400,000	
Solve for PV			(371,921)			=PV(0.03,8,8000,400000)

Coley purchased the bonds at a discount of \$28,079 because the \$371,921 purchase price is less than their \$400,000 face value. The journal entry to record the acquisition is as follows:

Account	January 1, 2018
Held-to-Maturity Debt Investments – Cost	371,921
Cash	371,921

Example 16.2 illustrates the same bond purchased at a premium when the market rate is lower than the stated rate.

EXAMPLE 16.2 Determining the Purchase Price of a Bond—Premium

PROBLEM: Referring to Example 16.1, now assume the same bonds were issued when the market rate of interest is 2%. What future cash inflows will Coley receive on this investment? What is the purchase price of the bonds? Did Coley purchase the bonds at a discount or premium?

SOLUTION: We know that Coley will receive semi-annual interest payments on the bonds and payment of the face value (\$400,000) when the bonds mature. Each semi-annual receipt is \$8,000, computed as follows:

$$\$400,000 \times 4\% \times 1/2 = \underline{\underline{\$8,000}}$$

The bond purchase price is equal to the present value of the future cash flows. This present value includes the face value of \$400,000 as well as the semi-annual interest payments. All present value inputs are at the semi-annual market rate because the bonds are priced to yield the market. Therefore, $I/Y = 1\%$, $(2\%/2)$, and $N = 8$ (4 years \times 2).

	N	I/Y	PV	PMT	FV	Excel Formula
Given	8	1.00%		8,000	400,000	
Solve for PV			(430,607)			=PV(0.01,8,8000,400000)

Coley purchased the bonds at a premium of \$30,607 because the \$430,607 purchase price is greater than their \$400,000 face value. The journal entry to record the acquisition is as follows:

Account	January 1, 2018
Held-to-Maturity Debt Investments – Cost	430,607
Cash	430,607

When purchasing bonds between interest payment dates, the purchaser pays the seller any accrued interest on the bonds. Because the interest payment is a part of the bond agreement, the issuing corporation pays the full interest payment to the current bondholder on the payment date regardless of how long the bondholder held the bond. To ensure that the purchaser receives the cash related to the interest revenue earned over the period the bonds were held, the seller requires the purchaser to pay for the interest accrued up to the purchase date.

For example, on October 1, a company purchases bonds that pay interest annually on December 31. Nine months of interest have accrued on the bonds at October 1. On December 31, the company purchasing the bonds will receive an interest payment representing the full 12 months of interest, but it held the bonds for only 3 months. When buying the bond on October 1, the purchaser must also pay the seller for the 9 months of accrued interest as Example 16.3 illustrates.

EXAMPLE 16.3 Bonds Purchased with Accrued Interest

PROBLEM: On October 1, 2018, Foley Corporation purchased \$500,000 par value 5% bonds that mature on December 31, 2021, for \$500,000 plus accrued interest. The company has the positive intent and ability to hold the bonds until maturity. The bonds pay interest annually on December 31. What is the amount of accrued interest on the bond? What is the journal entry at acquisition? What is the amount of the interest payment that Foley receives on December 31?

SOLUTION: Foley pays \$18,750 for 9 months of accrued interest when it purchases the bonds, computed as follows:

$$\$500,000 \times 5\% \times 9/12 = \underline{\$18,750}$$

The journal entry at acquisition includes interest receivable of \$18,750.

Account	October 1, 2018
Held-to-Maturity Debt Investments – Cost	500,000
Interest Receivable	18,750
Cash	518,750

On December 31, Foley receives the annual interest payment on the bonds of \$25,000, computed as follows:

$$\$500,000 \times 5\% = \underline{\$25,000}$$

Therefore, Foley's net interest revenue earned at December 31, 2018, is \$6,250 (\$25,000 – \$18,750). This amount represents the interest earned for the 3 months the bonds were held (\$6,250 = 5% × 3/12 × \$500,000).

Subsequent Valuation of Held-to-Maturity Debt Securities. After purchase, companies report HTM debt security investments at *amortized cost*. **Amortized cost** is original cost less the unamortized amount of the premium or discount. Any discount or premium is amortized to income subsequent to the date of acquisition and over the bond term. Amortized cost is a more relevant value than fair value for securities held until maturity. That is, fair values are not relevant if management does not intend to sell the debt investment before maturity.

In accounting for the debt investment, companies usually combine any discount or premium with the debt's face value. The debtor uses a separate premium or discount account when accounting for bonds payable; however, the investor typically combines these accounts into a single investment account. Using separate premium and discount accounts for investments is acceptable, but it is not typically found in practice.

Companies recognize interest revenue on HTM debt investments using the *effective interest method* of amortization. The **effective interest method** computes interest revenue by multiplying the *historical market rate* of interest by the carrying value of the debt investment at the beginning of the period. The **historical market rate** is the interest rate used to value the investment at the date of acquisition.

$$\text{Effective Interest Revenue} = \text{Historical Market Rate} \times \text{Carrying Value of Debt Investment at the Beginning of the Period} \quad (16.1)$$

When reporting interest revenue, companies also amortize the discount or premium. The amount amortized is the difference between the effective interest revenue and the cash interest received:

$$\text{Discount/Premium Amortization} = \text{Effective Interest Revenue} - \text{Cash Interest Received} \quad (16.2)$$

Example 16.4 illustrates the accounting for HTM debt securities.

EXAMPLE 16.4 Held-to-Maturity Debt Securities

PROBLEM: Cornish Associates acquired \$4,000,000 par value, 5%, 4-year bonds of Mendes Manufacturing on January 1 of the current year for investment purposes. Interest is payable semiannually each June 30 and December 31. The market rate on the date of acquisition was 8%. The investment is classified as held to maturity because Cornish has a positive intent and ability to hold the bonds until maturity. What are the journal entries for the current year and the journal entry to record the maturity of the debt investment?

SOLUTION: First, we determine the bond purchase price, which is equal to the sum of the present value of the future cash flows. All present value inputs are at the semi-annual market rate because the bonds are priced to yield the market. Therefore, $I/Y = 4\%$ ($8\%/2$), and $N = 8$ ($4 \text{ years} \times 2$).

	N	I/Y	PV	PMT	FV	Excel Formula
Given	8	4.00%		100,000	4,000,000	
Solve for PV			(3,596,035)			=PV(0.04,8,100000,4000000)

Cornish purchased the bonds at a discount of \$403,965 because the \$4,000,000 face value is greater than the \$3,596,035 purchase price. Cornish makes the following entry on the date of acquisition.

Account	Acquisition
Held-to-Maturity Debt Investments – Mendes Bonds	3,596,035
Cash	3,596,035

Continued

To determine the interest revenue each period, we construct an amortization table using the effective interest rate method as follows.

Period	Cash Interest at 2.5% (a)	Effective Interest at 4% (b) = 4% × Prior (d)	Discount Amortization (c) = (b) – (a)	Amortized Cost (d) = Prior (d) + (c)
0				\$3,596,035
1	\$100,000	\$ 143,841	\$ 43,841	3,639,876
2	100,000	145,595	45,595	3,685,471
3	100,000	147,419	47,419	3,732,890
4	100,000	149,316	49,316	3,782,206
5	100,000	151,288	51,288	3,833,494
6	100,000	153,340	53,340	3,886,834
7	100,000	155,473	55,473	3,942,307
8	<u>100,000</u>	<u>157,693*</u>	<u>57,693*</u>	4,000,000
Total	<u>\$800,000</u>	<u>\$1,203,965</u>	<u>\$403,965</u>	

*Adjusted due to rounding errors.

The cash interest received each period (\$100,000) is the face value (\$4,000,000) multiplied by the stated interest rate per semi-annual period of 2.5% (5%/2). The effective interest (Column 3) is the amortized cost at the beginning of the period multiplied by the 4% market interest rate. For example, the effective interest for Period 1 is computed as \$3,596,035 × 4%. The amount of discount amortization is the difference between the cash interest received and the effective interest. The ending amortized cost is the beginning amortized cost plus the discount amortization. In the case of a bond premium, the ending amortized cost is the beginning amortized cost less the premium amortization.

The entries to record interest revenue for the first year (first two interest periods) follow.

Account	June 30	December 31
Cash	100,000	100,000
Held-to-Maturity Debt Investments – Mendes Bonds	43,841	45,595
Interest Revenue	143,841	145,595

Every 6 months, Cornish records interest revenue and increases the carrying value of the investment according to the amortization table. Thus, when the debt matures, the investment account will reach \$4,000,000 at maturity. The journal entry to record the collection of face value at maturity is as follows:

Account	Maturity
Cash	4,000,000
Held-to-Maturity Debt Investments – Mendes bonds	4,000,000

Trading Debt Securities

A company holds trading debt securities with the intent to actively and frequently trade them. An investor reports changes in fair value of trading securities in net income. Reporting the changes in fair value in net income accurately portrays the way a company manages its operations and economic activity, resulting in relevant financial information for shareholders. When the company sells the securities, it also reports any realized gains or losses in net income.

Revaluing a debt investment to its current fair value requires a separate fair value adjustment account to reflect the difference between the fair value and the amortized cost of the investment. The fair value adjustment account captures fair value fluctuations each reporting period and avoids excessive changes in the investment account. The fair value adjustment account can have a debit or credit balance depending on whether the company recognizes unrealized gains or losses, respectively:

- If the fair value at the end of the year is *greater than* the amortized cost of the debt investment, the fair value adjustment account will have a debit balance.
- If the fair value at the end of the year is *less than* the amortized cost of the debt investment, the fair value adjustment account will have a credit balance.

For balance sheet reporting, the company combines the investment and fair value adjustment accounts. In addition to recording fair value adjustments, the company must amortize any discount or premium, similar to accounting for HTM debt investments. However, because of the short-term nature of trading securities, this amortization becomes much less significant than with long-term, HTM debt securities.

Example 16.5 illustrates accounting for a single investment classified as a trading security. The examples in this section focus on fair value adjustments and assume debt securities are purchased at face value. Therefore, there is no discount or premium to amortize.

EXAMPLE 16.5 Trading Debt Securities

PROBLEM: Phoneex Company, a calendar year-end firm, invested in a debt security with a face value of \$450,000 on October 1, 2018, that it properly classified as a trading security. Phoneex paid \$450,000 for the debt security. On December 31, 2018, the investment paid interest of \$4,500 and had a fair value of \$442,000. Phoneex sold the security on January 1, 2019, for \$441,000. Phoneex had not purchased any other trading securities before October 1, 2018, and it did not purchase any additional debt securities after the sale on January 1, 2019. What journal entries should Phoneex prepare to record these transactions?

SOLUTION: On October 1, Phoneex records the purchase of the securities as follows.

Account	October 1, 2018
Trading Debt Investments	450,000
Cash	450,000

Because the acquisition cost is equal to the face value, there is no discount or premium. On December 31, Phoneex records the interest revenue from the security.

Account	December 31, 2018
Cash	4,500
Interest Revenue	4,500

On December 31, Phoneex makes the entry to adjust the securities to fair value. Because the fair value of the security has decreased, Phoneex records an \$8,000 unrealized loss and credits the fair value adjustment account by \$8,000. The unrealized loss is reported in other income or investment income on the income statement.

Account	December 31, 2018
Unrealized Loss – Net Income	8,000
Fair Value Adjustment – Trading Debt Investments	8,000

Continued

After recording the fair value adjustment, the carrying value of the investments is \$442,000, as the t-accounts illustrate:

	Trading Debt Investments	+	Fair Value Adjustment – Trading Debt Investments	
Cost, 10/1	450,000			Fair Value
				Adjustment, 12/31
Balance, 12/31	<u>450,000</u>			<u>8,000</u>
				<u>8,000</u> = \$442,000

Phoneex reports the investment on the balance sheet as a single amount: \$442,000 fair value = \$450,000 investment at cost – \$8,000 fair value adjustment account.

In the following year, Phoneex records the sale of the trading securities as follows:

Account	January 1, 2019
Cash	441,000
Realized Loss – Net Income	9,000
Trading Debt Investments	450,000

Note that the realized gain or loss on sale is computed by subtracting the carrying value (using the original cost basis) from the selling price. We do not consider the fair value adjustment account on the sale of the securities.

At year-end, Phoneex holds no other trading securities but still has a balance in its fair value adjustment account that it must remove:

Account	December 31, 2019
Fair Value Adjustment – Trading Debt Investments	8,000
Unrealized Gain – Net Income	8,000

After this entry, Phoneex has a zero balance in its fair value adjustment account as well as a net loss of \$1,000 reported on its 2019 income statement. In summary, Phoneex reports a loss of \$8,000 in 2018 and a loss of \$1,000 in 2019, resulting in a total loss of \$9,000 over the life of the investment.

Available-for-Sale Debt Securities

A company reports available-for-sale securities at fair value and includes unrealized gains or losses in other comprehensive income. Reporting changes in fair value in other comprehensive income rather than net income reduces any volatility in earnings that could occur due to dramatic changes in the securities' fair value. Because a company holds the securities with the intent to have them available for sale (rather than to trade), the earnings volatility would not reflect the way it manages its business nor the impact of economic events on performance. Consequently, a company defers unrealized gains or losses by including them in accumulated other comprehensive income on the balance sheet. When the company sells the securities, it reports any realized gains or losses in net income.

Similar to trading securities, the company debits or credits a fair value adjustment account for the difference between the asset's fair value and its amortized cost. In addition, the company amortizes any discount or premium using the effective interest rate method.

Consider *Starbucks Corporation's* short-term and long-term investments in available-for-sale securities. *Starbucks* reported \$65.7 million of short-term securities and \$1,141.7 million of long-term securities accounted for as available for sale, including investments in

corporate debt, at the end of fiscal 2016. *Starbucks* reported unrealized holding gains of \$2.4 million (net of tax) during the year on its available-for-sale investments in other comprehensive income.

Example 16.6 illustrates the accounting for available-for-sale debt securities.

EXAMPLE 16.6 Available-for-Sale Debt Securities

PROBLEM: Littock, Inc. purchased JJR Company's \$400,000 par value, 5%, 4-year bonds on January 1, 2018, for \$359,604 and classified this investment as available for sale. The market rate on the date of issue was 8%. Interest is payable semiannually each June 30 and December 31. On December 31, 2018, the fair value of the investment was \$350,000 and on December 31, 2019, was \$360,050. Littock sold the investment on January 2, 2020, for \$365,000. Littock did not invest in any additional available-for-sale securities in 2020. Prepare the journal entries for 2018 through 2020 and reconcile the gains and losses reported in other comprehensive income over the life of the investment.

SOLUTION: Littock makes the following entry on the date of acquisition.

Account	January 1, 2018
Available-for-Sale Debt Investments	359,604
Cash	359,604

To determine the interest revenue each period, we construct an amortization table using the effective interest rate method as follows.

Date	Cash Interest at 2.5% (a)	Effective Interest at 4% (b) = 4% × Prior (d)	Discount Amortization (c) = (b) – (a)	Amortized Cost (d) = Prior (d) + (c)
January 1, 2018				\$359,604
June 30, 2018	\$10,000	\$14,384	\$ 4,384	363,988
December 31, 2018	10,000	14,560	4,560	368,548
June 30, 2019	10,000	14,742	4,742	373,290
December 31, 2019	10,000	14,932	4,932	378,222
June 30, 2020	10,000	15,129	5,129	383,351
December 31, 2020	10,000	15,334	5,334	388,685
June 30, 2021	10,000	15,547	5,547	394,232
December 31, 2021	10,000	15,768*	5,768*	400,000
Total	<u>\$80,000</u>	<u>\$120,396</u>	<u>\$40,396</u>	

*Adjusted due to rounding errors.

The entries to record interest revenue for the first year (first two interest periods) follow.

Account	June 30, 2018	December 31, 2018
Cash	10,000	10,000
Available-for-Sale Debt Investments	4,384	4,560
Interest Revenue	14,384	14,560

Based on the amortization table, the carrying value of the investment on December 31, 2018, is \$368,548. The fair value is \$350,000.

Continued

As of	Fair Value (a)	Amortized Cost (b)	Fair Value Adjustment Account Balance Debit (Credit) (c) = (b) – (a)
December 31, 2018	\$350,000	\$368,548	\$(18,548)
Existing balance in the fair value adjustment account			0
Amount of adjustment needed			<u>\$(18,548)</u>

← This is the balance needed in the fair value adjustment account at December 31, 2018

Thus, Littock needs a credit balance in the fair value adjustment account of \$18,548. Because there is currently a zero balance in the account, Littock will credit the full amount.

Account	December 31, 2018
Unrealized Loss – Other Comprehensive Income	18,548
Fair Value Adjustment – Available-for-Sale Debt Investments	18,548

After the fair value adjustment, the balance of AOCI related to unrealized gains and losses on securities is a debit of \$18,548 at December 31, 2018 (beginning balance \$0 plus \$18,548 unrealized loss), and the carrying value of the investment is at its fair value of \$350,000 as the t-accounts illustrate:

	Available-for-Sale Debt Investments	+	Fair Value Adjustment – Available-for-Sale Debt Investments	
Balance, 12/31/18	368,548			
			18,548	← Fair value adjustment, 12/31/18
Balance, 12/31/18	<u>368,548</u>		<u>18,548</u>	= \$350,000

The balance sheet will reflect the \$368,548 investment's amortized cost less the fair value adjustment at December 31, 2018, of \$18,548. As a result, Littock reports the net asset amount of \$350,000 on the balance sheet. The unrealized loss, reported in other comprehensive income, is closed out to accumulated other comprehensive income (AOCI) in stockholders' equity.

In 2019, Littock will first record the interest received and discount amortization on June 30 and December 31.

Account	June 30, 2019	December 31, 2019
Cash	10,000	10,000
Available-for-Sale Debt Investments	4,742	4,932
Interest Revenue	14,742	14,932

Based on the amortization table, the carrying value of the investment on December 31, 2019, is \$378,222. The fair value is \$360,050.

As of	Fair Value (a)	Amortized Cost (b)	Fair Value Adjustment Account Balance Debit (Credit) (c) = (b) – (a)
December 31, 2019	\$360,050	\$378,222	\$(18,172)
Existing balance in the fair value adjustment account			<u>\$(18,548)</u>
Amount of adjustment needed			<u>\$ 376</u>

← This is the balance needed in the fair value adjustment account at December 31, 2019

Thus, Littock needs a credit balance in the fair value adjustment account of \$18,172. Currently, the account has a credit balance of \$18,548. As a result, Littock must reduce the fair value adjustment account by \$376. The company will debit the fair value adjustment account and credit an unrealized gain in other comprehensive income for \$376.

Account	December 31, 2019
Fair Value Adjustment – Available-for-Sale Debt Investments	376
Unrealized Gain – Other Comprehensive Income	376

After the fair value adjustment, the balance of AOCI related to unrealized gains and losses on securities is a debit of \$18,172 at December 31, 2019 (beginning balance \$18,548 minus \$376 unrealized gain), and the carrying value of the investments is \$360,050 as the t-accounts illustrate:

	Accumulated Other Comprehensive Income	
Balance, 12/31/18	18,548	
Adjustment		376
Balance, 12/31/19	<u>18,172</u>	

	Available-for-Sale Debt Investments		+	Fair Value Adjustment – Available-for-Sale Debt Investments		
Balance, 12/31/18	368,548				18,548	12/31/18
Amortization	4,742					
Amortization	4,932					
Balance, 12/31/19	378,222			Fair value adjustment, 12/31/19	18,548	Balance, 12/31/19
				376		
Balance, 12/31/19	<u>378,222</u>				<u>18,172</u>	= \$360,050

The balance sheet will reflect the \$378,222 investment's amortized cost less the fair value adjustment at December 31, 2019, of \$18,172. As a result, Littock reports the fair value of the investment as the net asset amount of \$360,050 on the balance sheet. The unrealized gain, reported in other comprehensive income, is closed out to AOCI in stockholders' equity.

Continued

Littock records the sale of the securities on January 2, 2020. The journal entry to record the sale removes the investment from the balance sheet and reports a realized loss for the difference in the proceeds and the investment's amortized cost.

Account	January 2, 2020	
Cash	365,000	
Realized Loss	13,222	
Available-for-Sale Debt Investments		378,222

To compute the realized gain or loss on sale, we subtract the amortized cost (using the original cost basis) from the selling price. We do not consider the fair value adjustment account on the sale.

Sales price		\$365,000
Original cost	\$359,604	
Discount amortized to face value of investment	<u>18,618*</u>	
Amortized cost		<u>(378,222)</u>
Loss on sale of investment		<u>\$ (13,222)</u>

*\$4,384 + \$4,560 + \$4,742 + \$4,932 discount amortization from amortization table.

Finally, Littock must assess the fair value adjustment account at year-end. Because Littock does not have any available-for-sale debt investments remaining as of December 31, 2020, it adjusts the balance to zero, as follows.

Account	December 31, 2020	
Fair Value Adjustment – Available-for-Sale Debt Investments	18,172	
Unrealized Gain – Other Comprehensive Income		18,172

The \$13,222 represents the realized loss from the sale of the investment and is recorded on the income statement in other expenses. However, Littock reported \$18,172 of net unrealized losses (\$18,548 – \$376) in other comprehensive income in prior periods. Assuming that there are no other available-for-sale investments, the fair value adjustment account is no longer needed and should be removed. As a result, Littock reverses the fair value adjustment account at December 31, 2020. This entry also records a \$18,172 unrealized gain. If Littock did not make the reversal entry, the total loss on the investment would be \$31,394, which understates other comprehensive income (\$18,548 unrealized loss in 2018 less \$376 unrealized gain in 2019 plus \$13,222 realized loss in 2020).

The following table reconciles the total gains and losses recognized in comprehensive income for the security:

Date	Reported in Other Comprehensive Income		Reported in Net Income	Total Effect on Comprehensive Income
	Unrealized Gain	Unrealized Loss	Realized Loss	
12/31/18: FV adjustment		\$(18,548)		\$(18,548)
12/31/19: FV adjustment	\$ 376			376
01/02/20: Sale			\$(13,222)	(13,222)
12/31/20: FV adjustment	<u>18,172</u>			<u>18,172</u>
Totals	<u>\$18,548</u>	<u>\$(18,548)</u>	<u>\$(13,222)</u>	<u>\$(13,222)</u>

Exhibit 16.1 is an excerpt from *Coca-Cola Company's* accounting policies footnote for investments in debt securities from the 2016 financial statements. In the note, *Coca-Cola* explains its accounting for the three categories of debt investments we have just discussed. *Coca-Cola's* investment footnote (not disclosed here) further indicates that it classified the majority of its debt investments, with a fair value of \$4,758 million and cost of \$4,700 million, as available-for-sale securities in 2016.

EXHIBIT 16.1 Accounting Policy for Investments in Debt Securities, *Coca-Cola Company*, Financial Statements, December 31, 2016

NOTE 1: Business and Summary of Significant Accounting Policies

Investments in Equity and Debt Securities [Excerpt]

Our investments in debt securities are carried at either amortized cost or fair value. Investments in debt securities that the Company has the positive intent and ability to hold to maturity are carried at amortized cost and classified as held to maturity. Investments in debt securities that are not classified as held to maturity are carried at fair value and classified as either trading or available for sale.

Source: Financial Statements from Coca-Cola Company's 2016 Annual Report. <http://www.coca-colacompany.com/our-company/company-reports>

Exhibit 16.2 summarizes the accounting treatment for investments in debt securities.

EXHIBIT 16.2 Summary of Accounting Treatment for Investments in Debt Securities under U.S. GAAP

Management Intent	Portfolio Classification	Balance Sheet Treatment	Income Statement Treatment
Positive intent and ability to hold to maturity	Held-to-maturity	Amortized cost	Only realized gains and losses are recognized in net income. Unrealized gains and losses are not recognized. Interest revenue is recognized using the effective interest method; thus, discounts and premiums are amortized.
Acquired to sell	Trading	Fair value	Unrealized gains and losses are reported in net income.
Neither held to maturity nor short-term trading	Available for sale	Fair value	Unrealized gains and losses are reported in other comprehensive income.

Presentation of Other Comprehensive Income: Reclassification Adjustments for Available-for-Sale Debt Investments

A company classifying debt securities as available for sale reports unrealized gains and losses in other comprehensive income. It reports realized gains and losses in net income. When using fair values to measure the carrying amount of securities on the balance sheet, the company determines unrealized gains and losses at the end of each reporting period and again when realized on disposal of the investment. Consequently, a company might double count gains and losses in comprehensive income in the year it sells an investment. A reclassification adjustment avoids double counting by separating the change in the unrealized gains and losses from the realized gains and losses reported in net income.

Example 16.7 illustrates the reclassification adjustment.

EXAMPLE 16.7 Presentation in Other Comprehensive Income

PROBLEM: Consider the investments made by Littock, Inc. in Example 16.6. Specifically, consider the gains and losses reported in 2020. Assume that Littock reported net income before including any realized gains and losses of \$2,300,000 in 2020. It had no other items included in net income that year. Recall that Littock reported the following gains and losses in 2018 through 2020.

	Carrying Value	Fair Value	Cumulative Unrealized Gain (Loss)	Realized Gain (Loss)
1/1/18 (purchase date)	\$359,604			
12/31/18	368,548	\$350,000	(\$18,548)	
12/31/19	378,222	360,050	(18,172)	
1/2/20 (sale date)	378,222	365,000		(\$13,222)
12/31/20			18,172	

Prepare the partial statement of comprehensive income that relates to available-for-sale debt securities on December 31, 2020.

SOLUTION: Littock's statement of comprehensive income *without a reclassification* is as follows:

Littock, Inc.	
Partial Statement of Comprehensive Income	
For the Year Ended December 31, 2020	
Operating Income	\$2,300,000
Other Loss:	
Realized Loss on Available-for-Sale Investments	(13,222)
Net Income	\$2,286,778
Other Comprehensive Income:	
Unrealized Gain on Available-for-Sale Investments	\$18,172
Other Comprehensive Income	\$ 18,172
Comprehensive Income	<u>\$ 2,304,950</u>

However, this statement is misleading. Littock did not have an unrealized gain this year. The \$18,172 is a reversal of prior unrealized losses. Thus, the correct presentation for Littock for 2020 is as follows:

Littock, Inc.	
Partial Statement of Comprehensive Income	
For the Year Ended December 31, 2020	
Operating Income	\$2,300,000
Other Loss:	
Realized Loss on Available-for-Sale Investments	(13,222)
Net Income	\$2,286,778
Other Comprehensive Income:	
Unrealized Gain on Available-for-Sale Investments	\$ 0
Plus: Reclassification of Gains on Available-for-Sale Investments Included in Net Income	18,172
Other Comprehensive Income	\$ 18,172
Comprehensive Income	<u>\$2,304,950</u>

The *Coca-Cola Company* disclosed its reclassification adjustments in its financial statements for the year ended December 31, 2016. *Coca-Cola* reported \$17 million of net unrealized gains on available-for-sale securities in other comprehensive income in 2016. In its financial statement notes, *Coca-Cola* disclosed that \$96 million was unrealized gains (net of taxes) that arose during the year and \$79 million was a reclassification adjustment for realized gains reported in net income.

JUDGMENTS IN ACCOUNTING For Debt Investments

Financial statement reporting depends upon management intent when applying the accounting rules for debt investments. Whether a company reports the investment at fair value and whether it includes unrealized gains and losses in net income versus other comprehensive income is completely dependent upon managerial judgment in applying the accounting standards. If management states that debt investments will be held to maturity, then the financial statements will not include any unrealized gains or losses because held-to-maturity securities are valued at amortized cost, not at fair value. However, if management states that the debt investment will be sold in the short term and classifies them as trading, then the company values the trading securities at fair value and reports unrealized gains and losses on the income statement.

How can management know with certainty if they will hold or sell the investment and when it will be sold? This subjectivity can affect the financial statements. Consider Example 16.5. Because Phoneex Company classified the securities as trading, it reported a \$8,000 loss in net income in 2018. However, if it had classified the securities as available for sale, then net income would not have been affected. Rather, the \$8,000 would flow through other comprehensive income, where it is often overlooked by market participants. Alternatively, if these were debt securities classified as held to maturity, then Phoneex would not report a loss in the financial statements because they would be carried at amortized cost.

As another example, consider *Citigroup Inc.* As of December 31, 2016, it had investments in securities classified as held-to-maturity debt securities with a carrying value of \$45,667 million. This same portfolio had a fair value of \$45,555 million. Thus, at some point in time, *Citigroup* experienced net unrealized losses of \$112 million. However, because these securities were classified as held to maturity, *Citigroup* did not report these losses on the statement of comprehensive income. *Citigroup* also classified debt investments with a fair value of \$299,033 million at December 31, 2016, as available for sale. During the year ended December 31, 2016, *Citigroup* recorded unrealized gains on investment securities of \$108 million in other comprehensive income.⁴

Given the judgment and flexibility allowed under the accounting standards, it is prudent for financial statement users to carefully review the footnote disclosures related to debt investments and consider the financial statement implications of possible management changes in the classifications.

Transfers between Classifications

Management typically does not transfer securities from one portfolio classification (trading, available for sale, and held to maturity) to another. However, portfolio transfers may be implemented on occasion. All transfers between portfolios are accounted for at fair value on the date of the transfer to prevent managers from transferring securities to held to maturity to avoid fair value reporting.

Generally, any unrealized gains or losses are treated according to the rules associated with the portfolio to which the security is being transferred. In other words, if a company transfers a security into available for sale from held to maturity, then it reports the unrealized gains or losses in other comprehensive income.

⁴http://www.citigroup.com/citi/investor/quarterly/2016/ar15c_en.pdf

However, if the company is transferring from the trading portfolio, then no adjustment is necessary because the adjustment should have already occurred and been reported in net income. This treatment assumes that the transfer occurs at the end of the reporting period (annual or quarterly). For a transfer from available for sale to held to maturity, the company does not report the unrealized gain or loss at the time of transfer. Instead, it carries the unrealized gain or loss in accumulated other comprehensive income and amortizes the unrealized gain or loss to net income over the remaining life of the investment.

Exhibit 16.3 summarizes the accounting treatment for transfers of securities.

EXHIBIT 16.3 Accounting Treatment for Transfers of Securities

Transfer From	Transfer To	Unrealized Gain or Loss from Transfer at Fair Value
Available for sale	Trading	Recognize in net income.
Available for sale	Held to maturity	Unrealized gains and losses are not reported in income; they are carried in accumulated other comprehensive income and amortized to net income over the remaining life of the security.
Held to maturity	Trading	Recognize in net income.
Held to maturity	Available for sale	Recognize in other comprehensive income.
Trading	Held to maturity	Already recognized in net income; no adjustment is necessary.
Trading	Available for sale	Already recognized in net income; no adjustment is necessary.

Accounting for Debt Investments under IFRS

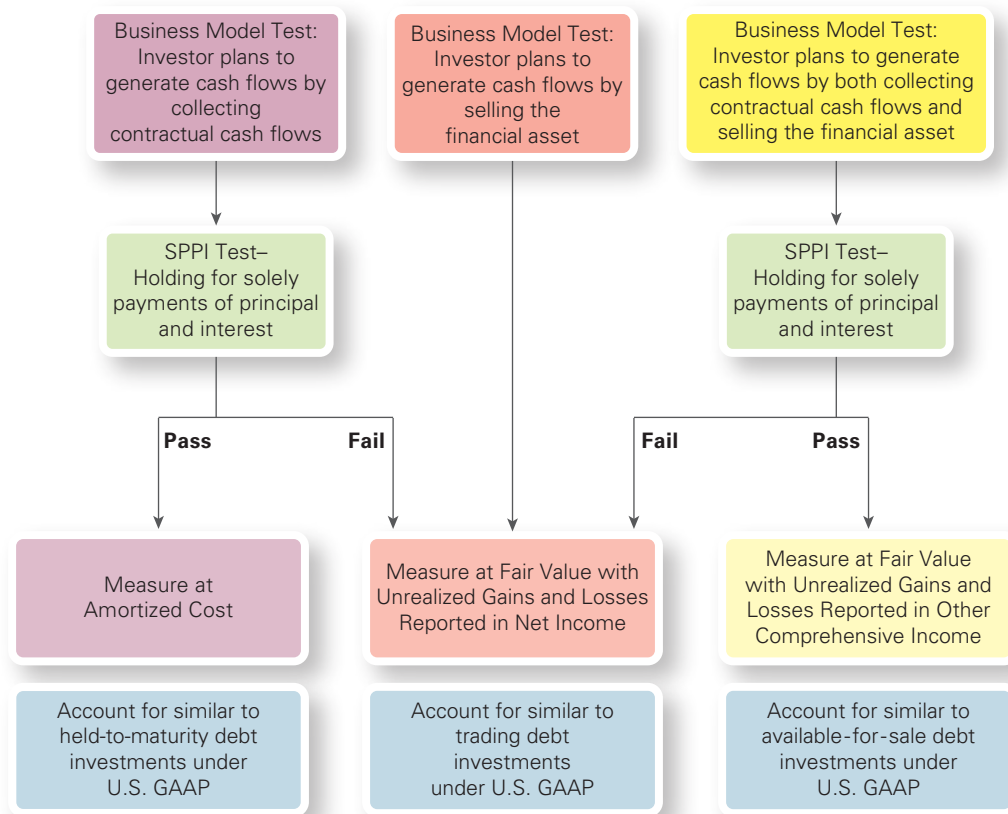

Similar to U.S. GAAP, debt investments may be measured at amortized cost, fair value with unrealized gains and losses reported in net income, or fair value with unrealized gains and losses reported in other comprehensive income under IFRS. However, the determination of which measure to use and when to use each measure differs under IFRS.

IFRS considers two tests to determine which measure to use: the *contractual cash flow characteristics test* and the *business model test*. The **contractual cash flow characteristics test** is passed if cash flows from the debt investment are solely payments of principal and interest on the outstanding principal balance. This test is referred to as the SPPI test (solely payments of principal and interest).

The **business model test** assesses management's intent in holding the investment. Management can intend to hold an investment to obtain cash flows for three reasons:

- Collecting contractual cash flows
- Selling the financial asset
- Both collecting contractual cash flows and selling the financial asset

If a debt investment passes the SPPI test and management's intent is to hold the asset to collect contractual cash flows, the investment is measured at amortized cost. If a debt investment passes the SPPI test and management's intent is to generate cash flows from the investment by both collecting contractual cash flows and selling the asset, the asset is measured at fair value with unrealized gains and losses reported in other comprehensive income. This treatment is similar to available-for-sale securities under U.S. GAAP. If management intends to sell the debt investment or it does not pass the SPPI test, then the debt investment is measured at fair value with unrealized gains and losses reported in net income, similar to trading securities under U.S. GAAP. Exhibit 16.4 presents the measurement of debt investments under IFRS.

EXHIBIT 16.4 IFRS Measurement of Debt Investments and Comparison to U.S. GAAP

- ③ Discuss and demonstrate accounting for investments in equity securities when the investor has no significant influence at initial recognition and subsequent to acquisition, including accounting for investments without readily determinable fair values.

Investments in Equity Securities: No Significant Influence

The appropriate accounting method for equity investments depends on the investor's level of influence over the investee company. There are three possible levels of influence:

1. **No significant influence.** The investor lacks the ability to participate in the decisions of the investee company.⁵
2. **Significant influence.** The investor company has the ability to exert influence over operating and financial policy decisions of the investee company even though it does not legally control the investee company, generally holding 20 to 50% of the investee's stock.
3. **Control.** Typically gained by an investor company holding more than 50% of the voting shares of the investee company.

Other factors that determine the level of influence that the investor can exert over the investee company include controlling membership on the investee's board of directors, interchanging management or technology, and interdependent inventory supply relationships.

We will first discuss the case in which the investor does not have significant influence followed by a discussion of accounting for investments in equity securities when the investor has

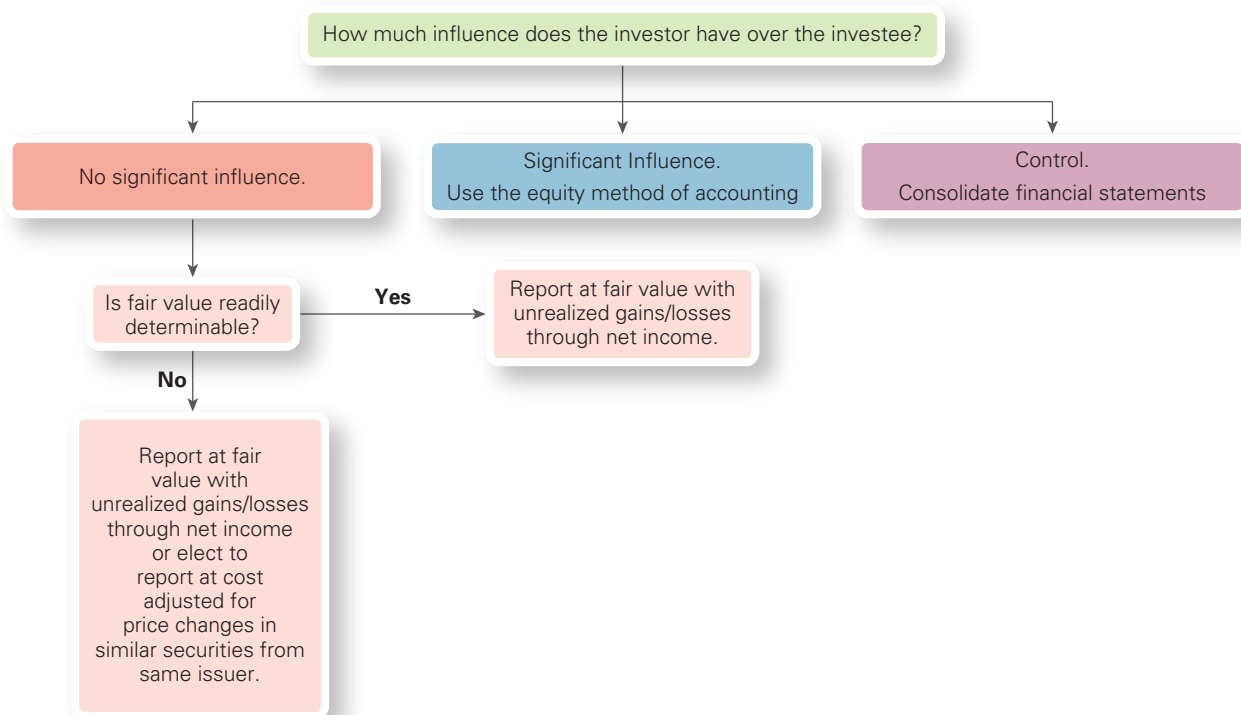

⁵For the relevant authoritative literature, see FASB ASC 321 – 10 – *Investments – Equity Securities – Overall* for U.S. GAAP and IASB, *International Financial Reporting Standard 9, "Financial Instruments"* (London, UK: International Accounting Standards Board, 2014).

significant influence but not legal control.⁶ We must also consider whether there is a readily determinable market value for an equity security.

Exhibit 16.5 illustrates the key considerations in determining the appropriate method to use when accounting for investments in equity securities. When there is no significant influence, companies generally use fair value accounting. They use the equity method when there is significant influence and consolidation accounting applies when there is control.

We begin by discussing securities with no significant influence and readily determinable fair values.

EXHIBIT 16.5 Accounting for Investments in Equity Securities

Equity Investments With No Significant Influence: Readily Determinable Fair Value

Companies report an equity investment with no significant influence and a readily determinable fair value at its fair value. Generally, an equity security has a readily determinable fair value if the sales price is currently available on a securities exchange that is registered with the SEC, or in the over-the-counter market, provided that those prices or quotations for the over-the-counter market are publicly reported by the National Association of Securities Dealers Automated Quotations systems or by OTC Markets Group Inc.⁷ Each reporting period, the company revalues the investment to its current fair value and reports unrealized gains or losses in net income. The company also reports realized gains and losses in net income when it sells the securities. Both realized and unrealized gains and losses reported in earnings are classified as other income (expense) on the income statement. Any dividends received are reported as dividend income. Example 16.8 illustrates accounting for a portfolio of equity securities with readily determinable fair values.

⁶Companies use consolidation accounting for investments when the investor has legal control; this topic is covered in advanced accounting textbooks and courses.

⁷See ASC 321-10-20 for more detail.

EXAMPLE 16.8**Equity Securities with No Significant Influence and Readily Determinable Fair Values**

PROBLEM: Easy as Pie, Incorporated purchased equity securities during 2018 and 2019. Easy as Pie does not have significant influence over the investees. The securities all have readily determinable fair values. It had not purchased any equity securities before this time and did not make any additional investments after its purchase of Security D. Information on the purchase, fair value, and selling price of the securities is presented in the following table.

Security	Purchase Date	Purchase Price	Fair Value – December 31, 2018	Fair Value – December 31, 2019	Date Sold	Selling Price
A	November 29, 2018	\$500,000	\$480,000	N/A	January 5, 2019	\$470,000
B	December 10, 2018	120,000	125,000	N/A	January 21, 2019	124,000
C	December 5, 2019	54,000	N/A	\$ 51,000	January 3, 2020	53,500
D	December 22, 2019	135,000	N/A	134,000	January 5, 2020	134,500

Prepare the journal entries to account for the events related to each investment. Reconcile the gains and losses reported in comprehensive income each year.

SOLUTION: Easy as Pie records the purchase of the 2018 investments (Securities A and B) as follows:

Account	November 29, 2018	December 10, 2018
Equity Investments – Cost	500,000	120,000
Cash	500,000	120,000

The total portfolio fair value as of December 31, 2018, is \$605,000 (\$480,000 + \$125,000). The portfolio fair value decreased by \$15,000 from the original purchase price of \$620,000. Thus, Easy as Pie records an unrealized loss in net income and uses the fair value adjustment account to decrease the carrying value of the investment.

Account	December 31, 2018
Unrealized Loss – Net Income	15,000
Fair Value Adjustment – Equity Investments	15,000

After the fair value adjustment, the carrying value of the investments is \$605,000 as the t-accounts illustrate:

Equity Investments		+	Fair Value Adjustment – Equity Investments		
Balance, 12/31/17	0			0	
2018 entries	620,000			15,000	
Balance, 12/31/18	<u>620,000</u>			<u>15,000</u>	= \$605,000

In January 2019, Easy as Pie records the sale of Securities A and B as follows:

Account	January 5, 2019	January 21, 2019
Cash	470,000	124,000
Realized Loss – Net Income	30,000	
Realized Gain – Net Income		4,000
Equity Investments – Cost	500,000	120,000

Continued

In December 2019, Easy as Pie records the purchase of Securities C and D.

Account	December 5, 2019	December 22, 2019
Equity Investments – Cost	54,000	135,000
Cash	54,000	135,000

On December 31, 2019, Easy as Pie must adjust the fair value adjustment account to properly reflect the fair value of the investments on the balance sheet. The fair value of the portfolio on December 31, 2019, is \$185,000 (\$51,000 + \$134,000) and consists of Securities C and D. The cost of the portfolio is \$189,000 (\$54,000 + \$135,000). We compute the adjustment as follows.

As of	Fair Value (a)	Cost (b)	Fair Value Adjustment Account Balance Debit (Credit) (c) = (b) – (a)
December 31, 2019	\$185,000	\$189,000	\$ (4,000)
Existing balance in the fair value adjustment account (credit)			<u>(15,000)</u>
Amount of adjustment needed			<u>\$11,000</u>

Easy as Pie will reduce the credit balance in the fair value adjustment account in this case because there is a \$15,000 credit balance in the account, and it needs only a \$4,000 credit balance. Consequently, it needs to debit the account by \$11,000.

Easy as Pie debits the fair value adjustment account for \$11,000 and recognizes a gain on the income statement for the same amount.

Account	December 31, 2019
Fair Value Adjustment – Equity Investments	11,000
Unrealized Gain – Net Income	11,000

After the fair value adjustment, the carrying value of the investments is \$185,000 as the t-accounts illustrate:

	Equity Investments		+	Fair Value Adjustment – Equity Investments		
Balance, 12/31/17	0				0	
2018 entries	620,000				15,000	
Balance, 12/31/18	620,000				15,000	= 605,000
Sale		620,000				
Purchase	189,000					
Fair value Adjustment				11,000		
Balance, 12/31/19	<u>189,000</u>				<u>4,000</u>	= <u>185,000</u>

In January 2020, Easy as Pie records the sale of the securities as follows:

Account	January 3, 2020	January 5, 2020
Cash	53,500	134,500
Realized Loss – Net Income	500	500
Equity Investments – Cost	54,000	135,000

As of December 31, 2020, Easy as Pie does not hold any investments in equity securities, and thus the balance in the fair value adjustment account should be zero. Easy as Pie makes the following entry:

Account	December 31, 2020
Fair Value Adjustment – Equity Investments	4,000
Unrealized Gain – Net Income	4,000

The following tables reconcile the total gains and losses for the security. First, we compute the amount of total gains and losses that flowed through the gain and loss accounts:

Date	Reported in Net Income				Total Effect on Comprehensive Income
	Unrealized Gain	Unrealized Loss	Realized Gain	Realized Loss	
12/31/18: FV adjustment		\$(15,000)			\$(15,000)
2019 sale			\$4,000	\$(30,000)	(26,000)
12/31/19: FV adjustment	\$11,000				11,000
2020 sale				(1,000)	(1,000)
12/31/20: FV adjustment	4,000				4,000
Totals	<u>\$15,000</u>	<u>\$(15,000)</u>	<u>\$4,000</u>	<u>\$(31,000)</u>	<u>\$(27,000)</u>

Second, we compare the total gain(loss) to the difference between the purchase price and the selling prices for all of the securities:

Security	Purchase Date	Purchase Price	Selling Price	Gain (Loss)
A	November 29, 2018	\$500,000	\$470,000	\$(30,000)
B	December 10, 2018	120,000	124,000	4,000
C	December 5, 2019	54,000	53,500	(500)
D	December 22, 2019	135,000	134,500	(500)
TOTAL		<u>\$809,000</u>	<u>\$782,000</u>	<u>\$(27,000)</u>

The computations show that the total loss on Easy as Pie's investing activities was \$(27,000).

Equity Investments With No Significant Influence: No Readily Determinable Fair Values

For certain equity investments with no significant influence, a readily determinable fair value is not available. Consider an investment in a private company—because the company is not publicly traded, no market price exists. Alternatively, a company could have more than one class of equity security available but only one class is publicly traded.

Generally, companies report no significant influence securities with no readily determinable fair values at estimated fair value with unrealized gains and losses in net income.⁸ Realized gains and losses on disposal are also reported in net income. However, a company can elect, on a security-by-security basis, to report an equity security without a readily determinable fair value at cost with an adjustment for changes resulting from observable price changes for similar (or identical) securities of the same issuer. The amount of the adjustment should account for any differences in the two securities. The adjustment is reported in net income along with any realized gains and losses.

⁸Companies use inputs specified in Level II and Level III of the fair value hierarchy to estimate fair value for these investments. Chapter 2 provides a more in-depth discussion of the fair value hierarchy.

Example 16.9 provides an illustration of the election available for equity securities with no readily determinable fair value.

EXAMPLE 16.9 Equity Investments with No Significant Influence and No Readily Determinable Fair Value

PROBLEM: Tekky Corporation purchased 10,000 shares of preferred stock – Class A in Hui Zu, Ltd. on December 15 for \$100,000 and sold it the following June 22 for \$114,000. Tekky does not have significant influence over the investee, Hui Zu, Ltd. This class of preferred stock is not actively traded and it does not have a readily determinable fair value. However, Hui Zu, Ltd. has another issue of preferred stock (Class B) outstanding that is nearly identical to the stock that Tekky holds except that it is publicly traded. The price of the Class B stock increased 10% between December 15 and December 31.

Tekky chooses to use the exception provided in the authoritative literature to measure the investment at adjusted cost. What journal entries are required to record these transactions?

SOLUTION: Tekky records the purchase at cost as follows:

Account	December 15, Current Year	
Equity Investments	100,000	
Cash		100,000

At year-end, Tekky will adjust the equity investment in the Class A shares for the 10% observable price increase in the Class B stock.

Account	December 31, Current Year	
Fair Value Adjustment – Equity Investments	10,000	
Unrealized Gain – Net Income		10,000

When Tekky sells the investment during the following year, it recognizes the realized gain of \$14,000 on the income statement computed as the difference between the \$114,000 selling price and the \$100,000 original cost. The entry to record the disposal of the investment follows:

Account	June 22, Following Year	
Cash	114,000	
Gain on Sale of Equity Investment		14,000
Equity Investments		100,000

As of December 31 of the following year, Tekky does not hold any investments in equity securities, and thus the balance in the fair value adjustment account should be zero. Tekky makes the following entry:

Account	December 31, Following Year	
Unrealized Loss – Net Income	10,000	
Fair Value Adjustment – Equity Investments		10,000

JUDGMENTS IN ACCOUNTING: Equity Investments with No Significant Influence and No Readily Determinable Fair Values

Determining the measurement for investments in equity securities with no readily determinable fair value requires a great deal of judgment. If a company does not make the election to report the investment at adjusted cost, then the company must determine a fair value of an investment that does not have a readily determinable fair value. Doing so requires an estimation technique.

But even if the company makes the election, it still needs to make a variety of estimates. For example, is the other security of that issuer “similar” enough to the investment that the company holds? The authoritative literature does not indicate just how similar the two instruments have to be. The authoritative literature does say that the company should consider the different rights and obligations, such as voting rights, distribution rights and preferences, and conversion features of the securities. However, the standard setters do not provide any specific guidance on how many differences can exist between the security that the company holds as an investment and the comparison security.

Once a company does decide that the comparison security is similar to the investment, it then must make adjustments to the observable price change of the comparison security to account for differences such as voting rights and conversion features before applying that price change to the measurement of its investment.

Accounting for Equity Investments with No Significant Influence under IFRS

Unlike U.S. GAAP, IFRS does not distinguish between no significant influence investments with and without a readily determinable value. Accounting for equity investments can differ under U.S. GAAP and IFRS. Under IFRS, these investments are typically measured at fair value with unrealized gains and losses reported in net income similar to U.S. GAAP. However, under certain circumstances, a company can elect to report gains and losses in other comprehensive income, called fair value through other comprehensive income (FVOCI). If the company makes this election, then all gains and losses—both realized and unrealized—are reported in other comprehensive income. A company can make this election under two circumstances, specifically, when the equity investment is:

- Not held for trading
- Not part of contingent consideration in a business combination when it could possibly be given as additional payment on the purchase of a business after it is acquired

This election to designate an equity investment as FVOCI is irrevocable and is made on an investment-by-investment basis. Example 16.10 illustrates accounting for equity investments using the FVOCI under IFRS.

EXAMPLE 16.10

IFRS Accounting for Equity Investments – Fair Value through Other Comprehensive Income

PROBLEM: Dobigs Company, an IFRS reporter, purchased equity securities on November 29, 2018, for \$25,000. Dobigs does not have significant influence in the investee and elects to report this investment at fair value through other comprehensive income. The fair value of the investment was \$23,500 on December 31, 2018, and \$26,000 on December 31, 2019. Dobigs sold the investment on January 22, 2020, for \$26,250.

Prepare the journal entries to account for the events related to this investment.

SOLUTION: Dobigs records the purchase of the security:

Account	November 29, 2018	
Equity Investment – FVOCI	25,000	
Cash		25,000

Dobigs records the 2018 year-end fair value adjustment, reducing the equity investment – FVOCI account as follows:

Account	December 31, 2018	
Unrealized Loss – Other Comprehensive Income	1,500	
Equity Investment – FVOCI		1,500

Continued

Dobigs records the 2019 year-end fair value adjustment by increasing the investment account and reporting the gain in other comprehensive income.

Account	December 31, 2019	
Equity Investment – FVOCI	2,500	
Unrealized Gain – Other Comprehensive Income		2,500

On January 22, 2020, Dobigs records the disposal of the security, recording the realized gain in other comprehensive income.

Account	January 22, 2020	
Cash	26,250	
Equity Investment – FVOCI		26,000
Realized Gain – Other Comprehensive Income		250

Dividends on equity investments designated at FVOCI are normally reported in net income. However, dividends that represent a return of the cost of the investment are reported in OCI. Determining whether dividends represents a return of the cost of the investment is a matter of judgment. For example, an unusually large dividend could represent a return of the cost of the investment rather than a distribution of earnings.

- 4 Explain and illustrate accounting for investments in equity securities when the investor has significant influence over the investee company.

Investments in Equity Securities: Significant Influence

When an investor has significant influence over the investee but does not have control, companies use the *equity method* of accounting for the investment.⁹ Significant influence is the power to participate in the financial and operating decisions of the company but not to control those policies. An investor is generally presumed to have significant influence at 20% or more ownership unless it can be clearly demonstrated that this is not the case.¹⁰ Significant influence changes to control when ownership exceeds 50%.

Under the **equity method**, the investor recognizes the increases and decreases in the economic resources of the investee. The investor initially reports the investment account at cost and thereafter reports any events that affect the book value of the investee's retained earnings in the carrying value of its investment account and financial statements.

During 2016, *Starbucks* used the equity method to account for its 50% ownership of companies in China, India, Korea, and Taiwan and a 50% partnership with *Pepsi-Cola Company* in North America. If *Starbucks'* equity investments in these companies were any larger than 50%, its influence would be considered a controlling interest rather than a significant influence as shown in Exhibit 16.6, and its accounting would change.

The Equity Method

When a company acquires an equity investment that provides significant influence over the investee company, it initially reports the investment at its cost. The investor company subsequently adjusts the investment's carrying amount for changes in the retained earnings of the investee company. The subsequent adjustments depend on whether:

- The book value of net assets of the investee *equals* its fair value at the date of the acquisition
- The book value of net assets of the investee *is different from* its fair value at the date of the acquisition.

A company's net assets are its equity, which is why this method is called the *equity method*.

⁹For the relevant authoritative literature for this topic, see FASB ASC 323-10, *Investments – Equity Method and Joint Ventures – Overall* for U.S. GAAP and IASC, *International Accounting Standard 28*, “Investments in Associates” (London, UK: International Accounting Standards Committee, 1989, Revised) for IFRS.

¹⁰For the relevant authoritative literature for this topic, see FASB ASC 323-10, *Investments – Equity Method and Joint Ventures – Overall* for U.S. GAAP and IASC, *International Accounting Standard 28*, “Investments in Associates,” for IFRS, Paragraph 6.

Investee's Net Assets Equal Fair Value. A company's net assets increase when it earns net income and decrease when it declares dividends or incurs a net loss. So, the investor's investment account increases by its share of the investee's net income. If the investee has a net loss, then the investor's investment account decreases by its share of the net loss. The investor decreases the investment account by its share of the dividends declared by the investee company.¹¹

Dividends reduce the investment account and are not recorded as income for several reasons:

1. Dividends received on investments accounted for under the equity method are a return *of* an investment, not a return *on* investment.
2. The decision to distribute investee dividends is influenced by the investor. As a result, this is not an objective transaction, and the investor should not recognize this event as income.
3. Because the investor recognizes its share of investee's net income or loss on the income statement, recognizing dividends as income would double count a portion of the investee's earnings on the investor's income statement.

When the book value of the net assets of the investment equals its fair value at acquisition, the increases and decreases to the investment account under the equity method are as follows.

Investment – Equity Method	
Purchase Price	– Percent of Investee's Net Loss
+ Percent of Investee's Net Income	– Percent of Investee's Dividends Declared
= Ending Balance	

Example 16.11 illustrates the equity method when the book value of the investee's net assets equals their fair value.

EXAMPLE 16.11

Equity Method: Net Assets Equal Fair Value

PROBLEM: Krieger Krisp Donuts, Inc. acquired 40% of the voting common shares of Delevan Bakers Corporation on January 1, 2018, at a total cost of \$2,535,000. At acquisition, the reported book value of Delevan Bakers' net assets equaled its fair value. This investment allows Krieger to exert significant influence over Delevan's operating and financing policies. At the end of 2018, Delevan reported \$769,500 in net income and declared and paid \$123,475 in dividends for the period. At the end of 2019, Delevan reported a net loss of \$432,000. No dividends were declared in 2019. What journal entries should Krieger record related to its investment in Delevan Bakers? What is the amount of the investment in Delevan Bakers at December 31, 2018? At December 31, 2019?

SOLUTION: Krieger initially records the investment at cost as follows:

Account	January 1, 2018
Investment in Delevan Bakers Corporation (Equity method)	2,535,000
Cash	2,535,000

At the end of 2018, Krieger records its share of net income ($\$769,500 \times 40\% = \$307,800$) and declared dividends ($\$123,475 \times 40\% = \$49,390$) as follows.

Account	December 31, 2018
Investment in Delevan Bakers Corporation (Equity method)	307,800
Income from Investment	307,800

Continued

¹¹If the investor pays more (or less) than the book value of the investee, then there are additional accounting considerations that we will discuss in a subsequent example.

Account	December 31, 2018	
Cash	49,390	
Investment in Delevan Bakers Corporation (Equity method)		49,390

At the end of 2019, Krieger records its share of net loss ($\$432,000 \times 40\%$).

Account	December 31, 2019	
Loss on Investment	172,800	
Investment in Delevan Bakers Corporation (Equity method)		172,800

Notice in the following t-account that Krieger's investment in Delevan Bakers is \$2,793,410 and \$2,620,610 at the end of 2018 and 2019, respectively. The t-account for the equity method investment follows.

Investment in Delevan Bakers Corporation			
1/1/18 Purchase Price	2,535,000		
40% of 2018 Net Income	307,800	49,390	40% of 2018 Dividends Declared
12/31/18 Balance	2,793,410		
		172,800	40% of 2019 Investee's Net Loss
12/31/19 Balance	<u>2,620,610</u>		

Investee's Net Assets Do Not Equal Fair Value. An investee's fair value often does not equal the reported book value of its net assets at the date of acquisition for a variety of reasons, including:

- Differences between the fair values and book values of assets such as inventory or property, plant, and equipment
- Unreported intangible assets such as brands that can be identified
- Unreported goodwill

The investor will make additional adjustments for any items that would affect net income. For example, consider the case when the book value of the investee's net assets are less than its fair value because the fair value of an investee's equipment is higher than its book value. The investee computes depreciation expense based on the equipment's book value. However, the purchase price is based on the equipment's fair value. In this case, the investor needs to adjust the income from the investment for additional depreciation expense on the difference between the equipment's fair value and its book value. Example 16.12 provides an illustration.

EXAMPLE 16.12

Equity Method: Net Assets Not Equal to Fair Value

PROBLEM: Krieger Krisp Donuts, Inc. acquired 40% of the voting common shares of Delevan Bakers Corporation on January 1, 2018, at a total cost of \$2,785,000, when its fair value was \$6,962,500. At acquisition, the reported book value of Delevan Bakers' net assets was \$6,337,500. The difference between Delevan's fair value and the book value of its net assets is due to the fair value of equipment that is higher than its book value. The equipment has a 20-year remaining useful life. This investment allows Krieger to exert significant influence over the operating and financing policies of Delevan. At the end of 2018, Delevan reported \$769,500 in net income and declared and paid \$123,475 in dividends for the period. What journal entries should Krieger record related to its investment in Delevan Bakers? What is the amount of the investment in Delevan Bakers at December 31, 2018?

SOLUTION: Krieger initially records the investment at cost as follows:

Account	January 1, 2018
Investment in Delevan Bakers Corporation (Equity method)	2,785,000
Cash	2,785,000

At the end of 2018, Krieger records its share of net income ($\$769,500 \times 40\% = \$307,800$) and declared dividends ($\$123,475 \times 40\% = \$49,390$) as follows:

Account	December 31, 2018
Investment in Delevan Bakers Corporation (Equity method)	307,800
Income from Investment	307,800

Account	December 31, 2018
Cash	49,390
Investment in Delevan Bakers Corporation (Equity method)	49,390

The fair value of Delevan's net assets is \$625,000 higher than its book value (\$6,962,500 less \$6,337,500) because the fair value of its equipment is higher than its book value. Krieger adjusts its income for the investment by its share of the additional depreciation expense computed as follows:

$$(\$625,000 \text{ Difference} / 20\text{-year Useful Life}) \times 40\% \text{ Ownership} = \$12,500$$

The additional depreciation expense reduces income from the investment and the investment. The journal entry is as follows:

Account	December 31, 2018
Income from Investment	12,500
Investment in Delevan Bakers Corporation (Equity method)	12,500

In the following t-account, notice that Krieger's investment in Delevan Bakery is \$3,030,910 at the end of 2018.

Investment – Equity Method			
1/1/18 Purchase Price	2,785,000		
40% of 2018 Net Income	307,800	49,390	40% of 2018 Dividends Declared
		12,500	40% of Additional Depreciation Expense
12/31/18 Balance	3,030,910		

Exhibit 16.6 presents an excerpt from *Starbucks Corporation's* 2016 financial statement footnote on equity and cost investments. *Starbucks* uses the equity method for equity investments when the investor has significant influence over the investee company—and *Starbucks's* significant influence over its investee companies is evidenced by the levels of ownership ranging from 39.6% to 50% of the voting shares held. At October 2, 2016, *Starbucks's* investments accounted for under the equity method were about \$354.5 million, or about 2.5% of its \$14,329.5 million in total assets. *Starbucks's* income from these investments during fiscal year 2016 was about \$318.2 million, or about 7.6% of its operating income.

EXHIBIT 16.6 Accounting for Equity Investments, *Starbucks Corporation*, Financial Statements, October 2, 2016

NOTE 6: Equity and Cost Investments (*in millions*)

Equity Method Investments [Excerpt]

As of October 2, 2016, we had a 50% ownership interest in each of the following international equity method investees: President Starbucks Coffee (Shanghai); Starbucks Coffee Korea Co., Ltd.; President Starbucks Coffee Corporation (Taiwan) Company Limited; and Tata Starbucks Limited (India). These international entities operate licensed Starbucks® retail stores.

We also license the rights to produce and distribute Starbucks-branded products to our 50% owned joint venture, The North American Coffee Partnership with the Pepsi-Cola Company, which develops and distributes bottled Starbucks® beverages, including Frappuccino® coffee drinks, Starbucks Doubleshot® espresso drinks, Starbucks Refreshers® beverages, and Starbucks® Iced Espresso Classics.

Our share of income and losses from our equity method investments is included in income from equity investees on the consolidated statements of earnings. Also included in this line item is our proportionate share of gross profit resulting from coffee and other product sales to, and royalty and license fee revenues generated from, equity investees.

Exhibit 16.7 summarizes the accounting methods for equity investments under U.S. GAAP and IFRS.

EXHIBIT 16.7 Summary of Accounting Treatment for Equity Investments under U.S. GAAP and IFRS

Investments in Equity Securities				
	No Significant Influence		Significant Influence	Control
	Fair Value Readily Determinable	Fair Value Not Readily Determinable	With or without a Readily Determinable Fair Value.	With or without a Readily Determinable Fair Value
U.S. GAAP	Fair value with unrealized gains/losses reported in net income.	Fair value with unrealized gains/losses reported in net income. Entities can also elect to report at cost adjusted for observable price changes in similar securities of the same entity.	Measured initially at cost and subsequently adjusted for the investor's share of income, dividends, and excess depreciation.	The investor reports consolidated financial statements.
IFRS	Fair value with unrealized gains/losses reported in net income. Entities can elect, under certain circumstances to report at fair value with unrealized gains/losses and realized gains/losses reported in other comprehensive income.		Measured initially at cost and subsequently adjusted for the investor's share of income, dividends, and excess depreciation.	The investor reports consolidated financial statements.

JUDGMENTS IN ACCOUNTING: For Equity Investments

When measuring an equity investment at fair value on the balance sheet, the investor typically holds less than 20% of the voting shares of the investee company. Conversely, when accounting for equity investments using the equity method, typically the investor holds less than a controlling share but 20% or more of the voting shares of the investee company.

Are these guidelines strict standards? No, the percentages are general guidelines—and the primary trigger to use the equity method is whether the investor can exert significant influence on the investee. Holding 20% or more of investee voting stock is presumed to be an indicator of influence but only in the absence of information to the contrary.¹² Thus, the decision as to whether the investor has significant influence is a matter of managerial judgment. Some indicators of significant influence include:

1. Controlling representation on the company's board of directors
2. Participation in policy-making processes, including participation in decisions about dividends or other distributions
3. Material transactions with the company
4. Interchange of managerial personnel
5. Provision of essential technical information¹³

Managers and auditors analyze and consider these indicators to determine the level of influence. For example, assume that an investor holds 25% of the voting stock of the investee corporation but was rejected controlling membership on the investee's board of directors. The investor likely does not have effective control over the investee. Now consider an investor holding only 15% of the voting stock of the investee corporation that has controlling membership on the investee's board of directors, is the major supplier or customer of the investee, and exchanges management with the investee. This investor likely possesses significant influence. Nonetheless, the degree of control is not always clear in practice.

Starbucks Corporation's 2016 financial statements provide strong evidence to justify its use of the equity method. Equity investments amount to 49% to 50% of the voting shares of investee companies. Further, Starbucks generates significant sales, royalty, and license fee revenues from its equity investees. Starbucks Corporation has also guaranteed the repayment of certain Japanese bank loans of its equity investee, Starbucks Japan.

The accounting method used can have a significant impact on the financial statements. An investor who does not have significant influence reports unrealized gains and losses through net income and reports the investment asset on the balance sheet at fair value. In contrast, an investor who does have significant influence will use the equity method and include its portion of the investee's income or loss in its income statement.

- 5 Explain and demonstrate the accounting for long-term notes receivable.

Long-Term Notes Receivable

As we discussed in Chapter 9, a note receivable is a formal, written promise to receive a fixed sum of money at a specified date (or dates) in the future with a stated interest rate. We now address **long-term notes receivable**, which are notes receivable with a maturity date longer than a year from the balance sheet date (or one operating cycle, if longer). Companies initially measure long-term notes receivable at the present value of future cash flows at the historical market rate of interest when issued. Subsequently, they report long-term notes receivable at amortized cost on the balance sheet. We begin with a discussion of notes with stated interest rates equal to the market rate and then move to notes with stated rates less than the market rate.

¹²For the relevant authoritative literature for this topic, see FASB ASC 323-10, *Investments – Equity Method and Joint Ventures – Overall* for U.S. GAAP and IASC, *International Accounting Standard 28, “Investments in Associates,”* for IFRS, Paragraph 7.

¹³See FASB ASC 323-10-15-6 for a complete list.

Stated Interest Rate Equal to the Market Rate

When a note's interest rate is the same as the market rate, the face value of the note equals its present value, and periodic payments are computed using the time value of money techniques. After computing the periodic payments, an amortization table assists in the preparation of journal entries with columns for the date, the interest earned (effective interest), principal reduction, total payment, and the note balance. The computation for each column is presented in Exhibit 16.8.

EXHIBIT 16.8 Computations for Amortization Table When Stated Rate Equals Market Rate

Column	Computation	Impact on Journal Entry
Effective Interest	Beginning Note Balance \times Market Interest Rate	Credit to interest revenue
Principal Reduction	Total Periodic Payment Received $-$ Effective Interest	Credit to note receivable
Payment Received	Computed as the payment using time value of money techniques	Debit to cash
Note Balance	Beginning Balance $-$ Principal Reduction	

Example 16.13 illustrates a note receivable with a stated rate equal to the market rate.

EXAMPLE 16.13 Note Amortization and Journal Entries

PROBLEM: AN, Inc. accepts a \$300,000, 12% note from Paulino Products on January 1, 2018, and lends money to Paulino. AN will receive periodic, equal payments every 6 months, beginning June 30. The loan matures in 3 years (on December 31, 2020), and the interest rate equals the market rate of 12%. AN is a calendar-year firm and prepares financial statements annually. Prepare the amortization table and the journal entries for the first year.

SOLUTION: Using Excel, the periodic payment is \$61,009.

	N	I/Y	PV	PMT	FV	Excel Formula
Given	6	6.00%	(300,000)			
Solve for PV				61,009		= PMT(0.06,6,-300000,0)

The amortization table is as follows:

Date	Effective Interest (6%) (a) = Prior (d) \times 6%	Principal Reduction (b) = (c) $-$ (a)	Payment Received (c)	Note Balance (d) = Prior (d) $-$ (b)
At inception				\$300,000
June 30, 2018	\$18,000	\$43,009	\$61,009	256,991
December 31, 2018	15,419	45,590	61,009	211,401
June 30, 2019	12,684	48,325	61,009	163,076
December 31, 2019	9,785	51,224	61,009	111,852
June 30, 2020	6,711	54,298	61,009	57,554
December 31, 2020	3,455*	57,554*	61,009	0

*Adjusted due to rounding errors.

During 2018, AN will first record the receipt of the note receivable:

Account	January 1, 2018
Notes Receivable	300,000
Cash	300,000

On June 30 and December 31, AN records the cash received, interest earned, and reduction in the note receivable balance:

Account	June 30, 2018	December 31, 2018
Cash	61,009	61,009
Interest Revenue	18,000	15,419
Note Receivable	43,009	45,590

A company may also initially recognize notes receivable with interest payment dates that do not coincide with a company's fiscal year-end. When this occurs, the company needs to accrue any interest receivable before preparing financial statements as shown in Example 16.14.

EXAMPLE 16.14 Note Receivable with Accrued Interest

PROBLEM: AN, Inc. accepts a \$300,000, 12% note from Paulino Products on February 1, 2018, and lends money to Paulino. AN will receive periodic, equal payments every six months, beginning July 31. The loan matures in 3 years (on January 31, 2021) and the interest rate equals the market rate of 12%. AN is a calendar-year firm and prepares quarterly financial statements. Prepare the journal entries from February 1 through July 31, 2018.

SOLUTION: The amortization table is the same as we computed in Example 16.13, except that the dates change.

Date	Effective Interest (6%) (a) = Prior (d) × 6%	Principal Reduction (b) = (c) – (a)	Payment Received (c)	Note Balance (d) = Prior (d) – (b)
At inception				\$300,000
July 31, 2018	\$18,000	\$43,009	\$61,009	\$256,991
January 31, 2019	15,419	45,590	61,009	211,401
July 31, 2019	12,684	48,325	61,009	163,076
January 31, 2020	9,785	51,224	61,009	111,852
July 31, 2020	6,711	54,298	61,009	57,554
January 31, 2021	3,455*	57,554*	61,009	0

*Adjusted due to rounding errors.

During 2018, AN first records the receipt of the note receivable:

Account	February 1, 2018
Notes Receivable	300,000
Cash	300,000

Because AN prepares quarterly financial statements on March 31 and June 30, it accrues interest on the note receivable. As of March 31, it has earned interest for the first 2 months of the note. The semi-annual interest earned for the first 6-month interest period is \$18,000, or

Continued

\$3,000 per month ($\$18,000 / 6$ months). Thus, we compute the accrued interest for 2 months ended March 31 as \$6,000 ($\$3,000 \times 2$). As of June 30, AN has earned 3 more months of interest from March 31, or \$9,000 ($\$3,000$ per month $\times 3$ months). The journal entries to accrue interest for the first 2 quarters of 2018 follow:

Account	March 31, 2018	June 30, 2018
Interest Receivable	6,000	9,000
Interest Revenue	6,000	9,000

An additional 1-month's interest is earned as of the July 31 payment date. The entry to record the first note payment follows. The first note payment records the collection of \$18,000 of interest and \$43,009 of the principal.

Account	July 31, 2018	
Cash	61,009	
Interest Receivable ($\$6,000 + \$9,000$)		15,000
Interest Revenue		3,000
Notes Receivable		43,009

Stated Interest Rate Less than the Market Rate

When there is no interest rate stated (a non-interest-bearing note) or the stated interest rate is less than the market interest rate, the face value of a note receivable will not equal its present value.

Because the stated rate is less than the market rate, the difference between the note's face value and its present value is a discount on the note. The note's present value is therefore the value of its future cash flows discounted at the market rate of interest.¹⁴ The discount represents deferred interest revenue to be earned over the life of the note. Companies amortize the discount to interest revenue over the loan term using the effective interest method.

There are two primary effects of the discount amortization:

1. Increases the interest revenue so that the corporation's effective rate of return is brought up to the higher market rate.
2. Reduces the discount and increases the carrying value of the note receivable until the carrying value is brought up to its face value at the maturity date.

The amortization table for notes with a stated rate less than the market rate starts with the computation of the present value of the note. The table includes columns for the date, the interest received, the effective interest, the discount amortization and the note balance. The computation for each column is presented in Exhibit 16.9.

EXHIBIT 16.9 Computations for Amortization Table When Stated Rate Is Less than the Market Rate

Column	Computation	Impact on Journal Entry
Interest Received	Face Value of the Note \times Stated Interest Rate	Debit to cash
Effective Interest	Beginning Note Balance \times Historical Market Interest Rate	Credit to interest revenue
Discount Amortized	Effective Interest $-$ Interest Received	Debit to discount on notes receivable
Note Balance	Beginning Balance $+$ Discount Amortized	

¹⁴If a company receives the note in exchange for goods or services, then we assume that the note's present value is the fair value of the goods or services provided if the fair value is determinable.

The cash interest received each period is the face value of the note multiplied by the stated interest rate. The effective interest revenue is computed each period as the beginning carrying value of the note multiplied by the historical market rate. The amount of discount that is amortized each period into interest revenue is the difference between the interest received and the computed interest revenue (effective interest). Finally, the change in the carrying value of the note receivable is the amount of the discount amortization.

Example 16.15 illustrates accounting for a non-interest-bearing note receivable.

EXAMPLE 16.15

Non-Interest-Bearing Note Receivable

PROBLEM: Amsterdam Sports Company accepts a \$1,000,000 note on January 1 issued by NJ Max Corporation, a major real estate developer. Specifically, NJ Max will issue a non-interest-bearing note due in 7 years in exchange for cash. The current market rate is 10%. Interest is compounded annually. Amsterdam is a calendar-year firm that prepares financial statements annually. Prepare the amortization table for the note and the journal entries for the first year.

SOLUTION: The first step is to compute the present value of the note:

	N	I/Y	PV	PMT	FV	Excel Formula
Given	7	10.00%		0	1,000,000	
Solve for PV			(513,158)			=PV(0.1,7,0,1000000)

The discount amount is then \$486,842 (\$1,000,000 less \$513,158).

The amortization table follows.

Date	Interest Received (0%) (a)	Effective Interest (10%) (b) = Prior (d) × 10%	Discount Amortized (c) = (b) – (a)	Note Balance (d) = Prior (d) + (c)
At inception	-	-	-	\$ 513,158
Year 1	0	\$ 51,316	\$ 51,316	564,474
Year 2	0	56,447	56,447	620,921
Year 3	0	62,092	62,092	683,013
Year 4	0	68,301	68,301	751,314
Year 5	0	75,131	75,131	826,445
Year 6	0	82,645	82,645	909,090
Year 7	0	90,910*	90,910*	1,000,000
Total	0	<u>\$486,842</u>	<u>\$486,842</u>	

*Adjusted due to rounding errors.

The journal entry to record the note receivable and discount is as follows:

Account	January 1
Notes Receivable	1,000,000
Discount on Notes Receivable	486,842
Cash	513,158

At this point, the carrying value of the note receivable on the balance sheet is \$513,158, which is the balance in the note receivable account (\$1,000,000) less the balance in the discount account (\$486,842). Note that in the case of the investment, the discount is a contra-asset account.

Continued

The entry to record the discount amortization for Year 1 follows.

Account	December 31
Discount on Notes Receivable	51,316
Interest Revenue	51,316

After the first period's amortization, the carrying value of the note receivable on the balance sheet is \$564,474, which is the balance in the note receivable account (\$1,000,000) less the balance in the discount account (\$435,526).

Example 16.16 illustrates a note receivable that is interest bearing, but the stated rate is below the market rate. We also include accrued interest revenue.

EXAMPLE 16.16 Note Receivable: Stated Rate Less than the Market Rate

PROBLEM: Helsinki Sports Company, a calendar-year company, accepts a \$1,000,000, 8% note on August 15, 2018, issued by JN Min Corporation, a major real estate developer. In exchange, Helsinki lends JN Min money. Specifically, JN Min will issue a note due in 3 years. The current market rate is 12%. Interest is paid quarterly, beginning on November 15. Helsinki prepares quarterly financial statements and is a calendar-year company. Prepare the amortization table for the note and the journal entries for 2018.

SOLUTION: The first step is to compute the present value of the note:

	N	I/Y	PV	PMT	FV	Excel Formula
Given	12	3.00%		20,000	1,000,000	
Solve for PV			(900,460)			=PV(0.03,12,20000,1000000)

The amortization table follows.

Date	Interest Received (2%) (a)	Effective Interest (3%) (b) = Prior (d) × 13%	Discount Amortized (c) = (b) – (a)	Note Balance (d) = Prior (d) + (c)
At inception				\$ 900,460
November 15, 2018	\$20,000	\$27,014	\$7,014	907,474
February 15, 2019	20,000	27,224	7,224	914,698
May 15, 2019	20,000	27,441	7,441	922,139
August 15, 2019	20,000	27,664	7,664	929,803
November 15, 2019	20,000	27,894	7,894	937,697
February 15, 2020	20,000	28,131	8,131	945,828
May 15, 2020	20,000	28,375	8,375	954,203
August 15, 2020	20,000	28,626	8,626	962,829
November 15, 2020	20,000	28,885	8,885	971,714
February 15, 2021	20,000	29,151	9,151	980,865
May 15, 2021	20,000	29,426	9,426	990,291
August 15, 2021	20,000	29,709	9,709	1,000,000

The journal entry to record the note receivable and discount is as follows:

Account	August 15, 2018	
Notes Receivable	1,000,000	
Discount on Notes Receivable		99,540
Cash		900,460

At this point, the carrying value of the note receivable on the balance sheet is \$900,460, which is the balance in the note receivable account (\$1,000,000) less the balance in the discount account (\$99,540).

On September 30, 2018, Helsinki prepares quarterly financial statements. Thus, it accrues interest from August 15 through September 30. This is one and one-half months or one-half of the quarter. The total interest for the first period is \$27,014 per the amortization table. Helsinki accrues interest revenue for half of that amount (for half the quarter, or \$27,014/2) and amortizes half of the discount (\$7,014/2). It records interest receivable of \$10,000, which is half of the anticipated interest receipt.

Account	September 30, 2018	
Interest Receivable	10,000	
Discount on Notes Receivable		3,507
Interest Revenue		13,507

On November 15, 2018, Helsinki receives a \$20,000 interest payment. At this point, the company must accrue the additional interest for one-half of the quarter and amortize the other half of the discount. It will also recognize the collection of the interest receivable accrued on September 30. Therefore, the company records the following journal entry.

Account	November 15, 2018	
Cash	20,000	
Discount on Notes Receivable		3,507
Interest Receivable		10,000
Interest Revenue		13,507

Finally, on December 31, 2018, Helsinki accrues interest for one-half the second period. Again, this is a period of one and one-half months from November 15 to December 31. This accrual is based on the amortization table; the company will recognize interest revenue of \$13,612 for one-half of the quarter (\$27,224/2) and amortize one-half of the discount of \$3,612 (\$7,224/2). The required journal entry on December 31 follows:

Account	December 31, 2018	
Interest Receivable	10,000	
Discount on Notes Receivable		3,612
Interest Revenue		13,612

IFRS Accounting for Note Receivable

Under IFRS, a company is likely to classify and account for a note receivable at amortized cost. Similar to determining the accounting for a debt investment at amortized cost, the note receivable must meet two criteria: (1) be held within a business model whose objective is to hold it to collect contractual cash flows and (2) satisfy the SPPI contractual cash flow characteristics test.

- 6 Discuss and illustrate the fair value option in accounting for investments in financial assets.

The Fair Value Option for Reporting Investments

Under the fair value option, companies can elect to value most types of financial assets and obligations at fair value.¹⁵ The fair value option improves financial reporting by enabling entities to offset volatility in reported earnings. Consider a company that has an asset and a liability whose fair values are related to one another. If the liability is reported at fair value but the asset is not, then the company will report an earnings stream that is more volatile than if both the asset and liability (whose fair values are negatively correlated) are reported at fair value. Thus, in this case, the fair value option allows management to report both the asset and liability at fair value.¹⁶

A company can choose the fair value option for some assets without choosing it for all assets. Typically, the company must elect the fair value option at the time it acquires the asset. After a company elects the fair value option, it is typically irrevocable.

When electing the fair value option at initial recognition, the company reports the asset on the balance sheet at fair value and reports all unrealized gains and losses in net income. Trading debt securities and equity investments without significant influence are also reported at fair value with gains and losses reported in net income, so the fair value option does not change the reporting for these investments.¹⁷ The accounting for held-to-maturity and available-for-sale debt investments as well as equity investments with significant influence will change substantially if a company elects the fair value option. For example, instead of using the equity method for an investment for which the investor has significant influence, the company will adjust the asset account by making an entry to a fair value adjustment account and then use this account to increase or decrease the investment account on the balance sheet. Example 16.17 demonstrates accounting under the fair value option.

EXAMPLE 16.17

Fair Value Option

PROBLEM: On May 2 of the current year, Alex Associates acquired an equity investment in a start-up company, Ayden Enterprises, for \$200,000. Alex has significant influence over Ayden Enterprises. Alex elected to report its investment in Ayden using the fair value option. Due to Ayden Enterprises' tremendous growth opportunities and the efforts it put into development activities, the fair value of Alex's investment at the end of the year increased to \$475,000. Prepare the journal entry to record the investment using the fair value option.

SOLUTION: Alex Associates records the investment on May 2 at cost:

Account	May 2, Current Year
Equity Investment in Ayden Enterprises	200,000
Cash	200,000

Alex records the fair value adjustment on December 31 as follows:

Account	December 31, Current Year
Fair Value Adjustment – Fair Value Option	275,000
Unrealized Gain on Equity Investment – Fair Value Option (Net income)	275,000

¹⁵Most financial instruments are eligible for the fair value option under U.S. GAAP. Paragraphs 4 and 5 of FASB ASC 825-10-15 outline the specific requirements. For example, financial instruments that are not eligible for the fair value option include pension assets and liabilities, obligations related to deferred compensation arrangements, financial assets and liabilities related to leasing transactions, and investments in subsidiaries or variable interest entities that the company is required to consolidate.

¹⁶For the relevant authoritative literature, see FASB ASC 825-10, *Financial Instruments – Overall* for U.S. GAAP and IASC, *International Accounting Standard 39*, “Financial Instruments: Recognition and Measurement” (London, UK: International Accounting Standards Committee, Revised) for IFRS.

¹⁷Some equity investments without significant influence are held at adjusted cost because the company elects to do so. The company would not make both this election and the fair value option election.

Fair Value Option: IFRS

Similar to U.S. GAAP, IFRS allows a company to use the fair value option with the exception of investments under the equity method. IFRS additionally stipulates that a company can use the fair value option for financial assets when doing so results in more relevant information because either:

- A company has a documented risk management or investment strategy that prescribes it will manage and evaluate its performance on the fair values and changes in fair values of its financial assets and/or liabilities.
- The fair value option ensures consistently measuring liabilities or assets and gains or losses on them on the same bases. That is, the fair value option eliminates or significantly reduces accounting mismatches from measuring liabilities or assets (and the gains and losses on them) on different bases.

7 Detail required disclosures for investments in financial assets.

Disclosures for Investments in Financial Assets

In general, companies provide qualitative and quantitative disclosures of investments in financial assets. Qualitative disclosures include the nature and extent of risks arising from financial assets. For each significant category of investments in financial assets, companies disclose a detailed list, description, and carrying value of each significant type of investing asset, including classification as trading, available-for-sale, or held-to-maturity debt securities. Major security types are based on the nature and risks of the security.

Next we discuss specific requirements for equity investments when the investor does not have the ability to exercise influence over the investee company. Then, we discuss disclosures related to equity method investments, notes receivable, and fair values. Disclosures under IFRS are similar except where noted.

Debt Securities

A company discloses major security types based on the nature and risks of the security. For investment in debt securities, a company considers the following factors in determining whether to disclose more detail by security type:

- Business sector
- Age of any debt
- Geographic concentration
- Credit quality
- Economic characteristic

We discuss additional disclosures related to the type of debt investment next.

Held-to-Maturity Debt Securities. For securities classified as held to maturity, companies disclose the following by major security type:

- Amortized cost basis
- Aggregate fair value
- Total unrealized gains (losses) for securities with net gains (losses) in accumulated other comprehensive income
- Information about the maturity of debt securities
- Any impairment loss and where reported

For any sales of or transfers from securities classified as held to maturity, a company discloses all of the following:

- Net carrying amount of the sold or transferred security
- Net gain or loss in accumulated other comprehensive income for any derivative that hedged the forecasted acquisition of the held-to-maturity security
- Related realized or unrealized gain or loss
- Circumstances leading to the decision to sell or transfer the security.

Available-for-Sale Debt Securities. For securities classified as available for sale, companies disclose the following by major security type:

- Amortized cost basis
- Aggregate fair value
- Total unrealized holding gains (losses)
- Net carrying amount
- Information about the maturity of debt securities

Related to earnings during the period, a company also discloses the following items:

- Proceeds from sales of available-for-sale securities and the gross realized gains and gross realized losses that have been included in earnings as a result of those sales
- Basis on which the cost of a security sold or the amount reclassified out of accumulated other comprehensive income into earnings was determined (that is, specific identification, average cost, or other method used)
- Gross gains and gross losses included in earnings from transfers of securities from the available-for-sale category into the trading category
- Amount of the net unrealized holding gain or loss on available-for-sale securities for the period that has been included in accumulated other comprehensive income and the amount of gains and losses reclassified out of accumulated other comprehensive income into earnings for the period

Exhibit 16.10 provides *Adobe Systems*' quantitative disclosures of its available-for-sale debt investments of \$3,749 million, or about 30% of its total assets, at December 2, 2016. There were both unrealized gains and losses on the debt securities in 2016. *Adobe Systems* reported all unrealized gains and losses on its available-for-sale debt securities in other comprehensive income.

Trading Debt Securities. A company discloses the portion of unrealized gains and losses for the period that relates to trading securities still held at the reporting date.

EXHIBIT 16.10 Disclosure of Investment Securities, *Adobe Systems Incorporated*, Financial Statements, December 2, 2016

NOTE 3: Cash, Cash Equivalents and Short-term Investments [Excerpt]

We classify all of our cash equivalents and short-term investments as "available-for-sale." In general, these investments are free of trading restrictions. We carry these investments at fair value, based on quoted market prices or other readily available market information. Unrealized gains and losses, net of taxes, are included in accumulated other comprehensive income (loss), which is reflected as a separate component of stockholders' equity in our Consolidated Balance Sheets. Gains and losses are recognized when realized in our Consolidated Statements of Income. When we have determined that an other-than-temporary decline in fair value has occurred, the amount of the decline that is related to a credit loss is recognized in income. Gains and losses are determined using the specific identification method.

... short-term investments consisted of the following as of December 2, 2016 (in thousands):

	Amortized Cost	Unrealized Gains	Unrealized Losses	Estimated Fair Value
Short-term fixed income securities:				
Asset-backed securities	\$ 111,009	\$ 95	(\$ 190)	\$ 110,914
Corporate bonds and commercial paper	2,464,769	3,135	(9,554)	2,458,350
Municipal securities	134,710	37	(525)	134,222
U.S. agency securities	39,538	42	—	39,580
U.S. Treasury securities	1,008,195	194	(1,470)	1,006,919
Total short-term investments	<u>\$3,758,221</u>	<u>\$3,503</u>	<u>(\$11,739)</u>	<u>\$3,749,985</u>

... short-term investments consisted of the following as of November 27, 2015 (in thousands):

	Amortized Cost	Unrealized Gains	Unrealized Losses	Estimated Fair Value
Short-term fixed income securities:				
Asset backed securities	\$ 83,449	\$ 11	(\$ 146)	\$ 83,314
Corporate bonds and commercial paper	1,890,253	2,273	(5,612)	1,886,914
Foreign government securities	1,276	—	(8)	1,268
Municipal securities	137,280	101	(49)	137,332
U.S. agency securities	130,397	85	(14)	130,468
U.S. Treasury securities	<u>873,400</u>	<u>101</u>	<u>(1,273)</u>	<u>872,228</u>
Total short-term investments	<u>\$3,116,055</u>	<u>\$2,571</u>	<u>(\$7,102)</u>	<u>\$3,111,524</u>

Source: Financial Statements from Adobe Systems Incorporated 2016 Annual Report. <http://www.images.adobe.com/content/dam/Adobe/en/investor-relations/PDFs/ADBE-10K-FY16-FINAL-CERTIFIED.PDF>

Equity Securities with No Significant Influence

A company reports the fair value of equity securities with no significant influence on the balance sheet and discloses the portion of unrealized gains and losses on equity securities held at the reporting date. The portion of unrealized gains and losses for the period related to equity securities still held at the reporting date is computed as net gains and losses recognized during the period less net gains or losses on equity securities sold during the period.

Equity Method Investments

For investments accounted for under the equity method, companies disclose:

- The name of the investee and percentage of ownership
- Investments held with less than 20% ownership that are accounted for under the equity method and why
- Investments held with greater than 20% ownership that are not accounted for under the equity method and why
- The difference, if any, between the carrying value of the investment and the amount of underlying equity in net assets
- The fair value for those investments with a quoted market price
- Whether the conversion of convertible securities of the investee would have significant effect on the reported income from the investment

Refer to Exhibit 16.6 for selected equity method disclosures for *Starbucks*, including the ownership percentage held for each equity method investment.

Disclosures of Equity Method Investments: IFRS. IFRS additionally requires disclosure of summarized financial information of the investee, including the amounts of total assets, total liabilities, revenues, and net income (loss).

Notes Receivable

Disclosures related to notes receivable are similar to those for accounts receivable, including a summary of significant accounting policies relating to notes receivable, receivables by customer group and significant customers, and information on an allowance for uncollectible accounts.

Fair Value Measurement Disclosures

For investments in financial assets reported at fair value, companies disclose information to enable users to assess the fair value estimates and reasonableness of assumptions made in determining fair values. Companies report securities based on a fair value hierarchy that reflects the reliability of

significant inputs used in making fair value measurements. Level 1 is the most reliable estimates of inputs used, and Level 3 fair value input estimates require the most judgment:

- **Level 1.** Fair values are determined based on quoted prices in active markets for identical assets.
- **Level 2.** Fair values are determined using significant other observable inputs. Other observable input could include securities dealer quotes or prices based on similar assets in other markets.
- **Level 3.** Fair values are determined using significant unobservable inputs. For instance, fair values in this group could be estimated based on pricing models such as discounted cash flows.

Fair Value Disclosures

For financial assets not reported at fair values, companies provide disclosures of their fair values, including the methods used and assumptions made.

Exhibit 16.11 contains an excerpt from *Coca-Cola Company's* fair value measurement disclosures in 2016. Note its description of each of the three levels in the hierarchy. At December 31, 2016, 27.3% of *Coca-Cola's* fair value securities were classified in Level 1 for which the fair value estimate was based on a quoted price in an active market. *Coca-Cola's* holdings of Level 3 securities for which there is no active market amounted to 2.1% of its investments.

EXHIBIT 16.11 Fair Value Measurement Disclosure, *Coca-Cola Company*, Financial Statements, December 31, 2016

[Excerpts from Annual Report]

NOTE 16: Fair Value Measurements

Accounting principles generally accepted in the United States define fair value as the exchange price that would be received for an asset or paid to transfer a liability (an exit price) in the principal or most advantageous market for the asset or liability in an orderly transaction between market participants at the measurement date. Additionally, inputs used to measure fair value are prioritized based on a three-level hierarchy. This hierarchy requires entities to maximize the use of observable inputs and minimize the use of unobservable inputs. The three levels of inputs used to measure fair value are as follows:

- Level 1 — Quoted prices in active markets for identical assets or liabilities.
- Level 2 — Observable inputs other than quoted prices included in Level 1. We value assets and liabilities included in this level using dealer and broker quotations, certain pricing models, bid prices, quoted prices for similar assets and liabilities in active markets, or other inputs that are observable or can be corroborated by observable market data.
- Level 3 — Unobservable inputs that are supported by little or no market activity and that are significant to the fair value of the assets or liabilities. This includes certain pricing models, discounted cash flow methodologies and similar techniques that use significant unobservable inputs.

Interview

THOMAS ANGELL
PARTNER,
WITHUMSMITH +
BROWN »

Thomas Angell

Thomas Angell is an audit partner in the Financial Services Group at WithumSmith + Brown's New York office. Tom has more than 30 years' experience providing audit, tax, and consulting services to private equity and venture capital funds and investment advisors on all aspects of private equity and venture capital transactions.

- 1 What specific steps should an auditor use to determine whether an investment in debt securities is properly classified as trading, held to maturity, or available for sale?

Auditors must first determine (1) the “type” of investment held by the reporting entity and (2) the reporting entity’s ability and intent to hold the investment to maturity. Then they must determine whether past and present security classifications corroborate the reporting entity’s intended classification, follow up on any securities classification changes, and verify that held-to-maturity securities will in fact be kept until the end of the debt term. Furthermore, a reporting entity cannot classify debt securities as held to maturity if certain financial or market conditions indicate management’s inability or intent to hold the investment to maturity (liquidity demands, availability, or yield of alternative investments, etc.).

- 2 What qualitative factors determine whether an investment asset should be considered impaired?

Some common qualitative factors of impairment include situations when fair value is significantly below cost; the decline in fair value can be attributed to adverse conditions related to the security or specific industry or geographic conditions; the decline in fair value has existed for an extended period of time; a rating agency has downgraded a debt security’s rating; the security issuer’s financial condition has deteriorated; scheduled interest payments on debt securities have not been made; or equity dividends have been reduced or eliminated.

- 3 How do fair value measurements help a financial statement user to assess an entity’s future operating performance and cash flows?

FASB’s ASC 820, *Fair Value Measurement and Disclosure*, provides a uniform framework for measuring fair value and assists financial statement users in making informed decisions about asset and liability values. For publicly traded securities, determining fair value is easier than for illiquid securities when fair value measurement is based on forward-looking assumptions of company growth and risk. For financial statement users, fair value provides a better measure of an entity’s true value than historical cost. It shows the current value of the entity’s assets and liabilities and helps predict future cash flows based on current values.

- 4 How effective is the fair value hierarchy disclosure in assessing the reliability of the inputs used in determining fair value?

The recently adopted three-level fair value hierarchy and the required detailed financial statement disclosures provide greater transparency and comparability of fair value measurements and disclosures among other reporting entities. For example, there is enhanced transparency into valuation assumptions such as expected growth rates, trends in profitability, future cash flow requirements, and potential risk factors that allows financial statement users to assess the future operating performance and cash flows of an entity.

- 5 What critical issues face the accounting profession from the expanded use of fair value measurements?

The more fair value measurement is used in financial reporting, the greater the accounting profession’s risk, especially relating to illiquid investments and the increased use of unobservable inputs in determining fair value. Unobservable inputs reflect the reporting entity’s own asset pricing assumptions. Examples include choice of discount rate, EBITDA multiple, and weighted average cost of capital. Fair value reporting requires a company to report significant swings in asset and liability values from one period to the next. In 2008–2010, the U.S. capital market experienced significant illiquidity and volatility, creating challenging conditions for fair value assessments. Many financial services companies were adversely affected by the new fair value measurement standard and had to significantly write down impaired assets. Some people even argue that the implementation of fair value accounting was a major contributor to the 2008 financial crisis.

Discussion Questions

1. Equity securities may not always have a readily determinable fair value. How are equity securities measured if fair values are not readily determinable?
2. How would the following items be classified in the fair value hierarchy?
 - a. Asset retirement obligations
 - b. Equity securities without readily determinable fair values

FINANCIAL STATEMENT ANALYSIS

Investments in Debt Securities and Equity Securities with No Significant Influence

Given management's choices to purchase debt and equity investments and its ability to choose how to classify the debt investment securities, understanding a company's investment securities is an important area when analyzing financial statements. For debt securities, the accounting depends on management's intent. Assessing a company's portfolio of held-to-maturity, trading, and available-for-sale debt securities is the starting point for such an analysis.

When a company records its debt or equity investments at fair value, the balance sheet is up-to-date with the most current values. However, the estimates and judgments involved in determining fair values make this area challenging to analyze. Understanding the models used to estimate fair values and the assumptions required is especially critical.

To analyze investment securities, begin by doing the following:

- Identify the types of investments.
- Determine the amount of debt investments in the firm's portfolio: held-to-maturity, trading, and available-for-sale securities.
- Identify whether the firm has any investment securities reported at fair value (no significant influence equity investments, trading debt securities, available-for-sale debt securities, or investments accounted for under the fair value option).
- Evaluate the footnote disclosure of the fair value hierarchy of investments.
- Assess the types and amount of investments in each level in the hierarchy.
- Evaluate the reasonableness of valuation methods used.
- Examine any assumptions and estimates used in valuation.
- Determine the effect of changes in fair value on net income and other comprehensive income. Consider the effects of the portfolio classification on net income.

The types of investments a company holds vary by industry. Many manufacturers and retailers hold investments. Given the nature of the industries, few actively trade investments. On the other hand, financial service companies, such as banks and insurance companies, more commonly hold trading portfolios. Therefore, the net income of a financial services company can vary more in line with debt and equity markets than other types of companies.

An example of financial statement analysis of investment securities is provided in Example 16.18.

EXAMPLE 16.18

Financial Statement Analysis of Investment Securities

PROBLEM: Use the following information with Exhibit 16.10 to analyze *Adobe Systems'* investment securities.

At or for the Year Ended (\$ thousands)	December 2, 2016	November 27, 2015
Total assets	\$12,707,114	\$11,726,472
Net income	1,168,782	629,551

CONSOLIDATED STATEMENTS OF COMPREHENSIVE INCOME

(thousands)	Year Ended		
	December 2, 2016	November 27, 2015	November 28, 2014
Net income	\$1,168,782	\$629,551	\$268,395
Other comprehensive income (loss), net of taxes:			
Available-for-sale securities:			
Unrealized gains/losses on available-for-sale securities	(1,618)	(9,226)	2,315
Reclassification adjustment for recognized gains/losses on available-for-sale securities	(1,895)	(2,955)	(3,928)
Net increase (decrease) from available-for-sale securities	(3,513)	(12,181)	(1,613)
Derivatives designated as hedging instruments:			
Unrealized gains/losses on derivative instruments	35,199	29,795	41,993
Reclassification adjustment for recognized gains/losses on derivative instruments	(16,425)	(55,535)	(18,705)
Net increase (decrease) from derivatives designated as hedging instruments	18,774	(25,740)	23,288
Foreign currency translation adjustments	(19,783)	(123,065)	(75,872)
Other comprehensive income (loss), net of taxes	(4,522)	(160,986)	(54,197)
Total comprehensive income, net of taxes	\$1,164,260	\$468,565	\$214,198

Source: Financial Statements from Adobe Systems Incorporated 2016 Annual Report. <http://www.adobe.com/content/dam/Adobe/en/investor-relations/PDFs/ADBE-10K-FY16-FINAL-CERTIFIED.PDF>

Address the following questions:

1. What types of investments does *Adobe Systems* hold in 2016 and 2015? What percentage of total assets do its investments compose? Use fair value.
2. How are *Adobe Systems*' investments reported on the balance sheet? Which investment securities does *Adobe Systems* report at fair value? What is the difference between fair value and cost?
3. Determine the effect of changes in fair value on net income and other comprehensive income. If unrealized gains and losses on available-for-sale securities were reported in net income rather than other comprehensive income, what would be the effect on net income?

SOLUTION:

1. From Exhibit 16.10, *Adobe Systems* held \$3,749,985 thousand and \$3,111,524 thousand of short-term investments at the end of 2016 and 2015, respectively. From the captions, these are debt investments. *Adobe* values these investments at fair value. In fiscal 2016 and 2015, the *Adobe Systems*' investments are a percentage of total assets of 29.5% ($\$3,749,985 / \$12,707,114$) and 26.5% ($\$3,111,524 / \$11,726,472$), respectively.

2. **Adobe Systems** reported its available-for-sale debt securities at fair value. At the end of 2016 and 2015, the amortized cost of the debt investments was higher than their fair value. Thus, the company had net unrealized losses on these debt investments. The difference between amortized cost and fair value is (\$8,236,000) and (\$4,531,000) in 2016 and 2015, respectively.

Total short-term investments	Amortized Cost	(in thousands)	
		Estimated Fair Value	Difference
December 2, 2016	\$3,758,221	\$3,749,985	(\$8,236)
November 27, 2015	\$3,116,055	\$3,111,524	(\$4,531)

3. The Statement of Comprehensive Income indicates that **Adobe Systems** had \$1,618 thousand of net unrealized losses in 2016 and \$9,226 thousand of net unrealized losses in 2015 on available-for-sale securities reported in other comprehensive income. From the statement of comprehensive income, \$1,895 thousand of losses and \$2,995 thousand of losses were realized and reported in net income in 2016 and 2015, respectively. If **Adobe Systems** had reported the unrealized losses on available-for-sale securities in net income, net income would have been \$1,167,164 thousand (\$1,168,782 thousand net income less unrealized losses of \$1,618 thousand), or about 0.1% lower in 2016. If **Adobe Systems** had reported the unrealized losses on available-for-sale securities in net income, net income would have been \$620,325 thousand (\$629,551 thousand net income minus unrealized losses of \$9,226 thousand), or about 1.5% lower in 2015.

Summary by Learning Objectives

In the following, we summarize the main points by learning objective. Throughout the chapter, we discuss the accounting and reporting of U.S. GAAP and IFRS side-by-side. The following table also highlights the major similarities and differences between the standards.

- 1 Describe debt and equity investments, the two main types of investment securities that companies hold, and the key issues in accounting for them, including cost and fair value accounting.

Summary	Similarities and Differences between U.S. GAAP and IFRS
<p>A debt investment is an investment in another company's bonds.</p> <p>An equity investment is an investment in another company's stock.</p> <p>Accounting at cost or fair value involves a trade-off between the two fundamental qualitative characteristics in the conceptual framework: relevance and faithful representation.</p>	<p>Similar under U.S. GAAP and IFRS.</p>

Summary by Learning Objectives, continued

2 Describe and illustrate accounting for investments in debt securities—including held-to-maturity, trading, and available-for-sale securities—at initial recognition and subsequent to acquisition.	
Summary	Similarities and Differences between U.S. GAAP and IFRS
<p>Companies classify investments into three categories based on their intent in holding the security:</p> <ul style="list-style-type: none"> • Held to maturity: debt securities that the company plans to hold to maturity (has both positive intent and ability to hold until maturity). These investments are reported at amortized cost on the balance sheet. Interest income is recorded using the effective interest rate method. • Trading securities: debt securities that a company plans to hold short term. They are reported at fair value on the balance sheet. All unrealized gains or losses are reported in net income. • Available for sale: debt securities that a company plans neither to hold to maturity nor to trade. They are reported at fair value on the balance sheet. All unrealized gains or losses are reported in other comprehensive income. 	<p>► Under IFRS, companies classify debt investments using two tests:</p> <ol style="list-style-type: none"> 1. Contractual cash flow characteristics test—passed if cash flows from the debt investment are solely payments of principal and interest (SPPI) on the outstanding principal balance. 2. Business model test—based on how the company plans to generate cash flows from the investment: <ul style="list-style-type: none"> • collect contractual cash flows • sell the financial asset • both collect contractual cash flows and sell the financial asset. <p>Debt investments are measured at</p> <ul style="list-style-type: none"> • Amortized cost when the company holds to collect contractual cash flows and the SPPI test is passed. • Fair value with unrealized gains and losses reported in net income when the company holds to sell. • Fair value with unrealized gains and losses reported in other comprehensive income when the company holds to collect contractual cash flows and to sell. The SPPI test also must be passed.
3 Discuss and demonstrate accounting for investments in equity securities when the investor has no significant influence at initial recognition and subsequent to acquisition, including accounting for investments without readily determinable fair values.	
Summary	Similarities and Differences between U.S. GAAP and IFRS
<p>Equity investments in which a company does not have significant influence—typically ownership less than 20%—are generally reported at fair value on the balance sheet. All unrealized gains or losses are reported in net income.</p> <p>When an equity investment does not have a readily determinable fair value, it is still reported at fair value, although the company can elect to report it at cost adjusted for observable price changes in similar securities of the same issuer. Changes in fair value are taken to net income.</p>	<p>► Under IFRS, equity investments are typically measured at fair value with unrealized gains and losses reported in net income similar to U.S. GAAP.</p> <p>Under certain circumstances, a company can elect to report unrealized and realized gains and losses in other comprehensive income, called fair value through other comprehensive income (FVOCI). A company can make this election when the equity instrument is:</p> <ul style="list-style-type: none"> • Not held for trading • Not part of contingent consideration in a business combination when it could possibly be given as additional payment on the purchase of a business after it is acquired.
4 Explain and illustrate accounting for investments in equity securities when the investor has significant influence over the investee company.	
Summary	Similarities and Differences between U.S. GAAP and IFRS
<p>Equity investments in which a company has significant influence are accounted for using the equity method. Generally, these are investments in which a company holds between 20% and 50% of equity.</p> <p>Equity investments with significant influence are initially reported at cost. The investor subsequently adjusts the carrying amount of the investment for changes in the net assets of the investee company. The investment is increased by the company's share of the investee's net income. If the investee has a net loss, then the investor's investment account is decreased by its share of the net loss. The investment account is decreased by dividends declared by the investee company.</p>	<p>Similar under U.S. GAAP and IFRS.</p>

*Summary by Learning Objectives, continued***5 Explain and demonstrate the accounting for long-term notes receivable.**

Summary	Similarities and Differences between U.S. GAAP and IFRS
<p>Long-term notes receivable are reported at the present value of their future cash flows using the historical market rate of interest when issued.</p> <p>Subsequently, a note receivable is reported at amortized cost with any discount or premium amortized to interest revenue.</p>	<p>► Similar under U.S. GAAP and IFRS because a note receivable is likely to be classified and accounted for at amortized cost under IFRS. However the note receivable must meet two criteria: (1) be held within a business model whose objective is to hold it to collect contractual cash flows and (2) meet the SPPI contractual cash flow characteristics test.</p>

6 Discuss and illustrate the fair value option in accounting for investments in financial assets.

Summary	Similarities and Differences between U.S. GAAP and IFRS
<p>Companies have the option to value most types of financial assets at fair value, which is referred to as the fair value option. A company can choose the fair value option for some assets without choosing it for all assets. Typically, the fair value option must be chosen at the time the asset is acquired.</p> <p>If the fair value option is used, the asset is reported on the balance sheet at fair value and all unrealized gains and losses are reported in net income.</p>	<p>► Similar to U.S. GAAP except that IFRS places additional conditions under which a company can use the fair value option for financial assets. Specifically, it can be used for financial assets when doing so results in more relevant information. IFRS does not allow the fair value option for equity method investments.</p>

7 Detail required disclosures for investments in financial assets.

Summary	Similarities and Differences between U.S. GAAP and IFRS
<p>Companies provide qualitative and quantitative disclosures of investments in financial assets. Qualitative disclosures include the nature and extent of risks arising from financial assets such as credit risk, liquidity risk, and market risk.</p> <p>For each significant category of investment securities, companies disclose a detailed list, description, and carrying value of each significant type of investment in financial assets, including classification as trading, available for sale, held to maturity, no significant influence, and significant influence.</p> <p>Unrealized holding gains and losses on available-for-sale securities included in other comprehensive income are reported. Unrealized gains and losses on trading securities included in net income are reported.</p> <p>Disclosure for equity-method investments include the name of the investee and percentage of ownership; disclosure of investments held with ownership less (more) than 20% that are (not) accounted for under the equity method and why; the difference, if any, between the carrying value of the investment and the amount of underlying equity in net assets; the fair value for those investments with a quoted market price; whether the conversion of convertible securities of the investee would have significant effect on the reported income from the investment.</p> <p>For investments measured at fair value, companies disclose three levels to allow users to assess the fair value estimates and reasonableness of assumptions made in determining fair values.</p> <ul style="list-style-type: none"> • Level 1: Fair values are determined based on quoted prices in active markets for identical assets. • Level 2: Fair values are determined using significant other observable inputs. Other observable inputs could include securities dealer quotes or prices based on similar assets in other markets. • Level 3: Fair values are determined using significant unobservable inputs. For instance, fair values in this group could be estimated based on pricing models such as discounted cash flows. <p>Companies must disclose fair values of those investments in financial assets <i>not</i> reported at fair values on the balance sheet.</p>	<p>Similar under U.S. GAAP and IFRS.</p> <p>► Under IFRS, companies must also disclose financial information of the investee including its total assets, total liabilities, revenue, and net income (loss).</p>

16 Investments in Financial Assets

Questions

- ① Q16-1. Are debt investments classified as current or non-current investments? Explain.
- ① Q16-2. Is reporting an investment at its cost considered relevant? Explain.
- ① Q16-3. Is the fair value of an investment subjective? Explain.
- ② Q16-4. What categories can managers use to classify debt investments?
- ③ Q16-5. How does a company account for equity investments in which it has significant influence?
- ② ③ Q16-6. Do entities report unrealized gains and losses on fair value adjustments to both debt and equity security investments in earnings? Explain.
- ③ Q16-7. What categories can managers use to classify equity investments?
- ④ Q16-8. When is the equity method of accounting for investments required?
- ⑥ Q16-9. Does the fair value option enable firms to offset earnings volatility in financial reporting? Explain.
- ⑥ Q16-10. Can companies apply the fair value option to all financial instruments? Explain.
- ⑦ Q16-11. What is the fair value hierarchy for investment securities?
- ⑦ Q16-12. Do companies generally disclose the amounts of debt investment by classification: held to maturity, trading, or available for sale? Explain.
- A Q16-13. How do companies report impairment losses on debt investments measured at amortized cost?
- A Q16-14. How do companies report impairment losses on equity investments?
- A Q16-15. Is there a difference in how companies report impairment losses on debt investments under IFRS compared to U.S. GAAP?
- A Q16-16. Is there a difference in how companies report impairment losses on equity investments under U.S. GAAP and IFRS?
- A Q16-17. Are companies required to assess whether their equity investments are impaired? Explain.

Multiple-Choice Questions

Becker CPA Exam Review multiple-choice questions are available in MyLab Accounting.

- ② MC16-1. Deutsch Imports has three securities in its available-for-sale debt investment portfolio. Information about these securities is as follows:

Security	Amortized Cost	Market Value	
		12/31/Year 1	12/31/Year 2
NCB	\$78,000	\$ 93,600	\$100,000
TRR	\$ 17,000	\$120,000	0
Enson	\$58,500	\$ 53,300	\$ 50,700

TRR was sold in Year 2 for \$127,400.

Which of the following statements is correct?

- i. On its 12/31/Year 2 balance sheet, Deutsch should report the NCB debt investment at its fair value of \$100,000.
 - ii. On its 12/31/Year 2 balance sheet, Deutsch should report an unrealized holding gain on the NCB debt investment of \$22,000 in stockholders' equity.
 - iii. On its income statement for the year ending December 31, year 2, Deutsch should report an unrealized holding gain on the NCB debt investment of \$22,000.
- a. I only is correct.
 - b. I and II only are correct.
 - c. I and III only are correct.
 - d. None of the listed answers is correct.

- 2 **MC16-2.** The following data pertains to Tyne Co.'s investments in marketable debt securities:

	Amortized Cost	Market Value	
		12/31/Y2	12/31/Y1
Trading	\$150,000	\$155,000	\$100,000
Available-for-sale	150,000	130,000	120,000

What amount should Tyne report as net unrealized loss on available-for-sale marketable debt securities at December 31, year 2, in accumulated other comprehensive income on the balance sheet?

- a. \$0
- b. \$10,000
- c. \$15,000
- d. \$20,000

- 2 **MC16-3.** Merlin Enterprises sold the following debt investment on September 30, year 2:

	Amortized Cost	Market Value	
		12/31/Y1	9/30/Y2
Beard Inc.	\$67,000	\$59,000	\$71,000

What is the amount of the realized gain or loss on Merlin's Year 2 income statement, assuming that the investment in Beard Inc. is classified as a trading debt security?

- a. \$0
- b. \$(8,000)
- c. \$4,000
- d. \$12,000

- 2 **MC16-4.** Merlin Enterprises sold the following debt investment on September 30, Year 2:

	Amortized Cost	Market Value	
		12/31/Y1	9/30/Y2
Beard Inc.	\$67,000	\$59,000	\$71,000

What is the amount of the realized gain or loss on Merlin's Year 2 income statement, assuming that the investment in Beard Inc. is classified as an available-for-sale debt security?

- a. \$0
- b. \$(8,000)
- c. \$4,000
- d. \$12,000

- 2 **MC16-5.** Money for Nothing Enterprises ("MNE") held the following available-for-sale debt securities during year 2:

	Amortized Cost	Market Value 12/31/Y1	Sales Price	Market Value 12/31/Y2
Alpha Corp.	\$50,000	\$53,000	\$57,000	—
Beta Corp.	\$35,000	\$30,000		\$38,000
Omega Corp.	\$21,000	\$27,000		\$24,000

What will MNE report as unrealized gain on available-for-sale debt securities on its Year 2 statement of comprehensive income (ignore taxes)?

- a. \$2,000
- b. \$3,000
- c. \$6,000
- d. \$8,000

- 2 **MC16-6.** Money for Nothing Enterprises (“MNE”) held the following available-for-sale debt securities during Year 2:

	Amortized Cost	Market Value 12/31/Y1	Sales Price	Market Value 12/31/Y2
Alpha Corp.	\$50,000	\$53,000	\$57,000	—
Beta Corp.	\$35,000	\$30,000		\$38,000
Omega Corp.	\$21,000	\$27,000		\$24,000

What will MNE report as accumulated other comprehensive income on its 12/31/Y2 balance sheet (ignore taxes)?

- a. \$2,000 b. \$3,000 c. \$6,000 d. \$8,000
- 4 **MC16-7.** On January 2, year 1, Kean Co. purchased a 30% interest in Pod Co. for \$250,000. On this date, Pod’s stockholders’ equity was \$500,000. The carrying amounts of Pod’s identifiable net assets approximated their fair values, except for land, whose fair value exceeded its carrying amount by \$200,000. Pod reported net income of \$100,000 for year 1, and paid no dividends. Kean accounts for this investment using the equity method. In its December 31, Year 1, balance sheet, what amount should Kean report as investment in subsidiary?
- a. \$210,000 b. \$220,000 c. \$270,000 d. \$280,000

Brief Exercises

- 2 **BE16-1. Debt Investments, Held to Maturity.** Sills Products acquired \$2,960,000 face value, 5% bonds as a held-to-maturity investment on January 1 of the current year when the market rate of interest was 10%. Interest is paid annually each December 31. Sills purchased the bonds, which mature in 6 years, for \$2,315,421. Sills amortizes the discount using the effective interest method. The fair value of the bonds at the end of the year is \$2,185,455. Prepare the journal entries required on the date of acquisition and at the end of the first year after acquisition.
- 2 **BE16-2. Debt Investments, Available for Sale.** Kuban Company acquired \$3,500,000 face value, 8% bonds as an available-for-sale investment on January 1 of the current year when the market rate of interest was 10%. Interest is paid annually each December 31. Kuban purchased the bonds, which mature in 12 years, for \$3,023,042. Kuban amortizes the discount using the effective interest rate method. The fair value of the bonds at the end of the year is \$3,000,000. Prepare the journal entries required on the date of acquisition and at the end of the first year after acquisition.
- 2 **BE16-3. Debt Investments, Trading.** Using the information provided in BE16-2, prepare the entry to record the fair value adjustment if Kuban classified this investment as a trading security.
- 2 **BE16-4. Debt Investments, IFRS.** Gills Products, an IFRS reporter, acquired \$2,960,000 face value, 5% bonds on January 1 of the current year when the market rate of interest was 10%. Gills plans to hold the bonds to generate cash flows by collecting contractual cash flows only, and it passes the SPPI test. Interest is paid annually each December 31. Gills purchased the bonds, which mature in 6 years, for \$2,315,421. Gills amortizes the discount using the effective interest method. The fair value of the bonds at the end of the year is \$2,185,455. Prepare the journal entries required on the date of acquisition and at the end of the first year after acquisition.
- 2 **BE16-5. Debt Investments, IFRS.** Ruban Company, an IFRS reporter, acquired \$3,500,000 face value, 8% bonds on January 1 of the current year when the market rate of interest was 10%. Ruban plans to hold the bonds to generate cash flows by collecting contractual cash flows but could sell them if needed, and it passes the SPPI test. Interest is paid annually each December 31. Ruban purchased the bonds, which mature in 12 years, for \$3,023,042. Ruban amortizes the discount using the effective interest rate method. The fair value of the bonds at the end of the year is \$3,000,000. Prepare the journal entries required on the date of acquisition and at the end of the first year after acquisition.
- 2 **BE16-6. Debt Investments, IFRS.** Using the information provided in BE16-5, prepare the entry to record the fair value adjustment if Ruban plans to hold the bonds to generate cash flows by selling the bonds.
- 3 **BE16-7. Equity Investments, Readily Determinable Fair Value.** Turner Tires, Inc. acquired 40,000 shares of Fenwick Corporation stock at a price of \$35 per share during 2016. This investment does not allow Turner to participate in the decision making of Fenwick, and the company therefore does not have the ability to exert significant influence over the investee company. The market value of the shares at December 31, 2016, is \$41 per share. Prepare the journal entries required on the date of acquisition and at the end of the year.
- 3 **BE16-8. Equity Investments, Readily Determinable Fair Value, IFRS.** Using the information provided in BE16-7, prepare the entries assuming that Turner Tires, Inc. is an IFRS reporter and elects to report these securities at fair value through other comprehensive income. Turner is not holding the investment for trading, nor is it part of contingent consideration in a business combination. Prepare the journal entries required on the date of acquisition and at the end of the year.

- 3** **BE16-9. Equity Investments, Readily Determinable Fair Value, IFRS.** Using the information provided in BE16-7, prepare the entries assuming that Turner Tires, Inc. is an IFRS reporter. Turner plans to trade the securities. Prepare the journal entries required on the date of acquisition and at the end of the year.
- 3** **BE16-10. Equity-Investments, Readily Determinable Fair Value with Partial Disposal of Shares, IFRS.** Prepare the journal entry needed to record the partial sale of the investment acquired in BE16-9. Assume that Turner sold 12,800 of the Fenwick shares for \$47 per share in 2017 and the fair value of the remaining shares is \$41 per share on December 31, 2017. Prepare the journal entry on December 31, 2017.
- 4** **BE16-11. Equity Investments, Equity Method.** On January 1, Jefferson Company acquired 25% of the outstanding voting shares of Tremont Corporation at a cost of \$1,340,000 by acquiring 20,000 of the total 80,000 outstanding shares at a cost of \$67 per share. During the year, Tremont reported \$875,000 in net income and declared and paid \$3.75 per share dividends. At acquisition, Tremont's market value equaled the book value of its net assets. Prepare the journal entries required to record these events assuming that Jefferson uses the equity method to account for its investment in Tremont.
- 4** **BE16-12. Equity Investments, Equity Method.** On January 1, Newman acquired a 30% interest in the common shares of MultiGram Entertainment at a cost of \$4,295,000. During the year, MultiGram reported a net loss of \$630,000 and paid no dividends. At acquisition, MultiGram's market value equaled the book value of its net assets. Prepare the journal entries required to record these events assuming that Newman uses the equity method to account for its investment in MultiGram.
- 5** **BE16-13. Notes Receivable.** Natale Enterprises, a major real estate developer, recently accepted a \$10,000,000, 5-year, 2% note receivable in exchange for products sold. Interest is paid annually. The current market rate of interest is 6%. The note is not publicly traded. Prepare the journal entry to record the sale. Ignore cost of goods sold.
- 5** **BE16-14. Notes Receivable.** Aaron Anatole accepted a \$250,000, 4-year, non-interest-bearing note receivable upon a sale. The current market rate of interest is 8%. The note is not publicly traded. Prepare the journal entry to record the sale. Ignore cost of goods sold.
- 6** **BE16-15. Debt Investments Classified as Held to Maturity, Fair Value Option.** Thornwood Consultants, Ltd. adopted the fair value option for a recent acquisition of debt investment securities that were originally classified as held to maturity. Thornwood acquired bonds of Wicker Enterprises at a cost of \$1,100,000. The year-end fair value of the debt held by Thornwood is \$1,300,000. Prepare the journal entries on the date of acquisition and at year-end to adjust Thornwood's investments to fair value.
- 7** **BE16-16. Disclosures, Fair Value Hierarchy.** Fill in the blanks in the following statements:
 a. Level 1: Fair values are determined based on _____ for identical assets.
 b. Level 2: Fair values are determined using _____. Other observable inputs could include _____ based on similar assets in other markets.
 c. Level 3: Fair values are determined using _____. For instance, fair values in this group could be estimated based on _____, such as discounted cash flows.
- A** **BE16-17. Debt Investments, Impairments.** For each debt investment in the following table, compute the impairment loss, if any, and determine whether the loss is reported in net income. All of the investments were purchased in the current year. Assume that the investor is not expected to sell the investments prior to full recovery of the decline in fair value except for Investment d.

	U.S. GAAP Classification	Significant Increase in Credit Risk?	12-Month Default Rate	Lifetime Default Rate	Carrying Value	Fair Value	Present Value of Future Cash Flows	Impairment Loss	Loss Reported in Net Income (NI) or Other Comprehensive Income (OCI)?
a.	Held to maturity	Yes	2%	10%	\$10,000	\$ 9,000	\$ 9,300	_____	_____
b.	Trading	No	3	15	10,000	9,000	9,300	_____	_____
c.	Available for sale	No	1	2	10,000	11,000	10,300	_____	_____
d.	Available for sale	Yes	1	8	10,000	9,000	9,300	_____	_____

- A** **BE16-18. Debt Investments, Impairments, IFRS.** For each debt investment in BE16-17, compute the impairment loss, if any, and determine whether the loss is reported in net income or other comprehensive income under IFRS. The available-for-sale investments are classified as fair value through other comprehensive income investments under IFRS.
- A** **BE16-19. Debt Investments, Impairments.** For each debt investment in the following table, compute the impairment loss, if any, and determine whether the loss is reported in net income. Assume that the investor is not expected to sell the investments prior to full recovery of the decline in fair value.

	Classification	Carrying Value	Fair Value	Present Value of Future Cash Flows	Impairment Loss	Loss Reported in Net Income (NI) or OCI?
a.	Trading	\$11,000	\$ 10,300	\$9,000	_____	_____
b.	Available for sale	11,000	8,000	11,000	_____	_____
c.	Available for sale	11,000	6,000	9,000	_____	_____

Exercises

- 2** **E16-1. Debt Investments, Held to Maturity.** The Davis Group acquired \$4,500,000 par value, 4%, 20-year bonds on their date of issue, January 1 of the current year. The market rate at the time of issue was 6%, and interest is paid annually on December 31. Davis will use the effective interest rate method to account for this investment. Davis intends to hold the investment until the bonds mature, and has the ability to do so.

Required »

- Determine the purchase price of the investment in bonds.
- Prepare the journal entry to record the acquisition of the bond investment.
- Prepare the journal entry to record the interest income for the first year.

- 2** **E16-2. Debt Investments, Available for Sale.** John Quinn Associates acquired \$7,550,000 par value, 6%, 20-year bonds on their date of issue, January 1 of the current year. The market rate at the time of issue is 10%, and interest is paid semiannually on June 30 and December 31. Quinn uses the effective interest rate method to account for this investment. It does not intend to hold the investment until maturity, nor will it actively trade the bonds. The fair value of the bonds at the end of the year of acquisition is \$5,197,500.

Required »

- Determine the purchase price of the investment in bonds.
- Prepare the journal entry to record the acquisition of the bond investment.
- Prepare the journal entries to record the interest income for the first year.
- Prepare the journal entry required to adjust the investment's carrying amount to fair value at year-end, if necessary.

- 2** **E16-3. Debt Investments, Available for Sale.** Using the information provided in E16-2, prepare the fair value adjustment journal entries at the end of the second and third years after the acquisition of the investment assuming that the fair value of the bonds is equal to \$5,100,000 at the end of Year 2 and \$4,905,750 at the end of Year 3. Prepare the amortization table for six semi-annual interest payments.

- 3** **E16-4. Equity-Investments, Fair Value is Readily Determinable.** Barney Equipment Corporation acquired the following equity investments at the beginning of Year 1. Barney does not have significant influence over the investees. Both companies are publicly traded.

Description	Boris Company	Monterey Group
Number of shares	10,550	8,355
Market price per share	× \$42	× \$87
Share acquisition price	<u>\$443,100</u>	<u>\$726,885</u>

Share prices at the end of Years 1 and 2 follow.

Fair Value	Boris Company	Monterey Group
End of Year 1	\$48	\$78
End of Year 2	\$43	\$83

Required »

- Prepare the journal entry to record the acquisition of the investments.
- Prepare the journal entry to record the end of Year 1 fair value adjustment.
- Assume that Barney sells 5,000 Boris Company shares for \$50 per share at the beginning of Year 2. Prepare the journal entry required to record the sale. Barney does not correct the fair value adjustment account at this time.
- Prepare the journal entry to record the end of Year 2 fair value adjustment.

- 3 E16-5. Equity-Investments, Fair Value Is Readily Determinable, IFRS.** Using the same information from E16-4, assume that Barney Equipment Corporation is an IFRS reporter and the company would like to elect to report these investments at fair value through other comprehensive income if it qualifies for this treatment. Barney is not holding the investment for trading, nor is it part of contingent consideration in a business combination.
- 3 E16-6. Equity-Investments, Fair Value Is Readily Determinable.** Armonico Capital Partners, Ltd. acquired the following equity investments at the beginning of Year 1. Armonico does not have significant influence over the investees.

Description	Finelli Brothers	MBW Company
Number of shares	15,500	20,000
Market price per share	× \$25	× \$18
Share acquisition price	<u>\$387,500</u>	<u>\$360,000</u>

Share prices at the end of Years 1 and 2 follow.

Fair Value	Finelli Brothers	MBW Company
End of Year 1	\$19	\$22
End of Year 2	23	28

Required »

- Prepare the journal entry to record the acquisition of the investments.
 - Prepare the journal entry to record the end of Year 1 fair value adjustment.
 - Assume that Armonico sells 15,000 MBW Company shares for \$16 per share at the beginning of Year 2. Prepare the journal entry required to record the sale. Armonico does not correct the fair value adjustment account at this time.
 - Prepare the journal entry to record the end of Year 2 fair value adjustment.
 - What is the effect of these investments on earnings in Years 1 and 2?
- 3 E16-7. Equity-Investments, Fair Value Is Not Readily Determinable.** Using the information provided in E16-6, satisfy the following requirements assuming that the equity securities held by Armonico Capital do not have a readily determinable fair value because neither company is publicly traded. Armonico elects to carry both securities at cost and to adjust the cost basis for changes in observable price changes for similar securities of the same investee. Assume that both companies have Class B common shares that are publicly traded and are similar to the securities held by Armonico. The market price of the Class B shares increased by 5% and 8% for Finelli and MBW, respectively.

Required »

- Prepare the journal entry to record the acquisition of the investments.
 - Prepare the journal entry to record the end of Year 1 fair value adjustment.
 - Assume that Armonico sells 15,000 MBW Company shares for \$16 per share at the beginning of Year 2 to a private investor. Prepare the journal entry required to record the sale. Armonico does not adjust the fair value adjustment account at this time.
 - Prepare the journal entry to record the sale of the remaining shares in the total portfolio for \$496,500 to a private investor in at the end of Year 2.
 - Prepare a table that compares the income effects over the 2-year period of the two methods (fair value through net income and adjusted cost).
- 2 3 E16-8. Debt and Equity Investments, Available-for-Sale Debt and Equity with Fair Values Readily Determinable.** Greenburg Company reported the following investment activity occurring at January 1 of the current year. Greenburg does not have significant influence over the investees.

Description	Amount Paid	Portfolio
Investment in bonds (\$5,600,000 par value, 7% coupon, annual interest paid on December 31, 15 years to maturity, 9% effective yield)	\$4,697,203	Held to maturity
Investment in publicly traded common stock (100,000 shares, \$33 per share acquisition price)	3,300,000	
Investment in publicly traded preferred stock (25,000 shares, \$10 par, \$10,000 annual dividend, \$18 per share acquisition price)	450,000	

Required »

- Prepare the journal entry required to record the acquisition of the investments at the beginning of the current year.
- Prepare the journal entries to record interest and dividend income at year-end assuming that Greenburg receives the dividends on the preferred shares.
- Prepare the journal entries required to adjust the carrying amount of the investments to their fair values at the end of the first year: bonds, \$4,595,425; common stock, \$38 per share; and preferred stock, \$12 per share.

2 3

E16-9. Debt and Equity Investments, Available-for-Sale Debt and Equity with Fair Values Readily Determinable, IFRS. Repeat E16-8 assuming that Greenburg Company is an **IFRS** reporter and the company would like to elect to report the investment at fair value through other comprehensive income if it qualifies for this treatment. Greenburg is holding the investment in common stock for trading. Greenburg is not holding the investment in preferred stock for trading, nor is it part of contingent consideration in a business combination.

3

E16-10. Equity Investments without a Readily Determinable Fair Value. Tekky Corporation purchased an equity investment in Hui Zu, Ltd. on December 15 for \$100,000. Tekky accounts for the equity investment by using market comparables. Hui Zu, Ltd.'s equity is not actively traded, and it does not have a readily determinable fair value, but fair value is estimated at \$105,000 on December 31. Tekky does not have significant influence over the investee. The investment is sold on June 22 of the next year for \$114,000. What are the necessary journal entries?

3

E16-11. Equity Investments without a Readily Determinable Fair Value, IFRS. Repeat E16-10 assuming that Tekky is an **IFRS** reporter. Tekky accounts for the investment as a fair value through other comprehensive income investment because the corporation does not intend to trade it nor is holding it as contingent consideration. Prepare the journal entries to record the purchase and sale of the investment assuming that Tekky is an **IFRS** reporter.

4

E16-12. Equity Investments, Equity Method, Book Value of Net Assets Equal to Fair Value. On January 1, Chloe Mikenzie Incorporated acquired 32% of the outstanding voting shares of Mannin Company at a cost of \$2,196,000 by acquiring 72,000 of the company's total 225,000 outstanding shares at a cost of \$30.50 per share. During the year, Mannin reported \$1,238,000 in net income and declared and paid \$1.15 per share dividends. At the time of acquisition, the book value of Mannin's net assets equaled its market value.

Required »

- Prepare the journal entry required to record the acquisition of the investment in Mannin Company.
- Prepare the journal entry required to record Chloe Mikenzie's share of the investee's net income.
- Prepare the journal entry required to record the receipt of the cash dividends.
- What is the carrying value of Chloe Mikenzie's investment in Mannin Company at the end of the year?

4

E16-13. Equity-Investments, Equity Method, Book Value of Net Assets Equal to Fair Value. Smart Cookie Corporation purchased 40% of the 320,000 outstanding shares of JT's Fine Foods, Inc. on January 1 of the current year. Smart Cookie acquired the shares at a price of \$3.20 per share. JT's Fine Foods, Inc. reported net income of \$64,000 and declared and paid cash dividends of \$25,600 during the current year. At the time of acquisition, the book value of JT's Fine Foods' net assets equaled its market value.

Prepare all journal entries necessary to account for this investment in JT's on Smart Cookie's books under the equity method.

4

E16-14. Equity-Investments, Equity Method, Book Value of Net Assets Equal to Fair Value. On January 1, Douglas Stores, Incorporated acquired 30% of Kirk Shoe Company. Douglas is acquiring the affiliate to secure a reliable source of supply. Douglas acquired 195,000 shares of the 650,000 shares of the investee company at a cost of \$2,540,000. At the time of acquisition, the book value of Kirk's net assets equaled its market value. Kirk reported \$8,136,700 net income and declared and paid dividends of \$2,275,000 at the end of the year of acquisition.

Required »

- Prepare the journal entry required to record the acquisition of the investment in Kirk Shoe.
- Prepare the journal entry required to record Douglas's share of the investee's net income.
- Prepare the journal entry required to record the receipt of the cash dividends.
- What is the carrying value of Douglas's investment in Kirk Shoe at the end of the year?

4 6

E16-15. Equity Method Investments, Fair Value Option. Using the information provided in E16-14, assume that Douglas elected the fair value option on the date of acquisition. At the end of the year of acquisition, Kirk's shares are trading for \$18 per share.

Required »

- Prepare the journal entry required to record the acquisition of the investment in Kirk Shoe.
- Prepare the journal entry required to record the receipt of the cash dividends.
- Prepare the journal entry required to adjust the investment balance to fair value.
- Prepare an analysis comparing the pre-tax income and cash flows relating to the investment under the equity method and the fair value method.
- Prepare an analysis comparing the pre-tax income and cash flows relating to the investment under the equity method and the fair value method, assuming that Douglas sold the investment for \$5,000,000 on January 1 of the year after acquisition.

4 6

E16-16. Equity Method Investments, Fair Value Option. On January 1, Clayton Incorporated acquired 32% of the outstanding voting shares of Kola Company at a cost of \$2,196,000 by acquiring 72,000 of the total 225,000 outstanding shares at a cost of \$30.50 per share. Clayton elected the fair value option. During the year, Kola reported \$1,238,000 in net income and declared and paid \$1.15 per share dividends. At the end of the year, the fair value of the investment is \$2,109,000.

Required »

- Prepare the journal entry to record the acquisition of the investment securities.
- Prepare the journal entries at year-end to record the fair value adjustment at the end of the year of acquisition.
- Prepare the journal entry to record the sale of 65% of the Kola common shares for \$1,675,000 on January 1 of the year following the acquisition.

5

E16-17. Notes Receivable. Each of the following three columns refers to an independent case. All data represent amounts as of January 1, the date on which the long-term notes receivable were issued except for the interest income, which is for the life of the note. Assume annual interest payments. Fill in the missing information identified by the letters A through I.

Item	Case 1	Case 2	Case 3
Notes receivable, face value	\$900,000	\$1,000,000	\$2,000,000
Initial carrying value	A	\$ 901,819	G
Market rate	B	8%	H
Stated rate	8%	7%	10%
Term of notes (in years)	20 years	D	5 years
Note receivable discount	(153,244)	E	I
Interest income over the note's term	C	F	1,200,000

5

E16-18. Notes Receivable. On January 1, 2018, Racine Company accepted a 10% note, dated January 1, 2018, with a face amount of \$2,400,000 in exchange for cash. The note is due in 10 years. For notes of similar risk and maturity, the market interest rate is 12%. Interest is paid each December 31.

Required »

- Determine the present value of the note at January 1, 2018.
- Prepare the journal entry at the issuance of the note.
- Prepare the journal entry to record the interest revenue for the first 2 years.

A

E16-19. Debt Investment, Held to Maturity, Impairments. Gretta Company purchased a debt investment on June 15, 2017, and classified it as held to maturity. On December 31, 2017, the investment had a carrying value of \$8,500 and a fair value of \$8,000. On that date, the present value of the future cash flows from the debt investment is \$8,100. On December 31, 2018, the carrying value, fair value, and present value of the future cash flows from the investment are \$7,900, \$7,800, and \$7,800, respectively. What is the amount of the impairment loss/gain in 2017 and 2018? Where does Gretta report the impairment loss/gain?

A

E16-20. Debt Investment, Impairments, IFRS. Repeat E16-19 assuming that Gretta Company reports under IFRS and measures the debt security at amortized cost. Gretta determines that there has not been a significant increase in credit risk in 2017 or 2018. In 2017, Gretta determines that the probability of default is 1% over the next 12 months and 3% over the life of the investment. In 2018, Gretta determines that there is a .75% probability of default over the next 12 months and a 2% probability over the lifetime of the investment.

A

E16-21. Debt Investment, Available for Sale, Impairments. Gretta Company purchased a debt investment on June 15, 2016, and classified it as available for sale. On December 31, 2016, the investment had a carrying value of \$8,500 and a fair value of \$8,000. On that date, the present value of the future cash flows from the debt investment is \$8,100. On December 31, 2017, the carrying value, fair value, and present value of the investment are \$7,900, \$7,800, and \$7,800, respectively. Gretta does not anticipate selling the investment before

it recovers. What is the amount of the impairment loss/gain in 2016 and 2017? Where does Gretta report the impairment loss/gain?

- A** **E16-22. Debt Investment, Impairments, IFRS.** Repeat E16-21 assuming that Gretta measures the debt security at fair value through OCI. Assume for simplicity that the carrying value is not reduced by amortization during 2017; thus, the carrying value on December 31, 2017, is \$8,000 (accounting for the prior year write-down). Gretta determines that there has not been a significant increase in credit risk in 2016 and 2017. In 2016, Gretta determines the probability of default is 1% over the next 12 months and 3% over the the life of the investment. In 2017, Gretta determines that the probability of default is 0.75% over the next 12 months and 2% over the lifetime of the investment.
- A** **E16-23. Equity Investment with No Readily Determinable Fair Value, Impairments.** Regal Inc., a **U.S. GAAP** reporter, holds an equity investment with a carrying value of \$107,250. This investment is not publicly traded and Regal has elected to carry it at adjusted cost. At December 31, 2016, the fair value of the investment is \$98,000, which was estimated by using a discounted cash flow valuation. Assume that Regal determines that the investment is impaired. What is the amount of the impairment? Where does Regal report the impairment loss?
- A** **E16-24. Equity Investment with No Readily Determinable Fair Value Impairments, IFRS.** Repeat E16-23 assuming that Regal Inc. reports under **IFRS**.
- A** **E16-25. Debt Investment, Impairments, IFRS.** Bronze Company, an IFRS reporter, holds a debt investment measured at fair value through OCI with a carrying value of \$45,000. The current fair value of the investment is \$38,000, and the appropriate expected credit loss is \$1,000. There has not been a significant increase in credit risk in the current year.

Required »

- Determine whether an impairment loss exists.
- If an impairment exists, what amount of loss will Bronze report in net income? What amount of loss will it report in other comprehensive income? What is the journal entry for the impairment loss if needed?

Problems

- 2** **P16-1. Debt Investments, Held to Maturity.** Capitol Corporation acquired \$6,735,000 par value, 6%, 5-year bonds on their date of issue, January 1 of the current year. The market rate at the time of issue was 10%, and interest is paid semiannually on June 30 and December 31. Capitol will use the effective interest rate method to account for this investment. Capitol intends to hold the investment until the bonds mature, and has the ability to do so.
- Required »**
- Determine the purchase price of the investment in bonds.
 - Prepare the journal entry to record the acquisition of the bond investment.
 - Prepare an amortization table for the investment using the effective interest rate method.
 - Prepare the journal entry to record the interest income for the first year.
 - Prepare the journal entry to record the sale of the bonds at the end of the third year for \$6,100,000.
- 2** **P16-2. Debt Investments, Trading.** Freder Software Group acquired \$1,550,000 par value, zero coupon, 5-year bonds on their date of issue, January 1 of the current year. The market rate at the time of issue was 6%, and interest is compounded annually. Freder uses the effective interest rate method to account for this investment. The company classifies the investment as a trading security. The fair value of the bonds at the end of the year of acquisition is \$1,097,500.
- Required »**
- Determine the purchase price of the investment in bonds.
 - Prepare the journal entry to record the acquisition of the bond investment.
 - Prepare an amortization table assuming that Freder uses the effective interest rate method.
 - Prepare the journal entry to record the interest income for the first 2 years.
 - Prepare the journal entry required to adjust the investment's carrying amount to fair value at the end of the first year.
 - Prepare the journal entry to record the sale of the investment on January 2 of Year 2 for a net price of \$987,150.
- 2** **P16-3. Debt Investments, Trading.** Sabran Corporation, a calendar year-end firm, invested in three debt securities on December 15, 2016, and classified them as trading securities. Sabran sold all three securities on January 1, 2017. The following table provides the purchase price, fair values, annual interest amounts, and selling prices for all three securities. All securities were acquired at face value and pay interest annually each December 31.

Security	Purchase Price	Fair Value at December 31, 2016	Annual Interest Amount	Selling Price
A	\$50,000	\$45,000	\$350	\$46,000
B	25,000	32,000	125	34,000
C	<u>10,000</u>	<u>9,000</u>	<u>175</u>	<u>8,000</u>
Total	<u>\$85,000</u>	<u>\$86,000</u>	<u>\$650</u>	<u>\$88,000</u>

Sabran had not purchased any other trading securities before January 1, 2016, and it did not make any additional investments subsequent to the sale on January 1, 2017. What journal entries are required to properly record these events?

3

P16-4. Equity Investments, Readily Determinable Fair Value. DeNault Aircraft Corporation acquired the following equity investments at the beginning of Year 1 to be held in a portfolio. DeNault does not have significant influence over the investees.

Description	Revere Group	Belton Brothers	Yan-Co Associates	Lopes Company
Number of shares	100,100	98,000	45,000	69,500
Market price per share	× \$23	× \$11	× \$16	× \$68
Share acquisition price	<u>\$2,302,300</u>	<u>\$1,078,000</u>	<u>\$720,000</u>	<u>\$4,726,000</u>

Share prices at the end of Years 1 and 2 follow.

Fair Value	Revere Group	Belton Brothers	Yan-Co Associates	Lopes Company
End of Year 1	\$26	\$9	\$21	\$59
End of Year 2	\$18	\$6	\$25	\$51

Required »

- Prepare the journal entry to record the acquisition of the investments.
- Prepare the journal entry to record the end of Year 1 fair value adjustment for the portfolio.
- Assume that DeNault sells 35,000 Yan-Co shares for \$23 per share at the beginning of Year 2. Prepare the journal entry required to record the sale. DeNault does not adjust the fair value adjustment account at this time.
- Prepare the journal entry to record the Year 2 fair value adjustment.

3

P16-5. Equity-Investments, Readily Determinable Fair Value, IFRS. Repeat P16-4 assuming that DeNault Aircraft Corporation is an IFRS reporter and would like to elect to report the investments at fair value through other comprehensive income if it qualifies for this treatment. DeNault is not holding the investments for trading nor is it part of contingent consideration in a business combination.

2 3

P16-6. Debt Investment, Equity Investments. K&Z Potato Chip Company, a U.S. GAAP reporter, provides you with the following information regarding its investments in equity securities during the current year.

Date	Description
January 1 (Beginning Balance: No entry required)	K&Z is currently holding 8,500 of Faithful Corporation common shares (publicly traded). The Faithful shares cost \$20 per share. There is a debit balance of \$17,000 in the fair value adjustment account. K&Z does not have a significant influence over the investee.
January 23	K&Z purchased 1,700 shares of Lawrence Company common stock for \$155 per share. Lawrence Company is publicly traded. K&Z does not have a significant influence over the investee.
February 4	K&Z acquired 136,000 of the 340,000 outstanding shares of Zombie, Inc. for a total cost of \$1,020,000.
March 23	Faithful Corporation paid a \$3.40 per share cash dividend.
June 30	Zombie, Inc. reported \$1,850,000 in net income for the year. Zombie also declared and paid a cash dividend of \$2.55 per share.
October 15	K&Z purchased 340 bonds of the Pierre Nardo Group (PNG) at \$1,000 par and intends to hold the debt investment to maturity.
December 31	K&Z accrued interest on the PNG bonds amounted to \$42,500.
December 31	The year-end market values of the Faithful Corporation and Lawrence shares are \$30.60 and \$170 per share, respectively. The PNG bonds were trading at \$1,700 at the end of the current period, and Zombie was trading at \$10 per share.

Required »

Prepare all journal entries necessary to record K&Z's investment transactions for the year. Show all computations.

- 3** **P16-7. Equity Investments, Readily Determinable Fair Value.** Bullet Bob Company has the following securities in its portfolio on December 31 of Year 1. Bullet Bob Company does not have a significant influence over the investees. All securities are purchased during Year 1:

Description	Cost	Fair Value
Dolt Corporation common stock: 15,000 shares	\$ 345,000	\$ 259,000
Single JA common stock: 200,000 shares	1,000,000	1,800,500
Portfolio totals	<u>\$1,345,000</u>	<u>\$2,059,500</u>

Bullet Bob acquired and sold securities from this portfolio during Year 2. Specifically, on June 3, the company sold 7,500 shares of Dolt Corporation stock for \$20 per share. On November 9, Bullet Bob acquired 4,000 shares of FOAH Stores' common stock for \$81 per share.

Bullet Bob Company's portfolio of equity securities on December 31 of Year 2 follows.

Description	Cost	Fair Value
Dolt Corporation common stock: 7,500 shares	\$ 172,500	\$ 157,000
Single JA common stock: 200,000 shares	1,000,000	1,400,850
FOAH common stock: 4,000 shares	324,000	344,000
Portfolio totals	<u>\$1,496,500</u>	<u>\$1,901,850</u>

Bullet Bob does not elect the adjusted cost method for any of its equity investments.

Required »

- Prepare the entry to record the acquisition of the investments in Year 1.
 - Prepare the journal entry to adjust the portfolio to fair value at the end of Year 1.
 - Prepare the journal entry to record the sale of the Dolt Corporation common shares.
 - Prepare the journal entry to record the acquisition of the FOAH common stock.
 - Prepare the journal entry to adjust the portfolio to fair value at the end of Year 2.
- 3** **P16-8. Equity Investments, Readily Determinable Fair Value.** Pugh Company purchased 1,800 shares of the Kramer Group common stock for \$64,800 (i.e., \$36 per share) at the beginning of the current year. There were 36,000 outstanding Kramer shares on the date of acquisition. Total stockholders' equity of Kramer Company is \$1,080,000 on the date of acquisition. Kramer reported \$360,000 in net income and declared and paid \$1.44 per share cash dividends at year-end.

Required »

- Prepare the journal entry to record the purchase of the Kramer shares.
 - Prepare the journal entries necessary to reflect Pugh's share of Kramer's dividends.
 - Prepare the journal entry required to adjust Pugh's investment to its fair value of \$54 per share at year-end.
 - Prepare the journal entry necessary to record the sale of 900 Kramer shares for \$63 per share at the beginning of the next year.
- 3** **P16-9. Equity Investments, Readily Determinable Fair Value, IFRS.** Repeat P16-8 assuming that Pugh Company is an IFRS reporter and would like to elect to report the investment at fair value through other comprehensive income if it qualifies for this treatment. Pugh is not holding the investments for trading, nor is it part of contingent consideration in a business combination.

- 3 4** **P16-10. Equity Investments, Equity Method.** Dale Corporation acquired a 35% interest in Roger Inc. for \$300,000 on January 1 of the current year. Specifically, Dale acquired 68,250 of the 195,000 voting common shares outstanding. Roger reported net income of \$120,000 at the end of the current year and paid cash dividends of \$36,000 during the current year. At the time of acquisition, the book value of Roger's net assets equaled its market value. Roger's shares were selling for \$6 per share at the end of the current year.

Required »

- Prepare all journal entries required to record the transactions indicated assuming that Dale uses the equity method.
- Determine the carrying value of the investment at the end of the current year assuming that Dale uses the equity method.
- Prepare the journal entries required to account for Dale's investment in Roger assuming that the investment does not permit Dale to exercise significant influence over Roger.

4

P16-11. Equity Investments, Equity Method, Net Assets Not Equal to Market Value. Smart Cookie Corporation purchased 40% of the 320,000 outstanding shares of JT's Fine Foods, Inc. on January 1 of the current year. Smart Cookie acquired the shares at a price of \$3.20 per share. The following additional data were available for JT's Fine Foods, Inc. on the date of acquisition.

Description	Book Values	Fair Values
Current assets	\$256,000	\$256,000
Depreciable assets (10-year remaining life/straight-line depreciation)	192,000	230,400
Total Assets	<u>\$448,000</u>	<u>\$486,400</u>
Liabilities	\$ 32,000	\$ 32,000
Contributed Capital (Common Stock and Additional Paid-in Capital)	\$320,000	\$320,000
Retained Earnings	96,000	134,400
Total Shareholders' Equity	<u>\$416,000</u>	<u>\$454,400</u>
Total Liabilities and Stockholders' Equity	<u>\$448,000</u>	<u>\$486,400</u>

JT's Fine Foods, Inc. reported net income of \$64,000 at the end of the current year and declared and paid cash dividends of \$25,600 during the current year.

Required »

- Compute the amount of goodwill implied on Smart Cookie's acquisition of JT's Fine Foods shares.
- Prepare all journal entries necessary to account for this investment in JT's under the equity method.

4 6

P16-12. Equity Investments, Equity Method, Fair Value Option, Net Assets Not Equal to Market Value. Jacob Corporation paid \$536,200 for a 30% share of Gardner Enterprises on January 1 of the current year. Gardner reported net assets at a book value of \$1,414,000 on the date of acquisition. On the date of acquisition, it was determined that Gardner's plant assets were undervalued by \$118,000. Gardner's plant assets have a 10-year remaining life and are depreciated by the straight-line method with no residual value. Gardner reported net income of \$224,000 and declared and paid cash dividends of \$182,000 during the current year. Finally, Gardner's common shares are valued at \$1,737,667 at the end of the current year.

Required »

- Compute the amount of goodwill on the exchange, if any, assuming that the equity method is used to account for the investment.
- Prepare all journal entries indicated on the books of the Jacob Corporation under the fair value option and equity methods.
- Assume that Jacob Corporation sold the investment for \$540,000 on January 1 of the next year. Prepare the journal entries required to record the sale of the investment under both the fair value option and the equity methods.
- Prepare a schedule that compares the amount and timing of revenue recognition for the fair value option and the equity methods.

