Amendment to Basis for Conclusions on other IFRSs

Basis for Conclusions on IFRS 1 *First-time Adoption of International Financial Reporting Standards*

This Basis for Conclusions accompanies, but is not part of, IFRS 1.

In this Basis for Conclusions the terminology has not been amended to reflect the changes made by IAS 1 Presentation of Financial Statements *(as revised in 2007).*

This Basis for Conclusions has not been revised to reflect the restructuring of IFRS 1 in November 2008, but cross-references have been updated.

Introduction

BC1 This Basis for Conclusions summarises the International Accounting Standards Board's considerations in reaching the conclusions in IFRS 1 *First-time Adoption of International Financial Reporting Standards*. Individual Board members gave greater weight to some factors than to others.

BC2 SIC-8 *First-time Application of IASs as the Primary Basis of Accounting*, issued in 1998, dealt with matters that arose when an entity first adopted IASs. In 2001, the Board began a project to review SIC-8. In July 2002, the Board published ED 1 *First-time Application of International Financial Reporting Standards*, with a comment deadline of 31 October 2002. The Board received 83 comment letters on ED 1. IFRS 1 was issued by the Board in June 2003.

BC2A IFRS 1 replaced SIC-8. The Board developed the IFRS to address concerns that:

(a) some aspects of SIC-8's requirement for full retrospective application caused costs that exceeded the likely benefits for users of financial statements. Moreover, although SIC-8 did not require retrospective application when this would be impracticable, it did not explain whether a first-time adopter should interpret impracticability as a high hurdle or a low hurdle and it did not specify any particular treatment in cases of impracticability.

(b) SIC-8 could require a first-time adopter to apply two different versions of a standard if a new version were introduced during the periods covered by its first financial statements prepared under IASs and the new version prohibited retrospective application.

(c) SIC-8 did not state clearly whether a first-time adopter should use hindsight in applying recognition and measurement decisions retrospectively.

(d) there was some doubt about how SIC-8 interacted with specific transitional provisions in individual standards.

BC2B Like SIC-8, IFRS 1 requires retrospective application in most areas. Unlike SIC-8, it:

(a) includes targeted exemptions to avoid costs that would be likely to exceed the benefits to users of financial statements, and a small number of other exceptions for practical reasons.

(b) clarifies that an entity applies the latest version of IFRSs.

 © IASCF

(c) clarifies how a first-time adopter's estimates in accordance with IFRSs relate to the estimates it made for the same date in accordance with previous GAAP.

(d) specifies that the transitional provisions in other IFRSs do not apply to a first-time adopter.

(e) requires enhanced disclosure about the transition to IFRSs.

BC3 The project took on added significance because of the requirement for listed European Union companies to adopt IFRSs in their consolidated financial statements from 2005. Several other countries announced that they would permit or require entities to adopt IFRSs in the next few years. Nevertheless, the Board's aim in developing the IFRS was to find solutions that would be appropriate for any entity, in any part of the world, regardless of whether adoption occurs in 2005 or at a different time.

Restructuring of the IFRS

BC3A Since it was issued in 2003, IFRS 1 has been amended many times to accommodate first-time adoption requirements resulting from new or amended IFRSs. Because of the way IFRS 1 was structured, those amendments made the IFRS more complex and less clear. As more amendments become necessary, this problem will become worse.

BC3B As part of its improvements project in 2007, therefore, the Board proposed to change the structure of IFRS 1 without amending its substance. Respondents to the exposure draft published in October 2007 supported the restructuring. The revised structure of the IFRS issued in November 2008 is easier for the reader to understand and is better designed to accommodate future changes. The focus of the restructuring was to move to appendices all specific exemptions and exceptions from the requirements of IFRSs. Exemptions are categorised into business combinations, exemptions and short-term exemptions. Exemptions are applicable to all first-time adopters regardless of their date of transition to IFRSs. Short-term exemptions are those exemptions applicable to users for a short time. Once those exemptions have become out of date, they will be deleted.

Scope

BC4 The IFRS applies to an entity that presents its first IFRS financial statements (a first-time adopter). Some suggested that an entity should not be regarded as a first-time adopter if its previous financial statements contained an explicit statement of compliance with IFRSs, except for specified (and explicit) departures. They argued that an explicit statement of compliance establishes that an entity regards IFRSs as its basis of accounting, even if the entity does not comply with every requirement of every IFRS. Some regarded this argument as especially strong if an entity previously complied with all recognition and measurement requirements of IFRSs, but did not give some required disclosures—for example,

segmental disclosures that IAS 14 *Segment Reporting*[*] requires or the explicit statement of compliance with IFRSs that IAS 1 *Presentation of Financial Statements* requires.

BC5 To implement that approach, it would be necessary to establish how many departures are needed—and how serious they must be—before an entity would conclude that it has not adopted IFRSs. In the Board's view, this would lead to complexity and uncertainty. Also, an entity should not be regarded as having adopted IFRSs if it does not give all disclosures required by IFRSs, because that approach would diminish the importance of disclosures and undermine efforts to promote full compliance with IFRSs. Therefore, the IFRS contains a simple test that gives an unambiguous answer: an entity has adopted IFRSs if, and only if, its financial statements contain an explicit and unreserved statement of compliance with IFRSs (paragraph 3 of the IFRS).

BC6 If an entity's financial statements in previous years contained that statement, any material disclosed or undisclosed departures from IFRSs are errors. The entity applies IAS 8 *Accounting Policies, Changes in Accounting Estimates and Errors* in correcting them.

Basic concepts

Useful information for users

BC7 In developing recognition and measurement requirements for an entity's opening IFRS balance sheet, the Board referred to the objective of financial statements, as set out in the *Framework for the Preparation and Presentation of Financial Statements*. The *Framework* states that the objective of financial statements is to provide information about the financial position, performance and changes in financial position of an entity that is useful to a wide range of users in making economic decisions.

BC8 The *Framework* identifies four qualitative characteristics that make information in financial statements useful to users. In summary, the information should be:

(a) readily understandable by users.

(b) relevant to the decision-making needs of users.

(c) reliable, in other words financial statements should:

(i) represent faithfully the transactions and other events they either purport to represent or could reasonably be expected to represent;

(ii) represent transactions and other events in accordance with their substance and economic reality and not merely their legal form;

(iii) be neutral, that is to say, free from bias;

(iv) contend with the uncertainties that inevitably surround many events and circumstances by the exercise of prudence; and

(v) be complete within the bounds of materiality and cost.

[*] In 2006 IAS 14 was replaced by IFRS 8 *Operating Segments*.

 © IASCF

(d) comparable with information provided by the entity in its financial statements through time and with information provided in the financial statements of other entities.

Comparability

BC9 The previous paragraph notes the need for comparability. Ideally, a regime for first-time adoption of IFRSs would achieve comparability:

(a) within an entity over time;

(b) between different first-time adopters; and

(c) between first-time adopters and entities that already apply IFRSs.

BC10 SIC-8 gave priority to ensuring comparability between a first-time adopter and entities that already applied IASs. It was based on the principle that a first-time adopter should comply with the same standards as an entity that already applied IASs. However, the Board decided that it is more important to achieve comparability over time within a first-time adopter's first IFRS financial statements and between different entities adopting IFRSs for the first time at a given date; achieving comparability between first-time adopters and entities that already apply IFRSs is a secondary objective.

Current version of IFRSs

BC11 Paragraphs 7–9 of the IFRS require a first-time adopter to apply the current version of IFRSs, without considering superseded or amended versions. This:

(a) enhances comparability, because the information in a first-time adopter's first IFRS financial statements is prepared on a consistent basis over time;

(b) gives users comparative information prepared using later versions of IFRSs that the Board regards as superior to superseded versions; and

(c) avoids unnecessary costs.

BC12 In general, the transitional provisions in other IFRSs do not apply to a first-time adopter (paragraph 9 of the IFRS). Some of these transitional provisions require or permit an entity already reporting in accordance with IFRSs to apply a new requirement prospectively. These provisions generally reflect a conclusion that one or both of the following factors are present in a particular case:

(a) Retrospective application may be difficult or involve costs exceeding the likely benefits. The IFRS permits prospective application in specific cases where this could occur (paragraphs BC30–BC73).

(b) There is a danger of abuse if retrospective application would require judgements by management about past conditions after the outcome of a particular transaction is already known. The IFRS prohibits retrospective application in some areas where this could occur (paragraphs BC74–BC84).

BC13 Some have suggested three further reasons for permitting or requiring prospective application in some cases:

(a) to alleviate unforeseen consequences of a new IFRS if another party uses financial statements to monitor compliance with a contract or agreement. However, in the Board's view, it is up to the parties to an agreement to determine whether to insulate the agreement from the effects of a future IFRS and, if not, how they might renegotiate it so that it reflects changes in the underlying financial condition rather than changes in reporting (paragraph 21 of the *Preface to International Financial Reporting Standards*).

(b) to give a first-time adopter the same accounting options as an entity that already applies IFRSs. However, permitting prospective application by a first-time adopter would conflict with the Board's primary objective of comparability within an entity's first IFRS financial statements (paragraph BC10). Therefore, the Board did not adopt a general policy of giving first-time adopters the same accounting options of prospective application that existing IFRSs give to entities that already apply IFRSs. Paragraphs BC20–BC23 discuss one specific case, namely derecognition of financial assets and financial liabilities.

(c) to avoid difficult distinctions between changes in estimates and changes in the basis for making estimates. However, a first-time adopter need not make this distinction in preparing its opening IFRS balance sheet, so the IFRS does not include exemptions on these grounds. If an entity becomes aware of errors made under previous GAAP, the IFRS requires it to disclose the correction of the errors (paragraph 26 of the IFRS).

BC14 The Board will consider case by case when it issues a new IFRS whether a first-time adopter should apply that IFRS retrospectively or prospectively. The Board expects that retrospective application will be appropriate in most cases, given its primary objective of comparability over time within a first-time adopter's first IFRS financial statements. However, if the Board concludes in a particular case that prospective application by a first-time adopter is justified, it will amend the IFRS on first-time adoption of IFRSs. As a result, IFRS 1 will contain all material on first-time adoption of IFRSs and other IFRSs will not refer to first-time adopters (except, when needed, in the Basis for Conclusions and consequential amendments).

BC15 Under the proposals in ED 1, a first-time adopter could have elected to apply IFRSs as if it had always applied IFRSs. This alternative approach was intended mainly to help an entity that did not wish to use any of the exemptions proposed in ED 1 because it had already been accumulating information in accordance with IFRSs without presenting IFRS financial statements. To enable an entity using this approach to use the information it had already accumulated, ED 1 would have required it to consider superseded versions of IFRSs if more recent versions required prospective application. However, as explained in paragraphs BC28 and BC29, the Board abandoned ED 1's all-or-nothing approach to exemptions. Because this eliminated the reason for the alternative approach, the Board deleted it in finalising the IFRS.

 © IASCF

Opening IFRS balance sheet

BC16 An entity's opening IFRS balance sheet is the starting point for its accounting in accordance with IFRSs. The following paragraphs explain how the Board used the *Framework* in developing recognition and measurement requirements for the opening IFRS balance sheet.

Recognition

BC17 The Board considered a suggestion that the IFRS should not require a first-time adopter to investigate transactions that occurred before the beginning of a 'look back' period of, say, three to five years before the date of transition to IFRSs. Some argued that this would be a practical way for a first-time adopter to give a high level of transparency and comparability, without incurring the cost of investigating very old transactions. They noted two particular precedents for transitional provisions that have permitted an entity to omit some assets and liabilities from its balance sheet:

(a) A previous version of IAS 39 *Financial Instruments: Recognition and Measurement* prohibited restatement of securitisation, transfer or other derecognition transactions entered into before the beginning of the financial year in which it was initially applied.

(b) Some national accounting standards and IAS 17 *Accounting for Leases* (superseded in 1997 by IAS 17 *Leases*) permitted prospective application of a requirement for lessees to capitalise finance leases. Under this approach, a lessee would not be required to recognise finance lease obligations and the related leased assets for leases that began before a specified date.

BC18 However, limiting the look back period could lead to the omission of material assets or liabilities from an entity's opening IFRS balance sheet. Material omissions would undermine the understandability, relevance, reliability and comparability of an entity's first IFRS financial statements. Therefore, the Board concluded that an entity's opening IFRS balance sheet should:

(a) include all assets and liabilities whose recognition is required by IFRSs, except:

   (i) some financial assets or financial liabilities derecognised in accordance with previous GAAP before the date of transition to IFRSs (paragraphs BC20–BC23); and

   (ii) goodwill and other assets acquired, and liabilities assumed, in a past business combination that were not recognised in the acquirer's consolidated balance sheet in accordance with previous GAAP and also would not qualify for recognition in accordance with IFRSs in the balance sheet of the acquiree (paragraphs BC31–BC40).

(b) not report items as assets or liabilities if they do not qualify for recognition in accordance with IFRSs.

BC19 Some financial instruments may be classified as equity in accordance with previous GAAP but as financial liabilities in accordance with IAS 32 *Financial Instruments: Presentation*. Some respondents to ED 1 requested an extended transitional period to enable the issuer of such instruments to renegotiate contracts that refer to debt-equity ratios. However, although a new IFRS may have unforeseen consequences if another party uses financial statements to monitor compliance with a contract or agreement, that possibility does not, in the Board's view, justify prospective application (paragraph BC13(a)).

Derecognition in accordance with previous GAAP

BC20 An entity may have derecognised financial assets or financial liabilities in accordance with its previous GAAP that do not qualify for derecognition in accordance with IAS 39. ED 1 proposed that a first-time adopter should recognise those assets and liabilities in its opening IFRS balance sheet. Some respondents to ED 1 requested the Board to permit or require a first-time adopter not to restate past derecognition transactions, on the following grounds:

(a) Restating past derecognition transactions would be costly, especially if restatement involves determining the fair value of retained servicing assets and liabilities and other components retained in a complex securitisation. Furthermore, it may be difficult to obtain information on financial assets held by transferees that are not under the transferor's control.

(b) Restatement undermines the legal certainty expected by parties who entered into transactions on the basis of the accounting rules in effect at the time.

(c) IAS 39 did not, before the improvements proposed in June 2002, require (or even permit) entities to restate past derecognition transactions. Without a similar exemption, first-time adopters would be unfairly disadvantaged.

(d) Retrospective application would not result in consistent measurement, as entities would need to recreate information about past transactions with the benefit of hindsight.

BC21 The Board had considered these arguments in developing ED 1. The Board's reasons for the proposal in ED 1 were as follows:

(a) The omission of material assets or liabilities would undermine the understandability, relevance, reliability and comparability of an entity's financial statements. Many of the transactions under discussion are large and will have effects for many years.

(b) Such an exemption would be inconsistent with the June 2002 exposure draft of improvements to IAS 39.

(c) The Board's primary objective is to achieve comparability over time within an entity's first IFRS financial statements. Prospective application by a first-time adopter would conflict with that primary objective, even if prospective application were available to entities already applying IFRSs.

© IASCF

(d) Although a new IFRS may have unforeseen consequences if another party uses financial statements to monitor compliance with a contract or agreement, that possibility does not justify prospective application (paragraph BC13(a)).

BC22 Nevertheless, in finalising the IFRS, the Board concluded that it would be premature to require a treatment different from the current version of IAS 39 before completing the proposed improvements to IAS 39. Accordingly, the IFRS originally required the same treatment as the then current version of IAS 39 for derecognition transactions before the effective date of the then current version of IAS 39, namely that any financial assets or financial liabilities derecognised in accordance with previous GAAP before financial years beginning on 1 January 2001 remain derecognised. The Board agreed that when it completed the improvements to IAS 39, it might amend or delete this exemption.

BC22A The Board reconsidered this issue in completing the revision of IAS 39 in 2003. The Board decided to retain the transition requirements as set out in IFRS 1, for the reasons given in paragraph BC20. However, the Board amended the date from which prospective application was required to transactions that occur on or after 1 January 2004 in order to overcome the practical difficulties of restating transactions that had been derecognised before that date.

BC22B The Board also noted that financial statements that include financial assets and financial liabilities that would otherwise be omitted under the provisions of the IFRS would be more complete and therefore more useful to users of financial statements. The Board therefore decided to permit retrospective application of the derecognition requirements. It also decided that retrospective application should be limited to cases when the information needed to apply the IFRS to past transactions was obtained at the time of initially accounting for those transactions. This limitation prevents the unacceptable use of hindsight.

BC23 The Board removed from IAS 39 the following consequential amendments to IAS 39 made when IFRS 1 was issued, because, for first-time adopters, these clarifications are clear in paragraphs IG26–IG31 and IG53 of the guidance on implementing IFRS 1. These were:

(a) the clarification that an entity is required to apply IAS 39 to all derivatives or other interests retained after a derecognition transaction, even if the transaction occurred before the effective date of IAS 39; and

(b) the confirmation that there are no exemptions for special purpose entities that existed before the date of transition to IFRSs.

Measurement

BC24 The Board considered whether it should require a first-time adopter to measure all assets and liabilities at fair value in the opening IFRS balance sheet. Some argued that this would result in more relevant information than an aggregation of costs incurred at different dates, or of costs and fair values. However, the Board concluded that a requirement to measure all assets and liabilities at fair value at the date of transition to IFRSs would be unreasonable, given that an entity may use an IFRS-compliant cost-based measurement before and after that date for some items.

© IASCF

BC25 The Board decided as a general principle that a first-time adopter should measure all assets and liabilities recognised in its opening IFRS balance sheet on the basis required by the relevant IFRSs. This is needed for an entity's first IFRS financial statements to present understandable, relevant, reliable and comparable information.

Benefits and costs

BC26 The *Framework* acknowledges that the need for a balance between the benefits of information and the cost of providing it may constrain the provision of relevant and reliable information. The Board considered these cost-benefit constraints and developed targeted exemptions from the general principle described in paragraph BC25. SIC-8 did not include specific exemptions of this kind, although it provided general exemptions from:

(a) retrospective adjustments to the opening balance of retained earnings 'when the amount of the adjustment relating to prior periods cannot be reasonably determined'.

(b) provision of comparative information when it is 'impracticable' to provide such information.

BC27 The Board expects that most first-time adopters will begin planning on a timely basis for the transition to IFRSs. Accordingly, in balancing benefits and costs, the Board took as its benchmark an entity that plans the transition well in advance and can collect most information needed for its opening IFRS balance sheet at, or very soon after, the date of transition to IFRSs.

BC28 ED 1 proposed that a first-time adopter should use either all the exemptions in ED 1 or none. However, some respondents disagreed with this all-or-nothing approach for the following reasons:

(a) Many of the exemptions are not interdependent, so there is no conceptual reason to condition use of one exemption on use of other exemptions.

(b) Although it is necessary to permit some exemptions on pragmatic grounds, entities should be encouraged to use as few exemptions as possible.

(c) Some of the exemptions proposed in ED 1 were implicit options because they relied on the entity's own judgement of undue cost or effort and some others were explicit options. Only a few exemptions were really mandatory.

(d) Unlike the other exceptions to retrospective application, the requirement to apply hedge accounting prospectively was not intended as a pragmatic concession on cost-benefit grounds. Retrospective application in an area that relies on designation by management would not be acceptable, even if an entity applied all other aspects of IFRSs retrospectively.

BC29 The Board found these comments persuasive. In finalising the IFRS, the Board grouped the exceptions to retrospective application into two categories:

(a) Some exceptions consist of optional exemptions (paragraphs BC30–BC63E).

(b) The other exceptions prohibit full retrospective application of IFRSs to some aspects of derecognition (paragraphs BC20–BC23), hedge accounting (paragraphs BC75–BC80), and estimates (paragraph BC84).

 © IASCF

Exemptions from other IFRSs

BC30 An entity may elect to use one or more of the following exemptions:

(a) business combinations (paragraphs BC31–BC40);

(b) deemed cost (paragraphs BC41–BC47E);

(c) employee benefits (paragraphs BC48–BC52);

(d) cumulative translation differences (paragraphs BC53–BC55);

(e) compound financial instruments (paragraphs BC56–BC58);

(f) investments in subsidiaries, jointly controlled entities and associates (paragraphs BC58A–BC58M);

(g) assets and liabilities of subsidiaries, associates and joint ventures (paragraphs BC59–BC63);

(h) designation of previously recognised financial instruments (paragraph BC63A);

(i) share-based payment transactions (paragraph BC63B);

(j) changes in existing decommissioning, restoration and similar liabilities included in the cost of property, plant and equipment (paragraphs BC63C and BC63CA);

(k) leases (paragraphs BC63D–BC63DB); and

(l) borrowing costs (paragraph BC63E).

Business combinations

BC31 The following paragraphs discuss various aspects of accounting for business combinations that an entity recognised in accordance with previous GAAP before the date of transition to IFRSs:

(a) whether retrospective restatement of past business combinations should be prohibited, permitted or required (paragraphs BC32–BC34).

(b) whether an entity should recognise assets acquired and liabilities assumed in a past business combination if it did not recognise them in accordance with previous GAAP (paragraph BC35).

(c) whether an entity should restate amounts assigned to the assets and liabilities of the combining entities if previous GAAP brought forward unchanged their pre-combination carrying amounts (paragraph BC36).

(d) whether an entity should restate goodwill for adjustments made in its opening IFRS balance sheet to the carrying amounts of assets acquired and liabilities assumed in past business combinations (paragraphs BC37–BC40).

BC32 Retrospective application of IFRS 3 *Business Combinations* could require an entity to recreate data that it did not capture at the date of a past business combination and make subjective estimates about conditions that existed at that date. These factors could reduce the relevance and reliability of the entity's first IFRS financial statements. Therefore, ED 1 would have prohibited restatement of past

© IASCF

business combinations (unless an entity used the proposed alternative approach, discussed in paragraph BC15, of applying IFRSs as if it had always applied IFRSs). Some respondents agreed, arguing that restatement of past business combinations would involve subjective, and potentially selective, use of hindsight that would diminish the relevance and reliability of financial statements.

BC33 Other respondents disagreed. They argued that:

(a) effects of business combination accounting can last for many years. Previous GAAP may differ significantly from IFRSs, and in some countries there are no accounting requirements at all for business combinations. Previous GAAP balances might not result in decision-useful information in these countries.

(b) restatement is preferable and may not involve as much cost or effort for more recent business combinations.

BC34 In the light of these comments, the Board concluded that restatement of past business combinations is conceptually preferable, although for cost-benefit reasons this should be permitted but not required. The Board decided to place some limits on this election and noted that information is more likely to be available for more recent business combinations. Therefore, if a first-time adopter restates any business combination, the IFRS requires it to restate all later business combinations (paragraph C1 of the IFRS).

BC35 If an entity did not recognise a particular asset or liability in accordance with previous GAAP at the date of the business combination, ED 1 proposed that its deemed cost in accordance with IFRSs would be zero. As a result, the entity's opening IFRS balance sheet would not have included that asset or liability if IFRSs permit or require a cost-based measurement. Some respondents to ED 1 argued that this would be an unjustifiable departure from the principle that the opening IFRS balance sheet should include all assets and liabilities. The Board agreed with that conclusion. Therefore, paragraph C4(f) of the IFRS requires that the acquirer should recognise those assets and liabilities and measure them on the basis that IFRSs would require in the separate balance sheet of the acquiree.

BC36 In accordance with previous GAAP, an entity might have brought forward unchanged the pre-combination carrying amounts of the combining entities' assets and liabilities. Some argued that it would be inconsistent to use these carrying amounts as deemed cost in accordance with IFRSs, given that the IFRS does not permit the use of similar carrying amounts as deemed cost for assets and liabilities that were not acquired in a business combination. However, the Board identified no specific form of past business combination, and no specific form of accounting for past business combinations, for which it would not be acceptable to bring forward cost-based measurements made in accordance with previous GAAP.

BC37 Although the IFRS treats amounts assigned in accordance with previous GAAP to goodwill and other assets acquired and liabilities assumed in a past business combination as their deemed cost in accordance with IFRSs at the date of the business combination, an entity needs to adjust their carrying amounts in its opening IFRS balance sheet, as follows.

© IASCF

(a) Assets and liabilities measured in accordance with IFRSs at fair value or other forms of current value: remeasure to fair value or that other current value.

(b) Assets (other than goodwill) and liabilities for which IFRSs apply a cost-based measurement: adjust the accumulated depreciation or amortisation since the date of the business combination if it does not comply with IFRSs. Depreciation is based on deemed cost, which is the carrying amount in accordance with previous GAAP immediately following the business combination.

(c) Assets (other than goodwill) and liabilities not recognised in accordance with previous GAAP: measure on the basis that IFRSs would require in the separate balance sheet of the acquiree.

(d) Items that do not qualify for recognition as assets and liabilities in accordance with IFRSs: eliminate from the opening IFRS balance sheet.

BC38 The Board considered whether a first-time adopter should recognise the resulting adjustments by restating goodwill. Because intangible assets and goodwill are closely related, the Board decided that a first-time adopter should restate goodwill when it:

(a) eliminates an item that was recognised in accordance with previous GAAP as an intangible asset but does not qualify for separate recognition in accordance with IFRSs; or

(b) recognises an intangible asset that was subsumed within goodwill in accordance with previous GAAP.

However, to avoid costs that would exceed the likely benefits to users, the IFRS prohibits restatement of goodwill for most other adjustments reflected in the opening IFRS balance sheet, unless a first-time adopter elects to apply IFRS 3 retrospectively (paragraph C4(g) of the IFRS).

BC39 To minimise the possibility of double-counting an item that was included in goodwill in accordance with previous GAAP, and is included in accordance with IFRSs either within the measurement of another asset or as a deduction from a liability, the IFRS requires an entity to test goodwill recognised in its opening IFRS balance sheet for impairment (paragraph C4(g)(ii) of the IFRS). This does not prevent the implicit recognition of internally generated goodwill that arose after the date of the business combination. However, the Board concluded that an attempt to exclude such internally generated goodwill would be costly and lead to arbitrary results.

BC40 Some respondents to ED 1 suggested that a formal impairment test should be required only if there is a possibility of double-counting—ie when additional, previously unrecognised, assets relating to a past business combination are recognised in the opening IFRS balance sheet (or an indicator of impairment is present). However, the Board decided that a first-time adopter should carry out a formal impairment test of all goodwill recognised in its opening IFRS balance sheet, as previous GAAP might not have required a test of comparable rigour.

© IASCF

Deemed cost

BC41 Some measurements in accordance with IFRSs are based on an accumulation of past costs or other transaction data. If an entity has not previously collected the necessary information, collecting or estimating it retrospectively may be costly. To avoid excessive cost, ED 1 proposed that an entity could use the fair value of an item of property, plant and equipment at the date of transition to IFRSs as its deemed cost at that date if determining a cost-based measurement in accordance with IFRSs would involve undue cost or effort.

BC42 In finalising the IFRS, the Board noted that reconstructed cost data might be less relevant to users, and less reliable, than current fair value data. Furthermore, the Board concluded that balancing costs and benefits was a task for the Board when it sets accounting requirements rather than for entities when they apply those requirements. Therefore, the IFRS permits an entity to use fair value as deemed cost in some cases without any need to demonstrate undue cost or effort.

BC43 Some expressed concerns that the use of fair value would lead to lack of comparability. However, cost is generally equivalent to fair value at the date of acquisition. Therefore, the use of fair value as the deemed cost of an asset means that an entity will report the same cost data as if it had acquired an asset with the same remaining service potential at the date of transition to IFRSs. If there is any lack of comparability, it arises from the aggregation of costs incurred at different dates, rather than from the targeted use of fair value as deemed cost for some assets. The Board regarded this approach as justified to solve the unique problem of introducing IFRSs in a cost-effective way without damaging transparency.

BC44 The IFRS restricts the use of fair value as deemed cost to those assets for which reconstructing costs is likely to be of limited benefit to users and particularly onerous: property, plant and equipment, investment property (if an entity elects to use the cost method in IAS 40 *Investment Property*) and intangible assets that meet restrictive criteria (paragraphs D5 and D7 of the IFRS).

BC45 Under the revaluation model in IAS 16 *Property, Plant and Equipment*, if an entity revalues an asset, it must revalue all assets in that class. This restriction prevents selective revaluation of only those assets whose revaluation would lead to a particular result. Some suggested a similar restriction on the use of fair value as deemed cost. However, IAS 36 *Impairment of Assets* requires an impairment test if there is any indication that an asset is impaired. Thus, if an entity uses fair value as deemed cost for assets whose fair value is above cost, it cannot ignore indications that the recoverable amount of other assets may have fallen below their carrying amount. Therefore, the IFRS does not restrict the use of fair value as deemed cost to entire classes of asset.

BC46 Some revaluations in accordance with previous GAAP might be more relevant to users than original cost. If so, it would not be reasonable to require time-consuming and expensive reconstruction of a cost that complies with IFRSs. In consequence, the IFRS permits an entity to use amounts determined using previous GAAP as deemed cost for IFRSs in the following cases:

(a) if an entity revalued one of the assets described in paragraph BC44 using its previous GAAP and the revaluation met specified criteria (paragraphs D6 and D7 of the IFRS).

© IASCF

(b) if an entity established a deemed cost in accordance with previous GAAP for some or all assets and liabilities by measuring them at their fair value at one particular date because of an event such as a privatisation or initial public offering (paragraph D8 of the IFRS).

BC47 Paragraph D6 of the IFRS refers to revaluations that are broadly comparable to fair value or reflect an index applied to a cost that is broadly comparable to cost determined in accordance with IFRSs. It may not always be clear whether a previous revaluation was intended as a measure of fair value or differs materially from fair value. The flexibility in this area permits a cost-effective solution for the unique problem of transition to IFRSs. It allows a first-time adopter to establish a deemed cost using a measurement that is already available and is a reasonable starting point for a cost-based measurement.

BC47A Under their previous GAAP many oil and gas entities accounted for exploration and development costs for properties in development or production in cost centres that include all properties in a large geographical area. (In some jurisdictions, this is referred to as full cost accounting.) Those entities will in most cases have to determine the carrying amounts for oil and gas assets at the date of transition to IFRSs. Information about oil and gas assets recorded in an accounting system using this method of accounting will almost always be at a larger unit of account than the unit of account that is acceptable under IFRSs. Amortisation at the IFRS unit of account level would also have to be calculated (on a unit of production basis) for each year, using a reserves base that has changed over time because of changes in factors such as geological understanding and prices for oil and gas. In many cases, particularly for older assets, this information may not be available. The Board was advised that even if such information is available the effort and associated cost to determine the opening balances at the date of transition would usually be very high.

BC47B IFRS 1 permits an entity to measure an item of property, plant and equipment at its fair value at the date of transition to IFRSs and to use that fair value as the item's deemed cost at that date. Determining the fair value of oil and gas assets is a complex process that begins with the difficult task of estimating the volume of reserves and resources. When the fair value amounts must be audited, determining significant inputs to the estimates generally requires the use of qualified external experts. For entities with many oil and gas assets, the use of this fair value as deemed cost alternative would not meet the Board's stated intention of avoiding excessive cost (see paragraph BC41).

BC47C The Board decided that for oil and gas assets in the development or production phases, it would permit entities that used the method of accounting described in paragraph BC47A under their previous GAAP to determine the deemed cost at the date of transition to IFRSs using an allocation of the amount determined for a cost centre under the entity's previous GAAP on the basis of the reserves associated with the oil and gas assets in that cost centre.

BC47D The deemed cost of oil and gas assets determined in this way may include amounts that would not have been capitalised in accordance with IFRSs, such as some overhead costs, costs that were incurred before the entity obtained legal rights to explore a specific area (and cannot be capitalised in accordance with IAS 38 *Intangible Assets*) and, most significantly, unsuccessful exploration costs.

This is a consequence of having included these costs in the single carrying amount under the method of accounting described in paragraph BC47A. To avoid the use of deemed costs resulting in an oil and gas asset being measured at more than its recoverable amount, the Board decided that oil and gas assets should be tested for impairment at the date of transition to IFRSs.

BC47E Not all oil and gas entities used the method of accounting described in paragraph BC47A under their previous GAAP. Some used a method of accounting that requires a unit of account that is generally consistent with IFRSs and does not cause similar transition issues. Therefore, the Board decided that the exemption would apply only to entities that used the method of accounting described in paragraph BC47A under their previous GAAP.

Employee benefits

BC48 If an entity elects to use the 'corridor' approach in IAS 19 *Employee Benefits*, full retrospective application of IAS 19 would require the entity to determine actuarial gains or losses for each year since the inception of the plan in order to determine the net cumulative unrecognised gains or losses at the date of transition to IFRSs. The Board concluded that this would not benefit users and would be costly. Therefore, the IFRS permits a first-time adopter to recognise all actuarial gains or losses up to the date of transition to IFRSs, even if its accounting policy in accordance with IAS 19 involves leaving some later actuarial gains and losses unrecognised (paragraph D10 of the IFRS).

BC49 The revision of IAS 19 in 1998 increased the reported employee benefit liabilities of some entities. IAS 19 permitted entities to amortise that increase over up to five years. Some suggested a similar transitional treatment for first-time adopters. However, the Board has no general policy of exempting transactions occurring before a specific date from the requirements of new IFRSs (paragraph 21 of the *Preface to International Financial Reporting Standards*). Therefore, the Board did not include a similar transitional provision for first-time adopters.

BC50 An entity's first IFRS financial statements may reflect measurements of pension liabilities at three dates: the reporting date, the end of the comparative year and the date of transition to IFRSs. Some suggested that obtaining three separate actuarial valuations for a single set of financial statements would be costly. Therefore, they proposed that the Board should permit an entity to use a single actuarial valuation, based, for example, on assumptions valid at the reporting date, with service costs and interest costs based on those assumptions for each of the periods presented.

BC51 However, the Board concluded that a general exemption from the principle of measurement at each date would conflict with the objective of providing understandable, relevant, reliable and comparable information for users. If an entity obtains a full actuarial valuation at one or two of these dates and rolls that (those) valuation(s) forward or back to the other date(s), any such roll forward or roll back needs to reflect material transactions and other material events (including changes in market prices and interest rates) between those dates (IAS 19 paragraph 57).

 © IASCF

BC52 Some suggested that the Board should exempt a first-time adopter from the requirement to identify and amortise the unvested portion of past service cost at the date of transition to IFRSs. However, this requirement is less onerous than the retrospective application of the corridor for actuarial gains and losses because it does not require the recreation of data since the inception of the plan. The Board concluded that no exemption was justified for past service cost.

Cumulative translation differences

BC53 IAS 21 *The Effects of Changes in Foreign Exchange Rates* requires an entity to classify some cumulative translation differences (CTDs) relating to a net investment in a foreign operation as a separate component of equity. The entity transfers the CTDs to the income statement on subsequent disposal of the foreign operation. The proposals in ED 1 would have permitted a first-time adopter to use the CTDs in accordance with previous GAAP as the deemed CTDs in accordance with IFRSs if reconstructing CTDs would have involved undue cost or effort.

BC54 Some respondents to ED 1 argued that it would be more transparent and comparable to exempt an entity from the requirement to identify CTDs at the date of transition to IFRSs, for the following reasons:

(a) An entity might know the aggregate CTDs, but might not know the amount for each subsidiary. If so, it could not transfer that amount to the income statement on disposal of that subsidiary. This would defeat the objective of identifying CTDs as a separate component of equity.

(b) The amount of CTDs in accordance with previous GAAP might be inappropriate as it might be affected by adjustments made on transition to IFRSs to assets and liabilities of foreign entities.

BC55 The Board found these arguments persuasive. Therefore, a first-time adopter need not identify the CTDs at the date of transition to IFRSs (paragraphs D12 and D13 of the IFRS). The first-time adopter need not show that identifying the CTDs would involve undue cost or effort.

Compound financial instruments

BC56 IAS 32 requires an entity to split a compound financial instrument at inception into separate liability and equity components. Even if the liability component is no longer outstanding, retrospective application of IAS 32 would involve separating two portions of equity. The first portion is in retained earnings and represents the cumulative interest accreted on the liability component. The other portion represents the original equity component of the instrument.

BC57 Some respondents to ED 1 argued that separating these two portions would be costly if the liability component of the compound instrument is no longer outstanding at the date of transition to IFRSs. The Board agreed with those comments. Therefore, if the liability component is no longer outstanding at the date of transition to IFRSs, a first-time adopter need not separate the cumulative interest on the liability component from the equity component (paragraph D18 of the IFRS).

BC58 Some respondents requested an exemption for compound instruments even if still outstanding at the date of transition to IFRSs. One possible approach would be to use the fair value of the components at the date of transition to IFRSs as deemed cost. However, as the IFRS does not include any exemptions for financial liabilities, the Board concluded that it would be inconsistent to create such an exemption for the liability component of a compound instrument.

Investments in subsidiaries, jointly controlled entities and associates

BC58A IAS 27 *Consolidated and Separate Financial Statements* requires an entity, in its separate financial statements, to account for investments in subsidiaries, jointly controlled entities and associates either at cost or in accordance with IAS 39.* For those investments that are measured at cost, the previous version of IAS 27 (before *Cost of an Investment* in a *Subsidiary, Jointly Controlled Entity or Associate* was issued in May 2008) required an entity to recognise income from the investment only to the extent the entity received distributions from post-acquisition retained earnings (the 'cost method'). Distributions received in excess of such profits were regarded as a recovery of investment and were recognised as a reduction in the cost of the investment.

BC58B For some jurisdictions, these aspects of IAS 27 led to practical difficulties on transition to IFRSs. In order to apply IAS 27 retrospectively, it would be necessary:

(a) to measure the fair value of the consideration given at the date of acquisition; and

(b) to determine whether any dividends received from a subsidiary after its acquisition were paid out of pre-acquisition retained earnings, which would reduce the carrying amount of the investment in the subsidiary in the parent's separate financial statements.

BC58C If a parent held an investment in a subsidiary for many years, such an exercise might be difficult, or even impossible, and perhaps costly. For example, in some jurisdictions, entities accounted for some previous acquisitions that were share-for-share exchanges using so-called 'merger relief' or 'group reconstruction relief'. In this situation, the carrying amount of the investment in the parent's separate financial statements was based on the nominal value of the shares given rather than the value of the purchase consideration. This might make it difficult or impossible to measure the fair value of the shares given.

BC58D The Board published *Cost of an Investment in a Subsidiary*, an exposure draft of proposed amendments to IFRS 1, in January 2007. In response to the issues outlined in paragraphs BC58A–BC58C, the Board proposed two exemptions from applying the requirements of IAS 27 retrospectively upon first-time adoption of IFRSs:

(a) an alternative approach for determining the cost of an investment in a subsidiary in the separate financial statements of a parent; and

(b) simplification of the process for determining the pre-acquisition retained earnings of that subsidiary.

* In November 2009 the IASB amended some of the requirements of IAS 39 and relocated them to IFRS 9 *Financial Instruments*.

 © IASCF

BC58E In developing that exposure draft, the Board considered three ways of determining a deemed cost of an investment in a subsidiary at the parent's date of transition to IFRSs in its separate financial statements. These were:

(a) the previous GAAP cost of the investment (previous GAAP deemed cost).

(b) the parent's interest in the subsidiary's assets less liabilities, using the carrying amounts that IFRSs would require in the subsidiary's statement of financial position (net asset deemed cost).

(c) the fair value of the investment (fair value deemed cost).

BC58F The Board decided that the net asset deemed cost option would provide relevant information to users about the subsidiary's financial position at the date of transition to IFRSs and would be relatively easy to determine. The fair value deemed cost option would provide relevant information at the date of transition to IFRSs, but might be more costly and difficult to determine.

BC58G In some situations, the cost of an investment in a subsidiary determined using the previous GAAP carrying amount might bear little resemblance to cost determined in accordance with IAS 27. Therefore, the Board rejected the use of a deemed cost based on the previous GAAP carrying amount. The Board proposed to allow entities a choice between the net asset deemed cost and the fair value deemed cost.

BC58H Respondents to the exposure draft stated that the previous GAAP carrying amount is a more appropriate deemed cost. They argued that:

(a) a net asset deemed cost would not include goodwill or other intangible assets that might be present in a carrying amount determined in accordance with previous GAAP. When this is the case, the net asset deemed cost option would understate the assets of the entities for which it is used. The resulting reduction in the carrying amount of the investment could reduce the distributable profits of the parent.

(b) it was difficult to see why, in the light of the exemption in IFRS 1 from applying IFRS 3 retrospectively, the Board did not propose to permit the cost of the investment in a subsidiary in accordance with previous GAAP to be used as a deemed cost. When an entity had chosen not to apply IFRS 3 retrospectively to a past business combination, it would be logical not to require it to restate the cost of the related investment in the separate financial statements of the parent.

BC58I In the light of respondents' comments, the Board observed that, in many instances, neither the previous GAAP carrying amount nor the net asset deemed cost represents 'cost'—both numbers could be viewed as being equally arbitrary.

BC58J In order to reduce the cost of adopting IFRSs in the parent entity's separate financial statements without significantly reducing the benefits of those statements, the Board decided to allow entities a choice between the previous GAAP carrying amount and the fair value as deemed cost.

BC58K The Board also agreed with respondents that similar issues arise for investments in associates and jointly controlled entities. As a result, paragraph D15 of the IFRS applies to such investments.

BC58L The Board published its revised proposals in *Cost of an Investment in a Subsidiary, Jointly Controlled Entity or Associate*, an exposure draft of proposed amendments to IFRS 1 and IAS 27, in December 2007. Respondents generally supported the proposed amendments to IFRS 1. The Board included the amendments in *Cost of an Investment in a Subsidiary, Jointly Controlled Entity or Associate* issued in May 2008.

BC58M In developing the December 2007 exposure draft, the Board decided to address the simplification of the process for determining the pre-acquisition retained earnings of a subsidiary more generally through an amendment to IAS 27 (see paragraph 38A of IAS 27 and paragraphs BC66D–BC66J of the Basis for Conclusions on IAS 27).

Assets and liabilities of subsidiaries, associates and joint ventures

BC59 A subsidiary may have reported to its parent in the previous period using IFRSs without presenting a full set of financial statements in accordance with IFRSs. If the subsidiary subsequently begins to present financial statements that contain an explicit and unreserved statement of compliance with IFRSs, it becomes a first-time adopter at that time. This might compel the subsidiary to keep two parallel sets of accounting records based on different dates of transition to IFRSs, because some measurements in accordance with the IFRS depend on the date of transition to IFRSs.

BC60 In developing ED 1, the Board concluded that a requirement to keep two parallel sets of records would be burdensome and not be beneficial to users. Therefore, ED 1 proposed that a subsidiary would not be treated as a first-time adopter for recognition and measurement purposes if the subsidiary was consolidated in IFRS financial statements for the previous period and all owners of the minority interests consented.*

BC61 Some respondents to ED 1 opposed the exemption, on the following grounds:

(a) The exemption would not eliminate all differences between the group reporting package and the subsidiary's own financial statements. The reporting package does not constitute a full set of financial statements, the parent may have made adjustments to the reported numbers (for example, if pension cost adjustments were made centrally), and the group materiality threshold may be higher than for the subsidiary.

(b) The Board's objective of comparability between different entities adopting IFRSs for the first time at the same date (paragraph BC10) should apply equally to any entity, including subsidiaries, particularly if the subsidiary's debt or equity securities are publicly traded.

BC62 However, the Board retained the exemption because it will ease some practical problems. Although the exemption does not eliminate all differences between the subsidiary's financial statements and a group reporting package, it does reduce them. Furthermore, the exemption does not diminish the relevance and reliability of the subsidiary's financial statements because it permits a

* In January 2008 the IASB issued an amended IAS 27 *Consolidated and Separate Financial Statements*, which amended 'minority interests' to 'non-controlling interests'.

 © IASCF

measurement that is already acceptable in accordance with IFRSs in the consolidated financial statements of the parent. Therefore, the Board also eliminated the proposal in ED 1 that the exemption should be conditional on the consent of minorities.

BC63 In finalising the IFRS, the Board simplified the description of the exemption for a subsidiary that adopts IFRSs after its parent. In accordance with the IFRS, the subsidiary may measure its assets and liabilities at the carrying amounts that would be included in the parent's consolidated financial statements, based on the parent's date of transition to IFRSs, if no adjustments were made for consolidation procedures and for the effects of the business combination in which the parent acquired the subsidiary. Alternatively, it may elect to measure them at the carrying amounts required by the rest of the IFRS, based on the subsidiary's date of transition to IFRSs. The Board also extended the exemption to an associate or joint venture that becomes a first-time adopter later than an entity that has significant influence or joint control over it (paragraph D16 of the IFRS). However, if a parent adopts IFRSs later than a subsidiary, the parent cannot, in its consolidated financial statements, elect to change IFRS measurements that the subsidiary has already used in its financial statements, except to adjust for consolidation procedures and for the effects of the business combination in which the parent acquired the subsidiary (paragraph D17 of the IFRS).

Designation of previously recognised financial instruments

BC63A IAS 39[*] permits an entity to designate, on initial recognition only, a financial instrument as (a) available for sale (for a financial asset) or (b) a financial asset or financial liability at fair value through profit or loss (provided the asset or liability qualifies for such designation in accordance with paragraph 9(b)(i), 9(b)(ii) or 11A of IAS 39). Despite this requirement, an entity that had already applied IFRSs before the effective date of IAS 39 (as revised in March 2004) may (a) designate a previously recognised financial asset as available for sale on initial application of IAS 39 (as revised in March 2004), or (b) designate a previously recognised financial instrument as at fair value through profit or loss in the circumstances specified in paragraph 105B of IAS 39. The Board decided that the same considerations apply to first-time adopters as to entities that already apply IFRSs. Accordingly, a first-time adopter of IFRSs may similarly designate a previously recognised financial instrument in accordance with paragraph D19 of the IFRS. Such an entity shall disclose the fair value of the financial assets or financial liabilities designated into each category at the date of designation and their classification and carrying amount in the previous financial statements.

Share-based payment transactions

BC63B IFRS 2 *Share-based Payment* contains various transitional provisions. For example, for equity-settled share-based payment arrangements, IFRS 2 requires an entity to apply IFRS 2 to shares, share options or other equity instruments that were granted after 7 November 2002 and had not vested at the effective date of IFRS 2.

[*] In November 2009 the IASB amended the requirements of IAS 39 relating to classification and measurement of assets within the scope of IAS 39 and relocated them to IFRS 9 *Financial Instruments*. IFRS 9 applies to all assets within the scope of IAS 39. This paragraph refers to matters relevant when IFRS 1 was issued.

IFRS 2 is effective for annual periods beginning on or after 1 January 2005. There are also transitional arrangements for liabilities arising from cash-settled share-based payment transactions, and for modifications of the terms or conditions of a grant of equity instruments to which IFRS 2 has not been applied, if the modification occurs after the effective date of IFRS 2. The Board decided that, in general, first-time adopters should be treated in the same way as entities that already apply IFRSs. For example, a first-time adopter should not be required to apply IFRS 2 to equity instruments that were granted on or before 7 November 2002. Similarly, a first-time adopter should not be required to apply IFRS 2 to equity instruments that were granted after 7 November 2002 if those equity instruments vested before 1 January 2005. In addition, the Board decided that a first-time adopter should not be required to apply IFRS 2 to equity instruments that were granted after 7 November 2002 if those equity instruments vested before the date of transition to IFRSs. Similarly, the Board decided that a first-time adopter should not be required to apply IFRS 2 to liabilities arising from cash-settled share-based payment transactions if those liabilities were settled before the date of transition to IFRSs.

Changes in existing decommissioning, restoration and similar liabilities included in the cost of property, plant and equipment

BC63C IFRIC 1 *Changes in Existing Decommissioning, Restoration and Similar Liabilities* requires specified changes in decommissioning, restoration and similar liabilities to be added to, or deducted from, the cost of the assets to which they relate, and the adjusted depreciable amount to be depreciated prospectively over the remaining useful life of those assets. Retrospective application of this requirement at the date of transition would require an entity to construct a historical record of all such adjustments that would have been made in the past. In many cases this will not be practicable. The Board agreed that, as an alternative to complying with this requirement, an entity should be permitted to include in the depreciated cost of the asset, at the date of transition to IFRSs, an amount calculated by discounting the liability at that date back to, and depreciating it from, when the liability was first incurred.

BC63CA Paragraph D21 of the IFRS exempts from the requirements of IFRIC 1 *Changes in Existing Decommissioning, Restoration and Similar Liabilities* changes in decommissioning costs incurred before the date of transition to IFRSs. Use of this exemption would require detailed calculations that would not be practicable for entities that used the method of accounting described in paragraph BC47A under their previous GAAP. The Board noted that adjustments to liabilities as a result of initial adoption of IFRSs arise from events and transactions before the date of transition to IFRSs and are generally recognised in retained earnings. Therefore, the Board decided that, for entities that used the method of accounting described in paragraph BC47A, any adjustment for a difference between decommissioning, restoration and similar liabilities measured in accordance with IAS 37 and the liability determined under the entity's previous GAAP should be accounted for in the same manner.

Leases

BC63D IFRIC 4 *Determining whether an Arrangement contains a Lease* contains transitional provisions because the IFRIC acknowledged the practical difficulties raised by full retrospective application of the Interpretation, in particular the difficulty of going back potentially many years and making a meaningful assessment of whether the arrangement satisfied the criteria at that time. The Board decided to treat first-time adopters in the same way as entities that already apply IFRSs.

BC63DA IFRIC 4 permits an entity to apply its requirements to arrangements existing at the start of the earliest period for which comparative information is presented on the basis of facts and circumstances existing at the start of that period. Before adopting IFRSs, a jurisdiction might adopt a national standard having the same effect as the requirements of IFRIC 4, including the same transitional provisions. An entity in that jurisdiction might then apply requirements having the same effect as the requirements of IFRIC 4 to some or all arrangements (even if the wording of those requirements is not identical). However, the entity might apply the requirements at a date different from the date in the transitional provisions of IFRIC 4. IFRS 1 would require such an entity to reassess that accounting retrospectively on first-time adoption. This might result in additional costs, with no obvious benefits. Accordingly, the Board decided that if a first-time adopter made the same determination under previous GAAP as that required by IFRIC 4 but at a date other than that required by IFRIC 4, the first-time adopter need not reassess that determination when it adopts IFRSs.

BC63DB The Board considered a more general modification to IFRS 1. It considered whether to modify IFRS 1 so that entities need not reassess, at the date of transition to IFRSs, prior accounting if that prior accounting permitted the same prospective application as IFRSs with the only difference from IFRSs being the effective date from when that accounting was applied. In this regard, the Board noted that any such proposal must apply to assessments resulting in the *same* determination, rather than *similar* determinations, because it would be too difficult to determine and enforce what constitutes a sufficient degree of similarity. The Board noted that many of the circumstances in which this situation might arise have been dealt with in IFRS 1 or other IFRSs. Accordingly, the Board decided to focus on IFRIC 4 only.

Borrowing costs

BC63E IAS 23 *Borrowing Costs* (as revised in 2007) contains transitional provisions because the Board acknowledged that if an entity has been following the accounting policy of immediately recognising borrowing costs as an expense and has not previously gathered the necessary information for capitalisation of borrowing costs, getting the information retrospectively may be costly. First-time adopters of IFRSs face problems similar to those facing entities that already apply IFRSs. Moreover, although first-time adopters have the option of using fair value as the deemed cost of an asset at the date of transition to IFRSs, this option is not applicable to all qualifying assets, such as inventories. Furthermore, the Board concluded that the existence of the deemed cost option is not sufficient to justify a more stringent requirement for the application of IAS 23 for first-time adopters than for entities that already apply IFRSs. A more stringent requirement for the adoption of the capitalisation treatment could be justified when IFRS 1 was

originally issued because capitalisation was then an option. The requirements for the application of mandatory capitalisation, on the other hand, should be the same for entities that already apply IFRSs and for first-time adopters. Therefore, the Board decided to amend IFRS 1, allowing first-time adopters transitional provisions equivalent to those available to entities that already apply IFRSs in paragraphs 27 and 28 of IAS 23, as revised in 2007.

Other possible exemptions rejected

BC64 The Board considered and rejected suggestions for other exemptions. Each such exemption would have moved the IFRS away from a principle-based approach, diminished transparency for users, decreased comparability over time within an entity's first IFRS financial statements and created additional complexity. In the Board's view, any cost savings generated would not have outweighed these disadvantages. Paragraphs BC65–BC73 discuss some of the specific suggestions the Board considered for embedded derivatives, hyperinflation, intangible assets and transaction costs on financial instruments.

Embedded derivatives

BC65 IAS 39[*] requires an entity to account separately for some embedded derivatives at fair value. Some respondents to ED 1 argued that retrospective application of this requirement would be costly. Some suggested either an exemption from retrospective application of this requirement, or a requirement or option to use the fair value of the host instrument at the date of transition to IFRSs as its deemed cost at that date.

BC66 The Board noted that US GAAP provides an option in this area. Under the transitional provisions of SFAS 133 *Accounting for Derivative Instruments and Hedging Activities*, an entity need not account separately for some pre-existing embedded derivatives. Nevertheless, the Board concluded that the failure to measure embedded derivatives at fair value would diminish the relevance and reliability of an entity's first IFRS financial statements. The Board also observed that IAS 39[*] addresses an inability to measure an embedded derivative and the host contract separately. In such cases, IAS 39 requires an entity to measure the entire combined contract at fair value.

Hyperinflation

BC67 Some argued that the cost of restating financial statements for the effects of hyperinflation in periods before the date of transition to IFRSs would exceed the benefits, particularly if the currency is no longer hyperinflationary. However, the Board concluded that such restatement should be required, because hyperinflation can make unadjusted financial statements meaningless or misleading.

[*] IFRS 9 *Financial Instruments*, issued in November 2009, amended the requirements in IAS 39 to identify and separately account for derivatives embedded in a financial host within the scope of IFRS 9. The requirements in IAS 39 continue to apply for derivatives embedded in non-financial hosts and financial hosts outside the scope of IFRS 9. This Basis for Conclusions has not been updated for changes in requirements since IFRIC 9 *Reassessment of Embedded Derivatives* was issued in March 2006.

 © IASCF

Intangible assets

BC68 For the following reasons, some proposed that a first-time adopter's opening IFRS balance sheet should exclude intangible assets that it did not recognise in accordance with previous GAAP:

(a) Using hindsight to assess retrospectively when the recognition criteria for intangible assets were met could be subjective, open up possibilities for manipulation and involve costs that might exceed the benefits to users.

(b) The benefits expected from intangible assets are often not related directly to the costs incurred. Therefore, capitalising the costs incurred is of limited benefit to users, particularly if the costs were incurred in the distant past.

(c) Such an exclusion would be consistent with the transitional provisions in IAS 38 *Intangible Assets*. These encourage (but do not require) the recognition of intangible assets acquired in a previous business combination that was an acquisition and prohibit the recognition of all other previously unrecognised intangible assets.

BC69 In many cases, internally generated intangible assets do not qualify for recognition in accordance with IAS 38 at the date of transition to IFRSs because an entity did not, in accordance with previous GAAP, accumulate cost information or did not carry out contemporaneous assessments of future economic benefits. In these cases, there is no need for a specific requirement to exclude those assets. Furthermore, when these assets do not qualify for recognition, first-time adopters will not generally, in the Board's view, need to perform extensive work to reach this conclusion.

BC70 In other cases, an entity may have accumulated and retained sufficient information about costs and future economic benefits to determine which intangible assets (whether internally generated or acquired in a business combination or separately) qualify in accordance with IAS 38 for recognition in its opening IFRS balance sheet. If that information is available, no exclusion is justified.

BC71 Some argued that fair value should be used as deemed cost for intangible assets in the opening IFRS balance sheet (by analogy with a business combination). ED 1 would not have permitted this. However, in finalising the IFRS, the Board concluded that this approach should be available for those intangible assets for which IFRSs already permit fair value measurements. Therefore, in accordance with the IFRS, a first-time adopter may elect to use fair value or some previous GAAP revaluations of intangible assets as deemed cost for IFRSs, but only if the intangible assets meet:

(a) the recognition criteria in IAS 38 (including reliable measurement of original cost); and

(b) the criteria in IAS 38 for revaluation (including the existence of an active market) (paragraph D7 of the IFRS).

Transaction costs: financial instruments

BC72 To determine the amortised cost of a financial asset or financial liability using the effective interest method, it is necessary to determine the transaction costs incurred when the asset or liability was originated. Some respondents to ED 1 argued that determining these transaction costs could involve undue cost or effort for financial assets or financial liabilities originated long before the date of transition to IFRSs. They suggested that the Board should permit a first-time adopter:

(a) to use the fair value of the financial asset or financial liability at the date of transition to IFRSs as its deemed cost at that date; or

(b) to determine amortised cost without considering transaction costs.

BC73 In the Board's view, the unamortised portion of transaction costs at the date of transition to IFRSs is unlikely to be material for most financial assets and financial liabilities. Even when the unamortised portion is material, reasonable estimates should be possible. Therefore, the Board created no exemption in this area.

Retrospective designation

BC74 The Board considered practical implementation difficulties that could arise from the retrospective application of aspects of IAS 39:*

(a) hedge accounting (paragraphs BC75–BC80);

(b) the treatment of cumulative fair value changes on available-for-sale financial assets at the date of transition to IFRSs (paragraphs BC81–BC83); and

(c) 'day 1' gain or loss recognition (paragraph BC83A).

Hedge accounting

BC75 Before beginning their preparations for adopting IAS 39 (or a local standard based on IAS 39), it is unlikely that most entities would have adopted IAS 39's criteria for (a) documenting hedges at their inception and (b) testing the hedges for effectiveness, even if they intended to continue the same hedging strategies after adopting IAS 39. Furthermore, retrospective designation of hedges (or retrospective reversal of their designation) could lead to selective designation of some hedges to report a particular result.

BC76 To overcome these problems, the transitional requirements in IAS 39 require an entity already applying IFRSs to apply the hedging requirements prospectively when it adopts IAS 39. As the same problems arise for a first-time adopter, the IFRS requires prospective application by a first-time adopter.

* In November 2009 the IASB amended the requirements of IAS 39 relating to classification and measurement of assets within the scope of IAS 39 and relocated them to IFRS 9 *Financial Instruments*. IFRS 9 applies to all assets within the scope of IAS 39. Paragraphs BC74(b) and (c) and BC81–BC83A discuss matters relevant when IFRS 1 was issued.

 © IASCF

BC77 ED 1 included a redrafted version of the transitional provisions in IAS 39 and related *Questions and Answers* (Q&As) developed by the IAS 39 Implementation Guidance Committee. The Board confirmed in the Basis for Conclusions published with ED 1 that it did not intend the redrafting to create substantive changes. However, in the light of responses to ED 1, the Board decided in finalising IFRS 1 that the redrafting would not make it easier for first-time adopters and others to understand and apply the transitional provisions and Q&As. However, the project to improve IAS 32 and IAS 39 resulted in certain amendments to the transition requirements. In addition, this project incorporated selected other Q&As (ie not on transition) into IAS 39. The Board therefore took this opportunity to consolidate all the guidance for first-time adopters in one place, by incorporating the Q&As on transition into IFRS 1.

BC78 Some respondents to ED 1 asked the Board to clarify what would happen if hedge accounting in accordance with previous GAAP involved hedging relationships of a type that does not qualify for hedge accounting in accordance with IAS 39. The problem can be seen most clearly for a hedge of a net position (macro hedge). If a first-time adopter were to use hedge accounting in its opening IFRS balance sheet for a hedge of a net position, this would involve either:

(a) recognising deferred debits and credits that are not assets and liabilities (for a fair value hedge); or

(b) deferring gains or losses in equity when there is, at best, a weak link to an underlying item that defines when they should be transferred to the income statement (for a cash flow hedge).

BC79 As either of these treatments would diminish the relevance and reliability of an entity's first IFRS financial statements, the Board decided that an entity should not apply hedge accounting in its opening IFRS balance sheet to a hedge of a net position that does not qualify as a hedged item in accordance with IAS 39. However, the Board concluded that it would be reasonable (and consistent with IAS 39 paragraph 133*) to permit a first-time adopter to designate an individual item as a hedged item within the net position, provided that it does so no later than the date of transition to IFRSs, to prevent selective designation. For similar reasons, the Board prohibited hedge accounting in the opening IFRS balance sheet for any hedging relationship of a type that does not qualify for hedge accounting in accordance with IAS 39 (see paragraph B5 of the IFRS).

BC80 Some respondents to ED 1 suggested that an entity adopting IFRSs for the first time in 2005 could not meet IAS 39's documentation and effectiveness criteria by the date of transition to IFRSs (1 January 2004 for many entities). Some requested an exemption from these criteria until the beginning of the latest period covered by the first IFRS financial statements (1 January 2005 for many entities). However, for the following reasons, the Board did not create an exemption in this area:

(a) The Board's primary objective is comparability within a first-time adopter's first IFRS financial statements and between different first-time adopters switching to IFRSs at the same time (paragraph BC10).

* In IAS 39, as revised in 2003, paragraph 133 was replaced by paragraphs 84 and AG101.

(b) The continuation of previous GAAP hedge accounting practices could permit the non-recognition of derivatives or the recognition of deferred debits and credits that are not assets and liabilities.

(c) The Board's benchmark for cost-benefit assessments was an entity that has planned the transition to IFRSs and is able to collect the necessary information at, or very soon after, the date of transition to IFRSs (paragraph BC27). Entities should not be 'rewarded' by concessions if they failed to plan for transition, nor should that failure be allowed to undermine the integrity of their opening IFRS balance sheet. Entities switching to IFRSs in 2005 need to have their hedge accounting systems in place by the beginning of 2004. In the Board's view, that is a challenging but achievable timetable. Entities preparing to switch to IFRSs in 2004 should have been aware of the implications of IAS 39 already and the exposure draft of improvements to IAS 39, published in June 2002, proposed very few changes in this area, so delayed transition is not justified for these entities either.

Available-for-sale financial assets*

BC81 Retrospective application of IAS 39 to available-for-sale financial assets requires a first-time adopter to recognise the cumulative fair value changes in a separate component of equity in the opening IFRS balance sheet, and transfer those fair value changes to the income statement on subsequent disposal or impairment of the asset. This could allow, for example, selective classification of assets with cumulative gains as available for sale (with subsequent transfers to the income statement on disposal) and assets with cumulative losses as held for trading (with no transfers on disposal).

BC82 IAS 39 confirmed the proposal in the exposure draft of June 2002 to give an entity that already applies IFRSs an option to designate any financial asset as at fair value through profit or loss when it first applies the proposed improvements. Although this requirement could increase the risk of selective classification by first-time adopters of the kind discussed in the previous paragraph, the Board noted that an entity could achieve a similar result by selective disposal of some assets before the date of transition to IFRSs. Therefore, the Board concluded that it should treat first-time adopters in the same way as entities that already apply IFRSs by requiring retrospective application.

BC83 Some respondents to ED 1 commented that the cost of determining the amount to be included in a separate component of equity would exceed the benefits. However, the Board noted that these costs would be minimal if a first-time adopter carried the available-for-sale financial assets in accordance with previous GAAP at cost or the lower of cost and market value. These costs might be more significant if it carried them at fair value, but in that case it might well classify the assets as held for trading. Therefore, the Board made no changes to ED 1's proposal that a first-time adopter should apply IAS 39 retrospectively to available-for-sale financial assets.

* IFRS 9 *Financial Instruments*, issued in November 2009, eliminated the category of available-for-sale financial assets. Paragraphs BC81–BC83A discuss matters relevant when IFRS 1 was issued.

 © IASCF

BC83A IFRS 1 originally required retrospective application of the 'day 1' gain or loss recognition requirements in IAS 39 paragraph AG76. After the revised IAS 39 was issued, constituents raised concerns that retrospective application would diverge from the requirements of US GAAP, would be difficult and expensive to implement, and might require subjective assumptions about what was observable and what was not. In response to these concerns, the Board decided to permit entities to apply the requirements in the last sentence of IAS 39 paragraph AG76 and in paragraph AG76A, in any one of the following ways:

(a) retrospectively;

(b) prospectively to transactions entered into after 25 October 2002; or

(c) prospectively to transactions entered into after 1 January 2004.

Estimates

BC84 An entity will have made estimates in accordance with previous GAAP at the date of transition to IFRSs. Events between that date and the reporting date for the entity's first IFRS financial statements might suggest a need to change those estimates. Some of those events might qualify as adjusting events in accordance with IAS 10 *Events after the Balance Sheet Date*.* However, if the entity made those estimates on a basis consistent with IFRSs, the Board concluded that it would be more helpful to users—and more consistent with IAS 8—to recognise the revision of those estimates as income or expense in the period when the entity made the revision, rather than in preparing the opening IFRS balance sheet (paragraphs 14–17 of the IFRS).

Presentation and disclosure

Comparative information

BC85 IAS 1 requires an entity to disclose comparative information (in accordance with IFRSs) for the previous period. Some suggested that a first-time adopter should disclose comparative information for more than one previous period. For entities that already apply IFRSs, users normally have access to financial statements prepared on a comparable basis for several years. However, this is not the case for a first-time adopter.

BC86 Nevertheless, the Board did not require a first-time adopter to present more comparative information than IAS 1 requires, because such a requirement would impose costs out of proportion to the benefits to users, and increase the risk that preparers might need to make arbitrary assumptions in applying hindsight.

* In September 2007 the IASB amended the title of IAS 10 *Events after the Balance Sheet Date* to *Events after the Reporting Period* as a consequence of the revision of IAS 1 *Presentation of Financial Statements* in 2007.

BC87 ED 1 proposed that if the first IFRS financial statements include more than one year of comparative information, the additional comparative information should comply with IFRSs. Some respondents to ED 1 noted that some regulators require entities to prepare more than two years of comparatives. They argued the following:

(a) A requirement to restate two years of comparatives would impose excessive costs and lead to arbitrary restatements that might be biased by hindsight.

(b) Consider an entity adopting IFRSs in 2005 and required by its regulator to give two years of comparatives. Its date of transition to IFRSs would be 1 January 2003—several months before the publication of the IFRS and of the standards resulting from the improvements project. This could contradict the Board's assertion in paragraph BC27 above that most preparers could gather most information they need for their opening IFRS balance sheet at, or soon after, the date of transition to IFRSs.

BC88 In response to these comments, the Board deleted this proposal. Instead, if a first-time adopter elects to give more than one year of comparative information, the additional comparative information need not comply with IFRSs, but the IFRS requires the entity:

(a) to label previous GAAP information prominently as not being prepared in accordance with IFRSs.

(b) to disclose the nature of the main adjustments that would make it comply with IFRSs (paragraph 22 of the IFRS).

BC89 Some respondents to ED 1 suggested that it would be onerous to prepare comparative information in accordance with IAS 32 and IAS 39[*] about financial instruments. They suggested that an entity should be able to apply IAS 39 prospectively from the beginning of the year of its first IFRS financial statements (eg 1 January 2005 for many first-time adopters). They noted that US companies were not required to restate comparatives on the introduction of SFAS 133 *Accounting for Derivative Instruments and Hedging Activities*. However, given the Board's emphasis on comparability within the first IFRS financial statements (paragraph BC10) and the assumption of timely planning (paragraph BC27), the Board introduced no general exemption in this area.

BC89A Nevertheless, the Board noted that the revised IAS 32 and IAS 39[*] were not issued until December 2003. Additionally, the Board's decision to re-expose its proposals for portfolio hedges of interest rate risk had the effect that some of the requirements will not be finalised until early 2004. The Board was sympathetic to concerns that entities that will be required to comply with IFRSs for the first time in 2005 could not make a timely transition to IFRSs because IAS 39 will not be issued in final form until after the start of 2004. Therefore, the Board decided to exempt entities adopting IFRSs for the first time before 1 January 2006 from producing comparative information that complies with IAS 32 and IAS 39, as revised in 2003, in their first IFRS financial statements.

[*] In November 2009 the IASB amended the requirements of IAS 39 relating to classification and measurement of assets within the scope of IAS 39 and relocated them to IFRS 9 *Financial Instruments*. IFRS 9 applies to all assets within the scope of IAS 39. This paragraph refers to matters relevant when IFRS 1 was issued.

 © IASCF

Historical summaries

BC90 Some entities choose, or are required, to present in their financial statements historical summaries of selected data covering periods before the first period for which they present full comparative information. Some argued that an entity should present this information in accordance with IFRSs, to ensure comparability over time. However, the Board concluded that such a requirement would cause costs out of proportion to the benefit to users. The IFRS requires disclosure of the nature of the main adjustments needed to make historical summaries included in financial statements or interim financial reports comply with IFRSs (paragraph 22 of the IFRS). Historical summaries published outside financial statements or interim financial reports are beyond the scope of the IFRS.

Explanation of transition to IFRSs

BC91 The IFRS requires disclosures about the effect of the transition from previous GAAP to IFRSs. The Board concluded that such disclosures are essential, in the first (annual) IFRS financial statements as well as in interim financial reports (if any), because they help users understand the effect and implications of the transition to IFRSs and how they need to change their analytical models to make the best use of information presented using IFRSs. The required disclosures relate to both:

(a) the most recent information published in accordance with previous GAAP, so that users have the most up-to-date information; and

(b) the date of transition to IFRSs. This is an important focus of attention for users, preparers and auditors because the opening IFRS balance sheet is the starting point for accounting in accordance with IFRSs.

BC92 Paragraph 24(a) and (b) of the IFRS requires reconciliations of equity and total comprehensive income. The Board concluded that users would also find it helpful to have information about the other adjustments that affect the opening IFRS balance sheet but do not appear in these reconciliations. Because a reconciliation could be voluminous, the IFRS requires disclosure of narrative information about these adjustments, as well as about adjustments to the cash flow statement (paragraph 25 of the IFRS).

BC92A The Board decided to require a first-time adopter to include in its first IFRS financial statements a reconciliation of total comprehensive income (or, if an entity did not report such a total, profit or loss) in accordance with previous GAAP to total comprehensive income in accordance with IFRSs for the latest period reported in accordance with previous GAAP.

BC92B The Board observed that the amendments to IAS 1 in 2007 regarding the presentation of income and expense might result in users having to change their analytical models to include both income and expense that are recognised in profit or loss and those recognised outside profit or loss. Accordingly, the Board concluded that it would be helpful to those users to provide information on the effect and implication of the transition to IFRSs on all items of income and expense, not only those recognised in profit or loss.

BC92C The Board acknowledged that GAAP in other jurisdictions might not have a notion of total comprehensive income. Accordingly, it decided that an entity should reconcile to total comprehensive income in accordance with IFRSs from the previous GAAP equivalent of total comprehensive income. The previous GAAP equivalent might be profit or loss.

BC93 Paragraph 26 of the IFRS states that the reconciliations should distinguish changes in accounting policies from the correction of errors. Some respondents to ED 1 argued that complying with this requirement could be difficult or costly. However, the Board concluded that both components are important and their disclosure should be required because:

(a) information about changes in accounting policies helps explain the transition to IFRSs.

(b) information about errors helps users assess the reliability of financial information. Furthermore, a failure to disclose the effect of material errors would obscure the 'results of the stewardship of management, or the accountability of management for the resources entrusted to it' (*Framework*, paragraph 14).

BC94 For impairment losses (and reversals) recognised in preparing the opening IFRS balance sheet, paragraph 24(c) of the IFRS requires the disclosures that IAS 36 would require if those impairment losses (and reversals) were recognised during the period beginning with the date of transition to IFRSs. The rationale for this requirement is that there is inevitably subjectivity about impairment losses. This disclosure provides transparency about impairment losses recognised on transition to IFRSs. These losses might otherwise receive less attention than impairment losses recognised in earlier or later periods.

BC95 Paragraph 30 of the IFRS requires disclosures about the use of fair value as deemed cost. Although the adjustment arising from the use of this exemption appears in the reconciliations discussed above, this more specific disclosure highlights it. Furthermore, this exemption differs from the other exemptions that might apply for property, plant and equipment (previous GAAP revaluation or event-driven fair value measurement). The latter two exemptions do not lead to a restatement on transition to IFRSs because they apply only if the measurement was already used in previous GAAP financial statements.

Interim financial reports

BC96 IAS 34 *Interim Financial Reporting* states that the interim financial report is 'intended to provide an update on the latest complete set of annual financial statements' (paragraph 6). Thus, IAS 34 requires less disclosure in interim financial statements than IFRSs require in annual financial statements. However, an entity's interim financial report in accordance with IAS 34 is less helpful to users if the entity's latest annual financial statements were prepared using previous GAAP than if they were prepared in accordance with IFRSs. Therefore, the Board concluded that a first-time adopter's first interim financial report in accordance with IAS 34 should include sufficient information to enable users to understand how the transition to IFRSs affected previously reported annual, as well as interim, figures (paragraphs 32 and 33 of the IFRS).

Guidance on implementing IFRS 1 *First-time Adoption of International Financial Reporting Standards*

This guidance accompanies, but is not part of, IFRS 1.

Introduction

IG1 This implementation guidance:

(a) explains how the requirements of the IFRS interact with the requirements of some other IFRSs (paragraphs IG2–IG62, IG64 and IG65). This explanation addresses those IFRSs that are most likely to involve questions that are specific to first-time adopters.

(b) includes an illustrative example to show how a first-time adopter might disclose how the transition to IFRSs affected its reported financial position, financial performance and cash flows, as required by paragraphs 24(a) and (b), 25 and 26 of the IFRS (paragraph IG63).

IAS 10 *Events after the Reporting Period*

IG2 Except as described in paragraph IG3, an entity applies IAS 10 in determining whether:

(a) its opening IFRS statement of financial position reflects an event that occurred after the date of transition to IFRSs; and

(b) comparative amounts in its first IFRS financial statements reflect an event that occurred after the end of that comparative period.

IG3 Paragraphs 14–17 of the IFRS require some modifications to the principles in IAS 10 when a first-time adopter determines whether changes in estimates are adjusting or non-adjusting events at the date of transition to IFRSs (or, when applicable, the end of the comparative period). Cases 1 and 2 below illustrate those modifications. In case 3 below, paragraphs 14–17 of the IFRS do not require modifications to the principles in IAS 10.

(a) Case 1—Previous GAAP required estimates of similar items for the date of transition to IFRSs, using an accounting policy that is consistent with IFRSs. In this case, the estimates in accordance with IFRSs need to be consistent with estimates made for that date in accordance with previous GAAP, unless there is objective evidence that those estimates were in error (see IAS 8 *Accounting Policies, Changes in Accounting Estimates and Errors*). The entity reports later revisions to those estimates as events of the period in which it makes the revisions, rather than as adjusting events resulting from the receipt of further evidence about conditions that existed at the date of transition to IFRSs.

(b) Case 2—Previous GAAP required estimates of similar items for the date of transition to IFRSs, but the entity made those estimates using accounting policies that are not consistent with its accounting policies in accordance

 © IASCF

with IFRSs. In this case, the estimates in accordance with IFRSs need to be consistent with the estimates required in accordance with previous GAAP for that date (unless there is objective evidence that those estimates were in error), after adjusting for the difference in accounting policies. The opening IFRS statement of financial position reflects those adjustments for the difference in accounting policies. As in case 1, the entity reports later revisions to those estimates as events of the period in which it makes the revisions.

For example, previous GAAP may have required an entity to recognise and measure provisions on a basis consistent with IAS 37 *Provisions, Contingent Liabilities and Contingent Assets*, except that the previous GAAP measurement was on an undiscounted basis. In this example, the entity uses the estimates in accordance with previous GAAP as inputs in making the discounted measurement required by IAS 37.

(c) Case 3—Previous GAAP did not require estimates of similar items for the date of transition to IFRSs. Estimates in accordance with IFRSs for that date reflect conditions existing at that date. In particular, estimates of market prices, interest rates or foreign exchange rates at the date of transition to IFRSs reflect market conditions at that date. This is consistent with the distinction in IAS 10 between adjusting events after the reporting period and non-adjusting events after the reporting period.

IG Example 1 Estimates

Background

Entity A's first IFRS financial statements are for a period that ends on 31 December 20X5 and include comparative information for one year. In its previous GAAP financial statements for 31 December 20X3 and 20X4, entity A:

(a) made estimates of accrued expenses and provisions at those dates;

(b) accounted on a cash basis for a defined benefit pension plan; and

(c) did not recognise a provision for a court case arising from events that occurred in September 20X4. When the court case was concluded on 30 June 20X5, entity A was required to pay CU1,000[*] and paid this on 10 July 20X5.

In preparing its first IFRS financial statements, entity A concludes that its estimates in accordance with previous GAAP of accrued expenses and provisions at 31 December 20X3 and 20X4 were made on a basis consistent with its accounting policies in accordance with IFRSs. Although some of the accruals and provisions turned out to be overestimates and others to be underestimates, entity A concludes that its estimates were reasonable and that, therefore, no error had occurred. As a result, accounting for those overestimates and underestimates involves the routine adjustment of estimates in accordance with IAS 8.

continued...

[*] In this guidance monetary amounts are denominated in 'currency units (CU)'.

...continued

IG Example 1 Estimates

Application of requirements

In preparing its opening IFRS statement of financial position at 1 January 20X4 and in its comparative statement of financial position at 31 December 20X4, entity A:

(a) does not adjust the previous estimates for accrued expenses and provisions; and

(b) makes estimates (in the form of actuarial assumptions) necessary to account for the pension plan in accordance with IAS 19 *Employee Benefits*. Entity A's actuarial assumptions at 1 January 20X4 and 31 December 20X4 do not reflect conditions that arose after those dates. For example, entity A's:

  (i) discount rates at 1 January 20X4 and 31 December 20X4 for the pension plan and for provisions reflect market conditions at those dates; and

  (ii) actuarial assumptions at 1 January 20X4 and 31 December 20X4 about future employee turnover rates do not reflect conditions that arose after those dates—such as a significant increase in estimated employee turnover rates as a result of a curtailment of the pension plan in 20X5.

The treatment of the court case at 31 December 20X4 depends on the reason why entity A did not recognise a provision in accordance with previous GAAP at that date.

Assumption 1 – Previous GAAP was consistent with IAS 37 *Provisions, Contingent Liabilities and Contingent Assets*. Entity A concluded that the recognition criteria were not met. In this case, entity A's assumptions in accordance with IFRSs are consistent with its assumptions in accordance with previous GAAP. Therefore, entity A does not recognise a provision at 31 December 20X4.

Assumption 2 – Previous GAAP was not consistent with IAS 37. Therefore, entity A develops estimates in accordance with IAS 37. Under IAS 37, an entity determines whether an obligation exists at the end of the reporting period by taking account of all available evidence, including any additional evidence provided by events after the reporting period. Similarly, in accordance with IAS 10 *Events after the Reporting Period*, the resolution of a court case after the reporting period is an adjusting event after the reporting period if it confirms that the entity had a present obligation at that date. In this instance, the resolution of the court case confirms that entity A had a liability in September 20X4 (when the events occurred that gave rise to the court case). Therefore, entity A recognises a provision at 31 December 20X4. Entity A measures that provision by discounting the CU1,000 paid on 10 July 20X5 to its present value, using a discount rate that complies with IAS 37 and reflects market conditions at 31 December 20X4.

 © IASCF

IG4 Paragraphs 14–17 of the IFRS do not override requirements in other IFRSs that base classifications or measurements on circumstances existing at a particular date. Examples include:

(a) the distinction between finance leases and operating leases (see IAS 17 *Leases*);

(b) the restrictions in IAS 38 *Intangible Assets* that prohibit capitalisation of expenditure on an internally generated intangible asset if the asset did not qualify for recognition when the expenditure was incurred; and

(c) the distinction between financial liabilities and equity instruments (see IAS 32 *Financial Instruments: Presentation*).

IAS 12 *Income Taxes*

IG5 An entity applies IAS 12 to temporary differences between the carrying amount of the assets and liabilities in its opening IFRS statement of financial position and their tax bases.

IG6 In accordance with IAS 12, the measurement of current and deferred tax reflects tax rates and tax laws that have been enacted or substantively enacted by the end of the reporting period. An entity accounts for the effect of changes in tax rates and tax laws when those changes are enacted or substantively enacted.

IAS 16 *Property, Plant and Equipment*

IG7 If an entity's depreciation methods and rates in accordance with previous GAAP are acceptable in accordance with IFRSs, it accounts for any change in estimated useful life or depreciation pattern prospectively from when it makes that change in estimate (paragraphs 14 and 15 of the IFRS and paragraph 61 of IAS 16). However, in some cases, an entity's depreciation methods and rates in accordance with previous GAAP may differ from those that would be acceptable in accordance with IFRSs (for example, if they were adopted solely for tax purposes and do not reflect a reasonable estimate of the asset's useful life). If those differences have a material effect on the financial statements, the entity adjusts accumulated depreciation in its opening IFRS statement of financial position retrospectively so that it complies with IFRSs.

IG8 An entity may elect to use one of the following amounts as the deemed cost of an item of property, plant and equipment:

(a) fair value at the date of transition to IFRSs (paragraph D5 of the IFRS), in which case the entity gives the disclosures required by paragraph 30 of the IFRS;

(b) a revaluation in accordance with previous GAAP that meets the criteria in paragraph D6 of the IFRS;

(c) fair value at the date of an event such as a privatisation or initial public offering (paragraph D8 of the IFRS); or

© IASCF

(d) an allocation of an amount determined under previous GAAP that meets the criteria in paragraph D8A of the IFRS.

IG9 Subsequent depreciation is based on that deemed cost and starts from the date for which the entity established the deemed cost.

IG10 If an entity chooses as its accounting policy the revaluation model in IAS 16 for some or all classes of property, plant and equipment, it presents the cumulative revaluation surplus as a separate component of equity. The revaluation surplus at the date of transition to IFRSs is based on a comparison of the carrying amount of the asset at that date with its cost or deemed cost. If the deemed cost is the fair value at the date of transition to IFRSs, the entity gives the disclosures required by paragraph 30 of the IFRS.

IG11 If revaluations in accordance with previous GAAP did not satisfy the criteria in paragraph D6 or D8 of the IFRS, an entity measures the revalued assets in its opening statement of financial position on one of the following bases:

(a) cost (or deemed cost) less any accumulated depreciation and any accumulated impairment losses under the cost model in IAS 16;

(b) deemed cost, being the fair value at the date of transition to IFRSs (paragraph D5 of the IFRS); or

(c) revalued amount, if the entity adopts the revaluation model in IAS 16 as its accounting policy in accordance with IFRSs for all items of property, plant and equipment in the same class.

IG12 IAS 16 requires each part of an item of property, plant and equipment with a cost that is significant in relation to the total cost of the item to be depreciated separately. However, IAS 16 does not prescribe the unit of measure for recognition of an asset, ie what constitutes an item of property, plant and equipment. Thus, judgement is required in applying the recognition criteria to an entity's specific circumstances (see IAS 16 paragraphs 9 and 43).

IG13 In some cases, the construction or commissioning of an asset results in an obligation for an entity to dismantle or remove the asset and restore the site on which the asset stands. An entity applies IAS 37 *Provisions, Contingent Liabilities and Contingent Assets* in recognising and measuring any resulting provision. The entity applies IAS 16 in determining the resulting amount included in the cost of the asset, before depreciation and impairment losses. Items such as depreciation and, when applicable, impairment losses cause differences between the carrying amount of the liability and the amount included in the carrying amount of the asset. An entity accounts for changes in such liabilities in accordance with IFRIC 1 *Changes in Existing Decommissioning, Restoration and Similar Liabilities*. However, paragraph D21 of IFRS 1 provides an exemption for changes that occurred before the date of transition to IFRSs, and prescribes an alternative treatment where the exemption is used. An example of the first-time adoption of IFRIC 1, which illustrates the use of this exemption, is given at paragraphs IG201–IG203.

 © IASCF

IAS 17 *Leases*

IG14 At the date of transition to IFRSs, a lessee or lessor classifies leases as operating leases or finance leases on the basis of circumstances existing at the inception of the lease (IAS 17 paragraph 13). In some cases, the lessee and the lessor may agree to change the provisions of the lease, other than by renewing the lease, in a manner that would have resulted in a different classification in accordance with IAS 17 had the changed terms been in effect at the inception of the lease. If so, the revised agreement is considered as a new agreement over its term. However, changes in estimates (for example, changes in estimates of the economic life or of the residual value of the leased property) or changes in circumstances (for example, default by the lessee) do not give rise to a new classification of a lease.

IG15 When IAS 17 was revised in 1997, the net cash investment method for recognising finance income of lessors was eliminated. IAS 17 permits finance lessors to eliminate this method prospectively. However, the transitional provisions in IAS 17 do not apply to an entity's opening IFRS statement of financial position (paragraph 9 of the IFRS). Therefore, a finance lessor measures finance lease receivables in its opening IFRS statement of financial position as if the net cash investment method had never been permitted.

IG16 SIC-15 *Operating Leases—Incentives* applies to lease terms beginning on or after 1 January 1999. However, a first-time adopter applies SIC-15 to all leases, whether they started before or after that date.

IAS 18 *Revenue*

IG17 If an entity has received amounts that do not yet qualify for recognition as revenue in accordance with IAS 18 (for example, the proceeds of a sale that does not qualify for revenue recognition), the entity recognises the amounts received as a liability in its opening IFRS statement of financial position and measures that liability at the amount received.

IAS 19 *Employee Benefits*

IG18 At the date of transition to IFRSs, an entity applies IAS 19 in measuring net employee benefit assets or liabilities under defined benefit plans, but it may elect to recognise all cumulative actuarial gains or losses from the inception of the plan until the date of transition to IFRSs even if its accounting policy in accordance with IAS 19 will involve leaving some later actuarial gains and losses unrecognised (paragraph D10 of the IFRS). The transitional provisions in IAS 19 do not apply to an entity's opening IFRS statement of financial position (paragraph 9 of the IFRS).

IG19 An entity's actuarial assumptions at the date of transition to IFRSs are consistent with actuarial assumptions made for the same date in accordance with previous GAAP (after adjustments to reflect any difference in accounting policies), unless there is objective evidence that those assumptions were in error (paragraph 14 of the IFRS). The impact of any later revisions to those assumptions is an actuarial gain or loss of the period in which the entity makes the revisions.

IG20 An entity may need to make actuarial assumptions at the date of transition to IFRSs that were not necessary in accordance with its previous GAAP. Such actuarial assumptions do not reflect conditions that arose after the date of transition to IFRSs. In particular, discount rates and the fair value of plan assets at the date of transition to IFRSs reflect market conditions at that date. Similarly, the entity's actuarial assumptions at the date of transition to IFRSs about future employee turnover rates do not reflect a significant increase in estimated employee turnover rates as a result of a curtailment of the pension plan that occurred after the date of transition to IFRSs (paragraph 16 of the IFRS).

IG21 In many cases, an entity's first IFRS financial statements will reflect measurements of employee benefit obligations at three dates: the end of the first IFRS reporting period, the date of the comparative statement of financial position and the date of transition to IFRSs. IAS 19 encourages an entity to involve a qualified actuary in the measurement of all material post-employment benefit obligations. To minimise costs, an entity may request a qualified actuary to carry out a detailed actuarial valuation at one or two of these dates and roll the valuation(s) forward or back to the other date(s). Any such roll forward or roll back reflects any material transactions and other material events (including changes in market prices and interest rates) between those dates (IAS 19 paragraph 57).

IAS 21 *The Effects of Changes in Foreign Exchange Rates*

IG21A An entity may, in accordance with previous GAAP, have treated goodwill arising on the acquisition of a foreign operation and any fair value adjustments to the carrying amounts of assets and liabilities arising on the acquisition of that foreign operation as assets and liabilities of the entity rather than as assets and liabilities of the foreign operation. If so, the entity is permitted to apply prospectively the requirements of paragraph 47 of IAS 21 to all acquisitions occurring after the date of transition to IFRSs.

 © IASCF

IFRS 3 *Business Combinations*

IG22 The following examples illustrate the effect of Appendix C of the IFRS, assuming that a first-time adopter uses the exemption.

IG Example 2 Business combination

Background

Entity B's first IFRS financial statements are for a period that ends on 31 December 20X5 and include comparative information for 20X4 only. On 1 July 20X1, entity B acquired 100 per cent of subsidiary C. In accordance with its previous GAAP, entity B:

(a) classified the business combination as an acquisition by entity B.

(b) measured the assets acquired and liabilities assumed at the following amounts in accordance with previous GAAP at 31 December 20X3 (date of transition to IFRSs):

  (i) identifiable assets less liabilities for which IFRSs require cost-based measurement at a date after the business combination: CU200 (with a tax base of CU150 and an applicable tax rate of 30 per cent).

  (ii) pension liability (for which the present value of the defined benefit obligation measured in accordance with IAS 19 *Employee Benefits* is CU130 and the fair value of plan assets is CU100): nil (because entity B used a pay-as-you-go cash method of accounting for pensions in accordance with its previous GAAP). The tax base of the pension liability is also nil.

  (iii) goodwill: CU180.

(c) did not, at the acquisition date, recognise deferred tax arising from temporary differences associated with the identifiable assets acquired and liabilities assumed.

continued...

...continued

IG Example 2 Business combination

Application of requirements

In its opening (consolidated) IFRS statement of financial position, entity B:

(a) classifies the business combination as an acquisition by entity B even if the business combination would have qualified in accordance with IFRS 3 as a reverse acquisition by subsidiary C (paragraph C4(a) of the IFRS).

(b) does not adjust the accumulated amortisation of goodwill. Entity B tests the goodwill for impairment in accordance with IAS 36 *Impairment of Assets* and recognises any resulting impairment loss, based on conditions that existed at the date of transition to IFRSs. If no impairment exists, the carrying amount of the goodwill remains at CU180 (paragraph C4(g) of the IFRS).

(c) for those net identifiable assets acquired for which IFRSs require cost-based measurement at a date after the business combination, treats their carrying amount in accordance with previous GAAP immediately after the business combination as their deemed cost at that date (paragraph C4(e) of the IFRS).

(d) does not restate the accumulated depreciation and amortisation of the net identifiable assets in (c), unless the depreciation methods and rates in accordance with previous GAAP result in amounts that differ materially from those required in accordance with IFRSs (for example, if they were adopted solely for tax purposes and do not reflect a reasonable estimate of the asset's useful life in accordance with IFRSs). If no such restatement is made, the carrying amount of those assets in the opening IFRS statement of financial position equals their carrying amount in accordance with previous GAAP at the date of transition to IFRSs (CU200) (paragraph IG7).

(e) if there is any indication that identifiable assets are impaired, tests those assets for impairment, based on conditions that existed at the date of transition to IFRSs (see IAS 36).

(f) recognises the pension liability, and measures it, at the present value of the defined benefit obligation (CU130) less the fair value of the plan assets (CU100), giving a carrying amount of CU30, with a corresponding debit of CU30 to retained earnings (paragraph C4(d) of the IFRS). However, if subsidiary C had already adopted IFRSs in an earlier period, entity B would measure the pension liability at the same amount as in subsidiary C's financial statements (paragraph D17 of the IFRS and IG Example 9).

continued...

 © IASCF

...continued

IG Example 2 Business combination

(g) recognises a net deferred tax liability of CU6 (CU20 at 30 per cent) arising from:

(i) the taxable temporary difference of CU50 (CU200 less CU150) associated with the identifiable assets acquired and non-pension liabilities assumed, less

(ii) the deductible temporary difference of CU30 (CU30 less nil) associated with the pension liability.

The entity recognises the resulting increase in the deferred tax liability as a deduction from retained earnings (paragraph C4(k) of the IFRS). If a taxable temporary difference arises from the initial recognition of the goodwill, entity B does not recognise the resulting deferred tax liability (paragraph 15(a) of IAS 12 *Income Taxes*).

IG Example 3 Business combination—restructuring provision

Background

Entity D's first IFRS financial statements are for a period that ends on 31 December 20X5 and include comparative information for 20X4 only. On 1 July 20X3, entity D acquired 100 per cent of subsidiary E. In accordance with its previous GAAP, entity D recognised an (undiscounted) restructuring provision of CU100 that would not have qualified as an identifiable liability in accordance with IFRS 3. The recognition of this restructuring provision increased goodwill by CU100. At 31 December 20X3 (date of transition to IFRSs), entity D:

(a) had paid restructuring costs of CU60; and

(b) estimated that it would pay further costs of CU40 in 20X4, and that the effects of discounting were immaterial. At 31 December 20X3, those further costs did not qualify for recognition as a provision in accordance with IAS 37 *Provisions, Contingent Liabilities and Contingent Assets*.

Application of requirements

In its opening IFRS statement of financial position, entity D:

(a) does not recognise a restructuring provision (paragraph C4(c) of the IFRS).

(b) does not adjust the amount assigned to goodwill. However, entity D tests the goodwill for impairment in accordance with IAS 36 *Impairment of Assets*, and recognises any resulting impairment loss (paragraph C4(g) of the IFRS).

(c) as a result of (a) and (b), reports retained earnings in its opening IFRS statement of financial position that are higher by CU40 (before income taxes, and before recognising any impairment loss) than in the statement of financial position at the same date in accordance with previous GAAP.

IG Example 4 Business combination—intangible assets

Background

Entity F's first IFRS financial statements are for a period that ends on 31 December 20X5 and include comparative information for 20X4 only.
On 1 July 20X1 entity F acquired 75 per cent of subsidiary G. In accordance with its previous GAAP, entity F assigned an initial carrying amount of CU200 to intangible assets that would not have qualified for recognition in accordance with IAS 38 *Intangible Assets*. The tax base of the intangible assets was nil, giving rise to a deferred tax liability (at 30 per cent) of CU60.

On 31 December 20X3 (the date of transition to IFRSs) the carrying amount of the intangible assets in accordance with previous GAAP was CU160, and the carrying amount of the related deferred tax liability was CU48 (30 per cent of CU160).

Application of requirements

Because the intangible assets do not qualify for recognition as separate assets in accordance with IAS 38, entity F transfers them to goodwill, together with the related deferred tax liability (CU48) and non-controlling interests (paragraph C4(g)(i) of the IFRS). The related non-controlling interests amount to CU28 (25 per cent of [CU160 – CU48 = CU112]). Thus, the increase in goodwill is CU84—intangible assets (CU160) less deferred tax liability (CU48) less non-controlling interests (CU28).

Entity F tests the goodwill for impairment in accordance with IAS 36 *Impairment of Assets* and recognises any resulting impairment loss, based on conditions that existed at the date of transition to IFRSs (paragraph C4(g)(ii) of the IFRS).

IG Example 5 Business combination—goodwill deducted from equity and treatment of related intangible assets

Background

Entity H acquired a subsidiary before the date of transition to IFRSs.
In accordance with its previous GAAP, entity H:

(a) recognised goodwill as an immediate deduction from equity;

(b) recognised an intangible asset of the subsidiary that does not qualify for recognition as an asset in accordance with IAS 38 *Intangible Assets*; and

(c) did not recognise an intangible asset of the subsidiary that would qualify in accordance with IAS 38 for recognition as an asset in the financial statements of the subsidiary. The subsidiary held the asset at the date of its acquisition by entity H.

continued...

 © IASCF

...continued

IG Example 5 Business combination—goodwill deducted from equity and treatment of related intangible assets

Application of requirements

In its opening IFRS statement of financial position, entity H:

(a) does not recognise the goodwill, as it did not recognise the goodwill as an asset in accordance with previous GAAP (paragraph C4(g)–(i) of the IFRS).

(b) does not recognise the intangible asset that does not qualify for recognition as an asset in accordance with IAS 38. Because entity H deducted goodwill from equity in accordance with its previous GAAP, the elimination of this intangible asset reduces retained earnings (paragraph C4(c)(ii) of the IFRS).

(c) recognises the intangible asset that qualifies in accordance with IAS 38 for recognition as an asset in the financial statements of the subsidiary, even though the amount assigned to it in accordance with previous GAAP in entity H's consolidated financial statements was nil (paragraph C4(f) of the IFRS). The recognition criteria in IAS 38 include the availability of a reliable measurement of cost (paragraphs IG45–IG48) and entity H measures the asset at cost less accumulated depreciation and less any impairment losses identified in accordance with IAS 36 *Impairment of Assets*. Because entity H deducted goodwill from equity in accordance with its previous GAAP, the recognition of this intangible asset increases retained earnings (paragraph C4(c)(ii) of the IFRS). However, if this intangible asset had been subsumed in goodwill recognised as an asset in accordance with previous GAAP, entity H would have decreased the carrying amount of that goodwill accordingly (and, if applicable, adjusted deferred tax and non-controlling interests) (paragraph C4(g)(i) of the IFRS).

© IASCF

IG Example 6 Business combination—subsidiary not consolidated in accordance with previous GAAP

Background

Parent J's date of transition to IFRSs is 1 January 20X4. In accordance with its previous GAAP, parent J did not consolidate its 75 per cent subsidiary K, acquired in a business combination on 15 July 20X1. On 1 January 20X4:

(a) the cost of parent J's investment in subsidiary K is CU180.

(b) in accordance with IFRSs, subsidiary K would measure its assets at CU500 and its liabilities (including deferred tax in accordance with IAS 12 *Income Taxes*) at CU300. On this basis, subsidiary K's net assets are CU200 in accordance with IFRSs.