4 6

P16-13. Equity Investments, Equity Method, Fair Value Option. Jacob Corporation paid \$536,200 for a 30% share of Gardner Enterprises on January 1 of the current year. Gardner reported net income of \$224,000 and declared and paid cash dividends of \$182,000 during the current year. At the time of acquisition, the book value of Gardner's net assets equaled its market value. Finally, Gardner's common shares are valued at \$1,737,667 at the end of the current year.

Required »

- Prepare all journal entries indicated on the books of the Jacob Corporation under the fair value option and the equity method.
- Assume that Jacob sells the investment for \$540,000 on January 1 of the next year. Prepare the journal entries required to record the sale of the investment under both the fair value option and the equity method.

- c. Prepare a schedule that compares the amount and timing of revenue recognition for the fair value option and the equity method.

A

P16-14. Debt Investment, Held to Maturity, Impairments. Melia Company purchased a debt investment in 2016 and classified it as held to maturity. The carrying value on December 31, 2016, is \$250,000. At December 31, 2016, the fair value of the investment is \$238,000, and the present value of the future cash flows from the debt investment is \$241,000. Melia does not intend to sell the investment, but it does deem it more likely than not that it will have to sell the investment before the market recovers.

Required »

- a. If there is an impairment, what amount of loss will Melia report in net income? What amount of loss will Melia report in other comprehensive income?
b. Prepare the journal entry for the impairment loss if needed.

A

P16-15. Debt Investment, Impairments, IFRS. Griffin Company, an IFRS reporter, holds a debt investment measured at amortized cost of \$250,000. The debt security is investment grade. The current fair value of the investment is \$238,000, and the present value of the future cash flows from the debt investment is \$241,000. The 12-month expected credit loss is \$1,250, and the lifetime expected credit loss is \$4,000. There has not been a significant increase in credit risk during the current year.

Required »

- a. If impairment exists, what amount of loss will Griffin report in net income? What amount of loss will it report in other comprehensive income?
b. Prepare the journal entry for the impairment loss if needed.

A

P16-16. Debt Investment, Available for Sale, Impairments. Potter Company holds an available-for-sale debt investment with a carrying value of \$95,000 that it purchased in the current year. The current fair value of the investment is \$87,000 and the present value of the future cash flows from the debt investment is \$90,000. Potter does not intend to sell the investment; however, it does deem it more likely than not that it will be able to hold the investment until the market recovers.

Required »

- a. If impairment exists, what amount of loss will Potter report in net income? What amount of loss will it report in other comprehensive income?
b. What is the journal entry for the impairment loss if needed?

A

P16-17. Debt Investment, Impairments, IFRS. Use the same information as in problem P16-16 except now assume that Potter Company is an IFRS reporter and carries the debt at fair value through OCI. Also, assume that the present value accurately measures the difference between the carrying value and the expected credit loss. There has not been a significant increase in credit risk during the current year.

Required »

- a. If impairment exists, what amount of loss will Potter report in net income? What amount of loss will it report in other comprehensive income?
b. What is the journal entry for the impairment loss if needed?

A

P16-18. Equity Investment, No Readily Determinable Fair Value, Impairments. Mulligan Company carries an equity investment of a privately held company. Mulligan elected to measure this equity security without a readily determinable fair value at adjusted cost. The current carrying value of the equity shares is equal to \$326,400. Mulligan uses market comparables to estimate the current fair value of the investment at \$315,000. A qualitative assessment indicates that impairment does exist.

Required »

- a. If impairment exists, what amount of loss will Mulligan report in net income? What amount of loss will it report in other comprehensive income?
b. What is the journal entry for the impairment loss if needed?

A

P16-19. Equity Investment, Impairments, IFRS. Repeat P16-18 assuming Mulligan Company reports under IFRS.

CASES

Judgment Cases

Judgment Case 1: Impairment Decisions: U.S. GAAP

Refer to Exhibit 16A.1, which presents a decision tree for impairments of investments in financial assets under **U.S. GAAP**. Detail the decisions and judgments that you must make when determining whether an investing asset has been impaired and, if so, the amount of impairment. Provide explanations as necessary. Is the area of investing asset impairments more of an objective or subjective area of financial reporting?

Judgment Case 2: Impairment Decisions: IFRS

Refer to Exhibit 16A.2, which presents a decision tree for impairments of investments in financial assets under **IFRS**. Please detail the decisions and judgments that you must make when determining whether an investing asset has been impaired and, if so, the amount of impairment. Provide explanations as necessary. Is the area of investing asset impairments more of an objective or subjective area of financial reporting?

Financial Statement Analysis Case

Cisco Systems, Inc., the leading Internet protocol-based networking equipment company, has significant holdings of investment securities. Use the financial statement information provided to analyze *Cisco's* holdings and answer the following questions and complete the following requirements:

1. What types of investments are in the firm's portfolio in fiscal 2016 and 2015? What percentage of total assets do its investments compose? Comment on changes in the composition and percentage of investments to total assets from year to year. Use fair value.
2. Which investment securities did *Cisco* report at fair value in fiscal 2016 and 2015? What is the difference between fair value and cost?
3. Determine the effect of changes in fair value on net income and other comprehensive income in fiscal 2016, 2015, and 2014. If unrealized gains and losses on available-for-sale securities were reported in net income rather than other comprehensive income, what would be the effect on net income in fiscal 2016, 2015, and 2014?
4. For its investment securities, determine the types and amount of investments in each level in the hierarchy in fiscal 2016.

At or for the Year Ended (in millions)	July 30, 2016 (Fiscal 2016)	July 25, 2015 (Fiscal 2015)	July 26, 2014 (Fiscal 2014)
Total Assets	\$121,652	\$113,373	\$105,070
Net Income	\$ 10,739	\$ 8,981	\$ 7,853

Statement of Comprehensive Income (excerpt)

Year Ended	July 30, 2016 (Fiscal 2016)	July 25, 2015 (Fiscal 2015)	July 26, 2014 (Fiscal 2014)
Net income	<u>\$10,739</u>	<u>\$8,981</u>	<u>\$7,853</u>
Available-for-sale investments:			
Change in net unrealized gains (losses), net of tax of \$(49), \$14, and \$(146) for fiscal 2016, 2015, and 2014, respectively	\$ 92	\$ (12)	\$ 233
Net (gains) losses reclassified into earnings, net of tax expense (benefit) of \$0, \$57, and \$111 for fiscal 2016, 2015, and 2014, respectively	<u>1</u>	<u>(100)</u>	<u>(189)</u>
Total	<u>\$ 93</u>	<u>(\$ 112)</u>	<u>\$ 44</u>

Selected Excerpts of Cisco Systems, Inc. Financial Statements and Annual Report

Note 2: Summary of Significant Accounting Policies [Excerpt]

(b) Available-for-Sale Investments The Company classifies its investments in both fixed income securities . . . as available-for-sale investments. Fixed income securities primarily consist of U.S. government securities, U.S. government agency securities, non-U.S. government and agency securities, corporate debt securities, and U.S. agency mortgage-backed securities. These available-for-sale investments are primarily held in the custody of a major financial institution. A specific identification method is used to determine the cost basis of fixed income and public equity securities sold. These investments are recorded in the Consolidated Balance Sheets at fair value. Unrealized gains and losses on these investments, to the extent the investments are unhedged, are included as a separate component of accumulated other comprehensive income (AOCI), net of tax. The Company classifies its investments as current based on the nature of the investments and their availability for use in current operations.

(k) Fair Value Fair value is defined as the price that would be received from selling an asset or paid to transfer a liability in an orderly transaction between market participants at the measurement date. When determining the fair value measurements for assets and liabilities required or permitted to be either recorded or disclosed at fair value, the Company considers the principal or most advantageous market in which it would transact, and it also considers assumptions that market participants would use when pricing the asset or liability.

The accounting guidance for fair value measurement requires an entity to maximize the use of observable inputs and minimize the use of unobservable inputs when measuring fair value. The standard establishes a fair value hierarchy based on the level of independent, objective evidence surrounding the inputs used to measure fair value. A financial instrument's categorization within the fair value hierarchy is based upon the lowest level of input that is significant to the fair value measurement. The fair value hierarchy is as follows:

Level 1 applies to assets or liabilities for which there are quoted prices in active markets for identical assets or liabilities.

Level 2 applies to assets or liabilities for which there are inputs other than quoted prices that are observable for the asset or liability such as quoted prices for similar assets or liabilities in active markets; quoted prices for identical assets or liabilities in markets with insufficient volume or infrequent transactions (less active markets); or model-derived valuations in which significant inputs are observable or can be derived principally from, or corroborated by, observable market data.

Level 3 applies to assets or liabilities for which there are unobservable inputs to the valuation methodology that are significant to the measurement of the fair value of the assets or liabilities.

Note 8. Investments

(a) Summary of Available-for-Sale Investments

The following tables summarize the Company's available-for-sale investments (in millions):

	Amortized Cost	Gross Unrealized Gains	Gross Unrealized Losses	Fair Value
July 30, 2016				
Fixed income securities:				
U.S. government securities	\$26,473	\$ 73	\$ (2)	\$26,544
U.S. government agency securities	2,809	8	–	2,817
Non-U.S. government and agency securities	1,096	4	–	1,100
Corporate debt securities	24,044	263	(15)	24,292
U.S. agency mortgage-backed securities	<u>1,846</u>	<u>22</u>	<u>–</u>	<u>1,868</u>
Total fixed income securities	<u>\$56,268</u>	<u>\$370</u>	<u>\$(17)</u>	<u>\$56,621</u>

Surfing the Standards Case

Surfing the Standards Case: Partnership Investment

GTI Corporation acquired a 15% interest in DDA Partnership on February 15 of the current year. GTI is preparing its financial statements for the first quarter and needs to determine how to report the investment. GTI realizes that it will either report at cost, fair value, or under the equity method. Auditors have pointed the corporation to ASC 323 *Investments – Equity Method and Joint Ventures* and ASC 825-10-25 *Financial Instruments – Overall – Recognition*. Based on your review of the pertinent codification, how should GTI report its investment in DDA Partnership?

Basis for Conclusions Cases

Basis for Conclusions Case 1: Reasons for the Fair Value Option

ASC 825-10 *Financial Instruments – Overall* permits (but does not require) the option to report most financial assets at fair value. Read paragraph A3 of the Basis for Conclusions in *Statement of Financial Accounting Standards No. 159*. Briefly explain the four reasons the board decided to allow the fair value option.

Basis for Conclusions Case 2: Electing the Fair Value Option

ASC 825-10 *Financial Instruments – Overall* permits (but does not require) the option to report most financial assets at fair value. Read paragraphs A12 – A19 of the Basis for Conclusions in *Statement of Financial Accounting Standards No. 159*.

1. When must entities make the fair value option election? Why did the board decide that?
2. ASC 825-10 allows the election of the fair value option on an instrument-by-instrument basis. What were the main concerns expressed by the respondents to the Exposure Draft to this approach? Why did the FASB decide to allow the instrument-by-instrument approach?

APPENDIX A

Impairments of Investment Securities

Firms must assess every asset on the balance sheet to ensure that all provide future economic benefit to the firm at an amount commensurate with the amount reported on the balance sheet. An **impairment** occurs when an asset's total future cash-generating ability falls below its carrying value.

The approach to testing and reporting impairments depends on the way that each type of investing asset, absent impairment, is measured. Accounting for increases or decreases in the fair value of investments varies for trading, available-for-sale, and held-to-maturity debt securities and equity securities with and without readily available fair values:

- For trading debt securities, companies account for changes in fair value through net income.
- For available-for-sale debt securities, companies account for changes in fair value through other comprehensive income.
- For held-to-maturity debt securities, companies do not report changes in fair value because they carry these investments at amortized cost, not at fair value.
- For equity securities with readily determinable fair values, companies reports changes in fair value through net income.
- For equity securities without readily determinable fair values, companies either report changes in fair value through net income or elect to report at cost with adjustments for price changes in similar securities of the same entity.

How does management account for impaired investment securities? When impairment occurs, companies reduce the value of the asset on the balance sheet and report this change in the carrying value of securities in income. The exact procedure depends on the type of investment. In the case of trading debt securities and equity securities with readily determinable fair values, companies do not need to perform an impairment assessment because they are already reported at fair value with the unrealized gains and losses reported in net income. We next discuss impairments of held-to-maturity and available-for-sale debt securities followed by equity securities without readily determinable fair values.¹⁸

Accounting for Impairments of Debt Investments Measured at Amortized Cost

Here we discuss the steps used to evaluate and measure impairments of debt investments that are measured at amortized cost such as held-to-maturity debt securities and notes receivable. U.S. GAAP and IFRS differ in several ways, as we address later.

We use an expected loss model to account for an impairment of a debt investment measured at amortized cost. A firm should report the asset on the balance sheet at the amount it expects to collect. Impairing debt investments measured at amortized cost involves the following steps.

Step 1. Compute the Expected Amount to Be Collected

At the end of every reporting period, the company should compute the expected amount that will be collected. The authoritative literature does not specify a particular method to use, and there are many approaches used in practice.¹⁹ However, whatever method the firm chooses must be consistently applied.

¹⁸Most of the U.S. GAAP relevant authoritative literature for this topic is found in FASB ASC 320-10, *Investments – Debt and Equity Securities – Overall*, ASC 321-10, *Investments – Equity Securities – Overall*, and ASC 326, *Financial Instruments – Credit Losses*. For IFRS the authoritative literature is found in IFRS 9, *Financial Instruments*.

¹⁹Examples of common methods are loss rate, roll rate, aging, and probability of default

We will focus on the discounted cash flow method, which requires discounting all expected future cash flows to the present value at the balance sheet date, using the effective interest rate of the financial asset.

Step 2. Compute an Allowance for Credit Loss

The allowance for credit loss is a contra-asset account. It measures the difference between the amortized cost of the investment and the amount expected to be collected. The account balance of the allowance for credit loss must be presented separately on the balance sheet.

Step 3. Report the Change in the Allowance for Credit Loss in Net Income

Any change in the allowance for credit loss is recognized through net income. When the amount that is expected to be collected falls below amortized cost for the first time, the firm reports an unrealized loss. In subsequent periods, the firm may report additional unrealized losses. Alternatively, if the security recovers, the firm can report a reversal of a prior unrealized loss in net income. However, these reversals cannot exceed the initial unrealized loss (that is, the allowance for credit loss can have only a credit balance).

Example 16A.1 illustrates accounting for the impairment of a held-to-maturity debt investment.

EXAMPLE 16A.1

Impairment of a Held-to-Maturity Debt Investment

PROBLEM: On January 1 of Year 1, Silver Company purchased a bond and classified it as held to maturity. The 5-year bond has a face value of \$1,000,000, pays interest annually on December 31, and has a stated and effective interest rate of 5%. Silver receives the first two payments on December 31, Year 1 and Year 2, respectively. On December 31 of Year 2, Silver determines that the investment's expected collections have dropped below the contractual amounts. Silver anticipates that the remaining three payments will be \$45,000 instead of \$50,000. Silver does anticipate that the principal balance will be received in full.

On December 31, Year 3, Silver reassesses the investment and anticipates that the remaining two payments will be \$48,000 each. Prepare the journal entry for the impairment loss and recovery on December 31 of Year 2 and Year 3.

SOLUTION: To determine whether an impairment loss exists, we follow the steps of impairment testing. We begin with Year 2.

STEP 1: COMPUTE THE EXPECTED AMOUNT TO BE COLLECTED

Silver expects to collect \$45,000 interest over the next 3 years and the \$1,000,000 principal at the end of the last year. The present value of this stream of cash flows at 5% is \$986,384.

	N	I/Y	PV	PMT	FV	Excel Formula
Given	3	5.00%		45,000	1,000,000	
Solve For PV			(986,384)			=PV(0.05,3,45000,1000000)

STEP 2: COMPUTE AN ALLOWANCE FOR CREDIT LOSS

The allowance is the difference between the amortized cost and the expected amount to be collected. The amortized cost is \$1,000,000. Because the bond was purchased at par value, there is no premium or discount amortization; thus, the cost basis remains at \$1,000,000. The expected amount to be collected is \$986,384 as determined in Step 1. Thus, the balance in the allowance for credit loss account should be \$13,616.

Continued

STEP 3: REPORT THE CHANGE FOR THE ALLOWANCE FOR CREDIT LOSS IN NET INCOME

The journal entry is:

Account	December 31, Year 2
Impairment Loss – Net Income	13,616
Allowance for Credit Loss: Held-to-Maturity Debt Investment	13,616

We continue with Year 3.

STEP 1: COMPUTE THE EXPECTED AMOUNT TO BE COLLECTED

Silver expects to collect \$48,000 interest over the next 2 years, and the \$1,000,000 principal at the end of the last year. The present value of this stream of cash flows at 5% is \$996,281.

	N	I/Y	PV	PMT	FV	Excel Formula
Given	2	5.00%		48,000	1,000,000	
Solve For PV			(996,281)			=PV(0.05,2,48000,1000000)

STEP 2: COMPUTE AN ALLOWANCE FOR CREDIT LOSS

The allowance is the difference between the amortized cost and the expected amount to be collected. The amortized cost is \$1,000,000. Because the bond was purchased at par value, there is no premium or discount amortization; thus, the cost basis remains at \$1,000,000. The expected amount to be collected is \$996,281 as determined in Step 1. Thus, the balance in the allowance for credit loss account should be \$3,719.

STEP 3: REPORT THE CHANGE FOR THE ALLOWANCE FOR CREDIT LOSS IN NET INCOME

Silver has a beginning balance in the allowance for credit loss account of \$13,616. At the end of Year 3, it needs a balance of \$3,719. Thus, it will debit the allowance account for \$9,897 and record a loss recovery in net income, which increases net income.

The journal entry is:

Account	December 31, Year 3
Allowance for Credit Loss: Held-to-Maturity Debt Investment	9,897
Recovery of Impairment Loss: Held-to-Maturity Debt Investment	9,897

Accounting for Impairments of Available-for-Sale Debt Investments

Recall that available-for-sale debt securities are measured at fair value with unrealized gains and losses reported in other comprehensive income even in the absence of an impairment. However, with an impairment, the portion of the difference between the carrying value and the fair value that is due to the credit loss is reported net income. We next discuss the steps used to evaluate and measure impairments of available-for-sale debt investments. U.S. GAAP and IFRS differ in several ways, as we address later.

Step 1. Compute the Present Value of Expected Future Cash Flows

To correctly account for changes in the value of available-for-sale debt securities, we need to know the present value of expected future cash flows of the investment as well as the fair value. To compute the present value, we use the effective interest rate implicit in the security at the date of acquisition.

Step 2. Compute the Balance in the Allowance for Credit Loss and the Security Fair Value Adjustment Account

We divide changes in the value of available-for-sale debt investments into two components:

- Credit loss component
- Non-credit loss component.

We report the credit loss in the allowance for credit loss (a contra-asset account) and the non-credit loss in the security fair value adjustment account. The allowance for credit loss is measured as the difference between the present value of future cash flows and the amortized cost. The security fair value adjustment account is measured as the difference between the present value of future cash flows and the fair value. Non-credit loss relates to all factors, such as market illiquidity and market interest rate fluctuations, that cause the debt security's fair value to be below its present value.

The allowance for credit loss cannot be higher than the difference between the amortized cost and the fair value of the asset. In other words, the credit loss portion of the impairment is limited to the amount by which the amortized cost exceeds the fair value. The account balance of the allowance for credit loss along with the amortized cost must be presented parenthetically on the balance sheet.

Step 3. Report the Impairment Loss in Other Comprehensive Income

Any change in the allowance for credit loss is reported in net income. Any change in the security fair value adjustment account is reported in other comprehensive income.

When a firm reports a credit loss on an asset for the first time, it reports an unrealized loss. In subsequent periods, the firm may report additional unrealized credit losses. Alternatively, if the security recovers, the firm can report a reversal of prior unrealized credit losses in net income. However, these reversals cannot exceed the initial unrealized credit loss (that is, the allowance for credit loss can have only a credit balance).

Accounting for the impairment of an available-for-sale debt investment is illustrated in Example 16A.2.

EXAMPLE 16A.2

Impairment of an Available-for-Sale Debt Investment

PROBLEM: On January 1 of Year 1, Palladium Converters, Inc. purchased a bond and classified it as available for sale. The 5-year bond has a face value of \$1,000,000, pays interest annually on December 31, and has a stated and effective interest rate of 5%. Palladium receives the \$50,000 interest payment on December 31, Year 1. On December 31, Year 1, the bond has a fair value of \$975,000. Palladium anticipates that it will receive only \$46,000 for each of the next four interest payments. However, it does believe it will receive the full principal amount at the end of the fifth year. Provide the journal entry to record the credit loss in Year 1.

SOLUTION: To determine the credit loss, we follow the steps of impairment testing.

STEP 1. COMPUTE THE PRESENT VALUE OF FUTURE CASH FLOWS

Palladium expects to collect \$46,000 interest over the next 4 years and the \$1,000,000 principal at the end of the last year. The present value of this stream of cash flows at 5% is \$985,816.

	N	I/Y	PV	PMT	FV	Excel Formula
Given	4	5.00%		46,000	1,000,000	
Solve For PV			(985,816)			=PV(0.05,4,46000,1000000)

STEP 2. COMPUTE THE BALANCE IN THE ALLOWANCE FOR CREDIT LOSS AND THE SECURITY FAIR VALUE ADJUSTMENT ACCOUNT

The total loss is the difference between the amortized cost and the fair value. The credit loss is the difference between the amortized cost and the present value of expected cash flows. The non-credit loss is the portion of the total loss that is not included in the credit loss.

Continued

Amortized Cost	Present Value of Future Cash Flows	Fair Value
\$1,000,000	\$985,816	\$975,000
	\$ 14,184	\$ 10,816
	Credit Loss	Non-Credit Loss

Palladium's allowance for credit loss is \$14,184.

STEP 3. REPORT THE IMPAIRMENT LOSS IN COMPREHENSIVE INCOME

Palladium reports the credit loss in net income and the non-credit loss in other comprehensive income.

Account	December 31, Year 1
Credit Loss – Net Income	14,184
Allowance for Credit Loss: Available-for-Sale Debt Investments	14,184
Non-Credit Loss – OCI	10,816
Fair Value Adjustment–Available-for-Sale Debt Investments	10,816

If the investor plans on selling the investment or if it is more likely than not that the investor will be required to sell the asset before it recovers the amortized cost, then the investment is written down to its fair value with the entire amount reported in net income. This new basis becomes the investment's amortized cost and thus cannot be reversed through net income if the investment recovers in value. Example 16A.3 illustrates accounting for the impairment of an available-for-sale debt investment when the investor is required to sell.

EXAMPLE 16A.3

Impairment of an Available-for-Sale Debt Investment—Investor Required to Sell

PROBLEM: Consider the previous example of Palladium Converters, Inc. How would the December 31, Year 1, journal entry change if Palladium concluded that it was more likely than not that it would need to sell the investment before recovering the amortized cost?

SOLUTION: In this case, Palladium will need to record the entire loss in net income and reduce the amortized cost basis of the asset. The total loss is \$25,000 (\$14,184 credit loss plus \$10,816 non-credit loss). Because Palladium is reducing the amortized cost basis of the asset, it credits the asset itself as opposed to an allowance account.

Account	December 31, Year 1
Impairment Loss – Net Income	25,000
Available-for-Sale Debt Investments	25,000

Accounting for Impairments of Equity Securities with No Readily Determinable Fair Value

Here we discuss the steps in evaluating and measuring impairments of equity securities with no readily determinable fair value. If a company has elected to measure an equity security without a readily determinable fair value at adjusted cost, it uses the following steps to assess and possibly record the impairment of an equity security.

Step 1. Determine Whether There Is an Impairment Loss for the Asset

Under U.S. GAAP the equity investment is impaired if the following apply to it:

- The fair value of the investment is less than its carrying value.
- A qualitative assessment indicates that the investment is impaired.

When making the qualitative assessment, companies should consider all of the following along with any other indicators that could be relevant.

- A significant deterioration in the earnings performance, credit rating, asset quality, or business prospects of the investee
- A significant adverse change in the regulatory, economic, or technological environment of the investee
- A significant adverse change in the general market condition of either the geographical area or the industry in which the investee operates
- A legitimate offer to purchase, an offer by the investee to sell, or a completed auction process for the same or similar investment for an amount less than the carrying amount of that investment
- Factors that raise significant concerns about the investee's ability to continue as a going concern, such as negative cash flows from operations, working capital deficiencies, or non-compliance with statutory capital requirements or debt covenants.²⁰

Step 2. Measure the Impairment Loss

The impairment loss for an equity security with no readily determinable fair value is the difference between the carrying value and the estimated fair value.

Step 3. Report the Impairment Loss in Net Income

For equity securities with no readily determinable fair value, companies report the impairment loss in net income. Example 16A.4 illustrates accounting for the impairment of a held-to-maturity debt investment with no readily determinable fair value.

EXAMPLE 16A.4

Impairment of an Equity Investment with No Readily Determinable Fair Value

PROBLEM: Platinum Plating Company holds an equity investment in Silver Metal Company with a carrying value of \$80,000. The investment does not have a readily determinable fair value. The current fair value of the investment is \$56,000. Silver Metal Company has experienced financial difficulty to the extent that it is now questionable as to whether it will even remain in business. Does impairment exist? If so, what amount of loss will Platinum report in net income? What amount of loss will it report in other comprehensive income? What is the journal entry for the impairment loss, if needed?

SOLUTION: To determine whether an impairment loss exists, we follow the steps of impairment testing.

STEP 1. DETERMINE WHETHER THERE IS AN IMPAIRMENT LOSS FOR THE ASSET

We base our determination on two parts.

1. Comparing the \$80,000 carrying value to the \$56,000 fair value indicates an impairment loss of \$24,000.
2. Because Silver Mining Company is experiencing significant financial difficulties, the qualitative assessment indicates that the investment is impaired.

STEP 2. MEASURE THE IMPAIRMENT LOSS

The impairment loss is the carrying value of \$80,000 less the fair value of \$56,000. Platinum should record an impairment loss of \$24,000.

STEP 3: REPORT THE IMPAIRMENT LOSS IN NET INCOME

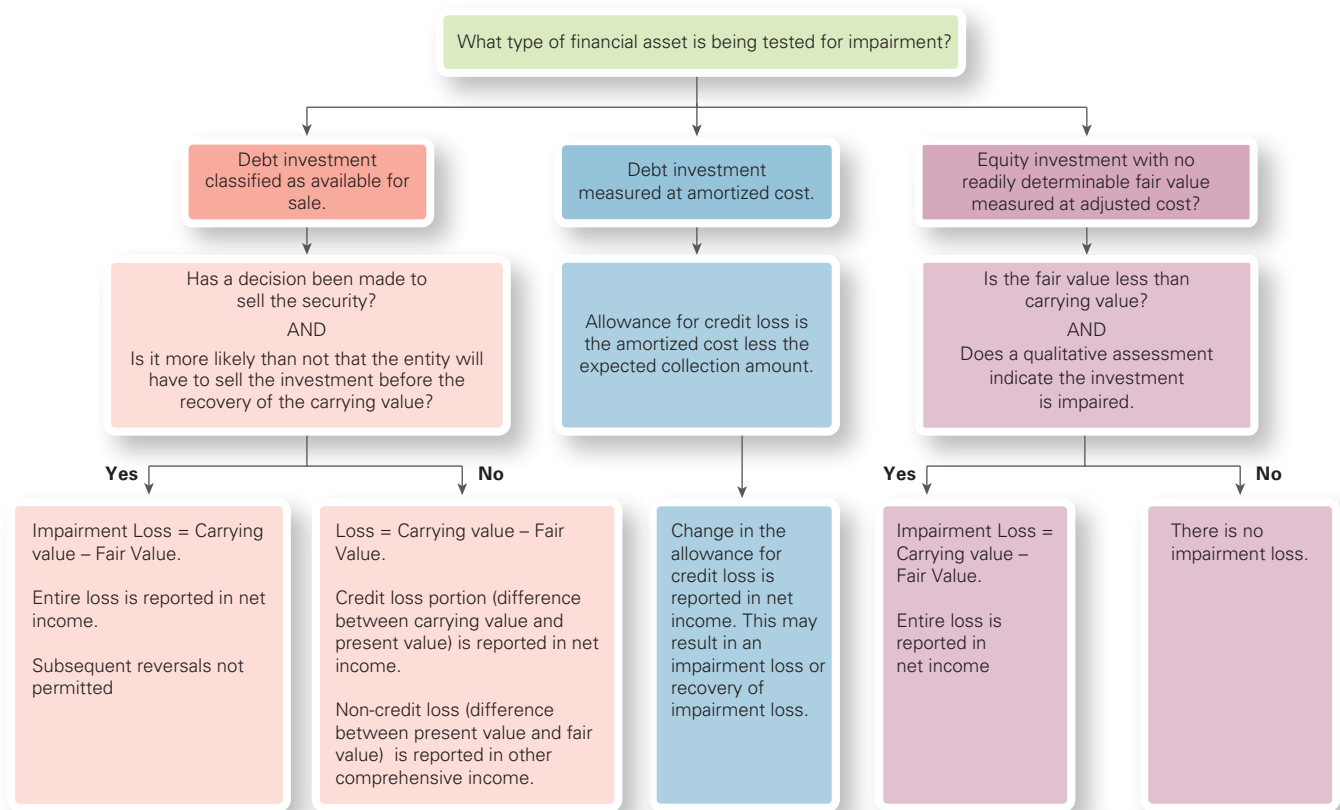

Platinum reports the impairment loss of \$24,000 in net income because it is an equity security.

The journal entry is:

<i>Account</i>	<i>December 31, Current Year</i>	
Impairment Loss – Income	24,000	
Equity Investment		24,000

Exhibit 16A.1 presents a decision tree for the impairment of investments in financial assets under U.S. GAAP.

²⁰ ASC 321-10-35-3.

EXHIBIT 16A.1 Investments in Financial Assets: Impairment Decision Tree, U.S. GAAP**Accounting for Impairments: IFRS**

Next, we discuss accounting for impairments of debt securities under IFRS, which differs from the U.S. GAAP approach to impairment. Under IFRS, equity securities are not tested for impairment. This is true even for the equity securities for which a company has elected to report unrealized gains and losses through other comprehensive income.

Accounting for Impairments under IFRS: Debt Securities Reported at Amortized Cost or Fair Value through Other Comprehensive Income

The computation of the impairment loss under IFRS is the same for debt investments measured at amortized cost and debt investments measured at fair value with unrealized gains and losses recognized in other comprehensive income. Although debt investment impairments are always based on an expected credit loss model, in accounting for debt investment impairments under IFRS, we must differentiate between two possible scenarios.

Scenario 1. The *credit risk* of the instrument has not significantly increased since initial recognition.

Scenario 2. The *credit risk* of the instrument has significantly increased since initial recognition. Thus, the accounting for impairments depends on the **credit risk**, which refers to the chance that the borrower will not repay the principal and/or interest. If the credit risk has not significantly increased since initial recognition of the instrument, then the computation of the expected credit loss is based on losses that would be incurred as a result of default events that are possible within

the next 12 months.²¹ If the credit risk has significantly increased since initial recognition, then the computation of the expected credit loss is based on losses that are expected over the remaining life of the investment.²²

In the case of debt investments measured at amortized cost, an allowance is computed as the expected credit loss. The change in the allowance is recognized in net income. Example 16A.5 illustrates accounting for the impairment of a debt investment measured at amortized cost under IFRS.

EXAMPLE 16A.5

Impairment of a Debt Investment Measured at Amortized Cost: IFRS

PROBLEM: On January 2, 2018, Bronze Company purchased a debt investment for \$100,000 and measures it at amortized cost. The debt has an interest rate of 5% over its contractual term of 10 years and has a 5% effective interest rate. On December 31, 2018, the fair value of the debt instrument has decreased to \$95,000 as a result of changes in market interest rates. Bronze determines that there has not been a significant increase in credit risk since initial recognition and that expected credit losses should be measured at an amount equal to 12-month expected credit losses, which amounts to \$3,000. What amount of loss, if any, will Bronze report in net income? What amount of loss will Bronze report in other comprehensive income? Prepare the journal entry for the impairment loss, if needed.

SOLUTION: Because the investment is measured at amortized cost, we are not concerned with the decrease in fair value. However, Bronze will recognize the allowance that is measured as the expected credit loss (\$3,000).

The journal entry is:

<i>Account</i>	<i>December 31, 2018</i>
Impairment Loss – Net Income	3,000
Allowance for Impairment Loss	3,000

For debt investments reported at fair value through OCI, an impairment loss is reported in net income; however, an allowance account is not utilized. In this case, IFRS-reporting firms report the change in fair value in other comprehensive income. Example 16A.6 illustrates accounting for the impairment of a debt investment measured at fair value through OCI under IFRS.

EXAMPLE 16A.6

Impairment of a Debt Investment Measured at Fair Value through OCI: IFRS

PROBLEM: On January 2, 2018, Bronze Company purchased a debt investment for \$100,000 and measures it at fair value through other comprehensive income. The debt has an interest rate of 5% over its contractual term of 10 years and has a 5% effective interest rate. On December 31, 2018, the fair value of the debt instrument has decreased to \$95,000 as a result of changes in market interest rates. Bronze determines that there has not been a significant increase in credit risk since initial recognition and that expected credit losses should be measured at an amount equal to 12-month expected credit losses, which amounts to \$3,000. What amount of loss, if any, will Bronze report in net income? What amount of loss will Bronze report in other comprehensive income? Prepare the journal entry for the impairment loss, if needed.

²¹The authoritative literature provides a useful simplification for investment grade instruments. In this case, the company can assume that there is not a significant increase in credit risk and thus compute only a 12-month expected credit loss.

²²If the asset is credit impaired, interest revenue is computed using the effective interest rate and the net carrying amount (gross carrying amount less the allowance for impairment losses). Otherwise, interest revenue is computed using the effective interest rate and the gross carrying amount.

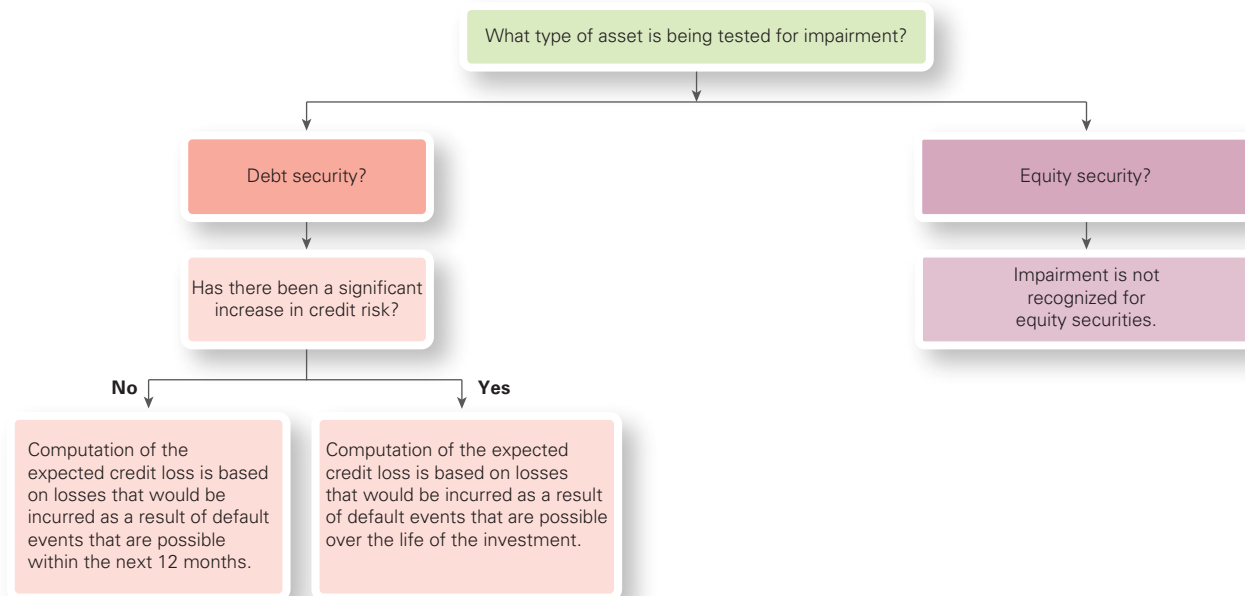

SOLUTION: Bronze separates the \$5,000 decline in fair value into a \$3,000 impairment credit loss reported in net income and the \$2,000 unrealized loss reported in other comprehensive income.

The journal entry is:

Account	December 31, 2018
Impairment Loss – Net Income	3,000
Unrealized Loss – Other Comprehensive Income	2,000
Debt Investment – FVOCI	5,000

Exhibit 16A.2 presents a decision tree for the impairment of investments in financial assets under IFRS.

EXHIBIT 16A.2 Investments in Financial Assets: Impairment Decision Tree, IFRS

JUDGMENTS IN ACCOUNTING: Impairments of Investments in Financial Assets

Assessing whether an asset has been impaired involves a great deal of judgment, particularly when there is not an objectively determined fair value. Specifically, determining an asset's fair value involves judgments when estimating the inputs into the measurement process.

In the case of equity securities, is there evidence to support a fair value higher than (or equal to) the carrying value? In the case of some debt investments, is management going to sell, or is it more likely than not that they will have to sell the investment before recovery? These decisions cannot be predicted with certainty. How will management know whether they will have to sell the investment before the market recovers?

In the case of debt investments, management may also need to estimate the present value of future cash flows. But again, it is not possible to provide management an accurate estimate of future cash flows.

Exhibit 16A.3 presents a disclosure in *Citigroup Inc.*'s 2016 annual report. The disclosure indicates that management must make estimates related to fair value measurements and that current market conditions increase the risk and complexity of these judgments.

EXHIBIT 16A.3 Summary of Significant Accounting Policies Note, *Citigroup Inc.*, Financial Statements, December 31, 2016 [Excerpt]**Use of Estimates**

Management must make estimates and assumptions that affect the Consolidated Financial Statements and the related Notes to the Financial Statements. Such estimates are used in connection with certain fair value measurements. See Note 24 to the Consolidated Financial Statements for further discussions on estimates used in the determination of fair value While management makes its best judgment, actual amounts or results could differ from those estimates. Current market conditions increase the risk and complexity of the judgments in these estimates.

A recent government debt crisis in Greece illustrates how judgment is used by managers to make valuation decisions. In 2011, a number of European banks such as France's *BNP Paribas SA* and Germany's *Deutsche Bank AG* made different accounting choices as to how they valued impaired Greek government bonds. Some banks valued the debt at its market value, which was about half of its face value, and then recorded an impairment charge against earnings to write down the other half. This approach resulted in a 100% write off of the investment on the balance sheet. Others asserted there was no active market for the debt, so they used their own valuation models. France's *BNP Paribas* reported impairment charges of 21% of its Greek debt. The U.K.'s *Royal Bank of Scotland Group PLC*, however, impaired similar Greek government debt by 50%. Among these banks, the amount of the impairment write-down for the same debt instrument ranged from 21 to 100%. These accounting choices highlight the subjectivity of impairments based on judgments related to the inputs used in developing the estimated fair value of investment securities.

Accounting for Income Taxes

LEARNING OBJECTIVES

- 1 Define book income and taxable income; compute income tax expense and income taxes payable when there are no book-tax differences.
- 2 Discuss permanent differences and calculate income tax expense and income taxes payable when there are permanent differences.
- 3 Explain temporary differences and illustrate the balance sheet approach of accounting for deferred tax assets and deferred tax liabilities.
- 4 Explain and demonstrate how to assess and report the realizability of deferred tax assets.
- 5 Illustrate the effects of a change in tax rates.
- 6 Determine the accounting for net operating losses (NOLs), including NOL carrybacks and carryforwards and the valuation of related deferred tax assets.
- 7 Explain and demonstrate accounting for uncertain tax positions.
- 8 Describe the financial statement presentation of the income tax accounts.
- 9 Detail required disclosures for income taxes.

Introduction

WHY DID T-MOBILE US INC. report income tax expense of \$867 million in 2016, but pay only \$25 million in income taxes? How could **AT&T** report income tax expense of \$6,479 million, but pay only \$3,721 million in income taxes in 2016?

The differing objectives of financial reporting and tax reporting provide insight into these questions. The primary objective of financial reporting is to provide useful financial information. In contrast, taxing authorities at federal, state, and local levels implement tax codes to raise revenues, achieve economic objectives, or promote social objectives.

The different accounting methods for financial reporting and income taxation cause a company to pay income taxes that are not equal to the income tax expense reported on the income statement under financial reporting standards. Financial reporting and tax reporting differ because the amount of income taxes currently owed to the taxing authority is determined by rules and regulations set forth by tax law whereas accounting standards determine the income tax expense reported on the income statement. For example, governments allow companies to depreciate long-lived assets faster than financial reporting permits in order to spur economywide investment. The higher depreciation expense incurred for tax purposes lowers companies' taxable income. This in turn decreases the amount of cash paid to the government and frees up cash to invest in plant assets or to hire additional employees. To promote social objectives, governments encourage donations to nonprofit organizations by allowing tax deductions for charitable contributions. Similarly, the federal government does not tax interest income from investments in state and local bonds to help finance municipal projects and infrastructure.

The timing of revenue and expense recognition differs for book and tax purposes. For example, when deducting accelerated depreciation for taxes, a company postpones paying

Sam Dao/Alamy Stock Photo

taxes in the current year that it will eventually owe in future years. So, the company has a *deferred tax liability* for financial reporting purposes. *AT&T*'s deferred tax liability related to depreciation was \$44.9 million at the end of 2016, meaning that it paid \$44.9 million less in taxes over time because of accelerated tax depreciation deductions. *AT&T* benefitted by keeping more cash in the company in the short term.

Retiree pension and health care benefit expense requires companies to pay more taxes today than the company recognizes under financial reporting. The government allows a tax deduction only when the actual benefits are paid to the retired employees. For financial reporting purposes, firms accrue an estimated retiree pension and health care benefit expense during the time the employees work and earn the retirement benefits. In the case of advance tax payments, the company reports a *deferred tax asset* that will provide a future tax benefit. *AT&T* reported a \$10.0 million deferred tax asset from retiree pension and health care benefits at the end of 2016.

Accounting for income taxes is not the same as tax return preparation. In fact, we rarely refer to preparing income tax returns in this chapter. Our focus is on reporting income tax expense and income taxes payable in the financial statements. We begin with a basic case in which book income—that is, income for financial reporting purposes—and taxable income are the same and then discuss differences between the book and taxable income. Some of these differences will create *deferred tax assets* and others will result in *deferred tax liabilities*. When evaluating deferred tax assets, companies must consider their ability to realize the future tax benefits. Because governments change tax rates, we will also address how to account for tax rate changes in terms of the effects of the changes on the measurement of income tax expense, income tax payable, and deferred income taxes. Next, we discuss two complex areas of tax accounting: *net operating losses* and *uncertain tax positions*. Finally, we conclude the chapter with discussions of disclosures and financial statement presentation of deferred tax assets and liabilities.¹ ‹‹

- ① Define book income and taxable income; compute income tax expense and income taxes payable when there are no book-tax differences.

No Differences between Book and Tax Reporting

Computing income tax expense and income taxes payable is straightforward when *book income* and *taxable income* are identical. **Book income** is the amount of income that a company reports in its financial statements. **Taxable income** is the amount of income that a company reports on its tax return. In this case, the **basis**, or carrying value, of assets and liabilities, as well as the income of the entity, are the same for book and tax reporting. That is, the amount a company records as income tax expense will equal the income taxes payable to the government as illustrated in Example 17.1.

EXAMPLE 17.1

No Difference between Book and Tax Reporting

PROBLEM: Otis Optics, Inc. began business in 2018 and billed but did not collect \$500,000 in revenue. Assume that Otis did not incur any expenses during the year. This sales transaction is treated identically for both book and income tax purposes. The tax rate is 35%, and Otis will pay any income taxes due in 2019. What journal entries are required to record both the revenues and the related income tax expense in 2018? What accounts and amounts will Otis report on its balance sheet?

SOLUTION: Otis Optics reports revenue of \$500,000 on its GAAP-based income statement for 2018. The company recognizes income tax expense of \$175,000 ($\$500,000 \times 35\%$).

¹For most of the relevant authoritative literature for this topic, see FASB ASC 740—*Income Taxes* for U.S. GAAP and IASC, *International Accounting Standard 12*, “Income Taxes” (London, UK: International Accounting Standards Committee, Revised, 2016) for IFRS.

Otis Optics will also pay income taxes of \$175,000 ($\$500,000 \times 35\%$) to the government because book income is the same as taxable income. On its 2018 year-end balance sheet, Otis reports an accounts receivable of \$500,000 and income taxes payable of \$175,000. Because net income increases stockholders' equity, Otis Optics now has equity of \$325,000. The journal entries are as follows:

Account	2018	
Accounts Receivable	500,000	
Sales Revenue		500,000

Account	December 31, 2018	
Income Tax Expense	175,000	
Income Taxes Payable		175,000

- ② Discuss permanent differences and calculate income tax expense and income taxes payable when there are permanent differences.

Permanent Differences between Book and Tax Reporting

We now consider transactions for which the book and tax treatment differs. These differences fall into two categories: *permanent differences* and *temporary differences*. We address *permanent differences* in this section.

Permanent differences in book income and taxable income result from transactions that are included:

1. In the computation of taxable income but never in book income.
2. In the computation of book income but never in taxable income.

Exhibit 17.1 presents several examples of permanent differences. Notice that permanent differences can cause book income to be greater or less than taxable income.

EXHIBIT 17.1 Permanent Book-Tax Differences under the U.S. Tax Code

Differences Resulting in Book Income Being Greater Than Taxable Income

1. Municipal interest income: Tax-free interest is reported on the financial statements as income, but it is not taxable.
2. Dividend received deduction: Corporations can deduct all or a portion of inter-corporate dividends received for tax purposes. However, all of the dividends received are reported as income on the financial statements.
3. Life insurance death proceeds for key officers or employees: Officers' life insurance proceeds received are reported as income on the financial statements but are not taxable.
4. Domestic production activities deduction: This is a tax deduction that provides incentives for businesses to produce most of their goods or services in the U.S., but it is not recognized as an expense on the financial statements.

Differences Resulting in Book Income Being Less Than Taxable Income

1. Fines and penalties: Fines and penalties are reported as expenses on the income statement but are not tax deductible.
2. Certain meals and entertainment expenses: Meals and entertainment costs are reported as expenses on the income statement but are not fully tax deductible.
3. Life insurance premiums paid for key officers or employees: Officers' life insurance is an expense subtracted on the income statement, but this cost cannot be deducted for tax purposes.
4. Expenses incurred in securing tax-exempt income: These expenses are subtracted from earnings on the income statement but are not deductible for tax purposes.

Accounting for Permanent Differences

When there are permanent differences, companies record both income tax expense and income tax payable on the financial statements based on the tax rules. For example, companies include municipal interest income in book revenues, but the U.S. federal government does not include municipal interest in taxable income. Therefore, a company does not pay taxes on this income and excludes the income from its computation of income tax expense as illustrated in Example 17.2.

EXAMPLE 17.2 Permanent Differences

PROBLEM: Modifying Example 17.1, assume that Otis Optics, a U.S. GAAP reporter, began business in 2018 and billed, but did not yet collect, \$500,000 in revenue. In addition to its 2018 sales revenue, Otis Optics received \$40,000 of municipal bond interest revenue. Otis Optics did not incur any expenses during the year. The company is subject to a 35% income tax rate. What journal entries are required to record the revenues and the related income tax for the year?

SOLUTION: Otis Optics's book income before income taxes is \$540,000 (\$500,000 in sales and \$40,000 of municipal bond interest), and its taxable income is \$500,000 (the \$40,000 municipal bond interest is not taxable). The company will never be taxed on the \$40,000 of municipal bond interest revenue, so we compute the income tax expense as follows:

Income before income taxes	\$540,000
Less: Permanent differences	<u>\$(40,000)</u>
Taxable income	\$500,000
Tax rate	<u>× 35%</u>
Income tax expense	<u>\$175,000</u>

Income taxes payable is computed as follows:

Taxable income	\$500,000
Tax rate	<u>× 35%</u>
Income tax payable	<u>\$175,000</u>

The journal entries to record these transactions follow:

Account	2018	
Accounts Receivable	500,000	
Sales Revenue		500,000

Account	2018	
Cash	40,000	
Interest Revenue		40,000

Account	December 31, 2018	
Income Tax Expense	175,000	
Income Taxes Payable		175,000

Permanent Differences and Effective Tax Rates

Permanent differences result in an *effective tax rate* that is different than the *statutory tax rate*. The **statutory tax rate** is the legally imposed rate in a given taxing jurisdiction. The **effective tax rate (ETR)** is income tax expense divided by book income before taxes. In Example 17.1 where book and taxable income are the same, the ETR is 35% ($\$175,000 / \$500,000$). In Example 17.2 where there is a permanent difference, the ETR is lower—specifically, 32.4% ($\$175,000 / \$540,000$). The company, Otis Optics, received tax-free income, so its tax rate on total income is lower than the 35% statutory income tax rate.

U.S. GAAP requires companies to reconcile the federal statutory income tax rate to the effective tax rate shown in either percentages of book income, dollars, or both. The required reconciliation for Example 17.2 follows.

Description	Dollars	Percentage
Income tax at the statutory tax rate	\$189,000*	35.0%
Tax savings from municipal interest	(14,000)**	(2.6%)**
Tax at the effective rate	<u>\$175,000</u>	<u>32.4%****</u>

* $\$540,000 \times 35\%$

** $\$40,000 \times 35\%$

*** $\$14,000 / \$540,000$

**** $\$175,000 / \$540,000$

Exhibit 17.2 illustrates the required reconciliation of a 35% statutory tax rate to 21.1%, 16.8%, and 19.3% effective tax rate for *Google* in fiscal 2014, 2015, and 2016, respectively. Its parent company is *Alphabet Inc.* *Google* provided the reconciliation of percentages from the statutory rate to its effective tax rate. Foreign tax rate differentials and federal research credits are permanent differences that reduce *Google's* tax rate.

EXHIBIT 17.2 Reconciliation of Statutory Tax Rate to Effective Tax Rate, *Google's* Annual Report, December 31, 2016

The reconciliation of federal statutory income tax rate to our effective income tax rate is as follows:

	Year Ended December 31,		
	2014	2015	2016
U.S. federal statutory tax rate	35.0%	35.0%	35.0%
Foreign rate differential	(12.2)%	(13.4)%	(11.0)%
Federal research credit	(1.8)%	(2.1)%	(2.0)%
Stock-based compensation expense	0.1%	0.3%	(3.4)%
Other adjustments	<u>0.0%</u>	<u>(3.0)%</u>	<u>0.7%</u>
Effective tax rate	<u>21.1%</u>	<u>16.8%</u>	<u>19.3%</u>

- 3 Explain temporary differences and illustrate the balance sheet approach of accounting for deferred tax assets and deferred tax liabilities.

Temporary Differences between Book and Tax Reporting

Temporary differences occur when the book treatment and the tax treatment for a given transaction are different in a given year but will be the same over the life of the firm. Specifically, the tax basis of an asset or liability differs from its book basis, resulting in taxable or deductible amounts in future years. Temporary differences occur because of events that have been recognized in the financial statements and will result in taxable or deductible amounts in future years or events that

are taxable or deductible before they will be recognized in the financial statements.² Example 17.3 illustrates differences in book and tax carrying values.

EXAMPLE 17.3 Temporary Differences: Book and Tax Carrying Values

PROBLEM: Azorca Company uses straight-line depreciation for financial accounting and accelerated depreciation for tax accounting. No salvage value is used for either book or tax purposes. The company purchased equipment for \$100,000 and depreciated it over 4 years for book purposes ($\$100,000/4$ years = \$25,000 per year). For tax purposes, the asset depreciates for 3 years: \$40,000 the first year and \$30,000 in each of the following 2 years. Thus, the total depreciation under both systems is \$100,000.

Determine the book carrying value and the tax basis of the asset over its 4-year useful life.

SOLUTION: Using different book and tax depreciation methods will result in a different book carrying value and tax basis until the asset is fully depreciated as illustrated in the following tables:

Book Depreciation

Year	Straight-Line Depreciation Expense per Books	Accumulated Depreciation per Books	Carrying Value per Books (\$100,000 – Accumulated Depreciation)
1	\$ 25,000	\$ 25,000	\$75,000
2	25,000	50,000	50,000
3	25,000	75,000	25,000
4	25,000	100,000	0
Total	<u>\$100,000</u>		

Tax Depreciation

Year	Accelerated Depreciation Deduction per Tax	Accumulated Depreciation per Tax	Tax Basis (\$100,000 – Accumulated Depreciation)
1	\$ 40,000	\$ 40,000	\$60,000
2	30,000	70,000	30,000
3	30,000	100,000	0
4	0	100,000	0
Total	<u>\$100,000</u>		

The following table illustrates the difference in the equipment's carrying value per books and tax basis.

Year	Carrying Value per Books—Book Basis	Carrying Value per Tax—Tax Basis	Book-Tax Difference
1	\$75,000	\$60,000	\$15,000
2	50,000	30,000	20,000
3	25,000	0	25,000
4	0	0	0

The differences between book income and taxable income originate in Years 1 through 3 and reverse (are reduced) in Year 4. At the end of the life of the asset, there are no differences between book income and taxable income and all differences are fully reversed.

²See FASB ASC 740-10-20 for a full definition of temporary differences.

Accounting for Temporary Differences

Companies use a *balance sheet approach* to account for temporary differences. The **balance sheet approach**, also referred to as the **asset and liability method**, focuses on the differences between book carrying values and tax bases of a firm's assets and liabilities.³

In Example 17.3, in Year 1 the book basis of the equipment is \$75,000 and the tax basis is \$60,000. The \$15,000 difference between the book basis and tax basis of the equipment represents \$15,000 less in current-year taxable income for the company and less tax currently payable. There is \$15,000 less taxable income because more depreciation is deducted for tax purposes resulting in the lower tax basis relative to book. However, at the future point when the equipment is fully depreciated, the company will pay taxes on this \$15,000 both for book and tax purposes. At a 35% tax rate, there is an additional \$5,250 in future taxes payable ($\$15,000 \times 35\%$). In effect, the company will owe this \$5,250 tax, but it does not need to pay it at this time.

Deferred Tax Assets and Liabilities

Temporary differences create either *deferred tax liabilities* or *deferred tax assets*. The \$5,250 tax liability from Example 17.3 is an example of a *deferred tax liability*. A **deferred tax liability** represents additional income taxes payable that will be due in future years. In other words, less tax is paid today, but that tax will be paid at some point in the future. Conversely, a **deferred tax asset** represents a future reduction in income taxes payable. That is, more tax is paid today, but the company will experience tax savings at some point in the future.

Under the balance sheet approach, deferred tax assets and deferred tax liabilities are computed by multiplying the income tax rate by the difference between the book carrying value and the tax basis of a company's assets and liabilities.

We discuss the four possible scenarios that create deferred tax assets or liabilities.

Scenario 1: Tax Basis of Asset Greater Than Book Basis of Asset. A deferred tax asset results when the tax basis of assets is greater than the book basis of assets. For example, consider inventory that a firm writes down for obsolescence under U.S. GAAP but not for tax purposes. If the firm has obsolete inventory, the tax basis of inventory will be higher than the book basis. When the firm eventually sells the inventory at a loss (or disposes of it), it receives a tax benefit because the transaction creates a tax deduction. Thus, until the temporary difference reverses (that is, until it sells or disposes of the inventory), the firm will report a deferred tax asset on its books representing this future tax benefit.

Scenario 2: Book Basis of Asset Greater Than Tax Basis of Asset. A deferred tax liability occurs when the book basis of assets is greater than the tax basis of assets. For example, a company typically depreciates fixed assets at a faster rate for tax purposes than it does for book purposes. Thus, in earlier years, the book basis in these assets is greater than the basis under income tax reporting. In future years, tax deductions for depreciation related to these assets will decrease, in turn increasing the company's income tax payment to the government.

Scenario 3: Tax Basis of Liability Greater Than Book Basis of Liability. There is a deferred tax liability when the tax basis of liabilities is greater than their book basis. This scenario is rare because it is far more likely that liabilities are accrued for book purposes before they are paid. When this scenario is found in practice, it involves complex transactions.

Scenario 4: Book Basis of Liability Greater Than Tax Basis of Liability. A deferred tax asset is created when the book basis of a liability is greater than the tax basis of the liability. For example, under book reporting, a firm will recognize a warranty expense and record an estimated liability for future warranty costs when it is both estimable and probable. However,

³Whereas it can be tempting to think of these transactions in terms of differences between book and taxable income, according to the authoritative guidance, this approach is not correct. In fact, in some more complex transactions, a computation approach that is based on income statement differences can yield incorrect results.

the company cannot deduct the estimated warranty cost under tax reporting until the warranty repairs actually take place. Thus, the book basis of the liability is greater than the tax basis. Because the firm has not yet deducted the cost of product repair under warranty, there will be a future tax benefit at the time the deduction occurs. As a result, a company will record a deferred tax asset for the future tax benefit when it records an estimated warranty liability for book purposes. Exhibit 17.3 summarizes these four scenarios.

EXHIBIT 17.3 Four Scenarios for Creating Deferred Tax Assets and Liabilities

Situation	Balance Sheet Elements	
	Assets	Liabilities
Tax basis > Book basis	Scenario 1. Deferred tax asset	Scenario 3. Deferred tax liability
Book basis > Tax basis	Scenario 2. Deferred tax liability	Scenario 4. Deferred tax asset

Exhibit 17.4 presents common examples of temporary differences based on U.S. GAAP and the U.S. tax laws. The first column, Differences That Lead to Deferred Tax Liabilities, identifies the item giving rise to the deferred tax. The second column lists which of the four scenarios the item usually falls under. The third column, Balance Sheet Effect, describes the difference in the book versus tax basis of the item resulting in the deferred tax. The fourth column explains the tax treatment accounting, and the fifth column explains the GAAP accounting. For example, *installment sales* generally fall under Scenario 2 in which the book basis of installment sales

EXHIBIT 17.4 Examples of Temporary Book-Tax Differences

Differences That Lead to Deferred Tax Liabilities	Scenario	Balance Sheet Effect	Tax Treatment	Book Treatment
1. Installment sales	Scenario 2: Deferred tax liability	Installment sales receivable is higher for book than for tax	Recognize revenue only when cash is received	Recognize revenue and installment sales receivable when the product is sold
2. Depreciation	Scenario 2: Deferred tax liability	Carrying value of property, plant, and equipment is higher for book than for tax	Use accelerated method to calculate depreciation expense	Record depreciation expense using straight line
3. Goodwill	Scenario 2: Deferred tax liability	Goodwill is higher for book than for tax	Generally amortize to expense over 15 years	Test for impairment and expense only if impaired
4. Equity method investment	Scenario 2: Deferred tax liability	Equity method investment (asset) is higher for book than for tax	Do not record share of investee's net income	Record share of investee's net income
Differences That Lead to Deferred Tax Assets	Scenario	Balance Sheet Effect	Tax Treatment	Book Treatment
1. Unearned revenues (advance receipts)	Scenario 4: Deferred tax asset	Unearned revenues higher for book than for tax	Recognize revenues when cash is received	Recognize revenue and decrease liability when earned
2. Contingent liabilities	Scenario 4: Deferred tax asset	Contingent liabilities higher for book than for tax	Deduct the loss only when amounts are known	Recognize the loss and liability when it is probable and estimable
3. Bad debt expense	Scenario 1: Deferred tax asset	Net accounts receivable lower for book than for tax	Deduct the bad debt expense only when specific account is written off	Deduct the bad debt expense and record a contra-asset in the period of the sale
4. Warranty liability	Scenario 4: Deferred tax asset	Warranty liability higher for books than for tax	Deduct only when the warranty service is performed	Expense the estimated cost of repair and record a liability when the product is sold

receivable is higher than the tax basis. For taxes, an **installment sale** is generally recognized as revenue only when cash is received. Therefore, the tax basis of the receivable is zero. Under GAAP, revenue is often recognized when the product is sold. So, there is usually an installment sales receivable under GAAP and higher book basis than tax basis of the receivable.

Exhibit 17.5 presents *Target Corporation's* tax footnote disclosing the components of deferred tax assets and liabilities from its January 2017 balance sheet. Note the allowance for accruals and reserves not currently deductible such as the doubtful accounts led to a deferred tax asset of \$328 million on January 28, 2017. Bad debts are written off only when the account is determined to be uncollectible for tax purposes. *Target* used the allowance method for book purposes when recording the bad debt expense in the year of the sale. In this case, the net accounts receivable is lower for book purposes than for tax purposes. That is, there is a lower carrying value of accounts receivable for books that resulted in a deferred tax asset. Property and equipment cost created a deferred tax liability of \$1,822 million at January 28, 2017. For it, *Target* used accelerated depreciation for tax purposes and the straight-line method for books. It reported fixed assets at a higher carrying value for financial reporting than for tax. The higher book carrying value for the fixed assets results in a deferred tax liability.

EXHIBIT 17.5 Components of Deferred Tax Assets and Liabilities, *Target Corporation*, Annual Financial Statements, January 28, 2017

Net Deferred Tax Asset/(Liability) (millions)	January 28, 2017	January 30, 2016
Gross deferred tax assets:		
Accrued and deferred compensation	\$ 455	\$ 476
Accruals and reserves not currently deductible	328	323
Self-insured benefits	178	199
Prepaid store-in-store lease income	258	270
Other	62	90
Total gross deferred tax assets	<u>\$ 1,281</u>	<u>\$ 1,358</u>
Gross deferred tax liabilities:		
Property and equipment	\$(1,822)	\$(1,790)
Inventory	(182)	(190)
Other	(102)	(168)
Total gross deferred tax liabilities	<u>(2,106)</u>	<u>(2,148)</u>
Total net deferred tax asset/(liability)	<u>\$ (825)</u>	<u>\$ (790)</u>

Example 17.4 provides a detailed illustration of accounting for temporary differences.

EXAMPLE 17.4

Scenario 2: Book Basis of Assets Greater Than Tax Basis Resulting in a Deferred Tax Liability

PROBLEM: Otis Optics, Inc. began business during 2018 and billed but did not collect \$500,000 in revenue. Otis Optics also sold \$60,000 of merchandise on installment sales. None of the installment sales is collected during the current year. Installment sales are considered revenue and installment sales receivable for book purposes but not for tax purposes. Otis will recognize revenue on installment sales for tax purposes only when it collects cash. Ignore cost of goods sold. Assume no operating expenses during the year. Assume also that the company did not incur any expenses during the year. In addition, Otis did not report any permanent differences.

Continued

The company's tax rate is 35%. What is Otis's income tax expense and income taxes payable? Show the difference in the book carrying value and the tax basis of the receivable from installment sales and compute the deferred tax liability. What journal entries are required for the year to record both the revenues and the related income tax?

SOLUTION: The book carrying value of the installment sales receivable is \$60,000 greater than the tax basis of zero. The tax basis is zero because the installment sale is not recorded as revenue or a receivable for tax purposes. Exhibit 17.3 indicates that when the book basis of an asset is greater than its tax basis, the company reports a deferred tax liability. The deferred tax liability is the difference in the basis of the asset times the statutory tax rate. Thus, we compute the deferred tax liability as follows:

	Book (GAAP) Basis	Tax Basis	Difference
Installment sales receivable	\$60,000	\$0	\$60,000
Tax rate			<u>× 35%</u>
Deferred tax liability			<u>\$21,000</u>

Income tax expense is the tax rate multiplied by book income adjusted for permanent differences. Otis's book income is \$560,000, which is the sum of its regular sales and installment sales (\$500,000 + \$60,000). There are no permanent differences in this example, so income tax expense is equal to \$196,000 (\$560,000 × 35%). Taxable income is only \$500,000 because it excludes the revenue from the installment sale. Income tax payable, the amount that Otis Optics owes the government this year, is \$175,000 (\$500,000 × 35%). These computations are presented in the following table.

Computation of Income Tax Expense		Computation of Income Tax Payable	
Sales revenue	\$500,000	Sales revenue	\$500,000
Installment sales revenue	<u>\$ 60,000</u>	Installment sales revenue	<u>0</u>
Income before income taxes	\$560,000	Taxable income	\$500,000
Tax rate	<u>× 35%</u>	Tax rate	<u>× 35%</u>
Income tax expense	<u>\$196,000</u>	Income taxes payable	<u>\$175,000</u>

The difference between Otis's income tax expense of \$196,000 and income taxes payable of \$175,000 results from the difference in the book and tax treatments for installment sales receivable.

The journal entries follow:

Account	2018
Accounts Receivable	500,000
Sales Revenue	500,000

Account	2018
Installment Sales Receivable	60,000
Installment Sales Revenue	60,000

Account	December 31, 2018
Income Tax Expense	196,000
Deferred Tax Liability	21,000
Income Taxes Payable	175,000

Temporary Difference Reversal

Example 17.4 provided an analysis of the initial creation of a deferred tax liability account. When a deferred tax account is created and continues to increase, we say that it originates. What accounting is required when Otis collects the installment sales receivable and the temporary difference reverses? In general, a temporary difference **reverses** when a company either:

1. Has to pay the taxes it previously recorded as a deferred tax liability or
2. Receives the benefits of reduced taxes originally reported as a deferred tax asset.

The reversal reduces the deferred tax account in both cases. To illustrate, Example 17.5 presents the reversal of the deferred tax liability created by Otis Optics in Example 17.4.

EXAMPLE 17.5

Temporary Difference Reversal—Scenario 2: Book Basis of Assets Greater Than Tax Basis

PROBLEM: Continuing with Example 17.4, assume that Otis Optics collected the \$60,000 of installment sales receivable in 2019. This amount is taxable income because it is collected in cash. Otis already had recorded book income for installment sales in 2018 along with the related installment sales receivable, so no book income is recognized in the year of cash collection. In addition, Otis recorded \$200,000 of regular sales on account during 2019. Ignore cost of goods sold. Assume no operating expenses in 2019. Determine the difference in the book carrying value and tax basis of the account receivable from the installment sale and compute the deferred tax liability. What is the journal entry to record income taxes for the year?

SOLUTION: Once Otis collects the \$60,000, both the book basis and tax basis of the related installment sales receivable is zero.

	Installment Sales Receivable— Book Basis	Installment Sales Receiv- able—Tax Basis	Difference	Tax Rate (%)	Deferred Tax Liability
Beginning balance	\$60,000	\$0	\$60,000	35%	\$21,000
Change	(60,000)	0	(60,000)	35	(21,000)
Ending balance	<u>\$ 0</u>	<u>\$0</u>	<u>\$ 0</u>	<u>35%</u>	<u>\$ 0</u>

So, the ending balance of the deferred tax liability is also equal to zero. The deferred tax liability of \$21,000 has fully reversed during the year as illustrated in the t-account that follows.⁴

Deferred Tax Liability		
	21,000	Prior Year—Origination
Following Year—Reversal	21,000	
	<u>0</u>	End of Year

We decrease the deferred tax liability for the reversal with a debit of \$21,000. When a deferred tax liability reverses, income taxes become currently payable. Therefore, we increase income taxes payable. The computation of income tax expense and income tax payable is presented on the next page.

Continued

⁴Although the book tax differences completely reverse, there is a tax benefit by paying less tax in Year 1 based on the time value of money. However, the time value of money is not considered in accounting for income taxes.

Computation of Income Tax Expense		Computation of Income Tax Payable	
Sales revenue	\$200,000	Sales revenue	\$200,000
Installment sales revenue	<u>0</u>	Installment sales revenue	<u>60,000</u>
Income before income tax	\$200,000	Taxable income	\$260,000
Tax rate	<u>× 35%</u>	Tax rate	<u>× 35%</u>
Income taxes expense	<u>\$ 70,000</u>	Income tax payable	<u>\$ 91,000</u>

The journal entries follow:

<i>Account</i>	<i>2019</i>
Accounts Receivable	200,000
Sales Revenue	200,000

<i>Account</i>	<i>2019</i>
Cash	60,000
Installment Sales Receivable	60,000

<i>Account</i>	<i>December 31, 2019</i>
Income Tax Expense	70,000
Deferred Tax Liability	21,000
Income Taxes Payable	91,000

Note that Otis will pay \$91,000 for income taxes this year. The payment consists of two parts: \$70,000 for income generated from current economic activity and \$21,000 to pay the liability deferred in the prior year and owed currently.

Examples 17.6 and 17.7 illustrate accounting for the origination of a deferred tax asset and its subsequent reversal.

EXAMPLE 17.6

Scenario 4: Book Basis of Liabilities Greater Than Tax Basis Resulting in a Deferred Tax Asset

PROBLEM: Otis Optics reported sales on account of \$500,000 in 2018 and no permanent differences. The company also recorded an estimated product warranty liability and the related warranty expense of \$110,000 for book purposes. There were no additional expenses in 2018. Under tax law, Otis cannot deduct the estimated warranty expense and does not create a tax liability for these amounts until it actually provides the services by repairing the product. Ignore cost of goods sold. Assume no operating expenses during the year. The company's tax rate is 35%. What is Otis's income tax expense and income taxes payable? Show the difference between the book carrying value and the tax basis of the warranty liability. In addition, compute the deferred tax asset. What journal entries are required for the year to record the revenues, warranty expense, and the related income tax?

SOLUTION: The book basis of the firm's liabilities is greater than the tax basis because Otis does not create a liability for the warranty for tax purposes until the product is actually

repaired. From Exhibit 17.3, we know that when the book basis of a liability is greater than its tax basis, the company will report a deferred tax asset. We compute the deferred tax asset as follows:

	Book (U.S. GAAP)	Tax	Difference
Warranty liability	\$110,000	\$0	\$110,000
Tax rate			<u>× 35%</u>
Deferred tax asset			<u>\$ 38,500</u>

The income tax expense is the tax rate times book income adjusted for permanent differences. Otis's book income is \$390,000 computed as revenues less the estimated warranty expense (\$500,000 – \$110,000). There are no permanent differences, so income tax expense is equal to \$136,500 (\$390,000 × 35%). Taxable income is equal to total revenues of \$500,000 because the warranty expense is not tax deductible until actual repairs are made. Income tax payable, the amount that Otis Optics owes the government this year, is \$175,000 (\$500,000 × 35%). Income tax expense and income tax payable are computed as follows:

Computation of Income Tax Expense		Computation of Income Taxes Payable	
Sales revenue	\$500,000	Sales revenue	\$500,000
Warranty expense	<u>\$(110,000)</u>	Warranty expense	<u>0</u>
Income before income taxes	\$390,000	Taxable income	\$500,000
Tax rate	<u>× 35%</u>	Tax rate	<u>× 35%</u>
Income tax expense	<u>\$ 136,500</u>	Income taxes payable	<u>\$175,000</u>

The difference between Otis's income tax expense and income taxes payable results from the difference in book and tax treatments of the warranty expense.

The journal entries to record the transactions for the year follow:

Account	2018
Accounts Receivable	500,000
Sales Revenue	500,000

Account	December 31, 2018
Warranty Expense	110,000
Warranty Liability	110,000

Account	December 31, 2018
Income Tax Expense	136,500
Deferred Tax Asset	38,500
Income Taxes Payable	175,000

In our next example, we account for a deferred tax asset and its reversal when the book basis of liabilities exceeds the tax basis. Example 17.7 demonstrates the creation of a deferred tax asset from an underlying difference in the book and tax basis of a warranty liability account. After the warranty liability is satisfied by making actual repairs, it is reduced to zero for book purposes, and the deferred tax asset reverses.

EXAMPLE 17.7**Temporary Difference Reversal—Scenario 4: Book Basis of Liabilities Greater Than Tax Basis**

PROBLEM: Continuing Example 17.6, assume that Otis Optics made actual warranty repairs at a total cost of \$110,000 in 2019. The company also reported \$300,000 in sales revenue on account and did not incur any additional expenses for the year. The company is subject to a 35% income tax rate and does not report any permanent differences. Ignore cost of goods sold. Show the difference in the book and tax bases of the warranty liability and compute the deferred tax asset. What journal entries are required to record this year's sales and the income tax provision for the year?

SOLUTION: Because Otis satisfied the warranty liability by making the actual product repairs, both the book and tax basis of the liability is zero. As a result, Otis can remove the deferred tax asset associated with this temporary difference (i.e., the book-tax difference reverses).

	Warranty Liability—Book Basis	Warranty Liability—Tax Basis	Difference	Tax Rate (%)	Deferred Tax Asset
Beginning balance	\$110,000	\$0	\$110,000	35%	\$38,500
Change	<u>(110,000)</u>	<u>0</u>	<u>(110,000)</u>	<u>35</u>	<u>(38,500)</u>
Ending balance	<u>\$ 0</u>	<u>\$0</u>	<u>\$ 0</u>	<u>35%</u>	<u>\$ 0</u>

The ending balance of the deferred tax asset is zero because the beginning balance of \$38,500 fully reversed during the year. The t-account for the deferred tax asset follows.

Deferred Tax Asset	
Prior Year—Origination	38,500
	38,500
End of Year	<u>0</u>

Following Year—Reversal

We decrease the deferred tax asset with a credit of \$38,500. Reversing a deferred tax asset lowers currently payable income taxes.

Computation of Income Tax Expense		Computation of Income Taxes Payable	
Sales revenue	\$300,000	Sales revenue	\$300,000
Warranty expense	<u>(0)</u>	Warranty expense	<u>(110,000)</u>
Income before income taxes	\$300,000	Taxable Income	\$190,000
Tax rate	<u>× 35%</u>	Tax rate	<u>× 35%</u>
Income tax expense	<u>\$105,000</u>	Income taxes payable	<u>\$ 66,500</u>

The journal entries to record transactions for the year are as follows:

Account	2019
Accounts Receivable	300,000
Sales Revenue	300,000

Account	2019
Warranty Liability	110,000
Cash	110,000

Account	December 31, 2019	
Income Tax Expense	105,000	
Deferred Tax Asset		38,500
Income Taxes Payable		66,500

Otis pays \$66,500 in tax rather than the income tax expense of \$105,000 recorded on the income statement because it had paid the difference of \$38,500 in the prior year. The taxes paid in the prior year provided future economic benefit and were recorded as a deferred tax asset (i.e., Otis deferred realization of the benefit of the asset until the year it actually made the warranty repair).

Examples 17.4 through 17.7 presented the origination and reversal of one book-tax difference without the existence of permanent differences. The chapter Appendix provides a comprehensive example of multiple temporary and permanent book-tax differences.

Temporary Differences and Tax Rates

In Examples 17.4 and 17.6, the effective tax rate is 35% as shown in the following, which is the same as the starting statutory rate.

Income Statement (GAAP or Book)	Example 17.4	Example 17.6
Income tax expense	\$196,000	\$136,500
Income before tax	\$560,000	\$390,000
Effective tax rate	35%	35%

Temporary differences do not cause the effective tax rate to vary from the statutory tax rate and do not change amounts that ultimately become taxable or become tax deductible. Temporary differences affect only the timing of revenue and expense recognition. Only permanent differences result in an effective rate that is different than the statutory rate, because permanent differences change the amounts that are ultimately taxable or tax deductible.

THE CONCEPTUAL FRAMEWORK CONNECTION

Temporary Differences

Preparers and users of financial statements have debated the merits of the current approach to accounting for temporary differences for years. The accounting standards used in accounting for income taxes are quite complex, leading some to question their necessity. Key areas questioned include the following:

1. Should companies base income tax expense reported on the income statement on book income after adjusting for permanent differences, or should they instead record income tax expense based on taxable income?
2. Should companies record deferred tax assets and deferred tax liabilities? In other words, are deferred tax assets and deferred tax liabilities *real* assets and liabilities?

The basics of financial reporting as presented in the conceptual framework provide insight into these questions. First, the framework states that “[a]ccrual accounting attempts to record the financial effects on an entity of transactions and other events and circumstances that have cash consequences for the entity in the periods in which those transactions, events, and circumstances occur rather than only in the periods in which cash is received or paid by the entity.”⁵

⁵ Financial Accounting Standards Board, *Statement of Financial Accounting Concepts No. 6, “Elements of Financial Statements,”* Paragraph 139.

Thus, under accrual accounting, income tax expense cannot simply be the amount that the firm pays to the government: That approach would occur only under a cash-basis system. Instead, firms should record expenses based on principles of the conceptual framework. The framework states “expenses are generally recognized when an entity’s economic benefits are consumed. . . .”⁶

Consider Example 17.4 involving installment sales. Otis recorded revenues and installment sales receivable for book purposes. It did not record these items on its tax returns. Because Otis recorded revenue in its books, it also recognized income tax expense related to that revenue. So Otis recognized income tax expense on its books even though there was no income tax currently payable. With an accrual system, the entity will eventually receive cash for *the transaction that has already occurred* and will pay income taxes on installment sales revenue only when cash is received. Otis earned revenue from the installment sales, and the fact that the company did not collect cash in the year the sales were made is not relevant for financial reporting.

Whether firms should record a deferred tax asset or liability is related to the question involving income tax expense. The conceptual framework defines assets as “probable future economic benefits obtained or controlled by a particular entity as a result of past transactions or events. . . .”⁷ Liabilities are “probable future sacrifices of economic benefits arising from present obligations of a particular entity to transfer assets or provide services to other entities in the future as a result of past transactions or events.”⁸ Thus, for example, Otis will eventually receive cash and will be required to pay taxes for the previously deferred liability related to the installment sales. Because the transaction has already occurred, the deferred income taxes are a true liability.⁹

- 4 Explain and demonstrate how to assess and report the realizability of deferred tax assets.

Realizability of Deferred Tax Assets: Assessing and Reporting

When a firm records a deferred tax asset, it is required to consider the likelihood that it will actually receive economic benefit from that asset. That is, the firm must consider whether it will ever realize a reduction in its income taxes paid to the government.

Consider the balance of accounts receivable reported on the balance sheet. A company will assess this balance for possible uncollectible accounts and use an allowance account to reduce the balance of accounts receivable to its net realizable value. The same assessment is required to arrive at the proper valuation of deferred tax assets. A company assesses deferred tax assets for future realization, and if it expects all or a portion of the future benefits to be unrealized, it uses an allowance account to reduce the deferred tax asset to its net realizable value. The reduction of the deferred tax asset increases income tax expense. We discuss the use of a *valuation allowance* to reduce the carrying value of a deferred tax asset in this section.

Treatment of Deferred Tax Assets

U.S. GAAP specifies that if it is “more likely than not” that the firm will not realize some portion of the deferred tax asset, the firm must reduce the deferred tax asset to its net realizable value. U.S. GAAP defines “more likely than not” as a likelihood of slightly more than 50%.

⁶Financial Accounting Standards Board, *Statement of Financial Accounting Concepts No. 5, “Recognition and Measurement in Financial Statements of Business Enterprises,”* Paragraph 65.

⁷Financial Accounting Standards Board, *Statement of Financial Accounting Concepts No. 6, “Elements of Financial Statements,”* 1985, Paragraphs 25 and 35.

⁸Ibid.

⁹For a further examination of this issue, see the Basis for Conclusions Cases at the end of the chapter.

Assessing Realizability. Because deferred tax assets produce future tax deductible amounts, income is needed in order to realize these tax benefits. Firms must use reasonable estimates of future income sources to assess the realizability of a deferred tax asset. U.S. GAAP lists four possible sources of taxable income that firms should consider:

1. Future reversals of existing taxable temporary differences
2. Future taxable income exclusive of reversing temporary differences and *carryforwards*
3. Taxable income in prior *carryback* year(s) if carryback is permitted under the tax law
4. Tax-planning strategies that would, if necessary, be implemented¹⁰

Management must examine all available evidence, both positive and negative, to determine whether it is more likely than not that all or a portion of the future tax benefits of a deferred tax asset will not be realized. Positive evidence would include any of the four sources of taxable income in addition to other forms of evidence, such as:

1. Existing contracts or firm sales backlog
2. An excess of appreciated asset value over the tax basis of the entity's net assets
3. A strong earnings history exclusive of the loss that created the future deductible amount¹¹

Some examples of negative evidence to be considered when assessing the need to reduce the net realizable value of a deferred tax asset are:

1. Cumulative losses in recent years
2. A history of operating loss or tax credit carryforwards expiring unused
3. Unsettled circumstances that could adversely affect future operations
4. A *carryback* or *carryforward* period that is so brief that it could limit realization of tax benefits¹²

Reporting Realizability. U.S. GAAP uses a two-step approach to record the net realizable amount:

1. Record the full amount of the deferred tax asset
2. Assess the deferred tax asset for realizability

If the firm determines that all or a portion of the deferred tax asset is not realizable, it uses a *valuation allowance* to reduce the balance of the deferred tax asset. The **valuation allowance** is a contra-asset to the deferred tax asset account on the balance sheet. Thus, the company reports a net deferred tax asset on its balance sheet measured as the deferred tax asset net of the valuation allowance.

Anytime a firm increases or decreases its valuation allowance to decrease or increase its deferred tax asset, there is a corresponding increase or decrease in income tax expense. As a result, there is a change in the firm's effective tax rate.

If the valuation allowance is increased (reducing the net realizable value of the deferred tax asset), income tax expense also increases. Conversely, when the valuation allowance is decreased (increasing the net realizable value of the deferred tax asset), there is a decrease in income tax expense (an increase to the *income tax benefit*). The **income tax benefit** is a reduction of income tax expense and thus increases income. Although temporary differences do not cause the ETR to differ from the statutory rate, a change in the assessment of deferred tax assets' realizability result in a change in the ETR. For example, *Luby's Inc.*, the restaurant operator, increased its valuation allowance by \$6.9 million in 2016, lowering its ETR by 128.3%. Example 17.8 illustrates assessing and reporting the realizability of deferred tax assets.

¹⁰This list can be found in FASB ASC 740-10-30-18.

¹¹This list can be found in FASB ASC 740-10-30-22.

¹²This list can be found in FASB ASC 740-10-30-21.

EXAMPLE 17.8**Assessing and Reporting the Realizability of Deferred Tax Assets**

PROBLEM: Consider Otis Optics from Example 17.6. Otis recorded \$500,000 in sales revenue in 2018. The company is subject to a 35% tax rate. Otis recorded a deferred tax asset of \$38,500 in 2018 because of a \$110,000 basis difference in warranty liabilities ($\$110,000 \times 35\%$). Based on its assessment of all positive and negative evidence associated with this deferred tax asset, management has assessed that it is more likely than not that it will not realize 40% of the deferred tax asset. Ignore cost of goods sold. What are the necessary journal entries to record the deferred tax asset and valuation allowance? Prepare a partial 2018 income statement and balance sheet for Otis Optics and compare it with the financial statements from Example 17.6 that do not include a valuation allowance. What is the effective tax rate in the two examples? Provide the footnote reconciliation of the federal statutory income tax rate to the effective tax rate in both dollars and percentages, incorporating the use of the valuation allowance.

SOLUTION: Management needs to record a 40% valuation allowance for the \$38,500 deferred tax asset, or \$15,400 ($\$38,500 \times 40\%$). The journal entries required to record the 2018 transactions follow:

<i>Account</i>	<i>2018</i>
Accounts Receivable	500,000
Sales Revenue	500,000

<i>Account</i>	<i>December 31, 2018</i>
Warranty Expense	110,000
Warranty Liability	110,000

<i>Account</i>	<i>December 31, 2018</i>
Income Tax Expense	136,500
Deferred Tax Asset	38,500
Income Taxes Payable	175,000

<i>Account</i>	<i>December 31, 2018</i>
Income Tax Expense	15,400
Valuation Allowance for Deferred Tax Asset	15,400

After recording the valuation allowance, Otis Optics has a net deferred tax asset of \$23,100 ($\$38,500 - \$15,400$) and income tax expense of \$151,900 ($\$136,500$ plus $\$15,400$). The comparison of the partial income statements shows that when a firm recognizes a valuation allowance, its net income decreases (by increasing income tax expense). Otis's net income is decreased from \$253,500 to \$238,100 in this case. A comparison of the partial balance sheets shows that when a firm recognizes a valuation allowance, it decreases assets (by decreasing the net deferred tax asset balance). In this case, Otis's assets were decreased from \$538,500 to \$523,100.

	Without Valuation Allowance	With Valuation Allowance
Partial Income Statement		
Sales Revenue	\$500,000	\$500,000
Warranty Expense	<u>(110,000)</u>	<u>(110,000)</u>
Income before Income Taxes	390,000	390,000
Income Tax Expense	<u>(136,500)</u>	<u>(151,900)</u>
Net Income	<u>\$253,500</u>	<u>\$238,100</u>
Effective Tax Rate	<u>35%</u>	<u>38.9%</u>
Partial Balance Sheet		
Assets:		
Accounts Receivable	\$500,000	\$500,000
Deferred Tax Asset—Net of Valuation Allowance	<u>38,500</u>	<u>23,100</u>
TOTAL	<u>\$538,500</u>	<u>\$523,100</u>
Liabilities and Stockholders' Equity:		
Warranty Liability	\$ 110,000	\$ 110,000
Income Taxes Payable	175,000	175,000
Stockholders' Equity	<u>253,500</u>	<u>238,100</u>
TOTAL	<u>\$538,500</u>	<u>\$523,100</u>

The ETR before recording a valuation allowance is 35% ($\$136,500 / \$390,000$). The effective tax rate after recording the valuation allowance increases to 38.9% ($\$151,900 / \$390,000$). The higher ETR is a result of the increase in income tax expense caused by the use of a valuation allowance.

The required footnote reconciliation after recognizing the valuation allowance follows.

Description	Dollars	Percentage
Income tax at the statutory tax rate	\$136,500*	35.0%
Increase in the valuation allowance	<u>15,400</u>	<u>3.9%**</u>
Tax at the effective rate	<u>\$151,900</u>	<u>38.9%***</u>
* $\$390,000 \times 35\%$		
** $\$15,400 / \$390,000$		
*** $\$151,900 / \$390,000$		

Treatment of Deferred Tax Assets: IFRS

IFRS uses the term “probable” when defining the portion of a deferred tax asset that the firm will not realize. IFRS guidance views “probable” as a likelihood greater than 50%. Although the terms that U.S. GAAP and IFRS use differ, the amount determined to be realizable should be the same. IFRS uses a one-step approach under which the company assesses the realizability of the deferred tax asset before recording it. Firms then report only the realizable portion of the deferred tax asset. IFRS does not use a valuation allowance. Because the assessment of the realizability should result in the same amount under IFRS and U.S. GAAP, the reported net deferred tax asset should be the same under both.

Companies evaluate the realizable amount of deferred tax assets every time they prepare financial statements. Thus, for example, if at the end of 2019 Otis Optics judged that there is more than a 50% chance that it will realize the entire deferred tax asset, it would remove the valuation allowance from its books and decrease the income tax expense.

Exhibit 17.6 summarizes the U.S. GAAP and IFRS approaches to valuing deferred tax assets.

EXHIBIT 17.6 U.S. GAAP and IFRS: Assessing and Recording the Realizability of Deferred Tax Assets

	U.S. GAAP	IFRS
Assessment of realizability [chance that the entity will not realize some portion of the deferred tax asset (DTA)]	“More likely than not” likelihood of more than 50%	“Probable” likelihood of more than 50%
Recording realizable deferred tax asset	Two steps: 1. Record full amount of deferred tax asset. 2. Assess deferred tax asset for realizability and establish a valuation allowance account, if needed.	One step: Assess realizability and record net deferred tax asset. A separate valuation allowance account is not used under IFRS.

Source: International Financial Reporting Standards (IFRS).

In Example 17.9, we revisit Example 17.8 under IFRS.

EXAMPLE 17.9

Assessing and Reporting the Realizability of Deferred Tax Assets: IFRS

PROBLEM: Otis Optics is an IFRS reporter. The firm earned revenues of \$500,000 and incurred warranty expense for book purposes of \$110,000. Otis estimates a deferred tax asset of \$38,500 because of a basis difference in warranty liabilities. Management has assessed that it is probable that it will not realize 40% of the deferred tax asset. What is the necessary journal entry to record the deferred tax asset? Prepare a simplified 2018 income statement and balance sheet for Otis Optics and compare it with the financial statements from Example 17.8 that do not include a valuation allowance. What is the effective tax rate in the two examples?

SOLUTION: Management records the deferred tax asset it expects to realize, which is 60% of the \$38,500 deferred tax asset, or \$23,100. It does not expect to collect \$15,400 (40% of \$38,500). The journal entry is as follows:

Account	December 31, 2018
Income Tax Expense	151,900
Deferred Tax Asset	23,100
Income Taxes Payable	175,000

Otis Optics now has a deferred tax asset of \$23,100 and income tax expense of \$151,900 (\$136,500 plus \$15,400 increase in expense because of a reduction of the deferred tax asset). The comparison of the simplified income statement shows that when a firm reduces a deferred tax asset because it assesses that the asset cannot be fully realizable, its net income decreases (by increasing tax expense). In this case, net income is decreased from \$253,500 to \$238,100. A comparison of the simplified balance sheet shows that Otis’s assets are also decreased (by decreasing the net deferred tax asset balance). In this case, assets were decreased from \$538,500 to \$523,100.

Otis's ETR before recording a valuation allowance is 35% (\$136,500 / \$390,000). Its ETR after recording the valuation allowance increases to 38.9% (\$151,900 / 390,000) because of the increase in the tax expense.

	Without Assessing Realizability of Deferred Tax Asset	With Assessing Realizability of Deferred Tax Asset
Simplified income statement		
Sales revenue	\$500,000	\$500,000
Warranty expense	(110,000)	(110,000)
Income before income taxes	\$390,000	390,000
Income tax expense	(136,500)	(151,900)
Net income	<u>\$253,500</u>	<u>\$238,100</u>
Balance sheet		
Asset:		
Accounts receivable	\$500,000	\$500,000
Deferred tax asset	38,500	23,100
TOTAL	<u>\$538,500</u>	<u>\$523,100</u>
Liabilities and stockholders' equity		
Warranty liability	\$ 110,000	\$ 110,000
Income taxes payable	175,000	175,000
Stockholders' equity	253,500	238,100
TOTAL	<u>\$538,500</u>	<u>\$523,100</u>
Effective tax rate	35%	38.9%

JUDGMENTS IN ACCOUNTING

Temporary Book-Tax Differences

Accounting for income taxes requires much judgment. In fact, 74% of 175 companies surveyed reported making estimates and using judgment in estimating their tax accounts.¹³ This area is the number two area, second only to impairments of goodwill and other intangibles, for which significant judgment is exercised, according to the survey.

Determining whether a valuation allowance account is needed to offset the deferred tax assets and, if so, the amount of the valuation allowance requires significant judgment. Making these determinations entails an assessment of future events, which are difficult to forecast.

Decisions regarding changes to the realizable value of deferred tax assets, including changes to the valuation allowance, directly impact earnings. Because of this impact on earnings, there is a potential for managers to manipulate earnings. Consider Example 17.8. Otis Optics recorded a deferred tax asset of \$38,500. Management concluded that it was more likely than not that it would not realize 40% of this deferred tax asset and thus recorded a valuation allowance of \$15,400. However, the reliability of this estimate is difficult to determine. Although managers carefully analyze these assessments and provide documentation for their decisions, there is still subjectivity involved. Exhibit 17.7 demonstrates the effect of different non-realizability estimates for deferred tax assets on income tax expense, net income, and the effective tax rate for this example.

Note that the impact on earnings varies from zero if Otis determines that the entire deferred tax asset is realizable, and to \$38,500 if Otis determines that none of the deferred tax asset is realizable. In addition, as management changes its estimated valuation allowance from year to year, there can be a significant impact on income tax expense and net income. Finally, changes

¹³AICPA, *IFRS Financial Statements: Best Practices in Presentation and Disclosure – 2012* (New York: AICPA, 2012).

EXHIBIT 17.7 Effects of Different Non-Realizability Estimates of Deferred Tax Assets for Otis Optics

Assessment of Non-Realizable Deferred Tax Asset (%)	0%	20%	40%	80%	100%
Income before tax	\$390,000	\$390,000	\$390,000	\$390,000	\$390,000
Income tax expense—no valuation allowance	\$136,500	\$136,500	\$136,500	\$136,500	\$136,500
Increase in income tax expense from the estimated valuation allowance	0	7,700	15,400	30,800	38,500
Income tax expense—with valuation allowance	\$136,500	\$144,200	\$151,900	\$167,300	\$175,000
Net income	\$253,500	\$245,800	\$238,100	\$222,700	\$215,000
Effective tax rate	35.0%	37.0%	38.9%	42.9%	44.9%

in the estimated valuation allowance result in volatility in the effective tax rate: Otis's effective tax rate ranges from 35.0% to 44.9% in this illustration.

Exhibit 17.8 presents part of the income tax footnote for *Luby's, Inc.'s* 2016 10-K. In this portion of the footnote disclosure, *Luby's* provides information regarding the judgments it used to determine the realizability of certain deferred tax assets, including future operational performance and taxable income, that have a direct effect on income tax expense and net income.

EXHIBIT 17.8 Discussion of Evaluation of the Valuation Allowance, *Luby's, Inc.*, Annual 10-K Report, August 31, 2016

The Company had deferred tax assets, excluding liabilities, at August 31, 2016 of approximately \$12.1 million, the most significant of which include the Company's general business tax credits carryovers to future years of approximately \$10.5 million. This item may be carried forward up to twenty (20) years for possible utilization in the future. The carryover of general business tax credits, beginning in fiscal 2002, will begin to expire at the end of fiscal 2022 through 2036, if not utilized by then.

...

Collectively, the available evidence supports an assertion that our deferred tax assets will be realized, but with the exception of a certain portion of the Company's general business and foreign tax credit carryovers that are not likely at this time to be realized, and on which the Company has established a valuation allowance. The general business credits and foreign tax credit carryovers generally expire if unused within twenty (20) years and ten (10) years, respectively. We have, as a result of the foregoing assessment, established a \$6.9 million valuation allowance for deferred tax assets pertaining to general business and foreign tax credit carryforward balances that are not likely to be realized prior to their expiration.

- 5 Illustrate the effects of a change in tax rates.

Change in Tax Rates

Changes in income tax rates directly affect the valuation of deferred tax assets and liabilities. In this section, we examine the accounting for these changes in tax rates and their impact on deferred tax accounts.

Accounting for Changes in Tax Rates

Properly valuing deferred tax assets and deferred tax liabilities requires measuring deferred tax accounts at the statutory income tax rate expected to be in effect at the future reversal date. The expected future income tax rate is the current rate if there is no change in tax rates or a tax rate enacted into law that will take effect in the future period. The standards view deferred taxes based on a future tax rate enacted into law as a faithful representation of the amount of deferred taxes. Companies remeasure deferred tax accounts whenever there is a change in the statutory income tax rate. Example 17.10 illustrates the use of future enacted tax rates to value deferred tax accounts.

EXAMPLE 17.10**Future Income Tax Rates**

PROBLEM: Lands Canoes recorded book income of \$100,000 in 2018. The company did not have any permanent differences; the company's only temporary difference relates to a \$30,000 warranty expense that it recorded on the income statement but cannot deduct for tax purposes until actual repairs are made. Lands Canoes anticipates satisfying the warranty liability equally over the next 3 years. The current enacted tax rate is 40%. The enacted tax rates for 2019, 2020, and 2021 are 35%, 30%, and 30%, respectively. Determine the value of the deferred tax asset to be recorded for this temporary book-tax difference.

SOLUTION: Because the book basis of the warranty liability is higher than the tax basis of the liability, Lands Canoes records a deferred tax asset. However, in order to properly measure the deferred tax asset, the company must apply the appropriate income tax rate to the amounts reversing each year. As a result, Lands Canoes needs to prepare a schedule to determine the years the reversals will occur.

	2019	2020	2021	Total
Amount of difference reversing each year	\$10,000	\$10,000	\$10,000	\$30,000
Relevant income tax rate	× 35%	× 30%	× 30%	
Deferred tax asset	<u>\$ 3,500</u>	<u>\$ 3,000</u>	<u>\$ 3,000</u>	<u>\$ 9,500</u>

By taking into consideration the different tax rates in the years of reversal, Lands computes a total deferred tax asset of \$9,500 in 2018.

Effect of Tax Rate Changes on Deferred Tax Accounts

Firms must adjust the balance of the deferred tax accounts in the year of tax rate change to reflect the change in tax rate. The adjustment is considered a change in estimate accounted for on a prospective basis, so there is no impact on prior-period financial statements from the adjustment. The adjustments needed to remeasure the balance of deferred tax accounts do, however, impact income tax expense and the effective tax rate. The effect on income tax expense results in a difference between the statutory income tax rate and the effective tax rate.

EXAMPLE 17.11**Effect of a Change in Tax Rates**

PROBLEM: Whitewater Rafts, Inc. reported a net deferred tax asset balance of \$137,000 resulting from an estimated warranty expense accrual for book purposes. The total book-tax difference related to the bases of the estimated warranty liability is \$391,429. The enacted statutory tax rate related to this balance changed from 35% to 30%, effective immediately. What journal entry does Whitewater Rafts need to make to adjust for this change in tax rates?

SOLUTION: Whitewater Rafts computed the current deferred asset balance of \$137,000 at a 35% tax rate. The adjusted deferred tax asset balance from the change in tax rate is \$117,429 ($\$391,429 \times 30\%$). Because tax rates decreased, the future tax deductions taken are less valuable. Consequently, Whitewater Rafts will reduce its deferred tax asset balance by \$19,571 ($\$137,000 - \$117,429$).¹⁴ The deferred tax asset is now expected to provide less future benefit, thereby increasing income tax expense and the effective tax rate, as reflected in the following journal entry:

Continued

¹⁴The tax rate change adjustment can also be computed by multiplying the cumulative book tax difference by the change in the tax rates: $\$391,429 \times (35\% - 30\%) = \$19,571$.

<i>Account</i>	<i>Current Year</i>
Income Tax Expense	19,571
Deferred Tax Asset	19,571

Accounting for Tax Rate Changes: IFRS

U.S. GAAP and IFRS definitions of the expected statutory tax rate differ. Under IFRS, the expected rate is the tax rate that has been substantively—but not necessarily fully—enacted.¹⁵

Example 17.11 would be the same under U.S. GAAP and IFRS because the future tax rates are enacted. Next, we look at Example 17.12 where the rates are substantively enacted to illustrate the differences under U.S. GAAP and IFRS.

EXAMPLE 17.12

Future Tax Rates: Substantively Enacted: U.S. GAAP/IFRS Comparison

PROBLEM: Sea Crafts recorded book income of \$250,000 in 2018. The company does not have any permanent differences; the company's only temporary difference relates to a \$45,000 installment sale that it recorded for book purposes. Sea Crafts anticipates receiving payments equally over the following 3 years. The current enacted tax rate in 2018 is 40%. The substantively enacted tax rates for the following 3 years are 35%, 30%, and 30%, respectively. What deferred tax amount should Sea Crafts record for this temporary difference under U.S. GAAP and IFRS?

SOLUTION: Because the book basis of the installment receivable from the installment sales is higher than the tax basis of the asset, Sea Crafts records a deferred tax liability.

Under U.S. GAAP, Sea Crafts uses the enacted tax rate of 40%. The deferred tax liability is \$18,000 (40% of \$45,000). Under IFRS, Sea Crafts uses the substantively enacted tax rate. We need to schedule out the reversal to take into account the changing tax rates under IFRS.

	2019	2020	2021	Total
Amount of difference reversing each year	\$15,000	\$15,000	\$15,000	\$45,000
Relevant tax rate	× 35%	× 30%	× 30%	
Deferred tax liability	<u>\$ 5,250</u>	<u>\$ 4,500</u>	<u>\$ 4,500</u>	<u>\$ 14,250</u>

Taking into consideration the substantively enacted tax rates in the years of reversal, the total deferred tax liability is \$14,250 in 2018 under IFRS and is lower than the \$18,000 deferred tax liability recognized under U.S. GAAP.

¹⁵Under IFRS, the point at which legislation is substantively enacted will vary from country to country based on the country's legal procedures. Typically, tax legislation requires the approval of the head of state before it can become law. However, the head of state in some jurisdictions has executive power whereas in other jurisdictions, the head of state plays only a ceremonial role. Thus, in the first case where the head of state has executive power, a tax rate is not substantively enacted until it has been actually approved by the head of state. In the latter case, the tax rate has been substantively enacted before it reaches the head of state.

JUDGMENTS IN ACCOUNTING

Changing Tax Rates

Predicting the expected reversal dates of temporary book-tax differences can require judgment. In contrast, the reversal dates of some deferred tax accounts are known with near certainty. For example, deferred tax liabilities arising from differences in the basis of equipment resulting from different depreciation methods can be estimated with a high degree of accuracy.

However, the reversal of other book-tax differences cannot be known with such certainty. Consider, for example, a deferred tax asset that has arisen from a lawsuit in which a company accrues a litigation liability for book purposes, but cannot recognize this obligation for tax purposes until the liability is paid.

Example 17.13 illustrates accounting for uncertainty in the timing of the reversal of a deferred tax asset.

EXAMPLE 17.13

Uncertainty in the Timing of the Reversal of a Deferred Tax Account

PROBLEM: In 2018, several customers at Maydew Restaurants, Inc. presented with cases of food poisoning and subsequently sued Maydew. Maydew reported a \$5 million contingent liability on its December 31, 2018, financial statements. The tax rate for 2018 is 35%. However, the enacted tax rates for 2019, 2020, 2021, and thereafter are 34%, 32%, and 30%, respectively. What amount should Maydew record for the deferred tax asset related to the contingency?

SOLUTION: Maydew needs to record a deferred tax asset computed as the book-tax basis difference in the contingent liability times the tax rate that will be in effect at the time of the reversal. The problem is that this deferred tax asset won't reverse until Maydew settles the case or the case works its way through the court system. If we assume that the case will not be resolved until after 2021, the deferred tax asset will be measured at \$1.5 million ($\$5 \text{ million} \times 30\%$). However, if we believe that the case will be resolved in 2019, the deferred tax asset will be measured at \$1.7 million ($\$5 \text{ million} \times 34\%$).

- 6 Determine the accounting for net operating losses (NOLs), including NOL carrybacks and carryforwards and the valuation of related deferred tax assets.

Accounting for Net Operating Losses

A **net operating loss** (NOL) is a net loss for tax purposes that occurs when tax-deductible expenses exceed taxable revenues. When a company reports a tax loss, it has no income taxes currently payable. However, many countries allow corporations experiencing an NOL to recover past income taxes paid or reduce future income taxes payable by applying the current year's loss to offset prior or future taxable income.

Carrybacks and Carryforwards under U.S. Tax Law

Under the U.S. tax law, companies with NOLs can elect to *carryback* or *carryforward* a tax loss. The **carryback** allows a company to offset the current tax loss against prior years' taxable income and claim a refund for taxes previously paid on the amount offset. The **carryforward** permits a company to offset the current tax loss against future taxable income, thereby reducing future taxable income and lowering the amount of tax due in the year of the offset.

NOL carrybacks and carryforwards provide a means of smoothing taxable income for companies that have a more volatile earnings stream as compared with those with a steady stream of income. To illustrate, consider two companies with a 35% tax rate that have taxable income of \$1 million over a 2-year period. Company B earns \$500,000 each year, and Company A has taxable income of \$1.5 million in Year 1 and a loss of \$500,000 in Year 2. Without any special provisions, Company B will pay taxes of \$175,000 ($\$500,000 \times 35\%$) each year for a total of \$350,000.

Company A will pay taxes in Year 1 of \$525,000 ($\$1.5 \text{ million} \times 35\%$) and no taxes in Year 2 for a total of \$525,000. But if Company A is able to carryback a loss and offset prior taxable income, it will incur the same tax liability as Company B, for example:

Company	Description	Year 1	Year 2	Total
A	Taxable income	\$1,500,000	\$(500,000)	\$1,000,000
	Carryback loss	<u>\$ (500,000)</u>	<u>0</u>	<u> </u>
	Taxable income	\$1,000,000	\$(500,000)	\$1,000,000
	Tax rate	<u>× 35%</u>	<u>N/A</u>	<u>× 35%</u>
	Tax liability	<u>\$ 350,000</u>	<u>\$ 0</u>	<u>\$ 350,000</u>
B	Taxable income	\$ 500,000	\$ 500,000	\$1,000,000
	Tax rate	<u>× 35%</u>	<u>× 35%</u>	<u>× 35%</u>
	Tax liability	<u>\$ 175,000</u>	<u>\$ 175,000</u>	<u>\$ 350,000</u>

U.S. GAAP allows companies to carry back a tax loss against prior taxable income for the previous 2 years and/or carry forward taxable income for 20 years or until the tax loss is fully utilized. Under current law, any unused carryforward deductions expire after 20 years. For example, a company with a taxable loss of \$100,000 in 2018 has two options:

1. Carryback the NOL into 2016 and 2017 in that order. The NOL must be carried back to the earliest year first. If taxable income for the prior 2 years is less than the NOL, it can carry forward the remainder of the NOL for up to 20 years.
2. Carryforward the NOL for up to 20 years if it does not have sufficient taxable income in the carryback period or if it elects not to carry back the tax loss.¹⁶

Accounting for an NOL Carryback

When a company carries back the entire NOL, it records a refund receivable for income taxes previously paid and reduces its income tax expense by the amount of the anticipated refund. The tax refund receivable and the related tax benefit are recognized in the year of the loss because it is measurable and currently realizable in that year. Example 17.14 illustrates accounting for an NOL carryback.

EXAMPLE 17.14 Net Operating Loss Carryback

PROBLEM: Lawson Enterprises experienced an NOL of \$567,000 in 2018. The company reported taxable income of \$434,000 in 2016 and \$327,000 in 2017. The tax rate for all years is 40%. Lawson elects to carryback the NOL. What is the necessary journal entry to record the NOL carryback in the year of the loss? Prepare a partial income statement for the year of the loss.

SOLUTION: Lawson Enterprises first carries back the loss to 2016, the earliest possible year to which the loss can be applied. If any of the loss remains, the company can carry back that amount to 2017. Lawson reported taxable income of \$434,000 in 2016, so the company can carry back that amount to 2016. The remaining NOL of \$133,000 ($\$567,000 - \$434,000$) is a carryback to 2017. Therefore, Lawson has sufficient taxable income in the 2 years before the year of the NOL to carry back the entire amount of the NOL.

¹⁶Generally, companies carry back losses if possible, but under certain conditions, they can choose not to carry back even if taxable income is available in the carryback period. For example, a company can expect higher future income and/or increased income tax rates in future periods. As a result, the carryforward can provide more tax benefit than the carryback.

Description	2016	2017	Year of the Loss 2018	Total NOL Carryback
Taxable income (loss)	\$434,000	\$327,000	\$(567,000)	
Carryback				
Carried back first to 2016 and then remaining amount to 2017	(434,000)	(133,000)		(567,000)

Income Tax Benefit Computation	2016	2017	Total
Carryback (from above)	\$(434,000)	\$(133,000)	\$(567,000)
× Tax rate	× 40%	× 40%	× 40%
Income tax benefit	<u>\$(173,600)</u>	<u>\$(53,200)</u>	<u>\$(226,800)</u>

Lawson carries back \$434,000 to 2016 and fully offsets 2016 taxable income. The company can also carry back the remaining \$133,000 (\$567,000 – \$434,000) to 2017. Given the 40% income tax rate in both years, Lawson can claim a refund for \$226,800 (see table above). In addition, Lawson will have \$194,000 (original taxable income of \$327,000 – \$133,000 used) remaining from 2017 that could be used to offset an NOL in 2019.

The journal entry to record the NOL carryback is presented follows:

Account	December 31, 2018
Income Tax Refund Receivable	226,800
Income Tax Benefit	226,800

The partial income statement is presented next. Note that Lawson reports an income tax benefit as opposed to income tax expense, which reduces its net loss after tax.

Partial Income Statement	
Net loss before tax benefit	\$ (567,000)
Income Tax Benefit	<u>226,800</u>
Net loss after tax benefit	<u>\$(340,200)</u>

The income tax benefit reduces Lawson's net loss by \$226,800.

Accounting for an NOL Carryforward

When a company does not have sufficient taxable income in prior years to fully utilize an NOL, it can carryforward the unused amount of the NOL. Alternatively, a company can simply forgo the carryback option and carryforward the entire NOL instead. The NOL carryforward gives rise to a deferred tax asset. A deferred tax asset provides a future reduction in income taxes payable. When a company reports positive earnings for tax purposes, it can reduce its taxable income by the NOL carryforward and pay less tax in the carryforward year. Accounting for a net operating loss carryforward is illustrated in Example 17.15.

EXAMPLE 17.15

Net Operating Loss Carryforward: Year of the NOL

PROBLEM: Piewares, Inc. began business in 2018 and reported sales revenue of \$500,000 and expenses of \$600,000, resulting in a \$100,000 net loss for the current year. Assume that Piewares has not yet received cash for its sales, nor has it paid cash for its expenses incurred during the year. It has no permanent or temporary differences; thus, its taxable loss equals its book loss of \$100,000. Because it began business in 2018, the carryback option is not

Continued

available, so Piewares must carry forward its \$100,000 NOL. The tax rate is 35%, and a valuation allowance is not required. What is the necessary journal entry to record the impact of the NOL carryforward on the company's financial statements? Prepare a partial 2018 income statement and balance sheet for Piewares.

SOLUTION: Piewares records a deferred tax asset of \$35,000 ($\$100,000 \times 35\%$) and a related income tax benefit of \$35,000. The company does not owe any taxes, nor will it record any income taxes payable for the current year.

Year of the Loss 2018	
Taxable income (loss)	<u>\$(100,000)</u>
NOL carryforward	(100,000)
Tax rate	<u>× 35%</u>
Income tax benefit	<u>\$ 35,000</u>

The journal entry is as follows:

Account	December 31, 2018
Deferred Tax Asset	35,000
Income Tax Benefit	35,000

The partial income statement and balance sheet follow. Note that Piewares reports an income tax benefit as opposed to income tax expense, which reduces its net loss after tax.

Partial Income Statement	
Sales Revenue	\$ 500,000
Operating Expenses	<u>(600,000)</u>
Net Loss before Tax Benefit	\$(100,000)
Income Tax Benefit	<u>35,000</u>
Net Loss after Tax Benefit	<u>\$ (65,000)</u>
Balance Sheet	
Assets:	
Accounts Receivable	\$ 500,000
Deferred Tax Assets	<u>35,000</u>
TOTAL	<u>\$ 535,000</u>
Liabilities and Stockholders' Equity:	
Accounts Payable	\$ 600,000
Stockholders' Equity	<u>(65,000)</u>
TOTAL	<u>\$ 535,000</u>

When a company carries forward an NOL, it realizes the benefits of a deferred tax asset in future periods when taxable income is earned. In the period that it reports future income, the company will compute income tax expense based on current-year book income. However, its income tax payable will be reduced because of the realization of the NOL carryforward benefit. Example 17.16 illustrates the realization of NOL carryforward benefits in the profitable years following the loss.

EXAMPLE 17.16**Net Operating Loss Carryforward: Years Following the Year of the NOL**

PROBLEM: In Example 17.15, we determined that Piewares has a deferred tax asset of \$35,000 related to the \$100,000 NOL in 2018. In 2019, the company generates revenues of \$500,000 and incurs operating expenses of \$200,000. Again, there are no temporary or permanent differences, meaning that book income is equal to taxable income. So, Piewares reports taxable income of \$300,000 before considering the effect of its NOL. The company's tax rate is 35%. What is the tax-related journal entry for 2019?

SOLUTION: Piewares' 2019 tax expense is \$105,000 ($\$300,000 \times 35\%$ tax rate). Piewares will apply the \$100,000 NOL carryforward to reduce taxable income to \$200,000 ($\$300,000 - \$100,000$ NOL). Therefore, income tax payable is only \$70,000 ($35\% \times \$200,000$).

	<u>2018</u>	<u>2019</u>	<u>Total NOL Carryforward</u>
Taxable income (loss)	\$(100,000)	\$ 300,000	
Carryforward: Carryforward NOL to 2019		<u>\$(100,000)</u>	\$(100,000)
Taxable income after carryforward		<u>\$ 200,000</u>	

Income Tax Benefit Computation	2019
Carryforward (from above)	\$(100,000)
× Tax rate	<u>× 35%</u>
Income tax benefit realized	<u>\$ (35,000)</u>

Applying the NOL results in an income tax payable of \$70,000 ($\$200,000 \times 35\%$). The \$35,000 difference between its tax expense and income taxes payable is the benefit from realization of the deferred tax asset. So, Piewares also reduces its deferred tax asset because it fully utilizes the NOL carryforward benefits in 2019.

The journal entry is as follows:

Account	December 31, 2019
Income Tax Expense	105,000
Income Tax Payable	70,000
Deferred Tax Asset	35,000

Note that Piewares still has \$200,000 of taxable income from 2019 that can be used to offset an NOL occurring in 2020 or 2021.

It is not uncommon that a company carries back an NOL to the preceding 2 years but will not be able to fully offset the loss. In this case, the company can then carry forward the remainder as illustrated in Example 17.17.

EXAMPLE 17.17 Net Operating Loss Carryback and Carryforward

PROBLEM: Backus Inc. reported a loss of \$500,000 in 2018. The company reported taxable income of \$125,000 in 2016 and \$230,000 in 2017. It has no permanent or temporary differences, and its tax rate is 35%. What is the necessary journal entry for 2018? Backus reported taxable income of \$250,000 in 2019. What is the necessary journal entry for 2019?

SOLUTION: Backus first carries back the loss to 2016, the earliest possible year in which it can apply the loss, and then to 2017. Backus reported taxable income of \$125,000 in 2016, so the company can carry back that amount to 2016. It reported taxable income of \$230,000 in 2017, so it carries back that amount also. Thus, the total carryback is \$355,000, leaving \$145,000 available as a carryforward.

Description	2016	2017	Year of the Loss 2018
Taxable income (loss)	\$ 125,000	\$ 230,000	\$(500,000)
Carryback	(125,000)	(230,000)	<u>(355,000)</u>
Carryforward			<u>\$(145,000)</u>

Computation Income Tax Benefit from the NOL	2016	2017	Total
Carryback (from above)	\$125,000	\$230,000	\$355,000
× Tax rate	× 35%	× 35%	× 35%
Income tax benefit	<u>\$ 43,750</u>	<u>\$ 80,500</u>	<u>\$124,250</u>

Because Backus did not have enough taxable income in the preceding 2 years to fully offset the current year's loss, it has an NOL carryforward of \$145,000 (\$500,000 – \$355,000). This carryforward results in a deferred tax asset of \$50,750 (\$145,000 × 35%). We compute the total tax benefit as follows:

Tax benefit of NOL carryback	\$124,250
Tax benefit of NOL carryforward	<u>50,750</u>
Total tax benefit	<u>\$175,000</u>

Note that the \$175,000 tax benefit can also be computed as the total loss (\$500,000) multiplied by the tax rate of 35%.

Backus records a tax benefit of \$175,000, a tax refund receivable of \$124,250 related to the carryback, and a deferred tax asset of \$50,750 related to the carryforward.

Account	December 31, 2018
Income Tax Refund Receivable	124,250
Deferred Tax Asset	50,750
Income Tax Benefit	175,000

In 2019, Backus generates enough taxable income to fully utilize its available NOL carryforward. We compute the impact on the tax accounts as follows:

	2019	Tax Rate (%)	Impact on Tax Accounts	Specific Account
Taxable income before carryforward (also book income before taxes)	\$ 250,000	35%	\$ 87,500	Tax Expense
Carryforward	<u>\$(145,000)</u>	35%	<u>\$(50,750)</u>	Deferred Tax Asset
Taxable income after carryforward	<u>\$ 105,000</u>	35%	<u>\$ 36,750</u>	Tax Payable

The journal entry is as follows:

Account	December 31, 2019	
Income Tax Expense	87,500	
Income Tax Payable		36,750
Deferred Tax Asset		50,750

Assessing NOL Carryforward Realizability

An important consideration when accounting for NOLs is the firm's ability to realize the tax benefit from a deferred tax asset. If a firm has an NOL carryforward, there is a possibility that it will not generate sufficient taxable income before the carryforward expires. Thus, the firm must assess the probability that it will be able to benefit from the NOL carryforward. If the firm determines that it is more likely than not that it will not benefit from some or all of the NOL carryforward, it will recognize a valuation allowance to reflect the deferred tax asset at its reduced net realizable value. Example 17.18 illustrates assessing the realizability of a net operating loss carryforward.

EXAMPLE 17.18

Net Operating Loss Carryforward: Assessing Realizability

PROBLEM: Refer to information for Piewares, Inc. from Example 17.15. In 2018, the company experienced a \$100,000 net operating loss and recorded a deferred tax asset of \$35,000 in 2018. Now assume that Piewares decides that it is more likely than not that it will be able to generate only \$60,000 of taxable income during the carryforward period. As a result, without generating an additional \$40,000 of future taxable income, it will not be able to fully realize the NOL carryforward benefit. What is the journal entry necessary to record the net deferred tax asset in 2018? Prepare a partial income statement and balance sheet for Piewares.

SOLUTION: Piewares will report a net deferred tax asset of \$21,000 [$(\$100,000 - \$40,000) \times 35\%$]. The company reports a deferred tax asset of \$35,000 ($\$100,000 \times 35\%$) and records a valuation allowance of \$14,000 ($\$40,000 \times 35\%$). Piewares' income tax benefit will decrease by \$14,000, and its net deferred tax asset will decrease by \$14,000 because of the need for the valuation allowance.

The journal entries follow:

Account	December 31, 2018	
Deferred Tax Asset	35,000	
Income Tax Benefit		35,000

Account	December 31, 2018	
Income Tax Benefit	14,000	
Valuation Allowance for Deferred Tax Asset		14,000

Continued

The income statement and balance sheet follow. Note that the deferred tax asset is reported at its net value of \$21,000 and the income tax amount is a net benefit of \$21,000.

Partial Income Statement	
Sales revenue	\$ 500,000
Operating expenses	<u>(600,000)</u>
Net Loss before income tax benefit	\$(100,000)
Income tax benefit	<u>21,000</u>
Net Loss after tax benefit	<u><u>\$ (79,000)</u></u>
Balance Sheet	
Assets:	
Accounts receivable	\$ 500,000
Deferred tax assets	<u>21,000</u>
Total	<u><u>\$ 521,000</u></u>
Liabilities and stockholders' equity:	
Accounts payable	\$ 600,000
Stockholders' equity	<u>(79,000)</u>
Total	<u><u>\$ 521,000</u></u>

Assessing NOL Carryforward Realizability: IFRS

As discussed earlier, IFRS reporters also assess the realizability of deferred tax assets. However, a valuation allowance is not used under IFRS.

- 7 Explain and demonstrate accounting for uncertain tax positions.

Uncertain Tax Positions

In many cases, tax authorities can disallow all or a portion of a particular position taken by a company on its tax return. For example, a company can classify a certain transaction as tax exempt. These positions are known as **uncertain tax positions**, which typically result from aggressive tax positions taken by companies when preparing tax returns. These tax positions can result in the company reporting a tax-related liability referred to as a **tax contingency** on its balance sheet.

Examples of uncertain tax positions include:

- A decision not to file a tax return
- A shift of income across jurisdictions
- A decision to exclude potentially taxable income from a tax return
- A choice to treat a transaction as tax-exempt¹⁷

To illustrate, consider a company that takes an aggressive tax position on its U.S. federal tax return to reduce income tax payable by \$100,000. It is possible that the Internal Revenue Service will ultimately require the company to pay at least some of this amount in the future. How much of the \$100,000 should the company record as a tax liability from the uncertain tax position, and how much should it record as a tax benefit?¹⁸ The tax benefit is simply the reduction in the reported tax expense and liability as the result of the uncertain tax position.

¹⁷These examples are taken from FASB ASC 740-10-20.

¹⁸Firms rarely report the liability from uncertain tax positions on the face of the balance sheet. However, disclosure standards (discussed later in the chapter) require that firms report the balance of the liability for uncertain tax positions in the footnotes.

Accounting for Uncertain Tax Positions

U.S. GAAP uses a two-step approach, recognition and measurement, to account for uncertain tax positions. In general, accounting under U.S. GAAP is intended to be a “principles-based” methodology requiring significant judgment by management, attorneys, and auditors.

Step 1: Recognition: To account for uncertain tax positions, the company first determines whether it should recognize any benefits from its tax position. To do so, it must decide if it is more likely than not that it will sustain the tax position after examination by the taxing authority, assuming that the taxing authority has full knowledge of all relevant information. In concrete terms, after the taxing authority examines all available evidence (both positive and negative), the company must determine whether there is slightly more than a 50% chance that it will sustain the tax position. If the company expects that it will sustain the position, it can recognize a benefit and measure the tax benefit as determined in Step 2.

Step 2: Measurement: If a tax position meets the more-likely-than-not threshold, the company measures the amount of tax benefit to be recognized in the financial statements. The tax benefit is the largest amount of benefit that is greater than 50% likely of being realized upon ultimate settlement. This measurement system is based on cumulative probability computations without considering the time value of money. In other words, a tax benefit should be measured as the largest amount of benefit that is cumulatively greater than 50% likely to be realized.

Exhibit 17.9 illustrates *AT&T*'s disclosure related to its uncertain tax position. Note the discussion of the more-likely-than-not likelihood of realization upon settlement explained in Step 2. At December 31, 2016, *AT&T* disclosed that approximately \$3,701 million of estimated liabilities for uncertain tax positions would be realized if such liabilities were actually incurred.

EXHIBIT 17.9 Uncertain Tax Position Disclosures, *AT&T Inc.*, Financial Statements, December 31, 2016

Note 11: Income Taxes

We recognize the financial statement effects of a tax return position when it is more likely than not, based on the technical merits, that the position will ultimately be sustained. For tax positions that meet this recognition threshold, we apply our judgment, taking into account applicable tax laws, our experience in managing tax audits and relevant GAAP, to determine the amount of tax benefits to recognize in our financial statements. For each position, the difference between the benefit realized on our tax return and the benefit reflected in our financial statements is recorded on our consolidated balance sheets as an unrecognized tax benefit (UTB). We update our UTBs at each financial statement date to reflect the impacts of audit settlements and other resolutions of audit issues, the expiration of statutes of limitation, developments in tax law and ongoing discussions with taxing authorities.

Source: AT&T, Inc. AT&T Inc. Annual Report. https://www.att.com/Investor/ATT_Annual/2016/downloads/att_ar2016_completeannualreport.pdf

Example 17.19 considers an expansive example of a tax contingency.

EXAMPLE 17.19

Recognition and Measurement of an Uncertain Tax Position

PROBLEM: Hush Sound Systems, Inc. took an aggressive tax position on its current-year tax return. The taxing jurisdictions have challenged the deduction claimed in prior years upon examining the returns of other firms in the industry. Hush reported \$600,000 in taxable income after the \$500,000 deduction in question. In other words, the company earned \$1,100,000 in taxable income before the \$500,000 deduction. Hush is subject to a 34% tax rate and has no book-tax differences.

Based on a careful analysis, management believes that it is more likely than not that the position will be sustained upon examination. Therefore, the potential tax benefit will be recognized. The company will assess the following probabilities corresponding to possible tax deduction outcomes in order to measure the potential tax benefit:

Possible Estimated Outcome (i.e., amount allowed as a tax deduction)	Individual Probability of Occurring (%)
\$500,000	5%
380,000	30
300,000	25
210,000	15
190,000	25

What journal entry is required to record the current year's income tax expense, income tax payable, and tax liability for the uncertain tax position?

SOLUTION: The first step is to determine whether management can report any benefit from this tax position. If they cannot recognize any tax benefit—that is, if the \$500,000 tax deduction is not recognized—taxable income is \$1,100,000 (\$600,000 + 500,000). If none of the deduction is recognized, the company debits income tax expense for \$374,000 (\$1,100,000 × 34%) and credits income tax payable for the same amount. However, because it is more likely than not that the position will be sustained upon examination, the company is allowed to recognize some amount of benefit. In other words, Hush will not be required to record the full \$374,000 of income tax expense.

With the more-likely-than-not threshold being satisfied, the next step is to measure the amount of the income tax benefit that Hush will recognize. The amount of the benefit recognized equals the largest amount of income tax benefit that is likely to be realized at a greater than 50% cumulative probability upon final settlement by the taxing authorities. The largest amount of the tax benefit is \$102,000 (\$300,000 × 34%) because it represents the largest amount of benefit that is cumulatively more than 50% likely to occur as determined in the following table:

Possible Estimated Outcome (i.e., amount allowed as a tax deduction)	Individual Probability of Occurring (%)	Cumulative Probability of Occurring (%)
\$500,000	5%	5%
380,000	30	35
300,000	25	60
210,000	15	75
190,000	25	100

Thus, Hush multiplies the remaining \$200,000 of the tax position by the tax rate and records a \$68,000 liability for the uncertain tax position [(\$500,000 – \$300,000) = \$200,000 × 34% = \$68,000]. It records income taxes payable of \$204,000, which is the reported taxable income of \$600,000 multiplied by the 34% tax rate. So, Hush's income tax expense is \$272,000, the sum of its current income tax payable of \$204,000 plus the liability of \$68,000 for the uncertain tax position.

Observe that Hush's income tax expense of \$272,000 is the \$374,000 full tax expense less the largest amount of the benefit allowed, \$102,000.

The journal entry to record the current year's tax provision and the liability for the uncertain tax position follows:

Description	December 31, Current Year
Income Tax Expense	272,000
Income Tax Payable	204,000
Tax Contingency	68,000

Accounting for Uncertain Tax Positions: IFRS

IFRS does not specifically address uncertain tax positions. Rather, it requires firms to measure tax assets and tax liabilities at the amount expected to be paid. So, IFRS reporters rely on standards for accounting for contingencies as guidance.¹⁹ Under this guidance, the company:

1. Assesses whether it has a present obligation as a result of a past event
2. Determines whether it is probable that it will use resources to settle the obligation and whether it can reliably estimate the obligation

Example 17.20 illustrates accounting for uncertain tax positions under IFRS.

EXAMPLE 17.20

Recognition and Measurement of an Uncertain Tax Position: IFRS

PROBLEM: Use the same information from Example 17.19 but assume that Hush Sound Systems, Inc., reports using IFRS. Determine the income tax liability that Hush should recognize in its financial statements under IFRS.

SOLUTION: Under IFRS, Hush Sound Systems needs to recognize the amount expected to be paid. However, there is no specific guidance on determining the amount to be recognized. Assuming a 34% income tax rate, the total possible liability related to this tax deduction is \$170,000 ($\$500,000 \times 34\%$). Because it is likely Hush would settle for less than the full amount of the entire position, it should recognize some amount of contingent liability less than \$170,000. The exact amount of the liability to be recognized is highly subjective and requires further analysis to determine with certainty.

JUDGMENTS IN ACCOUNTING Uncertain Tax Positions

Accounting for uncertain tax positions is based on management's decisions regarding difficult-to-predict projections of future events—and these decisions impact both income tax expense and reported net income. In order to record a liability for an uncertain tax position under U.S. GAAP, management must assess the probabilities that some portion of the position will be sustained upon examination by the taxing authorities.

In Example 17.19, Hush Sound Systems, Inc. recorded an aggressive \$500,000 tax deduction on its tax return constituting an uncertain tax position. The company reported \$600,000 in taxable income after the deduction. Consequently, Hush will record income taxes payable of \$204,000 ($\$600,000 \times 34\%$). How much income tax expense should Hush record? What is the amount of the liability for the uncertain tax position?

In Example 17.19, management provided the following schedule of estimated probabilities for the amounts of possible tax deductions allowed.

Possible Estimated Outcome (i.e., amount allowed as a tax deduction)	Individual Probability of Occurring (%)	Cumulative Probability of Occurring (%)
\$500,000	5%	5%
380,000	30	35
300,000	25	60
210,000	15	75
190,000	25	100

¹⁹IASC, *International Accounting Standard 37*, "Provisions, Contingent Liabilities and Contingent Assets" (London, UK: International Accounting Standards Committee, Revised, 2001).

Because these projections and estimated probabilities are highly subjective, the company could have used a different set of probabilities. For example, assume that management provided the following table as an alternative set of estimated outcomes and related probabilities:

Possible Estimated Outcome (i.e., amount allowed as a tax deduction)	Individual Probability of Occurring (%)	Cumulative Probability of Occurring (%)
\$500,000	15%	5%
480,000	40	55
300,000	5	60
210,000	15	75
190,000	25	100

The company projects that it will sustain a deduction of \$480,000. Thus, Hush will report a liability for an uncertain tax position of \$6,800 $[(\$500,000 - \$480,000) \times 34\%]$ and tax expense of \$210,800 $[(\$1,100,000 - \$480,000) \times 34\%]$. This \$210,800 income tax expense is significantly less than the income tax expense recognized in the original example in which Hush's reported income tax expense of \$272,000.

The amounts that firms could potentially report as liabilities related to uncertain tax positions can be quite large. For example, *AT&T's* reported unrecognized tax benefit (i.e., potential liability for uncertain tax positions) of \$3,701 million in the notes to its financial statements for the year ended December 31, 2016, is shown in Exhibit 17.10.

EXHIBIT 17.10 Reconciliation of the Unrecognized Tax Benefits, *AT&T Inc.*, Financial Statements, December 31, 2016

NOTE 11: Income Taxes

A reconciliation of the change in our UTB balance from January 1 to December 31 for 2016 and 2015 is as follows:

Federal, State and Foreign Tax (in millions)	2016	2015
Balance at beginning of year	\$6,898	\$4,465
Increases for tax positions related to the current year	318	1,333
Increases for tax positions related to prior years	473	660
Decreases for tax positions related to prior years	(1168)	(396)
Lapse of statute of limitations	(25)	(16)
Settlements	50	10
Current year acquisitions	-	864
Foreign currency effects	(30)	(22)
Balance at end of year	6,516	6,898
Accrued interest and penalties	1,140	1,138
Gross unrecognized income tax benefits	7,656	8,036
Less: Deferred federal and state income tax benefits	(557)	(582)
Less: Tax attributable to timing items included above	(3,398)	(3,460)
Less: UTBs included above that relate to acquisitions that would impact goodwill if recognized during the measurement period	-	(842)
Total UTB that, if recognized, would impact the effective income tax rate as of the end of the year	<u>\$3,701</u>	<u>\$3,152</u>

Source: AT&T, Inc. AT&T Inc. Financial Review 2016. https://www.att.com/Investor/ATT_Annual/2016/downloads/att_ar2016_completeannualreport.pdf

- 8 Describe the financial statement presentation of the income tax accounts.

Financial Statement Presentation

There are a number of important issues to consider in the financial statement presentation of the income tax accounts on the balance sheet and the income statement.

Balance Sheet Presentation

Companies report several income tax accounts on the balance sheet. For example, companies typically present income taxes payable in the current liabilities section. Income tax payable can be disclosed as a separate line item, or it can be combined with other short-term payables. In addition to income taxes payable, companies report the income tax contingency as a liability on the balance sheet.

The deferred tax account is the result of many book-tax differences. Some of these differences will give rise to deferred tax liabilities and others will result in deferred tax assets. Under both U.S. GAAP and IFRS, deferred tax liabilities and deferred tax assets should be netted as long as the right to offset exists. For example, netting is permitted only if the amounts are payable and receivable from the same taxing jurisdiction. For simplicity, all deferred tax assets and liabilities are reported as noncurrent. Example 17.21 illustrates the netting of deferred tax assets and liabilities.

EXAMPLE 17.21

Netting of Deferred Tax Assets and Liabilities

PROBLEM: Weiss Company has two deferred tax assets and two deferred tax liabilities at the end of the year as shown in the following table. How should Weiss report its deferred tax accounts on its balance sheet?

Deferred Tax Account	Amount
Deferred tax asset from Germany	\$ 80,000
Deferred tax liability from Brazil	320,000
Deferred tax asset from Brazil	8,000
Deferred tax liability from the Germany	62,000

SOLUTION: Weiss should net all of its deferred tax accounts from Germany and then all of its deferred tax accounts from Brazil.

Germany	
Deferred tax asset	\$ 80,000
Deferred tax liability	<u>(62,000)</u>
Net deferred tax asset	<u>\$ 18,000</u>
Brazil	
Deferred tax liability	\$320,000
Deferred tax asset	<u>(8,000)</u>
Net deferred tax liability	<u>\$312,000</u>

Thus, Weiss will report a deferred tax asset of \$18,000 and a deferred tax liability of \$312,000. On the balance sheet, the deferred tax asset will be classified as a noncurrent asset. The deferred tax liability will be classified as a noncurrent liability.

Income Statement Presentation

Companies report income tax expense (or income tax benefit) on the income statement. Typically, firms report a line item for income tax expense immediately before income from continuing operations. The amount of income tax expense reported consists of both current and deferred income tax expense.

Note, however, that the amount of total income tax expense reported as a line item on the face of the income statement does not necessarily include the firm's entire income tax expense. Discontinued operations are reported net of income tax expense following income from continuing operations on the income statement.

Companies also report taxes related to other comprehensive income items on the comprehensive statement of income. Other comprehensive income is reported net of tax.²⁰ For example, income tax expense related to unrealized gains or losses from available-for-sale debt investments is reported in other comprehensive income as opposed to net income. The allocation of income tax expense to different sections of the comprehensive income statement is referred to as **intra-period tax allocation**. Example 17.22 illustrates intraperiod tax allocation.

EXAMPLE 17.22 Intraperiod Tax Allocation

PROBLEM: Planet Entertainment, Inc. reported income from continuing operations before taxes of \$575,000 and income from discontinued operations of \$150,000. Planet also reported \$72,000 of unrealized gains from available-for-sale debt investments recorded as other comprehensive income. The company is subject to a 40% tax rate and reports no permanent differences. What is Planet's total income tax expense for the year? How much income tax expense does Planet report as a line item directly below Income from Continuing Operations before Taxes? Prepare a partial comprehensive income statement for Planet Entertainment.

SOLUTION: Planet Entertainment reports total comprehensive income before tax of \$797,000 (\$575,000 continuing operations before taxes + \$150,000 discontinued operations + \$72,000 other comprehensive income). The company's total tax expense is \$318,800 ($\$797,000 \times 40\%$) and its after-tax comprehensive income is \$478,200 ($\$797,000 - \$318,800$). However, because of intraperiod tax allocation, Planet will not report the entire \$318,800 in the line item Income Tax Expense. Planet reports income from continuing operations, income from discontinued operations, and other comprehensive income, net of tax, as presented in the table below.

Income Statement Component	Gross Amount	Tax	Net of Tax Amount
Income from continuing operations before taxes	\$575,000	\$230,000	\$345,000
Discontinued operations	150,000	60,000	90,000
Other comprehensive income	72,000	28,800	43,200
Total comprehensive income	<u>\$ 797,000</u>	<u>\$318,800</u>	<u>\$478,200</u>

Planet's partial statement of comprehensive income follows:

Income from continuing operations before taxes	\$575,000
Income tax expense	(230,000)
Income from continuing operations	\$345,000
Discontinued operations – Net of \$60,000 tax	90,000
Net Income	\$435,000
Other comprehensive income – Net of \$28,800 tax	43,200
Comprehensive income	<u>\$478,200</u>

²⁰The cumulative effect of accounting changes is also reported in the stockholders' equity section of the balance sheet net of income tax expense.

- 9 Detail required disclosures for income taxes.

Income Tax Financial Statement Disclosures

We discuss the required financial statement disclosures related to income taxes in this section.

Income Tax Expense and Income Taxes Paid

Firms disclose the portion of their income tax expense that is current and the portion that is non-current. The firm's current income tax expense represents the amount of expense that is attributable to current-year taxable income. The noncurrent portion of income tax expense, known as the *deferred provision*, is attributable to items that give rise to deferred taxes. These taxes are reported according to jurisdiction, commonly federal, state, and international.

Exhibit 17.11 illustrates *Google's* 2016 disclosure of its current and deferred taxes according to federal, state, and international jurisdictions. In 2016, its total tax expense is \$4,672 million, of which \$4,792 million is current and \$(120) million is deferred. The negative deferred amount indicates the reversal of net deferred tax assets.

In addition, firms must disclose the amount of income tax expense that they allocate to financial statement elements that are not part of income from continuing operations.

To provide information on cash flows, companies are also required to disclose the amount of income taxes paid. For example, *Google* disclosed that it paid \$1,643 million in income taxes in fiscal 2016.

EXHIBIT 17.11 Current and Deferred Income Tax Expense, *Google*, Financial Statements, December 31, 2016

Provision for Income Taxes (millions)	2014	2015	2016
Current:			
Federal	\$2,716	\$3,235	\$3,520
State	157	(397)	306
Foreign	774	723	966
Total current	<u>\$3,647</u>	<u>\$3,561</u>	<u>\$4,792</u>
Deferred:			
Federal	\$ 29	\$ (198)	\$ (70)
State	6	(43)	—
Foreign	(43)	(17)	(50)
Total deferred	<u>\$ (8)</u>	<u>\$ (258)</u>	<u>\$ (120)</u>
Total provision	<u>\$3,639</u>	<u>\$3,303</u>	<u>\$4,672</u>

Source: Alphabet Inc. Annual Report. 2016 Annual Report. https://abc.xyz/investor/pdf/2016_google_annual_report.pdf

Tax Rate Reconciliation

Firms must provide a reconciliation of the domestic federal statutory tax rate to their effective tax rate as illustrated for *Google* in Exhibit 17.2. The firm must disclose any significant reconciling items.²¹ Some of the major categories of differences in the effective tax rate and the federal statutory rate are significant permanent book-tax differences. As discussed earlier in this chapter, permanent differences cause the effective tax rate to fluctuate from the statutory rate.

Other items cause the reported effective tax rate to differ from the statutory rate, such as state, local, and foreign tax rates that differ from the U.S. statutory rate. These items are not differences in book and tax income, so they are not permanent differences. Most often, they are differences in the tax rates in the various jurisdictions in which a company operates.

²¹Securities and Exchange Commission, *Regulation S-X Rule 4-08(h)* indicates that significant is considered 5% of the statutory rate.

Deferred Tax Liabilities and Deferred Tax Assets

A company must disclose the individual components of its deferred tax liabilities and deferred tax assets if significant. Firms typically report these amounts on the balance sheet on a net basis and separately on an individual basis in the footnotes as illustrated for *Target* in Exhibit 17.5.

With regard to deferred tax assets, companies disclose the amount and expiration of carryforwards for net operating losses and unused tax credits. Companies must also report the amount of the valuation allowance for deferred tax assets and disclose any change in the valuation allowance because of a change in circumstances.

Uncertain Tax Positions

Finally, reporters are required to provide extensive disclosures related to uncertain tax positions, including both qualitative and quantitative information. For example, the qualitative disclosures must include the specific tax positions that management expects will change within 1 year from the balance sheet date. The quantitative disclosures require, among other things, a roll-forward reconciliation of worldwide, aggregated unrecognized tax benefits (UTB) from uncertain positions. The roll-forward, illustrated for *AT&T* in Exhibit 17.10, includes:

- The beginning balance
- The additions to the balance because of new tax positions
- The additions to the balance because of increases from adjustments of previously recorded positions
- A list of the reductions to the balance because of settlements
- A list of balance reductions from adjustments to previously recorded positions
- A list of balance reductions because of the lapse of the relevant statute of limitations

Income Statement Disclosures: IFRS

Disclosures under U.S. GAAP and IFRS are similar. However, under IFRS, a firm can begin the reconciliation to the effective tax rate with a statutory rate that aggregates domestic rates in various jurisdictions. U.S. GAAP reporters begin the rate reconciliation with the U.S. statutory tax rate.

Interview

Laurie Wax
Tax Partner,
RSM US LLP,
New York, NY »

Laurie Wax

Laurie Wax is a tax partner at RSM US LLP, the leading provider of audit, tax, and consulting services focused on the middle market. It is the U.S. member firm of RSM International, a global network of independent audit, tax, and consulting firms. Her areas of expertise include compliance and advising on corporate income tax accounting issues, including stock compensation and business combinations related to SEC filings along with IFRS preparation for tax accounting.

- 1 Do your clients have difficulty with the concept of deferred accounting for taxes? Why?

Although our clients can understand the mechanics of recording tax deferrals, often they do not understand *why* we have deferrals. Recording deferrals informs the financial statement user of the company's future tax situation, not just today's. Tax laws differ in general from the more conservative GAAP approach, necessitating a way for accountants to disclose and record the differences between the two very different systems. Deferrals represent this difference: a holding place to define the discrepancy between tax and GAAP accounting.

- 2 In what ways are deferred tax assets and deferred tax liabilities considered to be "real" economic resources and obligations in terms of future cash flows?

Deferrals are not just debits and credits—they are very real from a cash flow perspective. Deferred tax assets represent deductions in the future and thus provide a cash tax deduction on a future tax return. Cash planners must also factor in deferred tax liabilities, which represent higher taxes that the company must pay in the future. Therefore, deferrals affect a firm's day-to-day cash flow.

- 3 Are disclosures for uncertain tax positions (UTPs) informative in terms of scope and content? How do decision makers use these disclosures?

UTPs arise when a taxpayer believes its interpretation of earnings recognition or deductions can be less strong than the those of the IRS and therefore records a reserve in an audited financial statement. Companies must disclose any increases/decreases for uncertain tax positions. The financial statements show a dollar

figure with the details given in the footnotes. If there is a UTP, there must be a liability for it. Lenders and the informed investment community look at UTP disclosures to evaluate the magnitude and materiality of the liability as would someone buying the business. Typically, executives do not review UTPs but are involved in deciding whether to record one.

- 4 What factors does RSM US LLP consider in determining whether a client has created an adequate valuation allowance against a deferred tax asset?

As an audit firm, RSM US LLP would request that the client provide us an analysis that would evaluate the positive and negative evidence of a company's situation before asking management to include a valuation allowance. For example, 3 consecutive years of losses provides negative evidence that the client would need a valuation allowance against its deferred tax assets. We then work with the company to determine what the valuation allowance should be. A company with consistent tax losses will be reporting that most of its deferred tax assets result from net operating loss carryforwards. If the company does not expect to use the tax benefits from the net loss carryforwards, the deferred tax asset will be reduced by a valuation allowance. We can also find positive signs indicating that a valuation allowance is not necessary. These can include tax-planning strategies, significant deferred revenue, and property with built-in gains.

- 5 What are some common reasons given by your clients for not carrying back net operating losses?

We rarely have a client who does not want to carry back net operating losses so that it can apply for a refund of prior paid taxes. Occasionally, clients realize that they have not paid in enough taxes for the current year so they could want to carry the losses forward to avoid possible exposures to penalties in the current year. Some clients think doing so will trigger an audit; however, carrying back a loss typically does not cause an audit.

- 6 How do tax rate changes affect your clients' deferred tax assets and deferred tax liabilities?

Once a new rule is enacted, we recalculate the accounts with the applicable tax rates at that time. Any changes in tax expense are absorbed in the financial statement period when the law takes effect. This rate change usually affects the amount of projected cash taxes in the future. «

Discussion Questions

1. Laurie Wax mentions that most of her clients elect to carry-back a net operating loss (NOL) but provides several reasons why her clients elect to carry a loss forward rather than elect the carryback-carryforward option. Provide several other reasons why an entity would elect the NOL carryforward-only option, not the carryback loss.
2. How can the use of a valuation allowance against a deferred tax asset impact or smooth reported earnings?

FINANCIAL STATEMENT ANALYSIS

Accounting for Income Taxes

Companies have conflicting incentives when reporting taxes. On the one hand, a company wants to maximize net income, which usually implies higher taxes. On the other hand, a company seeks to minimize the amount of taxes it actually pays. Taxes paid are cash outlays, so the lower amount of taxes paid, the more cash a company can keep to use in its business operations.

The tax code provides opportunities for companies to pay lower taxes while maintaining book income. Permanently sheltering income from taxes—such as investing in tax-exempt securities—decreases a company's income tax expense and cash taxes paid. Another way to decrease tax paid is to defer income taxes paid, such as through the use of accelerated depreciation for tax purposes and straight-line depreciation for financial reporting purposes. This strategy would also increase a company's deferred tax liabilities.

However, an increase in deferred tax liabilities (or decrease in deferred tax assets) could indicate to financial statement users that a company is making income-increasing accounting choices as opposed to increasing its income from operations. For example, assume that a company extends the useful life or increases the salvage value of its depreciable long-lived assets to increase its reported net income. The deferred tax liability related to differences in depreciation accounting would increase. Or consider a case in which a company decreases its warranty expense to increase its net income. The deferred tax asset related to the warranty liability also decreases. It is important to note, however, that neither of these income-increasing accounting decisions indicates an increase in income from the company's operations—they are merely accounting strategies used to increase the net income line on the income statement.

The **conservatism ratio** is the ratio of a company's aggressiveness in financial reporting compared with tax reporting. The lower the ratio, the more conservative the company. The higher the ratio, the more aggressive the company.

$$\text{Conservatism Ratio} = \frac{\text{Reported Income before Taxes}}{\text{Taxable Income}} \quad (17.1)$$

Companies are not required to disclose taxable income, so this amount must be estimated. We can estimate taxable income as:²²

$$\text{Taxable Income} = \frac{\text{Current Tax Expense}}{\text{Effective Income Tax Rate}} \quad (17.2)$$

When reported income before taxes is high relative to taxable income, a company pays less in taxes in the short term. A high conservatism ratio, then, usually indicates that the company will have to pay higher taxes in the future relative to the present. Example 17.24 provides an example of the financial statement analysis of income taxes.

EXAMPLE 17.24

Financial Statement Analysis—Accounting for Income Taxes

PROBLEM: To further understand income tax reporting at *AT&T*, use the following information to address the questions after the note.

Note 11: Income Taxes

A reconciliation of income tax expense (benefit) and the amount computed by applying the statutory federal income tax rate (35%) to income from continuing operations before income taxes is as follows:

²²One potential problem with using the current tax expense to estimate taxable income is that the income tax expense reported on the income statement does not include all of the income tax expense. As noted earlier, certain items, such as income from discontinued operations and other comprehensive income, are reported net of tax after income from continuing operations.

Financial Statement Analysis, continued

(in millions)	2016	2015	2014
Taxes computed at federal statutory rate	\$6,934	\$7,242	\$3,624
Increases (decreases) in income taxes resulting from:			
State and local income taxes – net of federal income tax benefit	416	483	(113)
Connecticut wireline sale	—	—	350
Loss of foreign tax credits in connection with América Móvil sale	—	—	386
Mexico restructuring	(471)	—	—
Other – net	(400)	(720)	(628)
Total	\$6,479	\$7,005	\$3,619
Effective Tax Rate	32.7%	33.9%	34.9%

Other information follows:

(in millions)	2016	2015	2014
Provision for Income Taxes			
Current	\$ 3,532	\$ 2,888	\$ 1,671
Deferred	<u>2,947</u>	<u>4,117</u>	<u>1,948</u>
Total provision	<u>\$ 6,479</u>	<u>\$ 7,005</u>	<u>\$ 3,619</u>
Net Income before Taxes	<u>\$19,812</u>	<u>\$20,692</u>	<u>\$10,355</u>

Source: https://www.att.com/Investor/ATT_Annual/2016/downloads/att_ar2016_completeannualreport.pdf

- What is *AT&T's* effective tax rate each year? What is the difference between *AT&T's* effective tax rate and the statutory rate? Detail the items making up this difference.
- Compute *AT&T's* conservatism ratio for each year. Comment on any changes in the ratio over the years. Would you characterize *AT&T* as a conservative or aggressive tax reporter? Round to three decimal places.

SOLUTION:

- AT&T's* effective tax rate is 32.7%, 33.9%, and 34.9% in fiscal 2016, 2015, and 2014, respectively. In each year, the statutory tax rate is 35%. Therefore, *AT&T's* effective tax rate is lower than the statutory tax rate in all years. The effective tax rate is lower because of permanent tax differences such as state and local income taxes and Mexico restructuring costs.
- To compute the conservatism ratio, we first have to estimate taxable income. Then, we use the taxable income in the computation of the conservatism ratio.

	2016	2015	2014
Taxable Income	\$10,801	\$8,519	\$4,788
$= \frac{\text{Current Tax Expense}}{\text{Effective Income Tax Rate}}$	$= \frac{\$3,532}{32.7\%}$	$= \frac{\$2,888}{33.9\%}$	$= \frac{\$1,671}{34.9\%}$
Conservatism Ratio	1.834	2.429	2.163
$= \frac{\text{Reported Income before Taxes}}{\text{Taxable Income}}$	$= \frac{\$19,812}{\$10,801}$	$= \frac{\$20,692}{\$8,519}$	$= \frac{\$10,355}{\$4,788}$

AT&T's conservatism ratio is highest in fiscal 2015 at 2.429. A conservatism ratio of 2.429 indicates that *AT&T's* reported income before taxes is 2.429 times greater than its taxable income. Therefore, *AT&T* is deferring taxes to be paid in future periods. *AT&T's* conservatism ratio decreased from 2.163 to 1.834 from 2014 to 2016, respectively, indicating that *AT&T's* tax reporting has become somewhat more conservative. Yet in 2016, the conservatism ratio is still greater than 1.

Summary by Learning Objectives

In the following, we summarize the main points by Learning Objective. Throughout the chapter, we discuss the accounting and reporting of U.S. GAAP and IFRS side-by-side. The following table also highlights the major similarities and differences between the standards.

- 1** Define book income and taxable income; compute income tax expense and income taxes payable when there are no book-tax differences.

Summary	Similarities and Differences between U.S. GAAP and IFRS
Income tax expense is based on book income. Income tax payable is based on taxable income. When book income and taxable income are equal, there is tax conformity and income tax expense equals income tax payable.	Similar under U.S. GAAP and IFRS.

- 2** Discuss permanent differences and calculate income tax expense and income taxes payable when there are permanent differences.

Summary	Similarities and Differences between U.S. GAAP and IFRS
A permanent difference arises when book income and taxable income differ because either (1) an item is included in the computation of taxable income but never in book income or (2) an item is included in the computation of book income but never in taxable income. When there are permanent differences, companies record both income tax expense and income tax payable on the financial statements based on the tax rules.	Similar under U.S. GAAP and IFRS.

- 3** Explain temporary differences and illustrate the balance sheet approach of accounting for deferred tax assets and liabilities.

Summary	Similarities and Differences between U.S. GAAP and IFRS
Temporary differences occur when the book treatment and the tax treatment for a given transaction are different in a given year but will be the same over the life of the firm. Specifically, a temporary difference exists when the tax basis of an asset or liability differs from the book basis of that asset or liability. This difference results in taxable or deductible amounts in future years. Temporary differences give rise to deferred tax assets or deferred tax liabilities.	Similar under U.S. GAAP and IFRS.

- 4** Explain and demonstrate how to assess and report the realizability of deferred tax assets.

Summary	Similarities and Differences between U.S. GAAP and IFRS
Firms assess deferred tax assets for realizability and report them on the balance sheet at the amount they expect to realize. U.S. GAAP uses a two-step process: (1) Record the full amount of the deferred tax asset and (2) assess the deferred tax asset for realizability and set up a valuation allowance account if needed.	<p>► U.S. GAAP uses the criterion “more likely than not” to assess realizability. IFRS uses “probable.” Both imply the likelihood of more than 50%.</p> <p>IFRS assesses realizability and records the net deferred tax asset without using a valuation allowance.</p>

Summary by Learning Objectives, continued

5 Illustrate the effects of a change in tax rates.	
Summary	Similarities and Differences between U.S. GAAP and IFRS
Firms use future tax rates to calculate their deferred tax assets and liabilities. When tax rates change, the company remeasures its deferred tax assets and liabilities. Any differences are recorded as income tax expense or income tax benefit in the year of remeasure.	<ul style="list-style-type: none"> ▶ U.S. GAAP uses enacted tax rates. IFRS allows substantively enacted tax rates.
6 Determine the accounting for net operating losses (NOLs), including NOL carrybacks and carryforwards, and the valuation of related deferred tax assets.	
Summary	Similarities and Differences between U.S. GAAP and IFRS
A net operating loss (NOL) is a net loss for tax reporting purposes. A company offsets the current tax loss against prior taxable income with a carryback. A company can also offset the current tax loss against future taxable income with a carryforward. A carryforward gives rise to a deferred tax asset. The deferred tax asset is assessed for realizability as detailed in Learning Objective 4.	<ul style="list-style-type: none"> ▶ IFRS assesses the realizability of deferred tax assets but does not use a valuation allowance.
7 Explain and demonstrate accounting for uncertain tax positions.	
Summary	Similarities and Differences between U.S. GAAP and IFRS
Tax contingencies (also referred to as <i>uncertain tax positions</i> or <i>tax cushions</i>) are liabilities that represent the amount that a company determines that it will owe the government upon completion of a tax audit related to the use of aggressive tax positions on its tax return. U.S. GAAP uses a two-step approach in which companies first recognize and then measure any contingencies. A threshold of greater than 50% likelihood is used.	<ul style="list-style-type: none"> ▶ IFRS has no specific guidance for tax contingencies, so IFRS reporters refer to general guidance on accounting for contingencies.
8 Describe the financial statement presentation of the income tax accounts.	
Summary	Similarities and Differences between U.S. GAAP and IFRS
<p>On the balance sheet, firms net deferred tax assets and liabilities, as long as the right to offset exists.</p> <p>On the income statement, firms report a line item for income tax expense that is related to income before tax. Firms report discontinued operations net of tax expense. Tax expense related to items in other comprehensive income is included in other comprehensive income.</p>	Similar under U.S. GAAP and IFRS.

Summary by Learning Objectives, continued

9 Detail required disclosures for income taxes.	
Summary	Similarities and Differences between U.S. GAAP and IFRS
<p>Footnote disclosures include:</p> <ol style="list-style-type: none"> 1. Current and deferred portions of tax expense. 2. Tax expense that is not included in income from continuing operations. 3. Reconciliation of the federal statutory tax rate to the effective tax rate. 4. Individual components of deferred tax assets and liabilities. 5. Amount of and any changes in the deferred tax asset valuation allowance. 6. Disclosures related to tax contingencies. 	<p>► Similar under U.S. GAAP and IFRS except that under IFRS, a firm can also provide a reconciliation to the effective tax rate with a statutory rate that aggregates domestic rates in various jurisdictions. U.S. GAAP reporters begin the reconciliation with the U.S. statutory tax rate.</p>

MyLab Accounting

Go to <http://www.pearson.com/mylab/accounting> for the following Questions, Multiple-Choice Questions, Brief Exercises, Exercises, and Problems. They are available with immediate grading, explanations of correct and incorrect answers, and interactive media that acts as your own online tutor.

17 Accounting for Income Taxes

Questions

- 1 Q17-1. Do the objectives of GAAP accounting and tax accounting methods differ?
- 1 Q17-2. When will income tax expense and income taxes payable be equal?
- 2 Q17-3. Will permanent differences cause the effective tax rate to be lower than the statutory rate?
- 2 Q17-4. When do permanent differences arise?
- 3 Q17-5. How are deferred tax assets and deferred tax liabilities created?
- 3 Q17-6. How does the balance sheet approach measure deferred taxes?
- 3 Q17-7. When do deferred tax liabilities occur?
- 4 Q17-8. When can firms recognize net deferred tax assets on the balance sheet?
- 4 Q17-9. Does the requirement that a firm must assess its deferred tax assets every period for realizability and adjust the valuation allowance as necessary create volatility in the entity's effective tax rate? Explain.
- 4 Q17-10. How does a firm determine the need for a valuation allowance against a deferred tax asset in the more-likely-than-not test?
- 5 Q17-11. Do firms measure deferred tax accounts at the statutory tax rate expected to be in effect at the future reversal date to properly value the deferred tax asset and deferred tax liability?
- 5 Q17-12. When do firms adjust for the cumulative effect of changes in future tax rates affecting income?
- 6 Q17-13. Does accounting for a net operating loss (NOL) carryback require less judgment than accounting for the NOL carryforward?
- 7 Q17-14. How does an entity account for uncertain tax positions?
- 7 Q17-15. Do **U.S. GAAP** and **IFRS** have similar approaches to accounting for tax contingencies?
- 8 Q17-16. How do firms classify deferred tax accounts?
- 8 Q17-17. Do **U.S. GAAP** and **IFRS** classify deferred tax accounts in the same manner?
- 9 Q17-18. Are extensive disclosures required for deferred taxes?

Multiple-Choice Questions

Becker CPA Exam Review multiple-choice questions are available in **MyLab Accounting**.

- 3 MC17-1. Cavan Company prepared the following reconciliation between book income and taxable income for the current year

Pretax accounting	\$1,000,000
Taxable income	(600,000)
Difference	<u>\$ 400,000</u>
Differences	
Interest on municipal income	\$ 100,000
Lower financial depreciation	<u>300,000</u>
Total	<u>\$ 400,000</u>

© **Source:** 2014 DeVry/Becker Educational Development Corp. All rights reserved.

Cavan's effective income tax rate for Year 1 is 30%. The depreciation difference will reverse equally over the next 3 years at enacted tax rates as follows:

Year	Tax Rate (%)
Year 2	30%
Year 3	25
Year 4	25

In Cavan's Year 1 income statement, the current portion of its provision for income taxes should be:

- a. \$300,000 b. \$250,000 c. \$180,000 d. \$150,000

3 5

MC17-2. Cavan Company prepared the following reconciliation between book income and taxable income for the current year

Pretax accounting	\$1,000,000
Taxable income	<u>(600,000)</u>
Difference	<u>\$ 400,000</u>
Differences	
Interest on municipal income	\$ 100,000
Lower financial depreciation	<u>300,000</u>
Total	<u>\$ 400,000</u>

Cavan's effective income tax rate for Year 1 is 30%. The depreciation difference will reverse equally over the next 3 years at enacted tax rates as follows:

Year	Tax Rate (%)
Year 2	30%
Year 3	25
Year 4	25

In Cavan's Year 1 Income Statement, the deferred portion of its provision for income taxes should be:

- a. \$120,000 b. \$80,000 c. \$100,000 d. \$90,000

3

MC17-3. Two independent situations are described below. Each involves future deductible amounts and/or future taxable amounts produced by temporary differences:

Situation	1	2
Taxable income	\$40,000	\$80,000
Amounts at year-end		
Future deductible amounts	5,000	10,000
Future taxable amounts	0	5,000
Balances at beginning of year		
Deferred tax asset	\$ 1,000	\$ 4,000
Deferred tax liability	0	1,000

The enacted tax rate is 40% for both situations. Determine the deferred tax asset balance at year-end.

Situation 1	Situation 2
a. \$5,000	\$10,000
b. \$3,000	\$ 8,000
c. \$1,000	\$ 3,000
d. \$2,000	\$ 4,000

- 3** **MC17-4.** Two independent situations are described here. Each situation has future deductible amounts and/or future taxable amounts produced by temporary differences:

Situation	1	2
Taxable income	\$40,000	\$80,000
Amounts at year-end		
Future deductible amounts	5,000	10,000
Future taxable amounts	0	5,000
Balances at beginning of year		
Deferred tax asset	\$ 1,000	\$ 4,000
Deferred tax liability	0	1,000

The enacted tax rate is 40% for both situations. Determine the income tax expense for the year.

Situation 1	Situation 2
a. \$16,000	\$32,000
b. \$15,000	\$33,000
c. \$11,000	\$30,000
d. \$20,000	\$28,000

- 4 6 8** **MC17-5.** At the end of Year 6, the tax effects of temporary differences reported in Maple Company's year-end financial statements were as follows:

Deferred tax assets (liabilities)	
Accelerated tax depreciation	\$(120,000)
Warranty expense	80,000
NOL carryforward	<u>200,000</u>
	<u>\$ 160,000</u>

A valuation allowance was not considered necessary. Maple anticipates that \$40,000 of the deferred tax liability will reverse in Year 7, that actual warranty costs will be incurred evenly in Years 8 and 9, and that the NOL carryforward will be used in Year 7. On Maple's December 31, Year 6, balance sheet, what amount should be reported as a noncurrent deferred tax asset under U.S. GAAP? Assume all deferred accounts are from the same taxing jurisdiction.

- a. \$160,000 b. \$200,000 c. \$240,000 d. \$280,000

- 3 5 6** **MC17-6.** The pretax financial income and taxable income of Zeus Corporation were the same for the following years (i.e., there were no permanent or temporary differences):

	Income	Tax Rate (%)
Year 4	\$ 20,000	30%
Year 5	15,000	25
Year 6	(100,000)	25
Year 7	70,000	40

What amount of income tax benefit will Zeus Corporation record in Year 6 under U.S. GAAP, assuming that Zeus elects to use the 2-year carryback/20-year carryforward option? Assume that the Year 7 tax rate is known in Year 6 and is enacted at the beginning of Year 7.

- a. \$25,000 b. \$26,000 c. \$35,750 d. \$37,750

- 5 6** MC17-7. The pretax financial income and taxable income of Zeus Corporation were the same for the following years (i.e., there were no permanent or temporary differences):

	Income	Tax Rate (%)
Year 4	\$ 20,000	30%
Year 5	15,000	25
Year 6	(100,000)	25
Year 7	5,000	40

What amount of income tax benefit will Zeus Corporation record in Year 6 under U.S. GAAP, assuming that Zeus elects to use the 2-year carryback/20-year carryforward option and that it is more likely than not that there will be no taxable earnings after Year 7? Assume the Year 7 tax rate is known in Year 6.

- a. \$9,750 b. \$11,750 c. \$24,000 d. \$26,000

Brief Exercises

- 1** BE17-1. **Income Taxes Payable.** Immox Company has conformity between its taxable income and income before taxes. If Immox's taxes payable are \$140,000, and its tax rate is 40%, what is its net income?
- 1** BE17-2. **Income Taxes Payable.** Limmox Company has conformity between its taxable income and income before taxes. Limmox Company's net income after taxes is \$195,000, and its tax rate is 35%. What is its taxes payable?
- 2** BE17-3. **Permanent Differences.** Simmox Company's income before taxes is \$290,000, and its tax rate is 35%. Note that \$40,000 is nontaxable interest income from its investment in municipal bonds and is included in \$290,000. There are no other book-tax differences. What are Simmox's tax expense and taxes payable? What is its net income?
- 2** BE17-4. **Permanent Differences.** Plimmox Company's income before taxes is \$410,000, and its tax rate is 35%. Plimmox included \$60,000 in nondeductible fines in the \$410,000. There are no other book-tax differences. What are its tax expense and taxes payable? What is its net income?
- 2 9** BE17-5. **Permanent Differences, Reconciliation of Statutory Tax Rate to Effective Tax Rate.** Simmox Company's income before taxes is \$290,000, and its tax rate is 35%. Note that \$40,000 is nontaxable interest income from its investment in municipal bonds and is included in the \$290,000. There are no other book-tax differences. Prepare a reconciliation of Simmox's statutory tax rate to its effective tax rate.
- 2 9** BE17-6. **Permanent Differences, Reconciliation of Statutory Tax Rate to Effective Tax Rate.** Plimmox Company's income before taxes is \$410,000, and its tax rate is 35%. Plimmox included \$60,000 in nondeductible fines in the \$410,000. There are no other book-tax differences. Prepare a reconciliation of Plimmox's statutory tax rate to its effective tax rate.
- 3** BE17-7. **Temporary Differences, Deferred Tax Liability.** Marlena Group uses straight-line depreciation for financial reporting purposes and accelerated depreciation on its tax returns. The company reported \$40,000 in income before tax and depreciation for book purposes. The equipment has an original cost of \$20,000. Straight-line depreciation is \$2,000, and accelerated depreciation amounts to \$6,000 for the asset's first year of utilization. There are no other book-tax differences.

Required »

- What is the book basis of the equipment at the end of the first year?
- What is the tax basis of the equipment at the end of the first year?
- Compute the deferred tax liability, income tax payable, and income tax expense for the current year assuming that Marlena is subject to a 40% tax rate.

- 3** BE17-8. **Temporary Differences, Deferred Tax Asset.** Matus, Inc. reported income before tax of \$180,000, and taxable income was \$200,000. This \$20,000 difference resulted from unearned revenues that the firm recorded as revenue for tax purposes but as a liability for book purposes. Matus is subject to a 35% tax rate.

Required »

- What is the book basis of the unearned revenue?
- What is the tax basis of the unearned revenue?
- What are Matus's deferred tax asset, income tax payable, and income tax expense for the current year?
- Prepare the journal entry to record the tax provision for the current year.

- 3** **BE17-9. Temporary Differences, Deferred Tax Liability.** The Block Company uses the accrual basis to account for all sales transactions. Total sales for the current year amounted to \$450,000. Of this amount, \$120,000 is from sales on installment. The firm uses the installment method (i.e., cash basis) to account for the installment sale for tax purposes. Operating expenses are \$180,000 for both GAAP and tax reporting.
- Required »**
- What is the book basis of the installment sales receivable?
 - What is the tax basis of the installment sales receivable?
 - Assuming a 40% tax rate, compute income tax payable, the deferred tax provision, and income tax expense for the current year.
- 3** **BE17-10. Temporary Differences, Deferred Tax Asset.** Hondell Industries offers a 3-year basic warranty on all its products. At the beginning of the current year, the estimated warranty liability had a balance of \$110,000. Actual repairs cost \$35,000, and the company accrued an additional \$60,000 for the current year. Hondell reported \$380,000 in total sales this year for both GAAP and tax purposes. The company reported \$90,000 in other operating expenses for both GAAP and tax purposes.
- Assuming a 40% tax rate, determine the balance of the deferred tax account, the amount of income tax expense, and the income tax payable.
- 3** **BE17-11. Temporary Differences, Deferred Tax Liability.** Bobby James Puppet Company acquired a new plastic molding machine at the beginning of the current year at a cost of \$420,000. The asset has a 6-year useful life for financial reporting purposes and is depreciated on a straight-line basis with no residual value expected at the end of its useful life. The company uses the double-declining balance method on its income tax returns. The company is subject to a 34% tax rate.
- Compute the deferred tax portion of the income tax expense for the first 2 years.
- 3** **BE17-12. Temporary Differences, Deferred Tax Asset.** Reflections Mirrors, Ltd. offers a 3-year warranty on all its products. In Year 1, the company reported income before warranty expense of \$620,000 and estimated that warranty repairs would cost the company \$150,000 over the 3-year period. Actual repairs for the year amounted to \$50,000. Reflections Mirrors' tax rate is 40%.
- Prepare the journal entries required to record the tax provision for Year 1.
- 3** **BE17-13. Temporary Differences, Deferred Tax Asset.** Using the information for Reflections Mirrors, Ltd. provided in BE17-12, prepare the journal entries required to record the tax provision for Year 2 assuming that Reflections reported income before warranty costs and taxes of \$200,000 and incurred actual repair costs of \$40,000. Assume that the firm did not accrue additional warranty costs in Year 2.
- 2 3** **BE17-14. Temporary Differences, Deferred Tax Liability, Permanent Differences.** Wells Junior Apparel Incorporated reported pre-tax book income of \$825,000 for the current year. The change in the difference in the basis of plant assets is \$210,000, and the book basis is higher than the tax basis. Wells invested in tax-free bonds and earned \$78,000 in nontaxable interest income (included in the \$825,000 pre-tax income).
- Prepare the journal entry required to record the tax expense for the current year assuming a 40% income tax rate.
- 4** **BE17-15. Realizability of Deferred Assets.** Maves, Inc. booked a deferred tax asset of \$45,000 resulting from a basis difference in warranty liabilities. Management has assessed that it is more likely than not that the firm will not realize 30% of the deferred tax asset. Provide the necessary journal entries to record the deferred tax asset, and what is the valuation allowance?
- 4** **BE17-16. Realizability of Deferred Assets, IFRS.** Use the same information as in BE17-15 but now assume that Maves is an IFRS reporter. What is the journal entry to record the deferred tax asset?
- 5** **BE17-17. Change in Tax Rates.** Finer Shoes Company recorded book income of \$120,000 in 2016. It does not have any permanent differences, and the only temporary difference relates to a \$60,000 installment sale that it recorded for book purposes. Finer Shoes anticipates collecting the installment sales equally over the following 2 years. The current enacted tax rate is 40%. The substantively enacted tax rates for the following 3 years are 42%, 45%, and 45%, respectively. What deferred tax amount should Finer Shoes record for this temporary difference under U.S. GAAP?
- 5** **BE17-18. Change in Tax Rates, IFRS.** Use the same information as in BE17-17, but now assume that Finer Shoes Company is an IFRS reporter. What deferred tax amount should the company record for this temporary difference under IFRS?
- 5** **BE17-19. Change in Tax Rates.** Errol Toys, Inc. recorded book income of \$240,000 in 2016. It does not have any permanent differences, and the only temporary difference relates to a \$12,000 warranty expense that it recorded for book purposes. Errol Toys anticipates fulfilling half of the warranties in the following year and then the rest equally over the next 2 years. The current enacted tax rate is 40%. The enacted tax rates for the following 3 years are 32%, 25%, and 25%, respectively. What deferred tax amount should Errol Toys record for this temporary difference?

- 6** **BE17-20. Net Operating Losses.** W. Pickett Fence Company incurred a net loss for Year 3. The firm does not have any book-tax differences. We present the results of operations for the first 3 years of the company's operations:

Year	Income (Loss)	
	before Tax	Tax Rate (%)
1	\$300,000	40%
2	200,000	35
3	(450,000)	35

Future tax rates are expected to be 35%. W. Pickett always elects the carryback/carryforward option. There are no uncertainties regarding realization of future tax benefits.

Prepare the journal entry(s) required to record the Year 3 net operating loss.

- 6** **BE17-21. Net Operating Losses.** How would your answer to BE17-20 change if Year 1 income were equal to \$100,000?

- 7** **BE17-22. Tax Contingencies.** Terrell Toy Company uses an acceptable tax method that provided a \$10,000 tax deduction for the current year. Book income and taxable income before considering this tax deduction are equal to \$245,000 (i.e., there are no book-tax differences). Terrell is subject to a 35% income tax rate. Tax authorities have challenged this type of tax deduction in the past, and Terrell is now concerned about the realizability of this tax deduction in the future. However, management believes that it is more likely than not that the firm will sustain the tax benefits upon examination by tax authorities. Terrell provides the following analysis regarding the probabilities of sustaining the tax deduction:

Amount Sustained	Probability (%)
\$10,000	30%
8,000	15
6,000	10
2,000	45

Prepare the journal entry required to record the tax provision for the current year assuming that Terrell is subject to a 35% tax rate.

- 7** **BE17-23. Tax Contingencies, IFRS.** Using the data from BE17-22, now assume that Terrell Toy Company is an IFRS reporter. What amount should Terrell Toy report as a tax contingency?

- 8** **BE17-24. Deferred Tax Classification.** Following is a list of CCS Company's deferred tax assets and liabilities.

Item	Amount	Asset/Liability	Jurisdiction
Receivable—Installment sales	\$ 55,000	Liability	1
Equipment—Depreciation expense	64,000	Liability	2
Warranty liability—Warranty expense	2,000	Asset	1
Net operating loss—carryforward	120,000	Asset	2

What will CCS report on its balance sheet?

- 2 9** **BE17-25. Deferred Tax Disclosure.** Bell Junior Apparel Incorporated reported pre-tax book income of \$825,000 for the current year. The change in the difference in the basis of plant assets is \$210,000; the book basis is higher than the tax basis. Bell invested in tax-free bonds and earned \$90,000 in nontaxable interest income (included in the pre-tax income of \$825,000). Its income tax rate is 40%. Prepare the footnote to reconcile the federal tax rate to the firm's effective income tax rate. Present the reconciliation in both dollars and percentages.

Exercises

- 3** **E17-1. Temporary Differences, Deferred Tax Liability.** Farris Casinos recently acquired a newly built hotel and casino in Atlantic City. The cost of the complex was \$6,000,000 with a 6-year useful life and no residual value expected. Farris depreciates its buildings using the straight-line method for financial reporting and an accelerated method for tax purposes. The tax depreciation percentages for the first 2 years are 20% and 32%, respectively. Farris is subject to a 40% income tax rate.

Required »

- a. Assuming that Year 2 income before tax and depreciation is \$3,700,000, determine the Year 2 income tax payable, the deferred tax provision, and income tax expense.

b. Compute the deferred tax account on the balance sheet at the end of Year 2 and indicate whether the balance represents a deferred tax asset or a deferred tax liability.

3

E17-2. Temporary Differences, Deferred Tax Liability. Andre Company reported a \$192,640 balance in its deferred tax liability account at the beginning of Year 5. The deferred tax liability was the result of using the straight-line method on its books and an accelerated depreciation method for tax purposes. The plant asset has 2 years of useful life remaining. At the beginning of Year 5, the plant asset had a book basis of \$1,000,000 and a tax basis of \$518,400. We present depreciation expense and income before tax and depreciation for Years 5 and 6 in the following table.

Year	Tax Depreciation	GAAP Depreciation	Income before Tax and Depreciation
5	\$345,600	\$500,000	\$850,000
6	172,800	500,000	925,000

Assuming a tax rate of 40%, prepare the journal entries required to record the tax provision for Years 5 and 6.

2 3

E17-3. Temporary Differences, Deferred Tax Liability, Permanent Differences. Synthia Manufacturing Corporation reported pre-tax book income of \$3,250,000 for the current year.

- The change in the difference in the basis of plant assets is \$430,000. The book basis is higher than the tax basis.
- Of the Synthia's pre-tax book income, \$12,000 is nontaxable income from municipal bonds.
- At the beginning of the current year, Synthia's estimated warranty liability had a balance of \$67,000. Actual repairs cost \$55,000, and the company accrued an additional \$72,000 for the current year.
- Synthia paid fines of \$100,000 to the federal government for not complying with relevant regulations. Fines were included in pre-tax book income.

Prepare the journal entry required to record the tax expense for the current year assuming a 40% income tax rate.

3

E17-4. Temporary Differences, Deferred Tax Liability. Blue Collar Clothing, Inc. acquired a new fabric-cutting machine at the beginning of the current year. The machine cost \$600,000 with no residual value expected. Blue Collar uses the straight-line method for financial reporting assuming a 6-year useful life. The firm classifies the equipment as 5-year MACRS property for tax purposes using the following percentages.

Year	MACRS (%)
1	20.00%
2	32.00
3	19.20
4	11.52
5	11.52
6	5.76

The company is subject to a 40% income tax rate and has no other book-tax differences. We present Blue Collar's income before tax and depreciation:

Year	Income before Tax and Depreciation
1	\$ 850,000
2	900,000
3	930,000
4	1,100,000
5	1,400,000
6	1,850,000

Required »

(Show all supporting computations.)

- Prepare all journal entries required to record Blue Collar's income tax provision for Years 3 and 4.
- What is the balance of the deferred tax account at the end of Year 3?
- What is reported net income for Years 3 and 4?

- 3 E17-5. Temporary Differences, Deferred Tax Assets and Liabilities.** Oliver Starshine Group provided the following income information from its first 3 years of operation.

Account	Year 1		Year 2		Year 3	
	GAAP	Tax	GAAP	Tax	GAAP	Tax
Sales	\$1,100	\$1,100	\$1,250	\$1,250	\$1,420	\$1,420
Operating expenses	(600)	(600)	(720)	(720)	(833)	(833)
Estimated warranty cost	(110)	0	(125)	0	(142)	0
Actual warranty repairs	<u>0</u>	<u>0</u>	<u>0</u>	<u>(200)</u>	<u>0</u>	<u>(177)</u>
Income before tax	<u>\$ 390</u>		<u>\$ 405</u>		<u>\$ 445</u>	
Taxable income		\$ 500		\$ 330		\$ 410
Tax rate		<u>× 40%</u>		<u>× 40%</u>		<u>× 40%</u>
Tax payable		<u>\$ 200</u>		<u>\$ 132</u>		<u>\$ 164</u>

Oliver offers a 1-year warranty on its commercial floor polishing system. The company estimates its warranty cost at 10% of sales.

Required »

- Compute the deferred tax expense and the balance of the deferred tax account for each year.
- Prepare all journal entries required to record Oliver's income tax provision for all 3 years.

- 3 E17-6. Temporary Differences, Deferred Tax Assets and Liabilities.** Fortunes Hotel Associates reported the following income information for the current year:

Account	Current Year	
	GAAP	Tax
Sales	\$500,000	\$500,000
Operating expenses	(280,000)	(280,000)
Depreciation expense	(70,000)	(100,000)
Estimated warranty cost	(30,000)	0
Actual warranty repairs	<u>0</u>	<u>(10,000)</u>
Income before tax	<u>\$120,000</u>	
Taxable income		\$ 110,000
Tax rate		<u>× 35%</u>
Tax payable		<u>\$ 38,500</u>

Required »

- Prepare the journal entry to record the tax provision for the current year.
- Are there any differences between the federal income tax rate and Fortunes' effective tax rate? Explain.

- 2 3 E17-7. Temporary Differences, Deferred Tax Assets and Liabilities, Reconciliation of Statutory Tax Rate and Effective Tax Rate.** J.W. Jones Markets, Inc. accepts prepaid grocery orders for home and commercial delivery. This year, the company collected \$160,000 in advance orders and delivered \$48,000 of the advance orders. The company paid \$15,000 in insurance premiums for a policy covering the life of its founder and CEO. Income before considering any revenue recognized on the delivered groceries and the insurance expense is \$800,000. J.W. Jones is subject to a 40% income tax rate.

Required »

- Prepare the journal entry to record the current-year income tax provision.
- Prepare the footnote, in dollars and percentages, to reconcile the company's federal income tax rate to its effective (actual) tax rate.

- 3 E17-8. Temporary Differences, Deferred Tax Liabilities.** Meyer-Swift Construction Equipment Manufacturers engaged in an installment sale with one of its major customers. The firm negotiated the terms of the installment sale for a specialized piece of equipment; full payment is required within 3 years. We present information related to Meyer-Swift's first 3 years of operation:

Account	Year 1		Year 2		Year 3	
	GAAP	Tax	GAAP	Tax	GAAP	Tax
Sales	\$5,000	\$5,000	\$6,200	\$6,200	\$7,800	\$7,800
Gross profit on installment sales	3,200	0	0	0	0	0
Taxable portion of cash collected on installment sales		700		1,500		1,000
Operating expenses	(500)	(500)	(620)	(620)	(780)	(780)
Income before tax	<u>\$7,700</u>		<u>\$5,580</u>		<u>\$7,020</u>	
Taxable income		\$5,200		\$7,080		\$8,020
Tax rate		× 35%		× 35%		× 35%
Tax payable		<u>\$1,820</u>		<u>\$2,478</u>		<u>\$2,807</u>

Required »

- Prepare the journal entries required to record the tax expense for all 3 years.
- Determine the net income reported on the income statement for the 3 years.

2 5 9

E17-9. Change in Tax Rates, Permanent Difference, Reconciliation of Statutory Tax Rate to Effective Tax Rate. Using the same information provided in E17-8, assume that Meyer-Swift invested in tax-free municipal bonds. The bonds pay interest of \$1,000 each year. In addition, a new tax law enacted at the beginning of Year 2 reduced the corporate tax rate to 30%.

Required »

- Prepare the journal entries required to record the tax provision for all 3 years, as well as the journal entry needed to record the effect of the tax rate change on any deferred tax accounts.
- Determine the net income reported on the income statement for all 3 years.
- Prepare the footnote, in dollars and percentages, required to reconcile the company's federal statutory income tax rate with its effective tax rate.

4

E17-10. Deferred Tax Assets and Valuation Allowance. Flex Mirrors, Ltd. offers a 3-year warranty on all its products. In Year 1, the company reported income before warranty expense of \$600,000 and estimated that warranty repairs would cost the company \$115,000 over the 3-year period. Actual repairs for the current year amounted to \$40,000. Flex Mirrors' tax rate is 40%. After reviewing all available evidence, management determines that only 75% of the deferred tax asset will ultimately result in tax-deductible expenses over the warranty period.

Prepare the journal entries required to record the tax provision and valuation allowance for Year 1.

5

E17-11. Change in Tax Rates. Turnabout Enterprises provided the following information regarding book-tax differences for its first year of operations:

Source of Book-Tax Difference	GAAP	Tax
Installment sales: Income recognized	\$500,000	\$100,000
2-year warranty costs: Warranty expense	60,000	40,000
Depreciation expense	80,000	120,000

Installment sales are a normal part of Turnabout's operations. The depreciation expense is related to a building costing \$1,600,000. Income before including any of the book-tax differences is \$920,000. Deferred tax assets are expected to be fully realized and, as a result, no allowance account is needed. Turnabout is subject to a 40% income tax rate.

Prepare the journal entry(ies) necessary to record the effects of a tax-rate reduction from 40% to 34% effective the beginning of Year 2.

6 9

E17-12. Net Operating Loss, Carryback. Phlash Photo Labs, Ltd. provided you the following information for the 3 years ended December 31.

Year	Income (Loss) before Tax	Tax Rate (%)
1	\$120,000	34%
2	70,000	25
3	(280,000)	40

Required »

- Assuming no book-tax differences and no uncertainty regarding the realization of the tax benefits of the net operating loss carryforward, prepare the journal entry to record the tax expense for each of the 3 years presented. The company always elects the carryback/carryforward option. Future tax rates are expected to remain unchanged.
- Prepare a partial income statement for Year 3.

6 8 9

E17-13. Net Operating Loss, Carryforward. Loggins Lumber Company experienced net losses during the first 2 years of its operations. Year 3 was the company's first profitable year. Loggins uses the same accounting methods for financial reporting and its tax returns. The company always elects the carryback/carryforward option. Management examined all available evidence, both positive and negative, and has determined that it is more likely than not that all of the carryforward tax benefits are fully realizable. The following information is taken from the company's financial records for the first 4 years of its operations:

Year	Income (Loss) before Tax	Tax Rate (%)
1	\$(380,000)	34%
2	(135,000)	34
3	425,000	34
4	585,000	34

Required »

- Prepare the journal entries needed to record the tax provision for Years 3 and 4.
- Prepare partial income statements for all 4 years.
- What is the balance of the deferred tax account at the end of Year 3?

6 9

E17-14. Net Operating Loss, Carryback, Valuation Allowance. Aurora Incorporated provided the following information:

Year	Income (Loss) before Tax	Tax Rate (%)
1	\$405,000	34%
2	220,000	34
3	(975,000)	34

Aurora reported no book-tax differences and elected the carryback/carryforward option for its Year 3 loss. Future tax rates are not expected to change.

Required »

- Prepare any necessary journal entries needed to record the Year 3 tax provision assuming that Aurora expects only \$200,000 in future taxable income over the carryforward period.
- Prepare a partial income statement for Year 3.

6

E17-15. Net Operating Loss, Carryforward, Valuation Allowance, Disclosure. Use the same information provided in E17-14. Now assume that in Year 4, taxable income is \$280,000. This amount is higher than anticipated by management, and they now believe that they will be able to utilize the entire NOL carryforward.

Required »

- Prepare the journal entries needed to record Aurora's income tax provision for Year 4.
- Prepare the footnote in dollars and percentages required to reconcile the federal statutory income tax rate to the company's effective income tax rate.

2 5 6 9

E17-16. Net Operating Loss, Carryforward, Tax Rate Change. Hamilton Container Company reported the following income (loss) information for the first 4 years of its operations:

Year	Income (Loss) before Tax	Tax Rate (%)
1	\$(400,000)	40%
2	100,000	34
3	230,000	34
4	620,000	42

There are no uncertainties about the realization of the net operating loss benefits. All tax rate changes were enacted as of the beginning of the year. All tax rate changes are not known until the year of change.

Required »

- Prepare the journal entry(ies) needed to record the annual tax provision for Years 1 through 4.
- Prepare a partial income statement for each year.
- Prepare the footnote in both dollars and percentages required to reconcile Hamilton's federal tax rate to its effective income tax rate each year.

269

E17-17. Net Operating Losses, Carrybacks, Carryforwards. DiVito Imported Provisions, Inc. reported pre-tax accounting income equal to its taxable income as follows:

Year	Income (Loss) before Tax	Tax Rate (%)
1	\$60,000	35%
2	82,000	40
3	58,000	40
4	(300,000)	40
5	50,000	35
6	45,000	35
7	80,000	35
8	(250,000)	40
9	20,000	38
10	30,000	38

All tax changes are enacted into law as of the beginning of the year. No tax rate changes are known until the year of change. DiVito elects the carryback/carryforward option for all net operating losses. For the losses noted, management concluded that it is more likely than not that the benefits of the net operating losses will be fully realizable in the future.

Required »

- Prepare the journal entries necessary to record the tax provisions for Years 4 through 8.
- Prepare a partial income statement for Years 4 through 8.
- Compute the effective tax rate for Years 4 through 8.

269

E17-18. Net Operating Losses, Carrybacks, Carryforwards. Using the information provided in E17-17, assume that in Year 8, DiVito determined that it is more likely than not that it will earn only \$50,000 in the future to be used to offset the net operating loss carryforward.

Required »

- Prepare the journal entries necessary to record the tax provision for Years 8 through 10.
- Prepare the footnote in both dollars and percentages required to reconcile DiVito's federal tax rate to its effective income tax rate for Years 8 through 10.

7

E17-19. Uncertain Tax Positions. Lewis Eagle Corporation concluded that it was able to exclude \$2,500,000 in income from its current tax return. Income before the exclusion is \$6,000,000. There are no book-tax differences. This income is subject to a 30% tax rate. Based on its technical merits, Lewis Eagle determined that it is more likely than not that the exclusion would be sustained upon examination by tax auditors. The possible outcomes and their related probabilities follow.

Filed Amount of the Exclusion That Management Expects to Maintain	Likelihood That the Tax Position Will Be Sustained at This Level (%)
\$2,500,000	10%
2,000,000	20
1,500,000	25
1,000,000	35
880,000	10

Determine the amount of tax benefit from the exclusion that Lewis Eagle should recognize in its tax provision for the current year and prepare the journal entry needed to record the tax provision for the current year.

- 7** **E17-20. Uncertain Tax Positions.** Based on the information provided in E17-19, assume that Lewis Eagle Corporation reported the following income levels for both book and tax purposes for the following year.

Description	Amount
Income before exclusion	\$8,000,000
Tax exclusion	<u>(3,000,000)</u>
Income before tax	<u>\$5,000,000</u>

Assume that Lewis Eagle passed the more-likely-than-not test. Based on an analysis of the estimated cumulative probabilities, Lewis Eagle should recognize a tax benefit of \$1,950,000. Assuming a tax rate of 30%, prepare the journal entry(ies) needed to record the tax provision for the current year.

Problems

- 2 3** **P17-1. Temporary Differences, Deferred Tax Liabilities, Reconciliation of Statutory Tax Rate to Effective Tax Rate.** Bradley Manufacturing uses long-term installment contracts to market its building products. It uses the accrual basis for financial reporting and the cash basis for tax purposes. The company also sells several products without offering installment contracts. We present the results of operations for the last 5 years.

Account	Year 1		Year 2		Year 3		Year 4		Year 5	
	GAAP	Tax	GAAP	Tax	GAAP	Tax	GAAP	Tax	GAAP	Tax
Sales	\$3,200	\$3,200	\$4,000	\$4,000	\$4,400	\$4,400	\$4,750	\$4,750	\$5,100	\$5,100
Gross profit on installment sales	2,500	0	3,100	0	1,500	0	1,550	0	2,000	0
Taxable portion of cash collected on installment sales	0	1,340	0	2,800	0	2,325	0	1,600	0	2,585
Operating expenses	<u>1,500</u>	<u>1,500</u>	<u>1,800</u>	<u>1,800</u>	<u>2,100</u>	<u>2,100</u>	<u>2,250</u>	<u>2,250</u>	<u>1,900</u>	<u>1,900</u>
Income before tax	<u>\$4,200</u>		<u>\$5,300</u>		<u>\$3,800</u>		<u>\$4,050</u>		<u>\$5,200</u>	
Taxable income		\$3,040		\$5,000		\$4,625		\$4,100		\$5,785
Tax rate		× 40%		× 40%		× 40%		× 40%		× 40%
Tax payable		<u>\$1,216</u>		<u>\$2,000</u>		<u>\$1,850</u>		<u>\$1,640</u>		<u>\$2,314</u>

Required »

- Determine the balance of the deferred tax account at the end of each of the 5 years.
- Prepare the journal entries to record the tax for the 5 years. Show the effective tax rate for each year.

- 3 5** **P17-2. Temporary Differences, Deferred Tax Liabilities, Change in Tax Rate.** Simm-Mills Incorporated (SMI) acquired a piece of equipment at a total cost of \$4,200,000. SMI uses the straight-line method for financial reporting and an accelerated method for tax purposes. The asset has a 6-year life for book and tax purposes. There is no estimated scrap value. SMI is subject to a 40% tax rate. We present the income and depreciation summary for both tax and GAAP.

Year	Income before Tax and Depreciation	Tax Depreciation	GAAP Depreciation
1	\$ 920,000	\$ 840,000	\$ 700,000
2	1,600,000	1,344,000	700,000
3	1,780,000	806,400	700,000
4	2,100,000	483,840	700,000
5	1,750,000	483,840	700,000
6	1,200,500	<u>241,920</u>	<u>700,000</u>
Totals		<u>\$4,200,000</u>	<u>\$4,200,000</u>

Required »

- Determine the balance of the deferred tax account at the end of each year.
- Prepare the journal entries to record the tax provision for each year.
- Prepare the journal entry to record the effect of a 35% income tax rate that is enacted into law effective as of the beginning of Year 4.

3

P17-3. Temporary Differences, Deferred Tax Liabilities. Early in 2018, Bicycle Messenger Service Corporation (BMSC) purchased a multiline/multifunction telephone system at a cost of \$50,000. At that time, BMSC estimated that the system had a useful life of 5 years with no salvage value expected at the end of that time. The company elected to use the straight-line method for financial reporting with a half-year depreciation taken in the first and last years of the asset's life.

For tax purposes, the company depreciates the system using the following percentages:

Year	MACRS (%)
2018	20.00%
2019	32.00
2020	19.20
2021	11.52
2022	11.52
2023	5.76

There were no permanent differences during both 2018 and 2019. Income before tax and depreciation is \$120,000 in 2018 and \$200,000 in 2019. The company is subject to a 40% tax rate.

Required »

- Prepare a schedule comparing book and tax depreciation and show the deferred tax provision and the cumulative balance of the deferred tax account.
- Compute income tax expense and income taxes payable for 2018 and 2019.
- What is the balance in the deferred tax account at December 31, 2019?
- What is the firm's reported net income for 2018 and 2019?

3 4 5

P17-4. Temporary Differences, Deferred Tax Assets and Liabilities, Realizability of Deferred Assets, Change in Tax Rate. The following information is available for the first 4 years of operations for Shooting Star Corporation:

Year	Taxable Income (incorporates all information presented)	Enacted Tax Rate (%)
2018	\$200,000	40%
2019	132,000	40
2020	110,000	40
2021	120,000	40

On January 2, 2018, the firm acquired heavy equipment costing \$200,000 in a cash transaction. The equipment had a useful life of 5 years and no scrap value. The firm used the straight-line method of depreciation for book purposes; see the following for the tax depreciation taken each year:

Tax Depreciation				
2018	2019	2020	2021	Total
\$66,000	\$90,000	\$30,000	\$14,000	\$200,000

On January 2, 2019, the firm collected \$120,000 in advance for rental of a building for a 3-year period. The firm reported the entire \$120,000 as taxable income in 2019, but \$80,000 of the advance collection was unearned at December 31, 2019. The \$80,000 was earned evenly over the next 2 years (i.e., 2020 and 2021).

Required »

- Determine the balance of the deferred tax accounts at the end of 2021.
- Repeat requirement (a) assuming that a newly enacted tax law increased the corporate tax rate to 43%, effective the beginning of 2019.

- c. Prepare the journal entries for 2018 and 2019 in requirement (b).
 d. Prepare the journal entries for 2019 and 2020 in requirement (b) assuming that based on all available evidence, it is more likely than not that half of the deferred tax asset will not be realized. Reverse out the allowance for the realized portion of the deferred tax asset in 2020.

3 5

P17-5. Temporary Differences, Deferred Tax Liabilities, Change in Tax Rates. Kimm-Mills Incorporated (KMI) acquired a piece of equipment at a total cost of \$5,400,000. KMI uses the straight-line method of depreciation for financial reporting purposes and an accelerated method for tax purposes. The asset has a 6-year life for book purposes and for tax purposes. There is no estimated scrap value. KMI is subject to a 40% tax rate. We present the income and depreciation summary for both tax and GAAP.

Year	Income before Tax and Depreciation	Tax Depreciation	GAAP Depreciation
1	\$1,200,000	\$1,080,000	\$ 900,000
2	1,880,000	1,728,000	900,000
3	1,980,000	1,036,800	900,000
4	2,100,000	622,080	900,000
5	1,750,000	622,080	900,000
6	1,200,500	311,040	900,000
Totals		<u>\$5,400,000</u>	<u>\$5,400,000</u>

Required »

- a. Determine the balance of the deferred tax account at the end of each year.
 b. Prepare the journal entries to record the tax provision for each year.
 c. Prepare the journal entry to record the effect of a 35% income tax rate that is enacted into law effective as of the beginning of Year 4.

6

P17-6. Net Operating Loss, Carryback, Carryforward. Andrew, Inc. provides DJ services for corporate parties. Andrew reported a net operating loss of \$750,000 on its 2018 tax return. During the 3 preceding years, Andrew had taxable income and paid taxes at various tax rates as follows:

Year	Taxable Income	Income Tax Rate (%)
2015	\$300,000	34%
2016	100,000	25
2017	50,000	15

Although Andrew had a net operating loss in 2018, it was because of an unusual event. Andrew's management has substantial evidence to indicate that the company will be profitable over the foreseeable future and will incur a 34% tax rate for each of those years. In fact, during 2019, Andrew reported a profit before tax of \$800,000. Andrew does not report any book-tax differences.

Required »

- a. Prepare the journal entries to account for the NOL carryback and NOL carryforward in 2018.
 b. Compute reported net income (loss) after tax for 2018.
 c. Prepare the journal entries to account for income taxes in 2019.
 d. Compute reported net income after tax for 2019.

4 6

P17-7. Net Operating Loss, Carryback, Carryforward, Realizability of Deferred Assets. Michael's Incorporated reported the following tax information for its first 3 years of operations.

Year	Taxable Income or Loss	Income Tax Rate (%)
2017	\$ 400,000	34%
2018	(900,000)	36
2019	1,200,000	40

Assume that in 2018, there are no uncertainties regarding the realization of the NOL carryforward benefits. All tax rates were enacted at the beginning of the year. No tax rate changes are known until the year of change.

Required »

Based on the information provided,

- Determine the amount of any refund receivable from the 2018 NOL. In addition, indicate the amount of the tax benefits related to the NOL carryforward. Prepare any journal entries required in the year of the loss.
- What is the after-tax net income or loss reported on the 2018 income statement?
- Compute the amount of any tax due in 2019
- Determine the balance of the NOL carryforward benefits remaining at the end of 2019.
- Determine the income tax expense reported for 2019 and prepare the journal entry needed to record the 2019 tax provision.
- Repeat parts (a) and (b) assuming that management has negative evidence indicating that the firm will realize only 70% of the NOL carryforward benefits over the carryforward period.

2 4 6 9

- P17-8. Net Operating Loss, Carryforward, Realizability of Deferred Tax Assets, Reconciliation of Statutory Tax Rate to Effective Tax Rate.** In 2018, its first year of operations, Genius Corp. had a \$700,000 net operating loss when the tax rate was 30%. There are no differences between book (GAAP) income and taxable income. In 2018, the management of Genius Corp. determined that it was more likely than not that it would not realize the loss carryforward in the near future because the company had been in operations for only one year. In 2019, Genius had \$300,000 taxable income and the tax rate remained 30%.

Required »

- What are the journal entries in 2018 to record the tax loss carryforward?
- What journal entries should Genius make in 2019 to record the current and deferred income taxes and to recognize the loss carryforward?
- Assume that in 2018, management believes that the maximum amount of taxable income available for realization of the NOL carryforward is \$400,000. Therefore, \$300,000 of the NOL carryforward is expected to remain unrealized in the future. What journal entries are required to record the 2018 and 2019 tax provisions?
- Based on your answer to part (c), prepare the footnote in dollars and percentages to reconcile the federal tax rate to the firm's effective (actual) income tax rate for each year presented.

6

- P17-9. Net Operating Loss, Carryback, Carryforward.** CPF Corporation reported the following results for its first 3 years of operation:

Description	Amount
2018 income (before income taxes)	\$ 80,000
2019 loss (before income taxes)	(620,000)
2020 income (before income taxes)	800,000

There were no permanent or temporary differences during these 3 years. Assume a corporate tax rate of 46% for 2018, 40% for 2019, and 34% for 2020. CPF elects to use the carryback-carryforward provision. All tax rates were enacted at the beginning of the year. No tax rate changes are known until the year of change.

Required »

- What income (loss) should CPF report in 2019? (Assume that any deferred tax asset recognized is more likely than not to be realized.)
- Prepare the journal entry(ies) to record the tax provision for 2019.
- Prepare the journal entry or entries to record the tax provision for 2020.
- Independent of your answer to part (a), assume now that CPF elects to use the carryforward-only provision, not the carryback provision. What income (loss) does CPF report in 2019?
- Using the assumptions made in part (d), prepare the journal entry entries for 2019.
- Using the assumptions made in part (d), prepare the journal entry entries for 2020.

7 9

- P17-10. Uncertain Tax Position, Disclosure.** Assume that Kenne Diagnostics, Inc. makes an \$800,000 capital investment and elects an immediate expense deduction for tax purposes. Management designated this treatment to be an uncertain tax position. The uncertainty of this tax position is whether the capital expenditure qualifies as eligible property for an immediate deduction. The equipment is capitalized for financial reporting purposes and is depreciated over a 10-year useful life using the straight-line basis with no residual value, resulting in depreciation expense of \$80,000 per year.

Based on an analysis of prior tax cases, the most likely sustainable position would be to use MACRS depreciation for 5-year property resulting in a first-year depreciation expense of \$160,000 (i.e., 20% × \$800,000).

The entity reports \$1,960,000 of income before tax and depreciation (or taking any Section 179 deductions) and is subject to a 40% tax rate. Managements' analysis of the likelihood of sustainability of this deduction under examination by the taxing authorities is presented below.

"As Filed" Amount of the Tax Benefit That Management Expects to Sustain	Percentage Likelihood That the Tax Position Will Be Sustained at This Level
\$800,000	5%
340,000	30
160,000	20
110,000	45

Required »

- Prepare the journal entry to record the tax provision for the current year.
- Kenne's unrecognized tax benefits at the beginning of the year amounted to \$120,000. Of this amount, \$44,500 was settled during the year. Based on this information, prepare the roll forward reconciliation for Kenne's unrecognized tax benefits.

3 9

P17-11. Deferred Taxes, Classification of Deferred Tax Accounts, Financial Statement Presentation. Graham Department Stores reported the following year-end balances on its current balance sheet. Graham is subject to a 40% tax rate.

Account	GAAP Carrying Value	Tax Basis
Accounts Receivable—Net	\$ 105,500	\$ 125,000
Installment Sales Receivable	75,000	0
Estimated Warranty Liability	32,000	0
Unearned Subscription Revenue	120,000	0
Inventory	650,000	500,000
Plant and Equipment—Net	1,350,500	1,100,000
Investment in Affiliate Company (equity method)	675,000	500,000

The beginning cumulative balances of the deferred tax accounts are as follows:

Account	Beginning Balance
Deferred Tax Asset—Total	\$ 41,000
Deferred Tax Liability—Total	\$300,000

Taxable income is \$2,500,000 and book income is \$2,331,500. Assume installment sales, warranties, and subscriptions are 1-year contracts.

Required »

- Compute the ending balances of the total deferred tax asset and total deferred tax liability.
- Compute the deferred tax provision for the current year.
- Prepare the journal entry to record the tax provision for the current year.

2 3 8 9

P17-12. Permanent Differences, Temporary Differences, Reconciliation of Statutory and Effective Tax Rate, Financial Statement Presentation. The following information is from the financial statements of the Core Products Group for the first 3 years of its operations.

Account	Year 1		Year 2		Year 3	
	GAAP	Tax	GAAP	Tax	GAAP	Tax
Revenue from Product Sales	\$300,000	\$300,000	\$380,000	\$380,000	\$525,000	\$525,000
Revenue from Subscriptions	30,000	0	20,000	0	25,500	0
Cash Collected on Subscriptions	0	15,500	0	28,000	0	32,000
Installment Sales	230,000	0	128,500	0	195,000	0
Taxable Portion on Installment Sales Collections	0	145,500	0	198,000	0	210,000
Tax-Free Interest Income	42,000	0	42,000	0	42,000	0
Total Revenues	<u>\$602,000</u>	<u>\$461,000</u>	<u>\$570,500</u>	<u>\$606,000</u>	<u>\$787,500</u>	<u>\$767,000</u>

Account	Year 1		Year 2		Year 3	
	GAAP	Tax	GAAP	Tax	GAAP	Tax
Cost of Sales	\$120,000	\$180,000	\$150,000	\$195,000	\$180,000	\$75,000
Estimated Warranty Expense	60,000	0	62,000	0	98,000	0
Actual Repair Costs	0	20,000	0	80,000	0	120,000
Operating Expenses	80,000	80,000	140,000	140,000	170,000	170,000
Insurance Expense: Officers' Life	20,000	0	20,000	0	20,000	0
Depreciation Expense	90,000	135,000	90,000	90,000	90,000	45,000
Total Expenses	<u>\$370,000</u>	<u>\$415,000</u>	<u>\$462,000</u>	<u>\$505,000</u>	<u>\$558,000</u>	<u>\$410,000</u>
Income before Tax	<u>\$232,000</u>		<u>\$108,500</u>		<u>\$229,500</u>	
Taxable Income		\$ 46,000		\$101,000		\$357,000
Tax Rate		× 40%		× 40%		× 40%
Tax Payable		<u>\$ 18,400</u>		<u>\$ 40,400</u>		<u>\$142,800</u>

Required »

- Identify all book-tax differences and classify each difference as temporary or permanent.
- Prepare the footnote in percentages and dollars to reconcile the company's federal tax rate to its effective (actual) tax rate for the 3 years presented.
- Determine the net income reported on the income statement for each year.

2 3 5 9 P17-13. Permanent Differences, Temporary Tax Differences, Change in Tax Rates, Reconciliation of Statutory Tax Rate to Effective Tax Rate, Classification of Deferred Tax Accounts, Disclosure. Simply Syrup Incorporated, a maple syrup maker, reported the following events causing differences between pretax accounting income and taxable income during its first full year of operations:

- In 2018, Simply Syrup purchased equipment costing \$440,000 (with a useful life of 4 years and no salvage value) that it will depreciate on a straight-line basis for financial reporting purposes. Simply Syrup will use an accelerated method for tax purposes and depreciate \$200,000 in the first year and \$80,000 in the following 3 years (i.e., 2019 through 2021).
- On December 31, 2018, Simply Syrup collected \$70,000 for future delivery of 3,500 cases of its Maple Light Syrup. It is scheduled to deliver 2,100 cases in 2019 and the remainder in 2020.
- Simply Syrup invests in U.S. government securities to earn tax-free interest. In 2018, the company reported \$8,000 of interest income from this investment on its income statement.
- Simply Syrup makes a promise to its customers: "We will give you a full refund if you are hospitalized after eating our syrup on your pancakes." Based on past experience, the company estimates that this warranty will cost 10% of sales. Sales of syrup in 2018 amounted to \$100,000, and the firm recorded an accrued warranty expense of \$10,000. The warranties expire in 1 year.
- In 2018, Simply Syrup insured the life of its president, Hill L. Minimon. The premiums paid amounted to \$5,000. The company is the beneficiary.

Simply Syrup has a 40% tax rate and reported income before tax of \$500,000 under GAAP for 2018.

Required »

- Compute income tax payable in 2018.
- Determine the deferred tax asset and liability at the end of 2018.
- Determine income tax expense for 2018 and prepare the journal entry or entries necessary to record the tax provision for the year. Record deferred tax assets and deferred tax liabilities separately.
- Compute the 2018 effective tax rate and reconcile it to the statutory federal rate of 40% in both percentages and dollars.
- Prepare the entry necessary in 2018 based on having obtained information that Simply Syrup will not realize one-half of the deferred tax asset over the reversal period.
- Assume that the 2020 Congress enacts a new law on January 1, 2020, reducing the tax rate to 36% effective January 1, 2020. Assume also that Simply Syrup has no further warranty accruals and no warranty claims in 2019. Prepare the journal entry necessary on January 1, 2020, to reflect this tax rate change. Record any deferred tax assets and deferred tax liabilities separately and ignore any allowance account for a deferred tax asset. Assume that planned reversals of deferred accounts were recorded in 2019.

CASES

Judgment Cases

Judgment Case 1: Permanently Reinvested Earnings

[Note: Complete the “Permanently Reinvested Earnings” Surfing the Standards Case before making the judgments in this case.]

Mini Golf Corporation is a fully owned foreign subsidiary of Fun Parks, Inc. Mini Golf operates in a foreign jurisdiction with a tax rate of 15% whereas Fun Parks, Inc. is a U.S. corporation that has a 35% tax rate. Mini Golf has earnings of \$2,000,000 this year, and there are no book-tax differences. The firm is subject to taxation at 15% in its home country. When it eventually distributes the earnings back to Fun Parks (which will not happen in the current year), it will have to pay the additional 20% tax (the U.S. tax rate of 35% – the foreign rate of 15%).

Typically, Fun Parks (a **U.S. GAAP** reporter) does not use the exception for recording its tax accrual found in FASB ASC 730-30-25-17. Thus, it would typically record the tax expense in the current year at \$700,000. However, this year it has decided to take advantage of the exception and report tax expense of only \$300,000. If you were the auditor, what other pieces of information would you like to evaluate before signing off on the company’s tax accrual?

Judgment Case 2: Valuation Allowance

Fashion Designs, Inc. (FD) is a manufacturer of high-end women’s clothing. The firm is involved in the manufacture and design of the clothing. FD has been in this business for many years and has historically reported strong earnings. However, its earnings have been declining in recent years. In the 2 years prior to the current year, it reported only a very small net income. In the current year, it incurred a \$10,000,000 loss resulting from several factors:

- The economy as a whole was in a slump.
- There is a general consensus among buyers that FD’s designs are becoming dated and are not appealing to the new generation of consumers.

However, a few buyers still like the designs by FD. In fact, FD currently has nearly completed the negotiations for a large contract with one of its primary buyers.

The management of FD has begun an overhaul of the business to address buyer concerns. Unfortunately, this process will take some time, possibly several years. And, of course, there is uncertainty about the feasibility of any turnaround plan for the business. To make matters worse, FD is facing a discrimination lawsuit that could ultimately result in a large payout.

FD is a **U.S. GAAP** reporter and has no book-tax differences. Because the firm incurred a net operating loss this year and had very little net income in the two preceding years, it will record a deferred tax asset for the NOL carryforward.

Based upon your judgment, should FD record a valuation allowance to offset its deferred tax asset? If so, should it record a full valuation allowance (i.e., the valuation allowance amount would equal the deferred tax asset amount) or just a partial valuation allowance? If a partial allowance, what percentage of the deferred tax asset should it offset with the allowance? Justify your answer. (Consider consulting paragraphs 21 and 22 of FASB ASC 740-10-30.)

Financial Statement Analysis Case

Case: Accounting for Income Taxes

You have been tasked with understanding income tax reporting at *T-Mobile US, Inc.* and comparing it to that of *AT&T*. Use the following information from *T-Mobile* to address the questions.

NOTE 10: Income Tax

Income tax expense is summarized as follows:

<i>(Amounts in millions)</i>	Fiscal Years		
	2016	2015	2014
Current tax expense (benefit)			
Federal	\$ (66)	\$ (30)	\$ –
State	29	2	6
Puerto Rico	(10)	17	38
Total current tax expense (benefit)	(47)	(11)	44
Deferred tax expense (benefit)			
Federal	804	281	79
State	96	(37)	40
Puerto Rico	14	12	3
Total deferred tax expense	914	256	122
Total income tax expense	<u>\$867</u>	<u>\$245</u>	<u>\$166</u>

Effective Income Tax Rate Reconciliation

The reconciliation between the U.S. federal statutory income tax rate and our effective income tax rate is as follows:

	Year Ended December 31,		
	2016	2015	2014
Federal statutory income tax rate	35.0%	35.0%	35.0%
State taxes, net of federal benefit	4.0	(1.1)	(8.8)
Puerto Rico taxes, net of federal benefit	—	3.3	5.0
Change in valuation allowance	1.0	(3.2)	18.8
Permanent differences	0.6	1.6	1.4
Federal tax credits, net of reserves	(0.5)	(9.5)	(10.6)
Equity-based compensation	(2.2)	—	—
Other, net	(0.6)	(1.0)	(0.6)
Effective income tax rate	<u>37.3%</u>	<u>25.1%</u>	<u>40.2%</u>
Fiscal Year (in millions)	2016	2015	2014
Income before Taxes	<u>\$2,327</u>	<u>\$978</u>	<u>\$413</u>

Source: <http://investor.t-mobile.com/Cache/1001223313.PDF?O=PDF&T=&Y=&D=&FID=1001223313&iid=4091145>

Required »

- What is *T-Mobile's* effective tax rate each year? What is the difference between *T-Mobile's* effective tax rate and the statutory rate? Detail the items making up the difference.
- Compare *AT&T's* effective tax rate for 2016, 2015, and 2014 from Example 17.24 in the text with the rate for *T-Mobile*.
- Compute *T-Mobile's* conservatism ratio for each year. Comment on any changes in the ratio over the years. Would you characterize *T-Mobile* as a conservative or aggressive tax reporter?
- Compare *AT&T's* conservatism ratio from Example 17.24 in the text with the ratio for *T-Mobile*.

Surfing the Standards Cases

Surfing the Standards Case 1: Tax Rates Dependent upon Distribution²³

In certain countries, the tax rate applied in a company's tax return depends on whether the profits for the period are distributed or undistributed. Amounts are initially taxed at a higher rate, but a tax credit is received when amounts are distributed. Therefore, companies need to determine what rate (distributed versus undistributed) should be applied when measuring the amount of current and deferred taxes.

Multinational Corporation (Multinational) is a U.S. company that owns and operates a consolidated subsidiary in a foreign jurisdiction, where income taxes are payable at a higher rate on undistributed profits than on distributed earnings. For the year ending December 31, 2015, Multinational's foreign consolidated subsidiary's taxable income was \$150,000. Multinational's foreign consolidated subsidiary also had net taxable temporary differences amounting to \$50,000 for the year, thus creating the need for a deferred tax liability. The tax rate on distributed profits is 40% and the rate on undistributed profits is 50%; the difference results in a credit if profits are later distributed. As of the date of the balance sheet, no distributions have been proposed or declared. On March 31, 2016, Multinational's foreign consolidated subsidiary distributed dividends of \$75,000.

Required »

- Obtain and review the measurement guidance related to anticipated future tax credits in sections 25 and 30 of FASB ASC 740-10, *Income Taxes—Overall*.
- Review and discuss the general rules for this type of situation.
- Provide the necessary journal entries for 2015 and 2016.

Surfing the Standards Case 2: Tax Rates Dependent upon Distribution: IFRS²⁴

Using the information in the Surfing the Standards Case 1, now assume that Multinational Corporation (Multinational) is an IFRS reporter.

Required »

- Obtain and review the measurement guidance related to anticipated future tax credits in *International Accounting Standard 12*, "Income Taxes."
- Review and discuss the general rules for this type of transaction using IFRS.
- Provide the necessary journal entries for 2015 and 2016 under IFRS.

Surfing the Standards Case 3: Permanently Reinvested Earnings

Mini Golf Corporation is a fully owned foreign subsidiary of Fun Parks, Inc. Mini Golf operates in a foreign jurisdiction with a tax rate of 15% whereas Fun Parks, Inc. is a U.S. corporation that has a 35% tax rate. Mini Golf has earnings of \$2,000,000 this year and there are no book-tax differences. The firm is subject to taxation at 15% in its home country. When Mini Golf eventually distributes the earnings back to Fun Parks (which will not happen in the current year), it will have to pay the additional 20% tax (the U.S. tax rate of 35% – the foreign rate of 15%).

- What is your intuition as to how to handle this tax accrual? Specifically, for what amount should taxes payable be credited? For what amount should tax expense be debited? If these two numbers are not the same, what other account should be debited or credited and for how much? Why?
- Read FASB ASC 740-30-25-3. Based upon this paragraph, what is the journal entry to record the tax provision in the current year?
- Read FASB ASC 740-30-25-17. Are there any circumstances in which the company would not have to record the incremental tax expense and the deferred tax liability? If so, what would the journal entry be to record the tax provision in the current year?

²⁴Reprinted from the Ernst & Young Academic Resource Center with permission of the Ernst & Young Foundation. Copyright 2014. All rights reserved.

4. Does the exception in (3) make sense to you? Please explain.
5. **IFRS** contains the same general rule that is included in **U.S. GAAP** in FASB ASC 740-30-25-3. **IFRS** also has an exception to this rule. Read *International Accounting Standard 12*, “Income Taxes,” paragraph 39. Is the exception under **IFRS** the same as the exception under **U.S. GAAP**? Explain.

Basis for Conclusions Cases

[*Note:* In the following exercise, you are required to review the Basis for Conclusions (BCs) for the standard(s) that provide the accounting guidance for this topic. Because the BCs is generally not included in the Codification and thus is not authoritative, it will most likely be necessary for you to research it by reviewing the pre-codified standards. Appropriate references have been provided to allow you to do so. Pre-codified standards are accessible on the FASB website at www.fasb.org, or, in the event that your school participates in the American Accounting Association’s *Academic Accounting Access* program, they can be found there as well.]

Basis for Conclusions Case 1: Is it *really* a liability?²⁵

Scene 1: The concept of the deferred tax liability (which is reported under both **U.S. GAAP** and **IFRS**) has been at the root of disagreement among financial statement users for quite some time. While some do believe that it is truly a liability, others do not. The following is an excerpt from “The Valuation of Deferred Taxes,” by Eli Amir, Michael Kirschenheiter and Kristen Willard, published in *Contemporary Accounting Research*, Vol. 14, No. 4 (Winter 1997), pages 597–622.

Financial statement users often disagree as to the most appropriate method for valuing a firm that has deferred tax assets and liabilities on its balance sheet. Some claim that net deferred taxes represent obligations to pay taxes in the future, and hence, should be regarded as financial liabilities. As such, these liabilities should be offset against the firm’s other long-term net financial assets. Proponents of this method often argue that if the temporary differences, which gave rise to the deferred tax liabilities, are not expected to reverse (settle) in the near future, these liabilities should be discounted similar to other long-term financial obligations, taking into account the expected time to achieve reversal and the cost of borrowing.

Others argue that many deferred tax liabilities (e.g., deferred taxes resulting from depreciation and temporary amortization differences) are never settled; hence, net deferred tax liabilities should be added to (and net deferred tax assets should be subtracted from) the firm’s book value of shareholders’ equity. Consistent with this approach, *Statement of Standard Accounting Practice (SSAP) No. 15* issued by the Accounting Standards Committee in the United Kingdom (ASC 1985) requires companies to adopt a partial interperiod tax allocation method, that is, to recognize only those deferred taxes that are expected to materialize in the foreseeable future (3–5 years). This partial recognition effectively regards long-term temporary differences as part of equity.

Read paragraphs 75 through 79 in the BCs of FASB’s *Statement of Financial Accounting Standards No. 109*, “Income Taxes.” Does the FASB believe that the deferred tax liability is really a liability? How does it support this position?

Scene 2: Do you agree with the FASB’s position and its supporting arguments? Please explain and support your position.

Scene 3: IFRS Consistent with the discussion above, some financial statement users believe that the deferred tax liability account should be discounted, or that a partial interperiod tax allocation method should be allowed. Read *International Accounting Standard 12*, “Income Taxes,”

²⁵Reprinted from the Ernst & Young Academic Resource Center with permission of the Ernst & Young Foundation. Copyright 2014. All rights reserved.

paragraphs 16, 53, and 54. Also, read paragraphs 198, 199, 203, 204, and 205 in the BCs of FASB's *Statement of Financial Accounting Standards No. 109*, "Income Taxes."

- a. Do the boards allow deferred tax liabilities to be discounted?
- b. Do the boards allow the use of a partial interperiod allocation method?
- c. How do the boards support their position on discounting?
- d. How does the FASB support its position related to interperiod tax allocation?

Basis for Conclusions Case 2: Uncertain Tax Positions and Examination Risk²⁶

Scene 1: Current guidance on uncertain tax positions requires that when an entity is making its assessment as to whether a tax position is more likely than not to be sustained, it must assume that the position will be examined by the relevant taxing authority and that the taxing authority has all the relevant knowledge and information (FASB ASC 740-10-25-6 and FASB ASC 740-10-25-7). There is some controversy over this decision. Read paragraphs B17 through B22 in the BCs in FASB's *Interpretation No. 48*.

What are the arguments of the opponents of this rule?

Scene 2: What are the arguments of the proponents of this rule?

Scene 3: Which position do you support? Explain.

APPENDIX A

Comprehensive Book-Tax Difference Problem

Example 17A.1 this Appendix provides a comprehensive illustration of accounting for deferred taxes over a 3-year period.

EXAMPLE 17A.1

Comprehensive Book-Tax Difference Problem

PROBLEM: Homeward Products, Inc. provided the following information about its first 3 years of operations.

- In its first year of operations, the company used installment sales to promote its products. The company reported \$4,000 in installment sales for the period. It did not have any installment sales for the next 2 years. Homeward received cash of \$600, \$1,000, and \$2,400 for installment sales in Years 1, 2, and 3, respectively.
- Homeward uses MACRS (an accelerated depreciation system) for tax purposes and straight-line depreciation for book purposes. It recorded \$10,000 in depreciation expense each year for book purposes. For tax purposes, it recorded \$17,000, \$12,000, and \$9,000 in Years 1, 2, and 3, respectively.
- Homeward uses the allowance method to recognize bad debt expense for book purposes and the direct write-off method for tax purposes. Under the allowance method, Homeward recognized \$5,000, \$7,000, and \$6,500 of bad debt expense in Years 1, 2, and 3, respectively, for book purposes. It recognized \$0, \$4,600, and \$6,000 of bad debt expense in Years 1, 2, and 3, respectively, for tax purposes.
- Homeward recorded a \$5,000 contingent litigation liability in Year 2 for book purposes.
- In each year, the firm received municipal interest of \$1,000.
- Homeward operates only in one taxing jurisdiction, and its statutory tax rate is 35%. The firm assesses that it will not need a valuation allowance for any deferred tax assets.

Follows are the partial income statements and selected balance sheet accounts for both book and tax reporting purposes for each of the 3 years.

Description	Year 1		Year 2		Year 3	
	GAAP	Tax	GAAP	Tax	GAAP	Tax
Sales Revenue	\$50,000	\$50,000	\$61,300	\$61,300	\$72,000	\$72,000
Installment Sales Revenue	4,000	600	0	1,000	0	2,400
Total Revenue	<u>54,000</u>	<u>50,600</u>	<u>61,300</u>	<u>62,300</u>	<u>72,000</u>	<u>74,400</u>
Depreciation Expense	10,000	17,000	10,000	12,000	10,000	9,000
Bad Debt Expense	5,000	0	7,000	4,600	6,500	6,000
Litigation Expense	0	0	5,000	0	0	0
Other Operating Expenses	22,000	22,000	27,000	27,000	30,000	30,000

Receivable—Installment Sales	3,400	0	2,400	0	0	0
Property, Plant and Equipment—Net	115,000	108,000	105,000	96,000	95,000	87,000
LIABILITIES AND EQUITY						
Litigation Contingency	\$ 0	\$ 0	\$ 5,000	\$ 0	\$ 5,000	\$ 0

What is Homeward's income tax provision for each of the 3 years? Prepare the journal entries required to record the income tax provision for the first 3 years of operation.

SOLUTION: In order to prepare the journal entries to record the income tax provisions for the 3 years, we need to perform several computations. First, we compute the balances in Homeward's deferred tax accounts by comparing the tax basis of the underlying assets and liabilities to the book carrying values. Second, we determine the change in the deferred tax asset or liability balance. We also compute the income taxes payable based on taxable income and the income tax expense based on book income, adjusted for permanent differences.

We compute the balances in the deferred tax accounts as follows:

1. Installment sales create a difference in the book and tax bases of receivables. Because the book basis of the receivable is greater than the tax basis of the asset in all 3 years, there is a deferred tax liability (Scenario 2 from Exhibit 17.3).

Installment Sales Receivable	Year 1	Year 2	Year 3
Book basis	\$ 3,400	\$ 2,400	\$ 0
Tax basis	<u>0</u>	<u>0</u>	<u>0</u>
Difference	\$ 3,400	\$ 2,400	\$ 0
Tax rate	<u>× 35%</u>	<u>× 35%</u>	<u>× 35%</u>
Deferred tax liability	<u>\$ 1,190</u>	<u>\$ 840</u>	<u>\$ 0</u>

2. Depreciation creates a difference in the book and tax bases of property, plant, and equipment (PP&E). Because the book basis of PP&E is greater than the tax basis of the asset, there is a deferred tax liability (Scenario 2 from Exhibit 17.3).

Property, Plant, and Equipment (Depreciation)	Year 1	Year 2	Year 3
Book basis	\$115,000	\$105,000	\$95,000
Tax basis	<u>108,000</u>	<u>96,000</u>	<u>87,000</u>
Difference	7,000	9,000	8,000
Tax rate	<u>× 35%</u>	<u>× 35%</u>	<u>× 35%</u>
Deferred tax liability	<u>\$ 2,450</u>	<u>\$ 3,150</u>	<u>\$ 2,800</u>

3. Bad debt expense accounting causes a difference in the book and tax bases of accounts receivable. Because the book basis of accounts receivable is less than the tax basis of the asset, there is a deferred tax asset (Scenario 1 from Exhibit 17.3).

Accounts Receivable (Bad Debts)	Year 1	Year 2	Year 3
Book basis	\$17,000	\$ 9,000	\$12,500
Tax basis	<u>22,000</u>	<u>16,400</u>	<u>20,400</u>
Difference	5,000	7,400	7,900
Tax rate	<u>× 35%</u>	<u>× 35%</u>	<u>× 35%</u>
Deferred tax asset	<u>\$ 1,750</u>	<u>\$ 2,590</u>	<u>\$ 2,765</u>

4. Litigation expense creates a difference in the book and tax bases of contingent liabilities. Because the book basis of a contingent liability is greater than the tax basis of the liability, there is a deferred tax asset (Scenario 4 from Exhibit 17.3).

Contingencies Liability	Year 1	Year 2	Year 3
Book basis	\$ 0	\$5,000	\$5,000
Tax basis	<u>0</u>	<u>0</u>	<u>0</u>
Difference	\$ 0	\$5,000	\$5,000
Tax rate	<u>× 35%</u>	<u>× 35%</u>	<u>× 35%</u>
Deferred tax asset	<u>\$ 0</u>	<u>\$ 1,750</u>	<u>\$1,750</u>

We summarize the four temporary book-tax differences to determine the following net deferred tax balance in each of the 3 years (deferred liabilities are in parentheses):

Summary of Deferred Taxes	Year 1	Year 2	Year 3
Installment sales	\$(1,190)	\$ (840)	\$ 0
Depreciation	<u>(2,450)</u>	<u>(3,150)</u>	<u>(2,800)</u>
Total deferred tax liabilities	<u>\$(3,640)</u>	<u>\$(3,990)</u>	<u>\$(2,800)</u>
Change in deferred tax liabilities	<u>(3,640)</u>	<u>(350)</u>	<u>1,190</u>
Bad debts	\$ 1,750	\$ 2,590	\$ 2,765
Contingencies	<u>0</u>	<u>1,750</u>	<u>1,750</u>
Total deferred tax assets	<u>\$ 1,750</u>	<u>\$ 4,340</u>	<u>\$ 4,515</u>
Change in deferred tax assets	<u>\$ 1,750</u>	<u>\$ 2,590</u>	<u>\$ 175</u>
Change in net amount (deferred tax expense)	<u>\$(1,890)</u>	<u>\$ 2,240</u>	<u>\$ 1,365</u>

The journal entry for the deferred tax provision records the changes in the accounts. Thus, for Year 1, Homeward records a deferred tax liability of \$3,640 and a deferred tax asset of \$1,750. In Year 2, it records a deferred tax liability for \$350 and a deferred tax asset for \$2,590. In Year 3, Homeward records a deferred tax asset of \$175 and reduces (debits) the deferred tax liability by \$1,190.

The taxes payable based on taxable income are as follows:

Computation of Taxes Payable	Year 1	Year 2	Year 3
Taxable income	\$11,600	\$18,700	\$29,400
Tax rate	<u>× 35%</u>	<u>× 35%</u>	<u>× 35%</u>
Taxes payable	<u>\$ 4,060</u>	<u>\$ 6,545</u>	<u>\$10,290</u>

Finally, we compute the tax expense that Homeward will record on its income statement.

Computation of Tax Expense	Year 1	Year 2	Year 3
Income before Income Taxes	\$18,000	\$13,300	\$26,500
Less: Permanent Differences	<u>(1,000)</u>	<u>(1,000)</u>	<u>(1,000)</u>
	\$ 17,000	\$12,300	\$25,500
Tax Rate	<u>× 35%</u>	<u>× 35%</u>	<u>× 35%</u>
Tax Expense	<u>\$ 5,950</u>	<u>\$ 4,305</u>	<u>\$ 8,925</u>

Based upon these computations, the tax accrual journal entries are as follows:

Account	December 31, Year 1	
Deferred Tax Asset	1,750	
Income Tax Expense	5,950	
Deferred Tax Liability		3,640
Income Taxes Payable		4,060

Account	December 31, Year 2	
Deferred Tax Asset	2,590	
Income Tax Expense	4,305	
Deferred Tax Liability		350
Income Taxes Payable		6,545

Account	December 31, Year 3	
Income Tax Expense	8,925	
Deferred Tax Liability	1,190	
Deferred Tax Asset	175	
Income Taxes Payable		10,290

18

Accounting for Leases

LEARNING OBJECTIVES

- 1 Understand the basic concepts of lease accounting and identify the advantages and disadvantages of leasing.
- 2 Understand lease contracts and determine how to separate lease and nonlease components and how to allocate contract consideration to the various components.
- 3 Classify leases as operating, finance, direct financing, and sales-type.
- 4 Demonstrate the accounting for an operating lease for both the lessee and the lessor.
- 5 Demonstrate lessee accounting for a finance lease.
- 6 Illustrate lessor accounting for sales-type leases.
- 7 Illustrate lessor accounting for direct financing leases.
- 8 Detail the required lease disclosures.

Introduction

A *LEASE* IS ONE OF THE most common means by which companies obtain the use of long-term operating assets. In a lease, a company acquires the use of an asset—such as a copy machine, office space, or even an airplane—by financing it directly through the asset’s owner. In the airline industry,

about one-third of airplanes are leased.¹ Airlines decide to lease versus buy assets for a variety of reasons, including the ability to obtain financing, reduced risk of obsolescence, or operating flexibility. For example, small, recently established airlines, which may have difficulty obtaining capital to buy large airplanes, lease planes to exploit new routes. At the end of fiscal 2016, the operating fleet of *Spirit Airlines* consisted of 95 airplanes of which 38% were owned and 62% were leased. *Spirit* also leases most of its land and buildings that it occupies, such as its aircraft maintenance base as well as various computers, cargo, flight kitchens, and training facilities. On your next trip to the airport, consider that airlines lease the ticket counter and other terminal space, operating areas, and air cargo facilities in most of the airports that they serve.

Is there a difference in the economic substance of acquiring a long-term operating asset (such as an airplane) by issuing long-term debt or acquiring the use of an asset by signing a lease contract? In most cases, there is no real substantial difference in leasing and purchasing. The form of the contract is different, but the substance of these transactions is the same.

A lease typically results in obtaining the use and control of a long-term asset and the recognition of a long-term financing liability. Accounting for the liability requires similar accounting procedures as used in accounting for a long-term debt instrument. Because the lease will involve the use and control of an asset, we also discuss accounting for long-term operating assets.

We begin the chapter with an overview of leases and their advantages and disadvantages. Then, we discuss how to determine whether a lease exists, how to separate lease and nonlease components, and how to allocate consideration among these components. We then consider the proper

Carlos Yudica.Shutterstock

¹“Aircraft Leasing: Buy or Rent?: The Steady Rise of Airlines with No Passengers,” *The Economist*, January 21, 2012.

classification of leases and illustrate lease accounting from the perspective of both parties: the company obtaining the use of the asset (the lessee) and the company providing the asset for

use (the lessor). Finally, we review required lease disclosures and then explore the possible financial statement effects of the lease accounting alternatives. ◀◀

- 1 Understand the basic concepts of lease accounting and identify the advantages and disadvantages of leasing.

Leases: Overview

A **lease** gives the *lessee* the right to control and use the property, plant, or equipment legally owned by the *lessor* for a specified period of time in return for periodic payments or rentals made by the lessee. The owner of the asset is called the **lessor**. The party acquiring the use of the asset is the **lessee**. The lease contract conveys only the right to use the asset—it typically does not result in a transfer of ownership of the asset. This property right has economic value to the lessee and, in substance, represents the purchase of an asset with a corresponding obligation.

Advantages of Leasing for the Lessee

What accounts for the popularity of leasing? Leasing provides multiple advantages over buying.

Complete Financing. Many leases allow the lessee to enter into a lease agreement with little or no money down and with no security deposit. The lessee maintains its cash and other assets, resulting in 100% financing for the leased asset.

Lessor Bears the Risk of Obsolescence. The risk of obsolescence is borne by the owner of the asset, the lessor, and is reflected in high lessee monthly rental payments. However, the lessee is willing to pay this premium when leasing an asset that is subject to rapid technological obsolescence. A lessee company upgrading to the latest technology maintains its competitive advantage. For example, consider leased photocopy equipment, which is one of the most common types of leased assets. Over time, technology has improved the features in photocopiers with options such as scanning, emailing, and remote copying. A company that owns its copier would need to buy a new copy machine to obtain these features. A company that leases a photocopier can easily upgrade when new features become available.

Business and Financial Flexibility. Leases can offer many business options for the lessee. For example, the lessee can upgrade the asset, return the asset, continue the lease with extended terms, modify rental amounts, or exercise a purchase option. The lease may also provide financial flexibility by permitting the lessee to obtain an additional source of financing without affecting existing lines of credit.

Tax Benefits. When a company purchases equipment by issuing a long-term note, the interest element of the payment is tax deductible. However, if the company leases equipment, the *entire* lease payment may be tax deductible. In addition, in a purchase of real estate, only the building but not the land is depreciable. If a company leases a building (on the land), the total lease payment may be fully tax deductible as rent expense.

Disadvantages of Leasing for the Lessee

Although there are multiple advantages to leasing, there are a few disadvantages.

Overall Cost of the Asset. In general, the costs of the asset over the life of the lease are higher than had the lessee purchased the asset. The lease payments must compensate the lessor for the use of the asset, financing costs, and the risk of ownership.

Lack of Ownership. Unless the lease arrangement includes a transfer of ownership or a purchase option that is exercised, the asset does not belong to the lessee at the end of the lease.

Understanding the Basics of Lease Accounting

Lease accounting is complex and detailed. However, the basic concepts behind lease accounting are straightforward. Let's start with these basic concepts before examining the details of lease accounting.

An important concept to understand is that the substance of a typical lease transaction is similar to the purchase of an asset on credit. In a lease transaction, the lessor obtains the right to use the leased asset in return for payments made to the lessor. So, this is similar to the lessee purchasing an asset from the lessor with the lessor providing the financing. Although there are some differences in a lease transaction and a purchase financed by the seller, there are more similarities than differences.

Thus, the accounting treatment follows the substance of the transaction. As in the case of a purchase financed by the seller, a lease transaction typically results in the leased asset on the lessee's balance sheet. In addition, the lessee reports a long-term obligation. Consistent with accounting for long-term debt and long-term operating assets, the lessee records both interest expense and amortization on its income statement.²

The lessor often (although not always) removes the leased asset from its balance sheet and instead recognizes a financial asset that represents the amounts that are receivable from the lessee. The lessor also records interest revenue on its income statement related to the financing component of the transaction. In addition, the lessor may report revenue and cost of goods sold related to what is, in substance, a sales transaction.

2016 Lease Standards. This chapter is based on the lease standards issued by FASB and the IASB in 2016, which are effective beginning in 2019. Prior to the release of these standards, lessees did not report all leases on the balance sheet. These new standards accomplish the standard setters' primary goal of requiring lessees to report the leased asset and lease liability on their balance sheets.

Key Steps in Lease Transactions. This chapter addresses the key steps in the flow of a lease transaction.

Step 1. Identify a lease contract.

Step 2. Identify lease and nonlease components and allocate costs to each component.

Step 3. Classify the lease.

Step 4. Recognize and initially measure the lease transaction.

Step 5. Determine subsequent measurement of the lease transaction.

Within each step, lessees and lessors make many judgments in applying lease accounting. Exhibit 18.1 presents these steps.

EXHIBIT 18.1 Steps in Accounting for Leases

²We use the word "amortization" rather than "depreciation" for leased assets because the lessee does not own the physical asset but has the right to use it.

- ② Understand lease contracts and determine how to separate lease and nonlease components and how to allocate contract consideration to the various components.

Lease Contracts, Lease Components, and Contract Consideration

The first step in lease accounting for both the lessee and the lessor is to determine whether a contract contains a lease. A company makes this determination at the inception of a contract. An agreement could be a separate lease contract, or a lease contract could be embedded in another agreement, such as a contract for services. The determination of whether a contract contains a lease is generally clear, but there can be cases in which it is much more complex.³

Lease contracts often contain multiple *components* that may be lease or nonlease components. A **component** of a contract is an item or activity that transfers a good or service to the lessee. Both the lessee and lessor are required to identify and separate the various lease and nonlease components. After identifying the lease and nonlease components, the lessor and lessee will be able to allocate consideration to these components.

Companies include only lease components when accounting for the lease transaction. Any nonlease components are accounted for under other areas of the authoritative literature as appropriate. Examples of nonlease components in a lease agreement include goods or services such as maintenance services or supplies.

Separating Components in a Lease Contract

Prior to allocating any consideration, a company has to identify the components in the contract.

Lease Components. When lease contracts contain the right to use several assets, the company must identify each right-of-use asset. For example, a company that leases a building can also have the right to use the building's adjacent parking lot. Typically, the right to use these multiple assets is considered a single lease component. However, if both of the following criteria are met, the right to use an asset is considered a separate lease component:

1. The lessee can benefit from the right of use of the asset either on its own or together with other resources that are readily available to the lessee.
2. The right of use is neither highly dependent on nor highly interrelated with the other rights to use the underlying assets in the contract.

In the case of the building and parking lot, the parking lot is highly interrelated to the building. The lessee would have no use for the parking lot if it were not also leasing the building.

Land. The right to use land is considered a separate lease component unless the impact on the financial statements of not separating the land from the other asset(s) is insignificant.

Example 18.1 illustrates identifying lease and nonlease components.

EXAMPLE 18.1 Identification of Lease and Nonlease Components

PROBLEM: Bassey Seafood Company leased a warehouse from the Gilli Group for a term of 10 years to store its products. The warehouse includes refrigeration units. The warehouse lease includes the use of forklifts, pallets, and conveyer belts. In addition, Gilli provides maintenance of all items of equipment included in the agreement. The maintenance is included in the annual lease payments.

What are the lease and nonlease components of the contract? How many lease and nonlease components are included in the contract?

SOLUTION: Bassey receives the use of warehouse storage, refrigeration units, and warehouse equipment. It also gets the use of maintenance services. The warehouse and the refrigeration units cannot be separated because they are interdependent. That is, the warehouse cannot be

³We do not discuss identifying lease contracts in depth in this chapter. See Surfing the Standards Case 1 for a more in-depth analysis of this issue.

used to store seafood without proper refrigeration. However, the warehouse equipment (forklifts, pallets, and conveyer belts) function independently and can be used separately in any warehouse. Therefore, this contract contains two lease components: the warehouse (with refrigeration) and the equipment. Maintenance is an additional nonlease component of the contract.

In total, the contract contains three components: two lease and one nonlease.

Lease Components	Nonlease Component
Warehouse with refrigeration	Maintenance
Equipment	

Allocating Consideration in a Lease Contract

After identifying the lease and nonlease components of the contract, lessees and lessors must then allocate the total contract consideration to the components. Although the approach to allocating consideration across the components is similar for lessees and lessors, there are some differences. Let's examine the lessee and lessor requirements separately.

Lessee Allocation Procedures. To separate the lease and nonlease components, the lessee allocates the contract consideration on a relative *standalone price* basis. The lessee first determines the **standalone price** of each component, which is the price at which it would purchase a component of a contract separately. The lessee then computes for each component the percentage of the component's standalone price to the sum of the standalone prices for all components. Then, to determine the amount of consideration allocated to a particular component, the lessee multiplies the percentage by the total consideration.

Ideally, the lessee uses the observable standalone prices. However, if observable prices are not available, the lessee can estimate the standalone prices. When estimating standalone prices, the lessee should maximize the use of observable inputs.

In cases in which the standalone price is highly variable or uncertain, the lessee may use a *residual method* of determining the standalone price. The **residual method** subtracts the other standalone prices from the total contract consideration and assigns the remaining amount as the estimated standalone price of the remaining component.⁴

Initial direct costs are incremental costs that the lessee would not have incurred if he had not obtained the lease, such as commissions, legal fees resulting from the execution of the lease, costs to prepare documents after the execution of the lease, and payments to existing tenants to move out of a facility. The lessee allocates initial direct costs to the separate lease components on the same basis as the lease payments. We discuss the accounting treatment for initial direct costs in more detail later in the chapter.

Lessor Allocation Procedures. The lessor allocates the lease transaction price to the separate components in accordance with the revenue recognition guidance discussed in Chapter 8. The lessor allocates the total consideration in the contract to each individual lease and nonlease component using the relative standalone selling price allocation. If there is not an observable standalone selling price, the lessor must use an estimate of the standalone selling price and allocate it based on any of the following methods:

1. Adjusted market assessment approach
2. Expected-cost-plus-a-margin approach
3. Residual approach⁵

⁴The lessee can make an election not to allocate the lease and nonlease components separately. This choice simplifies the accounting for the lease because the lessee allocates all of the contract consideration to this single component.

⁵These methods are discussed in detail in Chapter 8.

In all cases, the lessor must use observable data when possible. The lessor allocates any initial direct costs to the separate lease and nonlease components to which the costs relate. Example 18.2 illustrates the allocation of consideration to separate lease and nonlease components.

EXAMPLE 18.2 Allocating Consideration to the Components

PROBLEM: Consider Bassey Seafood Company from Example 18.1. We determined three components in the lease agreement: (1) the warehouse and refrigeration, (2) the equipment, and (3) the maintenance services. The total consideration in the contract is a \$450,000 lease payment per year. Bassey identifies the following standalone prices:

Component	Standalone Price
Warehouse and refrigeration	\$275,000
Equipment	150,000
Maintenance	75,000
Total	<u>\$500,000</u>

How should Bassey allocate the consideration?

SOLUTION: Because the total consideration in the contract is not equal to the sum of the standalone prices, Bassey uses the relative standalone prices to allocate the total consideration to each component. Bassey allocates the \$450,000 total consideration as follows:

Component	Standalone Price	Percentage	Allocated Consideration
Warehouse and refrigeration	\$275,000	55%	\$ 247,500
Equipment	150,000	30	135,000
Maintenance	<u>75,000</u>	<u>15</u>	<u>67,500</u>
Total	<u>\$500,000</u>	<u>100%</u>	<u>\$450,000</u>

The next step in accounting for a lease transaction is to classify the lease. So far, we have identified the lease and its lease and nonlease components. At this point, we have to determine whether the lease transfers control of the asset in order to determine the proper lease classification.

- ③ Classify leases as operating, finance, direct financing, and sales-type.

Lease Classifications

Before discussing the procedures for lease accounting, we need to clearly classify the lease. The lease classification determines the lease's proper accounting treatment. Lessees classify all leases as either *operating leases* or *finance leases*. Lessors classify leases as *operating*, *sales type*, or *direct financing*.

Before examining the classification criteria, we first need to distinguish the *lease inception* date from the *lease commencement* date. The **lease inception** is the date the lease agreement is signed. The **lease commencement** is the date on which the lessee is allowed to begin using the leased asset.

Criteria for Classification

Parties involved in a lease transaction consider two groups of criteria to classify leases. The Group I criteria, which apply to both lessees and lessors, provide guidance on which party to the lease effectively "owns" and controls the asset. The Group II criteria, which apply only to lessors, determine the extent to which the lessor will absorb the credit risk related to the lease contract.

Group I Criteria. Group I criteria provide guidance to operationalize the concept of ownership and control of an asset. Both the lessor and lessee use the Group I criteria. To meet the Group I conditions, a transaction needs only to *meet one of the five criteria*:

1. The lease transfers ownership of the leased asset to the lessee at the end of the *lease term*. If the lease transfers ownership, the lessee firm has in essence purchased the asset.
2. The lessee is given an option to purchase the asset that the lessee is reasonably certain to exercise. For example, it might be reasonably certain that the lessee would exercise a purchase option if the specified purchase price is well lower than the expected value of the leased asset at the completion of the lease term.
3. The *lease term* is for a major part of the economic life of the asset.⁶ If the *lease term* provides the lessee the use and control over substantially all of the asset's useful life, the agreement should be considered equivalent to purchasing the asset.

The **lease term** begins at the lease commencement date and includes the noncancellable period for which a lessee has the right to use the leased asset. The lease term also includes periods covered by an option to renew the lease if the lessee is reasonably certain to renew. The lessee is likely to renew if the lease payments over the renewal period are substantially lower than the fair value rental amount. If the lessor controls the option to renew the lease, the renewal period is included in the lease term.

If a lease agreement contains an option to terminate and the lessee is reasonably likely to exercise that option, the lease term ends on the earliest date that the lease can be terminated. If the lessor has the option not to terminate the lease then, the lease term is the total lease period and will not terminate early.

4. The present value of the sum of the *lease payments* and any *residual value* the lessee guarantees to pay (that is not otherwise included in the lease payments) is equal to substantially all of the asset's fair value. In this case, the lessor is able to recover the cost of the asset. The present value computation includes lease payments in the renewal periods, if any. Meeting this criterion implies that the lessee is providing the lessor compensation that is equivalent to the purchase of the asset.
5. The leased asset is of a *specialized nature*. An asset with a **specialized nature** has no alternative use to the lessor at the end of the lease term. Because the asset has no alternative use to the lessor, its specialized nature implies that the lessor must have transferred control over the asset to the lessee.

Group II Criteria. Group II criteria apply to the lessor only. To meet the Group II criteria, a transaction must meet both criteria.

1. The present value of the sum of the lease payments and any residual value the lessee or a third party guarantees to pay (that is not otherwise included in the *lease payments*) is equal to substantially all of the asset's fair value.
2. It is probable that the lessor will collect the *lease payments* plus any amount necessary to satisfy a residual value guarantee.

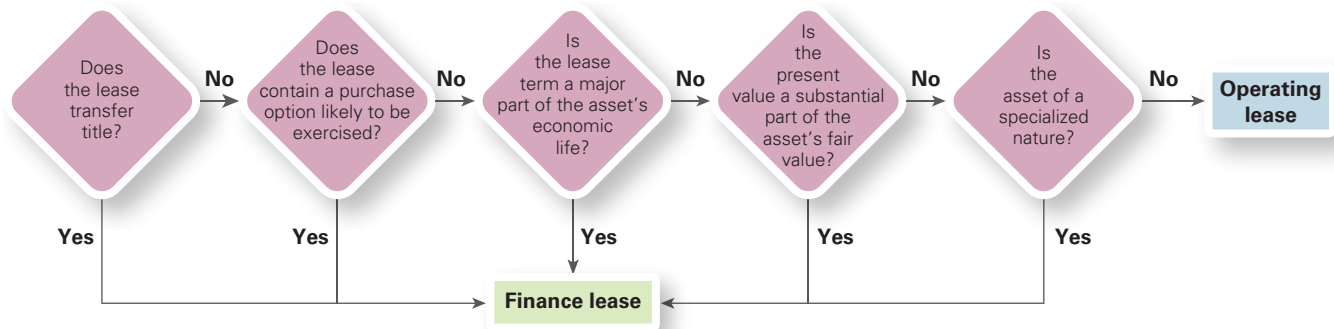

Many of the Group I and Group II criteria depend highly on judgment. FASB does give some implementation guidance, and we discuss that in the judgment section later in the chapter. However, even with this limited guidance, much judgment is needed.

Lessee Classification. The classification is fairly straightforward for lessees. If the lease transaction meets any one of the five Group I criteria, the lessee classifies the lease as a **finance lease**. If none of the Group I criteria is met, the lessee classifies the lease as an **operating lease**. The Group II criteria are not used by the lessee.

⁶ This criterion is not used for classification if the lease commencement date falls at or near the end of the life of the underlying asset.

Exhibit 18.2 presents lease classification for the lessee with the Group I criteria.

EXHIBIT 18.2 Lessee Classification of an Operating and Finance Lease

Lessor Classification. The classification for the lessor is a bit more complex than for the lessee. If the lessor meets any one of the five Group I criteria, the lessor classifies the lease as a **sales-type lease**. If the lessor meets both of the Group II criteria but none of the Group I criteria, the lessor classifies the lease as a **direct financing lease**. If the transaction does not meet either the Group I or Group II criteria, the lessor classifies the lease as an **operating lease**.

Exhibit 18.3 presents an illustration of lease classification for the lessor.

EXHIBIT 18.3 Lessor Classification of Operating, Sales-Type, and Direct Financing Leases

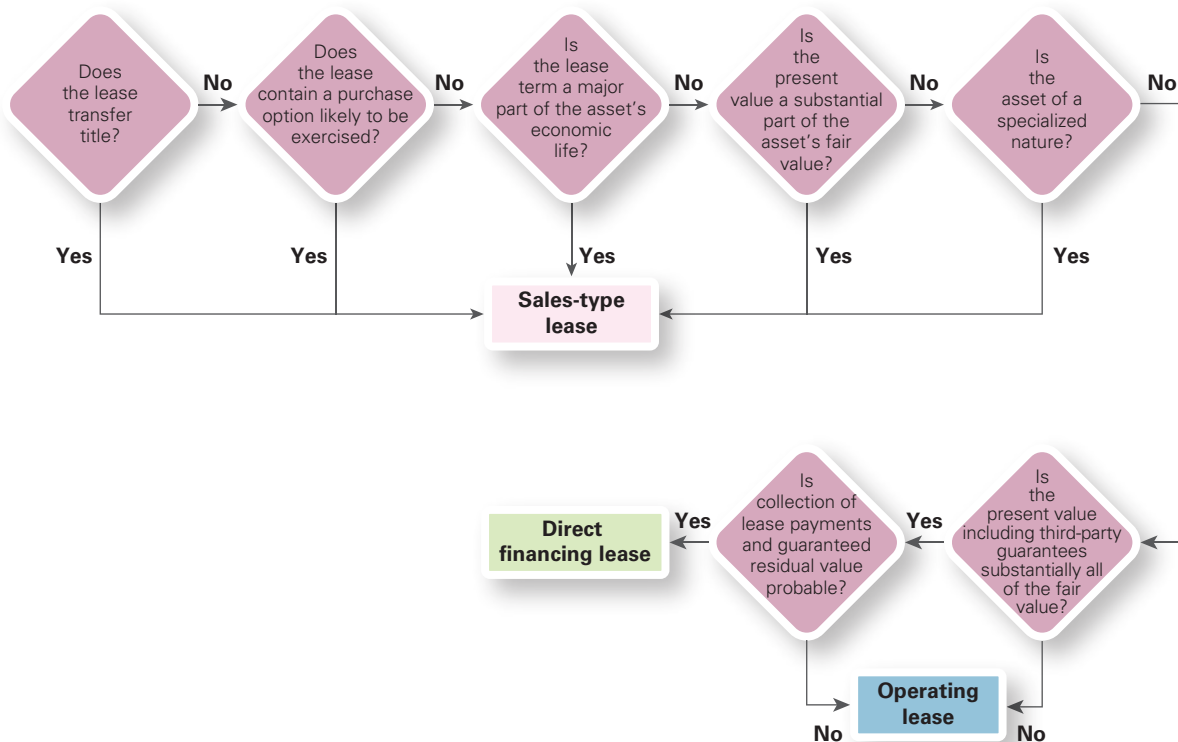

Exhibit 18.4 summarizes the lease classification decision.

EXHIBIT 18.4 Lease Classification Summary

Criteria	Lessee	Lessor	
Group I met	Finance	Sales-Type	
Group I not met	Operating	& Group II met	Direct-Financing
Group I not met		& Group II not met	Operating

Lease Payments and Discount Rates

In order to analyze the lease classification, we need to clearly define what is included in *lease payments* and what is the appropriate discount rate to use.

Lease Payments. The definition of a **lease payment** includes six elements. In any given lease arrangement, it is not likely that all six elements would be present. The six elements are:

1. Fixed payments less any *lease incentives* paid or payable to the lessee.⁷
2. Variable lease payments that depend on a rate or index (such as the consumer price level index or a market rate of interest) using the rate or index in effect at the lease commencement date.
3. The exercise price of an option to purchase the asset if the lessee is reasonably certain to exercise the option.
4. Penalty payments for lease termination if the lessee exercises an option to terminate the lease.
5. Fees paid by the lessee to the owners of a special-purpose entity for structuring the transaction. However, these fees are not included in the fair value of the leased asset.⁸
6. For a lessee only, the amounts that are probable of being owed by the lessee under *residual value guarantees*. Note that this component does not include any *unguaranteed residual assets* or any *residual value guarantees* made by a third party.

Lease incentives are payments the lessor makes to the lessee to provide an incentive to enter into a lease agreement. For example, the lessor may agree to pay IT system installation charges at a new location to give the lessee incentive to lease the new facility. As another example, the lessor may agree to pay the lessee's remaining rentals on another lease so the lessee can terminate that lease.

A **residual value guarantee** is a guarantee or assurance made to the lessor that he will receive a fixed dollar amount for the leased asset at the end of the lease. The lessee or a third party may provide this guarantee. If the fair value of the asset at the end of the lease is less than the residual value guarantee, the guarantor will make a payment to the lessor for the difference in the residual value guarantee and the fair value of the asset.

An **unguaranteed residual asset** is an amount the lessor expects to derive from the leased asset at the end of the lease term. This amount is simply the lessor's expectation; the lessee or a third party does not guarantee the residual value.

Discount Rates. Now that we have established the elements of lease payments, we discuss the determination of the appropriate discount rate to use in our lease computations. To compute the present value of the lease payments, both the lessor and the lessee have to determine the appropriate discount rate at the commencement of the lease. The lessor uses the *implicit rate*, which is a rate that is determined implicitly based on the equation in Exhibit 18.5.

The **implicit rate** is the rate of interest that sets the present value of the lease payments plus the present value of the amount that a lessor expects to obtain from the leased asset at the end of the lease term equal to the sum of the fair value of the leased asset and any deferred initial direct

⁷This includes any in-substance fixed payments. These types of payments are discussed in more depth in Surfing the Standards Case 2.

⁸These fees are not explicitly included by IFRS in the lease payments.

costs incurred by the lessor. Exhibit 18.5 presents the equality used in the computation of the implicit rate.

EXHIBIT 18.5 Implicit Rate

Because the lessor has to incur initial direct costs to obtain the lease, they are also included in determining the implicit rate of return on the lease. Note that the initial direct costs can either be deferred or expensed and if deferred, the initial direct costs are included in the computation of the implicit rate. The lessor may expense initial direct costs rather than defer these costs at the lease commencement. We discuss the rules that determine whether initial direct costs are expensed initially or deferred later in the chapter.

The lessee also uses the implicit rate unless it cannot determine the implicit rate. In that case, the lessee uses the **incremental borrowing rate**, which is the rate of interest that a lessee would have to pay to borrow an amount equal to the lease payments on a collateralized basis over a similar term to the lease in a similar economic environment. Example 18.3 illustrates determining the implicit rate.

EXAMPLE 18.3 Rate Implicit in the Lease

PROBLEM: JPAX Company, a lessor, enters into a 4-year lease transaction with payments due at the beginning of each year.

- The lease payments are \$48,000 per year.
- The fair value of the leased asset is \$260,000.
- The lessor's deferred initial direct costs are equal to \$12,000.
- The lessor's estimate of the unguaranteed residual asset is \$115,000.

What is the implicit rate in the lease for the lessor?

SOLUTION: JPAX solves for the implicit rate using the following equality:

$$\begin{aligned} \text{Present Value of Lease Payments} + \text{Present Value of Estimated Residual Value} \\ = \text{Fair Value of Asset} + \text{Deferred Initial Direct Costs} \end{aligned}$$

JPAX applies time value of money concepts to identify the terms needed to solve for the implicit rate: the present value, *PV*; the number of periods, *N*; the payments per period, *PMT*; and the future value, *FV*. Because the payments are due at the beginning of the period, this is a present value of an annuity due problem. The present value, *PV*, is the present value of the lease payments plus the expected residual value which equals the fair value of the leased asset plus the deferred initial direct costs:

$$\begin{aligned} \text{Present Value of Lease Payments} + \text{Present Value of Estimated Residual Value} \\ = \$260,000 \text{ Fair Value of Leased Asset} + \$12,000 \text{ Initial Direct Costs} = \$272,000 \end{aligned}$$

The number of periods, *N*, is 4 years. The payments each period, *PMT*, are \$48,000. The future value, *FV*, is the residual value of \$115,000. We use the spreadsheet application from Chapter 7 to determine the implicit rate as 5.22%:

	N	I/Y	PV	PMT	FV	Excel Formula
Given	4		-272,000	48,000	115,000	
Solve for RATE		5.22				=RATE(4,48000,-272000,115000,1)

After determining the lease payments and discount rates, we can now classify the lease as shown in Example 18.4.

EXAMPLE 18.4

Lease Classification

PROBLEM: On January 1, 2019, Sturge Manufacturing leased a piece of machinery for use in its North American operations from Borko Bank. The machinery is not specialized and, therefore, could also be leased to other parties. The 9-year, noncancellable lease requires lease payments of \$13,000 due at the beginning of each year. The present value of the lease payments is \$77,579. The lease agreement does not transfer ownership of the machinery and it does not contain a purchase option. Sturge has not guaranteed a residual value, but a third party has provided a guarantee with a present value of \$18,031. The machinery has a fair value of \$95,455 and an estimated life of 10 years. Borko views it highly probable that the bank will collect the lease payments from Sturge and the third-party residual value guarantor. Determine whether Sturge should report the lease as an operating or finance lease. Determine whether Borko should classify the lease as operating, direct financing, or sales type.

SOLUTION: The following table presents an analysis of the indicators to assess.

Group I Criteria	Met?	Explanation
Transfer of ownership?	No	
Purchase option likely to be exercised?	No	
Lease term major part of economic life?	Yes	The lease term is 90% (9 years / 10 years) of economic life.
Present value substantial part of fair value?	Uncertain	The present value of the lease payments of \$77,579 is 81% of the \$95,455 fair value of the machinery.
Asset is specialized?	No	

Group II Criteria	Met?	Explanation
Present value including third-party guarantees substantially all of fair value?	Yes	The present value of the lease payments plus the third-party guaranteed residual value of \$95,610 is 100.16% of the \$95,455 fair value of the machinery.
Lease payments and guaranteed residual value collection probable?	Yes	

To determine whether Sturge, the lessee, should classify the lease as an operating or a finance lease, we need only to assess the Group I criteria. Sturge should classify the lease as a finance lease because the lease term is 90% of the life of the asset. Whereas this is an area requiring judgment, 90% likely meets the “major part” criterion. For purposes of end-of-chapter exercises and problems, we will assume the cutoff for the third criterion is 75% and 90% for the fourth criterion.

To determine whether Borko Bank should classify the lease as operating, direct financing, or sales type, we assess the Group I first. The lease meets Group I criteria because the lease term is a major part of the economic life. Because the lease meets Group I criteria, Borko Bank will classify the lease as a sales-type lease. Borko does not need to assess the Group II criteria, but include them here to demonstrate the calculations involved.

IFRS Lease Classification

Lease classification is different under U.S. GAAP and IFRS.

In the case of the **lessee**, IFRS does not classify leases as operating and financing and does not distinguish two types of leases. Rather, lessee accounting treatment is the same for all leases under IFRS. All leases are recorded with leased assets and lease liabilities.

In the case of the **lessor**, IFRS includes only one group of criteria. If the criteria are met, the lease is classified as a finance lease; otherwise, the lease is classified as an operating lease. The goal of the IFRS classification standards for lessors is to determine whether the risks and rewards of ownership have been transferred to the lessee. IFRS does not distinguish between sales-type and direct financing leases.

The first five IFRS criteria are the same as U.S. GAAP Group I criteria for the lessor. However, IFRS does not specify that if one of the criteria is met, the lease is a finance lease. Rather, IFRS takes the approach that these scenarios are indicators that the lease is a finance lease for the lessor.

IFRS also identifies three additional indicators that individually or in combination could lead to classifying a lease as a finance lease. The terms of the lease imply a finance lease if:

1. The lessee bears the lessor's losses if the lessee cancels the lease.
2. The lessee absorbs the gains or losses from fluctuations in the fair value of the residual value of the asset.
3. The lessee may extend the lease for a secondary period at a rent substantially below the market rent in a renewal option.

An example of lease classification under IFRS is presented in Example 18.5.

EXAMPLE 18.5 IFRS Finance Lease: Lessor

PROBLEM: On January 1, 2019, Sturge Manufacturing, an IFRS reporter, leased a piece of machinery for use in its North American operations from Borko Bank. The 9-year, noncancellable lease requires lease payments of \$14,000 due at the beginning of each year. The machinery built to Sturge's specifications would require significant modifications for another manufacturer to use it. The present value of the lease payments, including payments during the renewal period, is \$77,519. The lease agreement does not transfer ownership of the machinery, and it does not contain a purchase option. Sturge can renew the lease for \$500 a year for 10 additional years and expects these terms to be lower than the market rent on the renewal date. The machinery has a fair value of \$95,455 and an estimated life of 20 years. Determine whether Borko Bank should report the lease as an operating or finance lease under IFRS.

SOLUTION: Borko Bank classifies this as a finance lease because the lease is for the major part of the machinery's economic life and at an amount representing a substantial portion of its fair value. Because the lease is noncancellable and the machinery is specialized, Sturge assumes the risks of ownership. The following table analyzes the situations and indicators of situations that Borko must assess. This analysis suggests that the lease transfers the risks and rewards of ownership. Therefore, Borko should classify the lease as a finance lease.

IFRS Criteria	Met?	Explanation
1. Transfer of ownership?	No	
2. Purchase option likely to be exercised?	No	
3. Lease term major part of economic life?	Yes	The lease term is 95% (19 years / 20 years) of economic life. Based on the IFRS criterion, it is likely that 95% would be considered a major part of the asset's economic life.
4. Present value substantial part of fair value?	Uncertain	The present value of \$77,519 is 81% of the \$95,455 fair value. Based on the IFRS criterion, it is likely that 81% would be considered substantially all of the fair value of the leased asset. Cutoffs for IFRS are lower than for U.S. GAAP.
5. Asset is specialized?	Yes	The problem states that major modifications would have to be made.

IFRS Criteria	Met?	Explanation
Additional IFRS Indicators		
1. Does the lessee bear the lessor's losses if the lessee cancels the lease?	Uncertain	This issue is not addressed.
2. Does the lessee absorb the gains or losses from fluctuations in the fair value of the residual value of the asset?	Uncertain	This issue is not addressed.
3. May the lessee extend the lease for a secondary period at a rent payment substantially lower than the market rental?	Yes	The decrease in rent from \$14,000 to \$500 implies that rent in the renewal would be substantially lower than the market rental.

CONCEPTUAL FRAMEWORK CONNECTION

Lease Classification

Prior to 2019, lessees did not include an asset and liability for operating leases on their balance sheets. Both FASB and IASB issued new standards that, with few exceptions, will require lessees to report an asset and liability on their balance sheets when they engage in a lease transaction. This accounting results in a more faithful representation of the rights and obligations arising from leases.

However, the FASB carried over the classification criteria from the previous standard in a way that does not always seem logical. The Group I criteria were originally designed to determine whether the lessee held the risks and rewards of the leased asset's ownership. For example, a purchase option that is likely to be exercised would indicate that the risks and rewards of ownership had been transferred to the lessee. The Group I criteria were effective in evaluating the transfer of risk and rewards. Because all leased assets and lease liabilities are now on the balance sheet, the current Group I criteria are no longer logical; that is, requiring the lessee to report all leased assets and lease liabilities on the balance sheet seems to answer the question of who holds the risks and rewards—the lessee.

In reality, the Group I criteria are now used to determine the subsequent accounting for operating and finance leases for the lessee. As we discuss later in the chapter, when the amount the expenses are reported and where on the income statement they are reported differs for an operating lease and a finance lease. Yet, the Group I criteria are not related to the leased asset's subsequent use and cannot be used to explain the differences in expense reporting. Whereas the U.S. GAAP standard initially results in a faithful representation of the leased asset and liability on the balance sheet, the subsequent treatment on the income statement is more difficult to justify from a conceptual standpoint. The IFRS model—for which there is no distinction in operating and finance leases for a lessee—is much more conceptually sound.

Likewise, it is challenging to understand the objective of the Group II criteria. Under the prior standards, U.S. GAAP distinguished a sales-type lease from a direct financing lease based on whether a profit existed. Now the distinction is based on whether there is a third-party guaranteed residual value. Presumably, FASB did not want lessors to recognize a profit at lease commencement from non-operating lease treatment due solely to a third-party residual value guarantee. But the Group II criteria seem like a highly complex way to achieve this reporting outcome.

Finally, there is a disconnect for lessee and lessor accounting under both U.S. GAAP and IFRS. Under both standards, the lessee always recognizes the leased asset and the lease liability (unless he meets one of the limited exceptions that we discuss later in the chapter). However, in the case of the operating lease, the lessor continues to recognize the asset on its balance sheet. If the risks and returns of ownership have truly passed to the lessee, causing the lessee to recognize the leased asset and lease liability on the balance sheet, then why wouldn't the lessor derecognize the asset? This is a question that the current standards do not answer.

- 4 Demonstrate the accounting for an operating lease for both the lessee and the lessor.

Accounting for Operating Leases: Lessee and Lessor

We now examine the details of lease accounting related to initial and subsequent measurement. Our discussion begins with operating leases of both lessee and lessor accounting.

Initial Measurement of an Operating Lease: Lessee

As noted earlier in this chapter, in the case of an operating lease, the lessee should report the leased asset and the related liability on its balance sheet. The lease transaction is similar to a purchase transaction in which the lessor provides financing. The lease liability reflects the fact that the lessee is obligated to make future lease payments whereas the leased asset, which we refer to as the **right-of-use asset**, indicates that the lessee then has the right to control the leased asset.

Measuring the Lease Liability. The lessee measures a lease liability on the lease commencement date as the present value of the remaining lease payments discounted at the implicit rate in the lease (or the incremental borrowing rate if the implicit rate is not readily determinable) plus the guaranteed residual value (if the lessee provides the guarantee).

The lease payments used to measure the lease are generally the same as those used in the Group I criteria to classify the lease. However, the lessee uses all payments (including payments made before the lease commencement date) to classify the lease whereas it uses only the remaining lease payments to measure the lease liability.

Measuring the Right-of-Use Asset. The right-of-use asset is initially measured to reflect the lessee's net cash outflows related to the lease. The lessee capitalizes all of the costs associated with the lease into the right-of-use asset account so that it includes all of the lease payments along with any initial direct costs incurred. In addition, if the lessee receives lease incentives (a cash inflow), then he reduces the right-of-use asset by this amount. Specifically, the right-of-use asset includes the following components:

1. The lease liability determined as the present value of the remaining lease payments as of the commencement date.
2. Lease payments the lessee makes to the lessor at or before the commencement date. These payments are prepayments made prior to the lease commencement date, often on the lease inception date. The lessee initially reports them as prepaid assets and then reclassifies them to right-of-use assets on the lease commencement date.
3. Any initial direct costs the lessee incurs. Lessees initially report initial direct costs as prepaid assets and then reclassify these costs to increase the right-of-use asset on the lease commencement date.
4. A reduction for any lease incentives the lessee receives. Lessees initially report lease incentives as liabilities and then reclassify these incentives to reduce the right-of-use asset on the lease commencement date.

The asset could have an initial measurement that differs from the liability because of the lease payments made before the lease commencement date, lease incentives, and initial direct costs. Exhibit 18.6 presents the initial measurement of the right-of-use asset.

EXHIBIT 18.6 Initial Measurement of the Right-of-Use Asset

Right-of-Use Asset	
	Lease liability defined as the present value of the remaining lease payments
+	Prepaid lease payments
+	Lessee's initial direct costs
–	Lease incentives

Example 18.6 illustrates the lessee's initial measurement of the lease liability and the right-of-use asset for an operating lease.

EXAMPLE 18.6**Initial Measurement of an Operating Lease: Lessee**

PROBLEM: Mac Sullivan Company leases nonspecialized medical equipment with a fair value of \$195,000 from RehabCo. The lease term is for 5 years and commences on January 1, 2019. The estimated economic life of the equipment is 10 years. Mac Sullivan prepaid the first rental payment of \$20,000 on December 15, 2018 (the inception date) and received \$28,800 from RehabCo on the inception date to terminate a lease from another lessor. Mac Sullivan must pay five additional rental fees of \$20,000 each year beginning on January 1, 2019. The second payment is due on December 31, 2019. Thereafter, each payment is due on December 31. The implicit rate in the lease is 4%. Mac Sullivan incurred initial direct costs prior to the lease commencement of \$3,500 that it originally recorded as prepaid initial direct costs. The lease agreement does not contain a transfer of ownership or a purchase option. Mac Sullivan has determined that none of the Group I criteria are met, so the company classifies the lease as an operating lease. How would the lessee measure and record the lease liability and the right-of-use asset?

SOLUTION: Mac Sullivan measures the lease liability as the present value of all remaining lease payments on the commencement date. The present value of the annuity due of the five lease payments of \$20,000 at a discount rate of 4% is \$92,598.

	N	I/Y	PV	PMT	FV	Excel Formula
Given	5	4.00%		-20,000	0	
Solve for PV			92,598			=PV(0.04,5,-20000,0,1)

Mac Sullivan measures the right-of-use asset as the sum of the initial lease liability measurement, prepayments net of lease incentives, and initial direct costs:

Initial measurement of the lease liability	\$92,598
Add: Prepayments Mac Sullivan made to the lessor prior to the lease commencement date	20,000
Subtract: Lease incentives Mac Sullivan receives	(28,800)
Add: Mac Sullivan's initial direct costs	3,500
Initial measurement of the right-of-use asset	<u>\$87,298</u>

The following entry records the payment Mac Sullivan made to the lessor RehabCo prior to the lease commencement date as an asset.

Account	December 15, 2018
Prepaid Lease Payment	20,000
Cash	20,000

The lessee receives \$28,800 from the lessor as an incentive to sign the lease. Mac Sullivan records this lease incentive as a liability.

Account	December 15, 2018
Cash	28,800
Liability for Lease Incentive	28,800

The lessee also paid initial direct costs and records that payment as a prepaid asset.

Account	Prior to January 1, 2019
Prepaid Initial Direct Costs	3,500
Cash	3,500

At December 31, 2018, the liability for the lease incentive, the prepaid initial direct costs and the prepaid lease payment appear on Mac Sullivan's balance sheet.

Continued

On the lease commencement date, Mac Sullivan records the right-of-use asset and the lease liability. In addition, it reclassifies the lease incentive and the initial direct costs. It also removes the prepaid lease payment. Mac Sullivan makes the following entry on January 1:

Account	January 1, 2019	
Right-of-Use Asset	87,298	
Liability for Lease Incentive	28,800	
Prepaid Lease Payment		20,000
Prepaid Initial Direct Costs		3,500
Lease Liability		92,598

In addition to the initial measurement of the lease liability and right-of-use asset, Mac Sullivan also records the first annual lease payment as follows:

Account	January 1, 2019	
Lease Liability	20,000	
Cash		20,000

Subsequent Measurement of an Operating Lease: Lessee

After the lease commences, the lessee subsequently adjusts the balances of the lease liability and the right-of-use asset and recognizes the lease expense. The lease expense is composed of interest on the lease liability and amortization of the right-of-use asset. We adopt a simplified, practical approach to subsequent measurement.⁹

The practical approach for subsequent measurement for an operating lease involves a five-step methodology:

- Step 1:** Determine the total payments to be made by the lessee from the lease inception date to the termination date, including prepayments and initial direct costs incurred by the lessee, net of any incentives received.
- Step 2:** Determine the amount of lease expense to be recognized each year by dividing the total payments computed in Step 1 by the lease term.
- Step 3:** Compute the periodic interest expense on the lease liability by using the effective interest rate method.
- Step 4:** Compute the reduction in the lease liability each period as the payment made that period less the interest computed in Step 3.
- Step 5:** Determine the amortization of the right-of-use asset, which is measured as the difference in the straight-line lease expense and the interest expense from Step 3.¹⁰

⁹The authoritative literature provides an approach to subsequent measurement that involves remeasuring the asset and liability, with the lease expense recognized on a straight-line basis. While the step-by-step method is different than that implied in the Codification, the end result, in terms of journal entries and financial statement impact is the same. See Surfing the Standards Case 3 for a more in-depth analysis of the Codification on this issue.

¹⁰The terminology for the systematic reduction of the carrying value of leased assets is slightly different than that used for other fixed assets. Normally, we refer to the periodic reduction in the asset balance as depreciation. However, in the case of a leased asset, we use the word *amortization*.

This approach is illustrated in Example 18.7.

EXAMPLE 18.7 Subsequent Measurement of an Operating Lease: Lessee

PROBLEM: Consider Mac Sullivan Company from the Example 18.6. Provide all necessary journal entries for Mac Sullivan over the lease term.

SOLUTION: As noted in Example 18.6, this is an operating lease. Also recall that we initially measured the lease liability at \$92,598 and the right-of-use asset at \$87,298. Given this information from the prior example, we now illustrate subsequent measurement using the five steps.

Step 1. Total Payments

In the first step, we sum all of the payments that Mac Sullivan will make and reduce this by any incentives it receives.

Annual payments ($\$20,000 \times 5$ years)	\$100,000
Lease payment on December 15, 2018	20,000
Lease incentive	(28,800)
Initial direct costs	<u>3,500</u>
Total payments	<u>\$ 94,700</u>

Step 2. Straight-Line Expense

In the second step, we allocate the total payments computed in Step 1 on a straight-line basis across the life of the lease to arrive at the annual lease expense.

Total Payments	\$94,700
Divided by years	<u>5</u>
Annual lease expense	<u>\$18,940</u>

We include this lease expense on the income statement each year on one line in operating income.

Steps 3 and 4. Periodic Interest and Reduction in the Liability

We next compute the periodic interest using the effective interest method. Each period the interest is computed as the beginning lease liability balance multiplied by the effective interest rate (the implicit rate if the lessee knows it). We can then compute the periodic reduction in the lease liability by subtracting the interest portion from the total payment.

Date	Payment (a)	Interest (b) = Prior-Period Balance \times 4% Step 3	Reduction in Lease Liability (c) = (a) - (b) Step 4	Balance (d) = Prior-period balance - (c)
Lease Commencement – January 1, 2019				\$92,598
January 1, 2019	\$20,000	0	20,000	72,598
December 31, 2019	20,000	2,904	17,096	55,502
December 31, 2020	20,000	2,220	17,780	37,722
December 31, 2021	20,000	1,509	18,491	19,231
December 31, 2022	20,000	<u>769</u>	<u>19,231</u>	0
		<u>\$7,402</u>	<u>\$92,598</u>	

Continued

Step 5: Amortization of the Right-of-Use Asset

Finally, we compute the portion of the annual lease expense that is attributable to the asset amortization. This amount is computed as the annual lease expense (computed in Step 2) less the interest portion that we computed in Step 3.

Date	Lease Expense (a)	Interest Column (b) of Preceding Table	Amortization of Right of Use Asset (c) = (a) – (b) Step 5
December 31, 2019	\$18,940	2,904	\$16,036
December 31, 2020	18,940	2,220	16,720
December 31, 2021	18,940	1,509	17,431
December 31, 2022	18,940	769	18,171
December 31, 2023	18,940	0	18,940
	<u>\$94,700</u>	<u>\$7,402</u>	<u>\$87,298</u>

The journal entries draw on the information provided in the previous tables.

Account	December 31, 2019
Lease Expense	18,940
Lease Liability	17,096
Accumulated Amortization—Right-of-Use Asset	16,036
Cash	20,000

Account	December 31, 2020
Lease Expense	18,940
Lease Liability	17,780
Accumulated Amortization—Right-of-Use Asset	16,720
Cash	20,000

Account	December 31, 2021
Lease Expense	18,940
Lease Liability	18,491

Operating Lease with Residual Values: Lessee Guaranteed Residual Value

Accounting for the lease is slightly more complex when the lessee makes a residual value guarantee. Residual value guaranteed by the lessee is included in the lease payments. If the residual value is guaranteed by a third party, or is unguaranteed, it does not impact the lessee accounting treatment.

Example 18.8 illustrates an operating lease when the lessee provides a residual value guarantee.

EXAMPLE 18.8

Initial Measurement of an Operating Lease with a Residual Value: Lessee

PROBLEM: Consider Mac Sullivan Company from Example 18.6. Assume that Mac Sullivan enters into the same lease agreement except that Mac Sullivan guarantees a residual value of \$25,000.¹¹ The company has determined that none of the Group I criteria have been met, so Mac Sullivan classifies the lease as an operating lease. Provide the journal entries for 2018 and January 1, 2019.

SOLUTION: Mac Sullivan determines the initial measurement of the lease liability as the present value of an annuity due of the lease payments that have not been made as of the lease commencement date. The present value of an annuity due of the five lease payments of \$20,000 and the guaranteed residual value of \$25,000 at a discount rate of 4% is \$113,146.

	N	I/Y	PV	PMT	FV	Excel Formula
Given	5	4.00%		-20,000	-25,000	
Solve for PV			113,146			=PV(0.04,5,-20000,-25000,1)

Continued

¹¹Note that the lessor would likely require lower annual lease payments if the lessee guarantees a residual value because the lessor requires a certain rate of return.

Mac Sullivan measures the right-of-use asset as the sum of the initial lease liability measurement, prepayments net of lease incentives, and initial direct costs.

Initial measurement of the lease liability	\$113,146
Add: Prepayments Mac Sullivan made to the lessor prior to the lease commencement date	20,000
Subtract: Lease incentives Mac Sullivan receives	(28,800)
Add: Mac Sullivan's initial direct costs	<u>3,500</u>
Initial measurement of the right-of-use asset	<u>\$107,846</u>

The following journal entry records the payment Mac Sullivan made to the lessor prior to the lease commencement date as an asset.

Account	December 15, 2018	
Prepaid Lease Payment	20,000	
Cash		20,000

The lessee receives \$28,800 from the lessor as an incentive to sign the lease. Mac Sullivan records this incentive as a liability.

Account	December 15, 2018	
Cash	28,800	
Liability for Lease Incentive		28,800

The lessee also paid initial direct costs and records that payment as a prepaid asset.

Account	Prior to January 1, 2019	
Prepaid Initial Direct Costs	3,500	
Cash		3,500

At December 31, 2018, the liability for the lease incentive, the prepaid initial direct costs, and the prepaid lease payment appear on Mac Sullivan's balance sheet.

On the lease commencement date, Mac Sullivan records the right-of-use asset and the lease liability. In addition, it reclassifies the lease incentive and the initial direct costs. It also removes the prepaid lease payment. Mac Sullivan makes the following entry on January 1:

Account	January 1, 2019	
Right-of-Use Asset	107,846	
Liability for Lease Incentive	28,800	
Prepaid Lease Payment		20,000
Prepaid Initial Direct Costs		3,500
Lease Liability		113,146

Short-Term Policy Election: Lessee

When a lease term is 12 months or less, the lessee can make a policy election not to record the lease liability and the right-of-use asset. The FASB included this exemption based on the cost constraint. That is, the costs of measuring and reporting the lease liability and the right-of-use asset outweigh the benefits of reporting these amounts on the lessee's balance sheet for a lease with a term of 1 year or less.

When a lessee makes the short-term lease policy election, it records rent expense based on the rent payments. Example 18.9 illustrates accounting for a short-term lease when the lessee makes a policy election not to record the lease liability and the right-of-use asset.

EXAMPLE 18.9**Lessee: Short-Term Lease Policy Election**

PROBLEM: Inwood Floor Care rents wood-scraping machinery from Elliot Manufacturing on January 1, 2019. Under the terms of the agreement, Inwood will pay rentals of \$2,000 per month for an 8-month period at the first day of every month, beginning on January 1, 2019. Inwood elects to apply the exemption for short-term leases. That is, Inwood makes a policy election not to record the lease liability and the right-of-use asset. What journal entry will Inwood make each month to record the rental payments?

SOLUTION: The monthly journal entry follows:

Account	First Day of Each Month
Prepaid Rent	2,000
Cash	2,000

At the end of each month, Inwood will record rent expense and reduce the prepaid asset account.

Account	Last Day of Each Month
Rent Expense	2,000
Prepaid Rent	2,000

Rent expense could be debited directly.

Operating Lease: Lessor Accounting

We discuss lessor accounting for operating leases in this section. In an operating lease, the lessor continues to report the leased asset on the lessor's balance sheet. It may also record depreciation expense if it classifies the asset as property, plant, and equipment. The lessor does not record depreciation if it holds the asset as part of inventory.

After the commencement date, the lessor will record rental revenue composed of the following:

- Total lease payments, recognized on a straight-line basis
- Variable payments not included in the lease payments¹²

The lessor expenses initial direct costs over the lease term, typically on a straight-line basis. Any residual value, whether guaranteed or unguaranteed, does not affect the lessor's accounting treatment for operating leases. Example 18.10 illustrates the lessor's accounting for an operating lease.

EXAMPLE 18.10**Operating Lease: Lessor**

PROBLEM: On January 1, 2019, Joseph Botti AutoWorld, Inc. leases a SUV that it carries in its inventory to Cava Company. The lease term is 4 years with no renewal options, and the economic life of the SUV is 7 years. The fair value of the automobile is \$45,000, and Joseph Botti's cost or carrying value is also \$45,000. There are no lease incentives. The lease requires monthly payments of \$600 at the end of each month. Botti incurs initial direct costs of \$2,400 on January 1, 2019. The implicit rate in the lease is 5%. There is no transfer of ownership at the end of the lease term. Lease payment collection is probable. How should the lessor classify the lease? Provide the journal entries for January 2019 and February 2019 for the lessor.

Continued

¹²If the collectability of lease payments and residual value guarantees is not probable, then revenue is limited to the lesser of (1) the amounts in (a) and (b) and (2) the lease payments and variable payments already received.

SOLUTION: To determine whether Botti, the lessor, should classify the lease as operating, direct financing, or sales type, we assess both Group I and Group II criteria.

We have information to assess all of the criteria except for the fourth criterion of Group I. The present value of an ordinary annuity of the 48 remaining lease payments of \$600 at a discount rate of 0.4167% per period (5%/12) is \$26,054.

	N	I/Y	PV	PMT	FV	Excel Formula
Given	48	0.4167%		600	0	
Solve for PV			(26,054)			=PV(0.004167,48,600,0)

The following table presents an analysis of the indicators.

Group I Criteria	Met?	Explanation
Transfer of ownership?	No	
Purchase option likely to be exercised?	No	
Lease term major part of economic life?	No	The lease term is 57% (4 years / 7 years) of economic life.
Present value substantial part of fair value?	No	The present value of \$26,054 is 58% of the \$45,000 fair value.
Asset is specialized?	No	

Group II Criteria	Met?	Explanation
Present value including third-party guarantees substantially all of fair value?	No	The present value of \$26,054 is 58% of the \$45,000 fair value.
Lease payment collection probable?	Yes	

The lease does not meet Group I or both of the Group II criteria and thus is an operating lease.

On January 1, 2019, Botti paid for initial direct costs, which it capitalizes as an asset.

Account	January 1, 2019
Prepaid Initial Direct Costs	2,400
Cash	2,400

Botti does not remove the asset from its books. However, because the SUV is included in inventory, it is not depreciated. Each period Botti records revenue for the lease payments and expense for the initial direct costs (\$2,400/48 months = \$50 per month).

Account	January 31, 2019
Cash	600
Initial Direct Cost Expense	50
Rent Revenue	600
Prepaid Initial Direct Costs	50

Account	February 28, 2019
Cash	600
Initial Direct Cost Expense	50
Rent Revenue	600
Prepaid Initial Direct Costs	50

- 5 Demonstrate lessee accounting for a finance lease.

Accounting for Finance Leases: Lessee

Next, we discuss the lessee's initial and subsequent measurement of a finance lease. We then explain the accounting treatment for a finance lease when there is a residual value.

Initial and Subsequent Measurement of Finance Leases: Lessee

The initial measurement for a finance lease is the same as for an operating lease. That is, the lessee records a right-of-use asset and a liability on the lease commencement date. However, the subsequent measurement differs.

Unlike subsequent measurement in an operating lease, under a finance lease, the lessee reduces the right-of-use asset by recording amortization expense on a straight-line basis. Companies generally amortize leased assets over the term of the lease because the asset will be returned at the end of the lease. However, if the lease contract includes an ownership transfer or a purchase option that is likely to be exercised, the company amortizes the asset over the expected life of the asset because the lessee will ultimately own the asset.

The lessee also remeasures the lease liability, reducing it by a portion of each lease payment. The lessee computes interest expense on the lease obligation using the effective interest rate method. The lessee allocates lease payments first to cover the interest and then to reduce the lease obligation. This remeasurement of the lease liability is the same as it is under an operating lease. However, recall that in the case of an operating lease, the interest and asset amortization are combined into a single, straight-line lease expense.

For a finance lease, the lessee records a lease expense each period of the lease that includes the following:

1. Use of the appropriate discount rate to compute the present value of the liability at the lease commencement date. Interest expense on the lease liability is computed under the effective interest rate method of amortization.
2. Variable lease payments not included in the lease liability in the period in which the obligation for the variable payments is incurred.
3. Changes in variable lease payments that depend on an index or rate.¹³

Exhibit 18.7 summarizes the subsequent measurement of a finance lease.

EXHIBIT 18.7 Subsequent Measurement of a Finance Lease

Lease Liability	Right-of-Use Asset	Lease Expense*
Present value of the remaining lease payments**	Record amortization expense on a straight-line basis	Interest expense on the lease liability using the effective interest rate method
Compute interest using the effective interest rate method. Allocate lease payment first to interest, and any remaining amount then reduces the lease liability.		Variable lease payments not included in the measurement of the lease liability
		Changes in the variable lease payments that depend on an index or rate

* The lease expense also includes any impairment of the right-of-use asset.

** Use the implicit rate at the commencement date if known. Otherwise, use the incremental borrowing rate at the commencement date.

¹³The lease expense also includes any impairment of the right-of-use asset.

Example 18.11 illustrates the lessee's accounting for a finance lease that does not contain a residual value guarantee.

EXAMPLE 18.11 Finance Lease: Lessee

PROBLEM: On January 1, 2019, Berg Manufacturing leased a nonspecialized piece of machinery for use in its North American operations from Borko Bank. The lease agreement was signed on January 1 and the equipment was provided to Berg on the same day. The 9-year, noncancellable lease requires annual lease payments of \$12,000, beginning January 1, 2019, and at each December 31 thereafter through 2026. The lease agreement does not transfer ownership of the machinery, nor does it contain a purchase option. The machinery has a fair value of \$75,000 and an estimated life of 10 years. Borko Bank's implicit rate is not known to Berg. Berg's incremental borrowing rate is 11%. Berg incurs initial direct costs of \$3,000 on January 1, 2019. Analyze the lease classification criteria to determine whether the lease is an operating or finance lease for Berg. Provide the journal entries for Berg for 2019.

SOLUTION: We use the Group I criteria to determine whether this lease should be classified as a finance lease for the lessee. We have information to assess all of the Group I criteria except for the fourth criterion on the present value as a substantial part of the fair value. The present value of an annuity due of the nine remaining lease payments of \$12,000 at a discount rate of 11% is \$73,753.

	N	I/Y	PV	PMT	FV	Excel Formula
Given	9	11.00%		-12,000	0	
Solve for PV			73,753			=PV(.011,9,-12000,0,1)

This lease is a finance lease because it meets both Criteria 3 and 4. The lease term is 90% of the life of the asset, which is a major part. Also, the present value of the lease payments is 98.3% of the asset's fair value, a substantial part.

Group I Criteria	Met?	Explanation
Transfer of ownership?	No	
Purchase option likely to be exercised?	No	
Lease term major part of economic life?	Yes	Lease term is 90% (9 years / 10 years of economic life).
Present value substantial part of fair value?	Yes	The present value of \$73,753 is 98.3% of the \$75,000 fair value.
Asset is specialized?	No	

The initial direct costs are paid on January 1, 2019.

Account	January 1, 2019
Prepaid Initial Direct Costs	3,000
Cash	3,000

Because this is a finance lease, Berg records the liability at the lease commencement as the present value of the lease payments not yet paid and removes the prepaid initial direct costs. Berg records the right-of-use asset at the amount of the lease liability plus the initial direct costs.

Account	January 1, 2019
Right-of-Use Asset	76,753
Prepaid Initial Direct Costs	3,000
Lease Liability	73,753

To account for the lease as a finance lease, Berg computes interest on the lease using the effective interest rate method. Interest each period is the beginning lease balance times the interest rate (Column b) as seen in the following table. Berg allocates each lease payment of \$12,000 first to interest and any remaining amount then reduces the lease liability (Column c). The amount that reduces the lease liability decreases the lease liability balance (Column d). The amortization table follows.

Date	Payment (a)	Interest (b) = Prior-Period Balance × 11%	Reduction in Lease Liability (c) = (a) – (b)	Balance (d) = Prior-Period Balance – (c)
Lease Commencement – January 1, 2019				\$73,753
January 1, 2019	\$12,000	\$ 0	\$12,000	61,753
December 31, 2019	12,000	6,793	5,207	56,546
December 31, 2020	12,000	6,220	5,780	50,766
December 31, 2021	12,000	5,584	6,416	44,350
December 31, 2022	12,000	4,879	7,121	37,229
December 31, 2023	12,000	4,095	7,905	29,324
December 31, 2024	12,000	3,226	8,774	20,550
December 31, 2025	12,000	2,261	9,739	10,811
December 31, 2026	12,000	1,189	10,811	0

Notice that Berg allocates the first payment entirely to principal because interest accrues only with the passage of time.

The journal entry for the first lease payment on January 1, 2019, is as follows:

Account	January 1, 2019
Lease Liability	12,000
Cash	12,000

At the end of the year, Berg records the following entry. As shown in the amortization table, Berg allocates the second payment on December 31, 2019, to interest expense of \$6,793 and reduction of the lease liability of \$5,207.

Account	December 31, 2019
Lease Liability	5,207
Interest Expense	6,793
Cash	12,000

Berg amortizes the leased asset on a straight-line basis over the lease term. Amortization expense is computed as \$8,528: the right-of-use asset of \$76,753 divided by the 9-year lease term.

Account	December 31, 2019
Amortization Expense—Right-of-Use Asset	8,528
Accumulated Amortization—Right-of-Use Asset	8,528

Exhibit 18.8 summarizes the accounting treatment for lessees.

EXHIBIT 18.8 Summary of Lessee Accounting Treatment

	Operating Lease	Finance Lease
Classification	Group I criteria not met	Group I criteria met
Initial measurement—Lease liability	Present value of the remaining lease payments*	
Initial measurement—Right-of-Use asset	Lease liability Plus Prepayments Initial direct costs incurred by the lessee Less Lease incentives received by lessee	
Subsequent measurement—Lease liability	Present value of the remaining lease payments*	Present value of the remaining lease payments* Compute interest using the effective interest rate method. Allocate lease payment first to interest and any remaining amount then reduces the lease liability.
Subsequent measurement—Right-of-Use asset	Lease liability Plus Prepaid lease payments Unamortized initial direct costs Less Accrued lease payments Remaining balance—Incentives Impairments	Record amortization expense on a straight-line basis
Measurement of the lease expense**	<ol style="list-style-type: none"> 1. A single lease cost (which includes the amortization of the right-of-use asset) calculated so that the remaining cost of the lease is allocated over the remaining lease term on a straight-line basis.*** 2. Variable lease payments not included in the measurement of the lease liability. 3. Changes in variable lease payments that depend on an index or rate 	<ol style="list-style-type: none"> 1. Interest expense on the lease liability using the effective interest rate method 2. Variable lease payments not included in the measurement of the lease liability. 3. Changes in the variable lease payments that depend on an index or rate

* Use the implicit rate at the commencement date if known. Otherwise, use the incremental borrowing rate at the commencement date.

** The lease expense for both operating and finance leases also includes any impairment of the right-of-use asset.

*** The remaining cost of the lease is calculated as total lease payments (including those previously paid and those not yet paid) plus total lessee initial direct costs less any lease cost recognized in prior periods.

Finance Lease with Residual Values: Lessee

If a lease provides a residual value guarantee, the lessee includes the present value of the residual value guarantee in the initial measurement of the lease liability. Similar to an operating lease, if the residual value is guaranteed by a third party or is unguaranteed, then the residual value does not impact the lessee's accounting treatment.

Example 18.12 illustrates a finance lease with a residual value guarantee.

EXAMPLE 18.12

Finance Lease with Residual Value: Lessee

PROBLEM: Consider Berg Manufacturing from Example 18.11. Assume that the lease agreement is the same except that Berg has guaranteed a residual value of \$15,000.¹⁴ Berg has determined that the lease meets both Group I Criteria 3 and 4, so Berg classifies the lease as a finance lease. Provide the journal entries for Berg for 2019. Provide the journal entry for 2027, assuming that Berg is required to pay Borko Bank the full \$15,000 residual value. Also provide the journal entry for 2027 assuming that Berg is not required to pay Borko Bank any of the residual value.

SOLUTION: The initial direct costs of \$3,000 are paid on January 1, 2019.

Account	January 1, 2019
Prepaid Initial Direct Costs	3,000
Cash	3,000

Because this is a finance lease, Berg records the liability at the lease commencement as the present value of the lease payments not yet paid. The present value of an annuity due of the nine remaining lease payments of \$12,000 and the present value of the guaranteed residual value of \$15,000 at a discount rate of 11% is \$79,617 computed as follows:

	N	I/Y	PV	PMT	FV	Excel Formula
Given	9	11.00%		-12,000	-15,000	
Solve For PV			79,617			=PV(0.11,9,-12000,-15000,1)

Berg also removes the prepaid initial direct costs. It records the asset at the amount of the lease liability plus the initial direct costs.

Account	January 1, 2019
Right-of-Use Asset	82,617
Prepaid Initial Direct Costs	3,000
Lease Liability	79,617

To account for the lease as a finance lease, Berg allocates each lease payment to reduce the lease debt and cover the interest expense for the period. Berg allocates the \$12,000 payment to interest and principal using the effective interest rate method of amortization.

Continued

¹⁴Note that the lessor would likely require lower annual lease payments if the lessee guarantees a residual value because the lessor requires a certain rate of return.

Date	Payment (a)	Interest (b) = Prior-Period Balance × 11%	Reduction in Lease Liability (c) = (a) – (b)	Balance (d) = Prior-Period Balance – (c)
Lease Commencement – January 1, 2019				\$79,617
January 1, 2019	\$12,000	\$ 0	\$12,000	67,617
December 31, 2019	12,000	7,438	4,562	63,055
December 31, 2020	12,000	6,936	5,064	57,991
December 31, 2021	12,000	6,379	5,621	52,370
December 31, 2022	12,000	5,761	6,239	46,131
December 31, 2023	12,000	5,074	6,926	39,205
December 31, 2024	12,000	4,313	7,687	31,518
December 31, 2025	12,000	3,467	8,533	22,985
December 31, 2026	12,000	2,528	9,472	13,513
December 31, 2027	15,000*	1,487**	13,513	0

* The lease liability is fully paid upon realization of the residual value.

** Adjusted due to rounding errors.

Notice that Berg allocates the first payment entirely to principal because interest accrues only with the passage of time.

Account	January 1, 2019
Lease Liability	12,000
Cash	12,000

Berg amortizes the asset on a straight-line basis over the lease term. Amortization expense is computed as \$7,513: the right-of-use asset of \$82,617 minus the guaranteed residual value of \$15,000 divided by the 9-year lease term.

Account	December 31, 2019
Amortization Expense—Right-of-Use Asset	7,513
Accumulated Amortization—Right-of-Use Asset	7,513

As shown in the amortization table, Berg allocates the second payment on December 31, 2019, to interest of \$7,438 and principal of \$4,562.

Account	December 31, 2019
Lease Liability	4,562
Interest Expense	7,438
Cash	12,000

At December 31, 2027, the lease termination date, the balance of the lease liability is \$13,513. Assuming that Berg must pay the \$15,000 to cover the guaranteed residual value, Berg will make the following entry:

Account	December 31, 2027
Lease Liability	13,513
Interest Expense	1,487
Accumulated Amortization—Right-of-Use Asset	67,617
Loss on Lease	15,000
Right-of-Use Asset	82,617
Cash	15,000

If Berg does not have to pay the \$15,000, it will make the following entry because it must remove the liability from its balance sheet:

Account	December 31, 2027
Lease Liability	13,513
Accumulated Amortization—Right-of-Use Asset	67,617
Interest Expense	1,487
Right-of-Use Asset	82,617

IFRS Accounting for Operating and Finance Leases: Lessee

The primary difference in IFRS and U.S. GAAP related to lessee accounting is that IFRS does not distinguish operating from finance leases in the same way that U.S. GAAP does. Under IFRS, lessees use the same accounting treatment for both types of leases. Specifically, IFRS uses the U.S. GAAP accounting for finance leases for both operating and finance leases. Thus, under IFRS, lessees report interest expense and amortization expense on all leases.

In addition to the short-term policy election to account for a lease as a rental agreement, IFRS makes an exception for leased assets that have low values. IFRS reporters may account for leased assets with original costs of less than \$5,000 as rental agreements. For example, assume that a company leases a \$4,800 computer for 2.5 years. Under U.S. GAAP, the company records a right-of-use asset and a lease liability because the lease term is greater than 1 year. Under IFRS, the company does not need to record the leased asset and lease liability because the original cost of the leased asset is less than \$5,000, and it is a simple rental agreement.

- 6 Illustrate lessor accounting for sales-type leases.

Accounting for Sales-Type Leases: Lessor

For the lessor, a sales-type lease meets at least one of the Group I criteria. Meeting any one of the five Group I criteria implies that the lessor no longer possesses the right to control the leased asset. That is, the lessor has sold the right to control the asset to the lessee. Thus, the lessor removes the leased asset from its books and instead reports a financial asset that represents its right to receive payments from the lessee. In addition, the lessor reports both revenue and cost of goods sold related to the leased asset.

Initial Measurement of a Sales-Type Lease

For a sales-type lease, a lessor recognizes revenue on the sale and records the asset *net investment in lease – sales-type*. It also removes the leased asset from its accounts and records the cost of goods sold.

Revenue for a sales-type lease is the lower of (1) the fair value of the leased asset and (2) the sum of the *lease receivable* plus any lease payments received before the lease commencement date. Cost of goods sold for a sales-type lease is equal to the carrying value of the leased asset less the present value of any unguaranteed residual asset plus any deferred initial direct costs paid by the lessor.

The **net investment in the lease for a sales-type lease** (NIL-ST) reflects the assets related to the lease transaction and is composed of:

1. The lease receivable
2. The present value of any unguaranteed residual asset

The **lease receivable** is the present value of the payments the lessor will receive plus the present value of any residual value guarantees when the guarantee can be provided by either the lessee or a third party. The lessor earns interest revenue on the lease receivable.

The lessor includes the present value of any unguaranteed residual value in the NIL-ST to reflect the value of the leased asset at the end of the lease. The guaranteed residual value is included in the lease receivable, whereas the unguaranteed residual asset is not part of the receivable.

The lessor expenses initial direct costs if the fair value of the leased asset is not equal to the carrying value. If the fair value equals the carrying value, the initial direct costs are deferred and included in the NIL-ST. However, the lessor does not need to explicitly add the initial direct costs to the NIL-ST. These costs are captured in the computation of the implicit rate. Recall that the implicit rate is the rate at which the present value of the lease payments plus the present value of the amount that a lessor expects to obtain from the leased asset at the end of the lease term equals the fair value of the leased asset plus deferred initial direct costs of the lessor.

Exhibit 18.9 depicts this relationship.

EXHIBIT 18.9 Implicit Rate

If we have deferred initial direct costs, the implicit rate will be set such that the present value of the payments and any residual values will include the deferred initial direct costs. Thus, the NIL-ST will include the deferred initial direct costs through the implicit rate.

Example 18.13 demonstrates how deferred initial direct costs are included in the NIL-ST.

EXAMPLE 18.13

Inclusion of Deferred Initial Direct Costs in the NIL-ST

PROBLEM: Hobnob Company leased a piece of machinery to Cutter, Inc. on January 1, 2019. The lease is correctly classified as a sales-type lease. Hobnob will receive three annual lease payments of \$19,000 with the first one received on January 1, 2019. There is no guaranteed or unguaranteed residual value. The fair value of the machine is \$50,000, and Hobnob incurs initial direct costs of \$5,000. Compute the implicit rate and the NIL-ST assuming that the initial direct costs are expensed. Compute the implicit rate and the NIL-ST assuming that the initial direct costs are deferred.

SOLUTION: First, we compute the implicit rate, assuming that the initial direct costs are expensed. Setting the present value of the payments equal to the fair value of the machine, the implicit rate is 14.72%.

	N	I/Y	PV	PMT	FV	Excel Formula
Given	3		-50,000	19,000	0	
Solve for RATE		14.72%				=RATE(3,19000,-50000,0,1)

The NIL-ST is measured as the lease receivable, which is the present value of the payments because there are no residual values. Thus, the NIL-ST equals \$50,000.

Now, if we assume that the initial direct costs are deferred, we compute an implicit rate by setting the present value of the lease payments equal to the fair value of the machine plus the deferred initial direct costs (i.e., \$55,000 = \$50,000 + 5,000).

	N	I/Y	PV	PMT	FV	Excel Formula
Given	3		-55,000	19,000	0	
Solve for RATE		3.68%				=RATE(3,19000,-55000,0,1)

The implicit rate is 3.68% and the NIL-ST is (by construction) \$55,000, which is the present value of the lease payments and is equal to the lease receivable in this case. Note that we do not separately add in the initial direct costs; they are included in the lease receivable because they are automatically included in the present value of the lease payments through the computation of the implicit rate.