Application of requirements

Parent J consolidates subsidiary K. The consolidated statement of financial position at 1 January 20X4 includes:

(a) subsidiary K's assets at CU500 and liabilities at CU300;

(b) non-controlling interests of CU50 (25 per cent of [CU500 – CU300]); and

(c) goodwill of CU30 (cost of CU180 less 75 per cent of [CU500 – CU300]) (paragraph C4(j) of the IFRS). Parent J tests the goodwill for impairment in accordance with IAS 36 *Impairment of Assets* and recognises any resulting impairment loss, based on conditions that existed at the date of transition to IFRSs (paragraph C4(g)(ii) of the IFRS).

IG Example 7 Business combination—finance lease not capitalised in accordance with previous GAAP

Background

Parent L's date of transition to IFRSs is 1 January 20X4. Parent L acquired subsidiary M on 15 January 20X1 and did not capitalise subsidiary M's finance leases. If subsidiary M prepared financial statements in accordance with IFRSs, it would recognise finance lease obligations of 300 and leased assets of 250 at 1 January 20X4.

Application of requirements

In its consolidated opening IFRS statement of financial position, parent L recognises finance lease obligations of CU300 and leased assets of CU250, and charges CU50 to retained earnings (paragraph C4(f)).

 © IASCF

IAS 23 *Borrowing Costs*

IG23 On first adopting IFRSs, an entity begins capitalising borrowing costs (IAS 23 as revised in 2007). In accordance with paragraph D23 of the IFRS, an entity:

(a) capitalises borrowing costs relating to qualifying assets for which the commencement date for capitalisation is on or after 1 January 2009 or the date of transition to IFRSs (whichever is later);

(b) may elect to designate any date before 1 January 2009 or the date of transition to IFRSs (whichever is later) and to capitalise borrowing costs relating to all qualifying assets for which the commencement date for capitalisation is on or after that date.

However, if the entity established a deemed cost for an asset, the entity does not capitalise borrowing costs incurred before the date of the measurement that established the deemed cost.

IG24 IAS 23 requires disclosure of interest capitalised during the period. Neither IAS 23 nor the IFRS requires disclosure of the cumulative amount capitalised.

IG25 [Deleted]

IAS 27 *Consolidated and Separate Financial Statements*

IG26 A first-time adopter consolidates all subsidiaries (as defined in IAS 27), unless IAS 27 requires otherwise.

IG27 If a first-time adopter did not consolidate a subsidiary in accordance with previous GAAP, then:

(a) in its consolidated financial statements, the first-time adopter measures the subsidiary's assets and liabilities at the same carrying amounts as in the IFRS financial statements of the subsidiary, after adjusting for consolidation procedures and for the effects of the business combination in which it acquired the subsidiary (paragraph D17 of the IFRS). If the subsidiary has not adopted IFRSs in its financial statements, the carrying amounts described in the previous sentence are those that IFRSs would require in those financial statements (paragraph C4(j) of the IFRS).

(b) if the parent acquired the subsidiary in a business combination before the date of transition to IFRS, the parent recognises goodwill, as explained in IG Example 6.

(c) if the parent did not acquire the subsidiary in a business combination because it created the subsidiary, the parent does not recognise goodwill.

IG28 When a first-time adopter adjusts the carrying amounts of assets and liabilities of its subsidiaries in preparing its opening IFRS statement of financial position, this may affect non-controlling interests and deferred tax.

© IASCF

IG29 IG Examples 8 and 9 illustrate paragraphs D16 and D17 of the IFRS, which address cases where a parent and its subsidiary become first-time adopters at different dates.

IG Example 8 Parent adopts IFRSs before subsidiary

Background

Parent N presents its (consolidated) first IFRS financial statements in 20X5. Its foreign subsidiary O, wholly owned by parent N since formation, prepares information in accordance with IFRSs for internal consolidation purposes from that date, but subsidiary O does not present its first IFRS financial statements until 20X7.

Application of requirements

If subsidiary O applies paragraph D16(a) of the IFRS, the carrying amounts of its assets and liabilities are the same in both its opening IFRS statement of financial position at 1 January 20X6 and parent N's consolidated statement of financial position (except for adjustments for consolidation procedures) and are based on parent N's date of transition to IFRSs.

Alternatively, subsidiary O may, in accordance with paragraph D16(b) of the IFRS, measure all its assets or liabilities based on its own date of transition to IFRSs (1 January 20X6). However, the fact that subsidiary O becomes a first-time adopter in 20X7 does not change the carrying amounts of its assets and liabilities in parent N's consolidated financial statements.

IG Example 9 Subsidiary adopts IFRSs before parent

Background

Parent P presents its (consolidated) first IFRS financial statements in 20X7. Its foreign subsidiary Q, wholly owned by parent P since formation, presented its first IFRS financial statements in 20X5. Until 20X7, subsidiary Q prepared information for internal consolidation purposes in accordance with parent P's previous GAAP.

Application of requirements

The carrying amounts of subsidiary Q's assets and liabilities at 1 January 20X6 are the same in both parent P's (consolidated) opening IFRS statement of financial position and subsidiary Q's financial statements (except for adjustments for consolidation procedures) and are based on subsidiary Q's date of transition to IFRSs. The fact that parent P becomes a first-time adopter in 20X7 does not change those carrying amounts (paragraph D17 of the IFRS).

IG30 Paragraphs D16 and D17 of the IFRS do not override the following requirements:

(a) to apply Appendix C of the IFRS to assets acquired, and liabilities assumed, in a business combination that occurred before the acquirer's date of transition to IFRSs. However, the acquirer applies paragraph D17 to new assets acquired, and liabilities assumed, by the acquiree after that business combination and still held at the acquirer's date of transition to IFRSs.

 © IASCF

(b) to apply the rest of the IFRS in measuring all assets and liabilities for which paragraphs D16 and D17 are not relevant.

(c) to give all disclosures required by the IFRS as of the first-time adopter's own date of transition to IFRSs.

IG31 Paragraph D16 of the IFRS applies if a subsidiary becomes a first-time adopter later than its parent, for example if the subsidiary previously prepared a reporting package in accordance with IFRSs for consolidation purposes but did not present a full set of financial statements in accordance with IFRSs. This may be relevant not only when a subsidiary's reporting package complies fully with the recognition and measurement requirements of IFRSs, but also when it is adjusted centrally for matters such as review of events after the reporting period and central allocation of pension costs. For the disclosure required by paragraph 26 of the IFRS, adjustments made centrally to an unpublished reporting package are not corrections of errors. However, paragraph D16 does not permit a subsidiary to ignore misstatements that are immaterial to the consolidated financial statements of its parent but material to its own financial statements.

IAS 29 *Financial Reporting in Hyperinflationary Economies*

IG32 An entity complies with IAS 21 *The Effects of Changes in Foreign Exchange Rates* in determining its functional currency and presentation currency. When the entity prepares its opening IFRS statement of financial position, it applies IAS 29 to any periods during which the economy of the functional currency or presentation currency was hyperinflationary.

IG33 An entity may elect to use the fair value of an item of property, plant and equipment at the date of transition to IFRSs as its deemed cost at that date (paragraph D5 of the IFRS), in which case it gives the disclosures required by paragraph 30 of the IFRS.

IG34 If an entity elects to use the exemptions in paragraphs D5–D8 of the IFRS, it applies IAS 29 to periods after the date for which the revalued amount or fair value was determined.

IAS 32 *Financial Instruments: Presentation*

IG35 In its opening IFRS statement of financial position, an entity applies the criteria in IAS 32 to classify financial instruments issued (or components of compound instruments issued) as either financial liabilities or equity instruments in accordance with the substance of the contractual arrangement when the instrument first satisfied the recognition criteria in IAS 32 (paragraphs 15 and 30), without considering events after that date (other than changes to the terms of the instruments).

IG36 For compound instruments outstanding at the date of transition to IFRSs, an entity determines the initial carrying amounts of the components on the basis of circumstances existing when the instrument was issued (IAS 32 paragraph 30). An entity determines those carrying amounts using the version of IAS 32 effective

at the end of its first IFRS reporting period. If the liability component is no longer outstanding at the date of transition to IFRSs, a first-time adopter need not separate the initial equity component of the instrument from the cumulative interest accreted on the liability component (paragraph D18 of the IFRS).

IAS 34 *Interim Financial Reporting*

IG37 IAS 34 applies if an entity is required, or elects, to present an interim financial report in accordance with IFRSs. Accordingly, neither IAS 34 nor the IFRS requires an entity:

(a) to present interim financial reports that comply with IAS 34; or

(b) to prepare new versions of interim financial reports presented in accordance with previous GAAP. However, if an entity does prepare an interim financial report in accordance with IAS 34 for part of the period covered by its first IFRS financial statements, the entity restates the comparative information presented in that report so that it complies with IFRSs.

IG38 An entity applies the IFRS in each interim financial report that it presents in accordance with IAS 34 for part of the period covered by its first IFRS financial statements. In particular, paragraph 32 of the IFRS requires an entity to disclose various reconciliations (see IG Example 10).

IG Example 10 Interim financial reporting

Background

Entity R's first IFRS financial statements are for a period that ends on 31 December 20X5, and its first interim financial report in accordance with IAS 34 is for the quarter ended 31 March 20X5. Entity R prepared previous GAAP annual financial statements for the year ended 31 December 20X4, and prepared quarterly reports throughout 20X4 .

Application of requirements

In each quarterly interim financial report for 20X5, entity R includes reconciliations of:

(a) its equity in accordance with previous GAAP at the end of the comparable quarter of 20X4 to its equity in accordance with IFRSs at that date; and

(b) its total comprehensive income (or, if it did not report such a total, profit or loss) in accordance with previous GAAP for the comparable quarter of 20X4 (current and year to date) to its total comprehensive income in accordance with IFRSs.

continued...

 © IASCF

...continued

IG Example 10 Interim financial reporting

In addition to the reconciliations required by (a) and (b) and the disclosures required by IAS 34, entity R's interim financial report for the first quarter of 20X5 includes reconciliations of (or a cross-reference to another published document that includes these reconciliations):

(a) its equity in accordance with previous GAAP at 1 January 20X4 and 31 December 20X4 to its equity in accordance with IFRSs at those dates; and

(b) its total comprehensive income (or, if it did not report such a total, profit or loss) for 20X4 in accordance with previous GAAP to its total comprehensive income for 20X4 in accordance with IFRSs.

Each of the above reconciliations gives sufficient detail to enable users to understand the material adjustments to the statement of financial position and statement of comprehensive income. Entity R also explains the material adjustments to the statement of cash flows.

If entity R becomes aware of errors made in accordance with previous GAAP, the reconciliations distinguish the correction of those errors from changes in accounting policies.

If entity R did not, in its most recent annual financial statements in accordance with previous GAAP, disclose information material to an understanding of the current interim period, its interim financial reports for 20X5 disclose that information or include a cross-reference to another published document that includes it (paragraph 33 of the IFRS).

IAS 36 *Impairment of Assets* and IAS 37 *Provisions, Contingent Liabilities and Contingent Assets*

IG39 An entity applies IAS 36 in:

(a) determining whether any impairment loss exists at the date of transition to IFRSs; and

(b) measuring any impairment loss that exists at that date, and reversing any impairment loss that no longer exists at that date. An entity's first IFRS financial statements include the disclosures that IAS 36 would have required if the entity had recognised those impairment losses or reversals in the period beginning with the date of transition to IFRSs (paragraph 24(c) of the IFRS).

IG40 The estimates used to determine whether an entity recognises an impairment loss or provision (and to measure any such impairment loss or provision) at the date of transition to IFRSs are consistent with estimates made for the same date in accordance with previous GAAP (after adjustments to reflect any difference in

accounting policies), unless there is objective evidence that those estimates were in error (paragraphs 14 and 15 of the IFRS). The entity reports the impact of any later revisions to those estimates as an event of the period in which it makes the revisions.

IG41 In assessing whether it needs to recognise an impairment loss or provision (and in measuring any such impairment loss or provision) at the date of transition to IFRSs, an entity may need to make estimates for that date that were not necessary in accordance with its previous GAAP. Such estimates and assumptions do not reflect conditions that arose after the date of transition to IFRSs (paragraph 16 of the IFRS).

IG42 The transitional provisions in IAS 36 and IAS 37 do not apply to an entity's opening IFRS statement of financial position (paragraph 9 of the IFRS).

IG43 IAS 36 requires the reversal of impairment losses in some cases. If an entity's opening IFRS statement of financial position reflects impairment losses, the entity recognises any later reversal of those impairment losses in profit or loss (except when IAS 36 requires the entity to treat that reversal as a revaluation). This applies to both impairment losses recognised in accordance with previous GAAP and additional impairment losses recognised on transition to IFRSs.

IAS 38 *Intangible Assets*

IG44 An entity's opening IFRS statement of financial position:

(a) excludes all intangible assets and other intangible items that do not meet the criteria for recognition in accordance with IAS 38 at the date of transition to IFRSs; and

(b) includes all intangible assets that meet the recognition criteria in IAS 38 at that date, except for intangible assets acquired in a business combination that were not recognised in the acquirer's consolidated statement of financial position in accordance with previous GAAP and also would not qualify for recognition in accordance with IAS 38 in the separate statement of financial position of the acquiree (see paragraph C4(f) of the IFRS).

IG45 The criteria in IAS 38 require an entity to recognise an intangible asset if, and only if:

(a) it is probable that the future economic benefits that are attributable to the asset will flow to the entity; and

(b) the cost of the asset can be measured reliably.

IAS 38 supplements these two criteria with further, more specific, criteria for internally generated intangible assets.

IG46 In accordance with paragraphs 65 and 71 of IAS 38, an entity capitalises the costs of creating internally generated intangible assets prospectively from the date when the recognition criteria are met. IAS 38 does not permit an entity to use hindsight to conclude retrospectively that these recognition criteria are met.

© IASCF

Therefore, even if an entity concludes retrospectively that a future inflow of economic benefits from an internally generated intangible asset is probable and the entity is able to reconstruct the costs reliably, IAS 38 prohibits it from capitalising the costs incurred before the date when the entity both:

(a) concludes, based on an assessment made and documented at the date of that conclusion, that it is probable that future economic benefits from the asset will flow to the entity; and

(b) has a reliable system for accumulating the costs of internally generated intangible assets when, or shortly after, they are incurred.

IG47 If an internally generated intangible asset qualifies for recognition at the date of transition to IFRSs, an entity recognises the asset in its opening IFRS statement of financial position even if it had recognised the related expenditure as an expense in accordance with previous GAAP. If the asset does not qualify for recognition in accordance with IAS 38 until a later date, its cost is the sum of the expenditure incurred from that later date.

IG48 The criteria discussed in paragraph IG45 also apply to an intangible asset acquired separately. In many cases, contemporaneous documentation prepared to support the decision to acquire the asset will contain an assessment of the future economic benefits. Furthermore, as explained in paragraph 26 of IAS 38, the cost of a separately acquired intangible asset can usually be measured reliably.

IG49 For an intangible asset acquired in a business combination before the date of transition to IFRSs, its carrying amount in accordance with previous GAAP immediately after the business combination is its deemed cost in accordance with IFRSs at that date (paragraph C4(e) of the IFRS). If that carrying amount was zero, the acquirer does not recognise the intangible asset in its consolidated opening IFRS statement of financial position, unless it would qualify in accordance with IAS 38, applying the criteria discussed in paragraphs IG45–IG48, for recognition at the date of transition to IFRSs in the statement of financial position of the acquiree (paragraph C4(f) of the IFRS). If those recognition criteria are met, the acquirer measures the asset on the basis that IAS 38 would require in the statement of financial position of the acquiree. The resulting adjustment affects goodwill (paragraph C4(g)(i) of the IFRS).

IG50 A first-time adopter may elect to use the fair value of an intangible asset at the date of an event such as a privatisation or initial public offering as its deemed cost at the date of that event (paragraph D8 of the IFRS), provided that the intangible asset qualifies for recognition in accordance with IAS 38 (paragraph 10 of the IFRS). In addition, if, and only if, an intangible asset meets both the recognition criteria in IAS 38 (including reliable measurement of original cost) and the criteria in IAS 38 for revaluation (including the existence of an active market), a first-time adopter may elect to use one of the following amounts as its deemed cost (paragraph D7 of the IFRS):

(a) fair value at the date of transition to IFRSs (paragraph D5 of the IFRS), in which case the entity gives the disclosures required by paragraph 30 of the IFRS; or

(b) a revaluation in accordance with previous GAAP that meets the criteria in paragraph D6 of the IFRS.

© IASCF

IG51 If an entity's amortisation methods and rates in accordance with previous GAAP would be acceptable in accordance with IFRSs, the entity does not restate the accumulated amortisation in its opening IFRS statement of financial position. Instead, the entity accounts for any change in estimated useful life or amortisation pattern prospectively from the period when it makes that change in estimate (paragraph 14 of the IFRS and paragraph 104 of IAS 38). However, in some cases, an entity's amortisation methods and rates in accordance with previous GAAP may differ from those that would be acceptable in accordance with IFRSs (for example, if they were adopted solely for tax purposes and do not reflect a reasonable estimate of the asset's useful life). If those differences have a material effect on the financial statements, the entity adjusts the accumulated amortisation in its opening IFRS statement of financial position retrospectively so that it complies with IFRSs (paragraph 14 of the IFRS).

IAS 39 *Financial Instruments: Recognition and Measurement* and IFRS 9 *Financial Instruments*

IG52 An entity recognises and measures all financial assets and financial liabilities in its opening IFRS statement of financial position in accordance with IFRS 9 and IAS 39 respectively, except as specified in paragraphs B2–B6 of the IFRS, which address derecognition and hedge accounting.

Recognition

IG53 An entity recognises all financial assets and financial liabilities (including all derivatives) that qualify for recognition in accordance with IAS 39 and IFRS 9 and have not yet qualified for derecognition in accordance with IAS 39, except non-derivative financial assets and non-derivative financial liabilities derecognised in accordance with previous GAAP before 1 January 2004, to which the entity does not choose to apply paragraph B3 (see paragraphs B2 and B3 of the IFRS). For example, an entity that does not apply paragraph B3 does not recognise assets transferred in a securitisation, transfer or other derecognition transaction that occurred before 1 January 2004 if those transactions qualified for derecognition in accordance with previous GAAP. However, if the entity uses the same securitisation arrangement or other derecognition arrangement for further transfers after 1 January 2004, those further transfers qualify for derecognition only if they meet the derecognition criteria of IAS 39.

IG54 An entity does not recognise financial assets and financial liabilities that do not qualify for recognition in accordance with IAS 39 or IFRS 9, or have already qualified for derecognition in accordance with IAS 39.

 © IASCF

Embedded derivatives

IG55 When IAS 39 requires an entity to separate an embedded derivative from a host contract outside the scope of IFRS 9, the initial carrying amounts of the components at the date when the instrument first satisfies the recognition criteria in IAS 39 reflect circumstances at that date (IAS 39 paragraph 11). If the entity cannot determine the initial carrying amounts of the embedded derivative and host contract reliably, it designates the entire combined contract as at fair value through profit or loss (IAS 39 paragraph 12).

Measurement

IG56 In preparing its opening IFRS statement of financial position, an entity applies the criteria in IAS 39 and IFRS 9 to identify on the basis of the facts and circumstances that exist at the date of transition to IFRSs those financial assets and financial liabilities that are measured at fair value and those that are measured at amortised cost. The resulting classifications are applied retrospectively.

IG57 For those financial assets and financial liabilities measured at amortised cost in the opening IFRS statement of financial position, an entity determines their cost on the basis of circumstances existing when the assets and liabilities first satisfied the recognition criteria in IAS 39 or IFRS 9. However, if the entity acquired those financial assets and financial liabilities in a past business combination, their carrying amount in accordance with previous GAAP immediately following the business combination is their deemed cost in accordance with IFRSs at that date (paragraph C4(e) of the IFRS).

IG58 An entity's estimates of impairments of financial assets measured at amortised cost at the date of transition to IFRSs are consistent with estimates made for the same date in accordance with previous GAAP (after adjustments to reflect any difference in accounting policies), unless there is objective evidence that those assumptions were in error (paragraph 14 of the IFRS). The entity treats the impact of any later revisions to those estimates as impairment losses (or, if the criteria in IAS 39 are met, reversals of impairment losses) of the period in which it makes the revisions.

Transition adjustments

IG58A An entity shall treat an adjustment to the carrying amount of a financial asset or financial liability as a transition adjustment to be recognised in the opening balance of retained earnings at the date of transition to IFRSs only to the extent that it results from adopting IAS 39 and IFRS 9. Because all derivatives, other than those that are financial guarantee contracts or are designated and effective hedging instruments, are measured at fair value through profit or loss, the differences between the previous carrying amount (which may have been zero) and the fair value of the derivatives are recognised as an adjustment of the balance of retained earnings at the beginning of the financial year in which IAS 39 and IFRS 9 are is initially applied (other than for a derivative that is a financial guarantee contract or a designated and effective hedging instrument).

© IASCF

IG58B IAS 8 (as revised in 2003) applies to adjustments resulting from changes in estimates. If an entity is unable to determine whether a particular portion of the adjustment is a transition adjustment or a change in estimate, it treats that portion as a change in accounting estimate in accordance with IAS 8, with appropriate disclosures (IAS 8 paragraphs 32–40).

IG59 An entity may, in accordance with its previous GAAP, have measured investments at fair value and recognised the revaluation gain outside profit or loss. If an investment is classified as at fair value through profit or loss, the pre-IFRS 9 revaluation gain that had been recognised outside profit or loss is reclassified into retained earnings on initial application of IFRS 9. If, on initial application of IFRS 9, an investment is classified as at fair value through other comprehensive income, then the pre-IFRS 9 revaluation gain is recognised in a separate component of equity. Subsequently, the entity recognises gains and losses on the financial asset in other comprehensive income (except dividends, which are recognised in profit or loss) and accumulates the cumulative gains and losses in that separate component of equity. On subsequent derecognition, the entity may transfer that separate component of equity within equity.

Hedge accounting

IG60 Paragraphs B4–B6 of the IFRS deal with hedge accounting. The designation and documentation of a hedge relationship must be completed on or before the date of transition to IFRSs if the hedge relationship is to qualify for hedge accounting from that date. Hedge accounting can be applied prospectively only from the date that the hedge relationship is fully designated and documented.

IG60A An entity may, in accordance with its previous GAAP, have deferred or not recognised gains and losses on a fair value hedge of a hedged item that is not measured at fair value. For such a fair value hedge, an entity adjusts the carrying amount of the hedged item at the date of transition to IFRSs. The adjustment is the lower of:

(a) that portion of the cumulative change in the fair value of the hedged item that reflects the designated hedged risk and was not recognised in accordance with previous GAAP; and

(b) that portion of the cumulative change in the fair value of the hedging instrument that reflects the designated hedged risk and, in accordance with previous GAAP, was either (i) not recognised or (ii) deferred in the statement of financial position as an asset or liability.

IG60B An entity may, in accordance with its previous GAAP, have deferred gains and losses on a cash flow hedge of a forecast transaction. If, at the date of transition to IFRSs, the hedged forecast transaction is not highly probable, but is expected to occur, the entire deferred gain or loss is recognised in equity. Any net cumulative gain or loss that has been reclassified to equity on initial application of IAS 39 remains in equity until (a) the forecast transaction subsequently results in the recognition of a non-financial asset or non-financial liability, (b) the forecast transaction affects profit or loss or (c) subsequently circumstances change and the forecast transaction is no longer expected to occur, in which case any related net

 © IASCF

cumulative gain or loss is reclassified from equity to profit or loss. If the hedging instrument is still held, but the hedge does not qualify as a cash flow hedge in accordance with IAS 39, hedge accounting is no longer appropriate starting from the date of transition to IFRSs.

IAS 40 *Investment Property*

IG61 An entity that adopts the fair value model in IAS 40 measures its investment property at fair value at the date of transition to IFRSs. The transitional requirements of IAS 40 do not apply (paragraph 9 of the IFRS).

IG62 An entity that adopts the cost model in IAS 40 applies paragraphs IG7–IG13 on property, plant and equipment.

Explanation of transition to IFRSs

IG63 Paragraphs 24(a) and (b), 25 and 26 of the IFRS require a first-time adopter to disclose reconciliations that give sufficient detail to enable users to understand the material adjustments to the statement of financial position, statement of comprehensive income and, if applicable, statement of cash flows. Paragraph 24(a) and (b) requires specific reconciliations of equity and total comprehensive income. IG Example 11 shows one way of satisfying these requirements.

IG Example 11 Reconciliation of equity and total comprehensive income

Background

An entity first adopted IFRSs in 20X5, with a date of transition to IFRSs of 1 January 20X4. Its last financial statements in accordance with previous GAAP were for the year ended 31 December 20X4.

Application of requirements

The entity's first IFRS financial statements include the reconciliations and related notes shown below.

Among other things, this example includes a reconciliation of equity at the date of transition to IFRSs (1 January 20X4). The IFRS also requires a reconciliation at the end of the last period presented in accordance with previous GAAP (not included in this example).

In practice, it may be helpful to include cross-references to accounting policies and supporting analyses that give further explanation of the adjustments shown in the reconciliations below.

If a first-time adopter becomes aware of errors made in accordance with previous GAAP, the reconciliations distinguish the correction of those errors from changes in accounting policies (paragraph 26 of the IFRS). This example does not illustrate disclosure of a correction of an error.

IG Example 11 Reconciliation of equity and total comprehensive income

Notes to the reconciliation of equity at 1 January 20X4:

1 Depreciation was influenced by tax requirements in accordance with previous GAAP, but in accordance with IFRSs reflects the useful life of the assets. The cumulative adjustment increased the carrying amount of property, plant and equipment by 100.

2 Intangible assets in accordance with previous GAAP included CU150 for items that are transferred to goodwill because they do not qualify for recognition as intangible assets in accordance with IFRSs.

3 Financial assets are all classified as at fair value through profit or loss in accordance with IFRSs and are carried at their fair value of CU3,891. They were carried at cost of CU3, 471 in accordance with previous GAAP. The resulting gains of CU294 (CU420, less related deferred tax of CU126) are included in retained earnings.

4 Inventories include fixed and variable production overhead of CU400 in accordance with IFRSs, but this overhead was excluded in accordance with previous GAAP.

5 Unrealised gains of CU431 on unmatured forward foreign exchange contracts are recognised in accordance with IFRSs, but were not recognised in accordance with previous GAAP. The resulting gains of CU302 (CU431, less related deferred tax of CU129) are included in the hedging reserve because the contracts hedge forecast sales.

6 A pension liability of CU66 is recognised in accordance with IFRSs, but was not recognised in accordance with previous GAAP, which used a cash basis.

7 A restructuring provision of CU250 relating to head office activities was recognised in accordance with previous GAAP, but does not qualify for recognition as a liability in accordance with IFRSs.

8 The above changes increased the deferred tax liability as follows:

	CU
Hedging reserve (note 5)	129
Retained earnings	331
Increase in deferred tax liability	460

Because the tax base at 1 January 20X4 of the items reclassified from intangible assets to goodwill (note 2) equalled their carrying amount at that date, the reclassification did not affect deferred tax liabilities.

continued...

...continued

IG Example 11 Reconciliation of equity and total comprehensive income

9 The adjustments to retained earnings are as follows:

	CU
Depreciation (note 1)	100
Financial assets (note 3)	420
Production overhead (note 4)	400
Pension liability (note 6)	(66)
Restructuring provision (note 7)	250
Tax effect of the above	(331)
Total adjustment to retained earnings	773

IG Example 11 Reconciliation of equity and total comprehensive income

Notes to the reconciliation of total comprehensive income for 20X4:

1 A pension liability is recognised in accordance with IFRSs, but was not recognised in accordance with previous GAAP. The pension liability increased by CU130 during 20X4, which caused increases in cost of sales (CU50), distribution costs (CU30) and administrative expenses (CU50).

2 Cost of sales is higher by CU47 in accordance with IFRSs because inventories include fixed and variable production overhead in accordance with IFRSs but not in accordance with previous GAAP.

3 Depreciation was influenced by tax requirements in accordance with previous GAAP, but reflects the useful life of the assets in accordance with IFRSs. The effect on the profit for 20X4 was not material.

4 A restructuring provision of CU250 was recognised in accordance with previous GAAP at 1 January 20X4, but did not qualify for recognition in accordance with IFRSs until the year ended 31 December 20X4. This increases administrative expenses for 20X4 in accordance with IFRSs.

5 Adjustments 1–4 above lead to a reduction of CU128 in deferred tax expense.

6 Financial assets at fair value through profit or loss increased in value by CU180 during 20X4. They were carried at cost in accordance with previous GAAP. Fair value changes have been included in 'Other income'.

7 The fair value of forward foreign exchange contracts that are effective hedges of forecast transactions decreased by CU40 during 20X4.

8 Adjustments 6 and 7 above lead to an increase of CU29 in deferred tax expense.

Explanation of material adjustments to the statement of cash flows for 20X4:

Income taxes of CU133 paid during 20X4 are classified as operating cash flows in accordance with IFRSs, but were included in a separate category of tax cash flows in accordance with previous GAAP. There are no other material differences between the statement of cash flows presented in accordance with IFRSs and the statement of cash flows presented in accordance with previous GAAP.

IFRS 2 *Share-based Payment*

IG64 A first-time adopter is encouraged, but not required, to apply IFRS 2 *Share-based Payment* to equity instruments that were granted after 7 November 2002 that vested before the later of (a) the date of transition to IFRSs and (b) 1 January 2005.

IG65 For example, if an entity's date of transition to IFRSs is 1 January 2004, the entity applies IFRS 2 to shares, share options or other equity instruments that were granted after 7 November 2002 and had not yet vested at 1 January 2005. Conversely, if an entity's date of transition to IFRSs is 1 January 2010, the entity applies IFRS 2 to shares, share options or other equity instruments that were granted after 7 November 2002 and had not yet vested at 1 January 2010.

[Paragraphs IG66–IG200 reserved for possible guidance on future standards]

IFRIC Interpretations

IFRIC 1 *Changes in Existing Decommissioning, Restoration and Similar Liabilities*

IG201 IAS 16 requires the cost of an item of property, plant and equipment to include the initial estimate of the costs of dismantling and removing the asset and restoring the site on which it is located. IAS 37 requires the liability, both initially and subsequently, to be measured at the amount required to settle the present obligation at the end of the reporting period, reflecting a current market-based discount rate.

IG202 IFRIC 1 requires that, subject to specified conditions, changes in an existing decommissioning, restoration or similar liability are added to or deducted from the cost of the related asset. The resulting depreciable amount of the asset is depreciated over its useful life, and the periodic unwinding of the discount on the liability is recognised in profit or loss as it occurs.

IG203 Paragraph D21 of IFRS 1 provides a transitional exemption. Instead of retrospectively accounting for changes in this way, entities can include in the depreciated cost of the asset an amount calculated by discounting the liability at the date of transition to IFRSs back to, and depreciating it from, when the liability was first incurred. IG Example 201 illustrates the effect of applying this exemption, assuming that the entity accounts for its property, plant and equipment using the cost model.

 © IASCF

IG Example 201 Changes in existing decommissioning, restoration and similar liabilities

Background

An entity's first IFRS financial statements are for a period that ends on 31 December 20X5 and include comparative information for 20X4 only. Its date of transition to IFRSs is therefore 1 January 20X4.

The entity acquired an energy plant on 1 January 20X1, with a life of 40 years.

As at the date of transition to IFRSs, the entity estimates the decommissioning cost in 37 years' time to be 470, and estimates that the appropriate risk-adjusted discount rate for the liability is 5 per cent. It judges that the appropriate discount rate has not changed since 1 January 20X1.

Application of requirements

The decommissioning liability recognised at the transition date is CU77 (CU470 discounted for 37 years at 5 per cent).

Discounting this liability back for a further three years to 1 January 20X1 gives an estimated liability at acquisition, to be included in the cost of the asset, of CU67. Accumulated depreciation on the asset is CU67 × 3/40 = CU5.

The amounts recognised in the opening IFRS statement of financial position on the date of transition to IFRSs (1 January 20X4) are, in summary:

	CU
Decommissioning cost included in cost of plant	67
Accumulated depreciation	(5)
Decommissioning liability	(77)
Net assets/retained earnings	(15)

IFRIC 4 *Determining whether an Arrangement contains a Lease*

IG204 IFRIC 4 specifies criteria for determining, at the inception of an arrangement, whether the arrangement contains a lease. It also specifies when an arrangement should be reassessed subsequently.

IG205 Paragraph D9 of the IFRS provides a transitional exemption. Instead of determining retrospectively whether an arrangement contains a lease at the inception of the arrangement and subsequently reassessing that arrangement as required in the periods before transition to IFRSs, entities may determine

© IASCF

whether arrangements in existence on the date of transition to IFRSs contain leases by applying paragraphs 6–9 of IFRIC 4 to those arrangements on the basis of facts and circumstances existing on that date.

IG Example 202 Determining whether an arrangement contains a lease

Background

An entity's first IFRS financial statements are for a period that ends on 31 December 20Y7 and include comparative information for 20Y6 only. Its date of transition to IFRSs is therefore 1 January 20Y6.

On 1 January 20X5 the entity entered into a take-or-pay arrangement to supply gas. On 1 January 20Y0, there was a change in the contractual terms of the arrangement.

Application of requirements

On 1 January 20Y6 the entity may determine whether the arrangement contains a lease by applying the criteria in paragraphs 6–9 of IFRIC 4 on the basis of facts and circumstances existing on that date. Alternatively, the entity applies those criteria on the basis of facts and circumstances existing on 1 January 20X5 and reassesses the arrangement on 1 January 20Y0. If the arrangement is determined to contain a lease, the entity follows the guidance in paragraphs IG14–IG16.

IG206 Paragraph D9A of IFRS 1 provides a transitional exemption in addition to that discussed in paragraph IG205. The exemption in paragraph D9A applies only to arrangements that were assessed in the same manner as required by IFRIC 4. If arrangements exist at the date of transition to IFRSs that an entity did not assess under previous GAAP in the same manner as required by IFRIC 4 to determine whether they contain a lease, the entity may apply the transition exemption discussed in paragraph IG205.

Basis for Conclusions on IFRS 2 *Share-based Payment*

This Basis for Conclusions accompanies, but is not part of, IFRS 2.

Introduction

BC1 This Basis for Conclusions summarises the International Accounting Standards Board's considerations in reaching the conclusions in IFRS 2 *Share-based Payment*. Individual Board members gave greater weight to some factors than to others.

BC2 Entities often issue[*] shares or share options to pay employees or other parties. Share plans and share option plans are a common feature of employee remuneration, not only for directors and senior executives, but also for many other employees. Some entities issue shares or share options to pay suppliers, such as suppliers of professional services.

BC3 Until the issue of IFRS 2, there has been no International Financial Reporting Standard (IFRS) covering the recognition and measurement of these transactions. Concerns have been raised about this gap in international standards. For example, the International Organization of Securities Commissions (IOSCO), in its 2000 report on international standards, stated that IASC (the IASB's predecessor body) should consider the accounting treatment of share-based payment.

BC4 Few countries have standards on the topic. This is a concern in many countries, because the use of share-based payment has increased in recent years and continues to spread. Various standard-setting bodies have been working on this issue. At the time the IASB added a project on share-based payment to its agenda in July 2001, some standard-setters had recently published proposals. For example, the German Accounting Standards Committee published a draft accounting standard *Accounting for Share Option Plans and Similar Compensation Arrangements* in June 2001. The UK Accounting Standards Board led the development of the Discussion Paper *Accounting for Share-based Payment*, published in July 2000 by IASC, the ASB and other bodies represented in the G4+1.[†] The Danish Institute of State Authorised Public Accountants issued a Discussion Paper *The Accounting Treatment of Share-based Payment* in April 2000. More recently, in December 2002, the Accounting Standards Board of Japan published a Summary Issues Paper on share-based payment. In March 2003, the US Financial Accounting Standards Board (FASB) added to its agenda a project to review US accounting requirements on share-based payment. Also, the Canadian

* The word 'issue' is used in a broad sense. For example, a transfer of shares held in treasury (own shares held) to another party is regarded as an 'issue' of equity instruments. Some argue that if options or shares are granted with vesting conditions, they are not 'issued' until those vesting conditions have been satisfied. However, even if this argument is accepted, it does not change the Board's conclusions on the requirements of the IFRS, and therefore the word 'issue' is used broadly, to include situations in which equity instruments are conditionally transferred to the counterparty, subject to the satisfaction of specified vesting conditions.

† The G4+1 comprised members of the national accounting standard-setting bodies of Australia, Canada, New Zealand, the UK and the US, and IASC.

Accounting Standards Board (AcSB) recently completed its project on share-based payment. The AcSB standard requires recognition of all share-based payment transactions, including transactions in which share options are granted to employees (discussed further in paragraphs BC281 and BC282).

BC5 Users of financial statements and other commentators are calling for improvements in the accounting treatment of share-based payment. For example, the proposal in the IASC/G4+1 Discussion Paper and ED 2 *Share-based Payment*, that share-based payment transactions should be recognised in the financial statements, resulting in an expense when the goods or services are consumed, received strong support from investors and other users of financial statements. Recent economic events have emphasised the importance of high quality financial statements that provide neutral, transparent and comparable information to help users make economic decisions. In particular, the omission of expenses arising from share-based payment transactions with employees has been highlighted by investors, other users of financial statements and other commentators as causing economic distortions and corporate governance concerns.

BC6 As noted above, the Board began a project to develop an IFRS on share-based payment in July 2001. In September 2001, the Board invited additional comment on the IASC/G4+1 Discussion Paper, with a comment deadline of 15 December 2001. The Board received over 270 letters. During the development of ED 2, the Board was also assisted by an Advisory Group, consisting of individuals from various countries and with a range of backgrounds, including persons from the investment, corporate, audit, academic, compensation consultancy, valuation and regulatory communities. The Board received further assistance from other experts at a panel discussion held in New York in July 2002. In November 2002, the Board published an Exposure Draft, ED 2 *Share-based Payment*, with a comment deadline of 7 March 2003. The Board received over 240 letters. The Board also worked with the FASB after that body added to its agenda a project to review US accounting requirements on share-based payment. This included participating in meetings of the FASB's Option Valuation Group and meeting the FASB to discuss convergence issues.

BC6A In 2007 the Board added to its agenda a project to clarify the scope and accounting for group cash-settled share-based payment transactions in the separate or individual financial statements of the entity receiving the goods or services when that entity has no obligation to settle the share-based payment. In December 2007 the Board published *Group Cash-settled Share-based Payment Transactions* (proposed amendments to IFRS 2). The resulting amendments issued in June 2009 also incorporate the requirements of two Interpretations—IFRIC 8 *Scope of IFRS 2* and IFRIC 11 *IFRS 2—Group and Treasury Share Transactions*. As a consequence, the Board withdrew both Interpretations.

Scope

BC7 Much of the controversy and complexity surrounding the accounting for share-based payment relates to employee share options. However, the scope of IFRS 2 is broader than that. It applies to transactions in which shares or other equity instruments are granted to employees. It also applies to transactions with

 © IASCF

parties other than employees, in which goods or services are received as consideration for the issue of shares, share options or other equity instruments. The term ‘goods’ includes inventories, consumables, property, plant and equipment, intangible assets and other non-financial assets. Lastly, the IFRS applies to payments in cash (or other assets) that are ‘share-based’ because the amount of the payment is based on the price of the entity’s shares or other equity instruments, eg cash share appreciation rights.

Broad-based employee share plans, including employee share purchase plans

BC8 Some employee share plans are described as ‘broad-based’ or ‘all-employee’ plans, in which all (or virtually all) employees have the opportunity to participate, whereas other plans are more selective, covering individual or specific groups of employees (eg senior executives). Employee share purchase plans are often broad-based plans. Typically, employee share purchase plans provide employees with an opportunity to buy a specific number of shares at a discounted price, ie at an amount that is less than the fair value of the shares. The employee’s entitlement to discounted shares is usually conditional upon specific conditions being satisfied, such as remaining in the service of the entity for a specified period.

BC9 The issues that arise with respect to employee share purchase plans are:

(a) are these plans somehow so different from other employee share plans that a different accounting treatment is appropriate?

(b) even if the answer to the above question is ‘no’, are there circumstances, such as when the discount is very small, when it is appropriate to exempt employee share purchase plans from an accounting standard on share-based payment?

BC10 Some respondents to ED 2 argued that broad-based employee share plans should be exempt from an accounting standard on share-based payment. The reason usually given was that these plans are different from other types of employee share plans and, in particular, are not a part of remuneration for employee services. Some argued that requiring the recognition of an expense in respect of these types of plans was perceived to be contrary to government policy to encourage employee share ownership. In contrast, other respondents saw no difference between employee share purchase plans and other employee share plans, and argued that the same accounting requirements should therefore apply. However, some suggested that there should be an exemption if the discount is small.

BC11 The Board concluded that, in principle, there is no reason to treat broad-based employee share plans, including broad-based employee share purchase plans, differently from other employee share plans (the issue of ‘small’ discounts is considered later). The Board noted that the fact that these schemes are available only to employees is in itself sufficient to conclude that the benefits provided represent employee remuneration. Moreover, the term ‘remuneration’ is not limited to remuneration provided as part of an individual employee’s contract:

it encompasses all benefits provided to employees. Similarly, the term services encompasses all benefits provided by the employees in return, including increased productivity, commitment or other enhancements in employee work performance as a result of the incentives provided by the share plan.

BC12 Moreover, distinguishing regular employee services from the additional benefits received from broad-based employee share plans would not change the conclusion that it is necessary to account for such plans. No matter what label is placed on the benefits provided by employees—or the benefits provided by the entity—the transaction should be recognised in the financial statements.

BC13 Furthermore, that governments in some countries have a policy of encouraging employee share ownership is not a valid reason for according these types of plans a different accounting treatment, because it is not the role of financial reporting to give favourable accounting treatment to particular transactions to encourage entities to enter into them. For example, governments might wish to encourage entities to provide pensions to their employees, to lessen the future burden on the state, but that does not mean that pension costs should be excluded from the financial statements. To do so would impair the quality of financial reporting. The purpose of financial reporting is to provide information to users of financial statements, to assist them in making economic decisions. The omission of expenses from the financial statements does not change the fact that those expenses have been incurred. The omission of expenses causes reported profits to be overstated and hence the financial statements are not neutral, are less transparent and comparable, and are potentially misleading to users.

BC14 There remains the question whether there should be an exemption for some plans, when the discount is small. For example, FASB Statement of Financial Accounting Standards No.123 *Accounting for Stock-Based Compensation* contains an exemption for employee share purchase plans that meet specified criteria, of which one is that the discount is small.

BC15 On the one hand, it seems reasonable to exempt an employee share purchase plan if it has substantially no option features and the discount is small. In such situations, the rights given to the employees under the plan probably do not have a significant value, from the entity's perspective.

BC16 On the other hand, even if one accepts that an exemption is appropriate, specifying its scope is problematic, eg deciding what constitutes a small discount. Some argue that a 5 per cent discount from the market price (as specified in SFAS 123) is too high, noting that a block of shares can be sold on the market at a price close to the current share price. Furthermore, it could be argued that it is unnecessary to exempt these plans from the standard. If the rights given to the employees do not have a significant value, this suggests that the amounts involved are immaterial. Because it is not necessary to include immaterial information in the financial statements, there is no need for a specific exclusion in an accounting standard.

BC17 For the reasons given in the preceding paragraph, the Board concluded that broad-based employee share plans, including broad-based employee share purchase plans, should not be exempted from the IFRS.

 © IASCF

BC18 However, the Board noted that there might be instances when an entity engages in a transaction with an employee in his/her capacity as a holder of equity instruments, rather than in his/her capacity as an employee. For example, an entity might grant all holders of a particular class of its equity instruments the right to acquire additional equity instruments of the entity at a price that is less than the fair value of those equity instruments. If an employee receives such a right because he/she is a holder of that particular class of equity instruments, the Board concluded that the granting or exercise of that right should not be subject to the requirements of the IFRS, because the employee has received that right in his/her capacity as a shareholder, rather than as an employee.

Transactions in which an entity cannot identify some or all of the goods or services received (paragraph 2)*

BC18A The Board incorporated into IFRS 2 the consensus of IFRIC 8 in *Group Cash-settled Share-based Payment Transactions* issued in June 2009. This section summarises the IFRIC's considerations in reaching that consensus, as approved by the Board.

BC18B IFRS 2 applies to share-based payment transactions in which the entity receives or acquires goods or services. However, in some situations it might be difficult to demonstrate that the entity has received goods or services. This raises the question of whether IFRS 2 applies to such transactions. In addition, if the entity has made a share-based payment and the identifiable consideration received (if any) appears to be less than the fair value of the share-based payment, does this situation indicate that goods or services have been received, even though those goods or services are not specifically identified, and therefore that IFRS 2 applies?

BC18C When the Board developed IFRS 2, it concluded that the directors of an entity would expect to receive some goods or services in return for equity instruments issued (paragraph BC37). This implies that it is not necessary to identify the specific goods or services received in return for the equity instruments granted to conclude that goods or services have been (or will be) received. Furthermore, paragraph 8 of the IFRS establishes that it is not necessary for the goods or services received to qualify for recognition as an asset in order for the share-based payment to be within the scope of IFRS 2. In this case, the IFRS requires the cost of the goods or services received or receivable to be recognised as expenses.

BC18D Accordingly, the Board concluded that the scope of IFRS 2 includes transactions in which the entity cannot identify some or all of the specific goods or services received. If the value of the identifiable consideration received appears to be less than the fair value of the equity instruments granted or liability incurred, typically,† this circumstance indicates that other consideration (ie unidentifiable goods or services) has been (or will be) received.

* Paragraphs BC18A–BC18D are added as a consequence of *Group Cash-settled Share-based Payment Transactions* (Amendments to IFRS 2) issued in June 2009.

† In some cases, the reason for the transfer would explain why no goods or services have been or will be received. For example, a principal shareholder, as part of estate planning, transfers some of his shares to a family member. In the absence of factors that indicate that the family member has provided, or is expected to provide, any goods or services to the entity in return for the shares, such a transaction would be outside the scope of IFRS 2.

Transfers of equity instruments to employees (paragraphs 3 and 3A)*

BC19 In some situations, an entity might not issue shares or share options to employees (or other parties) direct. Instead, a shareholder (or shareholders) might transfer equity instruments to the employees (or other parties).

BC20 Under this arrangement, the entity has received services (or goods) that were paid for by its shareholders. The arrangement could be viewed as being, in substance, two transactions—one transaction in which the entity has reacquired equity instruments for nil consideration, and a second transaction in which the entity has received services (or goods) as consideration for equity instruments issued to the employees (or other parties).

BC21 The second transaction is a share-based payment transaction. Therefore, the Board concluded that the entity should account for transfers of equity instruments by shareholders to employees or other parties in the same way as other share-based payment transactions. The Board reached the same conclusion with respect to transfers of equity instruments of the entity's parent, or of another entity within the same group as the entity, to the entity's employees or other suppliers.

BC22 However, such a transfer is not a share-based payment transaction if the transfer of equity instruments to an employee or other party is clearly for a purpose other than payment for goods or services supplied to the entity. This would be the case, for example, if the transfer is to settle a shareholder's personal obligation to an employee that is unrelated to employment by the entity, or if the shareholder and employee are related and the transfer is a personal gift because of that relationship.

BC22A In December 2007 the Board published an exposure draft *Group Cash-settled Share-based Payment Transactions* proposing amendments to IFRS 2 and IFRIC 11 to clarify the accounting for such transactions in the separate or individual financial statements of the entity receiving goods or services. The Board proposed to include specified types of such transactions within the scope of IFRS 2 (not IAS 19 *Employee Benefits*), regardless of whether the group share-based payment transaction is cash-settled or equity-settled.

BC22B Nearly all of the respondents to the exposure draft agreed that the group cash-settled transactions between a parent and a subsidiary described in the exposure draft should be within the scope of IFRS 2. Respondents generally believed that including these transactions is consistent with IFRS 2's main principle that the entity should recognise the goods or services that it receives in a share-based transaction. However, respondents also expressed concerns that the proposed scope:

(a) adopted a case-by-case approach and was inconsistent with the definitions of share-based payment transactions in IFRS 2.

(b) was unclear and increased the inconsistency in the scope requirements among the applicable IFRSs, including IFRIC 11.

* Paragraphs BC22A–BC22G are added as a consequence of *Group Cash-settled Share-based Payment Transactions* (Amendments to IFRS 2) issued in June 2009.

 © IASCF

BC22C Many respondents expressed concerns that similar transactions would continue to be treated differently. Because no amendments to the definitions of share-based payment transactions were proposed, some transactions might not be included within the scope of IFRS 2 because they did not meet those definitions. The Board agreed with respondents that the proposals did not achieve the objective of including all share-based payment transactions within the scope of IFRS 2 as intended.

BC22D When finalising the amendments issued in June 2009, the Board reaffirmed the view it had intended to convey in the proposed amendments, namely that the entity receiving the goods or services should account for group share-based payment transactions in accordance with IFRS 2. Consequently, IFRS 2 applies even when the entity receiving the goods or services has no obligation to settle the transaction and regardless of whether the payments to the suppliers are equity-settled or cash-settled. To avoid the need for further guidance on the scope of IFRS 2 for group transactions, the Board decided to amend some of the defined terms and to supersede paragraph 3 by a new paragraph 3A to state clearly the principles applicable to those transactions.

BC22E During its redeliberations of the proposed amendments, the Board agreed with respondents' comments that, as proposed, the scope of IFRS 2 remained unclear and inconsistent between the standard and related Interpretations. For example, the terms 'shareholder' and 'parent' have different meanings: a shareholder is not necessarily a parent, and a parent does not have to be a shareholder. The Board noted that share-based payment transactions among group entities are often directed by the parent, indicating a level of control. Therefore, the Board clarified the boundaries of a 'group' by adopting the same definition as in paragraph 4 of IAS 27 *Consolidated and Separate Financial Statements*, which includes only a parent and its subsidiaries.

BC22F Some respondents to the exposure draft questioned whether the proposals should apply to joint ventures. Before the Board's amendments, the guidance in paragraph 3 (now superseded by paragraph 3A) stated that when a shareholder transferred equity instruments of the entity (or another group entity), the transaction would be within the scope of IFRS 2 for the entity receiving the goods or services. However, that guidance did not specify the accounting by a shareholder transferor. The Board noted that the defined terms in Appendix A, as amended, would clearly state that any entity (including a joint venture) that receives goods or services in a share-based payment transaction should account for the transaction in accordance with the IFRS, regardless of whether that entity also settles the transaction.

BC22G Furthermore, the Board noted that the exposure draft and related discussions focused on clarifying guidance for transactions involving group entities in the separate or individual financial statements of the entity receiving the goods or services. Addressing transactions involving related parties outside a group structure in their separate or individual financial statements would significantly expand the scope of the project and change the scope of IFRS 2. Therefore, the Board decided not to address transactions between entities not in the same group that are similar to share-based payment transactions but outside the definitions as amended. This carries forward the existing guidance of IFRS 2 for entities not in the same group and the Board does not intend to change that guidance.

Transactions within the scope of IFRS 3 *Business Combinations*

BC23 An entity might acquire goods (or other non-financial assets) as part of the net assets acquired in a business combination for which the consideration paid included shares or other equity instruments issued by the entity. Because IFRS 3 applies to the acquisition of assets and issue of shares in connection with a business combination, that is the more specific standard that should be applied to that transaction.

BC24 Therefore, equity instruments issued in a business combination in exchange for control of the acquiree are not within the scope of IFRS 2. However, equity instruments granted to employees of the acquiree in their capacity as employees, eg in return for continued service, are within the scope of IFRS 2. Also, the cancellation, replacement, or other modifications to share-based payment arrangements because of a business combination or other equity restructuring should be accounted for in accordance with IFRS 2.

BC24A IFRS 3 (as revised in 2008) changed the definition of a business combination. The previous definition of a business combination was 'the bringing together of separate entities or businesses into one reporting entity'. The revised definition of a business combination is 'a transaction or other event in which an acquirer obtains control of one or more businesses'.

BC24B The Board was advised that the changes to that definition caused the accounting for the contribution of a business in exchange for shares issued on formation of a joint venture by the venturers to be within the scope of IFRS 2. The Board noted that common control transactions may also be within the scope of IFRS 2 depending on which level of the group reporting entity is assessing the combination.

BC24C The Board noted that during the development of revised IFRS 3 it did not discuss whether it intended IFRS 2 to apply to these types of transactions. The Board also noted that the reason for excluding common control transactions and the accounting by a joint venture upon its formation from the scope of revised IFRS 3 was to give the Board more time to consider the relevant accounting issues. When the Board revised IFRS 3, it did not intend to change existing practice by bringing such transactions within the scope of IFRS 2, which does not specifically address them.

BC24D Accordingly, in *Improvements to IFRSs* issued in April 2009, the Board amended paragraph 5 of IFRS 2 to confirm that the contribution of a business on the formation of a joint venture and common control transactions are not within the scope of IFRS 2.

 © IASCF

Transactions within the scope of IAS 32 *Financial Instruments: Presentation* and IAS 39 *Financial Instruments: Recognition and Measurement*[*]

BC25 The IFRS includes consequential amendments to IAS 32 and IAS 39 (both as revised in 2003)[†] to exclude from their scope transactions within the scope of IFRS 2.

BC26 For example, suppose the entity enters into a contract to purchase cloth for use in its clothing manufacturing business, whereby it is required to pay cash to the counterparty in an amount equal to the value of 1,000 of the entity's shares at the date of delivery of the cloth. The entity will acquire goods and pay cash at an amount based on its share price. This meets the definition of a share-based payment transaction. Moreover, because the contract is to purchase cloth, which is a non-financial item, and the contract was entered into for the purpose of taking delivery of the cloth for use in the entity's manufacturing business, the contract is not within the scope of IAS 32 and IAS 39.

BC27 The scope of IAS 32 and IAS 39 includes contracts to buy non-financial items that can be settled net in cash or another financial instrument, or by exchanging financial instruments, with the exception of contracts that were entered into and continue to be held for the purpose of the receipt or delivery of a non-financial item in accordance with the entity's expected purchase, sale or usage requirements. A contract that can be settled net in cash or another financial instrument or by exchanging financial instruments includes (a) when the terms of the contract permit either party to settle it net in cash or another financial instrument or by exchanging financial instruments; (b) when the ability to settle net in cash or another financial instrument, or by exchanging financial instruments, is not explicit in the terms of the contract, but the entity has a practice of settling similar contracts net in cash or another financial instrument, or by exchanging financial instruments (whether with the counterparty, by entering into offsetting contracts, or by selling the contract before its exercise or lapse); (c) when, for similar contracts, the entity has a practice of taking delivery of the underlying and selling it within a short period after delivery for the purpose of generating a profit from short-term fluctuations in price or dealer's margin; and (d) when the non-financial item that is the subject of the contract is readily convertible to cash (IAS 32, paragraphs 8–10 and IAS 39, paragraphs 5–7).

BC28 The Board concluded that the contracts discussed in paragraph BC27 should remain within the scope of IAS 32 and IAS 39 and they are therefore excluded from the scope of IFRS 2.

Recognition of equity-settled share-based payment transactions

BC29 When it developed ED 2, the Board first considered conceptual arguments relating to the recognition of an expense arising from equity-settled share-based payment transactions, including arguments advanced by respondents to the Discussion Paper and other commentators. Some respondents who disagreed

---

[*] In November 2009 the IASB amended some of the requirements of IAS 39 and relocated them to IFRS 9 *Financial Instruments*. IFRS 9 applies to all assets within the scope of IAS 39.

[†] The title of IAS 32 was amended in 2005.

with the recognition of an expense arising from particular share-based payment transactions (ie those involving employee share options) did so for practical, rather than conceptual, reasons. The Board considered those practical issues later (see paragraphs BC294–BC310).

BC30 The Board focused its discussions on employee share options, because that is where most of the complexity and controversy lies, but the question of whether expense recognition is appropriate is broader than that—it covers all transactions involving the issue of shares, share options or other equity instruments to employees or suppliers of goods and services. For example, the Board noted that arguments made by respondents and other commentators against expense recognition are directed solely at employee share options. However, if conceptual arguments made against recognition of an expense in relation to employee share options are valid (eg that there is no cost to the entity), those arguments ought to apply equally to transactions involving other equity instruments (eg shares) and to equity instruments issued to other parties (eg suppliers of professional services).

BC31 The rationale for recognising all types of share-based payment transactions—irrespective of whether the equity instrument is a share or a share option, and irrespective of whether the equity instrument is granted to an employee or to some other party—is that the entity has engaged in a transaction that is in essence the same as any other issue of equity instruments. In other words, the entity has received resources (goods or services) as consideration for the issue of shares, share options or other equity instruments. It should therefore account for the inflow of resources (goods or services) and the increase in equity. Subsequently, either at the time of receipt of the goods or services or at some later date, the entity should also account for the expense arising from the consumption of those resources.

BC32 Many respondents to ED 2 agreed with this conclusion. Of those who disagreed, some disagreed in principle, some disagreed for practical reasons, and some disagreed for both reasons. The arguments against expense recognition in principle were considered by the Board when it developed ED 2, as were the arguments against expense recognition for practical reasons, as explained below and in paragraphs BC294–BC310.

BC33 Arguments commonly made against expense recognition include:

(a) the transaction is between the shareholders and the employees, not the entity and the employees.

(b) the employees do not provide services for the options.

(c) there is no cost to the entity, because no cash or other assets are given up; the shareholders bear the cost, in the form of dilution of their ownership interests, not the entity.

(d) the recognition of an expense is inconsistent with the definition of an expense in the conceptual frameworks used by accounting standard-setters, including the IASB's *Framework for the Preparation and Presentation of Financial Statements*.

 © IASCF

(e) the cost borne by the shareholders is recognised in the dilution of earnings per share (EPS); if the transaction is recognised in the entity's accounts, the resulting charge to the income statement would mean that EPS is 'hit twice'.

(f) requiring the recognition of a charge would have adverse economic consequences, because it would discourage entities from introducing or continuing employee share plans.

'The entity is not a party to the transaction'

BC34 Some argue that the effect of employee share plans is that the existing shareholders transfer some of their ownership interests to the employees and that the entity is not a party to this transaction.

BC35 The Board did not accept this argument. Entities, not shareholders, set up employee share plans and entities, not shareholders, issue share options to their employees. Even if that were not the case, eg if shareholders transferred shares or share options direct to the employees, this would not mean that the entity is not a party to the transaction. The equity instruments are issued in return for services rendered by the employees and the entity, not the shareholders, receives those services. Therefore, the Board concluded that the entity should account for the services received in return for the equity instruments issued. The Board noted that this is no different from other situations in which equity instruments are issued. For example, if an entity issues warrants for cash, the entity recognises the cash received in return for the warrants issued. Although the effect of an issue, and subsequent exercise, of warrants might be described as a transfer of ownership interests from the existing shareholders to the warrant holders, the entity nevertheless is a party to the transaction because it receives resources (cash) for the issue of warrants and further resources (cash) for the issue of shares upon exercise of the warrants. Similarly, with employee share options, the entity receives resources (employee services) for the issue of the options and further resources (cash) for the issue of shares on the exercise of options.

'The employees do not provide services'

BC36 Some who argue that the entity is not a party to the transaction counter the points made above with the argument that employees do not provide services for the options, because the employees are paid in cash (or other assets) for their services.

BC37 Again, the Board was not convinced by this argument. If it were true that employees do not provide services for their share options, this would mean that entities are issuing valuable share options and getting nothing in return. Employees do not pay cash for the share options they receive. Hence, if they do not provide services for the options, the employees are providing nothing in return. If this were true, by issuing such options the entity's directors would be in breach of their fiduciary duties to their shareholders.

© IASCF

BC38 Typically, shares or share options granted to employees form one part of their remuneration package. For example, an employee might have a remuneration package consisting of a basic cash salary, company car, pension, healthcare benefits, and other benefits including shares and share options. It is usually not possible to identify the services received in respect of individual components of that remuneration package, eg the services received in respect of healthcare benefits. But that does not mean that the employee does not provide services for those healthcare benefits. Rather, the employee provides services for the entire remuneration package.

BC39 In summary, shares, share options or other equity instruments are granted to employees because they are employees. The equity instruments granted form a part of their total remuneration package, regardless of whether that represents a large part or a small part.

‘There is no cost to the entity, therefore there is no expense’

BC40 Some argue that because share-based payments do not require the entity to sacrifice any cash or other assets, there is no cost to the entity, and therefore no expense should be recognised.

BC41 The Board regards this argument as unsound, because it overlooks that:

(a) every time an entity receives resources as consideration for the issue of equity instruments, there is no outflow of cash or other assets, and on every other occasion the resources received as consideration for the issue of equity instruments are recognised in the financial statements; and

(b) the expense arises from the consumption of those resources, not from an outflow of assets.

BC42 In other words, irrespective of whether one accepts that there is a cost to the entity, an accounting entry is required to recognise the resources received as consideration for the issue of equity instruments, just as it is on other occasions when equity instruments are issued. For example, when shares are issued for cash, an entry is required to recognise the cash received. If a non-monetary asset, such as plant and machinery, is received for those shares instead of cash, an entry is required to recognise the asset received. If the entity acquires another business or entity by issuing shares in a business combination, the entity recognises the net assets acquired.

BC43 The recognition of an expense arising out of such a transaction represents the consumption of resources received, ie the ‘using up’ of the resources received for the shares or share options. In the case of the plant and machinery mentioned above, the asset would be depreciated over its expected life, resulting in the recognition of an expense each year. Eventually, the entire amount recognised for the resources received when the shares were issued would be recognised as an expense (including any residual value, which would form part of the measurement of the gain or loss on disposal of the asset). Similarly, if another business or entity is acquired by an issue of shares, an expense is recognised when the assets acquired are consumed. For example, inventories acquired will be recognised as an expense when sold, even though no cash or other assets were disbursed to acquire those inventories.

 © IASCF

BC44 The only difference in the case of employee services (or other services) received as consideration for the issue of shares or share options is that usually the resources received are consumed immediately upon receipt. This means that an expense for the consumption of resources is recognised immediately, rather than over a period of time. The Board concluded that the timing of consumption does not change the principle; the financial statements should recognise the receipt and consumption of resources, even when consumption occurs at the same time as, or soon after, receipt. This point is discussed further in paragraphs BC45–BC53.

'Expense recognition is inconsistent with the definition of an expense'

BC45 Some have questioned whether recognition of an expense arising from particular share-based payment transactions is consistent with accounting standard-setters' conceptual frameworks, in particular, the *Framework*, which states:

> Expenses are decreases in economic benefits during the accounting period in the form of outflows or *depletions of assets* or incurrences of liabilities that result in decreases in equity, other than those relating to distributions to equity participants. (paragraph 70, emphasis added)

BC46 Some argue that if services are received in a share-based payment transaction, there is no transaction or event that meets the definition of an expense. They contend that there is no outflow of assets and that no liability is incurred. Furthermore, because services usually do not meet the criteria for recognition as an asset, it is argued that the consumption of those services does not represent a depletion of assets.

BC47 The *Framework* defines an asset and explains that the term 'asset' is not limited to resources that can be recognised as assets in the balance sheet (*Framework*, paragraphs 49 and 50). Although services to be received in the future might not meet the definition of an asset,[*] services are assets when received. These assets are usually consumed immediately. This is explained in FASB Statement of Financial Accounting Concepts No. 6 *Elements of Financial Statements*:

> Services provided by other entities, including personal services, cannot be stored and are received and used simultaneously. They can be assets of an entity only momentarily—as the entity receives and uses them—although their use may create or add value to other assets of the entity ... (paragraph 31)

BC48 This applies to all types of services, eg employee services, legal services and telephone services. It also applies irrespective of the form of payment. For example, if an entity purchases services for cash, the accounting entry is:

Dr Services received

Cr Cash paid

BC49 Sometimes, those services are consumed in the creation of a recognisable asset, such as inventories, in which case the debit for services received is capitalised as part of a recognised asset. But often the services do not create or form part of a recognisable asset, in which case the debit for services received is charged

[*] For example, the entity might not have control over future services.

immediately to the income statement as an expense. The debit entry above (and the resulting expense) does not represent the cash outflow—that is what the credit entry was for. Nor does it represent some sort of balancing item, to make the accounts balance. The debit entry above represents the resources received, and the resulting expense represents the consumption of those resources.

BC50 The same analysis applies if the services are acquired with payment made in shares or share options. The resulting expense represents the consumption of services, ie a depletion of assets.

BC51 To illustrate this point, suppose that an entity has two buildings, both with gas heating, and the entity issues shares to the gas supplier instead of paying cash. Suppose that, for one building, the gas is supplied through a pipeline, and so is consumed immediately upon receipt. Suppose that, for the other building, the gas is supplied in bottles, and is consumed over a period of time. In both cases, the entity has received assets as consideration for the issue of equity instruments, and should therefore recognise the assets received, and a corresponding contribution to equity. If the assets are consumed immediately (the gas received through the pipeline), an expense is recognised immediately; if the assets are consumed later (the gas received in bottles), an expense is recognised later when the assets are consumed.

BC52 Therefore, the Board concluded that the recognition of an expense arising from share-based payment transactions is consistent with the definition of an expense in the *Framework*.

BC53 The FASB considered the same issue and reached the same conclusion in SFAS 123:

> Some respondents pointed out that the definition of expenses in FASB Concepts Statement No. 6, *Elements of Financial Statements*, says that expenses result from outflows or using up of assets or incurring of liabilities (or both). They asserted that because the issuance of stock options does not result in the incurrence of a liability, no expense should be recognised. The Board agrees that employee stock options are not a liability—like stock purchase warrants, employee stock options are equity instruments of the issuer. However, equity instruments, including employee stock options, are valuable financial instruments and thus are issued for valuable consideration, which...for employee stock options is employee services. Using in the entity's operations the benefits embodied in the asset received results in an expense ... (Concepts Statement 6, paragraph 81, footnote 43, notes that, in concept most expenses decrease assets. However, if receipt of an asset, such as services, and its use occur virtually simultaneously, the asset often is not recorded.) [paragraph 88]

'Earnings per share is "hit twice"'

BC54 Some argue that any cost arising from share-based payment transactions is already recognised in the dilution of earnings per share (EPS). If an expense were recognised in the income statement, EPS would be 'hit twice'.

BC55 However, the Board noted that this result is appropriate. For example, if the entity paid the employees in cash for their services and the cash was then returned to the entity, as consideration for the issue of share options, the effect on EPS would be the same as issuing those options direct to the employees.

 © IASCF

BC56 The dual effect on EPS simply reflects the two economic events that have occurred: the entity has issued shares or share options, thereby increasing the number of shares included in the EPS calculation—although, in the case of options, only to the extent that the options are regarded as dilutive—and it has also consumed the resources it received for those options, thereby decreasing earnings. This is illustrated by the plant and machinery example mentioned in paragraphs BC42 and BC43. Issuing shares affects the number of shares in the EPS calculation, and the consumption (depreciation) of the asset affects earnings.

BC57 In summary, the Board concluded that the dual effect on diluted EPS is not double-counting the effects of a share or share option grant—the same effect is not counted twice. Rather, two different effects are each counted once.

‘Adverse economic consequences’

BC58 Some argue that to require recognition (or greater recognition) of employee share-based payment would have adverse economic consequences, in that it might discourage entities from introducing or continuing employee share plans.

BC59 Others argue that if the introduction of accounting changes did lead to a reduction in the use of employee share plans, it might be because the requirement for entities to account properly for employee share plans had revealed the economic consequences of such plans. They argue that this would correct the present economic distortion, whereby entities obtain and consume resources by issuing valuable shares or share options without accounting for those transactions.

BC60 In any event, the Board noted that the role of accounting is to report transactions and events in a neutral manner, not to give ‘favourable’ treatment to particular transactions to encourage entities to engage in those transactions. To do so would impair the quality of financial reporting. The omission of expenses from the financial statements does not change the fact that those expenses have been incurred. Hence, if expenses are omitted from the income statement, reported profits are overstated. The financial statements are not neutral, are less transparent and are potentially misleading to users. Comparability is impaired, given that expenses arising from employee share-based payment transactions vary from entity to entity, from sector to sector, and from year to year. More fundamentally, accountability is impaired, because the entities are not accounting for transactions they have entered into and the consequences of those transactions.

Measurement of equity-settled share-based payment transactions

BC61 To recognise equity-settled share-based payment transactions, it is necessary to decide how the transactions should be measured. The Board began by considering how to measure share-based payment transactions in principle. Later, it considered practical issues arising from the application of its preferred measurement approach. In terms of accounting principles, there are two basic questions:

(a) which measurement basis should be applied?

(b) when should that measurement basis be applied?

BC62 To answer these questions, the Board considered the accounting principles applying to equity transactions. The *Framework* states:

> Equity is the residual interest in the assets of the enterprise after deducting all of its liabilities ... The amount at which equity is shown in the balance sheet is dependent upon the measurement of assets and liabilities. Normally, the aggregate amount of equity only by coincidence corresponds with the aggregate market value of the shares of the enterprise ... (paragraphs 49 and 67)

BC63 The accounting equation that corresponds to this definition of equity is:

> assets minus liabilities equals equity

BC64 Equity is a residual interest, dependent on the measurement of assets and liabilities. Therefore, accounting focuses on recording changes in the left side of the equation (assets minus liabilities, or net assets), rather than the right side. Changes in equity arise from changes in net assets. For example, if an entity issues shares for cash, it recognises the cash received and a corresponding increase in equity. Subsequent changes in the market price of the shares do not affect the entity's net assets and therefore those changes in value are not recognised.

BC65 Hence, the Board concluded that, when accounting for an equity-settled share-based payment transaction, the primary accounting objective is to account for the goods or services received as consideration for the issue of equity instruments. Therefore, equity-settled share-based payment transactions should be accounted for in the same way as other issues of equity instruments, by recognising the consideration received (the change in net assets), and a corresponding increase in equity.

BC66 Given this objective, the Board concluded that, in principle, the goods or services received should be measured at their fair value at the date when the entity obtains those goods or as the services are received. In other words, because a change in net assets occurs when the entity obtains the goods or as the services are received, the fair value of those goods or services at that date provides an appropriate measure of the change in net assets.

BC67 However, for share-based payment transactions with employees, it is usually difficult to measure directly the fair value of the services received. As noted earlier, typically shares or share options are granted to employees as one component of their remuneration package. It is usually not possible to identify the services rendered in respect of individual components of that package. It might also not be possible to measure independently the fair value of the total package, without measuring directly the fair value of the equity instruments granted. Furthermore, options or shares are sometimes granted as part of a bonus arrangement, rather than as a part of basic remuneration, eg as an incentive to the employees to remain in the entity's employ, or to reward them for their efforts in improving the entity's performance. By granting share options, in addition to other remuneration, the entity is paying additional remuneration to obtain additional benefits. Estimating the fair value of those additional benefits is likely to be difficult.

 © IASCF

BC68 Given these practical difficulties in measuring directly the fair value of the employee services received, the Board concluded that it is necessary to measure the other side of the transaction, ie the fair value of the equity instruments granted, as a surrogate measure of the fair value of the services received. In this context, the Board considered the same basic questions, as mentioned above:

(a) which measurement basis should be applied?

(b) when should that measurement basis be applied?

Measurement basis

BC69 The Board discussed the following measurement bases, to decide which should be applied in principle:

(a) historical cost

(b) intrinsic value

(c) minimum value

(d) fair value.

Historical cost

BC70 In jurisdictions where legislation permits, entities commonly repurchase their own shares, either directly or through a vehicle such as a trust, which are used to fulfil promised grants of shares to employees or the exercise of employee share options. A possible basis for measuring a grant of options or shares would be the historical cost (purchase price) of its own shares that an entity holds (own shares held), even if they were acquired before the award was made.

BC71 For share options, this would entail comparing the historical cost of own shares held with the exercise price of options granted to employees. Any shortfall would be recognised as an expense. Also, presumably, if the exercise price exceeded the historical cost of own shares held, the excess would be recognised as a gain.

BC72 At first sight, if one simply focuses on the cash flows involved, the historical cost basis appears reasonable: there is a cash outflow to acquire the shares, followed by a cash inflow when those shares are transferred to the employees (the exercise price), with any shortfall representing a cost to the entity. If the cash flows related to anything other than the entity's own shares, this approach would be appropriate. For example, suppose ABC Ltd bought shares in another entity, XYZ Ltd, for a total cost of CU500,000,[*] and later sold the shares to employees for a total of CU400,000. The entity would recognise an expense for the CU100,000 shortfall.

[*] All monetary amounts in this Basis for Conclusions are denominated in 'currency units (CU)'.

BC73 But when this analysis is applied to the entity's own shares, the logic breaks down. The entity's own shares are not an asset of the entity.[*] Rather, the shares are an interest in the entity's assets. Hence, the distribution of cash to buy back shares is a return of capital to shareholders, and should therefore be recognised as a decrease in equity. Similarly, when the shares are subsequently reissued or transferred, the inflow of cash is an increase in shareholders' capital, and should therefore be recognised as an increase in equity. It follows that no revenue or expense should be recognised. Just as the issue of shares does not represent revenue to the entity, the repurchase of those shares does not represent an expense.

BC74 Therefore, the Board concluded that historical cost is not an appropriate basis upon which to measure equity-settled share-based payment transactions.

Intrinsic value

BC75 An equity instrument could be measured at its intrinsic value. The intrinsic value of a share option at any point in time is the difference between the market price of the underlying shares and the exercise price of the option.

BC76 Often, employee share options have zero intrinsic value at the date of grant—commonly the exercise price is at the market value of the shares at grant date. Therefore, in many cases, valuing share options at their intrinsic value at grant date is equivalent to attributing no value to the options.

BC77 However, the intrinsic value of an option does not fully reflect its value. Options sell in the market for more than their intrinsic value. This is because the holder of an option need not exercise it immediately and benefits from any increase in the value of the underlying shares. In other words, although the ultimate benefit realised by the option holder is the option's intrinsic value at the date of exercise, the option holder is able to realise that future intrinsic value because of having held the option. Thus, the option holder benefits from the right to participate in future gains from increases in the share price. In addition, the option holder benefits from the right to defer payment of the exercise price until the end of the option term. These benefits are commonly referred to as the option's 'time value'.

BC78 For many options, time value represents a substantial part of their value. As noted earlier, many employee share options have zero intrinsic value at grant date, and hence the option's value consists entirely of time value. In such cases, ignoring time value by applying the intrinsic value method at grant date understates the value of the option by 100 per cent.

[*] The Discussion Paper discusses this point: Accounting practice in some jurisdictions may present own shares acquired as an asset, but they lack the essential feature of an asset—the ability to provide future economic benefits. The future economic benefits usually provided by an interest in shares are the right to receive dividends and the right to gain from an increase in value of the shares. When a company has an interest in its own shares, it will receive dividends on those shares only if it elects to pay them, and such dividends do not represent a gain to the company, as there is no change in net assets: the flow of funds is simply circular. Whilst it is true that a company that holds its own shares in treasury may sell them and receive a higher amount if their value has increased, a company is generally able to issue shares to third parties at (or near) the current market price. Although there may be legal, regulatory or administrative reasons why it is easier to sell shares that are held as treasury shares than it would be to issue new shares, such considerations do not seem to amount to a fundamental contrast between the two cases. (Footnote to paragraph 4.7)

© IASCF

BC79 The Board concluded that, in general, the intrinsic value measurement basis is not appropriate for measuring share-based payment transactions, because omitting the option's time value ignores a potentially substantial part of an option's total value. Measuring share-based payment transactions at such an understated value would fail to represent those transactions faithfully in the financial statements.

Minimum value

BC80 A share option could be measured at its minimum value. Minimum value is based on the premise that someone who wants to buy a call option on a share would be willing to pay at least (and the option writer would demand at least) the value of the right to defer payment of the exercise price until the end of the option's term. Therefore, minimum value can be calculated using a present value technique. For a dividend-paying share, the calculation is:

(a) the current price of the share, minus

(b) the present value of expected dividends on that share during the option term (if the option holder does not receive dividends), minus

(c) the present value of the exercise price.

BC81 Minimum value can also be calculated using an option pricing model with an expected volatility of effectively zero (not exactly zero, because some option pricing models use volatility as a divisor, and zero cannot be a divisor).

BC82 The minimum value measurement basis captures part of the time value of options, being the value of the right to defer payment of the exercise price until the end of the option's term. It does not capture the effects of volatility. Option holders benefit from volatility because they have the right to participate in gains from increases in the share price during the option term without having to bear the full risk of loss from decreases in the share price. By ignoring volatility, the minimum value method produces a value that is lower, and often much lower, than values produced by methods designed to estimate the fair value of an option.

BC83 The Board concluded that minimum value is not an appropriate measurement basis, because ignoring the effects of volatility ignores a potentially large part of an option's value. As with intrinsic value, measuring share-based payment transactions at the option's minimum value would fail to represent those transactions faithfully in the financial statements.

Fair value

BC84 Fair value is already used in other areas of accounting, including other transactions in which non-cash resources are acquired through the issue of equity instruments. For example, consideration transferred in a business combination is measured at fair value, including the fair value of any equity instruments issued by the entity.

BC85 Fair value, which is the amount at which an equity instrument granted could be exchanged between knowledgeable, willing parties in an arm's length transaction, captures both intrinsic value and time value and therefore provides a measure of the share option's total value (unlike intrinsic value or minimum value). It is the value that reflects the bargain between the entity and its

employees, whereby the entity has agreed to grant share options to employees for their services to the entity. Hence, measuring share-based payment transactions at fair value ensures that those transactions are represented faithfully in the financial statements, and consistently with other transactions in which the entity receives resources as consideration for the issue of equity instruments.

BC86 Therefore, the Board concluded that shares, share options or other equity instruments granted should be measured at their fair value.

BC87 Of the respondents to ED 2 who addressed this issue, many agreed with the proposal to measure the equity instruments granted at their fair value. Some respondents who disagreed with the proposal, or who agreed with reservations, expressed concerns about measurement reliability, particularly in the case of smaller or unlisted entities. The issues of measurement reliability and unlisted entities are discussed in paragraphs BC294–BC310 and BC137–BC144, respectively.

Measurement date

BC88 The Board first considered at which date the fair value of equity instruments should be determined for the purpose of measuring share-based payment transactions with employees (and others providing similar services).* The possible measurement dates discussed were grant date, service date, vesting date and exercise date. Much of this discussion was in the context of share options rather than shares or other equity instruments, because only options have an exercise date.

BC89 In the context of an employee share option, grant date is when the entity and the employee enter into an agreement, whereby the employee is granted rights to the share option, provided that specified conditions are met, such as the employee's remaining in the entity's employ for a specified period. Service date is the date when the employee renders the services necessary to become entitled to the share option.† Vesting date is the date when the employee has satisfied all the conditions necessary to become entitled to the share option. For example, if the employee is required to remain in the entity's employ for three years, vesting date is at the end of that three-year period. Exercise date is when the share option is exercised.

* When the Board developed the proposals in ED 2, it focused on the measurement of equity-settled transactions with employees and with parties other than employees. ED 2 did not propose a definition of the term 'employees'. When the Board reconsidered the proposals in ED 2 in the light of comments received, it discussed whether the term might be interpreted too narrowly. This could result in a different accounting treatment of services received from individuals who are regarded as employees (eg for legal or tax purposes) and substantially similar services received from other individuals. The Board therefore concluded that the requirements of the IFRS for transactions with employees should also apply to transactions with other parties providing similar services. This includes services received from (1) individuals who work for the entity under its direction in the same way as individuals who are regarded as employees for legal or tax purposes and (2) individuals who are not employees but who render personal services to the entity similar to those rendered by employees. All references to employees therefore include other parties providing similar services.

† Service date measurement theoretically requires the entity to measure the fair value of the share option at each date when services are received. For pragmatic reasons, an approximation would probably be used, such as the fair value of the share option at the end of each accounting period, or the value of the share option measured at regular intervals during each accounting period.

© IASCF

BC90 To help determine the appropriate measurement date, the Board applied the accounting concepts in the *Framework* to each side of the transaction. For transactions with employees, the Board concluded that grant date is the appropriate measurement date, as explained in paragraphs BC91–BC105. The Board also considered some other issues, as explained in paragraphs BC106–BC118. For transactions with parties other than employees, the Board concluded that delivery date is the appropriate measurement date (ie the date the goods or services are received, referred to as service date in the context of transactions with employees), as explained in paragraphs BC119–BC128.

The debit side of the transaction

BC91 Focusing on the debit side of the transaction means focusing on measuring the fair value of the resources received. This measurement objective is consistent with the primary objective of accounting for the goods or services received as consideration for the issue of equity instruments (see paragraphs BC64–BC66). The Board therefore concluded that, in principle, the goods or services received should be measured at their fair value at the date when the entity obtains those goods or as the services are received.

BC92 However, if the fair value of the services received is not readily determinable, then a surrogate measure must be used, such as the fair value of the share options or shares granted. This is the case for employee services.

BC93 If the fair value of the equity instruments granted is used as a surrogate measure of the fair value of the services received, both vesting date and exercise date measurement are inappropriate because the fair value of the services received during a particular accounting period is not affected by subsequent changes in the fair value of the equity instrument. For example, suppose that services are received during years 1–3 as the consideration for share options that are exercised at the end of year 5. For services received in year 1, subsequent changes in the value of the share option in years 2–5 are unrelated to, and have no effect on, the fair value of those services when received.

BC94 Service date measurement measures the fair value of the equity instrument at the same time as the services are received. This means that changes in the fair value of the equity instrument during the vesting period affect the amount attributed to the services received. Some argue that this is appropriate, because, in their view, there is a correlation between changes in the fair value of the equity instrument and the fair value of the services received. For example, they argue that if the fair value of a share option falls, so does its incentive effects, which causes employees to reduce the level of services provided for that option, or demand extra remuneration. Some argue that when the fair value of a share option falls because of a general decline in share prices, remuneration levels also fall, and therefore service date measurement reflects this decline in remuneration levels.

BC95 The Board concluded, however, that there is unlikely to be a high correlation between changes in the fair value of an equity instrument and the fair value of the services received. For example, if the fair value of a share option doubles, it is unlikely that the employees work twice as hard, or accept a reduction in the rest of their remuneration package. Similarly, even if a general rise in share prices is

accompanied by a rise in remuneration levels, it is unlikely that there is a high correlation between the two. Furthermore, it is likely that any link between share prices and remuneration levels is not universally applicable to all industry sectors.

BC96 The Board concluded that, at grant date, it is reasonable to presume that the fair value of both sides of the contract are substantially the same, ie the fair value of the services expected to be received is substantially the same as the fair value of the equity instruments granted. This conclusion, together with the Board's conclusion that there is unlikely to be a high correlation between the fair value of the services received and the fair value of the equity instruments granted at later measurement dates, led the Board to conclude that grant date is the most appropriate measurement date for the purposes of providing a surrogate measure of the fair value of the services received.

The credit side of the transaction

BC97 Although focusing on the debit side of the transaction is consistent with the primary accounting objective, some approach the measurement date question from the perspective of the credit side of the transaction, ie the issue of an equity instrument. The Board therefore considered the matter from this perspective too.

Exercise date

BC98 Under exercise date measurement, the entity recognises the resources received (eg employee services) for the issue of share options, and also recognises changes in the fair value of the option until it is exercised or lapses. Thus, if the option is exercised, the transaction amount is ultimately 'trued up' to equal the gain made by the option holder on exercise of the option. However, if the option lapses at the end of the exercise period, any amounts previously recognised are effectively reversed, hence the transaction amount is ultimately trued up to equal zero. The Board rejected exercise date measurement because it requires share options to be treated as liabilities, which is inconsistent with the definition of liabilities in the *Framework*. Exercise date measurement requires share options to be treated as liabilities because it requires the remeasurement of share options after initial recognition, which is inappropriate if the share options are equity instruments. A share option does not meet the definition of a liability, because it does not contain an obligation to transfer cash or other assets.

Vesting date, service date and grant date

BC99 The Board noted that the IASC/G4+1 Discussion Paper supported vesting date measurement, and rejected grant date and service date measurement, because it concluded that the share option is not issued until vesting date. It noted that the employees must perform their side of the arrangement by providing the necessary services and meeting any other performance criteria before the entity is obliged to perform its side of the arrangement. The provision of services by the employees is not merely a condition of the arrangement, it is the consideration they use to 'pay' for the share option. Therefore, the Discussion Paper concluded, in economic terms the share option is not issued until vesting date. Because the entity performs its side of the arrangement on vesting date, that is the appropriate measurement date.

 © IASCF

BC100 The Discussion Paper also proposed recognising an accrual in equity during the vesting period to ensure that the services are recognised when they are received. It proposed that this accrual should be revised on vesting date to equal the fair value of the share option at that date. This means that amounts credited to equity during the vesting period will be subsequently remeasured to reflect changes in the value of that equity interest before vesting date. That is inconsistent with the *Framework* because equity interests are not subsequently remeasured, ie any changes in their value are not recognised. The Discussion Paper justified this remeasurement by arguing that because the share option is not issued until vesting date, the option is not being remeasured. The credit to equity during the vesting period is merely an interim measure that is used to recognise the partially completed transaction.

BC101 However, the Board noted that even if one accepts that the share option is not issued until vesting date, this does not mean that there is no equity interest until then. If an equity interest exists before vesting date, that interest should not be remeasured. Moreover, the conversion of one type of equity interest into another should not, in itself, cause a change in total equity, because no change in net assets has occurred.

BC102 Some supporters of vesting date suggest that the accrual during the performance period meets the definition of a liability. However, the basis for this conclusion is unclear. The entity is not required to transfer cash or other assets to the employees. Its only commitment is to issue equity instruments.

BC103 The Board concluded that vesting date measurement is inconsistent with the *Framework*, because it requires the remeasurement of equity.

BC104 Service date measurement does not require remeasurement of equity interests after initial recognition. However, as explained earlier, the Board concluded that incorporating changes in the fair value of the share option into the transaction amount is unlikely to produce an amount that fairly reflects the fair value of the services received, which is the primary objective.

BC105 The Board therefore concluded that, no matter which side of the transaction one focuses upon (ie the receipt of resources or the issue of an equity instrument), grant date is the appropriate measurement date under the *Framework*, because it does not require remeasurement of equity interests and it provides a reasonable surrogate measure of the fair value of the services received from employees.

Other issues

IAS 32 Financial Instruments: Disclosure and Presentation*

BC106 As discussed above, under the definitions of liabilities and equity in the *Framework*, both shares and share options are equity instruments, because neither instrument requires the entity to transfer cash or other assets. Similarly, all contracts or arrangements that will be settled by the entity issuing shares or share options are classified as equity. However, this differs from the distinction between liabilities and equity applied in IAS 32. Although IAS 32 also considers, in its debt/equity distinction, whether an instrument contains an obligation to

* In August 2005 IAS 32 was amended as IAS 32 *Financial Instruments: Presentation.*

transfer cash or other assets, this is supplemented by a second criterion, which considers whether the number of shares to be issued (and cash to be received) on settlement is fixed or variable. IAS 32 classifies a contract that will or may be settled in the entity's own equity instruments as a liability if the contract is a non-derivative for which the entity is or may be obliged to deliver a variable number of the entity's own equity instruments; or a derivative that will or may be settled other than by the exchange of a fixed amount of cash or another financial asset for a fixed number of the entity's own equity instruments.

BC107 In some cases, the number of share options to which employees are entitled varies. For example, the number of share options to which the employees will be entitled on vesting date might vary depending on whether, and to the extent that, a particular performance target is exceeded. Another example is share appreciation rights settled in shares. In this situation, a variable number of shares will be issued, equal in value to the appreciation of the entity's share price over a period of time.

BC108 Therefore, if the requirements of IAS 32 were applied to equity-settled share-based payment transactions, in some situations an obligation to issue equity instruments would be classified as a liability. In such cases, final measurement of the transaction would be at a measurement date later than grant date.

BC109 The Board concluded that different considerations applied in developing IFRS 2. For example, drawing a distinction between fixed and variable option plans and requiring a later measurement date for variable option plans has undesirable consequences, as discussed in paragraphs BC272–BC275.

BC110 The Board concluded that the requirements in IAS 32, whereby some obligations to issue equity instruments are classified as liabilities, should not be applied in the IFRS on share-based payment. The Board recognises that this creates a difference between IFRS 2 and IAS 32. Before deciding whether and how that difference should be eliminated, the Board concluded that it is necessary to address this issue in a broader context, as part of a fundamental review of the definitions of liabilities and equity in the *Framework*, particularly because this is not the only debt/equity classification issue that has arisen in the share-based payment project, as explained below.

Suggestions to change the definitions of liabilities and equity

BC111 In concluding that, for transactions with employees, grant date is the appropriate measurement date under the *Framework*, the Board noted that some respondents to ED 2 and the Discussion Paper support other measurement dates because they believe that the definitions of liabilities and equity in the *Framework* should be revised.

BC112 For example, some supporters of vesting date argue that receipt of employee services between grant date and vesting date creates an obligation for the entity to pay for those services, and that the method of settlement should not matter. In other words, it should not matter whether that obligation is settled in cash or in equity instruments—both ought to be treated as liabilities. Therefore, the definition of a liability should be modified so that all types of obligations, however settled, are included in liabilities. But it is not clear that this approach

 © IASCF

would necessarily result in vesting date measurement. A share option contains an obligation to issue shares. Hence, if all types of obligations are classified as liabilities, then a share option would be a liability, which would result in exercise date measurement.

BC113 Some support exercise date measurement on the grounds that it produces the same accounting result as 'economically similar' cash-settled share-based payments. For example, it is argued that share appreciation rights (SARs) settled in cash are substantially similar to SARs settled in shares, because in both cases the employee receives consideration to the same value. Also, if the SARs are settled in shares and the shares are immediately sold, the employee ends up in exactly the same position as under a cash-settled SAR, ie with cash equal to the appreciation in the entity's share price over the specified period. Similarly, some argue that share options and cash-settled SARs are economically similar. This is particularly true when the employee realises the gain on the exercise of share options by selling the shares immediately after exercise, as commonly occurs. Either way, the employee ends up with an amount of cash that is based on the appreciation of the share price over a period of time. If cash-settled transactions and equity-settled transactions are economically similar, the accounting treatment should be the same.

BC114 However, it is not clear that changing the distinction between liabilities and equity to be consistent with exercise date measurement is the only way to achieve the same accounting treatment. For example, the distinction could be changed so that cash-settled employee share plans are measured at grant date, with the subsequent cash payment debited directly to equity, as a distribution to equity participants.

BC115 Others who support exercise date measurement do not regard share option holders as part of the ownership group, and therefore believe that options should not be classified as equity. Option holders, some argue, are only potential owners of the entity. But it is not clear whether this view is held generally, ie applied to all types of options. For example, some who support exercise date measurement for employee share options do not necessarily advocate the same approach for share options or warrants issued for cash in the market. However, any revision to the definitions of liabilities and equity in the *Framework* would affect the classification of all options and warrants issued by the entity.

BC116 Given that there is more than one suggestion to change the definitions of liabilities and equity, and these suggestions have not been fully explored, it is not clear exactly what changes to the definitions are being proposed.

BC117 Moreover, the Board concluded that these suggestions should not be considered in isolation, because changing the distinction between liabilities and equity affects all sorts of financial interests, not just those relating to employee share plans. All of the implications of any suggested changes should be explored in a broader project to review the definitions of liabilities and equity in the *Framework*. If such a review resulted in changes to the definitions, the Board would then consider whether the IFRS on share-based payment should be revised.

BC118 Therefore, after considering the issues discussed above, the Board confirmed its conclusion that grant date is the appropriate date at which to measure the fair value of the equity instruments granted for the purposes of providing a surrogate measure of the fair value of services received from employees.

Share-based payment transactions with parties other than employees

BC119 In many share-based payment transactions with parties other than employees, it should be possible to measure reliably the fair value of the goods or services received. The Board therefore concluded that the IFRS should require an entity to presume that the fair value of the goods or services received can be measured reliably.* However, in rare cases in which the presumption is rebutted, it is necessary to measure the transaction at the fair value of the equity instruments granted.

BC120 Some measurement issues that arise in respect of share-based payment transactions with employees also arise in transactions with other parties. For example, there might be performance (ie vesting) conditions that must be met before the other party is entitled to the shares or share options. Therefore, any conclusions reached on how to treat vesting conditions in the context of share-based payment transactions with employees also apply to transactions with other parties.

BC121 Similarly, performance by the other party might take place over a period of time, rather than on one specific date, which again raises the question of the appropriate measurement date.

BC122 SFAS 123 does not specify a measurement date for share-based payment transactions with parties other than employees, on the grounds that this is usually a minor issue in such transactions. However, the date at which to estimate the fair value of equity instruments issued to parties other than employees is specified in the US interpretation EITF 96-18 *Accounting for Equity Instruments That Are Issued to Other Than Employees for Acquiring, or in Conjunction with Selling, Goods or Services*:

> [The measurement date is] the earlier of the following:
>
> (a) The date at which a commitment for performance by the counterparty to earn the equity instruments is reached (a "performance commitment"), or
>
> (b) The date at which the counterparty's performance is complete.
> (extract from Issue 1, footnotes excluded)

---

* ED 2 proposed that equity-settled share-based payment transactions should be measured at the fair value of the goods or services received, or by reference to the fair value of the equity instruments granted, whichever fair value is more readily determinable. For transactions with parties other than employees, ED 2 proposed that there should be a rebuttable presumption that the fair value of the goods or services received is the more readily determinable fair value. The Board reconsidered these proposed requirements when finalising the IFRS. It concluded that it would be more consistent with the primary accounting objective (explained in paragraphs BC64–BC66) to require equity-settled share-based payment transactions to be measured at the fair value of the goods or services received, unless that fair value cannot be estimated reliably (eg in transactions with employees). For transactions with parties other than employees, the Board concluded that, in many cases, it should be possible to measure reliably the fair value of the goods or services received, as noted above. Hence, the Board concluded that the IFRS should require an entity to presume that the fair value of the goods or services received can be measured reliably.

 © IASCF

BC123 The second of these two dates corresponds to vesting date, because vesting date is when the other party has satisfied all the conditions necessary to become unconditionally entitled to the share options or shares. The first of the two dates does not necessarily correspond to grant date. For example, under an employee share plan, the employees are (usually) not committed to providing the necessary services, because they are usually able to leave at any time. Indeed, EITF 96-18 makes it clear that the fact that the equity instrument will be forfeited if the counterparty fails to perform is not sufficient evidence of a performance commitment (Issue 1, footnote 3). Therefore, in the context of share-based payment transactions with parties other than employees, if the other party is not committed to perform, there would be no performance commitment date, in which case the measurement date would be vesting date.

BC124 Accordingly, under SFAS 123 and EITF 96-18, the measurement date for share-based payment transactions with employees is grant date, but for transactions with other parties the measurement date could be vesting date, or some other date between grant date and vesting date.

BC125 In developing the proposals in ED 2, the Board concluded that for transactions with parties other than employees that are measured by reference to the fair value of the equity instruments granted, the equity instruments should be measured at grant date, the same as for transactions with employees.

BC126 However, the Board reconsidered this conclusion during its redeliberations of the proposals in ED 2. The Board considered whether the delivery (service) date fair value of the equity instruments granted provided a better surrogate measure of the fair value of the goods or services received from parties other than employees than the grant date fair value of those instruments. For example, some argue that if the counterparty is not firmly committed to delivering the goods or services, the counterparty would consider whether the fair value of the equity instruments at the delivery date is sufficient payment for the goods or services when deciding whether to deliver the goods or services. This suggests that there is a high correlation between the fair value of the equity instruments at the date the goods or services are received and the fair value of those goods or services. The Board noted that it had considered and rejected a similar argument in the context of transactions with employees (see paragraphs BC94 and BC95). However, the Board found the argument more compelling in the case of transactions with parties other than employees, particularly for transactions in which the counterparty delivers the goods or services on a single date (or over a short period of time) that is substantially later than grant date, compared with transactions with employees in which the services are received over a continuous period that typically begins on grant date.

BC127 The Board was also concerned that permitting entities to measure transactions with parties other than employees on the basis of the fair value of the equity instruments at grant date would provide opportunities for entities to structure transactions to achieve a particular accounting result, causing the carrying amount of the goods or services received, and the resulting expense for the consumption of those goods or services, to be understated.

© IASCF

BC128 The Board therefore concluded that for transactions with parties other than employees in which the entity cannot measure reliably the fair value of the goods or services received at the date of receipt, the fair value of those goods or services should be measured indirectly, based on the fair value of the equity instruments granted, measured at the date the goods or services are received.

Transactions in which the entity cannot identify specifically some or all of the goods or services received (paragraph 13A)*

BC128A The Board incorporated into IFRS 2 the consensus of IFRIC 8 in *Group Cash-settled Share-based Payment Transactions* issued in June 2009. This section summarises the IFRIC's considerations in reaching that consensus, as approved by the Board.

BC128B IFRS 2 presumes that the consideration received for share-based payments is consistent with the fair value of those share-based payments. For example, if the entity cannot estimate reliably the fair value of the goods or services received, paragraph 10 of the IFRS requires the entity to measure the fair value of the goods or services received by reference to the fair value of the share-based payment made to acquire those goods or services.

BC128C The Board noted that it is neither necessary nor appropriate to measure the fair value of goods or services as well as the fair value of the share-based payment for every transaction in which the entity receives goods or non-employee services. However, when the value of the identifiable consideration received appears to be less than the fair value of the share-based payment, measurement of both the goods or the services received and the share-based payment may be necessary in order to measure the value of the unidentifiable goods or services received.