In addition to recording the NIL-ST, the lessor records revenue and cost of goods sold. Revenue for a sales-type lease is the lower of (1) the fair value of the leased asset and (2) the sum of the *lease receivable* plus any lease payments received before the lease commencement date. Cost of goods sold for a sales-type lease is the carrying value of the leased asset less the present value of any unguaranteed residual asset plus any deferred initial direct costs of the lessor.¹⁵

Exhibit 18.10 illustrates the key terms associated with accounting for a sales-type lease.

EXHIBIT 18.10 Key Sales-Type Terminology for Lessors

Net Investment in: Lease—Sales Type	Lease Receivable	Revenue	Cost of Goods Sold
Lease receivable	Present value of payments to be received	Lower of: Fair value of leased asset OR	Carrying value of the leased asset
Plus: Present value of any unguaranteed residual asset	Plus: Present value of residual value guarantees	Lease receivable plus lease payments received before the lease commencement	Less: present value of unguaranteed residual asset Plus: Deferred initial direct cost of the lessor

Example 18.14 shows the lessor's accounting for the initial measurement of a sales-type lease.

EXAMPLE 18.14

Initial Measurement of a Sales-Type Lease: Lessor

PROBLEM: On January 1, 2019, Carney Brothers Equipment Manufacturers agreed to lease a piece of heavy equipment to Greenbaum Shipping Associates. The equipment is not specialized and was delivered on January 1, 2019. Carney Brothers paid \$800,000 to produce the machine and carries it at this amount in inventory. Carney Brothers incurred initial direct costs of \$5,000. The lease terms follow:

- Annual rental payments of \$188,692 are due on January 1, 2019, and December 31 of every year from 2019 through 2023.
- Lease term is 6 years.
- There is no transfer of the asset at the end of the lease term and no purchase option.
- The economic life of the asset is 6 years.
- Carney Brothers' implicit rate is 9%.
- Collectability of rental payments is probable.
- The fair value (current selling price) of the machine is \$922,638.
- There is no residual value guarantee, nor does Carney anticipate a residual value for the asset.

Continued

¹⁵If collectability is not probable at the lease commencement date, the underlying asset is not derecognized. The net investment in the lease and profit are not recognized. Lease payments received are recorded as a deposit liability.

How does Carney Brothers, the lessor, classify this lease? What journal entries does it make on January 1, 2019?

SOLUTION: This lease is a sales type because it meets both Criteria 3 and 4 of the Group I conditions. The lease term is 100% of the life of the asset, which is a major part of its economic life. Also, the present value of the lease payments is 100% of the asset's fair value. The present value of an annuity due of the six remaining lease payments of \$188,692 at a discount rate of 9% is \$922,638 computed as follows:

	N	I/Y	PV	PMT	FV	Excel Formula
Given	6	9.00%		188,692	0	
Solve for PV			(922,638)			=PV(0.09,6,188692,0,1)

The following table presents an analysis of the indicators.

Group I Criteria	Met?	Explanation
Transfer of ownership?	No	
Purchase option likely to be exercised?	No	
Lease term major part of economic life?	Yes	The lease term is 100% (6 years / 6 years) of its economic life.
Present value substantial part of fair value?	Yes	The present value of \$922,638 is 100% of the \$922,638 fair value.
Asset is specialized?	No	

Because the Group I criteria are met, we do not need to assess the Group II criteria.

At the commencement of the lease, Carney records the sales revenue and NIL-ST. It also removes the machine from its accounts and records the cost of goods sold. The lease receivable is equal to the net investment in the lease because there is no unguaranteed residual value. The NIL-ST is the present value of the lease payments (\$922,638). The sales revenue is \$922,638, which is the fair value of the leased asset and the lease receivable. Cost of goods sold includes only the carrying value of the machinery because there is no unguaranteed residual value or deferred initial direct costs. The difference in the \$922,638 sales revenue and the \$800,000 cost of goods sold is a gross profit (selling profit) of \$122,638.

Account	January 1, 2019
Net Investment in Lease – Sales-Type	922,638
Cost of Goods Sold	800,000
Sales Revenue	922,638
Inventory of Machinery	800,000

Carney expenses the initial direct costs because the fair value is not equal to the carrying value of the leased asset.

Account	January 1, 2019
Initial Direct Costs Expense	5,000
Cash	5,000

Carney allocates the first payment to principal by reducing the net investment in the lease because interest accrues only with the passage of time.

Account	January 1, 2019
Cash	188,692
Net Investment in Lease – Sales Type	188,692

Subsequent Measurement of a Sales-Type Lease

After the lease commencement date, the lessor remeasures the NIL-ST each period and computes interest revenue using the effective interest rate method. The lessor allocates lease payments first to cover the interest and then to reduce the NIL-ST. The interest revenue, which is reported on the income statement, is the amount that produces a constant periodic discount rate on the remaining balance of the NIL-ST.

The lessor records the following items in net income if they are part of the lease agreement:

1. Interest revenue on the NIL-ST
2. Any variable payments received that were not included in the NIL-ST
3. Any changes in variable lease payments that depend on an index or rate in the period of the change¹⁶

Example 18.15 shows the lessor's accounting for the subsequent measurement of a sales-type lease.

EXAMPLE 18.15

Subsequent Measurement of a Sales-Type Capital Lease: Lessor

PROBLEM: Consider Carney Brothers Equipment Manufacturers from Example 18.14. What journal entries are required for 2019 and 2020 after January 1, 2019?

SOLUTION: We first prepare the amortization table as follows:

Date	Payment (a)	Interest (b) = Prior-Period Balance × 9%	Reduction in Lease Liability (c) = (a) – (b)	NIL-ST Balance (d) = Prior Period Balance – (c)
Lease Commencement – January 1, 2019				\$922,638
January 1, 2019	\$188,692	\$ 0	\$188,692	733,946
December 31, 2019	188,692	66,055	122,637	611,309
December 31, 2020	188,692	55,018	133,674	477,635
December 31, 2021	188,692	42,987	145,705	331,930
December 31, 2022	188,692	29,874	158,818	173,112
December 31, 2023	188,692	15,580	173,112	0

As shown in the amortization table, Carney allocates \$66,055 of the second lease payment to interest revenue and \$122,637 to a reduction of the net investment in lease.

Account	December 31, 2019
Cash	188,692
Interest Revenue	66,055
Net Investment in Lease – Sales Type	122,637

On December 31, 2020, Carney allocates \$55,018 of the third lease payment to interest revenue and \$133,674 to a reduction of the net investment in the lease.

Account	December 31, 2020
Cash	188,692
Interest Revenue	55,018
Net Investment in Lease – Sales Type	133,674

¹⁶Any credit losses on the NIL-ST are also included in the lessor's net income.

Residual Values in a Sales-Type Lease

A guaranteed residual value is included in the lease receivable and thus the net investment in the lease. This is true whether the guarantee is from the lessee or from a third party. An unguaranteed residual asset is explicitly included in the measurement of the net investment in the lease, but it is not part of the lease receivable.

Including residual values has two implications for lease accounting. First, it changes the implicit rate in the lease, which is defined as the interest rate at which the present value of the lease payments plus the present value of the amount that a lessor expects to derive from the leased asset at the end of the lease term equals the sum of the asset's fair value plus any deferred initial indirect costs of the lessor.

Second, the cost of goods sold is affected only by an unguaranteed residual value. Specifically, the cost of goods sold is defined as the carrying value of the leased asset less the present value of any unguaranteed residual asset plus any deferred initial direct costs of the lessor. As a result, the inclusion of a residual value guarantee does not impact cost of goods sold; only the inclusion of an *unguaranteed* residual asset reduces cost of goods sold.

Example 18.16 illustrates a sales-type lease with both a guaranteed and unguaranteed residual value.

EXAMPLE 18.16

Residual Values in a Sales-Type Lease

PROBLEM: Consider Carney Brothers Equipment Manufacturers from Example 18.15. Assume that the lease agreement is the same except that Carney now estimates a residual value of \$60,000. The lessee guarantees \$25,000 of the \$60,000, so \$35,000 of the residual value is still not guaranteed. What journal entries are required for 2019?¹⁷ Prepare the amortization table for the NIL-ST.

SOLUTION: Because the lease contains a residual value, we must compute a new implicit rate such that the present value of the lease payments and any additional residual values equal the sum of the fair value of the leased asset plus any deferred initial direct costs. Carney expensed initial direct costs, so the present value of the payments plus the residual value must equal the fair value of \$922,638. We compute the implicit rate as 10.76867%.

	N	I/Y	PV	PMT	FV	Excel Formula
Given	6		-922,638	188,692	60,000	=RATE(6,188692, -922638,60000,1)
Solve for RATE		10.76867%				

Carney also needs to compute the lease receivable, which is the present value of the lease payments plus the present value of any guaranteed residual values:

	N	I/Y	PV	PMT	FV	Excel Formula
Given	6	10.76867%		188,692	25,000	=PV(0.1076867,6, 188692,25000,1)
Solve for PV			(903,690)			

At the commencement of the lease, Carney records the net investment in the lease, removes the machine from its accounts, and records the gross profit. The net investment in the lease is the present value of the lease payments plus the present value of the lessee-guaranteed residual value plus the present value of the unguaranteed residual value at the implicit rate (\$922,638). The sales revenue is \$903,690, which is the lower of the fair value of the leased asset (\$922,638) and the lease receivable (\$903,690). Cost of goods sold is the carrying value

¹⁷Note that the lessor would likely require lower annual lease payments if the lessee guarantees a residual value because the lessor requires a certain rate of return.

of the machinery, \$800,000, less the present value of the \$35,000 unguaranteed residual asset, \$18,948, at the implicit rate that is computed next:

	N	I/Y	PV	PMT	FV	Excel Formula
Given	6	10.76867%		0	35,000	
Solve for PV			(18,948)			= PV(0.1076867,6,0,35000,0)

The difference in the \$903,690 sales revenue and the \$781,052 cost of goods sold results in a gross profit of \$122,638.

Account	January 1, 2019
Net Investment in Lease – Sales Type	922,638
Cost of Goods Sold	781,052
Sales Revenue	903,690
Inventory of Machinery	800,000

Carney expenses the initial direct costs because the fair value is not equal to the carrying value.

Account	January 1, 2019
Initial Direct Cost Expense	5,000
Cash	5,000

Carney allocates the first payment to principal because interest accrues only with the passage of time.

Account	January 1, 2019
Cash	188,692
Net Investment in Lease – Sales Type	188,692

We can then prepare the amortization table as follows:

Date	Payment (a)	Interest (b) = Prior-Period Balance × 10.76867%	Reduction in Lease Liability (c) = (a) – (b)	NIL-ST Balance (d) = Prior-Period Balance – (c)
Lease Commencement – January 1, 2019				\$922,638
January 1, 2019	\$188,692	\$ 0	\$188,692	733,946
December 31, 2019	188,692	79,036	109,656	624,290
December 31, 2020	188,692	67,228	121,464	502,826
December 31, 2021	188,692	54,148	134,544	368,282
December 31, 2022	188,692	39,659	149,033	219,249
December 31, 2023	188,692	23,610	165,082	54,167
December 31, 2024	60,000*	5,833	54,167	0

* The net investment in the lease is fully recovered upon realization of the residual value.

As shown in the amortization table, Carney allocates the second payment to interest of \$79,036 and principal of \$109,656.

Account	December 31, 2019
Cash	188,692
Interest Revenue	79,036
Net Investment in Lease – Sales Type	109,656

- 7 Illustrate lessor accounting for direct financing leases.

Accounting for Direct Financing Leases: Lessor

A direct financing lease meets both of the Group II but not the Group I criteria. Because none of the Group I criteria is met, the lessor continues to possess the right to control the leased asset, yet the lessee expects to recover the leased asset's value through the lease agreement. A direct financing lease may give rise to a profit, which is deferred and recognized over the term of the direct financing lease. Any loss is recognized on the lease commencement date. A lessor is often willing to incur a loss at commencement because it will recognize interest revenue on the lease receivable over the lease term that will be greater than the initial loss.

A lessor can classify a lease as a direct financing lease only when there is a residual value guaranteed by a third party. In this situation, none of the Group I criteria is met, but both Group II criteria must be met. The fourth Group I criterion is that the present value of the sum of the lease payments and any residual value guaranteed by the lessee, which is not otherwise included in the lease payments, is equal to substantially all of the fair value of the asset. Group II contains the criterion that the present value of the sum of the lease payments and any residual value guarantee (from both the lessee and a third party in combination) that is not otherwise included in the lease payments is equal to substantially all of the fair value of the asset. Note that the Group I criterion includes only a lessee's guarantee but that the Group II criterion includes a third-party guarantee. Therefore, the Group II criteria may be met while those of the Group I are not met if there is a third-party guarantee.

Initial Measurement of a Direct Financing Lease

For a direct financing lease, the lessor removes the leased asset from its balance sheet and records the net investment in the lease as an asset at the commencement of the lease. The **net investment in the lease for a direct financing lease** (NIL-DF) is composed of

1. The lease receivable
2. The present value of any unguaranteed residual asset
3. A reduction for any deferred profit

In a direct financing lease, all of the initial direct costs are deferred. Similar to the treatment of deferred initial direct costs in a sales-type lease, those costs are automatically included in the NIL-DF because of the way the implicit rate is defined.

Exhibit 18.11 compares and contrasts the measurement of the net investment in the lease for sales-type and direct financing leases.

EXHIBIT 18.11 Initial Measurement of the New Investment in the Lease

Sales-Type Lease*	Direct Financing Lease*
Lease receivable	Lease receivable
Plus: Present value of unguaranteed residual asset	Plus: Present value of unguaranteed residual asset
	Less: Deferred profit

* All deferred initial direct costs are implicitly included in the NIL.

Revenue and cost of goods sold are defined in the same way in a direct financing lease as they are for a sales-type lease. Revenue for a direct financing lease is the lower of (1) the fair value of the leased asset or (2) the sum of the *lease receivable* and any lease payments received before the lease commencement date. Cost of goods sold for a direct financing lease is equal to the carrying value of the leased asset less the present value of any unguaranteed residual asset plus any deferred initial direct costs. The lessor presents revenue and cost of goods sold when it realizes value from goods that it also would sell without providing lease financing. If the lessor uses the lease to provide financing only, the lessor nets revenue and cost of goods sold to present profit or loss in a single line. In the examples of direct-financing leases, we show revenue and cost of goods sold separately, except in the case of deferred profit. When there is deferred profit, revenue and cost of goods sold will not be reported at the commencement of the lease.

Example 18.17 provides the lessor's accounting for the initial measurement of a direct financing lease.

EXAMPLE 18.17

Initial Measurement of a Direct Financing Lease

PROBLEM: On January 1, 2019, Flores Fitness Centers leases nonspecialized exercise equipment from Wright-Fit Equipment. The equipment is delivered on January 1. The lease term is 3 years with no renewal or purchase options, and title to the leased asset is retained by the lessor at the end of the lease term. The lease requires annual fixed rental payments of \$12,600 per year beginning on January 1, 2019, and then December 31 of each year starting on December 31, 2019. The fair value of the equipment is \$50,098 and has a carrying amount on Wright-Fit's books of \$55,000. The equipment has a remaining life of 6 years. The estimated residual value of the equipment is \$20,804. The lessee does not guarantee the residual value, but Wright-Fit secured an unrelated third party to guarantee \$20,804; collection of this guaranteed residual value and lease payments is reasonably certain. The rate implicit in the lease is 10%.

There are no prepaid rentals, and neither party to the agreement pays initial direct costs.

Analyze the lease classification criteria to determine the lessor's classification of this agreement. Provide the journal entries on January 1, 2019.

SOLUTION: We use the Group I and Group II criteria to determine the lessor's lease classification. We have information to assess all of the Group I criteria except for the fourth criterion. The present value of the annuity due of the three remaining lease payments of \$12,600 at a discount rate of 10% is \$34,468. Note that we do not include the residual value guarantee made by a third party in the lease payments when implementing the Group I conditions.

	N	I/Y	PV	PMT	FV	Excel Formula
Given	3	10.00%		12,600	0	
Solve for PV			(34,468)			=PV(0.1,3,12600,0,1)

For the Group II criteria, we compute the present value of the lease payments plus the residual value guaranteed by the third party as \$50,098:

	N	I/Y	PV	PMT	FV	Excel Formula
Given	3	10.00%		12,600	20,804	
Solve for PV			(50,098)			=PV(0.1,3,12600,20804,1)

The lease does not meet the Group I criteria. The agreement does not include a purchase option or a transfer of ownership. The lease term is for only 50% of the life of the asset. Because we do not include third-party guarantees in the present value computation for Group I, the present value is only 69% of the fair value.

The lease does, however, meet Group II criteria. For Group II, we compute the present value of the lease payments, including third-party guarantees. Thus, the present value is 100% of the fair value. Because the lease meets Group II, but not Group I, criteria, Wright-Fit classifies it as a direct financing lease.

Group I Criteria	Met?	Explanation
Transfer of ownership?	No	
Purchase option likely to be exercised?	No	
Lease term major part of economic life?	No	The lease term is 50% (3 years / 6 years) of economic life.
Present value substantial part of fair value?	No	The present value of \$34,468 is 69% of the \$50,098 fair value.
Asset is specialized?	No	

Group II Criteria	Met?	Explanation
Present value including third-party guarantees substantially all of fair value?	Yes	The present value of \$50,098 is 100% of the \$50,098 fair value.
Lease payment collection probable?	Yes	

At the commencement of the lease, Wright-Fit records the net investment in the lease and removes the machine from its accounts.

The sales revenue is \$50,098, which is both the fair value of the leased asset and the lease receivable. Cost of goods sold is \$55,000, the carrying value of the machinery, because there are no initial direct costs and no unguaranteed residual value. Thus, Wright-Fit recognizes the loss of \$4,902 on the lease transaction.

The net investment in the lease is defined as the lease receivable plus the present value of any unguaranteed residual value less any deferred profit. The lease receivable includes the present value of both the lease payments to be received and the residual value guaranteed by the third party. We just computed this amount as \$50,098. Thus, the NIL-DF is \$50,098 because there is no unguaranteed residual asset and no deferred profit.

Account	January 1, 2019	
Net Investment in Lease – Direct Financing	50,098	
Cost of Goods Sold	55,000	
Revenue		50,098
Inventory of Machinery		55,000

Wright-Fit allocates the first payment to principal because interest accrues only with the passage of time.

Account	January 1, 2019	
Cash	12,600	
Net Investment in Lease – Direct Financing		12,600

Subsequent Measurement of a Direct Financing Lease

After the lease commencement date, the lessor remeasures the NIL-DF each period. The lessor computes interest revenue using the effective interest rate method. The lessor allocates lease payments first to cover the interest and then to reduce the NIL-DF. The interest revenue, which is reported on the income statement, is the amount that produces a constant periodic discount rate on the remaining balance of the NIL-DF. The lessor records the following items in net income if they are part of the lease agreement:

1. Interest revenue on the NIL-DF, which includes interest on the lease receivable, interest on the accretion of any unguaranteed residual asset, and amortization of any deferred profit
2. Variable payments not included in the NIL-DF
3. Change in variable lease payments that depend on an index or rate¹⁸

Example 18.18 provides an example of the lessor's accounting for the subsequent measurement of a direct financing lease.

¹⁸ Any credit losses on the NIL-DF are also included in net income.

EXAMPLE 18.18**Subsequent Measurement of a Direct Financing Lease: Lessor**

PROBLEM: Consider Wright-Fit from Example 18.17. What journal entries are required for 2019 and 2020 after January 1, 2019?

SOLUTION: The amortization table follows. Note that the “payment” listed for December 31, 2021, is not an annual lease payment but rather is the realization of the guaranteed residual value of the asset.

Date	Payment (a)	(b) = Interest Prior-Period Balance × 10%	Reduction in Lease Liability (c) = (a) – (b)	NIL-DF Balance (d) = Prior-Period Balance (d) – (c)
Lease Commencement – January 1, 2019				\$50,098
January 1, 2019	\$12,600	\$ 0	\$12,600	37,498
December 31, 2019	12,600	3,750	8,850	28,648
December 31, 2020	12,600	2,865	9,735	18,913
December 31, 2021	20,804*	1,891	18,913	0

* The net investment in the lease is fully recovered upon realization of the residual value.

As shown by the amortization table, Wright-Fit allocates \$3,750 of the second lease payment to interest revenue and \$8,850 to a reduction of the net investment in lease.

Account	December 31, 2019
Cash	12,600
Interest Revenue	3,750
Net Investment in Lease – Direct Financing	8,850

On December 31, 2020, Wright-Fit allocates \$2,865 of the third lease payment to interest revenue and \$9,735 to a reduction of the net investment in lease.

Account	December 31, 2020
Cash	12,600
Interest Revenue	2,865
Net Investment in Lease – Direct Financing	9,735

Exhibit 18.12 presents a summary of lessor accounting treatment for operating, sales-type, and direct financing leases.

EXHIBIT 18.12 Summary of Lessor Accounting Treatment

	Operating Lease	Sales-Type Lease	Direct Financing Lease
Classification	Neither Group I or Group II criteria met	Group I criteria met	Group II criteria met, Group I criteria not met
Initial measurement—net investment in lease*	None recorded	Lease receivable** Plus: Present value of unguaranteed residual asset	Lease receivable** Plus: Present value of unguaranteed residual asset Less: Deferred profit
Initial measurement—net investment in lease	None recorded	Reduced by payment Increased to record interest revenue***	
Measurement of revenue at lease commencement	None recorded	Lessor of: Fair value of leased asset Lease receivable + Lease payments received before the lease commencement	
Measurement of cost of goods sold at lease commencement	None recorded	Carrying value of the leased asset Less: Present value of unguaranteed residual asset Plus: Deferred initial direct costs of lessor	
Measurement of profit or loss at commencement	None recorded	Profit or loss equal to revenue less cost of goods sold is reported.	If cost of goods sold is greater than revenue, then full loss is reported.
Impact on income statement	Record rental revenue composed of: 1. Total lease payments recognized on a straight-line basis 2. Variable payments not included in the lease payments	Record revenue over the lease term composed of: 1. Interest revenue on the NIL 2. Variable payments not included in the NIL 3. Change in variable lease payments that depend on an index or rate 4. Credit losses on the NIL	

* The NIL for both a sales-type and a direct financing lease implicitly includes any deferred initial direct costs.

** Includes the present value of the payments to be received plus the present value of residual value guarantees. Use the implicit rate at the commencement date.

*** Computed as the amount that produces a constant periodic discount rate on the remaining balance of the NIL. Note that the computation will be different for sales-type leases and direct financing leases because the initial measurement of the NIL is different.

IFRS Accounting for Leases: Lessor

Unlike U.S. GAAP, IFRS does not distinguish sales-type leases from direct financing leases. IFRS classifies leases based on whether the risks and rewards of ownership have been transferred to the lessee. If the risks and rewards have been transferred, IFRS classifies the lease as a finance lease (see the IFRS lease classification discussion earlier in the chapter).

The lessor's accounting for IFRS finance leases is similar to the U.S. GAAP accounting for sales-type leases. There are two types of lessors under IFRS: (1) manufacturers and dealers and (2) everyone else. Under IFRS, at the lease commencement manufacturers and dealers report a profit computed the same way as lessors compute profit under U.S. GAAP. Manufacturers and dealers always immediately expense initial direct costs. All other lessors do not recognize a profit at lease commencement and defer initial direct costs.

JUDGMENTS IN ACCOUNTING For Leases

Throughout the chapter, we have explored the criteria to classify leases. There is a great deal of subjectivity in implementing the criteria under both U.S. GAAP and IFRS.

We begin this section by reviewing the Group I and Group II criteria reproduced in Exhibit 18.13.

EXHIBIT 18.13 U.S. GAAP Lease Classification Criteria

Group I

1. The lease transfers ownership to the lessee at the end of the lease term.
2. The lessee is given an option to purchase the asset that is reasonably certain to be exercised.
3. The lease term is for a major part of the economic life of the asset.
4. The present value of the sum of the lease payments and any residual value guaranteed by the lessee that is not otherwise included in the lease payments is equal to substantially all of the fair value of the asset.
5. The leased asset is of a specialized nature.

Group II

1. The present value of the sum of the lease payments and any residual value guarantee (from both the lessee and a third party in combination) that is not otherwise included in the lease payments is equal to substantially all of the fair value of the asset.
2. It is probable that the lessor will collect the *lease payments* plus any amount necessary to satisfy a residual value guarantee.

Most of the Group I criteria include some aspect of judgment. The purchase option in the second criterion must be “reasonably certain to be exercised.” How likely is reasonably certain? The third criterion requires an estimate of the economic life of the property. In addition, the third criterion uses the phrase “major part.” What exactly would a “major part” be? FASB has indicated that 75% would be a reasonable cutoff to use, but it has not required that specific percentage as a definition of major part.

The fourth Group I criterion and the first Group II criterion requires the estimation of a fair market value. How subjective is the determination of fair market value for some assets? In addition, both of these criteria use the imprecise phrase “substantially all.” FASB has indicated that 90% would be a reasonable definition of substantially all, but it has not required that cutoff.

The Group II criteria also require assessments of collectability, which is again quite subjective. Lessees may prefer to use the judgment afforded by the accounting standards to classify leases as operating leases because expenses are typically recognized more slowly under an operating lease (see the financial statement analysis section for examples).

Conversely, the lessor would most likely prefer a direct financing or sales-type lease to an operating lease. Non-operating lease treatment would permit a financial service company lessor to remove heavy machinery and equipment, jet airlines, oceangoing vessels, and such from its balance sheet and replace it with the net investment in the lease, a financial asset compatible with the nature of its business. In addition, the non-operating lease results in the recognition of interest income rather than rent revenue. Interest income is a source of revenue consistent with a financial service company’s normal operations.

For a dealer or manufacturer lessor, the use of a non-operating lease is also preferred because it recognizes financing income and accelerates revenue recognition in the form of the gross profit on the sale in the year of commencement. Under an operating lease treatment, the lessor records only rental income each year, spreading the revenue flow over the lease term.

Interview

CHAD SOARES
PARTNER, TRANSACTION
SERVICES,

LLP »

Chad Soares

Chad Soares has more than 20 years of experience advising a variety of clients in the United States and overseas on complex transactions, including leasing. His clients typically need deep knowledge of not only lease accounting, but also related areas such as consolidation, revenue recognition, and joint venture accounting.

1. What is an embedded lease, and what are some of the difficulties in identifying an embedded lease?

An embedded lease is one contained within another type of agreement, such as IT outsourcing, logistics, or contract manufacturing arrangements. These leases exist if there is an explicit or implicit asset in the contract and the customer controls use of the asset. The new FASB leasing standard requires that companies report virtually all leases, including embedded ones, on the balance sheet. Ensuring that you capture all potential embedded leases is critical. Once you've done so, separating the original contract into lease and nonlease components, allocating consideration to each, and classifying each lease as an operating or finance lease would follow. Allocating consideration in the contract to components is not always straightforward. Contracts often include a combination of fixed and variable payments as well as optional purchases, adding complexity to this exercise. Getting it right is critical since it affects balance sheet measurement as well as classification and disclosure.

2. How will a lessee obtain standalone prices needed to allocate payments to lease and nonlease components? What if standalone prices are not available?

Judgment is often required to allocate payments to lease and nonlease components. For example, payments for highly integrated service offerings, such as contract manufacturing or outsourced activities, may not be based on market observable data related to specific components. The Board appears to have anticipated these concerns and allows estimation provided preparers “. . . maximize the use of observable information” and develop such estimates consistently.

3. What are the key conditions that differentiate a sales-type from a direct financing lease for the lessor?

The key distinction in a sales-type lease and a direct financing lease is whether the lease arrangement transfers control

from the lessor to the lessee. When control is transferred to the lessee, it represents an in-substance financed sale of an asset. When control doesn't transfer (e.g., when only the “substantially all” criterion is met as a result of third-party residual value insurance), the arrangement is a direct financing lease. Either model requires recognition of the net investment in the lease and derecognition of the underlying asset. However, only a sales-type lease permits up-front revenue and profit recognition.

4. How do we identify variable payments that are classified as in-substance fixed payments?

Variable lease payments may be based on a rate or index, usage of the underlying asset, or other factors. Some payments appear to be variable but are in fact unavoidable, such as a lease that provides the lessee an option about *which* payments it makes, but does not permit a lessee to *avoid* payment (e.g., a take or pay contract). Two examples are usage-based payments that specify a penalty payment if minimums are not achieved and rent payments based on movements in an index such as CPI and subject to a ceiling that is highly likely to be met. Assume that a 10-year lease includes a rent increase in year six, calculated as five times the change in the CPI over the prior 5-year period and capped at 5%. Assume also that a 5% rent increase commencing in the sixth year of the lease term is unavoidable. Therefore, the lessee and lessor should include the 5% rent increase in lease payments.

5. What are the fundamental differences between GAAP and IFRS when classifying lease arrangements?

The most notable difference between IFRS and GAAP is the single income statement model required of all IFRS lessees. Under IFRS all leases (other than short-term or small-ticket leases) will reflect interest expense and amortization similar to any other financing. Under GAAP, only finance leases follow this pattern, and many leases are likely to continue to present lease expense in the income statement similar to operating leases today.

Discussion Questions

1. Prior to the current lease standard, companies were able to structure a significant number of leases in order to keep them off-balance sheet. They did not report the asset and liability on the balance sheet; instead, rent expense was recorded each period without any impact on assets or liabilities. Discuss financial statement effects of the new standard's requirement that lessees record the leased asset and lease liability on the balance sheet for almost all lease transactions.
2. Discuss the factors that determine whether an entity should lease or purchase an asset.

- 8 Detail the required lease disclosures.

Lease Disclosures

The objective of lease-disclosure requirements is to enable users of financial statements to assess the amount, timing, and uncertainty of cash flows arising from lease agreements. Generally, lease disclosures vary by the type of lease and whether the lessee or lessor is making the disclosures. Both lessees and lessors disclose the significant judgments made in accounting for leases, including:

- The determination of whether a contract contains a lease
- The separation of lease and nonlease components
- The discount rate

Lessees and lessors also provide a description of the leases and amounts recognized in the financial statements. In the disclosures, lessees and lessors consider the level of detail necessary to satisfy the disclosure objective and how much emphasis to place on each of the various requirements. A lessee can aggregate or disaggregate disclosures so that useful information is not obscured by including a large amount of insignificant detail or by aggregating items that have different characteristics.

Lessee-Disclosure Requirements

The lessee's disclosures provide the user with the following information about the nature of the lease:

- Determination of variable lease payments
- Existence, terms, and conditions of options to extend or terminate the lease
- Existence, terms, and conditions of residual value guarantees
- Restrictions or covenants imposed by leases such as limits on dividends or the incurrence of additional financial obligations

Lessees disclose the following amounts relating to total lease costs and cash flows so that financial statement users can better understand the costs from a company's leases:

- Finance lease cost, separated into the amortization expense of the right-of-use assets and interest expense on the lease liabilities
- Operating lease costs
- Short-term lease costs
- Variable lease costs
- Sublease income disclosed on a gross basis separately from the finance or operating lease expense
- Net gain or loss recognized from sale and leaseback transactions
- Amounts for finance and operating leases for the following items:
 - Cash paid for amounts included in the measurement of lease liabilities segregated into operating and financing cash flows
 - Supplemental noncash information on lease liabilities arising from the acquisition of right-of-use assets
 - Weighted-average remaining lease term
 - Weighted-average discount rate

To help financial statement users assess the extent of future cash flows related to leases, lessees provide a maturity analysis of finance lease liabilities and operating lease liabilities separately. Lessees disclose the undiscounted cash flows on an annual basis for a minimum of 5 years and in total for the remaining years. Lessees reconcile the undiscounted cash flows to the finance lease liabilities and operating lease liabilities recognized on the statement of financial position.

Furthermore, the lessee discloses leases that have not yet commenced but that create significant rights and obligations for the lessee, including the nature of any involvement with the construction or design of the leased asset.

Lessees that elect the practical expedient of not separating lease components from nonlease components disclose this accounting policy election and the leased assets to which the election applies.

Lessor-Disclosure Requirements

Lessor disclosures are also quite extensive. The lessor's disclosures provide the user with the following information about the nature of its leases:

- Existence, terms, and conditions of options to extend or terminate the lease
- Existence, terms, and conditions of residual value guarantees
- Leased asset's residual value

To provide further information on income from leases, lessors disclose a table presenting lease income for sales-type leases and direct financing leases:

- Profit or loss recognized at the commencement date
- Interest income either in aggregate or separated by components of the net investment in the lease

For operating leases, lessors disclose lease income relating to lease payments and variable lease payments not included in the measurement of all types of lease receivables.

Related to balance sheet amounts, a lessor discloses the components of net investment in sales-type and direct financing leases. The components are the carrying amount of its lease receivables, its unguaranteed residual assets, and any deferred selling profit on direct financing leases. Lessors also explain significant changes in the balances of their unguaranteed residual assets and deferred selling profit on direct financing leases.

Lessors disclose information about how they manage risk associated with the residual value of leased assets. In particular, a lessor should disclose all of the following:

- Its risk management strategy for residual assets
- The carrying amount of residual assets covered by residual value guarantees
- Any other means by which the lessor reduces its residual asset risk (e.g., buyback agreements or variable lease payments for use in excess of specified limits)

Similar to disclosures for lessees, lessors provide a maturity analysis of operating, sales-type, and direct financing lease liabilities separately. Lessors disclose the undiscounted cash flows on an annual basis for a minimum of 5 years and in total for the remaining years. Lessors reconcile the undiscounted cash flows to the lease receivables recognized in the statement of financial position. Lessors also disclose the amount of leased assets under operating leases.

IFRS-Specific Lessee Disclosure Requirements. IFRS disclosures are similar to those of U.S. GAAP. However, because lease classifications are different, IFRS reporters provide disclosure related to the types of leases they have. For example, the lessee discloses costs related to low-value leases. The lessor's maturity analysis includes its finance leases and operating leases.

FINANCIAL STATEMENT ANALYSIS

Operating Leases versus Finance Leases for the Lessee

All leases result in a lessee reporting a right-of-use asset and a lease liability, but the financial statement effects of operating and finance leases differ. Net income and total assets under finance leases are generally lower in the early years of the lease. Because the lease liability is the present value of future payments, it is generally the same under both types of leases. Companies, then, have the incentive to report a lease as an operating lease to report higher net income and higher total assets.

Within the income statement, however, operating income for a finance lease will be higher. Under a finance lease, amortization of the right-of-use asset reduces operating income but interest expense is reported under non-operating income (or financial income). Under an operating lease, lease cost reduces only operating income. Because lease costs are usually higher than the asset amortization expense in the early years of a lease, operating income will be higher under a finance lease. Similarly, within the statement of cash flows, cash flows from operating activities for a finance lease will be higher. All lease payments for an operating lease reduce cash flows from operating activities. For a finance lease, only interest payments reduce cash flows from operating activities. The reduction in the lease obligation is classified as a cash outflow from financing. Total cash outflows will be the same because the lease payments are the same. Exhibit 18.14 summarizes the financial statement effects of lease classification.

EXHIBIT 18.14 Comparison of Financial Statement Effects of Operating versus Finance Leases in the Early Years of a Lease: Lessee Effects

	Operating Lease		Finance Lease	
	Includes	Effect	Includes	Effect
Income Statement				
Net income	Lease costs	Higher	Amortization expense Plus: Interest expense	Lower
Operating income	Lease costs	Lower	Amortization expense	Higher
Statement of Cash Flows				
Cash flows from operating activities	Lease payment	Lower	Lease payment Interest payment only	Higher
Cash flows from financing activities	None	Higher	Reduction of lease obligation	Lower
Balance Sheet				
Right-of-Use asset balance	Right-of-Use asset amortized less early on	Higher	Right-of-Use asset amortized straight line	Lower
Lease obligation	Lease obligation reduced to present value	Same	Lease obligation reduced to present value	Same

Example 18.19 illustrates the financial statement effects of accounting for the same lease as operating versus financing. Because IFRS accounts for all leases as finance leases, the example also illustrates the financial statement differences in U.S. GAAP and IFRS.

EXAMPLE 18.19 Financial Statement Effects of an Operating versus a Finance Lease

PROBLEM: You have been tasked with analyzing the financial statement effects of a lessee accounting for a lease as an operating lease versus finance lease. The lease payments are \$600,000 with the first lease payment due on January 1, Year 1, at the commencement of the 5-year lease. The next lease payment is due on December 31, Year 1. The remaining three lease payments are due on December 31 of Years 2 through 4. The lessee's discount rate is 11%, and the present value of the lease payments is \$2,461,467. Compare the differences in expenses, operating income, net income, total assets, and cash flows from operating activities of accounting for the lease as an operating lease and finance lease. We assume that the first payment is made at the beginning of Year 1. We ignore the rules that guide the determination of whether a lease is an operating lease or a finance lease so that we can focus on the financial statement effects. The lessee amortizes the right-of-use asset on a straight-line basis under a finance lease. Ignore income taxes.

SOLUTION: First, we need to determine the reporting for the lease as an operating lease. At commencement, the measurement of the right-of-use asset and obligation is \$2,461,467. We compute the interest expense and reduction of the lease obligation in the following table.

Date	Payment (a)	Interest (b) = Prior period balance (d) × 11%	Reduction in Lease Liability (c) = (a) – (b)	Balance (b) = Prior-Period balance (d) – (c)
Lease Commencement – January 1, Year 1				\$2,461,467
January 1, Year 1	\$600,000	\$ 0	\$600,000	1,861,467
December 31, Year 1	600,000	204,761	395,239	1,466,228
December 31, Year 2	600,000	161,285	438,715	1,027,513
December 31, Year 3	600,000	113,026	486,974	540,539
December 31, Year 4	600,000	59,461	540,539	0

Next, we compute the portion of the annual lease expense that is attributable to the asset amortization. This amount is computed as the annual lease expense less the interest portion as computed.

Date	Lease Expense (a)	Interest in Previous Table Column (b)	Amortization of Right of Use Asset (c) = (a) – (b)
Year 1	\$ 600,000	\$204,761	\$ 395,239
Year 2	600,000	161,285	438,715
Year 3	600,000	113,026	486,974
Year 4	600,000	59,461	540,539
Year 5	600,000	0	600,000
	<u>\$2,400,000</u>	<u>\$538,533</u>	<u>\$2,461,467</u>

The lease expense for the operating lease is \$600,000 per year. For a finance lease, the right-of-use asset is amortized on a straight-line basis at \$492,293 per year (\$2,461,467 / 5 years). Interest expense is the same as the expense we computed for the operating lease. A comparison of the lease costs for the operating lease and finance lease is presented in the following table.

Financial Statement Analysis, continued

Observe that total expenses are higher under a finance lease in the early years of the lease. Therefore, net income will be lower under a finance lease in the early years. Total expenses over the life of the lease are the same. Because the lease cost for the operating lease is reported in operating income whereas only the amortization expense is for the finance lease, operating income is lower for the operating lease.

Year	Operating Lease	Finance Lease			Difference
	Lease Expense	Amortization Expense	Interest Expense	Total Expense	
	Operating Income	Operating Income	Non-Operating Income		
Year 1	\$ 600,000	\$ 492,293	\$204,761	\$ 697,054	\$ 97,054
Year 2	600,000	492,293	161,285	653,578	53,578
Year 3	600,000	492,293	113,026	605,319	5,319
Year 4	600,000	492,293	59,461	551,754	(48,246)
Year 5	600,000	492,295*	0	492,295	(107,705)
Total	<u>\$3,000,000</u>	<u>\$2,461,467</u>	<u>\$538,533</u>	<u>\$3,000,000</u>	<u>\$ 0</u>

* Adjusted due to rounding errors.

On the balance sheet, total assets are lower for the finance lease early on because the amortization on the right-of-use asset is higher in the early years. The amortization on the right-of-use asset increases for the operating lease over time.

	Right-of-Use Asset Balance		
	Operating Lease	Finance Lease	Difference
January 1, Year 1	\$2,461,467	\$2,461,467	\$ 0
December 31, Year 1	2,066,228	1,969,174	97,054
December 31, Year 2	1,627,513	1,476,881	150,632
December 31, Year 3	1,140,539	984,588	155,951
December 31, Year 4	600,000	492,295	107,705
December 31, Year 5	0	0	0

On the statement of cash flows, the total lease payment reduces cash flow from operating activities for the operating lease. Only the interest portion reduces operating cash flows under the finance lease. Therefore, cash flows from operating activities are higher when a lease is classified as a finance lease each year and in total.

	Cash Outflows from Operating Activities		
	Operating Lease	Finance Lease	Difference
January 1, Year 1	\$ 600,000	\$ 0	\$ 600,000
December 31, Year 1	600,000	204,761	395,239
December 31, Year 2	600,000	161,285	438,715
December 31, Year 3	600,000	113,026	486,974
December 31, Year 4	600,000	59,461	540,539
Total	<u>\$3,000,000</u>	<u>\$538,533</u>	<u>\$2,461,467</u>

Summary by Learning Objectives

In the following, we summarize the main points by learning objective. Throughout the chapter, we discuss the accounting and reporting of leases under U.S. GAAP and IFRS. The following table also highlights the major similarities and differences in the standards.

1 Understand the basic concepts of lease accounting and identify the advantages and disadvantages of leasing.	
Summary	Similarities and Differences between U.S. GAAP and IFRS
<p>A lease is a contract between the owner of an asset (lessor) and the party acquiring the use of the asset (lessee). Advantages of leasing include complete financing, the lessor bears the risk of obsolescence, business and financial flexibility, and tax benefits. Disadvantages of leasing include the overall cost of the asset and the loss of ownership.</p>	<p>Similar under U.S. GAAP and IFRS.</p>

2 Understand lease contracts and determine how to separate lease and nonlease components and how to allocate contract consideration to the various components.	
Summary	Similarities and Differences between U.S. GAAP and IFRS
<p>The first step in lease accounting for both the lessee and the lessor is to determine whether a contract contains a lease. A company makes this determination at the inception of a contract.</p> <p>The right to use a leased asset is a separate lease component if</p> <ol style="list-style-type: none"> 1. The lessee can benefit from the right-of-use of the asset either on its own or together with other resources that are readily available to the lessee and 2. The right-of-use is neither highly dependent on nor highly interrelated with the other rights to use the leased assets in the contract. <p>Nonlease components are agreements to purchase other goods or services such as maintenance services or supplies.</p> <p>Lessee consideration allocation: Allocate contract consideration to lease components on a relative standalone price basis.</p> <p>Lessor consideration allocation: Allocate consideration based on revenue recognition guidance.</p>	<p>Similar under U.S. GAAP and IFRS.</p>

Summary by Learning Objectives, continued

3 Classify leases as operating, finance, direct financing, and sales-type.	
Summary	Similarities and Differences between U.S. GAAP and IFRS
<p>Lessees classify leases as operating or finance. Lessors classify leases as operating, direct financing, or sales type. Both use the following Group I criteria:</p> <ol style="list-style-type: none"> 1. The lease transfers ownership. 2. The lease contains a purchase option that the lessee is reasonably certain to exercise. 3. The lease term is a major part of the asset's economic life. 4. The present value of lease payments and residual value guaranteed by the lessee is a substantial part of the asset's fair value. 5. The asset is of a specialized nature. <p>If any one of the Group I criteria is met, the lessee classifies the lease as a finance lease. Otherwise, the lease is an operating lease.</p> <p>Lessors also consider the following Group II criteria:</p> <ol style="list-style-type: none"> 1. The present value of lease payments including third-party guarantees is a substantial part of the asset's fair value. 2. Lease payment and guaranteed residual value collection are probable. <p>If none of the Group I or II criteria is met, the lessor classifies the lease as an operating lease.</p> <p>If the Group I criteria are met, the lessor classifies the lease as a sales-type lease.</p> <p>If none of the Group I criteria is met but both Group II criteria are met, the lessor classifies the lease as a direct financing lease.</p> <p>Lease payments include six components.</p> <ol style="list-style-type: none"> 1. Fixed payments less any lease incentives paid or payable to the lessee. 2. Variable lease payments that depend on a rate or index using the rate or index in effect at the lease commencement date. 3. The exercise price of an option to purchase the leased asset if the lessee is reasonably certain to exercise the option. 4. Payments for penalties for terminating the lease if the lease term reflects the lessee exercising an option to terminate the lease. 5. Fees paid by the lessee to the owners of a special-purpose entity for structuring the transaction. 6. For a lessee only, the amounts probable of being owed by the lessee under residual value guarantees. <p>The lessor uses the rate implicit in the lease, which is the rate of interest that causes the present value of the lease payments plus the present value of the amount that a lessor expects to obtain from the leased asset at the end of the lease term to equal the sum of the fair value of the leased asset and any deferred initial direct costs of the lessor.</p> <p>The lessee's discount rate is the rate implicit in the lease unless that rate cannot be readily determined. In that case, the lessee uses the lessee's incremental borrowing rate.</p>	<p>➤ Lessees do not classify leases under IFRS. All leases are treated the same. Lessees treat all leases as U.S. GAAP finance leases. Lessors classify leases into operating and finance leases. If any one of the Group I criteria is met, the lease is classified as a finance lease. IFRS also includes three additional indicators that individually or in combination could lead to classifying a lease as a finance lease:</p> <ol style="list-style-type: none"> 1. The lessee bears the lessor's losses if the lessee cancels the lease. 2. The lessee absorbs the gains or losses from fluctuations in the fair value of the residual value of the asset. 3. The lessee may extend the lease for a secondary period at a rent substantially below the market rent in a renewal option. <p>For the lessor, IFRS does not distinguish between direct financing and sale-type leases. IFRS does not use the Group II criteria.</p>

Summary by Learning Objectives, continued

4 Demonstrate the accounting for an operating lease for both the lessee and the lessor.	
Summary	Similarities and Differences between U.S. GAAP and IFRS
<p>Lessee: Initially, the lessee recognizes a lease liability and a right-of-use asset on the lease commencement date.</p> <p>The lease liability is measured as the present value of the remaining lease payments.</p> <p>The right-of-use asset includes the following components:</p> <ul style="list-style-type: none"> • The present value of all lease payments—the lease liability amount. • Lease payments the lessee makes to the lessor at or before commencement date. • Lease incentives the lessee receives, which reduce the right-of-use asset. • Any initial direct costs the lessee incurs. <p>Subsequently, the liability is remeasured to the present value of remaining lease payments.</p> <p>Subsequently, the right-of-use asset is the sum of the following components:</p> <ul style="list-style-type: none"> • The present value of lease payments • Prepaid or accrued lease payments • The remaining balance of any lease incentives received • Unamortized initial direct costs • Impairments of the right-of-use asset <p>The lease cost is the remaining lease cost allocated over the remaining lease term on a straight-line basis. The remaining cost of the lease is calculated as total lease payments (including those previously paid and those not yet paid), net of any incentives received plus total lessee initial direct costs less any lease cost recognized in prior periods. Additional lease expenses are any variable lease payments, changes that depend on an index or rate, or impairments.</p> <p>When a lease term is 12 months or less, the lessee can make a policy election not to record the lease liability and the right-of-use asset.</p> <p>Lessor: The lessor records rental revenue, which includes the total lease payments recognized on a straight-line basis and any variable payments not included in the lease payments.</p> <p>The lessor's initial direct costs are expensed over the lease term, typically on a straight-line basis.</p> <p>The lessor records depreciation expense on the leased asset if it classifies the asset as property, plant, and equipment but not if it holds the asset as part of inventory.</p>	<p>► Under IFRS, the lessee accounts for both operating and finance leases in the same way that finance leases are accounted for under U.S. GAAP. See Learning Objective 6 summary.</p> <p>Lessor accounting for an operating lease is similar under IFRS and U.S. GAAP.</p>

5 Demonstrate lessee accounting for a finance lease.	
Summary	Similarities and Differences between U.S. GAAP and IFRS
<p>For a finance lease, the lessee records a right-of-use asset and a liability measured the same way that an operating lease is.</p> <p>The lessee records amortization expense on the right-of-use asset and interest expense on the liability using the effective interest rate method.</p> <p>Additional lease expenses are any variable lease payments, changes in variable lease payments that depend on an index or rate, or impairments.</p>	<p>► Under IFRS, the lessee accounts for both operating and finance leases in the same way that finance leases are accounted for under U.S. GAAP.</p> <p>► Optional election: Leased assets with original costs less than \$5,000 can be treated as rental agreements.</p>

Summary by Learning Objectives, continued

6 Illustrate lessor accounting for sales-type leases.	
Summary	Similarities and Differences between U.S. GAAP and IFRS
<p>Initially, the lessor reports the net investment in a lease–sales-type (NIL-ST). The NIL-ST is the sum of the lease receivable and any unguaranteed residual value.</p> <p>The lessor also records revenue and cost of goods sold and removes the asset’s carrying value from its books.</p> <p>Revenue is the lower of (1) the fair value of the leased asset and (2) the lease receivable plus lease payments received before the lease commencement.</p> <p>Cost of goods sold is the carrying value of the leased asset less the present value of any unguaranteed residual asset plus any deferred initial direct costs.</p> <p>Subsequently, the lessor earns interest revenue on the lease receivable. The lessor expenses initial direct costs if the fair value of the leased asset is not equal to the carrying value. If the fair value equals the carrying value, the initial direct costs are deferred and included in the NIL-ST by computation of the implicit rate.</p>	<p>► IFRS does not distinguish sales-type from direct financing leases. All are treated similar to U.S. GAAP sales-type leases.</p> <p>There are two types of lessors under IFRS: (1) manufacturers and dealers and (2) everyone else. Under IFRS, manufacturers and dealers report a profit at the lease commencement, computed the same as lessors compute profit under U.S. GAAP. Manufacturers and dealers always immediately expense initial direct costs. All other lessors do not recognize a profit at lease commencement and they defer initial direct costs.</p>
7 Illustrate lessor accounting for direct financing leases.	
Summary	Similarities and Differences between U.S. GAAP and IFRS
<p>Initially, the lessor recognizes the net investment in lease–direct financing (NIL-DF), which is composed of:</p> <ul style="list-style-type: none"> • The lease receivable • The present value of any unguaranteed residual asset • A reduction for any deferred profit <p>The lessor also records revenue and cost of goods sold and removes the asset’s carrying value from its books.</p> <p>Revenue and cost of goods sold are defined the same way they are in a direct financing lease as they are for a sales-type lease.</p> <p>Subsequently, the interest revenue is the amount that produces a constant periodic discount rate on the remaining balance of the NIL-DF. The lessor records the following items in net income, if they are part of the lease agreement:</p> <ul style="list-style-type: none"> • Interest revenue on the NIL-DF, which includes interest on the lease receivable, interest on the accretion of any unguaranteed residual asset, and amortization of any deferred profit. • Variable payments not included in the NIL-DF. • Change in variable lease payments that depend on an index or rate. • Credit loss on the NIL-DF. • All initial direct costs are deferred, and expensed over the lease term. 	<p>► IFRS does not distinguish sales-type from direct financing leases.</p> <p>There are two types of lessors under IFRS: (1) manufacturers and dealers and (2) everyone else. Under IFRS, manufacturers and dealers report a profit at the lease commencement computed the same as lessors compute profit under U.S. GAAP. Manufacturers and dealers always immediately expense initial direct costs. All other lessors do not recognize a profit at lease commencement, and they defer initial direct costs.</p>

Summary by Learning Objectives, continued

8 Detail the required lease disclosures.	
Summary	Similarities and Differences between U.S. GAAP and IFRS
<p>Both lessees and lessors disclose the significant judgments made in accounting for leases, including the determination of whether a contract contains a lease, the separation of lease and nonlease components, and the discount rate.</p> <p>Lessees and lessors also provide a description of the leases by type and amount of</p> <ul style="list-style-type: none"> • Assets and liabilities recognized on the balance sheet • Costs and revenues on the income statement • Related cash flows <p>Both lessees and lessors provide a maturity analysis of leases by type including annual undiscounted cash flows for a minimum of 5 years and for remaining years in total, and they reconcile undiscounted cash flows to amounts on the balance sheet.</p> <p>Both disclose options to extend or terminate the lease and any residual value guarantees.</p> <p>Lessees also disclose:</p> <ul style="list-style-type: none"> • The determination and amount of variable lease payments • Weighted-average remaining lease term • Any election of the practical expedient of not separating lease components from nonlease components <p>Lessors also disclose:</p> <ul style="list-style-type: none"> • The leased asset's residual value • Profit or loss recognized at the commencement date • Components of the carrying amount of its lease receivables, its unguaranteed residual assets, and any deferred selling profit on direct financing leases • An explanation of significant changes in the balances of its unguaranteed residual assets and deferred selling profit on direct financing leases • Risk management strategy for residual assets • The carrying amount of residual assets covered by residual value guarantees. 	<p>Disclosures are similar under U.S. GAAP and IFRS.</p> <p>► IFRS provides disclosures pertaining to types of leases reported such as low-value leases.</p>

MyLab Accounting

Go to <http://www.pearson.com/mylab/accounting> for the following Questions, Multiple-Choice Questions, Brief Exercises, Exercises, and Problems. They are available with immediate grading, explanations of correct and incorrect answers, and interactive media that acts as your own online tutor.

18 Accounting for Leases

Questions

- 1 Q18-1. Does the lessee become the owner of the equipment when entering into an agreement to lease a piece of equipment? Explain.
- 1 Q18-2. Is it advantageous to the lessee that the lessor bears the risk of the asset becoming obsolete? Explain.
- 1 Q18-3. Who bears the risk of obsolescence in a lease transaction?
- 1 Q18-4. What are typical terms and provisions in a lease contract?
- 1 Q18-5. How does a lease offer business and financial flexibility for the lessee?
- 2 Q18-6. Over what time period does the lessee amortize the leased asset transferred by the lessor?
- 2 Q18-7. How is the right-of-use asset measured?
- 2 Q18-8. What components are included in a lease contract?
- 2 Q18-9. How does a lessee separate lease and nonlease components?
- 2 Q18-10. How does a lessor separate lease and nonlease components?
- 2 Q18-11. Does a lessee have an option not to separate lease and nonlease components?
- 3 Q18-12. What are the criteria for a lessee to report a finance lease?
- 3 Q18-13. What elements are included in the total lease payments?
- 3 Q18-14. Can the lessor account for a lease either as an operating, direct financing, or a sales-type lease at its discretion? Explain.
- 3 Q18-15. What is the difference in the lessee's lease capitalization criteria under IFRS and U.S. GAAP?
- 3 Q18-16. How does a guaranteed residual value affect the lease accounting for the lessor and the lessee?
- 3 Q18-17. How does the probability of the collection of the lease payments and guaranteed residual value affect the net investment in lease by the lessor?
- 3 Q18-18. What discount rate does the lessee use to determine the present value of the lease payments? What is the rationale behind this requirement?
- 3 Q18-19. Does the choice of discount rate (i.e., the lessee's incremental borrowing rate versus the lessor's implicit rate) materially affect lease valuation for the lessee?
- 4 Q18-20. What does the lessor report on the income statement under an operating lease?
- 4 Q18-21. What is reported by a lessee under a lease when the lessee makes the short-term lease policy election?
- 4 Q18-22. What types of expenditures are included in initial direct costs paid by the lessee?
- 4 Q18-23. How does a lessee measure the lease liability?
- 4 Q18-24. What is the lessee's short-term lease policy election?
- 4 Q18-25. What are the lessee's accounting and reporting requirements for the initial measurement of the lease transaction if a lease is classified as an operating lease?
- 4 Q18-26. What are the lessee's accounting and reporting requirements for the subsequent measurement of the lease transaction if a lease is classified as an operating lease?
- 4 Q18-27. What is the accounting treatment for initial direct costs the lessor pays?
- 5 Q18-28. What are the lessee's accounting and reporting requirements for the initial measurement of the lease transaction if a lease is classified as a finance lease?
- 5 Q18-29. What are the lessee's accounting and reporting requirements for the subsequent measurement of the lease transaction if a lease is classified as a finance lease?
- 6 Q18-30. How does the lessor measure the net investment in the lease for a lease classified as a sales-type lease?
- 6 Q18-31. In a sales-type lease, does a lessor always report a selling profit or loss on the sale of the leased asset at the lease commencement date? Explain.
- 7 Q18-32. In a direct financing lease, does a lessor always report selling profit or loss on the sale of the leased asset at the lease commencement date? Explain.
- A Q18-33. What types of payments are included in variable lease payments? How are variable lease payments treated in accounting for leases?

Multiple-Choice Questions

Becker CPA Exam Review multiple-choice questions are available in MyLab Accounting.

- 2 3 4 MC18-1.** Baxter Brothers, Inc. enters into a four-year equipment lease with annual payments of \$700 per year. The lease payments are due at the beginning of each year. The implicit rate of interest is 5% and is known to Baxter. Baxter pays \$250 in initial direct costs. The measurement of the lease liability and right of use asset are:
- \$2,482 and \$2,782, respectively
 - \$2,482 and \$2,232, respectively
 - \$2,606 and \$2,856, respectively
 - \$2,606 and \$2,356, respectively
- 3 MC18-2.** Zhou Systems signed a 5-year lease at the beginning of the current year. The leased equipment is from standard dealer stock and has an economic life of 8 years and a fair value of \$21,500. Under the terms of the lease, Zhou is required to pay \$4,500 at the beginning of each year. There is no purchase option and Zhou must return the equipment at the end of the lease term. The lessor does anticipate there will be a positive residual value but it is unguaranteed. Zhou knows the lessor's implicit rate is 6%. The proper classification of this lease for the lessee is:
- Operating lease
 - Finance lease
 - Direct financing lease
 - Sales-type lease
- 3 A MC18-3.** Insight Corporation leases equipment for 5 years with annual rentals of \$2,000 per year. The agreement also requires that Insight purchase supplies such as oil, fasteners, and filters directly from the lessor and must spend a minimum of \$350 per year over the lease term. The total lease payments used to classify the lease are:
- \$11,750
 - \$10,350
 - \$10,000
 - \$1,750
- 3 5 A MC18-4.** Lowe Leasing Company recently leased machinery to Amina Associates. The 8-year lease contract requires rental payments of \$11,000 at the beginning of each year. The lease meets at least one of the Group I criteria. The 4% implicit rate on the lease is known to Amina Associates. There is a \$3,000 guaranteed residual value by the lessee, which is equal to the expected residual value at the end of the lease term. The present value of the minimum lease payments for the lessor are equal to:
- \$98,029
 - \$79,215
 - \$77,023
 - \$56,016
- 3 MC18-5.** You are given the following information for a 4-year lease, with \$65,000 payments due at the beginning of each year. The fair value of the underlying asset is \$250,000 and the deferred initial indirect costs of the lessor amounted to \$15,592. The lessor's estimated residual value in the underlying asset is \$50,000. The implicit rate in the lease is equal to:
- 5.89%
 - 8.33%
 - 8.85%
 - 12.77%
- 4 MC18-6.** DC Products, Inc. leases several copy machines from Avenue Office Services. Under the terms of the agreement, DC will pay rentals of \$1,000 per month for an eight-month period. The journal entry made each month is:
- No entry is required under the short-term policy election.
 - | | | |
|--------------|-------|-------|
| Rent Expense | 1,000 | |
| Cash | | 1,000 |
 - | | | |
|--------------|-------|-------|
| Rent Expense | 8,000 | |
| Cash | | 8,000 |
 - | | | |
|--------------|-------|-------|
| Prepaid rent | 8,000 | |
| Cash | | 8,000 |

- 4 MC18-7. Frankel Forges, Inc.**, an IFRS reporter, leases a high-capacity forge from Bleake Metal Works Company for total lease payments of \$4,200, which is the fair value of the asset. Under the terms of the agreement, Frankel will make equal payments over the 42-month rental period. The journal entry made each month by Frankel is:

a. Rent Expense	100	
Cash		100
b. Rent Expense	4,200	
Cash		4,200
c. Prepaid rent	4,200	
Cash		4,200
d. Leased Asset	100	
Cash		100

- 2 MC18-8. Bischoff Enterprises** leases office space from Kally-Mack Properties for a term of 30 years. The office space that is available will permit the use of existing office equipment and computer equipment. In addition, Kally-Mack will deliver all maintenance services for all items of equipment, including the maintenance of the building (elevator service, window cleaning, and copy machine repairs). The maintenance is included in the annual lease payments. The lease components in this agreement are:
- Office space
 - Office space and all equipment (office and computer)
 - Office space, office equipment and computer equipment
 - Office space, office equipment, computer equipment and maintenance.

Brief Exercises

- 2 BE18-1. Identifying Lease and Nonlease Components.** Deane Company leases office space from Blossom Building Associates for a term of 20 years in order to expand its operations into the southern region of the state. The office space includes the use of office equipment and computer equipment. In addition, Blossom will provide maintenance of all items of equipment included in the agreement and basic repairs and maintenance of the office as needed (e.g., air conditioning, cleaning services, and elevator repairs). The maintenance is included in the annual lease payments. How many lease components are included in the contract and specifically, what are they?
- 3 BE18-2. Classification as Finance or Operating Lease, Lessee.** Scott Manufacturing is considering a lease to acquire new equipment. The useful life of the asset is 10 years. Scott can lease the equipment from New City Bank for \$1,000 per year over an 8-year period. The lease does not contain a purchase option. There is no transfer of ownership clause in the contract. Should Scott account for this lease as an operating or a finance lease?
- 3 BE18-3. Classification as Finance or Operating Lease, Lessee.** Dial Digital Solutions signed a 3-year lease at the beginning of the current year. The leased equipment has an economic life of 5 years and a fair value of \$1,450. Under the terms of the lease, Dial is required to pay \$500 on January 1 of each year. There is no purchase option, and Dial must return the equipment at the end of the lease term. Dial does not know the lessor's implicit rate but recently borrowed at 5% under a 3-year loan agreement. Should Dial account for this lease as an operating or a finance lease?
- 3 BE18-4. Classification as Finance or Operating Lease, Lessee, Discount Rate.** Using the information provided in BE18-3, determine whether this lease is a finance or an operating lease if Dial Digital knows that the lessor's implicit rate is 6%.
- 3 BE18-5. Classification as Finance or Operating Lease, Lessee.** Iman Iron Works signed a lease on January 1 with Borko Bank for an iron-stamping machine. The equipment is not specialized in nature. The lease has a 12-year term with no purchase option or transfer of ownership. Under the terms of the contract, Iman must pay \$3,500 on January 1 of each year. Borko Bank's implicit rate is 12%. The iron-stamping machine has an economic life of 25 years and a fair value of \$35,000. If Iman borrowed at Borko Bank, the loan would carry an interest rate of 14%. The lessee knows the implicit rate. Is this contract an operating or a finance lease for the lessee?

- 3 4** **BE18-6. Classification as a Finance or Operating Lease, Lessee.** Using the information provided in BE18-5, prepare the journal entries for the lessee at the commencement of the lease.
- 3 5** **BE18-7. Classification as Finance or Operating Lease, Lessee.** Jenkins Manufacturing Company leased a piece of nonspecialized machinery for use in its operations from Perry Leasing on January 1. The 10-year lease requires lease payments of \$4,000 due on January 1 of each year. The machinery is estimated to have a 10-year life, is depreciated on the straight-line method, and will have no residual value at the end of the lease term. The present value of the lease payments using 11.2% and the asset's fair value on the date the lease is signed both equal \$25,977. Perry paid fair value to acquire the equipment the day before lease commencement. The lessor's implicit rate of 11.2% is known to Jenkins. Collection of all lease payments is reasonably assured. Prepare Jenkins Manufacturing's journal entries at the commencement of the lease and at the end of the first year.
- 3 6** **BE18-8. Classification of Lease, Lessor.** Repeat the requirements of BE18-7 for the lessor, Perry Leasing.
- 3 6** **BE18-9. Classification as Sales-Type or Operating Lease, Lessor.** Using the information provided in BE18-7, prepare the journal entries at the commencement of the lease and at the end of the first year for Perry Leasing assuming now that Perry paid \$23,000 to acquire the equipment.
- 3** **BE18-10. Classification of Lease, Lessor, IFRS.** Repeat the requirements of BE18-9 for the lessor, Perry Leasing assuming that Perry is an IFRS reporter. Perry is not a dealer.
- 3 A** **BE18-11. Composition of Lease Payments, Variable Payments.** Assume that Imprescia Industries leases machinery for 3 years with fixed rentals of \$8,000 per year. The agreement also requires that Imprescia purchase consumables (such as lubrication, drive belts, and springs) directly from the lessor and must spend a minimum of \$1,000 per year over the lease term. What are the lease payments to be used to classify the lease for the lessee?
- 3 5 A** **BE18-12. Finance Lease, Lessee, Lessor, Guaranteed Residual Value.** VJ Leasing Company recently leased machinery to Berg Building Associates. The 5-year lease contract requires rental payments of \$20,000 on January 1 of each year. The lease meets at least one of the Group I criteria. The 9% implicit rate on the lease is known to Berg Building Associates. There is a \$5,000 guaranteed residual value by the lessee, which is equal to the expected residual value at the end of the lease term. Therefore, there is no unguaranteed residual asset. Compute the present value of the lease payments for VJ Leasing Company and Berg Building.
- 3 5 A** **BE18-13. Finance Lease, Lessee, Lessor, Unguaranteed Residual Value.** Sun Bank recently leased machinery to Claude Company. The 8-year lease contract requires rental payments of \$100,000 due on January 1 of each year. The lease is classified as a finance lease for the lessee and a sales-type lease for the lessor. Claude knows Sun Bank's 6% implicit rate. There is a \$30,000 residual value. Compute the net investment in the lease for Sun Bank and the lease liability and right-of-use asset for the Claude Company assuming that the residual value is not guaranteed by the lessee or by a third party.
- 3 A** **BE18-14. Composition of Lease Payments, Variable Payments.** Assume that Sting Stores leases office space from Ramona Realty for \$15,000 per month. According to the terms of the lease, monthly rentals will increase by the annual increase in the Consumer Price Index (CPI). Index decreases will not be considered. What are the lease payments for this contract?
- 3 A** **BE18-15. Composition of Lease Payments, Variable Payments.** Assume that Anderson Associates, Inc. leases conference and training facilities from The Learning Company. Anderson will conduct training seminars for the clients at the leased space. The lease requires annual payments of \$400,000 plus a percentage of sales volume that cannot be less than 1% of total sales revenue. Assume total sales revenue is not known at the time of lease commencement. What are the payments to be used to classify the lease?
- 3** **BE18-16. Determining the Implicit Rate in the Lease.** Assume that you are given the following information for a 5-year lease (with payments due on January 1 of each year):
- The lease payments are \$60,000 per year.
 - The fair value of the underlying asset is \$500,000.
 - The deferred initial indirect costs of the lessor are equal to \$25,000.
 - The lessor's estimated residual value in the underlying asset is \$350,000.
- What is the implicit rate in the lease?
- 4** **BE18-17. Lessee Short-Term Lease Policy Election.** Morris Products, Inc. leases several copy machines from Stanley Office Services. Under the terms of the agreement, Morris will pay rentals of \$800 per month for an 11-month period. Morris elects to apply the exemption for short-term leases. That is, Morris makes a policy election not to record the lease liability and the right-of-use asset. What is the journal entry made each month to record the rental payments?
- 5 6** **BE18-18. Classification, Low-Value Lease Exception, Lessee, IFRS.** Aviata Products, Inc. leases a high-capacity printer from Dewey Office Services for \$4,200. The original cost of the printer was \$4,900. Under the terms of the agreement, Aviata will make even payments over the 42-month rental period. What is the journal entry made each month if Aviata elects to use the low-value lease exception to record the rental payments?

Exercises

- 2 A** E18-1. **Allocation of Total Payments to Lease and Nonlease Components and Variable Consideration.** SouthSide Services leases several computer servers from Sharpe Computing Company. The lease agreement includes consulting and training updates. The standalone prices charged by Sharpe for each separate component are \$850,000 for the servers and \$150,000 for the consulting and training. The lease is for 5 years with fixed payments of \$300,000 per year. There are also variable payments required amounting to \$7,000 per year on average based on the metered usage of the servers. There is no minimum charge included in the contract.
- Required »**
- Assuming that SouthSide allocates consideration based on relative standalone selling prices, determine the allocation of the total consideration to the computer servers and the consulting and training updates.
- 2 A** E18-2. **Allocation of Total Payments to Lease and Nonlease Components and Variable Consideration.** Using the same facts as included in E18-1, now assume that the variable payments cannot be less than \$2,000 per year.
- Required »**
- Assuming that SouthSide allocates consideration based on relative standalone selling prices, determine the allocation of the total consideration to the computer servers and the consulting.
- 2 3 4** E18-3. **Operating Lease, Nonlease Components, Lessee.** BabyClothing (BC) Enterprises leases digital imaging equipment from Sally Systems Leasing. The lease term is for 3 years and the economic life of the equipment is 5 years. The lease contract does not contain a purchase option and title will not be transferred at the end of the lease term. The fair value of the equipment is \$5,500 and there is no guaranteed residual value. Sally Systems does not offer any incentives to the lessee to enter the lease. BC paid \$550 in initial direct costs on the lease commencement date. BC's incremental borrowing rate is 4% and is used to measure the present value because the lessor's implicit rate is not readily determinable. The annual lease payments (due on January 1 of each year) are \$990, which includes technological consulting over the lease term. The digital imaging equipment is typically leased for \$900 per year and the consulting is provided at a price of \$450 per year. BC has not made the election to account for each separate lease component along with nonlease components as a single lease component. As a result, the components must be separated.
- Required »**
- Classify the lease for BC Enterprises.
 - Prepare the journal entries for the lessee and supporting amortization tables to account for this agreement over the lease term.
- 2 3 4 A** E18-4. **Operating Lease, Rate or Index, Effect of Variable Lease Payments, Lessee.** Caye Comfort, Inc. manufactures a complete line of beds, cots, and futons. Caye Comfort leases a spring fabricating machine from Stein Spring Company for 3 years with no renewal or purchase options. The equipment has a fair value of \$10,000 and title will be retained by the lessor at the end of the lease term. The economic life of the equipment is 6 years. The implicit rate in the lease is 5%. The lessee pays all maintenance to a third party, and there are no initial direct costs.
- There are no incentives offered by the lessor. The first annual payment is \$1,300 (due January 1, Year 1), and the payment increases each year by an amount equal to \$1,300 multiplied by the Producers Price Index (PPI). The PPI on the lease commencement date is 1.00 and is forecast to increase by 4% each year. The increases in the payments will be at least 4% per year. The remaining lease payments are due on December 31, Year 1 and December 31, Year 2.
- Required »**
- Determine the proper classification of the lease for the lessee.
 - Prepare the journal entries and supporting amortization tables to account for this agreement for the lessee over the lease term.
- 2 3 5** E18-5. **Classification as Finance or Operating Lease, Lessee, Journal Entries, Nonlease Components.** On January 1, 2019, Holt National Bank (HNB) acquired a fleet of trucks to be leased to J Rivers Company. HNB paid \$105,000 to acquire the vehicles, which is also the fair value of the fleet. The lease terms follow.
- Annual rental payments of \$36,272 are due on January 1 of each year.
 - Lease term is 3 years.
 - There is no residual value and no purchase option.
 - The economic life of the asset is 3 years.
 - The lessee's incremental borrowing rate is 5%; the lessor's implicit rate is not known to J Rivers Company.

- Included in the rental payments are annual sales taxes and maintenance. Annual sales taxes equal \$500 paid to the lessor on January 1 of the year and represent a lease component. Annual maintenance is \$800 and is paid to the lessor at the beginning of the year. The maintenance is a nonlease component, and the lessee elected not to allocate the consideration to the lease and nonlease components due to immateriality. The lessee has elected to account for each separate lease and nonlease component as a single component.
- HNB has no material uncertainties regarding future costs to be incurred under the lease, and collectability is reasonably assured. J Rivers depreciates similar vehicles that it owns using the straight-line method.

Required »

- Classify the lease as either a finance lease or an operating lease for J Rivers Company, the lessee.
- Prepare the journal entries for the first year of the lease for J Rivers Company, the lessee.

2 3 5

E18-6. Classification as Finance or Operating Lease, Lessee, Journal Entries, Nonlease Components. Fontana Company enters into a lease agreement on January 1, 2017, for nonspecialized equipment leased by Mindbender Insurance Company. The following data are relevant to the lease agreement:

- The term of the lease is 4 years with no renewal or purchase options. Annual lease payments of \$148,000 are due on January 1 of each year and include all applicable taxes.
- The fair value of the equipment on January 1, 2017, and the cost to Mindbender is \$450,000. The equipment has an economic life of 4 years with no salvage value.
- Fontana depreciates similar machinery that it owns using the straight-line method.
- The lessee payments to the lessor include a charge for maintenance. The lessor sells a similar maintenance agreement for \$25,000 when purchased without a lease contract. The machinery is leased for \$150,000 per year, including taxes, when lessees do not accept the maintenance contract.
- Fontana's incremental borrowing rate is 10% per year. The lessee does not know the implicit rate used in the lease computations.
- Mindbender indicates that collection from Fontana is reasonably certain.
- Fontana does not make a policy election not to separate the lease and nonlease components.

Required »

- Indicate the type of lease Fontana Company has entered into and what accounting treatment is applicable. Round percentages to the two decimal places.
- Prepare an amortization schedule for the entire lease term.
- Prepare the journal entries on Fontana's books that relate to the lease agreement for the first year of the lease term.

3 4

E18-7. Classification as Finance or Operating Lease, Lessee, Journal Entries, Amortization Tables, Unguaranteed Residual Asset, Annuity Due. On January 1, Gump Sales Company entered into an agreement to lease a piece of machinery for a period of 5 years from Smokey Boy Equipment (SBE). The machine is not specialized for Gump's business needs, has a sales price of \$70,000, and its useful life is 7 years with no guaranteed residual value. The \$15,000 annual rentals are due on January 1 of each year. The lease does not contain a transfer of ownership or a purchase option. Assume that there are no initial direct costs associated with this lease. There are also no nonlease components. SBE's implicit rate is not known to Gump whose incremental borrowing rate is 13%. The carrying value of the equipment to SBE is \$70,000, its fair value. Assume that collectability of all lease payments is reasonably assured. Gump's fiscal year ends on December 31.

Required »

- Determine the lease classification for Gump Sales.
- Prepare the journal entries over Years 1–3 for Gump Sales based on your answer to part (a).
- Include an amortization table for the lease liability and right-of-use asset.

3 6 7

E18-8. Classification as Finance or Operating Lease, Lessor, Journal Entries, Guaranteed Residual Value. Using the same information presented in E18-7, complete the following requirements:

Required »

- Prepare the entries for the lessor, SBE, for the first year of the lease. Determine the implicit rate.
- Would the accounting for the lessor change if a third party guarantees a residual value of \$20,000 and collection of this amount is probable?
- Prepare the amortization tables needed (if any) to account for the lease using the part (b) assumptions.

- 3 4 5** **E18-9. Initial Measurement of the Lease Liability and the Right-of-Use Asset.** Assume that Bergamini Builders leases medical equipment from Saint Martin's Machine Company. The lease term is for 7 years, and Bergamini must pay seven annual rentals of \$40,000 beginning on January 1, 2019, of the current year and every January 1 afterward. The implicit rate in the lease is 3.5%. Bergamini prepaid Saint Martin's Machine Company the first payment of \$40,000 on December 31, 2018 (the date the lease is executed, which is prior to the lease commencement date). Bergamini received \$15,000 from Saint Martin's Machine Company on the commencement date as an incentive to enter the lease agreement. Bergamini incurred initial direct costs of \$5,000 that were originally recorded as prepaid initial direct costs on December 31, 2018. The equipment has no residual value.

Required »

- Determine the lessee's initial measurement of the lease liability and the right-of-use asset. Note that the initial measurement is the same for both operating and finance leases.
- Prepare all journal entries necessary in order for Bergamini to record the transactions described in the facts provided.

- 3 5** **E18-10. Classification as Finance or Operating Lease, Lessee, Journal Entries.** On January 1, 2018, Temple Leasing Company (TLC) acquired a fleet of stock vehicles to be leased to Delaware River Company. TLC paid \$275,000 to acquire the vehicles, which is also the fair value of the fleet. The lease terms follow.
- Annual rental payments of \$57,900 are due on January 1 of each year, beginning on January 1, 2018. The lease agreement does not include any nonlease components.
 - The lease term is 5 years.
 - There is no residual value and no purchase option.
 - The economic life of the asset is 5 years.
 - The lessee's incremental borrowing rate is 5% and the lessee does not know the lessor's implicit rate.
- TLC indicates that collectability of all lease payments is reasonably assured. Delaware Rivers depreciates similar vehicles that it owns using the straight-line method.

Required »

- Classify the lease as either a finance lease or an operating lease for Delaware River Company, the lessee.
- Prepare the journal entries at lease commencement and the first lease payment for the lessee.
- Prepare an amortization table for the lease.
- Prepare the journal entries at the end of the first year and for the second lease payment for Delaware River Company, the lessee.

- 3 5** **E18-11. Classification as Finance or Operating Lease, Lessee, Journal Entries.** On January 1, 2018, Lima Leasing Company (LLC) acquired an airplane to be leased to LA Sky Company. LLC paid \$950,000 to acquire the plane, which is also its fair value. The lease terms follow.
- Annual rental payments of \$190,000 are due January 1 of each year, beginning on January 1, 2018. There are no nonlease payments.
 - The lease term is 6 years.
 - There is neither a residual value or a purchase option.
 - The economic life of the asset is 8 years, and the airplane is not specialized in nature.
 - The lessee's incremental borrowing rate is 8%, and the lessee does not know the lessor's implicit rate.
- LLC indicates that collectability of lease payments is reasonably assured. LA Sky depreciates similar vehicles it owns using the straight-line method.

Required »

- Classify the lease as either a finance lease or an operating lease for LA Sky Company, the lessee.
- Prepare the journal entries at lease commencement and the first lease payment for the lessee.
- Prepare an amortization table for the lease.
- Prepare the journal entries at the end of the first year and for the second lease payment for LA Sky Company, the lessee.

- 3 5** **E18-12. Classification as Finance or Operating Lease, Lessee, Journal Entries, Discount Rates, Lease Inception in Middle of Year.** Vanity Jewelers Incorporated signed a lease agreement on July 1, 2020, to lease diamond-polishing equipment from Whitehead Industries. The following information is relevant to the lease agreement.
- The term of the lease is 7 years with no renewal option. Payments of \$45,500 are due on July 1 of each year (at the beginning of each period).
 - The fair value of the equipment at July 1, 2020, is \$300,000. The equipment has an economic life of 10 years.

- Vanity Jewelers depreciates similar equipment that it owns using the straight-line method over the economic life of the property.
- Vanity Jeweler's incremental borrowing rate is 5%. Whitehead's implicit rate on the lease is not known to Vanity Jewelers.
- There are no nonlease components related to this lease.

Required »

- Determine the type of lease that Vanity Jewelers, the lessee, should record on its books.
- Prepare all journal entries necessary on the books of Vanity Jewelers for 2020 and 2021. Vanity Jewelers has a December 31 year-end.

3 4 5

E18-13. Classification as Finance or Operating Lease, Lessee, Sales-Type Lease, Journal Entries, Annuity Due. Seal Container Corporation (SCC) signed a lease agreement on January 1, 2018, to lease new forklift equipment. The terms of the lease follow.

- The lease has a term of 10 years. There are no purchase or renewal options.
- SCC makes the annual lease payments of \$70,000 on January 1 of each year, beginning on January 1, 2018.
- The fair value of the equipment at the commencement of the lease is \$567,548.
- The equipment has an economic life of 15 years.
- The lease terms do not include a guaranteed residual value clause.
- The cost of the equipment to the lessor, Cirella Manufacturing Company, is \$500,000.
- SCC depreciates the forklifts that it currently owns on a straight-line basis over the economic life of the property.
- SCC's incremental borrowing rate is 5%, and the lessor's implicit rate in the lease is not known to SCC.
- The lessee paid \$7,452 in initial direct costs related to this lease on the lease commencement date.
- The lessor is reasonably certain as to collection of the lease payments.

Required »

- Classify this lease as operating or finance for the lessee.
- Prepare an amortization table for the lessee from 2018 through 2020 using the effective interest rate method of amortization.
- Prepare all of SCC's journal entries for the first full year of the lease.
- Prepare the journal entries and the lease amortization schedule required for SCC in the first year of the lease if it classifies the lease as an operating lease.

3 5

E18-14. Finance Lease, Purchase Option, Lessee, Amortization Schedules, Journal Entries. Carrie-Ann Fashions, Inc. entered into a 5-year lease with Reese Rentals to occupy an office building. The economic life of the building is 30 years. The building had a fair value of \$8,500,000 and Carrie-Ann has an option to purchase the building at the end of the lease term for \$5,500,000, which is expected to be considerably below fair value at lease termination. The annual lease payments are \$842,500 and are due on January 1 with the first one due at lease commencement on January 1, 2019. The implicit rate in the lease is 6% and is known by Carrie-Ann. There is no guaranteed residual value specified. The lessor did not offer any incentives to sign the lease. Carrie-Ann did not incur any initial indirect costs. The lease commencement date is January 1. All payments are due on January 1.

Required »

- Classify this lease for Carrie-Ann Fashions (the lessee).
- Prepare the journal entries necessary to record this transaction on the lease commencement date.
- Prepare the lease amortization schedule and prepare the journal entries for the first year.

3 5 6

E18-15. Classification as Finance or Operating Lease, Lessee, Lessor, Journal Entries, Sales-Type Lease, Discount Rates, Annuity Due, Nonlease Components. On January 1, 2019, Kane Kite Company leased a nonspecialized fabric-cutting machine from Stewart Standard, Inc. Under the terms of the lease, Kane Kite must pay \$200,000 on January 1 of each year, starting in 2019, over a 9-year term. The lease terms do not contain a transfer of ownership, and there is no purchase option. There is also no residual value specified in the contract. The cutting machine has a useful life of 9 years and Kane Kite depreciates similar equipment that it owns using the straight-line method. Kane Kite's incremental borrowing rate is 9%, and the implicit rate of 8% in the lease is known to Kane Kite. The machine cost Stewart Standard \$1,300,000 to manufacture, and it has a selling price of \$1,349,328. Stewart indicates that collection of the annual lease payments is reasonably certain. Kane is required to pay \$5,600 at the end of each year for maintenance to independent third parties, which it records as general and administrative expenses. Neither party to the lease incurs initial indirect costs.

Required »

- What type of lease is this for both the lessee and lessor?
- Prepare the lease amortization table for the lease term.
- Prepare the journal entries necessary for Stewart Standard on January 1, 2019, and on December 31, 2019.
- Prepare the journal entries necessary for Kane Kite Company on January 1, 2019, and on December 31, 2019.

- 3 5 6** **E18-16. Classification as Finance or Operating Lease, Lessor, Journal Entries, Discount Rates, Annuity Due, Nonlease Components, IFRS.** Using the information provided in E18-15, assume now that Stewart Standard and Kane Kite are IFRS reporters.

Required »

- Determine the lessor's classification of the lease.
- Measure the right-of-use asset and the lease liability at January 1, 2019 and prepare the lessee's amortization table.
- Prepare the journal entries for Stewart Standard for 2019.

- 3 5 6** **E18-17. Classification as Finance or Operating Lease, Lessee, Lessor, Lessee Journal Entries, Lease Commencement in the Middle of Year, Annuity Due.** Mr. Kay Food Mart Inc., as lessee, enters into a lease agreement on July 1, 2018, to lease nonspecialized mobile refrigeration equipment from Pollet Products. The cost of the equipment to Pollet is \$180,000. The following information is relevant to the lease agreement.
- The term of the lease is 5 years with no renewal options and there is no transfer of title. Payments of \$44,880 are due beginning on July 1, 2018, and every July 1 thereafter.
 - The fair value of the equipment at July 1, 2018, is \$196,898. The equipment has an economic life of 5 years with no residual value.
 - Mr. Kay Food Mart depreciates similar equipment that it owns on the straight-line basis over the economic life of the property.
 - Mr. Kay Food Mart's incremental borrowing rate is 8%, and the lessor's implicit rate in the lease is not known.
 - There are no nonlease components related to this lease.
 - Collectability of all lease payments is reasonably assured.

Required »

- Determine the type of lease that Mr. Kay Food Mart, the lessee, should record on its books.
- Prepare all journal entries necessary on the books of Mr. Kay Food Mart for 2018 and 2019. Mr. Kay's year-end is December 31.
- How should Pollet Products classify this lease contract?

- 3 4** **E18-18. Operating Lease, Lessor.** True Image Copier Company leases a multifunction copier to Fabach Incorporated. The lease term is 4 years with no renewal options; the economic life of the copier is 7 years. The fair value of the copier is \$14,000, and True Image Company's equipment carrying value is also \$14,000. The residual value expected at the end of the lease term is \$5,000 and is not guaranteed. There are no lease incentives and no initial direct costs paid by either party to the lease. Fabach can acquire title to the copier by paying fair value at the end of the lease term. The lease calls for monthly payments of \$200 due on the first day of each month. Fabach pays for maintenance to an independent third party. The implicit rate in the lease is 5%. There is no transfer of ownership at the end of the lease term.

Required »

- Classify the lease for True Image Copier Company.
- Provide the journal entries required over the lease term assuming that True Image prepares financial statements monthly. Provide all supporting computations.

- 3 4** **E18-19. Operating Lease, Lessee, Amortization Schedules, Journal Entries.** Cardillo Capital enters into a lease agreement with Vincent Motors to lease a delivery van with a fair value of \$55,000 under a 36-month (3-year) lease. The van has an estimated useful life of 8 years. No initial direct costs are incurred by the lessor. Cardillo has an option to purchase the van at the end of the lease for its fair value. Monthly payments are \$775 per month (payable on the first day of each month) with no cash down at inception, and there are no lease incentives. Cardillo does not know the rate implicit in the lease and will use its annual incremental borrowing rate of 5%. There is no transfer of title. Cardillo does not guarantee a residual value at the end of the lease term and pays all insurance and maintenance independently of the lease contract to a third party. Any sales tax charged is included in the lease payments. Cardillo paid \$900 in initial direct costs on the lease commencement date. Cardillo has a fiscal year end of December 31, and prepares monthly financial statements. The lease starts on January 1.

Required »

- Classify the lease for Cardillo Capital.
- Determine the initial measurement of the lease liability and right-of-use asset.
- Prepare the partial amortization schedules needed to amortize the lease debt and the right-of-use asset for the first 3 months of the lease agreement.
- Prepare the journal entries for the first 3 months of the lease.

3 4

E18-20. Operating Lease, No Lessee Guaranteed Residual Value, Lessee. Beachmont Restaurants, Inc. enters into a lease for standard stoves and grills. The lease term is 3 years with no renewal or purchase options. There is no residual value guarantee, and the lease terms do not provide for a transfer of title. The economic life of the asset is 10 years. According to the terms of the lease contract, Beachmont is required to pay rentals of \$700 for the first year with payments increasing by 15% per year for Years 2 and 3. All lease payments are made on January 1. The implicit rate in the lease is 6%. The fair value of the asset is \$9,000. Beachmont knows the lessor's implicit rate. Beachmont's fiscal year ends on December 31.

Required »

- Determine the classification of the lease for the lessee.
- Measure the right-of-use asset and the lease liability and prepare the lessee's amortization tables.
- Prepare the journal entries over the lease term.

3 5

E18-21. Finance Lease with a Lessee Guaranteed Residual Value. Using the information provided in E18-20, assume now that Beachmont provides a guarantee of the residual value of \$7,000 that will cover any unrecovered fair value by the lessor.

Required »

- Determine the classification of the lease for the lessee.
- Measure the right-of-use asset and the lease liability and prepare the lessee's amortization table.
- Prepare the journal entries over the lease term. Assume the leased asset has a fair value of \$7,000 at the end of the lease term.

3 4 7

E18-22. Classification as Finance or Operating Lease, Lessee, Lessor, Journal Entries, Direct Financing Lease, Annuity Due, Lessee Initial Direct Costs, Third-Party Guaranteed Residual Value. Plash Photo Company leased a digital reproduction machine on January 1, 2019. The following information was obtained from the lease contract:

- The lease carries a term of 5 years. There is no renewal option and there is no transfer of ownership.
- The rental payments of \$120,000 per year are due each January 1 with the first payment due at lease commencement.
- The fair value of the equipment on the date the lease is signed is \$650,000. The equipment has an economic life of 8 years. The lessor paid fair value to acquire the asset. On January 1, 2019, the carrying value is \$650,000.
- There is a guaranteed residual value of \$100,000 provided by a third party. This guaranteed residual value is equal to the expected residual value so that there is no unguaranteed residual asset expected at the end of the lease term.
- Plash Photo depreciates similar machinery that it owns on a straight-line basis.
- The lessee pays initial direct costs of \$10,000 at the lease commencement date.
- Plash Photo's incremental borrowing rate is 10% per year. Plash does not know the lessor's implicit rate.
- The lessor is reasonably certain regarding the collection of the lease payments, and it is probable that the lessor will collect the lease payments plus any amount necessary to satisfy a residual value guarantee.

Required »

- Classify the lease for both the lessor and the lessee. Find the lessor's implicit rate.
- Prepare the journal entries for Plash Photo (the lessee) for the first year of the lease (i.e., January 1 and December 31).
- Prepare the journal entries for the lessor for the first year of the lease (i.e., January 1 and December 31).

Problems**2 3 5 6 A**

P18-1. Classification as Finance or Operating Lease, Lessor, Journal Entries, Discount Rates, Sales-Type Lease, Annuity Due, Executory Costs, Guaranteed Residual Value. Locatelli Partners (LP) agreed to lease a piece of heavy equipment to Sonata Company on January 1. LP paid \$195,100 to produce the machine and carried it at this amount in its inventory. This machine is routinely produced by LP and is part of its standard stock in inventory. The fair value (current selling price) of the machine is \$210,001. The lease terms follow.

Annual rental payments of \$46,466 are due on January 1 of each year. These rental payments do not include any other lease components.

- Lease term is 7 years.
- There is a purchase option that is reasonably expected to be exercised to acquire the asset at the end of 5 years for \$20,000.
- The lessor expects to recover the guaranteed residual value of \$30,000 at the termination of the lease. The lessee guarantees the residual value.
- The economic life of the asset is 8 years.
- Sonata Company knows the lessor's implicit rate.
- The lessee's incremental borrowing rate is 12%.
- Annual maintenance is \$8,000 and annual training is \$9,500. The lessee pays both at the end of the year to an independent third party.
- LP indicates that the collection of the lease payments is reasonably assured and the recovery of the residual value is probable.
- Sonata depreciates (amortizes) similar machinery that it owns using the straight-line method.

Required »

- a. Compute the implicit rate.
- b. Classify this lease agreement for both the lessor and the lessee.
- c. Prepare an amortization table for the lease.
- d. Prepare the journal entries for the lessor and the lessee during the first year of the contract.

3 4 5 6

P18-2. Classification as Finance or Operating Lease, Lessor, Journal Entries, Discount Rates, Sales-Type Lease, Nonlease Components, Guaranteed Residual Value. On January 1, 2018, the lease commencement date, Curran Manufacturing Corporation (CMC) agreed to lease a piece of nonspecialized, heavy equipment to Oates Products, Inc. CMC paid \$900,000 to manufacture the machine and carries it at this amount in its inventory. The fair value (current selling price) of the machine is \$929,049. The relevant lease terms follow.

- Annual rental payments of \$240,000 are due on December 31 of each year. However, the first payment is due at the commencement of the lease. The lease payments do not include any other lease components such as insurance or sales taxes.
- Lease term is 4 years.
- There is no purchase option.
- The lessee guarantees a residual value of \$60,000 at the termination of the lease. This amount is equal to the expected residual value and there is no unguaranteed residual asset.
- The economic life of the asset is 7 years.
- The lessor's 6% implicit rate is known to Oates Products, Inc.
- The lessee's incremental borrowing rate is 8%.
- Annual maintenance is \$10,000 and annual training is \$7,700. The lessee pays both at the end of the year to an independent third-party vendor. The lessee classifies these costs as general and administrative expenses.
- CMC indicates that collectability of all lease payments is reasonably assured, and it is probable that the residual value will be fully recovered.
- Oates depreciates (amortizes) similar equipment using the straight-line method.

Required »

- a. Determine whether this is an operating or a finance lease for the lessee and an operating, sales-type, or direct financing lease for the lessor.
- b. Prepare the amortization table for the entire lease term.
- c. Prepare the lessee's journal entries required for each year of the lease term assuming that the equipment is returned with a fair value of \$60,000.
- d. Prepare the lessor's journal entries required for each year of the lease term assuming that the equipment is returned with a fair value of \$60,000.
- e. Prepare the December 31, 2021, journal entry for the lessee assuming that the equipment is returned with a fair value of \$45,000.
- f. Prepare the December 31, 2021, journal entry for the lessor assuming that the equipment is returned with a fair value of \$45,000.

3 5 6 P18-3. Classification as Finance, Sales-Type, or Operating Lease, Lessee, Lessor, Journal Entries, Unguaranteed Residual Value.

Florida Energy Restoration, Ltd. (FER) enters into a lease agreement on January 1, 2018, to lease standard power generators from R&R Electric, Inc. The terms of the lease follow.

- The term of the lease is 7 years with no renewal option. The seven annual lease payments of \$300,000 will be made on January 1 of each year.
- The fair value of the equipment at January 1, 2018, is \$1,700,479. The equipment has an economic life of 10 years with no salvage value expected at that time. The cost of the equipment to the lessor, R&R, is \$1,500,000.
- FER depreciates similar equipment that it owns on a straight-line basis over the economic life of the property.
- FER's incremental borrowing rate is 10%, and the lessor's 9% implicit rate on the lease is known to FER.
- There are no nonlease components related to this lease.
- Neither party to the lease pays initial direct costs.
- The lessor indicates that the collection of the lease payments are reasonably certain.
- There is no guaranteed residual value in the lease contract; however, the lessor, R&R, expects the asset to be worth \$100,000 at the end of the lease term.

Required »

- a. Provide justification for classifying this as a finance lease for the lessee.
- b. Prepare a partial amortization table for 2018 through 2020 for the lessee using the effective interest rate method of amortization.
- c. Prepare all of FER's journal entries for 2018 and 2019.
- d. Prepare the journal entries required for 2018 and 2019 for FER if this were an operating lease.
- e. What type of lease is this for the lessor? Justify your answer.

3 5 6 P18-4. Classification as Finance or Operating Lease, Lessor, Journal Entries, Sales-Type Lease, Annuity Due.

On January 1, 2018, JLOU Company leases a fleet of stock delivery vehicles from Dolt Motors, Inc. Under the terms of the lease, JLOU must pay \$65,000 on January 1 of each year, beginning on January 1, 2018, over a 4-year term. The delivery vehicles have a useful life of 4 years. JLOU depreciates similar vehicles that it owns using the straight-line method. JLOU's incremental borrowing rate is 12%, and the 8% implicit rate in the lease is known to the lessee. The vehicles cost Dolt Motors \$200,000 and have a fair value of \$232,511. Dolt has no uncertainties as to future costs and collection. The lease terms do not contain a transfer of ownership, and there is no purchase option. There is also no residual value specified in the contract because no residual value is expected at the end of the lease term by the lessor. Assume that there are neither initial direct costs nor nonlease components related to the lease agreement.

Required »

- a. Classify this lease agreement for both the lessor and the lessee.
- b. Prepare the lease amortization table for the entire lease term.
- c. Prepare the journal entries necessary for Dolt Motors on January 1, 2018, and on December 31, 2018.
- d. Prepare the journal entries necessary for JLOU Company on January 1, 2018, and on December 31, 2018.

3 5 6 A P18-5. Classification as Finance or Operating Lease, Lessor, Journal Entries, Sales-Type Lease, Guaranteed Residual Value. Using the same information as found in P18-4, assume that the lease contains a guaranteed residual value of \$15,000. The lessee guarantees the residual value.

Required »

- a. Compute the annual rent payment needed to ensure that the lessor company recovers the fair value of the vehicles.
- b. Compute the present value of the lease payments using this new payment (exclude the guaranteed residual value from this part of the problem).
- c. Prepare the amortization table required for the entire term. Use the new payment and guaranteed residual value.

3 5 6 A P18-6. Classification as Finance or Operating Lease, Lessor, Journal Entries, Discount Rates, Sales-Type Lease, Executory Costs, Unguaranteed Residual Value. On January 1, 2018, Moorecraft Finance Company agreed to lease a piece of machinery to Ward Construction Products, Inc. Moorecraft paid \$1,554,516 to acquire the machine from the manufacturer and carries it at this amount in its financial statements. The fair value (current selling price) of the machine is \$1,554,516. The relevant lease terms follow.

- Annual rental payments of \$263,516 are due on January 1 of each year. These payments do not include any executory costs.
- Lease term is 6 years.

- There is no purchase option.
- The lessor expects to recover the unguaranteed residual value of \$280,000 at the termination of the lease.
- The economic life of the asset is 7 years.
- The lessor's implicit rate is known to Ward Construction.
- Annual maintenance is \$20,000, and annual property tax is \$12,500. The lessee pays both on January 1 of the year to the lessor. The property taxes are included in the payment made by the lessee to the lessor.
- The lessor has no material uncertainties regarding future costs to be incurred under the lease, and collectability of lease payments is reasonably assured.
- Ward depreciates similar machinery that it owns using the straight-line method.
- The fiscal year ends on December 31 for both companies.

Required »

- Determine the implicit rate.
- Determine the lease classification for both the lessor and the lessee.
- Prepare the amortization table for the entire lease term for the lessor.
- Prepare the amortization table for the entire lease term for the lessee.
- Prepare the lessee's journal entries required for each year of the lease term assuming that the equipment is returned with a fair value of \$280,000.
- Prepare the lessor's journal entries required for each year of the lease term assuming that the equipment is returned with a fair value of \$280,000.

3 5 6 A P18-7. **Classification as Finance or Operating Lease, Lessee, Lessor, Journal Entries, Discount Rates, Sales-Type Lease, Purchase Option.** On May 1, 2018, Gia Equipment Manufacturers (GEM) agreed to lease nonspecialized machinery to Jason Associates. GEM paid \$2,000,000 to produce the machine and carries it at this amount in its inventory. The fair value (current selling price) of the machine is \$2,104,317. The lease terms follow.

- Annual rental payments of \$345,000 are due beginning on May 1, 2018, and every year on May 1.
- The lease term is 8 years.
- There is a purchase option to acquire the asset at the end of 6 years for \$700,000. It is reasonably certain that Jason Associates will exercise this purchase option.
- The economic life of the asset is 10 years.
- The lessor's 9% implicit rate is known to Jason Associates.
- The lessee's incremental borrowing rate is 12%.
- Annual maintenance is \$20,000, and annual training is \$35,000. The lessee pays both December 31 to independent third parties and charges these payments to general and administrative expenses.
- GEM indicates that collection of all lease payments is reasonably assured.
- Jason depreciates similar machinery that it owns using the straight-line method over 10 years. Jason's and GEM's fiscal years end on December 31.

Required »

- Determine the lease classification for both the lessor and lessee.
- Prepare the amortization table for the entire lease term.
- Prepare the journal entries for the lessee during 2018.
- Prepare the journal entries for the lessor during 2018.

3 6 P18-8. **Sales-Type Lease, Unguaranteed Residual Value, Lessor.** Barisi Equipment Company leases nonspecialized cutting machinery to Bastone, Inc. over a 4-year term. The lease commencement date is January 1, 2019. The first payment is due on January 1, 2019. The remaining payments are due on December 31, 2019, December 31, 2020, and December 31, 2021. The equipment has a fair value of \$18,000 and an economic life of 10 years. Barisi carries the underlying asset at a cost of \$15,500. The lease has no renewal or purchase options, and title to the underlying asset remains with Barisi at the end of the lease term. The annual lease payments are \$4,500 per year with an estimated residual value of \$1,200 upon lease termination. The residual value is not guaranteed by the lessee, and a third-party guarantee is not obtained by Barisi. There are no lease incentives offered, and the lessee pays for all maintenance to third parties. There are no initial direct costs.

Required »

- Determine the implicit rate in the lease.
- Classify the lease for Barisi Equipment Company.
- Prepare the journal entries for the lessor over the lease term and provide all supporting computations. The machine has a fair value of \$1,200 at lease termination.

- 3 6** **P18-9. Finance Lease, Purchase Option, Lessor, Amortization Schedules, Journal Entries.** Lori-Ann Fashions, Inc. entered into a 5-year lease with Krishnan Rentals to use equipment. The economic life of the equipment is 30 years. The equipment had a fair value of \$8,500,000. Lori-Ann has an option to purchase the equipment at the end of the lease term for \$5,500,000, which is likely to be exercised. The annual lease payments are \$983,199 and are due on January 1 of each year. The first payment is due on the lease commencement date of January 1, 2019. The implicit rate in the lease is known by Lori-Ann. There is no guaranteed residual value specified. The lessor did not offer any incentives to sign the lease. Lori-Ann did not incur any initial indirect costs. The company's fiscal year ends on December 31. The carrying value of the equipment is \$6,500,000.

Required »

- Compute the implicit rate.
- Classify this lease for Krishnan Rentals.
- Prepare the journal entry necessary for Krishnan Rentals to record this transaction on the lease commencement date.
- Prepare the lease amortization schedule and prepare the journal entries through January 1, 2020, for Krishnan Rentals.

- 3 5** **P18-10. Finance Lease, Purchase Option, Lessee, Amortization Schedules, Journal Entries.** Use the information from P18-9 to complete the following requirements.

Required »

- Compute the implicit rate.
- Classify this lease for Lori-Ann Fashions.
- Prepare the journal entry necessary for Lori-Ann Fashions to record this transaction on the lease commencement date.
- Prepare the lease amortization schedule and prepare the journal entries through January 1, 2020, for Lori-Ann Fashions.

- 3 7 A** **P18-11. Direct Financing Lease, Deferred Selling Profit, Lessor, Amortization Schedules, Journal Entries.** Walker Power Washing Services, Inc. leases nonspecialized equipment from McCoy Equipment. The lease term is 3 years with no renewal or purchase options, and title to the underlying asset is retained by the lessor at the end of the lease term. The lease requires annual fixed rental payments of \$25,200 per year on July 1 of each year. The first payment occurs on July 1, 2019, at the lease commencement. The fair value of the equipment is \$108,000 and had a carrying amount on McCoy's books of \$86,400. The equipment has a remaining life of 6 years. The estimated residual value of the equipment is \$41,610. The lessee does not guarantee the residual value, but McCoy secured an unrelated third party guarantee of \$30,000, and the collection of this guaranteed residual is probable. The rate implicit in the lease is 5%. McCoy's fiscal year ends on December 31. There are no prepaid rentals, and neither party to the agreement pays initial direct costs.

Required »

- Classify this lease for the lessor, McCoy Equipment.
- Provide all journal entries for the lessor for 2019 and 2020. Show all supporting computations.

- 3 7 A** **P18-12. Direct Financing Lease, Deferred Selling Profit, Lessor, Amortization Schedules, Journal Entries.** Crabtree Products, Inc. leases machinery to Beane Poll Enterprises. The machinery is not specialized. The lease is for 3 years requiring payments of \$22,500 at the beginning of each lease year (April 1). The equipment has a fair value of \$82,833 and is carried in Crabtree's inventory at \$72,833. The expected residual value for the asset is \$25,000. Crabtree obtains a third-party residual value guarantee in the amount of \$15,000. Therefore, the unguaranteed residual value is \$10,000. Crabtree pays \$2,000 in sales commissions related to the lease transaction. This lease is classified as a direct financing lease. Crabtree has a December 31 year-end.

Required »

Prepare the journal entries for the lessor to account for this transaction over the 3-year period, and provide all supporting computations and amortization tables. Assume the machine has a fair value of \$0 at the end of the lease.

CASES

Judgment Cases

Judgment Case 1: Comparison of Lease Classification Rules

The lease rules discussed in this chapter have an effective date for fiscal years beginning after December 15, 2018. Under U.S. GAAP, the classification rules that were effective before that date are a bit different. Specifically, the Group I rules were as follows:

1. The lease transfers ownership of the property to the lessee at the end of the *lease term*.
2. The lease contains a **bargain purchase option**, which allows the lessee to acquire the property at a price specified at the inception of the lease that is substantially lower than the expected fair market value of the property at the date the option can be exercised.
3. The *lease term* is greater than or equal to 75% of the estimated economic life of the property.
4. The present value of the *minimum lease payments* is greater than or equal to 90% of the fair market value of the property at the inception of the lease.

Required »

- a. Compare and contrast the old rules to the new rules.
- b. Which set of rules require the most judgment?
- c. What are the advantages and disadvantages of the old classification rules versus the new classification rules?
- d. Which do you prefer? Explain your answer.

Judgment Case 2: Lease Classification

On January 1, 2019, Lessee Company leased a piece of machinery from Lessor Bank. The machinery could also be used by other parties. The 14-year lease requires payments of \$250,000 due at the beginning of each year. The lease agreement does not transfer ownership of the machinery nor does it contain a purchase option. Lessor Bank anticipates that the asset will have a residual value at the end of the lease term, but this value is not guaranteed by Lessee or a third party. The machinery has a fair value of \$2,628,000 and an estimated life of 19 years. Lessor Bank's implicit rate is 7% and is known by Lessee Company.

Do you think Lessee should classify this as an operating lease or a finance lease? Explain your answer.

Financial Statement Analysis Case

Financial Statement Analysis Case

You are reviewing the financial statements of Trident Incorporated and observed that Trident entered into a significant operating lease for office equipment at the end of the current year. Because of the nature of items leased and the length of the lease, you question the classification of the leases as operating. You are interested in assessing the income statement effect of classifying the lease as an operating versus a finance lease. Trident disclosed the following schedule of its lease payments:

Year	Future Lease Payments
2019	\$ 750,000
2020	750,000
2021	750,000
2022	750,000
2023	750,000
Thereafter	<u>3,750,000</u>
Total lease payments	7,500,000
Less imputed interest	<u>2,891,575</u>
Present value of future lease payments	<u>\$4,608,425</u>

Given that lease payments in each of the next 5 years total \$750,000, you assume that lease payments going forward are also \$750,000 per year. To determine the lease term, you divide the total payments of \$3,750,000 after 2023 by \$750,000 per year to compute an additional 5 years of lease payments after 2023. Therefore, the total lease term is 10 years. You also determine that Trident's discount rate is 10%.

Use Trident's information to determine its expenses in 2019, 2020, and 2021 related to its operating lease. Determine what the lease expense would be if Trident classified the lease as a finance lease. Assume lease payments occur at the end of each year.

Surfing the Standards Cases

Surfing the Standards Case 1: Lease Contracts

Consider each of the following scenarios and determine whether a lease contract exists for each scenario. Support your conclusions with Topic 842 in the Codification and provide appropriate citations to the Codification.

1. Guitar World Company (GWC) sells musical instruments online. It purchases acoustic guitars from several manufacturers in large volume and needs storage space for its distribution system. To secure storage space, GWC enters into an agreement with Safe Storage Inc. to deliver 500 acoustic guitars per month to Safe Storage's primary location, which is the closest location to GWC. GWC can retrieve the guitars from the storage facility whenever it chooses. Safe Storage can move the guitars anywhere within the storage facility or move some of this inventory to a location in another city that it owns. Safe Storage may want to move the inventory if it can obtain a higher rental rate from another customer for the primary location.
2. Guitar World Company (GWC) sells musical instruments online. It purchases acoustic guitars from several manufacturers in large volume and needs storage space for its distribution system. To secure storage space, GWC enters into an agreement with Safe Storage Inc. to deliver 500 acoustic guitars per month to Safe Storage's primary location, which is the closest location to GWC. GWC can retrieve the guitars from the storage facility whenever it chooses. Because GWC has a policy that all of its acoustic guitars must be kept in a facility that maintains humidity at 48%, the agreement between GWC and Safe Storage required the guitars to be stored at 48% humidity. To accommodate this requirement, Safe Storage modified a section in its primary location to maintain the humidity level at 48%.
3. Johnston Power Company (JPC) recently entered into contract with Spin Move Wind Associates (SMWA) to utilize a particular power-generating facility. JPC is seeking to obtain a backup power source and believes that SMWA can provide the electricity when needed. JPC will give SMWA advance notice as to when and how much additional power is needed up to SMWA facility's full capacity. Because SMWA agrees to provide electricity on demand, it runs the risk of having idle capacity during less-than-peak demand periods.
4. Johnston Power Company (JPC) recently entered into contract with Spin Move Wind Associates (SMWA) to utilize a particular power-generating facility. JPC is seeking to obtain a backup power source and believes that SMWA can provide the electricity needed. JPC agrees to buy all of its power from SPWA on a full-time basis.
5. DataCo enters into an agreement with UtilityCo to use 40% of the capacity UtilityCo's fiber optic cable that runs from Chicago to an outlying suburb. This is the only cable that DataCo will use in this area. DataCo makes the decisions about the use of the fibers (in terms of determining what data and how much data will be transported). UtilityCo can substitute cables but only if the original cables become damaged.
6. Farms, Inc. enters into a 10-year agreement with Land Lovers Company to farm 1,000 acres of Land Lovers' land. The exact plot of land is specified in the contract. Farms will likely use the land to grow corn but may rotate to soybean production every few years. Land Lovers included a clause in the contract that allows Land Lovers to specify operating procedures each year around the fertilization of the soil, depending upon annual soil tests.

Surfing the Standards Case 2: Lease Payments

On January 1, 2019 (lease inception date), Toofotles Company leases a piece of equipment from ABC Leasing Company. The lease term is for 4 years with the first payment of \$1,000 due on January 1, 2019. The remaining three payments of \$1,000 each are due on January 1, 2020, 2021, and 2022.

In addition to the \$1,000 base annual payment, the lease contract specifies an annual adjustment that is \$50 for every point that the Consumer Price Index is above 250. The CPI on January 1, 2019, was 250. However, the annual adjustment is limited to a 2% increase. The implicit rate (known by the lessee) in the lease is 8%.

Using Topic 842 in the Codification for support as necessary, determine the present value of the lease payments.

Surfing the Standards Case 3: Subsequent Measurement of Operating Leases

In the text, we discussed the practical, step-by-step approach for the subsequent measurement of an operating lease for the lessee. However, that exact approach is not specified by the Codification. Consider the following lease scenario.

Baldwin Brokerage enters into a lease agreement with Hoyt Motors to lease an automobile with a fair value of \$45,000 under a 5-year lease on December 20, 2018. The lease commences on January 1, 2019, and Baldwin will return the automobile to Hoyt on December 31, 2023. The automobile has an estimated useful life of 7 years. Baldwin made a lease payment of \$5,000 on December 20, 2018. The lease agreement stipulates the following annual payments in addition to the December 20 payment:

Date	Amount
December 31, 2019	\$6,000
December 31, 2020	5,000
December 31, 2021	4,000
December 31, 2022	3,000

The implicit rate of the lease is 9% and is known by Baldwin. There are no purchase option, no lease incentives, no residual value guarantees, and no transfer of ownership. Baldwin incurs initial direct costs of \$2,000 prior to lease commencement. Determine whether Baldwin should classify the lease as an operating or finance lease. Provide all journal entries to be recorded by Baldwin (the lessee) over the lease term.

Required »

- Provide the journal entries that would be made over the lease term using the step-by-step approach provided in the text.
- Research the Codification (Topic 842) and provide an analysis (with citations) as to what the Codification specifies as the approach to subsequent measurement.
- Reconcile your answer in (a) to the approach specified in Topic 842 in the Codification.

Basis for Conclusions Cases

Basis for Conclusions Case 1: Operating Lease Treatment versus Finance Lease Treatment

The lease rules discussed in this chapter have an effective date for fiscal years beginning after December 15, 2018. Under U.S. GAAP, the accounting treatment of operating leases for the lessee were quite different than these new rules. Under the old rules, lessees did not include an asset or a liability on their balance sheets related to the lease.

Required »

- Basing your answers on the Basis for Conclusions for ASU 2016-02, *Leases* (and including citations), explain FASB's reasoning behind changing the accounting treatment for lessee's operating leases.
- Do you think that the right-of-use asset and the lease liability should be included on the lessee's balance sheet in an operating lease? Justify your answer.

Basis for Conclusions Case 2: Measurement of Lease Expense and the Right-of-Use Asset in an Operating Lease

IFRS accounts for all leases in the same way (for the lessee), but U.S. GAAP measures lease-related expenses and the right-of-use asset for operating leases (lessee) differently than for finance leases.

Required »

- a. Explain the subsequent measurement differences in operating leases and finance leases (lessee).
- b. Explain the FASB's reasoning for requiring different subsequent measurement treatment for operating and finance leases. Base your explanation on the Basis for Conclusions for ASU 2016-02, *Leases*.
- c. Explain FASB's reasoning related to whether or not to just report one single lease cost for operating leases. Base your explanation on the Basis for Conclusions for ASU 2016-02, *Leases*.
- d. What do you think they should do? Which is better? Justify your answer.

Basis for Conclusions Case 3: Lease Classification

In deliberating on ASU 2016-02, *Leases*, the Board debated several methods for lease classification. What did the Board decide and why? What other methods did they consider and why did they not choose those methods? Provide citations to the Basis for Conclusions of ASU 2016-02.

APPENDIX A

Complexities in Accounting for Lease Transactions (with a Comprehensive Problem)

In the text, we discussed the accounting treatment for basic lease transactions. However, a number of additional considerations often arise, including the accrual of interest on leases, leasehold improvements, executory costs, purchase options, variable lease payments, deferred initial direct costs, and deferred profit.

Accruing Interest on Leases

The prior examples involved transactions in which the lease commencement occurred at the beginning of a year and the subsequent payments occurred at the end of the year. In reality, the company's year-end often occurs between payment dates, requiring the lessee to accrue the interest expense and the lessor to accrue interest revenue as adjusting entries at the end of the year. After making the payment, the lessee removes the interest payable. After receiving the lease payment, the lessor removes interest receivable.

Example 18A.1 illustrates accruing interest on leases.

EXAMPLE 18A.1

Finance Lease: Interest Accrual

PROBLEM: On January 1, 2019, Berg Manufacturing leased a nonspecialized piece of machinery for use in its North American operations from Borko Bank. The lease agreement was signed on January 1, and the equipment was provided to Berg on the same day. The 9-year, noncancellable lease requires annual lease payments of \$12,000 beginning January 1, 2019, and at each January 1 thereafter through 2027. The lease agreement does not transfer ownership of the machinery, nor does it contain a purchase option. The machinery has a fair value of \$75,000 and an estimated life of 10 years. Borko Bank's implicit rate of 11% is known to Berg. Berg incurs initial direct costs of \$3,000 on January 1, 2019, and debited them to Prepaid Initial Direct Costs. Berg's year-end is December 31. Prepare the journal entries for Berg through January 1, 2020.

SOLUTION: We conclude that this is a finance lease because the lease term is 90% (9 years / 10 years) of the economic life. The present value is \$73,753.

	N	I/Y	PV	PMT	FV	Excel Formula
Given	9	11.00%		-12,000	0	
Solve For PV			73,753			=PV(0.11,9,-12000,0,1)

Thus, Berg records the lease liability at the lease commencement at the present value of the lease payments. Berg records the right-of-use asset at the amount of the lease liability plus the initial direct costs.

Account	January 1, 2019
Right-of-Use Asset	76,753
Prepaid Initial Direct Costs	3,000
Lease Liability	73,753

We once again use the amortization table prepared in Example 18.11 and repeat the first few payments.

Date	Payment (a)	Interest (b) = Prior-Period Balance from (d) × 11%	Reduction in Lease Liability Principal (c) = (a) – (b)	Balance (d) = Prior-Period balance – (c)
Lease Commencement – January 1, 2019				\$73,753
January 1, 2019	\$12,000	\$ 0	\$12,000	61,753
January 1, 2020	12,000	6,793	5,207	56,546
January 1, 2021	12,000	6,220	5,780	50,766

Berg allocates the first payment entirely to principal because interest accrues only with the passage of time.

Account	January 1, 2019
Lease Liability	12,000
Cash	12,000

The leased asset is subject to amortization. Berg amortizes \$8,528 each year (\$76,753 right-of-use asset divided by 9-year lease term).

Account	December 31, 2019
Amortization Expense—Right-of-Use Asset	8,528
Accumulated Amortization—Right-of-Use Asset	8,528

As shown in the amortization table, Berg allocates the second payment to interest of \$6,793 and principal of \$5,207. However, because the payment does not occur until January 1, 2020, Berg must accrue the interest expense on December 31, 2019.

Account	December 31, 2019
Interest Expense	6,793
Interest Payable	6,793

On January 1, 2020, Berg records the payment. Because it has already recorded the interest expense, Berg removes the interest payable balance and does not record any additional interest expense.

Account	January 1, 2020
Lease Liability	5,207
Interest Payable	6,793
Cash	12,000

Leasehold Improvements

Lessees typically make **leasehold improvements**, which are improvements made to leased property that are not movable and revert to the lessor when the lease expires. For example, the lessee might construct a building on leased land or make modifications to an existing building such as installing new light fixtures, partitioning rooms, or replacing windows.

Lessees capitalize expenditures for leasehold improvements into a leasehold improvement account reported on the balance sheet under property, plant, and equipment. The lessee depreciates leasehold improvements over the shorter of the life of the improvements or the lease term. If the lease term is shorter than the life of the improvements, the lease term is used as the depreciation period because the leasehold improvement will not benefit the lessee after the leased asset reverts back to the lessor. Example 18A.2 provides an example of accounting for leasehold improvements.

EXAMPLE 18A.2**Leasehold Improvement**

PROBLEM: Tweetie Enterprises is currently leasing land with a lease that expires in 20 years. On January 1 of the current year, Tweetie built a barn on the land costing \$15,000 that is expected to last for 50 years. Tweetie depreciates its assets using the straight-line method. What is the entry to record the leasehold improvement? What is the journal entry to record the depreciation for the barn every year?

SOLUTION: Tweetie includes the barn in the leasehold improvement account.

<i>Account</i>	<i>January 1</i>
Leasehold Improvement	15,000
Cash	15,000

Tweetie depreciates the barn over 20 years, which is shorter than the life of the asset and the life of the lease. Thus, it depreciates \$750 per year ($\$15,000 / 20$).

<i>Account</i>	<i>December 31</i>
Depreciation Expense—Leasehold Improvement	750
Accumulated Depreciation—Leasehold Improvement	750

Executory Costs

Lessees often incur costs related to the ownership of a leased asset. These costs, referred to as **executory costs**, include items such as sales and property taxes, insurance, and maintenance. Accounting for these costs depends on the item. Payments related to maintenance such as snow removal and common area cleaning and maintenance are nonlease components. As noted earlier, contract consideration is allocated to the lease component and the nonlease component. Accounting treatment for each specific nonlease component is not included in the authoritative literature that covers leases. Typically, maintenance costs such as these are expensed as incurred.

The treatment of costs related to taxes and insurance depends on whether the payments are fixed or variable. In some cases, the costs are variable. That is, the lessee simply pays the taxes or insurance at whatever amount the government and/or insurance agency charges. In this case, these costs are considered variable lease payments that do not depend on an index or rate. Thus, these costs are excluded from the computation of the lease payments and are included in net income when the obligation is incurred.

Executory costs related to taxes and insurance can be fixed. These costs may be included in the fixed payments that the lessor charges the lessee. In this case, the fixed costs are included in the computation of the lease payments and, thus, the lease obligation.

Example 18A.3 illustrates accounting for executory costs.

EXAMPLE 18A.3**Finance Lease with Executory Costs**

PROBLEM: On January 1, 2019, Mapits, Inc. leased a floor of a building for use in its North American operations from Borko Bank. The 9-year, noncancellable lease requires annual lease payments of \$15,000, beginning January 1, 2019, and at each December 31 thereafter through 2026.

The lease payment includes costs related to property taxes of \$3,000. It also includes payments for common area maintenance. The observable standalone price for the lease (including the property taxes) is \$14,000, and the observable standalone price for the common area maintenance is \$2,000.

In addition, Mapits agrees to pay insurance on the floor of the building. It pays the insurance each year when it receives an invoice from Borko Bank for the insurance amount. On December 15, 2019, Mapits was billed and paid \$1,500 for this insurance.

The lease agreement does not transfer ownership, nor does it contain a purchase option. The leased floor of the building has a fair value of \$75,000 and an estimated remaining life of 10 years. Borko Bank's implicit rate of 11% is known to Mapits. Identify the items for which the contract includes executory costs and determine their accounting treatment. Provide Mapits's journal entries for the first year of the lease.

SOLUTION: The contract includes executory costs for property taxes, maintenance, and insurance. The insurance is a variable payment that is not dependent on an index or rate. Thus, insurance is not included in the computation of the lease payments and the lease liability. Insurance is recognized when Mapits becomes obligated to pay. Costs related to property taxes are included in the single lease component and the lease obligation. The common area maintenance is a nonlease component.

Items for Which the Contract Includes Executory Costs	Fixed or Variable?	Included in Lease or Nonlease Contract Consideration?	Accounting Treatment
Property Taxes	Fixed	Lease	Is included in lease payment component when allocating consideration.
Maintenance	Fixed	Nonlease	Allocate consideration from lease payment. Expense separately.
Insurance	Variable	Not included in lease payment	Expense as incurred.

So, Mapits allocates the contract consideration to the lease and nonlease components as follows:

Component	Standalone Price	Percentage	Allocated Consideration
Lease	\$14,000	87.5%	\$13,125
Nonlease (maintenance)	<u>2,000</u>	<u>12.5</u>	<u>1,875</u>
Total	<u>\$16,000</u>	<u>100.0%</u>	<u>\$15,000</u>

The present value of the lease is \$80,668:

	N	I/Y	PV	PMT	FV	Excel Formula
Given	9	11.00%		-13,125	0	
Solve for PV			80,668			=PV(0.11,9,-13125,0,1)

We then determine whether the lease is an operating lease or a finance lease.

Group I Criteria	Met?	Explanation
Transfer of ownership?	No	
Purchase option likely to be exercised?	No	
Lease term major part of economic life?	Yes	The lease term is 90% (9 years / 10 years) of economic life.
Present value substantial part of fair value?	Yes	The present value of \$80,668 is more than 100% of the \$75,000 fair value.
Asset is specialized?	No	

Based on this analysis, it is a finance lease. Because this is a finance lease, Mapits records the liability at the lease commencement as the present value of the lease payments. Mapits records the asset at the amount of the lease liability.

Account	January 1, 2019
Right-of-Use Asset	80,668
Lease Liability	80,668

Mapits allocates the \$13,125 payment to interest and principal using the effective interest rate method of amortization.

Date	Payment (a)	Interest (b) = Prior-Period Balance × 11%	Reduction in Lease Liability (c) = (a) – (b)	Balance (d) = Prior-Period Balance – (c)
Lease Commencement – January 1, 2019				\$80,668
January 1, 2019	\$13,125	\$ 0	\$13,125	67,543
December 31, 2019	13,125	7,430	5,695	61,848
December 31, 2020	13,125	6,803	6,322	55,526
December 31, 2021	13,125	6,108	7,017	48,509
December 31, 2022	13,125	5,336	7,789	40,720
December 31, 2023	13,125	4,479	8,646	32,074
December 31, 2024	13,125	3,528	9,597	22,477
December 31, 2025	13,125	2,472	10,653	11,824
December 31, 2026	13,125	1,301	11,824	0

Notice that Mapits allocates the first payment to principal and common area maintenance of \$1,875.

Account	January 1, 2019
Lease Liability	13,125
Maintenance Expense	1,875
Cash	15,000

On December 15, 2019, Mapits records the expense related to the insurance.

Account	December 15, 2019
Insurance Expense	1,500
Cash	1,500

The leased asset is subject to amortization. Mapits amortizes \$8,963 ($\$80,668 / 9$) each year.

Account	December 31, 2019
Amortization Expense—Right-of-Use Asset	8,963
Accumulated Amortization—Right-of-Use Asset	8,963

As shown by the amortization table, Mapits allocates the second payment to interest of \$7,430 and principal of \$5,695. On December 31, 2019, we debit Prepaid Maintenance Expense because the maintenance expense for 2019 was recorded on January 1, 2019.

Account	December 31, 2019
Lease Liability	5,695
Interest Expense	7,430
Prepaid Maintenance Expense	1,875
Cash	15,000

Purchase Options

Our discussion of the lease classification criteria included the purchase option, which gives the lessee the opportunity to acquire the leased property at the date of the option exercise. If at the lease commencement date, it is likely that the lessee will exercise the purchase option, the amount of the purchase option is included in the computation of the lease payments. Thus, the lessee's lease obligation and the lessor's net investment in the lease include the present value of the purchase option.

Some lease contracts allow the lessee to exercise the purchase option before lease termination. If the lessee is likely to exercise the purchase option before lease termination, the lease term ends on the date that the option can be exercised. In this case, the lease term will be shorter because it ends on the earlier exercise date. Because the lessee will eventually acquire the asset, the lessee amortizes the asset over the asset's life under a finance lease, not over the lease term. Example 18A.4 illustrates the accounting for a lease with a purchase option that the lessee is likely to exercise.

EXAMPLE 18A.4

Purchase Option

PROBLEM: On January 1, 2019, DeFeo Brothers Moving and Storage, Inc. entered into an 8-year lease with Firefall Leasing Company to occupy a warehouse. The economic life of the warehouse is 25 years. The warehouse had a fair value of \$2,500,000, and DeFeo has an option to purchase the warehouse at the end of the lease term for \$1,200,000, which is expected to be substantially lower than the fair value at the end of the lease. The annual lease payments are \$248,703 with the first due on January 1, 2019, and the rest on December 31 of each year. The implicit rate in the lease is 5% and is known by DeFeo. There is no guaranteed residual value specified. The lessor did not offer any incentives to sign the lease. DeFeo did not incur any initial indirect costs.

Determine the lessee's lease obligation and the lessor's NIL. Prepare the lease amortization table. How much should DeFeo record as amortization expense each year?

SOLUTION: The lessee's lease obligation and the lessor's NIL is the present value of two components: (1) the annuity due using an 8-year life and a 5% interest rate and (2) the \$1,200,000 single-sum purchase option.

The present value of the annuity due is \$1,687,791 as follows:

	N	I/Y	PV	PMT	FV	Excel Formula
Given	8	5.00%		-248,703		
Solve for PV			1,687,791			= PV(0.05,8,-248703,0,1)

The \$1,687,791 is the amount of the lessor's investment recovered through the lease payments.

The present value of the \$1,200,000 lump-sum purchase option is \$812,207 computed as follows:

	N	I/Y	PV	PMT	FV	Excel Formula
Given	8	5.00%		0	-1,200,000	
Solve for PV			812,207			= PV(0.05,8,0,-1200000,0)

The \$812,207 is the lessor's investment that is to be recovered by the collection of the purchase option.

Thus, the total present value is \$2,499,998 (\$1,687,791 + \$812,207), which is 100% of the fair value of the machinery. Thus, the lease meets the Group I criteria and is classified as a finance lease for the lessee and a sales-type lease for the lessor.

The lessee records a right-of-use asset and a lease liability of \$2,499,998, and the lessor records a NIL-ST of \$2,499,998.

The following amortization table applies to both the lessor and the lessee.

Date	Payment (a)	Interest (b) = Prior-Period Balance × 5%	Reduction in Lease Liability (c) = (a) – (b)	Balance (d) = Prior-Period Balance – (c)
Lease Commencement – January 1, 2019				\$ 2,499,998
January 1, 2019	\$ 248,703	\$ 0	\$ 248,703	2,251,295
December 31, 2019	248,703	112,565	136,138	2,115,157
December 31, 2020	248,703	105,758	142,945	1,972,212
December 31, 2021	248,703	98,611	150,092	1,822,120
December 31, 2022	248,703	91,106	157,597	1,664,523
December 31, 2023	248,703	83,226	165,477	1,499,046
December 31, 2024	248,703	74,952	173,751	1,325,295
December 31, 2025	248,703	66,265	182,438	1,142,857
December 31, 2026	1,200,000	57,143	1,142,857	0

The lease obligation is fully paid with the remittance of the \$1,200,000 purchase option.

DeFeo amortizes the right-of-use asset over the asset's economic life. Thus, amortization each year is \$100,000 (\$2,499,998 / 25 years).

Deferred Profit in Direct Financing Leases

As discussed earlier in the chapter, lessors are required to defer profit in a direct financing lease.

When a direct financing lease contains deferred profit, we need to compute a new effective interest rate. We use the lease's implicit rate to compute the lease receivable and the present values of any residual value guarantees, unguaranteed residual assets, and purchase options. Once we determine these present values and the initial measurement of the net investment in the lease, we compute the new effective interest rate that results in a constant periodic discount rate to amortize the balance in the NIL account.

Example 18A.5 illustrates a direct financing lease with deferred profit.

EXAMPLE 18A.5 Direct Financing Lease with Deferred Profit

PROBLEM: Correll Company leases machinery to Borelli Fabricating, Inc. Both the lease inception and commencement occur on January 1, 2019. It is a 3-year lease requiring payments of \$10,500 with the first payment on January 1, 2019, the second on December 31, 2019, and the last on December 31, 2020. The equipment has a fair value of \$40,000 and is carried in Correll's inventory at \$36,000. The implicit rate in the lease is 6.4368%. The guaranteed residual value (guaranteed by a third party) for the asset is \$12,500. The collection of lease payments and the guaranteed residual value is probable. Correll correctly classifies the lease as a direct financing lease.

Prepare Correll's journal entries needed to account for this transaction for 2019 and 2020.

SOLUTION: For a direct financing lease, we first determine any profit or loss. Revenue is the lower of the leased asset's fair value and the sum of the lease receivable plus any prepaid lease payments. Because there are no lease prepayments, we compute the lease receivable as follows:

	N	I/Y	PV	PMT	FV	Excel Formula
Given	3	6.4368%		10,500	12,500	
Solve for PV			(40,000)			= PV(0.064368,3,10500,12500,1)

Because the fair value is also \$40,000, we measure the revenue as the \$40,000.

Correll's cost of goods sold is the asset's carrying value less the present value of any unguaranteed residual asset plus deferred initial direct costs. Because we do not have an unguaranteed residual value or initial direct costs, cost of goods sold is \$36,000.

The profit is equal to \$4,000, which is the revenue of \$40,000 less the cost of goods sold of \$36,000.

Revenue	\$40,000
Less: Cost of goods sold	<u>36,000</u>
Profit	<u>\$ 4,000</u>

Correll must defer the profit because this is a direct financing lease. The net investment in the lease (NIL) of \$36,000 is equal to the lease receivable of \$40,000, less the deferred profit, \$4,000.

Lease receivable	\$40,000
Less: Deferred profit	<u>(4,000)</u>
Net investment in lease	<u>\$36,000</u>

When a firm defers profits, it recalculates the effective interest rate to obtain a constant periodic discount rate on the balance of the net investment in the lease. In Correll's case, the interest rate equates the NIL of \$36,000 with the present value of future lease payments of \$10,500 plus the present value of the guaranteed residual asset value of \$12,500 over the 3-year lease term. The appropriate discount rate is 14.5146%:

	N	I/Y	PV	PMT	FV	Excel Formula
Given	3		-36,000	10,500	12,500	
Solve for RATE		14.5146%				= RATE(3,10500,-36000,12500,1)

For the \$36,000 net investment in lease, we then compute an amortization table using the new effective interest rate of 14.5146% as follows:

Date	Payment (a)	Interest (b) = Prior-Period Balance × 14.5146%	Reduction in Lease Liability (c) = (a) – (b)	Balance (d) = Prior-Period Balance – (c)
Lease Commencement – January 1, 2019				\$36,000
January 1, 2019	\$10,500	\$ 0	\$10,500	25,500
December 31, 2019	10,500	3,701	6,799	18,701
December 31, 2020	10,500	2,714	7,786	10,915
December 31, 2021	12,500	1,585*	10,915	0

* Adjusted for rounding errors.

On January 1, 2019, Correll recognizes the NIL of \$36,000 and derecognizes the machinery at its carrying value of \$36,000.

Account	January 1, 2019
Net Investment in Lease – Direct Financing	36,000
Machinery	36,000

Correll records the receipt of the first lease payment as follows.

Account	January 1, 2019
Cash	10,500
Net Investment in Lease – Direct Financing	10,500

On December 31, 2019, Correll records receipt of the second lease payment as follows:

Account	December 31, 2019
Cash	10,500
Interest Revenue	3,701
Net Investment in Lease – Direct Financing	6,799

On December 31, 2020, Correll records receipt of the third lease payment as follows:

Account	December 31, 2020
Cash	10,500
Interest Revenue	2,714
Net Investment in Lease – Direct Financing	7,786

Variable Lease Payments

As noted earlier, certain variable lease payments are included in the computation of the lease payments and some are not. Specifically, variable lease payments that depend on a rate or index are included in the lease payments using the rate or index in effect at the lease commencement date. For example, payments are sometimes tied to the Consumer Price Index (CPI), a measure indicating the purchasing power based on the weighted average of a basket of consumer goods and services, to protect the lessor against inflation. Other variable payments are not included in the lease payments. Thus, lessees recognize other variable payments and changes in variable payments that depend on an index or rate in expense at the lease payment date when they incur the obligation. Lessors recognize these same amounts in revenue.

Example 18A.6 illustrates variable payments.

EXAMPLE 18A.6 Variable Lease Payments

PROBLEM: Chief Manufacturing Company (CMC) signs a lease agreement on December 10, 2019, to lease nonspecialized equipment with a fair value of \$85,000 and a 10-year economic life from TDR Inc. The lease commences on January 1, 2020. CMC will make five payments with the first one on January 1, 2020, and every year thereafter on December 31. These payments will be \$10,000 plus an amount based on the Consumer Price Index (CPI). For every point that the CPI is above 230, CMC will pay an extra 1% on the \$10,000. For example, if the CPI is equal to 235, or 5 points above the 230 benchmark, CMC would make a lease payment of \$10,500 (\$10,000 + 5% of \$10,000). The CPI as of January 1, 2020, is 240. The implicit rate is 7% and is known by CMC.

CMC correctly classifies the lease as an operating lease. Prepare the journal entries for 2020 through 2022. Assume that the CPI is 242 as of December 31, 2020, and 245 as of December 31, 2021.

SOLUTION: CMC measures the lease payments using the CPI at the lease commencement date. Thus, the lease payments are \$11,000, which is \$10,000 plus 10% of \$10,000. We use 10% because the CPI is 240 on January 1, 2020, and is 10 points higher than the 230 specified in the lease agreement.

CMC determines the initial measurement of the lease liability (\$48,259) as the present value of the lease payments that it has not made as of the lease commencement date.

	N	I/Y	PV	PMT	FV	Excel Formula
Given	5	7.00%		-11,000	0	
Solve for PV			48,259			= PV(0.07,5,0,-11000,0,1)

CMC measures the right-of-use asset as the sum of the initial lease liability measurement plus prepayments less lease incentives plus initial direct costs. Because there are no prepayments, lease incentives, or initial direct costs, the right-of-use asset is also \$48,259.

On the lease commencement date, CMC records the right-of-use asset and the lease liability:

Account	January 1, 2020
Right-of-Use Asset	48,259
Lease Liability	48,259

Given that each lease payment is \$11,000, the straight-line annual lease expense is \$11,000 per year.

We prepare the amortization table to determine the reduction in the liability each period.

Date	Payment (a)	Interest (b) = Prior-Period Balance × 7%	Reduction in Lease Liability (c) = (a) – (b)	Balance (d) = Prior-Period Balance – (c)
Lease Commencement – January 1, 2020				\$48,259
January 1, 2020	\$11,000	\$ 0	\$11,000	37,259
January 1, 2021	11,000	2,608	8,392	28,867
January 1, 2022	11,000	2,021	8,979	19,888
January 1, 2023	11,000	1,392	9,608	10,280
January 1, 2024	11,000	720	10,280	0

CMC records the first payment of \$11,000 on January 1, 2020.

Account	January 1, 2020
Lease Liability	11,000
Cash	11,000

CMC records the second payment on December 31, 2020. It makes a cash payment of \$11,200, which is the stated amount in the contract of \$10,000 times 1.12. We use the multiplier of 1.12 because the CPI is 12 points above the 230 level stated in the lease agreement.

CMC records the \$8,392 decrease in the lease liability and the same decrease in the right-of-use asset. It expenses the additional \$200 cash payment. This is a change in a variable lease payment that is based on an index.

Account	December 31, 2020
Lease Expense	11,000
Lease Expense – Change in Variable Payment	200
Lease Liability	8,392
Accumulated Amortization—Right-of-Use Asset	8,392
Cash	11,200

On December 31, 2021, CMC again records a payment. At this date, the CPI is 245. Thus, the payment amount is \$10,000 times 1.15, or \$11,500. CMC records the \$8,979 decrease in the lease liability and the same decrease in the right-of-use asset. It expenses the additional \$500 cash payment. This is a change in a variable lease payment that is based on the index.

Account	December 31, 2021
Lease Expense	11,000
Lease Expense – Change in Variable Payment	500
Lease Liability	8,979
Accumulated Amortization—Right-of-Use Asset	8,979
Cash	11,500

Exhibit 18.A1 summarizes the complex issues in lease accounting by lessee–lessor treatment.

EXHIBIT 18.A1 Summary of Complex Issues in Lease Accounting

Issue	Description	Lessor	Lessee
Lease commencements occurring in the middle of the year	Lease agreement is entered into during the middle of the year.	Accrues interest revenue and interest receivable as an adjusting entry. After the lease payment is received, removes the interest receivable and records the current-period interest revenue.	Accrues the interest expense and interest payable as an adjusting entry at the end of the year. After the payment is made, removes the interest payable and records the current period interest expense.
Leasehold improvements	Lessee makes expenditures for modifications to leased properties that remain with the leased properties after the lease term ends.		Expenditures are capitalized and depreciated over the shorter of the life of the improvement or the life of the lease.
Executory costs	Executory costs are the property tax, insurance, maintenance, and other costs associated with the ownership of the leased asset.	Fixed payments related to insurance and taxes are included in the computation of lease payments if the lessee pays the lessor.	<p>Payments related to maintenance are nonlease components.</p> <p>Variable payments related to insurance and taxes are variable lease payments that don't depend on an index or rate. These costs are excluded from the computation of lease payments.</p> <p>Fixed payments related to insurance and taxes are included in the computation of lease payments if the lessee pays the lessor.</p>
Purchase options	Option allowing the lessee to acquire the property at a price specified at the inception of the lease.	Include present value of purchase option in present value computations, and thus in the NIL balance.	Include present value of purchase option in present value computations and thus in the lease obligation balance.
Deferred profits	Direct financing lease: lessors always defer any profit.	Compute a new interest rate for the amortization table that results in a constant periodic discount rate to amortize the balance in the NIL account.	
Variable lease payments	Payments made to the lessor by the lessee that are not a fixed amount.	Variable lease payments that depend on a rate or index are included in the lease payments using the rate or index in effect at the lease commencement date. Other variable payments are not included in the lease payments. Lessors recognize these amounts in revenue.	Variable lease payments that depend on a rate or index are included in the lease payments using the rate or index in effect at the lease commencement date. Other variable payments are not included in the lease payments. Thus, lessees recognize other variable payments and changes in variable payments that depend on an index or rate in expense when they incur the obligation.

Comprehensive Problem: Leasing Complexities

Example 18A.7 is a comprehensive problem that incorporates many of the complexities discussed in this section.

EXAMPLE 18A.7

Comprehensive Problem

PROBLEM: On July 1, 2019, Phipps Motors, a calendar year–end company, leased a piece of nonspecialized machinery from Williams, Inc. Williams is also a calendar year–end company. Williams manufactured the machinery earlier that year for \$500,000. It incurred commission fees of \$4,000 related to the lease agreement. The lease terms are:

- Annual rental payments of \$113,000 due on July 1 each year. The first payment is due at the commencement of the lease and the last payment will be made on July 1, 2023.
- The lease term is effective through June 30, 2024.
- There is no transfer of the asset at the end of the lease term and no purchase option.
- The economic life of the asset is 6 years.
- Williams' implicit rate is not known by Phipps Motors. Phipps' incremental borrowing rate is 14%.
- Collectability of lease payments and residual value is reasonably assured.
- The fair value (current selling price) of the machine is \$500,000.
- Phipps Motors will incur insurance costs of \$2,500 each year with the first payment due on July 1, 2019. These payments are in addition to the \$113,000 payments, and are paid to the lessor.
- Although the lease contract guarantees a residual value of \$10,000, Williams expects a \$40,000 residual value at the termination of the lease contract. The lessee guarantees a residual value of \$10,000.

For both the lessee and lessor, analyze the lease criteria to determine whether the lease is an operating, finance, direct financing, or sales-type lease. What journal entries will both Phipps Motors and Williams make in 2019 and 2020?

SOLUTION

Phipps Motors (Lessee)

We begin with the lessee, Phipps Motors. It will classify this lease as a finance lease because it meets at least one of the Group I criteria. Because the executory costs are fixed and are for insurance, we include these in the lessee's lease payments.

Group I Criteria	Met?	Explanation—Lessee
Transfer of ownership?	No	
Purchase option likely to be exercised?	No	
Lease term major part of economic life?	??	Lease term is 83.3% (5 years / 6 years of economic life).
Present value substantial part of fair value?	Yes	The present value of \$457,227 (five payments of \$115,500 plus the guaranteed residual value of \$10,000 discounted at 14%) is 91.4% of the \$500,000 fair value.
Asset is specialized?	No	

Phipps Motors records the asset and the liability at the commencement of the lease. The present value of the lease is \$457,227. Phipps only recognized \$10,000 of the residual value because the remaining \$30,000 is unguaranteed.

	N	I/Y	PV	PMT	FV	Excel Formula
Given	5	14.00%		-115,500	-10,000	
Solve for PV			457,227			= PV(0.14,5,-115500,-10000,1)

The lessee's journal entry at lease commencement follows.

Account	July 1, 2019
Right-of-Use Asset	457,227
Lease Liability	457,227

Phipps' amortization table is as follows:

Date	Payment (a)	Interest (b) = Prior-Period balance(d) × 14%	Reduction in Lease Liability (c) = (a) – (b)	Balance (d) = Prior-Period Balance – (c)
July 1, 2019				\$457,227
July 1, 2019	\$115,500	\$ 0	\$115,500	341,727
July 1, 2020	115,500	47,842	67,658	274,069
July 1, 2021	115,500	38,370	77,130	196,939
July 1, 2021	115,500	27,571	87,929	109,010
July 1, 2022	115,500	15,261	100,239	8,771
June 30, 2023	10,000	1,229*	8,771	0

* Adjusted for rounding errors.

Phipps records the first payment on July 1, 2019, and attributes it entirely to principal because no time has elapsed.

Account	July 1, 2019
Lease Liability	115,500
Cash	115,500

Phipps needs to accrue interest on December 31 computed as 6 / 12 of the \$47,842 amount, or \$23,921.

Account	December 31, 2019
Interest Expense	23,921
Interest Payable	23,921

Phipps also records a half-year of amortization expense. Annual amortization expense is \$89,445 [(\$457,227 – \$10,000) / 5]. Therefore, Phipps records one-half of \$89,445, or \$44,723.

Account	December 31, 2019
Amortization Expense—Right-of-Use Asset	44,723
Accumulated Amortization—Right-of-Use Asset	44,723

As shown by the preceding table, Phipps allocates the second payment on July 1, 2020, to interest of \$47,842 and principal of \$67,658. Phipps has already reported interest expense of \$23,921 so that the remaining \$23,921 is to be expensed in 2020.

Account	July 1, 2020
Lease Liability	67,658
Interest Expense	23,921
Interest Payable	23,921
Cash	115,500

At year end of 2020, the company once again accrues interest for the last 6 months of the year. Because total interest expense for the second year of the lease, July 1, 2020, to June 30, 2021, is \$38,370, Phipps accrues \$19,185.

Account	December 31, 2020
Interest Expense	19,185
Interest Payable	19,185

Phipps also records amortization for the full year.

Account	December 31, 2020
Amortization Expense—Right-of-Use Asset	89,445
Accumulated Amortization—Right-of-Use Asset	89,445

Williams Incorporated (Lessor)

Our first step is to determine the lessor's implicit rate. The implicit rate equates the present value of the payments plus the present value of the residual value (guaranteed and unguaranteed) to the fair value of the leased asset plus deferred initial direct costs. The fair value is \$500,000. Initial direct costs are deferred in this case because the fair value equals the carrying value. Thus, we compute the implicit rate as 10.2727%.

	N	I/Y	PV	PMT	FV	Excel Formula
Given	5		-504,000	115,500	40,000	
Solve for RATE		10.2727%				= RATE(5,115500,-504000,40000,1)

The next step for the lessor is to classify the lease. It is a sales-type lease for Williams because it meets the Group I criteria. (The lease also meets the Group II criteria, but that is not relevant for a sales-type lease. Group II criteria are relevant if a lessor meets Group II criteria and does not meet the Group I criteria.)

Group I Criteria	Met?	Explanation—Lessor
Transfer of ownership?	No	
Purchase option likely to be exercised?	No	
Lease term major part of economic life?	Uncertain	Lease term is 83.3% (5 years / 6 years of economic life).
Present value substantial part of fair value?	Yes	The present value of \$485,601 (five payments of \$115,500 plus the guaranteed residual value of \$10,000 discounted at 10.2727%) is 97.1% of the \$500,000 fair value.
Asset is specialized?	No	

At the commencement of the lease, Williams records the net investment in the lease, removes the machine from its accounts, and reports the gross profit by recording sales revenue and cost of goods sold. The net investment in the lease is \$504,000—the present value of the payments and the residual value.

	N	I/Y	PV	PMT	FV	Excel Formula
Given	5	10.2727%		115,500	40,000	
Solve for PV			(504,000)			= PV(0.102727,5,115500,40000,1)

The cost of goods sold is the carrying value of the machinery (\$500,000) less the present value of the unguaranteed residual value (\$18,399) plus the deferred initial direct costs (\$4,000), or \$485,601.

	N	I/Y	PV	PMT	FV	Excel Formula
Given	5	10.2727%		0	30,000	
Solve for PV			(18,399)			= PV(0.102727,5,0,30000,0)

Williams will report revenue of \$485,601, which is the lower of the fair value of the machine and the lease receivable.

	N	I/Y	PV	PMT	FV	Excel Formula
Given	5	10.2727%		115,500	10,000	
Solve for PV			(485,601)			= PV(0.102727,5,115500,10000,1)

Williams will also derecognize the machinery and reduce cash for the initial direct costs.

Account	July 1, 2019
Net Investment in Lease – Sales Type	504,000
Cost of Goods Sold	485,601
Sales Revenue	485,601
Inventory of Machinery	500,000
Cash	4,000

Williams prepares the following amortization table:

Date	Payment (a)	Interest (b) = Prior-Period Balance × 10.2727%	Reduction in Lease Liability (c) = (a) – (b)	Balance (d) = Prior-Period Balance (d) – (c)
July 1, 2019				\$504,000
July 1, 2019	\$115,500	\$ 0	\$115,500	388,500
July 1, 2020	115,500	39,909	75,591	312,909
July 1, 2021	115,500	32,144	83,356	229,553
July 1, 2022	115,500	23,581	91,919	137,634
July 1, 2023	115,500	14,139	101,361	36,273
June 30, 2024	40,000	3,727*	36,273	0

* Adjusted for rounding errors.

As shown in the table, the first payment is entirely principal because interest accrues only with the passage of time.

Account	July 1, 2019
Cash	115,500
Net Investment in the Lease – Sales Type	115,500

On December 31, 2019, Williams accrues 6 months of interest ($\$39,909 \times 6/12$).

Account	December 31, 2019	
Interest Receivable	19,955	
Interest Revenue		19,955

On July 1, 2020, it records the second lease payment.

Account	July 1, 2020	
Cash	115,500	
Net Investment in Lease – Sales-Type		75,591
Interest Receivable		19,955
Interest Revenue		19,954

Finally, on December 31, 2020, Williams accrues interest for the first 6 months of the lease term, July 1, 2020, through June 31, 2021. It computes the interest receivable (and revenue) by multiplying \$32,144 by 6 / 12.

Account	December 31, 2020	
Interest Receivable	16,072	
Interest Revenue		16,072

Introduction

ATTRACTING, DEVELOPING, AND RETAINING talented employees is essential to a company's ability to operate successfully, grow, and compete in the marketplace. *Unilever*

PLC, the global consumer products company, highlighted this fact in its 2016 annual report's risk management discussion. *Unilever's* compensation awards structure is a critical element in retaining key talent and grooming future leaders.

Employees are compensated in a variety of ways for services, including salary, bonus, vacation time, retirement benefits, or stock options. The forms of compensation serve different purposes. Cash provides resources needed to pay for everyday living expenses. Bonuses reward employees for achieving a performance goal, such as a sales or earnings target. Stock-based compensation, including stock options, seeks to align employees' interests with those of the company's shareholders. *Pensions* and other post-retirement benefits encourage employees to build a long-term career with a company, thus providing a stable, reliable workforce. Over time, an employee's compensation mix can change.

At *Unilever*, employee compensation was about €6.5 billion, amounting to 12.4% of sales of €52.7 billion in 2016. For its 169,000 worldwide employees, cash and other short-term benefits represented about 91% of total compensation, pensions about 6%, and stock-based compensation about 3%. For the senior managers, the compensation mix shifted toward share-based compensation in line with the objective of better aligning managers' and shareholders' interests. Senior manager compensation was about 33% share-based compensation, 65% cash and other short-term benefits, and 2% pension.

Although adequately rewarding employees is critical to a company's success, many companies identify meeting promised pension obligations as a major risk. Because pensions are paid over many years, even decades, there is uncertainty regarding the future payments and cash needs. In recent years, companies such as *Verizon*, *Sears*, and *IBM* have frozen or cut pension benefits to reduce costs in order to remain competitive.

In this chapter, we examine stock-based compensation and pension benefits.¹ Employees earn these benefits in the periods that they provide services, but the benefits are paid in future periods. Accrual accounting requires the estimation of the benefits that employees have earned so that the company reports the cost of providing these benefits in the same period in which the services are provided regardless of when the employee is actually paid.

The two major accounts related to employee compensation and benefits—expenses and liabilities—are based on

the definitions of elements of the financial statements. In the case of stock-based compensation, employees are paid for services rendered. Thus, the employer recognizes an expense and reports it on the income statement over the period that the employee provides the services. Some types of pension plans obligate the employer to pay a fixed or a defined amount to retired employees. These *defined-benefit* pension plans result in liabilities representing the future amount for which the employer will be responsible. ◀◀

- ❶ Describe the characteristics and types of stock-based compensation.

Overview of Stock-Based Compensation

Stock-based compensation is a significant portion of total compensation for many employers. In a survey of 500 companies, 488 of the companies disclosed offering stock option plans.² Exhibit 19.1 shows the types of compensation plans used by these 488 companies. **Employee stock options**, the most prevalent form of compensation plans, are financial instruments that give an employee the right to purchase shares of the company's stock directly from the company at a fixed price over a specified period of time. The stock awards category ranks as the second most popular. It includes restricted stock awards, performance awards, and bonuses paid by issuing stock. In this section, we examine the initial and subsequent accounting for stock-based compensation.³

EXHIBIT 19.1 Use of Compensation Plans at 500 Companies

Source: Data taken from (AICPA, New York, NY). Accounting Trends and Techniques—2010 (AICPA, New York, NY).

Stock Option Terminology

Let's begin our discussion of stock-based compensation by reviewing the terminology. Employee stock options are a restricted form of a *call option*. A **call option** gives an investor the right (but not

¹We covered compensated absences and payroll taxes in Chapter 13.

²AICPA, *Accounting Trends and Techniques—2010* (New York, NY: AICPA, 2010).

³We focus our discussion on stock option plans because they are the most commonly used in practice. Research cases in the end-of-chapter material address other types of plans.

the obligation) to purchase a security at a fixed price over a specified period of time. Employees are given the right to purchase the employer's equity shares but there is no obligation to do so. Accounting for stock-based compensation plans requires an understanding of the following terms:

1. The **exercise price** or **strike price** is the fixed amount paid to acquire a share of stock based on the terms of the option plan.
2. The **vesting period** or **service period** is the time the employee must remain with the company before exercising the options.
3. The **expiration date** is the point at which the employee can no longer exercise the options.
4. The **compensation arrangement** specifies the number of options granted, the exercise price, the vesting period, and the expiration date.

Stock options seek to align the interests of employees with those of company owners and to motivate employees to work to increase the company's market value. Consequently, companies usually set the exercise price equal to the market price of the stock on the day the company grants the options.⁴ For example, *Johnson & Johnson* grants options at the average of the stock's high and low price on the date of grant. The employee is motivated to perform in order to increase the market price of the company's stock above the exercise price. The vesting period ensures that the employee works for a certain period of time before being entitled to the benefits. For example, *Johnson & Johnson* disclosed in its 2016 annual report that its stock option awards vest over service periods ranging from 6 months to 4 years. Additionally, the employee is usually the only one who can exercise the options. Stock options cannot be sold or transferred in the market.

Upon exercise, the employee turns in the option and pays the fixed cash (exercise) price to the employer. In return, the employer provides stock valued at the current market price. An employee exercises his or her option only when the current market price of the stock exceeds the fixed exercise price. When the market price is higher than the exercise price of the company's stock, the options are "in the money." If there are no restrictions on disposal, the employee may then sell the shares in the market at a gain.

The company can issue new shares of stock or treasury stock to employees exercising options.⁵ For example, *Johnson & Johnson* settles employee stock option exercises and stock issuances with treasury shares, usually replenishing the number of shares used over the year. An employee leaving the company before completing the vesting period and exercising the options usually forfeits them. However, there may be a forfeiture even if the employee is fully vested in the case of termination. That is, the options are available to the employee only when the employee remains with the company throughout the vesting period and even after the vesting period in certain cases.

THE CONCEPTUAL FRAMEWORK CONNECTION

Stock-Based Compensation

The major conceptual issue in accounting for stock-based compensation accounting is determining whether to recognize an expense on the income statement. When a company exchanges stock for services rendered, has it incurred an expense? The FASB requires companies to record stock compensation as an expense. This requirement, however, is contentious. Companies usually set the exercise price equal to the stock's market price on the day of the option grant. As a result, the stock's **intrinsic value**—the market price of the stock less the option's exercise price—is usually zero. Management at many companies that use stock-based compensation have asserted that because the intrinsic value is zero on the date of the grant, there is no compensation expense to accrue. However, FASB believes that options should be measured at fair value and the expense be based on fair value, not intrinsic value.

⁴There are also tax benefits to setting the exercise price equal to the market price on the grant date.

⁵Shares do not actually have to change hands because a net settlement is possible. That is, when the employee presents the option to the company, he or she receives the difference between the current market price and the exercise price. In all illustrations, we assume that the employee purchases newly issued shares from the corporation when the options are exercised.

The effect on net income of expensing stock-based compensation can be quite significant. For example, *Microsoft* reported stock option expense in 2016 that was 13.5% of its pre-tax income. Not surprisingly, one academic research study found strong evidence of an association between the use of stock options for top management compensation and the likelihood that a company opposed the FASB opinion that stock options should be expensed.⁶

Although financial statement preparers may not want to report stock option expense on their income statements, the conceptual framework clearly supports treating employee stock options as an expense. Expensing stock-based compensation at fair value is consistent with all other forms of nonmonetary exchanges. For example, assume that a consultant is paid in shares of stock. The company would measure the amount charged by the consultant at the fair value of the consideration given, the fair value of the stock, the fair value of the consideration received, or the value of the consulting services provided based on which is more clearly evident. The company would then expense this amount on the income statement.

Expensing employee stock options is also comparable to the treatment of other forms of employee compensation such as cash salaries. Therefore, expensing stock options is required to create comparable financial statements. For example, assume that one company pays its executives \$10 million in cash and another company pays its executives in stock options with a fair value of \$10 million. If stock-based compensation is not expensed, then the first company would report an expense of \$10 million, but the second company would not report any compensation expense. Under that scenario, the two sets of financial statements would not be comparable—and comparability is one of the enhancing qualitative characteristics specified in the conceptual framework.

Finally, some accountants have challenged whether the use of employee stock options meets the definition of an expense. According to FASB's *Statement of Financial Accounting Concepts No. 6*, expenses are "outflows or other using up of assets or incurrences of liabilities (or a combination of both) from delivering or producing goods, rendering services, or carrying out other activities that constitute the entity's ongoing major or central operations."⁷ The argument questions whether employee options meet this definition by incurring liabilities or using up assets. Standard setters agree that employee stock option transactions do not incur liabilities. However, they maintain that the transactions use up assets. Specifically, the acquisition of the asset (in this case, services) and the use of that asset occur simultaneously. Thus, the company does not record an asset and instead debits an expense account.⁸

Despite the controversy, there is no question that the appropriate accounting treatment is to record an expense for stock options; compensation plans are clearly an expense to the company and should be presented as such. Companies classify the cost of stock-based compensation as an operating expense on the income statement.

Estimates in Accounting for Stock-Based Compensation

Companies expense stock-based compensation in the income statement at fair value.⁹ In general, the accounting treatment for stock-based compensation is quite similar under U.S. GAAP and IFRS.

Fair Value Estimate. The first step in measuring compensation expense from granting employee stock options is determining the fair value on the date of the grant. The fair value is based on the market price of the options or similar options if a value is available. Because these values are frequently not available, companies estimate the fair value using either an option-pricing model such as the Black-Scholes option-pricing model (most commonly used in practice)

⁶Patricia Dechow, Amy Hutton, and Richard Sloan, "Economic Consequences of Accounting for Stock-Based Compensation," *Journal of Accounting Research* (Supplement 1996): 1–20.

⁷Financial Accounting Standards Board, *Statement of Financial Accounting Concepts No. 6*, "Elements of Financial Statements," Paragraph 80.

⁸See footnote 43 of FASB's *Statement of Financial Accounting Standards No. 6* for a discussion of the simultaneous acquisition and use of an asset.

⁹For the relevant authoritative literature for this topic, see FASB ASC 718-10 – *Compensation – Stock Compensation – Overall* for U.S. GAAP and IASB, *International Financial Reporting Standard 2*, *Share-Based Payments* (London, UK: International Accounting Standards Board, Revised, 2016) for IFRS.

or a binomial or lattice model (preferred but not required by the FASB).¹⁰ Option-pricing models require inputs such as the

- Stock price
- Time to expiration
- Exercise value
- Risk-free discount rate
- Volatility of the stock
- Probability that the options will vest

After determining the fair value of the stock options, the company allocates this amount to compensation expense over the vesting period.¹¹ The straight-line amortization method is used to allocate the compensation expense over the vesting period.

Forfeiture Estimate. When the vesting period has ended, an employee's right to receive the stock-based compensation generally no longer depends on continued employment. However, if the employee is terminated or leaves the entity before the vesting period is over, the options are forfeited. The value of the forfeited options reduces total compensation expense. A company can choose either to adjust the amount of compensation expense that it allocates for an estimate of the percentage of options that it expects to be forfeited or to account for actual forfeitures as they occur.

- ② Explain and illustrate the initial and subsequent measurement of equity-classified stock-based compensation.

Equity-Classified Stock-Based Compensation

The accounting for stock-based compensation depends on whether the employee receives equity or some other form of compensation based on the value of the company's equity. In the case of **equity-classified awards**, employees have the right to receive shares.

Issuance of Equity-Classified Awards

To account for the issuance of an equity-classified award, a company first computes the fair value of the award. If the company chooses to adjust for the estimated forfeiture rate, it expenses the adjusted fair value of the award on a straight-line basis over the vesting period. If the company does not adjust for the estimated forfeiture rate, it accounts for forfeitures when they occur. In this case, the company expenses the fair value of the awards on a straight-line basis over the vesting period and adjusts this expense each year for actual forfeitures. Example 19.1 illustrates accounting for equity-classified awards assuming that the company adjusts for estimated forfeitures.

EXAMPLE 19.1

Equity-Classified Award – Estimating Forfeitures

PROBLEM: Davis Enterprises, Inc. granted employee stock options on January 2, 2018, to acquire 60,000 shares of \$1.20 par value common stock with an exercise price of \$5.10 per share. The market price on January 2, 2018, was also \$5.10 per share, so there is no intrinsic value on the date of the grant. Employees must complete a 2-year service (vesting) period in order to exercise the options. The options will expire after a 5-year (total option) period. The estimated fair value of the options using the Black-Scholes option-pricing model is \$9.60 per option for a total of \$576,000 (60,000 options × \$9.60 per option). The company estimates that 10% of the options will be forfeited. The number of options forfeited in 2018 was 2,500 and in 2019 was 28,000. The options are equity-classified awards. Assume that Davis chooses to adjust the fair value for the estimated forfeitures. Determine the amount and allocation of the stock-based compensation expense for the years 2018 and 2019, and prepare the necessary journal entries.

Continued

¹⁰Both the Black-Scholes option-pricing model and binomial model are based on similar theoretical foundations and require similar assumptions. A key difference is that the binomial model can incorporate the early exercise of an option into its pricing whereas Black-Scholes cannot.

¹¹The service period is assumed to be the vesting period unless specified otherwise.

SOLUTION: We measure total compensation expense at the fair value of the options adjusted for estimated forfeitures. The total expense is the fair value of \$576,000 multiplied by 90% because the forfeiture rate is 10%, or the probability of vesting is 90%. The 2-year service period requires that Davis Enterprises allocate the expense equally in 2018 and 2019, recognizing \$259,200 of expense in each year.

Description	December 31, 2018	December 31, 2019
Total compensation expense at fair value	\$576,000	\$576,000
Percentage of options expected to vest	<u>× 90%</u>	<u>× 90%</u>
Expected compensation expense	\$518,400	\$518,400
Cumulative rate of amortization	<u>× 1/2</u>	<u>× 2/2</u>
Cumulative compensation expense	\$259,200	\$518,400
Less: Expense recognized in prior years	<u>(0)</u>	<u>(259,200)</u>
Compensation expense: Current year	<u>\$259,200</u>	<u>\$259,200</u>

The entries to recognize compensation expense over the 2-year amortization (service) period follow.

Account	December 31, 2018	December 31, 2019
Compensation Expense	259,200	259,200
Additional Paid-in Capital (APIC) – Stock Options	259,200	259,200

Example 19.2 uses the same facts but provides an example of accounting for forfeitures when they occur.

EXAMPLE 19.2 Equity-Classified Award – Accounting for Forfeitures When They Occur

PROBLEM: Use the facts from Example 19.1 but assume that Davis chooses to adjust for forfeitures when they occur. Determine the amount and allocation of the stock-based compensation expense for the years 2018 and 2019 and prepare the necessary journal entries.

SOLUTION: We measure total compensation expense at the fair value of the options, adjusted for actual forfeitures. The total expense over the life of the options is the fair value of the options still outstanding at the end of the period. Each year, the cumulative expense recognized should be the fair value of the options still outstanding times the percentage of the vesting period that has passed.

Description	December 31, 2018	December 31, 2019
Number of options	60,000	60,000
Actual forfeitures	<u>2,500</u>	<u>30,500</u>
Number of options outstanding	57,500	29,500
Fair value	<u>\$ 9.60</u>	<u>\$ 9.60</u>
Fair value outstanding	552,000	283,200
Number of years in vesting period	<u>2</u>	<u>2</u>
Cost per year	276,000	141,600
Years into the vesting period	<u>1</u>	<u>2</u>
Cumulative expense	276,000	283,200
Amount expensed to date	<u>0</u>	<u>(276,000)</u>
Current year expense	<u>\$276,000</u>	<u>\$ 7,200</u>

The entries to recognize compensation expense over the 2-year amortization (service) period follow.

Account	December 31, 2018	December 31, 2019
Compensation Expense	276,000	7,200
Additional Paid-in Capital—Stock Options	276,000	7,200

Each year's expense is justified by the fact that the allocation is designed to match compensation expense against increased employee productivity over the vesting period. For example, *Unilever* awarded about 7 million shares of equity-classified awards with a fair value of €244 million during fiscal 2016. *Unilever* expensed the fair value of its awards over 3 years. During 2016, *Unilever's* expense related to equity-classified awards was €198 million.

Change in the Fair Value of Equity-Classified Awards

Companies value an equity-classified award based on the market price of the options measured on the date of the grant. How, then, does the accounting change when the fair value of the options changes due to fluctuations in stock price or changes in other inputs to a valuation model after the grant date? Companies do not modify the compensation expense for these changes: The fair value at the grant date is the compensation agreed on by both the company and the employee. Thus, the company should use the fair value at the time it negotiated the compensation with the employees.

Change in the Estimated Forfeiture Rate

If the company chooses to adjust the fair value for the estimated forfeiture rate instead of accounting for actual forfeitures when they occur, it revalues equity-classified awards when there is a change in the estimated percentage of options that will be forfeited. So, the expense related to each option is not adjusted as the fair value changes, but the total expense is adjusted for changes in the number of options expected to be exercised. This is shown in Example 19.3. *Unilever's* forfeited shares were 7.5% of outstanding share awards in fiscal 2016 but 11.1% in fiscal 2015, illustrating the difficulty in estimating forfeitures and how it can change over time.

EXAMPLE 19.3 Equity-Classified Award—Forfeiture Change

PROBLEM: Using the information provided in Example 19.1 through 2018, assume that on December 31, 2019, Davis Enterprises estimated that employees will exercise only 40% of the options. What is the journal entry to reflect the change in the vesting probability in 2019? What is the journal entry to record the compensation expense in 2019? What are the balances in the relevant t-accounts after making the adjustment and recording compensation expense in 2019?

SOLUTION: We first compute the compensation expense for 2019, updating the forfeiture estimate to 60%.

Description	December 31, 2018	December 31, 2019
Total compensation expense at fair value	\$576,000	\$576,000
Percentage of options expected to vest	× 90%	× 40%
Expected compensation expense	\$518,400	\$230,400
Cumulative rate of amortization	× 1/2	× 2/2
Cumulative compensation expense	\$259,200	\$230,400
Less: Expense recognized in prior years	(0)	(259,200)
Compensation expense (income): Current year	<u>\$259,200</u>	<u>\$ (28,800)</u>

Continued

The journal entry to record the compensation expense for 2018 is the same as in Example 19.1

Account	December 31, 2018
Compensation Expense	259,200
Additional Paid-in Capital – Stock Options	259,200

Account	December 31, 2019
Additional Paid-in Capital – Stock Options	28,800
Compensation Expense	28,800

The t-accounts after posting the 2019 adjustments follow:

Additional Paid-in Capital – Stock Options	
2018	259,200
2019	28,800
2019 Balance	<u>230,400</u>

Compensation Expense	
2018	259,200
Close to Retained Earnings	259,200
2018 Balance	0
2019	28,800
Close to Retained Earnings	28,800
2019 Balance	<u>0</u>

Exercise of Equity-Classified Awards

Employee stock options will either be exercised or expire. If the employee exercises the option, the company records the issuance of new shares and removes the amount included for the options for those shares in the APIC – stock option account. Thus, the company will record the increase in cash for the amount received from the exercise and the increase in stock at par along with the decrease in the APIC – stock option account. The company will use the APIC in excess of par account to account for the remaining credit needed. This is illustrated in Example 19.4.

EXAMPLE 19.4 Accounting for an Option Exercise

PROBLEM: Davis Enterprises granted employee stock options on January 2, 2018, for 60,000 shares of \$1.20 par value common stock with an exercise price of \$5.10 per share. Davis chooses to adjust the fair value for the estimated forfeitures. The estimated forfeiture rate was 10%, so there is a 90% vesting probability throughout the 2-year vesting period. The options will expire after a 5-year period (total option period). The estimated fair value of the options using the Black-Scholes option-pricing model is \$9.60 per option for a total of \$576,000 (60,000 options × \$9.60 per option). The options are equity-classified awards. Employees exercised 100% of the options on January 2, 2020. What is the journal entry to record the option exercise? Ignore all tax benefits at exercise.

SOLUTION: Because employees exercised the options, the options must be in the money—that is, the stock price must be greater than \$5.10 per share. Since 100% of the options are

exercised, instead of 90%, Davis has a change in estimate whereby additional compensation expense must be recorded. The company issues new shares measured at \$882,000 separated into common stock at par and additional paid-in capital in excess of par. The \$882,000 is computed as the sum of the APIC – stock options balance (\$576,000) and the cash received upon exercise ($\$5.10 \times 60,000 = \$306,000$). Davis measures the common stock at \$72,000 (60,000 shares \times \$1.20 par value) and the additional paid-in capital in excess of par is the difference between the total value of the new shares and the par value of the common stock ($\$882,000 - \$72,000 = \$810,000$). The total amount of \$882,000 is compensation expense of \$576,000 (60,000 \times \$9.60), the value of employee services rendered plus cash received of \$306,000 (the \$5.10 exercise price per option times 60,000 options exercised).¹² Davis reverses the APIC – Stock Options by \$576,000 with a debit and increases cash by \$306,000.

<i>Account</i>	<i>January 2, 2020</i>	
Compensation Expense	57,600	
Additional Paid-in Capital – Stock Options		57,600

<i>Account</i>	<i>January 2, 2020</i>	
Cash	306,000	
Additional Paid-in Capital – Stock Options	576,000	
Common Stock		72,000
Additional Paid-in Capital in Excess of Par – Common		810,000

Expiration of Equity-Classified Awards

Companies account for expired options by reclassifying them from APIC – stock options into APIC – expired stock options. The contributed capital from expired options reflects the employee-provided services the company received without providing any compensation. Thus, the contributed capital is a form of donated capital measured at fair value. Accounting for expired options is illustrated in Example 19.5.

EXAMPLE 19.5

Accounting for Expired Options

PROBLEM: In Example 19.1, Davis Enterprises granted employee stock options on January 2, 2018, for 60,000 shares of \$1.20 par value common stock with an exercise price of \$5.10 per share and an estimated forfeiture rate of 10%. Assume that on January 2, 2023, which is the end of the 5-year total option period, the options are out of the money (i.e., the market price is less than the exercise price). All of the options will expire unexercised. What is the journal entry to record the expiration of the options?

SOLUTION: Because the market price is now less than \$5.10 per share, the journal entry to record the expiration is as follows:

<i>Account</i>	<i>January 2, 2023</i>	
Additional Paid-in Capital – Stock Options	518,400	
Additional Paid-in Capital – Expired Stock Options		518,400

Equity-Classified Awards: IFRS

Under IFRS, accounting for equity-classified awards is similar to that under U.S. GAAP except that companies are not allowed the option to adjust for actual forfeitures. Companies must adjust for an estimate of the percentage of the options that are expected to be forfeited.

¹²We assume that the entity issues new shares to satisfy the requirements of the option plan. In practice, it is more common for companies to use treasury shares to satisfy employee stock options. However, we avoid using treasury shares here because doing so creates complications that obscure the key points of accounting for stock options.

- 3 Describe and demonstrate the initial and subsequent measurement of liability-classified stock-based compensation.

Liability-Classified Stock-Based Compensation

For a **liability-classified award**, an employee receives cash or some other company resource based on the value of the shares in the stock-based compensation. Employee compensation is classified as a liability in the following situations:

1. The option is granted for the acquisition of securities classified as liabilities, such as redeemable preferred stock.
2. The employee can sell back the acquired shares to the employer corporation at the exercise price within a reasonable period of time (such as 6 months). Here the employee does not absorb any risk.
3. The compensation is in the form of **cash-settled stock appreciation rights** with the employee receiving cash for the amount of the increase in a company's share price over a fixed period of time.

Issuance of Liability-Classified Awards

To account for liability-classified awards, the company recognizes the compensation expense on a straight-line basis over the vesting period. As is the case with equity-classified awards, the company can choose to adjust the fair value of the award by an estimated forfeiture rate, or it can choose to account for actual forfeitures when they occur. As with equity-classified awards, if the company chooses to adjust for the estimated forfeiture rate, it revalues the awards when the estimated percentage of options that will be forfeited changes. When the company records the expense, it also accrues a liability. Example 19.6 illustrates accounting for liability-classified awards when the company estimates forfeitures.

EXAMPLE 19.6

Liability-Classified Awards – Estimating Forfeitures

PROBLEM: ALR Enterprises, Inc. granted employee stock options on January 2, 2018, for 100,000 shares of \$1 par value common stock with an exercise price of \$25 per share. The market price of a share of stock on January 2, 2018, was also \$25 per share, so there is no intrinsic value on the date of the grant. Employees must complete a 2-year service (vesting) period in order to exercise the options. The options will expire after a 5-year period (total option period). The estimated fair value of the options using the Black-Scholes option-pricing model is \$30 per option, or \$3,000,000, in total. The employees have the right to sell the shares back to ALR within 3 months of the exercise. The company estimates that there will be 5% forfeitures of the options. The actual number of forfeited options is 2,000 in 2018 and 3,000 in 2019. What journal entry does ALR make for compensation expense in 2018 and 2019 assuming that it adjusts the fair value for estimated forfeitures?

SOLUTION: ALR classifies the award as a liability because employees can sell the shares back to ALR within 3 months of the exercise. ALR allocates the \$2,850,000 fair value of the award over the 2-year service period, resulting in compensation expense in each year of \$1,425,000 recorded as follows:

Description	December 31, 2018	December 31, 2019
Total compensation expense at fair value	\$3,000,000	\$3,000,000
Percentage of options expected to vest	95%	95%
Expected total compensation expense	2,850,000	2,850,000
Cumulative rate of amortization	0.5000	1.0000
Cumulative compensation expense	1,425,000	2,850,000
Expense recognized in prior years	0	1,425,000
Current-year compensation expense	<u>\$1,425,000</u>	<u>\$1,425,000</u>

The journal entries are as follows:

Account	December 31, 2018	December 31, 2019
Compensation Expense	1,425,000	1,425,000
Liability for Stock-Based Compensation	1,425,000	1,425,000

Example 19.7 uses the same facts but provides an example of accounting for forfeitures when they occur.

EXAMPLE 19.7 Liability-Classified Award – Accounting for Forfeitures as They Occur

PROBLEM: Use the facts from Example 19.6 but assume that ALR chooses to adjust for forfeitures when they occur. What journal entry does ALR make for compensation expense in 2018 and in 2019?

SOLUTION: ALR measures total compensation expense at the fair value of the options adjusted for actual forfeitures. The total expense is the fair value of the options still outstanding at the end of the period. Each year, the cumulative expense recognized should be the fair value of the options still outstanding multiplied by the percentage of the vesting period that has passed.

Description	December 31, 2018	December 31, 2019
Number of options	100,000	100,000
Actual forfeitures	<u>2,000</u>	<u>5,000</u>
Number of options outstanding	98,000	95,000
Fair value	<u>\$ 30</u>	<u>\$ 30</u>
Fair value outstanding	2,940,000	2,850,000
Number of years in vesting period	<u>2</u>	<u>2</u>
Cost per year	1,470,000	1,425,000
Years into the vesting period	<u>1</u>	<u>2</u>
Cumulative expense	1,470,000	2,850,000
Amount expensed to date	<u>0</u>	<u>(1,470,000)</u>
Current year expense	<u>\$1,470,000</u>	<u>\$1,380,000</u>

The journal entries are as follows:

Account	December 31, 2018	December 31, 2019
Compensation Expense	1,470,000	1,380,000
Liability for Stock-Based Compensation	1,470,000	1,380,000

Fair Value Adjustments

At each balance sheet date, companies remeasure the liability and compensation expense to fair value until the award is settled. This treatment is different than the treatment of fair value changes for equity-classified awards. For liability-classified awards, the liability is remeasured because the obligation is actually changing with the change in the fair value. Thus, companies adjust liability-classified awards each year for any changes in the fair value of the options. These adjustments impact the compensation expense recognized in the period of adjustment, leading companies to remeasure the liability account accordingly. Example 19.8 illustrates accounting for liability-classified awards when the fair value changes.

EXAMPLE 19.8 Liability-Classified Award—Change in Fair Value

PROBLEM: Using the information provided in Example 19.6, assume that ALR Enterprises, Inc. reports that the fair value of the award as of December 31, 2018, is \$3,200,000 and its fair value as of December 31, 2019, is \$3,125,000. What are the journal entries required to record compensation expense in 2018 and 2019?

Continued

SOLUTION: Compensation expense is based on the fair value of the liability-classified award. In 2018, the compensation expense is \$1,520,000, which is the total fair value of \$3,200,000 adjusted for the vesting probability of 95% and divided by the vesting period of 2 years. In 2019, the fair value of the award is \$3,125,000. ALR again adjusts for the vesting probability of 95%. So, over the 2 years, the total compensation expense is \$2,968,750. Because ALR expensed \$1,520,000 in the prior year, the compensation expense recognized in 2019 is \$1,448,750, or \$2,968,750 less the \$1,520,000 previously expensed. The compensation expense for 2018 and 2019 is as follows:

<i>Description</i>	<i>December 31, 2018</i>	<i>December 31, 2019</i>
Total fair value	\$3,200,000	\$3,125,000
Vesting probability	× 95%	× 95%
Expected compensation expense	\$3,040,000	\$2,968,750
Cumulative rate of amortization	× 1/2	× 2/2
Cumulative compensation expense	\$1,520,000	\$2,968,750
Less: Expense recognized in prior years	(0)	(1,520,000)
Compensation expense (income): Current year	<u>\$1,520,000</u>	<u>\$1,448,750</u>

Thus, the journal entries to record compensation expense for 2018 and 2019 are as follows:

<i>Account</i>	<i>December 31, 2018</i>	<i>December 31, 2019</i>
Compensation Expense	1,520,000	1,448,750
Liability for Stock-Based Compensation	1,520,000	1,448,750

Exercise of Liability-Classified Awards

The accounting treatment for the exercise of a liability-classified award is similar to the exercise of an equity-classified award. The company records any cash received, removes the liability, and records the stock issuance in the common stock at par and additional paid-in capital in excess of par – common accounts as shown in Example 19.9.

EXAMPLE 19.9 Liability-Classified Award Exercise

PROBLEM: In Example 19.6, ALR granted employee stock options on January 2, 2018, for 100,000 shares of \$1 par value common stock with an exercise price of \$25 per share. The options are liability-classified awards. The employees exercise the stock options on January 2, 2020. What is the journal entry to record the exercise of 100% of the options? Ignore all tax benefits at exercise.

SOLUTION: ALR records the cash receipt of \$2,500,000 (100,000 shares × \$25 per share) and removes the \$2,850,000 liability. It also records common stock at par of \$100,000 (100,000 shares × \$1 par value) and credits the remainder to additional paid-in capital.

<i>Account</i>	<i>January 2, 2020</i>
Cash	2,500,000
Liability for Stock-Based Compensation	2,850,000
Common Stock	100,000
Additional Paid-in Capital in Excess of Par – Common	5,250,000

Expiration of Liability-Classified Awards

If a liability-classified award expires, the company removes the liability account and records the amount in APIC – expired stock options as shown in Example 19.10.

EXAMPLE 19.10

Liability-Classified Award Expiration

PROBLEM: In Example 19.6, the company granted employee stock options on January 2, 2018, for 100,000 shares of \$1 par value common stock with an exercise price of \$25 per share. On January 2, 2023, the end of the 5-year total option period, the options are out of the money (meaning the market price is less than the exercise price). All of the options will expire unexercised. What is the journal entry to record the expiration of the options?

SOLUTION: Because the market price is now less than \$25 per share, the journal entry to record the expiration is as follows:

Account	January 2, 2023
Liability for Stock-Based Compensation	2,850,000
Additional Paid-in Capital – Expired Stock Options	2,850,000

Exhibit 19.2 summarizes the treatment of adjustments to compensation expense.

EXHIBIT 19.2 Summary of Adjustments to Compensation Expense

Award	Adjustment of Compensation Expense for	
	Changes in Vesting Probability	Changes in Fair Value
Equity classified	Yes	No
Liability classified	Yes	Yes

Liability-Classified Awards: IFRS

Under IFRS, accounting for liability-classified awards is similar to that under U.S. GAAP except that companies must adjust for an estimate of the percentage of the options that are expected to be forfeited. IFRS reporters cannot choose to adjust for actual forfeitures of options.

- 4 Discuss accounting for stock appreciation rights, restricted stock plans, and employee stock purchase plans.

Other Types of Stock-Based Compensation

In this section, we discuss three other common types of stock-based employee compensation:

- Stock appreciation rights
- Restricted stock plans
- Employee stock purchase plans

Stock Appreciation Rights

A stock appreciation right (SAR) is a form of compensation that gives an employee the right to receive an amount equal to the appreciation in a company's stock from the award date to the exercise date. SARs are similar to a bonus tied to the company's stock price because SARs compensate the employee for the increase in the company's stock price. As a result, the employee benefits only if the stock price increases. Unlike stock options, the employee is not required to purchase shares.

A company can grant SARs that give the employee the right to receive cash or shares of stock at the exercise date. To account for SARs, a company records compensation expense based on the SAR's fair value.¹³ If the plan specifies that the employee will be compensated with cash, the SARs are liability classified.

If the plan specifies that the employee will be compensated with shares of stock, the SARs will be equity classified to the account additional paid-in capital—stock options. At the end of each period, the company remeasures the liability (or equity) to the SAR's current fair value. Accounting for SARs is illustrated in Example 19.11.

EXAMPLE 19.11 Stock Appreciation Rights

PROBLEM: Spitfire Motor Company initiated a share-appreciation rights plan on January 1, 2018, by granting 30,000 rights to its key executives. The vesting period is 3 years, and the SARs cannot be exercised before January 1, 2021. The plan also expires on January 1, 2022. The closing fair values of the SARs for the years ended December 31, 2018, through 2020 are presented in the following table.

Date	Fair Value
December 31, 2018	\$4
December 31, 2019	7
December 31, 2020	5
January 1, 2021	5

The SARs are all exercised on January 1, 2021, when the market price of a share of common stock is \$30.

Required »

- Prepare the journal entries necessary to record the SAR plan assuming that the executives receive cash.
- Prepare the journal entries as if the plan specified that the SARs would be settled with its \$1 par value common stock.

SOLUTION: The computation of the fair value of the SARs at each date is computed:

Date	Fair Value	Total Fair Value (30,000 Rights)	Percent Vested	Cumulative Expense to Be Accrued	Expense Accrued in Current Year
December 31, 2018	\$4	\$120,000	33.333%	\$ 40,000	\$ 40,000
December 31, 2019	7	210,000	66.667	140,000	100,000
December 31, 2020	5	150,000	100	150,000	10,000
January 1, 2021	5	150,000	100	150,000	0

- The journal entries for the scenario in which we assume that the SARs are settled in cash follow. Note that in 2020 the compensation expense and the related liability are both reduced.

Account	December 31, 2018
Compensation Expense	40,000
Obligation under SAR Plan	40,000

¹³ASC 718-30-35-4 permits a nonpublic entity to measure the compensation expense at either fair value or intrinsic value.

Account	December 31, 2019	
Compensation Expense	100,000	
Obligation under SAR Plan		100,000

Account	December 31, 2020	
Compensation Expense	10,000	
Obligation under SAR Plan		10,000

Spitfire makes the following entry when the executives exercise the SARs and it pays the obligation:

Account	January 1, 2021	
Obligation under SAR Plan	150,000	
Cash		150,000

b. If the SARs were settled with stock, then the journal entries would be as follows:

Account	December 31, 2018	
Compensation Expense	40,000	
Additional Paid-in Capital—Stock Options		40,000

Account	December 31, 2019	
Compensation Expense	100,000	
Additional Paid-in Capital—Stock Options		100,000

Account	December 31, 2020	
Compensation Expense	10,000	
Additional Paid-in Capital—Stock Options		10,000

When the executives exercise the SARs, Spitfire is required to compensate them with 5,000 shares of common stock (\$150,000 value of the SARs divided by \$30 market price). Spitfire makes the following entry when the executives exercise the SARs:

Account	January 1, 2021	
Additional Paid-in Capital—Stock Options	150,000	
Common Stock		5,000
Additional Paid-in Capital in Excess of Par— Common		145,000

Restricted Stock Plans

Under a **restricted stock plan**, a company awards actual shares in the name of a specific employee, resulting in an allocation of restricted shares to the designated employee. Restricted stock plans are therefore not stock options. The restrictions attached to the awarded shares often include the following provisions:

- The employee must remain with the employer for a specified number of years (a vesting period) before selling the awarded shares.
- The employee is not taxed on the award, nor may the employer take a tax deduction for compensation expense until the restrictions expire.

These restrictions create incentives for the employee to remain employed at the company and to increase productivity to enhance the value of the shares awarded. Restricted stock plans are beneficial to the employee. If the market price falls below the strike price of an option, the employee option is worthless. However, a restricted stock plan always has value as long as the

underlying shares trade at a non-zero price. Because the restricted shares are expected to have some value, fewer shares are needed as an incentive for employees, making restricted stock plans less dilutive than stock option plans.

On the grant date, deferred compensation on the restricted shares is measured as the fair value of the unrestricted shares multiplied by the number of restricted shares issued. The company amortizes the total deferred compensation evenly over the vesting period for financial reporting purposes. For example, *Johnson & Johnson* granted about 7.1 million shares of restricted stock units in fiscal 2016 at an average fair value of \$92.45. The units vest over 3 years, so *Johnson & Johnson* will amortize them to compensation expense over that period. *Johnson & Johnson* ignores subsequent changes in the fair value of the stock for purposes of computing the compensation expense.

When an employee fully vests in the restricted stock plan, no additional entries are required because the shares have already been issued. The company modifies footnote disclosures to indicate that it has removed the restrictions on the shares. Example 19.12 illustrates accounting for restricted stock plans.

EXAMPLE 19.12 Restricted Stock Plan

PROBLEM: On January 1, 2018, Newton Fig Factories, Inc. issued 10,000 shares of \$1 par value, restricted stock to one of its key executives, Wayne Smith. Newton's unrestricted shares have a market value of \$30 per share on the date of issue. The restricted shares require a vesting period of 3 years. Prepare the journal entries required for 2018 through 2020. Newton's year-end is December 31.

SOLUTION: Newton makes the following entry on the date of the grant of the restricted shares, January 1, 2018. The debit to deferred compensation is a negative or contra-shareholders' equity account that Newton will amortize over the 3-year vesting period.

Account	January 1, 2018
Deferred Compensation – Restricted Stock	300,000
Common Stock (10,000 shares × \$1 par value)	10,000
Additional Paid-in Capital in Excess of Par – Common	290,000

Newton amortizes deferred compensation on a straight-line basis over the 3-year vesting period by debiting compensation expense and crediting deferred compensation for \$100,000 per year (i.e., \$300,000 / 3 years). Newton makes the following entry each December 31.

Account	December 31, 2018, 2019, and 2020
Compensation Expense	100,000
Deferred Compensation – Restricted Stock	100,000

If an employee terminates employment prior to vesting, the company reverses the share issue, derecognizes the deferred compensation, and reverses the expense recognition to date by crediting compensation expense. The credit to compensation expense increases income. Accounting for employee termination in restricted stock plans is shown in Example 19.13.

EXAMPLE 19.13 Restricted Stock Plan with Employee Termination

PROBLEM: Continuing with Example 19.12, assume that on January 1, 2019, Wayne Smith leaves Newton Fig Factories 1 year after the restricted shares are issued. At this point, \$100,000 was expensed and \$200,000 remains in deferred compensation. Prepare the journal entry needed to record the forfeiture of the restricted stock award.

SOLUTION: The entry to record the forfeiture follows:

Account	January 1, 2019
Common Stock	10,000
Additional Paid-in Capital in Excess of Par – Common	290,000
Deferred Compensation – Restricted Stock	200,000
Compensation Expense	100,000

Employee Stock Purchase Plans

To encourage employee loyalty and to increase incentives, many employers offer *employee stock purchase plans*. An **employee stock purchase plan** offers employees the opportunity to purchase the company's shares, usually at a discount and without incurring transactions costs (i.e., brokerage fees). The accounting depends on whether these plans are compensatory or non-compensatory:

- In non-compensatory plans, the company records the issuance of shares purchased by employees in the same way as issuing shares in the open market.
- In compensatory plans, the company records the amount of the discount below the regular market purchase as compensation expense.

An employee stock purchase plan is non-compensatory if it meets the following three conditions:

1. The plan is made available to substantially all employees.
2. After the plan is established, there is a maximum 1-month period to elect to participate in the plan.
3. The discount is not larger than 5% of the open market price or, if a greater discount is offered, the discount can be justified.

Example 19.14 illustrates accounting for employee stock purchase plans.

EXAMPLE 19.14

Employee Stock Purchase Plans

PROBLEM: Milo Cookie Company offers all its employees the opportunity to purchase its \$2 par value common stock at a 3% discount (meaning that the employee pays 97% of the market price). The employees have 2 weeks to elect to participate in the plan. The current market price of the stock is \$30 per share. Employees purchased a total of 10,000 shares after 2 weeks of establishing the purchase plan and setting the discount. What journal entry will Milo make on the date the employees purchase the shares? What journal entry would Milo make if it offered the employee purchase plan only to its full-time, salaried employees?

SOLUTION: Based on the original terms, the plan is determined to be non-compensatory. Thus, Milo does not record compensation expense. It records cash of \$291,000 ($\$30 \times 97\% \times 10,000$) for the employee purchase. It records common stock of \$20,000 ($\$2 \text{ par} \times 10,000 \text{ shares}$) and the remainder in additional paid-in capital in excess of par – common.

Description	Date of Employee Purchase
Cash	291,000
Common Stock	20,000
Additional Paid-in Capital in Excess of Par – Common	271,000

If Milo offers the plan only to select employees, the plan is deemed to be compensatory, and Milo must charge the discount to salary expense. Milo records cash

Continued

of \$291,000 ($\$30 \times 97\% \times 10,000$) for the employee purchase and salary expense of \$9,000 ($\$30 \times 3\% \times 10,000$). It records common stock of \$20,000 ($\$2 \text{ par} \times 10,000 \text{ shares}$) and the remainder in additional paid-in capital in excess of par – common.

Description	Date of Employee Purchase
Cash	291,000
Salary Expense	9,000
Common Stock	20,000
Additional Paid-in Capital in Excess of Par – Common	280,000

- 5 Detail required disclosures for stock plans.

Stock-Based Compensation Disclosures

Minimum required disclosures for stock-based compensation are fairly extensive to provide financial statement users with enough information to understand:

1. The nature and terms of the stock-based compensation plans that existed during the periods covered by the financial statements
2. The methods used to estimate the required fair values, including models and assumptions used in valuing options
3. The income statement effect of the compensation cost arising from the entity's stock-based compensation plans
4. The effect of the stock-based compensation plans on the entity's cash flow

The description of the nature and terms of stock-based compensation plans include the service period and other vesting requirements, the maximum service period over which the shares are available or liability exists, the number of shares authorized for awards, and those exercisable at the end of the period. Companies must also disclose the policy choice as to whether it recognizes estimated forfeitures or actual forfeitures as incurred. In addition, companies also provide details on the number and weighted-average exercise prices of share options (or units) at the beginning and ending of the year and changes during the year including those related to grants, exercises (or conversion), forfeitures, and expirations. Commonly, this information provides a reconciliation of beginning and ending amounts. Companies disclose information separately for vested and non-vested shares. While stock compensation is accounted for at fair values, companies are also required to disclose the intrinsic values of outstanding stock and options granted.

Exhibit 19.3 illustrates selected stock-based compensation disclosures provided by *Pfizer Inc.*, a global pharmaceutical company, in its 2016 annual report. For example, *Pfizer* disclosed that the income statement effect of the various types of stock-based compensation was \$486 million, net of tax, in 2016. *Pfizer* disclosed that its stock options expire 10 years from the date of grant and vest after 3 years. *Pfizer* uses a variation of the Black-Scholes option-pricing model to value the options, making the required assumptions. The company provided a reconciliation of shares outstanding and the weighted-average exercise price from the beginning to the end of the year. Additionally, it included a table with the outstanding and exercisable shares by the exercise price range.

EXHIBIT 19.3 Selected Footnote Disclosure of Stock-Based Compensation Disclosures, *Pfizer Inc.*'s Financial Statements, December 31, 2016

NOTE 13: SHARE-BASED PAYMENTS

Our compensation programs can include share-based payments, in the form of Restricted Stock Units (RSUs), stock options, Portfolio Performance Shares (PPSs), Total Shareholder Return Units (TSRUs) and Performance Share Awards (PSAs).

A. Impact on Net Income

The following table provides the components of share-based compensation expense and the associated tax benefit:

(Millions of Dollars)	Year Ended December 31		
	2016	2015	2014
Restricted Stock Units	\$299	\$306	\$270
Portfolio Performance Shares	135	147	96
Total Shareholder Return Units	134	36	37
Stock Options	106	165	150
Performance Share Awards	13	11	30
Directors' compensation	4	4	3
Share-based payment expense	691	669	586
Tax benefit for share-based compensation expense	(205)	(198)	(179)
Share-based payment expense, net of tax	<u>\$486</u>	<u>\$471</u>	<u>\$407</u>

B. Restricted Stock Units (RSUs)

RSUs are awarded to select employees and, when vested, entitle the holder to receive a specified number of shares of **Pfizer** common stock, including shares resulting from dividend equivalents paid on such RSUs. For RSUs granted during the periods presented, in virtually all instances, the units vest after three years of continuous service from the grant date.

We measure the value of RSU grants as of the grant date using the closing price of **Pfizer** common stock. The values determined through this fair value methodology generally are amortized on a straight-line basis over the vesting term into *Cost of sales, Selling, informational and administrative expenses*, and *Research and development expenses*, as appropriate.

The following table summarizes all RSU activity during 2016:

	Shares (Thousands)	Weighted-Average Grant Date Fair Value Per Share
Nonvested, December 31, 2015	29,135	\$31.53
Granted	10,581	30.74
Vested	(9,630)	27.41
Reinvested dividend equivalents	1,093	32.56
Forfeited	(1,574)	32.18
Nonvested, December 31, 2016	<u>29,605</u>	<u>\$32.59</u>

The following table provides data related to all RSU activity:

(Millions of Dollars)	Year Ended December 31		
	2016	2015	2014
Total fair value of shares vested	\$293	\$371	\$401
Total compensation cost related to nonvested RSU awards not yet recognized, pre-tax	\$262	\$279	\$255
Weighted-average period over which RSU cost is expected to be recognized (years)	1.7	1.8	1.8

C. Stock Options

Stock options are awarded to select employees and, when vested, entitle the holder to purchase a specified number of shares of **Pfizer** common stock at a price per share equal to the closing market price of **Pfizer** common stock on the date of grant.

Beginning in 2016, only a limited set of overseas employees received stock option grants. No stock options were awarded to senior and other key management in any period presented; however, stock options were awarded to certain other employees. In virtually all instances, stock options granted since

Continued

2005 vest after three years of continuous service from the grant date and have a contractual term of ten years. In most cases, stock options must be held for at least one year from the grant date before any vesting may occur. In the event of a sale of business or plant closing or restructuring, options held by employees are immediately vested and are exercisable for a period from three months to their remaining term, depending on various conditions.

We measure the value of stock option grants as of the grant date using, for virtually all grants, the Black-Scholes-Merton option-pricing model. The values determined through this fair value methodology generally are amortized on a straight-line basis over the vesting term into *Cost of sales, Selling, informational and administrative expenses*, and *Research and development expenses*, as appropriate.

The following table summarizes all stock option activity during 2016:

	Shares (Thousands)	Weighted- Average Exercise Price Per Share	Weighted- Average Remaining Contractual Term (Years)	Aggregate Intrinsic Value ^(a) (Millions)
Outstanding, December 31, 2015	232,554	\$26.41		
Granted	1,371	30.59		
Exercised	(42,550)	24.03		
Forfeited	(2,949)	33.18		
Expired	(1,750)	28.55		
Outstanding, December 31, 2016	186,676	26.86	5.7	\$1,138
Vested and expected to vest ^(b) , December 31, 2016	184,537	26.77	5.6	1,138
Exercisable, December 31, 2016	105,862	\$21.85	4.1	\$1,126

^(a) Market price of underlying Pfizer common stock less exercise price.

^(b) The number of options expected to vest takes into account an estimate of expected forfeitures.

The following table summarizes data related to all stock option activity:

(Millions of Dollars, Except Per Stock Option Amounts)	Year Ended December 31		
	2016	2015	2014
Weighted-average grant date fair value per stock option	\$ 3.89	\$ 4.30	\$ 4.40
Aggregate intrinsic value on exercise	\$ 389	\$ 666	\$ 458
Cash received upon exercise	\$1,019	\$1,263	\$1,002
Tax benefits realized related to exercise	\$ 112	\$ 187	\$ 131
Total compensation cost related to nonvested stock options not yet recognized, pre-tax	\$ 58	\$ 159	\$ 147
Weighted-average period over which stock option compensation cost is expected to be recognized (years)	1.1	1.8	1.8

THE CONCEPTUAL FRAMEWORK CONNECTION

Stock-Based Compensation

Accountants make two important judgments related to stock-based compensation: measurement of the options at fair value and the probability of forfeiture. Option-pricing models determine the fair value for recording the amount of expense for the options in the income statement. However, even good models provide only an *estimate* of the fair value. Thus, similar to many

items reported in the financial statements, the expense related to employee stock options is a judgment-based estimate.

Consider Davis Enterprises, Inc. from Example 19.1. Davis estimated the fair value of its stock options at \$9.60 per share. Management could have also estimated an amount higher or lower than \$9.60 per share. For example, assume that they used an estimate of \$11 per share. Then, instead of reporting compensation expense of \$259,200 in 2018 and 2019, the company would report an expense of \$297,000, thus reducing net income by an additional \$37,800 in each year. There can be incentives for management to use a lower estimate of fair value to result in a lower charge to net income.

Estimating how many options will ultimately be exercisable also relies on judgment related to the probability that employees will exercise their options. Employees forfeit their options if they terminate employment before the option vesting date. Companies record only the amount of expense related to the estimate of options that will not be forfeited. Again, that determination is purely a matter of judgment, and the resulting measure of expense is an estimate.

There was a 10% forfeiture rate in Example 19.1. However, that forfeiture rate is only an estimate based on predictions of future events. What if Davis had instead estimated a 25% forfeiture rate? In that case, the fair value of \$576,000 would have been multiplied by 75% and the compensation expense for 2018 and 2019 would be reduced from \$259,200 per year to \$216,000 per year. Providing a relatively high estimate of the forfeiture rate to decrease expense recognized would directly increase net income, benefiting management.

- 6 Describe the characteristics of defined-contribution and defined-benefit pension plans.

Overview of Pensions

Employees are often entitled to receive benefits such as pension plans, healthcare plans, and life insurance coverage following retirement. Post-retirement benefits recognize years of service provided by employees. Because an employee will likely work for many years before retiring, the benefits owed to the employee are usually noncurrent liabilities. Our focus is on pensions, which are the most significant post-employment benefits provided to retired employees.¹⁴ After establishing the key background details on pensions, we will examine the accounting process.

Pension Plan Administration

Pension plans can be either *contributory* or *noncontributory*. **Contributory plans** require employees to fund some or all pension benefit costs and allow employees to make additional contributions to voluntarily increase their retirement benefits. In **noncontributory** plans, the employer is responsible for funding the total cost of the plan.

A company (referred to as the sponsor company) sets aside funds for future pension benefits and transfers these assets to a separate legal entity called a **pension trust**. The trust accumulates the pension fund assets and makes payments to retirees. Our focus is on the impact of pension plans on the financial statements of the sponsor company. We do not consider accounting issues related to the pension trust.¹⁵

Types of Pension Plans

There are two main types of pension arrangements: *defined contribution* and *defined benefit*. According to the *Employee Benefits Survey* for 2016 conducted by the Bureau of Labor Statistics, 8% of businesses offered a defined-benefit retirement plan and 46% offered a defined-contribution plan. We discuss the accounting treatment for both types of plans next.

Defined-Contribution Plans. In a **defined-contribution plan**, the employer contributes a fixed amount each period based on a formula that is typically a percentage of the employee's salary. The employer is not responsible for the value of the pension fund assets.

¹⁴Because the accounting for non-pension post-retirement benefits (for example, health insurance for retired employees) is very similar to the accounting for pensions, we do not discuss other post-retirement benefits in this text.

¹⁵The pension trust is a separate legal entity with its own set of financial statements. The pension trust follows unique accounting standards that are not covered in this text.

Employees determine the types of investments held in their plans that ultimately determine the rate of return on the assets and, therefore, the employees bear the risk of loss on their pension fund assets.

Accounting for defined-contribution plans involves recording contributions as expenses and is similar to recording any type of compensation expense. Specifically, when the employee provides services and earns the pension, the company records the pension expense. The company may pay cash into the plan at that time or have a payable to the plan. Example 19.15 illustrates accounting for defined-contribution plans.

EXAMPLE 19.15 Defined-Contribution Plans

PROBLEM: ADF Company pays wages of \$1,000,000 this period and has a defined-contribution pension plan that requires the company to contribute 5% of total wages into the plan. What is the journal entry to record ADF's pension expense?

SOLUTION: The following entry records ADF Company's pension expense of \$50,000 ($\$1,000,000 \times 5\%$).

Account	Current Year
Pension Expense	50,000
Cash	50,000

Under a defined-contribution plan, the employer's annual cost is the amount that it is obligated to contribute to the pension trust. If it makes the contribution in full each year, then there is no pension asset or liability on the balance sheet. If the company contributes more (less) than the formula amount, then a pension asset (liability) results.

Defined-Benefit Plans. A **defined-benefit plan** specifies a predetermined amount of benefits that the employee will receive at the time of retirement. The employer, who bears the risk of loss, is therefore concerned with the rate of return earned on the assets invested in the pension trust. In a defined-contribution plan, the contribution is fixed, but the benefits can vary. In a defined-benefit plan, the contributions can vary, but the benefits are fixed.

The defined-benefit formula is usually a function of a predetermined percentage, salary level, and credits granted for the number of years of service. The defined benefit is calculated as follows:

$$\text{Defined Benefit} = \% \times \text{Salary Level} \times \text{Credits for Years of Service}$$

The defined benefit due each year is a deferred future payment, so it is a liability. Because the quantitative complexity of the information required by the defined-benefit pension plan, *actuaries* handle the actual and projected plan measurements. An **actuary** is an individual skilled in mathematics, statistics, and finance who analyzes the financial consequences of risk based on probability assessments. Actuaries assist in determining the amount of pension plan funding and the costs to service the plan. Actuaries forecast key variables required in pension computations such as turnover rates, life expectancies, future salary levels, interest rates, and retirement patterns.

Measures of the Actuarially Determined Defined-Benefit Pension Obligation

Based on key variables, a company estimates its liability for the future benefits promised under a defined-benefit plan as the present value of the defined benefits. The following timeline depicts the sequence of events for the pension.

At the financial statement date, the defined-benefit obligation is the present value of the benefit payments to be made after employees retire. While the employees are working, the benefits are deferred. Therefore, the defined-benefit obligation is simply a deferred annuity. The deferral or waiting period is represented by the years of employment.

The defined-benefit payments begin on the retirement date (RD) and extend over a designated retirement period (RP). The length of the retirement period can be based on life expectancy, or it can be specified by the employment contract. For example, the contract may allow the employee to take a lump-sum payment at retirement, receive payments over a fixed term, or base the distribution period on life expectancy.

There are three distinct methods for measuring a company’s pension obligation to its employees:

1. Vested benefit obligation (VBO)
2. Accumulated benefit obligation (ABO)
3. Projected benefit obligation (PBO)

The three measures of obligations are equal to the present value of the promised benefit payments with the benefits defined differently depending on whether the employee is vested or not and the salary levels used.

Vested Benefit Obligation. The **vested benefit pension obligation (VBO)** bases the defined-benefit obligation on the vested benefits that accrue to current employees. *Vesting*, as explained, means that an employee’s right to pension benefits is not contingent on any future employment with the company. The employer computes the VBO using current salary levels and includes only vested benefits. Because the vested benefits must be paid even if the plan is discontinued or the employees are terminated, the VBO is considered a termination-basis obligation.

Accumulated Benefit Obligation. The **accumulated benefit obligation (ABO)** estimates the pension obligation based on years of service performed by all employees, both vested and non-vested, under the plan considering current salary levels. The ABO is partially a going-concern obligation because it considers all employees. However, it is sometimes considered a minimum obligation because it reflects only current salaries and does not factor in projected increases in compensation.

Projected Benefit Obligation. The **projected benefit obligation (PBO)** considers all employees, both vested and non-vested, using estimated future salary levels. The PBO is usually the largest estimate of the pension obligation because it uses projected future salary levels. The PBO is considered a going-concern obligation because it considers all employees and future compensation rates. FASB requires this obligation for use in pension computations.

Assuming inflation and no salary reductions, Exhibit 19.4 illustrates the expected ranking of the actuarially determined pension obligations.

EXHIBIT 19.4 Measures of the Pension Obligation

Pension Obligation	Benefits Included for Vested Only or Vested and Unvested?	Benefits Computed Using Current Salaries or Future Salaries?	Amount of Pension Benefit Obligation	
			VBO	Unvested at current salary levels
Vested benefit obligation	Vested only	Current	VBO	Unvested at current salary levels
Accumulated benefit obligation	Vested and unvested	Current	ABO	
Projected benefit obligation	Vested and unvested	Future	PBO	

Note: The diagram shows that the VBO is a subset of the ABO, and the ABO is a subset of the PBO. The ABO includes benefits attributable to future salary levels incremental to current salary levels.

The PBO provides the largest pension obligation of the three methods. The differences in the rankings are explained as follows:

1. The ABO exceeds the VBO by the present value of the difference between the service credits earned by all employees versus vested employees.
2. The PBO exceeds the ABO by the present value of the difference between estimated future and current salary levels.

The remainder of the chapter discusses the complexities of accounting for defined-benefit pension plans.

- 7** Demonstrate the measurement of pension costs and the related liability or asset under defined-benefit plans, including remeasurement due to changes in actuarial assumptions.

Defined-Benefit Pension Plan Accounting

There are seven key factors in accounting for defined-benefit pension plans. To provide a clear understanding of the financial statement effects of each factor, we consider each factor separately and present the related conceptual journal entry.¹⁶ Note, however, that companies make a single, combined journal entry at the end of the reporting period to account for defined-benefit pension plans. We conclude our discussion by summarizing the seven factors with a combined entry. Before examining each factor in depth, we use the conceptual framework as a starting point.

THE CONCEPTUAL FRAMEWORK CONNECTION Defined-Benefit Pension Plans

On the balance sheet, two primary accounts are involved in accounting for defined-benefit plans: pension plan assets and pension plan obligations. Companies use an account for pension plan assets because the sponsor company invests funds into the pension plan. A defined-benefit pension plan results in a projected benefit obligation liability. Companies report the difference between the pension plan asset account and the projected benefit obligation on the balance sheet as either a net pension asset or a net pension liability. This amount is called the *funded status of the plan*. If the plan assets exceed the PBO, the plan is overfunded; if the plan assets are less than the PBO, the plan is underfunded.

On the income statement, defined-benefit plans result in pension costs for the company. Consistent with the conceptual framework's definition of expense, the provision of retirement benefits results in either the outflow of assets (cash) or the creation of a liability related to the entity's major operations. In general, the current accounting treatment for pensions ensures that companies properly allocate pension costs in the income statement to the period that the employees provide services to the company.

Next we examine each factor in depth.

Factor 1: Service Cost

Service cost is the increase in the projected benefit obligation resulting from one additional year of service from employees. It is measured as the present value of the cost of providing pension benefits for 1 additional year of service using all employees and estimated future salary rates. The defined benefit and its related obligation increase with additional years of service.

Because service costs obligate a company to increase benefits to its retirees, they increase the PBO. Companies include the service cost in operating income in the same line item as other compensation costs. Similar to other compensation costs, service costs can be capitalized in connection with the production or construction of an asset such as inventory or property, plant, and equipment. Example 19.16 provides an example of accounting for service costs.

¹⁶ For the relevant authoritative literature, see FASB ASC 715-30 – *Compensation – Retirement Benefits – Defined-benefits Plans – Pensions* for U.S. GAAP and IASC, *International Accounting Standard 19*, “Employee Benefits” (London, UK: International Accounting Standards Committee, Revised, 2013) for IFRS.

EXAMPLE 19.16**Service Cost**

PROBLEM: Prepare the entry to reflect KMR Bookstore's service cost of \$167,000 (as determined by its actuary) in the current year.

SOLUTION: The entry to record service costs is as follows:

<i>Account</i>	<i>Current Year</i>	
Service Cost	167,000	(1)
Projected Benefit Obligation	167,000	

Use the numbered label to the right of the individual journal entry as a guide to understanding the combined entry at the end of the section.

Factor 2: Prior Service Costs

Prior service costs represent service benefits provided to current employees on the initial adoption or amendment of an existing defined-benefit pension plan. For example, assume that an employer amends a union pension plan to increase the defined-benefit rate from 4% to 6% of final salary levels for each year of service. The 2% increase is a retroactive benefit for all prior years of service. The prior service costs represent the present value of these retroactive benefits.

Prior service costs increase the liability balance. Because employers grant these plan amendments to both compensate and motivate employees in future periods, they do not include this additional cost in pension expense on the date of the amendment.¹⁷ Instead, employers defer the prior service cost in other comprehensive income and amortize it to pension expense over future periods. Prior service costs are deferred in other comprehensive income because income is not affected until subsequent periods. When recognized in income, prior service costs are an other pension expense.

U.S. GAAP allows two methods for allocating the amortization:

1. Determine a cost per service year by dividing the prior service cost by the number of future periods of service for each employee active at the date of the amendment who is expected to receive benefits under the plan. The amortization each year after that is the cost per service year multiplied by the actual number of service years performed.
2. Use a straight-line method over the average remaining service period of the employees that are expected to receive the plan benefits. Accounting for prior service costs is shown in Example 19.17.

EXAMPLE 19.17**Prior Service Costs**

PROBLEM: KMR Bookstores amends its defined-benefit pension plan, resulting in prior service costs of \$55,000. The company will amortize the prior service costs on a straight-line basis over 5 years. What is the journal entry?

SOLUTION: The entry to record this change is as follows:

<i>Account</i>	<i>Current Year</i>	
Other Comprehensive Income – Prior Service Costs	55,000	(2)
Projected Benefit Obligation	55,000	

Continued

¹⁷Employee compensation increases when an employer enhances pension benefits. Management expects that this increase in compensation will improve employee motivation and productivity in the future. As a result, companies defer the cost of providing increased pension benefits and amortize to future periods of benefit. This approach effectively matches the cost of providing additional compensation with the economic benefits received.

The company amortizes prior service costs over 5 years on a straight-line basis. So, KMR recognizes \$11,000 in pension expense each year (\$55,000 total prior service costs divided by 5 years). The entry to record the amortization is as follows:

Account	Current Year	
Pension Expense	11,000	(2a)
Other Comprehensive Income – Prior Service Costs	11,000	

Factor 3: Interest on the PBO

Defined-benefit pension plans create a liability (the PBO) computed as the present value of future cash outflows for the defined-benefit payments. As with any deferred-payment arrangement, companies use the effective interest rate method of amortization. The obligation increases by the accrued interest on the obligation each year. Similarly a company's other pension expense increases by this same amount.

The amount of interest is an appropriate interest rate multiplied by the balance of the PBO at the beginning of the year.¹⁸ An actuary determines the **settlement rate**, which is the interest rate used to compute the interest on the PBO.¹⁹ For example, *Johnson & Johnson's* settlement rate in fiscal 2016 was 3.78%, resulting in an interest cost of \$927 million on its pension obligation. Companies add the interest cost to the pension expense in operating income and increase the PBO by the same amount as shown in Example 19.18.

EXAMPLE 19.18

Interest on the PBO

PROBLEM: KMR Bookstores has a beginning PBO balance of \$789,000 and a settlement rate of 10%. What is the entry to record interest expense on the pension obligation?

SOLUTION: The entry to record the PBO interest is as follows ($10\% \times \$789,000$).

Account	Current Year	
Pension Expense	78,900	
Projected Benefit Obligation		78,900

When a plan amendment increases the PBO, interest costs are also computed on the additional prior service costs. The prior service costs are added to the PBO from the date the amendments are effective as illustrated by Example 19.19.

EXAMPLE 19.19

Interest on the PBO with Prior Service Costs during the Year

PROBLEM: KMR Bookstores has a beginning PBO balance of \$789,000 and a settlement rate of 10%. KMR amended its defined-benefit pension plan on January 1 of the current year. The prior service cost related to this amendment is \$55,000. What is the entry to record interest expense on the pension obligation?

¹⁸In determining interest expense, the accountant assumes that all prior service cost adjustments are effective as of the beginning of the year of initial adoption or amendment of the plan. So, companies add the full amount of the prior service cost to the beginning balance of the PBO to compute interest on the projected benefit obligation.

¹⁹The settlement rate is the rate of return needed to cover all retirement benefits if an annuity contract is purchased today using the current balance of plan assets. Companies can also use the market rate on high-quality Aa corporate bonds for this purpose.

SOLUTION: Interest expense is now \$84,400, which is 10% of the beginning PBO of \$789,000 plus the \$55,000 prior service costs. The entry to record the PBO interest is as follows:

<i>Account</i>	<i>Current Year</i>	
Pension Expense	84,400	(3)
Projected Benefit Obligation	84,400	

This calculation of interest will be used later in the chapter in the calculation of pension expense.

Factor 4: Expected Return on Pension Plan Assets

The sponsor corporation provides assets for the plan in order to pay its obligations when retirements take place. The invested plan assets earn interest, dividends, and capital gains upon sale. Every plan has an **expected return on plan assets**, which is the return based on expectations for interest, dividends, and fluctuations in the market value of the fund assets.

With pension accounting, companies include expected return on plan assets rather than the actual return in the pension cost. The expected return is the beginning plan assets at fair value multiplied by an expected rate of return.²⁰ Reporting the *expected* return as opposed to the *actual* return as part of pension expense smooths volatility in the pension cost.²¹

Remember that companies set aside plan assets to fulfill the pension obligation when it comes due. Because a company pays the retirement benefits over many years, the obligation decreases as the company pays retirees.

In addition, because of the long-term nature of the pension obligation, any current deviations between the actual and expected return on plan assets should offset over that time. To illustrate, assume that a plan holds only equity securities and the historical rate of return on equity is 15%. The expected return is the beginning plan assets multiplied by the expected rate of 15%. The actual return could be greater or less than 15%. The difference between the actual and expected return is known as the **unexpected return**, a topic that we return to in more detail later. As time passes, the amount of unexpected return above and below the expected return should approximately offset, causing the expected return to approximate the actual return.

Exhibit 19.5 graphs expected and actual average rates of return on pension plan assets for the S&P 500 companies per year from fiscal 2007 to 2016. The expected return on plan assets is fairly

EXHIBIT 19.5 Expected and Actual Rates of Return on Plan Assets, 2007 through 2016

* Based on S&P 500 Companies.

Source: Data taken from Compustat Pension Annual File.

²⁰U.S. GAAP specifies using the market-related value of the plan assets, which is a 5-year moving average of the portfolio value. For simplicity, we assume that fair value and the market-related value are the same.

²¹The expected return is also computed on assets contributed during the year. For simplicity, we assume that all funding into the plan takes place at the end of each year. In this way, the beginning balance takes into account all contributions made during the previous year.

constant over this time, around 7% to 9%. For example, *Johnson & Johnson's* expected return on plan assets was 8.55% in 2016. The actual return varies with market conditions. Note the large loss on actual plan assets in 2008 consistent with the drop in the stock market.

Expected returns reduce other pension expense and expected losses increase other pension expense. Example 19.20 illustrates accounting for the expected return on plan assets.

EXAMPLE 19.20 Expected Return on Plan Assets

PROBLEM: KMR Bookstores has beginning pension plan assets of \$654,000 and the expected return is 9%. What is the entry to record the expected return on plan assets?

SOLUTION: The expected return on plan assets is the beginning balance of pension plan assets multiplied by the expected rate of return. So, KMR will report an expected return on plan assets of \$58,860 (\$654,000 beginning pension plan assets \times 9% expected rate of return). The entry to record the expected return on plan assets is as follows:

Account	Current Year	
Pension Plan Assets	58,860	(4)
Pension Expense – Expected Return	58,860	

Factor 5: Current-Year Net Gains and Losses

The current year's net gains and losses arise from two sources:

1. The difference between the expected return on plan assets (factor 4) and the actual return.
2. Changes in actuarial assumptions related to the projected benefit obligation.

Sources of Current-Year Net Gains and Losses. Plan assets change with the actual return on investments—but accountants include the expected return on plan assets in the pension expense. If the actual return is greater than the expected return, the unexpected return is positive. In this case, plan assets have increased *more* than expected and there is a net actuarial gain. If the actual return is less than the expected return, the unexpected return is negative. In this case, plan assets have increased *less* than expected and there is a net actuarial loss. The actual return on the plan assets is the sum of the expected return and unexpected return.

Actuarial gains and losses also result from changes in assumptions related to the projected benefit obligation. Pension obligations are based on actuarial assumptions such as retirement rates, life expectancies, turnover rates, and future salary amounts. Modifying these actuarial assumptions changes the pension obligation, resulting in an increase or a decrease to the PBO.

U.S. GAAP accumulates the gain or loss from unexpected returns and changes in actuarial assumptions in accumulated other comprehensive income and amortizes it over future periods when the accumulated unrecognized gain or loss exceeds a materiality level (discussed on the next page). The amounts accumulated in other comprehensive income can be quite large. For example, *Johnson & Johnson* reported in other comprehensive income a \$2,302 million actuarial gain and a \$1,578 million actuarial loss in fiscal 2016 and 2015, respectively. Example 19.21 provides an illustration of accounting for current-year actuarial gains and losses.

EXAMPLE 19.21 Current-Year Actuarial Gains and Losses

PROBLEM: KMR Bookstores reports an actual return on plan assets of \$75,000. Its expected return on plan assets was \$58,860. Changes to its actuarial assumptions also resulted in an increase in the PBO of \$4,300. What is the entry to record the unexpected return on plan assets? What is the entry to adjust the PBO for changes in actuarial assumptions?

SOLUTION: First, because KMR's actual return on plan assets of \$75,000 was higher than the expected return of \$58,860, KMR records a gain of \$16,140 representing the unexpected return for the period. The entry to record the gain of \$16,140 related to plan assets includes a debit to the asset account with a credit to other comprehensive income:

Account	Current Year	
Pension Plan Assets	16,140	(5)
Other Comprehensive Income – Actuarial Gains/Losses	16,140	

Second, because actuarial assumptions have changed, KMR has to increase its obligation. The entry to record the effect on the PBO from the change in actuarial assumption includes a credit to the PBO account and a debit to other comprehensive income.

Account	Current Year	
Other Comprehensive Income – Actuarial Gains/Losses	4,300	(5a)
Projected Benefit Obligation	4,300	

The Corridor Approach. After a company records the net actuarial gains and losses in other comprehensive income, it may amortize them into pension expense over future periods. There is no typical, systematic basis for allocating the unamortized net actuarial gain or loss to future periods. Rather, companies amortize the accumulated amount of the net actuarial gain or loss only if it exceeds a materiality level known as the *corridor*.

The **corridor** is defined as 10% of the higher of the beginning balance of the projected benefit obligation or the beginning balance of the plan assets at market-related value. Key considerations for applying the corridor follow.

1. A company amortizes the net accumulated gain or loss only when the beginning accumulated unamortized balance of the net gain or loss exceeds the corridor. Companies only amortize the excess over the corridor.
2. Although companies may use any acceptable method of amortizing the excess, the amortized amount cannot be less than the amount computed using the straight-line method of amortization.
3. Commonly, the company allocates the amortization over the average remaining service life of its employee base.
4. The corridor test uses the absolute value of the accumulated net gain or loss.

For example, **Johnson & Johnson** exceeded the corridor and had to amortize a portion of its accumulated actuarial losses into pension costs, which increased pension costs by \$496 million and \$745 million in fiscal 2016 and 2015, respectively.

We present Example 19.22 in which there is no amortization required. Note that this example does not use KMR Bookstores. We return to KMR in Example 19.23.

EXAMPLE 19.22

Corridor Approach, No Amortization

PROBLEM: A&N Athletic Equipment, Inc. reports a beginning PBO balance of \$944,000 and a beginning balance in plan assets of \$852,000 (market-related value). The company has a net actuarial gain at the beginning of the period of \$74,200. The A&N employee base has an average remaining service life of 10 years. What is the corridor? What is the required amortization of actuarial gains or losses in the current year for A&N Athletic?

SOLUTION: The corridor is 10% of the greater of the beginning PBO or plan assets. Because the PBO balance is greater than the plan assets, the corridor is 10% of \$944,000, or \$94,400. The beginning balance related to net actuarial gains and losses is a credit of \$74,200, which is less than the \$94,400 corridor. So, no amortization is required.

Example 19.23 provides an illustration requiring amortization.

EXAMPLE 19.23 Corridor Approach with Amortization

PROBLEM: KMR Bookstores reports a beginning PBO balance of \$789,000 and a beginning balance in plan assets of \$654,000 (market-related value). The company has a net actuarial gain at the beginning of the period of \$83,500. The KMR employee base has an average remaining service life of 10 years. What is the corridor? What is the required amortization of actuarial gains or losses in the current year?²²

SOLUTION: The corridor is 10% of the greater of the beginning PBO or plan assets. Because the PBO balance is greater than the plan assets, the corridor is 10% of \$789,000, or \$78,900. The \$83,500 balance of net actuarial gains exceeds the corridor of \$78,900. So, KMR amortizes the \$4,600 difference between the accumulated net actuarial gain balance (\$83,500) and the corridor (\$78,900) over the remaining service life (10 years). The amortization is \$460 (\$83,500 less \$78,900 divided by 10). The journal entry is as follows:

<i>Account</i>	<i>Current Year</i>	
Other Comprehensive Income – Actuarial Gains/Losses	460	(5b)
Pension Expense	460	

If KMR had a beginning balance in accumulated other comprehensive income related to actuarial losses of \$83,500, the amortization would still have been \$460. The debit, however, would be to pension expense and the credit to other comprehensive income – actuarial gains/losses.

The amount of amortization is generally not the same each year under the straight-line method. In fact, there may be no amortization in the next year or the amount could be different depending on the results of the corridor test in that year. Therefore, when applying the corridor approach, it is important to note that:

- Companies test the need for amortization only at the beginning of each year. Thus, if in its first year of operations a company experiences an actuarial gain or loss, no corridor test is necessary and no amortization results because there is no beginning net balance in actuarial gains/losses in accumulated other comprehensive income.
- The test can result in no amortization in any given year if the net balance in actuarial gains/losses in accumulated other comprehensive income is less than the corridor.

Factor 6: Funding the Plan

The company funds the pension plan by contributing assets into the fund. As the company contributes cash into the fund, the pension plan assets increase. An example of accounting for plan funding is provided in Example 19.24.

EXAMPLE 19.24 Plan Funding

PROBLEM: KMR Bookstores contributes \$100,000 into the fund this year. What is the entry to record its contribution?

SOLUTION: The journal entry is as follows:

<i>Account</i>	<i>Current Year</i>	
Pension Plan Assets	100,000	(6)
Cash	100,000	

²²This example assumes the balance in its beginning accumulated OCI relates to actuarial gains.

Factor 7: Payments to Retirees

Payments made to retirees, the last factor, reduce the plan assets and the PBO. The plan assets decrease as the company uses them to make payments to the retirees on its liability, thus reducing the projected benefit obligation. This process is comparable to a company paying off any debt. Example 19.25 shows the accounting for payments to retirees.

EXAMPLE 19.25

Payments to Retirees

PROBLEM: The retirees of KMR Bookstores receive payments of \$72,000 in the current year. Provide the necessary entry to record this payment.

SOLUTION: Because the pension trust, not the sponsor corporation (KMR) pays the cash to the retirees, KMR Bookstores does not need to credit cash in this transaction. The journal entry is as follows:

<i>Account</i>	<i>Current Year</i>	
Projected Benefit Obligation	72,000	(7)
Pension Plan Assets	72,000	

Summary: Accounting Effects of Defined-Benefit Pension Plans

We now combine the KMR Bookstores examples to summarize the income, balance sheet, and off-balance sheet effects in Exhibit 19.6. The total pension cost included in net income is \$203,080. Additional prior service costs and actuarial gains included in other comprehensive income are \$32,620. On the balance sheet in Exhibit 19.6, the ending PBO is \$1,027,700 and plan assets of \$757,000 net to a liability of \$270,700. Because the beginning PBO was \$789,000 and the beginning plan assets were \$654,000, the beginning net pension liability was \$135,000. The increase in the net pension liability from the beginning balance of \$135,000 to the ending balance of \$270,700 is \$135,700, a credit in the pension journal entry. Finally, KMR credits cash for contributions to the pension fund of \$100,000. The summary journal entry made in Exhibit 19.6 is similar to the actual entry made in practice. Because service cost is reported in compensation expense in operating income, the service cost of \$167,000 is separated from other pension expenses. Other pension expenses of \$36,080 are reported in non-operating income. KMR's footnotes to the financial statements would include the components of pension costs, impact on accumulated other comprehensive income, the PBO, and the plan assets. We provide a comprehensive example in Appendix A.

Accounting for Defined-Benefit Pension Plans: IFRS

Accounting for defined-benefit plans under IFRS differs from U.S. GAAP in the following areas:

- Factor 2: expensing prior service costs
- Factors 3 and 4: measuring the return on plan assets and interest expense
- Factor 5: reporting current-year net actuarial gains and losses

Additionally, IFRS renames the projected benefit obligation under a defined-benefit pension plan the **present value of the defined-benefit obligation** (PVDBO).²³ We illustrate the IFRS differences in the context of the KMR Bookstores example.²⁴

²³For simplicity, we will use the term "PBO" throughout the rest of the chapter.

²⁴Under IFRS, a company may be limited in the amount of the net pension asset it reports, called the "asset ceiling." IFRS requires reporting the lower of the net pension asset or the present value of any refunds from the plan or reductions in future contributions to the plan.

EXHIBIT 19.6 Income and Balance Sheet Summary for KMR Bookstore, Pension Journal Entry (*Credits and credit balances reported in parentheses*)

Summary of KMR		Comprehensive Income			Balance Sheet			
Entry	Description	NI – Pension Expense	OCI – Prior Service Costs	OCI – Actuarial Gains/Losses	PBO	Plan Assets	AOCI – Prior Service Costs	AOCI – Actuarial Gains/Losses
	Beginning balance				\$ (789,000)	\$ 654,000		\$ (83,500)
(1)	Service cost	\$167,000			(167,000)			
(2)	Prior service cost		\$ 55,000		(55,000)		55,000	
(2a)	Amortization of PSC	11,000	(11,000)				(11,000)	
(3)	Interest on PBO	84,400			(84,400)			
(4)	Expected return on plan assets	(58,860)				58,860		
(5)	Unexpected return on plan assets			\$(16,140)		16,140		(16,140)
(5a)	Change in actuarial assumptions			4,300	(4,300)			4,300
(5b)	Amortization of actuarial gains	(460)		460				460
(6)	Funding					100,000		
(7)	Payments to retirees				72,000	(72,000)		
	Pension costs – Net income	<u>\$203,080</u>						
	Other comprehensive income		<u>\$ 44,000</u>	<u>\$(11,380)</u>				
	Ending balances				<u>\$(1,027,700)</u>	<u>\$ 757,000</u>	<u>\$44,000</u>	<u>\$(94,880)</u>
	Ending net liability on balance sheet					<u>\$(270,700)</u>		
KMR Journal Entry								
	Service Cost	167,000						
	Other Pension Expense	36,080						
	OCI – Prior Service Costs	44,000						
	OCI – Actuarial Gains/Losses		11,380					
	Cash (contributions)		100,000					
	Net Pension Liability		135,700	(change from beginning net liability of \$135,000 to ending net liability of \$270,700)				

Factor 2: Prior Service Costs. Accounting for service costs is the same under U.S. GAAP and IFRS. However, the accounting for prior service costs differs. IFRS reporters expense prior service costs when the plan amendments are made. Under U.S. GAAP, these costs are amortized over time. Additionally, IFRS refers to *prior service costs* as *past service costs*.²⁵ Example 19.26 illustrates that all past service costs are expensed in the current year under IFRS.

²⁵For simplicity, we will use the term “prior service costs” throughout the rest of the chapter.

EXAMPLE 19.26**Past Service Costs: IFRS**

PROBLEM: KMR Bookstores amends its defined-benefit pension plan, resulting in past service costs of \$55,000. What is the entry under IFRS?

SOLUTION: The entry to record this change under IFRS is as follows:

<i>Account</i>	<i>Current Year</i>	
Other Pension Expense – Past Service Costs	55,000	(2 – IFRS)
Projected Benefit Obligation	55,000	

Factors 3 and 4: Interest on the PBO and Expected Return on Pension Plan Assets.

Under IFRS, the computation of the interest on the PBO and the expected return on plan assets are combined into *net interest on the net defined benefit liability (asset)*. Under U.S. GAAP, companies can use one interest rate to determine interest expense and another one to determine the expected return on plan assets. IFRS requires applying one interest rate to both the obligation and asset.²⁶ The view under IFRS is that the plan assets should grow over time in the same way that the pension obligation grows. Therefore, using one rate to determine both interest expense and interest income is appropriate. This approach also recognizes that the pension is being financed by the employees of the company over the time they work for the company. IFRS specifies that a company should determine the interest rate based on market yields at the end of the reporting period on high-quality corporate bonds.²⁷

Under U.S. GAAP, companies add the interest cost and deduct expected return from the pension expense in non-operating income. IFRS allows companies the choice to report the net interest on the net defined benefits liability (asset) in operating or financing income. Example 19.27 illustrates accounting for net interest under IFRS.

EXAMPLE 19.27**Net Interest on the Net Defined Benefit Liability (Asset): IFRS**

PROBLEM: KMR Bookstores has a beginning PBO balance of \$789,000 and beginning pension plan assets of \$654,000. The interest rate based on market yields at the end of the reporting period on high-quality corporate bonds is 10%. KMR amended its defined-benefit pension plan on January 1 of the current year. The past service cost related to this amendment is \$55,000. What is KMR's interest expense? What is the expected return on plan assets? What is its net defined benefit liability (asset)? What is the net interest expense on the net defined benefit liability (asset)? What is the journal entry?

SOLUTION: Interest expense is \$84,400, which is 10% of the beginning PBO of \$789,000 plus the \$55,000 past service costs. KMR's expected return on plan assets is \$65,400 (\$654,000 plan assets \times 10%). KMR's net defined benefit liability (asset) is \$190,000, \$844,000 PBO less \$654,000 plan assets. Its net interest on the net defined benefit liability (asset) is \$19,000, which is 10% of the net defined benefit liability of \$190,000, or \$84,400 interest expense less \$65,400 return on plan assets.

²⁶IFRS specifies use of the fair value of the plan assets to determine the expected return on plans assets whereas U.S. GAAP specifies using the market-related value of the plan assets.

²⁷In countries where there is a limited market in high-yield corporate bonds, a company can use the market yields on government bonds.

KMR presents two entries separately emphasizing the interest on the PBO and the return on the plan assets that combined represent the net interest on the net defined benefit liability (asset).²⁸

<i>Account</i>	<i>Current Year</i>	
Pension Expense or Interest Expense	84,400	(3)
Projected Benefit Obligation	84,400	

<i>Account</i>	<i>Current Year</i>	
Pension Plan Assets	65,400	(4 – IFRS)
Pension Expense or Interest Expense	65,400	

Similar to U.S. GAAP, IFRS reporters add past service costs to the PBO from the date the amendments are effective. Under IFRS, a company accounts for any changes in the plan assets held during the period as a result of contributions and benefit payments in determining the interest expense.

Factor 5: Current-Year Net Gains and Losses. Under IFRS, a company reports all current-year actuarial gains or losses in other comprehensive income.²⁹ The accounting for current-year actuarial gains and losses is shown in Example 19.28. Therefore, in contrast to U.S. GAAP, actuarial gains and losses are not amortized under IFRS.

EXAMPLE 19.28

Current-Year Actuarial Gains and Losses: IFRS

PROBLEM: KMR Bookstores reports an actual return on plan assets of \$75,000. Its expected return on plan assets was \$65,400. Changes to its actuarial assumptions also resulted in an increase in the PBO of \$4,300. What is the entry to record the unexpected return on plan assets under IFRS? What is the entry to adjust the PBO for changes in actuarial assumptions under IFRS?

SOLUTION: First, because KMR's actual return on plan assets of \$75,000 was higher than the expected return of \$65,400, KMR records a gain of \$9,600. This \$9,600 gain is the unexpected return for the period. The entry under IFRS to record the gain of \$9,600 related to plan assets includes a debit to the asset account and a credit to other comprehensive income:

<i>Account</i>	<i>Current Year</i>	
Pension Plan Assets	9,600	(5 – IFRS)
Other Comprehensive Income – Actuarial Gains/Losses	9,600	

Second, because actuarial assumptions have changed, KMR has to increase its obligation. The IFRS entry to record the effect on the PBO of the change in actuarial assumption includes a credit to the PBO account and a debit to other comprehensive income.

<i>Account</i>	<i>Current Year</i>	
Other Comprehensive Income – Actuarial Gains/Losses	4,300	(5a – IFRS)
Projected Benefit Obligation	4,300	

²⁸If a company debits (credits) pension expense, it reports the amount in operating expenses. Alternatively, when a company debits (credits) interest expense, it reports it as part of financing expense.

²⁹Companies currently have the option under both IFRS and U.S. GAAP to report actuarial gains and losses immediately in income. That is, the corridor method results in the minimum amortization and larger amounts can be written off at the option of the reporting entity. However, few companies choose this option, so we do not discuss it further.

Summary: Accounting Effects of Defined-Benefit Pension Plan. Exhibit 19.7 shows the pension worksheet for KMR Bookstore under IFRS.

The total pension costs included in net income is \$241,000. We assume that KMR reports services costs of \$167,000 in operating income and all other pension expense of \$74,000 in non-operating income. Other pension income included in other comprehensive income is \$5,300, which is a credit in the pension journal entry.

On the balance sheet, the ending PBO of \$1,027,700 and the ending plan assets of \$757,000 net to a liability of \$270,700. The increase in the net pension liability from the beginning balance of \$135,000 to the ending balance of \$270,700 is \$135,700, a credit in the pension journal entry. Finally, KMR credits cash contributions in the pension journal entry for \$100,000.

EXHIBIT 19.7 IFRS Income and Balance Sheet Summary for KMR Bookstore with Pension Journal Entry
(Credits and credit balances reported in parentheses)

Summary of KMR		Comprehensive Income		Balance Sheet	
Entry	Description	NI—Pension Expense	OCI – Actuarial Gains/Losses	PBO	Plan Assets
	Beginning balance			\$ (789,000)	\$ 654,000
(1)	Service cost	\$ 167,000		(167,000)	
(2 – IFRS)	Past service cost	55,000		(55,000)	
(3)	Interest on PBO	84,400		(84,400)	
(4 – IFRS)	Interest income/Expected return on plan assets	(65,400)			65,400
(5 – IFRS)	Unexpected return on plan assets		\$(9,600)		9,600
(5a – IFRS)	Change in actuarial assumptions		4,300	(4,300)	
(6)	Funding				100,000
(7)	Payments to retirees			72,000	(72,000)

	Net Pension Liability		135,700		

Exhibit 19.8 highlights the key differences between GAAP and IFRS related to defined-benefit pension plans.

EXHIBIT 19.8 Comparison of Accounting for Defined-Benefit Pension Plans under U.S. GAAP and IFRS

Pension Factor	U.S. GAAP	IFRS
Factor 1: Service Cost	Increases PBO. Increases pension cost.	Similar under IFRS.
Factor 2: Prior Service Costs	Increases PBO. Report initially in other comprehensive income and amortize to pension cost over future periods.	Increases plan obligation. Increases pension cost. Called <i>past service cost</i> .
Factor 3: Interest on the PBO	Compute as beginning PBO plus prior service costs times settlement rate. Increases PBO. Increases pension cost.	Compute net interest as interest on PBO less expected return on plan assets. Compute interest cost as beginning PBO plus past service costs times the market yield on high-quality corporate bonds.
Factor 4: Expected Return on Pension Plan Assets	Compute as beginning plan assets times expected rate of return on plan assets. Increases plan assets. Decreases pension cost.	Interest cost increases PBO. Compute expected return on plan assets as beginning plan assets times the market yield on high-quality corporate bonds. Expected return on plan assets increases plan assets. Net interest cost increases pension cost.
Factor 5: Current-Year Net Actuarial Gains and Losses	Report initially in other comprehensive income. Amortize to pension cost based on corridor approach.	Report in other comprehensive income. Do not amortize actuarial gains and losses.
Factor 6: Funding the Plan	Increases plan assets	Similar under IFRS.
Factor 7: Payments to Retirees	Reduces PBO and plan assets	Similar under IFRS.

JUDGMENTS IN ACCOUNTING

Defined-Benefit Pension Plans

Accounting for pension plans involves extensive use of judgment. The pension liability measurement should reflect the present value of the company's obligation to provide future retirement benefits to its employees. Given that many of these payments will be made far into the future for any given company, there is a great deal of uncertainty regarding the accuracy of the estimates used in pension computations. In a survey of 175 companies, 49% reported making estimates and using judgment in reporting amounts related to employee benefits.³⁰

Consider, for example, the benefits provided to a 25-year-old employee. What amount should be recognized in the liability account today to result in a \$1 payment, for example, 40 years in the future? When will that employee retire? What will his salary level be 40 years from now? Once he retires, how long will he live? Actuaries must estimate all of these amounts before the company records the pension expense and liability.

To illustrate the effects of judgment in the pension area on the financial statements, let's consider some of our earlier examples. In Example 19.16, the service costs for KMR were \$167,000. But this number was developed by actuaries who estimated factors such as life expectancies, turnover rates, and future salary levels among others. What would be the effect if the actuaries returned with an estimate of the service costs of \$207,000? KMR would report net income that is \$40,000 lower. Similarly, in Example 19.17, the actuary estimated prior service costs of \$55,000. Any change in these estimates will directly affect net income.

Actuaries must also estimate interest rates and expected return on assets. In Example 19.18, the actuary estimated a settlement rate of 10%. What if he had estimated 13% instead? Instead of increasing pension expense by \$78,900, KMR would have increased pension expense by \$102,570. Again, the estimate has a direct impact on net income. Also, a higher settlement rate results in a lower PBO.

In Example 19.20, the actuary estimated an expected return of 9%. A change in this estimate would directly impact net income. Virtually every component of pension accounting is highly subjective and requires extensive judgments. Undoubtedly, the only reason that more than 49% of companies do not indicate that they used estimates and judgment in reporting amounts related to employee benefits is because many companies do not have a defined-benefit pension plan. Financial statement users should be aware of the subjectivity that surrounds pension accounting. Required disclosures reveal the nature and extent of the estimates used to measure pension expense and the pension asset or liability.

³⁰AICPA, *IFRS Financial Statements: Best Practices in Presentation and Disclosure—2012* (New York, NY: AICPA, 2012).

- 8 Detail required disclosures for pension plans.

Defined-Benefit Pension Plan Disclosure Requirements

Pension accounting standards require detailed disclosure requirements for pension benefits, including a reconciliation of the beginning and ending balances of the projected benefit obligation and plan assets at fair value. The difference represents the funded status of the plan reported on the balance sheet. Disclosures also provide information about the:

1. Estimated future amount of amortization of net gains and losses and prior service cost
2. Unamortized net actuarial gain or loss
3. Five elements of pension cost
 - a. Service cost
 - b. Interest cost
 - c. Expected return on plan assets
 - d. Amortization of prior service cost
 - e. Amortization of actuarial gains/losses
4. Assumptions used on a weighted-average basis (for example, discount rate, rate of increase in compensation, expected return on plan assets)

The pension footnote also provides amounts and types of securities held by the employer and related parties included in plan assets as well as any alternative methods used to amortize prior service costs and unamortized gains or losses. Under U.S. GAAP, companies report the service cost component of pension expense in operating income. The service cost is included in the same line item as other compensation costs. All other pension costs are reported in non-operating income. If these components are not reported as a separate line item, they must be disclosed. Pension footnotes also disclose target and actual allocation of plan assets within various asset categories—equity securities, debt securities, real estate, and such—and management’s investment strategy. In addition, the disclosures must include a detailed schedule of management’s best estimate of the cash requirements for the company (that is, the expected funding needs) and the future benefit payments required by the plan for all its pension plans and other benefit plans over each of the next 5 years and the following 5 years in aggregate.

Nonpublic entities are not required to separately disclose the components of net periodic benefit cost.

Exhibit 19.9 includes sample disclosures based on the KMR Bookstore example, including the required financial statement disclosures for KMR Bookstores under U.S. GAAP.

EXHIBIT 19.9 Sample Disclosures for KMR Bookstores, a U.S. GAAP Reporter

Notes to the Financial Statements

Pension Benefits. KMR Bookstores has a funded, noncontributory defined-benefit plan that covers substantially all of its employees. The plan provides defined benefits based on years of service and final average salary level.

Obligations and Funded Status (credit balances and liabilities are noted in parentheses)

At December 31	Current Year
Change in projected benefit obligation	
Projected benefit obligation at the beginning of the year	\$ (789,000)
Adjustment for prior service cost granted at the beginning of the year	(55,000)
Adjusted beginning balance of the projected benefit obligation	\$ (844,000)
Service cost	(167,000)
Interest on adjusted beginning balance of projected benefit obligation	(84,400)
Benefits paid during the year	72,000
Actuarial loss (from changes in actuarial assumptions) at year-end	(4,300)
Projected benefit obligation at the end of the year	\$ (1,027,700)

Continued

At December 31	Current Year
Change in plan assets	
Fair value of plan assets at the beginning of the year	\$ 654,000
Actual return on plan assets	75,000
Employer contributions made during the year	100,000
Benefits paid during the year	<u>(72,000)</u>
Fair value of plan assets at the end of the year	<u>\$ 757,000</u>
Funded status at the end of the year	<u><u>\$(270,700)</u></u>

Amounts recognized in the statement of financial position consist of:

Pension Benefits	
Noncurrent assets	<u>\$ 0</u>
Current liabilities	<u>\$ 0</u>
Noncurrent liabilities	<u><u>\$(270,700)</u></u>

Amounts recognized in accumulated other comprehensive income related to pensions consist of:

Pension Benefits	
Net actuarial gain	\$ 94,880
Prior service cost	<u>44,000</u>
Total	<u><u>\$138,880</u></u>

The accumulated benefit obligation for all defined-benefit pension plans was \$950,000 at December 31. Accumulated benefit obligation exceeded the fair value of plan assets by \$193,000 at December 31.

Information for pension plans with an accumulated benefit obligation in excess of plan assets:

December 31	
Projected benefit obligation	\$1,027,700
Accumulated benefit obligation	950,000
Fair value of plan assets	757,000

Components of net periodic benefit cost recognized in net income:

Current Year Pension Benefits	
Service cost	\$ 167,000
Interest cost	84,400
Expected return on beginning plan assets	(58,860)
Amortization of prior service costs	11,000
Amortization of actuarial gain	<u>(460)</u>
Net periodic benefit cost	<u><u>\$203,080</u></u>

Other changes in plan assets and benefit obligations recognized in other comprehensive income:

	Current Year
Net actuarial gains	\$ 11,380
Prior service cost	(55,000)
Amortization of prior service cost	<u>11,000</u>
Total recognized in other comprehensive income	\$ (32,620)
Net periodic benefit cost (above)	<u>203,080</u>
Total recognized in net periodic benefit cost and other comprehensive income	<u>\$170,460</u>

The estimated net loss and prior service cost for the defined-benefit pension plans that will be amortized from accumulated other comprehensive income into net periodic pension cost over the next fiscal year are \$0 and \$11,000, respectively.

Defined-Benefit Pension Disclosures: IFRS. IFRS disclosures and reporting for defined-benefit pension plans are similar to those under U.S. GAAP except that companies can choose where they classify pension cost components on the income statement and need to disclose where they report the components of pension expense. Most IFRS reporters classify the service cost component in operating income as it relates to employee services received in the current year.

Under IFRS, companies can report interest costs and the expected return on plan assets either in operating income or non-operating (financing) income. Providing a pension can also be viewed as borrowing from employees to be repaid after retirement. Therefore, IFRS allows companies to classify interest costs and the expected return on plan assets in non-operating (financing) income consistent with borrowing from employees.

FINANCIAL STATEMENT ANALYSIS

Defined-Benefit Pension Plan

The measurement and reporting of defined-benefits plans is complex: A company makes many assumptions and estimates in determining the present value of the future benefits it has promised employees. Financial statement users seek to analyze three main areas in a company's defined benefit-pension plans:

- Funded status
- Settlement rate and return on plan asset assumptions
- Actuarial gains/losses in other comprehensive income

The funded status of the pension is the pension obligation less pension plan assets. When pension obligations exceed plan assets, the plan is underfunded. When plan assets exceed the pension obligation, the plan is overfunded. In some countries, such as the United States, companies are required to fund a certain portion of their pension obligation. Yet, the majority of U.S. plans are underfunded. An underfunded pension plan increases a company's liabilities and thus its leverage. An underfunded pension plan also indicates that a company will either have to increase its contributions or earn greater income to meet its pension obligations as they come due.

The settlement rate and the expected return on plan assets estimates are critical in the computation of pension obligation and pension cost. In general, these rates are based on, and vary with, broad factors such as changes in interest rates and stock market performance. Company-specific factors such as creditworthiness and investment strategy also play a role in determining the settlement rate and expected return on plan assets.

The settlement rate is used to discount the future estimated cash payments to retirees. As with any discounting, the computed obligation is lower when the discount rate is higher. A higher discount rate will also lead to higher reported interest expense.

The expected return on plan assets, a component of pension costs, reduces pension costs. A higher expected return on plan assets results in a lower reported pension cost. Any difference between the expected return and the actual return on plan assets bypasses the income statement and is deferred in other comprehensive income. Pension cost is affected only when the difference combined with other actuarial gains or losses on the pension obligation exceeds the corridor. Even when the amount exceeds the corridor, the amortization into pension costs is usually not significant.

If actuarial gains or losses and the difference between the expected return and actual return were taken directly into net income, earnings would be more volatile. Therefore, deferring these gains and losses in accumulated other comprehensive income and subsequently amortizing them to pension expense tends to smooth earnings. For instance, when the stock market is performing well, a company's actual return on plan assets could be higher than its expected return. If the actual return was included in the pension cost, net income would be higher. The opposite is true when the stock market is down. Over the long term, these fluctuations in actuarial gains and losses naturally cancel out and therefore bypass net income. However, when actuarial gains and losses exist, the funded status changes. Example 19.29 illustrates the financial statement analysis of *Johnson & Johnson's* defined-benefits pension plan.

EXAMPLE 19.29 Financial Statement Analysis of Defined-Benefit Pension Plans

PROBLEM: You are interested in better understanding *Johnson & Johnson's* defined-benefits pension plan, including its pension costs and liability. The following table presents select data about *Johnson & Johnson's* defined benefits pension plan; use this information to answer the questions that follow.

At the end of fiscal years			
(Dollars in millions)	2016	2015	2014
Pension Accounts (select)			
Pension benefit obligation	\$ 28,116	\$ 25,855	\$ 26,889
Plan assets	23,633	22,254	22,575
Pension Cost			
Service cost	\$ 949	\$ 1,037	\$ 882
Interest cost	927	988	1,018
Expected return on plan assets	(1,962)	(1,809)	(1,607)
Amortization of prior service (credit)	1	2	7
Recognized actuarial losses	496	745	460
Other	11	8	(17)
Net periodic benefit cost	<u>\$ 422</u>	<u>\$ 971</u>	<u>\$ 743</u>
Pension-related Other Comprehensive Income (before Tax)			
Actuarial gain (loss) amortization during period	\$ 496	\$ 745	\$ 460
Actuarial gain (loss) – current year	(2,302)	1,578	(5,395)
Assumptions			
Discount rate on benefit obligation	3.78%	4.11%	3.78%
Return on plan assets	8.55%	8.53%	8.46%

At the end of fiscal years

(Dollars in millions)	2016	2015	2014
Other Financial Statement Information			
Total assets	\$141,208	\$133,411	\$130,358
Total liabilities	\$ 70,790	\$ 62,261	\$ 60,606
Net income	\$ 16,540	\$ 15,409	\$ 16,323

Required »

- What is *Johnson & Johnson's* pension cost in 2016, 2015, and 2014? What are the components of its pension cost? What are pension costs after taxes as a percentage of net income? Comment on any changes in pension costs after taxes as a percentage of net income. Assume a 35% tax rate.
- What is the funded status of *Johnson & Johnson's* defined-benefit pension plans in 2016, 2015, and 2014, respectively? How has the funded status changed over time? What is the percent of the net pension liability to total liabilities in 2016, 2015, and 2014, respectively?
- How have the settlement rate and expected return on plan assets changed from 2014 to 2016? How does the change in the settlement rate affect the pension obligation and pension cost? How does the change in the expected return on plan assets affect the pension cost?
- If *Johnson & Johnson* had reported all actuarial gains and losses in net income rather than other comprehensive income, what would its pension cost have been in 2016, 2015, and 2014, respectively? Comment on the changes in its pension cost.

SOLUTION:

- Johnson & Johnson* reported pension costs of \$422 million, \$971 million, and \$743 million in 2016, 2015, and 2014, respectively. Its pension costs included the following components: service cost, interest costs, expected return on plan assets, amortization of prior service costs, recognized actuarial losses, and other.

To find the pension cost as a percentage of net income, we first must compute the pension cost after taxes. The following shows the computations. Pension cost as a percentage of net income varies each year at 1.7% of net income in 2016, 4.1% in 2015, and 3.0% in 2014. Pension expense also varies each year. Examining the components of pension costs indicates that the interest costs declined each year whereas the expected return on plan assets increased each year. Both service costs and recognized actuarial losses peaked in 2015, while net income was lower. Both changes contributed to the highest ratio of pension costs to net income in 2015.

Fiscal Year	2016	2015	2014
Pension cost	\$ 422	\$ 971	\$ 743
Pension cost adjusted for tax (1 – 0.35)	\$ 274	\$ 631	\$ 483
Net income	\$16,540	\$15,409	\$16,323
Percentage of adjusted pension cost to net income	1.7%	4.1%	3.0%

- b. We compute the funded status next. Each year the defined benefit pension plan is underfunded. Although the pension benefit obligation and plan asset increased from 2014 to 2016, the increase in pension benefit obligation leads to the slightly higher underfunding in 2016. The funded status as a percentage of liabilities also decreased in 2016 from 2014 despite the total liabilities increasing.

Fiscal Year (in millions)	2016	2015	2014
Pension benefit obligation	\$28,116	\$25,855	\$26,889
Plan assets	<u>23,633</u>	<u>22,254</u>	<u>22,575</u>
Funded status – Underfunded	<u>\$ 4,483</u>	<u>\$ 3,601</u>	<u>\$ 4,314</u>
Funded status – Underfunded	\$ 4,483	\$ 3,601	\$ 4,314
Total liabilities	\$70,790	\$62,261	\$60,606
Percentage of funded status to total liabilities	<u>6.3%</u>	<u>5.8%</u>	<u>7.1%</u>

- c. The expected return on plan assets increased from 2014 to 2016 consistent with the increase in *J&J's* assumption on the increasing rate of return on plan assets. The discount rate also increased in 2015 but then declined in 2016. A decline in the discount rate increases the pension obligation but decreases the interest expense component of the pension cost. An increase in the expected return on plan assets would increase the pension cost as a smaller expected return is subtracted, ignoring any change in the amount of plan assets. The trend in both these areas has an opposite effect on pension cost.
- d. The table below adjusts pension costs as if *Johnson & Johnson* had reported all actuarial gains and losses in net income rather than other comprehensive income. We start with the reported pension cost, subtract the recognized actuarial losses (which would have been reported in an earlier period), and add the actuarial losses reported in other comprehensive income after adjusting for taxes.

Fiscal Year	2016	2015	2014
Pension cost	\$ 422	\$ 971	\$ 743
Subtract: Actuarial losses included in pension cost	(496)	(745)	(460)
Add (Subtract): Current year actuarial loss (gain)	<u>2,302</u>	<u>(1,578)</u>	<u>5,395</u>
Adjusted net periodic benefit cost (income)	<u>\$ 2,228</u>	<u>\$(1,352)</u>	<u>\$ 5,678</u>
Increase (Decrease) in net periodic benefit cost	<u>\$ 1,806</u>	<u>\$(2,323)</u>	<u>\$ 4,935</u>

In 2015, the pension cost would actually be pension income if the actuarial gain were reported in the income statement rather than deferred in other comprehensive income. In 2016, the \$2,302 million actuarial loss is greater than the pension costs. In 2016, the pension cost would have increased dramatically if *Johnson & Johnson* had reported the actuarial losses on the income statement.

Interview

PETER SAYRE
SENIOR VICE PRESIDENT
AND CORPORATE
CONTROLLER
PRUDENTIAL INSURANCE »

Peter Sayre

Prudential Peter Sayre is Senior Vice President and Corporate Controller at Prudential Insurance where he has served as Chief Tax Officer as well as Principal Accounting Officer in charge of companywide financial reporting and planning.

- 1 What significant assumptions does Prudential use in determining the projected benefit obligation (PBO) and the fair market value (FMV) of plan assets?

The most important economic assumption in the PBO is the discount rate we choose. Key demographic assumptions are actuarial and include the plan participants' termination rate (when they will leave Prudential), retirement, and mortality. Prudential states plan assets at fair market value and therefore there are no economic or demographic assumptions used in the asset values.

- 2 How sensitive are income statement amounts to changes in the expected return on assets (EROA) and discount rate on the liability?

EROA sensitivity is a function of the level of plan assets and the EROA. The effect of a change in EROA—say, from 5% to 5.5%—depends on the size of the asset balances. The 50 basis point change is material if the plan assets are \$1 billion, less so for a \$10 million plan. The discount rate affects the PBO, which affects the amount of actuarial gains or losses in equity and therefore its amortization. The PBO's sensitivity to discount rate is largely a function of the PBO's duration. If the duration is 12 years, a 1% change in the discount rate causes the PBO to change by 12%. The discount rate also affects P&L components (service cost and interest cost) in the subsequent year. Interest cost sensitivity is governed by PBO duration and how quickly the discount rate changes. We include these sensitivities in our annual report.

- 3 Do the EROA assumption and discount rate affect the level of plan assets?

The EROA does not affect the level of plan assets ultimately reported on the balance sheet. As mentioned previously, plan assets are ultimately recorded at fair value. Because the discount rate is used to calculate the present value of the expected cash flows associated with the PBO, it affects the PBO. PBO sensitivity to the discount rate is expressed in the PBO's duration.

- 4 What conditions are needed in order to report pension income rather than pension expense in the income statement?

Pension income statement activity is the net of expense items (service cost and interest cost), an income item (expected return on plan assets), and items that can either be expense items or income items (amortization of prior service cost/credit and amortization of actuarial gain or loss). Generally, an overfunded plan results in pension income; an underfunded plan, in pension expense. In an overfunded plan, the expected return on plan assets is likely to exceed the other expense items and vice versa for an underfunded plan.

- 5 How does Prudential Financial determine the amount of pension funding required each year?

One of our pension plans is significantly overfunded. Consequently, employer funding is not required. Rules are set by law for underfunded plans (e.g., the discount rate used to determine the PBO and hence the level of underfunding as well as the time period time during which to correct any underfunding). Companies with underfunded plans work with an actuary to determine the appropriate amount to fund each year based on the governing rules.

- 6 How can a deferred tax asset result from accounting for employee benefits?

This occurs in an underfunded plan (a plan in a net liability position). This situation arises when an expense has been taken per the books and the tax return has not yet taken a deduction. An examples of plans in a liability position that would give rise to a deferred tax asset is underfunded or unfunded pension plan or an underfunded or unfunded post-retirement plan.

- 7 How frequently are the estimates used in pension accounting reviewed and possibly changed?

We review our assumptions annually. Changes to economic assumptions—discount rate, salary scale—occur annually. Changes to demographic assumptions are based upon an actuarial assumption study conducted every 5 years. However, if at the third year in the cycle experience deviates more than 20%, we would change the assumption accordingly. «

Discussion Questions

1. Explain why accountants following U.S. GAAP use the expected return on assets (EROA) and the market-related asset value of plan assets rather than the actual return on plan assets and the closing fair value of plan assets, respectively.
2. In his interview, Peter Sayre notes that one of his company's pension plans is significantly overfunded and, therefore, employer contributions are not required. Discuss the factors that an entity considers when deciding on the amount to contribute to its defined benefit pension plan (i.e., funding).

Summary by Learning Objectives

In the following, we summarize the main points by learning objective. Throughout the chapter, we discuss the accounting and reporting of U.S. GAAP and IFRS side-by-side. The following table also highlights the major similarities and differences in the standards.

1 Describe the characteristics and types of stock-based compensation.

Summary	Similarities and Differences between U.S. GAAP and IFRS
<p>Stock-based compensation includes restricted stock awards, performance awards, and bonuses paid by issuing stock. Employee stock option plans are the most prevalent type of stock-based compensation in the United States.</p> <p>Employee stock options are financial instruments that give an employee the right to purchase shares of the company's stock directly from the company at a fixed price over a specified period of time.</p> <p>Stock-based compensation is classified as either equity-classified awards, to which employees have the right to receive shares, or as liability-classified awards, from which an employee receives cash or some other company resource based on the value of the shares.</p>	<p>Similar under U.S. GAAP and IFRS.</p>

2 Explain and illustrate the initial and subsequent measurement of equity-classified stock-based compensation.

Summary	Similarities and Differences between U.S. GAAP and IFRS
<p>Equity-classified stock-based options are initially recorded at fair value as a component of equity.</p> <p>The fair value of equity-classified awards is based on the market price of the shares measured on the date of the grant and is not subsequently remeasured for changes in market prices.</p> <p>Companies choose whether to adjust compensation expense for changes in the estimated percentage of options that will be forfeited or to account for actual forfeitures when they occur.</p>	<p>► Similar under U.S. GAAP and IFRS except that under IFRS, companies must adjust for an estimate of the percentage of the options that are expected to be forfeited.</p>

3 Describe and demonstrate the initial and subsequent measurement of liability-classified stock-based compensation.

Summary	Similarities and Differences between U.S. GAAP and IFRS
<p>Liability-classified stock-based options are initially recorded at fair value as a liability.</p> <p>Companies remeasure the liability and compensation expense to fair value at each balance sheet date until the award is settled.</p> <p>Companies choose whether to adjust compensation expense for changes in the estimated percentage of options that will be forfeited or to account for actual forfeitures when they occur.</p>	<p>► Similar under U.S. GAAP and IFRS except that under IFRS, companies must adjust for an estimate of the percentage of the options that are expected to be forfeited.</p>

Summary by Learning Objectives, continued

4 Discuss accounting for stock appreciation rights, restricted stock plans, and employee stock purchase plans.	
Summary	Similarities and Differences between U.S. GAAP and IFRS
<p>With stock appreciation rights (SARs), an employee is compensated for the increase in stock price over a pre-established price. To account for SARs, companies record compensation expense and either a SAR-related liability (if cash settled) or equity, additional paid-in-capital – stock options, if the SAR will be settled with shares of stock. The liability or equity is measured as the fair value of the SARs.</p> <p>Under restricted stock plans, actual shares are awarded in the name of a specific employee. Compensation expense on the restricted shares is the fair value of the restricted shares times the number of restricted shares issued; it is amortized evenly over the vesting period.</p> <p>An employee stock purchase plan offers employees the opportunity to purchase the company's shares, usually at a discount and without incurring transaction costs. The accounting depends on whether these plans are compensatory or non-compensatory:</p> <ul style="list-style-type: none"> • Non-compensatory plans: The issuance of shares purchased by employees is recorded in the same way as is issuing shares in the open market. • Compensatory plans: The amount of discount over a regular market purchase is recorded as compensation expense. 	<p>Similar under U.S. GAAP and IFRS.</p>

5 Detail required disclosures for stock plans.	
Summary	Similarities and Differences between U.S. GAAP and IFRS
<p>Disclosures must provide financial statement users with enough information to understand the nature and terms of the stock-based compensation plans, the methods used to estimate the fair values, and the income statement and cash flow effects.</p>	<p>Similar under U.S. GAAP and IFRS.</p>

6 Describe the characteristics of defined-contribution and defined-benefit pension plans.	
Summary	Similarities and Differences between U.S. GAAP and IFRS
<p>Pension plans are contributory or non-contributory.</p> <ul style="list-style-type: none"> • Contributory plans require employees to cover some or all pension benefit costs and allow employees to make additional contributions to increase their retirement benefits. • Non-contributory plans are plans in which the employer is responsible for funding the total cost of the plan. <p>The two main types of plans are defined contribution and defined benefit. In a defined-contribution plan, the employer contributes a fixed amount each period based on a formula that is often a percentage of the employee's salary. A defined-benefit plan specifies the benefits that the employee will receive at the time of retirement.</p>	<p>Similar under U.S. GAAP and IFRS.</p>

Summary by Learning Objectives, continued

7 Demonstrate the measurement of pension costs and the related liability or asset under defined-benefit plans, including remeasurement due to changes in actuarial assumptions.

Summary	Similarities and Differences between U.S. GAAP and IFRS
<p>For defined-contribution plans, the company records the pension expense when employees provide services and earn their pensions.</p> <p>For defined-benefit plans, the three main accounts are pension plan obligations, pension plan assets, and pension expense. The pension plan obligation is the present value of estimated future benefits promised to employees. Plan assets are available to pay the pension benefits. The net of the pension plan obligation and plan assets is reported on the balance sheet.</p> <p>The pension expense includes service cost, current-period prior service costs, interest on the PBO, and the expected return on plan assets. It may also include actuarial gains or losses.</p> <p>Actuarial gains/losses arise on remeasuring the pension plan obligation. Expected gains or losses reflect the difference between the actual and expected return on plan assets. Any net actuarial gains or losses are taken directly to other comprehensive income. Companies report them in income only as a component of pension expense when the cumulative amount exceeds the corridor.</p> <p>The corridor is 10% of the greater of the beginning pension plan obligation or pension plan assets.</p>	<p>► There are significant differences in recognizing and reporting defined-benefit plans under IFRS, as follows:</p> <ul style="list-style-type: none"> • Net interest expense is the sum of interest expense of the pension obligation less expected interest income on plan assets. Both interest expense and expected interest income are computed using the market yield at the end of the reporting period on high-quality corporate bonds. • All actuarial gains or losses are reported in other comprehensive income and are never reported in net income. • All past service costs are reported in pension expense. They are not amortized. • Pension liability is called Present Value of Defined-Benefit Obligation.

8 Detail required disclosures for pension plans.

Summary	Similarities and Differences between U.S. GAAP and IFRS
<p>Detailed disclosures include a reconciliation of the beginning and ending balances of the benefit obligation and plan assets at fair value, with the difference representing the funded status of the plan reported on the balance sheet.</p> <p>Companies must report components of pension expense, including where they are classified on the income statement.</p> <p>Pension footnotes also disclose target and actual allocation of plan assets within various asset categories—equity securities, debt securities, real estate—and management’s investment strategy.</p>	<p>► Similar under U.S. GAAP and IFRS except that IFRS allows companies to classify interest costs and the expected return on plan assets in non-operating (financing) income.</p>

MyLab Accounting

Go to <http://www.pearson.com/mylab/accounting> for the following Questions, Multiple-Choice Questions, Brief Exercises, Exercises, and Problems. They are available with immediate grading, explanations of correct and incorrect answers, and interactive media that acts as your own online tutor.

19 Accounting for Employee Compensation and Benefits

Questions

- 1 2** Q19-1. What is the allocation period used to expense stock-based compensation?
- 2 3** Q19-2. How do companies account for stock-based compensation?
- 2 3** Q19-3. Do companies with equity-based compensation plans make adjustments for changes in the market price of the stock?
- 2 3 4** Q19-4. When accounting for employee stock options, will a reduction of compensation expense or compensation "income" occur in future periods?
- 6 7** Q19-5. Does the employee always absorb the total risk of loss on pension plan assets?
- 6 7** Q19-6. Does the going-concern concept justify the use of the projected benefit obligation in all pension calculations?
- 6 7** Q19-7. The corridor method requires computing the amortization of net actuarial gains and losses under the straight-line method. Will the amortization be the same each year?
- 6 7** Q19-8. Does a company report the funded status of the defined-benefit plan as calculated by an actuary on the financial statements?
- 6 7** Q19-9. Do corporations report the projected benefit obligation and the plan assets as individual accounts on the sponsor corporation's balance sheet?
- 7 8** Q19-10. Does aggregating the five components of pension cost always results in a reduction in income?

Multiple Choice Questions

Becker CPA Exam Review multiple-choice questions are available in [MyLab Accounting](#).

- 2** MC19-1. On January 1, Year 1, Sweeney Company granted an employee options to purchase 100 shares of Sweeney's common stock at \$40 per share. The options became exercisable on December 31, Year 1, after the employee had completed 1 year of service and were exercised on that date. Market prices of the stock and fair values of the options were as follows:

	Market Price of Stock	Fair Value of Options
January 1, Year 1	\$50	\$61
December 31, Year 1	\$65	\$75

What amount should Sweeney recognize as compensation cost for Year 1?

- a. \$6,100 b. \$2,100 c. \$4,000 d. \$0
- 2** MC19-2. Gregory's on Ormond, Inc. grants its president 2,000 stock options on January 1, Year 1, that give him rights to purchase shares of the company for \$40 per share on December 31, Year 2. At the time the options were granted, the fair value of the options totaled \$20,000. At December 31, Year 1, the company's stock sold for \$45 per share and at December 31, Year 2, the selling price of the stock was \$55 per share. In its Year 2 financial statements, Gregory's on Ormond would recognize compensation expense relative to the options of:
- a. (\$10,000) b. \$0 c. \$15,000 d. \$10,000
- 7** MC19-3. The following information pertains to Burnel Corporation's defined benefit pension plan for Year 1:

Service cost	\$160,000
Actual and expected gain on plan assets	35,000
Unexpected loss on pension plan assets related to a Year 1 disposal of a subsidiary	40,000
Amortization of unrecognized prior service cost	5,000
Annual interest on pension obligation	50,000

What amount should Burnel report as total pension expense in Year 1?

- a. \$250,000 b. \$220,000 c. \$210,000 d. \$180,000

7

MC19-4. Do It Right, Inc.'s actuary provided the company with the following information regarding its defined benefit pension plan for the year ended December 31, Year 7:

Fair value of plan assets	\$5,580,000
Accumulated benefit obligation	3,400,000
Projected benefit obligation	4,930,000
Unrecognized prior service cost	400,000
Unrecognized net gain	140,000
Expected benefit obligation – Year 8	250,000

The company reported net periodic pension cost of \$310,000 on its income statement and made a \$500,000 contribution to the pension plan during Year 7. The company's effective tax rate is 40%. What amount should Do It Right report in accumulated other comprehensive income related to its pension plan on its December 31, Year 7, balance sheet?

- a. \$156,000 b. \$400,000 c. \$260,000 d. \$240,000

7

MC19-5. The following information applies to Babydoll Company's defined benefit pension plan:

Projected benefit obligation, December 31, Year 7	\$2,000,000
Projected benefit obligation, December 31, Year 8	2,220,000
Fair value of plan assets, December 31, Year 7	1,750,000
Fair value of plan assets, December 31, Year 8	2,025,000
Unrecognized prior service cost, December 31, Year 7	500,000
Year 8 service cost	200,000
Expected benefits payable – Year 9	400,000
Discount rate	6%
Expected rate of return on plan assets	8%

The company's employees have an average remaining service life of 10 years. The company has no unrecognized net gains or losses. What is Babydoll's net periodic pension cost for Year 8?

- a. \$208,000 b. \$221,200 c. \$230,000 d. \$243,200

7

MC19-6. Giant Jobs, Inc. amended its overfunded pension plan on December 31, Year 7, resulting in the recognition of prior service cost of \$700,000. On December 31, Year 7, Giant Job's employees had an average remaining service life of 20 years. The company has an effective tax rate of 30%. How should the prior service cost be reported in the December 31, Year 7, financial statements?

- a. \$490,000 increase in net periodic pension cost
 b. \$490,000 decrease in comprehensive income
 c. \$700,000 decrease in net income
 d. \$700,000 increase in pension benefit asset

7

MC19-7. The following information relates to the pension plan for the employees of Neal Co.:

	Jan. 1, Year 4	Dec. 31, Year 4	Dec. 31, Year 5
Accumulated benefit obligation	\$4,400,000	\$4,600,000	\$6,000,000
Projected benefit obligation	4,650,000	4,980,000	6,670,000
Fair value of plan assets	4,250,000	5,200,000	5,740,000
Market-related value of assets	4,100,000	5,160,000	5,650,000
Unrecognized net (gain) or loss	0	(720,000)	(800,000)
Settlement rate (for year)	11%		11%
Expected rate of return (for year)	8%	7%	

Neal estimates that the average remaining service life is 16 years. Neal's contribution was \$315,000 in Year 5 and benefits paid were \$235,000.

The amount of unrecognized net gain amortized in Year 5 is:

- a. \$12,750 b. \$12,500 c. \$9,688 d. \$8,314

- 8 MC19-8.** The following information applies to Babydoll Company's defined benefit pension plan at December 31, Year 8:

Projected benefit obligation, December 31, Year 7	\$2,000,000
Projected benefit obligation, December 31, Year 8	2,220,000
Fair value of plan assets, December 31, Year 7	1,750,000
Fair value of plan assets, December 31, Year 8	2,025,000
Unrecognized prior service cost, December 31, Year 7	500,000
Year 8 service cost	200,000
Expected benefits payable – year	400,000
Discount rate	6%
Expected rate of return on plan assets	8%

The company's employees have an average remaining service life of 10 years. The company has no unrecognized net gains or losses. What is the funded status of Babydoll's pension plan at December 31, Year 7?

- \$195,000 underfunded.
- \$195,000 overfunded.
- \$250,000 underfunded.
- \$250,000 overfunded.

Brief Exercises

- 1 2 3 4 BE19-1. Stock Compensation Terminology.** Match the type or form of stock compensation with its definition.

Form or Type

- Option
- Equity-classified awards
- Liability-classified award
- Stock appreciation rights
- Restricted stock plans
- Employee stock purchase plan

Type or Form

Definition

_____	An employee receives cash or some other company resource based on the value of the shares.
_____	An employee receives cash for the amount of the increase in share value over a pre-established price over a fixed period of time.
_____	An employee has the right to purchase a security at a pre-established price.
_____	An employee has the opportunity to purchase the company's shares usually at a discount and without incurring transaction costs.
_____	An employee has the right to receive shares.
_____	A specific employee is awarded actual shares.

- 2 BE19-2. Employee Stock Options, Equity-Classified Awards, Journal Entries at Grant Date.** Vince Pickwick Company awarded 1,000 options to acquire 1,000 shares of its common stock. The options have a fair value of \$12 each. The market price and the exercise price were both equal to \$6 per share on the date of the grant. Prepare the journal entry to record the options on the date of the grant.
- 2 BE19-3. Employee Stock Options, Equity-Classified Awards, Journal Entries after Grant Date.** B-Boy Jeans, Inc. awarded 2,000 options to acquire 2,000 shares of its common stock. The options have a fair value of \$30 each and cannot be exercised until employees complete a 3-year service period. The market price and the exercise price were both equal to \$17 per share on the date of the grant. Prepare the journal entry required at the end of the first year after the options are granted.
- 2 BE19-4. Employee Stock Options, Equity-Classified Awards, Journal Entries.** Hillview Homes, Ltd. granted options at the beginning of the current year to all its salaried employees. At the grant date, the options had a

fair value of \$900,000 and can be exercised only over a 3-year vesting period. At the end of the year, Hillview charged \$300,000 to expense, assuming that all employees would vest. Prepare the journal entry to record the compensation expense for Year 2 assuming that Hillview expects only 35% of employees to vest. Assume that Hillview chooses to adjust the fair value for the estimated forfeitures.

- 2** **BE19-5. Employee Stock Options, Equity-Classified Awards, Journal Entries at Exercise.** On-the-Fly Limousine Services granted 5,000 options to acquire 5,000 shares of its \$1 par value common stock. At the grant date, the fair value of the options is \$100,000 and the exercise price per option is \$8 each. Assuming that employees exercise all the options at the end of the service period, prepare the journal entry necessary to record the exercise of the options.
- 2** **BE19-6. Employee Stock Options, Equity-Classified Awards, Journal Entries at Exercise.** Prepare the necessary journal entry assuming that all the options granted by On-the-Fly in BE19-5 expired and were not exercised by any of the company's employees.
- 3** **BE19-7. Employee Stock Options, Liability-Classified Awards, Journal Entries after Grant Date.** The Goldwick Company awarded 1,000 options to acquire 1,000 shares of its common stock, which can be sold back to the company. The options vest over 3 years. The market price and the exercise price were both equal to \$12 per share on the date of the grant. At the grant date, the options have a fair value of \$15 each. Prepare the journal entry at the end of the first year, assuming that the fair value does not change during the year.
- 3** **BE19-8. Employee Stock Options, Liability-Classified Awards, Journal Entries after Grant Date.** Tommi-Boy Jeans, Inc. awarded 4,000 options to acquire 4,000 shares of its preferred stock that can be sold back to the company. At the grant date, the options have a fair value of \$12 each and cannot be exercised until employees complete a 2-year service period. The market price and the exercise price were both equal to \$8 per share on the date of the grant. Prepare the journal entry required at the end of the first year after the options are granted assuming that the fair value does not change during the year.
- 4** **BE19-9. Stock Appreciation Rights.** Togo Incorporation started a share appreciation plan on January 1, 2018, when it granted 50,000 rights to its executives. The vesting period is 2 years. The stock appreciation rights are settled for cash. The plan expires on January 1, 2020. The fair value of Togo's SARs for the years ended December 31, 2018 and 2019, are as follows:

Date	Fair Value
December 31, 2018	\$6
December 31, 2019	\$7

All rights are exercised on January 1, 2020, when their fair value is \$7 and the market price of the stock is \$35 per share. What is the compensation expense in 2018 and in 2019? Prepare the journal entries to record the SAR plan.

- 4** **BE19-10. Stock Appreciation Rights.** Using the information from BE19-9, now assume that the stock appreciation rights are settled for stock. Prepare the journal entries to record the SAR plan. The par value of common stock is \$1 per share. What journal entry will the company make on the date the employees purchase the shares?
- 4** **BE19-11. Stock Appreciation Rights.** Kogo Incorporation started a share appreciation plan on January 1, 2017, when it granted 100,000 rights to its executives. The vesting period is 2 years. The stock appreciation rights are settled for cash. The plan expires on January 1, 2019. The fair value of Kogo's SARs for the years ended December 31, 2017 and 2018, are as follows:

Date	Fair Value
December 31, 2017	\$4
December 31, 2018	\$3

All rights are exercised on January 1, 2019, when the fair value is \$5. What is the compensation expense in 2017 and in 2018?

- 4** **BE19-12. Restricted Stock.** Samsung Company issued 100,000 shares of \$1 par value, restricted stock to its top five key employees on January 1, 2017. The market value of Samsung's shares is \$45 per share on the date of issue. The restricted shares require a vesting period of 4 years. Prepare the journal entries for the first year.
- 4** **BE19-13. Employee Stock Purchase Plans, Non-Compensatory.** Siry Company offers all its employees the opportunity to purchase its \$2 par value common stock at a 5% discount. The employees have 3 weeks to elect to participate in the plan. The current market price of the stock is \$80 per share. Employees purchased a total of 200,000 shares. What journal entry will the company make on the date the employees purchase the shares?

- 4** **BE19-14. Employee Stock Purchase Plans, Compensatory.** Using the information from BE19-13, now assume that Siry Company offers the plan only to top executives. What journal entry will the company make on the date the employees purchase the shares?
- 4** **BE19-15. Employee Stock Purchase Plans, Compensatory.** Tash Company offers select executives the opportunity to purchase its \$1 par value common stock at a 10% discount. The employees have 2 weeks to elect to participate in the plan. The current market price of the stock is \$40 per share. Employees purchased a total of 100,000 shares. What journal entry will the company make on the date the employees purchase the shares?
- 6** **BE19-16. Defined-Contribution Pension Plan, Journal Entries.** Jen and Benny's Ice Cream offers a defined-contribution plan to its employees. Under the terms of the plan, Jen and Benny must contribute 2% of its employees' salaries. Prepare the journal entry required to record the cost of this plan assuming that total salaries for the year are equal to \$875,000 and that the sponsor corporation contributes the full amount due under the plan.
- 7** **BE19-17. Defined-Benefit Pension Plan, Corridor, Journal Entries.** Northhead Equipment offers its unionized employees a defined-benefit plan. The company determines that the beginning balance of its unamortized net actuarial gain is equal to \$136,000. A recent report from the pension plan indicates that the beginning balances of the projected benefit obligation and the plan assets at fair value (the same as the market-related asset value) are equal to \$1,150,000 and \$1,278,000, respectively.
- Required »**
- a. Compute the current year's amortization required by the corridor method assuming that the average remaining service life of Northhead's employees is 20 years.
- b. Prepare the journal entry.
- 7** **BE19-18. Defined-Benefit Pension Plan, Pension Costs.** Chester West Shoes, Inc., provided the following information regarding its defined-benefit pension plan: service cost, \$257,000; interest on the beginning PBO, \$121,000; expected return on plan assets, \$56,000; amortization of prior service costs related to unvested employees, \$24,000; and amortization of net actuarial gain, \$87,000. Based on this information, compute the total pension cost for the year.
- 7** **BE19-19. Defined-Benefit Pension Plan, Pension Costs, IFRS.** Chester West Shoes, Inc., provided the following information regarding its defined-benefit pension plan: service cost, \$257,000; interest on the PVDBO, \$121,000; expected return on plan assets, \$56,000; past service costs of \$24,000, and net actuarial gain, \$87,000. Based on this information, compute the total pension cost for the year under IFRS.
- 7** **BE19-20. Defined-Benefit Pension Plan, Journal Entries.** Bidell Builders reported \$500,000 of pension cost for the current year. In making this computation, Bidell informs you that the actual return on plan asset in excess of expected returns in the current year is a \$231,000 net gain. In addition, the amortization of prior service costs for unvested employees at the end of the year is \$79,000. Bidell contributed \$100,000 into the plan during the current year. Service cost for the year was \$95,000. Prepare the journal entry to record the pension cost for the current year.
- 7** **BE19-21. Defined-Benefit Pension Plan, Journal Entries, IFRS.** Bidell Builders, an IFRS reporter, has \$500,000 of pension cost for the current year. In making this computation, Bidell informs you that the current-year actual return on plan asset in excess of expected returns is a \$231,000 net actuarial gain. In addition, past service costs are \$79,000 (not included in \$500,000 pension cost). Bidell contributed \$100,000 into the plan during the current year. Service cost for the year was \$95,000. Bidell reports service cost as an operating expense and all other pension expenses as non-operating. Prepare the journal entry to record the pension cost for the current year.
- 7** **BE19-22. Defined-Benefit Pension Plan, Pension Benefit Obligation Computation.** Armando Hernandez Fashions, Inc. sponsors a defined-benefit pension plan for its employees. The company's pension trust provided the following information: fair value of beginning plan assets, \$569,000; projected benefit obligation at the beginning of the year, \$678,000; service cost, \$54,000; interest on beginning PBO, \$56,900; actual loss on plan assets, \$35,800 composed of expected gains of \$50,000 and unexpected losses of \$85,800; actuarial gains because of assumptions about PBO, \$98,543; benefit payments made to retirees, \$29,780; and contributions made by the sponsor corporation, \$86,500. There is no amortization necessary under the corridor approach. Compute the ending balance of the projected benefit obligation.

- 7 BE19-23. Defined-Benefit Pension Plan, Plan Asset Computation.** Using the data provided in BE19-22, determine the ending balance of the plan assets and indicate the funded status of the plan at the end of the year.
- 7 BE19-24. Defined-Benefit Pension Plan, Pension Benefit Obligation Computation, IFRS.** Silva Blanca Fashions, Inc. sponsors a defined-benefit pension plan for its employees. The company's pension trust provided the following information: fair value of beginning plan assets, \$569,000; projected benefit obligation at the beginning of the year, \$678,000; service cost, \$54,000; interest on PVDBO, \$56,900; actual loss on plan assets, \$35,800; actuarial gains due to changes in assumptions about PVDBO, \$98,543; benefit payments made to retirees, \$29,780; and contributions made by the sponsor corporation, \$86,500. Compute the ending balance of the PVDBO under IFRS.
- 7 BE19-25. Defined-Benefit Pension Plan, Plan Asset Computation, IFRS.** Using the data provided in BE19-24, determine the ending balance of the plan assets and indicate the funded status of the plan at the end of the year under IFRS.
- 7 BE19-26. Defined-Benefit Pension Plan, Pension Benefit Obligation Computation.** The following information is provided regarding a company's defined benefit pension plan. The projected benefit obligation (PBO) was \$600,000 at the beginning of the current year. During the year, pension benefits paid were \$165,000, service cost for the year was \$210,000, and a plan amendment retroactive to the beginning of the year increased the PBO by \$50,000. The settlement rate for the plan for the year was estimated at 4%. Determine the ending balance of the PBO for the current year.
- 7 BE19-27. Defined-Benefit Pension Plan, Plan Asset Computation.** OZ Leasing Associates provides you with the following information for the current year:

Beginning projected benefit obligation	\$900,000
Settlement rate	5%
Service costs for the current year	350,000
Pension benefits paid	210,000
Contributions into the plan	85,000
Beginning plan assets at fair value (equal to the market related asset value)	865,000
Actual return on plan assets (equal to the expected return)	100,000

Determine the pension asset or liability to be reported on the balance sheet of OZ Leasing Associates at the end of the year.

- 7 BE19-28. Defined-Benefit Pension Plan, Pension Asset, Liability Computation.** At December 31, 2019, the following information was provided by the Oscar Group:
- | | |
|--------------------------------|-----------|
| Fair value of plan assets | \$850,000 |
| Vested benefit obligation | 495,500 |
| Accumulated benefit obligation | 700,100 |
| Projected benefit obligation | 795,000 |

Determine the pension asset or liability that will be reported on Oscar's balance sheet on December 31, 2019.

Exercises

- 2 E19-1. Employee Stock Options, Equity Classified Awards, Journal Entries.** The following information is from the books of OZP Farms, Inc. regarding its employee stock options. The firm granted options on January 2, 2018, that permit employees to acquire 100,000 shares of \$1.20 par value common stock at an exercise price of \$4.80 per share. The market price of the company's shares on January 2, 2018, was also \$4.80 per share, so there is no intrinsic value on the date of the grant. Employees must complete a 2-year service (vesting) period in order to exercise the options. The options will expire after a 5-year period (total option period). At the grant date, the estimated fair value of the options using the Black-Scholes option-pricing model is \$850,000 (i.e., 100,000 shares \times \$8.50 per share). The firm assumes that the initial vesting probability is 100%. The option plan qualifies as an equity-classified award. Assuming no changes in vesting probability, prepare the journal entries required to record compensation expense over the vesting period.
- 2 E19-2. Employee Stock Options, Equity-Classified Awards, Journal Entries.** Max Ferguson Cosmetics compensates its key employees by offering stock options as part of total compensation. On January 1 of the current year, Max Ferguson granted 10,000 options to acquire 10,000 shares of its \$2 par value common stock at an

exercise price of \$18 per share. The market price on the date of the grant is also \$18 per share, so there is no intrinsic value. At the grant date, the fair value of the options is \$250,000, or \$25 per option. The initial vesting probability is assumed to be 100%. The option plan qualifies as an equity-classified award. Each executive is required to complete a 2-year service period in order to exercise the options.

Required »

- Assuming no changes in vesting probability, prepare the journal entries required to record compensation expense over the vesting period.
- Prepare all journal entries required in Year 2 assuming that the vesting probability is reduced to 60% in Year 2. Assume that the company chooses to adjust the fair value for the estimated forfeitures.
- Using the information computed from part (b), prepare the journal entry required to record the expiration of all options.
- Prepare all journal entries in Year 1 and Year 2 assuming that 20% of the options are forfeited in Year 1 and another 20% are forfeited in Year 2. Assume that the company accounts for forfeitures when they occur.

2

E19-3. Employee Stock Options, Equity-Classified Awards, Journal Entries. Davidson Company compensates its key employees by offering stock options as part of total compensation. On January 1 of the current year, Davidson granted 80,000 options to acquire 80,000 shares of its \$1 par value common stock at an exercise price of \$37 per share. The market price on the date of the grant is also \$37 per share, so there is no intrinsic value. At grant date, the fair value of the options is \$4,000,000, or \$50 per option. The initial vesting probability is assumed to be 60%. The option plan qualifies as an equity-classified award. There is a 2-year vesting period required before employees can purchase the shares.

Required »

- Assuming no changes in vesting probability, prepare the journal entries required to record compensation expense over the vesting period.
- Prepare all journal entries required in Year 2 assuming that the vesting probability increases to 80% in Year 2. Assume that the company chooses to adjust the fair value for the estimated forfeitures.
- Assume that employees exercise 80% of the options expected to vest from part (b) and the other 20% expire. Prepare any journal entries required to record the exercise and expirations.
- Assume that 20% of the options are forfeited in Year 1 and another 20% are forfeited in Year 2. Assume that the company accounts for forfeitures when they occur. Prepare all journal entries in Year 1 and Year 2, including the journal entry to record the exercise of the options.

3

E19-4. Employee Stock Options, Liability-Classified Awards, Journal Entries. Max Ferguson Cosmetics compensates its key employees by offering stock options as part of total compensation. On January 1 of the current year, Max Ferguson granted 10,000 options to acquire 10,000 shares of its \$2 par value common stock at an exercise price of \$18 per share. The market price on the date of the grant is also \$18 per share, so there is no intrinsic value. At the grant date, the fair value of the options is \$250,000, or \$25 per option. The initial vesting probability is assumed to be 100%. The option plan qualifies as a liability-classified award. Each executive is required to complete a 2-year service period in order to exercise the options. The fair value of the options does not change over the vesting period.

Required »

- Assuming no changes in vesting probability, prepare the journal entries required to record compensation expense over the vesting period.
- Prepare all journal entries required in Year 2 assuming that the vesting probability is reduced to 60%. Assume that the company chooses to adjust the fair value for the estimated forfeitures.
- Using the information computed from part (b), prepare the journal entry required to record the expiration of all options.
- Prepare all journal entries in Year 1 and Year 2 assuming that 20% of the options are forfeited in Year 1 and another 20% are forfeited in Year 2. Assume that the company accounts for forfeitures when they occur.

4

E19-5. Stock Appreciation Rights. eGear Company started a share appreciation plan on January 1, 2018, when it granted 200,000 rights to its executives. The vesting period is 2 years. The plan expires on January 1, 2020. The fair value of eGear's SARs for the years ended December 31, 2018 and 2019, are as follows:

Date	Fair Value
December 31, 2018	\$6
December 31, 2019	\$5

Employees exercise all SARs on January 1, 2020, when their fair value is \$5.

Required »

- Prepare all journal entries to record the SAR plan assuming that the rights are settled with cash.
- Prepare all journal entries to record the SAR plan assuming that the rights are settled with the company's \$1 par value common stock. On the date of exercise, the market price per share is \$20.

4

E19-6. Stock Appreciation Rights. NR Enterprises, Inc. granted stock appreciation rights to its key employees on January 2, 2018. These SARs allow the employees to receive cash at the end of the vesting period for the difference between the market price of the stock on the exercise date and the pre-established price of \$55. NR granted 200,000 of these SARs. Employees must complete a 3-year service (vesting) period in order to receive the cash. The fair value of the SARs on December 31, 2018, is \$7 per SAR. The fair value on December 31, 2019, is \$13 per SAR, and the fair value on December 31, 2020, is \$11 per SAR. The company estimates that there will not be any forfeitures of the rights.

Required »

- How much compensation expense, if any, should NR recognize in 2018, 2019, and 2020?
- What are the journal entries to record this compensation expense?

4

E19-7. Stock Appreciation Rights, IFRS. NR Enterprises, Inc., an IFRS reporter, granted stock appreciation rights to its key employees on January 2, 2018. These SARs allow the employees to receive cash at the end of the vesting period for the difference between the market price of the stock on the exercise date and the pre-established price of \$55. NR granted 200,000 of these SARs. Employees must complete a 3-year service (vesting) period in order to receive the cash. The fair value of the SARs on December 31, 2018, is \$7 per SAR. The fair value on December 31, 2019, is \$13 per SAR and the fair value on December 31, 2020, is \$11 per SAR. The company estimates that there will not be any forfeitures of the rights.

Required »

- How much compensation expense, if any, should NR recognize in 2018, 2019, and 2020?
- What is the journal entry to record this compensation expense?

4

E19-8. Restricted Stock Plan, Termination. Hwang Company issued 50,000 shares of \$1 par value, restricted stock to each of its five key executives on January 1, 2018. Each executive receives 10,000 shares. Hwang's shares have a market value of \$28 per share on the date of issue. The restricted shares require a vesting period of 4 years. Hwang's year-end is December 31.

Required »

- Prepare the journal entries required for 2018 through 2021.
- Independent of (a), prepare all journal entries for 2018 through 2021 assuming that three of the executives leave the company at January 1, 2020.

7

E19-9. Defined-Benefit Pension Plan, Comprehensive. Crystal Glass Works, Ltd. provided you with the following information regarding its defined-benefit pension plan.

Required »

- Beginning plan assets at fair value (market-related value), \$600,000
- Beginning projected benefit obligation (PBO), \$558,000
- Service cost for the year, \$125,800
- Settlement rate, 12%
- Expected return on plan assets, 9%
- Actual return on plan assets, \$30,100 loss
- Contributions for the year, \$45,700
- Benefit payments for the year, \$97,440
- Beginning accumulated other comprehensive income, \$42,000 (due to unamortized net actuarial gains)
- Prior service costs awarded during the year (not effective as of the beginning of the year) for vested employees, \$19,690
- Amortization of prior service costs, \$7,000
- Decrease in the ending projected benefit obligation due to changes in actuarial assumptions (i.e., actuarial gain), \$8,000
- Average remaining service life of the employee base, 15 years

Required »

- Prepare the separate "conceptual" journal entries for the preceding relevant information.
- Compute the total pension cost for the year.

- c. Determine the ending balances of the plan assets and the projected benefit obligation and indicate the funded status of the plan.
d. Prepare the journal entry to record the current year's pension cost.

7 **E19-10. Defined-Benefit Pension Plan, Comprehensive, IFRS.** Redo E19-9, assuming that Crystal Glass Works, Ltd. is an IFRS reporter and the expected return on plan assets is the same as the settlement rate. Crystal Glass reports service cost as an operating expense and all other pension expenses as non-operating.

7 **E19-11. Defined-Benefit Pension Plan, Comprehensive.** Season Tyme Tea Company provided the following information related to its defined-benefit pension plan.

Beginning plan assets at fair value (equal to the market-related asset value)	\$ 954,500
Beginning projected benefit obligation (PBO)	1,020,340
Service cost for the year	81,500
Settlement rate	10%
Expected return on plan assets	16%
Actual return on plan assets	123,400
Contributions for the year	67,480
Benefit payments for the year	47,440
Beginning accumulated other comprehensive income related to prior service costs (debit balance)*	65,840
Amortization of prior service costs	15,500
Increase in the ending projected benefit obligation due to changes in actuarial assumptions (i.e., actuarial loss)	78,625
Average remaining service life (ARSL) of employee base	10 years

*There is no AOCI related to actuarial gains/losses as of the beginning of the year.

Required »

- a. Compute the total pension cost for the year.
b. Determine the ending balances of the plan assets and the projected benefit obligation and indicate the funded status of the plan.
c. Determine the ending balance for accumulated other comprehensive income.
d. Prepare the journal entry to record the current year's pension cost.
e. Reconcile the ending balance in accumulated other comprehensive income.

7 **E19-12. Defined-Benefit Pension Plan, Comprehensive.** Technique Technologies, Inc. started a defined-benefit plan this year. As part of the union agreement, it provided \$560,000 in retroactive benefits to all employees for their prior years' service. The company amortized \$15,600 of these benefits during the current year. At the end of the year, the actuary provided you with the following information related to the plan:

- Service cost for the year, \$915,590
- Contributions for the year, \$345,700
- Expected return on plan assets, 10%
- Settlement rate, 10%
- No retirement benefits paid during the year

Required »

- a. Compute the total pension cost for the year.
b. Determine the ending balances of the plan assets and the projected benefit obligation and indicate the funded status of the plan.
c. Prepare the journal entry to record the current year's pension cost.
d. Reconcile the ending balance in accumulated other comprehensive income.

7 **E19-13. Defined-Benefit Pension Plan, Comprehensive.** Desmond Group provided the following information related to its defined-benefit plan for the current year:

Description	Current Year	Prior Year
Beginning plan assets at fair value (equal to the market-related asset value)	Solve	\$806,160
Beginning projected benefit obligation	Solve	965,270

Description	Current Year	Prior Year
Service cost	\$73,800	60,000
Settlement rate	10%	10%
Expected return on plan assets	8%	8%
Actual return on plan assets	40,320	40,000
Contributions for the year	106,080	65,760
Benefits paid during the year	28,800	34,560
Amortization of prior service cost	9,200	25,200
Beginning balance of accumulated other comprehensive income due to		
Unamortized prior service cost	<i>Solve</i>	38,580*
Unamortized net actuarial losses	<i>Solve</i>	95,047*
Average remaining service life of employees	10 years	10 years

*These amounts are included in the beginning balance of the PBO.

Required »

- Compute the total pension cost for the current year.
- Determine the ending balances of the plan assets and the projected benefit obligation and indicate the funded status of the plan.
- Reconcile the ending balance in accumulated other comprehensive income and indicate the amounts attributable to unamortized prior service cost and unamortized net actuarial losses.
- Prepare the journal entry to record the current year's pension cost.

7

E19-14. Defined-Benefit Pension Plan. McDonald-Johnson Engineering Associates offers its employees a defined-benefit pension plan. The company asked you to assess the impact of the following events on its annual pension cost, the balance of accumulated other comprehensive income, and its net pension obligation:

- The pension plan trustee reports actuarial gains and unexpected positive returns on the plan assets.
- The pension plan trustee reports actuarial losses and unexpected negative returns on the plan assets.
- The plan is amended when the plan trustee informs the company of the amount of prior service costs incurred.
- The company's accountant amortizes the balance of the unamortized actuarial gains.
- The company's accountant amortizes the balance of the unamortized actuarial losses.
- The company's accountant amortizes the balance of the unamortized prior service cost.

Required »

Prepare a table indicating the effect of each of the above events on each of the accounts indicated.

7

E19-15. Defined-Benefit Pension Plan. The following information relates to the defined benefit pension plan of Murry Corp. for the year ended December 31, 2019:

Prior service cost for a plan amendment during the year	\$ 800,000
Projected benefit obligation – beginning balance	945,000
Fair value of plan assets at the beginning of the year (equal to the market related asset value)	1,000,500
Service cost	400,000
Interest on projected benefit obligation at 5.4155%	<i>Solve</i>
Amortization of prior service cost	80,000
Expected and actual return on plan assets	82,500
Contributions into the plan	300,000
Beginning funded status (\$1,000,500 – \$945,000)	55,500*

* = overfunded so that there a pension asset on the balance sheet at the beginning of the year.

There were no benefit payments for the year.

Required: (Round all computations to the nearest dollar)

- Compute the total pension expense.
- Prepare the journal entry to record pension expense for the year.
- Determine the ending balances of the projected benefit obligation, plan assets, the pension asset or liability reported on the balance sheet, and accumulated other comprehensive income related to the pension plan.

7

E19-16. Defined-Benefit Pension Plan. Welsa Manufacturing, Inc. offers a noncontributory, defined-benefit pension plan to its employees. The average remaining service life of employees is 10 years. The company provides you with the following information for the year ended December 31, 2019:

Employer's contribution at end of year	\$1,600,000
Service cost	600,000
Projected benefit obligation – beginning of the year	6,043,200
Plan assets (at fair value market-related value) beginning of the year	4,000,000
Expected return on plan assets	9%
Settlement rate	8%
Actual return on plan assets	\$360,000
Cost of plan amendment retroactive to January 1	400,000

There were no benefits were paid during the year.

Required: »

- Compute the total pension expense recognized in 2019. Assume the prior service cost is amortized over the average remaining service life of the employees.
- Prepare the journal entry to record pension expense for the year ended December 31, 2019.
- Indicate the amounts that are reported on the income statement and the balance sheet for 2019.

Problems

2

P19-1. Employee Stock Options, Equity-Classified Awards – Comprehensive. The board of directors of Simon Art Supplies Company approved a plan to grant 150,000 options to its key executives to acquire 150,000 shares of no-par common stock at an exercise price of \$20 per share. The effective date of the grant is January 1 of Year 1. Simon granted the options on a date when the company's shares are trading for \$24 per share. On the grant date, the Black-Scholes option-pricing model estimates the fair value of the options at \$66 each. A 3-year service period is required to exercise the options and all options expire at the end of a 5-year period. Management estimates a vesting probability of 100%.

Required »

- Determine the compensation expense for Year 2.
- Determine the compensation expense for Year 3 assuming that 25% of Simon's key executives left the company at the beginning of Year 3 and prior to vesting. Prepare the required journal entry. Assume that the company chooses to adjust the fair value for the estimated forfeitures.
- Prepare the journal entry required to record the exercise of the options by the remaining key executives.

2

P19-2. Employee Stock Options, Equity-Classified Awards – Comprehensive. On January 1 of the current year, Brendan B Fashions granted 100,000 stock options to its division managers. The options are equity-classified awards. The plan permits the division managers to acquire the shares at an exercise price of \$12 per share. Each option permits the purchase of one share of the company's \$2 par value common stock. The options vest in 2 years and expire if they are unexercised at the end of 5 years. On the grant date, the fair value of the options, estimated by an accepted option-pricing model, is equal to \$45 each.

Required »

- Compute the total compensation cost to be recognized by Brendan B Fashions assuming that the company initially expects no forfeitures to occur.
- Record the journal entries over the vesting period.
- Prepare the journal entries required to record the actual exercise assuming that:
 - The market price of the stock on the date of exercise is equal to \$35 per share.
 - The market price of the stock on the date of exercise is equal to \$16 per share.