BC128D Paragraph 13 of the IFRS stipulates a rebuttable presumption that the value of identifiable goods or services received can be reliably measured. The Board noted that goods or services that are unidentifiable cannot be reliably measured and that this rebuttable presumption is relevant only for identifiable goods or services.

BC128E The Board noted that when the goods or services received are identifiable, the measurement principles in the IFRS should be applied. When the goods or services received are unidentifiable, the Board concluded that the grant date is the most appropriate date for the purposes of providing a surrogate measure of the value of the unidentifiable goods or services received (or to be received).

BC128F The Board noted that some transactions include identifiable and unidentifiable goods or services. In this case, it would be necessary to measure at the grant date the fair value of the unidentifiable goods or services received and to measure the value of the identifiable goods or services in accordance with the IFRS.

BC128G For cash-settled transactions in which unidentifiable goods or services are received, it is necessary to remeasure the liability at each subsequent reporting date in order to be consistent with the IFRS.

---

* Paragraphs BC128A–BC128H are added as a consequence of amendments to IFRS 2 *Group Cash-settled Share-based Payment Transactions* issued in June 2009.

 © IASCF

BC128H The Board noted that the IFRS's requirements in respect of the recognition of the expense arising from share-based payments would apply to identifiable and unidentifiable goods or services. Therefore, the Board decided not to issue additional guidance on this point.

Fair value of employee share options

BC129 The Board spent much time discussing how to measure the fair value of employee share options, including how to take into account common features of employee share options, such as vesting conditions and non-transferability. These discussions focused on measuring fair value at grant date, not only because the Board regarded grant date as the appropriate measurement date for transactions with employees, but also because more measurement issues arise at grant date than at later measurement dates. In reaching its conclusions in ED 2, the Board received assistance from the project's Advisory Group and from a panel of experts. During its redeliberations of the proposals in ED 2, the Board considered comments by respondents and advice received from valuation experts on the FASB's Option Valuation Group.

BC130 Market prices provide the best evidence of the fair value of share options. However, share options with terms and conditions similar to employee share options are seldom traded in the markets. The Board therefore concluded that, if market prices are not available, it will be necessary to apply an option pricing model to estimate the fair value of share options.

BC131 The Board decided that it is not necessary or appropriate to prescribe the precise formula or model to be used for option valuation. There is no particular option pricing model that is regarded as theoretically superior to the others, and there is the risk that any model specified might be superseded by improved methodologies in the future. Entities should select whichever model is most appropriate in the circumstances. For example, many employee share options have long lives, are usually exercisable during the period between vesting date and the end of the option's life, and are often exercised early. These factors should be considered when estimating the grant date fair value of share options. For many entities, this might preclude the use of the Black-Scholes-Merton formula, which does not take into account the possibility of exercise before the end of the share option's life and may not adequately reflect the effects of expected early exercise. This is discussed further below (paragraphs BC160–BC162).

BC132 All option pricing models take into account the following option features:

- the exercise price of the option
- the current market price of the share
- the expected volatility of the share price
- the dividends expected to be paid on the shares
- the rate of interest available in the market
- the term of the option.

BC133 The first two items define the intrinsic value of a share option; the remaining four are relevant to the share option's time value. Expected volatility, dividends and interest rate are all based on expectations over the option term. Therefore, the option term is an important part of calculating time value, because it affects the other inputs.

BC134 One aspect of time value is the value of the right to participate in future gains, if any. The valuation does not attempt to predict what the future gain will be, only the amount that a buyer would pay at the valuation date to obtain the right to participate in any future gains. In other words, option pricing models estimate the value of the share option at the measurement date, not the value of the underlying share at some future date.

BC135 The Board noted that some argue that any estimate of the fair value of a share option is inherently uncertain, because it is not known what the ultimate outcome will be, eg whether the share option will expire worthless or whether the employee (or other party) will make a large gain on exercise. However, the valuation objective is to measure the fair value of the rights granted, not to predict the outcome of having granted those rights. Hence, irrespective of whether the option expires worthless or the employee makes a large gain on exercise, that outcome does not mean that the grant date estimate of the fair value of the option was unreliable or wrong.

BC136 A similar analysis applies to the argument that share options do not have any value until they are in the money, ie the share price is greater than the exercise price. This argument refers to the share option's intrinsic value only. Share options also have a time value, which is why they are traded in the markets at prices greater than their intrinsic value. The option holder has a valuable right to participate in any future increases in the share price. So even share options that are at the money have a value when granted. The subsequent outcome of that option grant, even if it expires worthless, does not change the fact that the share option had a value at grant date.

Application of option pricing models to unlisted and newly listed entities

BC137 As explained above, two of the inputs to an option pricing model are the entity's share price and the expected volatility of its share price. For an unlisted entity, there is no published share price information. The entity would therefore need to estimate the fair value of its shares (eg based on the share price of similar entities that are listed, or on a net assets or earnings basis). It would also need to estimate the expected volatility of that value.

BC138 The Board considered whether unlisted entities should be permitted to use the minimum value method instead of a fair value measurement method. The minimum value method is explained earlier, in paragraphs BC80–BC83. Because it excludes the effects of expected volatility, the minimum value method produces a value that is lower, often much lower, than that produced by methods designed to estimate the fair value of an option. Therefore, the Board discussed how an unlisted entity could estimate expected volatility.

 © IASCF

BC139 An unlisted entity that regularly issues share options or shares to employees (or other parties) might have an internal market for its shares. The volatility of the internal market share prices provides a basis for estimating expected volatility. Alternatively, an entity could use the historical or implied volatility of similar entities that are listed, and for which share price or option price information is available, as the basis for an estimate of expected volatility. This would be appropriate if the entity has estimated the value of its shares by reference to the share prices of these similar listed entities. If the entity has instead used another methodology to value its shares, the entity could derive an estimate of expected volatility consistent with that methodology. For example, the entity might value its shares on the basis of net asset values or earnings, in which case it could use the expected volatility of those net asset values or earnings as a basis for estimating expected share price volatility.

BC140 The Board acknowledged that these approaches for estimating the expected volatility of an unlisted entity's shares are somewhat subjective. However, the Board thought it likely that, in practice, the application of these approaches would result in underestimates of expected volatility, rather than overestimates, because entities were likely to exercise caution in making such estimates, to ensure that the resulting option values are not overstated. Therefore, estimating expected volatility is likely to produce a more reliable measure of the fair value of share options granted by unlisted entities than an alternative valuation method, such as the minimum value method.

BC141 Newly listed entities would not need to estimate their share price. However, like unlisted entities, newly listed entities could have difficulties in estimating expected volatility when valuing share options, because they might not have sufficient historical share price information upon which to base an estimate of expected volatility.

BC142 SFAS 123 requires such entities to consider the historical volatility of similar entities during a comparable period in their lives:

> For example, an entity that has been publicly traded for only one year that grants options with an average expected life of five years might consider the pattern and level of historical volatility of more mature entities in the same industry for the first six years the stock of those entities were publicly traded. (paragraph 285b)

BC143 The Board concluded that, in general, unlisted and newly listed entities should not be exempt from a requirement to apply fair value measurement and that the IFRS should include implementation guidance on estimating expected volatility for the purposes of applying an option pricing model to share options granted by unlisted and newly listed entities.

BC144 However, the Board acknowledged that there might be some instances in which an entity—such as (but not limited to) an unlisted or newly listed entity—cannot estimate reliably the grant date fair value of share options granted. In this situation, the Board concluded that the entity should measure the share option at its intrinsic value, initially at the date the entity obtains the goods or the counterparty renders service and subsequently at each reporting date until the final settlement of the share-based payment arrangement, with the effects of the remeasurement recognised in profit or loss. For a grant of share options, the

share-based payment arrangement is finally settled when the options are exercised, forfeited (eg upon cessation of employment) or lapse (eg at the end of the option's life). For a grant of shares, the share-based payment arrangement is finally settled when the shares vest or are forfeited.

Application of option pricing models to employee share options

BC145 Option pricing models are widely used in, and accepted by, the financial markets. However, there are differences between employee share options and traded share options. The Board considered the valuation implications of these differences, with assistance from its Advisory Group and other experts, including experts in the FASB's Option Valuation Group, and comments made by respondents to ED 2. Employee share options usually differ from traded options in the following ways, which are discussed further below:

(a) there is a vesting period, during which time the share options are not exercisable;

(b) the options are non-transferable;

(c) there are conditions attached to vesting which, if not satisfied, cause the options to be forfeited; and

(d) the option term is significantly longer.

Inability to exercise during the vesting period

BC146 Typically, employee share options have a vesting period, during which the options cannot be exercised. For example, a share option might be granted with a ten-year life and a vesting period of three years, so the option is not exercisable for the first three years and can then be exercised at any time during the remaining seven years. Employee share options cannot be exercised during the vesting period because the employees must first 'pay' for the options, by providing the necessary services. Furthermore, there might be other specified periods during which an employee share option cannot be exercised (eg during a closed period).

BC147 In the finance literature, employee share options are sometimes called Bermudian options, being partly European and partly American. An American share option can be exercised at any time during the option's life, whereas a European share option can be exercised only at the end of the option's life. An American share option is more valuable than a European share option, although the difference in value is not usually significant.

BC148 Therefore, other things being equal, an employee share option would have a higher value than a European share option and a lower value than an American share option, but the difference between the three values is unlikely to be significant.

BC149 If the entity uses the Black-Scholes-Merton formula, or another option pricing model that values European share options, there is no need to adjust the model for the inability to exercise an option in the vesting period (or any other period), because the model already assumes that the option cannot be exercised during that period.

 © IASCF

BC150 If the entity uses an option pricing model that values American share options, such as the binomial model, the inability to exercise an option during the vesting period can be taken into account in applying such a model.

BC151 Although the inability to exercise the share option during the vesting period does not, in itself, have a significant effect on the value of the option, there is still the question whether this restriction has an effect when combined with non-transferability. This is discussed in the following section.

BC152 The Board therefore concluded that:

(a) if the entity uses an option pricing model that values European share options, such as the Black-Scholes-Merton formula, no adjustment is required for the inability to exercise the options during the vesting period, because the model already assumes that they cannot be exercised during that period.

(b) if the entity uses an option pricing model that values American share options, such as a binomial model, the application of the model should take account of the inability to exercise the options during the vesting period.

Non-transferability

BC153 From the option holder's perspective, the inability to transfer a share option limits the opportunities available when the option has some time yet to run and the holder wishes either to terminate the exposure to future price changes or to liquidate the position. For example, the holder might believe that over the remaining term of the share option the share price is more likely to decrease than to increase. Also, employee share option plans typically require employees to exercise vested options within a fixed period of time after the employee leaves the entity, or to forfeit the options.

BC154 In the case of a conventional share option, the holder would sell the option rather than exercise it and then sell the shares. Selling the share option enables the holder to receive the option's fair value, including both its intrinsic value and remaining time value, whereas exercising the option enables the holder to receive intrinsic value only.

BC155 However, the option holder is not able to sell a non-transferable share option. Usually, the only possibility open to the option holder is to exercise it, which entails forgoing the remaining time value. (This is not always true. The use of other derivatives, in effect, to sell or gain protection from future changes in the value of the option is discussed later.)

BC156 At first sight, the inability to transfer a share option could seem irrelevant from the entity's perspective, because the entity must issue shares at the exercise price upon exercise of the option, no matter who holds it. In other words, from the entity's perspective, its commitments under the contract are unaffected by whether the shares are issued to the original option holder or to someone else. Therefore, in valuing the entity's side of the contract, from the entity's perspective, non-transferability seems irrelevant.

© IASCF

BC157 However, the lack of transferability often results in early exercise of the share option, because that is the only way for the employees to liquidate their position. Therefore, by imposing the restriction on transferability, the entity has caused the option holder to exercise the option early, thereby resulting in the loss of time value. For example, one aspect of time value is the value of the right to defer payment of the exercise price until the end of the option term. If the option is exercised early because of non-transferability, the entity receives the exercise price much earlier than it would otherwise have done.

BC158 Non-transferability is not the only reason why employees might exercise share options early. Other reasons include risk aversion, lack of wealth diversification, and termination of employment (typically, employees must exercise vested options soon after termination of employment; otherwise the options are forfeited).

BC159 Recent accounting standards and proposed standards (including ED 2) address the issue of early exercise by requiring the expected life of a non-transferable share option to be used in valuing it, rather than the contractual option term. Expected life can be estimated either for the entire share option plan or for subgroups of employees participating in the plan. The estimate takes into account factors such as the length of the vesting period, the average length of time similar options have remained outstanding in the past and the expected volatility of the underlying shares.

BC160 However, comments from respondents to ED 2 and advice received from valuation experts during the Board's redeliberations led the Board to conclude that using a single expected life as an input into an option pricing model (eg the Black-Scholes-Merton formula) was not the best solution for reflecting in the share option valuation the effects of early exercise. For example, such an approach does not take into account the correlation between the share price and early exercise. It would also mean that the share option valuation does not take into account the possibility that the option might be exercised at a date that is later than the end of its expected life. Therefore, in many instances, a more flexible model, such as a binomial model, that uses the share option's contractual life as an input and takes into account the possibility of early exercise on a range of different dates in the option's life, allowing for factors such as the correlation between the share price and early exercise and expected employee turnover, is likely to produce a more accurate estimate of the option's fair value.

BC161 Binomial lattice and similar option pricing models also have the advantage of permitting the inputs to the model to vary over the share option's life. For example, instead of using a single expected volatility, a binomial lattice or similar option pricing model can allow for the possibility that volatility might change over the share option's life. This would be particularly appropriate when valuing share options granted by entities experiencing higher than usual volatility, because volatility tends to revert to its mean over time.

BC162 For these reasons, the Board considered whether it should require the use of a more flexible model, rather than the more commonly used Black-Scholes-Merton formula. However, the Board concluded that it was not necessary to prohibit the use of the Black-Scholes-Merton formula, because there might be instances in which the formula produces a sufficiently reliable estimate of the fair value of the

 © IASCF

share options granted. For example, if the entity has not granted many share options, the effects of applying a more flexible model might not have a material impact on the entity's financial statements. Also, for share options with relatively short contractual lives, or share options that must be exercised within a short period of time after vesting date, the issues discussed in paragraph BC160 may not be relevant, and hence the Black-Scholes-Merton formula may produce a value that is substantially the same as that produced by a more flexible option pricing model. Therefore, rather than prohibit the use of the Black-Scholes-Merton formula, the Board concluded that the IFRS should include guidance on selecting the most appropriate model to apply. This includes the requirement that the entity should consider factors that knowledgeable, willing market participants would consider in selecting the option pricing model to apply.

BC163 Although non-transferability often results in the early exercise of employee share options, some employees can mitigate the effects of non-transferability, because they are able, in effect, to sell the options or protect themselves from future changes in the value of the options by selling or buying other derivatives. For example, the employee might be able, in effect, to sell an employee share option by entering into an arrangement with an investment bank whereby the employee sells a similar call option to the bank, ie an option with the same exercise price and term. A zero-cost collar is one means of obtaining protection from changes in the value of an employee share option, by selling a call option and buying a put option.

BC164 However, it appears that such arrangements are not always available. For example, the amounts involved have to be sufficiently large to make it worthwhile for the investment bank, which would probably exclude many employees (unless a collective arrangement was made). Also, it appears that investment banks are unlikely to enter into such an arrangement unless the entity is a top listed company, with shares traded in a deep and active market, to enable the investment bank to hedge its own position.

BC165 It would not be feasible to stipulate in an accounting standard that an adjustment to take account of non-transferability is necessary only if the employees cannot mitigate the effects of non-transferability through the use of other derivatives. However, using expected life as an input into an option pricing model, or modelling early exercise in a binomial or similar model, copes with both situations. If employees were able to mitigate the effects of non-transferability by using derivatives, this would often result in the employee share options being exercised later than they would otherwise have been. By taking this factor into account, the estimated fair value of the share option would be higher, which makes sense, given that non-transferability is not a constraint in this case. If the employees cannot mitigate the effects of non-transferability through the use of derivatives, they are likely to exercise the share options much earlier than is optimal. In this case, allowing for the effects of early exercise would significantly reduce the estimated value of the share option.

BC166 This still leaves the question whether there is a need for further adjustment for the combined effect of being unable to exercise or transfer the share option during the vesting period. In other words, the inability to exercise a share option does not, in itself, appear to have a significant effect on its value. But if the share option cannot be transferred and cannot be exercised, and assuming that other derivatives are not available, the holder is unable to extract value from the share option or protect its value during the vesting period.

BC167 However, it should be noted why these restrictions are in place: the employee has not yet 'paid' for the share option by providing the required services (and fulfilling any other performance conditions). The employee cannot exercise or transfer a share option to which he/she is not yet entitled. The share option will either vest or fail to vest, depending on whether the vesting conditions are satisfied. The possibility of forfeiture resulting from failure to fulfil the vesting conditions is taken into account through the application of the modified grant date method (discussed in paragraphs BC170–BC184).

BC168 Moreover, for accounting purposes, the objective is to estimate the fair value of the share option, not the value from the employee's perspective. The fair value of any item depends on the expected amounts, timing, and uncertainty of the future cash flows relating to the item. The share option grant gives the employee the right to subscribe to the entity's shares at the exercise price, provided that the vesting conditions are satisfied and the exercise price is paid during the specified period. The effect of the vesting conditions is considered below. The effect of the share option being non-exercisable during the vesting period has already been considered above, as has the effect of non-transferability. There does not seem to be any additional effect on the expected amounts, timing or uncertainty of the future cash flows arising from the combination of non-exercisability and non-transferability during the vesting period.

BC169 After considering all of the above points, the Board concluded that the effects of early exercise, because of non-transferability and other factors, should be taken into account when estimating the fair value of the share option, either by modelling early exercise in a binomial or similar model, or using expected life rather than contracted life as an input into an option pricing model, such as the Black-Scholes-Merton formula.

Vesting conditions

BC170 Employee share options usually have vesting conditions. The most common condition is that the employee must remain in the entity's employ for a specified period, say three years. If the employee leaves during that period, the options are forfeited. There might also be other performance conditions, eg that the entity achieves a specified growth in share price or earnings.

BC171 Vesting conditions ensure that the employees provide the services required to 'pay' for their share options. For example, the usual reason for imposing service conditions is to retain staff; the usual reason for imposing other performance conditions is to provide an incentive for the employees to work towards specified performance targets.

 © IASCF

BC171A In 2005 the Board decided to take on a project to clarify the definition of vesting conditions and the accounting treatment of cancellations. In particular, the Board noted that it is important to distinguish between non-vesting conditions, which need to be satisfied for the counterparty to become entitled to the equity instrument, and vesting conditions such as performance conditions. In February 2006 the Board published an exposure draft *Vesting Conditions and Cancellations*, which proposed to restrict vesting conditions to service conditions and performance conditions. Those are the only conditions that determine whether *the entity receives the services* that entitle the counterparty to the share-based payment, and therefore whether the share-based payment vests. In particular, a share-based payment may vest even if some non-vesting conditions have not been met. The feature that distinguishes a performance condition from a non-vesting condition is that the former has an explicit or implicit service requirement and the latter does not.

BC171B In general, respondents to the exposure draft agreed with the Board's proposals but asked for clarification of whether particular restrictive conditions, such as 'non-compete provisions', are vesting conditions. The Board noted that a share-based payment vests when the counterparty's entitlement to it is no longer conditional on future service or performance conditions. Therefore, conditions such as non-compete provisions and transfer restrictions, which apply after the counterparty has become entitled to the share-based payment, are not vesting conditions. The Board revised the definition of 'vest' accordingly.

BC172 Some argue that the existence of vesting conditions does not necessarily imply that the value of employee share options is significantly less than the value of traded share options. The employees have to satisfy the vesting conditions to fulfil their side of the arrangement. In other words, the employees' performance of their side of the arrangement is what they do to pay for their share options. Employees do not pay for the options with cash, as do the holders of traded share options; they pay with their services. Having to pay for the share options does not make them less valuable. On the contrary, it proves that the share options are valuable.

BC173 Others argue that the possibility of forfeiture without compensation for part-performance suggests that the share options are less valuable. The employees might partly perform their side of the arrangement, eg by working for part of the period, then have to leave for some reason, and forfeit the share options without compensation for that part performance. If there are other performance conditions, such as achieving a specified growth in the share price or earnings, the employees might work for the entire vesting period, but fail to meet the vesting conditions and therefore forfeit the share options.

BC174 Similarly, some argue that the entity would take into account the possibility of forfeiture when entering into the agreement at grant date. In other words, in deciding how many share options to grant in total, the entity would allow for expected forfeitures. Hence, if the objective is to estimate at grant date the fair value of the entity's commitments under the share option agreement, that valuation should take into account that the entity's commitment to fulfil its side of the option agreement is conditional upon the vesting conditions being satisfied.

BC175 In developing the proposals in ED 2, the Board concluded that the valuation of rights to share options or shares granted to employees (or other parties) should take into account all types of vesting conditions, including both service conditions and performance conditions. In other words, the grant date valuation should be reduced to allow for the possibility of forfeiture due to failure to satisfy the vesting conditions.

BC176 Such a reduction might be achieved by adapting an option pricing model to incorporate vesting conditions. Alternatively, a more simplistic approach might be applied. One such approach is to estimate the possibility of forfeiture at grant date, and reduce the value produced by an option pricing model accordingly. For example, if the valuation calculated using an option pricing model was CU15, and the entity estimated that 20 per cent of the share options would be forfeited because of failure to satisfy the vesting conditions, allowing for the possibility of forfeiture would reduce the grant date value of each option granted from CU15 to CU12.

BC177 The Board decided against proposing detailed guidance on how the grant date value should be adjusted to allow for the possibility of forfeiture. This is consistent with the Board's objective of setting principles-based standards. The measurement objective is to estimate fair value. That objective might not be achieved if detailed, prescriptive rules were specified, which would probably become outdated by future developments in valuation methodologies.

BC178 However, respondents to ED 2 raised a variety of concerns about the inclusion of vesting conditions in the grant date valuation. Some respondents were concerned about the practicality and subjectivity of including non-market performance conditions in the share option valuation. Some were also concerned about the practicality of including service conditions in the grant date valuation, particularly in conjunction with the units of service method proposed in ED 2 (discussed further in paragraphs BC203–BC217).

BC179 Some respondents suggested the alternative approach applied in SFAS 123, referred to as the modified grant date method. Under this method, service conditions and non-market performance conditions are excluded from the grant date valuation (ie the possibility of forfeiture is not taken into account when estimating the grant date fair value of the share options or other equity instruments, thereby producing a higher grant date fair value), but are instead taken into account by requiring the transaction amount to be based on the number of equity instruments that eventually vest. Under this method, on a cumulative basis, no amount is recognised for goods or services received if the equity instruments granted do not vest because of failure to satisfy a vesting condition (other than a market condition), eg the counterparty fails to complete a specified service period, or a performance condition (other than a market condition) is not satisfied.

BC180 After considering respondents' comments and obtaining further advice from valuation experts, the Board decided to adopt the modified grant date method applied in SFAS 123. However, the Board decided that it should not permit the choice available in SFAS 123 to account for the effects of expected or actual forfeitures of share options or other equity instruments because of failure to satisfy a service condition. For a grant of equity instruments with a service

 © IASCF

condition, SFAS 123 permits an entity to choose at grant date to recognise the services received based on an estimate of the number of share options or other equity instruments expected to vest, and to revise that estimate, if necessary, if subsequent information indicates that actual forfeitures are likely to differ from previous estimates. Alternatively, an entity may begin recognising the services received as if all the equity instruments granted that are subject to a service requirement are expected to vest. The effects of forfeitures are then recognised when those forfeitures occur, by reversing any amounts previously recognised for services received as consideration for equity instruments that are forfeited.

BC181 The Board decided that the latter method should not be permitted. Given that the transaction amount is ultimately based on the number of equity instruments that vest, it is appropriate to estimate the number of expected forfeitures when recognising the services received during the vesting period. Furthermore, by ignoring expected forfeitures until those forfeitures occur, the effects of reversing any amounts previously recognised might result in a distortion of remuneration expense recognised during the vesting period. For example, an entity that experiences a high level of forfeitures might recognise a large amount of remuneration expense in one period, which is then reversed in a later period.

BC182 Therefore, the Board decided that the IFRS should require an entity to estimate the number of equity instruments expected to vest and to revise that estimate, if necessary, if subsequent information indicates that actual forfeitures are likely to differ from previous estimates.

BC183 Under SFAS 123, market conditions (eg a condition involving a target share price, or specified amount of intrinsic value on which vesting or exercisability is conditioned) are included in the grant date valuation, without subsequent reversal. That is to say, when estimating the fair value of the equity instruments at grant date, the entity takes into account the possibility that the market condition may not be satisfied. Having allowed for that possibility in the grant date valuation of the equity instruments, no adjustment is made to the number of equity instruments included in the calculation of the transaction amount, irrespective of the outcome of the market condition. In other words, the entity recognises the goods or services received from a counterparty that satisfies all other vesting conditions (eg services received from an employee who remains in service for the specified service period), irrespective of whether that market condition is satisfied. The treatment of market conditions therefore contrasts with the treatment of other types of vesting conditions. As explained in paragraph BC179, under the modified grant date method, vesting conditions are not taken into account when estimating the fair value of the equity instruments at grant date, but are instead taken into account by requiring the transaction amount to be based on the number of equity instruments that eventually vest.

BC184 The Board considered whether it should apply the same approach to market conditions as is applied in SFAS 123. It might be argued that it is not appropriate to distinguish between market conditions and other types of performance conditions, because to do so could create opportunities for arbitrage, or cause an economic distortion by encouraging entities to favour one type of performance condition over another. However, the Board noted that it is not clear what the result would be. On the one hand, some entities might prefer the ‘truing up’ aspect of the modified grant date method, because it permits a reversal of

remuneration expense if the condition is not met. On the other hand, if the performance condition is met, and it has not been incorporated into the grant date valuation (as is the case when the modified grant date method is used), the expense will be higher than it would otherwise have been (ie if the performance condition had been incorporated into the grant date valuation). Furthermore, some entities might prefer to avoid the potential volatility caused by the truing up mechanism. Therefore, it is not clear whether having a different treatment for market and non-market performance conditions will necessarily cause entities to favour market conditions over non-market performance conditions, or vice versa. Furthermore, the practical difficulties that led the Board to conclude that non-market performance conditions should be dealt with via the modified grant date method rather than being included in the grant date valuation do not apply to market conditions, because market conditions can be incorporated into option pricing models. Moreover, it is difficult to distinguish between market conditions, such as a target share price, and the market condition that is inherent in the option itself, ie that the option will be exercised only if the share price on the date of exercise exceeds the exercise price. For these reasons, the Board concluded that the IFRS should apply the same approach as is applied in SFAS 123.

Option term

BC185 Employee share options often have a long contractual life, eg ten years. Traded options typically have short lives, often only a few months. Estimating the inputs required by an option pricing model, such as expected volatility, over long periods can be difficult, giving rise to the possibility of significant estimation error. This is not usually a problem with traded share options, given their much shorter lives.

BC186 However, some share options traded over the counter have long lives, such as ten or fifteen years. Option pricing models are used to value them. Therefore, contrary to the argument sometimes advanced, option pricing models can be (and are being) applied to long-lived share options.

BC187 Moreover, the potential for estimation error is mitigated by using a binomial or similar model that allows for changes in model inputs over the share option's life, such as expected volatility, and interest and dividend rates, that could occur and the probability of those changes occurring during the term of the share option. The potential for estimation error is further mitigated by taking into account the possibility of early exercise, either by using expected life rather than contracted life as an input into an option pricing model or by modelling exercise behaviour in a binomial or similar model, because this reduces the expected term of the share option. Because employees often exercise their share options relatively early in the share option's life, the expected term is usually much shorter than contracted life.

Other features of employee share options

BC188 Whilst the features discussed above are common to most employee share options, some might include other features. For example, some share options have a reload feature. This entitles the employee to automatic grants of additional share options whenever he/she exercises previously granted share options and pays the exercise price in the entity's shares rather than in cash. Typically, the employee

 © IASCF

is granted a new share option, called a reload option, for each share surrendered when exercising the previous share option. The exercise price of the reload option is usually set at the market price of the shares on the date the reload option is granted.

BC189 When SFAS 123 was developed, the FASB concluded that, ideally, the value of the reload feature should be included in the valuation of the original share option at grant date. However, at that time the FASB believed that it was not possible to do so. Accordingly, SFAS 123 does not require the reload feature to be included in the grant date valuation of the original share option. Instead, reload options granted upon exercise of the original share options are accounted for as a new share option grant.

BC190 However, recent academic research indicates that it is possible to value the reload feature at grant date, eg Saly, Jagannathan and Huddart (1999).* However, if significant uncertainties exist, such as the number and timing of expected grants of reload options, it might not be practicable to include the reload feature in the grant date valuation.

BC191 When it developed ED 2, the Board concluded that the reload feature should be taken into account, where practicable, when measuring the fair value of the share options granted. However, if the reload feature was not taken into account, then when the reload option is granted, it should be accounted for as a new share option grant.

BC192 Many respondents to ED 2 agreed with the proposals in ED 2. However, some disagreed. For example, some disagreed with there being a choice of treatments. Some respondents supported always treating reload options granted as new grants whereas others supported always including the reload feature in the grant date valuation. Some expressed concerns about the practicality of including the reload feature in the grant date valuation. After reconsidering this issue, the Board concluded that the reload feature should not be included in the grant date valuation and therefore all reload options granted should be accounted for as new share option grants.

BC193 There may be other features of employee (and other) share options that the Board has not yet considered. But even if the Board were to consider every conceivable feature of employee (and other) share options that exist at present, new features might be developed in the future.

BC194 The Board therefore concluded that the IFRS should focus on setting out clear principles to be applied to share-based payment transactions, and provide guidance on the more common features of employee share options, but should not prescribe extensive application guidance, which would be likely to become outdated.

BC195 Nevertheless, the Board considered whether there are share options with such unusual or complex features that it is too difficult to make a reliable estimate of their fair value and, if so, what the accounting treatment should be.

---

* P J Saly, R Jagannathan and S J Huddart. 1999. Valuing the Reload Features of Executive Stock Options. *Accounting Horizons* 13 (3): 219–240.

BC196 SFAS 123 states that 'it should be possible to reasonably estimate the fair value of most stock options and other equity instruments at the date they are granted' (paragraph 21). However, it states that, 'in unusual circumstances, the terms of the stock option or other equity instrument may make it virtually impossible to reasonably estimate the instrument's fair value at the date it is granted'. The standard requires that, in such situations, measurement should be delayed until it is possible to estimate reasonably the instrument's fair value. It notes that this is likely to be the date at which the number of shares to which the employee is entitled and the exercise price are determinable. This could be vesting date. The standard requires that estimates of compensation expense for earlier periods (ie until it is possible to estimate fair value) should be based on current intrinsic value.

BC197 The Board thought it unlikely that entities could not reasonably determine the fair value of share options at grant date, particularly after excluding vesting conditions* and reload features from the grant date valuation. The share options form part of the employee's remuneration package, and it seems reasonable to presume that an entity's management would consider the value of the share options to satisfy itself that the employee's remuneration package is fair and reasonable.

BC198 When it developed ED 2, the Board concluded that there should be no exceptions to the requirement to apply a fair value measurement basis, and therefore it was not necessary to include in the proposed IFRS specific accounting requirements for share options that are difficult to value.

BC199 However, after considering respondents' comments, particularly with regard to unlisted entities, the Board reconsidered this issue. The Board concluded that, in rare cases only, in which the entity could not estimate reliably the grant date fair value of the equity instruments granted, the entity should measure the equity instruments at intrinsic value, initially at grant date and subsequently at each reporting date until the final settlement of the share-based payment arrangement, with the effects of the remeasurement recognised in profit or loss. For a grant of share options, the share-based payment arrangement is finally settled when the share options are exercised, are forfeited (eg upon cessation of employment) or lapse (eg at the end of the option's life). For a grant of shares, the share-based payment arrangement is finally settled when the shares vest or are forfeited. This requirement would apply to all entities, including listed and unlisted entities.

Recognition and measurement of services received in an equity-settled share-based payment transaction

During the vesting period

BC200 In an equity-settled share-based payment transaction, the accounting objective is to recognise the goods or services received as consideration for the entity's equity instruments, measured at the fair value of those goods or services when received. For transactions in which the entity receives employee services, it is often difficult

* ie vesting conditions other than market conditions.

 © IASCF

to measure directly the fair value of the services received. In this case, the Board concluded that the fair value of the equity instruments granted should be used as a surrogate measure of the fair value of the services received. This raises the question how to use that surrogate measure to derive an amount to attribute to the services received. Another related question is how the entity should determine when the services are received.

BC201 Starting with the latter question, some argue that shares or share options are often granted to employees for past services rather than future services, or mostly for past services, irrespective of whether the employees are required to continue working for the entity for a specified future period before their rights to those shares or share options vest. Conversely, some argue that shares or share options granted provide a future incentive to the employees and those incentive effects continue after vesting date, which implies that the entity receives services from employees during a period that extends beyond vesting date. For share options in particular, some argue that employees render services beyond vesting date, because employees are able to benefit from an option's time value between vesting date and exercise date only if they continue to work for the entity (since usually a departing employee must exercise the share options within a short period, otherwise they are forfeited).

BC202 However, the Board concluded that if the employees are required to complete a specified service period to become entitled to the shares or share options, this requirement provides the best evidence of when the employees render services in return for the shares or share options. Consequently, the Board concluded that the entity should presume that the services are received during the vesting period. If the shares or share options vest immediately, it should be presumed that the entity has already received the services, in the absence of evidence to the contrary. An example of when immediately vested shares or share options are not for past services is when the employee concerned has only recently begun working for the entity, and the shares or share options are granted as a signing bonus. But in this situation, it might nevertheless be necessary to recognise an expense immediately, if the future employee services do not meet the definition of an asset.

BC203 Returning to the first question in paragraph BC200, when the Board developed ED 2 it developed an approach whereby the fair value of the shares or share options granted, measured at grant date and allowing for all vesting conditions, is divided by the number of units of service expected to be received to determine the deemed fair value of each unit of service subsequently received.

BC204 For example, suppose that the fair value of share options granted, before taking into account the possibility of forfeiture, is CU750,000. Suppose that the entity estimates the possibility of forfeiture because of failure of the employees to complete the required three-year period of service is 20 per cent (based on a weighted average probability), and hence it estimates the fair value of the options granted at CU600,000 (CU750,000 × 80%). The entity expects to receive 1,350 units of service over the three-year vesting period.

BC205 Under the units of service method proposed in ED 2, the deemed fair value per unit of service subsequently received is CU444.44 (CU600,000/1,350). If everything turns out as expected, the amount recognised for services received is CU600,000 (CU444.44 × 1,350).

BC206 This approach is based on the presumption that there is a fairly bargained contract at grant date. Thus the entity has granted share options valued at CU600,000 and expects to receive services valued at CU600,000 in return. It does not expect all share options granted to vest because it does not expect all employees to complete three years' service. Expectations of forfeiture because of employee departures are taken into account when estimating the fair value of the share options granted, and when determining the fair value of the services to be received in return.

BC207 Under the units of service method, the amount recognised for services received during the vesting period might exceed CU600,000, if the entity receives more services than expected. This is because the objective is to account for the services subsequently received, not the fair value of the share options granted. In other words, the objective is not to estimate the fair value of the share options granted and then spread that amount over the vesting period. Rather, the objective is to account for the services subsequently received, because it is the receipt of those services that causes a change in net assets and hence a change in equity. Because of the practical difficulty of valuing those services directly, the fair value of the share options granted is used as a surrogate measure to determine the fair value of each unit of service subsequently received, and therefore the transaction amount is dependent upon the number of units of service actually received. If more are received than expected, the transaction amount will be greater than CU600,000. If fewer services are received, the transaction amount will be less than CU600,000.

BC208 Hence, a grant date measurement method is used as a practical expedient to achieve the accounting objective, which is to account for the services actually received in the vesting period. The Board noted that many who support grant date measurement do so for reasons that focus on the entity's commitments under the contract, not the services received. They take the view that the entity has conveyed to its employees valuable equity instruments at grant date and that the accounting objective should be to account for the equity instruments conveyed. Similarly, supporters of vesting date measurement argue that the entity does not convey valuable equity instruments to the employees until vesting date, and that the accounting objective should be to account for the equity instruments conveyed at vesting date. Supporters of exercise date measurement argue that, ultimately, the valuable equity instruments conveyed by the entity to the employees are the shares issued on exercise date and the objective should be to account for the value given up by the entity by issuing equity instruments at less than their fair value.

BC209 Hence all of these arguments for various measurement dates are focused entirely on what the entity (or its shareholders) has given up under the share-based payment arrangement, and accounting for that sacrifice. Therefore, if 'grant date measurement' were applied as a matter of principle, the primary objective would be to account for the value of the rights granted. Depending on whether the services have already been received and whether a prepayment for services to be

 © IASCF

received in the future meets the definition of an asset, the other side of the transaction would either be recognised as an expense at grant date, or capitalised as a prepayment and amortised over some period of time, such as over the vesting period or over the expected life of the share option. Under this view of grant date measurement, there would be no subsequent adjustment for actual outcomes. No matter how many share options vest or how many share options are exercised, that does not change the value of the rights given to the employees at grant date.

BC210 Therefore, the reason why some support grant date measurement differs from the reason why the Board concluded that the fair value of the equity instruments granted should be measured at grant date. This means that some will have different views about the consequences of applying grant date measurement. Because the units of service method is based on using the fair value of the equity instruments granted, measured at grant date, as a surrogate measure of the fair value of the services received, the total transaction amount is dependent upon the number of units of service received.

BC211 Some respondents to ED 2 disagreed with the units of service method in principle, because they did not accept that the fair value of the services received should be the accounting focus. Rather, the respondents focused on accounting for the 'cost' of the equity instruments issued (ie the credit side of the transaction rather than the debit side), and took the view that if the share options or shares are forfeited, no cost was incurred, and thus any amounts recognised previously should be reversed, as would happen with a cash-settled transaction.

BC212 Some respondents also disagreed with the treatment of performance conditions under the units of service method, because if the employee completes the required service period but the equity instruments do not vest because of the performance condition not being satisfied, there is no reversal of amounts recognised during the vesting period. Some argue that this result is unreasonable because, if the performance condition is not satisfied, then the employee did not perform as required, hence it is inappropriate to recognise an expense for services received or consumed, because the entity did not receive the specified services.

BC213 The Board considered and rejected the above arguments made against the units of service method in principle. For example, the Board noted that the objective of accounting for the services received, rather than the cost of the equity instruments issued, is consistent with the accounting treatment of other issues of equity instruments, and with the IASB *Framework*. With regard to performance conditions, the Board noted that the strength of the argument in paragraph BC212 depends on the extent to which the employee has control or influence over the achievement of the performance target. One cannot necessarily conclude that the non-attainment of the performance target is a good indication that the employee has failed to perform his/her side of the arrangement (ie failed to provide services).

BC214 Therefore, the Board was not persuaded by those respondents who disagreed with the units of service method in principle. However, the Board also noted that some respondents raised practical concerns about the method. Some respondents regarded the units of service method as too complex and burdensome to apply in practice. For example, if an entity granted share options to a group of employees but did not grant the same number of share options to each employee (eg the

number might vary according to their salary or position in the entity), it would be necessary to calculate a different deemed fair value per unit of service for each individual employee (or for each subgroup of employees, if there are groups of employees who each received the same number of options). Then the entity would have to track each employee, to calculate the amount to recognise for each employee. Furthermore, in some circumstances, an employee share or share option scheme might not require the employee to forfeit the shares or share options if the employee leaves during the vesting period in specified circumstances. Under the terms of some schemes, employees can retain their share options or shares if they are classified as a 'good leaver', eg a departure resulting from circumstances not within the employee's control, such as compulsory retirement, ill health or redundancy. Therefore, in estimating the possibility of forfeiture, it is not simply a matter of estimating the possibility of employee departure during the vesting period. It is also necessary to estimate whether those departures will be 'good leavers' or 'bad leavers'. And because the share options or shares will vest upon departure of 'good leavers', the expected number of units to be received and the expected length of the vesting period will be shorter for this group of employees. These factors would need to be incorporated into the application of the units of service method.

BC215 Some respondents also raised practical concerns about applying the units of service method to grants with performance conditions. These concerns include the difficulty of incorporating non-market and complex performance conditions into the grant date valuation, the additional subjectivity that this introduces, and that it was unclear how to apply the method when the length of the vesting period is not fixed, because it depends on when a performance condition is satisfied.

BC216 The Board considered the practical concerns raised by respondents, and obtained further advice from valuation experts concerning the difficulties highlighted by respondents of including non-market performance conditions in the grant date valuation. Because of these practical considerations, the Board concluded that the units of service method should not be retained in the IFRS. Instead, the Board decided to adopt the modified grant date method applied in SFAS 123. Under this method, service conditions and non-market performance conditions are excluded from the grant date valuation (ie the possibility of forfeiture is not taken into account when estimating the grant date fair value of the share options or other equity instruments, thereby producing a higher grant date fair value), but are instead taken into account by requiring that the transaction amount be based on the number of equity instruments that eventually vest.* Under this method, on a cumulative basis, no amount is recognised for goods or services received if the equity instruments granted do not vest because of failure to satisfy a vesting condition (other than a market condition), eg the counterparty fails to complete a specified service period, or a performance condition (other than a market condition) is not satisfied.

* The treatment of market conditions is discussed in paragraphs BC183 and BC184. As noted in paragraph BC184, the practical difficulties that led the Board to conclude that non-market conditions should be dealt with via the modified grant date method rather than being included in the grant date valuation do not apply to market conditions, because market conditions can be incorporated into option pricing models.

 © IASCF

BC217 However, as discussed earlier (paragraphs BC180–BC182), the Board decided that it should not permit the choice available in SFAS 123 to account for the effects of expected or actual forfeitures of share options or other equity instruments because of failure to satisfy a service condition. The Board decided that the IFRS should require an entity to estimate the number of equity instruments expected to vest and to revise that estimate, if necessary, if subsequent information indicates that actual forfeitures are likely to differ from previous estimates.

Share options that are forfeited or lapse after the end of the vesting period

BC218 Some share options might not be exercised. For example, a share option holder is unlikely to exercise a share option if the share price is below the exercise price throughout the exercise period. Once the last date for exercise is passed, the share option will lapse.

BC219 The lapse of a share option at the end of the exercise period does not change the fact that the original transaction occurred, ie goods or services were received as consideration for the issue of an equity instrument (the share option). The lapsing of the share option does not represent a gain to the entity, because there is no change to the entity's net assets. In other words, although some might see such an event as being a benefit to the remaining shareholders, it has no effect on the entity's financial position. In effect, one type of equity interest (the share option holders' interest) becomes part of another type of equity interest (the shareholders' interest). The Board therefore concluded that the only accounting entry that might be required is a movement within equity, to reflect that the share options are no longer outstanding (ie as a transfer from one type of equity interest to another).

BC220 This is consistent with the treatment of other equity instruments, such as warrants issued for cash. When warrants subsequently lapse unexercised, this is not treated as a gain; instead the amount previously recognised when the warrants were issued remains within equity.*

BC221 The same analysis applies to equity instruments that are forfeited after the end of the vesting period. For example, an employee with vested share options typically must exercise those options within a short period after cessation of employment, otherwise the options are forfeited. If the share options are not in the money, the employee is unlikely to exercise the options and hence they will be forfeited. For the same reasons as are given in paragraph BC219, no adjustment is made to the amounts previously recognised for services received as consideration for the share options. The only accounting entry that might be required is a movement within equity, to reflect that the share options are no longer outstanding.

* However, an alternative approach is followed in some jurisdictions (eg Japan and the UK), where the entity recognises a gain when warrants lapse. But under the *Framework*, recognising a gain on the lapse of warrants would be appropriate only if warrants were liabilities, which they are not.

Modifications to the terms and conditions of share-based payment arrangements

BC222 An entity might modify the terms of or conditions under which the equity instruments were granted. For example, the entity might reduce the exercise price of share options granted to employees (ie reprice the options), which increases the fair value of those options. During the development of ED 2, the Board focused mainly on the repricing of share options.

BC223 The Board noted that the IASC/G4+1 Discussion Paper argued that if the entity reprices its share options it has, in effect, replaced the original share option with a more valuable share option. The entity presumably believes that it will receive an equivalent amount of benefit from doing so, because otherwise the directors would not be acting in the best interests of the entity or its shareholders. This suggests that the entity expects to receive additional or enhanced employee services equivalent in value to the incremental value of the repriced share options. The Discussion Paper therefore proposed that the incremental value given (ie the difference between the value of the original share option and the value of the repriced share option, as at the date of repricing) should be recognised as additional remuneration expense. Although the Discussion Paper discussed repricing in the context of vesting date measurement, SFAS 123, which applies a grant date measurement basis for employee share-based payment, contains reasoning similar to that in the Discussion Paper.

BC224 This reasoning seems appropriate if grant date measurement is applied on the grounds that the entity made a payment to the employees on grant date by granting them valuable rights to equity instruments of the entity. If the entity is prepared to replace that payment with a more valuable payment, it must believe it will receive an equivalent amount of benefit from doing so.

BC225 The same conclusion is drawn if grant date measurement is applied on the grounds that some type of equity interest is created at grant date, and thereafter changes in the value of that equity interest accrue to the option holders as equity participants, not as employees. Repricing is inconsistent with the view that share option holders bear changes in value as equity participants. Hence it follows that the incremental value has been granted to the share option holders in their capacity as employees (rather than equity participants), as part of their remuneration for services to the entity. Therefore additional remuneration expense arises in respect of the incremental value given.

BC226 It could be argued that if (a) grant date measurement is used as a surrogate measure of the fair value of the services received and (b) the repricing occurs between grant date and vesting date and (c) the repricing merely restores the share option's original value at grant date, then the entity may not receive additional services. Rather, the repricing might simply be a means of ensuring that the entity receives the services it originally expected to receive when the share options were granted. Under this view, it is not appropriate to recognise additional remuneration expense to the extent that the repricing restores the share option's original value at grant date.

 © IASCF

BC227 Some argue that the effect of a repricing is to create a new deal between the entity and its employees, and therefore the entity should estimate the fair value of the repriced share options at the date of repricing to calculate a new measure of the fair value of the services received subsequent to repricing. Under this view, the entity would cease using the grant date fair value of the share options when measuring services received after the repricing date, but without reversal of amounts recognised previously. The entity would then measure the services received between the date of repricing and the end of the vesting period by reference to the fair value of the modified share options, measured at the date of repricing. If the repricing occurs after the end of the vesting period, the same process applies. That is to say, there is no adjustment to previously recognised amounts, and the entity recognises—either immediately or over the vesting period, depending on whether the employees are required to complete an additional period of service to become entitled to the repriced share options—an amount equal to the fair value of the modified share options, measured at the date of repricing.

BC228 In the context of measuring the fair value of the equity instruments as a surrogate measure of the fair value of the services received, after considering the above points, the Board concluded when it developed ED 2 that the incremental value granted on repricing should be taken into account when measuring the services received, because:

(a) there is an underlying presumption that the fair value of the equity instruments, at grant date, provides a surrogate measure of the fair value of the services received. That fair value is based on the share option's original terms and conditions. Therefore, if those terms or conditions are modified, the modification should be taken into account when measuring the services received.

(b) a share option that will be repriced if the share price falls is more valuable than one that will not be repriced. Therefore, by presuming at grant date that the share option will not be repriced, the entity underestimated the fair value of that option. The Board concluded that, because it is impractical to include the possibility of repricing in the estimate of fair value at grant date, the incremental value granted on repricing should be taken into account as and when the repricing occurs.

BC229 Many of the respondents to ED 2 who addressed the issue of repricing agreed with the proposed requirements. After considering respondents' comments, the Board decided to retain the approach to repricing as proposed in ED 2, ie recognise the incremental value granted on repricing, in addition to continuing to recognise amounts based on the fair value of the original grant.

BC230 The Board also discussed situations in which repricing might be effected by cancelling share options and issuing replacement share options. For example, suppose an entity grants at-the-money share options with an estimated fair value of CU20 each. Suppose the share price falls, so that the share options become significantly out of the money, and are now worth CU2 each. Suppose the entity is considering repricing, so that the share options are again at the money, which

would result in them being worth, say, CU10 each. (Note that the share options are still worth less than at grant date, because the share price is now lower. Other things being equal, an at-the-money option on a low priced share is worth less than an at-the-money option on a high priced share.)

BC231 Under ED 2's proposed treatment of repricing, the incremental value given on repricing (CU10 − CU2 = CU8 increment in fair value per share option) would be accounted for when measuring the services rendered, resulting in the recognition of additional expense, ie additional to any amounts recognised in the future in respect of the original share option grant (valued at CU20). If the entity instead cancelled the existing share options and then issued what were, in effect, replacement share options, but treated the replacement share options as a new share option grant, this could reduce the expense recognised. Although the new grant would be valued at CU10 rather than incremental value of CU8, the entity would not recognise any further expense in respect of the original share option grant, valued at CU20. Although some regard such a result as appropriate (and consistent with their views on repricing, as explained in paragraph BC227), it is inconsistent with the Board's treatment of repricing.

BC232 By this means, the entity could, in effect, reduce its remuneration expense if the share price falls, without having to increase the expense if the share price rises (because no repricing would be necessary in this case). In other words, the entity could structure a repricing so as to achieve a form of service date measurement if the share price falls and grant date measurement if the share price rises, ie an asymmetrical treatment of share price changes.

BC233 When it developed ED 2, the Board concluded that if an entity cancels a share or share option grant during the vesting period (other than cancellations because of employees' failing to satisfy the vesting conditions), it should nevertheless continue to account for services received, as if that share or share option grant had not been cancelled. In the Board's view, it is very unlikely that a share or share option grant would be cancelled without some compensation to the counterparty, either in the form of cash or replacement share options. Moreover, the Board saw no difference between a repricing of share options and a cancellation of share options followed by the granting of replacement share options at a lower exercise price, and therefore concluded that the accounting treatment should be the same. If cash is paid on the cancellation of the share or share option grant, the Board concluded that the payment should be accounted for as the repurchase of an equity interest, ie as a deduction from equity.

BC234 The Board noted that its proposed treatment means that an entity would continue to recognise services received during the remainder of the original vesting period, even though the entity might have paid cash compensation to the counterparty upon cancellation of the share or share option grant. The Board discussed an alternative approach applied in SFAS 123: if an entity settles unvested shares or share options in cash, those shares or share options are treated as having immediately vested. The entity is required to recognise immediately an expense for the amount of compensation expense that would otherwise have been recognised during the remainder of the original vesting period. Although the Board would have preferred to adopt this approach, it would have been

 © IASCF

difficult to apply in the context of the proposed accounting method in ED 2, given that there is not a specific amount of unrecognised compensation expense—the amount recognised in the future would have depended on the number of units of service received in the future.

BC235 Many respondents who commented on the treatment of cancellations disagreed with the proposals in ED 2. They commented that it was inappropriate to continue recognising an expense after a grant has been cancelled. Some suggested other approaches, including the approach applied in SFAS 123. After considering these comments, and given that the Board had decided to replace the units of service method with the modified grant date method in SFAS 123, the Board concluded that it should adopt the same approach as applied in SFAS 123 to cancellations and settlements. Under SFAS 123, a settlement (including a cancellation) is regarded as resulting in the immediate vesting of the equity instruments. The amount of remuneration expense measured at grant date but not yet recognised is recognised immediately at the date of settlement or cancellation.

BC236 In addition to the above issues, during its redeliberation of the proposals in ED 2 the Board also considered more detailed issues relating to modifications and cancellations. Specifically, the Board considered:

(a) a modification that results in a decrease in fair value (ie the fair value of the modified instrument is less than the fair value of the original instrument, measured at the date of the modification).

(b) a change in the number of equity instruments granted (increase and decrease).

(c) a change in services conditions, thereby changing the length of the vesting period (increase and decrease).

(d) a change in performance conditions, thereby changing the probability of vesting (increase and decrease).

(e) a change in the classification of the grant, from equity to liabilities.

BC237 The Board concluded that having adopted a grant date measurement method, the requirements for modifications and cancellations should ensure that the entity cannot, by modifying or cancelling the grant of shares or share options, avoid recognising remuneration expense based on the grant date fair values. Therefore, the Board concluded that, for arrangements that are classified as equity-settled arrangements (at least initially), the entity must recognise the grant date fair value of the equity instruments over the vesting period, unless the employee fails to vest in those equity instruments under the terms of the original vesting conditions.

BC237A During the deliberations of its proposals in the exposure draft *Vesting Conditions and Cancellations* published in February 2006, the Board considered how failure to meet a non-vesting condition should be treated. The Board concluded that in order to be consistent with the grant date measurement method, failure to meet a non-vesting condition should have no accounting effect when neither the entity nor the counterparty can choose whether that condition is met. The entity should continue to recognise the expense, based on the grant date fair value, over the vesting period unless the employee fails to meet a vesting condition.

BC237B However, the Board concluded that the entity's failure to meet a non-vesting condition is a cancellation if the entity can choose whether that non-vesting condition is met. Furthermore, the Board noted that no non-arbitrary or unambiguous criteria exist to distinguish between a decision by the counterparty not to meet a non-vesting condition and a cancellation by the entity. The Board considered establishing a rebuttable presumption that a counterparty's failure to meet a non-vesting condition is (or is not) a cancellation, unless it can be demonstrated that the entity had no (or had some) influence over the counterparty's decision. The Board did not believe that the information about the entity's decision-making processes that is publicly available would be sufficient to determine whether the presumption has been rebutted. Therefore, the Board concluded that a failure to meet a non-vesting condition should be treated as a cancellation when either the entity or the counterparty can choose whether that non-vesting condition is met.

Share appreciation rights settled in cash

BC238 Some transactions are 'share-based', even though they do not involve the issue of shares, share options or any other form of equity instrument. Share appreciation rights (SARs) settled in cash are transactions in which the amount of cash paid to the employee (or another party) is based upon the increase in the share price over a specified period, usually subject to vesting conditions, such as the employee's remaining with the entity during the specified period. (Note that the following discussion focuses on SARs granted to employees, but also applies to SARs granted to other parties.)

BC239 In terms of accounting concepts, share-based payment transactions involving an outflow of cash (or other assets) are different from transactions in which goods or services are received as consideration for the issue of equity instruments.

BC240 In an equity-settled transaction, only one side of the transaction causes a change in assets, ie an asset (services) is received but no assets are disbursed. The other side of the transaction increases equity; it does not cause a change in assets. Accordingly, not only is it not necessary to remeasure the transaction amount upon settlement, it is not appropriate, because equity interests are not remeasured.

BC241 In contrast, in a cash-settled transaction, both sides of the transaction cause a change in assets, ie an asset (services) is received and an asset (cash) is ultimately disbursed. Therefore, no matter what value is attributed to the first asset (services received), eventually it will be necessary to recognise the change in assets when the second asset (cash) is disbursed. Thus, no matter how the transaction is accounted for between the receipt of services and the settlement in cash, it will be 'trued up' to equal the amount of cash paid out, to account for both changes in assets.

BC242 Because cash-settled SARs involve an outflow of cash (rather than the issue of equity instruments) cash SARs should be accounted for in accordance with the usual accounting for similar liabilities. That sounds straightforward, but there are some questions to consider:

 © IASCF

(a) should a liability be recognised before vesting date, ie before the employees have fulfilled the conditions to become unconditionally entitled to the cash payment?

(b) if so, how should that liability be measured?

(c) how should the expense be presented in the income statement?

Is there a liability before vesting date?

BC243 It could be argued that the entity does not have a liability until vesting date, because the entity does not have a present obligation to pay cash to the employees until the employees fulfil the conditions to become unconditionally entitled to the cash; between grant date and vesting date there is only a contingent liability.

BC244 The Board noted that this argument applies to all sorts of employee benefits settled in cash, not just SARs. For example, it could be argued that an entity has no liability for pension payments to employees until the employees have met the specified vesting conditions. This argument was considered by IASC in IAS 19 *Employee Benefits*. The Basis for Conclusions states:

> Paragraph 54 of the new IAS 19 summarises the recognition and measurement of liabilities arising from defined benefit plans ... Paragraph 54 of the new IAS 19 is based on the definition of, and recognition criteria for, a liability in IASC's *Framework* ... The Board believes that an enterprise has an obligation under a defined benefit plan when an employee has rendered service in return for the benefits promised under the plan ... The Board believes that an obligation exists even if a benefit is not vested, in other words if the employee's right to receive the benefit is conditional upon future employment. For example, consider an enterprise that provides a benefit of 100 to employees who remain in service for two years. At the end of the first year, the employee and the enterprise are not in the same position as at the beginning of the first year, because the employee will only need to work for one year, instead of two, before becoming entitled to the benefit. Although there is a possibility that the benefit may not vest, that difference is an obligation and, in the Board's view, should result in the recognition of a liability at the end of the first year. The measurement of that obligation at its present value reflects the enterprise's best estimate of the probability that the benefit may not vest. (IAS 19, Basis for Conclusions, paragraphs BC11–BC14)

BC245 Therefore, the Board concluded that, to be consistent with IAS 19, which covers other cash-settled employee benefits, a liability should be recognised in respect of cash-settled SARs during the vesting period, as services are rendered by the employees. Thus, no matter how the liability is measured, the Board concluded that it should be accrued over the vesting period, to the extent that the employees have performed their side of the arrangement. For example, if the terms of the arrangement require the employees to perform services over a three-year period, the liability would be accrued over that three-year period, consistently with the treatment of other cash-settled employee benefits.

How should the liability be measured?

BC246 A simple approach would be to base the accrual on the entity's share price at the end of each reporting period. If the entity's share price increased over the vesting period, expenses would be larger in later reporting periods compared with earlier reporting periods. This is because each reporting period will include the effects

of (a) an increase in the liability in respect of the employee services received during that reporting period and (b) an increase in the liability attributable to the increase in the entity's share price during the reporting period, which increases the amount payable in respect of past employee services received.

BC247 This approach is consistent with SFAS 123 (paragraph 25) and FASB Interpretation No. 28 *Accounting for Stock Appreciation Rights and Other Variable Stock Option or Award Plans*.

BC248 However, this is not a fair value approach. Like share options, the fair value of SARs includes both their intrinsic value (the increase in the share price to date) and their time value (the value of the right to participate in future increases in the share price, if any, that may occur between the valuation date and the settlement date). An option pricing model can be used to estimate the fair value of SARs.

BC249 Ultimately, however, no matter how the liability is measured during the vesting period, the liability—and therefore the expense—will be remeasured, when the SARs are settled, to equal the amount of the cash paid out. The amount of cash paid will be based on the SARs' intrinsic value at the settlement date. Some support measuring the SAR liability at intrinsic value for this reason, and because intrinsic value is easier to measure.

BC250 The Board concluded that measuring SARs at intrinsic value would be inconsistent with the fair value measurement basis applied, in most cases, in the rest of the IFRS. Furthermore, although a fair value measurement basis is more complex to apply, it was likely that many entities would be measuring the fair value of similar instruments regularly, eg new SAR or share option grants, which would provide much of the information required to remeasure the fair value of the SAR at each reporting date. Moreover, because the intrinsic value measurement basis does not include time value, it is not an adequate measure of either the SAR liability or the cost of services consumed.

BC251 The question of how to measure the liability is linked with the question how to present the associated expense in the income statement, as explained below.

How should the associated expense be presented in the income statement?

BC252 SARs are economically similar to share options. Hence some argue that the accounting treatment of SARs should be the same as the treatment of share options, as discussed earlier (paragraph BC113). However, as noted in paragraphs BC240 and BC241, in an equity-settled transaction there is one change in net assets (the goods or services received) whereas in a cash-settled transaction there are two changes in net assets (the goods or services received and the cash or other assets paid out). To differentiate between the effects of each change in net assets in a cash-settled transaction, the expense could be separated into two components:

- an amount based on the fair value of the SARs at grant date, recognised over the vesting period, in a manner similar to accounting for equity-settled share-based payment transactions, and

 © IASCF

- changes in estimate between grant date and settlement date, ie all changes required to remeasure the transaction amount to equal the amount paid out on settlement date.

BC253 In developing ED 2, the Board concluded that information about these two components would be helpful to users of financial statements. For example, users of financial statements regard the effects of remeasuring the liability as having little predictive value. Therefore, the Board concluded that there should be separate disclosure, either on the face of the income statement or in the notes, of that portion of the expense recognised during each accounting period that is attributable to changes in the estimated fair value of the liability between grant date and settlement date.

BC254 However, some respondents to ED 2 disagreed with the proposed disclosure, arguing that it was burdensome and inappropriate to require the entity to account for the transaction as a cash-settled transaction and also calculate, for the purposes of the disclosure, what the transaction amount would have been if the arrangement was an equity-settled transaction.

BC255 The Board considered these comments and also noted that its decision to adopt the SFAS 123 modified grant date method will make it more complex for entities to determine the amount to disclose, because it will be necessary to distinguish between the effects of forfeitures and the effects of fair value changes when calculating the amount to disclose. The Board therefore concluded that the disclosure should not be retained as a mandatory requirement, but instead should be given as an example of an additional disclosure that entities should consider providing. For example, entities with a significant amount of cash-settled arrangements that experience significant share price volatility will probably find that the disclosure is helpful to users of their financial statements.

Share-based payment transactions with cash alternatives

BC256 Under some employee share-based payment arrangements the employees can choose to receive cash instead of shares or share options, or instead of exercising share options. There are many possible variations of share-based payment arrangements under which a cash alternative may be paid. For example, the employees may have more than one opportunity to elect to receive the cash alternative, eg the employees may be able to elect to receive cash instead of shares or share options on vesting date, or elect to receive cash instead of exercising the share options. The terms of the arrangement may provide the entity with a choice of settlement, ie whether to pay the cash alternative instead of issuing shares or share options on vesting date or instead of issuing shares upon the exercise of the share options. The amount of the cash alternative may be fixed or variable and, if variable, may be determinable in a manner that is related, or unrelated, to the price of the entity's shares.

© IASCF

BC257 The IFRS contains different accounting methods for cash-settled and equity-settled share-based payment transactions. Hence, if the entity or the employee has the choice of settlement, it is necessary to determine which accounting method should be applied. The Board considered situations when the terms of the arrangement provide (a) the employee with a choice of settlement and (b) the entity with a choice of settlement.

The terms of the arrangement provide the employee with a choice of settlement

BC258 Share-based payment transactions without cash alternatives do not give rise to liabilities under the *Framework*, because the entity is not required to transfer cash or other assets to the other party. However, this is not so if the contract between the entity and the employee gives the employee the contractual right to demand the cash alternative. In this situation, the entity has an obligation to transfer cash to the employee and hence a liability exists. Furthermore, because the employee has the right to demand settlement in equity instead of cash, the employee also has a conditional right to equity instruments. Hence, on grant date the employee was granted rights to a compound financial instrument, ie a financial instrument that includes both debt and equity components.

BC259 It is common for the alternatives to be structured so that the fair value of the cash alternative is always the same as the fair value of the equity alternative, eg where the employee has a choice between share options and SARs. However, if this is not so, then the fair value of the compound financial instrument will usually exceed both the individual fair value of the cash alternative (because of the possibility that the shares or share options may be more valuable than the cash alternative) and that of the shares or options (because of the possibility that the cash alternative may be more valuable than the shares or options).

BC260 Under IAS 32, a financial instrument that is accounted for as a compound instrument is separated into its debt and equity components, by allocating the proceeds received for the issue of a compound instrument to its debt and equity components. This entails determining the fair value of the liability component and then assigning the remainder of the proceeds received to the equity component. This is possible if those proceeds are cash or non-cash consideration whose fair value can be reliably measured. If that is not the case, it will be necessary to estimate the fair value of the compound instrument itself.

BC261 The Board concluded that the compound instrument should be measured by first valuing the liability component (the cash alternative) and then valuing the equity component (the equity instrument)—with that valuation taking into account that the employee must forfeit the cash alternative to receive the equity instrument—and adding the two component values together. This is consistent with the approach adopted in IAS 32, whereby the liability component is measured first and the residual is allocated to equity. If the fair value of each settlement alternative is always the same, then the fair value of the equity component of the compound instrument will be zero and hence the fair value of the compound instrument will be the same as the fair value of the liability component.

© IASCF

BC262 The Board concluded that the entity should separately account for the services rendered in respect of each component of the compound financial instrument, to ensure consistency with the IFRS's requirements for equity-settled and cash-settled share-based payment transactions. Hence, for the debt component, the entity should recognise the services received, and a liability to pay for those services, as the employees render services, in the same manner as other cash-settled share-based payment transactions (eg SARs). For the equity component (if any), the entity should recognise the services received, and an increase in equity, as the employees render services, in the same way as other equity-settled share-based payment transactions.

BC263 The Board concluded that the liability should be remeasured to its fair value as at the date of settlement, before accounting for the settlement of the liability. This ensures that, if the entity settles the liability by issuing equity instruments, the resulting increase in equity is measured at the fair value of the consideration received for the equity instruments issued, being the fair value of the liability settled.

BC264 The Board also concluded that, if the entity pays cash rather than issuing equity instruments on settlement, any contributions to equity previously recognised in respect of the equity component should remain in equity. By electing to receive cash rather than equity instruments, the employee has surrendered his/her rights to receive equity instruments. That event does not cause a change in net assets and hence there is no change in total equity. This is consistent with the Board's conclusions on other lapses of equity instruments (see paragraphs BC218–BC221).

The terms of the arrangement provide the entity with a choice of settlement

BC265 For share-based payment transactions in which the terms of the arrangement provide the entity with a choice of whether to settle in cash or by issuing equity instruments, the entity would need first to determine whether it has an obligation to settle in cash and therefore does not, in effect, have a choice of settlement. Although the contract might specify that the entity can choose whether to settle in cash or by issuing equity instruments, the Board concluded that the entity will have an obligation to settle in cash if the choice of settlement in equity has no commercial substance (eg because the entity is legally prohibited from issuing shares), or if the entity has a past practice or a stated policy of settling in cash, or generally settles in cash whenever the counterparty asks for cash settlement. The entity will also have an obligation to settle in cash if the shares issued (including shares issued upon the exercise of share options) are redeemable, either mandatorily (eg upon cessation of employment) or at the counterparty's option.

BC266 During its redeliberations of the proposals in ED 2, the Board noted that the classification as liabilities or equity of arrangements in which the entity appears to have the choice of settlement differs from the classification under IAS 32, which requires such an arrangement to be classified either wholly as a liability (if the contract is a derivative contract) or as a compound instrument (if the contract is a non-derivative contract). However, consistently with its conclusions

on the other differences between IFRS 2 and IAS 32 (see paragraphs BC106–BC110), the Board decided to retain this difference, pending the outcome of its longer-term Concepts project, which includes reviewing the definitions of liabilities and equity.

BC267 Even if the entity is not obliged to settle in cash until it chooses to do so, at the time it makes that election a liability will arise for the amount of the cash payment. This raises the question how to account for the debit side of the entry. It could be argued that any difference between (a) the amount of the cash payment and (b) the total expense recognised for services received and consumed up to the date of settlement (which would be based on the grant date value of the equity settlement alternative) should be recognised as an adjustment to the employee remuneration expense. However, given that the cash payment is to settle an equity interest, the Board concluded that it is consistent with the *Framework* to treat the cash payment as the repurchase of an equity interest, ie as a deduction from equity. In this case, no adjustment to remuneration expense is required on settlement.

BC268 However, the Board concluded that an additional expense should be recognised if the entity chooses the settlement alternative with the higher fair value because, given that the entity has voluntarily paid more than it needed to, presumably it expects to receive (or has already received) additional services from the employees in return for the additional value given.

Share-based payment transactions among group entities (2009 amendments)*

BC268A This section summarises the Board's considerations when finalising its proposals contained in the exposure draft *Group Cash-settled Share-based Payment Transactions* published in December 2007. Until the Board amended IFRS 2 in 2009, IFRIC 11 provided guidance on how an entity that received the goods or services from its suppliers should account for some specific group equity-settled share-based payment transactions in its separate or individual financial statements. Therefore, the amendments issued in June 2009 incorporated substantially the same consensus contained in IFRIC 11. The relevant matters the IFRIC considered when reaching the consensus contained in IFRIC 11, as approved by the Board, are also carried forward in this section.

BC268B The exposure draft published in December 2007 addressed two arrangements in which the parent (not the entity itself) has an obligation to make the required cash payments to the suppliers of the entity:

(a) Arrangement 1 – the supplier of the entity will receive cash payments that are linked to the price of the equity instruments of the entity.

(b) Arrangement 2 – the supplier of the entity will receive cash payments that are linked to the price of the equity instruments of the parent of the entity.

* Paragraphs BC268A–BC268O are added as a consequence of amendments to IFRS 2 *Group Cash-settled Share-based Payment Transactions* issued in June 2009.

 © IASCF

BC268C The Board noted that like those group equity-settled share-based payment transactions originally addressed in IFRIC 11, the two arrangements described in paragraph BC268B did not meet the definition of either an equity-settled or a cash-settled share-based payment transaction. The Board considered whether a different conclusion should be reached for such arrangements merely because they are cash-settled rather than equity-settled. Paragraphs BC22A–BC22F explain the Board's considerations in finalising the amendments to clarify the scope of IFRS 2. The section below summarises the Board's considerations in finalising the amendments relating to the measurement of such transactions.

BC268D The Board noted that the arrangements described in paragraph BC268B are

(a) for the purpose of providing benefits to the employees of the subsidiary in return for employee services, and

(b) share-based and cash-settled.

In addition, the Board noted that the guidance in paragraph 3 (now superseded by paragraph 3A) already stated that when a shareholder transferred equity instruments of the entity (or another group entity), the transaction would be within the scope of IFRS 2 for the entity receiving the goods or services.

BC268E For these reasons, in the exposure draft published in December 2007 the Board proposed to amend IFRS 2 and IFRIC 11 to require that, in the separate or individual financial statements of the entity receiving the goods or services, the entity should measure the employee services in accordance with the requirements applicable to cash-settled share-based payment transactions on the basis of the fair value of the corresponding liability incurred by the parent. Specifically, until the liability incurred by the parent is settled, the entity should recognise any changes in the fair value of the liability in profit or loss and changes in the entity's equity as adjustments to contributions from the parent.

BC268F Because group cash-settled share-based payment transactions did not meet the definition of either an equity-settled or a cash-settled share-based payment transaction, some respondents did not object to measuring them as cash-settled on the basis that the accounting reflects the form of the payment received by the entity's suppliers. However, many respondents questioned the basis for the conclusions reached, citing reasons that included:

(a) the lack of a 'push-down' accounting concept in current IFRSs that would require the parent's costs incurred on behalf of the subsidiary to be attributed to the subsidiary,

(b) conflicts with the *Framework* and with other IFRSs that prohibit remeasurement of equity, and

(c) conflicts with the rationale in the Basis for Conclusions on IFRS 2 related to the remeasurement of cash-settled share-based payment transactions when the entity itself has no obligation to its suppliers.

BC268G The Board agreed with respondents that the entity receiving goods or services has no obligation to distribute assets and that the parent's settlement is an equity contribution to the entity. The Board noted that regardless of how such group transactions are structured or accounted for in the separate or individual financial statements of the group entities, the accounting measurement in the

consolidated financial statements of the group will be the same. The Board also noted that the share-based payment expense measured on grant date results in the same fair value for both the entity receiving goods or services and the entity settling the transaction, regardless of whether it is measured as equity-settled or as cash-settled.

BC268H To address the comments received from respondents, the Board reviewed two issues to determine the appropriate subsequent measurement in the separate or individual financial statements of the entity receiving the goods or services. The first issue was whether the entity should recognise in its separate or individual financial statements:

(a) Approach 1 – an expense of the same amount as in the consolidated financial statements, or

(b) Approach 2 – an expense measured by classifying the transaction as equity-settled or cash-settled evaluated from its own perspective, which may not always be the same as the amount recognised by the consolidated group.

BC268I The Board noted that IFRSs have no broad-based guidance to address push-down accounting or the accounting in separate or individual financial statements for the allocation of costs among group entities. When addressing defined benefit plans that share risks between entities under common control, IAS 19 requires an expense to be recognised by the subsidiary on the basis of the cash amount charged by the group plan. When there are no repayment arrangements, in the separate or individual financial statements, the subsidiary should recognise a cost equal to its contribution payable for the period. This is consistent with Approach 2 described in paragraph BC268H.

BC268J The Board therefore decided to adopt Approach 2. However, the approach adopted in IFRS 2 is different from that in IAS 19 in that the entity receiving goods or services in a share-based payment transaction recognises an expense even when it has no obligation to pay cash or other assets. The Board concluded that this approach is consistent with the expense attribution principles underlying IFRS 2.

BC268K The Board noted that Approach 2 is consistent with the rationale that the information provided by general purpose financial reporting should 'reflect the perspective of the entity rather than the perspective of the entity's equity investors ….' because the reporting entity is deemed to have substance of its own, separate from that of its owners. Approach 1 reflects the perspective of the entity's owners (the group) rather than the rights and obligations of the entity itself.

BC268L The Board also noted that the consensus reached in IFRIC 11 reflected Approach 1 described in paragraph BC268H for some scenarios and Approach 2 for others. The Board concluded that this was undesirable and decided that there should be a single approach to measurement that would apply in all situations.

 © IASCF

BC268M The second issue the Board considered was identifying the criteria for classifying group share-based payment transactions as equity-settled or cash-settled. How a transaction is classified determines the subsequent measurement in the separate or individual financial statements of both the entity receiving the goods or services and the entity settling the transaction, if different. The Board reviewed the two classification criteria set out in the consensus in IFRIC 11 for group equity-settled transactions:

(a) based on the nature of the award given to the employees—therefore, classified as *equity-settled* if the entity's own equity instruments are given, regardless of which entity grants or settles it; otherwise classified as *cash-settled* even when the entity receiving the goods or services has no obligation.

(b) based on the entity's own rights and obligations—therefore, classified as *cash-settled* if the entity has an obligation to settle, regardless of the nature of the consideration; otherwise classified as *equity-settled*.

BC268N The Board noted that, on its own, either of the two criteria described above would not consistently reflect the entity's perspective when assessing the appropriate classification for transactions described in paragraph BC268B. The Board concluded that the entity should consider both criteria in IFRIC 11, ie *equity-settled* when suppliers are given the entity's own equity instruments or when the entity receiving the goods or services has no obligation to settle and *cash-settled* in all other circumstances. The Board also noted that when the entity receiving goods or services has no obligation to deliver cash or other assets to its suppliers, accounting for the transaction as cash-settled in its separate or individual financial statements is not appropriate. The equity-settled basis is more consistent with the principles and rationales in both IFRS 2 and IFRIC 11. Therefore, the Board decided that the entity receiving the goods or services should classify both of the group cash-settled share-based payment transactions described in paragraph BC268B as *equity-settled* in its separate or individual financial statements.

BC268O This conclusion is the main change to the proposals in the exposure draft. The Board concluded that the broader principles it developed during its redeliberations addressed the three main concerns expressed by respondents described in paragraph BC268F. Those principles apply to all group share-based payment transactions, whether they are cash-settled or equity-settled. The Board's conclusions do not result in any changes to the guidance in IFRIC 11 that addressed similar group equity-settled share-based payment transactions. Other than the change described above, the Board reaffirmed the proposals in the exposure draft. Therefore, the Board concluded that it was not necessary to re-expose the amendments before finalising them.

Transfers of employees between group entities (paragraphs B59–B61)

BC268P When it developed the consensus in IFRIC 11, the IFRIC noted that some share-based payment arrangements involve a parent granting rights to the employees of more than one subsidiary with a vesting condition that requires the employees to work for the group for a particular period. Sometimes, an employee of one subsidiary transfers employment to another subsidiary during the vesting period, without the employee's rights under the original share-based payment arrangements being affected.

BC268Q The IFRIC noted that the terms of the original share-based payment arrangement require the employees to work for the group, rather than for a particular group entity. Thus, the IFRIC concluded that the change of employment should not result in a new grant of equity instruments in the financial statements of the subsidiary to which the employees transferred employment. The subsidiary to which the employee transfers employment should measure the fair value of the services received from the employee by reference to the fair value of the equity instruments at the date those equity instruments were originally granted to the employee by the parent. For the same reason, the IFRIC concluded that the transfer itself should not be treated as an employee's failure to satisfy a vesting condition. Thus, the transfer should not trigger any reversal of the charge previously recognised in respect of the services received from the employee in the separate or individual financial statements of the subsidiary from which the employee transfers employment.

BC268R The IFRIC noted that paragraph 19 of the IFRS requires the cumulative amount recognised for goods or services as consideration for the equity instruments granted to be based on the number of equity instruments that eventually vest. Accordingly, on a cumulative basis, no amount is recognised for goods or services if the equity instruments do not vest because of failure to satisfy a vesting condition other than a market condition as defined in Appendix A. Applying the principles in paragraph 19, the IFRIC concluded that when the employee fails to satisfy a vesting condition other than a market condition, the services from that employee recognised in the financial statements of each group entity during the vesting period should be reversed.

BC268S When finalising the 2009 amendments to IFRS 2 for group share-based payment transactions, the Board concluded that the guidance in IFRIC 11 should apply to all group share-based payment transactions classified as equity-settled in the entity's separate or individual financial statements in accordance with paragraphs 43A–43C.

Overall conclusions on accounting for employee share options

BC269 The Board first considered all major issues relating to the recognition and measurement of share-based payment transactions, and reached conclusions on those issues. It then drew some overall conclusions, particularly on the treatment of employee share options, which is one of the most controversial aspects of the project. In arriving at those conclusions, the Board considered the following issues:

© IASCF

- convergence with US GAAP
- recognition versus disclosure of expenses arising from employee share-based payment transactions
- reliability of measurement of the fair value of employee share options.

Convergence with US GAAP

BC270 Some respondents to the Discussion Paper and ED 2 urged the Board to develop an IFRS that was based on existing requirements under US generally accepted accounting principles (US GAAP).

BC271 More specifically, respondents urged the Board to develop a standard based on SFAS 123. However, given that convergence of accounting standards was commonly given as a reason for this suggestion, the Board considered US GAAP overall, not just one aspect of it. The main pronouncements of US GAAP on share-based payment are Accounting Principles Board Opinion No. 25 *Accounting for Stock Issued to Employees*, and SFAS 123.

APB 25

BC272 APB 25 was issued in 1972. It deals with employee share plans only, and draws a distinction between non-performance-related (fixed) plans and performance-related and other variable plans.

BC273 For fixed plans, an expense is measured at intrinsic value (ie the difference between the share price and the exercise price), if any, at grant date. Typically, this results in no expense being recognised for fixed plans, because most share options granted under fixed plans are granted at the money. For performance-related and other variable plans, an expense is measured at intrinsic value at the measurement date. The measurement date is when both the number of shares or share options that the employee is entitled to receive and the exercise price are fixed. Because this measurement date is likely to be much later than grant date, any expense is subject to uncertainty and, if the share price is increasing, the expense for performance-related plans would be larger than for fixed plans.

BC274 In SFAS 123, the FASB noted that APB 25 is criticised for producing anomalous results and for lacking any underlying conceptual rationale. For example, the requirements of APB 25 typically result in the recognition of an expense for performance-related share options but usually no expense is recognised for fixed share options. This result is anomalous because fixed share options are usually more valuable at grant date than performance-related share options. Moreover, the omission of an expense for fixed share options impairs the quality of financial statements:

> The resulting financial statements are less credible than they could be, and the financial statements of entities that use fixed employee share options extensively are not comparable to those of entities that do not make significant use of fixed options. (SFAS 123, paragraph 56)

BC275 The Discussion Paper, in its discussion of US GAAP, noted that the different accounting treatments for fixed and performance-related plans also had the perverse effect of discouraging entities from setting up performance-related employee share plans.

SFAS 123

BC276 SFAS 123 was issued in 1995. It requires recognition of share-based payment transactions with parties other than employees, based on the fair value of the shares or share options issued or the fair value of the goods or services received, whichever is more reliably measurable. Entities are also encouraged, but not required, to apply the fair value accounting method in SFAS 123 to share-based payment transactions with employees. Generally speaking, SFAS 123 draws no distinction between fixed and performance-related plans.

BC277 If an entity applies the accounting method in APB 25 rather than that in SFAS 123, SFAS 123 requires disclosures of pro forma net income and earnings per share in the annual financial statements, as if the standard had been applied. Recently, a significant number of major US companies have voluntarily adopted the fair value accounting method in SFAS 123 for transactions with employees.

BC278 The FASB regards SFAS 123 as superior to APB 25, and would have preferred recognition based on the fair value of employee options to be mandatory, not optional. SFAS 123 makes it clear that the FASB decided to permit the disclosure-based alternative for political reasons, not because it thought that it was the best accounting solution:

> ... the Board ... continues to believe that disclosure is not an adequate substitute for recognition of assets, liabilities, equity, revenues and expenses in financial statements ... The Board chose a disclosure-based solution for stock-based employee compensation to bring closure to the divisive debate on this issue–not because it believes that solution is the best way to improve financial accounting and reporting.
> (SFAS 123, paragraphs 61 and 62)

BC279 Under US GAAP, the accounting treatment of share-based payment transactions differs, depending on whether the other party to the transaction is an employee or non-employee, and whether the entity chooses to apply SFAS 123 or APB 25 to transactions with employees. Having a choice of accounting methods is generally regarded as undesirable. Indeed, the Board recently devoted much time and effort to developing improvements to existing international standards, one of the objectives of which is to eliminate choices of accounting methods.

BC280 Research in the US demonstrates that choosing one accounting method over the other has a significant impact on the reported earnings of US entities. For example, research by Bear Stearns and Credit Suisse First Boston on the S&P 500 shows that, had the fair value measurement method in SFAS 123 been applied for the purposes of recognising an expense for employee stock-based compensation, the earnings of the S&P 500 companies would have been significantly lower, and that the effect is growing. The effect on reported earnings is substantial in some sectors, where companies make heavy use of share options.

 © IASCF

BC281 The Canadian Accounting Standards Board (AcSB) recently completed its project on share-based payment. In accordance with the AcSB's policy of harmonising Canadian standards with those in the US, the AcSB initially proposed a standard that was based on US GAAP, including APB 25. After considering respondents' comments, the AcSB decided to delete the guidance drawn from APB 25. The AcSB reached this decision for various reasons, including that, in its view, the intrinsic value method is flawed. Also, incorporating the requirements of APB 25 into an accounting standard would result in preparers of financial statements incurring substantial costs for which users of financial statements would derive no benefit—entities would spend a great deal of time and effort on understanding the rules and then redesigning option plans, usually by deleting existing performance conditions, to avoid recognising an expense in respect of such plans, thereby producing no improvement in the accounting for share option plans.

BC282 The Canadian standard was initially consistent with SFAS 123. That included permitting a choice between fair value-based accounting for employee stock-based compensation expense in the income statement and disclosure of pro forma amounts in the notes to both interim and annual financial statements. However, the AcSB recently amended its standard to remove the choice between recognition and disclosure, and therefore expense recognition is mandatory for financial periods beginning on or after 1 January 2004.

BC283 Because APB 25 contains serious flaws, the Board concluded that basing an IFRS on it is unlikely to represent much, if any, improvement in financial reporting. Moreover, the perverse effects of APB 25, particularly in discouraging performance-related share option plans, may cause economic distortions. Accounting standards are intended to be neutral, not to give favourable or unfavourable accounting treatments to particular transactions to encourage or discourage entities from entering into those transactions. APB 25 fails to achieve that objective. Performance-related employee share plans are common in Europe (performance conditions are often required by law) and in other parts of the world outside the US, and investors are calling for greater use of performance conditions. Therefore, the Board concluded that introducing an accounting standard based on APB 25 would be inconsistent with its objective of developing high quality accounting standards.

BC284 That leaves SFAS 123. Comments from the FASB, in the SFAS 123 Basis for Conclusions, and from the Canadian AcSB when it developed a standard based on SFAS 123, indicate that both standard-setters regard it as inadequate, because it permits a choice between recognition and disclosure. (This issue is discussed further below.) The FASB added to its agenda in March 2003 a project to review US accounting requirements on share-based payment, including removing the disclosure alternative in SFAS 123, so that expense recognition is mandatory. The Chairman of the FASB commented:

> Recent events have served as a reminder to all of us that clear, credible and comparable financial information is essential to the health and vitality of our capital market system. In the wake of the market meltdown and corporate reporting scandals, the FASB has received numerous requests from individual and institutional investors, financial analysts and many others urging the Board to mandate the expensing of the compensation cost relating to employee stock options ... While a number of major companies have voluntarily opted to reflect these costs as an expense in reporting their earnings, other companies continue to show these costs in the footnotes to their

> financial statements. In addition, a move to require an expense treatment would be consistent with the FASB's commitment to work toward convergence between U.S. and international accounting standards. In taking all of these factors into consideration, the Board concluded that it was critical that it now revisit this important subject. (FASB News Release, 12 March 2003)

BC285 During the Board's redeliberations of the proposals in ED 2, the Board worked with the FASB to achieve convergence of international and US standards, to the extent possible, bearing in mind that the FASB was at an earlier stage in its project—the FASB was developing an Exposure Draft to revise SFAS 123 whereas the IASB was finalising its IFRS. The Board concluded that, although convergence is an important objective, it would not be appropriate to delay the issue of the IFRS, because of the pressing need for a standard on share-based payment, as explained in paragraphs BC2–BC5. In any event, at the time the IASB concluded its deliberations, a substantial amount of convergence had been achieved. For example, the FASB agreed with the IASB that all share-based payment transactions should be recognised in the financial statements, measured on a fair value measurement basis, including transactions in which share options are granted to employees. Hence, the FASB agreed that the disclosure alternative in SFAS 123 should be eliminated.

BC286 The IASB and FASB also agreed that, once both boards have issued final standards on share-based payment, the two boards will consider undertaking a convergence project, with the objective of eliminating any remaining areas of divergence between international and US standards on this topic.

Recognition versus disclosure

BC287 A basic accounting concept is that disclosure of financial information is not an adequate substitute for recognition in the financial statements. For example, the *Framework* states:

> Items that meet the recognition criteria should be recognised in the balance sheet or income statement. The failure to recognise such items is not rectified by disclosure of the accounting policies used nor by notes or explanatory material. (paragraph 82)

BC288 A key aspect of the recognition criteria is that the item can be measured with reliability. This issue is discussed further below. Therefore, this discussion focuses on the 'recognition versus disclosure' issue in principle, not on measurement reliability. Once it has been determined that an item meets the criteria for recognition in the financial statements, failing to recognise it is inconsistent with the basic concept that disclosure is not an adequate substitute for recognition.

BC289 Some disagree with this concept, arguing that it makes no difference whether information is recognised in the financial statements or disclosed in the notes. Either way, users of financial statements have the information they require to make economic decisions. Hence, they believe that note disclosure of expenses arising from particular employee share-based payment transactions (ie those involving awards of share options to employees), rather than recognition in the income statement, is acceptable.

 © IASCF

BC290 The Board did not accept this argument. The Board noted that if note disclosure is acceptable, because it makes no difference whether the expense is recognised or disclosed, then recognition in the financial statements must also be acceptable for the same reason. If recognition is acceptable, and recognition rather than mere disclosure accords with the accounting principles applied to all other expense items, it is not acceptable to leave one particular expense item out of the income statement.

BC291 The Board also noted that there is significant evidence that there is a difference between recognition and disclosure. First, academic research indicates that whether information is recognised or merely disclosed affects market prices (eg Barth, Clinch and Shibano, 2003).[*] If information is disclosed only in the notes, users of financial statements have to expend time and effort to become sufficiently expert in accounting to know (a) that there are items that are not recognised in the financial statements, (b) that there is information about those items in the notes, and (c) how to assess the note disclosures. Because gaining that expertise comes at a cost, and not all users of financial statements will become accounting experts, information that is merely disclosed may not be fully reflected in share prices.

BC292 Second, both preparers and users of financial statements appear to agree that there is an important difference between recognition and disclosure. Users of financial statements have strongly expressed the view that all forms of share-based payment, including employee share options, should be recognised in the financial statements, resulting in the recognition of an expense when the goods or services received are consumed, and that note disclosure alone is inadequate. Their views have been expressed by various means, including:

(a) users' responses to the Discussion Paper and ED 2.

(b) the 2001 survey by the Association for Investment Management and Research of analysts and fund managers—83 per cent of survey respondents said the accounting method for all share-based payment transactions should require recognition of an expense in the income statement.

(c) public comments by users of financial statements, such as those reported in the press or made at recent US Senate hearings.

BC293 Preparers of financial statements also see a major difference between recognition and disclosure. For example, some preparers who responded to the Discussion Paper and ED 2 were concerned that unless expense recognition is required in all countries, entities that are required to recognise an expense would be at a competitive disadvantage compared with entities that are permitted a choice between recognition and disclosure. Comments such as these indicate that preparers of financial statements regard expense recognition as having consequences that are different from those of disclosure.

Reliability of measurement

BC294 One reason commonly given by those who oppose the recognition of an expense arising from transactions involving grants of share options to employees is that it is not possible to measure those transactions reliably.

BC295 The Board discussed these concerns about reliability, after first putting the issue into context. For example, the Board noted that when estimating the fair value of share options, the objective is to measure that fair value at the measurement date, not the value of the underlying share at some future date. Some regard the fair value estimate as inherently uncertain because it is not known, at the measurement date, what the final outcome will be, ie how much the gain on exercise (if any) will be. However, the valuation does not attempt to estimate the future gain, only the amount that the other party would pay to obtain the right to participate in any future gains. Therefore, even if the share option expires worthless or the employee makes a large gain on exercise, this does not mean that the grant date estimate of the fair value of that option was unreliable or wrong.

BC296 The Board also noted that accounting often involves making estimates, and therefore reporting an estimated fair value is not objectionable merely because that amount represents an estimate rather than a precise measure. Examples of other estimates made in accounting, which may have a material effect on the income statement and the balance sheet, include estimates of the collectability of doubtful debts, estimates of the useful life of fixed assets and the pattern of their consumption, and estimates of employee pension liabilities.

BC297 However, some argue that including in the financial statements an estimate of the fair value of employee share options is different from including other estimates, because there is no subsequent correction of the estimate. Other estimates, such as employee pension costs, will ultimately be revised to equal the amount of the cash paid out. In contrast, because equity is not remeasured, if the estimated fair value of employee share options is recognised, there is no remeasurement of the fair value estimate—unless exercise date measurement is used—so any estimation error is permanently embedded in the financial statements.

BC298 The FASB considered and rejected this argument in developing SFAS 123. For example, for employee pension costs, the total cost is never completely trued up unless the scheme is terminated, the amount attributed to any particular year is never trued up, and it can take decades before the amounts relating to particular employees are trued up. In the meantime, users of financial statements have made economic decisions based on the estimated costs.

BC299 Moreover, the Board noted that if no expense (or an expense based on intrinsic value only, which is typically zero) is recognised in respect of employee share options, that also means that there is an error that is permanently embedded in the financial statements. Reporting zero (or an amount based on intrinsic value, if any) is never trued up.

BC300 The Board also considered the meaning of reliability. Arguments about whether estimates of the fair value of employee share options are sufficiently reliable focus on one aspect of reliability only—whether the estimate is free from material error. The *Framework*, in common with the conceptual frameworks of other

 © IASCF

accounting standard-setters, makes it clear that another important aspect of reliability is whether the information can be depended upon by users of financial statements to represent faithfully what it purports to represent. Therefore, in assessing whether a particular accounting method produces reliable financial information, it is necessary to consider whether that information is representationally faithful. This is one way in which reliability is linked to another important qualitative characteristic of financial information, relevance.

BC301 For example, in the context of share-based payment, some commentators advocate measuring employee share options at intrinsic value rather than fair value, because intrinsic value is regarded as a much more reliable measure. Whether intrinsic value is a more reliable measure is doubtful—it is certainly less subject to estimation error, but is unlikely to be a representationally faithful measure of remuneration. Nor is intrinsic value a relevant measure, especially when measured at grant date. Many employee share options are issued at the money, so have no intrinsic value at grant date. A share option with no intrinsic value consists entirely of time value. If a share option is measured at intrinsic value at grant date, zero value is attributed to the share option. Therefore, by ignoring time value, the amount attributed to the share option is 100 per cent understated.

BC302 Another qualitative characteristic is comparability. Some argue that, given the uncertainties relating to estimating the fair value of employee share options, it is better for all entities to report zero, because this will make financial statements more comparable. They argue that if, for example, for two entities the 'true' amount of expense relating to employee share options is CU500,000, and estimation uncertainties cause one entity to report CU450,000 and the other to report CU550,000, the two entities' financial statements would be more comparable if both reported zero, rather than these divergent figures.

BC303 However, it is unlikely that any two entities will have the same amount of employee share-based remuneration expense. Research (eg by Bear Stearns and Credit Suisse First Boston) indicates that the expense varies widely from industry to industry, from entity to entity, and from year to year. Reporting zero rather than an estimated amount is likely to make the financial statements much less comparable, not more comparable. For example, if the estimated employee share-based remuneration expense of Company A, Company B and Company C is CU10,000, CU100,000 and CU1,000,000 respectively, reporting zero for all three companies will not make their financial statements comparable.

BC304 In the context of the foregoing discussion of reliability, the Board addressed the question whether transactions involving share options granted to employees can be measured with sufficient reliability for the purpose of recognition in the financial statements. The Board noted that many respondents to the Discussion Paper asserted that this is not possible. They argue that option pricing models cannot be applied to employee share options, because of the differences between employee options and traded options.

BC305 The Board considered these differences, with the assistance of the project's Advisory Group and other experts, and has reached conclusions on how to take account of these differences when estimating the fair value of employee share options, as explained in paragraphs BC145–BC199. In doing so, the Board noted

that the objective is to measure the fair value of the share options, ie an estimate of what the price of those equity instruments would have been on grant date in an arm's length transaction between knowledgeable, willing parties. The valuation methodology applied should therefore be consistent with valuation methodologies that market participants would use for pricing similar financial instruments, and should incorporate all factors and assumptions that knowledgeable, willing market participants would consider in setting the price.

BC306 Hence, factors that a knowledgeable, willing market participant would not consider in setting the price of an option are not relevant when estimating the fair value of shares, share options or other equity instruments granted. For example, for share options granted to employees, factors that affect the value of the option from the individual employee's perspective only are not relevant to estimating the price that would be set by a knowledgeable, willing market participant. Many respondents' comments about measurement reliability, and the differences between employee share options and traded options, often focused on the value of the option from the employee's perspective. Therefore, the Board concluded that the IFRS should emphasise that the objective is to estimate the fair value of the share option, not an employee-specific value.

BC307 The Board noted that there is evidence to support a conclusion that it is possible to make a reliable estimate of the fair value of employee share options. First, there is academic research to support this conclusion (eg Carpenter 1998, Maller, Tan and Van De Vyver 2002).[*] Second, users of financial statements regard the estimated fair values as sufficiently reliable for recognition in the financial statements. Evidence of this can be found in a variety of sources, such as the comment letters received from users of financial statements who responded to the Discussion Paper and ED 2. Users' views are important, because the objective of financial statements is to provide high quality, transparent and comparable information to help users make economic decisions. In other words, financial statements are intended to meet the needs of users, rather than preparers or other interest groups. The purpose of setting accounting standards is to ensure that, wherever possible, the information provided in the financial statements meets users' needs. Therefore, if the people who use the financial statements in making economic decisions regard the fair value estimates as sufficiently reliable for recognition in the financial statements, this provides strong evidence of measurement reliability.

BC308 The Board also noted that, although the FASB decided to permit a choice between recognition and disclosure of expenses arising from employee share-based payment transactions, it did so for non-technical reasons, not because it agreed with the view that reliable measurement was not possible:

> The Board continues to believe that use of option-pricing models, as modified in this statement, will produce estimates of the fair value of stock options that are sufficiently reliable to justify recognition in financial statements. Imprecision in those estimates does not justify failure to recognize compensation cost stemming from employee stock options. That belief underlies the Board's encouragement to

* J N Carpenter. 1998. The exercise and valuation of executive stock options. *Journal of Financial Economics* 48: 127–158.

© IASCF

> entities to adopt the fair value based method of recognizing stock-based employee compensation cost in their financial statements.
> (SFAS 123, Basis for Conclusions, paragraph 117)

BC309 In summary, if expenses arising from grants of share options to employees are omitted from the financial statements, or recognised using the intrinsic value method (which typically results in zero expense) or the minimum value method, there will be a permanent error embedded in the financial statements. So the question is, which accounting method is more likely to produce the smallest amount of error and the most relevant, comparable information—a fair value estimate, which might result in some understatement or overstatement of the associated expense, or another measurement basis, such as intrinsic value (especially if measured at grant date), that will definitely result in substantial understatement of the associated expense?

BC310 Taking all of the above into consideration, the Board concluded that, in virtually all cases, the estimated fair value of employee share options at grant date can be measured with sufficient reliability for the purposes of recognising employee share-based payment transactions in the financial statements. The Board therefore concluded that, in general, the IFRS on share-based payment should require a fair value measurement method to be applied to all types of share-based payment transactions, including all types of employee share-based payment. Hence, the Board concluded that the IFRS should not allow a choice between a fair value measurement method and an intrinsic value measurement method, and should not permit a choice between recognition and disclosure of expenses arising from employee share-based payment transactions.

Transitional provisions

Share-based payment transactions among group entities

BC310A The Board noted a potential difficulty when an entity retrospectively applies the amendments made by *Group Cash-settled Share-based Payment Transactions* issued in June 2009. An entity might not have accounted for some group share-based payment transactions in accordance with IFRS 2 in its separate or individual financial statements. In a few cases, an entity that settles a group share-based payment transaction may have to apply hindsight to measure the fair value of awards now required to be accounted for as cash-settled. However, the Board noted that such transactions would have been accounted for in accordance with IFRS 2 in the group's consolidated financial statements. For these reasons and those outlined in paragraph BC268G, if the information necessary for retrospective application is not available, the Board decided to require an entity to use amounts previously recognised in the group's consolidated financial statements when applying the new requirements retrospectively in the entity's separate or individual financial statements.

Consequential amendments to other Standards

Tax effects of share-based payment transactions

BC311 Whether expenses arising from share-based payment transactions are deductible, and if so, whether the amount of the tax deduction is the same as the reported expense and whether the tax deduction arises in the same accounting period, varies from country to country.

BC312 If the amount of the tax deduction is the same as the reported expense, but the tax deduction arises in a later accounting period, this will result in a deductible temporary difference under IAS 12 *Income Taxes*. Temporary differences usually arise from differences between the carrying amount of assets and liabilities and the amount attributed to those assets and liabilities for tax purposes. However, IAS 12 also deals with items that have a tax base but are not recognised as assets and liabilities in the balance sheet. It gives an example of research costs that are recognised as an expense in the financial statements in the period in which the costs are incurred, but are deductible for tax purposes in a later accounting period. The Standard states that the difference between the tax base of the research costs, being the amount that will be deductible in a future accounting period, and the carrying amount of nil is a deductible temporary difference that results in a deferred tax asset (IAS 12, paragraph 9).

BC313 Applying this guidance indicates that if an expense arising from a share-based payment transaction is recognised in the financial statements in one accounting period and is tax-deductible in a later accounting period, this should be accounted for as a deductible temporary difference under IAS 12. Under that Standard, a deferred tax asset is recognised for all deductible temporary differences to the extent that it is probable that taxable profit will be available against which the deductible temporary difference can be used (IAS 12, paragraph 24).

BC314 Whilst IAS 12 does not discuss reverse situations, the same logic applies. For example, suppose the entity is able to claim a tax deduction for the total transaction amount at the date of grant but the entity recognises an expense arising from that transaction over the vesting period. Applying the guidance in IAS 12 suggests that this should be accounted for as a taxable temporary difference, and hence a deferred tax liability should be recognised.

BC315 However, the amount of the tax deduction might differ from the amount of the expense recognised in the financial statements. For example, the measurement basis applied for accounting purposes might not be the same as that used for tax purposes, eg intrinsic value might be used for tax purposes and fair value for accounting purposes. Similarly, the measurement date might differ. For example, US entities receive a tax deduction based on intrinsic value at the date of exercise in respect of some share options, whereas for accounting purposes an entity applying SFAS 123 would recognise an expense based on the option's fair value, measured at the date of grant. There could also be other differences in the measurement method applied for accounting and tax purposes, eg differences in the treatment of forfeitures or different valuation methodologies applied.

 © IASCF

BC316 SFAS 123 requires that, if the amount of the tax deduction exceeds the total expense recognised in the financial statements, the tax benefit for the excess deduction should be recognised as additional paid-in capital, ie as a direct credit to equity. Conversely, if the tax deduction is less than the total expense recognised for accounting purposes, the write-off of the related deferred tax asset in excess of the benefits of the tax deduction is recognised in the income statement, except to the extent that there is remaining additional paid-in capital from excess tax deductions from previous share-based payment transactions (SFAS 123, paragraph 44).

BC317 At first sight, it may seem questionable to credit or debit directly to equity amounts that relate to differences between the amount of the tax deduction and the total recognised expense. The tax effects of any such differences would ordinarily flow through the income statement. However, some argue that the approach in SFAS 123 is appropriate if the reason for the difference between the amount of the tax deduction and the recognised expense is that a different measurement date is applied.

BC318 For example, suppose grant date measurement is used for accounting purposes and exercise date measurement is used for tax purposes. Under grant date measurement, any changes in the value of the equity instrument after grant date accrue to the employee (or other party) in their capacity as equity participants. Therefore, some argue that any tax effects arising from those valuation changes should be credited to equity (or debited to equity, if the value of the equity instrument declines).

BC319 Similarly, some argue that the tax deduction arises from an equity transaction (the exercise of options), and hence the tax effects should be reported in equity. It can also be argued that this treatment is consistent with the requirement in IAS 12 to account for the tax effects of transactions or events in the same way as the entity accounts for those transactions or events themselves. If the tax deduction relates to both an income statement item and an equity item, the associated tax effects should be allocated between the income statement and equity.

BC320 Others disagree, arguing that the tax deduction relates to employee remuneration expense, ie an income statement item only, and therefore all of the tax effects of the deduction should be recognised in the income statement. The fact that the taxing authority applies a different method in measuring the amount of the tax deduction does not change this conclusion. A further argument is that this treatment is consistent with the *Framework*, because reporting amounts directly in equity would be inappropriate, given that the government is not an owner of the entity.

BC321 The Board noted that, if one accepts that it might be appropriate to debit/credit to equity the tax effect of the difference between the amount of the tax deduction and the total recognised expense where that difference relates to changes in the value of equity interests, there could be other reasons why the amount of the tax deduction differs from the total recognised expense. For example, grant date measurement may be used for both tax and accounting purposes, but the valuation methodology used for tax purposes might produce a higher value than

the methodology used for accounting purposes (eg the effects of early exercise might be ignored when valuing an option for tax purposes). The Board saw no reason why, in this situation, the excess tax benefits should be credited to equity.

BC322 In developing ED 2, the Board concluded that the tax effects of share-based payment transactions should be recognised in the income statement by being taken into account in the determination of tax expense. It agreed that this should be explained in the form of a worked example in a consequential amendment to IAS 12.

BC323 During the Board's redeliberation of the proposals in ED 2, the Board reconsidered the points above, and concluded that the tax effects of an equity-settled share-based payment transaction should be allocated between the income statement and equity. The Board then considered how this allocation should be made and related issues, such as the measurement of the deferred tax asset.

BC324 Under IAS 12, the deferred tax asset for a deductible temporary difference is based on the amount the taxation authorities will permit as a deduction in future periods. Therefore, the Board concluded that the measurement of the deferred tax asset should be based on an estimate of the future tax deduction. If changes in the share price affect that future tax deduction, the estimate of the expected future tax deduction should be based on the current share price.

BC325 These conclusions are consistent with the proposals in ED 2 concerning the measurement of the deferred tax asset. However, this approach differs from SFAS 123, which measures the deferred tax asset on the basis of the cumulative recognised expense. The Board rejected the SFAS 123 method of measuring the deferred tax asset because it is inconsistent with IAS 12. As noted above, under IAS 12, the deferred tax asset for a deductible temporary difference is based on the amount the taxation authorities will permit as a deduction in future periods. If a later measurement date is applied for tax purposes, it is very unlikely that the tax deduction will ever equal the cumulative expense, except by coincidence. For example, if share options are granted to employees, and the entity receives a tax deduction measured as the difference between the share price and the exercise price at the date of exercise, it is extremely unlikely that the tax deduction will ever equal the cumulative expense. By basing the measurement of the deferred tax asset on the cumulative expense, the SFAS 123 method is likely to result in the understatement or overstatement of the deferred tax asset. In some situations, such as when share options are significantly out of the money, SFAS 123 requires the entity to continue to recognise a deferred tax asset even when the possibility of the entity recovering that asset is remote. Continuing to recognise a deferred tax asset in this situation is not only inconsistent with IAS 12, it is inconsistent with the definition of an asset in the *Framework*, and the requirements of other IFRSs for the recognition and measurement of assets, including requirements to assess impairment.

BC326 The Board also concluded that:

(a) if the tax deduction received (or expected to be received, measured as described in paragraph BC324) is less than or equal to the cumulative expense, the associated tax benefits received (or expected to be received) should be recognised as tax income and included in profit or loss for the period.

 © IASCF

(b) if the tax deduction received (or expected to be received, measured as described in paragraph BC324) exceeds the cumulative expense, the excess associated tax benefits received (or expected to be received) should be recognised directly in equity.

BC327 The above allocation method is similar to that applied in SFAS 123, with some exceptions. First, the above allocation method ensures that the total tax benefits recognised in the income statement in respect of a particular share-based payment transaction do not exceed the tax benefits ultimately received. The Board disagreed with the approach in SFAS 123, which sometimes results in the total tax benefits recognised in the income statement exceeding the tax benefits ultimately received because, in some situations, SFAS 123 permits the unrecovered portion of the deferred tax asset to be written off to equity.

BC328 Second, the Board concluded that the above allocation method should be applied irrespective of why the tax deduction received (or expected to be received) differs from the cumulative expense. The SFAS 123 method is based on US tax legislation, under which the excess tax benefits credited to equity (if any) arise from the use of a later measurement date for tax purposes. The Board agreed with respondents who commented that the accounting treatment must be capable of being applied in various tax jurisdictions. The Board was concerned that requiring entities to examine the reasons why there is a difference between the tax deduction and the cumulative expense, and then account for the tax effects accordingly, would be too complex to be applied consistently across a wide range of different tax jurisdictions.

BC329 The Board noted that it might need to reconsider its conclusions on accounting for the tax effects of share-based payment transactions in the future, for example, if the Board reviews IAS 12 more broadly.

Accounting for own shares held

BC330 IAS 32 requires the acquisition of treasury shares to be deducted from equity, and no gain or loss is to be recognised on the sale, issue or cancellation of treasury shares. Consideration received on the subsequent sale or issue of treasury shares is credited to equity.

BC331 This is consistent with the *Framework*. The repurchase of shares and their subsequent reissue or transfer to other parties are transactions with equity participants that should be recognised as changes in equity. In accounting terms, there is no difference between shares that are repurchased and cancelled, and shares that are repurchased and held by the entity. In both cases, the repurchase involves an outflow of resources to shareholders (ie a distribution), thereby reducing shareholders' investment in the entity. Similarly, there is no difference between a new issue of shares and an issue of shares previously repurchased and held in treasury. In both cases, there is an inflow of resources from shareholders, thereby increasing shareholders' investment in the entity. Although accounting practice in some jurisdictions treats own shares held as assets, this is not consistent with the definition of assets in the *Framework* and the conceptual frameworks of other standard-setters, as explained in the Discussion Paper (footnote to paragraph 4.7 of the Discussion Paper, reproduced earlier in the footnote to paragraph BC73).

© IASCF

BC332 Given that treasury shares are treated as an asset in some jurisdictions, it will be necessary to change that accounting treatment when this IFRS is applied, because otherwise an entity would be faced with two expense items—an expense arising from the share-based payment transaction (for the consumption of goods and services received as consideration for the issue of an equity instrument) and another expense arising from the write-down of the 'asset' for treasury shares issued or transferred to employees at an exercise price that is less than their purchase price.

BC333 Hence, the Board concluded that the requirements in the relevant paragraphs of IAS 32 regarding treasury shares should also be applied to treasury shares purchased, sold, issued or cancelled in connection with employee share plans or other share-based payment arrangements.

Guidance on implementing IFRS 2 *Share-based Payment*

This guidance accompanies, but is not part of, IFRS 2.

Definition of grant date

IG1 IFRS 2 defines grant date as the date at which the entity and the employee (or other party providing similar services) agree to a share-based payment arrangement, being when the entity and the counterparty have a shared understanding of the terms and conditions of the arrangement. At grant date the entity confers on the counterparty the right to cash, other assets, or equity instruments of the entity, provided the specified vesting conditions, if any, are met. If that agreement is subject to an approval process (for example, by shareholders), grant date is the date when that approval is obtained.

IG2 As noted above, grant date is when both parties agree to a share-based payment arrangement. The word 'agree' is used in its usual sense, which means that there must be both an offer and acceptance of that offer. Hence, the date at which one party makes an offer to another party is not grant date. The date of grant is when that other party accepts the offer. In some instances, the counterparty explicitly agrees to the arrangement, eg by signing a contract. In other instances, agreement might be implicit, eg for many share-based payment arrangements with employees, the employees' agreement is evidenced by their commencing to render services.

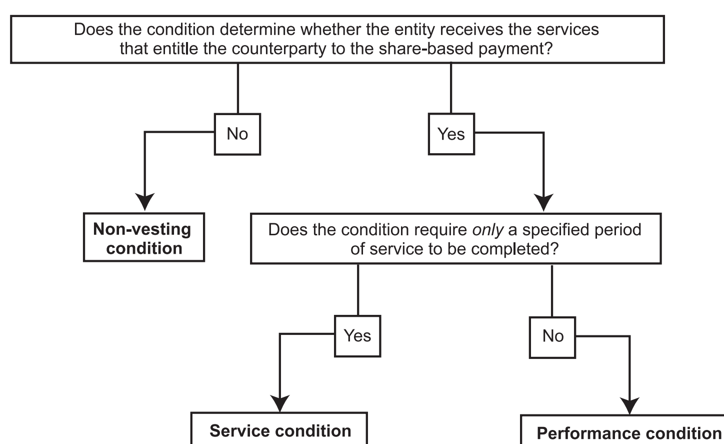
IG3 Furthermore, for both parties to have agreed to the share-based payment arrangement, both parties must have a shared understanding of the terms and conditions of the arrangement. Therefore, if some of the terms and conditions of the arrangement are agreed on one date, with the remainder of the terms and conditions agreed on a later date, then grant date is on that later date, when all of the terms and conditions have been agreed. For example, if an entity agrees to issue share options to an employee, but the exercise price of the options will be set by a compensation committee that meets in three months' time, grant date is when the exercise price is set by the compensation committee.

IG4 In some cases, grant date might occur after the employees to whom the equity instruments were granted have begun rendering services. For example, if a grant of equity instruments is subject to shareholder approval, grant date might occur some months after the employees have begun rendering services in respect of that grant. The IFRS requires the entity to recognise the services when received. In this situation, the entity should estimate the grant date fair value of the equity instruments (eg by estimating the fair value of the equity instruments at the end of the reporting period), for the purposes of recognising the services received during the period between service commencement date and grant date. Once the date of grant has been established, the entity should revise the earlier estimate so that the amounts recognised for services received in respect of the grant are ultimately based on the grant date fair value of the equity instruments.

 © IASCF

Definition of vesting conditions

IG4A IFRS 2 defines vesting conditions as the conditions that determine whether the entity receives the services that entitle the counterparty to receive cash, other assets or equity instruments of the entity under a share-based payment arrangement. The following flowchart illustrates the evaluation of whether a condition is a service or performance condition or a non-vesting condition.



Transactions with parties other than employees

IG5 For transactions with parties other than employees (and others providing similar services) that are measured by reference to the fair value of the equity instruments granted, paragraph 13 of IFRS 2 includes a rebuttable presumption that the fair value of the goods or services received can be estimated reliably. In these situations, paragraph 13 of IFRS 2 requires the entity to measure that fair value at the date the entity obtains the goods or the counterparty renders service.

Transaction in which the entity cannot identify specifically some or all of the goods or services received

IG5A In some cases, however, it might be difficult to demonstrate that goods or services have been (or will be) received. For example, an entity may grant shares to a charitable organisation for nil consideration. It is usually not possible to identify the specific goods or services received in return for such a transaction. A similar situation might arise in transactions with other parties.

IG5B Paragraph 11 of IFRS 2 requires transactions in which share-based payments are made to employees to be measured by reference to the fair value of the share-based payments at grant date.[*] Hence, the entity is not required to measure directly the fair value of the employee services received.

[*] In IFRS 2, all references to employees include others providing similar services.

IG5C It should be noted that the phrase 'the fair value of the share-based payment' refers to the fair value of the particular share-based payment concerned. For example, an entity might be required by government legislation to issue some portion of its shares to nationals of a particular country that may be transferred only to other nationals of that country. Such a transfer restriction may affect the fair value of the shares concerned, and therefore those shares may have a fair value that is less than the fair value of otherwise identical shares that do not carry such restrictions. In this situation, the phrase 'the fair value of the share-based payment' would refer to the fair value of the restricted shares, not the fair value of other, unrestricted shares.

IG5D Paragraph 13A of IFRS 2 specifies how such transactions should be measured. The following example illustrates how the entity should apply the requirements of the IFRS to a transaction in which the entity cannot identify specifically some or all of the goods or services received.

IG Example 1

Share-based payment transaction in which the entity cannot identify specifically some or all of the goods or services received

Background

An entity granted shares with a total fair value of CU100,000[(a)] to parties other than employees who are from a particular section of the community (historically disadvantaged individuals), as a means of enhancing its image as a good corporate citizen. The economic benefits derived from enhancing its corporate image could take a variety of forms, such as increasing its customer base, attracting or retaining employees, or improving or maintaining its ability to tender successfully for business contracts.

The entity cannot identify the specific consideration received. For example, no cash was received and no service conditions were imposed. Therefore, the identifiable consideration (nil) is less than the fair value of the equity instruments granted (CU100,000).

Application of requirements

Although the entity cannot identify the specific goods or services received, the circumstances indicate that goods or services have been (or will be) received, and therefore IFRS 2 applies.

In this situation, because the entity cannot identify the specific goods or services received, the rebuttable presumption in paragraph 13 of IFRS 2, that the fair value of the goods or services received can be estimated reliably, does not apply. The entity should instead measure the goods or services received by reference to the fair value of the equity instruments granted.

(a) In this example, and in all other examples in this guidance, monetary amounts are denominated in 'currency units (CU)'.

 © IASCF

Measurement date for transactions with parties other than employees

IG6 If the goods or services are received on more than one date, the entity should measure the fair value of the equity instruments granted on each date when goods or services are received. The entity should apply that fair value when measuring the goods or services received on that date.

IG7 However, an approximation could be used in some cases. For example, if an entity received services continuously during a three-month period, and its share price did not change significantly during that period, the entity could use the average share price during the three-month period when estimating the fair value of the equity instruments granted.

Transitional arrangements

IG8 In paragraph 54 of IFRS 2, the entity is encouraged, but not required, to apply the requirements of the IFRS to other grants of equity instruments (ie grants other than those specified in paragraph 53 of the IFRS), if the entity has disclosed publicly the fair value of those equity instruments, measured at the measurement date. For example, such equity instruments include equity instruments for which the entity has disclosed in the notes to its financial statements the information required in the US by SFAS 123 *Accounting for Stock-based Compensation*.

Equity-settled share-based payment transactions

IG9 For equity-settled transactions measured by reference to the fair value of the equity instruments granted, paragraph 19 of IFRS 2 states that vesting conditions, other than market conditions,[*] are not taken into account when estimating the fair value of the shares or share options at the measurement date (ie grant date, for transactions with employees and others providing similar services). Instead, vesting conditions are taken into account by adjusting the number of equity instruments included in the measurement of the transaction amount so that, ultimately, the amount recognised for goods or services received as consideration for the equity instruments granted is based on the number of equity instruments that eventually vest. Hence, on a cumulative basis, no amount is recognised for goods or services received if the equity instruments granted do not vest because of failure to satisfy a vesting condition, eg the counterparty fails to complete a specified service period, or a performance condition is not satisfied. This accounting method is known as the modified grant date method, because the number of equity instruments included in the determination of the transaction amount is adjusted to reflect the outcome of the vesting conditions, but no adjustment is made to the fair value of those equity instruments. That fair value is estimated at grant date (for transactions with employees and others providing similar services) and not subsequently revised. Hence, neither increases nor decreases in the fair value of the equity instruments after grant date are taken

[*] In the remainder of this paragraph, the discussion of vesting conditions excludes market conditions, which are subject to the requirements of paragraph 21 of IFRS 2.

© IASCF

into account when determining the transaction amount (other than in the context of measuring the incremental fair value transferred if a grant of equity instruments is subsequently modified).

IG10 To apply these requirements, paragraph 20 of IFRS 2 requires the entity to recognise the goods or services received during the vesting period based on the best available estimate of the number of equity instruments expected to vest and to revise that estimate, if necessary, if subsequent information indicates that the number of equity instruments expected to vest differs from previous estimates. On vesting date, the entity revises the estimate to equal the number of equity instruments that ultimately vested (subject to the requirements of paragraph 21 concerning market conditions).

IG11 In the examples below, the share options granted all vest at the same time, at the end of a specified period. In some situations, share options or other equity instruments granted might vest in instalments over the vesting period. For example, suppose an employee is granted 100 share options, which will vest in instalments of 25 share options at the end of each year over the next four years. To apply the requirements of the IFRS, the entity should treat each instalment as a separate share option grant, because each instalment has a different vesting period, and hence the fair value of each instalment will differ (because the length of the vesting period affects, for example, the likely timing of cash flows arising from the exercise of the options).

IG Example 1A

Background

An entity grants 100 share options to each of its 500 employees. Each grant is conditional upon the employee working for the entity over the next three years. The entity estimates that the fair value of each share option is CU15.

On the basis of a weighted average probability, the entity estimates that 20 per cent of employees will leave during the three-year period and therefore forfeit their rights to the share options.

Application of requirements

Scenario 1

If everything turns out exactly as expected, the entity recognises the following amounts during the vesting period, for services received as consideration for the share options.

Year	Calculation	Remuneration expense for period CU	Cumulative remuneration expense CU
1	50,000 options × 80% × CU15 × ⅓ years	200,000	200,000
2	(50,000 options × 80% × CU15 × ⅔ years) – CU200,000	200,000	400,000
3	(50,000 options × 80% × CU15 × 3⁄3 years) – CU400,000	200,000	600,000

continued...

 © IASCF

...continued
IG Example 1A

<u>Scenario 2</u>

During year 1, 20 employees leave. The entity revises its estimate of total employee departures over the three-year period from 20 per cent (100 employees) to 15 per cent (75 employees). During year 2, a further 22 employees leave. The entity revises its estimate of total employee departures over the three-year period from 15 per cent to 12 per cent (60 employees). During year 3, a further 15 employees leave. Hence, a total of 57 employees forfeited their rights to the share options during the three-year period, and a total of 44,300 share options (443 employees × 100 options per employee) vested at the end of year 3.

Year	Calculation	Remuneration expense for period	Cumulative remuneration expense
		CU	CU
1	50,000 options × 85% × CU15 × ⅓ years	212,500	212,500
2	(50,000 options × 88% × CU15 × ⅔ years) – CU212,500	227,500	440,000
3	(44,300 options × CU15) – CU440,000	224,500	664,500

IG12 In Example 1A, the share options were granted conditionally upon the employees' completing a specified service period. In some cases, a share option or share grant might also be conditional upon the achievement of a specified performance target. Examples 2, 3 and 4 illustrate the application of the IFRS to share option or share grants with performance conditions (other than market conditions, which are discussed in paragraph IG13 and illustrated in Examples 5 and 6). In Example 2, the length of the vesting period varies, depending on when the performance condition is satisfied. Paragraph 15 of the IFRS requires the entity to estimate the length of the expected vesting period, based on the most likely outcome of the performance condition, and to revise that estimate, if necessary, if subsequent information indicates that the length of the vesting period is likely to differ from previous estimates.

IG Example 2

Grant with a performance condition, in which the length of the vesting period varies

Background

At the beginning of year 1, the entity grants 100 shares each to 500 employees, conditional upon the employees' remaining in the entity's employ during the vesting period. The shares will vest at the end of year 1 if the entity's earnings increase by more than 18 per cent; at the end of year 2 if the entity's earnings increase by more than an average of 13 per cent per year over the two-year period; and at the end of year 3 if the entity's earnings increase by more than an average of 10 per cent per year over the three-year period. The shares have a fair value of CU30 per share at the start of year 1, which equals the share price at grant date. No dividends are expected to be paid over the three-year period.

By the end of year 1, the entity's earnings have increased by 14 per cent, and 30 employees have left. The entity expects that earnings will continue to increase at a similar rate in year 2, and therefore expects that the shares will vest at the end of year 2. The entity expects, on the basis of a weighted average probability, that a further 30 employees will leave during year 2, and therefore expects that 440 employees will vest in 100 shares each at the end of year 2.

By the end of year 2, the entity's earnings have increased by only 10 per cent and therefore the shares do not vest at the end of year 2. 28 employees have left during the year. The entity expects that a further 25 employees will leave during year 3, and that the entity's earnings will increase by at least 6 per cent, thereby achieving the average of 10 per cent per year.

By the end of year 3, 23 employees have left and the entity's earnings had increased by 8 per cent, resulting in an average increase of 10.67 per cent per year. Therefore, 419 employees received 100 shares at the end of year 3.

Application of requirements

Year	Calculation	Remuneration expense for period	Cumulative remuneration expense
		CU	CU
1	440 employees × 100 shares × CU30 × ½	660,000	660,000
2	(417 employees × 100 shares × CU30 × ⅔) – CU660,000	174,000	834,000
3	(419 employees × 100 shares × CU30 × 3⁄3) – CU834,000	423,000	1,257,000

© IASCF

IG Example 3

Grant with a performance condition, in which the number of equity instruments varies

Background

At the beginning of year 1, Entity A grants share options to each of its 100 employees working in the sales department. The share options will vest at the end of year 3, provided that the employees remain in the entity's employ, and provided that the volume of sales of a particular product increases by at least an average of 5 per cent per year. If the volume of sales of the product increases by an average of between 5 per cent and 10 per cent per year, each employee will receive 100 share options. If the volume of sales increases by an average of between 10 per cent and 15 per cent each year, each employee will receive 200 share options. If the volume of sales increases by an average of 15 per cent or more, each employee will receive 300 share options.

On grant date, Entity A estimates that the share options have a fair value of CU20 per option. Entity A also estimates that the volume of sales of the product will increase by an average of between 10 per cent and 15 per cent per year, and therefore expects that, for each employee who remains in service until the end of year 3, 200 share options will vest. The entity also estimates, on the basis of a weighted average probability, that 20 per cent of employees will leave before the end of year 3.

By the end of year 1, seven employees have left and the entity still expects that a total of 20 employees will leave by the end of year 3. Hence, the entity expects that 80 employees will remain in service for the three-year period. Product sales have increased by 12 per cent and the entity expects this rate of increase to continue over the next 2 years.

By the end of year 2, a further five employees have left, bringing the total to 12 to date. The entity now expects only three more employees will leave during year 3, and therefore expects a total of 15 employees will have left during the three-year period, and hence 85 employees are expected to remain. Product sales have increased by 18 per cent, resulting in an average of 15 per cent over the two years to date. The entity now expects that sales will average 15 per cent or more over the three-year period, and hence expects each sales employee to receive 300 share options at the end of year 3.

By the end of year 3, a further two employees have left. Hence, 14 employees have left during the three-year period, and 86 employees remain. The entity's sales have increased by an average of 16 per cent over the three years. Therefore, each of the 86 employees receives 300 share options.

continued...

...continued

IG Example 3

Application of requirements

Year	Calculation	Remuneration expense for period	Cumulative remuneration expense
		CU	CU
1	80 employees × 200 options × CU20 × ⅓	106,667	106,667
2	(85 employees × 300 options × CU20 × ⅔) – CU106,667	233,333	340,000
3	(86 employees × 300 options × CU20 × ³⁄₃) – CU340,000	176,000	516,000

IG Example 4

Grant with a performance condition, in which the exercise price varies

Background

At the beginning of year 1, an entity grants to a senior executive 10,000 share options, conditional upon the executive's remaining in the entity's employ until the end of year 3. The exercise price is CU40. However, the exercise price drops to CU30 if the entity's earnings increase by at least an average of 10 per cent per year over the three-year period.

On grant date, the entity estimates that the fair value of the share options, with an exercise price of CU30, is CU16 per option. If the exercise price is CU40, the entity estimates that the share options have a fair value of CU12 per option.

During year 1, the entity's earnings increased by 12 per cent, and the entity expects that earnings will continue to increase at this rate over the next two years. The entity therefore expects that the earnings target will be achieved, and hence the share options will have an exercise price of CU30.

During year 2, the entity's earnings increased by 13 per cent, and the entity continues to expect that the earnings target will be achieved.

During year 3, the entity's earnings increased by only 3 per cent, and therefore the earnings target was not achieved. The executive completes three years' service, and therefore satisfies the service condition. Because the earnings target was not achieved, the 10,000 vested share options have an exercise price of CU40.

continued...

 © IASCF

...continued
IG Example 4

Application of requirements

Because the exercise price varies depending on the outcome of a performance condition that is not a market condition, the effect of that performance condition (ie the possibility that the exercise price might be CU40 and the possibility that the exercise price might be CU30) is not taken into account when estimating the fair value of the share options at grant date. Instead, the entity estimates the fair value of the share options at grant date under each scenario (ie exercise price of CU40 and exercise price of CU30) and ultimately revises the transaction amount to reflect the outcome of that performance condition, as illustrated below.

Year	Calculation	Remuneration expense for period	Cumulative remuneration expense
		CU	CU
1	10,000 options × CU16 × ⅓	53,333	53,333
2	(10,000 options × CU16 × ⅔) – CU53,333	53,334	106,667
3	(10,000 options × CU12 × 3/3) – CU106,667	13,333	120,000

IG13 Paragraph 21 of the IFRS requires market conditions, such as a target share price upon which vesting (or exercisability) is conditional, to be taken into account when estimating the fair value of the equity instruments granted. Therefore, for grants of equity instruments with market conditions, the entity recognises the goods or services received from a counterparty who satisfies all other vesting conditions (eg services received from an employee who remains in service for the specified period of service), irrespective of whether that market condition is satisfied. Example 5 illustrates these requirements.

IG Example 5

Grant with a market condition

Background

At the beginning of year 1, an entity grants to a senior executive 10,000 share options, conditional upon the executive remaining in the entity's employ until the end of year 3. However, the share options cannot be exercised unless the share price has increased from CU50 at the beginning of year 1 to above CU65 at the end of year 3. If the share price is above CU65 at the end of year 3, the share options can be exercised at any time during the next seven years, ie by the end of year 10.

The entity applies a binomial option pricing model, which takes into account the possibility that the share price will exceed CU65 at the end of year 3 (and hence the share options become exercisable) and the possibility that the share price will not exceed CU65 at the end of year 3 (and hence the options will be forfeited). It estimates the fair value of the share options with this market condition to be CU24 per option.

Application of requirements

Because paragraph 21 of the IFRS requires the entity to recognise the services received from a counterparty who satisfies all other vesting conditions (eg services received from an employee who remains in service for the specified service period), irrespective of whether that market condition is satisfied, it makes no difference whether the share price target is achieved. The possibility that the share price target might not be achieved has already been taken into account when estimating the fair value of the share options at grant date. Therefore, if the entity expects the executive to complete the three-year service period, and the executive does so, the entity recognises the following amounts in years 1, 2 and 3:

Year	Calculation	Remuneration expense for period	Cumulative remuneration expense
		CU	CU
1	10,000 options × CU24 × ⅓	80,000	80,000
2	(10,000 options × CU24 × ⅔) – CU80,000	80,000	160,000
3	(10,000 options × CU24) – CU160,000	80,000	240,000

As noted above, these amounts are recognised irrespective of the outcome of the market condition. However, if the executive left during year 2 (or year 3), the amount recognised during year 1 (and year 2) would be reversed in year 2 (or year 3). This is because the service condition, in contrast to the market condition, was not taken into account when estimating the fair value of the share options at grant date. Instead, the service condition is taken into account by adjusting the transaction amount to be based on the number of equity instruments that ultimately vest, in accordance with paragraphs 19 and 20 of the IFRS.

© IASCF

IG14 In Example 5, the outcome of the market condition did not change the length of the vesting period. However, if the length of the vesting period varies depending on when a performance condition is satisfied, paragraph 15 of the IFRS requires the entity to presume that the services to be rendered by the employees as consideration for the equity instruments granted will be received in the future, over the expected vesting period. The entity is required to estimate the length of the expected vesting period at grant date, based on the most likely outcome of the performance condition. If the performance condition is a market condition, the estimate of the length of the expected vesting period must be consistent with the assumptions used in estimating the fair value of the share options granted, and is not subsequently revised. Example 6 illustrates these requirements.

IG Example 6

Grant with a market condition, in which the length of the vesting period varies

Background

At the beginning of year 1, an entity grants 10,000 share options with a ten-year life to each of ten senior executives. The share options will vest and become exercisable immediately if and when the entity's share price increases from CU50 to CU70, provided that the executive remains in service until the share price target is achieved.

The entity applies a binomial option pricing model, which takes into account the possibility that the share price target will be achieved during the ten-year life of the options, and the possibility that the target will not be achieved. The entity estimates that the fair value of the share options at grant date is CU25 per option. From the option pricing model, the entity determines that the mode of the distribution of possible vesting dates is five years. In other words, of all the possible outcomes, the most likely outcome of the market condition is that the share price target will be achieved at the end of year 5. Therefore, the entity estimates that the expected vesting period is five years. The entity also estimates that two executives will have left by the end of year 5, and therefore expects that 80,000 share options (10,000 share options × 8 executives) will vest at the end of year 5.

Throughout years 1–4, the entity continues to estimate that a total of two executives will leave by the end of year 5. However, in total three executives leave, one in each of years 3, 4 and 5. The share price target is achieved at the end of year 6. Another executive leaves during year 6, before the share price target is achieved.

continued...

© IASCF

...continued
IG Example 6

Application of requirements

Paragraph 15 of the IFRS requires the entity to recognise the services received over the expected vesting period, as estimated at grant date, and also requires the entity not to revise that estimate. Therefore, the entity recognises the services received from the executives over years 1–5. Hence, the transaction amount is ultimately based on 70,000 share options (10,000 share options × 7 executives who remain in service at the end of year 5).

Although another executive left during year 6, no adjustment is made, because the executive had already completed the expected vesting period of five years. Therefore, the entity recognises the following amounts in years 1–5:

Year	Calculation	Remuneration expense for period	Cumulative remuneration expense
		CU	CU
1	80,000 options × CU25 × ⅕	400,000	400,000
2	(80,000 options × CU25 × ⅖) – CU400,000	400,000	800,000
3	(80,000 options × CU25 × ⅗) – CU800,000	400,000	1,200,000
4	(80,000 options × CU25 × ⅘) – CU1,200,000	400,000	1,600,000
5	(70,000 options × CU25) – CU1,600,000	150,000	1,750,000

IG15 Paragraphs 26–29 and B42–B44 of the IFRS set out requirements that apply if a share option is repriced (or the entity otherwise modifies the terms or conditions of a share-based payment arrangement). Examples 7–9 illustrate some of these requirements.

IG Example 7

Grant of share options that are subsequently repriced

Background

At the beginning of year 1, an entity grants 100 share options to each of its 500 employees. Each grant is conditional upon the employee remaining in service over the next three years. The entity estimates that the fair value of each option is CU15. On the basis of a weighted average probability, the entity estimates that 100 employees will leave during the three-year period and therefore forfeit their rights to the share options.

continued...

 © IASCF

...continued

IG Example 7

Suppose that 40 employees leave during year 1. Also suppose that by the end of year 1, the entity's share price has dropped, and the entity reprices its share options, and that the repriced share options vest at the end of year 3. The entity estimates that a further 70 employees will leave during years 2 and 3, and hence the total expected employee departures over the three-year vesting period is 110 employees. During year 2, a further 35 employees leave, and the entity estimates that a further 30 employees will leave during year 3, to bring the total expected employee departures over the three-year vesting period to 105 employees. During year 3, a total of 28 employees leave, and hence a total of 103 employees ceased employment during the vesting period. For the remaining 397 employees, the share options vested at the end of year 3.

The entity estimates that, at the date of repricing, the fair value of each of the original share options granted (ie before taking into account the repricing) is CU5 and that the fair value of each repriced share option is CU8.

Application of requirements

Paragraph 27 of the IFRS requires the entity to recognise the effects of modifications that increase the total fair value of the share-based payment arrangement or are otherwise beneficial to the employee. If the modification increases the fair value of the equity instruments granted (eg by reducing the exercise price), measured immediately before and after the modification, paragraph B43(a) of Appendix B requires the entity to include the incremental fair value granted (ie the difference between the fair value of the modified equity instrument and that of the original equity instrument, both estimated as at the date of the modification) in the measurement of the amount recognised for services received as consideration for the equity instruments granted. If the modification occurs during the vesting period, the incremental fair value granted is included in the measurement of the amount recognised for services received over the period from the modification date until the date when the modified equity instruments vest, in addition to the amount based on the grant date fair value of the original equity instruments, which is recognised over the remainder of the original vesting period.

The incremental value is CU3 per share option (CU8 – CU5). This amount is recognised over the remaining two years of the vesting period, along with remuneration expense based on the original option value of CU15.

The amounts recognised in years 1–3 are as follows:

Year	Calculation	Remuneration expense for period	Cumulative remuneration expense
		CU	CU
1	(500 – 110) employees × 100 options × CU15 × ⅓	195,000	195,000
2	(500 – 105) employees × 100 options × (CU15 × ⅔ + CU3 × ½) – CU195,000	259,250	454,250
3	(500 – 103) employees × 100 options × (CU15 + CU3) – CU454,250	260,350	714,600

IG Example 8

Grant of share options with a vesting condition that is subsequently modified

Background

At the beginning of year 1, the entity grants 1,000 share options to each member of its sales team, conditional upon the employee's remaining in the entity's employ for three years, and the team selling more than 50,000 units of a particular product over the three-year period. The fair value of the share options is CU15 per option at the date of grant.

During year 2, the entity increases the sales target to 100,000 units. By the end of year 3, the entity has sold 55,000 units, and the share options are forfeited. Twelve members of the sales team have remained in service for the three-year period.

Application of requirements

Paragraph 20 of the IFRS requires, for a performance condition that is not a market condition, the entity to recognise the services received during the vesting period based on the best available estimate of the number of equity instruments expected to vest and to revise that estimate, if necessary, if subsequent information indicates that the number of equity instruments expected to vest differs from previous estimates. On vesting date, the entity revises the estimate to equal the number of equity instruments that ultimately vested. However, paragraph 27 of the IFRS requires, irrespective of any modifications to the terms and conditions on which the equity instruments were granted, or a cancellation or settlement of that grant of equity instruments, the entity to recognise, as a minimum, the services received, measured at the grant date fair value of the equity instruments granted, unless those equity instruments do not vest because of failure to satisfy a vesting condition (other than a market condition) that was specified at grant date. Furthermore, paragraph B44(c) of Appendix B specifies that, if the entity modifies the vesting conditions in a manner that is not beneficial to the employee, the entity does not take the modified vesting conditions into account when applying the requirements of paragraphs 19–21 of the IFRS.

Therefore, because the modification to the performance condition made it less likely that the share options will vest, which was not beneficial to the employee, the entity takes no account of the modified performance condition when recognising the services received. Instead, it continues to recognise the services received over the three-year period based on the original vesting conditions. Hence, the entity ultimately recognises cumulative remuneration expense of CU180,000 over the three-year period (12 employees × 1,000 options × CU15).

The same result would have occurred if, instead of modifying the performance target, the entity had increased the number of years of service required for the share options to vest from three years to ten years. Because such a modification would make it less likely that the options will vest, which would not be beneficial to the employees, the entity would take no account of the modified service condition when recognising the services received. Instead, it would recognise the services received from the twelve employees who remained in service over the original three-year vesting period.

© IASCF

IG Example 9

Grant of shares, with a cash alternative subsequently added

Background

At the beginning of year 1, the entity grants 10,000 shares with a fair value of CU33 per share to a senior executive, conditional upon the completion of three years' service. By the end of year 2, the share price has dropped to CU25 per share. At that date, the entity adds a cash alternative to the grant, whereby the executive can choose whether to receive 10,000 shares or cash equal to the value of 10,000 shares on vesting date. The share price is CU22 on vesting date.

Application of requirements

Paragraph 27 of the IFRS requires, irrespective of any modifications to the terms and conditions on which the equity instruments were granted, or a cancellation or settlement of that grant of equity instruments, the entity to recognise, as a minimum, the services received measured at the grant date fair value of the equity instruments granted, unless those equity instruments do not vest because of failure to satisfy a vesting condition (other than a market condition) that was specified at grant date. Therefore, the entity recognises the services received over the three-year period, based on the grant date fair value of the shares.

Furthermore, the addition of the cash alternative at the end of year 2 creates an obligation to settle in cash. In accordance with the requirements for cash-settled share-based payment transactions (paragraphs 30–33 of the IFRS), the entity recognises the liability to settle in cash at the modification date, based on the fair value of the shares at the modification date and the extent to which the specified services have been received. Furthermore, the entity remeasures the fair value of the liability at the end of each reporting period and at the date of settlement, with any changes in fair value recognised in profit or loss for the period. Therefore, the entity recognises the following amounts:

continued...

...continued

IG Example 9

Year	Calculation	Expense	Equity	Liability
		CU	CU	CU
1	Remuneration expense for year: 10,000 shares × CU33 × ⅓	110,000	110,000	
2	Remuneration expense for year: (10,000 shares × CU33 × ⅔) – CU110,000	110,000	110,000	
	Reclassify equity to liabilities: 10,000 shares × CU25 × ⅔		(166,667)	166,667
3	Remuneration expense for year: (10,000 shares × CU33 × ³⁄₃) – CU220,000	110,000	26,667[(a)]	83,333[(a)]
	Adjust liability to closing fair value: (CU166,667 + CU83,333) – (CU22 × 10,000 shares)	(30,000)		(30,000)
	Total	300,000	80,000	220,000

(a) Allocated between liabilities and equity, to bring in the final third of the liability based on the fair value of the shares as at the date of the modification.

IG15A If a share-based payment has a non-vesting condition that the counterparty can choose not to meet and the counterparty does not meet that non-vesting condition during the vesting period, paragraph 28A of the IFRS requires that event to be treated as a cancellation. Example 9A illustrates the accounting for this type of event.

IG Example 9A

Share-based payment with vesting and non-vesting conditions when the counterparty can choose whether the non-vesting condition is met

Background

An entity grants an employee the opportunity to participate in a plan in which the employee obtains share options if he agrees to save 25 per cent of his monthly salary of CU400 for a three-year period. The monthly payments are made by deduction from the employee's salary. The employee may use the accumulated savings to exercise his options at the end of three years, or take a refund of his contributions at any point during the three-year period. The estimated annual expense for the share-based payment arrangement is CU120.

After 18 months, the employee stops paying contributions to the plan and takes a refund of contributions paid to date of CU1,800.

IG Example 9A

Application of requirements

There are three components to this plan: paid salary, salary deduction paid to the savings plan and share-based payment. The entity recognises an expense in respect of each component and a corresponding increase in liability or equity as appropriate. The requirement to pay contributions to the plan is a non-vesting condition, which the employee chooses not to meet in the second year. Therefore, in accordance with paragraphs 28(b) and 28A of the IFRS, the repayment of contributions is treated as an extinguishment of the liability and the cessation of contributions in year 2 is treated as a cancellation.

YEAR 1	Expense	Cash	Liability	Equity
	CU	CU	CU	CU
Paid salary	3,600 (75% × 400 × 12)	(3,600)		
Salary deduction paid to the savings plan	1,200 (25% × 400 × 12)		(1,200)	
Share-based payment	120			(120)
Total	4,920	(3,600)	(1,200)	(120)

YEAR 2	Expense	Cash	Liability	Equity
	CU	CU	CU	CU
Paid salary	4,200 (75% × 400 × 6 + 100% × 400 × 6)	(4,200)		
Salary deduction paid to the savings plan	600 (25% × 400 × 6)		(600)	
Refund of contributions to the employee		(1,800)	1,800	
Share-based payment (acceleration of remaining expense)	240 (120 × 3 – 120)			(240)
Total	5,040	(6,000)	1,200	(240)

IG16 Paragraph 24 of the IFRS requires that, in rare cases only, in which the IFRS requires the entity to measure an equity-settled share-based payment transaction by reference to the fair value of the equity instruments granted, but the entity is unable to estimate reliably that fair value at the specified measurement date (eg grant date, for transactions with employees), the entity shall instead measure the transaction using an intrinsic value measurement method. Paragraph 24 also contains requirements on how to apply this method. The following example illustrates these requirements.

IG Example 10

Grant of share options that is accounted for by applying the intrinsic value method

Background

At the beginning of year 1, an entity grants 1,000 share options to 50 employees. The share options will vest at the end of year 3, provided the employees remain in service until then. The share options have a life of 10 years. The exercise price is CU60 and the entity's share price is also CU60 at the date of grant.

At the date of grant, the entity concludes that it cannot estimate reliably the fair value of the share options granted.

At the end of year 1, three employees have ceased employment and the entity estimates that a further seven employees will leave during years 2 and 3. Hence, the entity estimates that 80 per cent of the share options will vest.

Two employees leave during year 2, and the entity revises its estimate of the number of share options that it expects will vest to 86 per cent.

Two employees leave during year 3. Hence, 43,000 share options vested at the end of year 3.

The entity's share price during years 1–10, and the number of share options exercised during years 4–10, are set out below. Share options that were exercised during a particular year were all exercised at the end of that year.

continued...

 © IASCF

...continued

IG Example 10

Year	Share price at year-end	Number of share options exercised at year-end
1	63	0
2	65	0
3	75	0
4	88	6,000
5	100	8,000
6	90	5,000
7	96	9,000
8	105	8,000
9	108	5,000
10	115	2,000

Application of requirements

In accordance with paragraph 24 of the IFRS, the entity recognises the following amounts in years 1–10.

Year	Calculation	Expense for period	Cumulative expense
		CU	CU
1	50,000 options × 80% × (CU63 – CU60) × ⅓ years	40,000	40,000
2	50,000 options × 86% × (CU65 – CU60) × ⅔ years – CU40,000	103,333	143,333
3	43,000 options × (CU75 – CU60) – CU143,333	501,667	645,000
4	37,000 outstanding options × (CU88 – CU75) + 6,000 exercised options × (CU88 – CU75)	559,000	1,204,000
5	29,000 outstanding options × (CU100 – CU88) + 8,000 exercised options × (CU100 – CU88)	444,000	1,648,000
6	24,000 outstanding options × (CU90 – CU100) + 5,000 exercised options × (CU90 – CU100)	(290,000)	1,358,000
7	15,000 outstanding options × (CU96 – CU90) + 9,000 exercised options × (CU96 – CU90)	144,000	1,502,000
8	7,000 outstanding options × (CU105 – CU96) + 8,000 exercised options × (CU105 – CU96)	135,000	1,637,000
9	2,000 outstanding options × (CU108 – CU105) + 5,000 exercised options × (CU108 – CU105)	21,000	1,658,000
10	2,000 exercised options × (CU115 – CU108)	14,000	1,672,000

IG17 There are many different types of employee share and share option plans. The following example illustrates the application of IFRS 2 to one particular type of plan—an employee share purchase plan. Typically, an employee share purchase plan provides employees with the opportunity to purchase the entity's shares at a discounted price. The terms and conditions under which employee share purchase plans operate differ from country to country. That is to say, not only are there many different types of employee share and share options plans, there are also many different types of employee share purchase plans. Therefore, the following example illustrates the application of IFRS 2 to one specific employee share purchase plan.

IG Example 11

Employee share purchase plan

Background

An entity offers all its 1,000 employees the opportunity to participate in an employee share purchase plan. The employees have two weeks to decide whether to accept the offer. Under the terms of the plan, the employees are entitled to purchase a maximum of 100 shares each. The purchase price will be 20 per cent less than the market price of the entity's shares at the date the offer is accepted, and the purchase price must be paid immediately upon acceptance of the offer. All shares purchased must be held in trust for the employees, and cannot be sold for five years. The employee is not permitted to withdraw from the plan during that period. For example, if the employee ceases employment during the five-year period, the shares must nevertheless remain in the plan until the end of the five-year period. Any dividends paid during the five-year period will be held in trust for the employees until the end of the five-year period.

In total, 800 employees accept the offer and each employee purchases, on average, 80 shares, ie the employees purchase a total of 64,000 shares. The weighted-average market price of the shares at the purchase date is CU30 per share, and the weighted-average purchase price is CU24 per share.

Application of requirements

For transactions with employees, IFRS 2 requires the transaction amount to be measured by reference to the fair value of the equity instruments granted (IFRS 2, paragraph 11). To apply this requirement, it is necessary first to determine the type of equity instrument granted to the employees. Although the plan is described as an employee share purchase plan (ESPP), some ESPPs include option features and are therefore, in effect, share option plans. For example, an ESPP might include a 'look-back feature', whereby the employee is able to purchase shares at a discount, and choose whether the discount is applied to the entity's share price at the date of grant or its share price at the date of purchase. Or an ESPP might specify the purchase price, and then allow the employees a significant period of time to decide whether to participate in the plan. Another example of an option feature is an ESPP that permits the participating employees to cancel their participation before or at the end of a specified period and obtain a refund of amounts previously paid into the plan.

continued...

 © IASCF

...continued

IG Example 11

However, in this example, the plan includes no option features. The discount is applied to the share price at the purchase date, and the employees are not permitted to withdraw from the plan.

Another factor to consider is the effect of post-vesting transfer restrictions, if any. Paragraph B3 of IFRS 2 states that, if shares are subject to restrictions on transfer after vesting date, that factor should be taken into account when estimating the fair value of those shares, but only to the extent that the post-vesting restrictions affect the price that a knowledgeable, willing market participant would pay for that share. For example, if the shares are actively traded in a deep and liquid market, post-vesting transfer restrictions may have little, if any, effect on the price that a knowledgeable, willing market participant would pay for those shares.

In this example, the shares are vested when purchased, but cannot be sold for five years after the date of purchase. Therefore, the entity should consider the valuation effect of the five-year post-vesting transfer restriction. This entails using a valuation technique to estimate what the price of the restricted share would have been on the purchase date in an arm's length transaction between knowledgeable, willing parties. Suppose that, in this example, the entity estimates that the fair value of each restricted share is CU28. In this case, the fair value of the equity instruments granted is CU4 per share (being the fair value of the restricted share of CU28 less the purchase price of CU24). Because 64,000 shares were purchased, the total fair value of the equity instruments granted is CU256,000.

In this example, there is no vesting period. Therefore, in accordance with paragraph 14 of IFRS 2, the entity should recognise an expense of CU256,000 immediately.

However, in some cases, the expense relating to an ESPP might not be material. IAS 8 *Accounting Policies, Changes in Accounting Policies and Errors* states that the accounting policies in IFRSs need not be applied when the effect of applying them is immaterial (IAS 8, paragraph 8). IAS 8 also states that an omission or misstatement of an item is material if it could, individually or collectively, influence the economic decisions that users make on the basis of the financial statements. Materiality depends on the size and nature of the omission or misstatement judged in the surrounding circumstances. The size or nature of the item, or a combination of both, could be the determining factor (IAS 8, paragraph 5). Therefore, in this example, the entity should consider whether the expense of CU256,000 is material.

Cash-settled share-based payment transactions

IG18 Paragraphs 30–33 of the IFRS set out requirements for transactions in which an entity acquires goods or services by incurring liabilities to the supplier of those goods or services in amounts based on the price of the entity's shares or other equity instruments. The entity is required to recognise initially the goods or

services acquired, and a liability to pay for those goods or services, when the entity obtains the goods or as the services are rendered, measured at the fair value of the liability. Thereafter, until the liability is settled, the entity is required to recognise changes in the fair value of the liability.

IG19 For example, an entity might grant share appreciation rights to employees as part of their remuneration package, whereby the employees will become entitled to a future cash payment (rather than an equity instrument), based on the increase in the entity's share price from a specified level over a specified period of time. If the share appreciation rights do not vest until the employees have completed a specified period of service, the entity recognises the services received, and a liability to pay for them, as the employees render service during that period. The liability is measured, initially and at the end of each reporting period until settled, at the fair value of the share appreciation rights, by applying an option pricing model, and the extent to which the employees have rendered service to date. Changes in fair value are recognised in profit or loss. Therefore, if the amount recognised for the services received was included in the carrying amount of an asset recognised in the entity's statement of financial position (eg inventory), the carrying amount of that asset is not adjusted for the effects of the liability remeasurement. Example 12 illustrates these requirements.

IG Example 12

Background

An entity grants 100 cash share appreciation rights (SARs) to each of its 500 employees, on condition that the employees remain in its employ for the next three years.

During year 1, 35 employees leave. The entity estimates that a further 60 will leave during years 2 and 3. During year 2, 40 employees leave and the entity estimates that a further 25 will leave during year 3. During year 3, 22 employees leave. At the end of year 3, 150 employees exercise their SARs, another 140 employees exercise their SARs at the end of year 4 and the remaining 113 employees exercise their SARs at the end of year 5.

The entity estimates the fair value of the SARs at the end of each year in which a liability exists as shown below. At the end of year 3, all SARs held by the remaining employees vest. The intrinsic values of the SARs at the date of exercise (which equal the cash paid out) at the end of years 3, 4 and 5 are also shown below.

Year	Fair value	Intrinsic value
1	CU14.40	
2	CU15.50	
3	CU18.20	CU15.00
4	CU21.40	CU20.00
5		CU25.00

continued...

...continued
IG Example 12

Application of requirements

Year	Calculation		Expense	Liability
			CU	CU
1	(500 – 95) employees × 100 SARs × CU14.40 × ⅓		194,400	194,400
2	(500 – 100) employees × 100 SARs × CU15.50 × ⅔ – CU194,400		218,933	413,333
3	(500 – 97 – 150) employees × 100 SARs × CU18.20 – CU413,333	47,127		460,460
	+ 150 employees × 100 SARs × CU15.00	225,000		
	Total		272,127	
4	(253 – 140) employees × 100 SARs × CU21.40 – CU460,460	(218,640)		241,820
	+ 140 employees × 100 SARs × CU20.00	280,000		
	Total		61,360	
5	CU0 – CU241,820	(241,820)		0
	+ 113 employees × 100 SARs × CU25.00	282,500		
	Total		40,680	
	Total		787,500	

Share-based payment arrangements with cash alternatives

IG20 Some employee share-based payment arrangements permit the employee to choose whether to receive cash or equity instruments. In this situation, a compound financial instrument has been granted, ie a financial instrument with debt and equity components. Paragraph 37 of the IFRS requires the entity to estimate the fair value of the compound financial instrument at grant date, by first measuring the fair value of the debt component, and then measuring the fair value of the equity component—taking into account that the employee must forfeit the right to receive cash to receive the equity instrument.

IG21 Typically, share-based payment arrangements with cash alternatives are structured so that the fair value of one settlement alternative is the same as the other. For example, the employee might have the choice of receiving share options or cash share appreciation rights. In such cases, the fair value of the equity component will be zero, and hence the fair value of the compound financial instrument will be the same as the fair value of the debt component.

However, if the fair values of the settlement alternatives differ, usually the fair value of the equity component will be greater than zero, in which case the fair value of the compound financial instrument will be greater than the fair value of the debt component.

IG22 Paragraph 38 of the IFRS requires the entity to account separately for the services received in respect of each component of the compound financial instrument. For the debt component, the entity recognises the services received, and a liability to pay for those services, as the counterparty renders service, in accordance with the requirements applying to cash-settled share-based payment transactions. For the equity component (if any), the entity recognises the services received, and an increase in equity, as the counterparty renders service, in accordance with the requirements applying to equity-settled share-based payment transactions. Example 13 illustrates these requirements.

IG Example 13

Background

An entity grants to an employee the right to choose either 1,000 phantom shares, ie a right to a cash payment equal to the value of 1,000 shares, or 1,200 shares. The grant is conditional upon the completion of three years' service. If the employee chooses the share alternative, the shares must be held for three years after vesting date.

At grant date, the entity's share price is CU50 per share. At the end of years 1, 2 and 3, the share price is CU52, CU55 and CU60 respectively. The entity does not expect to pay dividends in the next three years. After taking into account the effects of the post-vesting transfer restrictions, the entity estimates that the grant date fair value of the share alternative is CU48 per share.

At the end of year 3, the employee chooses:

Scenario 1: The cash alternative

Scenario 2: The equity alternative

continued...

 © IASCF

...continued
IG Example 13

Application of requirements

The fair value of the equity alternative is CU57,600 (1,200 shares × CU48).
The fair value of the cash alternative is CU50,000 (1,000 phantom shares × CU50).
Therefore, the fair value of the equity component of the compound instrument is CU7,600 (CU57,600 – CU50,000).

The entity recognises the following amounts:

Year		Expense	Equity	Liability
		CU	CU	CU
1	Liability component: (1,000 × CU52 × ⅓)	17,333		17,333
	Equity component: (CU7,600 × ⅓)	2,533	2,533	
2	Liability component: (1,000 × CU55 × ⅔) – CU17,333	19,333		19,333
	Equity component: (CU7,600 × ⅓)	2,533	2,533	
3	Liability component: (1,000 × CU60)– CU36,666	23,334		23,334
	Equity component: (CU7,600 × ⅓)	2,534	2,534	
End Year 3	Scenario 1: cash of CU60,000 paid			(60,000)
	Scenario 1 totals	67,600	7,600	0
	Scenario 2: 1,200 shares issued		60,000	(60,000)
	Scenario 2 totals	67,600	67,600	0

Share-based payment transactions among group entities

IG22A Paragraphs 43A and 43B of IFRS 2 specify the accounting requirements for share-based payment transactions among group entities in the separate or individual financial statements of the entity receiving the goods or services. Example 14 illustrates the journal entries in the separate or individual financial statements for a group transaction in which a parent grants rights to its equity instruments to the employees of its subsidiary.

IG Example 14

Share-based payment transactions in which a parent grants rights to its equity instruments to the employees of its subsidiary

Background

A parent grants 200 share options to each of 100 employees of its subsidiary, conditional upon the completion of two years' service with the subsidiary. The fair value of the share options on grant date is CU30 each. At grant date, the subsidiary estimates that 80 per cent of the employees will complete the two-year service period. This estimate does not change during the vesting period. At the end of the vesting period, 81 employees complete the required two years of service. The parent does not require the subsidiary to pay for the shares needed to settle the grant of share options.

Application of requirements

As required by paragraph B53 of the IFRS, over the two-year vesting period, the subsidiary measures the services received from the employees in accordance with the requirements applicable to equity-settled share-based payment transactions. Thus, the subsidiary measures the services received from the employees on the basis of the fair value of the share options at grant date. An increase in equity is recognised as a contribution from the parent in the separate or individual financial statements of the subsidiary.

The journal entries recorded by the subsidiary for each of the two years are as follows:

Year 1		
Dr Remuneration expense (200 × 100 × CU30 × 0.8/2)	CU240,000	
Cr Equity (Contribution from the parent)		CU240,000
Year 2		
Dr Remuneration expense (200 × 100 × CU30 × 0.81 – 240,000)	CU246,000	
Cr Equity (Contribution from the parent)		CU246,000

Illustrative disclosures

IG23 The following example illustrates the disclosure requirements in paragraphs 44–52 of the IFRS.*

Extract from the Notes to the Financial Statements of Company Z for the year ended 31 December 20X5.

Share-based Payment

During the period ended 31 December 20X5, the Company had four share-based payment arrangements, which are described below.

Type of arrangement	Senior management share option plan	General employee share option plan	Executive share plan	Senior management share appreciation cash plan
Date of grant	1 January 20X4	1 January 20X5	1 January 20X5	1 July 20X5
Number granted	50,000	75,000	50,000	25,000
Contractual life	10 years	10 years	N/A	10 years
Vesting conditions	1.5 years' service and achievement of a share price target, which was achieved.	Three years' service.	Three years' service and achievement of a target growth in earnings per share.	Three years' service and achievement of a target increase in market share.

The estimated fair value of each share option granted in the general employee share option plan is CU23.60. This was calculated by applying a binomial option pricing model. The model inputs were the share price at grant date of CU50, exercise price of CU50, expected volatility of 30 per cent, no expected dividends, contractual life of ten years, and a risk-free interest rate of 5 per cent. To allow for the effects of early exercise, it was assumed that the employees would exercise the options after vesting date when the share price was twice the exercise price. Historical volatility was 40 per cent, which includes the early years of the Company's life; the Company expects the volatility of its share price to reduce as it matures.

The estimated fair value of each share granted in the executive share plan is CU50.00, which is equal to the share price at the date of grant.

* Note that the illustrative example is not intended to be a template or model and is therefore not exhaustive. For example, it does not illustrate the disclosure requirements in paragraphs 47(c), 48 and 49 of the IFRS.

© IASCF

Further details of the two share option plans are as follows:

	20X4		20X5	
	Number of options	Weighted average exercise price	Number of options	Weighted average exercise price
Outstanding at start of year	0	–	45,000	CU40
Granted	50,000	CU40	75,000	CU50
Forfeited	(5,000)	CU40	(8,000)	CU46
Exercised	0	–	(4,000)	CU40
Outstanding at end of year	45,000	CU40	108,000	CU46
Exercisable at end of year	0	CU40	38,000	CU40

The weighted average share price at the date of exercise for share options exercised during the period was CU52. The options outstanding at 31 December 20X5 had an exercise price of CU40 or CU50, and a weighted average remaining contractual life of 8.64 years.

	20X4	20X5
	CU	CU
Expense arising from share-based payment transactions	495,000	1,105,867
Expense arising from share and share option plans	495,000	1,007,000
Closing balance of liability for cash share appreciation plan	–	98,867
Expense arising from increase in fair value of liability for cash share appreciation plan	–	9,200

© IASCF

Summary of conditions for a counterparty to receive an equity instrument granted and of accounting treatments

IG24 The table below categorises, with examples, the various conditions that determine whether a counterparty receives an equity instrument granted and the accounting treatment of share-based payments with those conditions.

Summary of conditions that determine whether a counterparty receives an equity instrument granted						
	VESTING CONDITIONS			NON-VESTING CONDITIONS		
	Service conditions	Performance conditions				
		Performance conditions that are market conditions	Other performance conditions	Neither the entity nor the counterparty can choose whether the condition is met	Counterparty can choose whether to meet the condition	Entity can choose whether to meet the condition
Example conditions	Requirement to remain in service for three years	Target based on the market price of the entity's equity instruments	Target based on a successful initial public offering with a specified service requirement	Target based on a commodity index	Paying contributions towards the exercise price of a share-based payment	Continuation of the plan by the entity
Include in grant-date fair value?	No	Yes	No	Yes	Yes	Yes[(a)]
Accounting treatment if the condition is not met after the grant date and during the vesting period	Forfeiture. The entity revises the expense to reflect the best available estimate of the number of equity instruments expected to vest. (paragraph 19)	No change to accounting. The entity continues to recognise the expense over the remainder of the vesting period. (paragraph 21)	Forfeiture. The entity revises the expense to reflect the best available estimate of the number of equity instruments expected to vest. (paragraph 19)	No change to accounting. The entity continues to recognise the expense over the remainder of the vesting period. (paragraph 21A)	Cancellation. The entity recognises immediately the amount of the expense that would otherwise have been recognised over the remainder of the vesting period. (paragraph 28A)	Cancellation. The entity recognises immediately the amount of the expense that would otherwise have been recognised over the remainder of the vesting period. (paragraph 28A)

(a) In the calculation of the fair value of the share-based payment, the probability of continuation of the plan by the entity is assumed to be 100 per cent.

Table of Concordance

This table shows how the contents of IFRIC 8 and IFRIC 11 correspond with IFRS 2 (as amended in 2009).

IFRIC 8 paragraph	IFRS 2 (amended) paragraph	IFRIC 11 paragraph	IFRS 2 (amended) paragraph

BASIS FOR CONCLUSIONS ON IFRS 3 *BUSINESS COMBINATIONS*

BACKGROUND INFORMATION

INTRODUCTION **BC1–BC4**

DEFINITION OF A BUSINESS COMBINATION **BC5–BC21**

Change in terminology **BC14**

Definition of a business **BC15–BC21**

METHOD OF ACCOUNTING FOR BUSINESS COMBINATIONS **BC22–BC57**

Reasons for adopting the acquisition method **BC24–BC28**

Reasons for rejecting the pooling method **BC29–BC54**

Mergers and acquisitions are economically similar BC29–BC35
Information provided is not decision-useful BC36–BC40
Inconsistent with historical cost accounting model BC41–BC43
Disclosure not an adequate response BC44–BC45
Not cost-beneficial BC46–BC48
Perceived economic consequences not a valid reason for retention BC49–BC52
Acquisition method flaws remedied BC53–BC54

The fresh start method **BC55–BC57**

SCOPE **BC58–BC79**

Joint ventures and combinations of entities under common control **BC59–BC61**

Not-for-profit organisations **BC62–BC63**

Combinations of mutual entities **BC64–BC77**

Combinations achieved by contract alone **BC78–BC79**

APPLYING THE ACQUISITION METHOD **BC80–BC400**

Identifying the acquirer **BC82–BC105**

Developing the guidance in SFAS 141 BC84–BC92
Developing the guidance in IFRS 3 BC93–BC101
Identifying an acquirer in a business combination effected through an exchange of equity interests BC94–BC97
Identifying an acquirer if a new entity is formed to effect a business combination BC98–BC101
Convergence and clarification of SFAS 141's and IFRS 3's guidance for identifying the acquirer BC102–BC103
Identifying the acquirer in business combinations involving only mutual entities BC104–BC105

Determining the acquisition date **BC106–BC110**

Recognising and measuring the identifiable assets acquired, the liabilities assumed and any non-controlling interest in the acquiree **BC111–BC311**

Recognition BC111–BC196
Conditions for recognition BC112–BC130
An asset or a liability at the acquisition date BC113–BC114

Part of the business combination BC115–BC124
IFRS 3's criterion on reliability of measurement BC125
IFRS 3's criterion on probability of an inflow or outflow of benefits BC126–BC130
Recognising particular identifiable assets acquired and liabilities assumed BC131–BC184
Liabilities associated with restructuring or exit activities of the acquiree BC132–BC143
Operating leases BC144–BC148
Research and development assets BC149–BC156
Distinguishing identifiable intangible assets from goodwill BC157–BC184
Classifying and designating assets acquired and liabilities assumed BC185–BC188
Recognition, classification and measurement guidance for insurance and reinsurance contracts BC189–BC196
Measurement BC197–BC262
Why establish fair value as the measurement principle? BC198–BC245
Identifiable assets acquired and liabilities assumed BC198–BC204
Non-controlling interests BC205–BC221
Measuring assets and liabilities arising from contingencies, including subsequent measurement BC222–BC245
Definition of fair value BC246–BC251
Measuring the acquisition-date fair values of particular assets acquired BC252–BC262
Assets with uncertain cash flows (valuation allowances) BC252–BC260
Assets that the acquirer intends not to use or to use in a way that is different from the way other market participants would use them BC261–BC262
Exceptions to the recognition or measurement principle BC263–BC311
Exception to the recognition principle BC265–BC278
Assets and liabilities arising from contingencies BC265–BC278
Exceptions to both the recognition and measurement principles BC279–BC303
Income taxes BC279–BC295
Employee benefits BC296–BC300
Indemnification assets BC301–BC303
Exceptions to the measurement principle BC304–BC311
Temporary exception for assets held for sale BC305–BC307
Reacquired rights BC308–BC310
Share-based payment awards BC311

Recognising and measuring goodwill or a gain from a bargain purchase BC312–BC382

Goodwill qualifies as an asset BC313–BC327
Asset definition in the FASB's Concepts Statement 6 BC319–BC321
Asset definition in the IASB's *Framework* BC322–BC323
Relevance of information about goodwill BC324–BC327
Measuring goodwill as a residual BC328–BC336
Using the acquisition-date fair value of consideration to measure goodwill BC330–BC331
Using the acquirer's interest in the acquiree to measure goodwill BC332–BC336
Measuring consideration and determining whether particular items are part of the consideration transferred for the acquiree BC337–BC370
Measurement date for equity securities transferred BC338–BC342
Contingent consideration, including subsequent measurement BC343–BC360

 © IASCF

Subsequent measurement of contingent consideration BC353–BC360
Replacement awards BC361–BC364
Acquisition-related costs BC365–BC370
Bargain purchases BC371–BC381
Distinguishing a bargain purchase from measurement errors BC374–BC378
Distinguishing a bargain purchase from a 'negative goodwill result' BC379–BC381
Overpayments BC382
Additional guidance for particular types of business combinations BC383–BC389
Business combinations achieved in stages BC384–BC389
Measurement period BC390–BC400
DISCLOSURES BC401–BC428
Disclosure requirements of SFAS 141 BC403–BC410
Disclosure of information about the purchase price allocation and pro forma sales and earnings BC403–BC405
Disclosures related to goodwill BC406
Disclosure of information about intangible assets other than goodwill BC407
Other disclosure requirements BC408–BC409
Disclosures in interim financial information BC410
Disclosure requirements of IFRS 3 BC411–BC418
Disclosure requirements of the revised standards BC419–BC422
Disclosure of information about post-combination revenue and profit or loss of the acquiree BC423–BC428
EFFECTIVE DATE AND TRANSITION BC429–BC434
Effective date and transition for combinations of mutual entities or by contract alone BC433–BC434
BENEFITS AND COSTS BC435–BC439
APPENDIX
Amendments to the Basis for Conclusions on other IFRSs

DISSENTING OPINIONS

Basis for Conclusions on IFRS 3 *Business Combinations*

This Basis for Conclusions and its appendix accompany, but are not part of, IFRS 3.

Background information

In 2001 the International Accounting Standards Board began a project to review IAS 22 *Business Combinations* (revised in 1998) as part of its initial agenda, with the objective of improving the quality of, and seeking international convergence on, the accounting for business combinations. The Board decided to address the accounting for business combinations in two phases.

As part of the first phase, the Board published in December 2002 ED 3 *Business Combinations*, together with an exposure draft of proposed related amendments to IAS 36 *Impairment of Assets* and IAS 38 *Intangible Assets*, with a comment deadline of 4 April 2003. The Board received 136 comment letters.

The Board concluded the first phase in March 2004 by issuing simultaneously IFRS 3 *Business Combinations* and revised versions of IAS 36 and IAS 38. The Board's primary conclusion in the first phase was that virtually all business combinations are acquisitions. Accordingly, the Board decided to require the use of one method of accounting for business combinations—the acquisition method.

The US Financial Accounting Standards Board (FASB) also conducted a project on business combinations in multiple phases. The FASB concluded its first phase in June 2001 by issuing FASB Statements No. 141 *Business Combinations* (SFAS 141) and No. 142 *Goodwill and Other Intangible Assets*. The scope of that first phase was similar to IFRS 3 and the FASB reached similar conclusions on the major issues.

The two boards began deliberating the second phase of their projects at about the same time. They decided that a significant improvement could be made to financial reporting if they had similar standards for accounting for business combinations. They therefore agreed to conduct the second phase of the project as a joint effort with the objective of reaching the same conclusions.

The second phase of the project addressed the guidance for applying the acquisition method. In June 2005 the boards published an exposure draft of revisions to IFRS 3 and SFAS 141, together with exposure drafts of related amendments to IAS 27 *Consolidated and Separate Financial Statements* and Accounting Research Bulletin No. 51 *Consolidated Financial Statements*, with a comment deadline of 28 October 2005. The boards received more than 280 comment letters.

The boards concluded the second phase of the project by issuing their revised standards, IFRS 3 *Business Combinations* (as revised in 2008) and FASB Statement No. 141 (revised 2007) *Business Combinations* and the related amendments to IAS 27 and FASB Statement No. 160 *Noncontrolling Interests in Consolidated Financial Statements*.

 © IASCF

Introduction

BC1 This Basis for Conclusions summarises the considerations of the International Accounting Standards Board (IASB) and the US Financial Accounting Standards Board (FASB) in reaching the conclusions in their revised standards, IFRS 3 *Business Combinations* (as revised in 2008) and FASB Statement No. 141 (revised 2007) *Business Combinations* (SFAS 141(R)). It includes the reasons why each board accepted particular approaches and rejected others. Individual board members gave greater weight to some factors than to others.

BC2 The revised IFRS 3 and SFAS 141(R) carry forward without reconsideration the primary conclusions each board reached in IFRS 3 (issued in 2004) and FASB Statement No. 141 (SFAS 141, issued in 2001), both of which were titled *Business Combinations*. The conclusions carried forward include, among others, the requirement to apply the *purchase method* (which the revised standards refer to as the *acquisition method*) to account for all business combinations and the identifiability criteria for recognising an intangible asset separately from goodwill. This Basis for Conclusions includes the reasons for those conclusions, as well as the reasons for the conclusions the boards reached in their joint deliberations that led to the revised standards. Because the provisions of the revised standards on applying the acquisition method represent a more extensive change to SFAS 141 than to the previous version of IFRS 3, this Basis for Conclusions includes more discussion of the FASB's conclusions than of the IASB's in the second phase of their respective business combinations projects.

BC3 In discussing the boards' consideration of comments on exposure drafts, this Basis for Conclusions refers to the exposure draft that preceded the previous version of IFRS 3 as *ED 3* and to the one that preceded SFAS 141 as the *1999 Exposure Draft*; it refers to the joint exposure draft that preceded the revised standards as the *2005 Exposure Draft*. Other exposure drafts published by each board in developing IFRS 3 or SFAS 141 are explained in the context of the issues they addressed. As used in this Basis for Conclusions, *the revised IFRS 3*, *SFAS 141(R)* and *the revised standards* refer to the revised versions of IFRS 3 and SFAS 141; references to *IFRS 3* and *SFAS 141* are to the original versions of those standards.

BC4 The IASB and the FASB concurrently deliberated the issues in the second phase of the project and reached the same conclusions on most of them. The table of differences between the revised IFRS 3 and SFAS 141(R) (presented after the illustrative examples) describes the substantive differences that remain; the most significant difference is the measurement of a non-controlling interest in an acquiree (see paragraphs BC205–BC221). In addition, the application of some provisions of the revised standards on which the boards reached the same conclusions may differ because of differences in:

(a) other accounting standards of the boards to which the revised standards refer. For example, recognition and measurement requirements for a few particular assets acquired (eg a deferred tax asset) and liabilities assumed (eg an employee benefit obligation) refer to existing IFRSs or US generally accepted accounting principles (GAAP) rather than fair value measures.

(b) disclosure practices of the boards. For example, the FASB requires particular supplementary information or particular disclosures by public entities only. The IASB has no similar requirements for supplementary information and does not distinguish between listed and unlisted entities.

(c) particular transition provisions for changes to past accounting practices of US and non-US companies that previously differed.

Definition of a business combination

BC5 The FASB's 1999 Exposure Draft proposed that a *business combination* should be defined as occurring when one entity acquires net assets that constitute a business or acquires equity interests in one or more other entities and thereby obtains control over that entity or entities. Many respondents who commented on the proposed definition said that it would exclude certain transactions covered by APB Opinion No. 16 *Business Combinations* (APB Opinion 16), in particular, transactions in which none of the former shareholder groups of the combining entities obtained control over the combined entity (such as roll-ups, put-togethers and so-called mergers of equals). During its redeliberations of the 1999 Exposure Draft, the FASB concluded that those transactions should be included in the definition of a business combination and in the scope of SFAS 141. Therefore, paragraph 10 of SFAS 141 indicated that it also applied to business combinations in which none of the owners of the combining entities as a group retain or receive a majority of the voting rights of the combined entity. However, the FASB acknowledged at that time that some of those business combinations might not be acquisitions and said that it intended to consider in another project whether business combinations that are not acquisitions should be accounted for using the fresh start method rather than the purchase method.

BC6 IFRS 3 defined a business combination as 'the bringing together of separate entities or businesses into one reporting entity.' In developing IFRS 3, the IASB considered adopting the definition of a business combination in SFAS 141. It did not do so because that definition excluded some forms of combinations encompassed in IAS 22 *Business Combinations* (which IFRS 3 replaced), such as those described in paragraph BC5 in which none of the former shareholder groups of the combining entities obtained control over the combined entity. Accordingly, IFRS 3 essentially retained the definition of a business combination from IAS 22.

BC7 The definition of a business combination was an item of divergence between IFRS 3 and SFAS 141. In addition, the definition in SFAS 141 excluded combinations in which control is obtained by means other than acquiring net assets or equity interests. An objective of the second phase of the FASB's project leading to SFAS 141(R) was to reconsider whether the accounting for a change in control resulting in the acquisition of a business should differ because of the way in which control is obtained.

 © IASCF

BC8 The FASB considered several alternatives for improving the definition of a business combination, including adopting the definition of a business combination in IFRS 3. That definition would encompass all transactions or other events that are within the scope of the revised standards. The FASB concluded, however, that the definition of a business combination in IFRS 3 was too broad for its purposes because it would allow for the inclusion in a business combination of one or more businesses that the acquirer does not control.

BC9 Because the FASB considers all changes of control in which an entity acquires a business to be economically similar transactions or events, it decided to expand the definition of a business combination to include all transactions or other events in which an entity obtains control of a business. Application of the expanded definition will improve the consistency of accounting guidance and the relevance, completeness and comparability of the resulting information about the assets, liabilities and activities of an acquired business.

BC10 The IASB also reconsidered the definition of a business combination. The result was that the IASB and the FASB adopted the same definition. The IASB observed that the IFRS 3 definition could be read to include circumstances in which there may be no triggering economic event or transaction and thus no change in an economic entity, per se. For example, under the IFRS 3 definition, an individual's decision to prepare combined financial statements for all or some of the entities that he or she controls could qualify as a business combination. The IASB concluded that a business combination should be described in terms of an economic event rather than in terms of consolidation accounting and that the definition in the revised standards satisfies that condition.

BC11 The IASB also observed that, although the IFRS 3 definition of a business combination was sufficiently broad to include them, formations of joint ventures were excluded from the scope of IFRS 3. Because joint ventures are also excluded from the scope of the revised standards, the revised definition of a business combination is intended to include all of the types of transactions and other events initially included in the scope of IFRS 3.

BC12 Some respondents to the 2005 Exposure Draft who consider particular combinations of businesses to be 'true mergers' said that the definition of a business combination as a transaction or other event in which an acquirer obtains control of one or more businesses seemed to exclude true mergers. The boards concluded that the most straightforward way of indicating that the scope of the revised standards, and the definition of a business combination, is intended to include true mergers, if any occur, is simply to state that fact.

BC13 Some respondents to the 2005 Exposure Draft also said that it was not clear that the definition of a business combination, and thus the scope of the revised standards, includes reverse acquisitions and perhaps other combinations of businesses. The boards observed that in a reverse acquisition, one entity—the one whose equity interests are acquired—obtains economic (although not legal) control over the other and is therefore the acquirer, as indicated in paragraph B15 of the revised IFRS 3. Therefore, the boards concluded that it is unnecessary to state explicitly that reverse acquisitions are included in the definition of a business combination and thus within the scope of the revised standards.

© IASCF

Change in terminology

BC14 As defined in the revised standards, a business combination could occur in the absence of a purchase transaction. Accordingly, the boards decided to replace the term *purchase method*, which was previously used to describe the method of accounting for business combinations that the revised standards require, with the term *acquisition method*. To avoid confusion, this Basis for Conclusions uses that term throughout, including when it refers to IFRS 3 and SFAS 141 (and earlier exposure drafts or other documents), which used the term *purchase method*.

Definition of a business

BC15 The definition of a business combination in the revised standards provides that a transaction or other event is a business combination only if the assets acquired and liabilities assumed constitute a business (an acquiree), and Appendix A defines a *business*.

BC16 SFAS 141 did not include a definition of a business. Instead, it referred to EITF Issue No. 98-3 *Determining Whether a Nonmonetary Transaction Involves Receipt of Productive Assets or of a Business* for guidance on whether a group of net assets constitutes a business. Some constituents said that particular aspects of the definition and the related guidance in EITF Issue 98-3 were both unnecessarily restrictive and open to misinterpretation. They suggested that the FASB should reconsider that definition and guidance as part of this phase of the project, and it agreed to do so. In addition to considering how its definition and guidance might be improved, the FASB, in conjunction with the IASB, decided that the boards should strive to develop a joint definition of a business.

BC17 Before issuing IFRS 3, the IASB did not have a definition of a business or guidance similar to that in EITF Issue 98-3. Consistently with the suggestions of respondents to ED 3, the IASB decided to provide a definition of a business in IFRS 3. In developing that definition, the IASB also considered the guidance in EITF Issue 98-3. However, the definition in IFRS 3 benefited from deliberations in this project to that date, and it differed from EITF Issue 98-3 in some aspects. For example, the definition in IFRS 3 did not include either of the following factors, both of which were in EITF Issue 98-3:

(a) a requirement that a business be self-sustaining; or

(b) a presumption that a transferred set of activities and assets in the development stage that has not commenced planned principal operations cannot be a business.

BC18 In the second phase of their business combinations projects, both boards considered the suitability of their existing definitions of a business in an attempt to develop an improved, common definition. To address the perceived deficiencies and misinterpretations, the boards modified their respective definitions of a business and clarified the related guidance. The more significant modifications, and the reasons for them, are:

(a) to continue to exclude self-sustaining as the definition in IFRS 3 did, and instead, provide that the integrated set of activities and assets must be **capable** of being conducted and managed for the purpose of providing a

 © IASCF

return in the form of dividends, lower costs or other economic benefits directly to investors or other owners, members or participants. Focusing on the capability to achieve the purposes of the business helps avoid the unduly restrictive interpretations that existed in accordance with the former guidance.

(b) to clarify the meanings of the terms *inputs, processes* and *outputs* that were used in both EITF Issue 98-3 and IFRS 3. Clarifying the meanings of those terms, together with other modifications, helps eliminate the need for extensive detailed guidance and the misinterpretations that sometimes stem from such guidance.

(c) to clarify that inputs and processes applied to those inputs are essential and that although the resulting outputs are normally present, they need not be present. Therefore, an integrated set of assets and activities could qualify as a business if the integrated set is capable of being conducted and managed to produce the resulting outputs. Together with item (a), clarifying that outputs need not be present for an integrated set to be a business helps avoid the unduly restrictive interpretations of the guidance in EITF Issue 98-3.

(d) to clarify that a business need not include all of the inputs or processes that the seller used in operating that business if a market participant is capable of continuing to produce outputs, for example, by integrating the business with its own inputs and processes. This clarification also helps avoid the need for extensive detailed guidance and assessments about whether a missing input or process is minor.

(e) to continue to exclude a presumption that an integrated set in the development stage is not a business merely because it has not yet begun its planned principal operations, as IFRS 3 did. Eliminating that presumption is consistent with focusing on assessing the capability to achieve the purposes of the business (item (a)) and helps avoid the unduly restrictive interpretations that existed with the former guidance.

BC19 The boards also considered whether to include in the revised standards a presumption similar to the one in EITF Issue 98-3 that an asset group is a business if goodwill is present. Some members of the FASB's resource group suggested that that presumption results in circular logic that is not especially useful guidance in practice. Although the boards had some sympathy with those views, they noted that such a presumption could be useful in avoiding interpretations of the definition of a business that would hinder the stated intention of applying the revised standards' guidance to economically similar transactions. The presumption might also simplify the assessment of whether a particular set of activities and assets meets the definition of a business. Therefore, the revised standards' application guidance retains that presumption.

BC20 The boards considered whether to expand the scope of the revised standards to all acquisitions of groups of assets. They noted that doing so would avoid the need to distinguish between those groups that are businesses and those that are not. However, both boards noted that broadening the scope of the revised standards beyond acquisitions of businesses would require further research and deliberation of additional issues and delay the implementation of the revised

standards' improvements to practice. The boards therefore did not extend the scope of the revised standards to acquisitions of all asset groups. Paragraph 2(b) of the revised IFRS 3 describes the typical accounting for an asset acquisition.

BC21 SFAS 141(R) amends FASB Interpretation No. 46 (revised December 2003) *Consolidation of Variable Interest Entities* (FASB Interpretation 46(R)) to clarify that the initial consolidation of a variable interest entity that is a business is a business combination. Therefore, the assets, liabilities and non-controlling interests of the variable interest entity should be measured in accordance with the requirements of SFAS 141(R). Previously, FASB Interpretation 46(R) required assets, liabilities and non-controlling interests of variable interest entities that are businesses to be measured at fair value. The FASB concluded that variable interest entities that are businesses should be afforded the same exceptions to fair value measurement and recognition that are provided for assets and liabilities of acquired businesses. The FASB also decided that upon the initial consolidation of a variable interest entity that is not a business, the assets (other than goodwill), liabilities and non-controlling interests should be recognised and measured in accordance with the requirements of SFAS 141(R), rather than at fair value as previously required by FASB Interpretation 46(R). The FASB reached that decision for the same reasons described above, ie if SFAS 141(R) allows an exception to fair value measurement for a particular asset or liability, it would be inconsistent to require the same type of asset or liability to be measured at fair value. Except for that provision, the FASB did not reconsider the requirements in FASB Interpretation 46(R) for the initial consolidation of a variable interest entity that is not a business.

Method of accounting for business combinations

BC22 Both IAS 22 and APB Opinion 16 permitted use of either the acquisition method or the pooling of interests (pooling) method of accounting for a business combination, although the two methods were not intended as alternatives for the same set of facts and circumstances. ED 3 and the 1999 Exposure Draft proposed, and IFRS 3 and SFAS 141 required, use of the acquisition method to account for all business combinations. The boards did not redeliberate that conclusion during the project that led to the revised standards.

BC23 In developing IFRS 3 and SFAS 141, the IASB and the FASB considered three possible methods of accounting for business combinations—the pooling method, the acquisition method and the fresh start method. In assessing those methods, both boards were mindful of the disadvantages of having more than one method of accounting for business combinations, as evidenced by the experience with IAS 22 and APB Opinion 16. The boards concluded that having more than one method could be justified only if the alternative method (or methods) could be demonstrated to produce information that is more decision-useful and if unambiguous and non-arbitrary boundaries could be established that unequivocally distinguish when one method is to be applied instead of another. The boards also concluded that most business combinations are acquisitions and, for the reasons discussed in paragraphs BC24–BC28, that the acquisition method is the appropriate method for those business combinations. Respondents to ED 3 and the 1999 Exposure Draft generally agreed. Therefore, neither the pooling method nor the fresh start method could be appropriately used for all business combinations.

 © IASCF

Reasons for adopting the acquisition method

BC24 Both boards concluded that the acquisition method is the appropriate method of accounting for all business combinations in which one entity obtains control of one or more other businesses because that method is consistent with how the accounting model generally accounts for transactions in which assets are acquired and liabilities are assumed or incurred. Therefore, it produces information that is comparable with other accounting information.

BC25 The acquisition method views a combination from the perspective of the acquirer—the entity that obtains control of the other combining businesses. The acquirer purchases or otherwise obtains control over net assets and recognises in its financial statements the assets acquired and liabilities assumed, including those not previously recognised by the acquiree. Consequently, users of financial statements are better able to assess the initial investments made and the subsequent performance of those investments and compare them with the performance of other entities. In addition, by initially recognising almost all of the assets acquired and liabilities assumed at their fair values, the acquisition method includes in the financial statements more information about the market's expectation of the value of the future cash flows associated with those assets and liabilities, which enhances the relevance of that information.

BC26 Most of the respondents to ED 3 supported the proposal to eliminate the pooling method and to require all business combinations to be accounted for by applying the acquisition method, pending the IASB's future consideration of whether the fresh start method might be applied to some combinations. Respondents to the 1999 Exposure Draft generally agreed that most business combinations are acquisitions, and many said that all combinations involving only two entities are acquisitions. Respondents also agreed that the acquisition method is the appropriate method of accounting for business combinations in which one of the combining entities obtains control over the other combining entities. However, some qualified their support for the acquisition method as contingent upon the FASB's decisions about some aspects of applying that method, particularly the accounting for goodwill.

BC27 The boards concluded that most business combinations, both two-party transactions and those involving three or more entities (multi-party combinations), are acquisitions. The boards acknowledged that some multi-party combinations (in particular, those that are commonly referred to as roll-up or put-together transactions) might not be acquisitions; however, they noted that the acquisition method has generally been used to account for them. The boards decided not to change that practice at this time. Consequently, the revised standards require the acquisition method to be used to account for all business combinations, including those that some might not consider acquisitions.

BC28 Both boards considered assertions that exceptions to the acquisition method should be provided for circumstances in which identifying the acquirer is difficult. Respondents taking that view generally said that the pooling method would provide better information in those circumstances. Although acknowledging that identifying the acquirer sometimes may be difficult, the boards concluded that it would be practicable to identify an acquirer in all

business combinations. Moreover, in some jurisdictions an acquirer must be identified for tax purposes, regardless of how difficult it may be to do so. Both boards also concluded that in no circumstances does the pooling method provide better information than the acquisition method.

Reasons for rejecting the pooling method

Mergers and acquisitions are economically similar

BC29 Some observers, including some respondents to the ED 3 and to the 1999 Exposure Draft, argued that business combinations in which the predominant form of consideration is equity interests, generally referred to as *mergers*, are different from acquisitions and should be accounted for differently. They said that the pooling method is appropriate for a merger because ownership interests are continued (either completely or substantially), no new capital is invested and no assets are distributed, post-combination ownership interests are proportional to those before the combination, and the intention is to unite commercial strategies. Those respondents said that a merger should be accounted for in terms of the carrying amounts of the assets and liabilities of the combining entities because, unlike acquisitions in which only the acquirer survives the combination, all of the combining entities effectively survive a merger.

BC30 Most respondents who favoured retaining the pooling method also supported limiting its application. Many of those respondents suggested limiting use of the pooling method to 'true mergers' or 'mergers of equals', which they described as combinations of entities of approximately equal size or those in which it is difficult to identify an acquirer.

BC31 The boards also considered the assertion that the pooling method properly portrays true mergers as a transaction between the owners of the combining entities rather than between the combining entities. The boards rejected that assertion, noting that business combinations are initiated by, and take place because of, a transaction between the combining entities themselves. The entities—not their owners—engage in the negotiations necessary to carry out the combination, although the owners must eventually participate in and approve the transaction.

BC32 Many respondents agreed with the boards that although ownership interests are continued in a combination effected by an exchange of equity instruments, those interests **change** as a result of the combination. The former owners of each entity no longer have an exclusive interest in the net assets of the pre-combination entities. Rather, after the business combination, the owners of the combining entities have a residual interest in the net assets of the combined entity. The information provided by the pooling method fails to reflect that and is therefore not a faithful representation.

BC33 Both boards observed that all business combinations entail some bringing together of commercial strategies. Accordingly, the intention to unite commercial strategies is not unique to mergers and does not support applying a different accounting method to some combinations from that applied to others.

© IASCF

BC34 Some respondents said that, economically, mergers are virtually identical to acquisitions, making them in-substance acquisitions. Some noted that shares could have been issued for cash and that cash then used to effect the combination, with the result being economically the same as if shares had been used to effect the combination.

BC35 Both boards concluded that 'true mergers' or 'mergers of equals' in which none of the combining entities obtains control of the others are so rare as to be virtually non-existent, and many respondents agreed. Other respondents stated that even if a true merger or merger of equals did occur, it would be so rare that a separate accounting treatment is not warranted. The boards also observed that respondents and other constituents were unable to suggest an unambiguous and non-arbitrary boundary for distinguishing true mergers or mergers of equals from other business combinations and concluded that developing such an operational boundary would not be feasible. Moreover, even if those mergers could feasibly be distinguished from other combinations, both boards noted that it does not follow that mergers should be accounted for on a carry-over basis. If they were to be accounted for using a method other than the acquisition method, the fresh start method would be better than the pooling method.

Information provided is not decision-useful

BC36 Some proponents of the pooling method argued that it provides decision-useful information for the business combinations for which they favour its use. They said that the information is a more faithful representation than the information that the acquisition method would provide for those combinations. However, other respondents said that the information provided by the acquisition method is more revealing than that provided by the pooling method. Respondents also noted that the pooling method does not hold management accountable for the investment made and the subsequent performance of that investment. In contrast, the accountability that results from applying the acquisition method forces management to examine business combination deals carefully to see that they make economic sense.

BC37 Both boards observed that an important part of decision-useful information is information about cash-generating abilities and cash flows generated. The IASB's *Framework for the Preparation and Presentation of Financial Statements* says that 'The economic decisions that are taken by users of financial statements require an evaluation of the ability of an entity to generate cash and cash equivalents and of the timing and certainty of their generation' (paragraph 15). FASB Concepts Statement No. 1 *Objectives of Financial Reporting by Business Enterprises* indicates that '… financial reporting should provide information to help investors, creditors, and others assess the amounts, timing, and uncertainty of prospective net cash inflows to the related enterprise' (paragraph 37; footnote reference omitted). Neither the cash-generating abilities of the combined entity nor its future cash flows generally are affected by the method used to account for the combination. However, fair values reflect the expected cash flows associated with acquired assets and assumed liabilities. Because the pooling method records the net assets acquired at their carrying amounts rather than at their fair values, the information that the pooling method provides about the cash-generating abilities of those net assets is less useful than that provided by the acquisition method.

BC38 Both boards also concluded that the information provided by the pooling method is less relevant because it has less predictive value and feedback value than the information that is provided by other methods. It is also less complete because it does not reflect assets acquired or liabilities assumed that were not included in the pre-combination financial statements of the combining entities. The pooling method also provides a less faithful representation of the combined entity's performance in periods after the combination. For example, by recording assets and liabilities at the carrying amounts of predecessor entities, post-combination revenues may be overstated (and expenses understated) as the result of embedded gains that were generated by predecessor entities but not recognised by them.

BC39 The *Framework* and FASB Concepts Statement No. 2 *Qualitative Characteristics of Accounting Information* describe comparability as an important characteristic of decision-useful information. Use of different accounting methods for the same set of facts and circumstances makes the resulting information less comparable and thus less useful for making economic decisions. As discussed in paragraphs BC29–BC35, the boards concluded that all business combinations are economically similar. Accordingly, use of the same method to account for all combinations enhances the comparability of the resulting financial reporting information. Both boards observed that the acquisition method, but not the pooling method, could reasonably be applied to all business combinations in which one party to the combination obtains control over the combined entity.

BC40 Opponents of the pooling method generally said that eliminating that method would enhance the comparability of financial statements of entities that grow by means of acquisitions. Both boards agreed.

Inconsistent with historical cost accounting model

BC41 Both boards observed that the pooling method is an exception to the general concept that exchange transactions are accounted for in terms of the fair values of the items exchanged. Because the pooling method records the combination in terms of the pre-combination carrying amounts of the parties to the transaction, it fails to record and thus to hold management accountable for the investment made in the combination.

BC42 Some respondents to the FASB's 1999 Exposure Draft who advocated use of the pooling method asserted that it is consistent with the historical cost model and that eliminating the pooling method would be a step towards adopting a fair value model. They argued that before eliminating the pooling method, the FASB should resolve the broad issue of whether to adopt a fair value model in place of the historical cost model. The FASB disagreed, noting that, regardless of the merits of a fair value model, the pooling method is an aberration that is inconsistent with the historical cost model.

BC43 Although the historical cost model is frequently described as being 'transaction based', the fair value model also records all transactions. In both models, transactions are recognised on the basis of the fair values exchanged at the transaction date. In contrast, the pooling method does not result in recognising in the records of the combined entity the values exchanged; instead, only the carrying amounts of the predecessor entities are recognised. Failure to record those values can adversely affect the relevance and reliability of the combined

 © IASCF

entity's financial statements for years—and even decades—to come. For those reasons, both boards concluded that the pooling method is inconsistent with the historical cost model. Requiring use of the acquisition method is not a step towards adopting a fair value accounting model. Rather, it eliminates an exception to the historical cost model and requires accounting for assets acquired and liabilities assumed in a business combination consistently with other acquisitions of assets and incurrences of liabilities.

Disclosure not an adequate response

BC44 In urging that the pooling method should be retained, a few respondents to the 1999 Exposure Draft said that any perceived problems with having two methods of accounting could be addressed by enhanced disclosures in the notes to the financial statements. However, they generally did not specify what those disclosures should be and how they would help overcome the comparability problems that inevitably result from having two methods.

BC45 The FASB considered whether enhanced disclosures might compensate for the deficiencies of the pooling method but doubted the usefulness of almost any disclosures short of disclosing what the results would have been had the acquisition method been used to account for the business combination. Providing disclosures that would enable users of financial statements to determine what the results would have been had the transaction been accounted for by the acquisition method would be a costly solution that begs the question of why the acquisition method was not used to account for the transaction in the first place. Thus, the FASB rejected enhanced disclosures as a viable alternative.

Not cost-beneficial

BC46 Some of the boards' constituents cited cost-benefit considerations as a reason for retaining the pooling method. They argued that the pooling method is a quicker and less expensive way to account for a business combination because it does not require an entity to hire valuation experts to value assets for accounting purposes.

BC47 Other constituents favoured eliminating the pooling method for cost-benefit reasons. Some argued that the pooling method causes preparers of financial statements, auditors, regulators and others to spend unproductive time dealing with the detailed criteria required by IAS 22 or APB Opinion 16 in attempts to qualify some business combinations for the pooling method. Others noted that using the acquisition method of accounting for all business combinations would eliminate the enormous amount of interpretative guidance necessary to accommodate the pooling method. They also said that the benefits derived from making the acquisition method the only method of accounting for business combinations would significantly outweigh any issues that might arise from accounting for the very rare true merger or merger of equals by the acquisition method.