- d. Repeat part (b), assuming that the estimated amount of forfeitures changed to 20% at the beginning of the second year. Assume that the company chooses to adjust the fair value for the estimated forfeitures.
- e. Independent of your answers to parts (b), (c), and (d), prepare the journal entry required if 25% of the options expire unexercised. Assume that the company chooses to adjust the fair value for the estimated forfeitures.

2 3

P19-3. Employee Stock Options, Equity-Classified Awards, Liability-Classified Awards – Comprehensive. Eagle Builders, Inc. initiated a stock option plan for its employees on January 1 of the current year. The terms of the plan grant each employee 10 options to acquire 10 shares of the company's \$1 par value, common stock at an exercise price of \$45 per share. The market price on the date of the grant is also \$45 per share. On the grant date, a binomial model estimated the fair value of the options at \$83 per share. The option plan permits exercise only after 3 years of service and all options expire after 6 years. On the date of the grant, Eagle employed 1,200 employees. The options are equity-classified awards.

Required »

- a. Assuming that the initial vesting probability is 100%, prepare the journal entries necessary:
- To record the recognition of compensation expense each year assuming that the fair value of the options was as follows:
 - \$75 per share at the end of the year of the grant.
 - \$69 and \$81 per share at the end of Year 2 and Year 3, respectively, following the year of the grant.
- b. Assume that the company chooses to adjust the fair value for the estimated forfeitures. Repeat the requirements in part (a), assuming that the estimated vesting probabilities are:
- 80% at the beginning of Year 1
 - 65% at the beginning of Year 2
 - 75% at the beginning of Year 3
- c. Repeat the requirements in part (a) assuming that Eagle grants the options to acquire the company's redeemable preferred shares rather than its common stock.

4

P19-4. Stock Appreciation Rights. Fiar Company started a share appreciation plan on January 1, 2018, when it granted 100,000 rights to its executives. The vesting period is 3 years. The rights are settled for cash. The plan expires on January 1, 2021. The SARs fair value for the years ended December 31, 2018, through 2020 are as follows:

Date	Closing Market Price
December 31, 2018	\$2.00
December 31, 2019	3.00
December 31, 2020	1.60
January 1, 2021	1.00

All SARs are exercised on January 1, 2021, when the fair value is \$1.

Required »

- a. What is the compensation expense in 2018, 2019, and 2020?
- b. Prepare the journal entries to record the plan.

7

P19-5. Defined-Benefit Pension Plan – Comprehensive. Tony Joe Restaurants, Inc., provided the following information related to its defined-benefit plan for the current year:

Description	Current Year	Prior Year
Beginning plan assets at fair value (equal to the market-related asset value)	<i>Solve</i>	\$6,000
Beginning projected benefit obligation	<i>Solve</i>	\$4,800
Service cost	\$ 128	\$263
Settlement rate	12%	12%
Expected return on plan assets	10%	10%
Actual return on plan assets	\$320	\$500
Contributions for the year	\$180	\$760
Benefits paid during the year	\$800	\$560
Amortization of prior service cost	\$240	\$200

Description	Current Year	Prior Year
Beginning balance of accumulated other comprehensive income due to		
Unamortized prior service cost	Solve	\$580
Unamortized net actuarial losses	Solve	\$247
Average remaining service life of employees	5 years	5 years

Required »

(Hint: You must analyze prior-year results in full to complete the following requirements.)

- Compute the total pension cost for the current year.
- Determine the ending balances of the plan assets and the projected benefit obligation.
- Determine the ending balance in accumulated other comprehensive income related to unamortized prior service cost and unamortized net actuarial losses.
- Prepare the journal entry to record the current year's pension cost.

7

P19-6. Defined-Benefit Pension Plan, Comprehensive. Bruce-West Advertising, Inc., initiated a defined-benefit pension plan 5 years ago. All prior service costs are for vested employees. The beginning balances related to the company's pension plan follow:

Description	Current Year (000s omitted)
Beginning plan assets at fair value (market-related value)	\$8,010
Beginning projected benefit obligation	9,133
Service cost	1,827
Settlement rate	8%
Expected return on plan assets	4%
Actual return on plan assets	570
Contributions for the year	1,060
Benefits paid during the year	900
Amortization of prior service cost	670
Beginning balance of	
Unamortized prior service cost	2,020
Unamortized net actuarial gains	3,012
Average remaining service life of employees	5 years

Required »

- Compute the total pension cost for the year.
- Determine the ending balances of the plan assets and the projected benefit obligation and indicate the funded status of the plan.
- Reconcile the ending balance in accumulated other comprehensive income and indicate the amounts attributable to unamortized prior service cost and unamortized net actuarial gains/losses.
- Prepare the journal entry to record the current year's pension cost.

7

P19-7. Defined-Benefit Pension Plan – Comprehensive, IFRS. Repeat P19-6 now assuming that Bruce-West Advertising, Inc. follows IFRS and expected a return on plan assets equal to its settlement rate. Assume that there are no past service costs. Bruce-West reports service cost as an operating expense and all other pension expenses as non-operating.

Required »

- Compute the total pension cost for the year. Ignore past service costs.
- Determine the ending balances of the plan assets and the present value of defined-benefit obligation and indicate the funded status of the plan.
- Determine the net pension liability (or asset) reported on the ending balance sheet.
- Prepare the journal entry to record the current year's pension cost.

7

P19-8. Defined-Benefit Pension Plan – Comprehensive. Roweburry Blanket Company offers all employees a defined-benefit pension plan. At the end of the current year, Roweburry's pension plan trustee reported the

following information regarding the changes in the PBO, the plan assets at fair value, and the funded status of the plan.

Projected Benefit Obligation			
Benefits paid to retirees	48,672	1,043,692	Beginning balance
Actuarial gain	0	84,744	Prior service cost
		58,084	Service cost
		135,680	Interest on beginning PBO
		152,316	Actuarial loss
		<u>1,425,844</u>	Ending balance
Plan Assets			
Beginning balance	1,006,902	0	Actual return (loss)
Contributions (funding)	92,612	48,672	Benefits paid to retirees
Actual return (gain)	84,500		
Ending balance	<u>1,135,342</u>		

$$\text{Funded Status} = \text{PBO} - \text{Plan Assets} = \$1,425,844 - \$1,135,342 = \$290,502 \text{ Net Liability}$$

Rowebury's management confirmed that the market-related asset value of the plan assets is equal to its fair value. The company uses a 9% expected rate of return. The company amortized its unamortized prior service cost at a rate of 20% for the current year. The prior service costs are for employees who are not vested. The beginning balance in the accumulated other comprehensive income account was \$18,252 due to accumulated net actuarial losses. To date, there has been no required amortization of actuarial gains or losses. The accumulated benefit obligation on the pension plan trustee's report is equal to \$1,245,000 at the end of the current year.

Required »

- Compute the total pension cost for the current year.
- Prepare a t-account for the accumulated other comprehensive income account.

7

P19-9. Defined-Benefit Pension Plan – Comprehensive, IFRS. Botburry Sheet Company offers all employees a defined-benefit pension plan. At the end of the current year, Botburry's pension plan trustee reported the following information regarding the changes in the PVDBO, the plan assets at fair value, and the funded status of the plan.

Present Value of Defined-Benefit Obligation			
Benefits paid to retirees	48,672	1,043,692	Beginning balance
Actuarial gain	0	84,744	Past service cost
		58,084	Service cost
		93,932	Interest on PVDBO
		152,316	Actuarial loss
		<u>1,384,096</u>	Ending balance
Plan Assets			
Beginning balance	1,006,902	0	Actual return (loss)
Contributions (funding)	92,612	48,672	Benefits paid to retirees
Actual return (gain)	84,500		
Ending balance	<u>1,135,342</u>		

$$\text{Funded Status} = \text{PVDBO} - \text{Plan Assets} = \$1,384,096 - \$1,135,342 = \$248,754 \text{ Net Liability}$$

The beginning balance in the accumulated other comprehensive income account was \$18,252 due to accumulated net actuarial losses. Botburry Sheet reports service cost as an operating expense and all other pension expenses as non-operating. The expected rate of return is 9%.

Required »

- Compute the total pension cost for the current year.
- Compute pension-related other comprehensive income for the current year.

- 8** **P19-10. Defined-Benefit Pension Plan, Disclosure.** Prepare the footnote required for Roweburry Blanket Company in P19-8 for the current year that includes the following components of the pension disclosure:

Required »

- The plan obligations, the plan assets, and the funded status of the plan at the end of the year.
- Amounts recognized in the statement of financial position at the end of the year.
- Ending balance of accumulated other comprehensive income.
- Information for pension plans with an accumulated benefit obligation in excess of plan assets.
- Components of Net Periodic Benefit Cost and Other Amounts Recognized in Net Income.
- Other Changes in Plan Assets and Benefit Obligations Recognized in Other Comprehensive Income.

- 8** **P19-11. Defined-Benefit Pension Plan, Disclosure, IFRS.** Prepare the footnote required for Botburry Sheet Company in P19-9 for the current year that includes the following components of the pension disclosure:

Required »

- The plan obligations, the plan assets, and the funded status of the plan at the end of the year.
- Amounts recognized in the statement of financial position at year-end.
- Reconciliation of funded status from part (a) to amounts reported in the balance sheet from part (b).
- Components of net periodic benefit cost and other amounts recognized in net income and other comprehensive income.

- 7** **P19-12. Defined-Benefit Pension Plan – Comprehensive Three Years.** Penn Manufacturing Company offers a defined-benefit pension plan to its salaried employees. The following information summarizes events related to the Penn pension plan for 2018 through 2020.

Description	2018	2019	2020
Plan assets at the beginning of the year (at fair value, which is assumed to equal the market-related asset value)	\$680,000	<i>Solve</i>	<i>Solve</i>
Projected benefit obligation (PBO) at the beginning of the year	\$680,000	<i>Solve</i>	<i>Solve</i>
Service cost for the year	38,880	\$40,320	\$41,760
Settlement rate	8%	8%	8%
Expected return on plan assets	6%	6%	6%
Actual return on plan assets	\$ 42,000	\$37,500	\$30,240
Contributions for the year	\$ 36,000	\$40,000	\$45,000
Benefit payments for the year	\$ 25,000	\$30,000	\$32,000
Prior service costs granted on 1/1/2018	\$ 10,000	\$ 0	\$ 0
Amortization of prior service costs	\$ 2,000	\$ 2,000	<i>Solve</i>
Decrease in the ending projected benefit obligation due to changes in actuarial assumptions (i.e., actuarial gain)	\$ 0	\$97,600	\$ 0
Average remaining service life of employee base	5 years	5 years	5 years

Required »

- Provide the necessary computations and journal entries for Penn Manufacturing for 2018, 2019, and 2020.
- Prepare the worksheet that summarizes the income statement and balance sheet activity and the pension journal entries for 2018, 2019, and 2020.

Autograded Excel Project available in **MyLab Accounting**

CASES

Judgment Cases

Judgment Case 1: Anticipated Forfeitures in Employee Stock Option Grants

Jones Automotives granted employee stock options on January 2, 2018, to acquire 100,000 shares of common stock. The exercise price was \$25 per share and the vesting period is 4 years. The estimated fair value of the options is \$20 per share.

In 2018, Jones experienced a turnover rate of 1.25%. In 2017 and 2016, it experienced a turnover rate of 2% and 3%, respectively. Jones is using an expected forfeiture rate of 12% to calculate the expense for employee stock options. The managers believe that 12% is the most accurate estimate given the current economic environment in the automotive industry as well as the nature of the current pool of employees.

Jones' EPS for 2018 excluding consideration of these employee stock options is \$2.75 per share. The current consensus analyst forecast of EPS for Jones Automotives is \$2.15. Jones has 750,000 shares outstanding at the end of 2018.

You are the auditor for Jones Automotives. Will you sign off on the company's 2018 financial statements to report its stock option expense as currently reported? Why or why not? If not, what case will you make to management to support your view?

Financial Statement Analysis Cases

Financial Statement Analysis Case 1: Analysis of Defined-Benefit Pensions Plans

Eli Lilly and Company, a global pharmaceutical company, offers defined-benefit plans to its employees. The following table presents select data about *Eli Lilly's* defined-benefits pension plan. *Eli Lilly* reports under **U.S. GAAP**. Use this information to answer the questions that follow regarding *Eli Lilly's* defined-benefits pension plan, including its pension costs and liability.

At December 31, or for the year ended December 31 (Dollars in millions)	2016	2015	2014
Pension Accounts (select)			
Pension benefit obligation	\$12,455.9	\$11,719.2	\$12,012.4
Plan assets	\$10,179.7	\$ 9,995.6	\$ 9,835.7
Pension Cost			
Service cost	\$ 277.7	\$ 315.7	\$ 240.9
Interest cost	420.8	476.8	472.6
Expected return on plan assets	(752.1)	(782.3)	(756.6)
Amortization of prior service costs	11.8	10.4	3.6
Recognized actuarial losses	285.6	383.2	282.3
Net periodic benefit cost	\$ 243.8	\$ 403.8	\$ 242.8
Pension-Related Other Comprehensive Income			
Actuarial gain (loss) amortization during period	\$ (285.6)	\$ (383.2)	\$ (282.3)
Actuarial gain (loss)- current year	(725.2)	120.4	(1,939.3)
Assumptions			
Discount rate for benefit obligation	3.9%	4.3%	4.0%
Expected rate of return on plan assets	7.4%	7.4%	8.1%
Other Financial Statement Information			
Total Assets	\$38,805.9	\$35,568.9	\$37,178.2
Total Liabilities	24,725.4	20,978.6	21,790.1
Net Income	2,737.6	2,408.4	2,390.5

Source: Selected Footnote Disclosures from Eli Lilly Inc.'s 2016 Financial Statements. <https://investor.lilly.com/annuals.cfm>

- a. What is *Eli Lilly's* pension cost in 2016, 2015, and 2014? What are the components of its pension cost? What are pension costs after taxes as a percentage of net income? Comment on any changes in pension costs after taxes as a percentage of net income. Consider the growth in net income compared to the growth in pension costs after taxes. Assume a 35% tax rate.
- b. What is the funded status of *Eli Lilly's* defined-benefit pension plans in 2016, 2015, and 2014? How has the funded status changed over time? What is the percent of the net pension liability to total liabilities in 2016, 2015, and 2014?
- c. How have the settlement rate and expected return on plan assets changed from 2015 to 2016? How does the change in the settlement rate affect the pension obligation and pension cost? How does the change in the expected return on plan assets affect the pension cost?
- d. If *Eli Lilly* had reported all actuarial gains and losses in net income rather than other comprehensive income, what would its pension cost have been in 2016, 2015, and 2014? Comment on the changes in its pension cost.
- e. From Example 19.29 in the text, compare pensions at *Eli Lilly* to those at *Johnson & Johnson*. Specifically, compare the pension costs after taxes as a percentage of net income and the net pension obligation as a percentage of liabilities.

Financial Statement Analysis Case 2: Analysis of Stock-Based Compensation Disclosures

Pfizer Inc., a global pharmaceutical company, offers several different types of stock-based compensation to its employees. *Pfizer* reports under U.S. GAAP. Use the disclosures provided in Exhibit 19.3 to answer the following questions.

Required »

- a. What types of stock compensation plans does *Pfizer* offer?
- b. What was the total expense related to these plans in 2016, 2015, and 2014? What is the expense related to stock-based compensation as a percentage of net income? *Pfizer's* net income was \$7,125, \$6,960, and \$9,135 million in 2016, 2015, and 2014, respectively.
- c. How many shares of restricted stock units were granted in 2016? What is the vesting period? What is amount of compensation expense that will be recognized over the vesting period? If the restricted stock units were granted on January 1, 2016, what is the deferred compensation expense related to restricted stock units in 2016? How many shares were forfeited?
- d. Are the stock options awards equity or liability classified? How many options were granted in 2016? What is the entry when the grant is made? What is the vesting period? How many options were forfeited and expired? If *Pfizer's* average stock price during the year was \$32.82 per share, can you give a reason why the options expired? What is the compensation expense related to stock options at the end of 2016. Ignore forfeitures.

Surfing the Standards Cases

Surfing the Standards Case 1: Share-Based Payments – Graded Vesting

On January 1, 2018, Western Wear, Inc. granted 100,000 stock options to its employees. Of these options, 30% will vest on December 31, 2018, 30% will vest on December 31, 2019, and the remaining 40% will vest on December 31, 2020. The fair value of the options was \$15.34 per share using a weighted-average expected life. The fair value of the 30,000 shares that vest in 2018 is \$14.67 per share. The fair value of the 30,000 shares that vest in 2019 is \$15.38 per share and the fair value of the remaining options is \$16.30 per share in 2020. Western records stock-based compensation by adjusting for estimated forfeitures. However, Western does not expect any forfeitures for these options.

Prepare a memo to the file addressing Western Wear's compensation expense for 2018 through 2020. Use the Codification for support.

Surfing the Standards Case 2: Share-Based Payments – Graded Vesting – IFRS

On January 1, 2018, Western Wear, Inc. granted 100,000 stock options to its employees. Of these options, 30% will vest on December 31, 2018, 30% will vest on December 31, 2019, and the remaining 40% will

vest on December 31, 2020. The fair value of the options was \$15.34 per share using a weighted-average expected life. The fair value of the 30,000 shares that vest in 2018 is \$14.67 per share. The fair value of the 30,000 shares that vest in 2019 is \$15.38 per share and the fair value of the remaining options is \$16.30 per share in 2020. Western does not expect any forfeitures. Western Wear is an IFRS reporter.

Prepare a memo to the file addressing Western Wear's compensation expense for 2018 through 2020. Use the international authoritative literature for support.

Basis for Conclusions Cases

Basis for Conclusions Case 1: Are Employee Stock Options Really an Expense?

U.S. GAAP did not require companies to expense employee stock options through the income statement prior to 2005. Paragraphs B2 through B11 in the *Statement of Financial Accounting Standards No. 123(R)* basis for conclusions indicate that reaching an agreement to require employee stock option expensing was a long journey. Companies made a number of arguments opposing reporting this expense on their income statements, as laid out in the basis for conclusions in SFAS No. 123(R) (paragraphs B16 through B20 and B27 through B32). Provide a brief explanation of each of the arguments, a summary of the response from the standard setters, and your assessment of the appropriateness of the standard setting boards' responses.

Basis for Conclusions Case 2: Recognition versus Disclosure

Prior to 2005, firms did not have to recognize an expense for all employee stock options but could disclose the effect of the options in the footnotes. The concept of recognition versus disclosure in the context of employee stock options is discussed in the basis for conclusions in *Statement of Financial Accounting Standards No. 123(R)* (paragraphs B22 through B26).

- a. What is the standard setters' view on the ability of disclosure to substitute for recognition in the financial statements?
- b. What reasons do they give for holding this view?
- c. Do you agree or disagree? Why?

APPENDIX A**Comprehensive Illustration of Accounting for Defined-Benefit Pension Plans**

This Appendix provides a comprehensive problem to thoroughly illustrate pension accounting over 3 years.

EXAMPLE 19A.1**Comprehensive Example of Accounting for Defined-Benefit Pension Plans**

PROBLEM: Footos Candy Company offers a defined-benefit pension plan to its salaried employees. The following information summarizes events related to the Footos pension plan for 2018 through 2020. Provide the necessary computations and journal entries for Footos for 2018 through 2020.

Description	2018	2019	2020
Plan assets at the beginning of the year (at fair value, which is assumed to equal the market-related asset value)	\$540,000	Solve	Solve
Projected benefit obligation (PBO) at the beginning of the year	\$540,000	Solve	Solve
Service cost for the year	\$32,400	\$33,600	\$34,800
Settlement rate	9%	9%	9%
Expected return on plan assets	7%	7%	7%
Actual return on plan assets	\$37,800	\$50,000	\$33,600
Contributions for the year	\$38,400	\$54,800	\$88,400
Benefit payments for the year	\$20,400	\$28,800	\$24,000
Prior service costs granted on 1/1/2019	\$0	\$50,400	\$0
Amortization of prior service costs	\$0	\$21,000	\$25,200
Increase in the ending projected benefit obligation due to changes in actuarial assumptions (i.e., actuarial loss)	\$0	\$90,000	\$0
Average remaining service life of employee base	10 years	10 years	10 years

SOLUTION: We provide the computations and conceptual journal entries for each factor next. We first work through each factor for 2018 and then prepare the comprehensive journal entry for 2018 followed by 2019 and 2020.

Factor 1: Service Cost

	2018	2019	2020
Service Cost	32,400	33,600	34,800
Projected Benefit Obligation	32,400	33,600	34,800

Factor 2: Prior Service Costs

Recording prior services costs:

	2018	2019	2020
OCI – Prior Service Costs	0	50,400	0
Projected Benefit Obligation	0	50,400	0

Continued

Amortizing prior service costs

	2018	2019	2020
Pension Expense	0	21,000	25,200
OCI – Prior Service Costs	0	21,000	25,200

Factor 3: Interest on PBO

Computation:

	2018	2019	2020
PBO – Beginning of year	\$540,000	\$ 600,600	\$804,390
Plus: Prior service costs	0	50,400	0
Subtotal	540,000	\$ 651,000	\$804,390
Times: Settlement rate	9%	9%	9%
Interest on PBO	<u>\$ 48,600</u>	<u>\$ 58,590</u>	<u>\$ 72,395</u>
Computation of PBO – End of Year			
PBO – Beginning of year	\$540,000	\$ 600,600	\$ 804,390
Plus: Prior service costs	0	50,400	0
Plus: Increase in the ending projected benefit obligation due to changes in actuarial assumptions (i.e., actuarial loss)	0	90,000	0
Plus: Service costs	32,400	33,600	34,800
Less: Benefit payments for the year	(20,400)	(28,800)	(24,000)
Plus: Interest cost	<u>48,600</u>	<u>58,590</u>	<u>72,395</u>
PBO – End of year	<u>\$600,600</u>	<u>\$ 804,390</u>	<u>\$ 887,585</u>

	2018	2019	2020
Pension Expense	48,600	58,590	72,395
Projected Benefit Obligation	48,600	58,590	72,395

Factor 4: Expected Return on Pension Plan Assets

Computation:

	2018	2019	2020
PPA – Beginning of year	\$540,000	\$595,800	\$671,800
Expected rate of return	7%	7%	7%
Expected return on PPA	<u>\$ 37,800</u>	<u>\$ 41,706</u>	<u>\$ 47,026</u>

Computation of PPA – End of Year			
PPA – Beginning of year	\$540,000	\$595,800	\$671,800
Expected rate of return	7%	7%	7%
Expected return on PPA	<u>\$ 37,800</u>	<u>\$ 41,706</u>	<u>\$ 47,026</u>
PPA – Beginning of year	\$540,000	\$595,800	\$671,800
Plus: Actual return on plan assets	37,800	50,000	33,600
Plus: Contributions for the year	38,400	54,800	88,400
Less: Benefit payments for the year	(20,400)	(28,800)	(24,000)
PPA – End of year	<u>\$595,800</u>	<u>\$671,800</u>	<u>\$769,800</u>

	2018	2019	2020
Pension Plan Assets	37,800	41,706	47,026
Pension Expense	37,800	41,706	47,026

Factor 5: Gains and Losses

Difference between Expected Return and Actual Return on Plan Assets Computation:

	2018	2019	2020
Actual return	\$ 37,800	\$ 50,000	\$ 33,600
Less: Expected return (from factor 4)	<u>37,800</u>	<u>41,706</u>	<u>47,026</u>
Actuarial gain (Loss)	\$ 0	\$ 8,294	\$(13,426)

	2018	2019	2020
Pension Plan Assets	0	8,294	
OCI – Actuarial Gains/Losses	0	8,294	
OCI – Actuarial Gains/Losses			13,426
Pension Plan Assets			13,426

Change in Actuarial Assumptions

	2018	2019	2020
OCI – Actuarial Gains/Losses	0	90,000	0
Projected Benefit Obligation	0	90,000	0

Amortization of Gains and Losses Computation:

	2018*	2019*	2020
PBO – Beginning of year			\$ 804,390
PPA – Beginning of year			671,800
Greater of PBO or PPA			804,390
Corridor percentage			<u>10%</u>
Corridor			80,439
Accumulated OCI – Actuarial gains (losses) – beginning balance			<u>(81,706)**</u>
Amount to amortize			(1,267)
Average remaining service life			<u>10 years</u>
Gain (Loss) amortization			<u>\$ (127)</u>

* The beginning balance of the accumulated OCI actuarial gains (losses) is zero, so we do not perform the corridor computation.

** This consists of the prior year's change in actuarial assumptions (\$90,000 debit) and the prior year's unexpected return on plan assets (\$8,294 credit).

	2018	2019	2020
Pension Expense	0	0	127
OCI – Actuarial Gains/Losses	0	0	127

Continued

Factor 6: Funding the Plan

	2018	2019	2020
Pension Plan Assets	38,400	54,800	88,400
Cash	38,400	54,800	88,400

Factor 7: Payment to Retirees

	2018	2019	2020
Projected Benefit Obligation	20,400	28,800	24,000
Pension Plan Assets	20,400	28,800	24,000

After completing the analyses, Footos prepares one single journal entry for each year, as presented in Exhibit 19A.1.

EXHIBIT 19A.1 Income and Balance Sheet Summary of Pension Journal Entries (*Credits and credit balances reported in parentheses*)

Factor	2018	Comprehensive Income			Balance Sheet				
		Description	NI – Pension Expense	OCI – Prior Service Costs	OCI – Actuarial Gains/Losses	PBO	Plan Assets	AOCI – Prior Service Costs	AOCI – Actuarial Gains/Losses
		Beginning Balance				\$(540,000)	\$540,000	\$ 0	\$ 0

Earnings per Share

LEARNING OBJECTIVES

- 1 Compute basic earnings per share, including the necessary adjustments to the earnings per share numerator and the effect of stock splits and stock dividends on the denominator.
- 2 Calculate diluted earnings per share, including adjustments to income in the numerator and shares in the denominator for potentially dilutive securities such as convertible debt, convertible preferred stock, and employee options.
- 3 Determine the effect of antidilutive securities on the earnings or loss per share computation.
- 4 Describe required disclosures for earnings per share.

Introduction

MOST COMPANIES REPORT their financial statements in thousands, millions, even billions of dollars. So, you could find it surprising that CEOs, shareholders, and analysts care about pennies—that is, when those pennies are in *earnings per share*. Earnings per share (EPS), a measure of earnings available to

each common shareholder in a company, is the single most often quoted financial statistic in the business media. Business news channels consider every financial quarter “earnings season” and report earnings per share releases for numerous corporations. Commentators compare a company’s current-quarter EPS to analysts’ estimates. If actual EPS exceeds analysts’ expectations, there is typically a positive impact on share prices. Conversely, if actual EPS is lower than analysts’ forecasts, then the stock price will often decline.

Consider *Netflix, Inc.*, the subscription service company that provides movies and TV episodes over the Internet. *Netflix* reported a second-quarter EPS of \$1.15 per share in July 2014, an increase of \$0.66 per share from a year earlier. During the quarter, its revenues were \$1.34 billion, an increase of 25% from a year earlier. Yet, *Netflix* missed analysts’ expected EPS of \$1.16 per share by *one* penny and its stock price dropped by 5% on the earnings announcement.

We have discussed revenue and expense measurement and recognition issues throughout this text, working through several illustrations of how the choice of accounting methods can affect bottom-line net income or net loss. Net income or loss and its key subclassifications such as gross profit and operating income enable financial analysts to assess an entity’s future earnings and cash flows. These measures often fail to satisfy the information needed by many financial statement users. EPS, the seemingly simple financial ratio of net income divided by the number of common shares, is often the most critical disclosure reported on the income statement.

EPS figures guide potential investors and the market in general in estimating the value of a company. In addition, companies estimate the impact on EPS from new capitalization, initial public offerings, and merger and acquisition activity.

This chapter provides the details of constructing the earnings per share ratio. We begin with an overview of EPS and its importance to shareholders. We then move to the

M4OS Photos/Alamy Stock Photo

calculation of EPS (both *basic EPS* and *diluted EPS*), focusing on the income and shares used in different measures of earnings per common share. Throughout the discussion, we carefully integrate many topics from stockholders' equity,

employee options, convertible securities, and long-term debt. We also present required footnote disclosures for earnings per share. U.S. GAAP and IFRS are fully converged in the areas of EPS we discuss in the chapter. «

- 1 Compute basic earnings per share, including the necessary adjustments to the earnings per share numerator, and the effect of stock splits and stock dividends on the denominator.

Basic Earnings per Share

We begin our discussion with **basic earnings per share**, which is a measure of the earnings per share available to common shareholders that does not consider the potentially dilutive effects of convertible securities and employee options. We first discuss the conceptual underpinnings of EPS and then consider the components of the numerator and the denominator of basic EPS.¹

THE CONCEPTUAL FRAMEWORK CONNECTION Earnings per Share

According to the conceptual framework, the objective of financial reporting is to provide financial information useful to debt and equity investors for making investment decisions. Standard setters require that companies present EPS as a measure of an entity's performance for the reporting periods presented. EPS provides an easily understood snapshot of the performance of the firm in terms of each share of stock that investors own.

EPS is highly relevant to investors because it measures the overall performance of the firm. Specifically, EPS provides both predictive value for assessing the likely future performance of the firm as well as confirmatory value in evaluating prior predictions about the firm.

Basic EPS Numerator

The numerator for basic EPS is **net income available to common shareholders**, which is net income less preferred dividend requirements. Net income is the bottom line reported on the income statement.² We subtract preferred dividend requirements from net income to calculate the earnings that are available to common shareholders. That is, the calculation deducts any amounts paid, or required to be paid, to preferred shareholders.

The preferred dividend requirements include both dividends declared on preferred stock during the year and the current-year dividends in arrears on cumulative preferred stock.³ The prior years' EPS computations incorporated all past dividends in arrears, so it is not necessary to include the total balance of dividends in arrears. For example, *Kimberly-Clark Corporation* has no preferred stock, so its net income of \$2,166 million in 2016 is the numerator in the basic EPS computation. *Procter & Gamble Company*, on the other hand, has preferred stock and subtracted \$255 million of preferred stock dividends from its net income of \$10,508 million in the numerator of the basic EPS computation in 2016.

The numerator of the ratio is called net income available to common shareholders because the calculation excludes preferred shareholder claims. If there is a net loss, loss per share increases by the amount of preferred dividend requirements. The exclusion of preferred dividends clearly emphasizes the fact that EPS applies only to common shares.

¹For the relevant authoritative literature, see FASB ASC 260-10 – *Earnings per Share – Overall* for U.S. GAAP and IASC, *International Accounting Standard 33*, “Earnings per Share” (London, UK: International Accounting Standards Committee, Revised, 2003) for IFRS.

²EPS is reported on several different components of the income statement (e.g., EPS from income from continuing operations and EPS from income from discontinued operations). We will address these variations later in this chapter.

³As discussed in Chapter 15, cumulative preferred stock is a class of preference shares that accumulates undeclared dividends. If dividends are not declared on cumulative preferred shares, they go into arrears. Dividends in arrears must be paid before current-year preferred dividends and before any dividends can be paid to common shareholders. EPS computations deduct only the increase in dividends in arrears for the current year, not the total accumulated amount.

Basic EPS Denominator

The denominator for basic EPS is the weighted-average number of shares outstanding. Calculations of the weighted-average number of common shares include only outstanding shares. Outstanding shares are equal to issued shares less any treasury shares held by the company. The basic EPS denominator includes all classes of common stock. If an entity has two classes of common stock, it adds the shares outstanding for the two classes for basic EPS computations.⁴

The Importance of the Weighted Average. The weighted average is based on the amount of time that shares are outstanding. The numerator, net income, is a flow variable, and the denominator, number of outstanding shares, is a static or stock variable. Using the weighted-average number of common shares offers two advantages:

1. It creates a denominator that is consistent with the net income flow.
2. It matches the number of shares with the income generated from the economic resources provided by the shares issued.

The weighted-average computation uses the number of shares outstanding at different share-related events during the year and weights the shares by the percentage of the total year the shares are outstanding. The outstanding shares are weighted from the event date—such as the beginning balance date, issue date, conversion date, or exercise date—to year-end. For example, *Netflix's* weighted-average number of shares outstanding used in its basic EPS was 428.8 million in 2016. At the beginning of the year, *Netflix* had 427.9 million shares outstanding and at the end of the year, 430.1 million shares were outstanding. During the year, *Netflix* issued shares for stock-based executive compensation and upon the conversion of notes, both increasing the number of shares.

Equation 20.1 calculates basic EPS as follows:

$$\begin{aligned} \text{Basic EPS} &= \frac{\text{Net Income Available to Common Shareholders}}{\text{Weighted-Average Number of Common Shares Outstanding}} \\ &= \frac{\text{Net Income} - \text{Preferred Dividend Requirements}}{\text{Weighted-Average Number of Common Shares Outstanding}} \end{aligned} \quad (20.1)$$

Example 20.1 illustrates the computation of the weighted-average number of common shares.

EXAMPLE 20.1

Computation of Weighted-Average Number of Common Shares Using Changes in Shares Outstanding

PROBLEM: Storace Storage Corporation had \$170,000 net income and declared \$10,000 of preferred dividends in the current year. Storace begins the current year with 15,000 common shares outstanding. The company issued additional shares of 7,500 and 9,000 on May 1 and October 1, respectively. In addition, Storace purchased 1,500 shares of treasury stock on July 1. The firm's year-end is December 31. What is Storace's basic EPS?

SOLUTION: The numerator in Storace's basic EPS computation is \$160,000 computed as the \$170,000 net income less the \$10,000 preferred dividends declared.

Storace computes the weighted-average outstanding shares by defining weights as the percentage of the year from the event date to year-end. In the first row of the following table,

Continued

⁴Companies can issue several classes of common stock. For example, a company could have both Class A and Class B common stock that trade off voting rights for dividends. Class A can have more voting rights and a lower dividend payment than Class B. Nonetheless, both classes are combined for purposes of the EPS computation.

we assign the beginning balance, which is outstanding from January 1 to December 31, a weight of 12 / 12, or 100%. Similarly, the shares issued on May 1 are outstanding for 8 months from May 1 through December 31; the event date is May 1, so that the weight is 8/12. The following table shows the computation of the weighted-average number of common shares outstanding for the current year.

Date	Event	Number of Shares Outstanding	Weight by Number of Months Shares Outstanding	Weighted-Average Shares Outstanding
January 1	Balance	15,000	12 / 12	15,000
May 1	New issue	7,500	8 / 12	5,000
July 1	Treasury stock purchase	(1,500)	6 / 12	(750)
October 1	New issue	9,000	3 / 12	2,250
December 31	Balance	<u>30,000</u>		<u>21,500</u>

Storace has 30,000 outstanding shares at year-end and 21,500 weighted-average shares.

Storace's basic EPS is \$7.44 computed as \$160,000 divided by the 21,500 weighted shares outstanding.

Stock Splits and Stock Dividends. Stock splits and stock dividends also impact the computation of weighted-average common shares outstanding. For example, when *Nike Inc.* split its stock at the end of 2015, the number of shares outstanding doubled from 678 million to 1,356 million. Therefore, to calculate EPS, the company needed to divide its net income available to common stockholders by a greater number of shares outstanding after the split.

The accounting assumes that a stock split or stock dividend occurs at the *beginning of the year* for shares that were outstanding as of the beginning of the year. For share issuances that occur before the split or dividend, the **retroactive assumption** assumes that the split or dividend occurred at the *time of the issuance*. The retroactive assumption is a sound approach for several reasons:

1. In contrast to new issues and treasury share purchases, stock dividends and stock splits do not change cash or net assets. That is, stock dividends and stock splits do not change the economic resources available to generate income. As a result, including the additional shares on a retroactive basis does not mismatch the numerator and denominator of the EPS fraction.
2. Applying the retroactive assumption results in stating the number of shares before and after a stock dividend or split on the same basis. Financial statement users can therefore compare changes in EPS over time.
3. The retroactive assumption prevents management manipulation of EPS by the timing of stock dividends and stock splits. There are many economic reasons that affect the timing of stock dividends and stock splits, and the decision is not solely based on financial reporting results. However, the retroactive assumption prevents managers from timing the splits and dividends to occur later in the year, resulting in less weight, a smaller number for weighted-average shares outstanding, and thus a larger EPS. For example, if all shares are outstanding as of the beginning of the year, a company would weight the additional shares issued due to the stock split or stock dividend by 100%, regardless of the actual date of the split or dividend.⁵

Example 20.2 illustrates the effect of a stock split on the weighted-average number of common shares outstanding.

⁵The retroactive assumption also applies to stock dividends and stock splits that are distributed after the balance sheet date but before the company issues financial statements.

EXAMPLE 20.2**Computation of Weighted-Average Number of Common Shares with a Stock Split**

PROBLEM: Sports Emporium, Inc. began the year with 15,000 common shares outstanding. The firm issued an additional 7,500 shares on May 1 and another 1,500 shares on November 1. In addition, it implemented a 2-for-1 stock split on July 1. The firm's year-end is December 31. What are the weighted-average numbers of common shares outstanding for the year?

SOLUTION: Sports Emporium weights the beginning balance of 15,000 shares outstanding by 12/12 for the full year. We weight the 7,500 shares issued on May 1 by 8/12 because they are outstanding for 8 months (May through December). Multiplying the number of shares outstanding on May 1 by 2 reflects the effect of the 2-for-1 stock split on a retroactive basis.

We weight the stock issuance on November 1 by 2/12 because it is outstanding for 2 months. There is no adjustment of this amount for the stock split because it occurs after the split. The following table illustrates the computation of the weighted-average number of common shares outstanding for the current year. There are 40,250 weighted-average common shares and 46,500 outstanding shares at year-end.

Date	Event	Number of Shares Outstanding	Weight by Number of Months Shares Outstanding	Weighted-Average Shares Outstanding
January 1	Balance	15,000	12/12	15,000
May 1	New issue	<u>7,500</u>	8/12	<u>5,000</u>
	Subtotal before the stock split	22,500		20,000
July 1	2-1 stock split	<u>× 2</u>	Retroactive application	<u>× 2</u>
	Subtotal after the stock split	45,000		40,000
November 1	New issue	<u>1,500</u>	2/12	<u>250</u>
December 31	Balance	<u>46,500</u>	Weighted Average	<u>40,250</u>

JUDGMENTS IN ACCOUNTING**Presentation of EPS**

At first glance, the EPS computation seems mechanical—just enter numbers into a fixed formula. However, any judgment that affects income also affects EPS. In fact, managers can make decisions for the sole purpose of impacting EPS. As noted earlier, *Netflix* missed its second-quarter earnings forecasts in 2014 by only 1 cent per share and its stock price fell by 5%. Managers are incentivized to manage EPS to meet analysts' estimates and avoid the adverse effect on share prices from missing EPS forecasts. Managers are also motivated to manage the company's EPS in order to increase their own compensation when bonus plans or other compensation schemes are based on net income or stock price.

Many of the judgments that we have already discussed throughout this text impact EPS. For example, consider estimating the bad debt expense in a given year (discussed in Chapter 9). Any decisions that affect this accrual will also impact earnings and ultimately EPS. As another example, a decision to record a larger impairment loss will decrease net income and reduce EPS. Many decisions that a firm makes impact net income and thus EPS. Exhibit 20.1 outlines some of the judgments that we have discussed in this book and their impact on EPS.

EXHIBIT 20.1 Summary of Judgments

Chapter	Issue	Impact of Judgment on	
		Statement of Net Income Account	Balance Sheet Account
8	Various issues related to the five steps of revenue recognition	Revenue	Accounts Receivable and others
9	Measurement of bad debt expense and allowance for bad debts	Bad Debt Expense	Allowance for Bad Debts (netted with Accounts Receivable)
10	Initial measurement of inventory	Cost of Goods Sold	Inventory
10	Choice of inventory cost flow assumptions	Cost of Goods Sold	Inventory
11	Initial measurement of PPE*	Depreciation Expense	Accumulated Depreciation (netted with PPE)
12	Measurement of impairments of PPE	Impairment Loss	PPE
13	Initial measurement of ARO**	Depreciation Expense and Accretion Expense	ARO
13	Recognition and measurement of contingencies	Various expense accounts	Contingent Liabilities
14	Bifurcation of debt and equity components of hybrid securities	Interest Expense	Various Liability and Equity accounts
16	Classification of investments	Unrealized Gains/Losses and/or Investee's Portion of Income	Investments
16	Measurement of impairments of investments	Impairment Loss	Investments
17	Determination of valuation allowance	Income Tax Expense	Valuation Allowance (netted with Deferred Tax Asset)
17	Determination of tax contingency	Income Tax Expense	Deferred Tax Liability
18	Classification of lease types	Rental, Amortization, Lease, and Interest Expense, Rental and Interest Revenue	PPE and Lease Obligation
19	Measurement of stock-based compensation	Compensation Expense	APIC-Stock Options, Liability for Stock-Based Compensation
19	Measurement of the pension obligation	Pension Expense	Net Pension Asset or Liability

* Property, plant, and equipment

** Asset retirement obligation

- ② Calculate diluted earnings per share, including adjustments to income in the numerator and shares in the denominator for potentially dilutive securities such as convertible debt, convertible preferred stock, and employee options.

Diluted Earnings per Share

A company's **capital structure** indicates its sources of funds from debt and equity issuances used to finance overall operations and capital expenditures. The previous discussion focused on companies with *simple* capital structures that issue only common and nonconvertible preferred shares. That is, these companies have no **potentially dilutive securities**, which are securities that are not currently common shares but could become common stock through conversion or exercise.

Companies with *complex* capital structures issue potentially dilutive securities, including convertible debt, convertible preferred stock, employee options, and stock warrants.⁶ Potentially dilutive securities can increase the number of common shares outstanding when exercised or converted into common shares, thus reducing or diluting EPS. For example, *Johnson & Johnson's* earnings per share footnote disclosure in its 2016 financial statements noted that its outstanding convertible debt and stock options could potentially dilute its EPS.

The **diluted EPS** computation incorporates the effects of potentially dilutive securities. In this section, we examine three potentially dilutive securities that commonly impact diluted EPS: convertible debt, convertible preferred stock, and options.⁷

⁶Stock warrants are essentially long-term options and are usually satisfied from new share issues rather than from treasury shares.

⁷Contingent share arrangements are contracts or agreements that could result in firms issuing additional shares upon the satisfaction of certain future conditions. Firms typically include these shares in the computation of EPS when the condition has been met.

If-Converted Assumption

The *if-converted assumption* is used to incorporate potentially dilutive securities in the EPS computation. Under the **if-converted assumption**, a company assumes that both hypothetical and actual conversions of potentially dilutive securities occur:

1. At the *beginning of the year* if the potentially dilutive security is outstanding as of the beginning of the year
2. At the *issue date of the dilutive security* if the potentially dilutive security is issued during the year

This conservative approach maximizes the number of shares that reduce diluted EPS by assuming that events that increase the number of common shares outstanding and reduce EPS occur at the earliest possible point during the year. For example, if an actual bond conversion occurs on July 1 but the bonds were outstanding as of January 1, the company assumes that the conversion occurred at the beginning of the year. In this case, the shares will receive a full 12-month weight when computing the number of weighted-average common shares outstanding rather than using only the actual 6-month weight. As a result, the denominator is larger than if the actual event date is used to weight the shares.

Convertible Debt

Convertible debt is an obligation with an option that permits the debtholder to convert the debt into common stock. We discussed convertible debt extensively in Chapter 14. Calculating diluted EPS for a company with outstanding convertible debt requires adjusting both the numerator and the denominator.

Diluted EPS Numerator. The if-converted assumption places the conversion of all convertible debt into common stock at the earliest possible point during the year. This assumption affects the treatment of interest expense for convertible debt in two ways:

1. The firm avoids the interest expense on convertible debt for the period of the year the debt was assumed to be converted into common stock. For debt issued at a discount or premium, the firm uses the effective interest rate to compute interest expense. By assuming conversion, the firm avoids the amount of interest expense deducted in the computation of net income under the accrual basis and instead adds it back to net income.
2. Interest on debt is generally tax deductible. Therefore, the firm adjusts the net income in the numerator of the diluted EPS for the reduced interest expense, net of tax.

Johnson & Johnson added back \$2 million of interest on its convertible debt when computing its diluted EPS in 2016. Example 20.3 demonstrates the effect of convertible debt on the diluted EPS numerator.

EXAMPLE 20.3

Effect of Convertible Debt on the Diluted EPS Numerator

PROBLEM: Cincinnati Crafters reported \$100,000 in interest expense for convertible bonds issued several years ago. The company is subject to a 40% effective tax rate. There were no actual conversions during the current year. What adjustment is needed to the company's diluted EPS numerator?

SOLUTION: Using the if-converted assumption, the company assumes that debtholders converted the bonds as of the beginning of the current year and as a result, Cincinnati Crafters would not incur the \$100,000 interest expense before tax. The interest tax deduction saves the company \$40,000 in taxes paid ($40\% \times \$100,000$). Therefore, the after-tax cost of interest is \$60,000 ($\$100,000 - \$40,000$). As a result, net income in the numerator increases by \$60,000 computed as follows:

Interest expense	\$100,000
Tax deduction (based on a 40% effective tax rate)	(40,000)
Assumed after-tax interest savings on bond conversion	<u>\$ 60,000</u>

Diluted EPS Denominator. Firms increase the diluted EPS ratio denominator by the number of shares assumed to be issued upon conversion, weighting the additional shares from the beginning of the year or from the date of issue, if the convertible debt was issued during the year. To illustrate, consider a company that reports debt outstanding from the *beginning* of the year and the debt is convertible to 1,000 shares of common stock. The company increases the weighted-average number of common shares outstanding by 1,000 shares when computing diluted EPS ($1,000 \text{ shares} \times 12/12$). Alternatively, if the firm issued the convertible debt *midyear* on July 1 and assumed converted, then the company would increase the number of weighted-average common shares outstanding by 500 shares ($1,000 \times 6/12$) when computing diluted earnings per share.

In *Johnson & Johnson's* calculation of diluted EPS, it added 1.3 million shares in the denominator related to the dilutive effect of convertible debt in 2016. Exhibit 20.2 illustrates the numerator and denominator adjustments in the diluted EPS computation. Example 20.4 provides an example of the computation of diluted EPS when a company has convertible debt.

EXHIBIT 20.2 Computation of Diluted EPS with Convertible Debt

$$\text{Diluted EPS} = \frac{\text{Net Income Available to Common Shareholders} + \text{Interest Expense} \times (1 - \text{Tax Rate})}{\text{Weighted-Average Number of Common Shares Outstanding} + \text{Weighted Common Shares on Debt Conversion}} \quad (20.2)$$

$$\text{Diluted EPS} = \frac{\text{Net Income} - \text{Preferred Dividend Requirements} + \text{Interest Expense} \times (1 - \text{Tax Rate})}{\text{Weighted-Average Number of Common Shares Outstanding} + \text{Weighted Common Shares on Debt Conversion}} \quad (20.3)$$

EXAMPLE 20.4 Convertible Debt Outstanding for a Full Year with No Actual Conversions

PROBLEM: Dayton Builders began the current year with 800,000 common shares outstanding and issued an additional 300,000 shares on September 1. Dayton also reported \$2,300,000 par value, 3% nonconvertible, noncumulative preferred stock outstanding. The preferred shares were outstanding for a full year, and Dayton declared dividends for the current year. In addition, the firm has \$20,000,000, 5% convertible bonds outstanding for a full year. Dayton issued the bonds at face value. Therefore, the company incurs \$1,000,000 of interest expense per year (i.e., $5\% \times \$20,000,000$). The bonds are convertible into 450,000 shares of common stock. Debtholders did not convert any of the bonds during the current year. The company is subject to a 40% effective tax rate and reported net income of \$7,000,000 for the current year. What are basic and diluted EPS for Dayton Builders?

SOLUTION: We begin by computing basic EPS for Dayton Builders.

$$\begin{aligned} \text{Numerator} &= \text{Net Income Available to Common Shareholders} \\ &= \text{Net Income} - \text{Preferred Dividend Requirements} \\ &= \$7,000,000 - (\$2,300,000 \times 3\%) \\ &= \$7,000,000 - \$69,000 \\ &= \$6,931,000 \end{aligned}$$

The weighted-average number of common shares outstanding for the denominator is as follows:

Date	Event	Number of Shares Outstanding	Weight by Number of Months Shares Outstanding	Weighted-Average Shares Outstanding
January 1	Balance	800,000	12/12	800,000
September 1	New issue	<u>300,000</u>	4/12	<u>100,000</u>
December 31	Balance	<u>1,100,000</u>		<u>900,000</u>

There are 900,000 weighted-average common shares at year-end. Thus, basic EPS is:

$$\text{Basic EPS} = \frac{\$6,931,000}{900,000} = \underline{\underline{\$7.70}}$$

To compute diluted EPS, we need to adjust the numerator and the denominator. First, we compute the after-tax interest adjustment to the numerator as follows:

Interest expense	\$1,000,000
Tax deduction (based on a 40% effective tax rate)	<u>(400,000)</u>
Assumed after-tax interest savings on bond conversion	<u>\$ 600,000</u>

We add back \$600,000 of after-tax interest so that the adjusted numerator is \$7,531,000 (\$7,000,000 net income minus preferred dividends of \$69,000 plus the \$600,000 interest adjustment).

Second, the adjusted denominator is 1,350,000, which consists of the 900,000 shares computed for the basic EPS plus the 450,000 additional shares that Dayton Builders would have outstanding upon assumed conversion of the debt. Diluted EPS is therefore:

$$\begin{aligned} \text{Diluted EPS} &= \frac{(\$6,931,000 + \$600,000)}{(900,000 + 450,000)} \\ &= \frac{\$7,531,000}{1,350,000} = \underline{\underline{\$5.58}} \end{aligned}$$

Diluted EPS is \$5.58 in comparison to Dayton's basic EPS of \$7.70.

Convertible Debt Outstanding with Conversion. Firms still use the if-converted assumption if debtholders actually convert the debt during the year. For example, if all of Dayton Builders' bonds in Example 20.4 convert on October 1, then the 450,000 shares are actually issued for 3 months and receive a 3/12 weight in basic EPS. Dayton therefore includes 112,500 shares on the actual conversion to the weighted-average shares used for basic EPS (i.e., 450,000 shares \times 3/12). Applying the if-converted assumption for diluted EPS, Dayton includes shares as of the beginning of the year. This requires an additional 9/12 weight or 337,500 shares included in the weighted-average number of shares used for diluted EPS (i.e., 450,000 shares \times 9/12). The total weighted-average shares used in diluted EPS are 450,000 (i.e., 112,500 shares actually issued and 337,500 if-converted shares). This is the same number of weighted-average shares as in the case in which there are no actual conversions. Adjustments to the numerator of EPS will also be made for interest.

Example 20.5 illustrates a similar scenario to Example 20.4, but now all bondholders actually convert their convertible debt into common stock during the year.

EXAMPLE 20.5

Convertible Debt Outstanding with Actual Conversion During the Year

PROBLEM: Use the same information presented in Example 20.4 for Dayton Builders but now assume that all bonds actually converted on March 1 of the current year. Because of the actual bond conversion, 10 months' interest is avoided and Dayton's net income increased by \$500,000 to \$7,500,000. Dayton incurs interest for only 2 months rather than a full year because the bondholders convert on March 1. The difference in income is due to the after-tax interest savings, as computed as follows.

Description	Computations	Interest Expense
Debt interest for a full year	$\$20,000,000 \times 5\% \times (1 - .4) \times 12/12$	\$600,000
Debt interest for 2 months	$\$20,000,000 \times 5\% \times (1 - .4) \times 2/12$	<u>(100,000)</u>
Increase in income		<u>\$500,000</u>

Continued

What are basic and diluted EPS for Dayton Builders?

SOLUTION: We first compute basic EPS. Net income is \$7,500,000 and preferred dividend requirements are \$69,000 ($\$2,300,000 \times 3\%$). Thus, the numerator or net income available to common shareholders is \$7,431,000 (i.e., $\$7,500,000 - \$69,000$). The denominator will not be the same as in Example 20.4 because of the debt conversion on March 1. We compute the weighted-average number of common shares outstanding as follows:

Date and Event	Number of Shares Outstanding	Weight by Number of Months Shares Outstanding	Weighted-Average Shares Outstanding
1/1: Balance	800,000	12/12	800,000
3/1: Actual bond conversion	450,000	10/12	375,000
9/1: New issue	300,000	4/12	100,000
12/31: Balance	<u>1,550,000</u>		<u>1,275,000</u>

There are 1,275,000 weighted-average shares and 1,550,000 shares outstanding at year-end. Basic EPS is \$5.83 per share determined as follows:

$$\text{Basic EPS} = \frac{\$7,431,000}{1,275,000 \text{ shares}} = \underline{\underline{\$5.83}}$$

We now compute the diluted EPS, first determining the numerator adjustment. In Example 20.4, Dayton computed an adjustment to the numerator of \$600,000. However, now the debt is outstanding for only 2 months as opposed to 12 months, and the after-tax interest savings from the assumed conversion as of the beginning of the year is \$100,000 ($\$600,000 \times 2/12$).

Next, we compute the adjustment to the denominator. According to the if-converted assumption, we assume that Dayton converted the bonds at the beginning of the year instead of March 1. Thus, we need to weight the 450,000 converted shares by an additional 2/12 for an adjustment of 75,000 shares. Note that the weighted-average number of common shares for basic EPS captures the 10-month period from the date of conversion to year-end using a 10/12 weight and that the other 2/12 of the year is included in diluted earnings per share. As a result, a full year is included in diluted EPS, which is the same as the case in which the convertible debt was outstanding as of the beginning of the year.

Diluted EPS is computed as follows:

$$\begin{aligned} \text{Diluted EPS} &= \frac{\$7,500,000 - \$69,000 + \$100,000}{(1,275,000 + 75,000)} \\ &= \frac{\$7,531,000}{1,350,000} = \underline{\underline{\$5.58}} \end{aligned}$$

Diluted EPS is \$5.58 in comparison to Dayton's basic EPS of \$5.83.

Diluted EPS is \$5.58 in both Examples 20.4 and 20.5. Therefore, diluted EPS is the same whether there are actual or hypothetical events.

Convertible Debt Issued during the Year. Convertible debt was outstanding as of the beginning of the year in our prior illustrations. What adjustments are required if convertible debt is issued during the year? The firm adjusts the numerator by the interest amount computed from the date of issue until the end of the year and computes the denominator based on the assumption that the bonds are converted when issued. Example 20.6 illustrates computing diluted EPS when convertible debt is issued during the year.

EXAMPLE 20.6 Convertible Debt Issued During the Year

PROBLEM: Using the information from Example 20.4, now assume that Dayton Builders issued convertible debt on February 1 so that the debt is outstanding for only 11 months. With the convertible debt issued during the year, net income of \$7,050,000 is \$50,000 higher than in Example 20.4. The difference in net income resulting from after-tax interest savings is computed as follows:

Description	Computations	Interest Expense
Debt interest for a full year	$\$20,000,000 \times 5\% \times (1 - .4) \times 12/12$	\$600,000
Debt interest for 11 months	$\$20,000,000 \times 5\% \times (1 - .4) \times 11/12$	<u>(550,000)</u>
Increase in income		<u>50,000</u>

There are no actual conversions during the year. What are basic and diluted EPS for Dayton Builders?

SOLUTION: We first determine basic EPS. Net income is \$7,050,000 and preferred dividend requirements are equal to \$69,000 ($\$2,300,000 \times 3\%$). Thus, the numerator or net income available to common shareholders is \$6,981,000 ($\$7,050,000 - \$69,000$). The weighted-average number of common shares outstanding is as follows:

Date	Event	Number of Shares Outstanding	Weight by Number of Months Shares Outstanding	Weighted-Average Shares Outstanding
January 1	Balance	800,000	12/12	800,000
September 1	New issue	<u>300,000</u>	4/12	<u>100,000</u>
December 31	Balance	<u>1,100,000</u>		<u>900,000</u>

There are 900,000 weighted-average shares at year-end. We compute basic EPS as \$7.76 per share as follows:

$$\text{Basic EPS} = \frac{\$6,981,000}{900,000} = \underline{\underline{\$7.76}}$$

In order to compute diluted EPS, we need to adjust the numerator and the denominator. First, we compute the after-tax interest adjustment to the numerator. Dayton Builders incurred pre-tax interest expense of \$916,667 ($\$20,000,000 \times 5\% \times 11/12$) related to the convertible debt. We adjust the numerator for the after-tax interest savings from the assumed bond conversion as follows:

Interest expense	\$916,667
Tax deduction (based on a 40% effective tax rate)	<u>(366,667)</u>
Assumed after-tax interest savings on bond conversion	<u>\$550,000</u>

Adding back \$550,000 of after-tax interest savings, the adjusted numerator is \$7,531,000 ($\$7,050,000$ net income minus \$69,000 preferred dividend plus the \$550,000 interest adjustment).

Second, we adjust the denominator for the assumed conversion. Because Dayton Builders did not issue the convertible bonds until February 1, we can assume conversion only as of that point. Therefore, we weight the 450,000 additional shares by 11/12 to arrive at the 412,500 weighted shares issued on assumed conversion (i.e., $450,000 \text{ shares} \times 11/12$).

$$\begin{aligned} \text{Diluted EPS} &= \frac{\$7,050,000 - \$69,000 + \$550,000}{900,000 + 412,500} \\ &= \frac{\$7,531,000}{1,312,500} = \underline{\underline{\$5.74}} \end{aligned}$$

Diluted EPS is \$5.74 in comparison to Dayton's basic EPS of \$7.76.

Convertible Preferred Stock

As defined in Chapter 15, convertible preferred shares are securities that can be converted to a fixed number of shares of common stock at the option of preferred shareholders. Conversion of preferred stock requires adjustments to both the numerator and the denominator of the EPS equation from applying the if-converted assumption:

1. If the firm issues the preferred stock during the year: Assume that conversion occurs at the issue date.
2. If convertible preferred shares were outstanding as of the beginning of the year: Assume that conversion occurs at the beginning of the year.

Diluted EPS Numerator. Firms adjust the numerator of basic EPS for the preferred dividends avoided if the preferred shares are assumed to convert into common stock. The firm subtracts any preferred dividends declared as well as the current-year increase in dividends in arrears on cumulative preferred stock to determine income available to common shareholders in the computation of basic EPS. Applying the if-converted assumption avoids the dividends associated with the convertible preferred shares. As a result, firms can ignore the preferred dividends and therefore eliminate the effect of the preferred dividend requirements related to the convertible preferred shares. Because dividends are not generally tax deductible, tax effects are not applicable. Cumulative preferred dividends are weighted by the number of months the preferred stock is outstanding in any given year.

Diluted EPS Denominator. As is the case with convertible debt, the firm adjusts the diluted EPS ratio denominator for the impact of the assumed conversion of convertible preferred stock by increasing the denominator by the number of shares issued on assumed conversion. The firm weights the number of shares from the beginning of the year or from the date of issue if it issued the preferred stock during the year.

Exhibit 20.3 illustrates the numerator and denominator adjustments in the diluted EPS computation.

EXHIBIT 20.3 Computation of Diluted EPS with Convertible Preferred Stock

$$\text{Diluted EPS} = \frac{\text{Net Income Available to Common Shareholders} + \text{Preferred Dividends Avoided on Convertible Preferred Stock}}{\text{Weighted-Average Number of Common Shares Outstanding} + \text{Weighted Common Shares on Preferred Stock Conversion}} \quad (20.4)$$

$$\text{Diluted EPS} = \frac{\text{Net Income} - \text{Preferred Dividend Requirements} + \text{Preferred Dividends Avoided on Convertible Preferred Stock}}{\text{Weighted-Average Number of Common Shares Outstanding} + \text{Weighted Common Shares on Preferred Stock Conversion}} \quad (20.5)$$

Example 20.7 illustrates the adjustments for convertible preferred stock in the computation of diluted EPS.

EXAMPLE 20.7 Convertible Preferred Stock

PROBLEM: Hammond Aeronautics has 400,000 shares of common stock and 150,000 shares of noncumulative, convertible preferred stock outstanding throughout the year. Hammond declared \$100,000 in dividends on the preferred shares. The preferred stock is convertible into common stock at a rate of one share of preferred stock for each share of common stock. Hammond's net income for the year was \$700,000. What are basic and diluted EPS for Hammond Aeronautics?

SOLUTION: We compute the basic EPS as follows:

$$\text{Basic EPS} = \frac{\text{Net Income Available to Common Shareholders}}{\text{Weighted-Average Common Shares Outstanding}}$$

$$\begin{aligned} \text{Basic EPS} &= \frac{\text{Net Income} - \text{Preferred Dividend Requirements}}{\text{Weighted-Average Common Shares Outstanding}} \\ &= \frac{\$700,000 - \$100,000}{400,000} = \mathbf{\$1.50} \end{aligned}$$

To compute diluted EPS, we assume that all preferred shares convert into common stock as of the beginning of the year. Net income available to common shareholders will increase by the amount of the preferred dividends avoided on assumed conversion. As a result, we need to (1) add back the preferred dividends avoided to the numerator (no tax effects and not weighted) and (2) add the assumed-if converted weighted shares to the denominator as follows:

$$\text{Diluted EPS} = \frac{\$700,000 - \$100,000 + \$100,000}{400,000 + 150,000} = \mathbf{\$1.27}$$

Hammond's diluted EPS is \$1.27, in comparison to basic EPS of \$1.50.

Options and Warrants

Stock options and warrants are financial instruments that give the holder the right but not the obligation to acquire equity shares from the issuing corporation over a fixed time period and at a specified price. The options are often employee stock options granted by the company to its employees as a form of compensation.⁸ A company with any options or warrants outstanding must consider the effects of these potentially dilutive securities on EPS. The if-converted assumption does not usually impact the EPS numerator because there is typically no impact on net income available to common shareholders when the options or warrants are exercised.

Diluted EPS Denominator. There are two key factors to consider for the adjustment to the denominator:

1. The increase in common shares outstanding due to the assumed option/warrant exercise of in-the-money instruments.
2. The cash proceeds the company receives from the assumed exercise of the options or warrants.

The diluted EPS denominator adjustment assumes that the company uses the proceeds to buy its own shares in the market. Subtracting the treasury shares assumed to be repurchased from the total number of shares issued on the assumed exercise determines the number of **incremental shares** remaining in the market. The incremental shares are in the denominator of diluted EPS assuming that the options or warrants were exercised under an approach generally known as the *treasury stock method*.⁹

Treasury Stock Method. The **treasury stock method** assumes that firms use the proceeds from the hypothetical exercise of in-the-money options or warrants to purchase treasury stock at the average market price of the common stock for the period.¹⁰ The average market price should

⁸We discussed employee stock options in depth in Chapter 19.

⁹We use all outstanding options for this computation. Outstanding options include both vested (exercisable) and non-vested (non-exercisable) options.

¹⁰The period of the earnings per share computation can be annual or quarterly. The period of the earnings per share computation is critical because firms make a unique EPS computation for each quarter. As a result, options can be dilutive for 1 quarter and not for another. Similarly, the options can be dilutive for a certain quarter but not for the year-end EPS disclosure. Consequently, EPS cannot be added across quarters, and the annual EPS number is not the sum of those for the 4 quarters' EPS. U.S. GAAP requires that the incremental shares used in the EPS computation for the annual period is equal to the weighted average of the incremental shares reported in the 4 quarters.

represent a meaningful average. Yet what is a meaningful average? In theory, the calculation should include every market transaction for the period in the computation. In practice, a daily or weekly average price is used for companies that are actively traded. However, in cases where shares are not actively traded and there are no significant changes in capital structure, this approach might not be practical or cost effective, so a simple average annual price can be used. If there is little fluctuation in share price during the year, the closing price is considered a meaningful average.

Johnson & Johnson applied the treasury stock method to determine the dilutive effect of its employee stock options in its 2016 financial statements. In 2016, *Johnson & Johnson* increased the number of shares over those in its basic EPS by about 3.3% for the dilutive effect of options.

Exhibit 20.4 illustrates the denominator adjustment in the diluted EPS computation for options and warrants assuming no convertible securities.

EXHIBIT 20.4 Computation of Diluted EPS with Options or Warrants

$$\text{Diluted EPS} = \frac{\text{Net Income Available to Common Shareholders}}{\text{Weighted-Average Number of Common Shares Outstanding} + \text{Incremental Common Shares on Option or Warrant Exercise}} \quad (20.6)$$

$$\text{Diluted EPS} = \frac{\text{Net Income} - \text{Preferred Dividend Requirements}}{\text{Weighted-Average Number of Common Shares Outstanding} + \text{Incremental Common Shares on Option or Warrant Exercise}} \quad (20.7)$$

Example 20.8 shows the effect of options on diluted EPS.

EXAMPLE 20.8 Effect of Options on Diluted EPS

PROBLEM: The Edwards Group's current-year net income is \$9,000,000. The company reported 5,400,000 common shares outstanding for the year, and the average price per common share for the year is \$72. In addition, Edwards has 1,800,000 options outstanding all year with an exercise price of \$54 per share. Compute basic and diluted EPS for Edwards Group. Each option can be exercised for one share of common stock.

SOLUTION: The basic EPS for the year is simply the net income (\$9,000,000) divided by the weighted-average number of common shares outstanding (5,400,000), or \$1.67 per share.

$$\begin{aligned} \text{Basic EPS} &= \frac{\text{Net Income} - \text{Preferred Dividend Requirements}}{\text{Weighted-Average Common Shares Outstanding}} \\ &= \frac{\$9,000,000}{5,400,000} = \mathbf{\$1.67} \end{aligned}$$

The diluted EPS computation takes into account the potential dilutive effects of the assumed option exercise. First, we consider the 1,800,000 shares associated with the options because these shares would be outstanding if the options were exercised as of the beginning of the year. Second, we consider the number of shares that could be purchased in the market with the cash proceeds from the assumed option exercise. Edwards computes the number of treasury shares that it could purchase as follows:

Number of shares issued from assumed exercise	1,800,000	1,800,000
Times exercise price	<u>× \$54</u>	
Proceeds that would be received from assumed exercise	\$97,200,000	
Divided by average market price per share	<u>÷ \$72</u>	
Number of treasury shares from assumed purchase		(1,350,000)
Adjustment to denominator: Incremental shares		<u>450,000</u>

Thus, we increase the denominator by the 450,000 incremental shares. There is no numerator effect for the assumed exercise of options, so diluted EPS is computed as follows:

$$\text{Diluted EPS} = \frac{\$9,000,000 + 0}{5,400,000 + 450,000} = \underline{\underline{\$1.54}}$$

Edwards Group's diluted EPS is \$1.54 in comparison to basic EPS of \$1.67.

Exhibit 20.5 summarizes numerator and denominator adjustments to basic EPS for the three types of dilutive securities covered.

EXHIBIT 20.5 Summary of EPS Adjustments for Dilutive Securities

<i>Dilutive Security</i>	<i>Adjustments to Basic EPS Computation</i>	
	<i>Numerator</i>	<i>Denominator</i>
Convertible debt	Add back after tax interest expense	Add additional weighted shares on debt conversion
Convertible preferred stock	Add back preferred dividends on convertible preferred stock	Add additional weighted shares on preferred stock conversion
Options or warrants	No numerator effect	Add weighted incremental shares on option or warrant exercise using the if-converted assumption

Diluted Earnings per Share: IFRS

The computation of diluted EPS is similar under U.S. GAAP and IFRS except for the assumption related to the conversion of convertible bonds that can also be settled for cash. For example, a company could have the option to pay off convertible bonds rather than issue shares. U.S. GAAP assumes that all of the securities will be settled in shares unless evidence is provided to the contrary. In this case, IFRS assumes that all of these securities will be settled in shares.¹¹ Therefore, diluted EPS can be lower under IFRS because more shares would be included in the denominator.

- ③ Determine the effect of antidilutive securities on the earnings or loss per share computation.

Antidilutive Securities

An **antidilutive effect** occurs if EPS increases or loss per share decreases when assuming the conversion of securities or exercising options and warrants. Firms exclude the effects of all antidilutive securities in the EPS computation per the standard setters' intention that diluted EPS be the most conservative measure of EPS. In this section, we overview the process for treating antidilutive convertible securities and options and warrants. Antidilution is tested at the income from continuing operations level.

Antidilutive Convertible Securities

Convertible securities can have either a dilutive or antidilutive effect because they impact both the numerator and the denominator of the EPS ratio. Firms determine whether a security is antidilutive by computing the incremental income per share effect of the assumed conversion and comparing it to basic EPS. If the incremental income per share effect is higher than basic EPS, then the security is antidilutive. Example 20.9 demonstrates the antidilutive effect of a single convertible security.

¹¹Another minor difference between U.S. GAAP and IFRS relates to incremental share computation under the treasury stock method. In the computation of the number of incremental shares under the treasury stock method, U.S. GAAP requires the incremental shares to be computed as the weighted average of the incremental shares reported in the 4 quarters. IFRS does not have a similar requirement.

EXAMPLE 20.9 Antidilutive Effect of a Single Convertible Security

PROBLEM: Hammond Aeronautics has 400,000 shares of common stock and 150,000 shares of noncumulative, convertible preferred stock outstanding for the year. Hammond declared \$100,000 in dividends on the preferred shares; net income for the year is \$700,000. The preferred stock is convertible at a rate of one common share for three shares of preferred stock. Are the convertible preferred shares antidilutive?

SOLUTION: Hammond's basic EPS is \$1.50, as computed:

$$\text{Basic EPS} = \frac{\text{Net Income Available to Common}}{\text{Weighted-Average Common Shares Outstanding}}$$

$$\begin{aligned} \text{Basic EPS} &= \frac{\text{Net Income} - \text{Preferred Dividend Requirements}}{\text{Weighted-Average Common Shares Outstanding}} \\ &= \frac{\$700,000 - \$100,000}{400,000} = \mathbf{\$1.50} \end{aligned}$$

Hammond calculates the number of incremental shares using the 3-to-1 conversion ratio, weighting the additional shares by 12/12 because the preferred stock was outstanding for the year ($1/3 \times 150,000$ preferred shares = 50,000 common shares $\times 12/12$). The incremental income per share effect of the preferred shares is determined as follows:

$$\begin{array}{l} \text{Incremental Income} \\ \text{per Share Effect} \end{array} = \frac{\$100,000 \text{ Add Back of Preferred Dividends}}{50,000 \text{ Common Shares}} = \mathbf{\$2.00}$$

When eliminating the effect of preferred dividends, the \$2.00 incremental income per share effect is greater than the \$1.50 basic EPS, indicating that this security is antidilutive. Therefore, Hammond should not include these convertible preferred shares in the diluted EPS computation.

In a simple example with only one potentially dilutive security, firms can compute diluted EPS by making the adjustments to the numerator and the denominator of the EPS formula. Example 20.10 illustrates adjusting EPS for the antidilutive effect of convertible securities.

EXAMPLE 20.10 Antidilutive Effect of Convertible Securities—Adjusting the EPS Formula

PROBLEM: Consider the information in Example 20.9. Determine whether the convertible preferred stock is antidilutive by making the adjustments to the EPS formula.

SOLUTION: Hammond's diluted EPS is computed as follows:

$$\text{Diluted EPS} = \frac{\$700,000 - \$100,000 + \$100,000}{400,000 + 50,000} = \mathbf{\$1.56}$$

If all convertible preferred shareholders convert into common stock, the dividends on the convertible preferred shares are avoided. As a result, the dividends on the related convertible preferred shares are eliminated and diluted EPS (\$1.56) is higher than the basic EPS (\$1.50). Therefore, the convertible preferred shares are antidilutive and cannot be included in the diluted EPS computation. In this case, Hammond reports both basic and diluted EPS at \$1.50 per share.

Antidilutive Options and Warrants

When considering the effects of options and warrants on diluted earnings per share, the security must be in the money—that is, the exercise price must be less than the market price—to assume exercise. An investor would not exercise out-of-the-money securities if it were less expensive to purchase securities in the market. In-the-money securities result in incremental shares; out-of-the-money securities result in negative incremental shares and are antidilutive. With out-of-the-money securities, the issuing company has received more funds than it needs to buy back the issued shares and is able to acquire more shares than it issued. The number of outstanding shares will decrease, and EPS will increase as illustrated in Example 20.11.

Standard setters do not allow firms to include out-of-the-money options in the diluted EPS computation. For example, *Procter & Gamble's* diluted EPS excluded 55 million, 8 million, and 9 million shares related to options in 2016, 2015, and 2014, respectively, because the exercise price of the options was greater than their average market value. Positive incremental shares are required for dilution to take place.

EXAMPLE 20.11

Antidilutive Effect of Options on Diluted EPS

PROBLEM: Consider information for the Edwards Group from Example 20.8. Assume that the company reported net income of \$9,000,000 for the current year. There are 5,400,000 common shares outstanding for the entire year, and the average market price per common share for the year is \$72. In addition, Edwards has 1,800,000 options outstanding all year. The exercise price is now \$80 per share. Compute basic and diluted EPS for the Edwards Group. Each option can be used to purchase one share of common stock.

SOLUTION: The basic EPS for the year is the net income (\$9,000,000) divided by the weighted-average number of common shares outstanding (5,400,000), or \$1.67.

Because the \$72 market price is lower than the \$80 exercise price, the out-of-the-money options are antidilutive. Edwards cannot include the options and will report basic and diluted EPS as \$1.67.

We can also compute the antidilutive effect of out-of-the-money options on the denominator of the diluted EPS as follows:

Number of shares issued from assumed exercise	1,800,000	1,800,000
Times exercise price	× \$80	
Proceeds that would be received from assumed exercise	\$144,000,000	
Divided by average share price	÷ \$72	
Number of treasury shares from assumed purchase		(2,000,000)
Adjustment to denominator: Incremental shares		<u>(200,000)</u>

There are negative incremental shares (fewer shares in the market) because the options are out of the money. Thus, Edwards must *decrease* the denominator by the 200,000, resulting in diluted EPS as follows:

$$\text{Diluted EPS} = \frac{\$9,000,000}{5,400,000 - 200,000} = \mathbf{\$1.73}$$

Note that the \$1.73 diluted EPS is more than the \$1.67 basic EPS because these options are antidilutive. These out-of-the-money options would not be included in the diluted EPS reported to stockholders.

Antidilution Sequencing

How does a firm compute diluted EPS if it has more than one potentially dilutive security? A security could appear to be dilutive when computing its incremental income per share effect individually, but it could actually be antidilutive when including it in combination with other securities.

Testing for antidilution requires considering the issuance of potentially dilutive securities in sequence from the most dilutive to the least dilutive. That is, firms include the potential common shares with the lowest incremental income per share effect in the diluted EPS computation before those with higher incremental income per share effects. The test for dilution includes only the incremental income per share effects on income from continuing operations. This procedure, known as **antidilution sequencing**, results in including potentially dilutive securities in rank order from the most dilutive to the least dilutive. The comprehensive example later in the chapter includes antidilution sequencing.

Antidilution with a Net Loss from Continuing Operations

EPS is negative when a firm has a net loss from continuing operations. As a result, EPS always results in antidilutive per share effects when including potentially dilutive securities in the computation. Therefore, no potentially dilutive securities should be included in the computation of diluted EPS when there is a loss from continuing operations. Consequently, securities that would be dilutive when the company reports net income are antidilutive if the same company reports a net loss and vice versa. Example 20.12 demonstrates antidilution with a net loss from continuing operations.

EXAMPLE 20.12 Antidilution with a Net Loss from Continuing Operations

PROBLEM: PJS Company has 20,000 common shares outstanding with no preferred shares in its capital structure. PJS has outstanding in-the-money options that will result in 10,000 incremental shares. The current income statement indicates the following:

Loss from Continuing Operations	\$(600,000)
Income from Discontinued Operations (net of tax)	<u>500,000</u>
Net Loss	<u>\$ (100,000)</u>

What are basic and diluted earnings per share?

SOLUTION: Basic and diluted EPS are computed in the following table.

Loss from continuing operations	\$ (600,000)
Income from discontinued operations (net of tax)	<u>500,000</u>
Net loss	<u>\$ (100,000)</u>
<u>Basic EPS (20,000 shares):</u>	
• Loss from continuing operations $\$(600,000)/20,000$	\$ (30.00)
• Income from discontinued operations $\$500,000/20,000$	<u>25.00</u>
• Net loss $\$(100,000)/20,000$	<u>\$ (5.00)</u>
<u>Diluted EPS (30,000 shares):</u>	
• Loss from continuing operations $\$(600,000)/30,000$	\$ (20.00)
• Income from discontinued operations $\$500,000/30,000$	<u>16.67</u>
• Net loss $\$(100,000)/30,000$	<u>\$ (3.33)</u>

In this case, diluted EPS from continuing operations exceeds basic EPS: \$(20) is greater than \$(30). As a result, PJS cannot include the options in its EPS disclosures. It will report the same amounts for basic and diluted EPS:

Basic and Diluted EPS	
• Loss from continuing operations $\$(600,000)/20,000$	\$ (30.00)
• Income from discontinued operations $\$500,000/20,000$	<u>25.00</u>
• Net loss $\$(100,000)/20,000$	<u>\$ (5.00)</u>

- 4 Describe required disclosures for earnings per share.

Earnings per Share Presentation and Disclosures

Standard setters require that firms present basic EPS on the income statement for all periods for which they provide financial data. In addition, if a company has a complex capital structure for any one of the periods reported in the financial statements, it must also show diluted EPS on the income statement for all periods presented. Standard setters stipulate that firms report EPS numbers for continuing operations, discontinued operations, and net income.¹²

For example, in its 2016 annual report, *Procter & Gamble* reported both basic and diluted earnings per share for earnings from continuing operations, earnings from discontinued operations, and net earnings. *Procter & Gamble's* 2016 EPS disclosure on the income statement is presented in Exhibit 20.6.

EXHIBIT 20.6 Earnings per Share from the Income Statement, *Procter & Gamble Company*, Financial Statements, June 30, 2016

Procter & Gamble Company Consolidated Statements of Earnings			
Amounts in millions except per share amounts: Years ended June 30	2016	2015	2014
BASIC NET EARNINGS PER COMMON SHARE: ⁽¹⁾			
Earnings from continuing operations	\$3.59	\$2.92	\$3.78
Earnings (Loss) from discontinued operations	0.21	(0.42)	0.41
BASIC NET EARNINGS PER COMMON SHARE	<u>\$3.80</u>	<u>\$2.50</u>	<u>\$4.19</u>
DILUTED NET EARNINGS PER COMMON SHARE: ⁽¹⁾			
Earnings from continuing operations	\$3.49	\$2.84	\$3.63
Earnings (Loss) from discontinued operations	0.20	(0.40)	0.38
DILUTED NET EARNINGS PER COMMON SHARE	<u>\$3.69</u>	<u>\$2.44</u>	<u>\$4.01</u>
DIVIDENDS PER COMMON SHARE	<u>\$2.66</u>	<u>\$2.59</u>	<u>\$2.45</u>

⁽¹⁾ Basic net earnings per common share and diluted net earnings per common share are calculated on net earnings attributable to Procter & Gamble.

Source: From the Income Statement, The Procter & Gamble Company, Financial Statements, June 30, 2016.

<http://www.pginvestor.com/Cache/1500090608.PDF?O=PDF&T=&Y=&D=&FID=1500090608&iid=4004124>

In addition to the presentation on the income statement, firms must disclose a number of items in the footnotes to the financial statements such as per share data for discontinued operations. The company can also include this information on the face of the income statement.

Other required footnote disclosures for EPS include:

1. A discussion of adjustments to the numerator for preferred dividends
2. A reconciliation of both the numerator and denominator of the basic EPS to the numerator and denominator of the diluted EPS for income from continuing operations
3. A discussion of antidilutive securities that were excluded from the computation of diluted EPS
4. Any transactions that occurred after the close of the period that would have materially impacted the denominator of the EPS calculations (such as a new stock issue)

Procter & Gamble's earnings per share footnote from its 2016 annual report is presented in Exhibit 20.7. *Procter & Gamble's* income used in the basic EPS computation of \$10,508 million excludes \$255 million of preferred stock dividends in 2016. *Procter & Gamble's* weighted-average number of shares in the diluted EPS computation of 2,844.4 million includes 103.9 million shares for the conversion of preferred shares and 41.6 million shares for exercise of options and other unvested equity awards in 2016.

¹²Firms should restate prior-period EPS for any stock splits or stock dividends.

EXHIBIT 20.7 Earnings per Share Note Disclosure, *Procter & Gamble Company*, Financial Statements, June 30, 2016

NOTE 6: Earnings Per Share

Net earnings attributable to *Procter & Gamble* less preferred dividends (net of related tax benefits) are divided by the weighted-average number of common shares outstanding during the year to calculate basic net earnings per common share. Diluted net earnings per common share are calculated to give effect to stock options and other stock-based awards (see Note 7) and assume conversion of preferred stock (see Note 8).

Net earnings attributable to *Procter & Gamble* and common shares used to calculate basic and diluted net earnings per share were as follows (in millions):

Years ended June 30	2016			2015			2014		
CONSOLIDATED AMOUNTS	Continuing Operations	Discontinued Operations	Total	Continuing Operations	Discontinued Operations	Total	Continuing Operations	Discontinued Operations	Total
Net earnings/(loss)	\$10,027	\$ 577	\$10,604	\$ 8,287	\$(1,143)	\$ 7,144	\$10,658	\$ 1,127	\$11,785
Net earnings attributable to noncontrolling interests	(96)	—	(96)	(98)	(10)	(108)	(120)	(22)	(142)
Net earnings/(loss) attributable to P&G (Diluted)	9,931	577	10,508	8,189	(1,153)	7,036	10,538	1,105	11,643
Preferred dividends, net of tax	(255)	—	(255)	(259)	—	(259)	(253)	—	(253)
Net earnings/(loss) attributable to P&G available to common shareholders (Basic)	\$ 9,676	577	\$10,253	\$ 7,930	\$(1,153)	\$ 6,777	\$10,285	\$ 1,105	\$11,390
SHARES IN MILLIONS									
Basic weighted average common shares outstanding	2,698.9	2,698.9	2,698.9	2,711.7	2,711.7	2,711.7	2,719.8	2,719.8	2,719.8
Add: Effect of dilutive securities									
Conversion of preferred shares ⁽¹⁾	103.9	103.9	103.9	108.6	108.6	108.6	112.3	112.3	112.3
Impact of stock options and other unvested equity awards ⁽²⁾	41.6	41.6	41.6	63.3	63.3	63.3	72.6	72.6	72.6
Diluted weighted average common shares outstanding	2,844.4	2,844.4	2,844.4	2,883.6	2,883.6	2,883.6	2,904.7	2,904.7	2,904.7
PER SHARE AMOUNTS									
Basic net earnings/(loss) per common share⁽³⁾	\$ 3.59	\$ 0.21	\$ 3.80	\$ 2.92	\$ (0.42)	\$ 2.50	\$ 3.78	\$ 0.41	\$ 4.19
Diluted net earnings/(loss) per common share⁽³⁾	\$ 3.49	\$ 0.20	\$ 3.69	\$ 2.84	\$ (0.40)	\$ 2.44	\$ 3.63	\$ 0.38	\$ 4.01

⁽¹⁾ Despite being included currently in diluted net earnings per common share, the actual conversion to common stock occurs when the preferred shares are sold. Shares could only be sold after being allocated to the ESOP participants pursuant to the repayment of the ESOP's obligations through 2035.

⁽²⁾ Approximately 55 million in 2016 . . . of the Company's outstanding stock options were not included in the diluted net earnings per share calculation because the options were out of the money or to do so would have been antidilutive (i.e., the total proceeds upon exercise would have exceeded the market value of the underlying common shares).

⁽³⁾ Basic net earnings per common share and diluted net earnings per common share are calculated on net earnings attributable to Procter & Gamble.

Let's apply the presentation and disclosure requirements for EPS to the information for Dayton Builders from Example 20.4. We assume that \$1,000,000 of net income was from discontinued operations. Exhibit 20.8 shows the presentation of EPS on the income statement for Dayton Builders.

EXHIBIT 20.8 Dayton Builders EPS Disclosure

Income Statement	For the Current Year
Income from Continuing Operations	\$6,000,000
Income from Discontinued Operations (net of tax)	<u>1,000,000</u>
Net Income	<u>\$ 7,000,000</u>
Basic Earnings per Common Share	
Income from Continuing Operations	\$ 6.59
Income from Discontinued Operations*	<u>1.11</u>
Net Income	<u>\$ 7.70</u>
Diluted Earnings per Common Share	
Income from Continuing Operations	\$ 4.84
Income from Discontinued Operations**	<u>.74</u>
Net Income	<u>\$ 5.58</u>

* Basic EPS from Discontinued Operations = \$1,000,000/900,000 shares = \$1.11

** Diluted EPS from Discontinued Operations = \$1,000,000/1,350,000 shares = \$.74

In addition, Dayton includes a reconciliation of the numerator and denominator of the basic and diluted EPS computations for income from continuing operations as shown in Exhibit 20.9. This reconciliation ties the numbers used in the EPS computation back to the financial statements.

EXHIBIT 20.9 Dayton Builders EPS Reconciliation Using Income from Continuing Operations

Description	For the Current Year		
	Income (Numerator)	Shares (Denominator)	Per Share Amount
Income from continuing operations	\$6,000,000		
Less: Preferred dividend requirements	<u>(69,000)</u>		
Basic EPS			
Income available to common shareholders	\$5,931,000	900,000	\$6.59
Effect of Dilutive Securities			
5% Convertible Debt	<u>600,000</u>	<u>450,000</u>	
Diluted EPS			
Income available to common shareholders including the effect of assumed conversions	<u>\$6,531,000</u>	<u>1,350,000</u>	<u>\$4.84</u>

Comprehensive Example: EPS Calculation, Antidilution Sequencing, and Disclosures

As a conclusion to the chapter, Example 20.13 provides a comprehensive example illustrating all steps in EPS calculations and disclosures.

EXAMPLE 20.13**Dario Company's EPS Calculations and Disclosure**

PROBLEM: Dario Company reported net income of \$570,000 for the current year. The company's net income consisted of income from continuing operations of \$1,000,000 and a \$430,000 loss from discontinued operations, net of tax. The company is subject to a 40% tax rate. Dario provided the following common share information:

Event and Date	Number of Shares
1/1 Beginning balance	150,000
6/1 New share issue	240,000
8/1 Two-for-one stock split	390,000
10/1 New share issue	390,000
12/1 Treasury stock acquisition	(48,000)

The company granted 120,000 stock options on January 1 that allow employees to acquire 120,000 common shares at \$18 per share. The average market price of the company's common shares is \$24 per share. As of the beginning of the year, \$500,000 of 6% convertible debt is outstanding. Each \$1,000 face value bond converts into eight shares of the company's common stock. The company's shareholders' equity section also indicates that there are \$140,000 par value, 4%, noncumulative, convertible preferred shares outstanding for the current year. The board of directors declared the annual dividend of \$5,600 on these shares (\$140,000 × 4%). The preferred shares can convert into 10,000 shares of common stock. There were no actual exercises or conversions during the year. The bonds were issued at par value.

What are basic and diluted EPS for Dario Company? Provide the required income statement presentation and the reconciliation from basic to diluted EPS for income from continuing operations.

SOLUTION: We begin by computing the weighted-average number of common shares outstanding for basic EPS:

Date and Event	Number of Shares Outstanding	Weight by Number of Months Shares Outstanding	Weighted-Average Shares Outstanding
1/1 Balance	150,000	12/12	150,000
6/1 New issue	240,000	7/12	140,000
Subtotal	390,000		290,000
8/1 Two-for-one split	390,000	Retroactive application	× 2
Subtotal	780,000		580,000
10/1 New issue	390,000	3/12	97,500
12/1 Treasury stock	(48,000)	1/12	(4,000)
Total	<u>1,122,000</u>		<u>673,500</u>

Using the 673,500 weighted-average shares, basic EPS related to net income is as follows:

$$\begin{aligned} \text{Basic EPS for net income} &= \frac{\text{Net Income} - \text{Preferred Dividends}}{\text{Weighted-Average Common Shares Outstanding}} \\ &= \frac{\$570,000 - \$5,600}{673,500} = \mathbf{\$0.84} \end{aligned}$$

Again using the 673,500 weighted-average shares, basic EPS for income from continuing operations is as follows:

$$\begin{aligned} \text{Basic EPS for Income from Continuing Operations} &= \frac{\text{Income from Continuing Operations} - \text{Preferred Dividend Requirements}}{\text{Weighted-Average Common Shares Outstanding}} \\ &= \frac{\$1,000,000 - \$5,600}{673,500} = \mathbf{\$1.48} \end{aligned}$$

We make three adjustments to arrive at diluted EPS. All weights used are 12/12 because all potentially dilutive securities are outstanding for a full year.

1. Determine the number of additional shares to include in the denominator for the stock options using the treasury stock method: The options are dilutive because the average market price per share is higher than the exercise price (that is, the options are in the money).

Number of shares from assumed exercise	120,000	120,000
Times exercise price	<u>× \$18</u>	
Proceeds that would be received from assumed exercise	\$2,160,000	
Divided by average market price per share	<u>÷ \$24</u>	
Number of shares from assumed purchase		(90,000)
Adjustment to denominator: incremental shares		<u>30,000</u>

2. Determine the incremental income per share effect of the convertible preferred stock: The numerator effect would be \$5,600, which is the preferred dividend requirement avoided if the assumed conversion takes place (\$140,000 par × 4% dividend). The denominator effect is the 10,000 common shares that would exist if the preferred shares were converted. Thus, the incremental income per share effect is \$0.56 (\$5,600 / 10,000).
3. Determine the incremental income per share effect of the convertible debt: The numerator effect is the after-tax interest savings on assumed conversion of \$18,000 [\$500,000 × 6% × (1 - .40)]. The denominator effect is the number of shares assumed on conversion, which totals 4,000 shares (\$500,000/\$1,000 = 500 bonds and each bond converts into eight shares of common stock). Thus, the incremental income per share effect is \$4.50 (\$18,000 / 4,000 shares).

We now consider the sequencing of the three potentially dilutive securities. First, we show the earnings per incremental share effect for each potentially dilutive security. The incremental income per share effect is the increase in the numerator divided by the increase in the denominator of the EPS ratio, if conversion or exercise is assumed. Next, we rank the incremental income per share effects from low to high for each entry of potentially dilutive security into the EPS computation.

Determination of Incremental Income per Share

Potentially Dilutive Security	Increase in Income	Increase in the Number of Common Shares	Incremental Income per Share*	Rank: Order of Entry into the EPS Computation
Employee options	\$ 0	30,000	\$0.00	1st
6% convertible bonds	18,000	4,000	\$4.50	3rd
Convertible preferred stock	5,600	10,000	\$0.56	2nd

* Equal to the Increase in income / Increase in the number of common shares.

Second, we test for dilution at the income from continuing operations level using anti-dilution sequencing. The potential common shares with the lowest incremental income per share effect are included in the diluted EPS computation before those with higher incremental income per share effects.

Description	Income Available to Common Shareholders	Common Shares	Per Share	
Income from continuing operations	\$ 1,000,000			
Preferred dividend requirements	(5,600)			
Net income available to common	\$ 994,400	673,500	\$1.48	Basic EPS
1st: Employee options	0	30,000		
	\$ 994,400	703,500	\$1.41	Dilutive
2nd: Convertible preferred stock	5,600	10,000		
	\$ 1,000,000	713,500	\$1.40	Dilutive
3rd: Convertible bonds	18,000	4,000		
	\$ 1,018,000	717,500	\$1.42	Antidilutive

We exclude the convertible bonds from the EPS computation because their effects are antidilutive. Thus, diluted EPS on income from continuing operations is \$1.40.

We have tested for dilution and antidilution on the continuing operations level, but Dario Company must report EPS on net income as well. These basic and diluted EPS amounts are computed as follows.

$$\text{Basic EPS for Net Income} = \frac{\$570,000 - \$5,600}{673,500} = \mathbf{\$0.84}$$

$$\text{Diluted EPS for Net Income} = \frac{\$570,000 - \$5,600 + \$5,600 + 0}{673,500 + 10,000 + 30,000} = \mathbf{\$0.80}$$

Exhibit 20.10 shows Dario Company's presentation of EPS on the income statement and the related disclosures.

EXHIBIT 20.10 Dario Company EPS Disclosure

Partial Income Statement	
Income from Continuing Operations, net of tax	\$ 1,000,000
Loss from discontinued operations, net of tax	(430,000)
Net income	\$ 570,000
Basic net earnings per common share: (673,500 shares)	
Income from continuing operations	\$ 1.48
Loss on discontinued operations \$(430,000)/673,500 shares	(.64)
Net income	\$ 0.84
Diluted net earnings per common share: (713,500 shares)	
Income from continuing operations	\$ 1.40
Loss on discontinued operations \$(430,000)/713,500 shares	(.60)
Net income	\$ 0.80

Footnote Disclosure**Reconciliation of EPS Using Income from Continuing Operations**

Description	For the Current Year

FINANCIAL STATEMENT ANALYSIS

EPS

EPS is perhaps the most widely known financial statement ratio. Because EPS depends on the number of shares a company has, it cannot be compared across companies. Analyzing EPS values for one company over time is informative, however. For example, a financial statement user can examine whether EPS increased this year from last year or this quarter from the same quarter in the previous year. In addition, comparing the price per share to the earnings per share is a way of determining the price-earnings ratio.

In general, investors prefer higher EPS over lower EPS. Each investor has a greater return on a per share basis when EPS is higher. Investors also prefer growth in EPS over time because growing EPS means that an investor's return is increasing.

Increasing earnings is one way to elevate EPS. Managers can boost earnings through operating activities such as increasing sales or decreasing expenses. Financial statement analysis can alert users to managers' opportunistically managing earnings in an attempt to report an increase in EPS or to meet and beat analysts' forecasts. For example, a company close to the analysts' EPS forecast can reduce expenses such as research and development or advertising to meet the forecast. Reducing the number of shares outstanding by purchasing treasury stock is another way for a company to increase EPS.

To illustrate, assume that a company has \$1,000,000 of earnings and 1,000,000 common stock shares outstanding at the beginning of the year. If the company has no transactions in shares, the weighted-average number of shares outstanding during the year would be 1,000,000 and EPS would be \$1.00 per share. If the company repurchased 10,000 shares on July 1, its weighted-average shares outstanding during the year would be reduced to 995,000 [$1,000,000 - (10,000 \times \frac{1}{2})$]. The company's EPS would then be \$1.01 per share ($\$1,000,000 / 995,000$)—an increase of 1 cent, or 1%. Because the shares are reduced on a weighted-average basis over the fiscal year, a company cannot use share repurchases at the end of the fiscal year to increase EPS significantly.

Companies report EPS to the penny. Because the EPS computation involves many calculations, companies round up to the nearest penny. The usual convention is to round up when the thousandths decimal place is greater than 5 and down when it is less than 5. For example, when we computed the new EPS with share repurchases mentioned above, we rounded \$1.005 ($\$1,000,000 / 995,000$) up to the nearest penny to obtain the reported EPS of \$1.01. If the company had repurchased only 8,800 shares instead of 10,000, the EPS to the thousandths would be \$1.004 and would not be rounded up, remaining at \$1.00. In both the numerator and denominator amounts, companies can take advantage of rounding to increase EPS.

As we have discussed, a company with dilutive securities reports two main EPS ratios—basic EPS and diluted EPS. The difference between these ratios relates to a company's securities that entitle the holder the option to exchange the potentially dilutive securities for common stock. Therefore, understanding the effect of the potentially dilutive securities is important. The greater the difference between basic EPS and diluted EPS, the lower the potential return to current shareholders. This is due to the fact that if the potentially dilutive securities actually result in additional shares outstanding, an investor's market price per share will decline. Example 20.14 examines *Procter & Gamble's* EPS disclosures.

EXAMPLE 20.14 EPS Financial Statement Analysis

PROBLEM: Use the footnote disclosures in Exhibit 20.7 to answer the following questions regarding *Procter & Gamble's* EPS.

- Procter & Gamble* presents EPS from continuing operations and discontinued operations. Why do standard setters require companies to report both EPS amounts?
- In the income statement, *Procter & Gamble's* net income is not the same as net income available to common stockholders used in basic earnings per share. What does the fact that the two amounts are not the same suggest?
- Is there a difference between *Procter & Gamble's* basic income used for basic EPS and diluted income used for diluted EPS? If so, what types of securities create the difference between the company's basic income and diluted income?
- Is there a difference between *Procter & Gamble's* basic shares used for basic EPS and diluted shares used for diluted EPS? If so, what types of securities create the difference between *Procter & Gamble's* basic shares and diluted shares?
- Comment on the changes in basic income from continuing operations, basic EPS for income from continuing operations, and diluted EPS for income from continuing operations over the 3 years.
- What is the percentage difference in basic EPS for income from continuing operations and diluted EPS for income from continuing operations over time? Comment on changes over time.
- If you were an analyst, what further information would you want to have to assess changes in EPS over time?

SOLUTIONS: Solutions to each question follow.

- EPS from continuing operations relates to those activities that a company will continue to operate in the following year. Therefore, EPS from continuing operations is a basis on which to predict future EPS. EPS from discontinued operations relates to those activities that the company will not continue into the future. Therefore, EPS from discontinued operations should not be used to predict future EPS. Recall from Chapter 5, that companies report income from continuing operations and income from discontinued operations separately on the income statement. The presentation of the two EPS amounts follows the income statement.
- The fact that net income on the income statement and net income available to common stockholders used in the computation of basic EPS are not the same suggests that *Procter & Gamble* has preferred stock. From the footnote disclosures, *Procter & Gamble* subtracts dividends on preferred stock of \$255 million, \$259 million, and \$253 million, in 2016, 2015, and 2014, respectively. Net income available for common shareholders is then lower than reported net income.

- c. According to the footnote disclosures, the difference between basic income and diluted income is due to preferred dividends on convertible preferred stock. If **Procter & Gamble** had convertible notes or bonds, it would have had to adjust the basic income for interest expense, amortization of discount, and other changes in income or loss that would result from the assumed conversion.
- d. Yes, there is a difference between **Procter & Gamble's** basic shares and diluted shares. For example, in 2016, basic weighted-average common shares outstanding were 2,698.9 million whereas diluted weighted-average common shares outstanding were higher at 2,844.4 million. Convertible preferred stock, stock options, and other unvested equity awards create the difference between basic shares and diluted shares. As **Procter & Gamble** states, the diluted shares assume that these securities are converted or exercised.
- e. Calculations for income from continuing operations, basic EPS, and diluted EPS over the 3 years follow.

	2016	2015	2014
Basic income from continuing operations	\$9,676	\$7,930	\$10,285
Basic EPS for income from continuing operations	\$3.59	\$2.92	\$3.78
Diluted EPS for income from continuing operations	\$3.49	\$2.84	\$3.63
Percentage changes			
Basic income from continuing operations	22.02%	(22.90%)	
Basic EPS for income from continuing operations	22.95%	(22.75%)	
Diluted EPS for income from continuing operations	22.89%	(21.76%)	

The changes in basic EPS and diluted EPS mirror the changes in income from continuing operations. The change in income from continuing operations is positive in 2016 and negative in 2015. The percentage increase in basic and diluted EPS is greater than the percentage increase in basic income from continuing operations in 2016. These different relations imply that understanding the adjustments to income and shares are important when assessing the changes in EPS.

- f. Percentage differences in basic EPS and diluted EPS for income from continuing operations follows.

	2016	2015	2014
Basic EPS for income from continuing operations	\$3.59	\$2.92	\$3.78
Diluted EPS for income from continuing operations	\$3.49	\$2.84	\$3.63
Difference	<u>\$0.10</u>	<u>\$0.08</u>	<u>\$0.15</u>
Percentage of basic EPS	2.8%	2.7%	4.0%

The difference between basic and diluted EPS is lower in 2016 and 2015 than in 2014. One reason for the difference is the number of additional shares from dilution is decreasing, lowering the difference between the two.

- g. An analyst would be interested in assessing the variability in net income by examining whether components of net income changed from year to year because both net income and EPS amounts vary from year to year. Additionally, it would be informative to understand the significance of the decrease in dilutive options, a decrease in the number of shares outstanding, or being out of the money.

Dolan, a Managing Director and the New York Office City Leader for Duff & Phelps, LLC, has performed numerous valuations for financial and tax reporting in addition to merger and acquisition needs. He has valued companies' businesses and related assets, including patents, technological items, trademarks, and licenses across a broad spectrum of industries.

1 How is the earnings per share (EPS) ratio used at Duff & Phelps to determine the value of equity shares?

Duff & Phelps compiles projected EPS estimates for selected public companies deemed comparable to the company being valued (the Subject) that are sourced primarily from analyst research consensus. With these EPS estimates, we perform economic comparisons with respect to expected earnings growth, profitability, and return from the equity investor's point of view.

2 How do earnings per share affect a proposed merger or a company's financing plans?

Mergers have an *accretive* effect on EPS when they are expected to increase consolidated EPS for the Subject. Conversely, a merger that is expected to reduce the combined EPS has a *dilutive* effect. In the case of financing, projecting the EPS helps determine how much the proposed financing will increase or decrease current EPS based on the added cost of financing relative to the expansion of earnings it will provide. As an example, debt financing can help finance new earnings initiatives for the Subject, potentially producing levered returns to equity holders, or it can be used to help recapitalize and potentially increase the Subject's levered equity return and thus result in a positive effect on future EPS.

3 What role does judgment play in determining whether one company is of higher value than another if both report the same earnings per share?

First, you must understand the computation of basic or dilutive weighted-average shares outstanding and how this affects EPS. Although companies can have the same EPS, a share's pro rata

entitlement of the company's earnings has a bearing on the observed price. Placing that aside, the investment community often prices companies with identical EPS and share counts differently because of perceived risk based on each company's historical EPS trends and future expectation of EPS trends. A prudent investor would price a company with consistent, positive performance trends above one with more volatile earnings from either a growth or profitability perspective.

4 What judgments affect EPS, thereby determining the quality of earnings per share?

Evaluating the quality of earnings involves differentiating between recurring earnings generated from a company's normal operating activities and nonrecurring activities that are one-time or non-operational. Nonrecurring profit and loss items should be excluded from EBITDA¹³ on a normalized basis. These items include but are not limited to gains/losses on asset sales, out-of-period reserve reversal, litigation settlements, and changes in accounting methodology. However, you should consider these non-operating or nonrecurring items to understand a company's true earnings per share.

5 Most accountants consider diluted earnings per share the key statistic on the income statement. Do basic earnings per share have a role in valuation?

Because the basic earnings per share figure is calculated on the base of shares *prior* to expected dilution, it helps determine the realized return on equity employed. Prospective earnings would likely incorporate the effects of their expected dilution from such events as the vesting of restricted stock. Prudent investors would incorporate these effects into estimates of future equity returns when pricing equity investments.

6 Do earnings surprises always affect share prices?

In my review of recent studies on the subject, earnings surprises or material events often have an effect on real-time pricing of widely held, liquid equities that have in-depth analyst coverage. However, it is important to keep in mind that share prices reflect cash flow potential in both the short and long term and that to the extent that earnings surprises affect the risk perception of achieving long-term cash returns for shareholders, the effect is positively correlated.

Discussion Questions

1. Identify possible causes of accretion and dilution of EPS in a proposed merger.
2. Discuss the possible impact of managerial judgment and market transactions on reported EPS.

¹³EBITDA is the abbreviation for earnings before tax, depreciation, and amortization expenses.

Summary by Learning Objectives

In the following, we summarize the main points by learning objective. Throughout the chapter, we discuss the accounting and reporting of U.S. GAAP and IFRS side-by-side. The following table also highlights the major similarities and differences between the standards.

- 1** Compute basic earnings per share, including the necessary adjustments to the earnings per share numerator and the effect of stock splits and stock dividends on the denominator.

Summary	Similarities and Differences between U.S. GAAP and IFRS
<p>Earnings per share (EPS) is a measure of the earnings that are available to common shareholders. Basic earnings per share is net income less preferred dividends divided by the weighted-average number of shares outstanding.</p> <p>Basic EPS Equation:</p> $\text{Basic EPS} = \frac{\text{Net Income Available to Common Shareholders}}{\text{Weighted-Average Number of Common Shares Outstanding}}$ $\text{Basic EPS} = \frac{\text{Net Income} - \text{Preferred Dividends Requirements}}{\text{Weighted-Average Number of Common Shares Outstanding}} \quad (20.1)$ <p>The weighted-average number of shares is adjusted for all stock splits and stock dividends assuming that the split or dividend occurred at the beginning of the year or as of the date common shares were issued.</p>	<p>Similar under U.S. GAAP and IFRS.</p>

- 2** Calculate diluted earnings per share, including adjustments to income in the numerator and shares in the denominator for potentially dilutive securities such as convertible debt, convertible preferred stock, and employee options.

Summary	Similarities and Differences between U.S. GAAP and IFRS
<p>A firm has a simple capital structure if it issues only common and nonconvertible preferred stock. If a firm has potentially dilutive securities, it has a complex capital structure. The numerator and denominator effect of all potentially dilutive securities is important in the calculation of diluted EPS.</p> <ul style="list-style-type: none"> For convertible debt, add the after-tax interest expense back to the numerator and add the shares potentially issued to the denominator. For convertible preferred stock, add the preferred dividends back to the numerator and add the common shares potentially issued to the denominator. For options, add the number of incremental shares needed (using the treasury stock method) to the denominator. <p>The treasury stock method assumes that a company uses all proceeds received from the exercise of in-the-money options and warrants to buy back the company's stock at current market prices. So, the increase in shares from conversion is net of total shares needed for the exercise of the options or warrants less those that could be repurchased.</p>	<p>► Similar under U.S. GAAP and IFRS except when convertible securities can be settled for cash. U.S. GAAP assumes that all of the securities will be settled in shares unless evidence is provided to the contrary. IFRS assumes that all of these securities will be settled in shares.</p>

- 2 Calculate diluted earnings per share, including adjustments to income in the numerator and shares in the denominator for potentially dilutive securities such as convertible debt, convertible preferred stock, and employee options.

Summary	Similarities and Differences between U.S. GAAP and IFRS
<p>Diluted EPS Equations:</p> <p><i>With Convertible Debt</i></p> <p>Diluted EPS =</p> $\frac{\text{Net Income} - \text{Preferred Dividends} + \text{Interest Expense} \times (1 - \text{Tax Rate})}{\text{Weighted-Average Number of Common Shares Outstanding} + \text{Weighted Common Shares on Debt Conversion}}$ <p><i>With Convertible Preferred Stock</i></p> <p>Diluted EPS =</p> $\frac{\text{Net Income} - \text{Preferred Dividends} + \text{Preferred Dividends Avoided on Convertible Preferred Stock}}{\text{Weighted-Average Number of Common Shares Outstanding} + \text{Weighted Common Shares on Preferred Stock Conversion}}$ <p><i>With Options or Warrants</i></p> <p>Diluted EPS =</p> $\frac{\text{Net Income} - \text{Preferred Dividends}}{\text{Weighted-Average Number of Common Shares Outstanding} + \text{Incremental Common Shares on Option or Warrant Exercise}}$	<p>► Similar under U.S. GAAP and IFRS except when convertible securities can be settled for cash. U.S. GAAP assumes that all of the securities will be settled in shares unless evidence is provided to the contrary. IFRS assumes that all of these securities will be settled in shares.</p>

- 3 Determine the effect of antidilutive securities on the earnings or loss per share computation.

Summary	Similarities and Differences between U.S. GAAP and IFRS
<p>When a potentially dilutive security increases EPS, it is not included in the calculation of diluted EPS.</p>	<p>Similar under U.S. GAAP and IFRS.</p>

- 4 Describe required disclosures for earnings per share.

Summary	Similarities and Differences between U.S. GAAP and IFRS
<p>Firms must report basic EPS on the face of their financial statements. If a firm has potentially dilutive securities, it must also report diluted EPS on the face of the financial statements. Firms must present per share information for income from continuing operations, discontinued operations, and net income. Footnote disclosures for EPS include:</p> <ol style="list-style-type: none"> 1. Adjustments made in the numerator for preferred dividends 2. Reconciliation of basic EPS to diluted EPS for income from continuing operations 3. Discussion of antidilutive common shares not included in the computation of diluted EPS 4. Transactions that occurred after the close of the period that would have materially impacted the denominator of the EPS calculations. 	<p>Similar under U.S. GAAP and IFRS.</p>

MyLab Accounting

Go to <http://www.pearson.com/mylab/accounting> for the following Questions, Multiple-Choice Questions, Brief Exercises, Exercises, and Problems. They are available with immediate grading, explanations of correct and incorrect answers, and interactive media that acts as your own online tutor.

20 Earnings per Share

Questions

- 1 **Q20-1. Understanding EPS.** How do financial statement analysts use earnings per share information?
- 1 **Q20-2. Preferred Dividends.** Do firms adjust the numerator of the EPS ratio for preferred dividends if the dividends are declared?
- 2 **Q20-3. If-Converted Method.** Does the if-converted assumption apply only to diluted earnings per share?
- 2 **Q20-4. Diluted EPS.** If all potentially dilutive securities are dilutive (as opposed to antidilutive), will diluted earnings per share be the same whether there are actual or hypothetical conversions of potentially dilutive securities?
- 2 **Q20-5. Diluted EPS.** Can diluted earnings per share on bottom-line net income or net loss exceed basic earnings per share?
- 2 **Q20-6. Diluted EPS, Convertible Debt, and Preferred Stock.** Does a company with dilutive convertible debt and dilutive convertible preferred shares have to add the after-tax interest and after-tax preferred dividends back to net income in the numerator computation of diluted EPS?
- 2 **Q20-7. Diluted EPS and Convertible Debt.** Does the after-tax interest add-back for convertible debt require the amount of the coupon interest paid for the period of the earnings per share computation?
- 2 **Q20-8. Treasury Stock Method.** When can firms use the treasury stock method?
- 3 **Q20-9. Antidilution.** When is a potentially dilutive security antidilutive?
- 4 **Q20-10. EPS Disclosures.** Is an entity required to present earnings per share on income from continuing operations and earnings per share on discontinued operations on the face of its financial statements?
- 4 **Q20-11. EPS Disclosures.** Do earnings per share disclosures include a reconciliation of the numbers used in the computation of EPS to the information provided in the financial statements?

Multiple-Choice Questions

Becker CPA Exam Review multiple-choice questions are available in [MyLab Accounting](#).

- 2 **MC20-1.** Hutchins Company had 200,000 shares of common stock, 50,000 shares of convertible preferred stock, and \$2,000,000 of 10% convertible bonds outstanding during the entire year. The preferred stock was convertible into 40,000 shares of common stock.
- During the current year, Hutchins paid dividends of \$1.00 per share on the common stock and \$2.00 per share on the preferred stock. Each \$1,000 bond was convertible into 50 shares of common stock. The net income for the year was \$1,000,000, and the income tax rate was 30%.
- Basic earnings per share for the current year was (rounded to the nearest penny):
- a. \$5.00 b. \$4.50 c. \$4.30 d. \$4.55
- 1 **MC20-2.** Burken Co. has one class of common stock outstanding and no other securities that are potentially convertible into common stock. During Year 10, 100,000 shares of common stock were outstanding. In Year 11, two distributions of additional common shares occurred: On April 1, 20,000 shares of treasury stock were sold, and on July 1, a 2-for-1 stock split was issued. Net income was \$410,000 in Year 11 and \$350,000 in Year 10. What amounts should Burken report as earnings per share in its Year 11 and Year 10 comparative income statements?
- | Year 11 | Year 10 |
|-----------|---------|
| a. \$1.78 | \$3.50 |
| b. \$2.34 | \$3.50 |
| c. \$2.34 | \$1.75 |
| d. \$1.78 | \$1.75 |

- 1** **MC20-3.** Alvarado Company had the following common stock balances and transactions during the current year:

January 1	Common stock outstanding	60,000
March 1	Issue of a 10% common stock dividend	6,000
May 1	Issue of common stock	9,000
November 1	Issue of common stock for cash	<u>3,000</u>
December 31	Common stock outstanding	<u>78,000</u>

What was the number of Alvarado's current-year weighted-average shares outstanding for basic EPS?

- a. 78,000 b. 73,250 c. 72,500 d. 71,500

- 1 2** **MC20-4.** Anson Company had 8,000,000 shares of common stock outstanding on December 31, Year 11. Anson issued an additional 1,200,000 shares of common stock on April 1, Year 12, and 1,000,000 more on July 1, Year 12. On October 1, Year 12, Anson issued 50,000 of \$1,000 face value 4% convertible bonds. Each bond is convertible into 20 shares of common stock. No bonds were converted into common stock in Year 12. What is the number of shares to be used in computing basic earnings per share and diluted earnings per share, respectively, in Year 12?

- a. 8,000,000 and 8,000,000
 b. 9,400,000 and 9,400,000
 c. 9,400,000 and 9,650,000
 d. 7,500,000 and 8,500,000

- 2** **MC20-5.** Refer to the information about Hutchins Company in MC20-1.

Diluted earnings per share for the current year was (rounded to the nearest penny):

- a. \$5.00 b. \$3.35 c. \$3.53 d. \$3.06

- 2** **MC20-6.** In determining earnings per share, interest expense net of applicable income taxes on convertible debt that is dilutive should be:

- a. Added back to net income for diluted earnings per share and ignored for basic earnings per share.
 b. Added back to net income for both basic earnings per share and diluted earnings per share.
 c. Deducted from net income for basic earnings per share and ignored for basic diluted earnings per share.
 d. Deducted from net income for both basic earnings per share and diluted earnings per share.

Brief Exercises

- 1 4** **BE20-1. Compute Basic EPS.** Molino Motors, Inc. reported net income equal to \$1,200,000, which includes a \$650,000 after-tax loss from discontinued operations. Molino has 700,000 common shares outstanding for the entire year. Prepare a partial income statement beginning with income from continuing operations and include the earnings per share disclosures.

- 1** **BE20-2. Compute Basic EPS with Preferred Stock.** Rainbow Company reported \$239,000 net income for the current year. It has 100,000 shares of common shares outstanding for the entire year and another 50,000 shares of 3% nonconvertible, cumulative, \$10 par value preferred shares outstanding for the entire year. The board of directors did not declare dividends in the current year. Compute basic earnings per share for the current year.

- 1 2** **BE20-3. Computing Income for Basic EPS.** Russo Watches, Ltd. reported \$1,625,000 net income for the current year. Russo has \$5,000,000, 6% convertible debt issued at par and \$320,000 par value, 4% nonconvertible, noncumulative preferred shares outstanding. The firm declared dividends for the current year. Russo issued the bonds on April 1, and the preferred shares were outstanding for the entire year. Based on this information, determine net income available to common shareholders for basic earnings per share.

- 1** **BE20-4. Computing Income for Basic EPS.** Jackson Pet Food Suppliers reported \$7,000,000 net income for the current year. The company indicated that it has \$450,000 par value, 6% nonconvertible, cumulative preferred shares outstanding. The firm did not declare dividends for the current year. The preferred shares were outstanding for the entire year. Based on this information, determine net income available to common shareholders for basic earnings per share.

- 1** **BE20-5. Compute Weighted-Average Number of Shares Outstanding.** Elmwood Excavation Consultants began the current year with 30,000 common shares outstanding. It issued additional shares of 15,000 and 18,000 on March 1 and August 1, respectively. The company also purchased 3,000 shares of treasury stock on November 1. The firm's year-end is December 31. Based on this information, determine the weighted-average number of common shares outstanding for the year.
- 1** **BE20-6. Compute Weighted-Average Number of Shares Outstanding with a Stock Dividend.** Using the information provided in BE20-5, compute the weighted-average number of common shares outstanding for Elmwood Excavation Consultants assuming that the company implemented a 10% stock dividend on December 1.
- 1** **BE20-7. Compute Weighted-Average Number of Shares Outstanding with a Stock Split.** Bee-Boy Honey Products began the current year with 5,000 common shares outstanding. The firm issued additional shares of 1,500 and 1,800 on February 1 and June 1, respectively. In addition, the firm purchased 600 shares of treasury stock on September 1. The firm's year-end is December 31. In addition, Bee-Boy implemented a 3-for-1 stock split on May 1. Compute the weighted-average shares outstanding.
- 2** **BE20-8. Simple and Complex Capital Structure.** Fill in the following chart to indicate the capital structure type—simple or complex—for a company holding only this type of security.

Type of Security	Simple Capital Structure	Complex Capital Structure
Common stock	_____	_____
Preferred stock	_____	_____
Convertible preferred stock	_____	_____
Stock options	_____	_____
Debt	_____	_____
Convertible debt	_____	_____
Class A and Class B common stock	_____	_____

- 2** **BE20-9. Computing Income Available to Common Shareholders, Basic, and Diluted EPS.** Ardmore Pet Food Suppliers reported \$7,000,000 net income for the current year. The company indicated that it has \$6,000,000, 5% convertible debt issued at par and \$450,000 par value, 6% nonconvertible, cumulative preferred shares outstanding. The firm did not declare dividends for the current year. It issued the bonds on May 31, and the preferred shares were outstanding for the entire year. Based on this information, determine the numerator of the earnings per share fraction for both basic earnings per share and diluted earnings per share. Assume that all financial instruments described are dilutive. The tax rate is 40%.
- 2** **BE20-10. Computing Diluted EPS, Employee Options.** Crowe Interior Designs of Santa Monica granted 300,000 qualified employee options on June 1 of the current year. The options allow employees to exchange each option for 36 shares of the company's common stock at an exercise price of \$20 per share. The average market price of Crowe's common shares is \$18 per share. Based on this information, compute the incremental shares to include in the denominator of the diluted earnings per share ratio.
- 2** **BE20-11. Computing Diluted EPS, Employee Options.** Nickelfront Welders, Inc. granted 300,000 employee options on July 1 of the current year. Employees can exercise each option and receive two shares of the company's common stock at an exercise price of \$15 per share. The average market price of Nickelfront's common shares is \$18. Based on this information, compute the incremental shares to include in the denominator of the diluted earnings per share ratio.
- 2** **BE20-12. Computing Basic and Diluted EPS, Options.** Nick's Liquidators reported 450,000 shares of common stock outstanding for the year. The company also had stock options outstanding all year that will result in 125,000 incremental shares upon exercise. The company reported a net loss of \$680,000 for the year, but income from continuing operations was equal to \$1,500,000. Compute basic and diluted earnings per share for the year for both income from continuing operations and net loss.
- 2 3** **BE20-13. Computing Diluted EPS, Convertible Debt.** Axelon Enterprises has asked you to determine whether its proposed issue of convertible debt will have dilutive effects on earnings per share. If the convertible bonds prove to be dilutive, the company might consider an alternate vehicle to finance the \$10,000,000 construction cost of a new plant facility. Currently, Axelon's basic earnings per share is equal to \$14 per share after factoring in the after-tax interest expense on the proposed bond issue. The convertible debt will be issued on April 1 at \$10,000,000 par value, pays interest at a rate of 6%, and is convertible to 200,000 common shares. Axelon's tax rate is 25%. Will the convertible debt be dilutive? Provide a brief explanation and all computations needed to support your conclusion.

Exercises

- 1** **E20-1. Computing Basic and Diluted EPS, Preferred Stock.** Start Stamping began the current year with 450,000 common shares outstanding. The firm has \$1,150,000 par value, 3% nonconvertible, noncumulative preferred stock outstanding. The preferred shares were outstanding for a full year and the firm declared preferred dividends for the current year. The company's net income is \$3,500,000. Based on this information, compute basic earnings per share for the current year.
- 1** **E20-2. Computing Weighted-Average Number of Common Shares Outstanding with a Stock Split.** Thomas Company began the year with 150,000 common shares outstanding. The firm issued an additional 75,000 shares on May 1 and 15,000 shares on November 1. In addition, Thomas implemented a 2-for-1 stock split on July 1. The firm's year-end is December 31. Determine the weighted-average number of common shares outstanding for the year.
- 2** **E20-3. Computing Weighted-Average Number of Shares, Basic and Diluted EPS.** Assume that Jarden Associates began the year with 75,000 outstanding shares and implemented a 7% stock dividend on January 1 of the current year. Jarden employees held 90,000 options that were granted on April 1. If exercised, there would be 18,000 incremental shares. On July 1, Jarden implemented a 3-for-1 stock split. Finally, on November 1, the company purchased 135,000 shares to be held in the treasury. Compute the denominator for basic and diluted earnings per share. Assume that the stock split also applies to the options.
- 2** **E20-4. Computing Basic and Diluted EPS, Convertible Bonds, Preferred Stock.** Stewart Stamping began the current year with 400,000 common shares outstanding and issued an additional 150,000 shares on September 1. The firm has \$10,000,000, 2.5% convertible bonds outstanding for a full year (i.e., \$250,000 coupon interest per year), which are convertible into 325,000 shares of common stock. The firm issued the bonds at par and did not convert any during the current year. It also had \$1,150,000 par value, 3% nonconvertible, noncumulative preferred stock outstanding for the full year and declared dividends for the current year. The company is subject to a 40% effective tax rate, and net income is \$3,500,000. Based on this information, compute basic and diluted earnings per share for the current year.
- 2** **E20-5. Computing Basic and Diluted EPS, Convertible Bonds Issued during the Year, Preferred Stock.** Use the same information in E20-4 except assume that the company issued \$10,000,000, 2.5% convertible bonds on June 30 (i.e., \$250,000 coupon interest annually), which are convertible into 325,000 shares of common stock. Based on this information, compute basic and diluted earnings per share for the current year.
- 1 2** **E20-6. Computing Basic and Diluted EPS, Convertible Bonds Issued during the Year, Preferred Stock Issued during the Year.** On January 1, Bright Star Inc. had 600,000 common shares outstanding. The company issued an additional 200,000 shares on March 1. Bright Star also issued \$1,000,000 par value, 2% nonconvertible, noncumulative preferred stock on October 1 and declared dividends for the current quarter. On April 30, the firm issued \$5,000,000, 3% convertible bonds outstanding (i.e., \$150,000 coupon interest per year) that are convertible into 90,000 shares of common stock. The firm issued all bonds at par and did not convert any during the current year. The company is subject to a 40% effective tax rate, and net income is \$6,700,000. Based on this information, compute basic and diluted earnings per share for the current year.
- 2** **E20-7. Computing Basic and Diluted EPS, Convertible Bonds Converted during the Year.** Topher Company began the current year with 1,600,000 common shares outstanding. It also reported \$800,000 par value, 2% convertible bonds outstanding all year. The bonds were issued at par and can be converted to 800,000 shares of common stock. Topher made interest payments at the end of each quarter. The company is subject to a 40% effective tax rate and reported net income of \$950,000 for the current year.
- Required »**
- What are basic and diluted EPS for Topher Company?
 - Assume that the bonds were converted on October 1. What are basic and diluted EPS for Topher Company?
- 2 4** **E20-8. Computing Basic and Diluted EPS, Convertible Bonds, Preferred Stock.** Assume that the \$3,500,000 net income reported by Stewart Stamping in E20-4 includes a \$780,000 loss from discontinued operations, net of tax.
- Required »**
- Based on this information, compute basic and diluted earnings per share for the current year.
 - Prepare the earnings per share disclosure on the income statement beginning with income from continuing operations.

- 2 4** E20-9. **Computing Basic and Diluted EPS, Options, Warrants, Preferred Stock, Disclosures.** You are computing annual earnings per share and required disclosures for Tracy Fencing based on company-provided information. Net income is \$4,500,000. The weighted-average number of shares is 2,700,000. The year-end balance of outstanding shares is also 2,700,000. There are options outstanding all year to acquire 1,200,000 shares of common stock at \$27 per share. The average price of the company's common stock is \$36 per share. The firm has 90,000 shares of \$50 par value nonconvertible, noncumulative preferred stock outstanding as of the beginning of the year. The dividend rate is \$1.80 per share. The board of directors declared the annual dividend. The company is subject to a 40% tax rate.

Required »

- Based on this information, compute basic and diluted earnings per share for the current year.
- Prepare the earnings per share disclosure on the income statement beginning with net income.

- 2 3 4** E20-10. **Computing Basic and Diluted EPS, Convertible Bonds, Options, Convertible Preferred Stock, Antidilution, Disclosures.** Archangelo Company provided the following information for the current year. Net income is \$8,112,600, and the company is subject to a 40% tax rate. For the entire year, there are 1,020,300 shares of outstanding common stock with an average market price of \$32 per share. The company had three potentially dilutive securities outstanding for the full year. There are qualified employee options to acquire 98,000 shares of common stock at an exercise price of \$20 per share. The stockholders' equity section of the balance sheet includes 85,200 shares of convertible preferred stock. The board of directors declared preferred dividends of \$6.50 per share for the year. Each preferred share is convertible into 1 share of common stock. Finally, the company issued \$6,500,000 face value, 9% convertible bonds at par value on January 1. Each \$1,000 par value bond is convertible into 80 shares of common stock.

Required »

- Based on the information provided, compute basic and diluted earnings per share for the current year. Include all computations related to the application of antidilution sequencing.
- Prepare the required income statement disclosures beginning with net income.

- 2 3 4** E20-11. **Computing Basic and Diluted EPS, Convertible Bonds, Options, Convertible Preferred Stock, Antidilution, Disclosures.** We present Gamba Incorporated's current-year partial income statement: Gamba is subject to a 35% income tax rate.

Partial Income Statement	Current Year
Income from Continuing Operations	\$1,250,990
Discontinued operations—Income, net of tax	533,060
Net Income	<u>\$1,784,050</u>

A partial balance sheet for the current year follows.

Partial Balance Sheet	Current Year
Liabilities:	
5% Convertible Debt – Issued at \$1,000 par*	\$8,113,000
Stockholders' Equity:	
Common Stock, no par (1,032,000 shares issued and outstanding)**	\$5,160,000
\$3 Convertible Preferred Stock, \$100 par value (42,500 shares issued and outstanding)***	4,250,000
Additional Paid-in Capital—Stock Options (employee options to acquire 167,500 shares)****	(1,842,500)

Footnotes to the Balance Sheet:

* Each bond is convertible into 80 shares of common stock. The bonds are outstanding all year.

** The number of shares issued and outstanding did not change throughout the year.

*** Each preferred share is convertible into eight shares of common stock. The firm declared preferred dividends. The preferred stock was outstanding all year.

**** The options are exercisable at \$21 per share, and the average market price of the company's stock for the year is \$35. The options were outstanding all year.

Required »

- Based on the information provided, compute basic and diluted earnings per share for the current year. Include all computations related to the application of antidilution sequencing if needed.
- Prepare the income statement disclosures required beginning with income from continuing operations.

- 2 3 4** E20-12. **Computing Basic and Diluted EPS, Convertible Bonds, Options, Convertible Preferred Stock, Antidilution, Net Loss, Disclosures.** Refer to the income statement for Gamba Incorporated from E20-11, noting the following modifications:

Partial Income Statement	Current Year
Loss from Continuing Operations, net of tax	\$(1,250,990)
Discontinued Operations—Income, net of tax	<u>3,035,040</u>
Net Income	<u>\$ 1,784,050</u>

All other information from E20-11 is unchanged.

Required »

- Based on the information provided, compute basic and diluted earnings per share for the current year. Include all computations related to the application of antidilution sequencing if needed.
- Prepare the required income statement disclosures beginning with loss from continuing operations.

Problems

- 1 2 4** P20-1. **Computing Basic and Diluted EPS, Convertible Bonds, Preferred Stock, Disclosures.** Kollins Kids, Ltd. began the current year with 320,000 common shares outstanding and issued an additional 120,000 shares on August 1. The firm has \$8,000,000, 5% convertible bonds outstanding at the beginning of the year (i.e., \$400,000 coupon interest per year), which are convertible into 180,000 shares of common stock. The firm issued the bonds at their par value and converted them on April 1. Kollins Kids also has \$920,000 par value, 4% convertible, noncumulative preferred stock outstanding. The preferred shares can convert into 10,000 shares of common stock and were outstanding for a full year. The firm declared dividends for the current year. There were no actual conversions of the preferred stock during the year. Kollins is subject to a 40% effective tax rate, and net income is \$2,800,000. Assume that all convertible securities are dilutive.

Required »

- Based on this information, compute basic and diluted earnings per share for the current year.
- Prepare the earnings per share disclosure on the income statement beginning with net income.

- 2 4** P20-2. **Computing Basic and Diluted EPS, Convertible Bonds, Preferred Stock, Disclosures.** Assume that Kollins issued the convertible bonds described in P20-1 on February 1. Using the other information from P20-1, complete the following.

Required »

- Compute basic and diluted earnings per share for the current year.
- Prepare the earnings per share disclosure on the income statement beginning with net income.

- 1 2 4** P20-3. **Computing Basic and Diluted EPS, Convertible Bonds, Convertible Preferred Stock, Disclosures.** Daphne Company provided the following share information for the current year. Daphne reported income from continuing operations of \$1,100,000 and a \$450,000 loss from discontinued operations, net of tax. The company is subject to a 40% tax rate.

Event and Date	Number of Shares
1/1 Beginning balance	150,000
5/1 New share issue	345,000
7/1 Two-for-one stock split	
10/1 New share issue	300,000
12/1 Treasury stock acquisition	(120,000)

Daphne has \$400,000, 3% convertible debt outstanding as of the beginning of the year. The debt was issued at par. Each \$1,000 par value bond converts into 20 shares of the company's common stock. The company's shareholders' equity section indicates that the firm also holds \$140,000 par value, 4% convertible preferred shares outstanding for the entire year. The board of directors declared the annual dividend. The preferred shares can convert into 10,000 shares of common stock. There were no actual exercises or conversions during the year.

Required »

- Compute basic and diluted earnings per share for income from both continuing operations and net income. Show all computations.
- Prepare all required disclosures beginning with income from continuing operations.

P20-4. Computing Basic and Diluted EPS, Options, Convertible Preferred Stock, Disclosures. Baroke Bank, NA started the year with 600,000 common shares outstanding and issued 48,000, 840,000, and 72,000 shares on February 1, May 1, and September 1, respectively. Baroke acquired 12,000 treasury shares on March 1. The company has employee options outstanding all year that enable employees to acquire 358,000 shares of stock at an exercise price of \$15 per share. Baroke's shares traded at an annual average price of \$10 per share. Employees did not exercise any options during the year.

Baroke also reported convertible preferred shares that can be used to acquire 465,000 shares of common stock outstanding as of the beginning of the year. The firm reported preferred stock at \$1,567,000 par value. The preferred shares are cumulative and carry an 8% dividend rate. The board of directors declared the annual dividend.

The following is a partial income statement for the current year. Baroke is subject to a 35% income tax rate.

Partial Income Statement	For the Current Year
Income from Continuing Operations, net of tax	\$4,005,320
Loss from Discontinued Operations, net of tax	<u>(1,218,120)</u>
Net Income	<u>\$ 2,787,200</u>

Required »

- Compute basic and diluted earnings per share. Show all computations.
- Prepare all required disclosures beginning with income from continuing operations.

1 2 4

P20-5. Computing Basic and Diluted EPS, Convertible Bonds, Disclosures. Note the following partial income statement for Cassie Corporation for the current year.

Partial Income Statement	For the Current Year
Income from Continuing Operations	\$3,650,000
Income from Discontinued Operations, net of tax	<u>325,200</u>
Net Income	<u>\$3,975,200</u>

The company is subject to a 40% tax rate. We present share information for the current year in the following table.

Event and Date	Number of Shares
1/1 Beginning balance	1,890,000
3/1 New share issue	240,000
11/1 Treasury stock acquisition	(90,000)

Cassie had 360,000 options outstanding all year at an exercise price of \$25 per share. The average market price per share of the company's shares for the current year is \$40. The company issued 7%, \$6,500,000 convertible debt on April 1 of the current year at par value. Each \$1,000 par value bond converts into 25 shares of the company's common stock. All debt converted into common stock on October 1. Assume that the bonds are antidilutive. Each option is exercisable for one share of common stock.

Required »

- Compute basic and diluted earnings per share for income from continuing operations and net income. Show all computations.
- Prepare all required disclosures beginning with income from continuing operations.

1 2 3 4

P20-6. Computing Basic and Diluted EPS, Convertible Bonds, Options, Convertible Preferred Stock, Antidilution, Disclosures. Merion Company provided the following share information for the current year.

Event and Date	Number of Shares
1/1 Beginning balance	150,000
6/1 New share issue	240,000
8/1 Two-for-one stock split	
10/1 New share issue	390,000
12/1 Treasury stock acquisition	(48,000)

Merion reported income from continuing operations of \$1,000,000 and a \$430,000 loss from discontinued operations, net of tax. The company is subject to a 40% tax rate.

The company granted 120,000 employee options on January 1 that allow employees to acquire 120,000 common shares at \$18 per share. The options have an estimated fair value of \$10 per share. The average market price of the company's common shares is \$24 per share. Merion has \$500,000, 6% convertible debt outstanding as of the beginning of the year. Each \$1,000 par value bond converts into eight shares of the company's common stock. Merion also has \$140,000 par value, 4% convertible preferred shares outstanding for the entire year. The board of directors declared the annual dividend. The preferred shares can convert into 10,000 shares of common stock. There were no actual exercises or conversions during the year.

Required »

- Compute the weighted-average number of common shares outstanding for basic earnings per share.
- Determine whether any securities are antidilutive, and compute basic and diluted earnings per share. Show all computations.
- Prepare all required disclosures beginning with income from continuing operations.

1 2 3 4 P20-7. Computing Basic and Diluted EPS, Convertible Bonds, Options Preferred Stock, Disclosures, Antidilution, Net Loss. The following is a partial income statement for City Line Enterprises for the current year.

Partial Income Statement	For the Current Year
Loss from Continuing Operations	\$ (621,000)
Income from Discontinued Operations, net of tax	<u>3,256,000</u>
Net Income	<u>\$2,635,000</u>

The company is subject to a 40% tax rate. Share information for the current year follows.

Event and Date	Number of Shares
1/1 Beginning balance	2,000,000
5/1 New share issue	360,000
8/1 New share issue	120,000
12/1 Two-for-one split	2,480,000

City Line provided the following information about its capital structure. The company had employee options to acquire 500,000 shares at an exercise price of \$7 per share. The average market price of the company's shares for the current year is \$10 per share. The company issued 3%, \$1,500,000 convertible debt 2 years ago at par value. Each \$1,000 par value bond converts to five shares of the company's common stock. City Line has \$800,000 par value, 6% cumulative preferred shares outstanding for the entire year. The preferred shares are nonconvertible. There were no actual exercises or conversions during the year.

Required »

- Compute the weighted-average number of common shares outstanding for basic earnings per share.
- Determine whether any securities are antidilutive, and compute basic and diluted earnings per share. Show all computations.
- Prepare all required disclosures beginning with income from continuing operations.

1 2 3 4 P20-8. Computing Basic and Diluted EPS, Convertible Bonds, Options, Convertible Preferred Stock, Antidilution, Disclosures. Teek Bank, NA started the year with 600,000 common shares outstanding and issued 48,000, 840,000, and 72,000 shares on February 1, May 1, and September 1, respectively. Teek acquired 12,000 treasury shares on March 1.

The company has employee stock options outstanding all year that enable employees to acquire 358,000 shares at an exercise price of \$15 per share. Teek's shares traded at an annual average price of \$10 per share. Employees did not exercise any options during the year.

Teek also reported convertible debt and convertible preferred shares. The convertible debt securities the firm issued at par on August 1 for \$15,000,000 pay interest at 4% per year. Each \$1,000 par value bond converts into six shares of the company's common stock at the debtholder's option. Convertible preferred shares available to acquire 465,000 shares of common stock were outstanding as of the beginning of the year. Teek reported the preferred stock at a \$1,567,000 par value. The preferred shares are cumulative and carry an 8% dividend rate.

The following is a partial income statement for the current year. Teek is subject to a 35% income tax rate.

Partial Income Statement	For the Current Year
Income from Continuing Operations	\$4,005,320
Loss from Discontinued Operations, net of tax	<u>(1,218,120)</u>
Net Income	<u>\$ 2,787,200</u>

Required »

- Compute the weighted-average number of common shares outstanding for basic earnings per share.
- Determine whether any securities are antidilutive, and compute basic and diluted earnings per share. Show all computations.
- Prepare all required disclosures beginning with income or loss from continuing operations.

1 2 3 4 P20-9. Computing Basic and Diluted EPS, Convertible Bonds, Preferred Stock, Disclosures, Net Loss. The following is a partial income statement for Sonata Enterprises for the current year.

Partial Income Statement	For the Current Year
Loss from Continuing Operations	\$ (621,000)
Income from Discontinued Operations, net of tax	<u>3,256,000</u>
Net Income	<u>\$ 2,635,000</u>

The company is subject to a 40% tax rate. Share information for the current year follows.

Event and Date	Number of Shares
1/1 Beginning balance	2,000,000
5/1 New share issue	360,000
8/1 New share issue	120,000
12/1 Two-for-one split	

Sonata provided you the following information about its capital structure:

- It issued 3%, \$1,500,000 convertible debt 2 years ago at par value.
- Each \$1,000 par value bond converts into five shares of the company's common stock.
- It has \$800,000 par value, 6% cumulative, nonconvertible preferred shares outstanding for the entire year.
- There were no actual exercises or conversions during the year.

Required »

- Compute basic and diluted earnings per share for income from continuing operations and net income. Show all computations.
- Prepare all required disclosures beginning with income from continuing operations.

CASES

Judgment Case

Judgment Case 1: Earnings Management

The CFO of Last Things Computing, Inc. (LTC) prepared the following balance sheet and statement of net income for the year ended December 31, 2018.

Last Things Computing, Inc.
Balance Sheet
At December 31, 2018

Assets

Current Assets:

Cash	\$ 7,000
Trading Securities at Fair Value	900
Accounts Receivable – net	9,500
Merchandise Inventory	67,000
Office Supplies	550
Prepaid Rent	400
Total Current Assets	<u>\$ 85,350</u>

Noncurrent Assets:

Investments	\$ 17,000
Property, Plant, and Equipment	
Land	45,000
Buildings	275,000
Machinery and Equipment	60,000
Less: Accumulated Depreciation	(112,000)
Total Property, Plant, and Equipment – net	\$268,000
Deferred Tax Asset	\$ 7,500
Intangible Assets: Franchise – net	4,500
Other Assets	2,100
Total Noncurrent Assets	<u>\$299,100</u>
Total Assets	<u>\$384,450</u>

Liabilities

Current Liabilities:

Accounts Payable	\$ 22,600
Short-Term Notes Payable	2,000
Current Portion of Long-Term Debt	750
Interest Payable	300
Income Taxes Payable	2,000
Unearned Revenue	5,400
Total Current Liabilities	<u>\$ 33,050</u>

Long-Term Liabilities:

Notes Payable	\$ 55,000
Bonds Payable	160,000
Total Long-Term Liabilities	<u>\$215,000</u>
Total Liabilities	<u>\$248,050</u>

Stockholders' Equity

Common Stock – at par	\$ 15,000
Additional Paid-in Capital	34,500
Retained Earnings	77,900
Accumulated Other Comprehensive Income	9,000
Total Stockholders' Equity	<u>\$136,400</u>
Total Liabilities and Stockholders' Equity	<u>\$384,450</u>

Last Things Computing, Inc.
Statement of Net Income
For the Year Ended December 31, 2018

Revenues and Gains		
Sales	\$578,540	
Interest Income	25,000	
Dividend Income	2,500	
Income from Associates	9,000	
Gain on Disposal of Plant Assets	<u>5,800</u>	
Total Revenues and Gains		\$ 620,840
Expenses and Losses		
Cost of Goods Sold	\$172,000	
Selling Expenses and Salaries	48,000	
Office Supplies Expense	40,000	
Advertising Expense	21,000	
Office Salaries Expense	11,000	
Depreciation Expense	5,500	
Interest Expense	3,500	
Loss on Asset Impairment	<u>2,000</u>	
Total Expenses and Losses		<u>\$ 303,000</u>
Income before Taxes		\$ 317,840
Income Tax Expense		<u>(111,244)</u>
Income from Continuing Operations		<u>\$ 206,596</u>
Discontinued Operations		
Income from Operations of Discontinued Segment, net of tax of \$4,000	\$ 10,000	
Loss from Disposal of Discontinued Segment, net of tax of \$3,000	<u>(9,800)</u>	<u>\$ 200</u>
Net Income		<u>\$ 206,796</u>
Earnings per Share:		
Income from Continuing Operations		\$ 13.77
Income from Discontinued Operations		<u>0.02</u>
Earnings per Share		<u>\$ 13.79</u>

LTC had 15,000 common shares outstanding for the entire year. It had no preferred stock or dilutive securities. Assume that LTC records income tax expense at 35% of income from continuing operations before income taxes.

The CFO will make the following adjustments before finalizing the financial statements.

1. LTC needs to record some amount of bad debt expense. The offset will be a reduction in accounts receivable. This adjustment is a matter of judgment; reasonable estimates range between \$1,000 and \$3,000.
2. LTC needs to write down its inventory (i.e., reduce the reported value of inventory). The offset will be to cost of goods sold. This adjustment is a matter of judgment; reasonable estimates range between \$2,500 and \$3,750.
3. LTC could need to impair its PPE (that is, reduce the reported value of PPE). The offset will be an impairment loss reported on the statement of net income. This adjustment is a matter of judgment and reasonable estimates range between \$0 and \$5,000.
4. LTC could need to impair its noncurrent investments by reducing the reported value of noncurrent investments. The offset will be an impairment loss reported on the statement of net income. This adjustment is a matter of judgment; reasonable estimates range between \$250 and \$750.
5. LTC could need to record a litigation contingency by recording a liability for an unresolved lawsuit. The offset is to litigation expense. The lawsuit is expected to be settled in 2019. Reasonable estimates of the amount that LTC could be liable for are \$2,000 or \$10,000.

6. LTC could need to reduce the reported amount of its deferred tax asset. The amount by which the asset needs to be reduced is highly judgmental and ranges from \$0 to \$5,000. The offset to this adjustment is income tax expense.
7. LTC currently has unearned revenue on its balance sheet of \$5,400. However, up to \$5,000 of this amount could possibly be recognized as revenue in 2018. The amount is a matter of judgment.

Required »

- a. If LTC makes the most conservative choices for all these adjustments that will result in the lowest net income number, what is the impact on assets and liabilities in terms of absolute dollar impact and percentage change? What is the impact on net income and earnings per share?
- b. If LTC makes the least conservative choices for all these adjustments that will result in the highest net income number, what is the impact on assets and liabilities in terms of absolute dollar impact and percentage change? What is the impact on net income and earnings per share?
- c. What is the impact on the current ratio of these choices if management makes the most conservative choices? What is the impact on this ratio if management makes the least conservative choices?
- d. Do you think that the management of LTC will care very much about the choices related to these adjustments?

Financial Statement Analysis Case

Financial Statement Analysis Case 1: EPS Analysis of NCR Corporation

You are asked to analyze *NCR Corporation's* EPS. *NCR* is a business solution company manufacturing automated teller machines (ATMs), point of sale (POS) terminals and devices, and self-service kiosks. Use the footnote disclosure to answer the questions that follow the disclosure.

NCR Corporation, December 31, 2016, Financial Statements (excerpt)

NCR Corporation

NOTE 1. Basis of presentation and significant accounting policies

Earnings Per Share

The components of basic earnings (loss) per share are as follows:

	Twelve months ended December 31		
	2016	2015	2014
	In millions, except per share amounts		
Income (loss) from continuing operations	\$ 283	\$ (154)	\$ 181
Series A convertible preferred stock dividends	<u>(49)</u>	<u>(4)</u>	<u>—</u>
Numerator—from continuing operations	234	(158)	181
Loss (income) from discontinued operations, net of tax	<u>(13)</u>	<u>(24)</u>	<u>10</u>
Numerator—total	\$ 221	\$ (182)	\$ 191
Denominator			
Basic weighted average number of shares outstanding	125.6	167.6	167.9
Basic earnings (loss) per share:			
From continuing operations	\$ 1.86	\$ (0.94)	\$ 1.08
From discontinued operations	<u>(0.10)</u>	<u>(0.15)</u>	<u>0.06</u>
Total basic earnings (loss) per share	\$ 1.76	\$ (1.09)	\$ 1.14

The components of diluted earnings (loss) per share are as follows:

	Twelve months ended December 31		
	2016	2015	2014
	In millions, except per share amounts		
Income (loss) from continuing operations	\$ 283	\$ (154)	\$ 181
Series A convertible preferred stock dividends	—	(4)	—
Numerator—from continuing operations	283	(158)	181
Income (loss) from continuing operations	\$ 283	\$ (154)	\$ 181
Loss from discontinued operations, net of tax	(13)	(24)	10
Series A convertible preferred stock dividends	(49)	(4)	—
Numerator—total	\$ 221	\$ (182)	\$ 191
Basic weighted average number of shares outstanding	125.6	167.6	167.9
Dilutive effect of as-if Series A Convertible Preferred Stock	28.2	—	—
Dilutive effect of employee stock options and restricted stock units	3.6	—	3.3

Denominator—total	129.2	167.6	171.2
Diluted earnings (loss) per share:			
From continuing operations	\$ 1.80	\$ (0.94)	\$ 1.06
From discontinued operations	(0.10)	(0.15)	0.06
Total diluted earnings (loss) per share	\$ 1.71	\$ (1.09)	\$ 1.12

Source: From December 31, 2016, Financial Statements, NCR Corporation. http://investor.ncr.com/phoenix.zhtml?c=83840&p=irol-reportsannual_pf

Required »

- NCR's* net income on the income statement is the same as net income available for common stockholders in earnings per share in 2014 but not 2015 and 2016. What does the fact that the two amounts are not the same in 2015 and 2016 suggest?
- What types of securities create the difference between *NCR's* basic income from continuing operations and diluted income from continuing operations? What is the difference between *NCR's* basic income and diluted income each year?
- What types of securities create the difference between *NCR's* basic shares and diluted shares? What is the difference between *NCR's* basic shares and diluted shares each year?
- What are the percentage differences in income from continuing operations, basic EPS for income from continuing operations, and diluted EPS for income from continuing operations from 2014 to 2016? Comment on the changes.
- What are the percentage differences in basic and diluted EPS for income from continuing operations and the weighted-average number of shares for income from continuing operations used for basic and diluted EPS? Comment on changes over time.
- If you were an analyst, what further information would you want to assess changes in EPS over time?

Surfing the Standards Case

Surfing the Standards Case 1: Contingently Issuable Shares

On March 1 of the current year, Johanne Stores acquired 100% of the voting shares of Ferry Furniture Company. Johanne reports only annually on a calendar basis. As part of the merger agreement, Johanne agreed to distribute 0.2 additional shares for each share of outstanding stock to its current stockholders if, by the end of the current fiscal year, five new Ferry outlets are opened. On December 31, Johanne provided you the following information:

- Net income for the year is \$4,500,000.
- There are 1,000,000 outstanding common shares for the entire year.
- There are 200,000 contingently issuable shares (i.e., $0.2 \times 1,000,000$).
- Seven new Ferry outlets were opened by December 31 with the fifth store opened on November 1.
- Johanne had \$3,000,000 par value, 5% cumulative, nonconvertible preferred shares outstanding for the full year.

Required »

- Provide a general discussion of the effect of contingently issuable shares on basic earnings per share.
- Provide a general discussion of the effect of contingently issuable shares on diluted earnings per share.
- Compute basic earnings per share for Johanne Stores.
- Compute diluted earnings per share for Johanne Stores.

Basis for Conclusions Cases

Basis for Conclusions Case 1: Antidilutive Securities

Read paragraphs 95 through 99 in Appendix B: Background information and basis for conclusions in FASB's *Statement of Financial Accounting Standards No. 128*.

Required »

- Why did the Board decide to require an antidilution sequence that considers securities in the order of most dilutive to least dilutive?
- What line items could appear on an income statement after income from continuing operations, but before net income? Note that when *Statement of Financial Accounting Standards No. 128* was written, companies reported extraordinary items and the effect of changes in accounting principles on the income statement after income from continuing operations. This is no longer true.
- The FASB chose income from continuing operations as the number that should be used to determine whether securities are dilutive or antidilutive. Why did it choose income from continuing operations as opposed to net income?
- Did the constituents who wrote comment letters about the exposure draft of *Statement of Financial Accounting Standards No. 128* agree with the use of income from continuing operations as opposed to net income as the control number for the determination of which securities are dilutive?

Basis for Conclusions Case 2: Treasury Stock Method

Read paragraphs 105 through 107 in Appendix B: Background information and basis for conclusions in FASB's *Statement of Financial Accounting Standards No. 128*.

Required »

- Why did the Board decide to continue to use the treasury stock method?
- What were the Board's primary concerns with the treasury stock method?
- Why did the Board choose to use the average stock price to determine the number of treasury shares assumed purchased?

21

Accounting Changes and Error Analysis

LEARNING OBJECTIVES

- 1 Provide an overview of the types of accounting changes, including the difference between the retrospective and prospective methods.
- 2 Describe and demonstrate the accounting for a change in accounting principle.
- 3 Explain and illustrate the accounting for a change in an accounting estimate.
- 4 Explain the accounting for a change in the reporting entity.
- 5 Discuss common types of errors and error analysis and demonstrate how to correct errors.

Introduction

MANAGEMENT'S ASSESSMENT OF OPERATIONS drives a company's accounting policies and its financial reporting assumptions and estimates. Managers continually examine their choices, adjusting accounting policies when a financial accounting policy no longer faithfully represents the firm's

underlying economics or information lacks sufficient transparency for financial statement users.