BC48 Both boards concluded that requiring a single method of accounting is preferable because having more than one method would lead to higher costs associated with applying, auditing, enforcing and analysing the information produced by the different methods. The IASB's conclusions on benefits and costs are more fully discussed in paragraphs BC435–BC439.

Perceived economic consequences not a valid reason for retention

BC49 Some of the respondents to ED 3 and the 1999 Exposure Draft who favoured retaining the pooling method cited public policy considerations or other perceived economic consequences of eliminating it. Some argued that eliminating the pooling method would require some investors to adjust to different measures of performance, potentially affecting market valuations adversely in some industries during the transition period. Others argued that it would impede desirable consolidation in some industries, reduce the amount of capital flowing into those industries, slow the development of new technology and adversely affect entrepreneurial culture. Some argued that eliminating the pooling method would reduce the options available to some regulatory agencies and possibly require regulated entities to maintain a second set of accounting records.

BC50 Other respondents did not share those views. Some said that because business combinations are (or should be) driven by economic rather than accounting considerations, economically sound deals would be completed regardless of the method used to account for them. Others noted that the financial community values business combinations in terms of their fair values rather than book values; therefore, those transactions should initially be recognised in the financial statements at fair value.

BC51 Both boards have long held that accounting standards should be neutral; they should not be slanted to favour one set of economic interests over another. Neutrality is the absence of bias intended to attain a predetermined result or to induce a particular behaviour. Neutrality is an essential aspect of decision-useful financial information because biased financial reporting information cannot faithfully represent economic phenomena. The consequences of a new financial reporting standard may indeed be negative for some interests in either the short term or the long term. But the dissemination of unreliable and potentially misleading information is, in the long run, harmful for all interests.

BC52 Both boards rejected the view that the pooling method should be retained because eliminating it could have adverse consequences for some economic interests. Accounting requirements for business combinations should seek neither to encourage nor to discourage business combinations. Instead, those standards should produce unbiased information about those combinations that is useful to investors, creditors and others in making economic decisions about the combined entity.

Acquisition method flaws remedied

BC53 Some respondents to ED 3 or to the 1999 Exposure Draft supported retaining the pooling method because of perceived problems associated with the acquisition method. Most of those comments focused on the effects of goodwill amortisation.

BC54 Both boards concluded that the pooling method is so fundamentally flawed that it does not warrant retention, regardless of perceived problems with the acquisition method. The boards also observed that the most frequently cited concern is remedied by the requirement of IAS 36 *Impairment of Assets* and FASB Statement No. 142 *Goodwill and Other Intangible Assets* (SFAS 142) to test goodwill for impairment and recognise a loss if it is impaired rather than to amortise goodwill.

 © IASCF

The fresh start method

BC55 In the fresh start method, none of the combining entities is viewed as having survived the combination as an independent reporting entity. Rather, the combination is viewed as the transfer of the net assets of the combining entities to a new entity that assumes control over them. The history of that new entity, by definition, begins with the combination.

BC56 In the first part of their respective business combinations projects, both the IASB and the FASB acknowledged that a case could be made for using the fresh start method to account for the relatively rare business combination that does not clearly qualify as an acquisition. Such a combination might be defined either as one in which an acquirer cannot be identified or as one in which the acquirer is substantially modified by the transaction. However, the boards observed that those transactions have been accounted for by the acquisition method and they decided not to change that practice.

BC57 Neither the IASB nor the FASB has on its agenda a project to consider the fresh start method. However, both boards have expressed interest in considering whether joint venture formations and some formations of new entities in multi-party business combinations should be accounted for by the fresh start method. Depending on the relative priorities of that topic and other topics competing for their agendas when time becomes available, the boards might undertake a joint project to consider those issues at some future date.

Scope

BC58 The revised standards exclude from their scope some transactions that were also excluded from the scope of both IFRS 3 and SFAS 141. However, the revised standards include within their scope combinations involving only mutual entities and combinations achieved by contract alone, which were excluded from the scope of IFRS 3 and SFAS 141. Paragraphs BC59–BC79 discuss the boards' reasons for those conclusions.

Joint ventures and combinations of entities under common control

BC59 Formations of joint ventures and combinations of entities under common control are excluded from the scope of the revised standards. Those transactions were also excluded from the scope of both IFRS 3 and SFAS 141, and the boards continue to believe that issues related to such combinations are appropriately excluded from the scope of this project. The boards are aware of nothing that has happened since IFRS 3 and SFAS 141 were issued to suggest that the revised standards should be delayed to address the accounting for those events.

BC60 In developing IFRS 3, the IASB considered whether it should amend the definition of joint control in IAS 31 *Interests in Joint Ventures* because it was concerned that its decision to eliminate the pooling method would create incentives for business combinations to be structured to meet the definition of a joint venture. After considering comments on the definition proposed in ED 3, the IASB revised the definition of joint control in IAS 31 to clarify that:

(a) unanimous consent on **all** financial and operating decisions is not necessary for an arrangement to satisfy the definition of a joint venture—unanimous consent on only strategic decisions is sufficient.

(b) in the absence of a contractual agreement requiring unanimous consent to strategic financial and operating decisions, a transaction in which the owners of multiple businesses agree to combine their businesses into a new entity (sometimes referred to as a roll-up transaction) should be accounted for by the acquisition method. Majority consent on such decisions is not sufficient.

BC61 In developing SFAS 141, the FASB noted that constituents consider the guidance in paragraph 3(d) of APB Opinion No. 18 *The Equity Method of Accounting for Investments in Common Stock* in assessing whether an entity is a joint venture, and it decided not to change that practice in its project on business combinations.

Not-for-profit organisations

BC62 The FASB also decided to exclude from the scope of SFAS 141(R) business combinations of not-for-profit organisations and acquisitions of for-profit businesses by not-for-profit organisations. Some aspects of combinations of not-for-profit organisations are different from combinations of business entities. For example, it cannot be presumed that combinations of organisations that serve a public interest are necessarily exchange transactions in which willing parties exchange equal values. For that reason, the FASB is addressing the accounting for combinations of not-for-profit organisations in a separate project. It published an exposure draft in October 2006 that addresses accounting for combinations of not-for-profit organisations.

BC63 IFRSs generally do not have scope limitations for not-for-profit activities in the private or public sector. Although IFRSs are developed for profit-oriented entities, a not-for-profit entity might be required, or choose, to apply IFRSs. A scope exclusion for combinations of not-for-profit organisations is not necessary.

Combinations of mutual entities

BC64 During its deliberations leading to SFAS 141, the FASB concluded that combinations involving only mutual entities should also be accounted for using the acquisition method but decided not to mandate its use until the FASB had considered implementation questions raised about the application of that method. Similarly, IFRS 3 did not require use of the acquisition method for combinations of mutual entities, although the IASB had also concluded that the acquisition method was appropriate for those combinations. Instead, as part of the first phase of its business combinations project, the IASB published an exposure draft of proposed amendments to IFRS 3—*Combinations by Contract Alone or Involving Mutual Entities*, which proposed an interim approach for accounting for those combinations until the IASB had considered related implementation issues in the second phase of its project. In the light of respondents' comments, the IASB decided not to proceed with the proposals in the exposure draft, primarily for reasons of timing and impending consideration of those issues in the second phase of this project.

 © IASCF

BC65 After SFAS 141 was issued, the FASB began a joint project with the Canadian Accounting Standards Board (AcSB). The objective of that project was to develop guidance for combinations of two or more mutual entities. In October 2001 the FASB and the AcSB held a round-table discussion with representatives of mutual banks, credit unions, co-operatives and other mutual entities. In January 2004 the FASB met representatives of organisations of co-operative and other mutual entities to discuss its tentative conclusions and specific concerns raised by constituents. In addition, the FASB conducted field visits to three mutual entities in 2004.

BC66 A few participants in those meetings indicated a preference for the fresh start method as an alternative to the acquisition method for particular mergers, especially for those in which it is difficult to identify the acquirer. On both occasions, however, those participants acknowledged the costs and practical difficulties that a fresh start alternative would impose, especially on entities with recurring combinations. After considering those views, the FASB concluded that any potential advantages of using the fresh start method for some combinations of mutual entities would be outweighed by the disadvantages of having two methods of accounting.

BC67 During the deliberations leading to the 2005 Exposure Draft, some representatives of mutual entities reiterated concerns expressed during the development of SFAS 141 about requiring all combinations of mutual entities to be accounted for using the acquisition method. Many of those constituents reiterated public policy concerns similar to those discussed in paragraphs BC49–BC52. For example, some said that eliminating the pooling method could impede desirable combinations and reduce the amount of capital flowing into their industries. They suggested, for example, that the requirement to identify an acquirer could impede mergers of neighbouring mutual entities when both the fact and appearance of a merger of equals are of paramount importance to their directors, members and communities. The boards did not find those arguments persuasive for the same reasons discussed in paragraphs BC49–BC52.

BC68 Although mutual entities have particular characteristics that distinguish them from other business entities, the boards noted that the two types of entities also have many common characteristics. The boards also observed that the economic motivations for combinations of mutual entities, such as to provide their constituents with a broader range of, or access to, services and cost savings through economies of scale, are similar to those for combinations of other business entities. For example:

(a) although mutual entities generally do not have shareholders in the traditional sense of investor-owners, they are in effect ‘owned’ by their members and are in business to serve their members or other stakeholders. Like other businesses, mutual entities strive to provide their members with a financial return or benefits. A mutual entity generally does that by focusing on providing its members with its products and services at lower prices. For example, the benefit provided by a credit union may be a lower interest rate on a borrowing than might be obtainable through an investor-owned financial institution. In a wholesale buying co-operative, the benefit might be lower net costs, after reflecting patronage dividends.

(b) members' interests in a mutual entity are generally not transferable like other ownership interests. However, they usually include a right to share in the net assets of the mutual entity in the event of its liquidation or conversion to another form of entity.

(c) a higher percentage of combinations of mutual entities than of combinations of other business entities occur without an exchange of cash or other readily measurable consideration, but such combinations are not unique to mutual entities. Business combinations of other entities, particularly private entities, also take place without an exchange of cash or other readily measurable consideration.

BC69 Thus, the boards concluded that the attributes of mutual entities are not sufficiently different from those of other entities to justify different accounting for business combinations. The boards also concluded that the benefits of requiring combinations of mutual entities to be accounted for by the acquisition method would justify the related costs. Therefore, combinations of mutual entities were included within the scope of the 2005 Exposure Draft.

BC70 Many of the respondents to the 2005 Exposure Draft who commented on combinations of mutual entities objected to including them in the scope of the revised standards and thus requiring them to be accounted for by the acquisition method. Respondents objected to the use of the acquisition method for conceptual, practical and cost-benefit reasons. For example, some said that a combination involving only mutual entities is a 'true pooling of interests' and that the acquisition method would not reflect the economics of the transactions. Some also said that it would often be difficult to identify an acquirer. Some also noted the absence of readily measurable consideration transferred in many combinations of mutual entities, which would make it necessary to use other valuation techniques to develop the fair values needed to apply the acquisition method. For those reasons, respondents also said that using the acquisition method for combinations of mutual entities would not be cost-beneficial. Respondents proposed other methods of accounting for mutual entities, including the pooling method, the fresh start method and a net asset method that was the same as the modified version of the acquisition method proposed by the IASB in its exposure draft mentioned in paragraph BC64.

BC71 In considering those comments, the boards noted that respondents' reasons for their objections to the acquisition method were generally the same as the factors discussed in paragraphs BC67 and BC68. For the same reasons discussed in those paragraphs, the boards affirmed their conclusion that the attributes of mutual entities are not sufficiently different from those of investor-owned entities to justify a different method of accounting for combinations of mutual entities. The boards also noted that, regardless of the intentions of the combining entities, the general result of a combination involving only mutual entities is that one entity obtains control of the other entity (or entities). Thus, combinations involving only mutual entities are included in the scope of the revised standards.

BC72 Some representatives of mutual entities suggested that the revised standards should permit an acquisition of a mutual entity to be reported as an increase in the retained earnings of the acquirer (combined entity) as had been the practice in accordance with the pooling method of accounting. The boards observed that

 © IASCF

in a combination of two investor-owned entities in which the acquirer issues its equity shares as consideration for all of the acquiree's equity shares, the fair value of the acquiree's equity is recognised as an addition to the acquirer's equity—generally as an increase to the acquirer's ordinary shares and capital. Thus, the equity (net assets) of the combined entity is increased from the acquisition of the acquiree (and the fair value of its net assets), but retained earnings of the acquirer are unaffected. The boards concluded that business combinations of two investor-owned entities are economically similar to those of two mutual entities in which the acquirer issues member interests for all the member interests of the acquiree. Thus, the boards concluded that those similar transactions should be similarly reported. Therefore, the revised standards clarify that if the only consideration exchanged is the member interests of the acquiree for the member interests of the acquirer (or the member interests of the newly combined entity), the amount of the acquiree's net assets is recognised as a direct addition to capital or equity, not retained earnings (paragraph B47 of the revised IFRS 3).

BC73 During the boards' redeliberations of the 2005 Exposure Draft, some representatives of mutual entities also proposed that the entire amount of the acquiree's net assets recognised in accordance with the revised standards should be considered a gain on a bargain purchase. They contended that the exchange of member interests in at least some forms of mutual entities does not constitute consideration because the interests the acquirer transfers have no economic value. The boards disagreed, noting that one mutual entity—the acquiree—would presumably not be willing to transfer its net assets to the control of another—the acquirer—in exchange for nothing of value.

BC74 The FASB also considered more specific concerns of representatives of credit unions about adverse economic consequences for those entities. Those representatives argued that requiring the application of the acquisition method would impede consolidation within that industry and might misrepresent the financial soundness and regulatory capital of two credit unions that combine their operations. They noted that in the United States, applicable federal law defines net worth for credit unions as the 'retained earnings balance of the credit union, as determined under generally accepted accounting principles.' Because the regulatory definition of net worth is narrower than equity under US GAAP, they expressed concern that the exclusion of the equity of an acquired credit union from retained earnings of the combined entity could make a financially sound combined entity appear to be financially unsound. Thus, they suggested that credit unions should be permitted to continue to report the equity of an acquired mutual entity as an addition to retained earnings of the combined entity. The FASB was not persuaded by those arguments; it believes that Statement 141(R) will not affect the ability of credit unions to restructure and combine with other credit unions.

BC75 Additionally, constituents told the FASB that the number of combinations of credit unions in which the regulatory net worth calculation could be significantly affected is relatively small in any given year. The FASB also noted that the regulatory filings of credit unions and other entities and the needs of their regulators are separate matters beyond the purpose of financial statements. The FASB's Concepts Statement 2 states that a necessary and important characteristic of accounting information is neutrality. In the context of business combinations, neutrality means that accounting standards should neither

encourage nor discourage business combinations but rather provide information about those combinations that is fair and even-handed. The FASB observed that its public policy goal is to issue accounting standards that result in neutral and representationally faithful financial information. Eliminating use of the pooling method for all entities and requiring all entities, including mutual entities, to report the resulting increase directly in equity other than retained earnings is consistent with that public policy goal.

BC76 Some respondents to the 2005 Exposure Draft said that co-operatives do not fit within the definition of a mutual entity and that co-operatives are sufficiently different from other entities to justify a different method of accounting for combinations involving only co-operatives. To support their view, they cited factors such as differences in legal characteristics and different purposes of co-operatives in addition to providing economic benefits to members.

BC77 The boards considered the differences between, for example, a co-operative that provides electricity to its members in a rural area and other types of mutual entities, such as a mutual insurance company. The boards acknowledged particular differences between the two types of entities, for example, the co-operative issues member shares and the mutual insurance company does not. In addition, the objective of the co-operative may include providing more social and cultural benefits to its community in addition to the economic benefits provided to its members than does another type of mutual entity. However, the boards concluded that co-operatives generally provide direct and indirect economic benefits such as dividends and lower costs of services, including credit, or other products directly to its members. The boards concluded that differences in the amount of social and cultural benefits an entity seeks to provide do not justify a conclusion that co-operatives are sufficiently different from other mutual entities that they do not fit within the definition of a mutual entity in the revised standards. Thus, co-operatives are included in the definition of a mutual entity in the revised standards.

Combinations achieved by contract alone

BC78 Both boards also concluded that business combinations achieved by contract alone should be included in the scope of the revised standards. Those combinations were not included in the scope of either IFRS 3 or SFAS 141, although the boards understand that practice in the United States generally was to account for them in accordance with SFAS 141. For example, in EITF Issue No. 97-2 *Application of FASB Statement No. 94 and APB Opinion No. 16 to Physician Practice Management Entities and Certain Other Entities with Contractual Management Arrangements*, the Task Force reached a consensus that a transaction in which a physician practice management entity executes a management agreement with the physician practice should be accounted for as a business combination. Technically, that transaction would not meet the definition of a business combination in APB Opinion 16 or SFAS 141 because the physician practice management entity does not acquire either equity interests in, or the net assets of, the physician practice.

 © IASCF

BC79 The boards understand that difficulties may arise in applying the acquisition method to combinations achieved by contract alone. In particular, such business combinations normally do not involve the payment of readily measurable consideration and in rare circumstances it might be difficult to identify the acquirer. However, as for combinations of mutual entities and for the reasons discussed above, the boards concluded that the acquisition method can and should be applied in accounting for such business combinations. In reaching that conclusion, the boards also concluded that in a business combination achieved by contract alone:

(a) difficulties in identifying the acquirer are not a sufficient reason to justify a different accounting treatment, and no further guidance is necessary for identifying the acquirer for combinations by contract alone.

(b) in the United States, these transactions are already being accounted for by the acquisition method and insurmountable issues have not been encountered.

(c) determining the fair value of the identifiable assets acquired and liabilities assumed and calculating the related goodwill should be consistent with decisions reached in the second phase of the project.

Applying the acquisition method

BC80 The 2005 Exposure Draft identified four steps in applying the acquisition method, and it discussed the requirements for applying the acquisition method in terms of those steps:

(a) identifying the acquirer;

(b) determining the acquisition date;

(c) measuring the fair value of the acquiree; and

(d) measuring and recognising the assets acquired and the liabilities assumed.

BC80A In contrast, the revised standards indicate (paragraph 5 of the revised IFRS 3) that applying the acquisition method requires:

(a) identifying the acquirer;

(b) determining the acquisition date;

(c) recognising and measuring the identifiable assets acquired, liabilities assumed and any non-controlling interest in the acquiree; and

(d) recognising and measuring goodwill or a gain from a bargain purchase.

BC81 The main changes to the list of steps in applying the acquisition method are to eliminate measuring the fair value of the acquiree as a whole and to add recognising and measuring goodwill as a separate step. The primary reason for those changes is the boards' decision to focus on measuring the components of the business combination, including any non-controlling interest in the acquiree, rather than measuring the fair value of the acquiree as a whole. The boards observed that neither the requirements of the 2005 Exposure Draft nor those of the revised standards for applying the acquisition method result in a fair value

© IASCF

measure of either the acquiree as a whole or the acquirer's interest in the acquiree. For example, the revised standards do not provide for recognising a loss if the acquirer overpays for the acquiree, ie if the acquisition-date fair value of the consideration transferred exceeds the acquisition-date fair value of the acquirer's interest in the acquiree. The IASB's decision to allow an acquirer to choose to measure any non-controlling interest in the acquiree at fair value or on the basis of its proportionate interest in the acquiree's identifiable net assets adds another potential difference between the results of applying the requirements of the revised IFRS 3 and measuring the acquisition-date fair value of the acquiree as a whole. (See paragraphs BC209–BC221 for discussion of the reasons why the IASB provided that choice.) Paragraphs BC330 and BC331 discuss the reasons why the revised standards also eliminate the related presumption in the 2005 Exposure Draft that the consideration transferred in exchange for the acquiree measures the fair value of the acquirer's interest in the acquiree.

Identifying the acquirer

BC82 The boards' decision that all business combinations within the scope of the revised standards should be accounted for by the acquisition method means that the acquirer must be identified in every business combination.

BC83 The IASB and the FASB separately developed the guidance on identifying the acquirer that appeared in IFRS 3 and SFAS 141, respectively. Paragraphs BC84–BC92 discuss the FASB's development of the guidance in SFAS 141 and paragraphs BC93–BC101 discuss the IASB's development of the guidance in IFRS 3. Paragraphs BC102–BC105 discuss the boards' joint consideration of how to identify the acquirer in a business combination in the second phase of their projects on business combinations.

Developing the guidance in SFAS 141

BC84 SFAS 141's guidance on identifying the acquirer focused on the types of business combinations included in its scope, which excluded transactions in which one entity obtains control over one or more other entities by means other than transferring assets, incurring liabilities or issuing equity securities. Thus, SFAS 141 did not include the general guidance that the entity that obtains control is the acquirer, although that was the effect of the guidance for the combinations within its scope.

BC85 In developing its 1999 Exposure Draft, the FASB affirmed the guidance in APB Opinion 16 that in a business combination effected primarily through the distribution of cash or other assets or by incurring liabilities, the acquirer is generally the entity that distributes cash or other assets or assumes or incurs liabilities. The FASB considered a variety of suggestions on factors that should be considered in identifying the acquirer in a business combination effected through an exchange of equity interests. The guidance proposed in the 1999 Exposure Draft reflected the FASB's conclusion that all pertinent facts and circumstances should be considered when identifying the acquirer, particularly the relative voting rights in the combined entity after the combination. That proposed guidance said that the existence of unusual or special voting arrangements and options, warrants or convertible securities should be considered in determining which shareholder group retained or received the

 © IASCF

larger portion of the voting rights in the combined entity. In addition, factors related to the composition of the board of directors and senior management of the combined entity should be considered and should be weighted equally with the factors related to voting rights.

BC86 Respondents to the 1999 Exposure Draft who commented on the proposed criteria for identifying the acquirer generally agreed that they were appropriate. Some respondents said that the proposed guidance was an improvement over APB Opinion 16 because it provided additional factors to consider in determining which shareholder group retained or received the larger share of the voting rights in the combined entity. However, many respondents suggested improvements to the proposed criteria, and some suggested that the FASB should consider other criteria.

BC87 Several respondents suggested that the FASB should retain the presumptive approach in APB Opinion 16 for identifying the acquirer in transactions effected through an exchange of equity interests. That approach presumes that, in the absence of evidence to the contrary, the acquirer is the combining entity whose owners as a group retain or receive the larger share of the voting rights in the combined entity. Other respondents suggested that the factors to be considered in identifying the acquirer should be provided in the form of a hierarchy. Some of those respondents also suggested that the FASB should provide additional guidance explaining how factors relating to voting rights (unusual special voting arrangements and options, warrants or convertible securities) would affect the determination of the acquirer.

BC88 In considering those suggestions, the FASB observed, as it did in developing the 1999 Exposure Draft, that because each business combination is unique, the facts and circumstances relevant to identifying the acquirer in one combination may be less relevant in another. Therefore, SFAS 141 did not retain the presumptive approach in APB Opinion 16 nor did it provide hierarchical guidance because to do so would have implied that some factors are always more important than others in identifying the acquirer. However, as suggested by respondents, the FASB modified the proposed guidance to explain how some of the factors influence the identification of the acquirer.

BC89 The 1999 Exposure Draft did not propose requiring consideration of the payment of a premium over the market value of the equity securities acquired as evidence of the identity of the acquirer. Some respondents to the 1999 Exposure Draft said that the payment of a premium is a strong indicator of the identity of the acquirer. Upon reconsideration, the FASB decided to include in SFAS 141 the payment of a premium as a criterion to be considered in identifying the acquirer.

BC90 In developing SFAS 141, the FASB observed that identifying the acquirer might be difficult in some multi-party business combinations, particularly those that might not be acquisitions but are required to be accounted for as such. The FASB noted that in those circumstances it might be helpful to consider additional factors such as which of the entities initiated the combination and whether the reported amounts of assets, revenues and earnings of one of the combining entities significantly exceed those of the others. Respondents to the 1999 Exposure Draft generally agreed, and SFAS 141 included that guidance.

BC91 In addition, as suggested by respondents, the FASB decided that SFAS 141 should explicitly state that in some business combinations, such as reverse acquisitions, the entity that issues the equity interests may not be the acquirer. In a reverse acquisition, one entity (Entity A) obtains ownership of the equity instruments of another entity (Entity B), but Entity A issues enough of its own voting equity instruments as consideration in the exchange transaction for control of the combined entity to pass to the owners of Entity B.

BC92 If a new entity is formed to issue equity instruments to effect a business combination, SFAS 141 required that one of the combining entities that existed before the combination must be identified as the acquirer for essentially the same reasons as those discussed in paragraphs BC98–BC101 in the context of IFRS 3's similar requirement.

Developing the guidance in IFRS 3

BC93 As proposed in ED 3, IFRS 3 carried forward from IAS 22 the principle that in a business combination accounted for using the acquisition method the acquirer is the combining entity that obtains control of the other combining entities or businesses. The IASB observed that using the control concept as the basis for identifying the acquirer is consistent with using the control concept in IAS 27 *Consolidated and Separate Financial Statements* to define the boundaries of the reporting entity and to provide the basis for establishing the existence of a parent-subsidiary relationship. IFRS 3 also carried forward the guidance in IAS 22 that control is the power to govern the financial and operating policies of the other entity so as to obtain benefits from its activities. IFRS 3 also provided the same guidance as IAS 22 for identifying the acquirer if one of the combining entities might have obtained control even if it does not acquire more than one-half of the voting rights of another combining entity.

Identifying an acquirer in a business combination effected through an exchange of equity interests

BC94 In developing ED 3 and IFRS 3, the IASB decided not to carry forward the guidance in IAS 22 on identifying which of the combining entities is the acquirer in a reverse acquisition. IAS 22 required the entity whose owners control the combined entity to be treated as the acquirer. That approach presumed that in a business combination effected through an exchange of equity interests, the entity whose owners control the combined entity is always the entity with the power to govern the financial and operating policies of the other entity so as to obtain benefits from its activities. The IASB observed that because the presumption is not always accurate, carrying it forward would in effect override the control concept for identifying the acquirer.

BC95 The IASB observed that the control concept focuses on the relationship between two entities, in particular, whether one entity has the power to govern the financial and operating policies of another so as to obtain benefits from its activities. Therefore, determining which of the combining entities has, as a consequence of the combination, the power to govern the financial and operating policies of the other so as to obtain benefits from its activities is fundamental to identifying the acquirer, regardless of the form of the consideration.

 © IASCF

BC96 The IASB also observed that in some reverse acquisitions, the acquirer may be the entity whose equity interests have been acquired and the acquiree is the issuing entity. For example, a private entity might arrange to have itself 'acquired' by a smaller public entity through an exchange of equity interests as a means of obtaining a stock exchange listing. As part of the agreement, the directors of the public entity resign and are replaced by directors appointed by the private entity and its former owners. The IASB observed that in such circumstances, the private entity, which is the legal subsidiary, has the power to govern the financial and operating policies of the combined entity so as to obtain benefits from its activities. Treating the legal subsidiary as the acquirer in such circumstances is thus consistent with applying the control concept for identifying the acquirer. Treating the legal parent as the acquirer in such circumstances would place the form of the transaction over its substance, thereby providing less useful information than would be provided using the control concept to identify the acquirer.

BC97 Therefore, the IASB proposed in ED 3 that the acquirer in a business combination effected through an issue of equity interests should be identified by considering all pertinent facts and circumstances to determine which of the combining entities has the power to govern the financial and operating policies of the other so as to obtain benefits from its activities. Pertinent facts and circumstances include, but are not limited to, the relative ownership interests of the owners of the combining entities. Respondents to ED 3 generally supported that requirement, which was consistent with the requirement of SFAS 141.

Identifying an acquirer if a new entity is formed to effect a business combination

BC98 If a new entity is formed to issue equity instruments to effect a business combination, ED 3 proposed and IFRS 3 required one of the combining entities that existed before the combination to be identified as the acquirer on the basis of the evidence available. In considering that requirement, the IASB identified two approaches to applying the acquisition method that had been applied in various jurisdictions. The first approach viewed business combinations from the perspective of one of the combining entities that existed before the combination. Under that approach, the acquirer must be one of the combining entities that existed before the combination and therefore cannot be a new entity formed to issue equity instruments to effect a combination. The second approach viewed business combinations from the perspective of the entity providing the consideration, which could be a newly formed entity. Under that approach, the acquirer must be the entity providing the consideration. Some jurisdictions interpreted IAS 22 as requiring the first approach; other jurisdictions interpreted IAS 22 as requiring the second approach.

BC99 If a new entity is formed to issue equity instruments to effect a business combination involving two or more other entities, viewing the combination from the perspective of the entity providing the consideration would result in the newly formed entity applying the acquisition method to each of the other combining entities. The IASB noted that the result would be the same as applying

the fresh start method to account for the business combination, which would potentially provide users of the financial statements with more relevant information than requiring one of the pre-existing entities to be treated as the acquirer.

BC100 The IASB also considered whether treating a new entity formed to issue equity instruments to effect a business combination as the acquirer would place the form of the transaction over its substance, because the new entity may have no economic substance. The formation of such entities is often related to legal, tax or other business considerations that do not affect the identification of the acquirer. For example, a combination of two entities that is structured so that one entity directs the formation of a new entity to issue equity instruments to the owners of both of the combining entities is, in substance, no different from a transaction in which one of the combining entities directly acquires the other. Therefore, the transaction should be accounted for in the same way as a transaction in which one of the combining entities directly acquires the other. To do otherwise would impair both the comparability and the reliability of the information.

BC101 The IASB concluded that the users of an entity's financial statements are provided with more useful information about a business combination when that information faithfully represents the transaction it purports to represent. Therefore, IFRS 3 required the acquirer to be one of the combining entities that existed before the combination.

Convergence and clarification of SFAS 141's and IFRS 3's guidance for identifying the acquirer

BC102 The deliberations of the FASB and the IASB described in paragraphs BC84–BC101 resulted in similar but not identical guidance for identifying the acquirer in SFAS 141 and IFRS 3. But the guidance was worded differently, and the boards were concerned that differences in identifying the acquirer could arise. Therefore, as part of the effort to develop a common standard on accounting for business combinations, the boards decided to develop common guidance for identifying the acquirer that could be applied internationally. For example, the FASB adopted the IASB's definition of an acquirer as the entity that obtains control of the other combining entities, and both boards decided to include in the revised standards an explicit reference to their other standards that provide guidance for identifying the acquirer. That guidance, although previously implicit, was not in SFAS 141. The intention of the boards is to conform and clarify their guidance but not to change the substance of the provisions for identifying an acquirer previously provided in SFAS 141 and IFRS 3.

BC103 Some respondents to the 2005 Exposure Draft noted that the existing IASB and FASB definitions of control in their respective consolidations standards are somewhat different and, in rare instances, may lead to identifications of different acquirers. The boards agreed with that observation, but they affirmed their conclusion in developing the 2005 Exposure Draft that developing a common definition of control is outside the scope of the business combinations project.

 © IASCF

Identifying the acquirer in business combinations involving only mutual entities

BC104 The boards considered whether differences between mutual entities and investor-owned entities or differences between combinations of mutual entities and combinations of investor-owned entities result in a need for different or additional guidance for identifying the acquirer in combinations of mutual entities. The boards did not note any such differences. As a result, the boards concluded that an acquirer must be identified for all business combinations, including those involving only mutual entities.

BC105 The boards also concluded that the indicators for identifying the acquirer in a business combination are applicable to mutual entities and that no additional indicators are needed to identify the acquirer in those combinations. Both boards acknowledged that difficulties may arise in identifying the acquirer in combinations of two virtually equal mutual entities but observed that those difficulties also arise in combinations of two virtually equal investor-owned entities. The boards concluded that those difficulties, which are not unique to mutual entities, could be resolved in practice.

Determining the acquisition date

BC106 IFRS 3 and SFAS 141 carried forward without reconsideration the provisions of IAS 22 and APB Opinion 16, respectively, on determining the acquisition date. With one exception that applies only to SFAS 141 (see paragraphs BC108–BC110), that guidance resulted in the same acquisition date as the guidance in the revised standards.

BC107 In both IFRS 3 and SFAS 141, the guidance on the acquisition date, which IFRS 3 also referred to as the *exchange date*, was incorporated within the guidance on determining the cost of the acquisition rather than being stated separately. The revised standards clarify the acquisition-date guidance to make explicit that the acquisition date is the date that the acquirer obtains control of the acquiree. Paragraphs BC338–BC342 discuss the related issue of the measurement date for equity securities transferred as consideration in a business combination and the changes the revised standards make to the previous requirements on that issue.

BC108 The FASB also eliminated the 'convenience' exception that SFAS 141 carried forward from APB Opinion 16 and the reporting alternative permitted by Accounting Research Bulletin No. 51 *Consolidated Financial Statements* (ARB 51). SFAS 141, paragraph 48, permitted an acquirer to designate an effective date other than the date that assets or equity interests are transferred or liabilities are assumed or incurred (the acquisition date) if it also reduced the cost of the acquiree and net income as required by that paragraph to compensate for recognising income before consideration was transferred. Paragraph 11 of ARB 51 permitted an acquirer to include a subsidiary that was purchased during the year in the consolidation as though it had been acquired at the beginning of the year and to deduct the pre-acquisition earnings at the bottom of the consolidated income statement.

BC109 The FASB concluded that to represent faithfully an acquirer's financial position and results of operations, the acquirer should account for all business combinations at the acquisition date. In other words, its financial position should reflect the assets acquired and liabilities assumed at the acquisition date—not before or after they are obtained or assumed. Moreover, the acquirer's financial statements for the period should include only the cash inflows and outflows, revenues and expenses and other effects of the acquiree's operations after the acquisition date.

BC110 Very few respondents to the 2005 Exposure Draft commented on the proposed guidance on determining the acquisition date. Those who did so generally raised practicability issues related to eliminating the ability to designate an effective date other than the acquisition date. The boards concluded that the financial statement effects of eliminating that exception were rarely likely to be material. For example, for convenience an entity might wish to designate an acquisition date of the end (or the beginning) of a month, the date on which it closes its books, rather than the actual acquisition date during the month. Unless events between the 'convenience' date and the actual acquisition date result in material changes in the amounts recognised, that entity's practice would comply with the requirements of the revised standards. Therefore, the boards decided to retain the guidance in the 2005 Exposure Draft about determining the acquisition date.

Recognising and measuring the identifiable assets acquired, the liabilities assumed and any non-controlling interest in the acquiree

Recognition

BC111 The revised standards' recognition principle is stated in paragraph 10 of the revised IFRS 3. Paragraphs BC112–BC130 discuss the recognition conditions the acquirer is to use in applying the recognition principle. The revised standards also provide guidance for recognising particular assets and liabilities, which is discussed in paragraphs BC131–BC184. The revised standards' guidance on classifying and designating assets acquired and liabilities assumed is discussed in paragraphs BC185–BC188, and the limited exceptions to the recognition principle provided in the revised standards are discussed in paragraphs BC263–BC303.

Conditions for recognition

BC112 The boards decided that to achieve a reasonably high degree of consistency in practice and to resolve existing inconsistencies, the revised standards should provide guidance on applying the recognition principle. That guidance emphasises two fundamental conditions. To measure and recognise an item as part of applying the acquisition method, the item acquired or assumed must be:

(a) an asset or liability at the acquisition date; and

(b) part of the business acquired (the acquiree) rather than the result of a separate transaction.

 © IASCF

An asset or a liability at the acquisition date

BC113 In determining whether an item should be recognised at the acquisition date as part of the business combination, the boards decided that the appropriate first step is to apply the definitions of assets and liabilities in the IASB's *Framework* or FASB Concepts Statement No. 6 *Elements of Financial Statements*, respectively.

BC114 The boards observed that in accordance with both IFRS 3 and SFAS 141, and their predecessors and the related interpretative guidance, particular items were recognised **as if** they were assets acquired or liabilities assumed at the acquisition date even though they did not meet the definition of an asset or a liability. That practice was related to the previous emphasis on measuring the cost of (or investment in) the acquiree rather than the acquisition-date fair values of the assets acquired and liabilities assumed. For example, as discussed in paragraphs BC365–BC370, some expenses for services received in connection with a business combination were capitalised as part of the cost of the acquiree (and recognised as part of goodwill) **as if** they were an asset at the acquisition date. In addition, some future costs that an acquirer expected to incur often were viewed as a cost of the acquiree and recognised **as if** they were a liability at the acquisition date—expected restructuring costs were an example. The boards concluded that the representational faithfulness, consistency and understandability of financial reporting would be improved by eliminating such practices.

Part of the business combination

BC115 The second condition for recognising an asset acquired or a liability assumed or incurred in a business combination is that the asset or liability must be part of the business combination transaction rather than an asset or a liability resulting from a separate transaction. Making that distinction requires an acquirer to identify the components of a transaction in which it obtains control over an acquiree. The objective of the condition and the guidance on identifying the components of a business combination is to ensure that each component is accounted for in accordance with its economic substance.

BC116 The boards decided to provide application guidance to help address concerns about the difficulty of determining whether a part of the consideration transferred is for the acquiree or is for another purpose. The boards observed that parties directly involved in the negotiations of an impending business combination may take on the characteristics of related parties. Therefore, they may be willing to enter into other agreements or include as part of the business combination agreement some arrangements that are designed primarily for the benefit of the acquirer or the combined entity, for example, to achieve more favourable financial reporting outcomes after the business combination. Because of those concerns the boards decided to develop a principle for determining whether a particular transaction or arrangement entered into by the parties to the combination is part of what the acquirer and acquiree exchange in the business combination or is a separate transaction.

BC117 The boards concluded that a transaction that is designed primarily for the economic benefit of the acquirer or the combined entity (rather than the acquiree or its former owners before the business combination) is not part of the exchange for the acquiree. Those transactions should be accounted for separately from the business combination. The boards acknowledge that judgement may be required

to determine whether part of the consideration paid or the assets acquired and liabilities assumed stems from a separate transaction. Accordingly, the 2005 Exposure Draft included both a general principle and implementation guidance for applying that principle, including several examples.

BC118 Respondents' comments on the proposed guidance on identifying the components of a business combination transaction were mixed. For example, some respondents said that the general principle was clear and provided adequate guidance; others said that the proposed principle was not clear. Several respondents said that the focus on determining whether a transaction benefits the acquiree or the acquirer was not clear because a transaction or event that benefits the acquiree would also benefit the combined entity because the acquiree is part of the combined entity.

BC119 The boards agreed with respondents that the proposed principle for distinguishing between components of a business combination needed improvement. Accordingly, they revised the principle to focus on whether a transaction is entered into by or on behalf of the acquirer or **primarily** for the benefit of the acquirer or the combined entity, rather than **primarily** for the benefit of the acquiree or its former owners **before the combination** (paragraph 52 of the revised IFRS 3).

BC120 The boards also concluded that the focus of the principle should be on identifying whether a business combination includes separate transactions that should be accounted for separately in accordance with their economic substance rather than solely on assessing whether a transaction is part of the exchange for the acquiree (paragraph 51 of the revised IFRS 3). Focusing solely on whether assets or liabilities are part of the exchange for the acquiree might not result in all transactions being accounted for in accordance with their economic substance. For example, if an acquirer asks the acquiree to pay some or all of the acquisition-related costs on its behalf and the acquiree has paid those costs before the acquisition date, at the acquisition date the acquiree will show no liability for those costs. Therefore, some might think that the principle as stated in the 2005 Exposure Draft does not apply to the transactions giving rise to the acquisition-related costs. The boards concluded that focusing instead on whether a transaction is separate from the business combination will more clearly convey the intention of the principle and thus will provide users with more relevant information about the financial effects of transactions and events entered into by the acquirer. The acquirer's financial statements will reflect the financial effects of all transactions for which the acquirer is responsible in accordance with their economic substance.

BC121 To help in applying the principle, paragraph 52 of the revised IFRS 3 includes three examples of transactions that are separate from the transaction in which an acquirer obtains control over an acquiree, and Appendix B provides additional application guidance.

BC122 The first example in paragraph 52 is directed at ensuring that a transaction that in effect settles a pre-existing relationship between the acquirer and the acquiree is excluded from the accounting for the business combination. Assume, for example, that a potential acquiree has an asset (receivable) for an unresolved claim against the potential acquirer. The acquirer and the acquiree's owners

agree to settle that claim as part of an agreement to sell the acquiree to the acquirer. The boards concluded that if the acquirer makes a lump sum payment to the seller-owner, part of that payment is to settle the claim and is not part of the consideration transferred to acquire the business. Thus, the portion of the payment that relates to the claim settlement should be excluded from the accounting for the business combination and accounted for separately. In effect, the acquiree relinquished its claim (receivable) against the acquirer by transferring it (as a dividend) to the acquiree's owner. Thus, at the acquisition date the acquiree has no receivable (asset) to be acquired as part of the combination, and the acquirer would account for its settlement payment separately. The FASB observed that the conclusion that a transaction that settles a pre-existing relationship is not part of applying the acquisition method is consistent with the conclusion in EITF Issue No. 04-1 *Accounting for Preexisting Relationships between the Parties to a Business Combination*, which is incorporated into SFAS 141(R) and therefore superseded.

BC123 The second and third examples are also directed at ensuring that payments that are not part of the consideration transferred for the acquiree are excluded from the business combination accounting. The boards concluded that the payments for such transactions or arrangements should be accounted for separately in accordance with the applicable requirements for those transactions. Paragraph BC370 also discusses potential abuses related to the third example—payments to reimburse the acquiree or its former owners for paying the acquirer's costs incurred in connection with the business combination.

BC124 To provide additional help in identifying the components of a business combination, paragraph B50 of the revised IFRS 3 includes three factors to be considered in assessing a business combination transaction: (a) the reason for the transaction, (b) who initiated the transaction and (c) the timing of the transaction. Although those factors are neither mutually exclusive nor individually conclusive, the boards decided that the factors could help in considering whether a transaction or event is arranged primarily for the economic benefit of the acquirer or the combined entity or primarily for the benefit of the acquiree and its former owners before the business combination.

IFRS 3's criterion on reliability of measurement

BC125 IFRS 3 included another recognition criterion for assets acquired or liabilities assumed in a business combination. That criterion required an asset or liability to be recognised separately from goodwill only if it could be reliably measured. In its deliberations leading to the revised IFRS 3, the IASB decided to eliminate reliability of measurement as an overall criterion, which it observed is unnecessary because reliability of measurement is a part of the overall recognition criteria in the *Framework*.

IFRS 3's criterion on probability of an inflow or outflow of benefits

BC126 IFRS 3 provided that an acquirer should recognise the acquiree's identifiable assets (other than intangible assets) and liabilities (other than contingent liabilities) only if it is probable that the asset or liability will result in an inflow or outflow of economic benefits. The revised IFRS 3 does not contain that probability

recognition criterion and thus it requires the acquirer to recognise identifiable assets acquired and liabilities assumed regardless of the degree of probability of an inflow or outflow of economic benefits.

BC127 The recognition criteria in the *Framework* include the concept of probability to refer to the degree of uncertainty that the future economic benefits associated with an asset or liability will flow to or from the entity.

BC128 During the development of the revised IFRS 3, the IASB reconsidered items described in IAS 37 *Provisions, Contingent Liabilities and Contingent Assets* as contingent assets and contingent liabilities. Analysing the rights or obligations in such items to determine which are conditional and which are unconditional clarifies the question of whether the entity has an asset or a liability at the acquisition date.* As a result, the IASB concluded that many items previously described as contingent assets or contingent liabilities meet the definition of an asset or a liability in the *Framework* because they contain unconditional rights or obligations as well as conditional rights or obligations. Once the unconditional right in an asset (the unconditional obligation in a liability) is identified, the question to be addressed becomes what is the inflow (outflow) of economic benefits relating to that unconditional right (unconditional obligation).

BC129 The IASB noted that the *Framework* articulates the probability recognition criterion in terms of a flow of economic benefits rather than just direct cash flows. If an entity has an unconditional obligation, it is certain that an outflow of economic benefits from the entity is required, even if there is uncertainty about the timing and the amount of the outflow of benefits associated with a related conditional obligation. Hence, the IASB concluded that the liability (the unconditional obligation) satisfies the *Framework*'s probability recognition criterion. That conclusion applies equally to unconditional rights. Thus, if an entity has an unconditional right, it is certain that it has the right to an inflow of economic benefits, and the probability recognition criterion is satisfied.

BC130 Therefore, the IASB decided that inclusion of the probability criterion in the revised IFRS 3 is unnecessary because an unconditional right or obligation will always satisfy the criterion. In addition, the IASB made consequential amendments to paragraphs 25 and 33 of IAS 38 *Intangible Assets* to clarify the reason for its conclusion that the probability recognition criterion is always considered to be satisfied for intangible assets that are acquired separately or in a business combination. Specifically, the amendment indicates that an entity expects there to be an inflow of economic benefits embodied in an intangible asset acquired separately or in a business combination, even if there is uncertainty about the timing and the amount of the inflow.

Recognising particular identifiable assets acquired and liabilities assumed

BC131 To help ensure the consistent application of the requirements of the revised standards, the boards decided to provide specific recognition guidance for particular types of identifiable assets acquired and liabilities assumed in a business combination. That guidance and the reasons for it are discussed in the following paragraphs.

* Paragraphs BC11–BC17 and BC22–BC26 of the Basis for Conclusions on the draft amendments to IAS 37, published for comment in June 2005, discuss this issue in more detail.

 © IASCF

Liabilities associated with restructuring or exit activities of the acquiree

BC132 The revised standards explain that an acquirer recognises liabilities for restructuring or exit activities acquired in a business combination only if they meet the definition of a liability at the acquisition date (paragraph 11 of the revised IFRS 3). Costs associated with restructuring or exiting an acquiree's activities that are not liabilities at that date are recognised as post-combination activities or transactions of the combined entity when the costs are incurred. In considering acquired restructuring or exit activities the FASB and the IASB began at different points because the requirements of SFAS 141 and IFRS 3 on the issue differed.

BC133 In applying SFAS 141, acquirers looked to EITF Issue No. 95-3 *Recognition of Liabilities in Connection with a Purchase Business Combination* for guidance on recognising liabilities associated with restructuring or exit activities of an acquirer. EITF Issue 95-3 provided that the costs of an acquirer's plan (a) to exit an activity of an acquired company, (b) to involuntarily terminate the employment of employees of an acquired company or (c) to relocate employees of an acquired company should be recognised as liabilities assumed in a purchase business combination if specified conditions were met. Those conditions did not require the existence of a present obligation to another party. In developing the 2005 Exposure Draft, the FASB concluded, as it did in FASB Statement No. 146 *Accounting for Costs Associated with Exit or Disposal Activities* (SFAS 146), that only present obligations to others are liabilities under the definition in the FASB's Concepts Statement 6. An exit or disposal plan, by itself, does not create a present obligation to others for costs an entity expects to incur under the plan. Thus, an entity's commitment to an exit or disposal plan, by itself, is not a sufficient condition for recognition of a liability. Consistently with that conclusion, SFAS 141(R) nullifies the guidance in EITF Issue 95-3, which was not consistent with SFAS 146.

BC134 Before the IASB issued IFRS 3, IAS 22, like EITF Issue 95-3, required the acquirer to recognise as part of allocating the cost of a combination a provision for terminating or reducing the activities of the acquiree (*a restructuring provision*) that was not a liability of the acquiree at the acquisition date, provided that the acquirer had satisfied specified criteria. The criteria in IAS 22 were similar to those in EITF Issue 95-3. In developing ED 3 and IFRS 3, the IASB considered the view that a restructuring provision that was not a liability of the acquiree at the acquisition date should nonetheless be recognised by the acquirer as part of allocating the cost of the combination if the specified conditions were met. Those supporting this view, including some respondents to ED 3, argued that:

(a) the estimated cost of terminating or reducing the activities of the acquiree would have influenced the price paid by the acquirer for the acquiree and therefore should be taken into account in measuring goodwill.

(b) the acquirer is committed to the costs of terminating or reducing the activities of the acquiree because of the business combination. In other words, the combination is the past event that gives rise to a present obligation to terminate or reduce the activities of the acquiree.

© IASCF

BC135 In developing IFRS 3, the IASB rejected those arguments, noting that the price paid by the acquirer would also be influenced by future losses and other 'unavoidable' costs that relate to the future conduct of the business, such as costs of investing in new systems. IFRS 3 did not provide for recognising those costs as liabilities because they do not represent liabilities of the acquiree at the acquisition date, although the expected future outflows may affect the value of existing recognised assets. The IASB concluded that it would be inconsistent to recognise 'unavoidable' restructuring costs that arise in a business combination but to prohibit recognition of a liability for other 'unavoidable' costs to be incurred as a result of the combination.

BC136 The IASB's general criteria for identifying and recognising restructuring provisions are set out in IAS 37. IAS 37 states that a constructive obligation to restructure (and therefore a liability) arises only when the entity has developed a detailed formal plan for the restructuring and either raised a valid expectation in those affected that it will carry out the restructuring by publicly announcing details of the plan or begun implementing the plan. IAS 37 requires such a liability to be recognised when it becomes probable that an outflow of resources embodying economic benefits will be required to settle the obligation and the amount of the obligation can be reliably estimated.

BC137 IFRS 3 reflected the IASB's conclusion that if the criteria in paragraph 31 of IAS 22 for the recognition of a restructuring provision were carried forward, similar items would be accounted for differently. The timing of the recognition of restructuring provisions would differ, depending on whether a plan to restructure arises in connection with, or in the absence of, a business combination. The IASB decided that such a difference would impair the usefulness of the information provided to users about an entity's plans to restructure because both comparability and reliability would be diminished. Accordingly, IFRS 3 contained the same requirements as the revised IFRS 3 for recognising liabilities associated with restructuring or exit activities.

BC138 Few of the comments on the 2005 Exposure Draft from respondents who apply IFRSs in preparing their financial statements addressed its proposal on accounting for costs to restructure or exit activities of an acquiree (restructuring costs). Those who did so generally agreed with its proposal to carry forward the requirement of IFRS 3 for recognising liabilities associated with restructuring or exit activities of an acquiree. But the provisions of the 2005 Exposure Draft on that issue represented a change to GAAP in the United States, and the FASB received several responses objecting to the proposed change. It also received some responses that agreed with them, generally for the same reasons that the boards proposed the provisions in the 2005 Exposure Draft.

BC139 Respondents who disagreed with the proposed accounting for liabilities associated with restructuring or exit activities of an acquiree generally cited one or more of the following reasons in support of their view:

(a) Acquirers factor restructuring costs into the amount they are willing to pay for the acquiree. Therefore, those costs should be included in accounting for the business combination.

(b) It is not clear why the boards decided that restructuring costs should not be recognised as liabilities assumed in the business combination when those

 © IASCF

costs are more likely to be incurred than some of the liabilities related to contingencies that the boards proposed to recognise as liabilities assumed in a combination.

(c) Capitalising restructuring costs as part of a business combination would be consistent with the accounting for other asset acquisitions in which the amount capitalised is equal to the amount paid to acquire and place the asset in service.

BC140 The boards were not persuaded by those views. They observed that the view described in paragraph BC139(a) is essentially the same as the view of some respondents to ED 3 discussed in paragraph BC134(a). In addition, the boards noted that the acquirer does not pay the acquiree or its owners for the anticipated costs to restructure or exit activities and the acquirer's plans to do so do not give rise to an obligation and associated liability at the acquisition date. The acquirer ordinarily incurs a liability associated with such costs after it gains control of the acquiree's business.

BC141 The boards also disagreed with the view that the accounting for costs to restructure or exit some of an acquiree's activities is inconsistent with the requirements of the revised standards on contingencies. On the contrary, the two requirements are consistent with each other because both require recognition of a liability only if an obligation that meets the definition of a liability exists at the acquisition date.

BC142 The boards also observed that the requirements of the revised standards on restructuring costs are consistent with current practice in accounting for many similar costs expected to be incurred in conjunction with other acquisitions of assets. For example, one airline might acquire an aircraft from another airline. The acquirer was likely to consider the costs of changing the logo on the aircraft and making any other intended changes to its configuration in deciding what it was willing to pay for the aircraft. Other airlines bidding for the aircraft might also have plans to change the aircraft if they were the successful bidders. The nature and extent of the changes each airline expected to make and the costs each would incur were likely to differ.

BC143 In accordance with both US GAAP and IFRSs, the airline would recognise none of those expected, post-acquisition costs at the date the aircraft is acquired. Instead, those costs are accounted for after control of the aircraft is obtained. If the costs add to the value of the aircraft and meet the related requirements of US GAAP or IFRSs, they will be recognised as assets (probably as an addition to the carrying amount of the aircraft). Otherwise, those additional costs are likely to be charged to expense when incurred.

Operating leases

BC144 In accordance with both FASB Statement No. 13 *Accounting for Leases* (SFAS 13) and IAS 17 *Leases*, an acquiree that is the lessee in an operating lease does not recognise separately the rights and obligations embodied in operating leases. The boards considered whether to require, for example, the separate recognition of an asset acquired for an acquiree's rights to use property for the specified period and related renewal options or other rights and a liability assumed for an acquiree's obligations to make required lease payments for an operating lease acquired in a

business combination. However, at the time they considered how to account for operating leases in a business combination, they were considering adding to their agendas a joint project on accounting for leases. That project was added in 2006. Accordingly, the boards concluded that the revised standards should be consistent with the existing accounting requirements on accounting for leases. Therefore, the revised standards provide that the acquirer recognises no assets or liabilities related to an operating lease in which the acquiree is the lessee other than those referred to in paragraphs B29 and B30 of the revised IFRS 3, which are discussed in the following paragraphs.

BC145 The 2005 Exposure Draft proposed that the amount by which the terms of an operating lease are favourable or unfavourable in relation to market terms should be recognised as a separate intangible asset, regardless of whether the acquiree is the lessee or the lessor. For the FASB, that proposal would have carried forward the related guidance in SFAS 141 for leases in which the acquiree is the lessee. Some respondents suggested that, instead, the measure of the fair value of an asset subject to an operating lease in which the acquiree is the lessor should take into account the favourable or unfavourable aspect of the lease terms.

BC146 The boards considered this issue in the context of their respective guidance in other standards on how to determine the fair value of an asset. As noted above, the proposal in the 2005 Exposure Draft was generally consistent with US GAAP for business combinations. However, FASB Statement No. 157 *Fair Value Measurements* (SFAS 157) does not provide guidance on the *unit of valuation*—the level at which an asset or liability is aggregated or disaggregated to determine what is being measured. The IASB also does not have general guidance on determining the unit of valuation. However, IAS 40 *Investment Property* provides that the fair value of investment property takes into account rental income from current leases, and the IASB understands that practice in measuring the fair value of investment property is to take into account the contractual terms of the leases and other contracts in place relating to the asset.

BC147 The FASB concluded that SFAS 141 should retain the guidance in the 2005 Exposure Draft that the favourable or unfavourable aspect of an operating lease in which the acquiree is the lessor should be separately recognised as an intangible asset or liability. It concluded that separately reporting that amount rather than embedding an aspect of a lease contract in the fair value of the leased asset would provide more complete information to users of the post-combination financial statements. In addition, the FASB noted that reporting the favourable or unfavourable aspect of the lease contract separately would facilitate appropriate amortisation of that amount over the term of the lease rather than over the remaining life of the leased asset. Unlike IAS 16 *Property, Plant and Equipment*, US GAAP does not require an item of property, plant or equipment to be separated into components, with the components depreciated or amortised over different useful lives.

BC148 The IASB decided to require the acquirer in a business combination to follow the guidance in IAS 40 for assets subject to operating leases in which the acquiree is the lessor. The IASB observed that, for lessors who choose the cost option in IAS 40, both IAS 16 and IAS 38 require use of a depreciation or amortisation method that reflects the pattern in which the entity expects to consume the asset's future economic benefits. In addition, IAS 16 requires each part of an item

 © IASCF

of property, plant and equipment that has a cost that is significant in relation to the total cost of the item to be depreciated separately. Thus, an entity would be required to adjust the depreciation or amortisation method for the leased asset to reflect the timing of cash flows attributable to the underlying leases. Therefore, although the presentation of operating leases and the underlying leased assets in the statement of financial position will differ depending on whether an entity applies IFRSs or US GAAP, the IASB observed that the identifiable net assets and the depreciation or amortisation recognised in the post-combination financial statements will be the same.

Research and development assets

BC149 The revised standards require an acquirer to recognise all tangible and intangible research and development assets acquired in a business combination, as was proposed in the 2005 Exposure Draft. Previously, FASB Interpretation No. 4 *Applicability of FASB Statement No. 2 to Business Combinations Accounted for by the Purchase Method* (FASB Interpretation 4) required an acquirer to measure and immediately recognise as expense tangible and intangible assets to be used in research and development that had no alternative future use. A research and development asset was recognised as such only if it had an alternative future use. In contrast, IFRS 3 did not require a research and development asset to have an alternative future use for it to be recognised. The revised standards therefore do not change the provisions of IFRS 3 on that issue. Accordingly, most of the discussion in paragraphs BC150–BC156 pertains to the FASB's consideration of this issue.

BC150 The FASB concluded that the requirement to write off assets to be used in research and development activities immediately if they have no alternative future use resulted in information that was not representationally faithful. In addition, eliminating that requirement furthers the goal of international convergence of accounting standards. Therefore, SFAS 141(R) supersedes FASB Interpretation 4 and requires research and development assets acquired in a business combination to be recognised regardless of whether they have an alternative future use.

BC151 Relatively few respondents to the 2005 Exposure Draft commented on the proposed accounting for research and development assets. Those who did so generally disagreed with those proposals (they also generally applied US GAAP rather than IFRSs), citing either or both of the following concerns as support for their view:

(a) In-process research and development may not meet the definition of an asset in the FASB's Concepts Statement 6 because its low likelihood of success does not represent **probable** future economic benefits.

(b) The fair value of in-process research and development may not be measurable with sufficient reliability for recognition in financial statements.

The boards rejected both of those views for the reasons explained in the following paragraphs.

BC152 The boards agreed with respondents that the likelihood that an individual research and development project will result in a profitable product is often low. However, the boards also noted that the use of the word *probable* in the FASB's Concepts Statement 6 refers only to something that is not certain. The definition does not use that term as a recognition criterion that specifies the degree of probability of the inflow or outflow of future economic benefits that must be present for an item to qualify for recognition. Therefore, the boards concluded that in-process research and development acquired in a business combination will generally satisfy the definition of an asset because the observable exchange at the acquisition date provides evidence that the parties to the exchange expect future economic benefits to result from that research and development. Uncertainty about the outcome of an individual project is reflected in measuring its fair value.

BC153 The boards also agreed that determining the fair value of in-process research and development requires the use of estimates and judgement, and the resulting amount will generally not be as reliable as the fair values of other assets for which quoted prices in active markets are available. However, the boards observed that use of estimates and judgement, by itself, does not mean that information is unreliable; reliability does not require precision or certainty. For example, paragraph 86 of the IASB's *Framework* says that 'In many cases, cost or value must be estimated; the use of reasonable estimates is an essential part of the preparation of financial statements and does not undermine their reliability.' The boards also noted that the requirement to measure the fair value of in-process research and development assets acquired in a business combination is not new—not even in US GAAP. In accordance with FASB Interpretation 4, that amount was measured but immediately written off. Moreover, respondents to the 2005 Exposure Draft that apply IFRSs generally did not mention any problems with complying with the provisions of IFRS 3 on research and development assets, which are the same as those in the revised standards.

BC154 In developing the 2005 Exposure Draft, the FASB also considered whether it could make further improvements by extending the recognition provisions of SFAS 141(R) for research and development assets to purchases of in-process research and development assets outside a business combination. At that time, the FASB decided not to do so because the additional time needed to deliberate the related issues would have unduly delayed the revised standards.

BC155 Some respondents to the 2005 Exposure Draft objected to the resulting inconsistent US GAAP requirements for research and development assets acquired in a business combination and those acquired in another type of transaction. The FASB agreed with respondents that inconsistent accounting for research and development assets depending on how they are acquired is undesirable. Therefore, the FASB expects to reconsider the accounting for research and development assets acquired by means other than in a business combination separately from its project on business combinations.

BC156 The FASB also decided to provide guidance on the impairment testing of in-process research and development projects that are temporarily idled or abandoned. It did that by means of an amendment to SFAS 142.

 © IASCF

Distinguishing identifiable intangible assets from goodwill

BC157 Early in their respective projects on accounting for business combinations, the IASB and the FASB both observed that intangible assets make up an increasing proportion of the assets of many (if not most) entities. The boards also observed that intangible assets acquired in a business combination were often included in the amount recognised as goodwill.

BC158 Both the IASB and the FASB decided that they needed to provide explicit criteria for determining whether an acquired intangible asset should be recognised separately from goodwill. The FASB provided such criteria in SFAS 141 and the IASB provided similar, although not identical, criteria in IAS 38.* One reason for providing such criteria was the boards' conclusion that the decision-usefulness of financial statements would be enhanced if intangible assets acquired in a business combination were distinguished from goodwill. For example, the FASB's Concepts Statement No. 5 *Recognition and Measurement in Financial Statements of Business Enterprises* says that classification in financial statements facilitates analysis by grouping items with essentially similar characteristics and separating items with essentially different characteristics. Analysis aimed at objectives such as predicting amounts, timing and uncertainty of future cash flows requires financial information segregated into reasonably homogeneous groups.

BC159 In developing its 1999 Exposure Draft, the FASB considered various characteristics that might distinguish other intangible assets from goodwill. Because the FASB concluded that identifiability is the characteristic that conceptually distinguishes other intangible assets from goodwill, the 1999 Exposure Draft proposed that intangible assets that are identifiable and reliably measurable should be recognised as assets separately from goodwill. Most respondents to the 1999 Exposure Draft agreed that many intangible assets are identifiable and that various intangible assets are reliably measurable. However, respondents' views on the proposed recognition criteria varied. Many of those respondents suggested alternative recognition criteria and many urged the FASB to clarify the term *reliably measurable*.

BC160 The FASB considered those suggestions and decided to modify the proposed recognition criteria to provide a clearer distinction between intangible assets that should be recognised separately from goodwill and those that should be subsumed into goodwill. The FASB then published a revised exposure draft *Business Combinations and Intangible Assets—Accounting for Goodwill* (2001 Exposure Draft) which proposed that an intangible asset should be recognised separately from goodwill if either:

(a) control over the future economic benefits of the asset results from contractual or other legal rights (the contractual-legal criterion); or

(b) the intangible asset is capable of being separated or divided and sold, transferred, licensed, rented or exchanged (either separately or as part of a group of assets) (the separability criterion).

* More detailed information about the IASB's reasoning in developing the criteria in IAS 38 is available in its Basis for Conclusions.

The FASB concluded that sufficient information should exist to measure reliably the fair value of an asset that satisfies either of those criteria. Thus, the change in the recognition criteria eliminated the need explicitly to include *reliably measurable* as a recognition criterion or to clarify the meaning of that term.

BC161 IAS 38 (as issued by the IASB's predecessor body in 1998) clarified that the definition of an intangible asset required an intangible asset to be identifiable to distinguish it from goodwill. However, it did not define the term *identifiable*. Instead, IAS 38 stated that an intangible asset could be distinguished from goodwill if the asset was separable, though separability was not a necessary condition for identifiability.

BC162 In developing IFRS 3, the IASB affirmed the conclusion in IAS 38 that identifiability is the characteristic that conceptually distinguishes other intangible assets from goodwill. In addition, the IASB concluded that to provide a definitive basis for identifying and recognising intangible assets separately from goodwill, the concept of identifiability needed to be articulated more clearly. As a result of that consideration, which is discussed in paragraphs BC163–BC165, the IASB developed more definitive criteria for distinguishing between identifiable intangible assets and goodwill and included those criteria in both IFRS 3 and IAS 38 (as revised in 2004).

Reasons for the contractual-legal criterion

BC163 In developing IFRS 3 and SFAS 141, the IASB and the FASB observed that many intangible assets arise from rights conveyed legally by contract, statute or similar means. For example, franchises are granted to car dealers, fast food outlets and professional sports teams. Trademarks and service marks may be registered with the government. Contracts are often negotiated with customers or suppliers. Technological innovations are often protected by patents. In contrast, goodwill arises from the collection of assembled assets that make up an acquiree or the value created by assembling a collection of assets through a business combination, such as the synergies that are expected to result from combining two or more businesses. Therefore, both boards concluded that the fact that an intangible asset arises from contractual or other legal rights is an important characteristic that distinguishes many intangible assets from goodwill and an acquired intangible asset with that characteristic should be recognised separately from goodwill.

Reasons for the separability criterion

BC164 As already noted (paragraph BC161), the original version of IAS 38 included separability as a characteristic that helps to distinguish intangible assets from goodwill. In developing IFRS 3, the IASB affirmed that conclusion for the reasons discussed in the following paragraphs.

BC165 In developing IFRS 3 and SFAS 141, the IASB and the FASB observed that some intangible assets that do not arise from rights conveyed by contract or other legal means are nonetheless capable of being separated from the acquiree and exchanged for something else of value. Others, like goodwill, cannot be separated from an entity and sold or otherwise transferred. Both boards thus concluded that separability is another important characteristic that distinguishes many intangible assets from goodwill. An acquired intangible asset with that characteristic should be recognised separately from goodwill.

 © IASCF

BC166 The FASB's 2001 Exposure Draft proposed that an intangible asset that was not separable individually would meet the separability criterion if it could be sold, transferred, licensed, rented or exchanged along with a group of related assets or liabilities. Some respondents suggested that the FASB should eliminate that requirement, arguing that unless the asset is separable individually it should be included in the amount recognised as goodwill. Others asked the FASB to clarify the meaning of the term *group of related assets*, noting that even goodwill can be separated from the acquiree if the asset group sold constitutes a business.

BC167 The FASB noted that some intangible assets are so closely related to another asset or liability that they are usually sold as a 'package' (eg deposit liabilities and the related depositor relationship intangible asset). If those intangible assets were subsumed into goodwill, gains might be inappropriately recognised if the intangible asset was later sold along with the related asset or obligation. However, the FASB agreed that the proposed requirement to recognise an intangible asset separately from goodwill if it could be sold or transferred as part of an asset group was a broader criterion than it had intended. For those reasons, SFAS 141 provided, as do the revised standards, that an intangible asset that is not separable individually meets the separability criterion if it can be separated from the entity and sold, transferred, licensed, rented or exchanged in combination with a related contract, other identifiable asset or other liability.

BC168 Some respondents to the 2001 Exposure Draft suggested limiting the separability criterion to intangible assets that are separable **and** are traded in observable exchange transactions. Although the FASB agreed that exchange transactions provide evidence of an asset's separability, it concluded that those transactions were not necessarily the only evidence of separability and it did not adopt that suggestion.

BC169 Other respondents suggested that the separability criterion should be modified to require recognition of an intangible asset separately from goodwill only if management of the entity **intends** to sell, lease or otherwise exchange the asset. The FASB rejected that suggestion because it concluded that the asset's **capability** of being separated from the entity and exchanged for something else of value is the pertinent characteristic of an intangible asset that distinguishes it from goodwill. In contrast, management's intentions are not a characteristic of an asset.

The FASB's reasons for rejecting other recognition criteria suggested for SFAS 141

BC170 Some respondents suggested that the FASB should eliminate the requirement to recognise intangible assets separately from goodwill. Others suggested that all intangible assets with characteristics similar to goodwill should be included in the amount recorded as goodwill. The FASB rejected those suggestions because they would diminish rather than improve the decision-usefulness of reported financial information.

BC171 Some respondents doubted their ability to measure reliably the fair values of many intangible assets. They suggested that the only intangible assets that should be recognised separately from goodwill are those that have direct cash flows and those that are bought and sold in observable exchange transactions. The FASB rejected that suggestion. Although the fair value measures of some identifiable intangible assets might lack the precision of the measures for other

assets, the FASB concluded that the information that will be provided by recognising intangible assets at their estimated fair values is a more faithful representation than that which would be provided if those intangible assets were subsumed into goodwill. Moreover, including finite-lived intangible assets in goodwill that is not being amortised would further diminish the representational faithfulness of financial statements.

Convergence of criteria in SFAS 141 and IFRS 3

BC172 The criteria in IFRS 3 for determining if an intangible asset is identifiable and thus should be recognised separately from goodwill included the same contractual or legal and separability conditions as SFAS 141. However, IFRS 3 also included a requirement that the fair value of an identifiable intangible asset should be reliably measurable to be recognised separately. In developing the 2005 Exposure Draft, the boards considered how best to achieve convergence of their respective recognition criteria for intangible assets.

BC173 In developing IFRS 3, the IASB noted that the fair value of identifiable intangible assets acquired in a business combination is normally measurable with sufficient reliability to be recognised separately from goodwill. The effects of uncertainty because of a range of possible outcomes with different probabilities are reflected in measuring the asset's fair value; the existence of such a range does not demonstrate an inability to measure fair value reliably. IAS 38 (before amendment by the revised IFRS 3) included a rebuttable presumption that the fair value of an intangible asset with a finite useful life acquired in a business combination can be measured reliably. The IASB had concluded that it might not always be possible to measure reliably the fair value of an asset that has an underlying contractual or legal basis. However, IAS 38 provided that the only circumstances in which it might not be possible to measure reliably the fair value of an intangible asset that arises from legal or other contractual rights acquired in a business combination were if it either:

(a) is not separable; or

(b) is separable, but there is no history or evidence of exchange transactions for the same or similar assets, and otherwise estimating fair value would depend on immeasurable variables.

BC174 In developing the 2005 Exposure Draft, the IASB concluded that separate recognition of intangible assets, on the basis of an estimate of fair value, rather than subsuming them in goodwill, provides better information to the users of financial statements even if a significant degree of judgement is required to estimate fair value. For that reason, the IASB decided to propose consequential amendments to IAS 38 to remove the reliability of measurement criterion for intangible assets acquired in a business combination. In redeliberating the proposals in the 2005 Exposure Draft, the IASB affirmed those amendments to IAS 38.

Illustrative list of intangible assets

BC175 The illustrative examples that accompanied IFRS 3 included a list of examples of identifiable intangible assets that might be acquired in a business combination. A similar list accompanies the revised IFRS 3 (see the illustrative examples). The list reflects various changes to similar lists in the exposure drafts that the

 © IASCF

boards published earlier in their respective projects on business combinations. The boards observed that the list is not exhaustive, and a particular type of intangible asset that was included on an earlier list might not be mentioned in the illustrative examples. That does not necessarily mean that the intangible asset does not qualify as identifiable in accordance with the criteria in the revised standards. An acquirer must consider the nature of each acquired intangible asset in determining whether those criteria are met.

Assembled workforce

BC176 In developing SFAS 141, the FASB did not consider whether an assembled workforce met either the contractual-legal or the separability criterion for recognition as an identifiable intangible asset. Instead, SFAS 141 precluded separate recognition of an assembled workforce because of the FASB's conclusion that techniques to measure the value of an assembled workforce with sufficient reliability were not currently available. IFRS 3 and IAS 38, on the other hand, did not explicitly preclude separate recognition of an assembled workforce. However, paragraph 15 of IAS 38 noted that an entity would not usually have sufficient control over the expected future economic benefits arising from an assembled workforce for it to meet the definition of a separate intangible asset.

BC177 In developing the 2005 Exposure Draft, the boards concluded that an acquirer should not recognise an assembled workforce as a separate intangible asset because it meets neither the contractual-legal nor the separability criterion. The views of respondents who commented on recognition of an assembled workforce were mixed. Some agreed with its proposed recognition prohibition. Others suggested that the boards should reconsider that prohibition; they generally said that an assembled workforce is already valued in many situations for the purpose of calculating a 'contributory asset charge' in determining the fair value of some intangible assets. (In using an 'excess earnings' income valuation technique, a contributory asset charge is required to isolate the cash flows generated by the intangible asset being valued from the contribution to those cash flows made by other assets, including other intangible assets. Contributory asset charges are hypothetical 'rental' charges for the use of those other contributing assets.) Those respondents opposed a prohibition on recognising an assembled workforce as a separate intangible asset; they favoured permitting acquirers to assess whether an assembled workforce is separable in each situation and to recognise those that are separable.

BC178 In reconsidering the proposal in the 2005 Exposure Draft, the boards concluded that the prohibition of recognising an assembled workforce should be retained. Because an assembled workforce is a collection of employees rather than an individual employee, it does not arise from contractual or legal rights. Although individual employees might have employment contracts with the employer, the collection of employees, as a whole, does not have such a contract. In addition, an assembled workforce is not separable, either as individual employees or together with a related contract, identifiable asset or liability. An assembled workforce cannot be sold, transferred, licensed, rented or otherwise exchanged without causing disruption to the acquirer's business. In contrast, an entity could continue to operate after transferring an identifiable asset. Therefore, an assembled workforce is not an identifiable intangible asset to be recognised separately from goodwill.

BC179 The boards observed that neither IAS 38 nor SFAS 141 defined an assembled workforce, and that inconsistencies have resulted in practice. In addition, some who objected to the recognition prohibition in the 2005 Exposure Draft apparently consider that an assembled workforce represents the intellectual capital of the skilled workforce—the (often specialised) knowledge and experience that employees of an acquiree bring to their jobs. However, the boards view an assembled workforce as an existing collection of employees that permits an acquirer to continue to operate an acquired business from the acquisition date and they decided to include that definition in the revised standards (paragraph B37 of the revised IFRS 3).

BC180 The boards observed that the value of intellectual capital is, in effect, recognised because it is part of the fair value of the entity's other intangible assets, such as proprietary technologies and processes and customer contracts and relationships. In that situation, a process or methodology can be documented and followed to the extent that the business would not be materially affected if a particular employee left the entity. In most jurisdictions, the employer usually 'owns' the intellectual capital of an employee. Most employment contracts stipulate that the employer retains the rights to and ownership of any intellectual property created by the employee. For example, a software program created by a particular employee (or group of employees) would be documented and generally would be the property of the entity. The particular programmer who created the program could be replaced by another software programmer with equivalent expertise without significantly affecting the ability of the entity to continue to operate. But the intellectual property created in the form of a software program is part of the fair value of that program and is an identifiable intangible asset if it is separable from the entity. In other words, the prohibition of recognising an assembled workforce as an intangible asset does not apply to intellectual property; it applies only to the value of having a workforce in place on the acquisition date so that the acquirer can continue the acquiree's operations without having to hire and train a workforce.

Reacquired rights

BC181 As part of a business combination, an acquirer may reacquire a right that it had previously granted to the acquiree to use the acquirer's recognised or unrecognised intangible assets. Examples of such rights include a right to use the acquirer's trade name under a franchise agreement or a right to use the acquirer's technology under a technology licensing agreement. The 2005 Exposure Draft proposed, and the revised standards require, an acquirer to recognise such a reacquired right as an identifiable intangible asset (paragraph B35 of the revised IFRS 3). The fair value of a reacquired right is to be amortised over the remaining term of the contract that gave rise to the right. For entities applying US GAAP, that guidance is not new; it is the same as the related guidance in EITF Issue 04-1. (Paragraphs BC308–BC310 discuss the measurement of reacquired rights.)

BC182 A few respondents to the 2005 Exposure Draft disagreed with recognising a reacquired right as an identifiable intangible asset because they considered that doing so was the same as recognising an internally generated intangible asset. Some suggested recognising a reacquired right as the settlement of a pre-existing relationship; others said that a reacquired right should be recognised as part of goodwill.

 © IASCF

BC183 The boards rejected the alternative of treating a reacquired right as the termination of a pre-existing relationship because reacquisition of, for example, a franchise right does not terminate the right. After a business combination, the right to operate a franchised outlet in a particular region continues to exist. The difference is that the acquirer, rather than the acquiree by itself, now controls the franchise right.

BC184 The boards also rejected recognising a reacquired right as part of goodwill. Supporters of that alternative consider that such a right differs from other identifiable intangible assets recognised in a business combination because, from the perspective of the combined entity, a franchising relationship with an outside party no longer exists. As already noted, however, the reacquired right and the related cash flows continue to exist. The boards concluded that recognising that right separately from goodwill provides users of the financial statements of the combined entity with more decision-useful information than subsuming the right into goodwill. The boards also observed that a reacquired right meets the contractual-legal and the separability criteria and therefore qualifies as an identifiable intangible asset.

Classifying and designating assets acquired and liabilities assumed

BC185 In some situations, IFRSs and US GAAP provide for different accounting depending on how a particular asset or liability is classified or designated. For example, in accordance with both IAS 39 *Financial Instruments: Recognition and Measurement*[*] and FASB Statement No. 115 *Accounting for Certain Investments in Debt and Equity Securities*, the accounting for particular financial instruments differs depending on how the instrument is classified, for example, as at fair value through profit or loss, available for sale or held to maturity. Another example is the accounting for a derivative instrument in accordance with either IAS 39 or FASB Statement No. 133 *Accounting for Derivative Instruments and Hedging Activities* (SFAS 133), which depends on whether the derivative is designated as a hedge, and if so, the type of hedge designated.

BC186 The 2005 Exposure Draft proposed that the classification of an acquired lease would not change from the acquiree's classification at lease inception unless the terms of the lease were modified as a result of the business combination in a way that would require a different classification in accordance with IAS 17 or SFAS 13. But that exposure draft did not address classification or designation issues pertaining to other types of contracts. Some respondents and others asked the boards to provide additional guidance on when the acquirer in a business combination should reconsider and perhaps change the classification or designation of a contract for the purpose of applying other accounting requirements.

BC187 The boards decided that providing a general principle for classifying or designating contracts acquired in a business combination would facilitate consistent implementation of the revised standards. They observed that application of the acquisition method results in the initial recognition in the

[*] In November 2009 the IASB amended the requirements of IAS 39 relating to classification and measurement of assets within the scope of IAS 39 and relocated them to IFRS 9 *Financial Instruments*. IFRS 9 applies to all assets within the scope of IAS 39. This paragraph discusses matters relevant when IFRS 3 was issued.

© IASCF

acquirer's financial statements of the assets acquired and liabilities assumed in a business combination. Therefore, in concept, the acquirer should classify and designate all items acquired in a business combination at the acquisition date in the context of the contractual terms, economic conditions and other pertinent factors at that date. That concept underlies the classification and designation principle (paragraph 15 of the revised IFRS 3).

BC188 In the two situations described in paragraph 17 of the revised IFRS 3, classification of a lease contract as an operating lease or a finance lease and classification of a contract as an insurance or reinsurance contract or a deposit contract, other IFRSs and US GAAP require an entity to classify a contract only at its inception, on the basis of contractual terms and other factors at that date. Because those requirements apply to specific types of contracts regardless of the identity of the parties to the contract, the boards concluded that such requirements should also apply in accounting for a business combination. Thus, the revised standards provide an exception to the principle for classifying and designating assets acquired and liabilities assumed in a business combination for the two types of contracts identified in paragraph 17.

Recognition, classification and measurement guidance for insurance and reinsurance contracts

BC189 SFAS 141(R) provides guidance specific to insurance and reinsurance contracts acquired or assumed in a business combination, primarily by means of amendments to other insurance-related standards. Paragraphs BC190–BC195 discuss that guidance. Paragraph BC196 discusses the IASB's guidance on recognition and measurement of insurance contracts in a business combination, which is provided in IFRS 4 *Insurance Contracts*.

BC190 The FASB decided that insurance and reinsurance contracts acquired in a business combination should be accounted for on a fresh start (new contract) basis. Accordingly, all assets and liabilities arising from the rights and obligations of insurance and reinsurance contracts acquired in a business combination are recognised at the acquisition date, measured at their acquisition-date fair values. That recognition and measurement might include a reinsurance recoverable, a liability to pay future contract claims and claims expenses on the unexpired portion of the acquired contracts and a liability to pay incurred contract claims and claims expenses. However, those assets acquired and liabilities assumed would not include the acquiree's insurance and reinsurance contract accounts such as deferred acquisition costs and unearned premiums that do not represent future cash flows. The FASB considers that model the most consistent with the acquisition method and with the accounting for other types of contracts acquired in a business combination.

BC191 The FASB also decided to require the acquirer to carry forward the acquiree's classification of a contract as an insurance or reinsurance contract (rather than a deposit) on the basis of the terms of the acquired contract and any related contracts or agreements at the inception of the contract. If the terms of those contracts or agreements have been modified in a manner that would change the classification, the acquirer determines the classification of the contract on the basis of its terms and other pertinent factors as of the modification date,

 © IASCF

which may be the acquisition date. Consideration of related contracts and arrangements is important in assessing whether a contract qualifies as insurance or reinsurance because they can significantly affect the amount of risk transferred.

BC192 SFAS 141(R) also requires the fair value of the insurance and reinsurance contracts acquired in a business combination to be separated into (a) insurance and reinsurance US GAAP accounting balances using the acquirer's accounting policies and (b) an intangible asset (or, at times that are expected to be rare, another liability). That guidance permits the acquirer to report the acquired business subsequently on the same basis as its written business (with the exception of the amortisation of the intangible asset). Other contracts providing for third-party contingent commissions would be accounted for in the same way as other contingencies, and contracts that provide guarantees of the adequacy of claims liabilities would be accounted for as indemnifications.

BC193 The FASB concluded that the intangible asset should be amortised on a basis consistent with the measurement of the liability. For example, for most short-duration contracts such as property and liability insurance contracts, US GAAP claims liabilities are not discounted, so amortising the intangible asset like a discount using an interest method could be an appropriate method. For particular long-duration contracts such as most traditional life insurance contracts, using a basis consistent with the measurement of the liability would be similar to the guidance provided in paragraph 31 of FASB Statement No. 60 *Accounting and Reporting by Insurance Enterprises* (SFAS 60).

BC194 The FASB considered several implementation issues identified by respondents to the 2005 Exposure Draft but decided that specifying the fresh start model for acquired insurance and reinsurance contracts and providing limited guidance on subsequent accounting, including requiring the intangible asset to be amortised on a basis consistent with the liability, should be sufficient to resolve most practice issues. That level of guidance is also consistent with the limited guidance provided by IFRS 4.

BC195 The FASB decided to provide the guidance on recognition and measurement, including subsequent measurement, of insurance and reinsurance contracts acquired in a business combination by means of an amendment to SFAS 60. That parallels the location of the IASB's business combination guidance for insurance contracts in IFRS 4 and will make it easier to address any changes in that guidance that might result if the FASB and the IASB eventually undertake a joint project to reconsider comprehensively the accounting for insurance contracts.

BC196 Paragraphs 31–33 of IFRS 4 deal with limited aspects of insurance contracts acquired in a business combination. That guidance was developed in phase I of the IASB's project on insurance contracts. The IASB decided not to amend those paragraphs in phase II of the business combinations project, so as not to pre-empt phase II of the IASB's project on insurance contracts. In May 2007 the IASB published its initial thoughts for phase II of that project in a discussion paper *Preliminary Views on Insurance Contracts*.

Measurement

BC197 Paragraph 18 of the revised IFRS 3 establishes the principle that the identifiable assets acquired and liabilities assumed should be measured at their acquisition-date fair values. The reasons for that principle and its application to contingencies and non-controlling interests are discussed in paragraphs BC198–BC245, and the definition of fair value is discussed in paragraphs BC246–BC251. The revised standards provide guidance on determining the acquisition-date fair value of particular types of assets acquired, which is discussed in paragraphs BC252–BC262. The exceptions to the measurement principle are discussed in paragraphs BC279–BC311.

Why establish fair value as the measurement principle?

Identifiable assets acquired and liabilities assumed

BC198 In developing the measurement principle in the revised standards, the boards concluded that fair value is the most relevant attribute for assets acquired and liabilities assumed in a business combination. Measurement at fair value also provides information that is more comparable and understandable than measurement at cost or on the basis of allocating the total cost of an acquisition. Both IFRS 3 and SFAS 141 required allocation of that cost on the basis of the fair value of the assets acquired and the liabilities assumed. However, other guidance in those standards required measurements that were other than fair value. Moveover, SFAS 141's requirements for measuring identifiable assets acquired and liabilities assumed in an acquisition achieved in stages (a step acquisition) and in acquisitions of less than all of the equity interests in the acquiree resulted in another difference between fair value measurement of identifiable assets and liabilities and the process of accumulating and allocating costs. Those requirements were the same as the benchmark treatment in IAS 22, which IFRS 3 replaced. The following paragraphs discuss both the IASB's reasons for that change to IAS 22 and the FASB's reasons for the change to SFAS 141's requirements for step acquisitions, as well as providing additional discussion of the reasons for the fair value measurement principle in the revised standards.

BC199 In developing IFRS 3 and SFAS 141(R), respectively, the boards examined the inconsistencies that resulted from applying the benchmark treatment in IAS 22 and the provisions of SFAS 141, and the related implementation guidance, to acquisitions of businesses. For a step acquisition, that process involved accumulating the costs or carrying amounts of earlier purchases of interests in an entity, which may have occurred years or decades ago. Those amounts were added to the current costs to purchase incremental interests in the acquiree on the acquisition date. The accumulated amounts of those purchases were then allocated to the assets acquired and liabilities assumed. Allocating the accumulated amounts generally resulted in recognising the identifiable assets and liabilities of the acquiree at a mixture of current exchange prices and carry-forward book values for each earlier purchase rather than at their acquisition-date fair values. Users of financial statements have long criticised those practices as resulting in information that lacks consistency, understandability and usefulness. For example, in response to the September 1991 FASB Discussion Memorandum *Consolidation Policy and Procedures*, an organisation representing lending officers said:

 © IASCF

> [We believe] that the assets and liabilities of the subsidiary [acquiree] reported in the consolidation should reflect the full values established by the exchange transaction in which they were purchased. . . . [We believe] the current practice of reporting individual assets and liabilities at a mixture of some current exchange prices and some carry-forward book values is **dangerously misleading**. [emphasis added]

BC200 The boards concluded that no useful purpose is served by reporting the assets or liabilities of a newly acquired business using a mixture of their fair values at the date acquired and the acquirer's historical costs or carrying amounts. Amounts that relate to transactions and events occurring before the business is included in the acquirer's financial statements are not relevant to users of those financial statements.

BC201 The boards also observed the criticisms of the information resulting from application of the cost accumulation and allocation process to acquisitions of businesses that resulted in ownership of less than all of the equity interests in the acquiree. In those circumstances, application of the cost accumulation and allocation process also resulted in identifiable assets and liabilities being assigned amounts that were generally not their acquisition-date fair values. For example, in its 1993 Position Paper *Financial Reporting in the 1990s and Beyond* the Association for Investment Management and Research (AIMR)* said:

> An even more difficult situation arises when Firm B acquires less than total ownership of Firm A. Under current practice, only the proportionate share of Firm A's assets and liabilities owned by Firm B are re-valued, but all of Firm A's assets and liabilities—partially re-valued, partially not—are consolidated with those of Firm B, none of whose assets and liabilities have been re-valued. What a mélange! **The result is a combination of historic and current values that only a mystic could sort out with precision.** [page 28, emphasis added]

BC202 In contrast, if all of the interests in the business were acquired in a single purchase, the process of assigning that current purchase price generally resulted in the assets and liabilities being measured and recognised at their acquisition-date fair values. Thus, the reported amounts of assets and liabilities differed depending on whether an acquirer purchased all of the equity interests in an acquiree in one transaction or in multiple transactions.

BC203 The boards concluded that measuring assets acquired or liabilities assumed at amounts other than their fair values at the acquisition date does not faithfully represent their economic values or the acquirer's economic circumstances resulting from the business combination. As discussed in paragraph BC37, an important purpose of financial statements is to provide users with relevant and reliable information about the performance of the entity and the resources under its control. That applies regardless of the extent of the ownership interest a parent holds in a particular subsidiary. The boards concluded that measurement at fair value enables users to make a better assessment of the cash-generating abilities of the identifiable net assets acquired in the business combination and the accountability of management for the resources entrusted to it. Thus, the fair value measurement principle in the revised standards will improve the completeness, reliability and relevance of the information reported in an acquirer's financial statements. The boards also concluded that application of

* Subsequently, the AIMR changed its name to the CFA Institute. References to the organisation in this Basis for Conclusions use its name at the date it published a particular paper.

that measurement principle should not impose undue incremental costs on entities because it was also necessary to measure the fair values of assets acquired and liabilities assumed under the provisions of IFRS 3 and SFAS 141, even though those fair values were not always the amounts at which assets and liabilities were recognised.

BC204 Thus, the revised standards reflect the decisions of the IASB and the FASB to develop a standard (and related application guidance) for measuring assets acquired and liabilities assumed in a business combination that:

(a) is consistent with the general principle of initially measuring assets acquired and liabilities assumed at their fair values, thereby improving the relevance and comparability of the resulting information about the assets acquired and liabilities assumed;

(b) eliminates inconsistencies and other deficiencies of the purchase price allocation process, including those in acquisitions of businesses that occur in stages and those in which the acquirer obtains a business without purchasing all, or perhaps any, of the acquiree's equity interests on the acquisition date; and

(c) can be applied in practice with a reasonably high degree of consistency and without imposing undue costs.

Non-controlling interests

BC205 The 2005 Exposure Draft proposed that a non-controlling interest in an acquiree should be determined as the sum of the non-controlling interest's proportional interest in the identifiable assets acquired and liabilities assumed plus the non-controlling interest's share of goodwill. Thus, because goodwill is measured as a residual, the amount recognised for a non-controlling interest in an acquiree would also have been a residual. Also, an important issue in deciding how to measure a non-controlling interest was whether its share of goodwill should be recognised (often referred to as the 'full goodwill versus partial goodwill issue'). In developing the 2005 Exposure Draft, the boards concluded that it should be recognised (in other words, they selected the 'full goodwill' alternative).

BC206 In redeliberating the 2005 Exposure Draft, the boards observed that they had specified the mechanics of determining the reported amount of a non-controlling interest but had not identified its measurement attribute. The result of those mechanics would have been that the non-controlling interest was effectively measured as the 'final residual' in a business combination. That is to say, the reported amount of the non-controlling interest depended on the amount of goodwill attributed to it, and goodwill is measured as a residual. Thus, in a sense, a non-controlling interest would have been the residual after allocating the residual, or the residual of a residual.

BC207 The boards concluded that, in principle, it is undesirable to have two residual amounts in accounting for a business combination. They also observed that goodwill cannot be measured as other than as a residual; measuring the fair value of goodwill directly would not be possible. In contrast, an acquirer can measure the fair value of a non-controlling interest, for example, on the basis of market prices for the shares held by non-controlling shareholders or by applying another valuation technique. The non-controlling interest in the acquiree is a component

 © IASCF

of a business combination in which less than 100 per cent of the equity interests are acquired, and the boards concluded that, in concept, the non-controlling interest, like other components of the combination, should be measured at fair value. The boards concluded that the decision-usefulness of information about a non-controlling interest would be improved if the revised standards specified a measurement attribute for a non-controlling interest rather than merely mechanics for determining that amount. They also concluded that, in principle, the measurement attribute should be fair value. The boards also understand from consultation with some constituents who use financial statements for making (or making recommendations about) investment decisions that information about the acquisition-date fair value of a non-controlling interest would be helpful in estimating the value of shares of the parent company, not only at the acquisition date but also at future dates.

BC208 The boards also observed that a non-controlling interest is a component of equity in the acquirer's consolidated financial statements and that measuring a non-controlling interest at its acquisition-date fair value is consistent with the way in which other components of equity are measured. For example, outstanding shares of the parent company, including shares issued to former owners of an acquiree to effect a business combination, were measured in the financial statements at their fair value (market price) on the date they were issued. Accordingly, the fair value measurement principle in SFAS 141(R) applies to a non-controlling interest in an acquiree, and the revised IFRS 3 permits an acquirer to measure a non-controlling interest in an acquiree at its acquisition-date fair value.

IFRS 3's choice of measurement basis for a non-controlling interest

BC209 The IASB concluded that, in principle, an acquirer should measure all components of a business combination, including any non-controlling interest in an acquiree, at their acquisition-date fair values. However, the revised IFRS 3 permits an acquirer to choose whether to measure any non-controlling interest in an acquiree at its fair value or as the non-controlling interests' proportionate share of the acquiree's identifiable net assets.

BC210 Introducing a choice of measurement basis for non-controlling interests was not the IASB's first preference. In general, the IASB believes that alternative accounting methods reduce the comparability of financial statements. However, the IASB was not able to agree on a single measurement basis for non-controlling interests because neither of the alternatives considered (fair value and proportionate share of the acquiree's identifiable net assets) was supported by enough board members to enable a revised business combinations standard to be issued. The IASB decided to permit a choice of measurement basis for non-controlling interests because it concluded that the benefits of the other improvements to, and the convergence of, the accounting for business combinations developed in this project outweigh the disadvantages of allowing this particular option.

BC211 The following sections (a) provide additional information about the measurement alternatives considered by the IASB, (b) summarise the main effects of permitting a choice in measurement basis and (c) discuss the effect on convergence.

Measurement alternatives

BC212 Although the IASB supports the principle of measuring all components of a business combination at fair value, support for that principle was not unanimous. Some IASB members did not support that principle because it would require measuring non-controlling interests at fair value. For that reason, those IASB members supported making an exception to the measurement principle for the non-controlling interest in an acquiree.

BC213 Some other IASB members supported an exception for the non-controlling interest for different reasons. Some advocated an exception on the basis that they did not have sufficient evidence to assess the marginal benefits of reporting the acquisition-date fair value of non-controlling interests. Those members concluded that, generally, the fair value of the non-controlling interest could be measured reliably, but they noted that it would be more costly to do so than measuring it at its proportionate share of the acquiree's identifiable net assets. Those members observed that many respondents had indicated that they saw little information of value in the reported non-controlling interest, no matter how it is measured.

BC214 Those IASB members who did not support making an exception concluded that the marginal benefits of reporting the acquisition-date fair value of non-controlling interests exceed the marginal costs of measuring it.

BC215 The IASB considered making it a requirement to measure non-controlling interests at fair value unless doing so would impose undue cost or effort on the acquirer. However, feedback from constituents and staff research indicated that it was unlikely that the term *undue cost or effort* would be applied consistently. Therefore, such a requirement would be unlikely to increase appreciably the consistency with which different entities measured non-controlling interests.

BC216 The IASB reluctantly concluded that the only way the revised IFRS 3 would receive sufficient votes to be issued was if it permitted an acquirer to measure a non-controlling interest either at fair value or at its proportionate share of the acquiree's identifiable net assets, on a transaction-by-transaction basis.

Effects of the optional measurement of non-controlling interests

BC217 The IASB noted that there are likely to be three main differences in outcome that occur when the non-controlling interest is measured as its proportionate share of the acquiree's identifiable net assets, rather than at fair value. First, the amounts recognised in a business combination for non-controlling interests and goodwill are likely to be lower (and these should be the only two items affected on initial recognition). Second, if a cash-generating unit is subsequently impaired, any resulting impairment of goodwill recognised through income is likely to be lower than it would have been if the non-controlling interest had been measured at fair value (although it does not affect the impairment loss attributable to the controlling interest).

BC218 The third difference arises if the acquirer subsequently purchases some (or all) of the shares held by the non-controlling shareholders. If the non-controlling interests are acquired, presumably at fair value, the equity of the group is reduced by the non-controlling interests' share of any unrecognised changes in the fair value of the net assets of the business, including goodwill. If the non-controlling

 © IASCF

interest is measured initially as a proportionate share of the acquiree's identifiable net assets, rather than at fair value, that reduction in the reported equity attributable to the acquirer is likely to be larger. This matter was considered further in the IASB's deliberations on the proposed amendments to IAS 27.

Convergence

BC219 Both boards decided that, although they would have preferred to have a common measurement attribute for non-controlling interests, they had considered and removed as many differences between IFRS 3 and SFAS 141 as was practicable.

BC220 The boards were unable to achieve convergence of their respective requirements in several areas because of existing differences between IFRSs and US GAAP requirements outside a business combination. The boards observed that the accounting for impairments in IFRSs is different from that in US GAAP. This means that even if the boards converged on the initial measurement of non-controlling interests, and therefore goodwill, the subsequent accounting for goodwill would not have converged. Although this is not a good reason for allowing divergence in the initial measurement of non-controlling interests, it was a mitigating factor.

BC221 Because most business combinations do not involve a non-controlling interest, the boards also observed that the revised standards will align most of the accounting for most business combinations regardless of the different accounting for non-controlling interests in the revised standards.

Measuring assets and liabilities arising from contingencies, including subsequent measurement

BC222 FASB Statement No. 5 *Accounting for Contingencies* (SFAS 5) defines a *contingency* as an existing condition, situation or set of circumstances involving uncertainty as to possible gain or loss to an entity that will ultimately be resolved when one or more future events occur or fail to occur. SFAS 141(R) refers to the assets and liabilities to which contingencies relate as *assets and liabilities arising from contingencies*. For ease of discussion, this Basis for Conclusions also uses that term to refer broadly to the issues related to contingencies, including the issues that the IASB considered in developing its requirements on recognising and measuring contingent liabilities in a business combination (paragraphs BC242–BC245 and BC272–BC278).

BC223 The revised standards require the assets and liabilities arising from contingencies that are recognised as of the acquisition date to be measured at their acquisition-date fair values. That requirement is generally consistent with the measurement requirements of IFRS 3, but it represents a change in the way entities generally applied SFAS 141. In addition, the IASB's measurement guidance on contingent liabilities carries forward the related guidance in IFRS 3, pending completion of the project to revise IAS 37 (paragraphs BC272–BC276). Accordingly, the FASB's and the IASB's conclusions on measuring assets and liabilities arising from contingencies are discussed separately.