Consider *Netflix, Inc.*, the subscription service company that provides movies and TV episodes over the Internet, such as *House of Cards* and *Orange Is the New Black*, totaling \$10.9 billion at the end of 2016. *Netflix* amortizes the costs of its streaming content assets over the shorter of each title's estimated period of use or its contractual window of availability. For content when *Netflix* expects more upfront viewing from additional merchandising or marketing efforts, the amortization is on an accelerated basis. *Netflix*'s management reviews factors impacting the amortization of the content assets on a regular basis. Estimates related to these factors require considerable management judgment. In the third quarter of 2016, *Netflix* changed the amortization of certain content given changes in estimated viewing patterns of these content assets. The effect of this change in estimate was a \$19.8 million decrease in operating income and a \$12.3 million decrease in net income. The effect on both basic earnings per share and diluted earnings per share was a decrease of \$0.03 for 2016. *Netflix* noted that changes in estimates could have a significant impact on its future results of operations.

In this chapter, we discuss accounting changes related to accounting principle (method), accounting estimate, and reporting entity. Managers and investors alike expect these changes as businesses develop or modify overall strategy and expand into diverse markets. It is important to know the reason for the accounting change, the nature of the change, and its effect on the financial statements.

We illustrate the two methods for accounting for a change: the *retrospective* and the *prospective* methods. Firms generally account for and report changes in accounting principle on a *retrospective* basis and changes in accounting estimate on a *prospective* basis. A company's disclosure of both a change in principle and estimate must enable the financial statement user to compare the year of the change with all

sitthiphong/Shutterstock

prior periods. Finally, we examine error analysis because companies must correct mistakes in the financial statements. The method of correction depends on what financial statement is

in error and when the company discovers the error. Throughout the chapter, the accounting treatment is similar under U.S. GAAP and IFRS. ◀◀

- 1 Provide an overview of the types of accounting changes, including the difference between the retrospective and prospective methods.

Overview of Accounting Changes

In this section, we describe the three types of accounting changes and two methods that companies use for reporting them.

Types of Accounting Changes

There are three main types of accounting changes:

- **Changes in accounting principle**, which are changes from one generally accepted accounting method to another generally accepted accounting method
- **Changes in accounting estimate**, which involve revisions of estimates used in accounting
- **Changes in the reporting entity**, which occur when a company reports financial statements that are, in effect, financial statements for a different reporting entity¹

All accounting changes make the financial statements inconsistent from period to period. Consequently, the standards permit accounting changes only when companies provide adequate disclosures to assist financial statement users in restoring comparability with prior-years financial information.²

THE CONCEPTUAL FRAMEWORK CONNECTION Changes in Accounting Principles and Estimates

Comparability, one of the conceptual framework's enhancing qualitative characteristics, enhances the usefulness of relevant and faithfully represented information by helping users to identify and understand the similarities and differences in items reported. Changing accounting principles and estimates from period to period detracts from comparability.

Consistency refers to the firm's use of the same accounting methods for the same transactions from period to period. Although the conceptual framework does not specify consistency as a qualitative characteristic of useful financial information, it does help achieve the goal of comparability. When a company changes its accounting method or an accounting estimate for a particular transaction, its financial statements are not consistent from year to year—and financial statements that are not comparable from year to year violate the conceptual framework.

Whereas accounting standards allow changes in accounting principle, they should occur infrequently, and companies should make adequate disclosures. Changes in accounting estimates are more common than changes in accounting principles. As discussed in the conceptual framework, “financial reports are based on estimates, judgments, and models rather than exact depictions.”³ Consequently, companies commonly change estimates as additional information becomes available.

¹An additional category, correction of an error made in previously issued financial statements, or prior-period adjustments, will also result in changes in the financial statements. Although not specifically classified as an accounting change, prior-period adjustments will require similar accounting procedures.

²For the relevant authoritative literature, see FASB ASC 250–10, *Accounting Changes and Error Corrections – Overall* for U.S. GAAP and IASC, *International Accounting Standard 8, “Accounting Policies, Changes in Accounting Estimates and Errors”* (London, UK: International Accounting Standards Committee, Revised, 2013) for IFRS.

³Financial Accounting Standards Board, *Statement of Financial Accounting Concepts No. 8 Chapter 1, “The Objective of General Purpose Financial Reporting,”* Paragraph OB11.

Methods for Reporting Accounting Changes

There are two approaches for reporting accounting changes—the *retrospective* and *prospective methods*. Examples later in the chapter illustrate applying these methods to account for the three types of accounting changes.

Retrospective Change. Companies reporting an accounting change with the **retrospective method** restate all prior-year financial statements presented in the annual report as if the newly adopted principle had always been used. **Restated financial statements** adjust opening balance sheet accounts for the cumulative effect of applying the new principle in all prior years and present all subsequent financial statements as if the policy had always been used. Specifically, companies adjust:

1. Assets and liabilities as of the beginning of the first period presented to reflect the cumulative effect of the change on periods prior to those presented
2. Retained earnings (or other appropriate components of equity) for the beginning of the first period presented to reflect the cumulative effect of the change on reported income for periods prior to those presented
3. Financial statements for each period presented to reflect the effects of the change

Prospective Change. Companies using the **prospective method** to report an accounting change make the change in the current year (that is, the year of the change) and all future years. They do not make adjustments to previously issued financial statements: The prospective method treats information for all prior years as final and does not change previously issued financial information.

- ② Describe and demonstrate the accounting for a change in accounting principle.

Changes in Accounting Principle

In this section, we examine how firms report a change in accounting principle using the retrospective and prospective methods with related disclosures. Changes in accounting principle can be voluntary or mandatory. Newly issued accounting standards are mandatory accounting changes; voluntary changes occur when a firm decides to change accounting methods. For example, a change in a firm's inventory costing system from FIFO to LIFO or in revenue recognition methods from completed contract to percentage of completion would constitute a change in accounting principle. A firm should voluntarily change accounting principles only if it can justify use of the new principle on the basis that it more accurately portrays its financial position and performance.

The adoption of a new principle in recognition of events that have occurred for the first time is not considered a change in accounting principle. For example, assume that a company begins selling a new product and adopts the average-cost method for this inventory item while continuing to account for all other inventory items under the LIFO basis. The use of the average-cost method for the newly acquired inventory item is not a change in accounting principle.

Reporting a Change in Accounting Principle

Generally, firms are required to report all changes in accounting principle under the retrospective approach. There are two exceptions:

1. In the case of a mandatory change required by a new accounting standard, an entity should follow the specific transition requirements provided within the new standard. The new standard could specify retrospective or prospective application. If no such requirements exist, the firm should follow the retrospective approach.
2. If it is impractical to use the retrospective approach for any one of the following three conditions, the entity should use the prospective approach. The use of the retrospective method is impractical if:
 - The financial statement effects of the retrospective application are not determinable.
 - Retrospective application requires assumptions about management's intent in a prior period.
 - Retrospective application requires significant estimates for a prior period and the availability of the necessary information to determine these estimates cannot be objectively verified.

An entity meeting any one of these three conditions cannot implement a retrospective application but must apply the change in accounting principle prospectively. A change to the LIFO method is an example of an impractical change in accounting principle. For example, determining LIFO inventory base layers at prior-years unit costs is impractical if the firm did not track prior-year costs.

Consider *Google*, whose parent company is *Alphabet, Inc.*, as an example of a mandatory change required by a new accounting standard. In 2016, *Google* adopted a new FASB standard on accounting for employee share-based payments that we discussed in Chapter 19. *Google* used the retrospective method when it changed its method of accounting for forfeitures of stock-based compensation awards from estimating expected forfeitures to accounting for forfeitures as they occur. *Google's* cumulative adjustment was a decrease of \$133 million in beginning 2015 retained earnings.

Direct and Indirect Effects

Changes in accounting principle can have both *direct* and *indirect effects*. **Direct effects** are changes necessary to implement the change in accounting principle. For example, if a firm changes its method of costing inventory, there would be direct effects to the inventory and retained earnings balances. The direct effects could also include necessary changes to the tax accounts. Firms always apply direct effects retrospectively unless it is impractical to do so.

Indirect effects are changes to current or future cash flows that result from the change in accounting principle. The impact on cash flows related to profit sharing and bonus plans or from violating restrictive debt covenants are indirect effects. Firms apply indirect effects only prospectively; retrospective treatment is not permitted for indirect effects of a change in accounting principle. Exhibit 21.1 summarizes direct and indirect effects and the corresponding accounting method.

EXHIBIT 21.1 Summary of Direct and Indirect Effects

	Direct Effects	Indirect Effects
Definition	Changes necessary to implement the change in accounting principle	Changes to current or future cash flows that result from the change in accounting principle
Accounting Method	Retrospective unless it is impractical to do so	Prospective
Example	A change in the accounting method for revenue recognition would impact the revenue account and possibly the unearned revenue and the tax accounts	A change in the accounting method for revenue recognition could impact the bonus plans related to management's compensation

Retrospective Method Illustration

We examine the retrospective method for changes in an accounting principle in Example 21.1 to highlight the key elements involved in applying this approach.

EXAMPLE 21.1 Change in Accounting Principle: Retrospective Method

PROBLEM: Topeka Tile Company began operations on January 1, 2017. At the beginning of 2121, the company elected to change from the FIFO method to the average-cost method for financial reporting purposes. It did not change methods for tax purposes. The company has maintained adequate records to apply the retrospective method. The company is subject to a 40% tax rate and has not declared or paid any dividends. As is typical, in its December 31, 2121, annual report, it presents income statements and statements of stockholders' equity for the years ended December 31, 2019, 2020, and 2121. It reports balance sheets at December 31, 2020 and 2121.

Cost of goods sold under both methods follows.

Year	Cost of Goods Sold FIFO Method	Cost of Goods Sold Average-Cost Method
2017	\$7,000	\$9,000
2018	5,000	6,000
2019	6,000	7,400
2020	4,000	6,200
2121	2,000	4,700

Topeka's schedule of revenues, operating expenses, and purchases is presented here.

Year	Revenues	Operating Expenses	Purchases
2017	\$33,333	\$10,000	\$20,000
2018	30,000	8,000	10,000
2019	31,000	9,000	10,000
2020	32,000	11,000	5,000
2121	20,000	7,000	15,000

Topeka's balance sheet line items for December 31, 2020, as reported, follows.

Account	Balance
Cash	\$31,800
Inventory	23,000
Liabilities	5,000
Common Stock	10,000
Retained Earnings	39,800

As of December 31, 2121, Topeka had a cash balance of \$25,400. The balances in liabilities and common stock have not changed since December 31, 2020.

Topeka reported a retained earnings balance of \$20,000 as of December 31, 2018. Prepare the financial statements that will be included in the 2121 annual report and prepare the journal entry to implement the change.

SOLUTION: Topeka reports the change using the retrospective method because it is not impractical to do so.

Effect on Income

Cost of goods sold is higher under the new method, resulting in a decrease in net income. In order to compute the decrease in net income for each year, we multiply the difference in the cost of goods sold under the two methods by 1.0 minus the tax rate, or 0.6 ($1.0 - 0.4$).

Year	Cost of Goods Sold FIFO Method (a)	Cost of Goods Sold Average- Cost Method (b)	Decrease in Net Income Pre-Tax (a) - (b)	Decrease in Net Income (Net of Tax) [(a) - (b)] × 0.6	Cumulative Decrease in Net Income (Net of Tax)
2017	\$7,000	\$9,000	\$2,000	\$1,200	\$1,200
2018	5,000	6,000	\$1,000	600	1,800
2019	6,000	7,400	\$1,400	840	2,640
2020	4,000	6,200	\$2,200	1,320	3,960
2121	2,000	4,700	\$2,700	1,620	5,580

Continued

The comparative income statements after implementing the change in accounting principle follow. Note that the cost of goods sold is presented using the average-cost method (the new method).

Statements of Income			
	2121	2020 (As Adjusted)	2019 (As Adjusted)
Revenues	\$ 20,000	\$ 32,000	\$ 31,000
Cost of Goods Sold	(4,700)	(6,200)	(7,400)
Operating Expenses	(7,000)	(11,000)	(9,000)
Net Income before Tax	\$ 8,300	\$ 14,800	\$ 14,600
Income Tax Expense (net income before tax × 40%)	(3,320)	(5,920)	(5,840)
Net Income	<u>\$ 4,980</u>	<u>\$ 8,880</u>	<u>\$ 8,760</u>

Statement of Stockholders' Equity

Topeka begins the retained earnings portion of its statement of stockholders' equity with the balance as of December 31, 2018. The company originally reported a balance of \$20,000. Topeka reduces the balance by the cumulative decrease in net income (\$1,800), resulting in an ending balance of \$18,200.

Retained Earnings	
Balance: December 31, 2018 (as previously reported)	\$ 20,000
Cumulative effect of a change in accounting principle	(1,800)
Balance: December 31, 2018 (as adjusted)	\$ 18,200
Adjusted net income, 2019	8,760
Balance: December 31, 2019 (as adjusted)	\$ 26,960
Adjusted net income, 2020	8,880
Balance: December 31, 2020 (as adjusted)	\$ 35,840
Net income, 2121	4,980
Balance: December 31, 2121	<u>\$ 40,820</u>

Journal Entry

We can analyze the effect of the change on the inventory account by building the inventory accounts under both methods using the purchases and cost of goods sold information provided. Purchases will be the same under any inventory valuation technique. The general ledger inventory accounts under both the FIFO (old) and average cost (new) methods are as follows:

	FIFO (Old Method)	Average Cost (New Method)
2017		
Beginning Inventory	\$ 0	\$ 0
Purchases	20,000	20,000
Cost of Goods Available for Sale	20,000	20,000
Less: Cost of Goods Sold	(7,000)	(9,000)
Ending Inventory	<u>\$ 13,000</u>	<u>\$ 11,000</u>
2018		
Beginning Inventory	\$ 13,000	\$ 11,000
Purchases	10,000	10,000
Cost of Goods Available for Sale	23,000	21,000
Less: Cost of Goods Sold	(5,000)	(6,000)
Ending Inventory	<u>\$ 18,000</u>	<u>\$ 15,000</u>

	FIFO (Old Method)	Average Cost (New Method)
2019		
Beginning Inventory	\$18,000	\$ 15,000
Purchases	<u>10,000</u>	<u>10,000</u>
Cost of Goods Available for Sale	28,000	25,000
Less: Cost of Goods Sold	<u>(6,000)</u>	<u>(7,400)</u>
Ending Inventory	<u>\$22,000</u>	<u>\$ 17,600</u>
2020		
Beginning Inventory	\$22,000	\$ 17,600
Purchases	<u>5,000</u>	<u>5,000</u>
Cost of Goods Available for Sale	27,000	22,600
Less: Cost of Goods Sold	<u>(4,000)</u>	<u>(6,200)</u>
Ending Inventory	<u>\$23,000</u>	<u>\$16,400</u>
2121		
Beginning Inventory	\$23,000	\$ 16,400
Purchases	<u>15,000</u>	<u>15,000</u>
Cost of Goods Available for Sale	38,000	31,400
Less: Cost of Goods Sold	<u>(2,000)</u>	<u>(4,700)</u>
Ending Inventory	<u>\$36,000</u>	<u>\$26,700</u>

Topeka makes the journal entry to record the change in accounting principle to impact the balances as of January 1, 2121, because it has already closed the books for 2020. Topeka decreases the inventory account by \$6,600, which is the difference between FIFO inventory (\$23,000) and the average-cost inventory (\$16,400). The cumulative decrease in net income up to December 31, 2020, is \$3,960 (see preceding analysis). This amount represents the after-tax cumulative effect on retained earnings. This difference of \$3,960 is also determined as 60% of the total change in inventory ($\$6,600 \times 60\%$). The remaining 40% ($\$2,640 = \$6,600 \times 40\%$) is attributable to the tax impact. Topeka records a deferred-tax asset: If it used the average-cost method for book purposes and FIFO for tax purposes, the book carrying value of the asset inventory is less than its tax basis, creating future deductible amounts for tax (that is, a deferred-tax asset). The journal entry to record the retrospective change in accounting principle follows. Note that the amounts represent the cumulative adjustments up to, but not including, the year of the change.

Account	January 1, 2121
Retained Earnings	3,960
Deferred Tax Asset	2,640
Inventory	6,600

Balance Sheets

We begin with the balance sheet for December 31, 2020. Cash, liabilities, and common stock were not affected by the accounting change. As a result, Topeka continues to report them as originally presented. We have already determined the new ending inventory balance of \$16,400 and the ending retained earnings balance of \$35,840 (\$39,800 as originally reported less \$3,960 cumulative effect of the change). Topeka reports a deferred-tax asset of \$2,640 on the balance sheet.

The balances in cash, liabilities, and common stock as of December 31, 2121, are not affected by the change in inventory methods. We have already determined the new ending inventory balance of \$26,700 and the ending retained earnings balance of \$40,820. Topeka increases its deferred-tax asset balance by \$1,080 to \$3,720. The increase in the deferred-tax

Continued

asset is attributable to 40% of the \$2,700 (\$4,700 – \$2,000) difference in the inventory tax basis under the FIFO method and the inventory carrying value under the average-cost method.

Topeka includes the following balance sheets in its annual report for December 31, 2121:

	December 31, 2121	December 31, 2020 (Adjusted)
Cash	\$25,400	\$31,800
Inventory	26,700	16,400
Deferred Tax Asset	3,720	2,640
Total Assets	<u>\$55,820</u>	<u>\$50,840</u>
Liabilities	\$ 5,000	\$ 5,000
Common Stock	10,000	10,000
Retained Earnings	40,820	35,840
Total Liabilities and Equity	<u>\$55,820</u>	<u>\$50,840</u>

Abercrombie & Fitch Co. used the retrospective method when it changed its inventory accounting method to the weighted-average cost method from the retail method in fiscal 2012. *Abercrombie's* cumulative adjustment was an increase of \$47.3 million, about 2%, in beginning retained earnings of the first period presented in its financial statements.⁴ This adjustment to retained earnings is shown in the line “Cumulative restatement for change in inventory accounting . . .” in the excerpt of *Abercrombie's* statement of stockholders' equity in Exhibit 21.2. The adjustment for the change in inventory method also increased *Abercrombie's* beginning inventory by \$73.6 million, or about 11%, with the difference between the retained earnings and inventory adjustments going to deferred taxes.

All amounts presented in the financial statements related to the change in the inventory method are adjusted from the beginning of the year of the change and all future periods. The third line in the statement of stockholders' equity reports restated net income, which has been adjusted for the change in inventory method.

Prospective Method Illustration

In Example 21.2, we examine a change in an accounting principle under the prospective method.

EXHIBIT 21.2 Retrospective Method Cumulative Adjustment, *Abercrombie & Fitch Co.*, Financial Statements, February 2, 2013

Abercrombie & Fitch, Co.								
Consolidated Statements of Stockholders' Equity (Excerpt)								
(Thousands, except per share amounts)								
	Common Stock				Other Compre- hensive (Loss) Income	Treasury Stock		Total Stockhold- ers' Equity
	Shares Outstanding	Par Value	Paid-In Capital	Retained Earnings		Shares	At Aver- age Cost	
Balance, January 30, 2010	87,986	\$ 1,033	\$ 339,453	\$ 2,183,690	\$ (8,973)	15,314	\$ (687,286)	\$ 1,827,917
Cumulative restatement for change in inventory accounting (See Note 4)				47,341				47,341
Restated Net Income	—	—	—	155,709	—	—	—	155,709

Source: Retrospective Method Cumulative Adjustment, *Abercrombie & Fitch Co.*, Financial Statements, February 2, 2013.

⁴In its fiscal 2012 financial statements, *Abercrombie & Fitch Co.* presented its income statement and its statement of stockholders' equity for 3 years: fiscal 2012, 2011, and 2010. Therefore, the beginning of fiscal 2010 is January 30, 2010, and retained earnings on this date are adjusted.

EXAMPLE 21.2**Change in Accounting Principle: Prospective Application**

PROBLEM: Assume that Topeka Tile Company from Example 21.1 does not have sufficient information to report the change retrospectively. Prepare the financial statements that Topeka will include in its annual report for 2021.

SOLUTION: Because it is impractical for Topeka Tile to report the change in inventory costing retrospectively, it will report the change prospectively. Thus, the change will not affect prior financial statements. Instead, Topeka will use the FIFO inventory as of December 31, 2020, as its opening inventory balance for 2021 and commence the average-cost method in 2021.

Topeka computes its cost of goods sold for 2021 as follows:

Beginning inventory (FIFO – Old Method)	\$23,000
Purchases	<u>15,000</u>
Cost of goods available for sale	38,000
Less: Ending inventory (Average Cost – New Method)	<u>(26,700)</u>
Cost of goods sold	<u>\$ 11,300</u>

Topeka's income statements for 2019 and 2020 are as originally reported. Topeka reports cost of goods sold for 2021 as computed above.

Statement of Net Income			
	2021	2020 (As Previously Reported)	2019 (As Previously Reported)
Revenues	\$ 20,000	\$ 32,000	\$ 31,000
Cost of goods sold	(11,300)	(4,000)	(6,000)
Operating expenses	<u>(7,000)</u>	<u>(11,000)</u>	<u>(9,000)</u>
Net income before tax	\$ 1,700	\$ 17,000	\$ 16,000
Income tax expense	<u>(680)</u>	<u>(6,800)</u>	<u>(6,400)</u>
Net income	<u>\$ 1,020</u>	<u>\$ 10,200</u>	<u>\$ 9,600</u>

Topeka does not adjust the statement of retained earnings for the average-cost method.

Statement of Retained Earnings	
Balance: December 31, 2018	\$20,000
Net income, 2019	<u>9,600</u>
Balance: December 31, 2019	\$29,600
Net income, 2020	<u>10,200</u>
Balance: December 31, 2020	\$39,800
Net income, 2021	<u>1,020</u>
Balance: December 31, 2021	<u>\$40,820</u>

Finally, Topeka's balance sheet for 2020 remains as originally reported. The 2021 balance sheet is identical to the one prepared under the retrospective approach.

	December 31, 2021	December 31, 2020
Cash	\$25,400	\$31,800
Inventory	26,700	23,000
Deferred Tax Asset	<u>3,720</u>	<u>0</u>
Total Assets	<u>\$55,820</u>	<u>\$54,800</u>
Liabilities	\$ 5,000	\$ 5,000
Common Stock	10,000	10,000
Retained Earnings	<u>40,820</u>	<u>39,800</u>
Total Liabilities and Equity	<u>\$55,820</u>	<u>\$54,800</u>

Required Disclosures for a Change in Accounting Principle

For any change in accounting principle, firms must provide the following footnote disclosures in the year of the change:

1. Description of the nature of the change: An example of this disclosure is “effective January 1, 2019, the company changed its method of accounting for inventory from the FIFO method to the average-cost method.”
2. Management’s justification for the change, which indicates why the new method is preferable: An example of this disclosure is “management believes that the new method of accounting for inventory valuation will better reflect the company’s operations.”
3. The method of applying the change: The company specifies the retrospective or prospective method.
4. A description of any adjusted prior-period information.
5. The effect of the change on income from continuing operations, net income, per share amounts, and any other affected line item.
6. The cumulative effect of the change on retained earnings for the first balance sheet presented.

Disclosures: IFRS. IFRS additionally requires a company to report 3 years of balance sheets and 2 years of the other financial statements when reporting a change in accounting principle. IFRS requires these minimum number of years so that financial statement users can better compare changes in a company’s financial information from year-to-year as if the company had always applied the new accounting principle.

- ③ Explain and illustrate the accounting for a change in an accounting estimate.

Changes in Accounting Estimates

Accounting changes due to revisions of underlying estimates involve areas such as bad debt expense, depreciation expense, inventory obsolescence, and pensions. Estimates are natural parts of the accounting process: Changes in estimates are expected, particularly as management becomes more experienced and as new information becomes available.

Prospective Method Illustration

Firms must report changes in accounting estimates using the prospective method. That is, firms implement the new estimate in the year of the change and in all future years as appropriate. Prior-years financial statements are not affected. *Netflix’s* decrease in net income of \$12.3 million in 2016 resulting from changes in estimated viewing patterns is an example of a change in accounting estimate using the prospective method. Example 21.3 illustrates accounting for a change in an estimate.

EXAMPLE 21.3 Change in Accounting Estimate

PROBLEM: Adelaide Manufacturing Company acquired a plant asset for \$1,000 on January 1, 2013, and depreciated the equipment using the straight-line basis over a 10-year period with no scrap value. On January 1, 2019, after using the asset for 6 full years, Adelaide’s management believes that the asset will be productive for an additional 8 years (as opposed to 4 years). The increase in useful life results from an improved maintenance program initiated 2 years ago. How should Adelaide report this change in estimate?

SOLUTION: Annual depreciation is \$100 per year ($\$1,000/10$ years) before the change in estimate. After 6 years, when the asset’s net book value is \$400 ($\$1,000 - \600), the company believes that the asset will be productive for another 8 years. Therefore, the revised depreciation is \$50 per year ($\$400/8$ years). Adelaide will use the revised depreciation from the year of the change (2019) to the date of disposal.

Adelaide does not make any changes to prior financial statements.

Change in Accounting Estimate Effected by a Change in Accounting Principle

It is often difficult to differentiate between a change in accounting estimate and a change in accounting principle. A **change in accounting estimate effected by a change in accounting principle** is a change in estimate that is inseparable from the effect of a related change in accounting principle. For example, a change in depreciation method is based on a change in the estimate regarding the future economic benefits to be derived from the use of the asset. Firms account for a change in accounting estimate effected by a change in accounting principle the same way as a change in accounting estimate—that is, under the prospective method. Accounting for a change in accounting estimate effected by a change in accounting principle is illustrated in Example 21.4.

EXAMPLE 21.4

Change in Accounting Estimate Effected by a Change in Accounting Principle

PROBLEM: Cayo Horizons purchased a piece of equipment on January 1, 2017, for \$100,000. Cayo depreciated the asset using the straight-line method over 5 years with no residual value. On January 1, 2019, Cayo decided that the units-of-output method would be a more accurate method of computing depreciation on this equipment than the straight-line method. Management believes that the equipment has 5,000 units remaining as of January 1, 2019. During 2019, Cayo used the equipment to produce 1,000 units. How should Cayo report the change in depreciation methods? What depreciation expense should Cayo report in 2019?

SOLUTION: Because Cayo switched from using the straight-line method to the units-of-output method for depreciating the equipment, this is a change in accounting estimate effected by a change in accounting principle. Thus, Cayo accounts for it prospectively. On January 1, 2019, the book value of the equipment was \$60,000 [$\$100,000$ cost less $\$40,000$ for 2 years of depreciation expense ($\$100,000/5 \times 2$)]. Cayo uses a depreciation rate of \$12 per unit ($\$60,000$ book value divided by 5,000 units remaining) under the new depreciation method. Accordingly, Cayo records \$12,000 ($\12 per unit \times 1,000 units) depreciation expense in 2019.

JUDGMENTS IN ACCOUNTING

Changes in Accounting Estimates

Financial statement users understand that the statements contain many estimates. Judgments are pervasive in accounting for estimates and changes in estimates. We have demonstrated how firms estimate the balances for almost all the line items on a balance sheet to some degree throughout the book. For example, in order to measure accounts receivable, accountants must estimate the amount of uncollectible accounts. In the case of inventory, accountants make assumptions about the flow of inventory in order to estimate the cost of inventory. They also make judgments related to the need to write down inventory to market. Property, plant, and equipment are estimated because depreciation is simply a forecast of future usage.

Accountants use their best judgment to estimate and record these items as accurately as possible. However, as new information becomes available, estimates change—and the adjusted estimates are still estimates.

As an example of the importance of estimates, consider a company that purchased a factory building for \$30 million and depreciated it using the straight-line method. What useful life should be used to depreciate the building? The company might be able to reliably estimate that the life will be between 30 and 50 years. But this is a wide range of possible useful lives. If the company chooses 30 years, then the annual depreciation expense will be \$1 million. Alternatively, if management decides to depreciate the asset over a 50-year period, the annual depreciation expense will be \$600,000. This \$400,000 difference has a direct impact on net income.

Disclosure of a Change in Accounting Estimate

Companies should disclose the effect of a change in estimate on income from continuing operations, net income, and related per share amounts of the current period if a change in estimate affects several periods. Consider a change in the service lives of depreciable assets. Firms must provide footnote disclosure indicating why the new estimate is justifiable.

Companies are not required to disclose changes in accounting estimates made as part of normal operations, such as bad debt allowances or inventory obsolescence, unless those changes are material. When a company changes an accounting estimate effected by a change in accounting principle, the disclosure requirements for a change in accounting principle are required.

Exhibit 21.3 shows a sample disclosure for the Adelaide Manufacturing Company from Example 21.3. This disclosure assumes a 40% tax rate.

EXHIBIT 21.3 Change in Accounting Estimate Disclosure

After several years of implementing significant improvements in the Company's repair and maintenance policies, management has determined that the useful lives of its major plant assets have increased. Therefore, the Company extended the estimated useful lives of its plant assets effective January 1, 2019. The effect of this change in estimate is to reduce depreciation expense from \$100 to \$50 for the year ended December 31, 2019. Income from continuing operations after tax increased by \$30 as a result of the change in estimate for the year ended December 31, 2019.

Honda Motor Co. Ltd., the Japanese automobile manufacturer that reports under U.S. GAAP, changed its method for accounting for depreciation in fiscal 2012. *Honda* changed to the straight-line method from the declining-balance method because management believed the straight-line method better reflected the future economic benefit from the use of plant and equipment. *Honda* used the prospective method to account for the change. As a result of the change, *Honda's* net income increased by ¥35,746 million, or about 11%.

- 4 Explain the accounting for a change in the reporting entity.

Change in the Reporting Entity

The final type of accounting change that a company may report is the *change in the reporting entity*. A **change in the reporting entity** occurs when a company reports financial statements that are, in effect, financial statements for a different reporting entity. A change in the reporting entity primarily involves:

1. Presenting consolidated or combined financial statements instead of individual financial statements
2. Changing the specific subsidiaries that make up the group of entities for which consolidated financial statements are presented
3. Changing the entities included in combined financial statements

The acquisition of a business is not considered a change in the reporting entity.

Firms account for a change in the reporting entity using the retrospective method by adjusting all financial statements presented from prior periods to reflect the change. For example, *Sara Lee Corporation*, a manufacturer of consumer food products, announced that its board had agreed to divide the company into two separate publicly traded companies in 2012. The two new companies would be separate reporting entities—so *Sara Lee* restated prior financial statements to reflect the two new entities.

Disclosure of a Change in the Reporting Entity

Changes in reporting entity disclosures are essential in restoring comparability and offsetting the violation of consistency resulting from an accounting change. The financial statements for the year of the change should disclose the nature of the change and the reason for the change. Also,

firms disclose the effect of the change on income from continuing operations, net income, other comprehensive income, and related per share amounts for all periods presented.⁵

Exhibit 21.4 summarizes the types of accounting changes.

EXHIBIT 21.4 Types of Accounting Changes

Type of Change	Example	Accounting Treatment	Disclosures
Change in accounting principle	Switch from FIFO to LIFO for inventory costing	Retrospective unless a mandatory change required by a new standard does not call for a retrospective transition or if the retrospective method is impractical	<ol style="list-style-type: none"> 1. Description of the nature of the change 2. Management's justification for the change, which indicates why the new method is preferable 3. The method of applying the change: The company specifies the retrospective or prospective method 4. A description of any adjusted prior-period information 5. The effect of the change on income from continuing operations, net income, per share amounts, and any other affected line item 6. The cumulative effect of the change on retained earnings for the first balance sheet presented
Change in accounting estimate	Change in the estimate of the allowance for bad debts	Prospective	<ol style="list-style-type: none"> 1. Companies should disclose the effect of a change in estimate on income from continuing operations, net income, and related per share amounts of the current period if a change in estimate affects several periods 2. Firms must provide a footnote disclosure indicating why the new estimate is justifiable 3. Companies are not required to disclose changes in accounting estimates made as part of normal operations, such as bad debt allowances or inventory obsolescence, unless such changes are material
Change in accounting estimate effected by a change in accounting principle	Change in depreciation method	Prospective	Same as change in accounting principle
Change in the reporting entity	Present consolidated statements instead of individual statements	Retrospective	<ol style="list-style-type: none"> 1. The financial statements for the year of the change should disclose the nature of the change and the reason for it 2. Also, firms disclose the effect of the change on income from continuing operations, net income, other comprehensive income, and related per share amounts for all periods presented

- 5 Discuss common types of errors and error analysis and demonstrate how to correct errors.

Errors and Error Analysis

When an accountant discovers an *error* that is material in amount, the error must be corrected. An **error** is an unintentional mistake often due to an incorrect application of an accounting policy or incorrect mathematical computation. Do not confuse an accounting error with fraud: An error is unintentional, whereas fraud is considered an intentional misrepresentation.

Firms account for error corrections with the retrospective method and classify all changes affecting retained earnings as prior-period adjustments. We addressed the accounting for prior-period adjustments extensively in Chapter 15. In this section, we discuss common types of errors, their potential effects on the financial statements, and methods for correcting them.

⁵Changes in the reporting entity are covered more extensively in advanced accounting courses.

THE CONCEPTUAL FRAMEWORK CONNECTION

Errors

For financial information to be a faithful representation—one of the fundamental qualitative characteristics—of the underlying position and performance of the firm, it must be free from error. However, it is nearly impossible for accountants to make no errors in the financial reporting process. In fact, the conceptual framework states that “perfection is seldom, if ever, achievable.”⁶

Consequently, the framework states that financial information can provide a faithful representation even if it is not perfectly accurate. Information is considered to be free from error when the process used to produce the information is selected and applied with no errors and the description of the transaction is free from error. Financial statements will undoubtedly contain some oversights and errors, but the financial information faithfully represents the position and performance of the firm.

As stated earlier, if a company discovers a material error, it must correct it. Accounting errors can impact the balance sheet, income statement, or both.

Balance Sheet Errors

Balance sheet errors, which affect only asset, liability, and equity accounts, are typically the result of a misclassification of accounts in the recording of a transaction. For example, assume a firm recorded a long-term note receivable as a short-term receivable. After discovering a balance sheet error, the accountant should reclassify the item, and the company should also restate any comparative financial statements. Example 21.5 illustrates correcting balance sheet errors.

EXAMPLE 21.5

Balance Sheet Errors

PROBLEM: Douglas Designs, Incorporated incorrectly recorded a \$450,000 note issued by Phillips Bank, NA in 2017 by debiting cash but crediting accounts payable. The note is due in 5 years with no principal payments due until maturity. Interest accruals were recorded correctly. Douglas Designs’ auditors discovered the error in 2019. Provide the correcting journal entry.

SOLUTION: The correcting journal entry is a simple reclassification correction. Douglas Designs records the \$450,000 as a long-term liability and as a result will debit accounts payable and credit notes payable.

<i>Account</i>	<i>2019 Correcting Entry</i>
Accounts Payable – Phillips Bank	450,000
Long-Term Notes Payable – Phillips Bank	450,000

Douglas updates the 2018 comparative balance sheet to reflect the correction on a retrospective basis.

Income Statement Errors

Income statement errors, which affect only revenue, gain, expense, and loss accounts, are also commonly caused by misclassification mistakes. For example, a firm could improperly record interest expense as cost of goods sold or a gain from the sale of equipment as sales revenue. Income statement errors do not affect the balance sheet and might not affect net income.

⁶Financial Accounting Standards Board, *Statement of Financial Accounting Concepts No. 8 Chapter 3*, “Qualitative Characteristics of Useful Financial Information,” Paragraph QC12.

If accountants discover income statement errors in the year the error occurred, they must be corrected. However, if accountants discover income statement errors after financial statements have been prepared, no correcting entry is made. However, the company should restate the incorrect amounts from the financial statements that have already been issued in any future comparative financial statements. An example of correcting income statement errors is provided in Example 21.6.

EXAMPLE 21.6 Income Statement Errors

PROBLEM: Begg Incorporated sold a piece of machinery during 2019 for a \$35,000 gain. It incorrectly recorded the gain as sales revenue. Begg discovered the error in the same year as the transaction before closing the books. Prepare the correcting entry for 2019. If Begg had already closed its books before discovering the error, what would it need to do? Ignore the impact of income taxes.

SOLUTION: The error affects only the income statement. The correction involves a reclassification out of the sales revenue account and into the gain on sale of equipment account.

<i>Account</i>	<i>2019 Correcting Entry</i>
Sales Revenue	35,000
Gain on Sale of Equipment	35,000

If the books were already closed, a correcting entry would not be necessary because retained earnings is correctly stated. However, Begg must correct the income statement before issuing financial statements by moving the \$35,000 out of sales revenue and reclassifying it as a gain on sale of equipment.

Errors Affecting the Income Statement and the Balance Sheet

Some errors affect both the income statement and the balance sheet—and these errors might or might not correct themselves. A balance sheet error typically is not self-correcting. Consequently, the firm must make a correcting entry to reclassify the item it incorrectly recorded. Most other errors will eventually correct themselves. However, the correction often takes many years. Consider a company that purchases equipment for \$100,000 with a 10-year life. Instead of depreciating the asset over 10 years, the company immediately expensed it. The error will eventually correct after the 10th year; however, the financial statements will be incorrect over the 10-year life of the asset. Because of the possible lengthy period until correction, **self-correcting errors** are classified as errors that will self-correct within 2 years.

Self-Correcting Errors. The primary issues in analyzing self-correcting errors that will be offset or corrected over two accounting periods are:

1. Whether the error is discovered in the first year or the second year
2. Whether the books have been closed for the fiscal year

Consider the following specific scenarios:

- If the firm discovers the error after closing the books for the second year, no entry is needed. The error has already self-corrected, the books are closed, and, therefore, retained earnings is correctly stated. Thus, the permanent accounts are all correctly stated.
- If the firm discovers the error after the books are closed for the first year but before the books are closed for the second year, an entry is needed to correct beginning retained earnings and other balance sheet accounts as well as to make any necessary adjustments to the accounts for the second year.
- If the firm discovers the error in the first year and the books have not been closed, it must correct accounts for the first year.

Firms must adjust comparative financial statements retrospectively in all cases (regardless of whether they make correcting entries).

A misstatement of ending inventory, a common type of self-correcting error, has a direct effect on net income. If a firm understates ending inventory because it counted incorrectly, cost of goods sold will be overstated. Recall that ending inventory plus cost of goods sold equals cost of goods available for sale. If cost of goods available for sale is correct and ending inventory is understated, then cost of goods sold is overstated. Thus, net income will be understated. Once the books are closed in the first year, inventory and retained earnings will be understated. If ending inventory is understated, net income, and ultimately retained earnings, will be understated.

Inventory errors are self-correcting within two accounting periods. If ending inventory in the following year is recorded correctly, the original error will have the opposite effect in the second year. If ending inventory was understated in the first year, then cost of goods sold is overstated and net income is understated. In the second year, last year's ending inventory is then the beginning inventory and will be understated, causing cost of goods available for sale to be understated. Because ending inventory is correct in the second year, cost of goods sold is understated, causing net income to be overstated in the second year. However, once the books are closed after the second year, the errors in net income balance out and retained earnings is stated correctly.

Exhibit 21.5 illustrates the effects of an understatement of ending inventory in Year 1. The balance sheet and the income statement are incorrect in Year 1. However, the Year 2 balance sheet is correctly stated. Assuming no additional errors in inventory, accountants know that the income statement will be correct in the third year.

EXHIBIT 21.5 Analysis of a Self-Correcting Inventory Error

	Year 1	Year 2
Beginning inventory	Correct	Understated
+ Purchases	Correct	Correct
= Cost of goods available for sale	Correct	Understated
– Ending inventory	Understated	Correct
= Cost of goods sold	Overstated	Understated
Net income	Understated	Overstated
Retained earnings (after closing)	Understated	Correct
Balance sheet		
Assets (inventory)	Understated	Correct
Liabilities	Correct	Correct
Equity (retained earnings)	Understated	Correct

Example 21.7 analyzes a self-correcting inventory error.

EXAMPLE 21.7 Self-Correcting Inventory Error

PROBLEM: Fazon Associates incorrectly recorded inventory in 2018. Rather than recording ending inventory as \$250,000, Fazon's accounting manager entered \$280,000, overstating ending inventory by \$30,000. An inventory summary for 2018 and 2019 as actually recorded by the company follows. This summary includes the error in ending inventory in 2018.

2018		2019	
Beginning inventory	\$ 100,000	Beginning inventory	\$ 280,000
+ Purchases	300,000	+ Purchases	300,000
= Cost of goods available for sale	\$ 400,000	= Cost of goods available for sale	\$ 580,000
– Ending inventory	(280,000)	– Ending inventory	(450,000)
= Cost of goods sold	<u>\$ 120,000</u>	= Cost of goods sold	<u>\$ 130,000</u>

If this error goes undetected, what is the impact on the income statements and balance sheets for 2018 and 2019? What must Fazon do to correct this error if it is found (1) after the books are closed for 2019, (2) after the books are closed for 2018 but before the books are closed for 2019, and (3) before the books are closed in 2018? Ignore the impact of income taxes.

SOLUTION: The following schedule summarizes the analysis of the inventory error:

	2018		2019	
	As Reported	Correct	As Reported	Correct
Beginning inventory	\$ 100,000	\$ 100,000	\$ 280,000	\$250,000
+ Purchases	300,000	300,000	300,000	300,000
= Cost of goods available for sale	\$ 400,000	\$ 400,000	\$ 580,000	\$550,000
– Ending inventory	(280,000)	(250,000)	(450,000)	(450,000)
= Cost of goods sold	\$ 120,000	\$ 150,000	\$ 130,000	\$100,000
Net income	Overstated \$30,000		Understated \$30,000	
Retained Earnings (after closing)	Overstated \$30,000		Correct	
Balance sheet:				
Assets (inventory)	Overstated \$30,000		Correct	
Liabilities	Correct		Correct	
Equity (retained earnings)	Overstated \$30,000		Correct	

As noted in the preceding schedule, the inventory error self-corrects after the 2-year period is completed.

1. If Fazon discovers the error later than 2019 (after closing the books for 2019), the error has already been self-corrected and no correcting entry is needed. Any comparative financial statements for 2018 or 2019 should be restated to report the correct balances for cost of goods sold, inventory, and retained earnings.
2. If Fazon discovers the error before closing the books for 2019 but after issuing 2018 statements, it will debit the retained earnings account instead of the cost of goods sold account because cost of goods sold has already been closed to retained earnings.

Account	2019 Correcting Entry
Retained Earnings – Prior-Period Adjustment	30,000
Inventory	30,000

Fazon will report cost of goods sold of \$150,000 on its 2018 comparative income statement when it issues the annual report for 2019.

3. If Fazon discovers the error before closing the books in 2018, then it will simply correct the error by decreasing inventory and increasing cost of goods sold.

Account	2018 Correcting Entry
Cost of Goods Sold	30,000
Inventory	30,000

Errors That Do Not Self-Correct. If the error is not self-correcting within two accounting periods, correcting entries are always needed regardless of whether the closing entries for the period have been recorded. Again, firms must correct comparative financial statements on a retrospective basis. Example 21.8 examines a non-self-correcting error that is discovered while the books are still open.

EXAMPLE 21.8 Non-self-correcting Error Discovered while Books Are Open

PROBLEM: Underwood Computer Company acquired a circuit board stamping machine for \$700,000 on December 31, 2019. The general accountant incorrectly coded the invoice as repair expense. The equipment would normally be depreciated straight-line over 10 years with no salvage value. The error was discovered later on December 31, 2019, before the books were closed. Prepare the correcting entry for this transaction, ignoring income taxes.

SOLUTION: This error will not self-correct within two accounting periods: It will only reverse out at the end of the asset's life. Because the books have not yet been closed, the general accountant simply reclassifies the accounts by debiting machinery and crediting repair expense as shown in the following entry. There was no depreciation taken because the asset was acquired on the last day of the fiscal year.

<i>Account</i>	<i>December 31, 2019 (Correcting Entry)</i>	
Machinery	700,000	
Repair Expense		700,000

Example 21.9 examines a non-self-correcting error discovered after the books are closed.

EXAMPLE 21.9 Non-self-correcting Error Discovered after the Books Are Closed

PROBLEM: Underwood Computer Company acquired a circuit board stamping machine for \$700,000 on December 31, 2019. The general accountant incorrectly coded the invoice as repair expense. The equipment would normally be depreciated straight-line over 10 years with no salvage value. Underwood discovered the error in 2020 after closing the books for 2019. Prepare the correcting entry for this transaction, ignoring income taxes.

SOLUTION: In this case, the repair expense had already been closed out to retained earnings. As a result, Underwood Computer records machinery and corrects retained earnings. Underwood Computer would also record depreciation expense of \$70,000 at December 31, 2020.

<i>Account</i>	<i>2020 Correcting Entry</i>	
Machinery	700,000	
Retained Earnings – Prior-Period Adjustment		700,000

The 2019 financial statements should be corrected when they are presented as comparative statements in future years.

Example 21.10 presents an illustration of a non-self-correcting error that was discovered several years after the error was made.

EXAMPLE 21.10 Non-self-correcting Error Discovered in a Period after the Error Was Made

PROBLEM: Underwood Computer Company acquired a circuit board stamping machine for \$700,000 on December 31, 2016. The general accountant incorrectly coded the invoice as repair expense. The equipment would normally be depreciated straight-line over 10 years with no salvage value. Underwood discovered the error on December 31, 2019, before closing the books for 2019. Prepare the correcting entry for this transaction, ignoring income taxes.

SOLUTION: In this case, the error affects the amount of expense recorded in the year the error was made (overstating expenses), and it results in a failure to record depreciation on the equipment for the 3 years after the acquisition of the equipment (understating expenses).

The annual depreciation expense should have been \$70,000 per year ($\$700,000/10$). Depreciation should have been recorded for 2017 and 2018 as well as 2019. Because 2017 and 2018 have already been closed, Underwood has overstated retained earnings by \$140,000 because it did not record depreciation expense. Recording a repair expense in 2016 understated retained earnings by \$700,000. Thus, the correcting entry involves a credit to retained earnings of \$560,000 ($\$700,000 - \$140,000$). Underwood should record machinery of \$700,000. The company also needs to record depreciation for 2019. Finally, Underwood records accumulated depreciation of \$210,000 ($\$70,000 \times 3$ years). The entry to record the error correction follows.

Account	December 31, 2019 (Correcting Entry)	
Machinery	700,000	
Depreciation Expense – Machinery	70,000	
Accumulated Depreciation – Machinery		210,000
Retained Earnings – Prior-Period Adjustment		560,000

Underwood also restates any comparative financial statements for 2016 through 2018 that are presented with current-period annual reports.

Exhibit 21.6 summarizes accounting for error corrections. Note that in addition to any necessary correcting entries, firms should correctly state financial statements (both current year and comparative).

EXHIBIT 21.6 Summary of Error Corrections

	Error Self-Corrects within Two Accounting Periods	Error Does Not Self-Correct within Two Accounting Periods
Books closed in year of error	<p>No entry needed if the error has already self-corrected</p> <p>Entry needed to adjust retained earnings and other affected balance sheet accounts if the error has not yet self-corrected</p>	<p>Correcting entry needed to adjust retained earnings and other affected balance sheet accounts</p>
Books not closed in year of error	<p>Entry needed to correct the current-year income statement and balance sheet accounts</p>	<p>Correcting entry needed to adjust income statement and balance sheet accounts</p>

JUDGMENTS IN ACCOUNTING

Error Corrections

What makes an error material enough to correct? If an error is immaterial, the company does not need to apply the processes we have just discussed. Materiality is a matter of judgment: The conceptual framework states that financial information is material if omitting it or misstating it would impact a user's decisions.

Consequently, there is no formal specification of a quantitative materiality threshold for all firms and all transactions. Rather, companies must consider materiality in the context of the nature and magnitude of the transaction as well as the context of the financial reports. Different

managers' judgment of the level of materiality varies. For example, consider a company with annual revenues of \$200 million and assets of \$700 million. An error of \$100,000 would not typically be considered material for this company. However, a company with annual revenues of \$5 million and assets of \$7 million might consider a \$100,000 error to be material. When judging materiality, qualitative and quantitative factors are relevant. Consider the first company that reports \$200 million in annual revenue. Although \$100,000 is not a particularly large number comparatively, if correcting the error would result in reporting a net loss instead of a net profit, the company would most likely consider this item to be material because a user would view a net profit much differently than a net loss.

FINANCIAL STATEMENT ANALYSIS

Accounting Changes

Accounting changes, whether changes in a principle or an estimate, can occur in almost every topic we have discussed in the text, from accounts receivable to long-lived assets to pensions. Management makes these changes for various reasons. For example, standard setters can mandate companies to make a change in an accounting principle such as requiring previously off-balance sheet pension assets and obligations to be reported on the balance sheet. Management can also decide to change accounting methods such as switching from the retail inventory method to the weighted-average method. Management, though, almost always initiates changes in estimates such as those used in determining the allowance for bad debts.

In analyzing accounting changes, understanding the reason for the change is important. A company can make a change because it is required as the result of a change in accounting standards, of changing business or macroeconomic conditions, or a shift in its operating strategy. For changes management initiates, it is especially important to consider the effect on earnings and earnings quality. If the change increases earnings, is management acting opportunistically? That is, changing an accounting method or estimate can show an increase in earnings without a change in the underlying economic performance.

In examining accounting changes, a financial statement user should understand and assess the following:

- Whether the company has any changes in accounting principles or estimates. If so, determine the reason for the change. For changes in accounting principle, determine whether the standard setters required the changes or the changes were initiated by management.
- When the changes in accounting principle or estimate are reported in the financial statements, such as the accounts affected on the balance sheet and income statement. For changes in accounting principle, determine whether the reporting is retrospective or prospective.
- Assess the effects of the change on the income statement and balance sheet.

Example 21.11 illustrates the financial statement analysis of the effect of a change in accounting principle.

EXAMPLE 21.11

Financial Statement Analysis of an Accounting Change

PROBLEM: *Abercrombie & Fitch, Company* disclosed an inventory accounting change in the notes of its 2012 financial statements presented in Exhibit 21.7.

EXHIBIT 21.7 Accounting Change Disclosures, *Abercrombie & Fitch, Co.*, Financial Statements, February 2, 2013

NOTE 4: Change in Accounting Principle

The Company elected to change its method of accounting for inventory from the lower of cost or market utilizing the retail method to the weighted average cost method effective February 2, 2013. In accordance with generally accepted accounting principles, all periods have been retroactively adjusted to reflect the period-specific effects of the change to the weighted average cost method. The Company believes that accounting under the weighted average cost method is preferable as it better aligns with the Company's focus on realized selling margin and improves the comparability of the Company's financial results with those of its competitors. Additionally, it will improve the matching of cost of goods sold with the related net sales and reflect the acquisition cost of inventory outstanding at each balance sheet date. The cumulative adjustment as of January 30, 2010, was an increase in its inventory of \$73.6 million and an increase in retained earnings of \$47.3 million.

Source: Accounting Change Disclosures, Abercrombie & Fitch, Co., Financial Statements, February 2, 2013. www.bercrombie.com/anf/investors/investorrelations.html

When *Abercrombie* announced its 2012 earnings, the company also prepared additional information on the accounting change, including the following information.

For the Year Ended February 2, 2013 (fiscal 2012)

Line Item – Unaudited (in thousands)	Weighted-Average Cost Method	Retail Method
Net sales	\$4,510,805	\$4,510,805
Gross profit	2,816,709	2,861,855
Tax expense	132,749	151,715
Net income	241,603	267,783
EPS diluted	2.90	3.22

Source: www.bercrombie.com/anf/investors/investorrelations.html

Use the excerpt from *Abercrombie's* financial statement note in Exhibit 21.7, the effects of this change on stockholders' equity in Exhibit 21.2, and the additional disclosures on the accounting change to answer the following questions:

- What accounting policy did *Abercrombie* change?
- What reason(s) did *Abercrombie* give for making this change?
- What method did *Abercrombie* use to account for this change?
- How did the change affect cost of goods sold, gross profit, tax expense, net income, and earnings per share (EPS) in 2012? What would net income have been in 2012 if *Abercrombie* had not made this change?

SOLUTION:

- Abercrombie* changed its method of accounting for inventory. Prior to fiscal 2012, *Abercrombie* used the retail method. In fiscal 2012, *Abercrombie* changed to the weighted-average cost method.

Continued

- b. **Abercrombie** provides four reasons for the change in accounting method in the notes to its financial statements. It states that the weighted-average cost method is preferable because it:
1. Better aligns with the company's focus on realized selling margin
 2. Improves the comparability of the company's financial results with those of its competitors
 3. Improves the matching of cost of goods sold with the related net sales
 4. Reflects the acquisition cost of inventory outstanding at each balance sheet date
- c. **Abercrombie** used the retrospective method to account for this change in accounting method by adjusting the assets, liabilities, and retained earnings as of the beginning of first period presented, fiscal 2010, as shown in Exhibit 21.2. **Abercrombie** adjusted the financial statements for each period presented afterward to reflect the effects of the change of accounting method.
- d. From the additional information that **Abercrombie** presented, the change in accounting method had the following changes on income statement items.

Line Item – Unaudited (in thousands)	Weighted-Average Cost Method	Retail Method	Difference	Percentage of Difference
Net Sales	\$ 4,510,805	\$ 4,510,805	\$ 0	
Cost of goods sold (computed)	<u>1,694,096</u>	<u>1,648,950</u>	<u>\$ 45,146</u>	<u>2.7%</u>
Gross profit	<u>\$ 2,816,709</u>	<u>\$ 2,861,855</u>	<u>\$(45,146)</u>	<u>(1.6%)</u>
Tax expense	<u>\$ 132,749</u>	<u>\$ 151,715</u>	<u>\$(18,966)</u>	<u>(12.5%)</u>
Net income	<u>\$ 241,603</u>	<u>\$ 267,783</u>	<u>\$(26,180)</u>	<u>(9.8%)</u>
EPS diluted	<u>\$ 2.90</u>	<u>\$ 3.22</u>	<u>\$ (0.32)</u>	<u>(9.9%)</u>

Abercrombie's change in accounting for inventory increased its cost of goods sold, which decreased its gross profit, tax expense, net income, and EPS. If Abercrombie did not make the change in inventory method, net income in 2012 would have been \$267,783,000.

Interview

**LAWRENCE
STEEVOORDEN**
**VICE PRESIDENT &
GLOBAL CONTROLLER,
SIEMENS HEALTHCARE
DIAGNOSTICS,
TARRYTOWN, NY »**

Lawrence Steenvoorden

Lawrence Steenvoorden joined Siemens after 4 years in public accounting. He has held various roles in corporate accounting, reporting, and finance both in the United States and abroad in addition to his involvement with conversions from U. S. GAAP to IFRS. In his current role, he is responsible for global business performance controlling for Siemens Healthcare Diagnostics with worldwide revenues of more than \$4 billion.

- 1 What primary factors would Siemens consider to determine whether a change in accounting method or estimate is appropriate?

One key consideration is whether the new method or estimate reflects actual business performance. For accounting methods, does the new principle better reflect how the business operates? With regard to an estimate, what facts and circumstances changed that should be reflected in the financial statements? The Siemens Healthcare Diagnostics division evolved from three separate acquisitions, and upon review of an updated business plan in 2010, management reassessed growth prospects to reflect delays in technology, product development, and increased competition. The cash flow projection changes resulted in a goodwill write-off in excess of \$1 billion. Another consideration is how material the change is to our balance sheet or income statements. IFRS and U.S. GAAP are similar, both providing limited guidance to make this assessment.

- 2 Why are changes in accounting method given retrospective treatment and changes in accounting estimates given a prospective application?

Comparability is essential for both preparers and users of financial statements. When new standards are pronounced, a retrospective approach that restates all years presented best shows comparability over the periods, “as-if” it were enacted from the first year. We base estimates on management judgment at a certain point in time with the best knowledge available. Hindsight is always “20/20,” but management should not be burdened with restating financial statements because certain assumptions have changed. This is not practical and would misrepresent facts and circumstances at the financial statement date.

- 3 How would Siemens use accounting change disclosures to restore consistency and comparability of the financial information reported in comparative financial statements?

Siemens provides extensive disclosures with a view toward transparency for shareholders, investors, and regulators. We must communicate any changes clearly and, if necessary, present both views to maintain financial statement comparability. Disclosures are critical to explain the underlying story behind the numbers.

- 4 What are some key judgments involved when making an accounting change?

A cost-benefit analysis is important to consider before making accounting changes. How material is the change to the financial statements? What are the implementation costs? How are other companies also dealing with accounting changes? Once a decision is made to implement an accounting change, it must reflect business performance and be practical to apply. For example, implementing new revenue recognition standards is likely to be expensive and they may drive new business models or even change language in customer contracts.

- 5 What are the major costs that Siemens incurs when there is a change in accounting principle (either voluntary or mandatory)?

Often changes in accounting principles look simple on paper, but implementation can be quite complex. A global company like Siemens has to consider both local GAAP and IFRS in implementing new accounting principles. In the migration from U.S. GAAP to IFRS, significant costs were incurred for both internal and external resources—for example, to change IT system configurations. Training costs can also be significant to ensure that accounting principles are applied consistently in every country where we operate.

- 6 In your experience, what are the most common areas subject to accounting changes?

Revenue recognition tops the lists when it comes to accounting changes. Revenue standards can be quite complex, and Siemens operates in various industries, generating sales under many different types of business models. We are now preparing for a new revenue recognition standard that focuses more on a “control” concept than an “ownership” or transfer of title view. Accruals for termination benefits, restructuring, derivatives, and income taxes are other complex areas that tend to have more accounting changes.

Discussion Questions

1. In his interview, Lawrence Steenvoorden mentions some of the costs of implementing an accounting change. Discuss some other possible costs of changing accounting methods.
2. Discuss why disclosures are important whenever there is a change in accounting method or estimate.

Summary by Learning Objectives

In the following, we summarize the main points by learning objective. Throughout the chapter, we discuss the accounting and reporting of U.S. GAAP and IFRS side-by-side. The following table also highlights the major similarities and differences between the standards.

1 Provide an overview of the types of accounting changes, including the difference between the retrospective and prospective methods.	
Summary	Similarities and Differences between U.S. GAAP and IFRS
<p>Accounting changes include:</p> <ul style="list-style-type: none"> • Changes in accounting principles • Changes in accounting estimates • Changes in the reporting entity <p>The retrospective method presents all prior-year financial statements in the annual report as if the newly adopted principle had always been used. Restated financial statements adjust opening balance sheet accounts for the cumulative effect of applying the new principle in all prior years and all subsequent financial statements presented as if the policy had always been used.</p> <p>The prospective method presents an accounting change in the current year and all future years.</p>	<p>Similar under U.S. GAAP and IFRS.</p>

2 Describe and demonstrate the accounting for a change in accounting principle.	
Summary	Similarities and Differences between U.S. GAAP and IFRS
<p>A change in accounting principle involves a change from one generally accepted accounting method to another generally accepted accounting method. Changes in accounting principle may be voluntary or mandatory.</p> <p>Generally, all changes in accounting principle are required to be reported under the retrospective approach. There are two exceptions:</p> <ol style="list-style-type: none"> 1. In the case of a mandatory change required by a new accounting standard, an entity should follow the specific transition requirements provided within the new standard. 2. It is impractical to use the retrospective approach. <p>Application of the retrospective approach is impractical if any one of the following three conditions exists:</p> <ul style="list-style-type: none"> • Financial statement effects are not determinable. • Application requires assumptions about management's intent in a prior period. • Application requires significant estimates for a prior period and the availability of the necessary information to determine these estimates cannot be objectively verified. 	<p>► Similar under U.S. GAAP and IFRS except that IFRS requires a company to report 3 years of balance sheets and 2 years of the other financial statements when reporting a change in accounting principle.</p>

Summary by Learning Objectives, continued

3 Explain and illustrate the accounting for a change in accounting estimate.	
Summary	Similarities and Differences between U.S. GAAP and IFRS
<p>A change in accounting estimate involves revisions of estimates used in accounting for areas such as the bad debt expense, depreciation, inventory obsolescence, and pensions.</p> <p>The prospective method is used to account for a change in an accounting estimate.</p>	Similar under U.S. GAAP and IFRS.

4 Explain the accounting for a change in the reporting entity.	
Summary	Similarities and Differences between U.S. GAAP and IFRS
<p>A change in the reporting entity occurs when a company reports financial statements that are, in effect, financial statements of a different reporting entity. A change in the reporting entity primarily involves the following changes:</p> <ol style="list-style-type: none"> 1. Presenting consolidated or combined financial statements instead of individual financial statements. 2. Changing the specific subsidiaries that make up the group of entities for which consolidated financial statements are presented. 3. Changing the entities that are included in combined financial statements. <p>Firms account for a change in the reporting entity using the retrospective method.</p>	Similar under U.S. GAAP and IFRS.

5 Discuss common types of errors and error analysis and demonstrate how to correct errors.	
Summary	Similarities and Differences between U.S. GAAP and IFRS
<p>Balance sheet errors affect only asset, liability, and equity accounts. These errors are typically the result of a misclassification.</p> <p>Income statement errors affect only revenue, gain, expense, and loss accounts. Misclassification mistakes are a common cause of income statement errors.</p> <p>Some errors affect both the income statement and the balance sheet. Errors are of two types:</p> <ol style="list-style-type: none"> 1. Self-correcting errors (errors that will self-correct within 2 years) 2. Errors that do not self-correct 	Similar under U.S. GAAP and IFRS.

MyLab Accounting

Go to <http://www.pearson.com/mylab/accounting> for the following Questions, Multiple-Choice Questions, Brief Exercises, Exercises, and Problems. They are available with immediate grading, explanations of correct and incorrect answers, and interactive media that acts as your own online tutor.

21 Accounting Changes and Error Analysis

Questions

- 1 Q21-1. Are accounting changes permitted in financial statements?
- 1 Q21-2. How do firms report accounting changes under the retrospective method?
- 1 2 Q21-3. Explain the two approaches that firms use to report accounting changes.
- 1 3 Q21-4. How do firms account for changes in accounting estimates and changes in accounting principles?
- 2 Q21-5. What are the direct and indirect effects of changes in accounting principle on the financial statements?
- 2 3 Q21-6. How do firms account for a change in depreciation method?
- 2 3 Q21-7. What type of change would a change from LIFO to FIFO be considered?
- 4 Q21-8. When does a change in reporting entity occur?
- 5 Q21-9. Do accounting errors that self-correct within two accounting periods require correcting entries?
- 5 Q21-10. Does a firm need to correct an error that misclassifies equipment as inventory if total assets are correct?

Multiple-Choice Questions

Becker CPA Exam Review multiple-choice questions are available in
 MyLab Accounting.

- 2 MC21-1. On December 31, Year 10, Brown Company changed its inventory valuation method from the weighted-average method to FIFO for financial statement purposes. The change will result in an \$800,000 decrease in the beginning inventory at January 1, Year 10. The tax rate is 30%. The cumulative effect of this accounting change for the year ended December 31, Year 10, in the statement of retained earnings is:
 a. \$0 b. \$800,000 c. \$240,000 d. \$560,000
- 2 MC21-2. The proper accounting treatment to account for a change in inventory valuation from FIFO to LIFO under U.S. GAAP is:
 a. Prospective application
 b. Retrospective application
 c. Retroactive approach
 d. Ignored
- 2 MC21-3. On August 31 of the current year, Harvey Co. decided to change from the FIFO periodic inventory system to the weighted-average periodic inventory system. Harvey uses U.S. GAAP, is on a calendar-year basis, and does not present comparative financial statements. The cumulative effect of the change is determined:
 a. During the current year by a weighted average of the purchases
 b. During the 8 months ending August 31, by a weighted average of the purchases
 c. As of August 31 of the current year
 d. As of January 1 of the current year
- 2 MC21-4. On August 31 of the current year, Harvey Co. decided to change from the FIFO periodic inventory system to the weighted-average periodic inventory system. Harvey uses IFRS and is on a calendar-year basis. The cumulative effect of the change is shown as an adjustment to beginning retained earnings on the balance sheet for:
 a. August 31 of the current year
 b. December 31 of the current year
 c. January 1 of the current year
 d. January 1 of the prior year

- 3 **MC21-5.** Gonzales Company purchased a machine on January 1, Year 1, for \$600,000. On the date of acquisition, the machine had an estimated useful life of 6 years with no salvage value. The machine was being depreciated on a straight-line basis. On January 1, Year 4, Gonzales determined that the machine had an estimated life of 8 years from the date of acquisition. An accounting change was made in Year 4. What is the amount of the depreciation expense that should be recorded for the year ended Year 4?
a. \$75,000 b. \$100,000 c. \$60,000 d. \$0

Brief Exercises

- 1 **BE21-1. Accounting Changes, Retrospective, and Prospective Methods.** For each of the following events, indicate the type of change and the proper accounting treatment (retrospective or prospective).

Event	Type of Change	Accounting Method
Change in the useful life for a plant asset	_____	_____
Change in accounting for long-term contracts	_____	_____
Adoption of the FIFO method for a new product line	_____	_____
Change from the average-cost method to the LIFO method	_____	_____
Change from the straight-line method to the declining-balance method	_____	_____
Switching to an aging of accounting receivables to compute bad debt expense and the allowance for bad debts instead of using a percentage of sales	_____	_____

- 2 **BE21-2. Change in Accounting Principle, Inventory.** Mills Abrams Manufacturing Company changed its method of accounting for inventory from the average-cost method to the LIFO basis as of January 1 of the current year. It still uses the average-cost method for tax purposes. The company is subject to a 40% tax rate. Cumulative cost of goods sold reported prior to the current year is \$140,000 under the average-cost method and it would have been \$300,000 if Mills had always used the LIFO method. Prepare the journal entry to record the change in method.
- 2 **BE21-3. Change in Accounting Principle, Inventory, Disclosure.** Draft a footnote to disclose the accounting change implemented by the Mills Abrams Manufacturing Company using the information provided in BE21-2. Assume that pre-tax income for the current year is \$230,000 under the LIFO method but would have been \$455,000 under the prior average-cost method. Use the caption "Note F: Change in Method of Accounting for Inventory Valuation."
- 2 **BE21-4. Change in Accounting Principle, Long-Term Construction Contracts.** Serat Construction Company elected to change its method of accounting from the percentage-of-completion method to the completed-contract method. Prior-years income (cumulative) would have been \$300,000 lower if Serat had always used the completed contract method. The company is subject to a 35% tax rate. Prepare the journal entry to record the change in method.
- 2 **BE21-5. Change in Accounting Principle, Long-Term Construction Contracts.** Cole Construction Company elected to change its method of accounting from the completed-contract method to the percentage-of-completion method. Prior-years income (cumulative) would have been \$550,000 higher if Cole had always used the percentage-of-completion method. The company is subject to a 35% tax rate. Prepare the journal entry to record the change in method.
- 2 **BE21-6. Change in Accounting Principle, Long-Term Construction Contracts, Direct and Indirect Effects.** Assume now that Cole Construction Company from BE21-5 compensates its management team by offering a base salary and a 2% bonus based on reported earnings before tax. The bonus plan requires adjustment for changes in accounting methods that includes prior bonus awards. Compute the effect of the accounting change on management compensation, indicating whether it is a direct or indirect effect of the accounting change and how Cole should report it in the financial statements.
- 3 **BE21-7. Change in Estimate, Depreciation.** Enko Incorporated has one plant asset. The asset's original cost was \$750,000. There is a \$50,000 expected residual value and the estimated useful life is 20 years. On January 1 of the current year, following 10 full years of depreciation, the company determined that the asset will be useful for only another 5 years and reduced the expected residual value to \$30,000. The change in estimate is needed to reflect advanced technology used in newer equipment currently available on the market. Enko uses the straight-line method of depreciation. Prepare the journal entry to record the change in estimate, ignoring any tax effects.

- 3** **BE21-8. Change in Estimate, Depreciation, Disclosure.** Using the information in BE21-7, prepare the footnote to disclose the change in accounting estimate for Enko Incorporated.
- 3** **BE21-9. Change in Estimate, Depreciation.** Natalie Charles Designs elected to change its method of depreciation from the double-declining balance method to the straight-line method. Cumulative depreciation up to—but not including—the year of the change would have been \$345,000 lower had the company always used the straight-line method. Depreciation expense in the year of the change is \$30,000 under the straight-line method. Prepare the journal entry to record the change in depreciation method, ignoring any income tax effects.
- 5** **BE21-10. Error Correction, before Books Closed.** Wilson Incorporated acquired a leather-cutting machine for \$200,000 on December 31, 2018. The general accountant incorrectly coded the invoice as Miscellaneous Expense. The general accountant discovered the error in 2018 before the books were closed. The transaction was correctly recorded for tax purposes and all taxes were paid. Prepare the correcting entry for this transaction.
- 5** **BE21-11. Error Correction, Self-correcting Error, after Books Closed.** Using the data from BE21-10 for Wilson Incorporated, assume now that the general accountant discovered the error in 2019 when the books had already been closed for 2018. Prepare the correcting entry for this transaction.
- 5** **BE21-12. Error Correction, Self-Correcting Error, before Books Closed.** Barin Retail Outlets incorrectly recorded inventory in 2016. Rather than recording ending inventory as \$960,000, Barin’s accounting manager entered \$690,000, understating ending inventory by \$270,000. Barin’s controller discovered the error in 2018. Prepare the journal entry necessary to correct the inventory error, ignoring any income tax effects.
- 5** **BE21-13. Error Correction, after Books Closed.** Using the information from BE21-12, prepare the journal entry necessary to correct the inventory error, assuming that Barin’s controller discovered the error in 2017 after the books had been closed for 2016. Ignore any income tax effects.
- 5** **BE21-14. Error Correction, after Books Closed.** Tyrion Retailers, Inc. incorrectly recorded inventory in 2016. Rather than recording ending inventory as \$570,000, Tyrion’s accounting manager entered \$750,000. Tyrion’s controller discovered the error in 2017. Prepare the journal entry necessary to correct the inventory error, ignoring any income tax effects.

Exercises

- 2** **E21-1. Change in Accounting Principle, Inventory.** Massi Pharmacies, Inc. started operations on January 1, 2014. The company initially used the average-cost method to value its inventory for both book and tax purposes. Effective January 1, 2018, Massi elected to change its inventory valuation method to the FIFO basis for financial reporting purposes. Massi still uses the average-cost method on the company’s tax returns. Massi is subject to a 35% tax rate.
- The following information is available for net income after tax for both the FIFO and the average-cost methods.

Year Ended	Net Income	
	Average Cost	FIFO
December 31, 2014	\$235,000	\$310,000
December 31, 2015	300,000	376,000
December 31, 2016	310,000	400,500
December 31, 2017	425,500	535,000
December 31, 2018	500,000	585,000

Required » (Round to the nearest whole dollar)

- Prepare the journal entry required to record the accounting change on January 1, 2018.
- Prepare the partial comparative income statements for the 3 years ending December 31, 2018.
- Prepare the footnote to disclose the change from the average cost to the FIFO basis. Designate the note as “Note A: Change in Method of Accounting for Inventory Valuation.”

2

E21-2. Change in Accounting Principle, Long-Term Construction Contracts. Arlen Technology Solutions, Inc. adopted the percentage-of-completion method when it began operations on January 1, 2016. The company elected to change to the completed-contract method on January 1, 2018, due to a change in the size of its computer network contracts. Net income under both methods for the first 3 years of the company's operations is presented in the following table. Ignore income tax effects.

Year Ended	Net Income	
	Percentage of Completion	Completed Contract
December 31, 2016	\$168,000	\$147,000
December 31, 2017	112,000	98,000
December 31, 2018	231,000	210,000

Required » (Round to the nearest whole dollar)

- Prepare the journal entry required to record the accounting change on January 1, 2018.
- Prepare the footnote to disclose the change from the percentage-of-completion to the completed-contract method. Designate the note as "Note A: Change in Method of Accounting for Computer Network Contracts."

2

E21-3. Change in Accounting Principle, Inventory. Sumner Stores began operations on January 1, 2014, and adopted the average-cost method of accounting. In 2017, it is considering a change to the FIFO basis. Sumner provided the following information to assist in deciding whether to change inventory valuation techniques.

Year Ended	Ending Inventory		Cost of Sales		Retained Earnings	
	Average Cost	FIFO	Average Cost	FIFO	Average Cost	FIFO
12/31/2014	\$10,000	\$12,000	\$76,000	\$74,000	\$23,400	\$24,600
12/31/2015	16,000	19,500	82,000	78,500	48,300	51,600
12/31/2016	24,000	28,000	95,000	91,000	72,300	78,000
12/31/2017	32,000	35,600	108,000	90,000	95,100	111,600

Sumner Stores reported the following income statement information:

Account	2017	2016	2015	2014
Sales revenue	\$200,000	\$175,000	\$160,000	\$145,000
Selling, general, and administrative expenses	\$ 54,000	\$ 40,000	\$ 36,500	\$ 30,000
Income tax rate	40%	40%	40%	40%

Required »

- Prepare the income statements under both methods for the years ended December 31, 2014, through December 31, 2016.
- Assume that Sumner Stores changes to the FIFO basis effective January 1, 2017. Prepare the comparative income statements for the 3 years ended December 31, 2017.
- Prepare the retained earnings column of the statement of stockholders' equity for the year ended December 31, 2017, assuming that Sumner does not present comparative statements. Sumner does not declare dividends in 2014–2017.

2

E21-4. Change in Accounting Principle, Inventory. Winthur Stores began operations on January 1, 2014, and adopted the FIFO method of accounting for its inventory for book and tax purposes. In 2017, it is considering a change to the average-cost method basis for book purposes only. Winthur provided the following information to assist in deciding whether to change inventory valuation techniques.

Year Ended	Ending Inventory		Cost of Sales		Retained Earnings	
	FIFO	Average Cost	FIFO	Average Cost	FIFO	Average Cost
12/31/2014	\$12,000	\$10,000	\$74,000	\$ 76,000	\$ 24,600	\$23,400
12/31/2015	19,500	16,000	78,500	82,000	51,600	48,300
12/31/2016	28,000	24,000	91,000	95,000	78,000	72,300
12/31/2017	35,600	32,000	90,000	108,000	111,600	95,100

Winthur Stores reported the following income statement information:

Account	2017	2016	2015	2014
Sales revenue	\$200,000	\$175,000	\$160,000	\$145,000
Selling, general, and administrative expenses	\$54,000	\$40,000	\$36,500	\$30,000
Income tax rate	40%	40%	40%	40%

Required »

- Prepare the income statements under both methods for the years ended December 31, 2014, through December 31, 2016.
- Assume that Winthur Stores changes to the average-cost method effective January 1, 2017. Prepare the comparative income statements for the 3 years ended December 31, 2017.
- Prepare the retained earnings column of the statement of stockholders' equity for the year ended December 31, 2017, assuming that Winthur does not present comparative statements. Winthur does not declare dividends in 2014–2017.

3

E21-5. Change in Estimate, Depreciation. Corrnuto Equipment Manufacturers, Inc. (CEM) reported the net book value of a plant asset at \$2,600,000 on January 1 of the current year. There is a \$500,000 expected residual value, and the estimated useful life is 25 years. On January 1 of the current year, following 10 full years of depreciation, the company determined that the asset will be useful for only another 10 years and reduced the expected residual value to \$100,000. The change in estimate is needed to reflect extended usage and running the factory above normal capacity to meet increased demand. CEM uses the straight-line method of depreciation. The company is subject to a 40% tax rate.

Required »

- Determine the original cost of CEM's plant asset.
- Compute the annual depreciation expense for the first 10 years of the asset's life.
- Prepare the journal entry to record the change in estimate.
- Prepare the footnote disclosure for the accounting change.

3

E21-6. Change in Estimate, Depreciation. Hi-Lo Corporation elected to change its method of depreciation from the double-declining balance method to the straight-line method on January 1, of the current year. It acquired the equipment 2 years ago on January 1 for \$300,000. The original estimated useful life was 5 years with an original scrap value of \$18,000. The company is subject to a 40% income tax rate.

Required »

- Prepare the journal entry to record the change in depreciation method.
- Draft a footnote disclosure for the change in depreciation method.

5

E21-7. Error Analysis and Correction. Feinstein and Company completed an internal audit of its bookkeeping system that uncovered several errors. It discovered the errors on December 31 before the books were closed.

- A \$45,000 payment for advertising was recorded as an asset in the account deferred advertising expense.
- Payroll for the two weeks ending November 11 amounted to \$123,500 but was never recorded. Payroll taxes withheld for this pay period were \$8,500.
- A 3-year insurance policy for \$90,000 acquired on April 1 of the current year was recorded by debiting insurance expense.
- Sales tax was not recorded separately during the year. The company is required to collect 2% sales tax on its sales. The company's credit sales amounted to \$2,500,000 for the current year; there were no cash sales.

Required »

Prepare the journal entries needed to correct the errors listed.

- 5 E21-8. Error Analysis and Correction.** Lombardo Lumber Company incorrectly recorded inventory in 2017. Rather than recording ending inventory as \$500, Lombardo's accounting manager entered \$560, overstating ending inventory by \$60.

An inventory summary for 2017 and 2018 as actually recorded by the company follows.

2017		2018	
Beginning inventory	\$ 200	Beginning inventory	\$ 560
Purchases	+600	Purchases	+600
Available	\$ 800	Available	\$1,160
Ending inventory	(560)	Ending inventory	(900)
Cost of goods sold	<u>\$ 240</u>	Cost of goods sold	<u>\$ 260</u>

Required »

- Prepare an analysis of this error over the 2-year period, recommend any correcting entries required to correct the inventory error, and comment on the effect of the error on gross profit. Assume that Lombardo discovered the error in 2018 before closing the books.
 - What correcting entries are necessary if Lombardo discovered the error in 2019 after closing the books for 2018?
- 5 E21-9. Error Analysis and Correction.** Tuscany Timber Company incorrectly recorded inventory in 2017. Rather than recording ending inventory as \$2,200, Tuscany's accounting manager entered \$2,500. An inventory summary for 2017 and 2018 follows.

	2017	2018
Beginning inventory	\$1,400	\$2,500
Purchases	2,200	3,600
Ending inventory	2,500	3,800

Required »

- Prepare an analysis of this error over the 2-year period, recommend any correcting entries required to correct the inventory error, and comment on the effect of the error on gross profit. Assume that Tuscany discovered the error in 2018 before closing the books.
 - What correcting entries are necessary if Tuscany discovered the error in 2019 after closing the books for 2018?
- 5 E21-10. Error Analysis and Correction.** Greer Incorporated discovered the following errors on the books at the beginning of 2017:
- Maintenance expense on account was overstated by \$20,000 in 2015 and understated by \$30,000 in 2016. The payables for both years are still unpaid.
 - Depreciation expense was overstated by \$55,000 in 2015 and understated by \$70,000 in 2016.
 - Ending inventory was understated by \$120,000 in 2015 and overstated by \$178,000 in 2016.

Required »

Prepare the entry required to correct these entries in 2017 when they are discovered, assuming that books have been closed for both 2015 and 2016. Greer does not prepare comparative statements.

Problems

- 2 P21-1. Change in Accounting Principle, Inventory.** Second Thought Products (STP) began operations on January 1, 2017, and adopted the FIFO method of inventory valuation at that time. Management elected to change its inventory method to the average-cost method effective January 1, 2020. The new method more fairly presents the company's financial position and results of operations. The following information is available for the years ended December 31, 2017, through December 31, 2020. STP is subject to a 40% income tax rate. The company still uses the FIFO method for income tax reporting.

Year	Cost of Goods Sold Under	
	Average Cost Method	FIFO Method
2017	\$176,400	\$201,600
2018	117,600	134,400
2019	252,000	277,200
2020	285,600	260,400

Required »

- Compute the cumulative effect, net of tax, for the 3-year period needed to record a change from the FIFO method to the average-cost method.
- Prepare the journal entry to record the change in accounting for inventory valuation.
- Indicate where STP should report the net of tax cumulative effect, assuming that the first balance sheet presented is for the year ended December 31, 2019.
- Indicate the cost of goods sold reported on the income statement for 2017, 2018, 2019, and 2020.
- Assume that this change in principle is considered to be impractical. Indicate the cost of goods on the income statement for 2017, 2018, 2019, and 2020.

2

P21-2. Change in Accounting Principle, Inventory. J&S Arnez Company began operations in 2017 and initially adopted the weighted-average method for inventory valuation. In 2019, in accordance with the inventory valuation policies followed by other companies in its industry, Arnez changed its inventory pricing to the FIFO method. The company still uses the weighted-average method of inventory valuation for income tax purposes. Arnez has a 30% tax rate. The pretax income data is reported as follows.

Year	Weighted Average	FIFO
2017	\$518,000	\$553,000
2018	546,000	602,000
2019	574,000	630,000

Required »

- What is J&S Arnez's net income in 2019?
- Compute the cumulative effect on retained earnings from the change in accounting principle from weighted average to FIFO pricing (up to but not including the year of the change).
- Show condensed, comparative income statements for J&S Arnez Company, beginning with income before taxes, as presented on the 2019 income statement.

2

P21-3. Change in Accounting Principle, Inventory. Welsh, Inc. began operations January 1, 2017. During 2019, management changed its method of accounting for inventories from the average-cost method to the first-in, first-out (FIFO) method. This change is effective as of January 1, 2019.

If cost of goods sold had been determined under each of these two methods for all years of operation, the results would have been:

Cost of Goods Sold	2019	2018	2017
Average cost	\$142,500	\$120,000	\$129,000
FIFO	90,000	72,000	78,000

The company's income statements as reported under average cost before implementing the accounting change for 2019, 2018, and 2017 follow. The income tax rate for Welsh is 40%. Welsh will continue to use average cost for income tax reporting.

Welsh, Inc.
Comparative Income Statements
For the Years Ended December 31

	2019	2018	2017
Sales	\$ 525,000	\$450,000	\$ 420,000
Cost of Goods Sold	(142,500)	(120,000)	(129,000)
Operating Expenses	<u>(67,500)</u>	<u>(49,500)</u>	<u>(28,500)</u>
Income before Tax	\$ 315,000	\$280,500	\$ 262,500
Tax Expense (40%)	<u>(126,000)</u>	<u>(112,200)</u>	<u>(105,000)</u>
Net Income after Tax	<u>\$ 189,000</u>	<u>\$168,300</u>	<u>\$ 157,500</u>

Required »

- Prepare the comparative income statements for Welsh after the change to FIFO.
- Determine the after-tax cumulative effect in the retained earnings balance for the first balance sheet presented (i.e., at December 31, 2018). Welsh presents comparative balance sheets.

2

P21-4. Change in Accounting Principle, Leases. Romer Corporation began operations on January 1, 2015. The company decided to lease all plant assets rather than purchase them. Romer used the operating method for all leased assets in 2015 and 2016. On January 1, 2017, a new accountant joined the company and determined that the assets should be accounted for as finance leases following U.S. GAAP. Assume that this is a correction of an error. Income before tax and lease-related expenses in 2015, 2016, and 2017 are \$580,000, \$600,000, and \$720,000, respectively. The tax rate is 40%. Lease-related expenses under the two methods follow:

Year	Finance Lease	Operating Lease
2015	\$165,500	\$118,000
2016	140,000	118,000
2017	129,000	118,000

Required »

- Determine the amount of the prior-period adjustment in the year of the correction.
- Prepare partial comparative income statements for the years ended December 31, 2015 through 2017.

2

P21-5. Change in Accounting Principle, Long-Term Construction Contracts. Porco Construction Company initiated operations on January 1, 2016. At that time, Porco's management used the percentage-of-completion method to account for its contracts. The estimates used indicated that the contracts would generate income equally each year; the projects were 4 years in duration and were 25% complete each year. On January 1, 2019, the company switched to the completed-contract method to better reflect the company's shift in contract length. Contracts are shorter in duration and are not as material in terms of total value. Relevant income information for both methods follows. Porco is subject to a 40% income tax rate. Assume that Porco can use the percentage-of-completion method for tax purposes and on the company's tax returns after the change for financial reporting purposes.

Year	Percentage-of-Completion Method (Old Method)	Completed-Contract Method (New Method)
2016	\$88,560	\$ 0
2017	88,560	0
2018	88,560	0
2019	88,560	354,240

Required »

- Compute the cumulative effect after tax.
- Prepare the journal entry to record the change in method effective January 1, 2019.
- Prepare the accounting change footnote in the financial statements for the year of the change.

2 3

P21-6. Change in Estimate, Inventory, Bad Debt Expense. Rocket Man, Incorporated provided the following financial statement information for 2018:

Credit sales	\$2,500,000
Retained earnings, January 1, 2018	1,600,000
Sales	3,000,000
Selling and administrative expenses	480,000
Restructuring gain (pretax)	720,000
Cash dividends declared	190,000
Cost of goods sold	1,755,000
Error correction: 2013 rent was unpaid and unrecorded	40,000
Interest income	480,000
Interest expense	820,000
Gain on sale of investments (pre-tax)	500,000

- On January 1, 2018, Rocket Man changed its plant and equipment accounting for depreciation from the double-declining balance method to the straight-line method. Rocket Man purchased the assets on January 1, 2017 for \$600,000; they had no scrap value and useful lives of 10 years. The balance in the accumulated depreciation account at January 1, 2018 amounted to \$120,000. Rocket Man recorded the straight-line depreciation expense of \$53,333 in 2018 and included it in the \$480,000 reported for selling and administrative expenses. Depreciation expense would have been \$96,000 if Rocket Man still used the double-declining balance method.
- Bad debt expense for 2018 of \$50,000 is included in selling, general, and administrative expenses on the income statement. Rocket Man uses the percentage of accounts receivable method of estimating bad debt expense. The estimated percentage was 5% in both 2016 and 2017 but changed to 10% in 2018. At December 31, 2018, the Accounts Receivable balance is \$600,000, and the Allowance for Uncollectible Accounts (before adjustment) was \$10,000 credit balance.

Required »

- Assuming a tax rate of 40%, prepare the multiple-step income statement for Rocket Man for the year ended December 31, 2018.
- Compute the cumulative effect of the accounting changes made in 2018.
- Prepare the journal entries to record the accounting changes made in 2018.
- Prepare the footnote disclosures required for the accounting changes made in 2018.
- Prepare the retained earnings column of the statement of stockholders' equity for the year ended December 31, 2018.

2 3

P21-7. Change in Accounting Principle, Change in Estimate. Jupiter Electric Company provided the following financial statement information for 2018 before considering the accounting changes that follow:

Retained earnings, January 1, 2018	\$ 49,540
Sales	308,000
Selling and administrative expenses	54,000
Cash dividends declared	15,000
Cost of goods sold (weighted-average cost)	182,000
Interest income	3,300
Interest expense	8,200

- The company failed to record \$7,000 interest expense on a zero-coupon bond in 2014. The bonds are still outstanding.
- The company changed its accounting method to FIFO from the weighted-average method in 2018. Beginning inventory would have been \$3,000 higher and cost of goods sold would have been \$3,000 lower in 2018 using FIFO.
- Bad debt expense is included in selling and administrative expenses on the income statement. Jupiter uses the percentage of accounts receivable method of estimating bad debt expense. At December 31, 2018, the Allowance for Uncollectible Accounts is \$5,280 (credit balance), based on the estimates of uncollectible accounts for the quarterly financial statements. At December 31, 2018, the company now believes the quarterly estimates were too high and the Allowance for Uncollectible Accounts should be \$2,640 with a credit balance.
- Jupiter's tax rate is 40%.

Required »

- Prepare the journal entries to record the accounting changes made in 2018.
- Compute the cumulative effect of the accounting changes made in 2018.
- Prepare the multiple-step income statement for Jupiter for the year ended December 31, 2018.
- Prepare the footnote disclosures required for the accounting changes made in 2018.
- Prepare the retained earnings column of the statement of stockholders' equity for the year ended December 31, 2018.

Autograded Excel Project available in **MyLab Accounting**

CASES

Judgment Case

Judgment Case: Materiality and Error Corrections

SAB Topic 1.M., *Assessing Materiality*, found in FASB ASC 250-10-S99-1, presents the SEC's views on the issue of materiality in the financial statements. Based on this document, indicate whether each of the following errors is material and thus should be corrected.

1. Talky Solutions discovered several large errors. One error overstates inventory and understates cost of goods sold by 8% of uncorrected net income. The other error understates sales revenue and understates accounts receivable by 8.5% of uncorrected net income. Consequently, the two errors combined result in a slight understatement of net income.
2. Net income for the current year for Walker Electric is \$1,500,000. It has discovered an error that affects its contingent liability account in the amount of \$35,000. The error understates the liability account and overstates net income. Walker has also discovered an error that affects its accounts payable account in the amount of \$35,000. The error understates the liability account and overstates net income.
3. Net income for CoCo Corporation is \$7,000,000 in the current year. CoCo has a simple capital structure with 1,000,000 shares outstanding, so earnings per share is \$7.00 per share. Earnings per share was \$6.94 last year and \$6.90 the year before that. Analyst forecasts for CoCo's earnings per share this year will be \$6.98. CoCo discovered an error of \$40,000 that affects its inventory accounts and overstates net income.
4. Net income for Soda, Inc. is \$5,000,000 in the current year. Soda has a simple capital structure with 1,000,000 shares outstanding, so earnings per share is \$5 per share. Earnings per share was \$4.95 last year and \$4.93 the year before that. Soda discovered an error of \$20,000 in its estimate of bad debts that overstates income.

Financial Statement Analysis Case

Financial Statement Analysis Case

The 2013 financial statements of *Lexmark International, Inc.*, a leading developer, manufacturer, and supplier of printing, imaging, and device management, indicated that it reported an accounting policy change. Use the following information and excerpts from its financial statements to analyze the change and its effect on the financial statements.

- a. What accounting policy did *Lexmark* change?
- b. What reason(s) does *Lexmark* give for making this change?
- c. What method did *Lexmark* use to account for this change?
- d. What was *Lexmark's* net income in 2013, 2012, and 2011 under the new accounting policy? If *Lexmark* did not change its accounting policy, what would its 2013, 2012, and 2011 net income have been? Comment on the difference.
- e. What was *Lexmark's* difference in pension expense in 2013, 2012, and 2011 under the two accounting policies? Using the new policy, is pension expense higher or lower in 2013, 2012, and 2011? Did *Lexmark* experience net actuarial gains or losses in 2013, 2012, and 2011?

Accounting Change, **Lexmark Communications, Inc.**, Financial Statements, December 31, 2013

NOTE 2: Significant Accounting Policies (excerpt)

The Company's significant accounting policies are an integral part of its financial statements.

Change in Accounting Policy for Pension and Other Postretirement Plans

During the fourth quarter of 2013, Lexmark changed its accounting methodology for recognizing costs for all of its company sponsored U.S. and international pension and postretirement benefit obligations. Previously, the Company recognized the net actuarial gains and losses as a component of stockholders' equity within the Consolidated Statements of Financial Position. On an annual basis the net gains and losses . . . were amortized into operating results (to the extent that they exceeded 10% of the higher of the market-related value of plan assets or the projected benefit obligation of each respective plan) over the average future service period of active employees within the related plans. . . .

Under the new accounting method, Lexmark immediately recognizes the change in the fair value of plan assets and net actuarial gains and losses in pension and other postretirement benefit plan costs annually in the fourth quarter of each year and in any quarter during which a remeasurement is triggered. The remaining components of net periodic benefit cost, primarily net service cost, interest cost and the expected return on plan assets, are recorded on a quarterly basis as ongoing benefit costs. . . . While Lexmark's historical policy of recognizing pension and other postretirement benefit plan asset and actuarial gains and losses was considered acceptable under U.S. GAAP, the Company believes that the new policy is preferable as it eliminates the delay in recognizing changes in the fair value of plan assets and actuarial gains and losses within operating results. This change also improves transparency within Lexmark's operating results by immediately recognizing the effects of economic and interest rate trends on plan investments and assumptions in the year these gains and losses are actually incurred. This change in accounting policy has been applied retrospectively, adjusting all prior periods presented.

Source: Accounting Change, Lexmark Communications, Inc., Financial Statements, December 31, 2013. <http://investor.lexmark.com/phoenix.zhtml%3F%3D92369%26p%3Diol-reportsannual>

The following summarizes the impact of all adjustments made to the financial statements presented (amounts in millions):

For the year ended December 31 (in millions)		Previous Policy	New Policy
2013	Earnings before income taxes	\$252.7	\$368.4
	Net earnings	190.6	261.8
2012	Earnings before income taxes	158.0	162.4
	Net earnings	106.3	107.6
2011	Earnings before income taxes	413.6	338.4
	Net earnings	320.0	275.2

Surfing the Standards Case

Surfing the Standards: Change in Accounting Principle

1. Read FASB ASC 250-10-S99 to respond to the following question. ASCO Recordings has decided to change its inventory system from the LIFO method to the FIFO method for the 2015 fiscal year. Because it does not carry much inventory, the change in principle does not have a material effect on the financial statements of prior periods. Accordingly, it plans not to adjust comparative financial statements presented but rather to report the cumulative effect of the change through retained earnings as of the beginning of the 2015 fiscal year. Is this approach permissible? If not, how must ASCO Recordings report this change in principle?
2. Read FASB ASC 250-10-45 to respond to the following question. Basty Needleworks, a calendar-year firm, has decided to change its inventory system from the FIFO method to the LIFO method. It made

this decision in July 2015, and thus plans to report under LIFO for the first time in its third quarter of 2015 filings. Based on the impracticability rules associated with retrospective application, it plans to use the prospective method of reporting for the change in principle beginning in the third quarter. Is this approach permissible? If not, how must Basty report this change in principle?

Basis for Conclusions Case

Basis for Conclusions: Change in Accounting Principle

Read the Basis for Conclusions (paragraphs B1 through B38) in FASB's *Statement of Financial Accounting Standards No. 154* to respond to the following questions.

1. When debating the issues of FASB's "Accounting Changes and Error Corrections," *Statement of Financial Accounting Standards No. 154*, the Board concluded that the retrospective method is the correct approach to use for changes in accounting principles. Why did FASB reach this conclusion?
2. Changes in accounting principle can have both direct and indirect effects. The direct effects are the impact on the related balance sheet and income statement accounts. Firms always apply direct effects retrospectively unless it is impractical to do so. Indirect effects are changes to current or future cash flows that result from the change in accounting principle. Firms apply indirect effects only prospectively. There is some disagreement as to whether indirect effects should be applied retrospectively or prospectively. What are the arguments for each reporting method?

The Statement of Cash Flows

LEARNING OBJECTIVES

- 1 State the purpose of the statement of cash flows and define cash and cash equivalents.
- 2 Describe the format of the statement of cash flows, including classification of activities into operating, investing, and financing sections; the reconciliation of cash and cash equivalents; and the disclosure of significant noncash investing and financing transactions.
- 3 Understand and use the conceptual model based on the accounting equation to prepare the statement of cash flows.
- 4 Explain and prepare the operating cash flows section of the statement of cash flows using the indirect and direct methods.
- 5 Describe and illustrate the investing cash flows section of the statement of cash flows.
- 6 Describe and illustrate the financing cash flows section of the statement of cash flows.
- 7 Discuss and illustrate the reporting of complex transactions in determining cash flows.
- 8 Detail required disclosures related to the statement of cash flows.

Introduction

CASH, ONE OF A COMPANY'S most important assets, is critical to successful operations and growth. Although cash is only one line on the balance sheet, a separate financial statement—the statement of cash flows—is devoted to explaining a company's sources and uses of cash.

Chapter 6 explained that the statement of cash flows summarizes changes in a firm's cash inflows and outflows over a period of time for operating, investing, and financing activities. Thus, the statement of cash flows plays a pivotal role in completing the financial reporting cycle and enhancing the articulation among the financial statements.

The statement of cash flows explains and reconciles net income to net cash provided by operating activities and reconciles significant changes in balance sheet items. To illustrate, consider *Alphabet Inc.*, the parent company of *Google*. In 2016, its statement of cash flows indicated that it had generated \$36,036 million of net cash from operations. Yet, *Alphabet's* net income of \$19,478 million was lower than its net cash provided by operating activities. *Alphabet's* statement of cash flows indicates that the difference between the net income and net cash provided by operating activities was due mainly to noncash expenses such as depreciation and amortization expenses and stock-based compensation expense. It is common for a growing business to earn lower or no income but to generate positive operating cash flows as is the case with *Alphabet*. The company used this cash to purchase property and equipment, invest in securities, and acquire other businesses.

Throughout this chapter, we briefly revisit the topics covered in Chapter 6's discussion of the statement of cash flows, including its purposes; classification of cash flows into operating, investing, and financing activities; and the direct and indirect methods of reporting cash flows. We also discuss additional details focusing on the preparation of the statement of cash flows. We develop a conceptual model based on the accounting equation that provides the logic underlying

Bloomberg/Contributor/Getty Images

the preparation of the statement of cash flows. Then, we examine the cash flow statement effects on complex topics we have discussed throughout the text and conclude by addressing disclosure requirements for the cash flow statement.

In general, preparation of the statement of cash flows under IFRS and U.S. GAAP is quite similar. We identify significant differences between U.S. GAAP and IFRS when appropriate. ‹‹

- ① State the purpose of the statement of cash flows and define cash and cash equivalents.

Overview of the Statement of Cash Flows

The statement of cash flows summarizes a firm's cash inflows and outflows over a period of time. Reconciling the change in the cash balance (where cash is defined as cash, cash equivalents, restricted cash, and restricted cash equivalents) to the cash flows for the period enhances the articulation among the financial statements. The statement is also useful in explaining and reconciling many other significant changes in balance sheet items, particularly when the statement is used in conjunction with the other financial statements and related footnote disclosures.

THE CONCEPTUAL FRAMEWORK CONNECTION Statement of Cash Flows

The conceptual framework's financial reporting objective is to provide existing and potential investors, lenders, and creditors with useful information to help them assess an entity's future net cash flows. Investment decisions by market participants in a company depend on the expected risks and returns. Consequently, it is important for investors to have information about an entity's cash flows. Information in the statement of cash flows explains how the entity obtains and uses cash, including information about debt issuances, repayments, and distributions to equity investors. This information helps market participants understand the operations of the entity and evaluate its liquidity and solvency.

Purposes of the Cash Flow Statement

The primary purpose of the statement of cash flows is to provide information about a firm's cash receipts and cash payments from its operating, investing, and financing activities over a period of time. The statement of cash flows assists financial statement users in:

1. Assessing the ability of the firm to generate future cash flows, particularly related to its operating activities
2. Evaluating the ability of the entity to meet its obligations and pay dividends
3. Determining the entity's need for external financing
4. Understanding the differences between net income and the associated cash receipts and payments
5. Identifying the entity's investing and financing transactions during the period

Cash and Cash Equivalents

The cash flow statement explains the change in cash and *cash equivalents* (including restricted cash and equivalents) during the period.¹ Cash equivalents are short-term, highly liquid investments with original maturities of 3 months or less when acquired. The acquisition and disposal of short-term investments in cash and cash equivalents is part of the firm's overall cash management activities. Exhibit 22.1 provides a description of both cash and cash equivalents.

¹For the remainder of this chapter, we assume that cash and cash equivalents includes both restricted and non-restricted cash and cash equivalents.

EXHIBIT 22.1 Cash and Cash Equivalents

Item	Description
Cash	Coins, currency, and bank deposits as well as negotiable instruments such as checks and money orders
Cash Equivalents	Short-term, highly liquid investments with original maturities of 3 months or less, including: <ul style="list-style-type: none"> • Treasury bills • Commercial paper • Money market funds

Original maturity is the length of time between the investment's purchase date by the firm and the date of maturity. For example, a 3-year Treasury instrument purchased with 1 month left until maturity qualifies as a cash equivalent whereas a 3-year Treasury instrument acquired at issuance (with 3 years left until maturity) is not a cash equivalent. Exhibit 22.2 illustrates *Alphabet's* disclosure of its definition of cash and cash equivalents from its 2016 annual report.

EXHIBIT 22.2 Cash and Cash Equivalents Disclosure (excerpt), *Alphabet Inc.*, Financial Statements, December 31, 2016**Cash, Cash Equivalents, and Marketable Securities**

We invest our excess cash primarily in debt investments including those of the U.S. government and its agencies, debt instruments, corporate debt securities, agency mortgage-backed securities, money market and other funds, municipal securities, time deposits, asset backed securities, and debt instruments issued by foreign governments.

We classify all investments that are readily convertible to known amounts of cash and have stated maturities of three months or less from the date of purchase as cash equivalents and those with stated maturities of greater than three months as marketable securities.

Source: Alphabet Inc., Cash and Cash Equivalents Disclosure Excerpt, Financial Statements, December 31, 2016. https://abc.xyz/investor/pdf/2016_google_annual_report.pdf

Cash Equivalents under IFRS

The U.S. GAAP and IFRS definitions of cash equivalents are similar with the exception of *bank overdrafts*. A **bank overdraft** occurs when the balance in a bank account falls below zero. U.S. GAAP does not specifically address bank overdrafts, although they are typically considered to be liabilities. So, a company cannot report a negative cash balance on the asset side of the balance sheet under U.S. GAAP.

Under IFRS, firms include bank overdrafts as cash and cash equivalents and net them against the positive balances included in cash and cash equivalents.

Format of the Cash Flow Statement

Before examining the preparation of the statement of cash flows, we outline the key sections and classifications used in the statement of cash flows.

Sections in the Statement of Cash Flows

The statement of cash flows is divided into three sections.

1. Classification of cash flows by three major activities:
 - Operating activities, which include cash flows that relate to the production and delivery of goods and services
 - Investing activities, which include cash flows that relate to the acquisition and disposal of noncurrent assets, such as plant and equipment and long-term investments, and from the acquisition and disposal of short-term investments not classified as cash equivalents

- 2 Describe the format of the statement of cash flows, including classification of activities into operating, investing, and financing sections; the reconciliation of cash and cash equivalents; and the disclosure of significant noncash investing and financing transactions.

- Financing activities, which include cash flows that relate to the cash receipts and payments of principal from the short- and long-term debt and equity financing. Financing activities also include dividend distributions to owners.
2. Reconciliation of cash flows during the period to the change in cash and cash equivalents
 3. Disclosure of interest paid and taxes paid for cash flow statements prepared under the indirect method and significant noncash investing and financing transactions

In *Alphabet's* statement of cash flows in Exhibit 22.3, divisions of the statement of cash flows into cash from operating, investing, and financing activities are in bold print. The line items in each section are added together with net cash flows from operating, investing, and financing activities, summing to \$36,036, \$(31,165), and \$(8,332) (all in millions), respectively, in the year ended December 31, 2016. The total of cash flows from these three major activities (plus exchange rate effects) decreases cash and cash equivalents by \$3,631 million in 2016. Next, *Alphabet* presents the reconciliation of cash and cash equivalents balances during the period. Adding the beginning cash and cash equivalents of \$16,549 million to the \$3,631 million decrease in cash and cash equivalents during the year results in the ending cash and cash equivalents balance of \$12,918 million. Of course, \$12,918 million is the amount of cash and cash equivalents *Alphabet* reports on its December 31, 2016, balance sheet.

After the reconciliation, *Alphabet* discloses supplemental cash flow information, including cash paid for taxes of \$1,643 million and cash paid for interest of \$84 million.

Statement of Cash Flows Classifications

Next, we discuss in detail the classifications used in the statement of cash flows. The classifications into operating, investing, and financing activities indicate the source and use of each cash flow, enabling financial statement users to assess the firm's ability to repay principal and interest and to pay dividends in the future. For example, cash generated from operating activities is of higher quality than cash generated from borrowed funds because it is more likely to recur in future periods. Firms disclose significant investing and financing activities that do not involve cash as supplemental information.

Exhibit 22.4 summarizes cash inflows and outflows from operating, investing, and financing activities.

Classification of Dividends, Interest, and Taxes

Companies classify the following items relating to dividends, interest, and taxes in operating cash flows:

1. Cash receipts from interest and dividends
2. Cash payments for taxes
3. Cash payments for interest

Cash payments for dividends to owners are classified as financing activities.

IFRS Classification of Dividends, Interest, and Taxes. In contrast to U.S. GAAP, recall from Chapter 6 that IFRS allows companies discretion in classifying some items as operating, investing, or financing activities. Exhibit 22.5 compares the classification options under U.S. GAAP and IFRS.

EXHIBIT 22.3 Statement of Cash Flows, *Alphabet Inc.*, Financial Statements, December 31, 2016

Alphabet Inc.			
Consolidated Statements of Cash Flows			
(In millions)			
	Year Ended December 31		
	2014	2015	2016
Operating activities			
Net income	\$14,136	\$16,348	\$19,478

EXHIBIT 22.4 Cash Flows from Operating, Investing, and Financing Activities

Cash Receipts (Inflows)	Cash Payments (Outflows)
Operating Activities	
From the sale of goods and services	To suppliers for inventory, utilities, services, etc.
From interest and dividend income	To employees for services
	To government agencies for taxes
	To creditors for interest paid
Investing Activities	
From the sale of property, plant, and equipment	For acquiring property, plant, and equipment
From the sale of debt and equity security investments ²	For acquiring debt or equity security investments
	For extending credit to others
From the collection of principal payments from loans made to others	
Financing Activities	
From the issuance of debt securities	To redeem or retire debt
From the issuance of common and preferred stock	To purchase treasury stock or retire capital stock
From the resale of treasury stock	To make dividend distributions to shareholders

EXHIBIT 22.5 Classification of Dividends, Interest, and Taxes

Activities	Standard	
	U.S. GAAP	IFRS
Cash receipts from interest and dividends	Operating	Operating or investing
Cash payments for taxes	Operating	Operating unless they can be specifically identified with financing or investing activities
Cash payments for interest	Operating	Operating or financing
Cash payments for dividends to owners	Financing	Operating or financing

Reconciliation of Cash and Cash Equivalents

A firm adds the net cash inflow or outflow from operating, investing, and financing activities to obtain the net increase/decrease in cash and cash equivalents for the period. It then reconciles the net increase/decrease in cash and cash equivalents for the period to the ending cash and cash equivalents balance for the period, using a format similar to the following:

	Net Cash Provided (Used) by Operating Activities
Plus	Net cash provided (used) by investing activities
Plus	Net cash provided (used) by financing activities
Equals	Net increase (decrease) in cash and cash equivalents
Plus	Beginning cash and cash equivalents
Equals	Ending cash and cash equivalents

²Cash payments and receipts related to investments in debt securities that are classified as trading securities can be classified as operating or investing activities based on management's intent.

Firms present the reconciliation at the end of the cash flow statement. Exhibit 22.3 shows the reconciliation section of *Alphabet's* statement of cash flows. In 2016, *Alphabet's* net decrease in cash and cash equivalents was \$(3,631) million (including foreign exchange effects), which it adds to beginning cash and cash equivalents of \$16,549 million to arrive at the ending cash and cash equivalents of \$12,918 million.

IFRS Reconciliation of Cash and Cash Equivalents. IFRS also requires a reconciliation of the net increase (decrease) in cash and cash equivalents for the period to the ending balance of cash and cash equivalents. However, IFRS does not require that the increase or decrease in cash and cash equivalents explained in the statement of cash flows agree to a single line item in the balance sheet because cash management practices and banking arrangements differ around the world. If a company uses a different cash and cash equivalents amount, it must provide a reconciliation of the components of cash and cash equivalents to the amounts presented on the statement of financial position.

Significant Noncash Investing and Financing Transactions

A firm generally engages in many significant investing and financing transactions that do not have immediate cash flow consequences. For example, the acquisition of a plant asset financed by the issuance of long-term debt does not involve the receipt or disbursement of cash. These noncash items are not incorporated in the statement of cash flows. Instead, firms disclose them in a footnote or a separate schedule (if material). Other common significant noncash investing and financing activities include:

- Stock dividends
- Conversion of bonds into capital stock
- Finance lease commencement
- Plant asset exchanges and other nonmonetary exchanges

A company can report significant noncash investing and financing transactions at the end of its statement of cash flows or in a note to the financial statements. For example, *Amazon.com Inc.* reported about \$4 billion as a significant noncash investing and financing transaction from the investment in property and equipment that was financed through finance leases in a noncash transaction.

- ③ Understand and use the conceptual model based on the accounting equation to prepare the statement of cash flows.

Conceptual Model for the Statement of Cash Flows

In the remainder of the chapter, we explain how to prepare a statement of cash flows. We begin with a conceptual model for the statement of cash flows and follow with a discussion of each section of the cash flows statement.

Firms can prepare the cash flows statement based on changes in balance sheet accounts. We begin with the accounting equation in Equation 22.1.

$$\text{Assets} = \text{Liabilities} + \text{Stockholders' Equity} \quad (22.1)$$

Next in Equation 22.2, we disaggregate each element of the balance sheet equation into its main components.³ The restated balance sheet equation is as follows:

$$\text{Cash} + \text{OCA} + \text{NCA} = \text{CL} + \text{NCL} + \text{CS} + \text{RE} \quad (22.2)$$

OCA = Other Current Assets

NCA = Noncurrent Assets

CL = Current Liabilities

NCL = Noncurrent Liabilities

CS = Capital Stock

RE = Retained Earnings

³For simplicity, we do not include accumulated other comprehensive income as a component of stockholders' equity.

Subtracting OCA and NCA from both sides of the equation solves for cash as in Equation 22.3.

$$\text{Cash} = \text{CL} + \text{NCL} - \text{OCA} - \text{NCA} + \text{CS} + \text{RE} \quad (22.3)$$

Taking the changes in each equation component creates a model for the statement of cash flows.

$$\Delta\text{Cash} = \Delta\text{CL} + \Delta\text{NCL} - \Delta\text{OCA} - \Delta\text{NCA} + \Delta\text{CS} + \Delta\text{RE} \quad (22.4)$$

Equation 22.4 indicates that the change in cash is based on the changes in all balance sheet accounts. For example, consider accounts payable, a current liability (CL). If accounts payable increase, there is a positive effect on cash flows. Conversely, cash flows decrease by the acquisition (increase) of a noncurrent asset.

For each account, the firm identifies whether the change relates to operating, investing, or financing activities. For example, accounts receivable and accounts payable relate to operating activities. Bonds payable and treasury stock relate to financing activities. Some changes in account balances can relate to more than one activity, and other changes may relate to noncash adjustments as we discuss later in the chapter along with additional complexities.⁴

- 4** Explain and prepare the operating cash flows section of the statement of cash flows using the indirect and direct methods.

Operating Cash Flows

There are two acceptable formats for the operating section in the statement of cash flows: the indirect method and the direct method. The two methods report the same amount of net cash provided by operating activities using different approaches. Standard setters prefer the direct method, but it is currently less popular in practice than the indirect method.

The Indirect Method

Under the indirect method (also referred to as the reconciliation format), firms reconcile net income to net cash provided by operating activities by making two types of adjustments:

1. Adjustments for noncash revenues, expenses, and other gains and losses
2. Adjustments for changes in current assets and current liabilities

To adjust net income to net cash provided by operating activities, firms add noncash expenses and losses back to net income. Conversely, firms subtract any noncash revenues or gains from net income to arrive at net cash provided by operating activities.⁵

Equation 22.4 illustrated the effects of changes in current assets and liabilities:

1. Increases in current liabilities cause operating cash flows to be higher than accrual-basis income.
2. Decreases in current liabilities cause operating cash flows to be lower than accrual-basis income.
3. Increases in current assets cause operating cash flows to be lower than accrual-basis income.
4. Decreases in current assets cause operating cash flows to be higher than accrual-basis income.

Exhibit 22.6 shows the effects on operating cash flows under the indirect method of changes in specific common current assets and current liabilities.

⁴The change in accumulated other comprehensive income does not actually enter into the preparation of the cash flow statement because OCI transactions are noncash, and we begin the preparation of the cash flow statement with net income, not OCI.

⁵The adjustments needed for gains and losses on sales of noncurrent assets and the cash flow effects of these adjustments will be discussed later in the chapter.

EXHIBIT 22.6 The Effects of Changes in Current Assets and Current Liabilities

Current Asset/ Liability	Increase/ Decrease	Effect on Cash Flows	Rationale	Action
Trade receivables	Increase	Decrease	An increase in trade receivables represents uncollected sales.	Deduct the amount of the increase from net income to adjust sales to the amount of cash collected from customers.
	Decrease	Increase	A decrease in trade receivables indicates that all current-year sales were collected as well as a portion of prior-years sales.	Add the amount of the decrease back to net income to adjust sales to the amount of cash collected from customers.
Inventory	Increase	Decrease	An increase in inventory indicates that the company acquired inventory to cover the cost of goods sold and increased inventory held in the warehouse. The increase in warehouse inventory results in additional cash outflow to pay for this inventory.	Deduct the amount from net income to adjust cost of goods sold to cash paid for purchases of inventory.
	Decrease	Increase	A decrease in inventory indicates that of the cost of inventory sold this year, some of the units sold were purchased in prior years.	Add the amount back to net income to adjust the cost of goods sold to the cash paid for inventory.
Prepaid expenses	Increase	Decrease	An increase in prepaid expenses is a cash outflow that appears on the balance sheet and does not affect net income. However, the cash is paid as part of operations.	Deduct the increase in prepaid expenses from net income to adjust to the amount of cash paid for operating expenses.
	Decrease	Increase	A decrease in prepaid expenses represents a cash outflow made in a previous period that is reflected as an expense on the income statement in the current period.	Add the decreased amount back to net income to arrive at cash paid for operating expenses.
Accounts payable	Increase	Increase	An accounts payable increase represents invoices for inventory not paid in the current year.	Add the increase in accounts payable to net income to adjust cost of goods sold to cash paid for inventory acquired.
	Decrease	Decrease	If accounts payable decreases, the current invoices as well as a portion of last year's invoices were paid.	Deduct this decrease from net income to arrive at cash paid for inventory acquired.
Accrued expenses	Increase	Increase	An accrued expense increase represents operating expenses not paid in the current year.	Add the increase in accrued expenses to net income to adjust operating expenses to cash paid to suppliers.
	Decrease	Decrease	Decreases in accrued expenses indicate that this year's operating expenses were paid in cash as well as a portion of prior years' expenses.	Deduct the decrease in accrued expenses from net income to adjust operating expenses to cash paid to suppliers.

Example 22.1 demonstrates preparing the operating cash flows section of the cash flow statement.

EXAMPLE 22.1 Operating Cash Flows: Indirect Method

PROBLEM: Uniform Direct, Inc. presented the following income statement and selected balance sheet accounts. Prepare the operating cash flows section of the cash flow statement using the indirect method.

Uniform Direct, Inc. Income Statement	
Sales Revenue	\$1,345,000
Cost of Goods Sold	<u>852,000</u>
Gross Profit	493,000
Selling Expenses*	57,000
General and Administrative Expenses	112,000
Depreciation Expense	<u>27,000</u>
Operating Income	297,000
Interest Expense	10,000
Interest Revenue	<u>6,000</u>
Income before Taxes	293,000
Income Tax Expense	<u>85,000</u>
Net Income	<u>\$ 208,000</u>

*Includes \$23,000 expense for stock-based compensation and \$34,000 of wage expense.

Selected Balance Sheet Accounts		
	Ending	Beginning
Accounts Receivable, net	\$ 15,250	\$ 20,000
Interest Receivable	200	1,000
Inventory	575,300	562,400
Prepaid Expenses	11,590	12,450
Accounts Payable	52,000	55,670
Wages Payable	5,600	5,400
Interest Payable	2,000	2,250
Income Taxes Payable	35,500	43,200
Accrued Liabilities	15,330	13,830

SOLUTION: We begin with net income and adjust for noncash expenses. From the income statement and additional information, there are the following noncash expenses:

- Depreciation expense of \$27,000
- Stock-based compensation expense of \$23,000

We add these noncash expenses back to net income because although they reduce income, they do not generate a cash outflow. There are no noncash revenues to include in the adjustments.

We then adjust for changes in the current assets and liabilities according to Equation 22.4 and Exhibit 22.6. The following table identifies the balance sheet accounts, the change in each account, the parts of Equation 22.4 relating to the account, and how the change is presented in the operating cash flow section of the statement of cash flows.

Account	Ending Balance	Beginning Balance	Increase (Decrease) in Account Balance	Equation 22.4	Effect on Statement
Accounts Receivable, net	\$ 15,250	\$ 20,000	\$ (4,750)	$\Delta\text{CASH} = - \Delta\text{OCA}$	Increase
Interest Receivable	200	1,000	(800)	$\Delta\text{CASH} = - \Delta\text{OCA}$	Increase
Inventory	575,300	562,400	12,900	$\Delta\text{CASH} = - \Delta\text{OCA}$	Decrease
Prepaid Expenses	11,590	12,450	(860)	$\Delta\text{CASH} = - \Delta\text{OCA}$	Increase
Accounts Payable	52,000	55,670	(3,670)	$\Delta\text{CASH} = \Delta\text{CL}$	Decrease
Wages Payable	5,600	5,400	200	$\Delta\text{CASH} = \Delta\text{CL}$	Increase
Interest Payable	2,000	2,250	(250)	$\Delta\text{CASH} = \Delta\text{CL}$	Decrease
Income Taxes Payable	35,500	43,200	(7,700)	$\Delta\text{CASH} = \Delta\text{CL}$	Decrease
Accrued Liabilities	15,330	13,830	1,500	$\Delta\text{CASH} = \Delta\text{CL}$	Increase

The operating activities section of the statement of cash flows follows.

Uniform Direct, Inc.	
Statement of Cash Flows (Partial)	
Operating Activities	
Net Income	\$208,000
Adjustments to Reconcile Net Income to Net Cash Provided by Operating Activities	
Depreciation Expense	27,000
Compensation Expense – Stock Options	23,000
Changes in Operating Working Capital Accounts	
Decrease in Accounts Receivable	4,750
Decrease in Interest Receivable	800
Increase in Inventory	(12,900)
Decrease in Prepaid Expenses	860
Decrease in Accounts Payable	(3,670)
Increase in Wages Payable	200
Decrease in Interest Payable	(250)
Decrease in Income Taxes Payable	(7,700)
Increase in Accrued Liabilities	1,500
Net Cash Provided by Operating Activities	<u>\$241,590</u>

The Indirect Method under IFRS. IFRS does not specify the income items to reconcile to operating cash flows. Where U.S. GAAP requires that firms reconcile net income to operating cash flows, IFRS allows reporters to choose the income starting point. For example, a company can begin the reconciliation under IFRS with operating income (instead of net income).

An IFRS reporter choosing to reconcile operating income to operating cash flows adjusts for cash inflows and outflows related to all items that are presented after operating income on the income statement. For example, items commonly reported after operating income are taxes paid, interest paid, and interest received. For these items, the actual cash flows are included in the operating cash flows section. Example 22.2 illustrates the operating section of the indirect method with operating income as the starting point.

EXAMPLE 22.2 Operating Cash Flows: IFRS Indirect Method

PROBLEM: Uniform Direct, Inc. presented the following income statement and select balance sheet accounts. Prepare the operating cash flows section of the cash flow statement assuming that Uniform is an IFRS reporter that begins its operating section of the cash flows statement with operating income. Uniform uses the indirect method and treats interest expense, interest revenue, and tax expense as operating activities.

Uniform Direct, Inc. Income Statement	
Sales Revenue	\$1,345,000
Cost of Goods Sold	852,000
Gross Profit	<u>493,000</u>
Selling Expenses*	57,000
General and Administrative Expenses	112,000
Depreciation Expense	<u>27,000</u>
Operating Income	297,000
Interest Expense	10,000
Interest Revenue	<u>6,000</u>
Income before Taxes	293,000
Income Tax Expense	<u>85,000</u>
Net Income	<u><u>\$ 208,000</u></u>

*Includes \$23,000 expense for stock-based compensation and \$34,000 of wage expense.

Selected Balance Sheet Accounts		
	<u>Ending</u>	<u>Beginning</u>
Accounts Receivable – net	\$ 15,250	\$ 20,000
Interest Receivable	200	1,000
Inventory	575,300	562,400
Prepaid Expenses	11,590	12,450
Accounts Payable	52,000	55,670
Wages Payable	5,600	5,400
Interest Payable	2,000	2,250
Income Taxes Payable	35,500	43,200
Accrued Liabilities	15,330	13,830

SOLUTION: We begin with operating income and adjust for noncash expenses. There are no noncash revenues to include in the adjustments. The following items are reported after operating income: interest expense, interest revenue, and income tax expense. For each item, we compute cash flows from the income statement items and changes in balance sheet accounts using t-accounts.

Interest Receivable		
Beginning Balance	1,000	Solve for
Interest Revenue	6,000	6,800
Ending Balance	<u>200</u>	Interest Received

Interest Payable

Solve for		2,250	Beginning Balance
Interest Paid	10,250	10,000	Interest Expense
		<u>2,000</u>	Ending Balance

Income Taxes Payable

Solve for		43,200	Beginning Balance
Income Taxes Paid	92,700	85,000	Income Tax Expense
		<u>35,500</u>	Ending Balance

We then adjust for noncash items and changes in the other current assets and liabilities, similar to the process in Example 22.1.

Uniform Direct, Inc.
Statement of Cash Flows (Partial)

Operating Activities

Operating income	\$ 297,000
Adjustments to reconcile operating income to net cash provided by operating activities	
Depreciation Expense	27,000
Compensation Expense – Stock Options	23,000
Changes in Operating Working Capital Accounts	
Decrease in Accounts Receivable	4,750
Increase in Inventory	(12,900)
Decrease in Prepaid Expenses	860
Decrease in Accounts Payable	(3,670)
Increase in Wages Payable	200
Increase in Accrued Liabilities	<u>1,500</u>
Cash from Operating Activities before Financial Items and Tax	337,740
Interest Received	6,800
Interest Paid	(10,250)
Income Taxes Paid	<u>(92,700)</u>
Net Cash Provided by Operating Activities	<u>\$241,590</u>

As illustrated in Exhibit 22.7, the IFRS reporter *A.P. Møller (Maersk Group)*, a global Danish company operating in the transportation and energy sectors, began its 2016 cash flow statement under the indirect method in the operations section with profit (loss) before financial items. In 2016, this amount was \$(226). On its income statement (not provided), *Maersk* reported several items *after* its profit before financial items, including financial income of \$989, financial expenses of \$1,606, and tax expense of \$1,054. On the statement of cash flows, the corresponding items are the cash flows of \$77 of financial income received, \$694 of financial expenses paid, and \$1,155 of taxes paid (all amounts are in millions).

EXHIBIT 22.7 Cash Flows from Operating Activities, *A.P. Møller (Maersk Group)*, Financial Statements, December 31, 2016

A.P. Møller (Maersk Group), Consolidated Cash Flow Statement Amounts in US\$ million		
	2016	2015
Profit (Loss) before financial items	\$ (226)	\$ 1,870
Depreciation, amortisation and impairment losses, net	7,265	7,944
Gain on sale of non-current assets, etc, net	(90)	(451)
Share of profit/loss in joint ventures	(149)	(165)
Share of profit/loss in associated companies	55	(97)
Change in working capital	(265)	382
Change in provisions and pension obligations, etc.	(855)	(99)
Other noncash items	131	130
Cash flow from operating activities before financial items and tax	5,866	9,514
Dividends received	232	155
Financial income received	77	50
Financial expenses paid	(694)	(277)
Taxes paid	(1,155)	(1,473)
Cash flow from operating activities	<u>\$ 4,326</u>	<u>\$ 7,969</u>

Source: Cash Flows from Operating Activities, A.P. Møller (Maersk Group), Financial Statements, December 31, 2016. www.maersk.com/en/the-maersk-group/press-room/press-release-archive/2017/2/annual-report-2016

The Direct Method

The direct method (also referred to as the income statement format) prepares the statement of cash flows by disaggregating the income statement and adjusting each line item to convert from the accrual basis to the cash basis. In substance, the firm prepares a cash-basis income statement. The firm applies similar adjustments as under the indirect method except that the adjustments apply to *individual* items of revenue and expense rather than against aggregate net income.

At a minimum, the direct method requires the following line items in the cash flow from operating activities calculation:

- Cash collected from customers, lessees, licensees, etc.
- Cash collected for interest and dividends
- Cash paid for merchandise
- Cash paid to employees and cash paid for other accrued expenses, including interest and taxes
- Cash paid for other operating costs, including insurance and other prepaid expenses

Golden Enterprises, Inc., a manufacturer and distributor of snack items, uses the direct method to prepare the operating cash flow section of its statement of cash flows. As illustrated in Exhibit 22.8, *Golden* reported actual cash receipts and payments rather than reconcile net income to net cash provided by operating activities in its 2016 financial statements. For example, *Golden* reported the following items that *increased* cash from operating activities: cash received from customers of \$136,289,283 and miscellaneous income received of \$97,108. *Golden* reported items that *decreased* cash from operating activities, including cash paid to suppliers and employees for cost of goods sold of \$66,550,001; cash paid for suppliers and employees for selling, general, and administrative of \$61,224,782; income taxes of \$1,140,191; and interest paid of \$335,562. The direct method statement of cash flows does not refer to net income. The income statement (not provided) shows that *Golden's* net income was \$3,184,803, which is lower than net cash provided by operating activities of \$7,135,855.

EXHIBIT 22.8 Direct Method of Reporting Cash Flows from Operating Activities, *Golden Enterprises, Inc.*, Financial Statements, June 3, 2016

Golden Enterprises, Inc. and Subsidiary Consolidated Statement of Cash Flows For the Fiscal Years Ended June 3, 2016 and May 29, 2015		
	2016	2015
CASH FLOWS FROM OPERATING ACTIVITIES		
Cash received from customers	\$136,289,283	\$131,980,056
Miscellaneous income	97,108	88,918
Cash paid to suppliers and employees for cost of goods sold	(66,550,001)	(63,720,473)
Cash paid for suppliers and employees for selling, general and administrative	(61,224,782)	(61,947,388)
Income taxes	(1,140,191)	(1,839,759)
Interest expense	(335,562)	(458,184)
Net cash provided by operating activities	<u>7,135,855</u>	<u>4,103,170</u>
CASH FLOWS FROM INVESTING ACTIVITIES		
Purchases of property, plant and equipment	(1,182,854)	(2,725,450)
Proceeds from sale of property, plant and equipment	56,446	284,806
Net cash used in investing activities	<u>(1,126,408)</u>	<u>(2,440,644)</u>
CASH FLOWS FROM FINANCING ACTIVITIES		
Change in line of credit	(2,823,477)	294,966
Debt (repayments) proceeds	(824,435)	1,698,505
Principal payments under capital lease obligation	(30,970)	–
Purchases of treasury shares	–	(2,204,375)
Cash dividends paid	(1,496,160)	(1,452,803)
Net cash used in financing activities	<u>(5,175,042)</u>	<u>(1,663,707)</u>
NET INCREASE (DECREASE) IN CASH AND CASH EQUIVALENTS	834,405	(1,181)
CASH AND CASH EQUIVALENTS AT BEGINNING OF YEAR	<u>1,159,449</u>	<u>1,160,630</u>
CASH AND CASH EQUIVALENTS AT END OF YEAR	<u>\$ 1,993,854</u>	<u>\$ 1,159,449</u>

Source: Direct Method of Reporting Cash Flows from Operating Activities, Golden Enterprises, Inc., Financial Statements, June 3, 2016. www.sec.gov/Archives/edgar/data/42228/000114420416116506/v444550_10k.htm#013

Next, we explain how to convert each of the key line items on the income statement into cash flows.

Cash Collected from Customers. To compute cash collected from customers, start with the accrual-basis revenue and (1) subtract an increase in accounts receivable or (2) add a decrease in accounts receivable to arrive at cash-basis revenue or cash collected from customers. An increase in accounts receivable indicates that the firm has recorded more revenue under the accrual system than the amount of cash it received. A decrease in accounts receivable indicates that the firm recorded less revenue under the accrual system than the amount of cash it received.

Cash Collected from Customers:

Sales Revenue

Less: Increase in Net Accounts Receivable

OR

Add: Decrease in Net Accounts Receivable

Cash Collected from Customers

Cash Collected for Interest and Dividends. To compute cash collected for interest or dividends, start with the accrual-basis revenue and (1) subtract an increase in interest or dividend receivable or (2) add a decrease in interest or dividends receivable to arrive at cash-basis revenue. An increase in the receivable indicates that the firm has recorded more revenue under the accrual system than the amount of cash it received. A decrease in the receivable indicates that the firm has recorded less revenue under the accrual system than the amount of cash it received.

Cash Collected for Interest (Dividends):

Interest (Dividend) Revenue
 Less: Increase in Net Interest (Dividend) Receivable

OR

Add: Decrease in Net Interest (Dividend) Receivable
Cash Collected for Interest (Dividends)

Cash Paid for Merchandise. The computation of cash paid for merchandise requires two steps:

1. Determine the purchases on an accrual basis.
2. Determine how much cash the firm expended for these purchases.

To determine the purchases on an accrual basis, start with cost of goods sold and adjust for changes in inventory. If inventory increases, purchases are greater than cost of goods sold. That is, the company purchased enough inventory to cover its sales and also increased inventory in its warehouse. If inventory decreases, purchases are less than cost of goods sold. In this case, the company sold all inventory purchased as well as some of the beginning inventory to cover units sold in the current period.

Firms adjust the accrual-basis purchases for the change in accounts payable related to inventory. An increase in accounts payable represents invoices for inventory not paid in the current year. Subtract the increase in accounts payable from purchases to arrive at cash paid for inventory acquired. A decrease in accounts payable represents invoices for inventory paid for in the current year but not purchased in the current year. Add the decrease in accounts payable from purchases to adjust to cash paid for inventory acquired.

Cash Paid for Merchandise:

Cost of Goods Sold
 Add: Increase in Inventory

OR

Less: Decrease in Inventory
 Purchases on the Accrual Basis
 Add: Decrease in Accounts Payable related to Inventory

OR

Less: Increase in Accounts Payable related to Inventory
Cash Paid for Merchandise

Cash Paid to Employees and Cash Paid for Other Accrued Expenses Including Interest and Taxes. To compute cash paid to employees and other vendors, subtract the increase in the relevant payable account from the accrual-basis expense to arrive at the cash-basis expense. An increase in the payable indicates that the firm has recorded more expense under the accrual system than the amount of cash paid. Add the decrease in the relevant

payable account from the accrual-basis expense to arrive at the cash-basis expense. A decrease in the payable indicates that the firm has recorded less expense under the accrual system than the amount of cash paid.⁶

Cash Paid to Employees for Wages and Other Accrued Expenses:

Wage Expense

Add: Decrease in Wages Payable

OR

Less: Increase in Wages Payable

Cash Paid to Employees for Wages

Cash Paid for Interest:

Interest Expense

Add: Decrease in Interest Payable

OR

Less: Increase in Interest Payable

Cash Paid for Interest

Cash Paid for Income Taxes

Income Tax Expense

Add: Decrease in Income Taxes Payable

OR

Less: Increase in Income Taxes Payable

Cash Paid for Income Taxes

Cash Paid for Other Operating Costs Including Insurance and Other Prepaid Expenses. To compute the cash paid for expenditures included in prepaid expenses, subtract the decrease in the relevant prepaid account from the accrual-basis expense to arrive at the cash-basis expense. A decrease in prepaid expenses represents a cash outflow made in a previous period that is reflected as an expense on the income statement in the current period. Thus, subtract it from the accrual-basis expense to arrive at cash paid for operating expenses.

Add the increase in the relevant prepaid account to the accrual-basis expense to arrive at the cash-basis expense. An increase in prepaid expenses is a cash outflow in the current period that appears on the balance sheet as an asset but does not affect net income. Because the firm paid cash as part of operations, add the increase in prepaid expense to the accrual-basis expense to adjust to the amount of cash paid for operating expenses.

Cash Paid for Insurance and Other Prepaid Expenses:

Insurance Expense

Add: Increase in Prepaid Insurance

OR

Less: Decrease in Prepaid Insurance

Cash Paid for Insurance

⁶This formula for income taxes paid is simplified because it does not consider balances in the deferred tax accounts. We cover these accounts later in this chapter.

Example 22.3 illustrates preparing the operating cash flows section of the cash flow statement using the direct method.

EXAMPLE 22.3 Operating Cash Flows, Direct Method

PROBLEM: Uniform Direct, Inc. presented the following income statement and select balance sheet accounts. Prepare the operating cash flows section of the cash flow statement using the direct method. Assume that accrued liabilities pertain to general, and administrative expenses.

Uniform Direct, Inc. Income Statement	
Sales Revenue	\$1,345,000
Cost of Goods Sold	<u>852,000</u>
Gross Profit	493,000
Selling Expenses*	57,000
General and Administrative Expenses	112,000
Depreciation Expense	<u>27,000</u>
Operating Income	297,000
Interest Expense	10,000
Interest Revenue	<u>6,000</u>
Income before Taxes	293,000
Income Tax Expense	<u>85,000</u>
Net Income	<u>\$ 208,000</u>

*Includes \$23,000 expense for stock-based compensation and \$34,000 of wage expense.

Selected Balance Sheet Accounts		
	Ending	Beginning
Accounts Receivable – net	\$ 15,250	\$ 20,000
Interest Receivable	200	1,000
Inventory	575,300	562,400
Prepaid Expenses	11,590	12,450
Accounts Payable	52,000	55,670
Wages Payable	5,600	5,400
Interest Payable	2,000	2,250
Income Taxes Payable	35,500	43,200
Accrued Liabilities	15,330	13,830

SOLUTION: We compute each line item separately, as follows.

Cash Received from Customer	
Sales Revenue	\$1,345,000
Add: Decrease in Accounts Receivable	<u>4,750</u>
Cash Received from Customers	<u>\$1,349,750</u>
Interest Received	
Interest Revenue	\$ 6,000
Add: Decrease in Interest Receivable	<u>800</u>
Interest Received	<u>\$ 6,800</u>

Cash Paid for Merchandise	
Cost of Goods Sold	\$852,000
Add: Increase in Inventory	<u>12,900</u>
Accrual Basis Purchases	864,900
Add: Decrease in Accounts Payable	<u>3,670</u>
Cash Paid for Merchandise	<u><u>\$868,570</u></u>
Cash Paid to Employees	
Wage Expense	\$ 34,000
Deduct: Increase in Wages Payable	<u>(200)</u>
Cash Paid to Employees	<u><u>\$ 33,800</u></u>
Cash Paid to Other Suppliers	
General and Administrative Expenses	\$ 112,000
Deduct: Decrease in Prepaid Expenses	(860)
Deduct: Increase in Accrued Liabilities	<u>(1,500)</u>
Cash Paid to Other Suppliers	<u><u>\$109,640</u></u>
Interest Paid	
Interest Expense	\$ 10,000
Add: Decrease in Interest Payable	<u>250</u>
Interest Paid	<u><u>\$ 10,250</u></u>
Income Taxes Paid	
Income Tax Expense	\$ 85,000
Add: Decrease in Income Taxes Payable	<u>7,700</u>
Income Taxes Paid	<u><u>\$ 92,700</u></u>

The operating activities section of the cash flow statement follows:

Uniform Direct, Inc.	
Statement of Cash Flows (Partial)	
Operating Activities:	
Cash Collected from Customers	\$1,349,750
Cash Received for Interest	6,800
Cash Paid for Merchandise	(868,570)
Cash Paid to Employees	(33,800)
Cash Paid to Other Suppliers	(109,640)
Cash Paid for Interest	(10,250)
Cash Paid for Income Taxes	<u>(92,700)</u>
Net Cash Provided by Operating Activities	<u><u>\$ 241,590</u></u>

- 5 Describe and illustrate the investing cash flows section of the statement of cash flows.

Investing Cash Flows

Although operating cash flows are presented on a net basis (for example, the change in accounts receivable), investing and financing cash flows are reported on a gross basis. Consequently, firms must report both the cash receipts and cash payments related to a particular account—such as property, plant, and equipment—separately.

The gross amount of cash receipts and payments is more informative than the net receipts and payments. Why, then, are operating cash flows presented on the net basis? The turnover of these items is quick, the amounts are large, and the maturities are short. Thus, knowledge of the gross cash receipts and payments is not necessary to understand the company's activities.

Firms compute cash flows from investing activities using a direct method approach. As noted in Exhibit 22.4, investing cash flows include transactions involving property, plant, and equipment; debt and equity investments; and notes receivable. Consequently, the investing section of the cash flow statement includes line items such as:

- Acquisitions of property, plant, and equipment
- Proceeds from the sale of property, plant, and equipment
- Purchase of investments
- Proceeds from the sale of investments
- Lending cash
- Proceeds from collection of notes receivable

Firms report increases and decreases separately in the investing section of the cash flow statement. Therefore, the acquisitions and disposals of property, plant, and equipment are separate line items rather than a net change in cash from these activities. The investing cash flows section is based on an analysis of the balance sheet accounts for property, plant, and equipment; investments; and long-term receivables as illustrated in Example 22.4.

EXAMPLE 22.4 Investing Cash Flows

PROBLEM: Prepare the investing section of Zatota, Inc.'s cash flow statement based on the following transactions:

- Purchased equipment this year costing \$20,000 using cash. There were no equipment disposals during the period.
- Sold a building for \$50,000.
- Purchased stock in Todla, Inc. for \$10,000.
- Sold its investment in Lutka, Inc. for \$8,000.
- Loaned \$3,000 to an unrelated party.

SOLUTION: Zatota reports each investing amount separately on the statement of cash flows as follows:

Zatota, Inc.	
Statement of Cash Flows (Partial)	
Investing Activities:	
Acquisition of Equipment	\$(20,000)
Proceeds from Sale of Building	50,000
Acquisition of Equity Investments	(10,000)
Proceeds from Sale of Equity Investments	8,000
Accepted Notes Receivable	<u>(3,000)</u>
Net Cash Provided by Investing Activities	<u>\$ 25,000</u>

- 6** Describe and illustrate the financing cash flows section of the statement of cash flows.

Financing Cash Flows

Firms also compute cash flows from financing activities using a direct method approach. Exhibit 22.4 indicates that financing cash flows include transactions involving the company's own debt and equity. Consequently, the financing section of the cash flow statement includes line items such as:

- Proceeds from the issuance of capital stock
- Purchase of treasury stock
- Proceeds from bond issues
- Dividends paid
- Payment of principal on debt
- Sale of treasury stock

As is the case with investing cash flows, firms report increases and decreases from financing cash flows separately in the financing section of the cash flow statement. The financing cash flows section is based on an analysis of the debt and equity balance sheet accounts as shown in Example 22.5.

EXAMPLE 22.5 Financing Cash Flows

PROBLEM: Campano, Inc. issued 1,000 shares of common stock for \$89 each and 500 shares of preferred stock for \$74 each. The company issued bonds at their face value of \$200,000 and, in addition, it retired bonds at a cost of \$154,300. Campano distributed cash dividends to its shareholders totaling \$5,400. Prepare the financing section of Campano's cash flow statement.

SOLUTION: Campano reports the issuance of the common (\$89,000) and preferred stock (\$37,000) as well as the issuance of bonds (\$200,000) as cash inflows. It reports the bond retirement \$(154,300) and the dividend distribution \$(5,400) as cash outflows. Campano calculates its financing cash flows as follows:

Campano, Inc.	
Statement of Cash Flows (Partial)	
Financing Activities	
Issuance of Common Stock	\$ 89,000
Issuance of Preferred Stock	37,000
Issuance of Bonds	200,000
Retirement of Bonds	(154,300)
Dividends Paid	<u>(5,400)</u>
Net Cash Provided by Financing Activities	<u>\$166,300</u>

Note that the issuance and retirement of bonds are shown on a gross change basis and are not netted on the statement of cash flows.

Illustration of the Statement of Cash Flows

Example 22.6 reviews the basic issues involved in preparing the three sections of the statement of cash flows, setting the stage for our discussion of the advanced topics that follow.

EXAMPLE 22.6 Comprehensive Illustration

PROBLEM: Leif Corporation provided the following financial statements and additional information for the year ended December 31, 2019.

Leif Corporation		
Statement of Income		
For the Year Ended December 31, 2019		
Sales		\$1,250
Less: Cost of Goods Sold		<u>(950)</u>
Gross Profit		\$ 300
Operating Expenses		
Selling, General, and Administrative Expenses	\$(75)	
Depreciation Expense	<u>(55)</u>	<u>(130)</u>
Operating Income		170
Interest Expense	\$(75)	
Interest Revenue	<u>50</u>	<u>(25)</u>
Income before Taxes		145
Income Tax Expense		<u>(53)</u>
Net Income		<u>\$ 92</u>

Continued

Leif Corporation
Balance Sheets
December 31, 2019 and 2018

	2019	2018
ASSETS		
Cash and Cash Equivalents	\$ 150	\$ 212
Accounts Receivable – net	238	175
Inventory	750	300
Prepaid Expenses	350	225
Plant Assets	485	638
Accumulated Depreciation	(248)	(250)
Total Assets	<u>\$1,725</u>	<u>\$1,300</u>
LIABILITIES AND STOCKHOLDERS' EQUITY		
Accounts Payable	\$ 132	\$ 125
Taxes Payable	125	75
Long-Term Debt	555	250
Capital Stock	750	750
Retained Earnings	163	100
Total Liabilities and Stockholders' Equity	<u>\$1,725</u>	<u>\$1,300</u>

During 2019, Leif paid \$263 in cash for new equipment and financed an additional \$55 in plant asset acquisitions, borrowing the full amount by issuing a note payable using the equipment dealer's finance subsidiary. Therefore, total capital expenditures are equal to \$318. Leif sold plant assets for their book value in a cash transaction. It did not repay any debt during the current year. All dividends declared by the company were cash dividends. Prepare the cash flow statement using both the direct and indirect methods.

SOLUTION: First, we compute the changes in the balance sheet accounts. Second, we classify each account into operating, investing, or financing activities. We describe accounts related to more than one activity in notes ** and ***.

Analysis and Classification of Changes in Balance Sheet Items

	2019	2018	Change*	Activity
ASSETS				
Cash and Cash Equivalents	\$ 150	\$ 212	\$(62)	
Accounts Receivable – net	238	175	63	Operating
Inventory	750	300	450	Operating
Prepaid Expenses	350	225	125	Operating
Plant Assets	485	638	(153)	Investing
Accumulated Depreciation	(248)	(250)	(2)	**
Total Assets	<u>\$1,725</u>	<u>\$1,300</u>		
LIABILITIES AND EQUITIES				
Accounts Payable	\$ 132	\$ 125	\$ 7	Operating
Taxes Payable	125	75	50	Operating
Long-Term Debt	555	250	305	Financing
Capital Stock	750	750	0	Financing
Retained Earnings	163	100	63	***
Total Equities	<u>\$1,725</u>	<u>\$1,300</u>		

*This column includes the account change, not necessarily the change in cash.

**Accumulated depreciation is changed by depreciation expense (operating) and plant asset disposals (investing).

***Retained earnings is changed by net income or loss (operating) and dividends declared (financing).

Next, we will address the items for the operating, investing, and financing sections.

Operating Cash Flows Section

For the indirect method, we take the changes in working capital accounts. These are:

Working Capital Accounts	2019	2018	Change	Impact on Cash Flows
Accounts Receivable – net	\$238	\$175	\$ 63	Subtract increase
Inventory	750	300	450	Subtract increase
Prepaid Expenses	350	225	125	Subtract increase
Accounts Payable	132	125	7	Add increase
Taxes Payable	125	75	50	Add increase

For the direct method, we need to compute the actual cash flows for these accounts.

Cash Collected from Customers during the Year

Sales	\$ 1,250
Less: Increase in Accounts Receivable	<u>(63)</u>
Cash Collected from Customers	<u>\$1,187</u>

Cash Paid for Merchandise

Cost of Goods Sold	\$ 950
Add: Increase in Inventory	<u>450</u>
Purchases (accrual basis)	\$1,400
Less: Increase in Accounts Payable	<u>(7)</u>
Cash Paid for Merchandise	<u>\$1,393</u>

Cash Paid to Other Suppliers

Selling, General, and Administrative Expenses	\$ 75
Add: Increase in Prepaid Expenses	<u>125</u>
Cash Paid to Other Suppliers	<u>\$ 200</u>

Cash Paid for Income Taxes

Income Tax Expense	\$ 53
Less: Increase in Taxes Payable	<u>(50)</u>
Cash Paid for Income Taxes	<u>\$ 3</u>

Cash Paid for Interest

Interest Expense	\$ 75
Adjust: Change in Interest Payable	<u>0</u>
Cash Paid for Interest	<u>\$ 75</u>

Continued

Investing and Financing Cash Flows Sections

Presenting investing and financing activities requires analyzing each balance sheet account with changes and reconciling all changes in account balances using t-accounts as follow. We solve for missing information identified with an “X”.

Plant Assets		Retained Earnings	
Beginning Balance	638	Beginning Balance	100
Acquisitions	318	Net Income	92
X = Assets Sold		X = Dividends Declared	29
Ending Balance	<u>485</u>	Ending Balance	<u>163</u>

Accumulated Depreciation – Plant Assets		Long-Term Debt	
Beginning Balance	250	Beginning Balance	250
Depreciation Expense	55	Equipment Purchase	55
X = Assets Sold	57	X = Additional Borrowing	250
Ending Balance	<u>248</u>	Ending Balance	<u>555</u>

The net book value of the asset sold is \$414 (Cost – Accumulated Depreciation = \$471 – \$57). Because Leif sold the asset for its book value, there is no gain or loss on the income statement.

All dividends declared are paid because there are no dividends payable on the balance sheet. (If there were dividends payable and they had increased/decreased during the period, we would subtract/add the change from dividends declared to obtain cash dividends paid.)

With all changes in the balance sheet accounts explained, we proceed to prepare the cash flow statement. The statement of cash flows under the direct and indirect methods follows.

Leif Corporation Statement of Cash Flows (Direct Method) For the Year Ended December 31, 2019

Operating Activities		
Cash Received from Customers	\$1,187	
Cash Interest Received	50	
Cash Paid for Merchandise	(1,393)	
Cash Paid to Other Suppliers	(200)	
Interest Paid	(75)	
Income Taxes Paid	<u>(3)</u>	
Net Cash Used by Operating Activities		\$(434)
Investing Activities		
Proceeds from the Sale of Plant Asset	\$ 414	
Purchase Equipment	<u>(263)</u>	
Net Cash Provided by Investing Activities		\$ 151
Financing Activities		
Proceeds from Issuance of Long-Term Debt	\$ 250	
Cash Dividends Paid	<u>(29)</u>	
Net Cash Provided by Financing Activities		\$ 221
Net Decrease in Cash and Cash Equivalents		<u>\$ (62)</u>
Cash and Cash Equivalents, Beginning of Year		<u>212</u>
Cash and Cash Equivalents, End of Year		<u>\$ 150</u>

Noncash Investing and Financing Activity: Acquisition of plant asset with note payable \$55.

Leif Corporation
Statement of Cash Flows (Indirect Method)
For the Year Ended December 31, 2019

Operating Activities

Net Income	\$	92	
Adjustments to Reconcile Net Income to Net Cash Provided by Operating Activities			
Depreciation Expense		55	
Changes in Operating Working Capital Accounts			
Increase in Accounts Receivable		(63)	
Increase in Prepaid Expenses		(125)	
Increase in Inventory		(450)	
Increase in Taxes Payable		50	
Increase in Accounts Payable		<u>7</u>	
Net Cash Used by Operating Activities			\$(434)
Investing Activities			
Proceeds from the Sale of Plant Asset	\$	414	
Purchase Equipment		<u>(263)</u>	
Net Cash Provided by Investing Activities			\$ 151
Financing Activities			
Proceeds from Issuance of Long-Term Debt	\$	250	
Cash Dividends Paid		<u>(29)</u>	
Net Cash Provided by Financing Activities			\$ 221
Net Decrease in Cash and Cash Equivalents			\$ (62)
Cash and Cash Equivalents, Beginning of Year			<u>212</u>
Cash and Cash Equivalents, End of Year			<u>\$ 150</u>

Noncash Investing and Financing Activity: Acquisition of plant asset with note payable \$55.

JUDGMENTS IN ACCOUNTING

Impacts on the Statement of Cash Flows

Many decisions that managers make impact net income and thus earnings per share (EPS). It is possible that managers make decisions for the sole purpose of impacting earnings per share. Exhibit 20.1 provided a summary of the most significant types of judgments covered throughout this textbook. The earnings management discussions thus far focused on accruals management. That is, the judgments relate to the timing and measurement of certain accounts on the financial statements. For example, the choice of the amount of bad debt expense to report in a particular period impacts the net accounts receivable balance reported on the balance sheet as well as the bad debt expense reported on the income statement. However, this decision does not impact cash flows. Accruals earnings management could help a firm avoid a loss, exceed analysts' forecasts, or increase management compensation.

In contrast, real earnings management occurs when decisions regarding a company's cash flows and earnings for the period impact a firm's actual operations. For example, management could increase price discounts in an effort to increase sales. If sales increase, then this decision has a positive impact on both earnings and cash flows. Management could engage in real earnings management for the same reasons that explain the use of accruals management. Other examples of real earnings management are decreases in discretionary spending, decreases in research and development expenditures, and altering the timing of

Continued

dispositions of long-term operating assets and investment assets. While these activities might improve current performance, they are likely to have a negative long-term impact on the firm.