The FASB's conclusions on measuring assets and liabilities arising from contingencies

BC224 The amount of an asset or a liability arising from a contingency recognised in accordance with SFAS 141 was seldom the acquisition-date fair value. Rather, it was often the settlement amount or a best estimate of the expected settlement amount on the basis of circumstances existing at a date after the acquisition date.

BC225 In developing the 2005 Exposure Draft, the FASB considered whether to require a strict SFAS 5 approach for the initial measurement and recognition of all contingencies in a business combination. That would mean that contingencies that did not meet the SFAS 5 'probability' criterion would be measured at zero (or at a minimum amount that qualifies as probable) rather than at fair value. Some constituents said that applying SFAS 5 in accounting for a business combination might be a practical way to reduce the costs and measurement difficulties involved in obtaining the information and legal counsel needed to measure the fair value of numerous contingencies that the acquiree had not recognised in accordance with SFAS 5.

BC226 The FASB observed that paragraph 17(a) of SFAS 5 states that 'Contingencies that might result in gains usually are not reflected in the accounts since to do so might be to recognize revenue prior to its realization.' Thus, to apply SFAS 5 in accounting for a business combination in the same way it is applied in other situations was likely to result in non-recognition of gain contingencies, including those for which all of the needed information is available at the acquisition date. The FASB concluded that that would be a step backwards; SFAS 141 already required the recognition of gain contingencies at the acquisition date and for which fair value is determinable (paragraphs 39 and 40(a) of SFAS 141). Also, in accordance with SFAS 5's requirements, contingent losses that arise outside a business combination are not recognised unless there is a high likelihood of a future outflow of resources. In addition, because goodwill is calculated as a residual, omitting an asset for an identifiable contingent gain would also result in overstating goodwill. Similarly, omitting a liability for a contingent loss would result in understating goodwill. Thus, the FASB rejected the SFAS 5 approach in accounting for a business combination.

BC227 The FASB also considered but rejected retaining existing practice based on FASB Statement No. 38 *Accounting for Preacquisition Contingencies of Purchased Enterprises* (SFAS 38), which SFAS 141 carried forward without reconsideration. For the reasons described in the preceding paragraph, the FASB concluded that continuing to permit the delayed recognition of most assets and liabilities arising from contingencies that occurred in applying SFAS 141 and the related guidance would fail to bring about needed improvements in the accounting for business combinations. The FASB decided that requiring an acquirer to measure at fair value and recognise any assets and liabilities arising from contingencies that meet the conceptual elements definition would help bring about those needed improvements, in particular, improvements in the completeness of reported financial information.

BC228 Some respondents to the 2005 Exposure Draft were concerned about the ability to measure reliably the fair value of assets and liabilities arising from contingencies at the acquisition date. The FASB concluded that measuring the fair value of an asset or a liability arising from a contractual contingency with sufficient

 © IASCF

reliability as of the acquisition date should not be more difficult than measuring the fair value of many other assets and liabilities that the revised standards require to be measured at fair value as of that date. The terms of the contract, together with information developed during the acquisition process, for example, to determine the price to be paid, should provide the needed information. Sufficient information is also likely to be available to measure the acquisition-date fair value of assets and liabilities arising from non-contractual contingencies that satisfy the more-likely-than-not criterion (see paragraphs BC270 and BC271). The FASB acknowledges that non-contractual assets and liabilities that do not meet that criterion at the acquisition date are most likely to raise difficult measurement issues and concerns about the reliability of those measures. To address those reliability concerns, the FASB decided that an acquirer should not measure and recognise such assets and liabilities. Rather, assets and liabilities arising from non-contractual contingencies that do not satisfy the more-likely-than-not criterion at the acquisition date are accounted for in accordance with other US GAAP, including SFAS 5.

BC229 The FASB also observed that respondents who are concerned about the reliability with which the fair values of assets and liabilities arising from contingencies can be measured may be interpreting *reliable measurement* differently from the FASB. To determine a reliable measure of the fair value of a contingency, the acquirer need not be able to determine, predict or otherwise know the ultimate settlement amount of that contingency at the acquisition date (or within the measurement period) with certainty or precision.

BC230 In 2006 the FASB and the IASB published for comment the first discussion paper in their joint project to improve their respective conceptual frameworks. Paragraph QC21 of that paper—*Preliminary Views on an improved Conceptual Framework for Financial Reporting: The Objective of Financial Reporting and Qualitative Characteristics of Decision-useful Financial Reporting Information*—discusses the relationship between faithful representation, the quality of decision-useful financial reporting information that pertains to the reliability of information, and precision. It says that accuracy of estimates is desirable and some minimum level of accuracy is necessary for an estimate to be a faithful representation of an economic phenomenon. However, faithful representation implies neither absolute precision in the estimate nor certainty about the outcome.

BC231 The FASB concluded that the fair values of assets and liabilities arising from contingencies meeting the recognition criteria of SFAS 141(R) are measurable with sufficient reliability as of the acquisition date for recognition in accounting for a business combination if the estimates are based on the appropriate inputs and each input reflects the best available information about that factor. The FASB acknowledges that the fair value measured at the acquisition date will not be the amount for which the asset or liability is ultimately settled, but it provides information about the current value of an asset or a liability by incorporating uncertainty into the measure.

Subsequent measurement of assets and liabilities arising from contingencies

BC232 The FASB observed that applying SFAS 5 in the post-combination period to a recognised liability or asset arising from a contingency that did not meet the SFAS 5 probability threshold at the acquisition date would result in derecognising that liability or asset and reporting a gain or loss in income of the

post-combination period. That result would not faithfully represent the economic events occurring in that period. The FASB noted that similar concerns about the potential for misleading reporting consequences do not exist for many financial instruments arising from contingencies, such as options, forward contracts and other derivatives. Such assets and liabilities generally would continue to be measured at fair value in accordance with other applicable US GAAP, which also provides guidance on how to report subsequent changes in the fair values of financial instruments in earnings or comprehensive income. Thus, the FASB decided that it must address the subsequent measurement of assets and liabilities arising from contingencies recognised in a business combination. However, it limited the scope of that effort to assets and liabilities that would be subsequently subject to SFAS 5.

BC233 The FASB considered five alternatives for subsequent measurement of assets and liabilities arising from contingencies that would be subject to SFAS 5 if not acquired or assumed in a business combination:

Alternative 1— Subsequently measuring at fair value

Alternative 2—Subsequently reporting amounts initially recognised in a business combination at their acquisition-date fair values until the acquirer obtains new information about the possible outcome of the contingency. When new information is obtained the acquirer evaluates that new information and measures a liability at the **higher** of its acquisition-date fair value or the amount that would be recognised if applying SFAS 5 and an asset at the **lower** of its acquisition-date fair value or the best estimate of its future settlement amount

Alternative 3—'Freezing' amounts initially recognised in a business combination

Alternative 4—Applying an interest allocation method (similar to the model in FASB Statement No. 143 *Accounting for Asset Retirement Obligations* (SFAS 143))

Alternative 5—Applying a deferred revenue method, but only to those items that relate to revenue-generating activities.

BC234 Paragraphs BC224–BC231 discuss the reasons for the FASB's decision to require fair value measurement for initial recognition of assets and liabilities arising from contingencies. For many of those same reasons, the FASB considered requiring Alternative 1—subsequent measurement at fair value. For a variety of reasons, the FASB ultimately rejected that alternative. Adopting this alternative would mean that for some entities (maybe many entities) assets and liabilities arising from contingencies acquired in a business combination would be reported at fair value, while other similar assets and liabilities would be reported at SFAS 5 amounts—different measurement of similar assets and liabilities would make financial reports more difficult to understand. The FASB noted that a project on business combinations would not be the appropriate place to address broadly perceived deficiencies in SFAS 5. Moreover, at the same time as SFAS 141(R) was finalised, the FASB was considering adding a project to its technical agenda to reconsider comprehensively the accounting for contingencies in SFAS 5. (The FASB added a project to reconsider the accounting for contingencies to its agenda in September 2007.) The FASB concluded that requiring assets and

 © IASCF

liabilities arising from contingencies to be subsequently measured at fair value was premature and might prejudge the outcome of its deliberations in that project.

BC235 The FASB decided, as a practical alternative, to require Alternative 2. In accordance with that approach, the acquirer continues to report an asset or liability arising from a contingency recognised as of the acquisition date at its acquisition-date fair value in the absence of new information about the possible outcome of the contingency. When such new information is obtained, the acquirer evaluates that information and measures the asset or liability as follows:

(a) a liability is measured at the **higher** of:

  (i) its acquisition-date fair value; and

  (ii) the amount that would be recognised if applying SFAS 5.

(b) an asset is measured at the **lower** of:

  (i) its acquisition-date fair value; or

  (ii) the best estimate of its future settlement amount.

BC236 The FASB concluded that this alternative was a practical bridge between improved reporting at the acquisition date and subsequent accounting under the existing requirements of SFAS 5. It would not prejudge the outcome of deliberations that the FASB will have in a project to reconsider SFAS 5. It also addressed the concerns of some constituents that requiring contingencies to be subsequently measured at fair value would result in contingencies acquired or assumed in a business combination being measured differently from contingencies that arise outside of a business combination.

BC237 The FASB observed that this alternative provides slightly different guidance for liabilities from its guidance for assets. Unlike liabilities, it could not require assets to be measured at the lower of their acquisition-date fair values or *the amounts that would be recognised if applying* SFAS 5. Because SFAS 5 does not allow recognition of gain contingencies, the amount that would be recognised by applying SFAS 5 to an asset would be zero. Thus, the FASB decided that an asset arising from a contingency should be measured at the lower of its acquisition-date fair value or *the best estimate of its future settlement amount*. The FASB believes that that measure is similar to the measure required by SFAS 5 for liabilities (loss contingencies). The FASB also observed that the approach for assets allows for the recognition of impairments to the asset; it requires an asset to be decreased to the current estimate of the amount the acquirer expects to collect.

BC238 The FASB rejected Alternative 3—freezing the amounts initially recognised. The FASB observed that this alternative results in less relevant information than Alternative 2. Because the FASB views Alternative 2 as a practical and operational solution, it saw no compelling reason to adopt a less optimal alternative. The FASB also rejected Alternative 4—the interest allocation method. In accordance with that method, the contingency would be remeasured using a convention similar to SFAS 143 whereby interest rates are held constant for initial cash flow assumptions. The FASB noted that the reasons for selecting the interest allocation method in SFAS 143 for long-term asset retirement obligations,

© IASCF

including concerns about income statement volatility, are not compelling for contingencies such as warranties and pending litigation that generally have shorter lives.

BC239 In accordance with Alternative 5—the deferred revenue method—the acquisition-date fair value of a deferred revenue liability (performance obligation) would be amortised after the acquisition date, like the approach for separately priced extended warranties and product maintenance contracts acquired outside a business combination. Accruals would be added to the contingency for subsequent direct costs. The FASB acknowledged that the costs to apply that measurement approach would be lower than other measurement approaches. However, the FASB concluded that the potential reduction in costs does not justify (a) creating inconsistencies in the subsequent accounting for particular classes of contingencies acquired or assumed in a business combination and (b) the diminished relevance of the resulting information. Thus, the FASB also rejected Alternative 5. Some respondents to the 2005 Exposure Draft supported recognition of subsequent changes in the amounts recognised for assets and liabilities arising from contingencies either as adjustments to goodwill or in comprehensive income rather than in earnings. Some who favoured reporting such changes as adjustments to goodwill did so at least in part because of the difficulties they see in distinguishing between changes that result from changes in circumstances after the acquisition date and changes that pertain more to obtaining better information about circumstances that existed at that date. They noted that the latter are measurement period adjustments, many of which result in adjustments to goodwill.

BC240 The FASB understands that distinguishing between measurement period adjustments and other changes in the amounts of assets and liabilities arising from contingencies will sometimes be difficult. It observed, however, that similar difficulties exist for other assets acquired and liabilities assumed in a business combination; changes in the amounts of those assets and liabilities after the acquisition date are included in earnings. The FASB saw no compelling reason to treat items arising from contingencies differently.

BC241 Those who favoured reporting subsequent changes in the amounts recognised for assets and liabilities arising from contingencies in other comprehensive income rather than in earnings generally analogised to the present accounting for available-for-sale securities. They said that items arising from contingencies were not 'realised' until the contingency is resolved. The FASB rejected that alternative because it saw no compelling reason to add to the category of items that are initially recognised as other comprehensive income and later 'recycled' to earnings. The FASB considers reporting subsequent changes in the amounts of items arising from contingencies in earnings not only conceptually superior to reporting those changes only in comprehensive income but also consistent with the way in which other changes in amounts of items acquired or assumed in a business combination are recognised.

The IASB's conclusions on initial and subsequent measurement of contingent liabilities

BC242 As noted in paragraph BC223, the IASB's measurement guidance on contingencies carries forward the related guidance in IFRS 3 (except for clarifying that an acquirer cannot recognise a contingency that is not a liability), pending

 © IASCF

completion of the project to revise IAS 37. Accordingly, contingent liabilities recognised in a business combination are initially measured at their acquisition-date fair values.

BC243 In developing IFRS 3, the IASB observed that not specifying the subsequent accounting for contingent liabilities recognised in a business combination might result in inappropriately derecognising some or all of those contingent liabilities immediately after the combination.

BC244 In ED 3 the IASB proposed that a contingent liability recognised in a business combination should be excluded from the scope of IAS 37 and subsequently measured at fair value with changes in fair value recognised in profit or loss until the liability is settled or the uncertain future event described in the definition of a contingent liability is resolved. In considering respondents' comments on this issue, the IASB noted that subsequently measuring such contingent liabilities at fair value would be inconsistent with the conclusions it reached on the accounting for financial guarantees and commitments to provide loans at below-market interest rates when it revised IAS 39.*

BC245 The IASB decided to revise the proposal in ED 3 for consistency with IAS 39. Therefore, the revised IFRS 3 requires contingent liabilities recognised in a business combination to be measured after their initial recognition at the higher of:

(a) the amount that would be recognised in accordance with IAS 37; or

(b) the amount initially recognised less, when appropriate, cumulative amortisation recognised in accordance with IAS 18 *Revenue*.

Definition of fair value

BC246 The revised IFRS 3 and SFAS 141(R) each use the same definition of fair value that the IASB and the FASB respectively use in their other standards. Specifically, IAS 39 and other IFRSs define fair value as 'the amount for which an asset could be exchanged, or a liability settled, between knowledgeable, willing parties in an arm's length transaction' and the revised IFRS 3 uses that definition. SFAS 157, on the other hand, defines fair value as 'the price that would be received to sell an asset or paid to transfer a liability in an orderly transaction between market participants at the measurement date' and that definition is used in SFAS 141(R).

BC247 The IASB considered also using the definition of fair value from SFAS 157 but decided that to do so would prejudge the outcome of its project on fair value measurements. Similarly, the FASB considered using the definition of fair value from IFRS 3 but decided that to do so would be inappropriate in the light of SFAS 157, which it intends for use in all situations in which a new standard requires measurement at fair value.

BC248 The boards acknowledge that the differing definitions of fair value might result in measuring the fair values of assets acquired and liabilities assumed in a business combination differently depending on whether the combination is accounted for in accordance with the revised IFRS 3 or SFAS 141(R). However, the

* In November 2009 the IASB relocated to IFRS 9 *Financial Instruments* the requirements on the accounting for financial guarantees and commitments to provide loans at below-market interest rates.

boards consulted valuation experts on the likely effects of the differing definitions of fair value. As a result of that consultation, the boards understand that such differences are unlikely to occur often. The boards also observed that the definitions use different words to articulate essentially the same concepts in two general areas—the non-performance risk and credit standing of financial liabilities and the market-based measurement objective.

BC249 SFAS 157 defines non-performance risk as the risk that an obligation will not be fulfilled and indicates that it affects the fair value of a liability. Non-performance risk includes but may not be limited to the reporting entity's own credit risk. In comparison, IFRSs do not use the term *non-performance risk* in discussing the fair value of a liability. However, IAS 39 requires the fair value of a financial liability to reflect its credit risk. Although the words are different, the boards believe that the underlying concepts are essentially the same.

BC250 The definition of fair value from SFAS 157 indicates that it is a price in an orderly transaction between market participants. In comparison, IFRSs indicate that fair value reflects an arm's length transaction between knowledgeable, willing parties. Paragraphs 42–44 of IAS 40 discuss what a *transaction between knowledgeable, willing parties* means:

> ... In this context, 'knowledgeable' means that both the willing buyer and the willing seller are reasonably informed about the nature and characteristics of the investment property, its actual and potential uses, and market conditions at the end of the reporting period ...
>
> ... The willing seller is motivated to sell the investment property at market terms for the best price obtainable. The factual circumstances of the actual investment property owner are not a part of this consideration because the willing seller is a hypothetical owner (eg a willing seller would not take into account the particular tax circumstances of the investment property owner).
>
> The definition of fair value refers to an arm's length transaction. An arm's length transaction is one between parties that do not have a particular or special relationship that makes prices of transactions uncharacteristic of market conditions. The transaction is presumed to be between unrelated parties, each acting independently.

Thus, although the two definitions use different words, the concept is the same—fair value is a market-based measure in a transaction between unrelated parties.

BC251 However, differences in the results of applying the different definitions of fair value may occur in particular areas. For example, SFAS 157 defines fair value as an exit price between market participants and IFRSs define fair value as an exchange price in an arm's length transaction. Most valuation experts the boards consulted said that, because transaction costs are not a component of fair value in either definition, an exit price for an asset or liability acquired or assumed in a business combination would differ from an exchange price (entry or exit) only (a) if the asset is acquired for its defensive value or (b) if a liability is measured on the basis of settling it with the creditor rather than transferring it to a third party. However, the boards understand that ways of measuring assets on the basis of their defensive value in accordance with paragraph A12 of SFAS 157 are developing, and it is too early to tell the significance of any differences that might result. It is also not clear that entities will use different methods of measuring the fair value of liabilities assumed in a business combination.

Measuring the acquisition-date fair values of particular assets acquired

Assets with uncertain cash flows (valuation allowances)

BC252 Both IFRS 3 and SFAS 141 required receivables to be measured at the present values of amounts to be received determined at appropriate current interest rates, less allowances for uncollectibility and collection costs, if necessary. The boards considered whether an exception to the fair value measurement principle is necessary for assets such as trade receivables and other short-term and long-term receivables acquired in a business combination. Several of the boards' constituents suggested that an exception should be permitted for practical and other reasons, including concerns about comparing credit losses on loans acquired in a business combination with those on originated loans. In developing the 2005 Exposure Draft, however, the boards saw no compelling reason for such an exception. The boards observed that using an acquiree's carrying basis and including collection costs is inconsistent with the revised standards' fair value measurement requirement and the underlying notion that the acquirer's initial measurement, recognition and classification of the assets acquired and liabilities assumed begins on the acquisition date. Because uncertainty about collections and future cash flows is included in the fair value measure of a receivable, the 2005 Exposure Draft proposed that the acquirer should not recognise a separate valuation allowance for acquired assets measured at fair value.

BC253 In developing the 2005 Exposure Draft, the FASB acknowledged that including uncertainties about future cash flows in a fair value measure, with no separate allowance for uncollectible amounts, differed from the current practice for SEC registrants. That practice was established in SEC Staff Accounting Bulletin Topic 2.A.5 *Adjustments to Allowances for Loan Losses in Connection with Business Combinations* which states that generally the acquirer's estimation of the uncollectible portion of the acquiree's loans should not change from the acquiree's estimation before the acquisition. However, the FASB also observed that fair value measurement is consistent with guidance in AICPA Statement of Position 03-3 *Accounting for Certain Loans or Debt Securities Acquired in a Transfer* (AICPA SOP 03-3), which prohibits 'carrying over' or creating valuation allowances in the initial accounting of all loans acquired in transfers that are within its scope, including business combinations accounted for as an acquisition.

BC254 In developing the 2005 Exposure Draft, the boards also acknowledged that the fair value measurement approach has implications for the capital requirements for financial institutions, particularly banks. The boards noted, however, that regulatory reporting requirements are a separate matter that is beyond the scope of general purpose financial reporting.

BC255 Some respondents to the 2005 Exposure Draft who commented on this issue agreed with the proposal, but many who commented on it disagreed with not recognising a separate valuation allowance for receivables and similar assets. Some of those respondents favoured retaining the guidance in IFRS 3 and SFAS 141. They said that the costs of measuring the fair value of trade receivables, loans, receivables under financing leases and the like would be high; they did not think the related benefits would justify those costs. Some also said that software systems currently available for loans and other receivables do not provide for

separate accounting for acquired and originated loans; they have to account manually for loans to which AICPA SOP 03-3 applies, incurring significant costs to do so.

BC256 As they did in developing the 2005 Exposure Draft, the boards acknowledged that the requirement to measure receivables and similar assets at fair value with no separate valuation allowance may lead to additional costs for some entities. However, the boards observed that entities that apply IAS 39* are required to measure financial assets acquired outside a business combination, as well as those originated, at fair value on initial recognition. The boards do not think financial or other assets should be measured differently because of the nature of the transaction in which they are acquired. Because the boards saw no compelling reason to provide an exception to the measurement principle for receivables or other assets with credit risk, they affirmed their conclusion that the benefits of measuring receivables and similar assets at fair value justify the related costs.

BC257 Some respondents to the 2005 Exposure Draft said that separate recognition of valuation allowances for loans and similar assets was important to users in evaluating the credit assumptions built into loan valuations. They suggested that the fair value of receivables should be split into three components: (a) the gross contractual amounts, (b) a separate discount or premium for changes in interest rates and (c) a valuation allowance for the credit risk, which would be based on the contractual cash flows expected to be uncollectible. In evaluating that alternative presentation, the boards noted that the valuation allowance presented would differ from the valuation allowance for receivables under IAS 39 and SFAS 5, each of which is determined on the basis of incurred, rather than expected, losses. Thus, how to determine the valuation allowance on an ongoing basis would be problematic. For example, if requirements for other receivables were applied, an immediate gain would be recognised for the difference between incurred losses and expected losses. In contrast, if the valuation allowance for receivables acquired by transfer, including in a business combination, rather than by origination was determined subsequently on an expected loss basis, the result would be a new accounting model for those receivables. The boards concluded that this project is not the place to consider the broader issues of how best to determine the valuation allowances for receivables, regardless of the manner in which the receivables are acquired.

Disclosure of information about receivables acquired

BC258 Some constituents asked the boards to consider requiring additional disclosures about receivables measured at fair value to help in assessing considerations of credit quality included in the fair value measures, including expectations about receivables that will be uncollectible. Those constituents were concerned that without additional disclosure, it would be impossible to determine the contractual cash flows and the amount of the contractual cash flows not expected to be collected if receivables were recognised at fair value. In response to those

* In November 2009 the IASB amended the requirements of IAS 39 relating to classification and measurement of assets within the scope of IAS 39 and relocated them to IFRS 9 *Financial Instruments*. IFRS 9 applies to all assets within the scope of IAS 39. This paragraph discusses matters relevant when IFRS 3 was issued.

 © IASCF

comments, the boards decided to require disclosure of the fair value of receivables acquired, the gross contractual amounts receivable and the best estimate at the acquisition date of the contractual cash flows not expected to be collected. The disclosures are required for each major class of receivable.

BC259 In January 2007 the FASB added a project to its technical agenda to improve disclosures relating to the allowance for credit losses associated with financing receivables. As part of that project, the FASB is considering potential new disclosures and enhanced current disclosures about the credit quality of an entity's portfolio, the entity's credit risk exposures, its accounting policies on valuation allowances and possibly other areas.

BC260 The boards observed that the work involved in developing a complete set of credit quality disclosures to be made for receivables acquired in a business combination would be similar to that required in the FASB's disclosure project related to valuation allowances. Combining those efforts would be a more efficient use of resources. Accordingly, the FASB decided to include disclosures that should be made in a business combination in the scope of its project on disclosures related to valuation allowances and credit quality, and the IASB will monitor that project. In the interim, the disclosures required by the revised standards (paragraph B64(h) of the revised IFRS 3) will provide at least some, although perhaps not all, of the information users need to evaluate the credit quality of receivables acquired.

Assets that the acquirer intends not to use or to use in a way that is different from the way other market participants would use them

BC261 While the revised standards were being developed, the FASB received enquiries about inconsistencies in practice in accordance with SFAS 141 related to measuring particular intangible assets that an acquirer intends not to use or intends to use in a way different from the way other market participants would use them. For example, if the acquirer did not intend to use a brand name acquired in a business combination, some entities assigned no value to the asset and other entities measured it at the amount at which market participants could be expected to exchange the asset, ie at its fair value.

BC262 To avoid such inconsistencies in practice, the boards decided to clarify the measurement of assets that an acquirer intends not to use (paragraph B43 of the revised IFRS 3). The intention of both IFRS 3 and SFAS 141 was that assets, both tangible and intangible, should be measured at their fair values regardless of how or whether the acquirer intends to use them. The FASB observed that measuring such assets in accordance with their highest and best use is consistent with SFAS 157. Paragraph A12 of SFAS 157 illustrates determining the fair value of an in-process research and development project acquired in a business combination that the acquirer does not intend to complete. The IASB understands from its consultation with preparers, valuation experts and auditors that IFRS 3 was applied in the way the revised standards require.

Exceptions to the recognition or measurement principle

BC263 As indicated in paragraphs 14 and 20 of the revised IFRS 3, the revised standards include limited exceptions to its recognition and measurement principles. Paragraphs BC265–BC311 discuss the types of identifiable assets and liabilities for which exceptions are provided and the reasons for those exceptions.

BC264 It is important to note that not every item that falls into a particular type of asset or liability is an exception to either the recognition or the measurement principle (or both). For example, contingent liabilities are identified as an exception to the recognition principle because the revised IFRS 3 includes a recognition condition for them in addition to the recognition conditions in paragraphs 11 and 12. Although applying that additional condition will result in not recognising some contingent liabilities, those that meet the additional condition will be recognised in accordance with the recognition principle. Another example is employee benefits, which are identified as a type of asset or liability for which exceptions to both the recognition and the measurement principles are provided. As discussed further in paragraphs BC296–BC300, the acquirer is required to recognise and measure liabilities and any related assets resulting from the acquiree's employee benefit arrangements in accordance with IAS 19 *Employee Benefits* rather than by applying the recognition and measurement principles in the revised IFRS 3. Applying the requirements of IAS 19 will result in recognising many, if not most, types of employee benefit liabilities in the same way as would result from applying the recognition principle (see paragraph BC297). However, others, for example withdrawal liabilities from multi-employer plans for entities applying US GAAP, are not necessarily consistent with the recognition principle. In addition, applying the requirements of IAS 19 generally will result in measuring liabilities for employee benefits (and any related assets) on a basis other than their acquisition-date fair values. However, applying the requirements of SFAS 146 to one-off termination benefits results in measuring liabilities for those benefits at their acquisition-date fair values.

Exception to the recognition principle

Assets and liabilities arising from contingencies

BC265 Both the FASB's conclusions on recognising assets and liabilities arising from contingencies and the IASB's conclusions on recognising contingent liabilities resulted in exceptions to the recognition principle in the revised standards because both will result in some items being unrecognised at the acquisition date. However, the details of the exceptions differ. The reasons for those exceptions and the differences between them are discussed in paragraphs BC266–BC278.

The FASB's conclusions on assets and liabilities arising from contingencies

BC266 SFAS 141 carried forward without reconsideration the requirements of SFAS 38, which required an acquirer to include in the purchase price allocation the fair value of an acquiree's contingencies if their fair value could be determined during the allocation period. For those contingencies whose fair value could not be determined during the allocation period, SFAS 141 required the acquirer to recognise the contingency in earnings when the occurrence of the contingency became probable and its amount could be reasonably estimated.

BC267 Members of its resource group and others told the FASB that in practice acquirers often did not recognise an acquiree's assets and liabilities arising from contingencies at the acquisition date. Instead, contingencies were recognised after the acquisition date at an amount determined at that later date either because their amount could not be 'reasonably estimated' or because the contingency was determined not to meet the SFAS 5 'probability' criterion for recognition.

 © IASCF

BC268 The 2005 Exposure Draft proposed that an acquirer should recognise all assets and liabilities arising from an acquiree's contingencies if they meet the definition of an asset or a liability in the FASB's Concepts Statement 6 regardless of whether a contingency meets the recognition criteria in SFAS 5. The FASB, like the IASB, concluded that to represent faithfully the economic circumstances at the acquisition date, in principle, all identifiable assets acquired and liabilities assumed should be recognised separately from goodwill, including assets and liabilities arising from contingencies at the acquisition date.

BC269 Respondents to the 2005 Exposure Draft that apply US GAAP expressed concern about how to deal with uncertainty about whether and when a contingency gives rise to an asset or a liability that meets the definition in the FASB's Concepts Statement 6, referred to as *element uncertainty*. An example cited by some respondents involved an acquiree's negotiations with another party at the acquisition date for reimbursement of costs incurred on the other party's behalf. How should the acquirer determine whether that contingency gave rise to an asset that should be recognised as part of the accounting for the business combination? Respondents suggested several means of dealing with element uncertainty, which generally involved introducing a threshold either for all contingencies or for the non-contractual contingencies an acquirer is required to recognise at the acquisition date. Other respondents suggested requiring recognition of only those assets and liabilities arising from contingencies whose fair values can be reliably determined, which would be similar to the requirements of SFAS 141.

BC270 The FASB understands the potential difficulty of resolving element uncertainty, especially for assets or liabilities arising from non-contractual contingencies. It considered whether to deal with element uncertainty by requiring assets and liabilities arising from contingencies to be recognised only if their fair values are reliably measurable. The FASB concluded that applying the guidance in SFAS 157 on measuring fair value should result in an estimate of the fair value of assets and liabilities arising from contingencies that is sufficiently reliable for recognition. The FASB also observed that adding a measurement condition is an indirect way of dealing with uncertainty involving recognition; it would be better to deal with such uncertainty more directly.

BC271 The FASB concluded that most cases of significant uncertainty about whether a potential asset or liability arising from a contingency meets the pertinent definition (element uncertainty) are likely to involve non-contractual contingencies. To help preparers and their auditors deal with element uncertainty, the FASB decided to add a requirement for the acquirer to assess whether it is **more likely than not** that the contingency gives rise to an asset or a liability as defined in the FASB's Concepts Statement 6. For an asset arising from a contingency, applying that criterion focuses on whether it is more likely than not that the acquirer has obtained control of a future economic benefit as a result of a past transaction or other event. For a liability, the more-likely-than-not criterion focuses on whether the acquirer has a present obligation to sacrifice future economic benefits as a result of a past transaction or other event. If that criterion is met at the acquisition date, the acquirer recognises the asset or liability, measured at its acquisition-date fair value, as part of the accounting for the business combination. If that criterion is not met at the acquisition date, the acquirer accounts for the non-contractual contingency in accordance with other

US GAAP, including SFAS 5, as appropriate. The FASB concluded that adding the more-likely-than-not criterion would permit acquirers to focus their efforts on the more readily identifiable contingencies of acquirees, thereby avoiding spending disproportionate amounts of time searching for contingencies that, even if identified, would have less significant effects.

The IASB's conclusions on contingent liabilities

BC272 In developing the 2005 Exposure Draft, the IASB concluded that an asset or a liability should be recognised separately from goodwill if it satisfies the definitions in the *Framework*. In some cases, the amount of the future economic benefits embodied in the asset or required to settle the liability is contingent (or conditional) on the occurrence or non-occurrence of one or more uncertain future events. That uncertainty is reflected in measurement. The FASB reached a consistent conclusion.

BC273 At the same time as it published the 2005 Exposure Draft, the IASB also published for comment a separate exposure draft containing similar proposals on the accounting for contingent assets and contingent liabilities within the scope of IAS 37. At that time, the IASB expected that the effective date of the revised IAS 37 would be the same as the effective date of the revised IFRS 3. However, the IASB now expects to issue a revised IAS 37 at a later date. Accordingly, except for clarifying that an acquirer should not recognise a so-called contingent liability that is not an obligation at the acquisition date, the IASB decided to carry forward the related requirements in the original IFRS 3. The IASB expects to reconsider and, if necessary, amend the requirements in the revised IFRS 3 when it issues the revised IAS 37.

BC274 The IASB concluded that an acquirer should recognise a contingent liability assumed in a business combination only if it satisfies the definition of a liability in the *Framework*. This is consistent with the overall objective of the second phase of the project on business combinations in which an acquirer recognises the assets acquired and liabilities assumed at the date control is obtained.

BC275 However, the IASB observed that the definition of a contingent liability in IAS 37 includes both (a) 'possible obligations' and (b) present obligations for which either it is not probable that an outflow of resources embodying economic benefits will be required to settle the obligation or the amount of the obligation cannot be measured reliably. The IASB concluded that a contingent liability assumed in a business combination should be recognised only if it is a present obligation. Therefore, unlike the previous version of IFRS 3, the revised IFRS 3 does not permit the recognition of 'possible obligations'.

BC276 Like its decision on the recognition of contingent liabilities assumed in a business combination, the IASB concluded that an acquirer should recognise a contingent asset acquired in a business combination only if it satisfies the definition of an asset in the *Framework*. However, the IASB observed that the definition of a contingent asset in IAS 37 includes only 'possible assets'. A contingent asset arises when it is uncertain whether an entity has an asset at the end of the reporting period, but it is expected that some future event will confirm whether the entity has an asset. Accordingly, the IASB concluded that contingent assets should not be recognised, even if it is virtually certain that they will become unconditional

 © IASCF

or non-contingent. If an entity determines that an asset exists at the acquisition date (ie that it has an unconditional right at the acquisition date), that asset is not a contingent asset and should be accounted for in accordance with the appropriate IFRS.

Convergence

BC277 The result of the FASB's and the IASB's conclusions on recognising assets and liabilities arising from contingencies is that the criteria for determining which items to recognise at the acquisition date differ, at least for the short term. That lack of convergence is inevitable at this time, given the status of the IASB's redeliberations on its revision of IAS 37 and the fact that the FASB had no project on its agenda to reconsider the requirements of SFAS 5 while the boards were developing the revised standards. (The FASB added a project to reconsider the accounting for contingencies to its agenda in September 2007.) To attempt to converge on guidance for recognising assets and liabilities arising from contingencies in a business combination now would run the risk of establishing requirements for a business combination that would be inconsistent with the eventual requirements for assets and liabilities arising from contingencies acquired or incurred by means other than a business combination.

BC278 However, the boards observed that the assets or liabilities arising from contingencies that are recognised in accordance with the FASB's recognition guidance and the contingent liabilities recognised in accordance with the IASB's recognition guidance will be measured consistently. In other words, the initial measurement requirements for assets and liabilities arising from contingencies recognised at the acquisition date have converged. However, the boards acknowledge that the subsequent measurement requirements differ because SFAS 5's measurement guidance differs from that in IAS 37. The reasons for the boards' conclusion on measuring those assets and liabilities are discussed in paragraphs BC224–BC245.

Exceptions to both the recognition and measurement principles

Income taxes

BC279 The 2005 Exposure Draft proposed, and the revised standards require, that a deferred tax asset or liability should be recognised and measured in accordance with either IAS 12 *Income Taxes* or FASB Statement No. 109 *Accounting for Income Taxes* (SFAS 109) respectively. IAS 12 and SFAS 109 establish requirements for recognising and measuring deferred tax assets and liabilities—requirements that are not necessarily consistent with the recognition and measurement principles in the revised standards.

BC280 The boards considered identifying deferred tax assets and liabilities as an exception to only the measurement principle because most, if not all, of the requirements of IAS 12 and SFAS 109 are arguably consistent with the revised standards' recognition principle. The recognition principle requires the acquirer to recognise at the acquisition date the assets acquired and liabilities assumed that meet the conceptual definition of an asset or a liability at that date. However, the boards concluded that exempting deferred tax assets and liabilities from both the recognition and the measurement principles would more clearly

indicate that the acquirer should apply the recognition and measurement provisions of IAS 12 and SFAS 109 and their related interpretations or amendments.

BC281 Deferred tax assets or liabilities generally are measured at undiscounted amounts in accordance with IAS 12 and SFAS 109. The boards decided not to require deferred tax assets or liabilities acquired in a business combination to be measured at fair value because they observed that:

(a) if those assets and liabilities were measured at their acquisition-date fair values, their subsequent measurement in accordance with IAS 12 or SFAS 109 would result in reported post-combination gains or losses in the period immediately following the acquisition even though the underlying economic circumstances did not change. That would not faithfully represent the results of the post-combination period and would be inconsistent with the notion that a business combination that is a fair value exchange should not give rise to the recognition of immediate post-combination gains or losses.

(b) to measure those assets and liabilities at their acquisition-date fair values and overcome the reporting problem noted in (a) would require a comprehensive consideration of whether and how to modify the requirements of IAS 12 and SFAS 109 for the subsequent measurement of deferred tax assets or liabilities acquired in a business combination. Because of the complexities of IAS 12 and SFAS 109 and the added complexities that would be involved in tracking deferred tax assets acquired and liabilities assumed in a business combination, the boards concluded that the benefits of applying the revised standards' fair value measurement principle would not warrant the costs or complexities that would cause.

Respondents to the 2005 Exposure Draft generally supported that exception to the fair value measurement requirements.

BC282 To align IAS 12 and SFAS 109 more closely and to make the accounting more consistent with the principles in the revised standards, the boards decided to address four specific issues pertaining to the acquirer's income tax accounting in connection with a business combination:

(a) accounting for a change in the acquirer's recognised deferred tax asset that results from a business combination;

(b) accounting for a change after the acquisition date in the deferred tax benefits for the acquiree's deductible temporary differences or operating loss or tax credit carryforwards acquired in a business combination;

(c) accounting for tax benefits arising from tax-deductible goodwill in excess of goodwill for financial reporting; and

(d) accounting for changes after the acquisition date in the uncertainties pertaining to acquired tax positions.

BC283 The boards addressed the first issue because the existing requirements of IAS 12 and SFAS 109 differed, with IAS 12 accounting for a change in recognised deferred tax assets separately from the business combination and SFAS 109 including a

 © IASCF

change in the acquirer's valuation allowance for its deferred tax asset in the business combination accounting. The FASB decided to converge with the IAS 12 requirement on the first issue, which the IASB decided to retain. Thus, the acquirer would recognise the change in its recognised deferred tax assets as income or expense (or a change in equity), as required by IAS 12, in the period of the business combination.

BC284 Because the boards considered the first issue primarily in an attempt to achieve convergence, they limited their consideration to the requirements of IAS 12 and SFAS 109. The FASB acknowledged that both alternatives are defensible on conceptual grounds. However, it concluded that on balance the benefits of converging with the IAS 12 method outweigh the costs related to a change in the accounting in accordance with SFAS 109. SFAS 141(R) therefore amends SFAS 109 accordingly.

BC285 Most of the respondents to the 2005 Exposure Draft supported its proposal on accounting for changes to the acquirer's own deferred taxes in conjunction with a business combination. But some disagreed; they said that an acquirer factors its expected tax synergies into the price it is willing to pay for the acquiree, and therefore those tax synergies constitute goodwill. Those respondents were concerned about the potential for double-counting the synergies once in the consideration and a second time by separately recognising the changes in the acquirer's income taxes.

BC286 The boards acknowledged that in some situations a portion of the tax synergies might be factored into the price paid in the business combination. However, they concluded that it would be difficult, if not impossible, to identify that portion. In addition, an acquirer would not pay more for an acquiree because of tax synergies unless another bidder would also pay more; an acquirer would not knowingly pay more than necessary for the acquiree. Therefore, in some situations none (or only a very small portion) of the tax synergies are likely to be factored into the price paid. The boards also observed that the revised standards (paragraph 51 of the revised IFRS 3) require only the portion of the consideration transferred for the acquiree and the assets acquired and liabilities assumed in the exchange for the acquiree to be included in applying the acquisition method. Excluding effects on the acquirer's ability to utilise its deferred tax asset is consistent with that requirement. Therefore, the boards decided to retain the treatment of changes in an acquirer's tax assets and liabilities proposed in the 2005 Exposure Draft.

BC287 The revised standards also amend IAS 12 and SFAS 109 to require disclosure of the amount of the deferred tax benefit (or expense) recognised in income in the period of the acquisition for the reduction (or increase) of the acquirer's valuation allowance for its deferred tax asset that results from a business combination. The boards decided that disclosure of that amount is necessary to enable users of the acquirer's financial statements to evaluate the nature and financial effect of a business combination.

BC288 The second issue listed in paragraph BC282 relates to changes after the acquisition date in the amounts recognised for deferred tax benefits acquired in a business combination. IAS 12 and SFAS 109 both required subsequent

recognition of acquired tax benefits to reduce goodwill. However, IAS 12 and SFAS 109 differed in that:

(a) IAS 12 did not permit the reduction of other non-current intangible assets, which SFAS 109 required; and

(b) IAS 12 required the recognition of offsetting income and expense in the acquirer's profit or loss when subsequent changes are recognised.

BC289 In developing the 2005 Exposure Draft, the FASB concluded that the fair value of other long-lived assets acquired in a business combination should no longer be reduced for changes in a valuation allowance after the acquisition date. That decision is consistent with the boards' decision not to adjust other acquired assets or assumed liabilities, with a corresponding adjustment to goodwill, for the effects of other events occurring after the acquisition date.

BC290 Few respondents to the 2005 Exposure Draft addressed this issue, and the views of those who commented differed. Some favoured providing for reduction of goodwill indefinitely because they view the measurement exception for deferred tax assets as resulting in a measure that is drastically different from fair value. Those who supported not permitting the indefinite reduction of goodwill said that, conceptually, changes in estimates pertaining to deferred taxes recognised in a business combination should be treated the same as other revisions to the amounts recorded at acquisition. The boards agreed with those respondents that a measurement exception should not result in potentially indefinite adjustments to goodwill. The revised standards provide other limited exceptions to the recognition and measurement principles, for example, for employee benefits—none of which result in indefinite adjustments to goodwill for subsequent changes.

BC291 The 2005 Exposure Draft proposed a rebuttable presumption that the subsequent recognition of acquired tax benefits within one year of the acquisition date should be accounted for by reducing goodwill. The rebuttable presumption could have been overcome if the subsequent recognition of the tax benefits resulted from a discrete event or circumstance occurring after the acquisition date. Recognition of acquired tax benefits after the one-year period would be accounted for in profit or loss (or, if IAS 12 or SFAS 109 so requires, outside profit or loss). Respondents suggested particular modifications to that proposal, including removing the rebuttable presumption about subsequent recognition of acquired tax benefits within one year of the acquisition date and treating increases and decreases in deferred tax assets consistently. (IAS 12 and SFAS 109 provided guidance on accounting for decreases.) The boards agreed with those suggestions and revised the requirements of the revised standards accordingly.

BC292 As described in paragraph BC282(c), the boards considered whether a deferred tax asset should be recognised in a business combination for any excess amount of tax-deductible goodwill over the goodwill for financial reporting purposes (excess tax goodwill). From a conceptual standpoint, the excess tax goodwill meets the definition of a temporary difference. Not recognising the tax benefit of that temporary difference at the date of the business combination would be inappropriate and inconsistent with IAS 12 and SFAS 109; it would also be inconsistent with the recognition principle in the revised standards. Thus, the revised IFRS 3 clarifies IAS 12 and SFAS 141(R) amends SFAS 109 accordingly.

 © IASCF

BC293 On the issue in paragraph BC282(d), respondents to the 2005 Exposure Draft suggested that the revised standards should address how to account for subsequent adjustments to amounts recognised for acquired income tax uncertainties. Respondents supported accounting for subsequent adjustments to amounts recognised for tax uncertainties using the same approach as the accounting for subsequent adjustments to acquired deferred tax benefits.

BC294 The FASB agreed with respondents' suggestion that an acquirer should recognise changes to acquired income tax uncertainties after the acquisition in the same way as changes in acquired deferred tax benefits. Therefore, SFAS 141(R) amends FASB Interpretation No. 48 *Accounting for Uncertainty in Income Taxes* (FASB Interpretation 48) to require a change to an acquired income tax uncertainty within the measurement period that results from new information about facts and circumstances that existed at the acquisition date to be recognised through a corresponding adjustment to goodwill. If that reduces goodwill to zero, an acquirer would recognise any additional increases of the recognised income tax uncertainty as a reduction of income tax expense. All other changes in the acquired income tax uncertainties would be accounted for in accordance with FASB Interpretation 48.

BC295 The IASB also considered whether to address the accounting for changes in acquired income tax uncertainties in a business combination. IAS 12 is silent on income tax uncertainties. The IASB is considering tax uncertainties as part of the convergence income tax project. Therefore, the IASB decided not to modify IAS 12 as part of this project to address specifically the accounting for changes in acquired income tax uncertainties in a business combination.

Employee benefits

BC296 The revised standards provide exceptions to both the recognition and measurement principles for liabilities and any related assets resulting from the employee benefit arrangements of an acquiree. The acquirer is required to recognise and measure those assets and liabilities in accordance with IAS 19 or applicable US GAAP.

BC297 As with deferred tax assets and liabilities, the boards considered identifying employee benefits as an exception only to the measurement principle. The boards concluded that essentially the same considerations discussed in paragraph BC280 for deferred tax assets and liabilities also apply to employee benefits. In addition, the FASB observed that FASB Statements No. 43 *Accounting for Compensated Absences* and 112 *Employers' Accounting for Postemployment Benefits* require recognition of a liability for compensated absences or post-employment benefits, respectively, only if payment is probable. Arguably, a liability for those benefits exists, at least in some circumstances, regardless of whether payment is probable. Accordingly, to make it clear that the acquirer should apply the recognition and measurement requirements of IAS 19 or applicable US GAAP without separately considering the extent to which those requirements are consistent with the principles in the revised standards, the boards exempted employee benefit obligations from both the recognition and the measurement principles.

BC298 The FASB decided to amend FASB Statements No. 87 *Employers' Accounting for Pensions* (SFAS 87) and 106 *Employers' Accounting for Postretirement Benefits Other Than Pensions* (SFAS 106) to require the acquirer to exclude from the liability it

recognises for a single-employer pension or other post-retirement benefit plan the effects of expected plan amendments, terminations or curtailments that it has no obligation to make at the acquisition date. However, those amendments also require the acquirer to include in the liability it recognises at the acquisition date the expected withdrawal liability for a multi-employer plan if it is probable at that date that the acquirer will withdraw from the plan. For a pension or other post-retirement benefit plan, the latter requirement brings into the authoritative literature a provision that previously appeared only in the Basis for Conclusions on SFASs 87 and 106. The FASB acknowledges that the provisions for single-employer and multi-employer plans are not necessarily consistent, and it considered amending SFASs 87 and 106 to require recognition of withdrawal liabilities not yet incurred in post-combination financial statements of the periods in which withdrawals occur. However, it observed that the liability recognised upon withdrawal from a multi-employer plan represents the previously unrecognised portion of the accumulated benefits obligation, which is recognised as it arises for a single-employer plan. In addition, the FASB observed that some might consider the employer's contractual obligation upon withdrawal from a multi-employer plan an unconditional obligation to 'stand ready' to pay if withdrawal occurs and therefore a present obligation. Therefore, the FASB decided not to require the same accounting for expected withdrawals from a multi-employer plan as it requires for expected terminations or curtailments of a single-employer plan.

BC299 The effect of the revised standards' measurement exception for liabilities and any related assets resulting from the acquiree's employee benefit plans is more significant than the related recognition exception. The boards concluded that it was not feasible to require all employee benefit obligations assumed in a business combination to be measured at their acquisition-date fair values. To do so would effectively require the boards to reconsider comprehensively the relevant standards for those employee benefits as a part of their business combinations projects. Given the complexities in accounting for employee benefit obligations in accordance with existing requirements, the boards decided that the only practicable alternative is to require those obligations, and any related assets, to be measured in accordance with their applicable standards.

BC300 The 2005 Exposure Draft proposed exempting only employee benefits subject to SFASs 87 and 106 from its fair value measurement requirement. Some respondents observed that existing measurement requirements for other types of employee benefits are not consistent with fair value and said that those benefits should also be exempted. The FASB agreed and modified the measurement exception for employee benefits accordingly.

Indemnification assets

BC301 A few constituents asked about the potential inconsistency if an asset for an indemnification is measured at fair value at the acquisition date and the related liability is measured using a different measurement attribute. Members of the FASB's resource group raised the issue primarily in the context of FASB Interpretation 48, which requires an entity to measure a tax position that meets the more-likely-than-not recognition threshold at the largest amount of tax benefit that is more than 50 per cent likely to be realised upon ultimate settlement with a taxing authority.

 © IASCF

BC302 The boards understand that a business combination sometimes includes an indemnification agreement under which the former owners of the acquiree are required to reimburse the acquirer for any payments the acquirer eventually makes upon settlement of a particular liability. If the indemnification pertains to uncertainty about a position taken in the acquiree's tax returns for prior years or to another item for which the revised standards provide a recognition or measurement exception, not providing a related exception for the indemnification asset would result in recognition or measurement anomalies. For example, for an indemnification pertaining to a deferred tax liability, the acquirer would recognise at the acquisition date a liability to the taxing authority for the deferred taxes and an asset for the indemnification due from the former owners of the acquiree. In the absence of an exception, the asset would be measured at fair value, and the liability would be measured in accordance with the pertinent income tax accounting requirements, such as FASB Interpretation 48 for an entity that applies US GAAP, because income taxes are an exception to the fair value measurement principle. Those two amounts would differ. The boards agreed with constituents that an asset representing an indemnification related to a specific liability should be recognised and measured on the same basis as that liability.

BC303 The boards also provided an exception to the recognition principle for indemnification assets. The reasons for that exception are much the same as the reasons why the boards exempted deferred tax assets and liabilities and employee benefits from that principle. Providing an exception to the recognition principle for indemnification assets clarifies that the acquirer does not apply that principle in determining whether or when to recognise such an asset. Rather, the acquirer recognises the asset when it recognises the related liability. Therefore, the revised standards provide an exception to the recognition and measurement principles for indemnification assets.

Exceptions to the measurement principle

BC304 In addition to the exceptions to both the recognition and measurement principles discussed above, the revised standards provide exceptions to the measurement principle for particular types of assets acquired or liabilities assumed in a business combination. Those exceptions are discussed in paragraphs BC305–BC311.

Temporary exception for assets held for sale

BC305 The 2005 Exposure Draft proposed that non-current assets qualifying as held for sale at the acquisition date under IFRS 5 *Non-current Assets Held for Sale and Discontinued Operations* or FASB Statement No. 144 *Accounting for the Impairment or Disposal of Long-Lived Assets* (SFAS 144) should be measured as those standards require—at fair value less costs to sell. The purpose of that proposed exception was to avoid the need to recognise a loss for the selling costs immediately after a business combination (referred to as a *Day 2 loss* because in theory it would be recognised on the day after the acquisition date). That Day 2 loss would result if the assets were initially measured at fair value but the acquirer then applied either IFRS 5 or SFAS 144, requiring measurement at fair value less costs to sell, for subsequent accounting. Because that loss would stem entirely from different measurement requirements for assets held for sale acquired in a business combination and for assets already held that are classified as held for sale, the reported loss would not faithfully represent the activities of the acquirer.

BC306 After considering responses to the 2005 Exposure Draft, the boards decided that the exception to the measurement principle for assets held for sale should be eliminated. The definitions of fair value in the revised standards, and their application in other areas focuses on market data. Costs that a buyer (acquirer) incurs to purchase or expects to incur to sell an asset are excluded from the amount at which an asset is measured. The boards concluded that disposal costs should also be excluded from the measurement of assets held for sale.

BC307 However, avoiding the Day 2 loss described in paragraph BC305 will require the boards to amend IFRS 5 and SFAS 144 to require assets classified as held for sale to be measured at fair value rather than at fair value less costs to sell. The boards decided to do that, but their respective due process procedures require those amendments to be made in separate projects to give constituents the opportunity to comment on the proposed changes. Although the boards intend the amendments of IFRS 5 and SFAS 144 to be effective at the same time as the revised standards, they decided as an interim step to include a measurement exception until completion of the amendments.

Reacquired rights

BC308 The revised standards (paragraph 29 of the revised IFRS 3) require the fair value of a reacquired right recognised as an intangible asset to be measured on the basis of the remaining contractual term of the contract that gave rise to the right, without taking into account potential renewals of that contract. In developing the 2005 Exposure Draft, the boards observed that a reacquired right is no longer a contract with a third party. An acquirer who controls a reacquired right could assume indefinite renewals of its contractual term, effectively making the reacquired right an intangible asset with an indefinite life. (The boards understood that some entities had been classifying reacquired rights in that way.) The boards concluded that a right reacquired from an acquiree has in substance a finite life; a renewal of the contractual term after the business combination is not part of what was acquired in the business combination. Accordingly, the 2005 Exposure Draft proposed, and the revised standards require, limiting the period over which the intangible asset is amortised (its useful life) to the remaining contractual term of the contract from which the reacquired right stems.

BC309 The 2005 Exposure Draft did not include guidance on determining the fair value of a reacquired right. Some constituents indicated that determining that value is a problem in practice, and the boards agreed that the revised standards should include guidance on that point. To be consistent with the requirement for determining the useful life of a reacquired right, the boards concluded that the fair value of the right should be based on the remaining term of the contract giving rise to the right. The boards acknowledge that market participants would generally reflect expected renewals of the term of a contractual right in the fair value of a right traded in the market. The boards decided, however, that determining the fair value of a reacquired right in that manner would be inconsistent with amortising its value over the remaining contractual term. The boards also observed that a contractual right transferred to a third party (traded in the market) is not a **reacquired** right. Accordingly, the boards decided that departing from the assumptions that market participants would use in measuring the fair value of a reacquired right is appropriate.

 © IASCF

BC310 A few constituents asked for guidance on accounting for the sale of a reacquired right after the business combination. The boards concluded that the sale of a reacquired right is in substance the sale of an intangible asset, and the revised standards require the sale of a reacquired right to be accounted for in the same way as sales of other assets (paragraph 55 of the revised IFRS 3). Thus, the carrying amount of the right is to be included in determining the gain or loss on the sale.

Share-based payment awards

BC311 FASB Statement No. 123 (revised 2004) *Share-Based Payment* (SFAS 123(R)) requires measurement of share-based payment awards using what it describes as the *fair-value-based method*. IFRS 2 *Share-based Payment* requires essentially the same measurement method, which the revised IFRS 3 refers to as the *market-based measure*. For reasons identified in those standards, application of the measurement methods they require generally does not result in the amount at which market participants would exchange an award at a particular date—its fair value at that date. Therefore, the revised standards provide an exception to the measurement principle for share-based payment awards. The reasons for that exception are essentially the same as the reasons already discussed for other exceptions to its recognition and measurement principles that the revised standards provide. For example, as with both deferred tax assets and liabilities and assets and liabilities related to employee benefit arrangements, initial measurement of share-based payment awards at their acquisition-date fair values would cause difficulties with the subsequent accounting for those awards in accordance with IFRS 2 or SFAS 123(R).

Recognising and measuring goodwill or a gain from a bargain purchase

BC312 Consistently with IFRS 3 and SFAS 141, the revised standards require the acquirer to recognise goodwill as an asset and to measure it as a residual.

Goodwill qualifies as an asset

BC313 The FASB's 1999 and 2001 Exposure Drafts listed six components of the amount that in practice, under authoritative guidance in effect at that time, had been recognised as goodwill. The IASB's ED 3 included a similar, but not identical, discussion. The components and their descriptions, taken from the FASB's exposure drafts, were:

> Component 1—The excess of the fair values over the book values of the acquiree's net assets at the date of acquisition.
>
> Component 2—The fair values of other net assets that the acquiree had not previously recognised. They may not have been recognised because they failed to meet the recognition criteria (perhaps because of measurement difficulties), because of a requirement that prohibited their recognition, or because the acquiree concluded that the costs of recognising them separately were not justified by the benefits.
>
> Component 3—The fair value of the *going concern* element of the acquiree's existing business. The going concern element represents the ability of the established business to earn a higher rate of return on an assembled

collection of net assets than would be expected if those net assets had to be acquired separately. That value stems from the synergies of the net assets of the business, as well as from other benefits (such as factors related to market imperfections, including the ability to earn monopoly profits and barriers to market entry—either legal or because of transaction costs—by potential competitors).

Component 4—The fair value of the expected synergies and other benefits from combining the acquirer's and acquiree's net assets and businesses. Those synergies and other benefits are unique to each combination, and different combinations would produce different synergies and, hence, different values.

Component 5—Overvaluation of the consideration paid by the acquirer stemming from errors in valuing the consideration tendered. Although the purchase price in an all-cash transaction would not be subject to measurement error, the same may not necessarily be said of a transaction involving the acquirer's equity interests. For example, the number of ordinary shares being traded daily may be small relative to the number of shares issued in the combination. If so, imputing the current market price to all of the shares issued to effect the combination may produce a higher value than those shares would command if they were sold for cash and the cash then used to effect the combination.

Component 6—Overpayment or underpayment by the acquirer. Overpayment might occur, for example, if the price is driven up in the course of bidding for the acquiree; underpayment may occur in a distress sale (sometimes termed a fire sale).

BC314 The boards observed that the first two components, both of which relate to the acquiree, are conceptually not part of goodwill. The first component is not itself an asset; instead, it reflects gains that the acquiree had not recognised on its net assets. As such, that component is part of those assets rather than part of goodwill. The second component is also not part of goodwill conceptually; it primarily reflects intangible assets that might be recognised as individual assets.

BC315 The fifth and sixth components, both of which relate to the acquirer, are also not conceptually part of goodwill. The fifth component is not an asset in and of itself or even part of an asset but, rather, is a measurement error. The sixth component is also not an asset; conceptually it represents a loss (in the case of overpayment) or a gain (in the case of underpayment) to the acquirer. Thus, neither of those components is conceptually part of goodwill.

BC316 The boards also observed that the third and fourth components are part of goodwill. The third component relates to the acquiree and reflects the excess assembled value of the acquiree's net assets. It represents the pre-existing goodwill that was either internally generated by the acquiree or acquired by it in prior business combinations. The fourth component relates to the acquiree and the acquirer jointly and reflects the excess assembled value that is created by the combination—the synergies that are expected from combining those businesses. The boards described the third and fourth components collectively as 'core goodwill'.

 © IASCF

BC317 The revised standards try to avoid subsuming the first, second and fifth components of goodwill into the amount initially recognised as goodwill. Specifically, an acquirer is required to make every effort:

(a) to measure the consideration accurately (eliminating or reducing component 5);

(b) to recognise the identifiable net assets acquired at their fair values rather than their carrying amounts (eliminating or reducing component 1); and

(c) to recognise all acquired intangible assets meeting the criteria in the revised standards (paragraph B31 of the revised IFRS 3) so that they are not subsumed into the amount initially recognised as goodwill (reducing component 2).

BC318 In developing IFRS 3 and SFAS 141, the IASB and the FASB both considered whether 'core goodwill' (the third and fourth components) qualifies as an asset under the definition in their respective conceptual frameworks. (That consideration was based on the existing conceptual frameworks. In 2004, the IASB and the FASB began work on a joint project to develop an improved conceptual framework that, among other things, would eliminate both substantive and wording differences between their existing frameworks. Although the asset definition is likely to change as a result of that project, the boards observed that nothing in their deliberations to date indicates that any such changes are likely to call into question whether goodwill continues to qualify as an asset.)

Asset definition in the FASB's Concepts Statement 6

BC319 Paragraph 172 of the FASB's Concepts Statement 6 says that an item that has future economic benefits has the capacity to serve the entity by being exchanged for something else of value to the entity, by being used to produce something of value to the entity or by being used to settle its liabilities.

BC320 The FASB noted that goodwill cannot be exchanged for something else of value to the entity and it cannot be used to settle the entity's liabilities. Goodwill also lacks the capacity singly to produce future net cash inflows, although it can—in combination with other assets—produce cash flows. Thus, the future benefit associated with goodwill is generally more nebulous and may be less certain than the benefit associated with most other assets. Nevertheless, goodwill generally provides future economic benefit. The FASB's Concepts Statement 6 observes that 'Anything that is commonly bought and sold has future economic benefit, including the individual items that a buyer obtains and is willing to pay for in a "basket purchase" of several items or in a business combination' (paragraph 173).

BC321 For the future economic benefit embodied in goodwill to qualify as an asset, the acquirer must control that benefit. The FASB observed that the acquirer's control is demonstrated by means of its ability to direct the policies and management of the acquiree. The FASB also observed that the past transaction or event necessary for goodwill to qualify as the acquirer's asset is the transaction in which it obtained the controlling interest in the acquiree.

Asset definition in the IASB's Framework

BC322 Paragraph 53 of the IASB's *Framework* explains that 'The future economic benefit embodied in an asset is the potential to contribute, directly or indirectly, to the flow of cash and cash equivalents to the entity.'

BC323 The IASB concluded that core goodwill represents resources from which future economic benefits are expected to flow to the entity. In considering whether core goodwill represents a resource **controlled** by the entity, the IASB considered the assertion that core goodwill arises, at least in part, through factors such as a well-trained workforce, loyal customers and so on, and that these factors cannot be regarded as controlled by the entity because the workforce could leave and the customers could go elsewhere. However, the IASB, like the FASB, concluded that control of core goodwill is provided by means of the acquirer's power to direct the policies and management of the acquiree. Therefore, both the IASB and the FASB concluded that core goodwill meets the conceptual definition of an asset.

Relevance of information about goodwill

BC324 In developing SFAS 141, the FASB also considered the relevance of information about goodwill. Although the IASB's Basis for Conclusions on IFRS 3 did not explicitly discuss the relevance of information about goodwill, the FASB's analysis of that issue was available to the IASB members as they developed IFRS 3, and they saw no reason not to accept that analysis.

BC325 More specifically, in developing SFAS 141, the FASB considered the views of users as reported by the AICPA Special Committee[*] and as expressed by the Financial Accounting Policy Committee (FAPC) of the Association for Investment Management and Research (AIMR) in its 1993 position paper *Financial Reporting in the 1990s and Beyond*. The FASB observed that users have mixed views about whether goodwill should be recognised as an asset. Some are troubled by the lack of comparability between internally generated goodwill and acquired goodwill that results under present standards, but others do not appear to be particularly bothered by it. However, users appear to be reluctant to give up information about goodwill acquired in a business combination. In the view of the AICPA Special Committee, users want to retain the option of being able to use that information. Similarly, the FAPC said that goodwill should be recognised in financial statements.

BC326 The FASB also considered the growing use of 'economic value added' (EVA)[†] and similar measures, which are increasingly being employed as means of assessing performance. The FASB observed that such measures commonly incorporate goodwill, and in business combinations accounted for by the pooling method, an adjustment was commonly made to incorporate a measure of the goodwill that was not recognised under that method. As a result, the aggregate amount of goodwill is included in the base that is subject to a capital charge that is part of the EVA measure and management is held accountable for the total investment in the acquiree.

---

† EVA was developed by the consulting firm of Stern Stewart & Company (and is a registered trademark of Stern Stewart) as a financial performance measure that improves management's ability to make decisions that enhance shareholder value.

 © IASCF

BC327 The FASB also considered evidence about the relevance of goodwill provided by a number of research studies that empirically examined the relationship between goodwill and the market value of business entities.* Those studies generally found a positive relationship between the reported goodwill of entities and their market values, thereby indicating that investors in the markets behave as if they view goodwill as an asset.

Measuring goodwill as a residual

BC328 The revised standards require the acquirer to measure goodwill as the excess of one amount (described in paragraph 32(a) of the revised IFRS 3) over another (described in paragraph 32(b) of the revised IFRS 3). Therefore, goodwill is measured as a residual, which is consistent with IFRS 3 and SFAS 141, in which the IASB and the FASB, respectively, concluded that direct measurement of goodwill is not possible. The boards did not reconsider measuring goodwill as a residual in the second phase of the business combinations project. However, the boards simplified the measurement of goodwill acquired in a business combination achieved in stages (a step acquisition). In accordance with IFRS 3 and SFAS 141, an entity that acquired another entity in a step acquisition measured goodwill by reference to the cost of each step and the related fair value of the underlying identifiable net assets acquired. This process was costly because it required the acquirer in a step acquisition to determine the amounts allocated to the identifiable net assets acquired at the date of each acquisition, even if those steps occurred years or decades earlier. In contrast, the revised standards require goodwill to be measured once—at the acquisition date. Thus, the revised standards reduce the complexity and costs of accounting for step acquisitions.

BC329 Both boards decided that all assets acquired and liabilities assumed, including those of an acquiree (subsidiary) that is not wholly-owned, as well as, in principle, any non-controlling interest in the acquiree, should be measured at their acquisition-date fair values (or in limited situations, their amounts determined in accordance with other US GAAP or IFRSs). Thus, SFAS 141(R) eliminates the past practice of not recognising the portion of goodwill related to the non-controlling interests in subsidiaries that are not wholly-owned. However, as discussed in paragraphs BC209–BC211, the IASB concluded that the revised IFRS 3 should permit entities to measure any non-controlling interest in an acquiree as its proportionate share of the acquiree's identifiable net assets. If an entity chooses that alternative, only the goodwill related to the acquirer is recognised.

Using the acquisition-date fair value of consideration to measure goodwill

BC330 As discussed in paragraph BC81, the revised standards do not focus on measuring the acquisition-date fair value of either the acquiree as a whole or the acquirer's interest in the acquiree as the 2005 Exposure Draft did. Consistently with that change, the boards also eliminated the presumption in the 2005 Exposure Draft that, in the absence of evidence to the contrary, the acquisition-date fair value of the consideration transferred is the best evidence of the fair value of the acquirer's interest in the acquiree at that date. Therefore, the revised standards describe the measurement of goodwill in terms of the recognised amount of the consideration transferred—generally its acquisition-date fair value (paragraph 32 of the revised IFRS 3)—and specify how to measure goodwill if the fair value of the acquiree is more reliably measurable than the fair value of the consideration transferred or if no consideration is transferred (paragraph 33 of the revised IFRS 3).

BC331 Because business combinations are generally exchange transactions in which knowledgeable, unrelated willing parties exchange equal values, the boards continue to believe that the acquisition-date fair value of the consideration transferred provides the best evidence of the acquisition-date fair value of the acquirer's interest in the acquiree in many, if not most, situations. However, that is not the case if the acquirer either makes a bargain purchase or pays more than the acquiree is worth at the acquisition date—if the acquirer underpays or overpays. The revised standards provide for recognising a gain in the event of a bargain purchase, but they do not provide for recognising a loss in the event of an overpayment (paragraph BC382). Therefore, the boards concluded that focusing directly on the fair value of the consideration transferred rather than on the fair value of the acquirer's interest in the acquiree, with a presumption that the two amounts are usually equal, would be a more straightforward way of describing how to measure goodwill. (The same conclusion applies to measuring the gain on a bargain purchase, which is discussed in paragraphs BC371–BC381.) That change in focus will also avoid unproductive disputes in practice about whether the consideration transferred or another valuation technique provides the best evidence for measuring the acquirer's interest in the acquiree in a particular situation.

Using the acquirer's interest in the acquiree to measure goodwill

BC332 The boards acknowledge that in the absence of measurable consideration, the acquirer is likely to incur costs to measure the acquisition-date fair value of its interest in the acquiree and incremental costs to have that measure independently verified. The boards observed that in many of those circumstances companies already incur such costs as part of their due diligence procedures. For example, an acquisition of a privately held entity by another privately held entity is often accomplished by an exchange of equity shares that do not have observable market prices. To determine the exchange ratio, those entities generally engage advisers and valuation experts to assist them in valuing the acquiree as well as the equity transferred by the acquirer in exchange for the acquiree. Similarly, a combination of two mutual entities is often accomplished by an exchange of member interests of the acquirer for all of the member

 © IASCF

interests of the acquiree. In many, but not necessarily all, of those cases the directors and managers of the entities also assess the relative fair values of the combining entities to ensure that the exchange of member interests is equitable to the members of both entities.

BC333 The boards concluded that the benefits in terms of improved financial information resulting from the revised standards outweigh the incremental measurement costs that the revised standards may require. Those improvements include the increased relevance and understandability of information resulting from applying the revised standards' measurement principle and guidance on recognising and measuring goodwill, which are consistent with reflecting the change in economic circumstances that occurs at that date.

BC334 The 2005 Exposure Draft included illustrative guidance for applying the fair value measurement requirement if no consideration is transferred or the consideration transferred is not the best evidence of the acquisition-date fair value of the acquiree. That illustrative guidance drew on related guidance in the FASB's exposure draft that preceded SFAS 157. Because SFAS 157 provides guidance on using valuation techniques such as the market approach and the income approach for measuring fair value, the FASB decided that it is unnecessary for SFAS 141(R) to provide the same guidance.

BC335 The IASB decided not to include in the revised IFRS 3 guidance on using valuation techniques to measure the acquisition-date fair value of the acquirer's interest in the acquiree. The IASB has on its agenda a project to develop guidance on measuring fair value. While deliberations on that project are in progress, the IASB considers it inappropriate to include fair value measurement guidance in IFRSs.

BC336 The FASB, on the other hand, completed its project on fair value measurement when it issued SFAS 157. SFAS 141(R), together with SFAS 157, provides broadly applicable measurement guidance that is relevant and useful in measuring the acquirer's interest in the acquiree. However, both boards were concerned that without some discussion of special considerations for measuring the fair value of mutual entities, some acquirers might neglect to consider relevant assumptions that market participants would make about future member benefits when using a valuation technique. For example, the acquirer of a co-operative entity should consider the value of the member discounts in its determination of the fair value of its interest in the acquiree. Therefore, the boards decided to include a discussion of special considerations in measuring the fair value of mutual entities (paragraphs B47–B49 of the revised IFRS 3).

Measuring consideration and determining whether particular items are part of the consideration transferred for the acquiree

BC337 Paragraphs BC338–BC360 discuss the boards' conclusions on measuring specific items of consideration that are often transferred by acquirers. Paragraphs BC361–BC370 then discuss whether particular replacement awards of share-based remuneration and acquisition-related costs incurred by acquirers are part of the consideration transferred for the acquiree.

Measurement date for equity securities transferred

BC338 The guidance in IFRS 3 and SFAS 141 on the measurement date for equity securities transferred as consideration in a business combination differed, and SFAS 141's guidance on that issue was contradictory. Paragraph 22 of SFAS 141, which was carried forward from APB Opinion 16, said that the market price for a reasonable period before and after the date that the terms of the acquisition are agreed to and announced should be considered in determining the fair value of the securities issued. That effectively established the agreement date as the measurement date for equity securities issued as consideration. However, paragraph 49 of SFAS 141, which was also carried forward from APB Opinion 16, said that the cost of an acquiree should be determined as of the acquisition date. IFRS 3, on the other hand, required measuring the consideration transferred in a business combination at its fair value on the exchange date, which was the acquisition date for a combination in which control is achieved in a single transaction. (IFRS 3, like SFAS 141, included special guidance on determining the cost of a business combination in which control is achieved in stages.) In their deliberations leading to the 2005 Exposure Draft, the boards decided that the fair value of equity securities issued as consideration in a business combination should be measured at the acquisition date.

BC339 In reaching their conclusions on this issue, the boards considered the reasons for the consensus reached in EITF Issue No. 99-12 *Determination of the Measurement Date for the Market Price of Acquirer Securities Issued in a Purchase Business Combination*. That consensus states that the value of the acquirer's marketable equity securities issued to effect a business combination should be determined on the basis of the market price of the securities over a reasonable period before and after the terms of the acquisition are agreed to and announced. The arguments for that consensus are based on the view that the announcement of a transaction, and the related agreements, normally bind the parties to the transaction so that the acquirer is obliged at that point to issue the equity securities at the closing date. If the parties are bound to the transaction at the agreement (announcement) date, the value of the underlying securities on that date best reflects the value of the bargained exchange. The boards did not find those arguments compelling. The boards observed that to make the announcement of a recommended transaction binding generally requires shareholders' authorisation or another binding event, which also gives rise to the change in control of the acquiree.

BC340 Additionally, the boards noted that measuring the fair value of equity securities issued on the agreement date (or on the basis of the market price of the securities for a short period before and after that date) did not result in a consistent measure of the consideration transferred. The fair values of all other forms of consideration transferred are measured at the acquisition date. The boards decided that all forms of consideration transferred should be valued on the same date, which should also be the same date as when the assets acquired and liabilities assumed are measured. The boards also observed that negotiations between an acquirer and an acquiree typically provide for share adjustments in the event of material events and circumstances between the agreement date and acquisition date. In addition, ongoing negotiations after announcement of agreements, which are not unusual, provide evidence that agreements are generally not binding at the date they are announced. Lastly, the boards also

 © IASCF

observed that the parties typically provide for cancellation options if the number of shares to be issued at the acquisition date would not reflect an exchange of approximately equal fair values at that date.

BC341 Respondents to the 2005 Exposure Draft expressed mixed views on the measurement date for equity securities. Some supported the proposal to measure equity securities at their fair value on the acquisition date, generally for the same reasons given in that exposure draft. Others, however, favoured use of the agreement date. They generally cited one or more of the following as support for their view:

(a) An acquirer and a target entity both consider the fair value of a target entity on the agreement date in negotiating the amount of consideration to be paid. Measuring equity securities issued as consideration at fair value on the agreement date reflects the values taken into account in negotiations.

(b) Changes in the fair value of the acquirer's equity securities between the agreement date and the acquisition date may be caused by factors unrelated to the business combination.

(c) Changes in the fair value of the acquirer's equity securities between the agreement date and the acquisition date may result in inappropriate recognition of either a bargain purchase or artificially inflated goodwill if the fair value of those securities is measured at the acquisition date.

BC342 In considering those comments, the boards observed, as they did in the 2005 Exposure Draft, that valid conceptual arguments can be made for both the agreement date and the acquisition date. However, they also observed that the parties to a business combination are likely to take into account expected changes between the agreement date and the acquisition date in the fair value of the acquirer and the market price of the acquirer's securities issued as consideration. The argument against acquisition date measurement of equity securities noted in paragraph BC341(a) is mitigated if acquirers and targets generally consider their best estimates at the agreement date of the fair values of the amounts to be exchanged on the acquisition dates. The boards also noted that measuring the equity securities on the acquisition date avoids the complexities of dealing with situations in which the number of shares or other consideration transferred can change between the agreement date and the acquisition date. The boards therefore concluded that equity instruments issued as consideration in a business combination should be measured at their fair values on the acquisition date.

Contingent consideration, including subsequent measurement

BC343 In accordance with the guidance in SFAS 141, which was carried forward from APB Opinion 16 without reconsideration, an acquirer's obligations to make payments conditional on the outcome of future events (often called *contingent consideration*) were not usually recognised at the acquisition date. Rather, acquirers usually recognised those obligations when the contingency was resolved and consideration was issued or became issuable. In general, issuing additional securities or distributing additional cash or other assets upon resolving contingencies on the basis of reaching particular earnings levels resulted in delayed recognition of an additional element of cost of an acquiree.

In contrast, issuing additional securities or distributing additional assets upon resolving contingencies on the basis of security prices did not change the recognised cost of an acquiree.

BC344 The IASB carried forward in IFRS 3 the requirements for contingent consideration from IAS 22 without reconsideration. In accordance with IFRS 3, an acquirer recognised consideration that is contingent on future events at the acquisition date only if it is probable and can be measured reliably. If the required level of probability or reliability for recognition was reached only after the acquisition date, the additional consideration was treated as an adjustment to the accounting for the business combination and to goodwill at that later date.

BC345 Therefore, in accordance with both SFAS 141 and IFRS 3, unlike other forms of consideration, an obligation for contingent consideration was not always measured at its acquisition-date fair value and its remeasurement either sometimes (SFAS 141) or always (IFRS 3) resulted in an adjustment to the business combination accounting.

BC346 In developing the 2005 Exposure Draft, both boards concluded that the delayed recognition of contingent consideration in their previous standards on business combinations was unacceptable because it ignored that the acquirer's agreement to make contingent payments is the obligating event in a business combination transaction. Although the amount of the future payments the acquirer will make is conditional on future events, the obligation to make them if the specified future events occur is unconditional. The same is true for a right to the return of previously transferred consideration if specified conditions are met. Failure to recognise that obligation or right at the acquisition date would not faithfully represent the economic consideration exchanged at that date. Thus, both boards concluded that obligations and rights associated with contingent consideration arrangements should be measured and recognised at their acquisition-date fair values.

BC347 The boards considered arguments that it might be difficult to measure the fair value of contingent consideration at the acquisition date. The boards acknowledged that measuring the fair value of some contingent payments may be difficult, but they concluded that to delay recognition of, or otherwise ignore, assets or liabilities that are difficult to measure would cause financial reporting to be incomplete and thus diminish its usefulness in making economic decisions.

BC348 Moreover, a contingent consideration arrangement is inherently part of the economic considerations in the negotiations between the buyer and seller. Such arrangements are commonly used by buyers and sellers to reach an agreement by sharing particular specified economic risks related to uncertainties about future outcomes. Differences in the views of the buyer and seller about those uncertainties are often reconciled by their agreeing to share the risks in such ways that favourable future outcomes generally result in additional payments to the seller and unfavourable outcomes result in no or lower payments. The boards observed that information used in those negotiations will often be helpful in estimating the fair value of the contingent obligation assumed by the acquirer.

BC349 The boards noted that most contingent consideration obligations are financial instruments, and many are derivative instruments. Reporting entities that use such instruments extensively, auditors and valuation professionals are familiar

 © IASCF

with the use of valuation techniques for estimating the fair values of financial instruments. The boards concluded that acquirers should be able to use valuation techniques to develop estimates of the fair values of contingent consideration obligations that are sufficiently reliable for recognition. The boards also observed that an effective estimate of zero for the acquisition-date fair value of contingent consideration, which was often the result under IFRS 3 and SFAS 141, was unreliable.

BC350 Some respondents to the 2005 Exposure Draft were especially concerned about the reliability with which the fair value of performance-based contingent consideration can be measured. The IASB and the FASB considered those concerns in the context of related requirements in their standards on share-based payments (IFRS 2 and SFAS 123(R), respectively), neither of which requires performance conditions that are not market conditions to be included in the market-based measure of an award of share-based payment at the grant date. For example, remuneration cost is recognised for a share option with vesting requirements that depend on achievement of an earnings target based on the number of equity instruments expected to vest and any such cost recognised during the vesting period is reversed if the target is not achieved. Both IFRS 2 and SFAS 123(R) cite constituents' concerns about the measurability at the grant date of the expected outcomes associated with performance conditions as part of the reason for that treatment.

BC351 The boards concluded that the requirements for awards of share-based payment subject to performance conditions should not determine the requirements for contingent (or conditional) consideration in a business combination. In addition, the boards concluded that the negotiations between buyer and seller inherent in a contingent consideration arrangement in a business combination provide better evidence of its fair value than is likely to be available for most share-based payment arrangements with performance conditions.

BC352 The boards also noted that some contingent consideration arrangements oblige the acquirer to deliver its equity securities if specified future events occur. The boards concluded that the classification of such instruments as either equity or a liability should be based on existing IFRSs or US GAAP, as indicated in paragraph 40 of the revised IFRS 3.

Subsequent measurement of contingent consideration

BC353 For reasons similar to those discussed in the context of contingent liabilities (paragraphs BC232 and BC243), the boards concluded that the revised standards must address subsequent accounting for contingent consideration. For consistency with the accounting for other obligations that require an entity to deliver its equity shares, the boards concluded that obligations for contingent payments that are classified as equity should not be remeasured after the acquisition date.

BC354 The boards observed that many obligations for contingent consideration that qualify for classification as liabilities meet the definition of derivative instruments in IAS 39 or SFAS 133. To improve transparency in reporting particular instruments, the boards concluded that all contracts that would otherwise be within the scope of those standards (if not issued in a business combination) should be subject to their requirements if issued in a business

combination. Therefore, the boards decided to eliminate their respective provisions (paragraph 2(f) of IAS 39 and paragraph 11(c) of SFAS 133) that excluded contingent consideration in a business combination from the scope of those standards. Accordingly, liabilities for payments of contingent consideration that are subject to the requirements of IAS 39 or SFAS 133 would subsequently be measured at fair value at the end of each reporting period, with changes in fair value recognised in accordance with whichever of those standards an entity applies in its financial statements.

BC355 In considering the subsequent accounting for contingent payments that are liabilities but are not derivatives, the boards concluded that, in concept, all liabilities for contingent payments should be accounted for similarly. Therefore, liabilities for contingent payments that are not derivative instruments should also be remeasured at fair value after the acquisition date. The boards concluded that applying those provisions would faithfully represent the fair value of the liability for the contingent payment of consideration that remains a liability until settled.

BC356 The boards also considered whether subsequent changes in the fair values of liabilities for contingent consideration should be reflected as adjustments to the consideration transferred in the business combination (usually in goodwill). Some respondents to the 2005 Exposure Draft favoured that alternative because they thought that changes in the fair value of contingent consideration effectively resolve differing views of the acquirer and the former owners of the acquiree about the acquisition-date fair value of the acquiree. The boards acknowledged that a conclusive determination at the acquisition date of the fair value of a liability for contingent consideration might not be practicable in the limited circumstances in which particular information is not available at that date. As discussed in more detail in paragraphs BC390–BC400, the boards decided that the revised standards should provide for provisional measurement of the fair value of assets acquired or liabilities assumed or incurred, including liabilities for contingent payments, in those circumstances.

BC357 Except for adjustments during the measurement period to provisional estimates of fair values at the acquisition date, the boards concluded that subsequent changes in the fair value of a liability for contingent consideration do not affect the acquisition-date fair value of the consideration transferred. Rather, those subsequent changes in value are generally directly related to post-combination events and changes in circumstances related to the combined entity. Thus, subsequent changes in value for post-combination events and circumstances should not affect the measurement of the consideration transferred or goodwill on the acquisition date. (The boards acknowledge that some changes in fair value might result from events and circumstances related in part to a pre-combination period. But that part of the change is usually indistinguishable from the part related to the post-combination period and the boards concluded that the benefits in those limited circumstances that might result from making such fine distinctions would not justify the costs that such a requirement would impose.)

BC358 The boards also considered arguments that the results of the requirements of the revised standards for recognition of changes in the fair value of contingent consideration after the acquisition date are counter-intuitive because they will result in:

 © IASCF

(a) recognising gains if the specified milestone or event requiring the contingent payment is not met. For example, the acquirer would recognise a gain on the reversal of the liability if an earnings target in an earn-out arrangement is not achieved.

(b) recognising losses if the combined entity is successful and the amount paid exceeds the estimated fair value of the liability at the acquisition date.

BC359 The boards accept the consequence that recognising the fair value of a liability for payment of contingent consideration is likely to result subsequently in a gain if smaller or no payments are required or result in a loss if greater payments are required. That is a consequence of entering into contingent consideration arrangements related to future changes in the value of a specified asset or liability or earnings of the acquiree after the acquisition date. For example, if a contingent consideration arrangement relates to the level of future earnings of the combined entity, higher earnings in the specified periods may be partially offset by increases in the liability to make contingent payments based on earnings because the acquirer has agreed to share those increases with former owners of the acquiree.

BC360 The boards also observed that liabilities for contingent payments may be related to contingencies surrounding an outcome for a particular asset or another liability. In those cases, the effect on income of the period of a change in the fair value of the liability for the contingent payment may be offset by a change in the value of the asset or other liability. For example, after an acquisition the combined entity might reach a favourable settlement of pending litigation of the acquiree for which it had a contingent consideration arrangement. If the combined entity is thus required to make a contingent payment to the seller of the acquiree that exceeds the initially estimated fair value of the liability for contingent consideration, the effect of the increase in that liability may be offset in part by the reduction in the liability to the litigation claimant. Similarly, if the acquirer is not required to make a contingent payment to the seller because an acquired research and development project failed to result in a viable product, the gain from the elimination of the liability may be offset, in whole or in part, by an impairment charge to the asset acquired.

Replacement awards

BC361 An acquirer sometimes issues replacement awards to benefit the employees of the acquiree for past services, for future services or for both. Accordingly, the 2005 Exposure Draft included guidance for determining the extent to which replacement awards are for past services (and thus part of the consideration transferred in the business combination) or future services (and thus not part of the consideration transferred). In developing that guidance, the boards' objective was, as far as possible, to be consistent with the guidance in their respective standards on share-based payments.

BC362 Few respondents to the 2005 Exposure Draft commented on this issue, and those who did so generally agreed with the proposals, at least as they related to entities that apply IFRS 2 in accounting for share-based payment awards granted otherwise than in a business combination. However, in redeliberating the 2005 Exposure Draft, the FASB observed that some of its proposals on share-based payment awards were not consistent with SFAS 123(R), which was published after

the related deliberations in the second phase of its business combinations project. For example, the 2005 Exposure Draft proposed that the excess, if any, of the fair value of replacement awards over the fair value of the replaced acquiree awards should be immediately recognised as remuneration cost in the post-combination financial statements even if employees were required to render future service to earn the rights to the replacement awards. SFAS 123(R), on the other hand, requires recognition of additional remuneration cost arising in a modification of the terms of an award (which is the same as the replacement of one award with another) over the requisite service period. The FASB concluded that, in general, the requirements of SFAS 141(R) on accounting for replacements of share-based payment awards should be consistent with the requirements for other share-based payment awards in SFAS 123(R). To achieve that goal the FASB modified the guidance in SFAS 141(R) on accounting for any excess of the fair value of replacement awards over the fair value of the replaced awards.

BC363 In addition, the FASB's constituents raised questions about other aspects of the guidance on accounting for the replacement of share-based payment awards. Those questions generally related to interpretative guidance that SFAS 123(R) superseded or nullified without providing comparable guidance—specifically, FASB Interpretation No. 44 *Accounting for Certain Transactions involving Stock Compensation* and EITF Issue No. 00-23 *Issues Related to the Accounting for Stock Compensation under APB Opinion No. 25 and FASB Interpretation No. 44*. Paragraphs B56–B62 of the revised IFRS 3 provide guidance to help in resolving those implementation questions. In developing that guidance, the FASB sought to apply the same principles to the replacement of share-based payment awards in a business combination that are applied to share-based payment awards in other situations. The IASB agreed with that goal, and it decided that the guidance on accounting for replacement awards of share-based payment is consistent with the guidance in IFRS 2 on accounting for modification of share-based payment awards.

BC364 The boards concluded that the guidance in the revised standards is consistent with the objective that the consideration transferred for an acquired business includes those payments that are for the business and excludes those payments that are for other purposes. Remuneration for future services to be rendered to the acquirer by former owners or other employees of the acquiree is not, in substance, consideration for the business acquired.

Acquisition-related costs

BC365 The boards considered whether acquisition-related costs are part of the consideration transferred in exchange for the acquiree. Those costs include an acquirer's costs incurred in connection with a business combination (a) for the services of lawyers, investment bankers, accountants and other third parties and (b) for issuing debt or equity instruments used to effect the business combination (issue costs). Generally, acquisition-related costs are charged to expense as incurred, but the costs to issue debt or equity securities are an exception. Currently, the accounting for issue costs is mixed and conflicting practices have developed in the absence of clear accounting guidance. The FASB is addressing issue costs in its project on liabilities and equity and has tentatively decided that those costs should be recognised as expenses as incurred. Some FASB members would have preferred to require issue costs to effect a business combination to be

 © IASCF

recognised as expenses, but they did not think that the business combinations project was the place to make that decision. Therefore, the FASB decided to allow mixed practices for accounting for issue costs to continue until the project on liabilities and equity resolves the issue broadly.

BC366 The boards concluded that acquisition-related costs are not part of the fair value exchange between the buyer and seller for the business. Rather, they are separate transactions in which the buyer pays for the fair value of services received. The boards also observed that those costs, whether for services performed by external parties or internal staff of the acquirer, do not generally represent assets of the acquirer at the acquisition date because the benefits obtained are consumed as the services are received.

BC367 Thus, the 2005 Exposure Draft proposed, and the revised standards require, the acquirer to exclude acquisition-related costs from the measurement of the fair value of both the consideration transferred and the assets acquired or liabilities assumed as part of the business combination. Those costs are to be accounted for separately from the business combination, and generally recognised as expenses when incurred. The revised standards therefore resolve inconsistencies in accounting for acquisition-related costs in accordance with the cost-accumulation approach in IFRS 3 and SFAS 141, which provided that the cost of an acquiree included *direct* costs incurred for an acquisition of a business but excluded *indirect* costs. Direct costs included out-of-pocket or incremental costs, for example, finder’s fees and fees paid to outside consultants for accounting, legal or valuation services for a successful acquisition, but direct costs incurred in unsuccessful negotiations were recognised as expenses as incurred. Indirect costs included recurring internal costs, such as maintaining an acquisition department. Although those costs also could be directly related to a successful acquisition, they were recognised as expenses as incurred.

BC368 Some respondents to the 2005 Exposure Draft said that acquisition-related costs, including costs of due diligence, are unavoidable costs of the investment in a business. They suggested that, because the acquirer intends to recover its due diligence cost through the post-acquisition operations of the business, that transaction cost should be capitalised as part of the total investment in the business. Some also argued that the buyer specifically considers those costs in determining the amount that it is willing to pay for the acquiree. The boards rejected those arguments. They found no persuasive evidence indicating that the seller of a particular business is willing to accept less than fair value as consideration for its business merely because a particular buyer may incur more (or less) acquisition-related costs than other potential buyers for that business. Furthermore, the boards concluded that the intentions of a particular buyer, including its plans to recover such costs, are a separate matter that is distinct from the fair value measurement objective in the revised standards.

BC369 The boards acknowledge that the cost-accumulation models in IFRS 3 and SFAS 141 included some acquisition-related costs as part of the carrying amount of the assets acquired. The boards also acknowledge that all asset acquisitions are similar transactions that, in concept, should be accounted for similarly, regardless of whether assets are acquired separately or as part of a group of assets that may meet the definition of a business. However, as noted in paragraph BC20, the boards decided not to extend the scope of the revised standards to all

acquisitions of groups of assets. Therefore, the boards accept that, at this time, accounting for most acquisition-related costs separately from the business combination, generally as an expense as incurred for services received in connection with a combination, differs from some standards or accepted practices that require or permit particular acquisition-related costs to be included in the cost of an asset acquisition. The boards concluded, however, that the revised standards improve financial reporting by eliminating inconsistencies in accounting for acquisition-related costs in connection with a business combination and by applying the fair value measurement principle to all business combinations. The boards also observed that in practice under IFRS 3 and SFAS 141, most acquisition-related costs were subsumed in goodwill, which was also not consistent with accounting for asset acquisitions.

BC370 The boards also considered concerns about the potential for abuse. Some constituents, including some respondents to the 2005 Exposure Draft, said that if acquirers could no longer capitalise acquisition-related costs as part of the cost of the business acquired, they might modify transactions to avoid recognising those costs as expenses. For example, some said that a buyer might ask a seller to make payments to the buyer's vendors on its behalf. To facilitate the negotiations and sale of the business, the seller might agree to make those payments if the total amount to be paid to it upon closing of the business combination is sufficient to reimburse the seller for payments it made on the buyer's behalf. If the disguised reimbursements were treated as part of the consideration transferred for the business, the acquirer might not recognise those expenses. Rather, the measure of the fair value of the business and the amount of goodwill recognised for that business might be overstated. To mitigate such concerns, the revised standards require any payments to an acquiree (or its former owners) in connection with a business combination that are payments for goods or services that are not part of the acquired business to be assigned to those goods or services and accounted for as a separate transaction. The revised standards specifically require an acquirer to determine whether any portion of the amounts transferred by the acquirer are separate from the consideration exchanged for the acquiree and the assets acquired and liabilities assumed in the business combination. The revised standards (see paragraphs 51–53 and B50 of the revised IFRS 3) provide guidance for making that determination.

Bargain purchases

BC371 Paragraphs 34–36 of the revised IFRS 3 set out the accounting requirements for a bargain purchase. The boards consider bargain purchases anomalous transactions—business entities and their owners generally do not knowingly and willingly sell assets or businesses at prices below their fair values. However, bargain purchases have occurred and are likely to continue to occur. Circumstances in which they occur include a forced liquidation or distress sale (eg after the death of a founder or key manager) in which owners need to sell a business quickly, which may result in a price that is less than fair value.

BC372 The boards observed that an economic gain is inherent in a bargain purchase. At the acquisition date, the acquirer is better off by the amount by which the fair value of what is acquired exceeds the fair value of the consideration transferred (paid) for it. The boards concluded that, in concept, the acquirer should recognise that gain at the acquisition date. However, the boards acknowledged that

 © IASCF

although the reasons for a forced liquidation or distress sale are often apparent, sometimes clear evidence might not exist, for example, if a seller uses a closed (private) process for the sale and to maintain its negotiating position is unwilling to reveal the main reason for the sale. The appearance of a bargain purchase without evidence of the underlying reasons would raise concerns in practice about the existence of measurement errors.

BC373 Constituents, including some respondents to the 2005 Exposure Draft, expressed concerns about recognising gains upon the acquisition of a business, particularly if it is difficult to determine whether a particular acquisition is in fact a bargain purchase. They also suggested that an initial determination of an excess of the acquisition-date fair value (or other recognised amounts) of the identifiable net assets acquired over the fair value of the consideration paid by the acquirer plus the recognised amount of any non-controlling interest in the acquiree might arise from other factors, including:

(a) errors in measuring the fair values of (i) the consideration paid for the business, (ii) the assets acquired or (iii) the liabilities assumed; and

(b) using measures in accordance with IFRSs or US GAAP that are not fair values.

Distinguishing a bargain purchase from measurement errors

BC374 The boards acknowledged concerns raised by constituents that a requirement to recognise gains on a bargain purchase might provide an opportunity for inappropriate gain recognition from intentional errors resulting from the acquirer's:

(a) understating or failing to identify the value of items of consideration that it transferred;

(b) overstating values attributed to particular assets acquired; or

(c) understating or failing to identify and recognise particular liabilities assumed.

BC375 The boards think that problems surrounding intentional measurement errors by acquirers are generally best addressed by means other than setting standards specifically intended to avoid abuse. Strong internal control systems and the use of independent valuation experts and external auditors are among the means by which both intentional and unintentional measurement errors are minimised. Standards specifically designed to avoid abuse would inevitably lack neutrality. (See paragraph BC51 for a discussion of the need for neutrality in accounting and accounting standards.) However, the boards share constituents' concerns about the potential for inappropriate gain recognition resulting from measurement bias or undetected measurement errors. Thus, the boards decided (see paragraph 36 of the revised IFRS 3) to require the acquirer to reassess whether it has correctly identified all of the assets acquired and all of the liabilities assumed before recognising a gain on a bargain purchase. The acquirer must then review the procedures used to measure the amounts the revised standards require to be recognised at the acquisition date for all of the following:

(a) the identifiable assets acquired and liabilities assumed;

(b) the non-controlling interest in the acquiree, if any;

(c) for a business combination achieved in stages, the acquirer's previously held equity interest in the acquiree; and

(d) the consideration transferred.

The objective of that review is to ensure that appropriate consideration has been given to all available information in identifying the items to be measured and recognised and in determining their fair values. The boards believe that the required review will mitigate, if not eliminate, undetected errors that might have existed in the initial measurements.

BC376 The boards acknowledged, however, that the required review might be insufficient to eliminate concerns about unintentional measurement bias. They decided to address that concern by limiting the extent of gain that can be recognised. Thus, the revised standards provide that a gain on a bargain purchase is measured as the excess of:

(a) the net of the acquisition-date amounts of the identifiable assets acquired and liabilities assumed; over

(b) the acquisition-date fair value of the consideration transferred plus the recognised amount of any non-controlling interest in the acquiree and, if the transaction is an acquisition achieved in stages, the acquisition-date fair value of the acquirer's previously held equity interest in the acquiree.

That means that a gain on a bargain purchase and goodwill cannot both be recognised for the same business combination. The 2005 Exposure Draft defined a bargain purchase as a transaction in which the fair value of the acquirer's interest in the acquiree exceeds the consideration transferred for it, but it would have required that any resulting goodwill should be written off before a gain was recognised. The result of the revised standards' requirement is the same, but there will be no goodwill to write off if the gain is measured with reference to the identifiable net assets acquired rather than the fair value of the acquirer's interest in the acquiree. In addition, the revised standards require (paragraph B64(n) of the revised IFRS 3) the acquirer to disclose information about a gain recognised on a bargain purchase.

BC377 The main purpose of the limitation on gain recognition is to mitigate the potential for inappropriate gain recognition through measurement errors, particularly those that might result from unintended measurement bias. The main purpose of the disclosure requirement is to provide information that enables users of an acquirer's financial statements to evaluate the nature and financial effect of business combinations that occur during the period. The boards acknowledged, however, that the limitation and disclosure requirements may also help to mitigate constituents' concerns about potential abuse, although that is not their primary objective.

BC378 Moreover, the boards believe that concerns about abuse resulting from the opportunity for gain recognition may be overstated. Financial analysts and other users have often told the boards that they give little weight to one-off or unusual gains, such as those resulting from a bargain purchase transaction. In addition, the boards noted that managers of entities generally have no incentive to overstate assets acquired or understate liabilities assumed in a business

 © IASCF

combination because that would generally result in higher post-combination expenses—when the assets are used or become impaired or liabilities are remeasured or settled.