In addition to real earnings management, firms could engage in activities that impact operating cash flows but not earnings. Investors focus on operating cash flows, so management could take certain actions to move cash inflows out of investing or financing activities and into operating cash flows. Or they could move cash outflows out of operating activities and into financing or investing activities. As an example, judgment is involved in determining whether to capitalize or expense certain costs. The decision has an immediate impact on net income and on operating cash flows. Typically, if an expenditure is capitalized, the firm reports the associated cash outflow in cash flows from investing activities. If the cost is expensed immediately, the firm typically reports the cash flows in operating activities. There is no effect on the total net income reported over the life of the transaction because the asset is ultimately depreciated or amortized and the same total expense is charged against income and retained earnings. However, because depreciation and amortization expenses are added back to determine operating cash flow, the cumulative impact on operating cash flow is zero. Other examples of moving cash flows on the statement are investing in purchased research and development (investing outflow) as opposed to internally generated research and development (operating cash outflow) and factoring receivables (operating cash inflows because of the decrease in receivables).

Accelerating customer payments, reducing inventory, and postponing payments to vendors also impact operating cash flows. While all of these actions may be considered a part of cash management, they will have only a one-time impact on operating cash flows. Also, some companies engage in these activities simply to increase operating cash flows. The ultimate business impact, however, could be to create poor relationships with customers and vendors.

- 7** Discuss and illustrate the reporting of complex transactions in determining cash flows.

Complexities in Determining Cash Flows

Several issues increase the complexity of the cash flow statement preparation:

1. Acquisition and disposition of long-term assets
2. Deferred income taxes
3. Net accounts receivable and bad debt expense
4. Unrealized gains and losses on fair value adjustments
5. Equity method investments
6. Share-based compensation
7. Pension adjustments
8. Amortization of bond discounts and premiums

We analyze each of these issues in detail.

Acquisition and Disposition of Long-Term Assets

Firms must accurately report the gain or loss on the sale of long-term assets. The gain or loss by itself does not provide or use cash. The cash inflow, the amount of cash received on disposal, is reported as an investing activity on the cash flow statement. The gain or loss on disposal is the difference between the cash received and the carrying value of the asset at the time of sale. Thus, firms include any cash proceeds in the investing cash flows section, and the gain or loss is reported in the operating section of the cash flow statement under the indirect method.

Under the indirect method, firms treat gains and losses as adjustments to net income (deducting gains and adding losses) and report the cash proceeds in the investing activities section. Under

the direct method, firms include all of the cash proceeds from the sale of property, plant, and equipment in the investing section of cash flows, with no adjustment needed in operating activities. Example 22.7 demonstrates how the sale of property, plant, and equipment is reported on the cash flow statement.

EXAMPLE 22.7 Sale of Property, Plant, and Equipment

PROBLEM: Aline Corporation sold equipment with a net book value of \$10,000 for \$12,000. The equipment had an original cost of \$50,000, and accumulated depreciation taken as of the date of sale was \$40,000. Aline reported a \$2,000 gain \$(12,000 – \$10,000). The company also purchased debt securities for \$7,000. Net income for the year was \$15,000. There were no other transactions conducted during the period. Using the indirect method, what are the operating and investing cash flows for Aline?

SOLUTION: Aline reports net operating cash flows of \$13,000:

Net income	\$15,000
Less: Gain on sale of plant assets	<u>(2,000)</u>
Net cash provided by operating activities	<u>\$13,000</u>

Aline reports net investing cash flows of \$5,000:

Acquisition of debt securities	\$ (7,000)
Proceeds from the disposal of property, plant, and equipment	<u>12,000</u>
Net cash provided by investing activities	<u>\$ 5,000</u>

The investing section of the cash flow statement separates changes in property, plant, and equipment into cash outflows from acquisitions and cash inflows from dispositions. Specifically, firms separately identify the changes in net plant assets as depreciation, additions, and disposals as illustrated in Example 22.8.

EXAMPLE 22.8 Effects of the Changes in the Property, Plant, and Equipment Accounts on the Statement of Cash Flows

PROBLEM: Bline Corporation had the following balances in its property, plant, and equipment accounts:

	<u>End of Year</u>	<u>Beginning of Year</u>
Equipment	\$ 113,000	\$ 100,000
Accumulated Depreciation – Equipment	(41,000)	(32,000)
Buildings	100,000	125,000
Accumulated Depreciation – Buildings	(76,000)	(82,000)
Land	<u>95,000</u>	<u>100,000</u>
Total Property, Plant, and Equipment	<u>\$191,000</u>	<u>\$211,000</u>

Continued

It reported depreciation expense as follows:

Account	Amount of Depreciation Expense
Equipment	\$ 9,000
Building	\$12,000

It recorded a gain on the sale of a building of \$3,000.

During the year, Bline acquired one new piece of equipment for \$13,000 and paid cash and did not sell any equipment. It also acquired land costing \$20,000 and paid cash in the current year. Bline did not acquire any buildings during the year. What should Bline report in its investing cash flows related to property, plant, and equipment?

SOLUTION: We begin with an analysis of the equipment account. It increased by \$13,000 (from \$100,000 to \$113,000). Also, the increase in the accumulated depreciation of \$9,000 (from \$32,000 to \$41,000) reconciles with the depreciation expense reported. Thus, Bline reports a cash outflow of \$13,000 for acquisition of equipment.

Bline's building account decreased by \$25,000 this year from \$125,000 to \$100,000. Because Bline did not acquire any buildings this year, this total change amount results from the sale of a building. The following analysis of the accumulated depreciation account for buildings uses a t-account to input the beginning and ending balances as well as the credit from depreciation expense for the year. This analysis indicates that the debit needed to balance the account is \$18,000 and is likely because of disposals.

Accumulated Depreciation – Building			
		82,000	Beginning Balance
		12,000	Depreciation Expense
X = Disposition of Building	18,000		
		<u>76,000</u>	Ending Balance
Cost of building sold		\$25,000	
Accumulated depreciation on building sold		<u>(18,000)</u>	
Net book value of building sold		\$ 7,000	
Gain on sale of building		<u>3,000</u>	
Cash proceeds on the sale of the building		<u>\$10,000</u>	

Thus, Bline records a cash inflow of \$10,000 from the sale of the building.

Finally, we analyze the land account by using a t-account.

Land			
Beginning Balance	100,000		
Acquisition	20,000		
		25,000	X = Disposition
Ending Balance	<u>95,000</u>		

The land disposition must be \$25,000 in order to reconcile the beginning balance of \$100,000 and the \$20,000 acquisition to the ending balance of \$95,000. As noted earlier, investing and financing activities are reported on a gross change basis so that Bline records the cash inflow from the disposition of land of \$25,000 separately from the cash outflow of \$20,000 for the acquisition of land.

Deferred Income Taxes

The earlier discussion of the computation of income taxes paid reported in operating cash flows did not consider the deferred income tax accounts.

Direct Method Deferred Income Taxes. Under the direct method, firms include deferred taxes in the computation of cash paid for taxes with the following adjustments:

Cash Paid for Income Taxes

Income Tax Expense (Accrual Basis)

Add: Decrease in Income Taxes Payable

OR

Less: Increase in Income Taxes Payable

AND

Add: Decrease in a Deferred Tax Liability or Increase in a Deferred Tax Asset

OR

Less: Increase in a Deferred Tax Liability or Decrease in a Deferred Tax Asset

Cash Paid for Income Taxes

1. An increase in a deferred tax liability represents an amount that is included in tax expense but is not a cash expenditure in the current year. As a result, firms deduct it from the accrual-basis tax expense to arrive at cash-basis tax expense.
2. A decrease in a deferred tax liability represents an amount that a firm previously recorded as an accrual-basis expense but paid in the current period. Therefore, the firm adds it to the accrual-basis expense to arrive at cash-basis expense.
3. An increase in a deferred-tax asset represents amounts the firm paid this period but will not expense until future periods. So, the firm must add the increase to accrual-basis income tax expense to arrive at cash-basis expense.
4. A decrease in a deferred tax asset represents amounts that the firm paid out in previous periods but expensed in the current period. Thus, the firm subtracts this amount from accrual-basis tax expense to arrive at the cash-basis tax expense because it did not use cash in the current period.

Indirect Method Deferred Income Taxes. Under the indirect method, the firm treats adjustments needed for changes in the deferred tax accounts as any asset or liability change—with noncash adjustments rather than part of operating working capital. That is, the firm adds (subtracts) increases (decreases) in deferred-tax liabilities or decreases (increases) in deferred-tax assets back to net income in operating activities. Increases in deferred tax liabilities represent an amount of taxes not paid in the current period. Decreases in deferred tax assets reflect the amortization of the deferred-tax asset to tax expense. This treatment, illustrated in Example 22.9, is the same as any type of depreciation or amortization and is treated as a noncash expense.

EXAMPLE 22.9

Cash Paid for Income Taxes

PROBLEM: D'Antona Delivery Service prepared the following journal entry to record its tax provision for the current year.

<i>Account</i>	<i>Current Year</i>
Income Tax Expense	1,500
Deferred Tax Asset	500
Income Tax Payable	800
Cash	1,200

Continued

Recompute the amount of cash paid for income taxes under the direct method by reconciling income tax expense to cash paid. What would D'Antona report in the operating section of the cash flow statement under the indirect method?

SOLUTION: We compute the cash paid for taxes under the direct method as follows:

Cash Paid for Income Taxes	
Income tax expense (accrual basis)	\$ 1,500
Less: Increase in income taxes payable	(800)
Add: Increase in a deferred tax asset	<u>500</u>
Cash paid for income taxes	<u>\$ 1,200</u>

Under the indirect method, to arrive at operating cash flow, D'Antona will:

- Subtract the \$500 increase in the deferred tax assets from net income.
- Add the \$800 increase in income taxes payable to net income.

Net Accounts Receivable and Bad Debt Expense

Firms typically report the change in net accounts receivable in operating cash flows. The reporting approach varies under the indirect and direct methods:

- As an adjustment to net income under the indirect method
- As an adjustment to sales revenue to arrive at cash collected from customers under the direct method

The indirect method approach does not address the fact that bad debt expense is a noncash expense. Therefore, it is more accurate to separate the changes in net accounts receivable from bad debt expense for the year from the changes from increased sales and customer payments. Example 22.10 demonstrates the treatment of a change in accounts receivable.

EXAMPLE 22.10 Change in Accounts Receivable

PROBLEM: Horton Industries reported net income of \$120,000 for the current year. The balances in its accounts receivable and allowance for bad debts accounts follow. In addition, the company recorded \$2,000 of bad debt expense and wrote off \$1,500 of uncollectible accounts. Prepare the operating section of the cash flow statement under the indirect method.

	End of Year	Beginning of Year
Accounts Receivable	\$27,000	\$20,000
Allowance for Bad Debts	\$ 4,500	\$ 4,000

SOLUTION: The net receivables balance increased from \$16,000 to \$22,500. Thus, in total, Horton subtracts the increase of \$6,500 from net income to arrive at operating cash flows.

	End of Year	Beginning of Year	Change
Accounts Receivable	\$ 27,000	\$20,000	
Less: Allowance for Bad Debts	<u>4,500</u>	<u>4,000</u>	
Net Accounts Receivable	<u>\$22,500</u>	<u>\$16,000</u>	<u>\$6,500</u>

To separate the overall change in net accounts receivable, we examine the following t-accounts.

Accounts Receivable		
Beginning Balance	20,000	
Write-off (given)		1,500
Change excluding Write-off (computed)	8,500	
Ending Balance	<u>27,000</u>	

Allowance for Bad Debts		
	4,000	Beginning Balance
	2,000	Bad Debt Expense (given)
	1,500	Write-off (given)
	<u>4,500</u>	Ending Balance

Thus, Horton has

- A decrease in net receivables of \$2,000 from bad debt expense
- An increase in net accounts receivables of \$8,500 from customer sales

Note that the write-off does not affect the net receivables balance because it decreases both the allowance and the gross accounts receivable balance.

Under the indirect method, the operating section of the cash flow statement is as follows:

Net Income	\$120,000
Add: Bad Debt Expense	2,000
Less: Increase in Accounts Receivable	(8,500)
Net Cash Provided by Operating Activities	<u>\$ 113,500</u>

Unrealized Gains and Losses on Fair Value Adjustments

When adjusting investments and other financial instruments to fair value, the treatment of the unrealized gain or loss varies depending on the classification of the security. For example, if the firm classifies a debt investment as a trading security or uses the fair value option, it reports the unrealized gains and losses in net income. If the firm classifies a debt investment as available for sale, it reports the unrealized gains and losses in other comprehensive income.

The adjustment for unrealized gains and losses reported through other comprehensive income does not have any cash flow effects. The write-up or write-down to fair value changes the carrying value of the investment with the unrealized gain or loss reported in accumulated other comprehensive income in the equity section of the balance sheet. With the exception of disclosure, there are no implications for the cash flow statement.

Conversely, if the firm reports unrealized gains and losses through net income, it needs to adjust net income under the indirect method:

1. Unrealized gains are noncash revenues deducted from net income in the operating activities section of the statement of cash flows.
2. Unrealized losses are noncash expenses added back to net income in operating activities.

Example 22.11 demonstrates the reporting of unrealized gains and losses from debt investments on the statement of cash flows.

EXAMPLE 22.11 Unrealized Gains and Losses From Debt Investments

PROBLEM: Investors, Inc. had net income of \$875,000 in the current year. The company reported net unrealized gains from available-for-sale debt investments of \$120,000 in other comprehensive income and net unrealized losses from trading debt investments of \$80,000 in net income. Prepare the operating section of the cash flow statement.

SOLUTION: To prepare the operating section, we add back the unrealized losses that Investors reported in net income.

Net Income	\$875,000
Add: Unrealized Losses From Trading Debt Investments	<u>80,000</u>
Net Cash Provided by Operating Activities	<u>\$955,000</u>

We do not adjust for the unrealized gains reported in other comprehensive income because they have no effect on net income or operating cash flows.

Equity Method Investments

In preparing the operating section of the cash flow statement under the indirect method, firms adjust net income for investments accounted for under the equity method. Under the equity method, the investor company reports its share of the investee's net income in its own income statement. However, this is a noncash event, and only the dividends received by the investee should be reported as cash flows. Thus, the operating activities section is affected by the difference between the equity income or loss recognized by the investor company and the cash dividends received from the investee.⁷

When equity income exceeds the amount of cash dividends received, the investor company deducts the excess from net income in operating activities to reflect the dividends received in cash. When cash dividends exceed equity income or if there is a loss from the equity investment, the investor company adds this amount back in the operating activities section. Example 22.12 provides an example of reporting income from equity method investments on the cash flow statement.

EXAMPLE 22.12 Income from Equity Method Investments

PROBLEM: Green Robin Enterprises holds a 40% share of Zito, Incorporated. Zito reported \$50,000 in net income and paid \$12,500 in cash dividends in the current year. Green Robin recognized its 40% share of the investee company's net income (\$20,000) on the income statement as equity income. Green Robin received \$5,000 in cash dividends ($40\% \times \$12,500$). It reported net income of \$900,000, including the equity method income. Prepare the operating activities section of the cash flow statement under the indirect method.

SOLUTION: Green Robin reports \$20,000 of net equity income in net income but received only \$5,000 in cash. Thus, Green Robin decreases net income by the difference of \$15,000 to arrive at operating cash flows. A partial cash flow statement follows.

Net Income	\$ 900,000
Less: Equity Method Income in Excess of Cash Distributions	<u>(15,000)</u>
Net Cash Provided by Operating Activities	<u>\$ 885,000</u>

Share-Based Compensation

Employee compensation paid in equity shares is a noncash expense. Similar to all noncash expenses, firms add back the amount of share-based compensation cost recognized on the income statement to net income in the operating activities section of the statement of cash flows under the indirect method.

⁷Distributions received by an entity reporting the investment under the equity method can be classified as operating or investing, depending on several different factors. For simplicity, we assume that these distributions are reported as operating activities.

Pension Adjustments

The financial reporting standards for defined-benefit pensions require that firms report a pension expense in the income statement. This expense consists of a variety of factors, including service cost, amortization of prior service costs, interest on the projected benefit obligation, and the expected return on plan assets. However, pension expense is a noncash expense. The cash flow related to pension obligations is simply the amount funded or paid into the plan during the current year.

As is the case with equity method investments, under the indirect method, firms adjust net income for the difference between the expense reported and the cash used to fund the plan:

- If the expense is greater than the amount funded, the adjustment is added back to net income.
- If the expense reported is less than the amount funded, the adjustment is deducted from net income.

Example 22.13 illustrates adjusting operating cash flows for defined-benefit pension plans.

EXAMPLE 22.13

Defined-Benefit Pension Plan

PROBLEM: McCrae Associates determined that its pension expense for the year is \$71,500 and contributed \$55,000 into its pension plan during the year. It reported net income for the year of \$567,000. Prepare the operating activities section of the cash flow statement under the indirect method.

SOLUTION: McCrae expensed \$16,500 more than it funded (\$71,500 of expense less \$55,000 in contributions). McCrae adds the difference back to net income to arrive at operating cash flows.

Net Income	\$ 567,000
Add: Excess of Pension Expense over Pension Funding	16,500
Net Cash Provided by Operating Activities	<u>\$583,500</u>

Amortization of Bond Premiums and Discounts

The amortization of bond discounts and premiums results in a difference between the interest expense reported in net income and the interest paid. When a firm records an interest payment for bonds, it debits interest expense, credits cash, and debits (credit) the bond premium (discount). As a result:

1. The amortization of a bond discount results in more interest expense than cash paid.
2. The amortization of a bond premium results in less interest expense than cash paid.

When computing cash interest paid under the direct method, firms subtract any bond discount amortization to reduce cash paid for interest and add back any bond premium amortization to increase the amount of cash interest paid. The indirect method begins with net income, so firms add any bond discount amortization to and subtract any bond premium amortization from net income to arrive at operating cash flows. Firms include these adjustments with the noncash items as shown in Example 22.14.

EXAMPLE 22.14

Bond Premium Amortization

PROBLEM: McDoodle Industries reported net income in the current year of \$150,300. The company reported interest expense of \$20,000. The balances of all accounts related to its bonds follow. Compute the cash paid for interest if McDoodle presented its cash flow statement using the direct method. Prepare the operating activities section of the cash flow statement using the indirect method.

	End of Year	Beginning of Year
Interest Payable	\$ 5,000	\$ 2,000
Bonds Payable	400,000	400,000
Bond Premium	5,800	7,000

Continued

SOLUTION: Under the direct method, we subtract the increase in interest payable and add the premium amortization to interest expense to compute the amount of cash paid for interest.

Cash Paid for Interest

Interest Expense	\$20,000
Less: Increase in Interest Payable	(3,000)
Add: Amortization of Bond Premium	<u>1,200</u>
Cash Paid for Interest	<u>\$18,200</u>

Under the indirect method, we subtract the premium amortization from net income and add the increase in interest payable to net income to compute operating cash flows.

Net Income	\$150,300
Less: Bond Premium Amortization	(1,200)
Add: Increase in Interest Payable	<u>3,000</u>
Net Cash Provided by Operating Activities	<u>\$152,100</u>

Overview of Indirect Method Adjustments

Now that we have discussed the various complexities involved with preparing the cash flow statement, Exhibit 22.9 presents a summary of the most common reconciling items in the indirect method of presenting cash flows from operating activities.

EXHIBIT 22.9 Indirect Method Reconciling Items

ADDITIONS

Noncash Expenses and Losses

- Depreciation, depletion, and amortization expense
- Impairment loss
- Bad debt expense
- Stock-based compensation expense
- Amortization of bond discounts
- Increase in the deferred tax liability or decrease in the deferred tax asset
- Losses recognized on investments under the equity method plus distributions in excess of income
- Loss on the sale of long-term assets
- Unrealized losses on trading debt investments reported through net income
- The excess of pension costs reported over pension funding

Changes in Operating Working Capital Accounts

- Decreases in current assets (receivables, inventory, prepaid expenses)
- Increases in current liabilities (accounts payable, accrued liabilities)

DEDUCTIONS

Noncash Revenues and Gains

- Amortization of bond premiums
- Decrease in the deferred tax liability or increase in the deferred tax asset
- Income recognized on investments under the equity method in excess of distributions
- Gain on the sale of long-term assets
- Unrealized gains on trading debt investments reported through net income
- The excess of pension funding over pension costs reported

Changes in Operating Working Capital Accounts

- Increases in current assets (receivables, inventory, prepaid expenses)
- Decreases in current liabilities (accounts payable, accrued expenses)

- 8** Detail required disclosures related to the statement of cash flows.

Cash Flow Statement Disclosures

There are five key disclosure items for the statement of cash flows. Specifically, the standards require that an entity disclose its policy regarding cash equivalents, all significant noncash investing and financing activities, interest and dividends paid when the indirect method is used, a reconciliation of net income to net cash flows from operating activities if the direct method is used, and information about cash restrictions. We summarize these disclosure requirements in this section.

Cash Equivalents Policy: Direct and Indirect Methods

An entity is required to disclose its policy for determining which items it treats as cash equivalents. Any change to that policy is a change in accounting principle, requiring that the firm restate financial statements for earlier years for comparative purposes.

Noncash Investing and Financing Activities: Direct and Indirect Methods

Cash flow statement disclosures must include information about any of an entity's investing and financing activities during a period that affect assets or liabilities on the balance sheet but that do not result in cash receipts or cash payments in the period. These disclosures can be either in a footnote or in a separate schedule. Some transactions are part cash and part nonmonetary: The firm reports only the cash portion in the statement of cash flows and reports the noncash amount of the transaction in the notes. In cases when there are only a few noncash events, an entity can provide a summary schedule following the statement of cash flows.

Interest and Income Taxes Paid: Indirect Method Only

If the firm uses the indirect method, it must disclose amounts of interest paid (net of amounts capitalized) and income taxes paid during the period.

Reconciliation of Net Income to Net Cash Provided by Operating Activities: Direct Method Only

When the firm uses the direct method, it must provide a separate schedule that reconciles accrual-basis net income to net cash provided by operations. This is effectively the operating activities section under the indirect method.

Restrictions on Cash and Cash Equivalents: Direct and Indirect Methods

A firm is required to disclose information related to any restricted cash and cash equivalents it has. The firm must provide a discussion of the nature of any restrictions it has on its cash balance.

Cash Flow Statement Disclosures under IFRS

IFRS does not require a reconciliation of net income to net cash provided by operations under the direct method, but it has additional disclosure requirements. IFRS requires that companies disclose any cash balances that are held but not available for use. For example, a company may operate a subsidiary in a country where there are foreign exchange controls or other legal restrictions prohibiting the conversion of cash.⁸ IFRS also requires that the entity provide adequate disclosure to explain changes in financing liabilities arising from both cash and noncash changes. Finally, IFRS encourages management to comment on any additional information that could be relevant to users in understanding a company's financial position and its liquidity, such as available borrowing arrangements and cash flows by business segments.

Comprehensive Cash Flow Problem

Example 22.15 presents a comprehensive problem that includes the complexities discussed previously and requires preparation of a firm's statement of cash flows and related disclosures.

⁸IASC, *International Accounting Standard 7*, "Statement of Cash Flows" (London, UK: International Accounting Standards Committee, Revised, 2001), Paragraph 49.

EXAMPLE 22.15 Comprehensive Cash Flow Problem Including Complexities

PROBLEM: KaseyKraft Company's balance sheets and income statement follow.

KaseyKraft Company Balance Sheets At December 31		
Assets	December 31	
	Current Year	Prior Year
Current Assets		
Cash	\$ 30,000	\$ 5,000
Trading Debt Investments	108,500	25,000
Accounts Receivable – net	182,500	68,500
Merchandise Inventory	400,000	402,500
Total Current Assets	<u>\$ 721,000</u>	<u>\$ 501,000</u>
Noncurrent Assets		
Investments in Affiliate Companies	\$ 785,600	\$ 620,000
Property, Plant, and Equipment – net	4,075,000	3,214,460
Equipment under Finance Lease	300,000	0
Intangible Assets – net	825,500	900,500
Total Noncurrent Assets	<u>\$5,986,100</u>	<u>\$4,734,960</u>
Total Assets	<u><u>\$ 6,707,100</u></u>	<u><u>\$5,235,960</u></u>
Liabilities		
Current Liabilities		
Current Portion of Long-Term Debt	\$ 56,000	\$ 68,500
Accounts Payable	100,580	125,020
Income Taxes Payable	187,500	200,000
Total Current Liabilities	<u>\$ 344,080</u>	<u>\$ 393,520</u>
Noncurrent Liabilities		
Bonds Payable	\$2,500,000	\$2,500,000
Less: Discount on Bonds	(325,600)	(360,600)
Notes Payable	1,270,880	1,301,450
Obligations under Finance Lease	300,000	0
Deferred Tax Liability	52,000	31,000
Net Obligations under Pension Plans	90,500	61,500
Total Noncurrent Liabilities	<u>\$ 3,887,780</u>	<u>\$3,533,350</u>
Total Liabilities	<u>\$4,231,860</u>	<u>\$3,926,870</u>
Shareholders' Equity		
Common Stock, \$1 par value	\$ 500,500	\$ 100,000
Additional Paid-in Capital in Excess of Par – Common	670,000	154,000
Additional Paid-in Capital – Stock Options	11,500	0
Retained Earnings	1,000,000	555,550
Accumulated Other Comprehensive Income	293,240	499,540
Total Shareholders' Equity	<u>\$2,475,240</u>	<u>\$1,309,090</u>
Total Liabilities and Shareholders' Equity	<u><u>\$ 6,707,100</u></u>	<u><u>\$5,235,960</u></u>

KaseyKraft Company
Income Statement
For the Current Year Ended December 31

Sales	\$ 2,457,693
Cost of Goods Sold	1,474,616
Gross Profit	<u>\$ 983,077</u>
Selling, General, and Administrative Expenses	\$ 25,000
Pension Expense	120,000
Bad Debt Expense	6,500
Depreciation Expense	90,500
Amortization Expense	<u>8,000</u>
Total Operating Expenses	<u>\$ 250,000</u>
Operating Income	\$ 733,077
Interest Expense	\$ (38,800)
Unrealized Gains on Investments	\$ 14,000
Investment Income	19,690
Equity Earnings from Affiliate Companies	<u>256,200</u>
Income before Tax	\$ 984,167
Income Tax Expense	<u>(393,667)</u>
Net Income	<u><u>\$ 590,500</u></u>

KaseyKraft provided the following additional information:

- It sold trading investments acquired at a cost of \$55,000 for \$57,550 and acquired additional trading securities during the year.
- Investment income includes interest income received and the gain on the sale made during the year.
- The company acquired a new plant in a cash transaction; it did not dispose of any property, plant, and equipment.
- It sold one of its franchises for cash: There was no gain or loss on the sale.
- The selling, general, and administrative expenses include stock-based compensation expense of \$11,500.
- Pension funding for the year was \$297,300.
- The company had no additional borrowings.
- The company leased a fleet of heavy vehicles on December 31 with no cash paid at inception.
- All changes in common stock and additional paid-in capital in excess of par – common result from a new share issue for cash.
- Treat the trading securities as investing activities.

Prepare KaseyKraft's cash flow statement, including disclosures, for the current year under both the indirect and direct reporting formats.

SOLUTION: We prepare the indirect statement of cash flows first and then apply the direct method.

Indirect Method

We begin by computing the changes in the balance sheet accounts. Next, we classify each account into operating, investing, or financing activities. Some accounts relate to more than one classification under the indirect method as noted in the table on the next page.

Analysis of Balance Sheet Changes and Cash Flow Classification

Balance Sheet Item	Ending	Beginning	Change*	Classification**	Notes for Indirect Method
Cash	\$ 30,000	\$ 5,000	\$ 25,000	Answer	
Trading Debt Investments	108,500	25,000	83,500	I, O	Purchases and sales are in investing. Unrealized gain/losses are noncash adjustments in operating.
Accounts receivable – net	182,500	68,500	114,000	O	Bad debt expense is a noncash adjustment in operating.
Merchandise inventory	400,000	402,500	(2,500)	O	
Investments in affiliate companies	785,600	620,000	165,600	I, O	Purchases and sales are in investing. Undistributed equity earnings are noncash adjustments in operating.
Property, plant, and equipment – net	4,075,000	3,214,460	860,540	I, O	Acquisitions and disposals are in investing. Depreciation expense is a noncash adjustment in operating.
Equipment under finance lease	300,000	0	300,000	NC	
Intangible assets – net	825,500	900,500	(75,000)	I, O	Acquisitions and disposals are in investing. Amortization expense is a noncash adjustment in operating.
Current portion of long-term debt	56,000	68,500	(12,500)	F	
Accounts payable	100,580	125,020	(24,440)	O	
Income taxes payable	187,500	200,000	(12,500)	O	
Bonds payable	2,500,000	2,500,000	0	F	
Less: Discount on bonds	(325,600)	(360,600)	(35,000)	NC, O	Amortization is a noncash adjustment in operating.
Notes payable	1,270,880	1,301,450	(30,570)	F	
Obligations under finance leases	300,000	0	300,000	NC	
Deferred tax liability	52,000	31,000	21,000	O	
Net Obligations under pension plans	90,500	61,500	29,000	O	Difference between pension expense and funding is a noncash adjustment in operating.
Common stock, \$1 par value	500,500	100,000	400,500	F	
Additional paid-in-capital in excess of par – common	670,000	154,000	516,000	F	
Additional paid-in capital – stock options	11,500	0	11,500	O	Stock-based compensation expense is a noncash adjustment in operating.
Retained earnings	1,000,000	555,550	444,450	O, F	Net income or loss begins the operating section. Dividends paid are in financing.
Accumulated other comprehensive income	293,240	499,540	(206,300)	NA	

*This column includes the account change but not necessarily the change in cash.

**O = Operating, I = Investing, F = Financing, NC = Noncash, NA = Not applicable.

Next, we analyze the items to be included in the operating, investing, and financing sections of the cash flow statement.

Operating Cash Flows Section

For the indirect method, we take the changes in all working capital accounts except accounts receivable for which we must consider the noncash bad debt expense. The working capital accounts include:

Working Capital Account	Ending	Beginning	Change	In Statement and Balance Increase or Decrease
Accounts Receivable	\$182,500	\$ 68,500	\$114,000	Separate change and bad debt expense.
Merchandise Inventory	400,000	402,500	(2,500)	Add decrease.
Accounts Payable	100,580	125,020	(24,440)	Subtract decrease.
Income Taxes Payable	187,500	200,000	(12,500)	Subtract decrease.

The balance sheet provides information only about net accounts receivable. Therefore, we solve for the change (excluding any write-off) from the net account. We obtain the balances from the balance sheet and identify items obtained from the income statement with "IS." We must solve for missing information identified with an "X." Notice that a write-off has zero effect on the net accounts receivable, so we do not need to know its amount.

Accounts Receivable, Net			
Beginning Balance	68,500		
X = Change excluding Write-off	120,500	6,500	Bad Debt Expense from IS
Ending Balance	<u>182,500</u>		

We add the bad debt expense of \$6,500 to net income as a noncash adjustment and subtract the increase in the accounts receivable balance of \$120,500.

Investing and Financing Cash Flows Sections

We need to analyze each balance sheet account with changes and reconcile all changes in account balances in order to present investing and financing activities using t-accounts as follows. This approach determines the noncash adjustments for the operating section using the indirect method. We identify these adjustments as each account is solved, but we also determine the amount of depreciation expense, amortization expense, share-based compensation expense, and bond discount amortization deducted on the income statement.

Trading Debt Investments		Bond Discount	
25,000	Beginning Balance	360,600	Beginning Balance
14,000	Fair Value Adjustment		
	Unrealized Gains from IS	35,000	Amortization from IS
	Sales*		
124,500	X = Purchased		
<u>108,500</u>	Ending Balance	<u>325,600</u>	Ending Balance

*Related to the sale, we compute any gain/loss as a noncash adjustment in the operating section.

Sales Proceeds – Cost = \$57,550 – \$55,000 = \$2,550 Gain

Continued

Property, Plant, and Equipment – Net

3,214,460		Beginning Balance
	90,500	Depreciation Expense from IS
951,040		X = Purchased
<u>4,075,000</u>		Ending Balance

Notes Payable

	1,301,450	Beginning Balance
30,570		X = Payments
	<u>1,270,880</u>	Ending Balance

Intangible Assets – Net

900,500		Beginning Balance
	8,000	Amortization Expense from IS
	67,000	X = Franchise Sold
<u>825,500</u>		Ending Balance

Common Stock

	100,000	Beginning Balance
	400,500	X = Stock Issue
	<u>500,500</u>	Ending Balance

Investments in Affiliate Companies

620,000		Beginning Balance
256,200*		Equity Income
	90,600*	X = Cash Dividends
<u>785,600</u>		Ending Balance

Additional Paid-In Capital in Excess of Par – Common

	154,000	Beginning Balance
	516,000	X = Stock Issue
	<u>670,000</u>	Ending Balance

*Undistributed earnings = \$256,200 – \$90,600 = \$165,600.

Current Portion of Long-Term Debt

	68,500	Beginning Balance
12,500		X = Payments

For the obligations under pension plans, we do not have information to complete all changes in the account. However, the firm reported that the amount funded was \$297,300. From the income statement, we know that the pension expense is \$120,000. Therefore, we subtract the noncash adjustment for the excess of the funding over the expense of \$177,300 from net income.

The cash flow statement under the indirect method is presented be follows.

Indirect Method

KaseyKraft Company	
Cash Flow Statement—Indirect Method	
For the Year Ended December 31	
Operating Activities	
Net Income	\$ 590,500
Adjustments to Reconcile Net Income to Net Cash Provided by Operating Activities	
Depreciation Expense	90,500
Amortization Expense	8,000
Undistributed Equity Earnings	(165,600)
Unrealized Gain on the Trading Portfolio	(14,000)
Increase in Deferred Tax Liability	21,000
Pension Contributions in Excess of Pension Expense	(177,300)
Stock-Based Compensation Expense	11,500
Gain on Sale of Investments	(2,550)
Amortization of Discount on Bonds Payable	35,000
Bad Debt Expense	6,500
Changes in Operating Working Capital Accounts	
Increase in Accounts Receivable	(120,500)
Decrease in Inventory	2,500
Decrease in Accounts Payable	(24,440)
Decrease in Taxes Payable	(12,500)
Net Cash Provided by Operating Activities	<u>\$ 248,610</u>
Investing Activities	
Trading Debt Securities Acquired	\$ (124,500)
Trading Debt Securities Sold	57,550
Purchase of Plant	(951,040)
Sale of Franchise	67,000
Net Cash Used by Investing Activities	<u>\$ (950,990)</u>
Financing Activities	
Payment of Note	\$ (43,070)
Cash Dividends Paid	(146,050)
Common Stock Issue	916,500
Net Cash Provided by Financing Activities	<u>\$ 727,380</u>
Increase in Cash	\$ 25,000
Beginning Cash Balance	<u>5,000</u>
Ending Cash Balance	<u>\$ 30,000</u>

Finally, we prepare necessary disclosures under the indirect method. The company needs to disclose its significant noncash investing activities, its accounting policy for the definition of

Continued

cash equivalents, the amounts of cash paid for taxes, and the cash paid for interest. We compute the cash payments for taxes and interest as follows.

Cash Paid for Income Taxes

Income Tax Expense	\$393,667
Less: Increase in Deferred Tax Liability	(21,000)
Add: Decrease in Income Taxes Payable	<u>12,500</u>
Cash Paid for Income Taxes	<u>\$385,167</u>

Cash Paid for Interest

Interest Expense	\$ 38,800
Less: Discount Amortization	<u>(35,000)</u>
Cash Paid for Interest	<u>\$ 3,800</u>

Cash Flow Disclosures for the Indirect Method

Significant Noncash Investing and Financing Activities. The company leased equipment on December 31 of the current year during which it made no payments. Leased equipment and a lease obligation of \$300,000 were recognized on the balance sheet.

Accounting Policy for Definition of Cash Equivalents. For purposes of the statement of cash flows, the company considers all highly liquid debt instruments purchased with maturities of 3 months or less to be cash equivalents.

Cash Paid for Taxes and Interest

Cash Paid for Taxes	<u>\$385,167</u>
Cash Paid for Interest	<u>\$ 3,800</u>

Direct Method

We determine the individual line items in operating activities under the direct method as follows.

Cash Collected from Customers

Sales	\$2,457,693
Less: Increase in Accounts Receivable	(114,000)
Less: Bad Debt Expense	<u>(6,500)</u>
Cash Collected from Customers	<u>\$ 2,337,193</u>

Interest Received

Investment Income	\$ 19,690
Less: Gain on Sale of Investments	<u>(2,550)</u>
Cash Interest Received	<u>\$ 17,140</u>

Cash Paid for Merchandise

Cost of Goods Sold	\$1,474,616
Less: Decrease in Inventory	<u>(2,500)</u>
Purchases (accrual basis)	\$1,472,116
Add: Decrease in Accounts Payable	<u>24,440</u>
Cash Paid for Merchandise	<u>\$1,496,556</u>

Cash Paid to Other Suppliers and Employees

Selling, General, and Administrative Expenses	\$ 25,000
Less: Stock-Based Compensation	(11,500)
Add: Cash Paid for Pension Funding	<u>297,300</u>
Cash Paid to Other Suppliers and Employees	<u>\$310,800</u>

Cash paid for income taxes of \$385,167 and cash paid for interest of \$3,800 are the same as computed under the indirect method on page 1344. The dividends received on equity investments are calculated on page 1342. The investing and financing sections are the same as under the indirect method from page 1343.

The cash flow statement under the direct method follows.

KaseyKraft Company
Cash Flow Statement—Direct Method
For the Year Ended December 31

Operating Activities

Cash Collected from Customers	\$ 2,337,193
Dividends Received	90,600
Interest Received	17,140
Cash Paid for Merchandise	(1,496,556)
Cash Paid to Other Suppliers and Employees	(310,800)
Cash Paid for Interest	(3,800)
Cash Paid for Taxes	<u>(385,167)</u>
Net Cash Provided by Operating Activities	<u>\$ 248,610</u>

Investing Activities

Trading Debt Securities Acquired	\$ (124,500)
Trading Debt Securities Sold	57,550
Purchase of Plant	(951,040)
Sale of Franchise	<u>67,000</u>
Net Cash Used by Investing Activities	<u>\$ (950,990)</u>

Financing Activities

Payment of Note	\$ (43,070)
Cash Dividends Paid	(146,050)
Common Stock Issue	<u>916,500</u>
Net Cash Provided by Financing Activities	<u>\$ 727,380</u>

Increase in Cash \$ 25,000

Beginning Cash Balance 5,000

Ending Cash Balance \$ 30,000

Finally, we prepare necessary disclosures under the direct method.

Cash Flow Disclosures for the Direct Method

Significant Noncash Investing and Financing Activities. The company leased equipment on December 31 of the current year during which it made no payments. Leased equipment and a lease obligation of \$300,000 were recognized on the balance sheet.

Accounting Policy for Definition of Cash Equivalents. For purposes of the statement of cash flows, the company considers all highly liquid debt instruments purchased with maturities of 3 months or less to be cash equivalents.

Interview

CHRISTINA LOEBACH
VICE PRESIDENT,
GLOBAL FINANCE
NCH MARKETING SERVICES,
DEERFIELD, IL»

Christina Loebach

As NCH Marketing's Vice President, Global Finance, Christina Loebach is responsible for strategic financial planning, accounting, and financial controls for businesses located throughout North America and Europe. Prior to joining NCH Marketing, she was an associate director at Kraft and a senior manager in KPMG's Economic & Valuation Services practice.

- 1 Why is the indirect method of reporting operating activities more popular with U.S. companies than the direct method?

The indirect method, the method currently used by a majority of companies, starts with net income (from the income statement) and adjusts for noncash items, including changes in the balance sheet. Companies prefer this method because it easily relates back to the income statement, which is usually the first financial statement investors review.

In addition, the direct method typically requires more information to prepare. You must separately track all transactions on a cash basis, rather than an accrual basis, to arrive at cash flow from operations. Under the indirect method, you can complete most of the cash flow statement by relying on the income statement and balance sheet.

- 2 What are the most common uses of the statement of cash flows by investors and creditors?

Investors generally seek a certain return on a potential investment. The value of a company is usually directly correlated to the discounted value of its future cash flows. The more cash generated (and the sooner), the higher the value of a company. Evaluating a company's cash position and the riskiness in its ability to generate cash flow helps investors determine the potential value of a company—and therefore their potential return on investment.

Creditors focus on a company's ability to repay debt. Assessing liquidity through a review of cash flow enables lenders to decide whether to issue a loan to a company and, if so, the rate, which is normally tied to the assessed risk of repayment.

Looking at a company's balance sheet, stakeholders can determine whether the company maintains sufficient liquidity to pay its obligations.

- 3 What incremental information is provided by the statement of cash flows to supplement balance sheet and income statement data?

The investing section of the cash flow statement shows how much the company spent on capital expenditures; those are not separately disclosed in the balance sheet or income statement. Comparing capital expenditures to depreciation (in the operating section of the cash flow statement) gives investors an understanding of whether the business is investing significantly in future growth. A high-growth company generally reports higher capital spending than depreciation.

The financing section of the cash flow statement provides information on how cash is returned to stakeholders (i.e., dividends, share repurchase, and debt repayment). A high dividend yield could signal that a company expects to have very stable cash flow. Companies tend to be penalized heavily (through stock price declines) for lowering dividend payments. Significant treasury stock purchases also can indicate that a company has limited investment alternatives or that it is supporting its earnings per share.

- 4 Companies are required to use the accrual, rather than cash, basis of accounting. Why, then, is the cash flow statement important to complete the financial reporting cycle?

With accrual-based accounting, significant differences can occur between a company's earnings and its cash flow. Bonus payments are a good example of an accrual difference. A company may pay a bonus once a year—even though that bonus relates to the company's/employee's performance over the course of the year. Under accrual-based accounting, one-twelfth of the estimated bonus expense is recognized in earnings each month. However, the cash bonus payment will not appear in the cash flow statement until it is ultimately paid, sometimes not even in the same year it was expensed.

Capital expenses also could have a significant impact on a company's cash flow but not its income statement. An asset is depreciated over its life with only a portion of the expense hitting the income statement each year. However, the full amount of the cash spent to purchase the asset is reflected in cash flow.

Thus, cash flow reporting allows stakeholders to reconcile differences between earnings and cash flow. Cash flow may be a better indication of the health of a company.

Discussion Questions

1. Christina Loebach discussed why the indirect method is the most popular format for the operating activities section of the statement of cash flows in the United States. Although the indirect method is the most popular, the direct method is preferred by the FASB. Discuss some of the reasons why the direct method could have advantages over the indirect reporting format.
2. Beginning with the response provided by Christina Loebach, discuss the specific, expected results (positive or negative) on each activity (operating, investing, and financing) during the four stages of a company's life cycle: rapid growth phase, sustained growth phase, mature phase, and decline phase.

FINANCIAL STATEMENT ANALYSIS

Operating Cash Flow

Operating cash flow is a measure of a company's cash flows generated from operations. A company needs to generate sufficient cash to meet its obligations and operational needs. Operating cash flow is a gauge of how effectively a company translates its operating activities into cash. Here we present two tools for the financial statement analysis of operating cash flow: cash coverage ratios and *free cash flow*.

Cash Coverage Ratios

Cash coverage ratios measure a company's operating cash flows relative to specific items such as obligations, dividends, and sales. Common cash coverage ratios include the following:

- Short-term debt coverage
- Debt coverage
- Dividend coverage
- Sales coverage
- Operating cash flows (OCF) to income ratio

Both the short-term debt and debt coverage ratios are indicators of a company's ability to pay its debts from operating activities.

$$\text{Short-Term Debt Coverage} = \frac{\text{Operating Cash Flows}}{\text{Short-Term Debt}} \quad (22.5)$$

$$\text{Debt Coverage} = \frac{\text{Operating Cash Flows}}{\text{Total Debt}} \quad (22.6)$$

The higher the cash flows relative to debt, the better able a company is to pay off its debt as it comes due and to seek additional financing if needed. Short-term debt includes short-term borrowings, the current portion of finance leases, and the current portion of long-term debt. Total debt is the sum of short-term debt, long-term debt, and finance leases. This debt coverage ratio indicates a company's ability to pay its debt from the cash it generates from operations. Low debt coverage ratios can indicate that a company has a high amount of debt or insufficient cash flows.

The dividend coverage ratio indicates the ability of a company to continue to pay its current level of dividends.

$$\text{Dividend Coverage} = \frac{\text{Operating Cash Flows}}{\text{Cash Dividends}} \quad (22.7)$$

The dividend coverage ratio can assist financial statement users in determining whether the firm can sustain current levels of dividends through operations. The higher the dividend coverage ratio, the better able the firm is to maintain dividends. Large and mature companies often pay large and consistent dividends. On the other hand, growth companies usually keep cash on hand for expansion purposes rather than paying out high dividends.

The sales coverage ratio, also called the cash return on sales ratio, compares a company's operating cash flows to its net sales or revenues. This ratio indicates a company's ability to convert sales into cash.

$$\text{Sales Coverage} = \frac{\text{Operating Cash Flows}}{\text{Net Sales (Revenues)}} \quad (22.8)$$

The higher the sales coverage ratio, the greater the company's ability to generate cash from sales.

The OCF to income ratio highlights the difference between net income and cash flows from operations.

$$\text{OCF to Income Ratio} = \frac{\text{Operating Cash Flows}}{\text{Net Income}} \quad (22.9)$$

The higher the OCF to income ratio, the greater the company's ability to generate cash from its operations and activities. An OCF to income ratio greater than 1 indicates that a company is able to generate greater cash flows than net income. The ratio would be greater than 1 when noncash expenses such as depreciation lower a company's income or working capital changes boost cash flows such as increases in accounts payable.

Free Cash Flow

To maintain and increase its ability to continue to generate operating cash flows, a company needs to invest in its productive capacity. That is, a company needs to make capital expenditures to maintain its facilities, whether manufacturing plants or retail stores, that are used to generate the cash flows. **Free cash flow (FCF)** is another measure of cash flows that adjusts for a company's capital expenditures.

$$\text{Free Cash Flow} = \text{Operating Cash Flow} - \text{Capital Expenditures} \quad (22.10)$$

The "free" in free cash flow indicates that cash is available for further expansion and acquisition, repayment of debt, or payment to owners as dividends. The free cash flow to operating cash flow ratio measures the relationship between free cash flow and operating cash flow.

$$\text{Free Cash Flow to Free Cash Flow Ratio} = \frac{\text{Operating Cash Flow} - \text{Capital Expenditure}}{\text{Operating Cash Flow}} \quad (22.11)$$

A higher ratio of free cash flow to operating cash flow suggests a stronger and more flexible cash position. Example 22.16 illustrates the analysis of operating cash flows.

EXAMPLE 22.16

Analysis of Operating Cash Flow

PROBLEM: You are interested in analyzing *Johnson & Johnson's* operating cash flows. Use *Johnson & Johnson's* statement of cash flows in Exhibit 22.10 and the additional information to address the questions that follow:

Additional Information

For the Year Ended, or at the Year-End (in millions)	2016	2015	2014
Sales	\$71,890	\$ 70,074	\$74,331
Net Income	16,540	15,409	16,323
Short-Term Debt	4,684	7,004	3,638
Long-Term Debt	22,442	12,857	15,122

- What is *Johnson & Johnson's* net cash flow from operations each year? What were the change and percentage of change in *Johnson & Johnson's* net cash flow from operations each year? Compare the changes in net cash flow from operations to the changes in net income.
- What are the major adjustments for noncash expenses and losses? What are the major adjustments for noncash revenues and gains?
- Compute the following cash coverage ratios for each year and comment on them:
 - Short-term debt coverage
 - Debt coverage
 - Dividend coverage
 - Sales coverage
 - OCF to income ratio
- Compute *Johnson & Johnson's* free cash flows for each year and comment on them. Compare *Johnson & Johnson's* free cash flows to its operating cash flows for each year.

Sources: Johnson & Johnson Subsidiaries Consolidated Statements of Cash Flows, Financial Statements, January 1, 2017. <http://files.shareholder.com/downloads/JNJ/3809936545x0xS200406-17-6/200406/filing.pdf>

SOLUTION:

- a. The following table presents *Johnson & Johnson's* net cash flow from operations, the change, and the percentage of change each year. Net cash flow from operations is obtained from the operating section of the statement of cash flows. Net cash flow from operations was positive each year. The table also presents *Johnson & Johnson's* net income as well as the change and the percentage of change each year. Net income is obtained from the top line of *Johnson & Johnson's* indirect method operating section. Net cash flow from operations increased in 2015 but decreased in 2016 whereas net income decreased in 2015 but increased in 2016. The directions of the changes in net cash flow from operations are opposite to the changes in net income. In all years, net cash flow from operations was higher than net income. Part (b) explores reasons for the difference between net cash flow from operations and net income.

	2016	2015	2014
Net Cash Flow from Operations (in millions)	\$18,767	\$ 19,569	\$ 18,710
Change	\$ (802)	\$ 859	
Percentage of Change	(4.1%)	4.6%	
Net Income (in millions)	\$16,540	\$ 15,409	\$ 16,323
Change	\$ 1,131	\$ (914)	
Percentage of Change	7.3%	(5.6%)	

- b. Major adjustments for noncash expenses and losses are depreciation and amortization of property and intangibles (2014–2016) and stock-based compensation (2014–2016). Major adjustments for noncash revenues and gains are the net gain on equity investment transactions (2014–2016) and the deferred tax provision (2015–2016).
- c. The following table provides the computation of the cash coverage ratios.

Ratio		2016	2015	2014
Short-Term Debt Coverage =	$\frac{\text{Operating Cash Flow}}{\text{Short-Term Debt}}$	$4.01 = \frac{\$18,767}{\$4,684}$	$2.79 = \frac{\$19,569}{\$7,004}$	$5.14 = \frac{\$18,710}{\$3,638}$
Debt Coverage =	$\frac{\text{Operating Cash Flow}}{\text{Total Debt}}$	$0.69 = \frac{\$18,767}{\$4,684 + \$22,442}$	$0.99 = \frac{\$19,569}{\$7,004 + \$12,857}$	$1.00 = \frac{\$18,710}{\$3,638 + \$15,122}$
Dividends Coverage =	$\frac{\text{Operating Cash Flow}}{\text{Cash Dividends}}$	$2.18 = \frac{\$18,767}{\$8,621}$	$2.39 = \frac{\$19,569}{\$8,173}$	$2.41 = \frac{\$18,710}{\$7,768}$
Sales Coverage =	$\frac{\text{Operating Cash Flow}}{\text{Net Sales}}$	$0.26 = \frac{\$18,767}{\$71,890}$	$0.28 = \frac{\$19,569}{\$70,074}$	$0.25 = \frac{\$18,710}{\$74,331}$
OCF to Income Ratio	$\frac{\text{Operating Cash Flow}}{\text{Net Income}}$	$1.13 = \frac{\$18,767}{\$16,540}$	$1.27 = \frac{\$19,569}{\$15,409}$	$1.15 = \frac{\$18,710}{\$16,323}$

With a ratio greater than 1.00 each year, the short-term debt coverage ratio indicates that the company generated enough operating cash flows each year to cover its short-term debt obligations. The debt coverage ratio indicates that operating cash flows each year were high relative to all debt outstanding. In 2015 and 2014, the company had almost enough operating cash flow to pay for all its debt. The debt coverage ratio decreased each year and was the lowest in 2016 when long-term debt increased.

The dividend coverage ratio of more than 2.1 each year shows that the company had over twice as much operating cash as necessary to cover its dividends. The company appears to have used more than 46% (\$8,621 dividends divided by \$18,767 operating cash flow in 2016) of its operating cash flows for dividends.

Continued

Financial Statement Analysis, continued

The sales coverage ratio indicates that for each dollar of sales, the company generated between 25 and 28 cents in operating cash flow between 2014 and 2016. The OCF to income ratio was greater than 1.00 each year, indicating that **Johnson & Johnson** was generating more cash from operations than net income.

d. The following table shows the computations of free cash flow and free cash flow over operating cash flow.

Ratio		2016		2015		2014				
Free Cash Flow =	Operating Cash Flow less Capital Expenditures	\$15,541 =	\$18,767 -	\$3,226	\$16,106 =	\$19,569 -	\$3,463	\$14,996 =	\$18,710 -	\$3,714
Free Cash Flow to Operating Cash Flow =	$\frac{\text{Free Cash Flow}}{\text{Operating Cash Flow}}$	0.83 =	$\frac{\$15,541}{\$18,767}$		0.82 =	$\frac{\$16,106}{\$19,569}$		0.80 =	$\frac{\$14,996}{\$18,710}$	

The company's free cash flow was positive, indicating that it could replace existing productive capacity through capital expenditures using internally generated cash without the need to borrow. The ratio of free cash flow to operating cash flow, ranging from 0.80 to 0.83, implies that the company had about 80 cents of each dollar of operating cash flow available for use in expanding the business, acquiring new companies, or making investments even after it had replaced its productive capacity.

Summary by Learning Objectives

In the following, we summarize the main points by learning objective. Throughout the chapter, we discuss the accounting and reporting of U.S. GAAP and IFRS side-by-side. The following table also highlights the major similarities and differences between the standards.

1 State the purpose of the statement of cash flows and define cash and cash equivalents.

Summary	Similarities and Differences between U.S. GAAP and IFRS
<p>The statement of cash flows provides information about a firm's cash receipts and cash payments during a period of time. It summarizes the firm's cash flows by category: operating, investing, and financing activities.</p> <p>Operating activities include producing and delivering goods and services.</p> <p>Investing activities relate to the acquisition and sale of property, plant, and equipment; long-term investments; short-term investments not classified as cash equivalents; and intangible assets.</p> <p>Financing activities include borrowing from creditors and repaying them, obtaining resources from owners, and providing owners with a return on their investment.</p> <p>Cash consists of coins, currency, and bank deposits as well as negotiable instruments such as checks and money orders.</p> <p>Cash equivalents include short-term, highly liquid investments with original maturities of 3 months or less when acquired.</p> <p>Bank overdrafts are usually classified as liabilities.</p>	<p>► Similar under U.S. GAAP and IFRS except that IFRS allows bank overdrafts to be reported as reductions of cash and cash equivalents.</p>

Summary by Learning Objectives, continued

2 Describe the format of the statement of cash flows, including classification of activities into operating, investing, and financing sections; the reconciliation of cash and cash equivalents; and the disclosure of significant noncash investing and financing transactions.	
Summary	Similarities and Differences between U.S. GAAP and IFRS
<p>The statement of cash flows summarizes cash inflows and outflows for a firm over a period of time by category: operating, investing, and financing activities.</p> <p>Operating activities include:</p> <ol style="list-style-type: none"> 1. Cash receipts from customers 2. Cash payments for the purchase of goods for resale or for use in production 3. Cash payments to suppliers and employees 4. Cash payments related to taxes 5. Cash receipts related to interest and dividend income 6. Cash payments of interest <p>Investing activities include:</p> <ol style="list-style-type: none"> 1. Cash receipts from the collection or sale of notes receivable 2. Cash receipts from the sale of debt and equity securities of other entities 3. Cash receipts from the sale of productive assets (for example, property, plant, and equipment) 4. Cash payments for loans made by the entity 5. Cash payments for debt and equity securities of other entities 6. Cash payments for property, plant, and equipment and other productive assets <p>Financing activities include:</p> <ol style="list-style-type: none"> 1. Cash receipts from issuing equity to owners 2. Cash receipts from borrowing through bonds, notes, or other instruments 3. Cash payments to repurchase equity from owners 4. Cash payments for principal on debt 5. Cash payments of dividends <p>The statement of cash flows provides a reconciliation of the change in cash during the period.</p> <p>Firms must disclose significant noncash investing and financing transactions on the statement of cash flows.</p>	<p>► Similar under U.S. GAAP and IFRS except that:</p> <ul style="list-style-type: none"> • IFRS allows companies choices in how to classify interest received, interest paid, dividends received, dividends paid, and taxes paid. • IFRS does not require that the increase or decrease in cash and cash equivalents explained in the statement of cash flows agree to a single line item on the balance sheet. If a different amount is used, companies must provide a reconciliation schedule.

3 Understand and use the conceptual model based on the accounting equation to prepare the statement of cash flows.	
Summary	Similarities and Differences between U.S. GAAP and IFRS
<p>The cash flow statement is built from changes in balance sheet accounts. We derive a model for the statement of cash flows by converting the accounting equation into a cash equation:</p> $\text{Assets} = \text{Liabilities} + \text{Stockholders' Equity} \quad (22.1)$ $\Delta\text{CASH} = \Delta\text{CL} + \Delta\text{NCL} - \Delta\text{OCA} - \Delta\text{NCA} + \Delta\text{CS} + \Delta\text{RE} \quad (22.4)$	<p>Similar under U.S. GAAP and IFRS.</p>

*Summary by Learning Objectives, continued***4 Explain and prepare the operating cash flows section of the statement of cash flows using the indirect and direct methods.**

Summary	Similarities and Differences between U.S. GAAP and IFRS
<p>The operating cash flows section reports cash flows relating to operating activities.</p> <p>The indirect method (also referred to as the reconciliation format) begins with net income from the income statement and reconciles it to net cash provided by operating activities.</p> <p>The direct method (also referred to as the income statement format) reports cash receipts and payments for all operating activities.</p> <p>The investing and financing sections of the direct and indirect statement of cash flows are the same: The only difference between the two methods is how cash flows are reported in the operating activities section.</p>	<p>► Similar under U.S. GAAP and IFRS except that IFRS does not specify the income line item that must begin the reconciliation of operating cash flows under the indirect method.</p>

5 Describe and illustrate the investing cash flows section of the statement of cash flows.

Summary	Similarities and Differences between U.S. GAAP and IFRS
<p>The investing section reports cash receipts and payments for all investing activities.</p>	<p>Similar under U.S. GAAP and IFRS.</p>

6 Describe and illustrate the financing cash flows section of the statement of cash flows.

Summary	Similarities and Differences between U.S. GAAP and IFRS
<p>The financing section reports cash receipts and payments for all financing activities.</p>	<p>Similar under U.S. GAAP and IFRS.</p>

7 Discuss and illustrate the reporting of complex transactions in determining cash flows.

Summary	Similarities and Differences between U.S. GAAP and IFRS
<p>The more complex topics reviewed in this chapter include:</p> <ol style="list-style-type: none"> 1. Acquisitions and dispositions of long-term assets 2. Deferred income taxes 3. Accounts receivable: net and bad debt expense 4. Unrealized gains and losses on fair value adjustments 5. Equity method investments 6. Share-based compensation 7. Pension adjustments 8. Amortization of bond discounts and premiums <p>For each of these, any noncash adjustments and cash inflows or outflows must be computed from the relevant income statement and balance sheet information.</p>	<p>Similar under U.S. GAAP and IFRS.</p>

Summary by Learning Objectives, continued

8 Detail required disclosures related to the statement of cash flows.	
Summary	Similarities and Differences between U.S. GAAP and IFRS
<p>A company is required to disclose:</p> <ul style="list-style-type: none"> • Its policy regarding cash equivalents. • All significant noncash investing and financing activities. • Interest and taxes paid when using the indirect method. • A reconciliation of net income to net cash flows from operating activities when using the direct method. • The nature of any restrictions on its cash balance. 	<p>► Similar under U.S. GAAP and IFRS except that under IFRS:</p> <ul style="list-style-type: none"> • A company does not have to prepare a reconciliation of net income to net cash flows from operating activities if using the direct method. • IFRS requires that companies disclose any cash balances that are held but not available for use. • IFRS also encourages management's comment on any additional information that may be relevant to users in understanding a company's financial position and liquidity. • IFRS requires the entity to provide adequate disclosure to explain changes in financing liabilities arising from cash and noncash changes.

22 The Statement of Cash Flows

Questions

- 1 Q22-1. What is the cash flow statement?
- 1 Q22-2. What is the primary purpose of the cash flow statement?
- 1 2 Q22-3. To what does the total cash flow computed on the statement of cash flows reconcile?
- 2 Q22-4. Does a firm classify the acquisition of a plant asset by common stock issuance as both an investing and a financing activity on the cash flow statement in the year of acquisition?
- 4 Q22-5. What are the two different reporting formats for preparing the operating activities section of the statement of cash flows?
- 2 5 Q22-6. How do firms reclassify gains and losses on the disposal of property, plant, and equipment? Why is this reclassification appropriate?
- 2 Q22-7. How do firms classify interest paid and interest received on the statement of cash flows under IFRS?
- 4 Q22-8. Does the direct reporting format provide complete flexibility in terms of the line items to report in operating activities?
- 2 Q22-9. How does a firm classify the acquisition of a plant asset by issuing common stock?
- 3 Q22-10. Does the accounting equation explain the change in cash during the period?
- 4 Q22-11. Under the indirect method, do companies using IFRS begin the operating section with net income?
- 4 5 6 Q22-12. What approach is used in preparing the operating activities, investing activities, and financing activities sections of the statement of cash flows?
- 4 7 Q22-13. Under the indirect method, do firms subtract bond discount amortization from net income to determine operating cash flows?
- 4 7 Q22-14. Do firms subtract pension expense from net income to determine operating cash flows?
- 8 Q22-15. Are cash flow disclosure requirements the same for both the direct and indirect reporting formats?
- 8 Q22-16. Can financial analysts use the required disclosure of interest and taxes paid under the indirect reporting format to offset the inconsistent classification of interest expense and tax paid within the operating activities section of the cash flow statement?

Multiple-Choice Questions

Becker CPA Exam Review multiple-choice questions are available in
 MyLab Accounting.

- 2 4 MC22-1. Oscar Company is preparing its financial statements for the current year. Which of the following statements is/are correct?
- I. A main difference between the income statement and the statement of cash flows is that the income statement is based on the accrual method of accounting and the statement of cash flows is based on the cash basis of accounting.
 - II. Depreciation is added back to net income in a direct method statement of cash flows because it is a source of cash.
 - III. Investing and financing activities that do not affect cash do not require disclosure in the financial statements.
 - IV. Allowing a client company to buy on credit is a use of cash to the client company.
 - a. I only is correct.
 - b. I and II only are correct.
 - c. I and III only are correct.
 - d. I, II, III, and IV are correct.

- 4 **MC22-2.** In its year-end income statement, Black Knights Company reports cost of goods sold of \$450,000. Changes occurred in several balance sheet accounts during the year as follows:

Inventory	\$160,000 decrease
Accounts Payable – Suppliers	40,000 decrease

What amount should the Black Knights Company report as cash paid to suppliers in its cash flow statement prepared under the direct method?

- 4 **MC22-3.** Big Dollars Corporation's comparative financial statements included the following amounts for the current year:

Net income	\$ 650,000
Depreciation expense	\$ 93,000
Equity in earnings of unconsolidated affiliate	\$ 61,000
Gain on sale of fixed assets	\$ 4,000
Increase in accounts receivable	\$ 25,000
Decrease in inventory	\$ (57,000)
Decrease in fixed assets	\$ 38,000
Increase in accounts payable	\$ 42,000
Decrease in notes payable	\$ (75,000)

On its current year statement of cash flows, what is Big Dollars' net cash provided by operating activities?

- 4 **MC22-4.** Which of the following items would *not* be included in the operating activities section of an entity's statement of cash flows under **U.S. GAAP**?
- Interest received
 - Proceeds from the sale of trading securities
 - Dividends paid
 - Income taxes paid

- 4 5 **MC22-5.** The Year 11 balance sheet of Cool Tools, Inc. reported the following fixed asset balances:

	Year 11	Year 10
Fixed assets	\$160,000	\$128,000
Accumulated depreciation	(53,000)	(41,000)
Fixed assets – net	<u>\$107,000</u>	<u>\$ 87,000</u>

On January 1, Year 11, Cool Tools purchased fixed assets for \$50,000 and sold fixed assets with an original cost of \$18,000 and a book value of \$6,000 for \$10,000. Cool Tools made no other long-term asset purchases or sales during Year 11. What are the company's (1) net cash used in investing activities and (2) the amount of the depreciation adjustment to the operating section of its statement of cash flows prepared using the indirect method?

	Net Cash Used in Investing Activities	Depreciation Adjustment in Operating Section
a.	\$32,000	\$12,000
b.	\$32,000	\$24,000
c.	\$40,000	\$12,000
d.	\$40,000	\$24,000

- 5 **MC22-6.** Sykes Corporation's comparative balance sheets at December 31, Year 2 and Year 1, reported accumulated depreciation balances of \$800,000 and \$600,000, respectively. Property acquired at a cost of \$50,000 and a carrying amount of \$40,000 was the only property sold in Year 2. Depreciation charged to operations in Year 2 was:

- a. \$190,000 b. \$200,000 c. \$210,000 d. \$220,000

- 6 **MC22-7.** During Year 1, Brianna Company had the following transactions related to its financing operations:

Payment for the retirement of long-term bonds payable (carrying value \$740,000)	\$ 750,000
Distribution in Year 1 of cash dividend declared in Year 0 to preferred shareholders	\$ 62,000
Carrying value of convertible preferred stock of Brianna converted into common shares	\$ 120,000
Proceeds from sale of treasury stock (carrying value at cost \$86,000)	\$ 95,000

On its Year 1 statement of cash flows, net cash used in financing activities should be:

- a. \$717,000 b. \$716,000 c. \$597,000 d. \$535,000
- 8 **MC22-8.** Which of the following supplemental disclosures to the statement of cash flows is *not* required when the indirect method is used?
- Income taxes paid
 - Reconciliation of net income to net cash provided by operating activities
 - Interest paid
 - Noncash investing and financing activities

Brief Exercises

- 2 **BE22-1.** **Classification as Operating, Investing, or Financing Activity on the Statement of Cash Flows.** Classify each item in the following list of cash receipts and cash payments as operating, investing, or financing.

Cash Receipt or Payment	Classification
Cash payments to suppliers and employees	_____
Cash payments for principal on debt	_____
Cash receipts from customers	_____
Cash payments for property, plant, and equipment	_____
Cash receipts from the sale of available-for-sale investment securities	_____
Cash receipts from interest	_____
Cash receipts from issuing equity to owners	_____
Cash payments for interest	_____
Cash receipts from the sale of property, plant, and equipment	_____
Cash payment of dividends	_____
Cash receipts of dividends from investments	_____

- 2 **BE22-2.** **Classification as Operating, Investing, or Financing Activity on the Statement of Cash Flows, IFRS.** Classify each item in the following list of cash receipts and cash payments as operating, investing, or financing under **IFRS**.

Cash Receipt or Payment	Classification – IFRS
Cash payments to suppliers and employees	_____
Cash payments for principal on debt	_____
Cash receipts from customers	_____
Cash payments for property, plant, and equipment	_____
Cash receipts from the sale of investment securities	_____
Cash receipts from interest	_____
Cash receipts from issuing equity to owners	_____
Cash payments for interest	_____
Cash receipts from the sale of property, plant, and equipment	_____
Cash payment of dividends	_____
Cash receipts of dividends from investments	_____

- 3 4** **BE22-3. Operating Activities Section, Indirect Method.** State whether a firm would add or subtract the following items from income to compute cash flows from operations under the indirect method.

Items	Added or Subtracted
Increase in prepaid expense	_____
Decrease in income taxes payable	_____
Decrease in accounts receivable	_____
Increase in inventory	_____
Decrease in the current portion of long-term debt	_____
Increase in accounts payable	_____

- 3 4** **BE22-4. Operating Activities Section, Indirect Method.** State whether a firm would add or subtract the following items from income to compute cash flows from operations under the indirect method.

Items	Added or Subtracted
Depreciation expense	_____
Increase in income taxes payable	_____
Gain on sale of equipment	_____
Decrease in inventory	_____
Impairment loss	_____
Increase in salaries payable	_____
Bond premium amortization	_____

- 4** **BE22-5. Operating Activities Section, Direct Method.** Larry's Luggage Company provided the following balance sheet and income statement for the current year. Prepare the operating activities section of the cash flow statement using the direct method. Assume that accrued expenses relate to selling, general, and administrative expenses.

**Larry's Luggage Company
Balance Sheets
At December 31**

Assets	Ending	Beginning
Cash	\$ 1,000	\$ 5,000
Accounts Receivable – net	5,500	3,000

- 4** **BE22-6. Operating Activities Section, Indirect Method.** Repeat the requirements of BE22-5 under the indirect method.
- 4** **BE22-7. Operating Activities Section, Indirect Method, IFRS.** Repeat the requirements of BE22-5 under the indirect method assuming that Larry's Luggage Company reports under **IFRS** and begins the reconciliation to operating cash flows with operating income. Larry's Luggage classifies interest paid, interest received, and taxes paid as operating activities.
- 4** **BE22-8. Operating Activities Section, Indirect Method, IFRS.** Repeat the requirements of BE22-5 under the indirect method assuming that Larry's Luggage Company reports under **IFRS** and it begins the reconciliation to operating cash flows with operating income. Larry's Luggage classifies interest paid as a financing activity and interest received as an investing activity.
- 6** **BE22-9. Financing Activities Section, IFRS.** Using the information provided in BE22-5, prepare the financing activities section of Larry's Luggage Company's cash flow statement assuming that Larry's Luggage reports under **IFRS**. Larry's Luggage classifies interest paid as a financing activity and interest received as an investing activity. Larry's Luggage made payments of \$2,000 on its notes payable.
- 4** **BE22-10. Operating Activities Section, Direct Method.** Rodent World Exotic Pet Shops, Incorporated reported the following comparative balance sheets and income statement for the current year. Prepare the operating activities section of the statement of cash flows using the direct method. Assume that accrued expenses relate to selling, general, and administrative expenses.

**Rodent World Exotic Pet Shops,

Total Liabilities	\$ 650	\$ 559
Capital Stock	\$ 286	\$ 221
Retained Earnings	338	260
Total Shareholders' Equity	\$ 624	\$ 481
Total Liabilities and Equity	\$1,274	\$1,040

Simons Products, Inc.
Income Statement
For the Current Year Ended December 31

Sales		\$1,300
Operating Expenses		
Cost of Goods Sold	\$ 780	
Depreciation	65	
Insurance	39	
Gain on Sale of Equipment	(26)	
Other Expenses	195	(1,053)
Income before Tax		\$ 247
Provision for Income Tax		104
Net Income		\$ 143

During the year, Simons Products purchased new equipment for \$195 and sold equipment with a net book value of \$26 for \$52. Both events were cash transactions. It paid any dividends declared. Simons made no repayments of debt during the year. Prepare the operating activities section of the statement of cash flows using the indirect method.

- 4 BE22-16. Operating Activities Section, Direct Method.** Using the information provided in BE22-15, prepare the operating activities section of the statement of cash flows using the direct method.
- 4 BE22-17. Statement of Cash Flows, Indirect Method.** Soccer Emporium provided the following information for the current year.

Simplified Income Statement	Amount
Sales	\$ 567,000
Depreciation Expense	(52,000)
Selling, General, and Administrative Expenses	(488,000)
Operating Income	27,000
Tax Expense	(8,000)
Net Income	<u>\$ 19,000</u>

Account Changes from the Balance Sheet

Increase in Accounts Receivable	\$ 9,000
Decrease in Prepaid Expenses	\$ 8,000
Increase in Accounts Payable	\$ 11,000
Decrease in Income Taxes Payable	\$ 3,000

Compute cash flows from operating activities for Soccer Emporium under the indirect reporting format.

- 4 BE22-18. Statement of Cash Flows, Indirect Method, IFRS.** Use the information from BE22-17 assuming that Soccer Emporium is an IFRS reporter that reconciles operating income to operating cash flows. Compute cash flows from operating activities for Soccer Emporium under the indirect reporting format.
- 4 BE22-19. Statement of Cash Flows, Direct Method.** Soccer Emporium provides the following information for the current year.

Simplified Income Statement	Amount
Sales	\$ 567,000
Depreciation Expense	(52,000)
Selling, General, and Administrative Expenses	(488,000)
Tax Expense	(8,000)
Net Income	<u>\$ 19,000</u>

Account Changes from the Balance Sheet

Increase in Accounts Receivable	\$ 9,000
Decrease in Prepaid Expenses	\$ 8,000
Increase in Accounts Payable	\$ 11,000
Decrease in Income Taxes Payable	\$ 3,000

Compute cash flows from operating activities for Soccer Emporium under the direct reporting format.

- 5 BE22-20. Investing Activities Section, Direct Method.** Using the information provided in BE22-15, prepare the investing activities section of Simons Products' cash flow statement.
- 6 BE22-21. Financing Activities Section, Direct Method.** Using the information provided in BE22-15, prepare the financing activities section of Simons Products' cash flow statement.
- 7 BE22-22. Complex Transactions, Acquisitions and Dispositions of Long-Term Assets.** During the year, Solar Corporation sold equipment with a net book value of \$6,000 for \$9,000. It also purchased equity securities for \$8,000. Net income for the year is \$22,000. There were no other transactions conducted during the period.

Additional Information:

- American Safety Products sold trading securities at a loss.
- The company sold one of its franchises at cost.
- The company sold plant assets with a carrying value of \$1,077,404 for a loss of \$189,875.
- The company made debt payments to reduce the current portion of long-term debt and finance lease obligations. American Safety Products borrowed an additional \$3,662 by issuing a long-term note.
- The change in AOCI is the result of adjustments required for the company's defined-benefit pension plan.
- American Safety Products acquired additional securities classified as held to maturity. It did not purchase any other investments during the year.
- It did not reissue any treasury stock.
- Treat the trading securities as an investing activity.
- Ignore the amortization of the held-to-maturity investment.
- Assume no adjustments to fair value for trading investments.

Required »

Prepare the cash flow statement for American Safety Products for the current year using the indirect method. Provide all required disclosures.

4 5 6 7 8

- P22-14. Statement of Cash Flows, Direct Method, Complex Accounts, Disclosures.** Using the information provided in P22-13, prepare the cash flow statement and all required disclosures for American Safety Products using the direct method.

CASES

Judgment Case

Judgment Case 1: Operating Cash Flows

Consider KaseyKraft Company from Example 22.15 in the text. As discussed, its operating cash flow (OCF) for the year is \$248,610. Because this is much lower than operating income of \$733,077, KaseyKraft would like to report a higher OCF figure. What decisions could KaseyKraft make to increase its OCF?

How much would KaseyKraft's operating cash flow increase if it factored one-half of its receivables, reduced its inventory by one-third, and postponed its payment to vendors so that it did not pay off an additional \$50,000 of accounts payable?

Financial Statement Analysis Case

Financial Statement Analysis Case 1: Analysis of Operating Cash Flows

Your assignment is to analyze *Pfizer's Inc.* operating cash flows and compare it to that of *Johnson & Johnson*. Use *Pfizer's* statement of cash flows and the following information to address these questions:

- What is *Pfizer's* net cash provided by operating activities each year? What was the change and percentage of change in *Pfizer's* net cash provided by operating activities each year? Compare the changes in net cash provided by operating activities to the changes in net income.
- What are *Pfizer's* major adjustments for noncash expenses and losses? What are the major adjustments for noncash revenues and gains?
- For each year, compute and comment on the following cash coverage ratios for *Pfizer*:
 - Short-term debt coverage
 - Debt coverage
 - Dividend coverage
 - Sales coverage
 - OCF to income ratio
- For each year, compute and comment on *Pfizer's* free cash flows. Compare its free cash flows to its operating cash flows.
- Using *Johnson & Johnson's* information from Example 22.16 in the text, compare *Pfizer* and *Johnson & Johnson's* cash coverage ratios and free cash flows.

Surfing the Standards Cases

Surfing the Standards Case 1: Classification in the Statement of Cash Flows

Refer to the Codification to determine the correct classification in the statement of cash flows (operating, investing, or financing) for the following transactions:

1. Cash contributions to charities
2. Proceeds from insurance on a building that was destroyed
3. Cash payments made to settle an asset retirement obligation
4. Payment for costs of debt issuance
5. Receipts from the sale of securities that were acquired specifically for resale
6. Cash payments to settle lawsuits
7. Interest paid that is capitalized into the cost of a building

Surfing the Standards Case 2: Cash Flow per Share

Refer to FASB ASC 230-10 and the Basis for Conclusions in FASB's *Statement of Financial Accounting Standards No. 95* to answer the following questions:

1. Are companies permitted to report cash flow per share on their financial statements?
2. What was FASB's rationale for making this decision?

Basis for Conclusions Cases

Basis for Conclusions Case 1: Classification of Interest and Dividends on the Statement of Cash Flows

U.S. GAAP and **IFRS** differ in the classifications of dividends and interest on the statement of cash flows. **U.S. GAAP** requires firms to classify cash receipts from interest and dividends and cash payments for interest as operating cash flows. However, **IFRS** allows entities to report these items in any of the three categories—operating, investing, or financing. Read the basis for conclusions in “Statement of Cash Flows,” *FASB Statement of Financial Accounting Standards No. 95*, Paragraphs 88 through 90.

1. Where did certain respondents think these cash receipts and payments should be classified? What was their reasoning?
2. What was the Board's reasoning for requiring that firms include these items in operating cash flows?

Basis for Conclusions Case 2: Indirect versus Direct Method of Presenting Operating Cash Flows

Currently, **U.S. GAAP** allows entities to present their operating cash flows either under the direct or the indirect method.

1. Briefly describe each method's approach.
2. What is the primary advantage of each method?
3. Discuss which participants in the financial reporting process preferred each of the methods and why.
4. Why did the Board decide to allow both methods?

Glossary/Index

A Combined Glossary/Subject Index

Note: Headings in bold indicate defined terms.

A

- abandonment of assets, 614
- Abercrombie & Fitch, 507, 1272, 1284–1286
- account.** An individual record of increases and decreases in specific asset, liability, and stockholder equity items, 98
- account format.** A balance sheet presentation that lists assets on the left side and liabilities and stockholders' equity on the right side of the statement, 242
- accounting cycle.** Describes the process by which a company records business *transactions* and ultimately aggregates and summarizes them in the financial statements, 91–169
- adjusted trial balance preparation in, 113–115
 - adjusting journal entries in, 106–113
 - alternative treatment of expenses and revenues in, 159–161
 - analysis of transactions in, 92–97
 - closing temporary accounts in, 117–118
 - comprehensive example of, 119–134
 - definition of, 92
 - financial statement preparation in, 115–117
 - introduction to, 91
 - journalizing transactions in, 97–104
 - post-closing trial balance preparation in, 118–119
 - reversing entries in, 168–169
 - review of, 140–158
 - unadjusted trial balance preparation in, 105
 - using a worksheet in, 161–167
- accounting equation.** An equation which illustrates the relationship among assets, liabilities, and stockholders' equity as follows: $\text{Assets} = \text{Liabilities} + \text{Stockholders' Equity}$ or $A = L + E$, 92–97
- definition of, 92
 - definition of terms in, 93
 - expanded, 95–97
- accounting policies footnote.** Part of the financial statements that describes the portfolio of accounting choices. It is typically one of the first notes to the financial statements, 57–58
- Accounting Principles Board (APB), 9
- Accounting Research Bulletins (ARBs), 9
- accounting standards
- conceptual framework in setting, 24–25
 - global process for, 12, 14–15
 - history of, 9–10
 - international, 8
 - political process of setting, 15
 - process for setting, 9–12, 14–17
 - role of standard setters in, 8
 - trends in, 15–17
- Accounting Standards Codification.** (Often referred to as the Codification) The single source of GAAP in the United States and includes all pronouncements issued by any of the standard-setting bodies that have not been superseded, 10
- as authoritative literature in research, 64–67
 - Herz on, 68
 - referencing, 66
 - structure of, 65–66
 - topic groupings in, 65
- accounting standard setters.** Organizations that develop and promulgate accounting concepts, rules, and guidelines that provide information that is relevant and faithfully represents the economic performance and the financial position of the reporting entity, 6
- role of, 8
- Accounting Standards Update (ASU), 10, 12, 64
- accounts payable.** Amounts owed for goods, supplies, or services purchased on open account, meaning that the invoice is the only formal documentation for the credit agreement, 239, 736–737
- accounts payable turnover ratio.** The number of times per year a company goes from full accounts payable balances to full repayment, 471
- accounts receivable.** Amounts owed to the entity resulting from the sale of goods or services to customers on credit. Also called trade receivables, 238, 446
- aging of, 452–455
 - cases on, 495–499
 - disclosures for, 468
 - factoring, 460–463
 - financing with, 458–463
 - initial measurement of, 446–450
 - pledging and assigning, 459
 - subsequent measurement of, 450–452
 - uncollectible, 450–458
- accounts receivable turnover ratio.** Indicates how many times per year the firm goes from a full receivable balance to complete collection, 469
- accretion expense.** The expense, reported in operating income, resulting from the increase in the carrying amount of the liability, 746
- accrual basis of accounting.** A system of accounting that recognizes revenues according to the revenue recognition concept and recognizes expenses according to the expense recognition concept, regardless of when they receive or pay cash, 42
- in adjusting journal entries, 42

- accruals.** Occur when the economic event that gives rise to revenue or expenses occurs before the cash is received or paid, 110
 accrued expenses, 111–113
 accrued revenues, 110–111
- accrued expenses.** Occur when the economic event that gives rise to revenue or expenses occurs before the cash is received or paid, 111
 in adjusting journal entries, 111–113
 in cash flow reporting, 303–304
- accrued liabilities.** Represent expenses incurred by an entity that remain unpaid at the end of the accounting period, 240
- accrued revenues.** Occur when a company has earned revenues but has not yet received cash, 110
 in adjusting journal entries, 110–111
- accumulated benefit obligation.** A pension obligation that estimates the pension obligation based on years of service performed by all employees under the plan, both vested and non-vested, using current salary levels, 1173
- accumulated depreciation.** A contra-asset account that represents the total depreciation taken over the life of the asset, 606
- accumulated depreciation elimination method.** Under the accumulated depreciation elimination method, a company eliminates all prior accumulated depreciation and adjusts the historical cost of the asset to fair value, 726
- accumulated other comprehensive income.** The cumulative amount of items such as unrealized gains and losses on available-for-sale investment securities, foreign currency translation adjustments, and certain pension cost adjustments, 240, 860
- accumulated rights.** Permit an employee to carry forward unused benefits to future periods, 743
- acquired in-process R&D.** An asset obtained in a business combination representing the fair value assigned to in-progress research and development projects that are not yet commercially viable, 623
- acquisition costs.** The price paid to obtain the property or the right to search and explore, including acquisitions accounted for as capitalized leases, 660
- Activision Blizzard, 55, 56, 64
- actual default.** When a debtor misses interest and/or principal payments, it is known as an actual default, 797
- actual return.** *See* effective interest rate
- actuary.** An individual skilled in mathematics, statistics, and finance who analyzes the financial consequences of risk based on probability assessments, 1172
- additional markup.** The amount that the firm increases the selling price above the original selling price, 546
- additional paid-in capital.** The amounts that common and preferred shareholders contribute in excess of the par or stated value, 860
- Adidas, 315
- adjusted market assessment approach.** An approach to determine the standalone selling price that focuses on the amount that the seller believes that customers are willing to pay for the good or service by evaluating the market, 388
- adjusted trial balance.** The listing of all accounts and their ending debit or credit balances after making the adjusting journal entries, 106, 113
 preparing the, 113–115
- adjusting journal entries.** Entries made to ensure that all revenues are recognized in the period earned and all expenses are recognized in the period incurred, 106
 accrued expenses, 111–113
 accrued revenues, 110–111
 deferred revenues, 108–110
 preparing, 106–113
- Adobe Systems, 954–955, 958–960
- advance collections. *See* deferred revenue
- aging of accounts receivable.** An estimate of the allowance for uncollectible accounts using the following steps: 1. determine the balance in each aging category by separating the accounts receivable balances based on the age of the receivable (i.e., the amount of time that has passed from the original date of sale to the bad debt estimation date). 2. multiply the balance in each aging category by an estimated percentage of uncollectible accounts for that specific category. 3. Add the subtotals of each aging category to determine the required balance in the allowance for uncollectible accounts. 4. Record the bad debt expense needed to adjust the allowance for uncollectible accounts to the correct balance, 452–455
- allowance method.** Estimates the net realizable value (NRV) of accounts receivable and the current period's bad debt expense in the period of the sale, 451–452
- Alphabet Inc., 995, 1268, 1303, 1305, 1306, 1307, 1309
- Amazon, 373, 1309
- American Airlines, 29–30
- American Institute of Certified Public Accountants (AICPA).** The national professional association for certified public accountants (CPAs) in the United States. The AICPA prepares and grades the Uniform CPA Examination, 6, 13
- amortization.** The systematic and rational allocation of the cost of a finite-life intangible asset to expense over the asset's expected useful life or legal life, whichever is shorter, 106, 624
 as deferred expense in adjusting journal entries, 106–108
 of intangible assets, 624–625
 in statement of cash flows, 1335–1336
- amortized cost.** The original cost less the unamortized amount of the premium or discount, 921
- anchoring bias.** The tendency to focus on one piece of information (often the first piece that he encounters), weighting it more heavily than other pieces of information. It is a cognitive bias, 63
- Angell, Thomas, 957
- annual report, 262–265

- annuity.** A series of periodic payments or receipts of equal amounts that occur at equal time intervals between each cash flow, 319. *See also* annuity due
- annuity due.** An annuity where the cash flows occur at the beginning of the interest period, 319, 331
 future value of, 335–339
 present value of, 342–346
- annuity in advance. *See* annuity due
- annuity in arrears. *See* ordinary annuity
- antidilution sequencing.** A procedure to place potentially dilutive securities in rank order, from the most dilutive to the least dilutive, to determine whether each security has an antidilutive effect on diluted earnings per share, 1237–1238, 1243–1244
- antidilutive effect.** Occurs if EPS increases or loss per share decreases when assuming the conversion of securities or exercising options and warrants, 1235
 convertible securities and, 1235–1236
 with net loss from continuing operations, 1238
 options and warrants, 1237
- Apple, 618, 665
- applied financial accounting research process, 69–75
 applying, 71
 authoritative literature used in, 64–69
 communicating results of, 70
 developing conclusions in, 70
 establishing and understanding the facts in, 69
 evaluating results of literature searches in, 70
 example of, 71–75
 identifying the issue/research question in, 69
 searching the authoritative literature in, 70
 summary of, 77
- Aries Endoscope, 300–302, 305–307
- arms-length transaction.** A transaction that involves a buyer and seller who are independent and unrelated parties, each bargaining to maximize his or her own wealth, 39
- Asklepion Pharmaceuticals, 620
- asset grouping.** Before testing assets for impairment, a firm must determine whether to assess them as individual assets or in asset groups. An asset grouping is the lowest level of identifiable and independent cash flows. So, if cash flows are identifiable and independent for an individual asset such as a delivery truck, the firm can test the delivery truck for impairment. Alternatively, if the delivery truck is part of a fleet of a store's delivery trucks, the delivery fleet could be considered an asset group. The rationale is that the cash flows from an individual truck are dependent on the cash flows from the other trucks in the fleet, 667, 673
- asset/liability (balance sheet) approach.** Basing the decision to record a transaction on whether an economic resource is received and it meets the definition of an asset, such as accounts receivable, 17, 997
- asset retirement obligations.** Long-term legal obligations to dismantle and scrap assets or to restore property used for business purposes, 746–748
- assets.** Probable future economic benefits obtained or controlled by a particular entity as a result of past transactions or events, 32
 in the accounting equation, 92–95
 derecognition of, 613–614
 determinable market value of, 592
 in IFRS, 34–35, 241
 nondeterminable market value of, 592–593
 in statement of cash flows, 1329–1330
 in statements of financial position, 238–239, 241
- assigns accounts receivable.** When the company assigns accounts receivable, specifically designated receivables are collateral for the loan, but the company must use the receipts on collection of the receivables to repay the debt, 459
- assumptions, in financial reporting, 42–43
 IFRS-specific disclosures on, 59–61
- assurance-type warranty.** A warranty that does not provide an additional good or service to the customer. Also referred to as a base warranty, 754–756
- AstraZeneca plc, 58
- AT&T, 587–588, 606, 615, 617, 619, 627–628, 630–631, 992, 1023, 1026, 1030, 1033
- auditors, 6
 report of in annual reports, 263–264
- authoritative literature, 64–69
 Basis for Conclusions, 69
 searching, 70
- authorized shares.** The total number of shares that the firm can legally issue, 861
- availability bias.** The tendency to use the data that is most readily available or most easily recalled to make a decision, as opposed to considering all relevant data. It is a cognitive bias, 63
- available-for-sale security.** If a debt security is not classified as held-to-maturity or trading, then it is classified as an available-for-sale security, 924–931
 definition of, 918
 disclosures for, 954
 impairment of, 982–985
 reclassification adjustments for, 929–931
- average age.** Estimate of how old a company's assets are, computed as the amount of accumulated depreciation divided by depreciation expense, 629
- average remaining life.** Computed as the balance of ending net fixed assets divided by depreciation expense, 629
- avoidable interest.** The interest the firm could have avoided if it had not borrowed funds to construct the plant asset. Used in determining when to capitalize interest costs, 594
- B**
- bad debt expense.** An expense recorded on the income statement to reflect the cost of uncollectible accounts, 450
- bad debt expenses, 1332–1333
- balance sheet, 3, 235. *See also* statement of financial position

- balance sheet approach.** A method to compute deferred tax based on the differences between book carrying values and tax bases of a firm's assets and liabilities. Also referred to as the asset and liability method, 997. *See also* balance sheet
- balance sheet equation. *See* accounting equation
- balance sheet errors.** Errors which only affect asset, liability, and equity accounts, are typically the result of a misclassification of accounts in the recording of a transaction, 1276. *See also* balance sheet
- bank charges and credits.** Banks charge depositors for services such as check printing, safe deposit box rentals, and other services. Bank credits include interest accrued, 501
- Bank of America, 27
- bank overdraft.** Occurs when the balance in a bank account falls below zero, 444, 1305
- bank reconciliation.** Compares the bank statement to the amount recorded in the company's general ledger cash account, 501–504
- bargain purchase.** A company makes a bargain purchase when the fair value of the identifiable net assets in an acquisition exceeds the purchase price, meaning that the buying entity acquired the company for less than its fair value, 620
- bargain purchase option.** An option allowing the lessee to acquire the property at a price specified at the inception of the lease that is substantially below the expected fair market value of the property at the date the option can be exercised, 1129
- base warranty. *See* assurance-type warranty
- base year.** The first year that the company reports under dollar-value LIFO, 530
- basic earnings per share.** A measure of the earnings per share available to common shareholders that does not consider the potentially dilutive effects of convertible securities and employee options, 1222–1226
denominator for, 1223–1225
judgments in, 1225–1226
numerator for, 1222
- Basis for Conclusions (BC).** Discussions of the Board's reasoning and thought processes used to create the standard, 69
- basis.** The carrying values of assets and liabilities, either for book or tax reporting, 992
- basket purchase.** In a basket purchase, a firm acquires two or more fixed assets together for a single purchase price, 590–591
- Bayer AG, 820
- BellSouth, 617
- beneficial conversion option.** An option to convert the debt to equity that is in the money, 816–818
- Best Buy, 507
- Biché, Peter, 354
- big bath.** Increasing a net loss to allow the firm to show increased net income in the future, 175, 536
- bill-and-hold arrangements.** Transactions where a buyer accepts title and billings but delays the physical receipt of the goods, 414
- billings in excess of costs and recognized profits.** A liability account arising from netting the billings on construction in progress account and the construction-in-progress account when the billings on construction-in-progress account is larger. It is used in accounting for long-term contracts, 404
- billings on construction in progress.** A contra account to the construction-in-progress account that reduces the net carrying value of the asset, CIP, 404
- BlackBerry Limited, 665, 668, 669, 693
- BMW, 27
- BNP Paribas SA, 989
- board of directors.** A body that oversees the activities of the company, 265
- bond indenture.** The bond indenture contract between the corporation and the bondholders (represented by a trustee) protects the rights of multiple creditors by outlining the debt covenants, enforcement, and the type and terms of the bond, 796–797
- bond issue proceeds, computing, 355–357
- bonds payable.** Debt instruments typically issued for a period greater than a year to raise capital that requires the debtor to repay the principal balance at a specified date in the future, referred to as the maturity date, 795
amortization of in statement of cash flows, 1335–1336
credit ratings, 795–796
effective interest rate method of amortization, 802–804
interest accrual for, 806–808
issued at a discount, accounting for, 804–809
issued at a premium, accounting for, 802–804
issued at par, 800–801
overview of, 795–800, 801
pricing, 797–800
zero-coupon, 808–809
- bonds with stock warrants attached.** Bonds which are bonds that also include long-term options to acquire common stock, 797, 820–822
- book and tax reporting, differences between
comprehensive problem on, 1059–1062
no differences, 992–993
permanent, 993–995
temporary, 995–1006
- book income.** The amount of income that a company reports in its financial statements, 992. *See also* book and tax reporting, differences between
- breakage.** A percentage of the company's total gift card sales that is never redeemed, 738, 739–740
- bright-line tests.** Tests that require meeting a pre-established numerical threshold, 16
- Broadwind Energy, Inc., 414
- buildings, 590
- business environment complexity, 64
- business model test, 932
- business or economic entity concept.** A concept in financial reporting that states that all transactions and events relate to the reporting entity and must be kept separate from personal affairs of the owner, related businesses, and the owner's outside business interest, 43

C

- callable bonds.** Bonds which can be called at the corporation's option at specified dates, 797
- callable obligations.** Liabilities for which the creditor can require immediate payment when specified conditions exist, 826–827
- callable preferred shares.** Preferred shares for which the issuing entity has the right to call (in essence, buy back) the shares at a specified price and future date, 876
- call option.** Gives an investor the right (but not the obligation) to purchase a security at a fixed price over a specified period of time, 1152–1153
- capital expenditure.** A cost recorded by a company as an asset rather than an expense, 588
- capitalization policy.** A company's guidelines for when an expenditure should be considered an expense *versus* an asset, usually based on the type and/or the magnitude of the cost of the asset acquired, 589. *See also* interest capitalization
- capitalization.** The process of recording an expenditure as an asset, 588
- constructed assets and overhead costs, 599
 - with general outstanding debt, 597–599
 - IFRS, 599–603
 - of interest, 593–603
 - period of, 595
 - without general outstanding debt, 595–597
- capital maintenance adjustments.** Restatements or revaluations of reported amounts of assets and liabilities that companies usually report in comprehensive income, 35
- capital structure.** A company's capital structure indicates its sources of funds from debt and equity issuances used to finance overall operations and capital expenditures, 1226
- carryback.** Allows a company to offset the current tax loss against prior years' taxable income and claim a refund for taxes previously paid on the amount offset, 1015–1016
- accounting for NOL, 1016–1017
- carryforward.** Permits a company to offset the current tax loss against future taxable income, thereby reducing future taxable income and lowering the amount of tax due in the year of the offset, 1015–1016
- accounting for NOL, 1017–1020
 - realizability of, 1020–1021
- cash.** Consists of coins, currency, and bank deposits, as well as negotiable instruments such as checks and money orders, 444
- cash and cash equivalents.** Include cash (coins, currency, and money orders) and cash equivalents (short-term, highly liquid investments acquired with three months or less to maturity), 238, 444
- accounting for, 444–446
 - internal controls over, 500–505
 - reconciliation of in statement of cash flows, 1308–1309
 - in statement of cash flows, 1304–1305, 1308–1309
- cash-basis accounting.** Accounting system that recognizes revenues when they receive cash and only recognizes expenses when they pay cash, 41
- in adjusting journal entries, 106
- cash basis.** Under the cash basis, companies only recognize revenues when cash is received and expenses when cash is paid, 106
- cash coverage ratios, 1348–1349
- cash discounts. *See* sales discounts
- cash dividends.** Distributions that firms make to the shareholders in cash, 879, 880–881
- cash equivalents.** Short-term, highly liquid investments with original maturities of three months or less, 444, 1304–1305
- cash flows. *See also* statement of cash flows
- direct method of reporting from operating activities, 302–306
 - from investing and financing activities, reporting, 306–307
 - present value of expected, 353, 354
- cash-generating unit (CGU).** The smallest identifiable group of assets that generates cash inflows that are largely independent of the cash inflows from other assets or groups of assets, 680
- cash operating cycle.** The period of time it takes a company to pay its suppliers less the time a company takes to collect cash from sales, 470–471
- cash ratio.** Includes only cash and cash equivalents and highly liquid short-term marketable securities in the numerator, 763
- cash-settled stock appreciation rights.** A type of stock-based compensation with the employee receiving cash for the amount of the increase in a company's share price over a fixed period of time, 1160
- Caterpillar Inc., 528–529
- ceiling.** The lowest amount at which inventory can be measured under the lower-of-cost-or-market rule. The ceiling is the net realizable value (NRV), 536
- changes in accounting, 1265–1301
- errors and error analysis, 1277–1284
 - estimates, 1266, 1274–1276
 - financial statement analysis and, 1284–1286
 - methods for reporting, 1267
 - principle, 1266, 1267–1274
 - reporting entity, 1266, 1276–1277
- changes in accounting estimate.** Changes which involve revisions of estimates used in accounting, 1266
- disclosure of, 1276
 - judgment in, 1275
 - prospective method and, 1274
- changes in accounting estimate effected by a change in accounting principle.** A change in estimate that is inseparable from the effect of a related change in accounting principle, 1275
- changes in accounting principle.** Changes from one generally accepted accounting method to another generally accepted accounting method, 1266
- direct and indirect effects of, 1268
 - disclosures for, 1274
 - prospective method and, 1272–1273
 - reporting, 1267–1268
 - retrospective method and, 1268–1272
- changes in the reporting entity.** Changes which occur when a company reports financial statements that are, in effect, financial statements for a different reporting entity, 1266, 1276
- disclosure of, 1276–1277

- channel stuffing.** A practice in which a company induces wholesale distributors to buy more inventory than they can sell in the current period, thus “stuffing” the distribution channel, with increased discounts or liberal return policies. Also referred to as trade loading, 415
- chart of accounts.** A numerical listing of the account names and numbers that assists in locating the account in the ledger, 98
- Chevron Corporation, 526
- Cisco Systems, Inc., 589
- Citigroup Inc., 915, 931, 988–989
- Click Group Limited, 543
- closing.** The process of bringing all temporary accounts to a zero balance, 117
temporary accounts, 117–118
- Coca-Cola Company, 929, 931, 956
- codification. *See* Accounting Standards Codification
- cognitive biases.** Systematic deviations from rationality, to which we are all subject, that can impact judgments on a day-to-day basis, 63
techniques to mitigate, 63–64
types of, 63
- Cohen, Michael, 261
- CohnReznick, 261
- collectability assessment, 376–377
- commercial substance.** The risk, timing, or amount of the entity’s future cash flows is expected to change as a result of the contract, 376, 655
nonmonetary exchanges and, 655–660
- Committee on Accounting Procedures (CAP), 9
- common shareholders.** The residual claimants of the firm who receive dividend distributions after the company has paid all other providers of capital their return on investment, 860
- common-size financial statements.** Statements that measure each financial statement line item relative to some key amount or total, 228
- common stock, 861–866
issuances, accounting for, 862–865
issue costs, 863–864
issued for cash, 863
issued for noncash consideration, 864–865
par and stated values, 862
stock splits, 865–866
- comparability.** Financial information that allows financial statements users to identify and understand similarities and differences among several entities. Comparability is an enhancing characteristic, 29–30
- comparative financial statements.** Companies issue comparative financial statements in order to provide financial information for more than one reporting period, thus allowing a user to compare the company on a year-to-year basis, 228
- compensated absences.** Employer-paid time off for vacation, illness, holidays, military service, jury duty, and maternity leave, 742–745
- compensating balances.** Minimum cash balances that debtors are required to keep on deposit as support for existing credit agreements that are either part of a contractual agreement or informal, 797
- compensation arrangement.** Specifies the number of options granted, the exercise price, the vesting period, and the expiration date, 1153
- competitors.** Companies that produce the same service or product, 5
- completed-contract method.** A method that only recognizes gross profit at the end of a long-term contract, 401, 407–410
comparison of with percentage-of-completion method, 418–420
- complete.** Financial information that includes all information—both descriptions and explanations—necessary for the financial statement user to understand the underlying economic event. Complete information is an attribute of a faithful representation, 28
- complexity, judgment issues related to, 64
- component.** A component is an activity that transfers a good or service to the lessee, 1066–1067
allocation of, 1067–1068
- component of an entity.** It is (1) a portion of the entity (2) comprising operations and cash flows (3) that can be clearly distinguished, operationally and for financial reporting purposes, from the rest of the entity, 187
- compounding.** The process of moving from the PV to the FV, 319. *See also* number of compounding periods
- compound interest.** Interest computed on both the principal and the interest left on deposit, 317–318
- comprehensive income.** The change in equity of a business enterprise during a period from transactions and other events and circumstances from nonowner sources. It includes all changes in equity during a period except those resulting from investments by owners and distributions to owners, 33–34. *See also* statement of comprehensive income
accounting for, 886–888
accumulated, 888
components of, 886–887
in income statements, 172
reporting, 887–888
- Computer Sciences Corporation (CSC), 2–3
- conceptual framework.** Sets forth theory, concepts, and principles to ensure that accounting standards are coherent and uniform, 24. *See also* financial reporting
accounting changes and, 1266
accounting for impaired long-term operating assets, 66
components of, 24–25
convertible bonds and, 815
cost-allocation of intangible assets and, 624
defined-benefit pension plans, 1174
depreciation and, 605
earnings per share and, 66
elements of financial reporting, 30, 32–36
fair value vs. cost of investments in financial assets, 917
IFRS, 27

- income statements, usefulness and limitations of, 173–174
- intangible asset measurement, 618
- inventory valuation methods and, 526
- lease classification and, 1075
- loss contingencies and, 750
- lower or cost or market and, 536
- notes to the financial statements and, 256–257
- objective of financial reporting, 27
- other comprehensive income and, 887
- preferred stock and, 872
- present value of expected cash flows, 353
- property, plant, and equipment measurement, 588–589
- revaluation and, 725
- revenue recognition and, 375
- revenue recognition for long-term contracts, 402
- share repurchase transactions and, 866
- statement of cash flows and, 246, 1304, 1309–1310
- statement of financial position and, 236–237
- stock-based compensation and, 1153–1154, 1170–1171
- temporary differences and, 1005–1006
- uncollectible accounts and, 450
- condensed statement of net income, 179–181
- confirmatory bias.** The tendency to under-weight information that is not consistent with their initial beliefs. It is a cognitive bias, 63
- confirmatory value.** Financial information that provides feedback about prior evaluations. Confirmatory value is an attribute of relevance, 28
- conservatism ratio.** A ratio of a company's aggressiveness in financial reporting compared to tax reporting, 1032
- consideration payable to a customer, 386–387
- consignment sale.** An arrangement where a seller (referred to as the consignor) delivers goods to a third party (the consignee), who sells the goods to the customer, 411–413
- inventory costing and, 513
- consistency.** The firm's use of the same accounting methods for the same transactions from period to period, 1266
- constraining estimates of variable consideration, 383–384
- construction in progress.** An asset account because, as project costs are incurred, the contractor has the right to bill the buyer, 404
- Consumer Price Index (CPI), 1142
- contingencies.** Existing conditions, situations, or set of circumstances involving uncertainty that will ultimately be resolved when one or more future events occur or fail to occur, 749–762
- definition of, 749
- disclosures for, 762
- gain, 749, 762
- IFRS accounting for, 752
- judgment and, 760
- loss, 749–762
- premiums, 758–759
- unrecognized, 762
- warranty costs, 754–758
- contra-asset account.** An asset account that has a normal credit balance, 107
- contract.** An agreement between two or more parties that creates enforceable rights and obligations, 376
- allocating transaction price of performance obligations in, 387–392
- criteria for, 376–377
- determining transaction price for, 381–387
- identifying performance obligations in, 379–381
- identifying with a customer, 376–379
- lease, 1066–1068
- long-term, accounting for, 401–415
- multiple, with the same customer, 378
- revenue recognition disclosures in, 415–420
- revenue recognition in, 393–421
- contract balances, 415–416
- contractual cash flow characteristics test.** The contractual cash flow characteristics test is passed if cash flows from the debt investment are solely payments of principal and interest on the outstanding principal balance. This test is referred to as the *SPPI test* (solely payments of principal and interest), 932
- contributed capital.** The amounts paid into a company by *common* and *preferred* shareholders, 240, 860
- in the accounting equation, 93
- contributory plans.** Pension plans that require employees to fund some or all pension benefit costs and allow employees to make additional contributions to voluntarily increase their retirement benefits, 1171
- control.** When a customer has the ability to direct the use of an asset and receives (or substantially all) of the remaining benefits of owning the asset, 393
- equity securities and, 933–934
- conventional retail inventory method.** An inventory allocation method that approximates the cost of ending inventory balance by taking into consideration the requirement that firms report inventory at lower of cost or market based on the relationship between cost and selling price, 545–548
- convertible bonds.** Bonds which bondholders may convert into capital stock, 814–820
- accounting for, 815–816
- beneficial conversion options, 816–818
- conceptual framework and, 815
- definition of, 797, 814
- convertible debt, 829
- diluted EPS and, 1227–1231
- convertible preferred shares.** Preferred shares that allow the shareholder to convert its shares to common shares at a predetermined rate or exchange ratio, 875–876
- cookie jar reserves.** Increasing earnings as needed, possibly to exceed analysts' forecasts, 176
- copyrights.** An exclusive right to reproduce and sell an original work—including books, musical scores, advertisements, other works of art, and computer programs—for the creator's life plus 70 years, 616

corridor. A method used in accounting for defined-benefits pensions plans to determine when to report actuarial gains (losses) in net income. A corridor is defined as 10% of the larger of the beginning balance of the projected benefit obligation or the beginning balance of the plan assets, 1179–1180

Cosgrove, Stephen J., 626

cost-benefit constraint. A requirement that the expected benefits from recognition exceed the costs of recognition, 36–37

cost constraint, 30

cost-flow assumption. A company will choose a cost-flow assumption to move the cost of the item from inventory to cost of goods sold in the accounting system, 516
determining cost of goods for sale and, 516–517
inventory allocation methods and, 518–526
LIFO, 523–535

cost method. Records the acquisition of treasury shares at the cost of the repurchased shares, 867–868

costs and recognized profits in excess of billings. Billings in excess of costs and recognized profits—a liability account arising from netting the billings on construction in progress account and the construction-in-progress account when the billings on construction in progress account is larger. It is used in accounting for long-term contracts, 404

cost-to-cost approach. A common method used in practice that estimates the cumulative percentage of completion by dividing the total cost incurred to date by total estimated costs, 402, 403

credit. The right-hand side of an account, 99
journalizing, 99–100

credit loss. A difference between the amortized cost of the investment and the present value of cash flows expected to be collected, 981–982

creditors and other debt investors. Entities, including banks and other financial institutions, that lend money to the company either through a private agreement or through a public debt offering, 5

credit ratings, 795–796

credit risk. Credit risk is the chance that the borrower will not repay the principal and/or interest, 830–832

cumulative preferred shares. Preferred shares that contain a provision stipulating that if the board of directors does not declare a dividend, the dividends accumulate, 874

current assets. Resources that the firm expects to convert to cash, use, or consume within one year or one *operating cycle*, whichever is longer, 238

current cost. The amount of cash (or equivalent) that would be required if the firm acquired the asset currently, 38
in IFRS, 41

current liabilities. Obligations that the firm expects to liquidate through the use of current assets or the creation of other current liabilities, 239–240

current market value. The amount of cash (or equivalent) that the firm would receive by selling the asset in an orderly liquidation. Liabilities may also be measured at current market value, 38, 39

current maturities of long-term debt. Represent the portion of any long-term debt that is payable within the next year or operating cycle, if longer, 239

current ratio. Expresses liquidity as the ratio of current assets to current liabilities. Also known as the working capital ratio, 308

current replacement cost (CRC). The amount at which inventory can be purchased or reproduced, which is used to measure inventory under the lower-of-cost-or-market rule, 536–537

customer lists. A customer list consists of information about customers such as their names and contact information, 616
customers, reporting cash collected from, 302, 1317

D

days accounts payable outstanding. The number of days a company takes to pay its suppliers, and is calculated by dividing the number of days in a year, 365, by the number of times accounts payable turns over in a year, 471

days inventory on hand. The number of days a company takes to sell its inventory, and is calculated by dividing the number of days in a year, 365, by the number of times inventory turns over in a year, 470

days sales outstanding. The number of days a company takes to collect its receivables from customers, and is calculated by dividing the number of days in a year, 365, by the number of times accounts receivable turns in a year, 469–470

debenture bonds. Bonds which are unsecured bonds (that is, there is no collateral backing), 797

debit. The left-handpost side of an account, 99
journalizing, 99–100

debt covenants. Debt compliance agreements that place restrictions on the corporation to protect the bondholders' interest and ensure cash is available for repayment of the debt, 797

debt extinguishment. When a company retires bonds early, it is referred to as a debt extinguishment, 813–814

debt securities

available-for-sale, 924–931

classification of, 918

disclosures for, 953

held-to-maturity, 918–922

IFRS accounting for, 932–933

investments in, 916

key questions for, 917

trading, 922–924

transfers between classifications, 931–933

debt-to-equity ratio. A measure of leverage, 309–310

declaration date. The date on which the board of directors declares the dividend and the firm records a legal liability for the dividend, the company records the dividend with a debit to the dividends account and a credit to dividends payable, 880

decreasing-charge methods. Depreciation methods that take more depreciation in the early years than in the late years of the asset's useful life, 608–611

Deere & Company, 528, 534–535, 757, 758

- defensive interval ratio.** A ratio which gauges liquidity based on current resources available to meet current cash expenditures, 763–764
- deferrals.** Occur when a company receives or pays cash before recognizing the revenue or expense in the financial statements, 106–110
 expenses, 106–108
 revenues, 108–110
- deferred annuity.** Results from a variety of contracts where payments or receipts are delayed until a future period, 351–353
 future value of, 351–352
 present value of, 352–353
- deferred expense.** An expense which occurs when a company makes a cash payment before incurring an expense under accrual basis accounting. Also referred to as prepaid expense, 106
 in adjusting journal entries, 106–108
 alternative treatment of, 159–160
 in cash flow reporting, 304–305
- deferred revenue.** Occurs when a company receives cash before earning revenue and recognizes it on the financial statements under accrual basis accounting, 108
 in adjusting journal entries, 108–110
 alternative treatment of unearned, 160–161
- deferred tax asset.** Represents a future reduction in income taxes payable, 997
 IFRS treatment of, 1009–1013
 realizability of, 1006–1013
 tax rate changes and, 1013–1015
 treatment of, 1006–1013
- deferred tax liability.** Represents additional income taxes payable that will be due in future years, 997
- deficit.** A negative balance in retained earnings, 94
- defined-benefit plan.** A pension plan that specifies a predetermined amount of benefits that the employee will receive at the time of retirement, 1174
 accounting for, 1174–1186
 comprehensive problem on, 1215–1220
 current-year net gains and losses, 1178–1180
 expected return on assets, 1177–1178
 IFRS, 1181–1186
 interest on the PBO, 1176–1177
 judgments in, 1186
 payments to retirees, 1181
 plan funding, 1180
 prior service costs, 1175–1176
 service cost, 1174–1175
 disclosures, 1187–1189
 financial statement analysis, 1189–1192
- defined-contribution plan.** A pension plan in which the employer contributes a fixed amount each period based on a formula that is typically a percentage of the employee's salary, 1172
- Deloitte & Touche LLP, 761
- Delta Air Lines, 29–30, 737–738
- depletion.** The process of allocating the cost of the natural resource over its useful life, 660, 661–663
- deposits.** Businesses often require buyers to pay a deposit for goods or services, which is an amount a buyer remits to a seller that will be returned to the buyer at some point in time when a specific event occurs, 741
- deposits in transit.** Timing difference that occurs when a company makes a bank deposit at the end of the current month and the amount of that deposit is recorded in the company's books, 501
- depreciation.** The systematic and rational allocation of the cost of a long-term operating asset to expense over the asset's expected useful life, 106, 605
 conceptual framework and, 605
 as deferred expense in adjusting journal entries, 106–108
 guidelines for, 606
 methods for, 606–612
 overview of, 606
 partial-year, 611–612
 revaluation and, 726
 of tangible fixed assets, 605–613
- derecognition of assets, 613–614, 625
 previously revalued, 732–733
- detachable warrants.** Detachable warrants can be removed by the holder and sold separately on the secondary market, whereas nondetachable warrants cannot, 820
- determinable market value, 592
- Deutsche Bank AG, 989
- development costs.** Costs that include intangible costs (such as grading the land and digging tunnels and shafts) as well as tangible costs (such as heavy equipment needed to extract the natural resource), 661
- Diageo PLC, 415
- diluted EPS.** A computation that incorporates the effects of potentially dilutive securities, 1226
 convertible debt and, 1227–1231
 convertible preferred stock and, 1232–1233
 if-converted assumption and, 1227
 options and warrants and, 1233–1235
- direct effects.** Changes necessary to implement the change in accounting principle, 1268
- direct financing lease.** For a lessor, a lease that meets both of the Group II criteria but none of the Group I criterion is classified as a direct financing lease, 1070
 accounting for, 1098–1102
 deferred profit in, 1139–1141
 initial measurement of, 1098–1100
 subsequent measurement of, 1100–1101
- direct method.** For reporting cash flows from operating activities, companies report actual cash inflows and outflows in the operating section of the statement of cash flows. Also referred to as the income statement format, 302–306
 for deferred income taxes, 1331
 in statement of cash flows, 1316–1321

assumptions in, 57
IFRS-specific disclosures on, 59–61, 260
sources of uncertainty in, 260
- ex-dividend date.** The date on which the current holder of stock will not receive the dividend payable. It is determined by the relevant stock exchange once the company has announced the record date, 880
- executory costs.** Costs incurred by a lessee related to ownership of a leased asset such as sales and property taxes, insurance, and maintenance, 1135–1138
- executory costs.** Costs that include property taxes, insurance, maintenance, and other costs that are associated with the ownership of the leased asset, 1135–1138
- exercise price.** The fixed amount paid to acquire a share of stock based on the terms of the option plan. Also referred to as strike price, 1153
- expected cash flow approach.** Uses a range of cash flows and incorporates the probabilities of those cash flows to provide a present value measurement, 353, 355
- expected-cost-plus-a-margin approach.** An approach to determine the standalone selling price that focuses on internal factors by forecasting the costs associated with providing the goods or services and adding an appropriate profit margin, 388
- expected return on plan assets.** The return based on expectations for interest, dividends, and fluctuations in the market value of the fund assets, 1177–1178

expected-value approach. An approach for computing the transaction amount when there is variable consideration under which the entity sums the probability-weighted amounts in a range of possible consideration amounts, 381–382
for accounts receivable, 449–450

expense recognition principle. A financial reporting principle to determine the period when a company reports an expense on the income statement, 37–38
in cash *vs.* accrual accounting, 41–42
in IFRS, 40–41
in U.S. GAAP, 40

expenses. Outflows or other consumption of assets or incurrences of liabilities (or a combination of both) from delivering or producing goods, rendering services, or carrying out other activities that constitute the entity's ongoing major or central operations, 33, 34
in the expanded accounting equation, 93–94

expiration date. The point at which the employee can no longer exercise the options, 1153

exploration and evaluation costs. Costs incurred to find and determine the technical feasibility and commercial viability of extracting the resource, 660, 661

Exposure Drafts (EDs), 11

extended warranty. A warranty that exists if the customer has the option to purchase the warranty separately or if the warranty provides a service to the customer beyond the period covered by the assurance-type warranty. Also referred to as a service-type warranty, 754, 756–757

external auditors. Individuals that are independent of the company and are responsible for ensuring that management prepares and issues financial statements that comply with accounting standards and fairly present the financial position and economic performance of the company, 6

impairment. Occurs when an asset's total future cash-generating ability falls below its carrying value, 666
cases on, 717–725
conceptual framework and, 666
determining loss from, 670–672
disclosure requirements, 692–695
financial statement analysis and, 700–702
of goodwill, 675–679
of indefinite-life intangible assets, 673–679
of investments in financial assets, 980–989
judgment in, 678–679
of long-term operating assets held for sale or disposal, 696–700
overview on, 666–667
revaluation model for, 725–734
testing for, 667–672
two-step test for, 669–672

impairment indicators. Indicates that an asset may be impaired, 668–669

impairment loss. When the asset's carrying value is greater than its fair value, a company reports an impairment loss, calculated as the carrying value less the fair value, 670–672

impairment testing, 664

implicit rate. The rate of interest that sets the present value of the lease payments plus the present value of the amount that a lessor expects to obtain from the leased asset at the end of the lease term equal to the sum of the fair value of the leased asset and any deferred initial direct costs incurred by the lessor, 1071–1072

- imprest petty cash system.** A cash fund for which a fixed amount of cash is reserved on hand and is then replenished at the end of the period, 505
- imputed rate of interest.** Reflects the market rate of interest that a borrower would incur today under similar terms and conditions, 592
- income before tax, 187
- income from continuing operations.** Income from portions of the business that are expected to continue into the future, 184–187
- income statement approach.** Recording based on revenue recognition criteria involving, 17
- income statement errors.** Errors which only affect revenue, gain, expense, and loss accounts, are also commonly caused by misclassification mistakes, 1279–1280
- income statements, 171–234
- discontinued operations, 187–193
 - earnings quality and, 174–176

 - with temporary differences book and tax reporting, 995–1006
 - uncertain tax positions and, 1022–1026
 - withheld, 783
- income tax provision.** Reports the tax expense determined by considering the income tax effects of operating in all jurisdictions, 187
- incremental borrowing rate.** The rate of interest that a lessee would have to pay to borrow an equal amount on a collateralized basis over a similar term to the lease payments in a similar economic environment, 1072
- incremental (or residual) method.** If the fair value of the bonds or the warrants is not readily determinable, then allocate the portion of the proceeds to the instrument based on the readily available fair value and allocate the residual amount to the other instrument, 821
- indefinite-life intangible asset.** An indefinite-life intangible asset has no identifiable legal, regulatory, contractual, or competitive factors that limit the asset's revenue-generating term, 617
- IFRS impairment calculation, 683–685
 - impairment of, 673–679
- indirect effects.** Changes to current or future cash flows that result from the change in accounting principle, 1268
- indirect method.** Under the indirect method, firms reconcile net income to cash generated from operating activities by making two types of adjustments: 1. Adjustments for noncash revenues, expenses, and other gains and losses 2. Adjustments for changes in current assets and liabilities. Also referred to as the reconciliation format, 249
- adjustments in, 1336
 - for deferred income taxes, 1331–1332
 - in reporting cash flows, 249–252, 299–302
 - in statement of cash flows, 1310–1316
- individually significant operations, 190
- industry comparisons, 58
- infrequent in occurrence.** Transactions or events not reasonably expected to reoccur in the foreseeable future, 186
- initial direct costs.** Incremental costs that the lessee would not have incurred if it had not obtained the lease, such as commissions, legal fees resulting from the execution of the lease, costs to prepare documents after the execution of the lease, and payments to existing tenants to move out of a facility, 1067
- initial markup.** The difference between the selling price that the company originally sells the product for and the cost of the product, 546
- initial public offerings (IPOs), 859
- installment loan.** An installment loan requires a fixed payment each period that includes both principal and interest, 790–793
- installment sale.** A sale that is recognized as revenue only when cash is received for tax reporting but is recognized as revenue before cash is received for financial reporting, 998–999
- instrument-specific credit risk.** The risk of the specific security, not general market risk or interest rate risk, 827–828
- insurance, cash paid for, 1319–1320
- intangible assets.** Assets without physical substance that have economic value because of the contractual or legal rights they confer upon the holder, 616–629
- acquired in a business acquisition, 618
 - acquired individually or with a group of assets, 618
 - amortization of, 624–625

 - markdown cancellation.** The amount by which the firm reduces an additional markup but not below the original selling price, 546
 - markdown.** The amount that the firm decreases the original selling price, 546

market rate. The actual return that the investors will receive.
Also known as yield, 464–466

market value. The number of common shares outstanding multiplied by the price per share at which the stock is currently trading for a company whose stock is traded on a public stock exchange. Also called market capitalization, 892

Markey, Jack, 699

markup, initial. The difference between the selling price that the company originally sells the product for and the cost of the product, 546

markup cancellation. The amount by which the firm reduces a markdown and increases the selling price, but not to exceed the original selling price, 546

material. Financial information that if reported inaccurately or omitting it would affect financial statement users' decisions. Materiality is an attribute of relevance, 28

materiality threshold. A requirement that an item be recognized in the financial statements if its omission or misstatement would significantly influence the judgment of a reasonably informed statement user, 37

maturity date. The specified date when the bond issuer must pay the face value of the bonds to the bondholders, 797

McDonald's, 617

measurement
bases of, 38–39, 41
fair value, 39–40
IFRS, 41

merchandise, cash paid for, 303, 1318

merchandise inventory. Inventory consisting of goods purchased to resell without any additional manufacturing, 508

Merck & Co., 474, 895

Microsoft Corporation, 238, 745, 867, 1154

MillerCoors, 199

monetary unit assumption. An assumption in financial reporting that stipulates that an entity measure and report its economic activities in dollars (or some other monetary unit) in dollars (or some other monetary unit), 43

Monitoring Board, 14

Monumental Sports & Entertainment, 354

Moody's, 796

most-likely-amount approach. An approach for computing the transaction amount when there is variable consideration under which uses the entity uses the single most likely amount in a range of possible consideration amounts as the estimate. This approach is best suited when there are only two possible outcomes, 382–383 for accounts receivable, 447

moving-average method. The company determines an average cost for the units on hand and applies that average unit cost to the next sale to determine the cost of goods sold, 518, 519–521, 524–525

multiple-step income statement format. Reports several critical subtotals before computing income from continuing operations and net income, 178–179

N

National Association of Securities, 931

natural resources. A category of long-term operating assets, including oil and gas deposits, timberlands, coal and other mineral deposits, 660–664
costs included in, 660–661
depletion of, 660, 661–664

nature approach. Classification by the source of the expense such as: payroll costs, cost of raw materials used, or depreciation expense, 177

NCH Marketing Services, 1347

net accounts receivable, 1332–1333

net assets. Net assets, equal to assets minus liabilities, is another term used for equity, 244, 860. *See also* equity

net book value. Firms subtract accumulated depreciation from the original cost of the fixed asset and report net book value (NBV) in the noncurrent asset section of the balance sheet. Also referred to as net fixed assets (NFA), 606

net fixed assets. *See* net book value

Netflix, Inc., 865, 1221, 1223, 1225, 1265, 1274

net income. A measure of financial performance resulting from the aggregation of revenues, expenses, gains, and losses that are not items of other comprehensive income. Net income is also referred to as earnings, 172, 193
in cash vs. accrual accounting, 41–42

net income available to common shareholders. Net income less preferred dividend requirements, 1222

net investment in the lease for a direct financing lease. Composed of the lease receivable, the present value of any unguaranteed residual asset, and a reduction for any deferred profit, 1098–1100

net investment in the lease for a sales-type lease. Reflects the assets related to the lease transaction and is composed of the lease receivable and the present value of an unguaranteed residual asset, 1091–1092

net method. A method for recording the discount or premium on a bond payable in which the discount is subtracted from the face value or the premium is added to the face value without using a separate discount or premium account. The net method is preferred under IFRS, 514–515, 809

net of tax. The amount of income, gain or loss, reported includes any income tax effects. As noted earlier, the income tax expense (or benefit) related to discontinued operations is not included in the tax provision related to continuing operations, 188

net operating loss. A net loss for tax purposes that occurs when tax-deductible expenses exceed taxable revenues, 1015
carrybacks and, 1015–1017
carryforwards and, 1015, 1017–1022

net realizable value (NRV). In accounting for receivables, NRV describes the estimated amount a company reasonably expects to collect from its customers and is measured as the gross accounts receivable less an estimated allowance for uncollectible accounts (a contra-asset account), 450
in lower-of-cost-or-market rule method, 536–537

net realizable value less a normal profit margin

(NRV – NP). The lowest measure of market value at which the firm can carry inventory on its balance sheet, 536–537

net revenue reporting approach. Approach under which only the net amount is recorded in revenue, 413

neutral. Financial information that is free from bias in both the selection and presentation of financial data. Neutrality if an attribute of a faithful representation, 28

Nike Inc., 175, 617, 1224

Noll, Daniel J., 13

noncash consideration, 385–386

common stock issued for, 864–865

noncontributory plans. Pension plans in which the employer is responsible for funding the total cost of the plan, 1171

noncontrolling interest. When one company controls another company (e.g., a subsidiary), but owns less than 100% of its voting shares, 240

noncurrent assets. Resources that the firm expects to convert to cash, use, or consume in a period greater than one year or one operating cycle, whichever is longer, 237

noncurrent liabilities. Obligations that are due after one year or one operating cycle, whichever is longer, 240

nondetachable warrants. Detachable warrants can be removed by the holder and sold separately on the secondary market, whereas nondetachable warrants cannot, 820

nondeterminable market value, 592–593

non-interest-bearing note. The holder of a noninterest-bearing note does not receive periodic interest over the term of the note, 464

non-mandatorily redeemable preferred shares. Preferred shares that can be redeemed at the option of the shareholder, but that option may not be exercised with certainty, 877, 878

nonmonetary exchange. In a nonmonetary exchange, a company acquires an asset by exchanging another asset with the seller rather than paying cash, 655–660

with commercial substance, 655–656

definition of, 590

IFRS on, 659–660

without commercial substance and cash received, 657–659

without commercial substance and no cash received, 657

non-operating income items. Gains and losses along with revenues and expenses resulting from a company's peripheral activities, 186–187

nontrade notes receivable. Are distinguished from notes receivable and include loans made to officers or employees and special financing arrangements with customers or vendors, 464

normal balance. Refers to the expected balance in an account, and it is the side that increases the value of the account, 99

no significant influence. The investor lacks the ability to participate in the decisions of the investee company, 933
no readily determinable fair values and, 937–940
readily determinable fair values and, 934–937

note receivable. A formal, written promise to receive a fixed sum of money at a specified date (or dates) in the future, usually with a stated interest rate, 464

basic features of, 464

disclosures for, 955

financing with, 467

no stated interest rate or less than market rate, 465–467

stated interest rate equal to market rate, 464–465

notes payable. Formal credit arrangements between a creditor (lender) and a debtor (borrower) requiring the payment of a stated face amount on a specified maturity date, 592

long-term, 789–795

installment loans, 790–793

stated rate less than market rate, 793–795

term loans, 789–790

short-term, 788–789

notes to financial statements, 255–260, 262

Novartis, 895

number of compounding periods. The number of times per year that interest compounds times the total number of years for which a present or future value is computed, 320

solving for annuities, 348–349

solving for in single-sum problems, 329–331

O

objectives-oriented standard. A standard that refers to a standard that is somewhere in between a pure principles-based standard and a pure rules-based standard, 16–17

obsolescence, 1064

off-balance sheet subsidiaries, 6–7

Old Navy, 507

operating activities. Cash receipts and disbursements related to the production and delivery of goods and services that are reported on an accrual basis on the statement of net income, 246

direct method of reporting cash flows from, 252

indirect method of reporting cash flows from, 246–251

operating cash flows, 1310–1321, 1348–1352

indirect method for, 1310–1316

operating cycle. The length of time it takes a company to generate cash from its operations, thereby providing answers to the questions of how long it takes a company to collect cash and how long it takes to convert inventory to cash, 469–473

operating income. Gross profit less all operating expenses (i.e., selling expenses and general and administrative expenses), 186

operating lease. For a lessee, a lease that does not meet any one of the five Group I criteria is classified as an operating lease. For a lessor, a lease that does not meet any one of the five Group I criteria or the Group II criteria is classified as an operating lease, 1070–1071

initial measurement of, 1076–1078

lessee guaranteed residual value, 1081–1082

lessor accounting for, 1083–1084

short-term policy election, 1082–1083

subsequent measurement of, 1078–1081

operating liabilities. Obligations arising from the firm's primary business operations, including short-term obligations such as accounts payable, trade notes payable, accrued liabilities such as advance collections, sales and payroll taxes payable, and income tax payable, 736

accounts payable and trade notes payable,
736–737

asset retirement obligations, 746–748

cases on, 777–781

compensated absences, 742–745

deposits, 741

footnote disclosures, 745

gift cards, 738–740

income taxes payable, 742

sales taxes payable, 742

unearned revenues, 737–738

operating segment. A component of a public entity with the following three characteristics: 1. It engages in business activities from which it may earn revenues and incur expenses. 2. The entity's chief decision maker regularly reviews the performance of the segment. 3. The segment's discrete financial information is available, 675

ordinary annuity. An annuity where the cash flows occur at the end of the interest period, 319, 331

deferred, 351–353

future value of, 332–335

present value of, 339–342

solving for interest rate, 346–348

solving for number of periods in, 348–349

solving for payment amount, 350–351

OTC Markets Group Inc., 931

other assets. Includes any noncurrent asset that does not fall into any of the primary balance sheet classifications, 239

other comprehensive income. Revenues, expenses, gains, and losses that are explicitly excluded from net income in specific accounting standards, 172

accounting for, 886–888

available-for-sale debt investments and, 929–931

outstanding checks. Result from timing differences. The company will deduct checks written on the books, but the checks may not clear the bank in time to be reported on the bank statement, 501

outstanding shares. The number of shares still in the hands of the stockholders, computed as issued shares less treasury shares, 862

overconfidence bias. The tendency to be more confident than your abilities and experience level would objectively warrant. It is a cognitive bias, 63

P

Practer, Paul, 26

Papa John's International, 870

partial-year depreciation, 611–612

participating preferred shares. Preferred shares that contain a provision requiring that preferred shareholders share ratably in distributions with common shareholders, 875

par value. An arbitrary value that the organizers of the corporation place on the stock, 240, 860, 862
preferred stock, 873

par value method. Records the acquisition at the par value of the repurchased shares, 867

patents. Grants the holder an exclusive right to use a formula, product, or process for a fixed period of time, usually 20 years, 600 legal fees incurred to successfully defend, 616

payment date. The date that the firm actually distributes the dividend, 880

payments. (PMT) A series of equal cash flows paid (or received) evenly over time in an annuity, 331
solving for payment amount, 350–351

payroll taxes payable. Liabilities that companies incur related to the payment of employee salary and wages. Payroll taxes include Social Security taxes, unemployment taxes, and income taxes withheld, 782–786

pension. Separate legal entity called to which a company (referred to as the sponsor company) sets aside funds for future pension benefits. The trust accumulates the pension fund assets and makes payments to retirees, 1171. *See also* defined-benefit plan

adjustments, in statement of cash flow, 1335

IFRS-specific disclosures on, 61

measures of defined-benefit obligation, 1170–1174

overview of, 1171–1174

types of, 1171–1172

pension trust. Separate legal entity called to which a company (referred to as the sponsor company) sets aside funds for future pension benefits. The trust accumulates the pension fund assets and makes payments to retirees, 1171

Pepsi-Cola Company, 940

percentage-of-completion method. A method that only recognizes gross profit at the end of a long-term contract, 401, 402–407

comparison of with completed-contract method,
418–420

performance obligation. A promise to transfer a good or service that is distinct, 379

allocating transaction price to, 387–392

disclosures on, 387–392

identifying in contracts, 379–381

periodicity assumption. An assumption in financial reporting specifies that an economic entity can divide its life into artificial time periods for the purpose of providing periodic reports on its economic activities, 43

periodic system. Under a periodic system, a company determines the inventory balance and cost of goods sold at the end of the accounting period, 509–510

period-of-time elements. Results of events and circumstances that affect an entity during a period of time and appear on the income statement, statement of comprehensive income, or statement of changes in shareholders' equity, 32, 33–34, 35–36 in IFRS, 35–36

- permanent accounts.** Accounts with cumulative balances carried forward period after period, 117
- permanent components of earnings.** Likely to continue into the future, 174
- permanent differences.** Differences in the book treatment and the treatment for a given transaction that are different over the life of the firm, 993
accounting for, 994
effective tax rates and, 995
- perpetual system.** Under a perpetual system, firms continually update inventory accounts for each purchase and each sale, 510–512
- petty cash.** Minor amounts of cash that a company keeps on hand in order to pay for small, miscellaneous expenses such as visitor parking, lunches, and reimbursements for tolls and supplies, 505
- Pfizer Inc., 58, 308–309, 895, 1168–1170
- physical capital maintenance.** A concept of earning a profit where capital is viewed as the productive capacity of a company, such as units of output per day, 36
- pledges accounts receivable.** When a firm pledges accounts receivable, the receivables are collateral for a financing arrangement, 459
- point-in-time elements.** Resources, claims to resources, or interests in resources as of a specific point in time and appear on the balance sheet (statement of financial position), 30, 32–33, 34–35
in IFRS, 34–35
in U.S. GAAP, 32–33
- politics of standard setting, 15
- pools.** A group of inventory under the LIFO inventory allocation method, 530
- Porsche, 27
- post-closing trial balance.** A trial balance, containing only permanent balance sheet accounts, which is prepared after all temporary accounts were closed out and have zero balances, 118–119
- posting.** The process of transferring information contained in journal entries to the individual ledger accounts, 101–104
definition of, 101
- potentially dilutive securities.** Securities that are not currently common shares, but could become common stock through conversion or exercise, 1226
- predictive value.** Financial information that decision makers can use it as an input into processes that help forecast future outcomes. Predictive value is an attribute of relevance, 27
- preferred shareholders.** Investors holding shares in a company that have preferential rights over common shares, 860
- preferred stock.** Equity securities that have a higher claim than common stock in two common areas: priority in receiving dividends and the right to claim assets in the event of liquidation. Most preferred shares are nonvoting, 872
callable, 876
convertible, 875–876
earnings per share and, 1232–1233
cumulative, 874
debt financing vs., 873
features of, 874–879
fixed-dividend, 877–878
IFRS on, 878–879
mandatorily redeemable, 877
non-mandatorily redeemable, 877, 878
overview of, 872–873
participating, 875
par values, 873
- premium.** A price above face value, 797, 1335–1336
- premiums.** Promotional items such as toys, t-shirts, coffee mugs, or other collectables featuring a brand name that a company offers to buyers of specific products, 758–759
- prepaid expense, 238. *See also* deferred expense
- present value of future cash flows.** The amount that results from discounting net cash flows the firm expects to receive on the exchange of an asset, or to pay to liquidate a liability, 39
in IFRS, 41
- present value of the defined-benefit obligation (PVDBO).** A term used under IFRS to describe the net liability under a defined-benefit pension plan. The same as the pension benefit obligation under U.S. GAAP, 1181
- present value.** (PV) The value today of a cash flow or a series of cash flows to be received or paid in the future, 319
of an annuity due, 342–346
of an ordinary annuity, 339–342
of a deferred ordinary annuity, 352–353
of expected cash flows, 353, 355
of a single sum, 323–326
- price concession.** A reduction in the contract price that a seller offers, 376
- Priceline.com, 413
- price to book (P/B) ratio.** Expresses the company's market value to its book value. A P/B ratio greater (less) than indicates that the market is valuing a company's net assets at more (less) than its book value, 892–894
- price to earnings (P/E) ratio.** Expresses the relationship between the company's market value and its net income. P/E ratio indicates how much an investor is willing to pay for a company per dollar of its earnings, 892–894
- PriceWaterhouseCoopers LLP, 1104
- principal.** The amount that the company will pay the bondholder at maturity. Also, referred to as par value or principal, 788
- principal-agent arrangement.** Where one party (the agent) acts on behalf of another party (the principal), 411–413
- principles-based standard.** A standard that relies on theories, concepts, and principles of accounting that are linked to a well-developed theoretical framework, 16
- prior-period adjustment.** The correction of a prior-period's financial statements, 885–886
- prior service costs.** Costs that represent service benefits provided to current employees on the initial adoption or amendment of an existing defined-benefit pension plan, 1175–1176

Private Company Council (PCC), 10, 11

proactive factors, 7–8

probable. If the loss is likely to occur, it is considered probable, 751

Procter & Gamble Company, 1222, 1239–1240

professional organizations, 6

professional skepticism. An attitude that includes a questioning mind and a critical assessment of audit evidence, 63

profitability. A company's ability to generate a return for its shareholders based on the revenues or resources available, 232

profitability analysis, 231–234

profit margin. Indicates the percent of each dollar of sales remaining after covering cost of sales and other business expenses, 232

projected benefit obligation. A pension obligation that considers all employees, both vested and non-vested, using estimated future salary levels, 1173–1174

property, plant, and equipment (PPE). Assets used in the production of goods and services that the firm sells in order to generate operating income and cash flow. Also referred to as tangible fixed assets, 239

conceptual framework and, 588

disclosures of, 614–616

impairment of, 667–673

initial measurement of, 588–604

in statement of cash flows, 1329–1330

subsequent measurement of, 604–614

property dividends. Distributions firms make of any asset other than cash (e.g., inventory or investments in shares of other entities), 879

proportional method. Under the proportional method, breakage revenue is recognized ratably as actual card redemptions occur, 740, 821

prospective method. Companies using the prospective method to report an accounting change make the change in the current year (that is, the year of the change) and all future years, 1267
change in accounting estimates and, 1274
change in accounting principle and, 1272–1273

provision. Under IFRS, a contingency is called a provision when a company reports it as an obligation or an asset, 752

Prudential Insurance, 1193

Public Company Accounting Oversight Board (PCAOB), 6, 10–11

public meetings, 11

public roundtables, 12

purchase discounts. Discounts reduce the amount that is due to sellers if the buyer pays within a certain time period, 514–515

purchase options, 1138–1139

Q

quick or acid test ratio. A ratio which modifies the current ratio by only including the current assets the firm expects to convert into cash quickly, 763

R

ratio analysis, 231–234

ratios. Ratios compute meaningful relationships between financial statement items useful in: understanding a company over time, comparing one company to another company, and benchmarking a company to an industry standard, 231

raw materials inventory. Inventory comprised of inputs that the firm has not yet placed into production, 508

reactive factors, 6–7

readily available resource. A resource that a seller or other company sells separately or the customer already can obtain from the seller at in some transaction, 380

realized gains and losses. Changes in the value of investments result in realized gains and losses if the company actually sells the securities, 918

realized/realizable. An item is realized or realizable when a company exchanges a good or service for cash or claims to cash, 37

assessing realizability, 1007

carryforwards, 1021–1022

deferred tax assets, 1006–1013

reporting realizability, 1007–1009

reasonably possible. The probability of occurrence is less than likely, but more than remote, 751

reclassification of financing liabilities, 823–827

available-for-sale debt investments, 929–931

callable obligations, 826–827

current maturities of long-term debt, 823

short-term debt expected to be

refinanced, 823–826

recognition. The process of reporting an economic event in the financial statements, 36–42

definition of, 36

general principles of, 36–37

IFRS, 40–41

revenue and expense, 37–38

reconciliation, tax rate, 1029

reconciliation format. *See* indirect method

record date. The date on which the firm determines the registered stockholders, and only these stockholders receive the cash dividend, 880

recourse. Provision guaranteeing that they will be collected in the factoring contract, 460–462

recoverability. The recoverability of an asset refers to the firm's ability to recover the asset's carrying value based on the sum of the undiscounted cash flows from the use and disposal of the asset: 1. If the sum of the undiscounted future cash flows is less than the carrying value of the asset, then the asset is impaired and the company must measure the impairment loss. 2. If the sum of the undiscounted future cash flows exceeds the carrying value of the asset, then the asset is not impaired, 669–670

recovery. When a company receives payment on an account it had previously written off, 456–458

- redeemable preferred shares.** Preferred shares that can be redeemed at certain dates or upon the occurrence of certain events, 877
- redeliberation, 12
- regulatory bodies.** Bodies responsible for protecting investors and overseeing the accounting standard-setting process, 6
- related-party transactions.** Transactions that an entity engages in with owners, firm management, affiliated entities, or any other entity that can exert significant influence on the company, 259
IFRS on, 260
- relative fair value method.** Allocates the total purchase cost to the individual assets acquired in a single transaction by assigning the total cost incurred based on the percentage that each asset's fair value bears to the total fair value of all the assets purchased, 591
- relevance.** Financial information that is capable of making a difference in decision making by exhibiting the following attributes: predictive value, confirmatory value, materiality. Relevance is a fundamental characteristic of accounting information, 27–28
recognition and, 36
- reliability, recognition and, 36
- remote method.** In accounting for gift cards, an approach to accounting for breakage where the company recognizes revenue from gift card breakage and removes the liability for the advance collection (unearned revenue) only when the probability of redemption becomes remote, 739–740
- remote.** The probability of occurrence is only slight, 751
- renewable indefinite-life intangible assets.** Assets subject to renewal on a regular basis whose renewal is reasonably certain, such as renewable broadcast licenses and taxi cab medallions, 617
- report format.** A balance sheet presentation that lists liabilities and stockholder's equity directly below assets on the same page, 242, 244
- reporting unit (RU).** An operating segment or one level below an operating segment, 675–676
- research and development (R&D) costs, 620–624
- research.** The systematic investigation into an issue. We will focus our discussion on applied research that requires critical-thinking skills, a knowledge base, thoroughness, and professional judgment, 64
authoritative literature used in, 64–69
steps in applied financial accounting, 69–75
- residual approach.** An approach to determine the standalone selling price that allows an entity to estimate one or more, but not all, of the standalone selling prices to allocate the remainder of the transaction price, or the residual amount, to the goods or services for which it does not have a standalone selling price estimate, 388
- residual method.** In a lease contract, residual method subtracts the other standalone prices from the total contract consideration and assigns the remaining amount as the estimated standalone price of the remaining component, 1067
- residual value guarantee.** A guarantee or assurance made to the lessor that it will receive a fixed dollar amount for the leased asset at the end of the lease, 1071
finance lease, 1089–1091
operating lease, 1081–1082
- restated financial statements.** Statements which adjust opening balance sheet accounts for the cumulative effect of applying the new principle in all prior years and present all subsequent financial statements as if the policy had always been used. Specifically, companies adjust: 1. Assets and liabilities as of the beginning of the first period presented to reflect the cumulative effect of the change on periods prior to those presented. 2. Retained earnings (or other appropriate components of equity) for the beginning of the first period presented to reflect the cumulative effect of the change on reported income for periods prior to those presented. 3. Financial statements for each period presented to reflect the effects of the change, 1267
- restoration costs.** Companies may incur substantial costs, referred to as restoration costs, to return property to its original condition after the removal of the natural resource, 661
- restricted cash.** A company classifies cash as a current asset on the balance sheet unless it is restricted from use in the current operating cycle, 444–445
- restricted stock plan.** Under a restricted stock plan, a company awards actual shares in the name of a specific employee, resulting in an allocation of restricted shares to the designated employee, 1165–1167
- retail inventory method, 545–548
basic LIFO, 545–546, 583–584
conventional, 547–548
dollar-value LIFO, 584–585
terminology in, 546–547
- retained earnings.** A firm's cumulative earnings or losses that it has not distributed as dividends, 240, 860
in the accounting equation, 93
accounting for, 879–886
cash dividends, 880–881
stock dividends, 881–885
prior-period adjustments, 885–886
types of dividends, 879–880
- retirees, payments to. *See* pensions
- retroactive adjustment.** Adjustments to the financial statements that correctly recognizes, measures, and provides disclosures as if an error never occurred. Also referred to as a restatement, 885
- retroactive assumption.** For share issuances that occur before the split or dividend, the retroactive assumption assumes that the split or dividend occurred at the *time of the issuance*, 1224
- Retrophin, Inc., 620
- retrospective method.** Companies reporting an accounting change with the retrospective method restate all prior-year financial statements presented in the annual report as if the newly adopted principle had always been used, 1267
change in accounting principle and, 1267–1272
- return on assets ratio.** Measures the income generated for share holders from each dollar of average total assets, 232

- return on equity ratio.** Measures the return on shareholders' investment in the company, 232–233
DuPont Analysis of, 311–313
- revaluation.** A revaluation occurs when a company reports a long-term asset at its fair value, rather than its historical cost. Thus, the revaluation can increase or decrease the carrying value of an asset: 1. If an asset's fair value is *greater than* its carrying value, the firm increases the carrying value of the asset. 2. If an asset's fair value is *less than* its carrying value, the firm decreases the carrying value of the asset, 36
derecognition of previously revalued assets, 732–733
initial downward, 730–731
initial upward, 727–729
measuring fair value and, 726

transfer over time, 393–394
when, or as, each performance obligation is satisfied, 393–401
- revenue recognition principle.** A financial reporting principle to determine when to recognize revenue when it is realized or realizable and earned, 37–38
- revenues.** Inflows or other enhancements of an entity's assets or settlements of its liabilities (or a combination of both) from delivering or producing goods, rendering services, or other activities that constitute the entity's ongoing major or central operations, 34
in the expanded accounting equation, 93–94
reversal of inventory write-downs, 542
- reverses.** When a deferred tax asset or liability is reduced, either when a company: 1. Has to pay the taxes it previously recorded as a deferred tax liability, or 2. Receives the benefits of reduced taxes originally reported as a deferred tax asset, 1001
of temporary difference, 1001–1005
- reversing entries.** Companies make reversing entries as an optional step in the accounting cycle at the beginning of the next accounting period to reverse the effects of the adjusting journal entries made in the previous period, 168–169
- right-of-use asset.** A leased asset that the lessee has the right to control, 1076
amortization of, 1080–1081
initial measurement of, 1076–1077
in operating and finance leases, 1088
- right-to-return sale.** A sale a company makes providing customers with the ability to return a product that has been transferred to them. The seller is obligated to accept the returned product, if the buyer chooses to return it. The right of return does not represent a separate performance obligation, but rather is a component of variable consideration affecting the transaction price, 410–411
- risk-free rate of return.** The rate of return plus the expected inflation rate, 362
- Royal Bank of Scotland Group PLC, 989
- RSM US LLP, 1031
- rules-based standard.** A standard that contains specific, prescriptive procedures rather than relying on a consistent theoretical framework, 16
- ## S
- sales discounts.** Reductions granted to customers for early cash payment as an incentive to encourage quick invoice payment. Also referred to as cash discounts, 447
- sales of assets, 613–614
- sales taxes payable.** A liability (typically classified as current) resulting from the seller's obligation to collect sales taxes from customers and remit these taxes to the appropriate taxing jurisdiction, 742
- sales-type lease.** For a lessor, a lease that meets any one of the five Group I criteria is classified as a sales-type lease, 1070
accounting for, 1091–1097

- Sanofi, 894
- Sara Lee Corporation, 1276
- Sarbanes-Oxley Act, 500
- Sasini Limited, 734
- Sayre, Peter, 1193
- scrap value.** The amount the firm expects to realize on disposal of the fixed asset at the end of its productive service to the firm. Also referred to as residual or salvage value, 606

- Sears/IBM Sears, 1151
- secured bonds.** Bonds which use specific assets as collateral, 797
- Securities and Exchange Commission, 2–3, 6
 on annual reports, 262–263
 authoritative literature from, 65–67, 68
 international standards and, 8
- Securities Exchange Act, 9
- securitization.** A financing technique that involves taking many separate, and oftentimes diverse, financial assets and combining them into a single pool or bundle. Investors then purchase interests in the pool of assets rather than buying an individual asset or group of assets, 463
- self-correcting errors, 1279–1281
- serial bonds.** Bonds which have multiple maturity dates, 797
- service cost.** The increase in the projected benefit obligation resulting from one additional year of service from employees, 1174–1175
- service period. *See* vesting period
- service-type warranty.** A warranty that exists if the customer has the option to purchase the warranty separately or if the warranty provides a service to the customer beyond the period covered by the assurance-type warranty. Also referred to as an extended warranty, 754, 756–757
- settlement rate.** the interest rate used to compute the interest on the PBO, 1176
- share repurchase transactions, 866–872
 purpose of, 866–867
 share retirements, 870–872
 treasury stock, 867–870
- ShoeBuy, 135
- short-term investments.** Short term investments not classified as cash equivalents are investments in debt or equity securities of other corporations or governmental entities that the entity has the ability and intent to sell within the next year or operating cycle, whichever is longer, 238
- short-term notes payable.** Formal, written promises to pay cash at a fixed maturity date in the future, 239, 788–789
- short-term operating assets
 cash and receivables, 443–505
 inventory, 507–585
- sick days, 743
- Siemens AG, 822
- Siemens Healthcare Diagnostics, 1287
- significant financing component, 384–385
- significant influence.** The investor company has the ability to exert influence over operating and financial policy decisions of the investee company even though it does not legally control the investee company, generally holding 20 to 50% of the investee's stock, 933
 equity method and, 940–945
- simple interest.** The initial investment multiplied by the stated interest rate for a single period and the amount of time (in terms of the number of periods) the investment is held, 317
- single-step income statement format.** Combines all revenues and gains, and all expenses and losses into single categories, 181–182
- single-step statement of net income, 181–182
- single-sum problems, 319–331
 future value in, 320, 321–323
 present value in, 323–326
 solving for interest rate in, 327–329
 solving for number of compounding periods in, 329–331
- sinking fund.** Cash or other assets held in a separate account that is used to repay debt at maturity, 829
- Slaski, Carolyn, 833
- small- and medium-sized entities (SMEs), 12
- small (ordinary) stock dividend.** A stock dividend is considered a small stock dividend if the number of shares issued does not exceed 20% to 25% of the previously outstanding shares, 881–882
- Smart, Dalton, 474
- Smith, Larry, 68
- Snap Inc., 859, 863
- Soares, Chad, 1104
- Social Security taxes, 782
- SolarCity, 787
- solvency.** A measure of a firm's long-term ability to pay its obligations as they mature, 236
 analysis of, 309–311
- specialized nature.** An asset that has to alternative use to the lessor at the end of the lease term, 1069
- Special Purpose Entities (SPEs), 261
- specific identification method.** The company identifies each unit and tracks the cost associated with that specific unit, 518–519
- Spirit Airlines, 1063
- spreadsheet solutions