Distinguishing a bargain purchase from a 'negative goodwill result'

BC379 The boards acknowledged that a so-called negative goodwill result remains a possibility (although in most situations, a remote possibility) because the revised standards continue to require particular assets acquired and liabilities assumed to be measured at amounts other than their acquisition-date fair values. The boards observed, however, that the revised standards address most deficiencies in past requirements on accounting for business combinations that previously led to negative goodwill results—ie a result that had the appearance but not the economic substance of a bargain purchase. For example, often no liability was recognised for some contingent payment arrangements (eg earn-outs) at the acquisition date, which could result in the appearance of a bargain purchase by understating the consideration paid. The revised standards, in contrast, require the measurement and recognition of substantially all liabilities at their fair values on the acquisition date.

BC380 The boards also considered concerns raised by some constituents that a buyer's expectations of future losses and its need to incur future costs to make a business viable might give rise to a negative goodwill result. In other words, a buyer would be willing to pay a seller only an amount that is, according to that view, less than the fair value of the acquiree (or its identifiable net assets) because to make a fair return on the business the buyer would need to make further investments in that business to bring its condition to fair value. The boards disagreed with that view for the reasons noted in paragraphs BC134–BC143 in the context of liabilities associated with restructuring or exit activities of the acquiree, as well as those that follow.

BC381 Fair values are measured by reference to unrelated buyers and sellers that are knowledgeable and have a common understanding about factors relevant to the business and the transaction and are also willing and able to transact business in the same market(s) and have the legal and financial ability to do so. The boards are aware of no compelling reason to believe that, in the absence of duress, a seller would willingly and knowingly sell a business for an amount less than its fair value. Thus, the boards concluded that careful application of the revised standards' fair value measurement requirements will mitigate concerns that negative goodwill might result and be misinterpreted as a bargain purchase transaction.

Overpayments

BC382 The boards considered whether the revised standards should include special provisions to account for a business combination in which a buyer overpays for its interest in the acquiree. The boards acknowledged that overpayments are possible and, in concept, an overpayment should lead to the acquirer's recognition of an expense (or loss) in the period of the acquisition. However, the boards believe that in practice any overpayment is unlikely to be detectable or known at the acquisition date. In other words, the boards are not aware of instances in which a buyer knowingly overpays or is compelled to overpay a seller

© IASCF

to acquire a business. Even if an acquirer thinks it might have overpaid in some sense, the amount of overpayment would be difficult, if not impossible, to quantify. Thus, the boards concluded that in practice it is not possible to identify and reliably measure an overpayment at the acquisition date. Accounting for overpayments is best addressed through subsequent impairment testing when evidence of a potential overpayment first arises.

Additional guidance for particular types of business combinations

BC383 To help entities apply the acquisition method as required by the revised standards, the boards decided to provide additional guidance for business combinations achieved in stages and those achieved without the transfer of consideration. Paragraphs BC384–BC389 discuss the guidance provided on business combinations achieved in stages. The guidance on combinations achieved without the transfer of consideration merely responds to a question about how to report the acquiree's net assets in the equity section of the acquirer's post-combination statement of financial position, and this Basis for Conclusions does not discuss that guidance further.

Business combinations achieved in stages

BC384 In a business combination achieved in stages, the acquirer remeasures its previously held equity interest at its acquisition-date fair value and recognises the related gain or loss in profit or loss (paragraph 42 of the revised IFRS 3). The boards concluded that a change from holding a non-controlling investment in an entity to obtaining control of that entity is a significant change in the nature of and economic circumstances surrounding that investment. That change warrants a change in the classification and measurement of that investment. Once it obtains control, the acquirer is no longer the owner of a non-controlling investment asset in the acquiree. As in present practice, the acquirer ceases its accounting for an investment asset and begins reporting in its financial statements the underlying assets, liabilities and results of operations of the acquiree. In effect, the acquirer exchanges its status as an owner of an investment asset in an entity for a controlling financial interest in all of the underlying assets and liabilities of that entity (acquiree) and the right to direct how the acquiree and its management use those assets in its operations.

BC385 In August 2003 the FASB held a round-table meeting with members of its resource group on business combinations and other constituents to discuss, among other things, the decision to require an acquirer to remeasure any previously held equity investment in an acquiree at its acquisition-date fair value and to recognise in earnings any gain or loss. The users of financial statements indicated they did not have significant concerns with that change to present practice, as long as the amount of the gain or loss is clearly disclosed in the financial statements or in the notes. Paragraph B64(p) of the revised IFRS 3 requires that disclosure.

BC386 The boards rejected the view expressed by some constituents that the carrying amount of any pre-acquisition investment should be retained in the initial accounting for the cost of the business acquired. The boards concluded that

 © IASCF

cost-accumulation practices led to many of the inconsistencies and deficiencies in financial reporting as required by SFAS 141 and, to a lesser extent, by IFRS 3 (see paragraphs BC198–BC202).

BC387 Some constituents also expressed concern about what they described as allowing an opportunity for gain recognition on a purchase transaction. The boards noted that the required remeasurement could also result in loss recognition. Moreover, the boards rejected the characterisation that the result is to recognise a gain or loss on a purchase. Rather, under today's mixed attribute accounting model, economic gains and losses are recognised as they occur for some, but not all, financial instruments. If an equity interest in an entity is not required to be measured at its fair value, the recognition of a gain or loss at the acquisition date is merely a consequence of the delayed recognition of the economic gain or loss that is present in that financial instrument. If the investment asset had been measured at fair value at the end of each reporting period, the gain or loss would have been recognised as it occurred and measurement of the asset at its acquisition-date fair value would result in no further gain or loss.

BC388 Some respondents who agreed that an acquirer should remeasure its previously held equity interest at fair value would recognise any resulting gain or loss in other comprehensive income rather than in profit or loss. Those respondents said that the accounting for previously held equity interests is similar to the accounting for available-for-sale securities. Changes in the value of available-for-sale securities are recognised in other comprehensive income. They view each step in a step acquisition as a transaction in which the acquirer only obtains more shares in the acquiree. Because the shares that the acquirer previously held have not been exchanged or sold, they think that the recognition of profit or loss is not appropriate.

BC389 The boards understand that the required treatment of a previously held equity investment in a step acquisition is different from the initial recognition of gains or losses on available-for-sale securities. However, the boards noted that changes in the value of available-for-sale securities are recognised in profit or loss when the securities are derecognised. In a business combination achieved in stages, the acquirer derecognises its investment asset in an entity in its consolidated financial statements when it achieves control. Thus, the boards concluded that it is appropriate to recognise any resulting gain or loss in profit or loss at the acquisition date.

Measurement period

BC390 The revised standards provide an acquirer with a reasonable period after the acquisition date, a *measurement period*, during which to obtain the information necessary to identify and measure the items specified in paragraph 46 of the revised IFRS 3 as of the acquisition date in accordance with the requirements of the revised standards. If sufficient information is not available at the acquisition date to measure those amounts, the acquirer determines and recognises provisional amounts until the necessary information becomes available.

BC391 The boards concluded that providing for retrospective adjustments during the measurement period should help to resolve concerns about the quality and availability of information at the acquisition date for measuring the fair values of

© IASCF

particular items at that date. Constituents especially indicated such concerns about contingent liabilities and contingent consideration arrangements, which also affect the amount of goodwill or the gain recognised on a bargain purchase.

BC392 The boards decided to place constraints on the period for which it is deemed reasonable to be seeking information necessary to complete the accounting for a business combination. The measurement period ends as soon as the acquirer receives the necessary information about facts and circumstances that existed as of the acquisition date or learns that the information is not obtainable. However, in no circumstances may the measurement period exceed one year from the acquisition date. The boards concluded that allowing a measurement period longer than one year would not be especially helpful; obtaining reliable information about circumstances and conditions that existed more than a year ago is likely to become more difficult as time passes. Of course, the outcome of some contingencies and similar matters may not be known within a year. But the objective of the measurement period is to provide time to obtain the information necessary to measure the fair value of the item as of the acquisition date. Determining the ultimate settlement amount of a contingency or other item is not necessary. Uncertainties about the timing and amount of future cash flows are part of the measure of the fair value of an asset or liability.

BC393 The boards also concluded that acquirers should provide users of their financial statements with relevant information about the status of items that have been measured only provisionally. Thus, paragraph B67(a) of the revised IFRS 3 specifies particular disclosures about those items.

BC394 Both IFRS 3 and SFAS 141 included a period during which an acquirer might measure particular amounts provisionally if the necessary information was not available at the acquisition date. Neither of those provisions was identical to the measurement period guidance in the revised standards, although IFRS 3's was quite similar. However, the measurement period provisions in the revised standards differ in important ways from the allocation period guidance of SFAS 141 and its cost-allocation method. The revised standards emphasise the principle that assets acquired, liabilities assumed and any non-controlling interest in the acquiree should be measured at their acquisition-date fair values. SFAS 141's allocation period and its post-combination adjustments delayed the recognition of assets and liabilities, and those assets and liabilities were not measured at their acquisition-date fair values when they were recognised. Therefore, the FASB decided to replace the SFAS 141 term *allocation period* and its guidance with the measurement period guidance in the revised standards.

BC395 The FASB also decided that to improve the quality of comparative information reported in financial statements and to converge with the requirements of IFRS 3, SFAS 141(R) should require an acquirer:

(a) to recognise adjustments made during the measurement period to the provisional values of the assets acquired and liabilities assumed as if the accounting for the business combination had been completed at the acquisition date.

(b) to adjust comparative information in previously issued financial statements, including any change in depreciation, amortisation or other income effect recognised as a result of completing the initial accounting.

 © IASCF

BC396 SFAS 141 was silent about whether adjustments during its allocation period were to be reported retrospectively, but the FASB noted that in practice the effects of those adjustments were typically reported in the post-combination period, not retrospectively. The FASB acknowledged concerns that retrospective adjustments and adjusting previously issued comparative information are more costly. The FASB observed, however, that applying measurement period adjustments retrospectively would result in at least two significant benefits: (a) improvements in comparative period information and (b) avoidance of divergent accounting between US entities and others and the reduction of reconciling items and their attendant costs. The FASB concluded, as had the IASB in developing IFRS 3, that those overall benefits outweigh the potential costs of retrospective application.

BC397 Some respondents to the 2005 Exposure Draft (generally those who apply US GAAP rather than IFRSs) disagreed with retrospective application of measurement period adjustments. They regarded measurement period adjustments as similar to changes in estimates, which are accounted for prospectively. They noted that FASB Statement No. 154 *Accounting Changes and Error Corrections* (SFAS 154) and IAS 8 *Accounting Policies, Changes in Accounting Estimates and Errors* both require retrospective adjustment only for changes in accounting policy or restatement for errors.

BC398 In considering those responses, the boards observed that measurement period adjustments in a business combination differ from the changes in estimates dealt with by SFAS 154 and IAS 8. Measurement period adjustments result from information about assets, liabilities and non-controlling interests **as of** the acquisition date that becomes available only after that date. In contrast, adjustments for changes in estimates generally result from changes in facts and circumstances that affect an estimate, for example, a change in technology that affects the useful life of an asset.

BC399 The boards concluded that adjustments during the measurement period following a business combination are more analogous to adjusting events after the end of the reporting period (IAS 10 *Events after the Reporting Period*) than to changes in estimates. The effects of events that occur after the end of an accounting period but before the financial statements for the period are authorised for issue and provide evidence of a condition that existed at the date of the financial statements are reflected in financial statements as of that date. Similarly, the effects of information that first becomes available during the measurement period and provides evidence of conditions or circumstances that existed at the acquisition date should be reflected in the accounting as of that date.

BC400 To recognise measurement period adjustments only prospectively would be inconsistent with the recognition and measurement principles in the revised standards. Thus, although the boards understand the practical and other difficulties with retrospective adjustments, on balance, they concluded that requiring such adjustments in this situation is appropriate.

© IASCF

Disclosures

BC401 Because a business combination often results in a significant change to an entity's operations, the nature and extent of the information disclosed about the transaction bear on users' abilities to assess the effects of such changes on post-combination profit or loss and cash flows. Accordingly, as part of their respective projects that led to IFRS 3 and SFAS 141, the IASB and the FASB both considered the usefulness of the disclosure requirements required by IAS 22 and APB Opinion 16, respectively, for the acquisition method. IFRS 3 and SFAS 141 carried forward disclosures from the earlier requirements for business combinations that remained relevant, eliminated those that did not and modified those that were affected by changes in the recognition or measurement requirements. In the second phase of their projects on business combinations, the boards undertook essentially the same sort of reconsideration of the disclosure requirements in IFRS 3 and SFAS 141, and they also considered particular disclosures requested by respondents to the 2005 Exposure Draft.

BC402 The remainder of this section first reviews the changes that SFAS 141 and IFRS 3 made to the disclosure requirements of APB Opinion 16 and IAS 22 respectively (paragraphs BC403–BC418). Paragraphs BC419–BC428 then discuss the changes the revised standards make to the disclosure requirements of SFAS 141 and IFRS 3.

Disclosure requirements of SFAS 141

Disclosure of information about the purchase price allocation and pro forma sales and earnings

BC403 The 1999 Exposure Draft would have required tabular disclosure of the fair values allocated to each of the major classes of assets and liabilities presented in the statement of financial position and the acquiree's related carrying amounts immediately before its acquisition. That exposure draft also proposed eliminating the pro forma sales and earnings disclosures required by APB Opinion 16.

BC404 Approximately half of the respondents who commented on the proposed requirement to disclose information about the purchase price allocation agreed that the information would be useful in assessing post-acquisition earnings and cash flows of the acquirer. However, some respondents questioned the usefulness of the proposed disclosure of information about the acquiree's carrying amounts of assets acquired and liabilities assumed, particularly if the financial statements of the acquiree were not audited or were prepared on a basis other than US GAAP. After considering those views, the FASB affirmed its conclusion that information about the allocation of the purchase price to major classes of assets and liabilities in the statement of financial position would be useful in assessing the amount and timing of future cash flows. However, it agreed that information about the related carrying amounts might be of limited usefulness. Thus, SFAS 141 required disclosure of information about the allocation of the purchase price to each major class of asset and liability in the acquiree's statement of financial position but not their previous carrying amounts.

BC405 After considering respondents' views, the FASB included in SFAS 141 the pro forma disclosure requirements from APB Opinion 16. However, the FASB also continued the exemption of non-public entities from the pro forma disclosure

 © IASCF

requirements. Preparers and auditors of financial statements of non-public entities urged the FASB to continue that exemption, which was initially provided by FASB Statement No. 79 *Elimination of Certain Disclosures for Business Combinations by Nonpublic Enterprises*.

Disclosures related to goodwill

BC406 The FASB's 2001 Exposure Draft (see paragraph BC160 for a discussion of that exposure draft) would have required the acquirer to disclose (a) the reasons for the acquisition, including a description of the factors that led to a purchase price that resulted in goodwill and (b) the amount of goodwill assigned to each reportable segment. The requirement to disclose goodwill by reportable segment was limited to entities that are within the scope of FASB Statement No. 131 *Disclosures about Segments of an Enterprise and Related Information*. That exposure draft also proposed requiring disclosure of the amount of goodwill expected to be deductible for tax purposes if the goodwill initially recognised in a material business combination was significant in relation to the total cost of the acquiree. After considering the comments of respondents, the FASB affirmed its conclusion that the information would be useful in estimating the amount and timing of future impairment losses, and SFAS 141 required that disclosure.

Disclosure of information about intangible assets other than goodwill

BC407 If the amount assigned to intangible assets was significant in relation to the total cost of an acquiree, SFAS 141 required disclosure of the following information to help users of financial statements assess the amount and timing of future cash flows:

(a) the total amount assigned to intangible assets subject to amortisation and the total amount assigned to those that are not subject to amortisation;

(b) the amount assigned to each major intangible asset class;

(c) for intangible assets subject to amortisation, the weighted average amortisation period in total and for each major intangible asset class; and

(d) the amount of any significant residual value assumed, both in total and for each major class of intangible asset.

Other disclosure requirements

BC408 The 1999 Exposure Draft proposed, and SFAS 141 required, disclosure of specified information for a series of immaterial business combinations that are material in the aggregate completed in a reporting period:

(a) the number of entities acquired and a brief description of them;

(b) the aggregate cost of the acquired entities, the number of equity interests issued or issuable and the value assigned to them;

(c) the aggregate amount of any contingent payments, options or commitments and the accounting treatment that will be followed should any such contingency occur (if potentially significant in relation to the aggregate cost of the acquired entities); and

(d) the information about goodwill required for a material acquisition if the aggregate amount assigned to goodwill or to other intangible assets acquired was significant in relation to the aggregate cost of the acquired entities.

BC409 In addition, the 1999 Exposure Draft proposed, and SFAS 141 required, that the information required to be disclosed for a completed business combination would also be disclosed for a material business combination completed after the balance sheet date but before the financial statements are authorised for issue (unless disclosure of such information was not practicable). That requirement was consistent with auditing standards on subsequent events.

Disclosures in interim financial information

BC410 Several analysts and other users recommended that the FASB should require disclosure of supplemental pro forma revenues and earnings in interim financial information because that information would be more useful if it was available earlier. SFAS 141 amended APB Opinion No. 28 *Interim Financial Reporting* to require disclosure of that information.

Disclosure requirements of IFRS 3

BC411 IFRS 3 identified three objectives that its disclosure requirements were intended to meet, specifically, to provide the users of an acquirer's financial statements with information that enables them to evaluate:

(a) the nature and financial effect of business combinations that were effected during the reporting period or after the balance sheet date but before the financial statements were authorised for issue.

(b) the financial effects of gains, losses, error corrections and other adjustments recognised in the current period that relate to business combinations that were effected in the current period or in previous periods.

(c) changes in the carrying amount of goodwill during the period.

BC412 The IASB began its discussion of the disclosure requirements necessary to meet the objectives by assessing the disclosure requirements in SIC-28 *Business Combinations—"Date of Exchange" and Fair Value of Equity Instruments* and IAS 22. The IASB concluded that information disclosed in accordance with SIC-28 about equity instruments issued as part of the cost of a business combination helped to meet the first of the three objectives outlined above. Therefore, IFRS 3 carried forward the disclosure requirements in SIC-28.

BC413 The IASB also concluded that information previously disclosed in accordance with IAS 22 about business combinations classified as acquisitions and goodwill helped to meet the objectives in paragraph BC411. Therefore, IFRS 3 carried forward the related disclosure requirements in IAS 22, amended as necessary to reflect changes IFRS 3 made to the provisions of IAS 22. For example, IAS 22 required disclosure of the amount of any adjustment during the period to goodwill or 'negative goodwill' resulting from subsequent identification or changes in value of the acquiree's identifiable assets and liabilities. IFRS 3 required an acquirer, with specified exceptions, to adjust the initial accounting for a combination after

 © IASCF

that accounting was complete only to correct an error. Thus, IFRS 3 revised the IAS 22 disclosure requirement to require disclosure of information about error corrections required to be disclosed by IAS 8.

BC414 The IASB then assessed whether any additional disclosure requirements should be included in IFRS 3 to ensure that the three disclosure objectives were met and considered the disclosure requirements in the corresponding standards of its partner standard-setters. As a result, and after considering respondents' comments on ED 3, the IASB identified, and IFRS 3 required, the following additional disclosures to help meet the first of the three disclosure objectives in paragraph BC411:

(a) For each business combination effected during the period:

  (i) the amounts recognised at the acquisition date for each class of the acquiree's assets, liabilities and contingent liabilities and, if practicable, the carrying amounts of each of those classes, determined in accordance with IFRSs, immediately before the combination. If such disclosure was impracticable, an entity disclosed that fact, together with an explanation of why disclosure was impracticable.

  (ii) a description of the factors that contributed to the recognition of goodwill—including a description of each intangible asset that was not recognised separately from goodwill and an explanation of why the intangible asset's fair value could not be measured reliably. If the acquirer's interest in the acquiree's identifiable net assets exceeded the cost, the acquirer was required to describe the nature of that excess.

  (iii) the amount of the acquiree's profit or loss since the acquisition date included in the acquirer's profit or loss for the period, unless disclosure was impracticable. If such disclosure was impracticable, the acquirer disclosed that fact, together with an explanation of why disclosure was impracticable.

(b) The information required to be disclosed for each business combination that was effected during the period in aggregate for business combinations that are individually immaterial.

(c) The revenue and profit or loss of the combined entity for the period as though the acquisition date for all business combinations that were effected during the period had been the beginning of that period, unless such disclosure was impracticable.

BC415 To aid in meeting the second disclosure objective in paragraph BC411, IFRS 3 also required disclosure of the amount and an explanation of any gain or loss recognised in the current period that both:

(a) related to the identifiable assets acquired or liabilities or contingent liabilities assumed in a business combination that was effected in the current or a previous period; and

(b) was of such size, nature or incidence that disclosure was relevant to an understanding of the combined entity's financial performance.

BC416 To help achieve the third disclosure objective in paragraph BC411, the IASB concluded that the previous requirement to disclose a reconciliation of the carrying amount of goodwill at the beginning and end of the period should be amended to require separate disclosure of net exchange rate differences arising during the period in accordance with IAS 21 *The Effects of Changes in Foreign Exchange Rates*.

BC417 The IASB observed that there might be situations in which the information disclosed under the specific requirements would not completely satisfy IFRS 3's three disclosure objectives. In that situation, IFRS 3 required disclosure of any additional information necessary to meet those objectives.

BC418 IFRS 3 also required the acquirer to disclose the number of equity instruments issued or issuable as part of the cost of a business combination, the fair value of those instruments and the basis for determining that fair value. Although IAS 22 did not explicitly require disclosure of that information, the IASB concluded that the acquirer should have provided it as part of disclosing the cost of acquisition and a description of the purchase consideration paid or contingently payable in accordance with paragraph 87(b) of IAS 22. The IASB decided that to avoid inconsistent application, IFRS 3 should explicitly require disclosure of that information.

Disclosure requirements of the revised standards

BC419 The boards decided that the revised standards should include overall objectives for the disclosure of information that would be useful to investors, creditors and others in evaluating the financial effects of a business combination. The objectives, which are stated in paragraphs 59 and 61 of the revised IFRS 3, are, in substance, the same as those in IFRS 3 and the 2005 Exposure Draft. Respondents to the 2005 Exposure Draft who discussed the proposed disclosures generally agreed with the disclosure objectives. In reconsidering that exposure draft, however, the boards noted that the third objective in IFRS 3, to provide information that enables users of an entity's financial statements to evaluate changes in the carrying amount of goodwill during the period, is effectively included in the objective in paragraph 61. Thus, the boards combined those two objectives.

BC420 In addition, both boards concluded, as the IASB did in developing IFRS 3, that it is not necessary (or possible) to identify all of the specific information that may be necessary to meet those objectives for all business combinations. Rather, the revised standards specify particular disclosures that are generally required to meet those objectives and require acquirers to disclose any additional information about the circumstances surrounding a particular business combination that they consider necessary to meet those objectives (paragraph 63 of the revised IFRS 3).

BC421 Changes to the disclosure requirements of IFRS 3 and SFAS 141 include the elimination of disclosures of amounts or information that was based on applying the cost allocation (purchase price) method for assigning amounts to assets and liabilities that is replaced by the revised standards' fair value measurement principle. Some of those disclosures are modified to retain the information but conform the amounts to be disclosed with the fair value measurement principle.

 © IASCF

BC422 The boards added some disclosure requirements to those in IFRS 3, SFAS 141 or both and modified or eliminated others. Those changes are described below, together with an indication of how the changes relate to each board's previous requirements and references to related discussions in other parts of this Basis for Conclusions where pertinent.

(a) In response to requests from some commentators on the 2005 Exposure Draft, the boards added to both IFRS 3 and SFAS 141 disclosure of information about receivables acquired. (paragraphs BC258–BC260)

(b) The boards modified both IFRS 3's and SFAS 141's disclosures about contingent consideration in a business combination to make them consistent with the revised standards' requirements for contingent consideration. Paragraph B64(g) of the revised IFRS 3 describes the specific disclosures now required.

(c) The FASB added to SFAS 141 disclosure of the revenue and earnings of the acquiree, if practicable, for a minimum of the period from the acquisition date to the end of the current year. The disclosure is required only from public business entities for the current year, the current interim period and cumulative interim periods from the acquisition date to the end of the current year. IFRS 3 already required disclosure of the amount of the acquiree's profit or loss included in the acquirer's profit or loss for the period, unless that was impracticable; the IASB added revenues to that disclosure. (paragraphs BC423–BC428)

(d) The FASB modified SFAS 141's disclosure of supplemental pro forma information about results of operations for the comparable prior period presented to focus on revenue and earnings of the combined entity for the comparable prior reporting period as though the acquisition date for all business combinations during the current year had been the beginning of the comparable prior annual reporting period. The disclosure is required only from public entities and only if practicable. The IASB decided not to add that disclosure. (paragraph BC428)

(e) The FASB replaced SFAS 141's disclosure of the period for which the results of operations of the acquiree are included in the income statement of the combined entity with disclosure of the acquisition date—a disclosure that IFRS 3 already required. SFAS 141(R) no longer permits the alternative practice of reporting revenues and expenses of the acquiree as if the acquisition occurred as of the beginning of the year (or a designated date) with a reduction to eliminate the acquiree's pre-acquisition period earnings. (paragraphs BC108–BC110)

(f) The boards revised both IFRS 3's and SFAS 141's disclosures about contingencies, at the acquisition date and subsequently, to make them consistent with the requirement of the revised standards on assets and liabilities arising from contingencies. The IASB's and the FASB's disclosures on contingencies differ because the recognition requirements to which they relate differ. (paragraphs BC265–BC278)

(g) The FASB added to SFAS 141 disclosure of the amount of acquisition-related costs, which IFRS 3 already required, and the boards added to both IFRS 3

and SFAS 141 disclosure of the amount of acquisition-related costs recognised as expense and the statement of comprehensive income line item in which that expense is reported.

(h) The FASB eliminated SFAS 141's requirement to disclose the amount of in-process research and development acquired that had been measured and immediately written off to expense in accordance with FASB Interpretation 4. SFAS 141(R) no longer permits that practice. (paragraphs BC149–BC155)

(i) The boards added to both IFRS 3 and SFAS 141 disclosure of the acquisition-date fair value or other recognised amount of the non-controlling interest in the acquiree and the valuation techniques and key model inputs used for determining that value. An entity that prepares its financial statements in accordance with IFRSs also discloses the measurement basis selected for the non-controlling interest.

(j) For a business combination achieved in stages, the boards added to both IFRS 3 and SFAS 141 disclosure of the fair value of the acquirer's previously held equity interest in the acquiree, the amount of gain or loss recognised in accordance with paragraph 42 of the revised IFRS 3 and the line item in the statement of comprehensive income in which that gain or loss is recognised.

(k) The FASB replaced SFAS 141's disclosure of extraordinary gains recognised for 'negative goodwill' with disclosure of the amount of any gain recognised in the period for a bargain purchase, the line item in the statement of comprehensive income in which it is recognised and a description of the reasons why the transaction resulted in a gain (paragraphs BC371–BC381). IFRS 3 already required disclosure of that amount (although it was not called a gain on a bargain purchase).

(l) The boards added to both IFRS 3 and SFAS 141 the disclosures described in paragraph B64(l) of the revised IFRS 3 about transactions that are separate from the acquisition of assets and assumption of liabilities in the exchange for the acquiree. The 2005 Exposure Draft proposed requiring disclosures about only pre-existing relationships between the acquirer and acquiree. The boards broadened the disclosure to all separate transactions in response to comments on the exposure draft.

(m) The boards revised the disclosures in IFRS 3 and SFAS 141 about aspects of the purchase price allocation not yet completed to make them consistent with the requirements of the revised standards about the measurement period. The specific disclosures required are in paragraph B67(a) of the revised IFRS 3.

(n) The IASB eliminated IFRS 3's required disclosure of the acquiree's carrying amounts in accordance with IFRSs for each class of its assets and liabilities immediately before the combination. The IASB concluded that providing that disclosure could often involve significant costs because the acquiree might not be applying IFRSs and that those costs might exceed the benefits of the information to users.

 © IASCF

Disclosure of information about post-combination revenue and profit or loss of the acquiree

BC423 Paragraph B64(q) of the revised IFRS 3 requires an entity to disclose, for each business combination (and for individually immaterial business combinations that are material collectively), the amounts of revenue and profit or loss of the acquiree since the acquisition date included in the consolidated statement of comprehensive income for the period. At its August 2003 round-table discussion with users of financial statements, the FASB discussed the potential usefulness of information about increases or decreases in post-combination revenues and earnings from acquired businesses versus revenues and earnings from the operations already owned by the acquirer (organic growth). The FASB also asked whether that information would be preferable to the pro forma supplemental disclosure of revenue and results of operations of the combined entity for the current period as though the acquisition date for all business combinations during the year had been as of the beginning of the annual reporting period. SFAS 141 carried that disclosure forward from APB Opinion 16 and IFRS 3 required a similar disclosure.

BC424 The FASB also questioned whether those disclosures are directed at similar objectives and, if so, whether one may be preferable. The FASB observed that making post-combination distinctions might be too costly or impossible if the operations of the acquiree are integrated with those of the acquirer. Although users acknowledged that point, they indicated that information about actual post-combination revenues and earnings is preferable to the pro forma disclosures and should be required whenever possible. Some also said that distinguishing acquired revenues from organic revenues is most important and suggested that acquirers should be required to provide that information for a twelve-month period following an acquisition rather than only to the end of the annual period.

BC425 The boards agreed with users that the information about post-combination revenues and profit or loss of the acquiree is useful. However, for practical reasons, the boards concluded that the revised standards should provide an exception to that requirement if distinguishing the post-combination earnings of the acquiree from earnings of the combined entity is impracticable. The boards also decided that in those circumstances the acquirer should disclose that fact and the reasons why it is impracticable to provide the post-combination information. The period for that disclosure is limited to the end of the current annual period because the boards concluded that the information needed to provide the disclosure during that period will generally be available. A short period is often required to integrate an acquiree's operations fully with those of the acquirer. The boards also observed that the usefulness of the separate information diminishes as the operations of the acquiree are integrated with the combined entity.

BC426 The FASB proposed in its version of the 2005 Exposure Draft that the post-combination disclosures should focus on *results of operations* rather than on revenues and earnings. *Results of operations* was defined as revenue, income before extraordinary items and the cumulative effect of accounting changes, earnings and earnings per share. In considering the responses to the exposure draft and opportunities for further convergence, the FASB decided to revise its disclosures

© IASCF

to focus on revenues and earnings, which is consistent with the related requirements of the IASB. The boards observed that the term *results of operations* is not used or defined in IFRSs; it would thus have been more difficult for the IASB to converge with the disclosures initially proposed by the FASB.

BC427 The FASB considered expanding the disclosure of post-combination revenues and earnings of an acquiree to all entities because the information would be valuable to any investor, not merely investors in public business entities. To do so would also converge with the requirements of the IASB. However, the FASB was concerned about imposing the additional costs on non-public entities because it believes that the benefits to users of those entities would not be sufficient to warrant imposing those costs. The FASB also observed that the IASB has not completed its separate deliberations on its small and medium-sized entities project and thus does not have an established practice of differential disclosure for circumstances in which it is clear that the benefits would be sufficient for some entities but not so clear for all entities. Because of those cost-benefit concerns, the FASB decided not to extend this disclosure requirement to all entities.

BC428 If comparative financial statements are presented, the FASB decided to require disclosure of supplemental pro forma information about the revenue and earnings of the combined entity for the comparable prior reporting period as though the acquisition date for all business combinations during the current year had been the beginning of the comparable prior annual reporting period. The disclosure is required only for public entities and only if practicable. The IASB considered also requiring that disclosure, but it observed that the needed information would be particularly difficult and costly to obtain in the international environment. An entity that prepares its financial statements in accordance with IFRSs might in a given year acquire other entities that had previously applied the domestic reporting requirements of several different countries. Because the IASB did not consider it feasible to require the disclosure in the international environment, the revised IFRS 3 requires only disclosure of revenues and profit or loss for the current reporting period determined as though the acquisition date for all combinations during the period had been as of the beginning of the annual reporting period.

Effective date and transition

BC429 SFAS 141(R) is effective for business combinations for which the acquisition date is on or after the beginning of the first annual reporting period beginning on or after 15 December 2008, ie for 2009 financial statements. The IASB decided to provide a slightly later effective date. The revised IFRS 3 is effective for business combinations for which the acquisition date is on or after the beginning of the first annual reporting period beginning on or after 1 July 2009. The IASB made a commitment to its constituents that there would be a transition period of approximately 18 months between the publication date and the effective date of the revised IFRS 3 as part of its commitment to have a period of stability following the initial transition to IFRSs. The FASB decided to make SFAS 141(R) effective as soon as practicable, ie for 2009 financial statements. The FASB believes that that effective date provides sufficient time for entities and their auditors to analyse, interpret and prepare for implementation of the provisions of SFAS 141(R).

 © IASCF

BC430 The boards also concluded that the effective date of the revised standards should be the same as that of the amendments to their respective consolidation standards (FASB Statement No. 160 *Noncontrolling Interests in Consolidated Financial Statements* and the IASB's amendments to IAS 27). Particular provisions in those amendments, which address the subsequent accounting for an acquiree in consolidated financial statements, are related to provisions in the revised standards that address the initial accounting for an acquiree at the acquisition date. The boards concluded that linking the timing of the changes in accounting required by those amendments to those required by the revised standards would minimise disruptions to practice, which benefits both preparers and users of financial statements.

BC431 SFAS 141(R) prohibits early application and the revised IFRS 3 permits early application. The FASB's Investors Technical Advisory Committee and other users of financial statements told the FASB that providing alternatives for when entities adopt a new standard impairs comparability. The IASB observed, however, that the changes to IFRS 3 are less extensive than the changes to SFAS 141. In addition, the IASB observed that IAS 27 is silent on the accounting for changes in controlling ownership interests in a subsidiary and it wanted entities to be able to adopt the guidance in the amended IAS 27 as soon as it is published. Accordingly, the IASB retained the proposal in the 2005 Exposure Draft to permit entities to adopt the revised IFRS 3 early if they so choose.

BC432 The IASB and the FASB also concluded that the revised standards should be applied prospectively. As with most other requirements that relate to particular types of transactions, applying the revised standards retrospectively would not be feasible.

Effective date and transition for combinations of mutual entities or by contract alone

BC433 IFRS 3 excluded from its scope combinations of mutual entities and those achieved by contract alone. In developing IFRS 3, the IASB decided that these combinations should be excluded from its scope until the IASB published interpretative guidance for the application of the acquisition method to those transactions. The revised IFRS 3 provides that guidance. The effective date for combinations of mutual entities and those achieved by contract alone is the same as the effective date for all other entities applying the revised IFRS 3.

BC434 For the reasons outlined in paragraph BC180 of IFRS 3 the IASB concluded that the transitional provisions for combinations involving mutual entities only or those achieved by contract alone should be prospective. Given that these combinations were not within the scope of IFRS 3, they may have been accounted for differently from what IFRS 3 required. The transitional provisions in IFRS 3 took into consideration that entities may have used a range of alternatives in accounting for combinations in the past. The IASB concluded that the transitional provisions for these combinations should incorporate the transitional provisions in IFRS 3 for other business combinations. In addition, the IASB concluded that the transitional provisions should provide that an entity should continue to classify prior combinations in accordance with its previous accounting for such combinations. This is consistent with the prospective approach. Those provisions are contained in paragraphs B68 and B69 of the revised IFRS 3.

© IASCF

Benefits and costs

BC435 The objective of financial statements is to provide information about the financial position, performance and changes in financial position of an entity that is useful to a wide range of users in making economic decisions. However, the benefits derived from information should exceed the cost of providing it. The evaluation of benefits and costs is substantially a judgemental process. Furthermore, the costs do not necessarily fall on those who enjoy the benefits. For these reasons, it is difficult to apply a cost-benefit test in any particular case. In making its judgement, the IASB considers:

(a) the costs incurred by preparers of financial statements;

(b) the costs incurred by users of financial statements when information is not available;

(c) the comparative advantage that preparers have in developing information, when compared with the costs that users would incur to develop surrogate information; and

(d) the benefit of better economic decision-making as a result of improved financial reporting.

In the second phase of the business combinations project the IASB also considered the costs and benefits of the revised IFRS 3 relative to IFRS 3.

BC436 The IASB concluded that the revised IFRS 3 benefits both preparers and users of financial statements by converging to common high quality, understandable and enforceable accounting standards for business combinations in IFRSs and US GAAP. This improves the comparability of financial information around the world and it also simplifies and reduces the costs of accounting for entities that issue financial statements in accordance with both IFRSs and US GAAP.

BC437 The revised IFRS 3 builds on the core principles established by IFRS 3. However, the IASB sought to improve the understandability, relevance, reliability and comparability of information provided to users of financial statements as follows:

(a) **Scope**

The revised IFRS 3 has a broader scope than IFRS 3. Those entities that will now be required to apply the acquisition method might incur additional costs to obtain valuations and account for intangible assets and goodwill after the acquisition date. However, the IASB observes that much of the information required to account for a business combination by applying the acquisition method is already prepared by those entities that are currently applying the pooling of interests method. There might be additional costs associated with presenting this information within the financial statements, such as audit costs, but much of the information will already be available to management. The IASB concluded therefore that the benefits of improved comparability and faithful representation outweigh the costs that those entities will incur.

(b) **Non-controlling interest**

Paragraph 19 of the revised IFRS 3 provides preparers of financial statements with a choice for each business combination to measure

 © IASCF

initially a non-controlling interest either at fair value or as the non-controlling interest's proportionate share of the acquiree's identifiable net assets. Paragraphs BC209–BC221 discuss the benefits and costs associated with granting a choice on how non-controlling interests should be measured.

(c) **Contingent consideration**

Paragraph 58 of the revised IFRS 3 requires contingent consideration that is classified as a liability and is within the scope of IAS 39[*] to be remeasured to fair value (or for those within the scope of IAS 37 or another IFRS, to be accounted for in accordance with that IFRS) and that contingent consideration classified as equity is not remeasured. The IASB understands that remeasuring the fair value of contingent consideration after the acquisition date results in additional costs to preparers. Preparers will need to measure the fair value of these arrangements or will need to obtain external valuations at the end of each reporting period. However, users have stated that the information they receive under IFRS 3 is too late to be useful. The IASB concluded therefore that the benefits of relevance and representational faithfulness and the increased information that would be provided to users outweigh the costs.

(d) **Acquisition-related costs**

Paragraph 53 of the revised IFRS 3 requires the costs the acquirer incurs in connection with a business combination to be accounted for separately from the business combination. The IASB concluded that this treatment would improve the understandability of the information provided to users of financial statements. The IASB observed that the new requirement does not create significant additional costs for preparers of financial statements because paragraph 67(d) of IFRS 3 already required disclosure of acquisition-related costs.

(e) **Business combinations achieved in stages**

The revised IFRS 3 establishes the acquisition date as the single measurement date for all assets acquired, liabilities assumed and any non-controlling interest in the acquiree. In a business combination achieved in stages, the acquirer also remeasures its previously held equity interest in the acquiree at its acquisition-date fair value and recognises the resulting gain or loss, if any, in profit or loss. In contrast, IFRS 3 required that for a business combination achieved in stages each exchange transaction should be treated separately by the acquirer, using the cost of the transaction and fair value information at the date of each exchange transaction, to determine the amount of any goodwill associated with that transaction. Therefore, the previous treatment required a comparison of the cost of the individual investments with the acquirer's interest in the fair values of the acquiree's identifiable assets and liabilities at each step. The IASB concluded that the revised treatment of business combinations

[*] In November 2009 the IASB amended the requirements of IAS 39 relating to classification and measurement of assets within the scope of IAS 39 and relocated them to IFRS 9 *Financial Instruments*. IFRS 9 applies to all assets within the scope of IAS 39. This paragraph discusses matters relevant when IFRS 3 was issued.

achieved in stages would improve understandability and relevance of the information provided as well as reduce the cost of accounting for such transactions.

BC438 The IASB concluded that the guidance in the revised IFRS 3 is not unduly complex. Indeed, it eliminates guidance that many have found to be complex, costly and arbitrary and that has been the source of considerable uncertainties and costs in the marketplace. Moreover, the revised IFRS 3 does not introduce a new method of accounting but rather expands the use of the acquisition-method of accounting that is familiar, has been widely used and for which there is a substantial base of experience. However, the IASB also sought to reduce the costs of applying the revised IFRS 3 by:

(a) requiring particular assets and liabilities (eg those related to deferred taxes and employee benefits) to continue to be measured in accordance with existing accounting standards rather than at fair value;

(b) carrying over the basic requirements of IFRS 3 on contingent liabilities assumed in a business combination into the revised IFRS 3 until the IASB has comprehensively reconsidered the accounting for contingencies in its liabilities project; and

(c) requiring the revised IFRS 3 to be applied prospectively rather than retrospectively.

BC439 The IASB acknowledges that those steps may result in some sacrifice to the benefits of improved information in financial statements in accordance with the revised IFRS 3. However, the IASB concluded that the complexities and related costs that would result from applying the fair value measurement requirement to all assets and liabilities, at this time, and requiring retrospective application are not justified.

Appendix
Amendments to the Basis for Conclusions on other IFRSs

This appendix contains amendments to the Basis for Conclusions on other IFRSs that are necessary in order to ensure consistency with IFRS 3 (as revised in 2008) and the related amendments to other IFRSs. Amended paragraphs are shown with new text underlined and deleted text struck through.

* * * * *

The amendments contained in this appendix when the revised IFRS 3 was issued in 2008 have been incorporated into the text of the Basis for Conclusions on IFRSs 2, 4 and 5 and on IASs 36 and 38 as issued at 10 January 2008.

Dissenting opinions

Dissent of Mary E Barth, Robert P Garnett and John T Smith

DO1 Professor Barth and Messrs Garnett and Smith dissent from the publication of IFRS 3 *Business Combinations* (as revised in 2008), for the reasons set out below.

Measurement of non-controlling interest

DO2 Professor Barth and Mr Smith disagree with the Board's decision to make an exception to the IFRS's measurement principle and permit acquirers a free choice, acquisition by acquisition, to measure any non-controlling interest in an acquiree as the non-controlling interest's proportionate share of the acquiree's identifiable net assets, rather than at fair value (paragraph 19 of the IFRS).

DO3 Professor Barth and Mr Smith agree with the measurement principle as explained in paragraph BC207 that the acquirer should recognise the identifiable assets acquired, the liabilities assumed and any non-controlling interest in the acquiree at their acquisition-date fair values. Paragraph BC209 indicates that the Board also supports this principle, but decided to make an exception. Professor Barth and Mr Smith support the Board's general view that exceptions should be avoided because they undermine principle-based standards, but understand that they are necessary in well-justified circumstances. Professor Barth and Mr Smith do not believe that an exception to this principle, with a free choice in applying it, is justified in this situation.

DO4 First, Professor Barth and Mr Smith are among those Board members mentioned in paragraph BC213 who believe that non-controlling interests can be measured reliably. Second, Professor Barth and Mr Smith believe that the benefits of consistently measuring all assets acquired and liabilities assumed outweigh the costs involved in conducting the measurement. To address concerns about costs exceeding benefits in particular acquisitions, they would have supported an exception to the principle based on undue cost or effort. Such an exception would not have been a free choice, but would have required assessment of the facts and circumstances associated with the acquisition. Professor Barth and Mr Smith disagree with the Board's decision to permit a free choice, rather than to adopt such an exception. They also disagree with the Board's decision not to require fair value measurement even for acquisitions of listed acquirees, for which the cost would be nil. Third, a consequence of failure to measure non-controlling interests at fair value is that acquired goodwill is not measured at fair value. In addition to being an exception to the IFRS's measurement principle, this has several undesirable effects beyond the initial accounting for goodwill. The Board acknowledges these in paragraphs BC217 and BC218. In particular, if goodwill is impaired the impairment loss is understated, and if the acquirer subsequently purchases more of the non-controlling interests equity is reduced more than it would be had goodwill been measured initially at fair value. Fourth, based on staff research, the choice will benefit only a minority of acquirers because most acquisitions are for 100 per cent of the acquiree. As noted above, any benefit is reduced if such acquirers subsequently impair goodwill or acquire more of the non-controlling interest because of the resulting anomalous accounting results.

 © IASCF

DO5 Professor Barth and Mr Smith agree with the Board that permitting entities a choice between alternative accounting methods impairs comparability, as noted in paragraph BC210. They disagree with the Board's decision not to support a single method, particularly a method consistent with the IFRS's measurement principle. However, Professor Barth and Mr Smith disagree with the Board that the benefits of other changes to the IFRS outweigh the disadvantages of permitting entities that acquire less than 100 per cent of an acquiree a free choice as to how to account for the acquisition. Although Professor Barth and Mr Smith agree with the other changes to IFRS 3, they believe that these changes are not as important as having a consistent measurement principle.

DO6 In addition to improving the accounting for business combinations, a primary goal of the business combinations project was to achieve convergence between IFRS 3 and FASB Statement No. 141 (revised 2007) *Business Combinations* (SFAS 141(R)). Professor Barth and Mr Smith strongly support that goal. The Board's decision to make the exception to the measurement principle for non-controlling interests creates a divergence from SFAS 141(R). Both the FASB and the IASB made compromises to achieve a converged result in other aspects of the IFRS, and the FASB made a number of changes to its standard that conform to IFRS 3 (as issued in 2004). Professor Barth and Mr Smith believe that the Board's compromise on this particular issue diminishes the importance of convergence, establishes a precedent for allowing a choice when the two boards cannot reach agreement and may suggest that full convergence in the long term cannot be achieved. This is particularly concerning for this decision given that the Board supports the principle underlying the FASB's answer, there are comparability costs inherent in a free choice of accounting methods and there are likely to be few benefits arising from the exception.

DO7 Mr Garnett dissents from the issue of the IFRS because it both establishes a measurement principle for non-controlling interests with which he disagrees, and permits an exception to that principle. Whilst the exception permits the accounting that he considers appropriate, the use of alternative accounting methods reduces the comparability of financial statements.

DO8 Mr Garnett observes that the application of the measurement principle that an acquirer should measure the components of a business combination, including non-controlling interests, at their acquisition-date fair values results in the recognition of not only the purchased goodwill attributable to the acquirer as a result of the acquisition transaction, but also the goodwill attributable to the non-controlling interest in the acquiree. This is often referred to as the 'full goodwill' method.

DO9 Mr Garnett considers that goodwill is unlike other assets since it cannot be identified separately, or measured directly. Purchased goodwill is a residual resulting from a calculation that absorbs the effects of recognition and measurement exceptions made in the IFRS (such as the accounting for employee benefit plans and deferred taxes) and any differences between an entry price used in valuing the business as a whole and the valuation of the individual assets and liabilities acquired.

DO10 Mr Garnett notes that the 'parent-only' approach to goodwill in the previous version of IFRS 3 (as issued in 2004) avoids this difficulty by measuring goodwill as the difference between the fair value of the consideration paid by the parent for the acquiree and its share of the fair value of the identifiable net assets of the acquiree. Thus, purchased goodwill is the amount implicit in the acquisition transaction and excludes any goodwill attributable to non-controlling interests. This method gives rise to more reliable measurement because it is based on the purchase consideration, which can usually be reliably measured, and it reflects faithfully the acquisition transaction to which the non-controlling interests were not a party.

A business combination achieved in stages

DO11 Mr Garnett disagrees with the requirement in a business combination achieved in stages to recognise the effect of remeasuring any previously-held equity interest in the acquiree to fair value through profit or loss (paragraph 42 of the IFRS), because that investment was not part of the exchange. Mr Garnett agrees that gaining control is a significant economic event that warrants a change from investment accounting to consolidation. However, the previous investment has not been sold. Under current IFRSs, gains and losses on cost method, available-for-sale and equity method investments are recognised in profit or loss only when the investment is sold (other than impairment). Mr Garnett would have recognised the effect of those remeasurements as a separate component of other comprehensive income instead of profit or loss.

COMPARISON OF IFRS 3 (AS REVISED IN 2008) AND SFAS 141(R)

TABLE OF CONCORDANCE

IFRS 3 *Business Combinations* Illustrative examples

These examples accompany, but are not part of, IFRS 3.

Reverse acquisitions

Illustrating the consequences of recognising a reverse acquisition by applying paragraphs B19–B27 of IFRS 3.

IE1 This example illustrates the accounting for a reverse acquisition in which Entity B, the legal subsidiary, acquires Entity A, the entity issuing equity instruments and therefore the legal parent, in a reverse acquisition on 30 September 20X6. This example ignores the accounting for any income tax effects.

IE2 The statements of financial position of Entity A and Entity B immediately before the business combination are:

	Entity A (legal parent, accounting acquiree)	**Entity B** (legal subsidiary, accounting acquirer)
	CU*	**CU**
Current assets	500	700
Non-current assets	1,300	3,000
Total assets	1,800	3,700
Current liabilities	300	600
Non-current liabilities	400	1,100
Total liabilities	700	1,700
Shareholders' equity		
Retained earnings	800	1,400
Issued equity		
100 ordinary shares	300	
60 ordinary shares		600
Total shareholders' equity	1,100	2,000
Total liabilities and shareholders' equity	1,800	3,700

IE3 This example also uses the following information:

(a) On 30 September 20X6 Entity A issues 2.5 shares in exchange for each ordinary share of Entity B. All of Entity B's shareholders exchange their shares in Entity B. Therefore, Entity A issues 150 ordinary shares in exchange for all 60 ordinary shares of Entity B.

* In these examples monetary amounts are denominated in 'currency units (CU)'.

 © IASCF

(b) The fair value of each ordinary share of Entity B at 30 September 20X6 is CU40. The quoted market price of Entity A's ordinary shares at that date is CU16.

(c) The fair values of Entity A's identifiable assets and liabilities at 30 September 20X6 are the same as their carrying amounts, except that the fair value of Entity A's non-current assets at 30 September 20X6 is CU1,500.

Calculating the fair value of the consideration transferred

IE4 As a result of Entity A (legal parent, accounting acquiree) issuing 150 ordinary shares, Entity B's shareholders own 60 per cent of the issued shares of the combined entity (ie 150 of 250 issued shares). The remaining 40 per cent are owned by Entity A's shareholders. If the business combination had taken the form of Entity B issuing additional ordinary shares to Entity A's shareholders in exchange for their ordinary shares in Entity A, Entity B would have had to issue 40 shares for the ratio of ownership interest in the combined entity to be the same. Entity B's shareholders would then own 60 of the 100 issued shares of Entity B—60 per cent of the combined entity. As a result, the fair value of the consideration effectively transferred by Entity B and the group's interest in Entity A is CU1,600 (40 shares with a fair value per share of CU40).

IE5 The fair value of the consideration effectively transferred should be based on the most reliable measure. In this example, the quoted market price of Entity A's shares provides a more reliable basis for measuring the consideration effectively transferred than the estimated fair value of the shares in Entity B, and the consideration is measured using the market price of Entity A's shares—100 shares with a fair value per share of CU16.

Measuring goodwill

IE6 Goodwill is measured as the excess of the fair value of the consideration effectively transferred (the group's interest in Entity A) over the net amount of Entity A's recognised identifiable assets and liabilities, as follows:

	CU	CU
Consideration effectively transferred		1,600
Net recognised values of Entity A's identifiable assets and liabilities		
Current assets	500	
Non-current assets	1,500	
Current liabilities	(300)	
Non-current liabilities	(400)	(1,300)
Goodwill		300

Consolidated statement of financial position at 30 September 20X6

IE7 The consolidated statement of financial position immediately after the business combination is:

	CU
Current assets [CU700 + CU500]	1,200
Non-current assets [CU3,000 + CU1,500]	4,500
Goodwill	300
Total assets	6,000
Current liabilities [CU600 + CU300]	900
Non-current liabilities [CU1,100 + CU400]	1,500
Total liabilities	2,400
Shareholders' equity	
Retained earnings	1,400
Issued equity	
250 ordinary shares [CU600 + CU1,600]	2,200
Total shareholders' equity	3,600
Total liabilities and shareholders' equity	6,000

IE8 The amount recognised as issued equity interests in the consolidated financial statements (CU2,200) is determined by adding the issued equity of the legal subsidiary immediately before the business combination (CU600) and the fair value of the consideration effectively transferred (CU1,600). However, the equity structure appearing in the consolidated financial statements (ie the number and type of equity interests issued) must reflect the equity structure of the legal parent, including the equity interests issued by the legal parent to effect the combination.

 © IASCF

Earnings per share

IE9 Assume that Entity B's earnings for the annual period ended 31 December 20X5 were CU600 and that the consolidated earnings for the annual period ended 31 December 20X6 were CU800. Assume also that there was no change in the number of ordinary shares issued by Entity B during the annual period ended 31 December 20X5 and during the period from 1 January 20X6 to the date of the reverse acquisition on 30 September 20X6. Earnings per share for the annual period ended 31 December 20X6 is calculated as follows:

Number of shares deemed to be outstanding for the period from 1 January 20X6 to the acquisition date (ie the number of ordinary shares issued by Entity A (legal parent, accounting acquiree) in the reverse acquisition)	150
Number of shares outstanding from the acquisition date to 31 December 20X6	250
Weighted average number of ordinary shares outstanding [(150 × 9/12) + (250 × 3/12)]	175
Earnings per share [800/175]	CU4.57

IE10 Restated earnings per share for the annual period ended 31 December 20X5 is CU4.00 (calculated as the earnings of Entity B of 600 divided by the number of ordinary shares Entity A issued in the reverse acquisition (150)).

Non-controlling interest

IE11 Assume the same facts as above, except that only 56 of Entity B's 60 ordinary shares are exchanged. Because Entity A issues 2.5 shares in exchange for each ordinary share of Entity B, Entity A issues only 140 (rather than 150) shares. As a result, Entity B's shareholders own 58.3 per cent of the issued shares of the combined entity (140 of 240 issued shares). The fair value of the consideration transferred for Entity A, the accounting acquiree, is calculated by assuming that the combination had been effected by Entity B issuing additional ordinary shares to the shareholders of Entity A in exchange for their ordinary shares in Entity A. That is because Entity A is the accounting acquirer, and paragraph B20 of IFRS 3 requires the acquirer to measure the consideration exchanged for the accounting acquiree.

IE12 In calculating the number of shares that Entity B would have had to issue, the non-controlling interest is excluded from the calculation. The majority shareholders own 56 shares of Entity B. For that to represent a 58.3 per cent equity interest, Entity B would have had to issue an additional 40 shares. The majority shareholders would then own 56 of the 96 issued shares of Entity B and, therefore, 58.3 per cent of the combined entity. As a result, the fair value of the consideration transferred for Entity A, the accounting acquiree, is CU1,600 (ie 40 shares, each with a fair value of CU40). That is the same amount as when all 60 of Entity B's shareholders tender all 60 of its ordinary shares for exchange. The recognised amount of the group's interest in Entity A, the accounting acquiree, does not change if some of Entity B's shareholders do not participate in the exchange.

© IASCF

IE13 The non-controlling interest is represented by the four shares of the total 60 shares of Entity B that are not exchanged for shares of Entity A. Therefore, the non-controlling interest is 6.7 per cent. The non-controlling interest reflects the proportionate interest of the non-controlling shareholders in the pre-combination carrying amounts of the net assets of Entity B, the legal subsidiary. Therefore, the consolidated statement of financial position is adjusted to show a non-controlling interest of 6.7 per cent of the pre-combination carrying amounts of Entity B's net assets (ie CU134 or 6.7 per cent of CU2,000).

IE14 The consolidated statement of financial position at 30 September 20X6, reflecting the non-controlling interest, is as follows:

	CU
Current assets [CU700 + CU500]	1,200
Non-current assets [CU3,000 + CU1,500]	4,500
Goodwill	300
Total assets	6,000
Current liabilities [CU600 + CU300]	900
Non-current liabilities [CU1,100 + CU400]	1,500
Total liabilities	2,400
Shareholders' equity	
Retained earnings [CU1,400 x 93.3 per cent]	1,306
Issued equity	
240 ordinary shares [CU560 + CU1,600]	2,160
Non-controlling interest	134
Total shareholders' equity	3,600
Total liabilities and shareholders' equity	6,000

IE15 The non-controlling interest of CU134 has two components. The first component is the reclassification of the non-controlling interest's share of the accounting acquirer's retained earnings immediately before the acquisition (CU1,400 × 6.7 per cent or CU93.80). The second component represents the reclassification of the non-controlling interest's share of the accounting acquirer's issued equity (CU600 × 6.7 per cent or CU40.20).

Identifiable intangible assets

Illustrating the consequences of applying paragraphs 10–14 and B31–B40 of IFRS 3.

IE16 The following are examples of identifiable intangible assets acquired in a business combination. Some of the examples may have characteristics of assets other than intangible assets. The acquirer should account for those assets in accordance with their substance. The examples are not intended to be all-inclusive.

 © IASCF

IE17 Intangible assets identified as having a contractual basis are those that arise from contractual or other legal rights. Those designated as having a non-contractual basis do not arise from contractual or other legal rights but are separable. Intangible assets identified as having a contractual basis might also be separable but separability is not a necessary condition for an asset to meet the contractual-legal criterion.

Marketing-related intangible assets

IE18 Marketing-related intangible assets are used primarily in the marketing or promotion of products or services. Examples of marketing-related intangible assets are:

Class	Basis
Trademarks, trade names, service marks, collective marks and certification marks	Contractual
Trade dress (unique colour, shape or package design)	Contractual
Newspaper mastheads	Contractual
Internet domain names	Contractual
Non-competition agreements	Contractual

Trademarks, trade names, service marks, collective marks and certification marks

IE19 Trademarks are words, names, symbols or other devices used in trade to indicate the source of a product and to distinguish it from the products of others. A service mark identifies and distinguishes the source of a service rather than a product. Collective marks identify the goods or services of members of a group. Certification marks certify the geographical origin or other characteristics of a good or service.

IE20 Trademarks, trade names, service marks, collective marks and certification marks may be protected legally through registration with governmental agencies, continuous use in commerce or by other means. If it is protected legally through registration or other means, a trademark or other mark acquired in a business combination is an intangible asset that meets the contractual-legal criterion. Otherwise, a trademark or other mark acquired in a business combination can be recognised separately from goodwill if the separability criterion is met, which normally it would be.

IE21 The terms *brand* and *brand name*, often used as synonyms for trademarks and other marks, are general marketing terms that typically refer to a group of complementary assets such as a trademark (or service mark) and its related trade name, formulas, recipes and technological expertise. IFRS 3 does not preclude an entity from recognising, as a single asset separately from goodwill, a group of complementary intangible assets commonly referred to as a brand if the assets that make up that group have similar useful lives.

Internet domain names

IE22 An Internet domain name is a unique alphanumeric name that is used to identify a particular numeric Internet address. Registration of a domain name creates an association between that name and a designated computer on the Internet for the period of the registration. Those registrations are renewable. A registered domain name acquired in a business combination meets the contractual-legal criterion.

Customer-related intangible assets

IE23 Examples of customer-related intangible assets are:

Class	Basis
Customer lists	Non-contractual
Order or production backlog	Contractual
Customer contracts and related customer relationships	Contractual
Non-contractual customer relationships	Non-contractual

Customer lists

IE24 A customer list consists of information about customers, such as their names and contact information. A customer list also may be in the form of a database that includes other information about the customers, such as their order histories and demographic information. A customer list does not usually arise from contractual or other legal rights. However, customer lists are often leased or exchanged. Therefore, a customer list acquired in a business combination normally meets the separability criterion.

Order or production backlog

IE25 An order or production backlog arises from contracts such as purchase or sales orders. An order or production backlog acquired in a business combination meets the contractual-legal criterion even if the purchase or sales orders can be cancelled.

Customer contracts and the related customer relationships

IE26 If an entity establishes relationships with its customers through contracts, those customer relationships arise from contractual rights. Therefore, customer contracts and the related customer relationships acquired in a business combination meet the contractual-legal criterion, even if confidentiality or other contractual terms prohibit the sale or transfer of a contract separately from the acquiree.

IE27 A customer contract and the related customer relationship may represent two distinct intangible assets. Both the useful lives and the pattern in which the economic benefits of the two assets are consumed may differ.

 © IASCF

IE28 A customer relationship exists between an entity and its customer if (a) the entity has information about the customer and has regular contact with the customer and (b) the customer has the ability to make direct contact with the entity. Customer relationships meet the contractual-legal criterion if an entity has a practice of establishing contracts with its customers, regardless of whether a contract exists at the acquisition date. Customer relationships may also arise through means other than contracts, such as through regular contact by sales or service representatives.

IE29 As noted in paragraph IE25, an order or a production backlog arises from contracts such as purchase or sales orders and is therefore considered a contractual right. Consequently, if an entity has relationships with its customers through these types of contracts, the customer relationships also arise from contractual rights and therefore meet the contractual-legal criterion.

Examples

IE30 The following examples illustrate the recognition of customer contract and customer relationship intangible assets acquired in a business combination.

(a) Acquirer Company (AC) acquires Target Company (TC) in a business combination on 31 December 20X5. TC has a five-year agreement to supply goods to Customer. Both TC and AC believe that Customer will renew the agreement at the end of the current contract. The agreement is not separable.

The agreement, whether cancellable or not, meets the contractual-legal criterion. Additionally, because TC establishes its relationship with Customer through a contract, not only the agreement itself but also TC's customer relationship with Customer meet the contractual-legal criterion.

(b) AC acquires TC in a business combination on 31 December 20X5. TC manufactures goods in two distinct lines of business: sporting goods and electronics. Customer purchases both sporting goods and electronics from TC. TC has a contract with Customer to be its exclusive provider of sporting goods but has no contract for the supply of electronics to Customer. Both TC and AC believe that only one overall customer relationship exists between TC and Customer.

The contract to be Customer's exclusive supplier of sporting goods, whether cancellable or not, meets the contractual-legal criterion. Additionally, because TC establishes its relationship with Customer through a contract, the customer relationship with Customer meets the contractual-legal criterion. Because TC has only one customer relationship with Customer, the fair value of that relationship incorporates assumptions about TC's relationship with Customer related to both sporting goods and electronics. However, if AC determines that the customer relationships with Customer for sporting goods and for electronics are separate from each other, AC would assess whether the customer relationship for electronics meets the separability criterion for identification as an intangible asset.

(c) AC acquires TC in a business combination on 31 December 20X5. TC does business with its customers solely through purchase and sales orders. At 31 December 20X5, TC has a backlog of customer purchase orders from

60 per cent of its customers, all of whom are recurring customers. The other 40 per cent of TC's customers are also recurring customers. However, as of 31 December 20X5, TC has no open purchase orders or other contracts with those customers.

Regardless of whether they are cancellable or not, the purchase orders from 60 per cent of TC's customers meet the contractual-legal criterion. Additionally, because TC has established its relationship with 60 per cent of its customers through contracts, not only the purchase orders but also TC's customer relationships meet the contractual-legal criterion. Because TC has a practice of establishing contracts with the remaining 40 per cent of its customers, its relationship with those customers also arises through contractual rights and therefore meets the contractual-legal criterion even though TC does not have contracts with those customers at 31 December 20X5.

(d) AC acquires TC, an insurer, in a business combination on 31 December 20X5. TC has a portfolio of one-year motor insurance contracts that are cancellable by policyholders.

Because TC establishes its relationships with policyholders through insurance contracts, the customer relationship with policyholders meets the contractual-legal criterion. IAS 36 *Impairment of Assets* and IAS 38 *Intangible Assets* apply to the customer relationship intangible asset.

Non-contractual customer relationships

IE31 A customer relationship acquired in a business combination that does not arise from a contract may nevertheless be identifiable because the relationship is separable. Exchange transactions for the same asset or a similar asset that indicate that other entities have sold or otherwise transferred a particular type of non-contractual customer relationship would provide evidence that the relationship is separable.

Artistic-related intangible assets

IE32 Examples of artistic-related intangible assets are:

Class	Basis
Plays, operas and ballets	Contractual
Books, magazines, newspapers and other literary works	Contractual
Musical works such as compositions, song lyrics and advertising jingles	Contractual
Pictures and photographs	Contractual
Video and audiovisual material, including motion pictures or films, music videos and television programmes	Contractual

© IASCF

IE33 Artistic-related assets acquired in a business combination are identifiable if they arise from contractual or legal rights such as those provided by copyright. The holder can transfer a copyright, either in whole through an assignment or in part through a licensing agreement. An acquirer is not precluded from recognising a copyright intangible asset and any related assignments or licence agreements as a single asset, provided they have similar useful lives.

Contract-based intangible assets

IE34 Contract-based intangible assets represent the value of rights that arise from contractual arrangements. Customer contracts are one type of contract-based intangible asset. If the terms of a contract give rise to a liability (for example, if the terms of an operating lease or customer contract are unfavourable relative to market terms), the acquirer recognises it as a liability assumed in the business combination. Examples of contract-based intangible assets are:

Class	Basis
Licensing, royalty and standstill agreements	Contractual
Advertising, construction, management, service or supply contracts	Contractual
Lease agreements (whether the acquiree is the lessee or the lessor)	Contractual
Construction permits	Contractual
Franchise agreements	Contractual
Operating and broadcast rights	Contractual
Servicing contracts, such as mortgage servicing contracts	Contractual
Employment contracts	Contractual
Use rights, such as drilling, water, air, timber cutting and route authorities	Contractual

Servicing contracts, such as mortgage servicing contracts

IE35 Contracts to service financial assets are one type of contract-based intangible asset. Although servicing is inherent in all financial assets, it becomes a distinct asset (or liability) by one of the following:

(a) when contractually separated from the underlying financial asset by sale or securitisation of the assets with servicing retained;

(b) through the separate purchase and assumption of the servicing.

IE36 If mortgage loans, credit card receivables or other financial assets are acquired in a business combination with servicing retained, the inherent servicing rights are not a separate intangible asset because the fair value of those servicing rights is included in the measurement of the fair value of the acquired financial asset.

Employment contracts

IE37 Employment contracts that are beneficial contracts from the perspective of the employer because the pricing of those contracts is favourable relative to market terms are one type of contract-based intangible asset.

Use rights

IE38 Use rights include rights for drilling, water, air, timber cutting and route authorities. Some use rights are contract-based intangible assets to be accounted for separately from goodwill. Other use rights may have characteristics of tangible assets rather than of intangible assets. An acquirer should account for use rights on the basis of their nature.

Technology-based intangible assets

IE39 Examples of technology-based intangible assets are:

Class	Basis
Patented technology	Contractual
Computer software and mask works	Contractual
Unpatented technology	Non-contractual
Databases, including title plants	Non-contractual
Trade secrets, such as secret formulas, processes and recipes	Contractual

Computer software and mask works

IE40 Computer software and program formats acquired in a business combination that are protected legally, such as by patent or copyright, meet the contractual-legal criterion for identification as intangible assets.

IE41 Mask works are software permanently stored on a read-only memory chip as a series of stencils or integrated circuitry. Mask works may have legal protection. Mask works with legal protection that are acquired in a business combination meet the contractual-legal criterion for identification as intangible assets.

Databases, including title plants

IE42 Databases are collections of information, often stored in electronic form (such as on computer disks or files). A database that includes original works of authorship may be entitled to copyright protection. A database acquired in a business combination and protected by copyright meets the contractual-legal criterion. However, a database typically includes information created as a consequence of an entity's normal operations, such as customer lists, or specialised information, such as scientific data or credit information. Databases that are not protected by copyright can be, and often are, exchanged, licensed or leased to others in their entirety or in part. Therefore, even if the future economic benefits from a database do not arise from legal rights, a database acquired in a business combination meets the separability criterion.

 © IASCF

IE43 Title plants constitute a historical record of all matters affecting title to parcels of land in a particular geographical area. Title plant assets are bought and sold, either in whole or in part, in exchange transactions or are licensed. Therefore, title plant assets acquired in a business combination meet the separability criterion.

Trade secrets, such as secret formulas, processes and recipes

IE44 A trade secret is 'information, including a formula, pattern, recipe, compilation, program, device, method, technique, or process that (a) derives independent economic value, actual or potential, from not being generally known and (b) is the subject of efforts that are reasonable under the circumstances to maintain its secrecy.'[*] If the future economic benefits from a trade secret acquired in a business combination are legally protected, that asset meets the contractual-legal criterion. Otherwise, trade secrets acquired in a business combination are identifiable only if the separability criterion is met, which is likely to be the case.

Gain on a bargain purchase

Illustrating the consequences of recognising and measuring a gain from a bargain purchase by applying paragraphs 32–36 of IFRS 3.

IE45 The following example illustrates the accounting for a business combination in which a gain on a bargain purchase is recognised.

IE46 On 1 January 20X5 AC acquires 80 per cent of the equity interests of TC, a private entity, in exchange for cash of CU150. Because the former owners of TC needed to dispose of their investments in TC by a specified date, they did not have sufficient time to market TC to multiple potential buyers. The management of AC initially measures the separately recognisable identifiable assets acquired and the liabilities assumed as of the acquisition date in accordance with the requirements of IFRS 3. The identifiable assets are measured at CU250 and the liabilities assumed are measured at CU50. AC engages an independent consultant, who determines that the fair value of the 20 per cent non-controlling interest in TC is CU42.

IE47 The amount of TC's identifiable net assets (CU200, calculated as CU250 – CU50) exceeds the fair value of the consideration transferred plus the fair value of the non-controlling interest in TC. Therefore, AC reviews the procedures it used to identify and measure the assets acquired and liabilities assumed and to measure

[*] Melvin Simensky and Lanning Bryer, *The New Role of Intellectual Property in Commercial Transactions* (New York: John Wiley & Sons, 1998), page 293.

the fair value of both the non-controlling interest in TC and the consideration transferred. After that review, AC decides that the procedures and resulting measures were appropriate. AC measures the gain on its purchase of the 80 per cent interest as follows:

		CU
Amount of the identifiable net assets acquired (CU250 – CU50)		200
Less: Fair value of the consideration transferred for AC's 80 per cent interest in TC; plus	150	
Fair value of non-controlling interest in TC	42	
		192
Gain on bargain purchase of 80 per cent interest		8

IE48 AC would record its acquisition of TC in its consolidated financial statements as follows:

	CU	CU
Dr Identifiable assets acquired	250	
Cr Cash		150
Cr Liabilities assumed		50
Cr Gain on the bargain purchase		8
Cr Equity—non-controlling interest in TC		42

IE49 If the acquirer chose to measure the non-controlling interest in TC on the basis of its proportionate interest in the identifiable net assets of the acquiree, the recognised amount of the non-controlling interest would be CU40 (CU200 x 0.20). The gain on the bargain purchase then would be CU10 (CU200 − (CU150 + CU40)).

Measurement period

Illustrating the consequences of applying paragraphs 45–50 of IFRS 3.

IE50 If the initial accounting for a business combination is not complete at the end of the financial reporting period in which the combination occurs, paragraph 45 of IFRS 3 requires the acquirer to recognise in its financial statements provisional amounts for the items for which the accounting is incomplete. During the measurement period, the acquirer recognises adjustments to the provisional amounts needed to reflect new information obtained about facts and circumstances that existed as of the acquisition date and, if known, would have affected the measurement of the amounts recognised as of that date. Paragraph 49 of IFRS 3 requires the acquirer to recognise such adjustments as if the accounting for the business combination had been completed at the acquisition date. Measurement period adjustments are not included in profit or loss.

 © IASCF

IE51 Suppose that AC acquires TC on 30 September 20X7. AC seeks an independent valuation for an item of property, plant and equipment acquired in the combination, and the valuation was not complete by the time AC authorised for issue its financial statements for the year ended 31 December 20X7. In its 20X7 annual financial statements, AC recognised a provisional fair value for the asset of CU30,000. At the acquisition date, the item of property, plant and equipment had a remaining useful life of five years. Five months after the acquisition date, AC received the independent valuation, which estimated the asset's acquisition-date fair value as CU40,000.

IE52 In its financial statements for the year ended 31 December 20X8, AC retrospectively adjusts the 20X7 prior year information as follows:

(a) The carrying amount of property, plant and equipment as of 31 December 20X7 is increased by CU9,500. That adjustment is measured as the fair value adjustment at the acquisition date of CU10,000 less the additional depreciation that would have been recognised if the asset's fair value at the acquisition date had been recognised from that date (CU500 for three months' depreciation).

(b) The carrying amount of goodwill as of 31 December 20X7 is decreased by CU10,000.

(c) Depreciation expense for 20X7 is increased by CU500.

IE53 In accordance with paragraph B67 of IFRS 3, AC discloses:

(a) in its 20X7 financial statements, that the initial accounting for the business combination has not been completed because the valuation of property, plant and equipment has not yet been received.

(b) in its 20X8 financial statements, the amounts and explanations of the adjustments to the provisional values recognised during the current reporting period. Therefore, AC discloses that the 20X7 comparative information is adjusted retrospectively to increase the fair value of the item of property, plant and equipment at the acquisition date by CU9,500, offset by a decrease to goodwill of CU10,000 and an increase in depreciation expense of CU500.

Determining what is part of the business combination transaction

Settlement of a pre-existing relationship

Illustrating the consequences of applying paragraphs 51, 52 and B50–B53 of IFRS 3.

IE54 AC purchases electronic components from TC under a five-year supply contract at fixed rates. Currently, the fixed rates are higher than the rates at which AC could purchase similar electronic components from another supplier. The supply contract allows AC to terminate the contract before the end of the initial five-year term but only by paying a CU6 million penalty. With three years remaining under the supply contract, AC pays CU50 million to acquire TC, which is the fair value of TC based on what other market participants would be willing to pay.

IE55 Included in the total fair value of TC is CU8 million related to the fair value of the supply contract with AC. The CU8 million represents a CU3 million component that is 'at market' because the pricing is comparable to pricing for current market transactions for the same or similar items (selling effort, customer relationships and so on) and a CU5 million component for pricing that is unfavourable to AC because it exceeds the price of current market transactions for similar items. TC has no other identifiable assets or liabilities related to the supply contract, and AC has not recognised any assets or liabilities related to the supply contract before the business combination.

IE56 In this example, AC calculates a loss of CU5 million (the lesser of the CU6 million stated settlement amount and the amount by which the contract is unfavourable to the acquirer) separately from the business combination. The CU3 million 'at-market' component of the contract is part of goodwill.

IE57 Whether AC had recognised previously an amount in its financial statements related to a pre-existing relationship will affect the amount recognised as a gain or loss for the effective settlement of the relationship. Suppose that IFRSs had required AC to recognise a CU6 million liability for the supply contract before the business combination. In that situation, AC recognises a CU1 million settlement gain on the contract in profit or loss at the acquisition date (the CU5 million measured loss on the contract less the CU6 million loss previously recognised). In other words, AC has in effect settled a recognised liability of CU6 million for CU5 million, resulting in a gain of CU1 million.

Contingent payments to employees

Illustrating the consequences of applying paragraphs 51, 52, B50, B54 and B55 of IFRS 3.

IE58 TC appointed a candidate as its new CEO under a ten-year contract. The contract required TC to pay the candidate CU5 million if TC is acquired before the contract expires. AC acquires TC eight years later. The CEO was still employed at the acquisition date and will receive the additional payment under the existing contract.

IE59 In this example, TC entered into the employment agreement before the negotiations of the combination began, and the purpose of the agreement was to obtain the services of CEO. Thus, there is no evidence that the agreement was arranged primarily to provide benefits to AC or the combined entity. Therefore, the liability to pay CU5 million is included in the application of the acquisition method.

IE60 In other circumstances, TC might enter into a similar agreement with CEO at the suggestion of AC during the negotiations for the business combination. If so, the primary purpose of the agreement might be to provide severance pay to CEO, and the agreement may primarily benefit AC or the combined entity rather than TC or its former owners. In that situation, AC accounts for the liability to pay CEO in its post-combination financial statements separately from application of the acquisition method.

 © IASCF

Replacement awards

Illustrating the consequences of applying paragraphs 51, 52 and B56–B62 of IFRS 3.

IE61 The following examples illustrate replacement awards that the acquirer was obliged to issue in the following circumstances:

		Acquiree awards Has the vesting period been completed before the business combination?	
		Completed	**Not completed**
Replacement awards Are employees required to provide additional service after the acquisition date?	**Not required**	Example 1	Example 4
	Required	Example 2	Example 3

IE62 The examples assume that all awards are classified as equity.

Example 1

Acquiree awards	*Vesting period **completed** before the business combination*
Replacement awards	*Additional employee services **are not** required after the acquisition date*

IE63 AC issues replacement awards of CU110 (market-based measure) at the acquisition date for TC awards of CU100 (market-based measure) at the acquisition date. No post-combination services are required for the replacement awards and TC's employees had rendered all of the required service for the acquiree awards as of the acquisition date.

IE64 The amount attributable to pre-combination service is the market-based measure of TC's awards (CU100) at the acquisition date; that amount is included in the consideration transferred in the business combination. The amount attributable to post-combination service is CU10, which is the difference between the total value of the replacement awards (CU110) and the portion attributable to pre-combination service (CU100). Because no post-combination service is required for the replacement awards, AC immediately recognises CU10 as remuneration cost in its post-combination financial statements.

Example 2

Acquiree awards	*Vesting period **completed** before the business combination*
Replacement awards	*Additional employee services **are** required after the acquisition date*

© IASCF

IE65 AC exchanges replacement awards that require one year of post-combination service for share-based payment awards of TC, for which employees had completed the vesting period before the business combination. The market-based measure of both awards is CU100 at the acquisition date. When originally granted, TC's awards had a vesting period of four years. As of the acquisition date, the TC employees holding unexercised awards had rendered a total of seven years of service since the grant date.

IE66 Even though TC employees had already rendered all of the service, AC attributes a portion of the replacement award to post-combination remuneration cost in accordance with paragraph B59 of IFRS 3, because the replacement awards require one year of post-combination service. The total vesting period is five years—the vesting period for the original acquiree award completed before the acquisition date (four years) plus the vesting period for the replacement award (one year).

IE67 The portion attributable to pre-combination services equals the market-based measure of the acquiree award (CU100) multiplied by the ratio of the pre-combination vesting period (four years) to the total vesting period (five years). Thus, CU80 (CU100 x 4/5 years) is attributed to the pre-combination vesting period and therefore included in the consideration transferred in the business combination. The remaining CU20 is attributed to the post-combination vesting period and is therefore recognised as remuneration cost in AC's post-combination financial statements in accordance with IFRS 2.

Example 3

Acquiree awards	*Vesting period* ***not completed*** *before the business combination*
Replacement awards	*Additional employee services* ***are*** *required after the acquisition date*

IE68 AC exchanges replacement awards that require one year of post-combination service for share-based payment awards of TC, for which employees had not yet rendered all of the service as of the acquisition date. The market-based measure of both awards is CU100 at the acquisition date. When originally granted, the awards of TC had a vesting period of four years. As of the acquisition date, the TC employees had rendered two years' service, and they would have been required to render two additional years of service after the acquisition date for their awards to vest. Accordingly, only a portion of the TC awards is attributable to pre-combination service.

IE69 The replacement awards require only one year of post-combination service. Because employees have already rendered two years of service, the total vesting period is three years. The portion attributable to pre-combination services equals the market-based measure of the acquiree award (CU100) multiplied by the ratio of the pre-combination vesting period (two years) to the **greater of** the total vesting period (three years) or the original vesting period of TC's award (four years). Thus, CU50 (CU100 x 2/4 years) is attributable to pre-combination service and therefore included in the consideration transferred for the acquiree. The remaining CU50 is attributable to post-combination service and therefore recognised as remuneration cost in AC's post-combination financial statements.

 © IASCF

Example 4

Acquiree awards	*Vesting period* ***not completed*** *before the business combination*
Replacement awards	*Additional employee services* ***are not*** *required after the acquisition date*

IE70 Assume the same facts as in Example 3 above, except that AC exchanges replacement awards that require no post-combination service for share-based payment awards of TC for which employees had not yet rendered all of the service as of the acquisition date. The terms of the replaced TC awards did not eliminate any remaining vesting period upon a change in control. (If the TC awards had included a provision that eliminated any remaining vesting period upon a change in control, the guidance in Example 1 would apply.) The market-based measure of both awards is CU100. Because employees have already rendered two years of service and the replacement awards do not require any post-combination service, the total vesting period is two years.

IE71 The portion of the market-based measure of the replacement awards attributable to pre-combination services equals the market-based measure of the acquiree award (CU100) multiplied by the ratio of the pre-combination vesting period (two years) to the **greater of** the total vesting period (two years) or the original vesting period of TC's award (four years). Thus, CU50 (CU100 × 2/4 years) is attributable to pre-combination service and therefore included in the consideration transferred for the acquiree. The remaining CU50 is attributable to post-combination service. Because no post-combination service is required to vest in the replacement award, AC recognises the entire CU50 immediately as remuneration cost in the post-combination financial statements.

Disclosure requirements

Illustrating the consequences of applying the disclosure requirements in paragraphs 59–63 and B64–B67 of IFRS 3.

IE72 The following example illustrates some of the disclosure requirements of IFRS 3; it is not based on an actual transaction. The example assumes that AC is a listed entity and that TC is an unlisted entity. The illustration presents the disclosures in a tabular format that refers to the specific disclosure requirements illustrated. An actual footnote might present many of the disclosures illustrated in a simple narrative format.

© IASCF

Footnote X: Acquisitions

Paragraph reference		
B64(a–d)	On 30 June 20X0 AC acquired 15 per cent of the outstanding ordinary shares of TC. On 30 June 20X2 AC acquired 60 per cent of the outstanding ordinary shares of TC and obtained control of TC. TC is a provider of data networking products and services in Canada and Mexico. As a result of the acquisition, AC is expected to be the leading provider of data networking products and services in those markets. It also expects to reduce costs through economies of scale.	
B64(e)	The goodwill of CU2,500 arising from the acquisition consists largely of the synergies and economies of scale expected from combining the operations of AC and TC.	
B64(k)	None of the goodwill recognised is expected to be deductible for income tax purposes. The following table summarises the consideration paid for TC and the amounts of the assets acquired and liabilities assumed recognised at the acquisition date, as well as the fair value at the acquisition date of the non-controlling interest in TC.	
	At 30 June 20X2	
	Consideration	**CU**
B64(f)(i)	Cash	5,000
B64(f)(iv)	Equity instruments (100,000 ordinary shares of AC)	4,000
B64(f)(iii); B64(g)(i)	Contingent consideration arrangement	1,000
B64(f)	**Total consideration transferred**	10,000
B64(p)(i)	**Fair value of AC's equity interest in TC held before the business combination**	2,000
		12,000
B64(m)	**Acquisition-related costs** (included in selling, general and administrative expenses in AC's statement of comprehensive income for the year ended 31 December 20X2)	1,250
B64(i)	**Recognised amounts of identifiable assets acquired and liabilities assumed**	
	Financial assets	3,500
	Inventory	1,000
	Property, plant and equipment	10,000
	Identifiable intangible assets	3,300
	Financial liabilities	(4,000)
	Contingent liability	(1,000)
	Total identifiable net assets	12,800
B64(o)(i)	**Non-controlling interest in TC**	(3,300)
	Goodwill	2,500
		12,000

 © IASCF

B64(f)(iv) The fair value of the 100,000 ordinary shares issued as part of the consideration paid for TC (CU4,000) was determined on the basis of the closing market price of AC's ordinary shares on the acquisition date.

B64(f)(iii)
B64(g)
B67(b)

The contingent consideration arrangement requires AC to pay the former owners of TC 5 per cent of the revenues of XC, an unconsolidated equity investment owned by TC, in excess of CU7,500 for 20X3, up to a maximum amount of CU2,500 (undiscounted).

The potential undiscounted amount of all future payments that AC could be required to make under the contingent consideration arrangement is between CU0 and CU2,500.

The fair value of the contingent consideration arrangement of CU1,000 was estimated by applying the income approach. The fair value estimates are based on an assumed discount rate range of 20–25 per cent and assumed probability-adjusted revenues in XC of CU10,000–20,000.

As of 31 December 20X2, neither the amount recognised for the contingent consideration arrangement, nor the range of outcomes or the assumptions used to develop the estimates had changed.

B64(h) The fair value of the financial assets acquired includes receivables under finance leases of data networking equipment with a fair value of CU2,375. The gross amount due under the contracts is CU3,100, of which CU450 is expected to be uncollectible.

B67(a) The fair value of the acquired identifiable intangible assets of CU3,300 is provisional pending receipt of the final valuations for those assets.

B64(j)
B67(c)
IAS 37.84, 85

A contingent liability of CU1,000 has been recognised for expected warranty claims on products sold by TC during the last three years. We expect that the majority of this expenditure will be incurred in 20X3 and that all will be incurred by the end of 20X4. The potential undiscounted amount of all future payments that AC could be required to make under the warranty arrangements is estimated to be between CU500 and CU1,500.
As of 31 December 20X2, there has been no change since 30 June 20X2 in the amount recognised for the liability or any change in the range of outcomes or assumptions used to develop the estimates.

B64(o) The fair value of the non-controlling interest in TC, an unlisted company, was estimated by applying a market approach and an income approach. The fair value estimates are based on:

(a) an assumed discount rate range of 20–25 per cent;

(b) an assumed terminal value based on a range of terminal EBITDA multiples between 3 and 5 times (or, if appropriate, based on long-term sustainable growth rates ranging from 3 to 6 per cent);

(c) assumed financial multiples of companies deemed to be similar to TC; and

(d) assumed adjustments because of the lack of control or lack of marketability that market participants would consider when estimating the fair value of the non-controlling interest in TC.

© IASCF

B64(p)(ii)	AC recognised a gain of CU500 as a result of measuring at fair value its 15 per cent equity interest in TC held before the business combination. The gain is included in other income in AC's statement of comprehensive income for the year ending 31 December 20X2.
B64(q)(i)	The revenue included in the consolidated statement of comprehensive income since 30 June 20X2 contributed by TC was CU4,090. TC also contributed profit of CU1,710 over the same period.
B64(q)(ii)	Had TC been consolidated from 1 January 20X2 the consolidated statement of comprehensive income would have included revenue of CU27,670 and profit of CU12,870.

Appendix
Amendments to guidance on other IFRSs

The following amendments to guidance on other IFRSs are necessary in order to ensure consistency with IFRS 3 (as revised in 2008) and the related amendments to other IFRSs. In the amended paragraphs, new text is underlined and deleted text is struck through.

* * * * *

The amendments contained in this appendix when IFRS 3 was issued in 2008 have been incorporated into the text of the Guidance on Implementing IFRS 5, Appendices A and B of IAS 12 and the Illustrative Examples of IAS 36, as issued at 10 January 2008.

© IASCF

Comparison of IFRS 3 (as revised in 2008) and SFAS 141(R)

1 IFRS 3 *Business Combinations* (as revised in 2008) and FASB Statement No. 141 (revised 2007) *Business Combinations* (SFAS 141(R)) are the result of the IASB's and the FASB's projects to improve the accounting for and reporting of business combinations. The first phase of those projects led to IFRS 3 (issued in 2004) and FASB Statement No. 141 (issued in 2001). In 2002, the IASB and the FASB agreed to reconsider jointly their guidance for applying the purchase method (now called the acquisition method) of accounting for business combinations. The objective of the joint effort was to develop a common and comprehensive standard for the accounting for business combinations that could be used for both domestic and international financial reporting. Although the boards reached the same conclusions on most of the issues addressed in the project, they reached different conclusions on a few matters.

2 On those matters on which the boards reached different conclusions, each board includes its own requirements in its version of the standard. The following table identifies and compares those paragraphs in which the IASB and the FASB have different requirements. The table does not identify non-substantive differences. For example, the table does not identify differences in terminology that do not change the meaning of the guidance, such as the IASB using the term *profit or loss* and the FASB using the term *earnings*.

3 Most of the differences identified in the table arise because of the boards' decision to provide guidance for accounting for business combinations that is consistent with other IFRSs or FASB standards. Many of those differences are being considered in current projects or are candidates for future convergence projects, which is why the boards allowed those differences to continue at this time.

Guidance	IFRS 3 (as revised in 2008)	SFAS 141(R)
Scope exception for not-for-profit organisations	IFRSs generally do not have scope limitations for not-for-profit activities in the private or public sector. Therefore, this scope exception is not necessary for the revised IFRS 3.	SFAS 141(R) does not apply to combinations of not-for-profit organisations or the acquisition of a for-profit business by a not-for-profit organisation. The FASB is developing guidance for the accounting for mergers and acquisitions by not-for-profit organisations in a separate project. [paragraph 2(d)]
Identifying the acquirer	The guidance on control in IAS 27 *Consolidated and Separate Financial Statements* is used to identify the acquirer. The revised IFRS 3 does not have guidance for primary beneficiaries because it does not have consolidation guidance equivalent to FASB Interpretation No. 46 (revised December 2003) *Consolidation of Variable Interest Entities* (FASB Interpretation 46(R)). [Appendix A and paragraph 7]	The guidance on *controlling financial interest* in ARB No. 51 *Consolidated Financial Statements* (ARB 51), as amended, is used to identify the acquirer, unless the acquirer is the primary beneficiary of a variable interest entity. The primary beneficiary of a variable interest entity is always the acquirer and the determination of which party is the primary beneficiary is made in accordance with FASB Interpretation 46(R), not based on the guidance in ARB 51 or paragraphs A11–A15 of SFAS 141(R). [paragraphs 3(b) and 9]
Definition of control	*Control* is defined as the power to govern the financial and operating policies of an entity so as to obtain benefits from its activities. [Appendix A]	*Control* has the meaning of *controlling financial interest* in paragraph 2 of ARB 51, as amended, and interpreted by FASB Interpretation 46(R). [paragraph 3(g)]

Guidance	IFRS 3 (as revised in 2008)	SFAS 141(R)
Definition of fair value	*Fair value* is defined as the amount for which an asset could be exchanged, or a liability settled, between knowledgeable, willing parties in an arm's length transaction. The IASB has a separate project in which it is considering the definition of fair value and related measurement guidance. [Appendix A]	*Fair value* is defined in paragraph 5 of FASB Statement No. 157 *Fair Value Measurements* as the price that would be received to sell an asset or paid to transfer a liability in an orderly transaction between market participants at the measurement date. [paragraph 3(i)]
Operating leases	The revised IFRS 3 requires the acquirer to take into account the terms of a lease in measuring the acquisition-date fair value of an asset that is subject to an operating lease in which the acquiree is the lessor. This is consistent with the guidance in IAS 40 *Investment Property*. Accordingly, the revised IFRS 3 does not require the acquirer of an operating lease in which the acquiree is the lessor to recognise a separate asset or liability if the terms of an operating lease are favourable or unfavourable compared with market terms as is required for leases in which the acquiree is the lessee. [paragraphs B29 and B42]	Regardless of whether the acquiree is the lessee or the lessor, SFAS 141(R) requires the acquirer to recognise an intangible asset if the terms of an operating lease are favourable relative to market terms or a liability if the terms are unfavourable relative to market terms. Accordingly, an acquirer measures the acquisition-date fair value of an asset that is subject to an operating lease in which the acquiree is the lessor separately from the lease contract. [paragraphs A17 and A58]
Non-controlling interest in an acquiree	**Initial recognition** The revised IFRS 3 permits an acquirer to measure the non-controlling interest in an acquiree either at fair value or as its proportionate share of the acquiree's identifiable net assets. [paragraph 19]	**Initial recognition** SFAS 141(R) requires the non-controlling interest in an acquiree to be measured at fair value. [paragraph 20]

 © IASCF

Guidance	IFRS 3 (as revised in 2008)	SFAS 141(R)
Non-controlling interest in an acquiree	**Disclosures** Because an acquirer is permitted to choose between two measurement bases for the non-controlling interest in an acquiree, the revised IFRS 3 requires an acquirer to disclose the measurement basis used. If the non-controlling interest is measured at fair value, the acquirer must disclose the valuation techniques and key model inputs used. [paragraph B64(o)]	**Disclosures** SFAS 141(R) requires an acquirer to disclose the valuation technique(s) and significant inputs used to measure fair value. [paragraph 68(p)]
Assets and liabilities arising from contingencies	**Initial recognition** The revised IFRS 3 requires the acquirer to recognise a contingent liability assumed in a business combination if it is a present obligation that arises from past events and its fair value can be measured reliably. [paragraphs 22 and 23]	**Initial recognition** SFAS 141(R) requires the acquirer to recognise as of the acquisition date the assets acquired and liabilities assumed that arise from *contractual contingencies*, measured at their acquisition-date fair values. For all other contingencies (referred to as *non-contractual contingencies*), the acquirer recognises an asset or liability as of the acquisition date if it is **more likely than not** that the contingency gives rise to an asset or a liability as defined in FASB Concepts Statement No. 6 *Elements of Financial Statements*. Non-contractual contingencies that do not meet the recognition threshold as of the acquisition date are accounted for in accordance with other GAAP, including FASB Statement No. 5 *Accounting for Contingencies* (SFAS 5) as appropriate. [paragraphs 23–25]

Guidance	IFRS 3 (as revised in 2008)	SFAS 141(R)
Assets and liabilities arising from contingencies	**Subsequent measurement** The revised IFRS 3 carries forward the existing requirements that a contingent liability recognised in a business combination must be measured subsequently at the higher of the amount that would be recognised in accordance with IAS 37 *Provisions, Contingent Liabilities and Contingent Assets* or the amount initially recognised less, if appropriate, cumulative amortisation recognised in accordance with IAS 18 *Revenue*. [paragraph 56]	**Subsequent measurement** SFAS 141(R) requires an acquirer to continue to report an asset or liability arising from a contractual or non-contractual contingency that is recognised as of the acquisition date that would be in the scope of SFAS 5 if not acquired or assumed in a business combination at its acquisition-date fair value until the acquirer obtains new information about the possible outcome of the contingency. The acquirer evaluates that new information and measures the asset or liability as follows: (a) a liability is measured at the *higher* of: (i) its acquisition-date fair value; or (ii) the amount that would be recognised if applying SFAS 5. (b) an asset is measured at the *lower* of: (i) its acquisition-date fair value; or (ii) the best estimate of its future settlement amount. [paragraphs 62 and 63]

 © IASCF

Guidance	IFRS 3 (as revised in 2008)	SFAS 141(R)
Assets and liabilities arising from contingencies	**Disclosures** SFAS 141(R)'s disclosures related to assets and liabilities arising from contingencies are slightly different from those required by the revised IFRS 3 because the IASB's disclosures are based on the requirements in IAS 37. [the revised IFRS 3, paragraphs B64(j) and B67(c); SFAS 141(R), paragraphs 68(j) and 72(c)] **Application guidance** SFAS 141(R) provides application guidance for applying the more-likely-than-not criterion for recognising non-contractual contingencies. The revised IFRS 3 does not have equivalent guidance. [SFAS 141(R), paragraphs A62–A65]	
Assets and liabilities for which the acquirer applies other IFRSs or US GAAP rather than the recognition and measurement principles	The revised IFRS 3 and SFAS 141(R) provide exceptions to the recognition and measurement principles for particular assets and liabilities that the acquirer accounts for in accordance with other IFRSs or US GAAP. For example, income taxes and employee benefit arrangements are accounted for in accordance with existing IFRSs or US GAAP. Differences in the existing guidance might result in differences in the amounts recognised in a business combination. For example, differences between the recognition and measurement guidance in IAS 12 *Income Taxes* and FASB Statement No. 109 *Accounting for Income Taxes* (SFAS 109) might result in differences in the amounts recognised in a business combination related to income taxes. [the revised IFRS 3, paragraphs 24–26; SFAS 141(R), paragraphs 26–28]	
Replacement share-based payment awards	The revised IFRS 3 requires an acquirer to account for share-based payment awards that it exchanges for awards held by employees of the acquiree in accordance with IFRS 2 *Share-based Payment* and SFAS 141(R) requires the acquirer to account for those awards in accordance with FASB Statement No. 123 (revised 2004) *Share-Based Payment* (SFAS 123(R)). Differences between IFRS 2 and SFAS 123(R) might cause differences in the accounting for share-based payment awards entered into as part of the business combination. In addition, the implementation guidance differs because of the different requirements in IFRS 2 and SFAS 123(R). [the revised IFRS 3, paragraphs 30 and B56–B62; SFAS 141(R), paragraphs 32, 43–46 and A91–A106]	

<table>
<tr><th>Guidance</th><th>IFRS 3 (as revised in 2008)</th><th>SFAS 141(R)</th></tr>
<tr><td rowspan="2">Contingent consideration</td><td colspan="2">Initial classification

The revised IFRS 3 and SFAS 141(R) require an acquirer to classify contingent consideration as an asset, a liability or equity on the basis of other IFRSs or US GAAP, respectively. Differences between the related IFRSs and US GAAP might cause differences in the initial classification and, therefore, might cause differences in the subsequent accounting.
[the revised IFRS 3, paragraph 40; SFAS 141(R), paragraph 42]</td></tr>
<tr><td>Subsequent measurement

Contingent consideration classified as an asset or liability that:

(a) is a financial instrument and is within the scope of IAS 39 Financial Instruments: Recognition and Measurement is measured at fair value, with any resulting gain or loss recognised either in profit or loss or in other comprehensive income in accordance with that IFRS.

(b) is not within the scope of IAS 39 is accounted for in accordance with IAS 37 or other IFRSs as appropriate.
[paragraph 58]</td><td>Subsequent measurement

Contingent consideration classified as an asset or liability is measured subsequently at fair value. The changes in fair value are recognised in earnings unless the contingent consideration is a hedging instrument for which FASB Statement No. 133 Accounting for Derivative Instruments and Hedging Activities requires the subsequent changes to be recognised in other comprehensive income.
[paragraph 65]</td></tr>
<tr><td>Subsequent measurement and accounting for assets, liabilities or equity instruments</td><td colspan="2">In general, after a business combination an acquirer measures and accounts for assets acquired, liabilities assumed or incurred and equity instruments issued in accordance with other applicable IFRSs or US GAAP, depending on their nature. Differences in the other applicable guidance might cause differences in the subsequent measurement and accounting for those assets, liabilities and equity instruments.
[the revised IFRS 3, paragraphs 54 and B63; SFAS 141(R), paragraphs 60 and 66]</td></tr>

Guidance	IFRS 3 (as revised in 2008)	SFAS 141(R)
Goodwill by reportable segment	The disclosure of goodwill by reportable segment is not required by the revised IFRS 3. Paragraph 134 of IAS 36 *Impairment of Assets* requires an entity to disclose the aggregate carrying amount of goodwill allocated to each cash-generating unit (group of units) for which the carrying amount of goodwill allocated to that unit (group of units) is significant in comparison with the entity's total carrying amount of goodwill. This information is not required to be disclosed for each material business combination that occurs during the period or in the aggregate for individually immaterial business combinations that are material collectively and occur during the period.	SFAS 141(R) requires the acquirer to disclose **for each business combination that occurs during the period or in the aggregate for individually immaterial business combinations that are material collectively and that occur during the period,** the amount of goodwill by reportable segment, if the combined entity is required to disclose segment information in accordance with FASB Statement No. 131 *Disclosures about Segments of an Enterprise and Related Information* (SFAS 131) unless such disclosure is impracticable. Like IAS 36, paragraph 45 of FASB Statement No. 142 *Goodwill and Other Intangible Assets* (SFAS 142) requires disclosure of this information in the aggregate by each reportable segment, not for each material business combination that occurs during the period or in the aggregate for individually immaterial business combinations that are material collectively and occur during the period. [paragraph 68(l)]

Guidance	IFRS 3 (as revised in 2008)	SFAS 141(R)
Pro forma disclosures	The disclosures required by this paragraph apply to all acquirers. The revised IFRS 3 does not require the disclosure of *revenue and profit or loss* of the combined entity for the comparable prior period even if comparative financial statements are presented. [paragraph B64(q)]	The disclosures required by this paragraph apply only to acquirers that are *public business enterprises*, as described in paragraph 9 of SFAS 131. If comparative financial statements are presented, SFAS 141(R) requires disclosure of *revenue and earnings* of the combined entity for the comparable prior reporting period as though the acquisition date for all business combinations that occurred during the current year had occurred as of the beginning of the comparable prior annual reporting period (*supplemental pro forma* information). [paragraph 68(r)]
Goodwill reconciliation	The revised IFRS 3 requires an acquirer to provide a goodwill reconciliation and provides a detailed list of items that should be shown separately. [paragraph B67(d)]	SFAS 141(R) requires an acquirer to provide a goodwill reconciliation in accordance with the requirements of SFAS 142. SFAS 141(R) amends the requirement in SFAS 142 to align the level of detail in the reconciliation with that required by the IASB. As a result, there is no substantive difference between the FASB's and the IASB's requirements; however, the guidance is contained in different standards. [paragraph 72(d)]

 © IASCF

Guidance	IFRS 3 (as revised in 2008)	SFAS 141(R)
Disclosures of the financial effects of adjustments to the amounts recognised in a business combination	The revised IFRS 3 requires the acquirer to disclose the amount and an explanation of any gain or loss recognised in the current period that (a) relates to the identifiable assets acquired or liabilities assumed in a business combination that was effected in the current or previous reporting period and (b) is of such a size, nature or incidence that disclosure is relevant to understanding the combined entity's financial statements. [paragraph B67(e)]	SFAS 141(R) does not require this disclosure.
Effective date	The revised IFRS 3 is required to be applied prospectively to business combinations for which the acquisition date is on or after the beginning of the first annual reporting period beginning on or after 1 July 2009. Early application is permitted. [paragraph 64]	SFAS 141(R) is required to be applied prospectively to business combinations for which the acquisition date is on or after the beginning of the first annual reporting period beginning on or after 15 December 2008. Early application is prohibited. [paragraph 74]
Income taxes	The revised IFRS 3 and SFAS 141(R) require the subsequent recognition of acquired deferred tax benefits in accordance with IAS 12 or SFAS 109, respectively. Differences between IAS 12 and SFAS 109 might cause differences in the subsequent recognition. Also, in accordance with US GAAP, the acquirer is required to recognise changes in the acquired income tax positions in accordance with FASB Interpretation No. 48 *Accounting for Uncertainty in Income Taxes*, as amended by SFAS 141(R). [the revised IFRS 3, paragraph 67; SFAS 141(R), paragraph 77]	

The revised IFRS 3 and SFAS 141(R) have also been structured to be consistent with the style of other IFRSs and FASB standards. As a result, the paragraph numbers of the revised standards are not the same, even though the wording in the paragraphs is consistent (except for the differences identified above). This table shows how the paragraph numbers of the revised standards correspond.

The main revisions made in 2008 were:

- The scope was broadened to cover business combinations involving only mutual entities and business combinations achieved by contract alone.
- The definitions of a *business* and a *business combination* were amended and additional guidance was added for identifying when a group of assets constitutes a business.
- For each business combination, the acquirer must measure any non-controlling interest in the acquiree either at fair value or as the non-controlling interest's proportionate share of the acquiree's net identifiable assets. Previously, only the latter was permitted.
- The requirements for how the acquirer makes any classifications, designations or assessments for the identifiable assets acquired and liabilities assumed in a business combination were clarified.
- The period during which changes to deferred tax benefits acquired in a business combination can be adjusted against goodwill has been limited to the measurement period (through a consequential amendment to IAS 12 *Income Taxes*).
- An acquirer is no longer permitted to recognise contingencies acquired in a business combination that do not meet the definition of a liability.
- Costs the acquirer incurs in connection with the business combination must be accounted for separately from the business combination, which usually means that they are recognised as expenses (rather than included in goodwill).
- Consideration transferred by the acquirer, including contingent consideration, must be measured and recognised at fair value at the acquisition date. Subsequent changes in the fair value of contingent consideration classified as liabilities are recognised in accordance with IAS 39, IAS 37 or other IFRSs, as appropriate (rather than by adjusting goodwill). The disclosures required to be made in relation to contingent consideration were enhanced.
- Application guidance was added in relation to when the acquirer is obliged to replace the acquiree's share-based payment awards; measuring indemnification assets; rights sold previously that are reacquired in a business combination; operating leases; and valuation allowances related to financial assets such as receivables and loans.
- For business combinations achieved in stages, having the acquisition date as the single measurement date was extended to include the measurement of goodwill. An acquirer must remeasure any equity interest it holds in the acquiree immediately before achieving control at its acquisition-date fair value and recognise the resulting gain or loss, if any, in profit or loss.

Approval by the Board of IFRS 4 issued in March 2004

International Financial Reporting Standard 4 *Insurance Contracts* was approved for issue by eight of the fourteen members of the International Accounting Standards Board. Professor Barth and Messrs Garnett, Gélard, Leisenring, Smith and Yamada dissented. Their dissenting opinions are set out after the Basis for Conclusions on IFRS 4.

DISSENTING OPINIONS

Basis for Conclusions on IFRS 4 *Insurance Contracts*

This Basis for Conclusions accompanies, but is not part of, IFRS 4.

Introduction

BC1 This Basis for Conclusions summarises the International Accounting Standards Board's considerations in reaching the conclusions in IFRS 4 *Insurance Contracts*. Individual Board members gave greater weight to some factors than to others.

Background

BC2 The Board decided to develop an International Financial Reporting Standard (IFRS) on insurance contracts because:

(a) there was no IFRS on insurance contracts, and insurance contracts were excluded from the scope of existing IFRSs that would otherwise have been relevant (eg IFRSs on provisions, financial instruments and intangible assets).

(b) accounting practices for insurance contracts were diverse, and also often differed from practices in other sectors.

BC3 The Board's predecessor organisation, the International Accounting Standards Committee (IASC), set up a Steering Committee in 1997 to carry out the initial work on this project. In December 1999, the Steering Committee published an *Issues Paper*, which attracted 138 comment letters. The Steering Committee reviewed the comment letters and concluded its work by developing a report to the Board in the form of a *Draft Statement of Principles* (DSOP). The Board started discussing the DSOP in November 2001. The Board did not approve the DSOP or invite formal comments on it, but made it available to the public on the IASB's Website.

BC4 Few insurers report using IFRSs at present, although many more are expected to do so from 2005. Because it was not feasible to complete this project for implementation in 2005, the Board split the project into two phases so that insurers could implement some aspects in 2005. The Board published its proposals for phase I in July 2003 as ED 5 *Insurance Contracts*. The deadline for comments was 31 October 2003 and the Board received 135 responses. After reviewing the responses, the Board issued IFRS 4 in March 2004.

BC5 The Board's objectives for phase I were:

(a) to make limited improvements to accounting practices for insurance contracts, without requiring major changes that may need to be reversed in phase II.

(b) to require disclosure that (i) identifies and explains the amounts in an insurer's financial statements arising from insurance contracts and (ii) helps users of those financial statements understand the amount, timing and uncertainty of future cash flows from insurance contracts.

 © IASCF

Tentative conclusions for phase II

BC6 The Board sees phase I as a stepping stone to phase II and is committed to completing phase II without delay once it has investigated all relevant conceptual and practical questions and completed its due process. In January 2003, the Board reached the following tentative conclusions for phase II:

(a) The approach should be an asset-and-liability approach that would require an entity to identify and measure directly the contractual rights and obligations arising from insurance contracts, rather than create deferrals of inflows and outflows.

(b) Assets and liabilities arising from insurance contracts should be measured at their fair value, with the following two caveats:

(i) Recognising the lack of market transactions, an entity may use entity-specific assumptions and information when market-based information is not available without undue cost and effort.

(ii) In the absence of market evidence to the contrary, the estimated fair value of an insurance liability shall not be less, but may be more, than the entity would charge to accept new contracts with identical contractual terms and remaining maturity from new policyholders. It follows that an insurer would not recognise a net gain at inception of an insurance contract, unless such market evidence is available.

(c) As implied by the definition of fair value:

(i) an undiscounted measure is inconsistent with fair value.

(ii) expectations about the performance of assets should not be incorporated into the measurement of an insurance contract, directly or indirectly (unless the amounts payable to a policyholder depend on the performance of specific assets).

(iii) the measurement of fair value should include an adjustment for the premium that marketplace participants would demand for risks and mark-up in addition to the expected cash flows.

(iv) fair value measurement of an insurance contract should reflect the credit characteristics of that contract, including the effect of policyholder protections and insurance provided by governmental bodies or other guarantors.

(d) The measurement of contractual rights and obligations associated with the closed book of insurance contracts should include future premiums specified in the contracts (and claims, benefits, expenses, and other additional cash flows resulting from those premiums) if, and only if:

(i) policyholders hold non-cancellable continuation or renewal rights that significantly constrain the insurer's ability to reprice the contract to rates that would apply for new policyholders whose characteristics are similar to those of the existing policyholders; and

(ii) those rights will lapse if the policyholders stop paying premiums.

(e) Acquisition costs should be recognised as an expense when incurred.

(f) The Board will consider two more questions later in phase II:

(i) Should the measurement model unbundle the individual elements of an insurance contract and measure them individually?

(ii) How should an insurer measure its liability to holders of participating contracts?

BC7 In two areas, those tentative conclusions differ from the IASC Steering Committee's recommendations in the DSOP:

(a) the use of a fair value measurement objective rather than entity-specific value. However, that change is not as significant as it might seem because entity-specific value as described in the DSOP is indistinguishable in most respects from estimates of fair value determined using measurement guidance that the Board has tentatively adopted in phase II of its project on business combinations.*

(b) the criteria used to determine whether measurement should reflect future premiums and related cash flows (paragraph BC6(d)).

BC8 Since January 2003, constraints on Board and staff resources have prevented the Board from continuing work to determine whether its tentative conclusions for phase II can be developed into a standard that is consistent with the IASB *Framework* and workable in practice. The Board intends to return to phase II of the project in the second quarter of 2004. It plans to focus at that time on both conceptual and practical issues, as in any project. Only after completing its deliberations will the Board proceed with an Exposure Draft of a proposed IFRS. The Board's deliberations in all projects include a consideration of alternatives and whether those alternatives represent conceptually superior approaches to financial reporting issues. Consequently, the Board will examine existing practices throughout the world to ascertain whether any could be deemed to be a superior answer suitable for international adoption.

BC9 As discussed in paragraph BC84, ED 5 proposed a 'sunset clause', which the Board deleted in finalising the IFRS. Although respondents generally opposed the sunset clause, many applauded the Board's signal of its commitment to complete phase II without delay.

Scope

BC10 Some argued that the IFRS should deal with all aspects of financial reporting by insurers, to ensure that the financial reporting for insurers is internally consistent. They noted that regulatory requirements, and some national accounting requirements, often cover all aspects of an insurer's business. However, for the following reasons, the IFRS deals with insurance contracts of all entities and does not address other aspects of accounting by insurers:

* The Board completed the second phase of its project on business combinations in 2008 by issuing a revised IFRS 3 *Business Combinations* and an amended version of IAS 27 *Consolidated and Separate Financial Statements*.

 © IASCF

(a) It would be difficult, and perhaps impossible, to create a robust definition of an insurer that could be applied consistently from country to country. Among other things, an increasing number of entities have major activities in both insurance and other areas.

(b) It would be undesirable for an insurer to account for a transaction in one way and for a non-insurer to account in a different way for the same transaction.

(c) The project should not reopen issues addressed by other IFRSs, unless specific features of insurance contracts justify a different treatment. Paragraphs BC166–BC180 discuss the treatment of assets backing insurance contracts.

Definition of insurance contract

BC11 The definition of an insurance contract determines which contracts are within the scope of IFRS 4 rather than other IFRSs. Some argued that phase I should use existing national definitions of insurance contracts, on the following grounds:

(a) Before phase II gives guidance on applying IAS 39 *Financial Instruments: Recognition and Measurement*[*] to difficult areas such as discretionary participation features and cancellation and renewal rights, it would be premature to require insurers to apply IAS 39 to contracts that contain these features and rights.

(b) The definition adopted for phase I may need to be amended again for phase II. This could compel insurers to make extensive changes twice in a short time.

BC12 However, in the Board's view, it is unsatisfactory to base the definition used in IFRSs on local definitions that may vary from country to country and may not be most relevant for deciding which IFRS ought to apply to a particular type of contract.

BC13 Some expressed concerns that the adoption of a particular definition by the IASB could lead ultimately to inappropriate changes in definitions used for other purposes, such as insurance law, insurance supervision or tax. The Board emphasises that any definition used in IFRSs is solely for financial reporting and is not intended to change or pre-empt definitions used for other purposes.

BC14 Various Standards issued by IASC used definitions or descriptions of insurance contracts to exclude insurance contracts from their scope. The scope of IAS 37 *Provisions, Contingent Liabilities and Contingent Assets* and of IAS 38 *Intangible Assets* excluded provisions, contingent liabilities, contingent assets and intangible assets that arise in insurance enterprises from contracts with policyholders. IASC used this wording when its insurance project had just started, to avoid prejudging whether the project would address insurance contracts or a broader class of contracts. Similarly, the scope of IAS 18 *Revenue* excluded revenue arising from insurance contracts of insurance enterprises.

[*] In November 2009 the IASB amended some of the requirements of IAS 39 and relocated them to IFRS 9 *Financial Instruments*. IFRS 9 applies to all assets within the scope of IAS 39. This paragraph discusses matters relevant when IFRS 4 was issued.

BC15 The following definition of insurance contracts was used to exclude insurance contracts from the scope of an earlier version of IAS 32 *Financial Instruments: Disclosure and Presentation* and IAS 39.

> An insurance contract is a contract that exposes the insurer to identified risks of loss from events or circumstances occurring or discovered within a specified period, including death (in the case of an annuity, the survival of the annuitant), sickness, disability, property damage, injury to others and business interruption.

BC16 This definition was supplemented by a statement that IAS 32 and IAS 39 did, nevertheless, apply when a financial instrument 'takes the form of an insurance contract but principally involves the transfer of financial risks.'

BC17 For the following reasons, the Board discarded the previous definition in IAS 32 and IAS 39:

(a) The definition gave a list of examples, but did not define the characteristics of the risks that it was intended to include.

(b) A clearer definition reduces the uncertainty about the meaning of the phrase 'principally involves the transfer of financial risks'. This will help insurers adopting IFRSs for the first-time ('first-time adopters') in 2005 and minimises the likelihood of further changes in classification for phase II. Furthermore, the previous test could have led to many contracts being classified as financial instruments even though they transfer significant insurance risk.

BC18 In developing a new definition, the Board also considered US GAAP. The main FASB statements for insurers deal with financial reporting by insurance entities and do not define insurance contracts explicitly. However, paragraph 1 of SFAS 113 *Accounting and Reporting for Reinsurance of Short-Duration and Long-Duration Contracts* states:

> Insurance provides indemnification against loss or liability from specified events and circumstances that may occur or be discovered during a specified period. In exchange for a payment from the policyholder (a premium), an insurance enterprise agrees to pay the policyholder if specified events occur or are discovered.

BC19 Paragraph 6 of SFAS 113 applies to any transaction, regardless of its form, that indemnifies an insurer against loss or liability relating to insurance risk. The glossary appended to SFAS 113 defines insurance risk as:

> The risk arising from uncertainties about both (a) the ultimate amount of net cash flows from premiums, commissions, claims, and claim settlement expenses paid under a contract (often referred to as underwriting risk) and (b) the timing of the receipt and payment of those cash flows (often referred to as timing risk). Actual or imputed investment returns are not an element of insurance risk. Insurance risk is fortuitous—the possibility of adverse events occurring is outside the control of the insured.

BC20 Having reviewed these definitions from US GAAP, the Board developed a new definition of insurance contract for the IFRS and expects to use the same definition for phase II. The following aspects of the definition are discussed below:

(a) insurance risk (paragraphs BC21–BC24);

(b) insurable interest (paragraphs BC25–BC29);

 © IASCF

(c) quantity of insurance risk (paragraphs BC30–BC37);

(d) expiry of insurance-contingent rights and obligations (paragraphs BC38 and BC39);

(e) unbundling (paragraphs BC40–BC54); and

(f) weather derivatives (paragraphs BC55–BC60).

Insurance risk

BC21 The definition of an insurance contract in the IFRS focuses on the feature that causes accounting problems unique to insurance contracts, namely insurance risk. The definition of insurance risk excludes financial risk, defined using a list of risks that also appears in IAS 39's definition of a derivative.

BC22 Some contracts have the legal form of insurance contracts but do not transfer significant insurance risk to the issuer. Some argue that all such contracts should be treated as insurance contracts, for the following reasons:

(a) These contracts are traditionally described as insurance contracts and are generally subject to regulation by insurance supervisors.

(b) Phase I will not achieve great comparability between insurers because it will permit a diverse range of treatments for insurance contracts. It would be preferable to ensure consistency at least within a single insurer.

(c) Accounting for some contracts under IAS 39[*] and others under local GAAP is unhelpful to users. Moreover, some argued that IAS 39 contains insufficient, and possibly inappropriate, guidance for investment contracts.[†]

(d) The guidance proposed in ED 5 on significant insurance risk was too vague, would be applied inconsistently and relied on actuarial resources in short supply in many countries.

BC23 However, as explained in the *Framework*, financial statements should reflect economic substance and not merely legal form. Furthermore, accounting arbitrage could occur if the addition of an insignificant amount of insurance risk made a significant difference to the accounting. Therefore, the Board decided that contracts described in the previous paragraph should not be treated as insurance contracts for financial reporting.

BC24 Some respondents suggested that an insurance contract is any contract under which the policyholder exchanges a fixed amount (ie the premium) for an amount payable if an insured event occurs. However, not all insurance contracts have explicit premiums (eg insurance cover bundled with some credit card contracts). Adding a reference to premiums would have introduced no more clarity and might have required more supporting guidance and explanations.

---

[*] In November 2009 the IASB amended some of the requirements of IAS 39 and relocated them to IFRS 9 *Financial Instruments*. IFRS 9 applies to all assets within the scope of IAS 39. This paragraph discusses matters relevant when IFRS 4 was issued.

[†] 'Investment contract' is an informal term referring to a contract issued by an insurer that does not expose the insurer to significant insurance risk and is therefore within the scope of IAS 39.

Insurable interest

BC25 In some countries, the legal definition of insurance requires that the policyholder or other beneficiary should have an insurable interest in the insured event. For the following reasons, the definition proposed in 1999 by the former IASC Steering Committee in the Issues Paper did not refer to insurable interest:

(a) Insurable interest is defined in different ways in different countries. Also, it is difficult to find a simple definition of insurable interest that is adequate for such different types of insurance as insurance against fire, term life insurance and annuities.

(b) Contracts that require payment if a specified uncertain future event occurs cause similar types of economic exposure, whether or not the other party has an insurable interest.

BC26 Because the definition proposed in the Issues Paper did not include a notion of insurable interest, it would have encompassed gambling. Several commentators on the Issues Paper stressed the important social, moral, legal and regulatory differences between insurance and gambling. They noted that policyholders buy insurance to reduce risk, whereas gamblers take on risk (unless they use a gambling contract as a hedge). In the light of these comments, the definition of an insurance contract in the IFRS incorporates the notion of insurable interest. Specifically, it refers to the fact that the insurer accepts risk from the policyholder by agreeing to compensate the policyholder if an uncertain event adversely affects the policyholder. The notion of insurable interest also appears in the definition of financial risk, which refers to a non-financial variable not specific to a party to the contract.

BC27 This reference to an adverse effect is open to the objections set out in paragraph BC25. However, without this reference, the definition of an insurance contract might have captured any prepaid contract to provide services whose cost is uncertain (see paragraphs BC74–BC76 for further discussion). This would have extended the meaning of the term ‘insurance contract’ too far beyond its traditional meaning.

BC28 Some respondents to ED 5 were opposed to including the notion of insurable interest, on the following grounds:

(a) In life insurance, there is no direct link between the adverse event and the financial loss to the policyholder. Moreover, it is not clear that survival adversely affects an annuitant. Any contract that is contingent on human life should meet the definition of insurance contract.

(b) This notion excludes some contracts that are, in substance, used as insurance, such as weather derivatives (see paragraphs BC55–BC60 for further discussion). The test should be whether there is a reasonable expectation of some indemnification to policyholders. A tradable contract could be brought within the scope of IAS 39.[*]

[*] In November 2009 the IASB amended some of the requirements of IAS 39 and relocated them to IFRS 9 *Financial Instruments*. IFRS 9 applies to all assets within the scope of IAS 39. This paragraph discusses matters relevant when IFRS 4 was issued.

© IASCF

(c) It would be preferable to eliminate the notion of insurable interest and replace it with the notion that insurance is a business that involves assembling risks into a pool that is managed together.

BC29 The Board decided to retain the notion of insurable interest because it gives a principle-based distinction, particularly between insurance contracts and other contracts that happen to be used for hedging. Furthermore, it is preferable to base a distinction on the type of contract, rather than the way an entity manages a contract or group of contracts. Moreover, the Board decided that it was unnecessary to refine this notion for a life insurance contract or life-contingent annuity, because such contracts typically provide for a predetermined amount to quantify the adverse effect (see paragraph B13 of the IFRS).

Quantity of insurance risk

BC30 Paragraphs B22–B28 of Appendix B of the IFRS discuss how much insurance risk must be present before a contract qualifies as an insurance contract. In developing this material, the Board noted the conditions in US GAAP for a contract to be treated as an insurance contract. SFAS 113 requires two conditions for a contract to be eligible for reinsurance accounting, rather than deposit accounting:

(a) the contract transfers significant insurance risk from the cedant to the reinsurer (which does not occur if the probability of a significant variation in either the amount or timing of payments by the reinsurer is remote); and

(b) either:

   (i) there is a reasonable possibility that the reinsurer will suffer a significant loss (based on the present value of all cash flows between the ceding and assuming enterprises under reasonably possible outcomes); or

   (ii) the reinsurer has assumed substantially all of the insurance risk relating to the reinsured portions of the underlying insurance contracts (and the cedant has retained only insignificant insurance risk on the reinsured portions).

BC31 Under paragraph 8 of SFAS 97 *Accounting and Reporting by Insurance Enterprises for Certain Long-Duration Contracts and for Realized Gains and Losses from the Sale of Investments*, an annuity contract is considered an insurance contract unless (a) the probability that life contingent payments will be made is remote[*] or (b) the present value of the expected life-contingent payments relative to the present value of all expected payments under the contract is insignificant.

[*] Paragraph 8 of SFAS 97 notes that the term remote is defined in paragraph 3 of SFAS 5 *Accounting for Contingencies* as 'the chance of the future event or events occurring is slight.'

BC32 The Board noted that some practitioners use the following guideline in applying US GAAP: a reasonable possibility of a significant loss is a 10 per cent probability of a 10 per cent loss. In this light, the Board considered whether it should define the amount of insurance risk in quantitative terms in relation to, for example:

(a) the probability that payments under the contract will exceed the expected (ie probability-weighted average) level of payments; or

(b) a measure of the range of outcomes, such as the range between the highest and lowest level of payments or the standard deviation of payments.

BC33 Quantitative guidance creates an arbitrary dividing line that results in different accounting treatments for similar transactions that fall marginally on different sides of the line. It also creates opportunities for accounting arbitrage by encouraging transactions that fall marginally on one side or the other of the line. For these reasons, the IFRS does not include quantitative guidance.

BC34 The Board also considered whether it should define the significance of insurance risk by referring to materiality, which the *Framework* describes as follows. 'Information is material if its omission or misstatement could influence the economic decisions of users taken on the basis of the financial statements.' However, a single contract, or even a single book of similar contracts, could rarely generate a loss that is material in relation to the financial statements as a whole. Therefore, the IFRS defines the significance of insurance risk in relation to the individual contract (paragraph B25). The Board had two reasons for this:

(a) Although insurers manage contracts on a portfolio basis, and often measure them on that basis, the contractual rights and obligations arise from individual contracts.

(b) An assessment contract by contract is likely to increase the proportion of contracts that qualify as insurance contracts. If a relatively homogeneous book of contracts is known to consist of contracts that all transfer insurance risk, the Board did not intend to require insurers to examine each contract within that book to identify a few non-derivative contracts that transfer insignificant insurance risk (paragraph B25 of the IFRS). The Board intended to make it easier, not harder, for a contract to meet the definition.

BC35 The Board also rejected the notion of defining the significance of insurance risk by expressing the expected (ie probability-weighted) average of the present values of the adverse outcomes as a proportion of the expected present value of all outcomes, or as a proportion of the premium. This notion had some intuitive appeal because it would consider both amount and probability. However, it would have meant that a contract could start as an investment contract (ie a financial liability) and become an insurance contract as time passes or probabilities are reassessed. In the Board's view, requiring continuous monitoring over the life of the contract would be too onerous. Instead, the Board adopted an approach that requires this decision to be made once only, at the inception of a contract. The guidance in paragraphs B22–B28 of the IFRS focuses on whether insured events could cause an insurer to pay additional amounts, judged contract by contract.

 © IASCF

BC36 Some respondents objected to ED 5's proposal that insurance risk would be significant if a single plausible event could cause a loss that is more than trivial. They suggested that such a broad notion of significant insurance risk might permit abuse. Instead, they suggested referring to a reasonable possibility of a significant loss. However, the Board rejected this suggestion because it would have required insurers to monitor the level of insurance risk continually, which could have given rise to frequent reclassifications. It might also have been too difficult to apply this notion to remote catastrophic scenarios; indeed, some respondents asked the Board to clarify whether the assessment should include such scenarios. In finalising the IFRS, the Board clarified the terminology by (a) replacing the notion of a plausible scenario with an explanation of the need to ignore scenarios that have no commercial substance and (b) replacing the term 'trivial' with the term 'insignificant'.

BC37 Some respondents asked the Board to clarify the basis of comparison for the significance test, because of uncertainty about the meaning of the phrase 'net cash flows arising from the contract' in ED 5. Some suggested that this would require a comparison with the profit that the issuer expects from the contract. However, the Board had not intended this reading, which would have led to the absurd conclusion that any contract with a profitability of close to zero might qualify as an insurance contract. In finalising the IFRS, the Board confirmed in paragraphs B22–B28 that:

(a) the comparison is between the amounts payable if an insured event occurs and the amounts payable if no insured event occurs. Implementation Guidance in IG Example 1.3 addresses a contract in which the death benefit in a unit-linked contract is 101 per cent of the unit value.

(b) surrender charges that might be waived on death are not relevant in assessing how much insurance risk a contract transfers because their waiver does not compensate the policyholder for a pre-existing risk. Implementation Guidance in IG Examples 1.23 and 1.24 is relevant.

Expiry of insurance-contingent rights and obligations

BC38 Some respondents suggested that a contract should no longer be treated as an insurance contract after all insurance-contingent rights and obligations have expired. However, this suggestion could have required insurers to set up new systems to identify these contracts. Therefore, paragraph B30 states that an insurance contract remains an insurance contract until all rights and obligations expire. IG Example 2.19 in the Implementation Guidance addresses dual-trigger contracts.

BC39 Some respondents suggested that a contract should not be regarded as an insurance contract if the insurance-contingent rights and obligations expire after a very short time. The IFRS includes material that may be relevant: paragraph B23 explains the need to ignore scenarios that lack commercial substance and paragraph B24(b) notes that there is no significant transfer of pre-existing risk in some contracts that waive surrender penalties on death.

Unbundling

BC40 The definition of an insurance contact distinguishes insurance contracts within the scope of the IFRS from investments and deposits within the scope of IAS 39.[*] However, many insurance contracts contain a significant deposit component (ie a component that would, if it were a separate instrument, be within the scope of IAS 39).[*] Indeed, virtually all insurance contracts have an implicit or explicit deposit component, because the policyholder is generally required to pay premiums before the period of risk; therefore, the time value of money is likely to be one factor that insurers consider in pricing contracts.

BC41 To reduce the need for guidance on the definition of an insurance contract, some argue that an insurer should 'unbundle' the deposit component from the insurance component. Unbundling has the following consequences:

(a) The insurance component is measured as an insurance contract.

(b) The deposit component is measured under IAS 39[*] at either amortised cost or fair value. This might not be consistent with the basis used for insurance contracts.

(c) Premium receipts for the deposit component are recognised not as revenue, but rather as changes in the deposit liability. Premium receipts for the insurance element are typically recognised as revenue.

(d) A portion of the transaction costs incurred at inception is allocated to the deposit component if this allocation has a material effect.

BC42 Supporters of unbundling deposit components argue that:

(a) an entity should account in the same way for the deposit component of an insurance contract as for an otherwise identical financial instrument that does not transfer significant insurance risk.

(b) the tendency in some countries for banks to own insurers (and vice versa) and the similarity of products offered by the insurance and fund management sectors suggest that insurers, banks and fund managers should account for the deposit component in a similar manner.

(c) many groups sell products ranging from pure investments to pure insurance, with all variations in between. Unbundling would avoid sharp discontinuities in the accounting between a product that transfers just enough insurance risk to be an insurance contract, and another product that falls marginally on the other side of the line.

(d) financial statements should make a clear distinction between premium revenue derived from products that transfer significant insurance risk and premium receipts that are, in substance, investment or deposit receipts.

[*] In November 2009 the IASB amended some of the requirements of IAS 39 and relocated them to IFRS 9 *Financial Instruments*. IFRS 9 applies to all assets within the scope of IAS 39. This paragraph discusses matters relevant when IFRS 4 was issued.

BC43 The Issues Paper published in 1999 proposed that the deposit component should be unbundled if it is either disclosed explicitly to the policyholder or clearly identifiable from the terms of the contract. However, commentators on the Issues Paper generally opposed unbundling, giving the following reasons:

(a) The components are closely interrelated and the value of the bundled product is not necessarily equal to the sum of the individual values of the components.

(b) Unbundling would require significant and costly systems changes.

(c) Contracts of this kind are a single product, regulated as insurance business by insurance supervisors and should be treated in a similar way for financial reporting.

(d) Some users of financial statements would prefer that either all products are unbundled or no products are unbundled, because they regard information about gross premium inflows as important. A consistent use of a single measurement basis might be more useful as an aid to economic decisions than mixing one measurement basis for the deposit component with another measurement basis for the insurance component.

BC44 In the light of these arguments, the DSOP proposed that an insurer or policyholder should not unbundle these components. However, that was against the background of an assumption that the treatments of the two components would be reasonably similar. This may not be the case in phase I, because phase I permits a wide range of accounting treatments for insurance components. Nevertheless, the Board did not wish to require costly changes in phase I that might be reversed in phase II. Therefore, the Board decided to require unbundling only when it is easiest to perform and the effect is likely to be greatest (paragraphs 10–12 of the IFRS and IG Example 3 in the Implementation Guidance).

BC45 The Board acknowledges that there is no clear conceptual line between the cases when unbundling is required and the cases when unbundling is not required. At one extreme, the Board regards unbundling as appropriate for large customised contracts, such as some financial reinsurance contracts, if a failure to unbundle them could lead to the complete omission from the balance sheet of material contractual rights and obligations. This may be especially important if a contract was deliberately structured to achieve a specific accounting result. Furthermore, the practical problems cited in paragraph BC43 are much less significant for these contracts.

BC46 At the other extreme, unbundling the surrender values in a large portfolio of traditional life insurance contracts would require significant systems changes beyond the intended scope of phase I. Furthermore, failing to unbundle these contracts would affect the measurement of these liabilities, but not lead to their complete omission from the insurer's balance sheet. In addition, a desire to achieve a particular accounting result is much less likely to influence the precise structure of these transactions.

© IASCF

BC47 The option for the policyholder to surrender a traditional life insurance contract at an amount that differs significantly from its carrying amount is an embedded derivative and IAS 39* would require the insurer to separate it and measure it at fair value. That treatment would have the same disadvantages, described in the previous paragraph, as unbundling the surrender value. Therefore, paragraph 8 of the IFRS exempts an insurer from applying this requirement to some surrender options embedded in insurance contracts. However, the Board saw no conceptual or practical reason to create such an exemption for surrender options in non-insurance financial instruments issued by insurers or by others.

BC48 Some respondents opposed unbundling in phase I on the following grounds, in addition to the reasons given in paragraph BC43:

(a) Insurance contracts are, in general, designed, priced and managed as packages of benefits. Furthermore, the insurer cannot unilaterally terminate the agreement or sell parts of it. In consequence, any unbundling required solely for accounting would be artificial. Insurance contracts should not be unbundled unless the structure of the contract is clearly artificial.

(b) Unbundling may require extensive systems changes that would increase the administrative burden for 2005 and not be needed for phase II.

(c) There would be no need to require unbundling if the Board strengthened the liability adequacy test, defined significant insurance risk more narrowly and confirmed that contracts combined artificially are separate contracts.

(d) The unbundling conditions in ED 5 were vague and did not explain the underlying principle.

(e) Because ED 5 did not propose recognition criteria, insurers would use local GAAP to judge whether assets and liabilities were omitted. This would defeat the stated reason for unbundling.

(f) If a contract is unbundled, the premium for the deposit component is recognised not as premium revenue but as a balance sheet movement (ie as a deposit receipt). Requiring this would be premature before the Board completes its project on reporting comprehensive income.

BC49 Some suggested other criteria for unbundling:

(a) All contracts should be unbundled, or unbundling should always be permitted at least. Unbundling is required in Australia and New Zealand.

(b) All non-insurance components (for example, service components) should be unbundled, not only deposit components.

* IFRS 9 *Financial Instruments*, issued in November 2009, amended the requirements in IAS 39 to identify and separately account for derivatives embedded in a financial host within the scope of IFRS 9. The requirements in IAS 39 continue to apply for derivatives embedded in non-financial hosts and financial hosts outside the scope of IFRS 9. This Basis for Conclusions has not been updated for changes in requirements since IFRIC 9 *Reassessment of Embedded Derivatives* was issued in March 2006.

 © IASCF

(c) Unbundling should be required only when the components are completely separable, or when there is an account in the name of the policyholder.

(d) Unbundling could affect the presentation of revenue more than it affects liability recognition. Therefore, unbundling should also be required if it would have a significant effect on reported revenue and is easy to perform.

BC50 Some respondents argued that the test for unbundling should be two-sided (ie the cash flows of the insurance component and the investment component do not interact) rather than the one-sided test proposed in ED 5 (ie the cash flows from the insurance component do not affect the cash flows from the deposit component). Here is an example where this might make a difference: in some life insurance contracts, the death benefit is the difference between (a) a fixed amount and (b) the value of a deposit component (for example, a unit-linked investment). The deposit component can be measured independently, but the death benefit depends on the unit value so the insurance component cannot be measured independently.

BC51 The Board decided that phase I should not require insurers to set up systems to unbundle the products described in the previous paragraph. However, the Board decided to rely on the condition that provides an exemption from unbundling if all the rights and obligations under the deposit component are recognised. If this condition is not met, unbundling is appropriate.

BC52 Some argued that it is irrelevant whether the insurance component affects the deposit component. They suggested that a deposit component exists if the policyholder will receive a minimum fixed amount of future cash flows in the form of either a return of premium (if no insured event occurs) or an insurance recovery (if an insured event occurs). However, the Board noted that this focus on a single cash flow would not result in unbundling if a financial instrument and an insurance contract are combined artificially into a single contract and the cash flows from one component offset cash flows from the other component. The Board regarded that result as inappropriate and open to abuse.

BC53 In summary, the Board retained the approach broadly as in ED 5. This requires unbundling if that is needed to ensure the recognition of rights and obligations arising from the deposit component and those rights and obligations can be measured separately. If only the second of these conditions is met, the IFRS permits unbundling, but does not require it.

BC54 Some respondents suggested that if a contract has been artificially separated through the use of side letters, the separate components of the contract should be considered together. The Board did not address this because it is a wider issue for the Board's possible future work on linkage (ie accounting for separate transactions that are connected in some way). The footnote to paragraph B25 refers to simultaneous contracts with the same counterparty.

Weather derivatives

BC55 The scope of IAS 39[*] previously excluded contracts that require a payment based on climatic, geological, or other physical variables (if based on climatic variables, sometimes described as weather derivatives). It is convenient to divide these contracts into two categories:

(a) contracts that require a payment only if a particular level of the underlying climatic, geological, or other physical variables adversely affects the contract holder. These are insurance contracts as defined in the IFRS.

(b) contracts that require a payment based on a specified level of the underlying variable regardless of whether there is an adverse effect on the contract holder. These are derivatives and the IFRS removes a previous scope exclusion to bring them within the scope of IAS 39.[*]

BC56 The previous scope exclusion was created mainly because the holder might use such a derivative in a way that resembles the use of an insurance contract. However, the definition of an insurance contract in the IFRS now provides a principled basis for deciding which of these contracts are treated as insurance contracts and which are treated as derivatives. Therefore, the Board removed the scope exclusion from IAS 39 (see paragraph C3 of Appendix C of the IFRS). Such contracts are within the scope of the IFRS if payment is contingent on changes in a physical variable that is specific to a party to the contract, and within the scope of IAS 39 in all other cases.

BC57 Some respondents suggested that a weather derivative should be treated as:

(a) an insurance contract if it is expected to be highly effective in mitigating an existing risk exposure.

(b) a derivative financial instrument otherwise.

BC58 Some argued that some weather derivatives are, in substance, insurance contracts. For example, under some contracts, the policyholder can claim a fixed sum based on rainfall levels at the nearest weather station. The contract was purchased to provide insurance against low rainfall but was structured like this because of difficulties in measuring actual loss suffered and because of the moral hazard of having a rainfall gauge on the policyholder's property. It can reasonably be expected that the rainfall at the nearest weather station will affect the holder, but the physical variable specified in the contract (ie rainfall) is not specific to a party to the contract. Similarly, some insurers use weather derivatives as a hedge against insurance contracts they issue and view them as similar to reinsurance.

BC59 Some suggested that weather derivatives should be excluded from the scope of the IFRS because they are tradable instruments that behave like other derivatives and have an observable market value, rather than because there is no contractual link between the holder and the event that triggers payment.

---

[*] In November 2009 the IASB amended some of the requirements of IAS 39 and relocated them to IFRS 9 *Financial Instruments*. IFRS 9 applies to all assets within the scope of IAS 39. This paragraph discusses matters relevant when IFRS 4 was issued.

 © IASCF

BC60 The IFRS distinguishes an insurance contract (in which an adverse effect on the policyholder is a contractual precondition for payment) from other instruments, such as derivatives and weather derivatives (in which an adverse effect is not a contractual precondition for payment, although the counterparty may, in fact, use the instrument to hedge an existing exposure). In the Board's view, this is an important and useful distinction. It is much easier to base a classification on the terms of the contract than on an assessment of the counterparty's motive (ie hedging or trading). Consequently, the Board made no change to ED 5's proposals for the treatment of weather derivatives.

Scope exclusions

BC61 The scope of the IFRS excludes various items that may meet the definition of insurance contracts, but are, or will be, covered by existing or proposed future IFRSs (paragraph 4). The following paragraphs discuss:

(a) financial guarantees and insurance against credit risk (paragraphs BC62–BC68);

(b) product warranties (paragraphs BC69–BC72);

(c) accounting by policyholders (paragraph BC73); and

(d) prepaid service contracts (paragraphs BC74–BC76).

Financial guarantees and insurance against credit risk

BC62 The Basis for Conclusions on IAS 39 explains the reasons for the Board's conclusions on financial guarantee contracts.

BC63–BC68 [Deleted]

Product warranties

BC69 A product warranty clearly meets the definition of an insurance contract if an entity issues it on behalf of another party (such as a manufacturer, dealer or retailer). The scope of the IFRS includes such warranties.

BC70 A product warranty issued directly by a manufacturer, dealer or retailer also meets the definition of an insurance contract. Although some might think of this as 'self-insurance', the risk retained arises from existing contractual obligations towards the customer. Some may reason that the definition of insurance contracts should exclude such direct warranties because they do not involve a transfer of risk from buyer to seller, but rather a crystallisation of an existing responsibility. However, in the Board's view, excluding these warranties from the definition of insurance contracts would complicate the definition for only marginal benefit.

BC71 Although such direct warranties create economic exposures similar to warranties issued on behalf of the manufacturer, dealer or retailer by another party (ie the insurer), the scope of the IFRS excludes them because they are closely related to the underlying sale of goods and because IAS 37 addresses product warranties. IAS 18 deals with the revenue received for such warranties.

BC72 In a separate project, the Board is exploring an asset and liability approach to revenue recognition. If this approach is implemented, the accounting model for these direct product warranties may change.

Accounting by policyholders

BC73 The IFRS does not address accounting and disclosure by policyholders for direct insurance contracts because the Board does not regard this as a high priority for phase I. The Board intends to address accounting by policyholders in phase II (see IASB *Update* February 2002 for the Board's discussion of accounting by policyholders). IFRSs address some aspects of accounting by policyholders for insurance contracts:

(a) IAS 37 addresses accounting for reimbursements from insurers for expenditure required to settle a provision.

(b) IAS 16 addresses some aspects of compensation from third parties for property, plant and equipment that was impaired, lost or given up.

(c) Because policyholder accounting is outside the scope of the IFRS, the hierarchy of criteria in paragraphs 10–12 of IAS 8 *Accounting Policies, Changes in Accounting Estimates and Errors* applies to policyholder accounting (see paragraphs BC77–BC86).

(d) A policyholder's rights and obligations under insurance contracts are outside the scope of IAS 32 and IAS 39.[*]

Prepaid service contracts

BC74 Some respondents noted that the definition proposed in ED 5 captured some prepaid contracts to provide services whose cost is uncertain. Because these contracts are not normally regarded as insurance contracts, these respondents suggested that the Board should change the definition or exclude these contracts from the scope of the IFRS. Respondents cited two specific examples.

(a) Fixed fee service contracts if the level of service depends on an uncertain event, for example maintenance contracts if the service provider agrees to repair specified equipment after a malfunction. The fixed service fee is based on the expected number of malfunctions, although it is uncertain that the machines will actually break down. The malfunction of the equipment adversely affects its owner and the contract compensates the owner (in kind, rather than cash).

(b) Some car breakdown assistance if (i) each breakdown has little incremental cost because employed patrols provide most of the assistance, (ii) the motorist pays for all parts and repairs, (iii) the service provider's only responsibility is to take the car to a specified destination (eg the nearest garage, home or the original destination), (iv) the need to provide assistance (and the related cost) is known within hours and (v) the number of call-outs is limited.

[*] In November 2009 the IASB amended some of the requirements of IAS 39 and relocated them to IFRS 9 *Financial Instruments*. IFRS 9 applies to all assets within the scope of IAS 39. This paragraph discusses matters relevant when IFRS 4 was issued.

 © IASCF

BC75 The Board saw no conceptual reason to change either the definition of insurance contracts or the scope of the IFRS in the light of the two examples cited by respondents. Paragraphs B6 and B7 of the IFRS note that complying with the IFRS in phase I is unlikely to be particularly burdensome in these two examples, for materiality reasons. The Board may need to review this conclusion in phase II.

BC76 Some respondents argued that the proposals in ED 5 were directed primarily at entities that are generally regarded as insurers. They suggested that the Board should not impose these proposals on entities that have a relatively small amount of a given transaction type. The Board concluded that these comments were primarily about materiality. IAS 1 *Presentation of Financial Statements* and IAS 8 address materiality and the Board decided that no further guidance or specific exemption was needed in this case.

Temporary exemption from some other IFRSs

BC77 Paragraphs 10–12 of IAS 8 specify a hierarchy of criteria that an entity should use in developing an accounting policy if no IFRS applies specifically to an item. Without changes made in the IFRS, an insurer adopting IFRSs in 2005 would have needed to assess whether its accounting policies for insurance contracts comply with these requirements. In the absence of guidance, there might have been uncertainty about what would be acceptable. Establishing what would be acceptable could have been costly and some insurers might have made major changes in 2005 followed by further significant changes in phase II.

BC78 To avoid unnecessary disruption for both users and preparers in phase I that would not have eased the transition to phase II, the Board decided to limit the need for insurers to change their existing accounting policies for insurance contracts. The Board did this by the following measures:

(a) creating a temporary exemption from the hierarchy in IAS 8 that specifies the criteria an entity uses in developing an accounting policy if no IFRS applies specifically to an item. The exemption applies to insurers, but not to policyholders.

(b) limiting the impact of that exemption from the hierarchy by five specific requirements (relating to catastrophe provisions, liability adequacy, derecognition, offsetting and impairment of reinsurance assets, see paragraphs BC87–BC114).

(c) permitting some existing practices to continue but prohibiting their introduction (paragraphs BC123–BC146).

BC79 Some respondents opposed the exemption from the hierarchy on the grounds that it would permit too much diversity and allow fundamental departures from the *Framework* that could prevent an insurer's financial statements from presenting information that is understandable, relevant, reliable and comparable. The Board did not grant the exemption from the hierarchy in IAS 8 lightly, but took this unusual step to minimise disruption in 2005 for both users (eg lack of continuity of trend data) and preparers (eg systems changes).

BC80 ED 6 *Exploration for and Evaluation of Mineral Resources* proposes a temporary exemption from paragraphs 11 and 12 of IAS 8 (ie sources of guidance), but not from paragraph 10 (ie relevance and reliability). That proposed exemption is narrower than in IFRS 4 because ED 6 leaves a relatively narrow range of issues unaddressed. In contrast, because IFRS 4 leaves many significant aspects of accounting for insurance contracts until phase II, a requirement to apply paragraph 10 of IAS 8 to insurance contracts would have had much more pervasive effects and insurers would have needed to address matters such as completeness, substance over form and neutrality.

BC81 Some suggested that the Board should specifically require an insurer to follow its national accounting requirements (national GAAP) in accounting for insurance contracts during phase I, to prevent selection of accounting policies that do not form a comprehensive basis of accounting to achieve a predetermined result ('cherry-picking'). However, defining national GAAP would have posed problems. Further definitional problems could have arisen because some insurers do not apply the national GAAP of their own country. For example, some non-US insurers with a US listing apply US GAAP. Moreover, it is unusual and, arguably, beyond the Board's mandate to impose requirements set by another body.

BC82 In addition, an insurer might wish to improve its accounting policies to reflect other accounting developments with no counterpart in national GAAP. For example, an insurer adopting IFRSs for the first time might wish to amend its accounting policies for insurance contracts for greater consistency with accounting policies that it uses for contracts within the scope of IAS 39.[*] Similarly, an insurer might wish to improve its accounting for embedded options and guarantees by addressing both their time value and their intrinsic value, even if no similar improvements are made to its national GAAP.

BC83 Therefore, the Board decided that an insurer could continue to follow the accounting policies that it was using when it first applied the phase I requirements, with some exceptions noted below. An insurer could also improve those accounting policies if specified criteria are met (see paragraphs 21–30 of the IFRS).

BC84 The criteria in paragraphs 10–12 of IAS 8 include relevance and reliability. Granting an exemption from those criteria, even temporarily, is a highly unusual step. The Board was prepared to contemplate that step only as part of an orderly and relatively fast transition to phase II. Because the exemption is so exceptional, ED 5 proposed that it would apply only for accounting periods beginning before 1 January 2007. Some described this time limit as a 'sunset clause'.

BC85 Many respondents opposed the sunset clause. They argued the following:

(a) If the exemption expired in 2007 before phase II is in force, there would be considerable confusion, disruption and cost for both users and preparers. It would not be appropriate to penalise users and preparers if the Board does not complete phase II on time.

[*] In November 2009 the IASB amended some of the requirements of IAS 39 and relocated them to IFRS 9 *Financial Instruments*. IFRS 9 applies to all assets within the scope of IAS 39. This paragraph discusses matters relevant when IFRS 4 was issued.

(b) The sunset clause might be perceived as putting pressure on the Board to complete phase II without adequate consultation, investigation and testing.

The Board accepted the validity of these objections to the sunset clause and deleted it.

BC86 The Board decided to maintain some requirements that follow from the criteria in IAS 8. The Board acknowledges that it is difficult to make piecemeal changes to recognition and measurement practices in phase I because many aspects of accounting for insurance contracts are interrelated with aspects that will not be completed until phase II. However, abandoning these particular requirements would detract from the relevance and reliability of an insurer's financial statements to an unacceptable degree. Moreover, these requirements are not interrelated to a great extent with other aspects of recognition and measurement and the Board does not expect phase II to reverse these requirements. The following points are discussed below:

(a) catastrophe and equalisation provisions (paragraphs BC87–BC93)

(b) liability adequacy (paragraphs BC94–BC104)

(c) derecognition (paragraph BC105)

(d) offsetting (paragraph BC106)

(e) impairment of reinsurance assets (paragraphs BC107–BC114).

Catastrophe and equalisation provisions

BC87 Some insurance contracts expose the insurer to infrequent but severe catastrophic losses caused by events such as damage to nuclear installations or satellites or earthquake damage. Some jurisdictions permit or require catastrophe provisions for contracts of this type. The catastrophe provisions are generally built up gradually over the years out of the premiums received, usually following a prescribed formula, until a specified limit is reached. They are intended to be used on the occurrence of a future catastrophic loss that is covered by current or future contracts of this type. Some countries also permit or require equalisation provisions to cover random fluctuations of claim expenses around the expected value of claims for some types of insurance contract (eg hail, credit, guarantee and fidelity insurance) using a formula based on experience over a number of years.

BC88 Those who favour recognising catastrophe or equalisation provisions as liabilities base their view on one or more of the following arguments:

(a) Such provisions represent a deferral of unearned premiums that are designed to provide for events that are not expected, on average, to occur in any single contract period but are expected to occur over an entire cycle of several contract periods. Although contracts cover only one period in form, in substance contracts are commonly renewed, leading to pooling of risks over time rather than within a single period. Indeed, some jurisdictions make it difficult for an insurer to stop offering insurance against some forms of risk, such as hurricanes.

(b) In some jurisdictions, an insurer is required to segregate part of the premium (the catastrophe premium). The catastrophe premium is not available for distribution to shareholders (except on liquidation) and, if the insurer transfers the contract to another insurer, it must also transfer the catastrophe premium.

(c) In years when no catastrophe occurs (or when claims are abnormally low), such provisions portray an insurer's long-term profitability faithfully because they match the insurer's costs and revenue over the long term. Also, they show a pattern of profit similar to one obtained through reinsurance, but with less cost and administrative burden.

(d) Such provisions enhance solvency protection by restricting the amounts distributed to shareholders and by restricting a weak company's ability to expand or enter new markets.

(e) Such provisions encourage insurers to accept risks that they might otherwise decline. Some countries reinforce this encouragement with tax deductions.

BC89 For the following reasons, the IFRS prohibits the recognition as a liability of provisions for possible future claims under contracts that are not in existence at the reporting date (such as catastrophe and equalisation provisions):

(a) Such provisions are not liabilities as defined in the *Framework*, because the insurer has no present obligation for losses that will occur after the end of the current contract period. As the *Framework* states, the matching concept does not allow the recognition of items in the balance sheet that do not meet the definition of assets or liabilities. Recognising deferred credits as if they were liabilities would diminish the relevance and reliability of an insurer's financial statements.

(b) Even if the insurance law requires an insurer to segregate catastrophe premiums so that they are not available for distribution to shareholders in any circumstances, earnings on those segregated premiums will ultimately be available to shareholders. Therefore, those segregated amounts are appropriately classified as equity, not as a liability.

(c) Recognising such provisions obscures users' ability to examine the impact of past catastrophes and does not contribute to their analysis of an insurer's exposure to future catastrophes. Given adequate disclosure, knowledgeable users understand that some types of insurance expose an insurer to infrequent but severe losses. Moreover, the analogy with reinsurance contracts is irrelevant, because reinsurance actually changes the insurer's risk profile.

(d) The objective of general purpose financial statements is not to enhance solvency but to provide information that is useful to a wide range of users for economic decisions. Moreover, the recognition of provisions does not, by itself, enhance solvency. However, if the objective of financial statements were to enhance solvency and such provisions were an appropriate means of enhancing solvency, it would follow that the insurer should recognise the entire provision immediately, rather than accumulating it over time. Furthermore, if catastrophes (or unusual

 © IASCF

experience) in one period are independent of those in other periods, the insurer should not reduce the liability when a catastrophe (or unusually bad experience) occurs. Also, if diversification over time were a valid basis for accounting, above-average losses in early years should be recognised as assets, yet proponents of catastrophe and equalisation provisions do not advocate this.

(e) Recognising catastrophe or equalisation provisions is not the only way to limit distributions to shareholders. Other measures, such as solvency margin requirements and risk-based capital requirements, could play an important role. Another possibility is for an insurer to segregate a portion of its equity for retention to meet possible losses in future years.

(f) The objective of general purpose financial statements is not to encourage or discourage particular transactions or activities, but to report neutral information about transactions and activities. Therefore, accounting requirements should not try to encourage insurers to accept or decline particular types of risks.

(g) If an insurer expects to continue writing catastrophe cover, presumably it believes that the future business will be profitable. It would not be representationally faithful to recognise a liability for future contracts that are expected to be profitable.

(h) There is no objective way to measure catastrophe and equalisation provisions, unless an arbitrary formula is used.

BC90 Some suggested that it is not appropriate to eliminate catastrophe and equalisation provisions in phase I as a piecemeal amendment to existing approaches. However, the Board concluded that it could prohibit these provisions without undermining other components of existing approaches. There is no credible basis for arguing that catastrophe or equalisation 'provisions' are recognisable liabilities under IFRSs and there is no realistic prospect that the Board will permit them in phase II. Indeed, as noted above, paragraphs 10–12 of IAS 8 require an entity to consider various criteria in developing an accounting policy for an item if no IFRS applies specifically to that item. In the Board's view, if the IFRS had not suspended that requirement, it would clearly have prohibited the recognition of such items as a liability. Accordingly, the IFRS preserves this prohibition (see paragraph 14(a) of the IFRS).

BC91 Some respondents presented additional arguments for permitting the recognition of catastrophe and equalisation provisions as a liability:

(a) Some insurers measure insurance contracts without margins for risk, but instead recognise catastrophe or equalisation provisions. If catastrophe provisions are eliminated in phase I, this change might be partly reversed in phase II if insurers are then required to include margins for risk.

(b) Some insurers regard these provisions as relating partly to existing contracts and partly to future contracts. Splitting these components may be difficult and involve systems changes that might not be needed in phase II.

BC92 For the following reasons, these arguments did not persuade the Board:

(a) Present imperfections in the measurement of recognisable liabilities do not justify the recognition of other items that do not meet the definition of a liability.

(b) Additions to these provisions are often based on a percentage of premium revenue. If the risk period has already expired, that premium does not relate to an existing contractual obligation. If the risk period has not yet fully expired, the related portion of the premium relates to an existing contractual obligation, but most existing models defer all the related premium as unearned premium, so recognising an additional provision would be double-counting (unless the contract were known to be underpriced).

BC93 Accordingly, the Board retained the proposal in ED 5 to eliminate these provisions. However, although the IFRS prohibits their recognition as a liability, it does not prohibit the segregation of a component of equity. Changes in a component of equity are not recognised in profit or loss. IAS 1 requires a statement of changes in equity.

Liability adequacy

BC94 Many existing accounting models have tests to confirm that insurance liabilities are not understated, and that related amounts recognised as assets, such as deferred acquisition costs, are not overstated. The precise form of the test depends on the underlying measurement approach. However, there is no guarantee that these tests exist everywhere and the credibility of IFRSs could suffer if an insurer claims to comply with IFRSs but fails to recognise material and reasonably foreseeable losses arising from existing contractual obligations. To avoid this, the IFRS requires a liability adequacy test[*] (see paragraphs 15–19).

BC95 The Board's intention was not to introduce piecemeal elements of a parallel measurement model, but to create a mechanism that reduces the possibility that material losses remain unrecognised during phase I. With this in mind, paragraph 16 of the IFRS defines minimum requirements that an insurer's existing test must meet. If the insurer does not apply a test that meets those requirements, it must apply a test specified by the Board. To specify a test on a basis that already exists in IFRSs and minimise the need for exceptions to existing principles, the Board decided to draw on IAS 37.

BC96 The liability adequacy test also applies to deferred acquisition costs and to intangible assets representing the contractual rights acquired in a business combination or portfolio transfer. As a result, when the Board revised IAS 36 *Impairment of Assets* in 2004, it excluded deferred acquisition costs and those intangible assets from the scope of IAS 36.

BC97 The Board considered whether it should retain the impairment model in IAS 36 for deferred acquisition costs, and perhaps also the related insurance liabilities. However, the IAS 36 model cannot be applied to deferred acquisition costs alone, without also considering the cash flows relating to the recognised liability.

* ED 5 described this as a 'loss recognition test'.

 © IASCF

Indeed, some insurers capitalise acquisition costs implicitly through deductions in the measurement of the liability. Moreover, it would be confusing and difficult to apply this model to liabilities without some re-engineering. In the Board's view, it is simpler to use a model that is designed for liabilities, namely the IAS 37 model. In practice, a re-engineered IAS 36 model and IAS 37 might not lead to very different results.

BC98 Some respondents suggested that the Board should specify that the cash flows considered in a liability adequacy test should include the effect of embedded options and guarantees, such as guaranteed annuity rates. They expressed concerns that many national practices have not required insurers to recognise these exposures, which can be very large.

BC99 Although the Board's objective was not to develop a detailed liability adequacy test, it observed that the size of exposures to embedded guarantees and options and the failings of many national practices in this area warranted specific requirements, even in phase I. Accordingly, the Board decided that the minimum requirements for an existing liability adequacy test should include considering cash flows resulting from embedded options and guarantees. The Board did not specify how those cash flows should be considered but noted that an insurer would consider this matter in developing disclosures of its accounting policies. If an existing liability adequacy test does not meet the minimum requirements, a comparison is made with the measurement that IAS 37 would require. IAS 37 refers to the amount that an entity would rationally pay to settle the obligation or transfer it to a third party. Implicitly, this amount would consider the possible effect of embedded options and guarantees.

BC100 ED 5 did not specify the level of aggregation for the liability adequacy test and some respondents asked the Board to clarify this. Paragraph 18 of the IFRS confirms that the aggregation requirements of the existing liability adequacy test apply if the test meets the minimum requirements specified in paragraph 16 of the IFRS. If that test does not meet those minimum requirements, there is no conceptual justification for offsetting a loss on one contract against an otherwise unrecognisable gain on another contract. However, the Board concluded that a contract-by-contract assessment would impose costs that exceed the likely benefits to users. Therefore, paragraph 18 states that the comparison is made at the level of a portfolio of contracts that are subject to broadly similar risks and managed together as a portfolio. More precise definition would be difficult and is not needed, given the Board's restricted objective of ensuring at least a minimum level of testing for the limited life of phase I.

BC101 It is beyond the scope of phase I to create a detailed accounting regime for insurance contracts. Therefore, the IFRS does not specify:

(a) what criteria determine when existing contracts end and future contracts start.

(b) whether or how the cash flows are discounted to reflect the time value of money or adjusted for risk and uncertainty.

(c) whether the liability adequacy test considers both the time value and the intrinsic value of embedded options and guarantees.

(d) whether additional losses recognised because of the liability adequacy test are recognised by reducing the carrying amount of deferred acquisition costs or by increasing the carrying amount of the related insurance liabilities.

BC102 Some respondents asked the Board to clarify that no formal liability adequacy test is needed if an entity can demonstrate that its method of measuring insurance liabilities means that they are not understated. Paragraph 15 of the IFRS requires an insurer to 'assess whether its recognised insurance liabilities are adequate, using current estimates of future cash flows'. The fundamental point is that future cash flows must be considered in some way, and not merely be assumed to support the existing carrying amount. The IFRS does not specify the precise means of ensuring this, as long as the minimum requirements in paragraph 16 are met.

BC103 Some respondents read the liability adequacy test proposed in ED 5 as requiring fair value measurement as a minimum. That was not the Board's intention. An insurer needs to refer to IAS 37 only if the minimum requirements in paragraph 16 are not met.

BC104 Some respondents noted that many existing liability adequacy tests require measurements that do not include a risk margin. However, IAS 37 requires such a margin. To achieve consistency, these respondents suggested that a liability adequacy test under IAS 37 should also exclude these margins. The Board did not adopt this suggestion. The idea behind using IAS 37 for phase I was to take an existing measurement basis 'off the shelf' rather than create a new model.

Derecognition

BC105 The Board identified no reasons why derecognition requirements for insurance liabilities and insurance assets should differ from those for financial liabilities and financial assets. Therefore, the derecognition requirements for insurance liabilities are the same as for financial liabilities (see paragraph 14(c) of the IFRS). However, because derecognition of financial assets is a controversial topic, the IFRS does not address derecognition of insurance assets.

Offsetting

BC106 A cedant (ie the insurer that is the policyholder under a reinsurance contract) does not normally have a right to offset amounts due from a reinsurer against amounts due to the underlying policyholder. Normal offsetting criteria prohibit offsetting when no such right exists. When these criteria are not met, a gross presentation gives a clearer picture of the cedant's rights and obligations, and related income and expense (see paragraph 14(d) of the IFRS).

Reinsurance assets

Impairment of reinsurance assets

BC107 ED 5 proposed that a cedant should apply IAS 36 *Impairment of Assets* to its reinsurance assets. Respondents opposed this proposal for the following reasons:

 © IASCF

(a) This would compel many cedants to change their accounting model for reinsurance contracts in a way that is inconsistent with the accounting for the underlying direct insurance liability.

(b) IAS 36 would require the cedant to address matters that are beyond the scope of phase I for the underlying direct insurance liability, such as the cash flows to be discounted, the discount rate and the approach to risk. Some saw IAS 36 as an indirect way of imposing something similar to a fair value model. There would also have been systems implications.

(c) Reinsurance assets are essentially a form of financial asset and should be subject, for impairment testing, to IAS 39 rather than IAS 36.

BC108 The Board concluded that an impairment test for phase I (a) should focus on credit risk (arising from the risk of default by the reinsurer and also from disputes over coverage) and (b) should not address matters arising from the measurement of the underlying direct insurance liability. The Board decided that the most appropriate way to achieve this was an incurred loss model based on that in IAS 39 (see paragraph 20 of the IFRS).

Gains and losses on buying reinsurance

BC109 The IFRS defines a reinsurance contract as an insurance contract issued by one insurer (the reinsurer) to compensate another insurer (the cedant) for losses on one or more contracts issued by the cedant. One consequence is that the level of insurance risk required to meet the definition of an insurance contract is the same for a reinsurance contract as for a direct insurance contract.

BC110 National accounting requirements often define reinsurance contracts more strictly than direct insurance contracts to avoid distortion through contracts that have the legal form of reinsurance but do not transfer significant insurance risk (sometimes known as financial reinsurance). One source of such distortions is the failure to discount many non-life insurance claims liabilities. If the insurer buys reinsurance, the premium paid to the reinsurer reflects the present value of the liability and is, therefore, less than the previous carrying amount of the liability. Reporting a gain on buying the reinsurance is not representationally faithful if no economic gain occurred at that time. The accounting gain arises largely because of the failure to use discounting for the underlying liability. Similar problems arise if the underlying insurance liability is measured with excessive prudence.

BC111 The Board decided that it would not use the definition of a reinsurance contract to address these problems because the Board found no conceptual reason to define a reinsurance contract more or less strictly than a direct insurance contract. Instead, ED 5 addressed these problems through the following proposals:

(a) prohibiting derecognition if the liability is not extinguished (paragraphs 14(c) of the IFRS and BC105) and prohibiting the offsetting of reinsurance assets against the related direct insurance liabilities (paragraphs 14(d) of the IFRS and BC106).

(b) requiring unbundling in some cases (paragraphs 10–12 of the IFRS, IG Example 3 in the Implementation Guidance and paragraphs BC40–BC54).

(c) limiting the recognition of gains when an insurer buys reinsurance.

BC112 Respondents to ED 5 generally opposed the proposal described in paragraph BC111(c), on the following grounds:

(a) These piecemeal amendments to existing accounting models were beyond the scope of phase I and would require new systems that might not be needed in phase II.

(b) The proposals would have been difficult to apply to more complex reinsurance contracts, including excess of loss contracts and contracts that reinsure different layers of a portfolio of underlying direct insurance contracts.

(c) The proposals would have created inconsistencies with the measurement of the underlying direct insurance contracts.

(d) The artificial gain recognised at inception of some reinsurance contracts mitigates an artificial loss that arose earlier from excessive prudence or lack of discounting. If the net exposure has been reduced by reinsurance, there is no reason to continue to overstate the original liability.

(e) Any deferral of profit on buying reinsurance should be recognised as a liability, not as a reduction in the carrying amount of the reinsurance asset. This would permit assets and liabilities relating to the same underlying insurance contracts to be measured on a consistent basis and would also be consistent with other accounting bases such as US GAAP.

(f) Any restrictions in phase I should be targeted more precisely at financial reinsurance transactions (ie transactions that do not meet the definition of an insurance contract or that have significant financial components) or contracts that provide retroactive cover (ie ones that cover events that have already occurred).

(g) The liability adequacy test and unbundling proposals would have provided sufficient safeguards against the recognition of excessive profits.

BC113 The Board considered limiting the proposed requirements to cases where significant distortions in reported profit were most likely to occur, for example retroactive contracts. However, developing such a distinction would have been time-consuming and difficult, and there would have been no guarantee of success. The Board also considered drawing on requirements in US GAAP but decided not to include detailed requirements of this kind as a temporary and only partly effective solution. The proposals in ED 5 were an attempt to develop a simpler temporary solution. The responses indicated that the proposed solution contained too many imperfections to achieve its purpose.

BC114 The Board decided to delete the proposal in ED 5 and replace it with a specific disclosure requirement for gains and losses that arose on buying reinsurance (see paragraph 37(b) of the IFRS).

 © IASCF

Other existing practices

BC115 The IFRS does not address:

(a) acquisition costs (paragraphs BC116–BC119);

(b) salvage and subrogation (paragraphs BC120 and BC121); and

(c) policy loans (paragraph BC122).

Acquisition costs

BC116 Acquisition costs are the costs that an insurer incurs to sell, underwrite and initiate a new insurance contract. The IFRS neither prohibits nor requires the deferral of acquisition costs, nor does it prescribe what acquisition costs are deferrable, the period and method of their amortisation or whether an insurer should present deferred acquisition costs as an asset or as a reduction in insurance liabilities. The treatment of deferred acquisition costs is an integral part of existing models and cannot be amended easily without a more fundamental review of those models in phase II.

BC117 The treatment of acquisition costs for insurance contracts in phase I may differ from the treatment of transaction costs incurred for investment contracts (ie financial liabilities). IAS 39 requires specified transaction costs to be presented as a deduction in determining the initial carrying amount of a financial liability. The Board did not wish to create exceptions to the definition of the transaction costs to which this treatment applies. Those costs may be defined more broadly or more narrowly than the acquisition costs that an insurer is required or permitted to defer using its existing accounting policies.

BC118 Some entities incur significant costs in originating long-term savings contracts. Some respondents argued that most, if not all, of these costs relate to the right to charge future investment management fees rather than to the financial liability that is created when the first instalment is received. They asked the Board to clarify whether the cost of originating those rights could be recognised as a separate asset rather than as a deduction in determining the initial carrying amount of the financial liability. They noted that this treatment would:

(a) simplify the application of the effective interest method for a financial liability carried at amortised cost.

(b) prevent the recognition of a misleading loss at inception for a financial liability that contains a demand feature and is carried at fair value. IAS 39 states that the fair value of such a liability is not less than the amount payable on demand (discounted, if applicable, from the first date when that amount could be required to be paid).

BC119 In response to these comments, the Board decided that incremental costs directly attributable to securing an investment management contract should be recognised as an asset if they meet specified criteria, and that incremental costs should be defined in the same way as in IAS 39. The Board clarified these points by adding guidance to the appendix of IAS 18 *Revenue*.

© IASCF

Salvage and subrogation

BC120 Some insurance contracts permit the insurer to sell (usually damaged) property acquired in settling the claim (ie salvage). The insurer may also have the right to pursue third parties for payment of some or all costs (ie subrogation). The Board will consider salvage and subrogation in phase II.

BC121 In the following two related areas, the IFRS does not amend IAS 37:

(a) Gains on the expected disposal of assets are not taken into account in measuring a provision, even if the expected disposal is closely linked to the event giving rise to the provision. Instead, an entity recognises gains on expected disposals of assets at the time specified by the IFRS dealing with the assets concerned (paragraphs 51 and 52 of IAS 37).

(b) Paragraphs 53–58 of IAS 37 address reimbursements for some or all of the expenditure required to settle a provision.

The Board is working on a project to amend various aspects of IAS 37.

Policy loans

BC122 Some insurance contracts permit the policyholder to obtain a loan from the insurer. The DSOP proposed that an insurer should treat these loans as a prepayment of the insurance liability, rather than as the creation of a separate financial asset. Because the Board does not regard this issue as a priority, phase I does not address it.

Changes in accounting policies

Relevance and reliability

BC123 IAS 8 prohibits a change in accounting policies that is not required by an IFRS, unless the change will result in the provision of reliable and more relevant information. Although the Board wished to avoid imposing unnecessary changes in phase I, it saw no need to exempt insurers from the requirement to justify changes in accounting policies. Therefore, paragraph 22 of the IFRS permits an insurer to change its accounting policies for insurance contracts if, and only if, the change makes the financial statements more relevant and no less reliable or more reliable and no less relevant, judged by the criteria in IAS 8.[*] As the Board's conclusions for phase II develop (see paragraphs BC6–BC8), they will give insurers further context for judgements about whether a change in accounting policies will make their financial statements more relevant and reliable.

* Unlike IAS 8, paragraph 22 of the IFRS permits changes in accounting policies that make the financial statements more reliable and no less relevant. This permits improvements that make financial statements more reliable even if they do not achieve full reliability. In IAS 8 and the *Framework*, reliability is not synonymous with verifiability but includes characteristics such as neutrality and substance over form.

 © IASCF

BC124 The IFRS contains further specific requirements supporting paragraph 22:

(a) paragraph 24 permits an insurer to change its accounting policies for some insurance liabilities that it designates, without satisfying the normal requirement in IAS 8 that an accounting policy should be applied to all similar items (paragraphs BC174–BC177).

(b) paragraph 25 permits the following practices to continue but prohibits their introduction:

  (i) measuring insurance liabilities on an undiscounted basis (paragraphs BC126 and BC127).

  (ii) measuring contractual rights to future investment management fees at an amount that exceeds their fair value as implied by a comparison with current fees charged by other market participants for similar services (paragraphs BC128–BC130).

  (iii) using non-uniform accounting policies for the insurance contracts of subsidiaries (paragraphs BC131 and BC132).

(c) paragraph 26 prohibits the introduction of additional prudence if an insurer already measures insurance liabilities with sufficient prudence (paragraph BC133).

(d) paragraphs 27–29 create a rebuttable presumption against the introduction of future investment margins in the measurement of insurance contracts (paragraphs BC134–BC144).

(e) paragraph 30 addresses 'shadow accounting' (paragraphs BC181–BC184).

(f) paragraph 45 permits an insurer to redesignate financial assets as 'at fair value through profit or loss' when it changes its accounting policies for insurance liabilities (paragraphs BC145 and BC146).

BC125 Some respondents suggested that phase I should not permit changes in accounting policies, to prevent lack of comparability (especially within a country) and management discretion to make arbitrary changes. However, the Board decided to permit changes in accounting policies for insurance contracts if they make the financial statements more relevant and no less reliable, or more reliable and no less relevant.

Discounting

BC126 In present practice, most general insurance claims liabilities are not discounted. In the Board's view, discounting of insurance liabilities results in financial statements that are more relevant and reliable. However, because the Board will not address discount rates and the basis for risk adjustments until phase II, the Board concluded that it could not require discounting in phase I. Nevertheless, the IFRS prohibits a change from an accounting policy that involves discounting to one that does not involve discounting (paragraph 25(a)).

BC127 Some respondents to ED 5 opposed discounting for contracts in which almost all the cash flows are expected to arise within one year, on materiality and cost-benefit grounds. The Board decided to create no specific exemption for these liabilities, because the normal materiality criteria in IAS 8 apply.

Investment management fees

BC128 Under some insurance contracts, the insurer is entitled to receive a periodic investment management fee. Some suggest that the insurer should, in determining the fair value of its contractual rights and obligations, discount the estimated future cash flows at a discount rate that reflects the risks associated with the cash flows. Some insurers use this approach in determining embedded values.

BC129 However, in the Board's view, this approach can lead to results that are not consistent with a fair value measurement. If the insurer's contractual asset management fee is in line with the fee charged by other insurers and asset managers for comparable asset management services, the fair value of the insurer's contractual right to that fee would be approximately equal to what it would cost insurers and asset managers to acquire similar contractual rights.* Therefore, paragraph 25(b) of the IFRS confirms that an insurer cannot introduce an accounting policy that measures those contractual rights at more than their fair value as implied by fees charged by others for comparable services; however, if an insurer's existing accounting policies involve such measurements, it may continue to use them in phase I.

BC130 The Board's agenda includes a project on revenue recognition.

Uniform accounting policies on consolidation

BC131 IAS 27 *Consolidated and Separate Financial Statements* requires entities to use uniform accounting policies. However, under current national requirements, some insurers consolidate subsidiaries without conforming the measurement of insurance liabilities using the subsidiaries' own local GAAP to the accounting policies used by the rest of the group.

BC132 The use of non-uniform accounting policies reduces the relevance and reliability of financial statements. However, prohibiting this would force some insurers to change their accounting policies for the insurance liabilities of some subsidiaries in phase I. This could have required systems changes that might no longer be needed in phase II. Therefore, the Board decided that an insurer already using non-uniform accounting policies for insurance contracts could continue to do so in phase I. However, if an insurer already uses uniform accounting policies for insurance contracts, it could not switch to a policy of using non-uniform accounting policies (paragraph 25(c) of the IFRS).

Excessive prudence

BC133 Insurers sometimes measure insurance liabilities on what is intended to be a highly prudent basis that lacks the neutrality required by the *Framework*. However, phase I does not define how much prudence is appropriate and cannot, therefore, eliminate excessive prudence. Consequently, the IFRS does not attempt to prohibit existing measurements of insurance liabilities that lack neutrality because of excessive prudence. Nevertheless, it prohibits the introduction of

* This approach is consistent with the discussion of servicing rights and obligations in IAS 39.

 © IASCF

additional prudence if an insurer already measures insurance liabilities with sufficient prudence (see paragraph 26 of the IFRS). The liability adequacy test in paragraphs 15–19 addresses the converse problem of understated insurance liabilities.

Future investment margins

BC134 In the Board's view, the cash flows from an asset are irrelevant for the measurement of a liability (unless those cash flows affect (a) the cash flows arising from the liability or (b) the credit characteristics of the liability). Many existing measurement practices for insurance liabilities conflict with this principle because they use a discount rate based on the estimated return from the assets that are deemed to back the insurance liabilities. However, the Board concluded that it could not eliminate these practices until phase II gives guidance on discount rates and the basis for risk adjustments.

BC135 ED 5 stated that an accounting policy change makes financial statements less relevant and reliable if it introduces a practice of including future investment margins. On the following grounds, some respondents opposed this proposal, which would have prohibited the introduction of any measurements that reflect future investment margins:

(a) The proposal prejudges a phase II issue. Most actuaries and insurers believe that a fair value measure (ie one calibrated to transactions involving insurance contracts) must include some consideration of asset performance because product pricing, reinsurance and market transactions are observed to reflect this feature.

(b) A current market rate results in more relevant and reliable information than an out-of-date discount rate prescribed by a regulator, even if the current market rate reflects expected asset returns.

(c) Asset-based discount rates are a feature of most existing national systems, including some modern systems that use current estimates of future cash flows and current (albeit asset-based) discount rates. The prohibition proposed in ED 5 would have prevented an insurer from replacing its existing accounting policies for insurance contracts with another comprehensive basis of accounting for insurance contracts that is, in aggregate, more relevant and reliable despite the disadvantage of using an asset-based discount rate.

(d) Because US GAAP uses an asset-based discount rate for some insurance liabilities, the prohibition would have prevented insurers from adopting US GAAP for their insurance liabilities in phase I. This would have been unfair because some insurers that have already adopted IFRSs apply US GAAP to their insurance contracts and could continue to do so in phase I.

BC136 In the light of these comments, the Board replaced the prohibition proposed in ED 5 with a rebuttable presumption, which could be overcome if the other components of a change in accounting policies increase the relevance and reliability of an insurer's financial statements sufficiently to outweigh the disadvantage of introducing the practice in question (see paragraph 28 of the IFRS for an example).

BC137 The IFRS identifies two practices that include future investment margins in the measurement of insurance liabilities: (a) using a discount rate that reflects the estimated return on the insurer's assets,[*] (b) projecting the returns on those assets at an estimated rate of return, discounting those projected returns at a different rate and including the result in the measurement of the liability. Some suggested that (b) should be eliminated in phase I because they regarded it as less acceptable than (a). However, the Board noted that although (b) appears more obviously incorrect than (a), these two practices have the same effect and are logically equivalent.

Future investment margins and embedded value

BC138 In addition to considering asset-based discount rates in general, the Board also considered a specific measurement technique that, at least in present practice, typically reflects future investment margins, namely embedded value. Embedded value is an indirect method of measuring an insurance liability. Indirect methods measure the liability by discounting all cash flows arising from both the book of insurance contracts and the assets supporting the book, to arrive at a net measurement for the contracts and supporting assets. The measurement of the assets is then deducted to arrive at a measurement of the book of contracts.[†] In contrast, direct methods measure the liability by discounting future cash flows arising from the book of insurance contracts only. If the same assumptions are made in both methods, direct and indirect methods can produce the same results.[§]

BC139 Life insurers in an increasing number of countries disclose embedded value information. Most disclose this information outside the financial statements or as supplementary information (usually unaudited), but a few use it as a measurement in their balance sheets.[ø]

BC140 Some respondents felt that embedded value methodology is far more relevant and reliable than most local accounting methods, and insurers should be permitted to adopt it. They noted that embedded values are often an important consideration in determining prices for acquisitions of insurers and of blocks of insurance contracts. Furthermore, embedded value and similar indirect methods are often used in accounting for the insurance liabilities assumed in these acquisitions.

---

* Some approaches attempt to find a portfolio of assets ('replicating portfolio') with characteristics that replicate the characteristics of the liability very closely. If such a portfolio can be found, it may be appropriate to use the expected return on the replicating portfolio as the discount rate for the liability, with suitable adjustments for differences in their characteristics. However, replicating portfolio approaches should not be regarded as using an asset-based discount rate because they attempt to measure the characteristics of the liability. They are not based on the characteristics of the actual assets held, which may or may not match those of the liability.

† If embedded values are recognised in the statement of financial position, they are typically presented as two components: an insurance liability and a separate intangible asset. This is similar to the expanded presentation that the IFRS permits in a business combination or portfolio transfer.

§ Luke N Girard, *Market Value of Insurance Liabilities: Reconciling the Actuarial Appraisal and Option Pricing Methods*, North American Actuarial Journal, Volume 4, Number 1

ø IAS 1 *Presentation of Financial Statements* (as revised in 2007) replaced the term 'balance sheet' with 'statement of financial position'.

 © IASCF

BC141 For the following reasons, some suggested that phase I should prohibit embedded value measurements in the balance sheet.

(a) Embedded value approaches are largely unregulated at present and there is diversity in their application. For example, some view the methods used to reflect risk as fairly crude, diverse and not always fully consistent with capital market prices.

(b) Embedded value methods today typically involve two practices whose introduction ED 5 regarded as unacceptable:

(i) reflecting future investment margins in the measurement of the 'embedded value' asset associated with insurance liabilities (see paragraphs BC134–BC144).

(ii) measuring contractual rights to future investment management fees at an amount that exceeds their fair value as implied by a comparison with current fees charged by other market participants for similar services (see paragraphs BC128–BC130).

(c) In current practice, embedded values are generally determined on a single best estimate basis that does not reflect the full range of possible outcomes. This does not generally adequately address embedded guarantees and options, such as embedded interest rate guarantees. Until recently, embedded values would have ignored these items if they were out of the money. Indeed, in some cases, they might have been ignored even if they were in the money, because of assumptions about future investment performance. More attention is now being devoted to these options and guarantees and embedded value methods may begin to address them more rigorously, but that development is not yet complete.

BC142 However, for the following reasons, the IFRS permits continued use of embedded value measurements:

(a) One objective of phase I is to avoid disturbing existing practice for insurance contracts, unless a change creates a significant improvement and leads in a direction consistent with the likely direction of phase II. Prohibiting the continued use of embedded values would not meet that criterion.

(b) Embedded value methods are based on estimates of future cash flows, not an accumulation of past transactions. The advantages of this may, in some cases, outweigh the disadvantage of including future investment margins. Therefore, eliminating embedded value methods may not result in more relevant and reliable financial statements in every case.

(c) Given that the Board did not prohibit asset-based discount rates for other measurements of insurance liabilities in phase I, there is no compelling reason in phase I to prohibit embedded value measurements that contain future investment margins.

(d) Although embedded value measurements today typically include future investment margins, some practitioners have suggested improving embedded value methods by adjusting the asset cash flows fully for risk to make them consistent with market prices.

BC143 It follows from the Board's conclusions on relevance and reliability (paragraphs BC123–BC125), investment management fees (paragraphs BC128–BC130) and future investment margins (paragraphs BC134–BC137) that an insurer can introduce embedded value measurements in its balance sheet only if all the following conditions are met:

(a) the new accounting policy will result in more relevant and reliable financial statements (paragraph 22 of the IFRS). This is not an automatic decision and will depend on a comparison of the insurer's existing accounting with the way in which it intends to apply embedded value.

(b) this increase in relevance and reliability is sufficient to overcome the rebuttable presumption against including future investment margins (paragraph 29 of the IFRS).

(c) the embedded values include contractual rights to future investment management fees at an amount that does not exceed their fair value as implied by a comparison with current fees charged by other market participants for similar services (paragraph 25(b) of the IFRS and paragraphs BC128–BC130).

BC144 In some measurement approaches, the discount rate is used to determine the present value of a future profit margin, which is then attributed to different periods using a formula. However, in other approaches (such as most applications of embedded value), the discount rate determines the measurement of the liability directly. The Board concluded that it is highly unlikely that an insurer could overcome the rebuttable presumption in the latter case (see paragraph 29 of the IFRS).

Redesignation of financial assets

BC145 When an insurer changes its accounting policies for insurance liabilities, it is permitted, but not required, to reclassify some or all financial assets as 'at fair value through profit or loss'. This permits an insurer to avoid artificial mismatches when it improves its accounting policies for insurance liabilities. The Board also decided:

(a) not to restrict redesignation to assets backing the insurance contracts for which the accounting policies were changed. The Board did not wish to create unnecessary barriers for those insurers that wish to move to a more consistent measurement basis that reflects fair values.

(b) not to introduce an option to reclassify financial assets as 'available for sale'.* Such reclassification would have caused changes in carrying amount to be recognised directly in equity for assets, but in profit or loss for insurance liabilities. An insurer can avoid this inconsistency by classifying the financial assets as 'at fair value through profit or loss'.

BC146 IAS 39 permits redesignation of assets in specified circumstances when an entity adopts the revised IAS 39. IFRS 1 *First-time Adoption of International Financial Reporting Standards* contains corresponding provisions for first-time adopters.

* IFRS 9 *Financial Instruments*, issued in November 2009, eliminated the category of available-for-sale financial assets.

 © IASCF

Acquisition of insurance contracts in business combinations and portfolio transfers

BC147 When an entity acquires another entity in a business combination, IFRS 3 *Business Combinations* requires the acquirer to measure at fair value the identifiable assets and liabilities acquired. Similar requirements exist under many national accounting frameworks. Nevertheless, in practice, insurers have often used an expanded presentation that splits the fair value of acquired insurance contracts into two components:

(a) a liability measured in accordance with the insurer's accounting policies for insurance contracts that it issues; and

(b) an intangible asset, representing the difference between (i) the fair value of the contractual insurance rights acquired and insurance obligations assumed and (ii) the amount described in (a). Life insurers often describe this intangible asset by names such as the present value of in force business (PVIF), present value of future profits (PVFP or PVP) or value of business acquired (VOBA). Similar principles apply in non-life insurance, for example if claims liabilities are not discounted.

BC148 For the following reasons, the Board decided to permit these existing practices during phase I (paragraph 31 of the IFRS):

(a) One objective of phase I is to avoid prejudging most phase II issues and to avoid requiring systems changes for phase I that might need to be reversed for phase II. In the meantime, disclosure about the nature of, and changes in, the related intangible asset provides transparency for users.

(b) The IFRS gives no guidance on how to determine the fair value of the insurance liabilities, because that would be premature in phase I. Thus, fair values identified during phase I might need to be changed in phase II.

(c) It may be difficult to integrate a fair value measurement at the date of a business combination into subsequent insurance contract accounting without requiring systems changes that could become obsolete in phase II.

BC149 The intangible asset described above is generally amortised over the estimated life of the contracts. Some insurers use an interest method of amortisation, which appears appropriate for an asset that essentially comprises the present value of a set of contractual cash flows. However, it is doubtful whether IAS 38 *Intangible Assets* would have permitted its use. Therefore, the Board decided that this asset should remain outside the scope of IAS 38 and its subsequent measurement should be consistent with the measurement of the related insurance liability (paragraph 31(b) of the IFRS). Because this asset would be covered by the liability adequacy test in paragraphs 15–19, the Board also excluded it from the scope of IAS 36 *Impairment of Assets*.

BC150 IAS 36 and IAS 38 still apply to customer lists and customer relationships reflecting the expectation of contracts that are not part of the contractual insurance rights and contractual insurance obligations that existed at the date of a business combination. An illustrative example published with IFRS 3 deals with customer relationships acquired together with a portfolio of one-year motor insurance contracts.

© IASCF

BC151 Measurements of the intangible asset described in paragraph BC147(b) sometimes include future investment margins. Those margins are subject to the same requirements as future investment margins included in the measurement of the related insurance liability (see paragraphs BC134–BC144).

BC152 In some cases, an insurer's accounting policies under previous GAAP (ie those used before it adopted IFRSs) involved measuring the intangible asset described in paragraph BC147(b) on a basis derived from the carrying amounts of other assets and liabilities. In such cases, if an entity changes the measurements of its assets and liabilities on adopting IFRSs for the first time, shadow accounting may become relevant (see paragraphs BC181–BC184 for a discussion of shadow accounting).

BC153 Some respondents requested an exemption from fair value measurement for insurance liabilities assumed in a business combination. They argued that there is still too much uncertainty about how fair value should be defined and determined. However, insurers have apparently been able to cope with the existing requirements in IFRSs and in national standards. The Board saw no compelling reason for a new exemption.

Discretionary participation features

BC154 Some insurance contracts contain a discretionary participation feature as well as a guaranteed element. The insurer has discretion over the amount and/or timing of distributions to policyholders, although that discretion may be subject to some contractual constraints (including related legal and regulatory constraints) and competitive constraints. Distributions are typically made to policyholders whose contracts are still in force when the distribution is made. Thus, in many cases, a change in the timing of a distribution means that a different generation of policyholders will benefit.

BC155 Although the issuer has contractual discretion over distributions, it is usually likely that current or future policyholders will ultimately receive some part of the accumulated surplus available, at the reporting date, for distribution to holders of contracts with discretionary participation features (ie distributable surplus). The main accounting question is whether that part of the distributable surplus is a liability or a component of equity. The Board will explore that question in phase II.

BC156 Features of this kind are found not only in insurance contracts but also in some investment contracts (ie financial liabilities). Requiring a particular accounting treatment in phase I for investment contracts with these features would create the risk that the Board might decide on a different treatment in phase II. Furthermore, in some cases, holders of insurance contracts and investment contracts have a contractual right to share in discretionary payments out of the same pool of assets. If the Board required a particular treatment for the discretionary participation features of the investment contracts in phase I, it might prejudge the treatment of these features in insurance contracts that are linked to the same pool of assets.

 © IASCF

BC157 For these reasons, the Board decided not to address most aspects of the accounting treatment of such features in phase I, in either insurance contracts or investment contracts. However, paragraphs 34 and 35 of the IFRS confirm that it is unacceptable to classify a discretionary participation feature as an intermediate category that is neither liability nor equity, because this would be inconsistent with the *Framework*. If a balance sheet item does not meet the *Framework*'s definition of, and recognition criteria for, assets or liabilities, that item is included in equity.

BC158 Furthermore, ED 5 proposed a requirement for the issuer of an investment contract containing such a feature to recognise a liability measured at no less than the amount that would result from applying IAS 39 to the guaranteed element of the contract. Because issuers need not determine the IAS 39 measurement of the guaranteed element if the total recognised liability is clearly higher, ED 5 noted the Board's expectation that issuers would not need extensive new systems to comply with this requirement.

BC159 Some respondents objected that determining the result of applying IAS 39 to the guaranteed element would either have virtually no effect (in which case the requirement would be unnecessary) or require extensive new systems (causing costs exceeding the likely benefit to users). In finalising the IFRS, the Board adopted a more flexible approach that limits the need for systems to apply IAS 39 to the guaranteed element alone, while still requiring some rigour to avoid the understatement of the financial liability. Specifically, paragraph 35 permits two approaches for a discretionary participation feature in a financial liability:

(a) The issuer may classify the entire discretionary participation feature as a liability, but need not separate it from the guaranteed element (and so need not determine the result of applying IAS 39 to the guaranteed element). An issuer choosing this approach is required to apply the liability adequacy test in paragraphs 15–19 of the IFRS to the contract.

(b) The issuer may classify part or all of the feature as a separate component of equity. If so, the liability recognised cannot be less than the result of applying IAS 39 to the guaranteed element. The issuer need not determine that measurement if the total liability recognised is clearly higher.

BC160 There may be timing differences between retained earnings under IFRSs and distributable surplus (ie the accumulated amount that is contractually eligible for distribution to holders of discretionary participation features). For example, distributable surplus may exclude unrealised investment gains that are recognised under IFRSs. The resulting timing differences are analogous, in some respects, to temporary differences between the carrying amounts of assets and liabilities and their tax bases. The IFRS does not address the classification of these timing differences because the Board will not determine until phase II whether the distributable surplus is all equity, all liability or part equity and part liability.

© IASCF

BC161 The factor that makes it difficult to determine the appropriate accounting for these features is constrained discretion, in other words, the combination of discretion and constraints on that discretion. If participation features lack discretion, they are embedded derivatives and within the scope of IAS 39[*].

BC162 The definition of a discretionary participation feature does not capture an unconstrained contractual discretion to set a 'crediting rate' that is used to credit interest or other returns to policyholders (as found in the contracts described in some countries as 'universal life' contracts). Some view these features as similar to discretionary participation features because crediting rates are constrained by market forces and the insurer's resources. The Board will revisit the treatment of these features in phase II.

BC163 Some respondents asked the Board to clarify the treatment of premiums received for financial instruments containing discretionary participation features. Conceptually the premium for the guaranteed element is not revenue, but the treatment of the premium for the discretionary participation feature could depend on matters that will not be resolved until phase II. Furthermore, requiring the premium to be split could involve system changes that might become redundant in phase II. To avoid unnecessary disruption in phase I, the Board decided that entities could continue presenting premiums as revenue, with a corresponding expense representing the change in the liability.

BC164 Conceptually, if part or all of a discretionary participation feature is classified as a component of equity, the related portion of the premium should not be included in profit or loss. However, the Board concluded that requiring each incoming premium to be split would require systems changes beyond the scope of phase I. Therefore, the Board decided that an issuer could recognise the entire premium as revenue without separating the portion that relates to the equity component. However, the Board confirmed that the portion of profit or loss attributable to the equity component is presented as an allocation of profit or loss (in a manner similar to the presentation of minority interests[†]), not as expense or income.

BC165 Some suggested that investment contracts containing a discretionary participation feature should be excluded from the fair value disclosure required by IAS 32.[§] They noted both conceptual and practical problems in determining the fair value of an instrument of this kind. However, instead of creating a new exclusion from the required disclosure of fair value, the Board added new paragraph 91A to IAS 32. This extends existing requirements in IAS 32 governing those unquoted equity instruments whose fair value cannot be determined reliably.

---

* IFRS 9 *Financial Instruments*, issued in November 2009, amended the requirements in IAS 39 to identify and separately account for derivatives embedded in a financial host within the scope of IFRS 9. The requirements in IAS 39 continue to apply for derivatives embedded in non-financial hosts and financial hosts outside the scope of IFRS 9. This Basis for Conclusions has not been updated for changes in requirements since IFRIC 9 *Reassessment of Embedded Derivatives* was issued in March 2006.

† In January 2008 the IASB issued an amended IAS 27 *Consolidated and Separate Financial Statements*, which amended 'minority interests' to 'non-controlling interests'.

§ In August 2005, the IASB relocated all disclosures relating to financial instruments to IFRS 7 *Financial Instruments: Disclosures*.

Issues related to IAS 39*

Assets held to back insurance contracts

BC166 The IFRS does not address financial or non-financial assets held by insurers to back insurance contracts. IAS 39 identifies four categories of financial asset, with three different accounting treatments. In developing IAS 39, the Board's predecessor (IASC) acknowledged that most countries had a mixed measurement model, measuring some financial assets at amortised cost and others at fair value. IASC decided to retain, but regulate and structure, the different approaches as follows:

(a) financial assets classified as 'at fair value through profit or loss' (including all financial assets held for trading) are measured at fair value, with all changes in their fair value recognised in profit or loss. Furthermore, all derivatives are deemed to be held for trading, and hence measured at fair value, because this is the only method that provides sufficient transparency in the financial statements.

(b) available-for-sale assets (ie those that do not fall into any of the other categories) are measured at fair value, with changes in their fair value recognised in equity until the asset is derecognised or becomes impaired. Measurement at fair value is appropriate given that available-for-sale assets may be sold in response to, for example, changes in market prices or a liquidity shortage.

(c) assets with a fixed maturity may be measured at amortised cost if the entity intends to hold them to maturity and shows that it has the ability to do so. This treatment is based on the view of some that changes in market prices are irrelevant if an asset is held to maturity because those changes will reverse before maturity (unless the asset becomes impaired).

(d) loans and receivables are measured at amortised cost. IASC was persuaded that there are difficulties in estimating the fair value of such loans, and that further progress was needed in valuation techniques before fair value should be required.

BC167 Some expressed concerns that accounting mismatches would arise in phase I if financial assets (particularly interest-bearing investments) held to back insurance contracts are measured at fair value under IAS 39 whilst insurance liabilities are measured on a different basis. If the insurer classifies the assets as 'available for sale', this difference in measurement basis would not affect profit or loss but it could lead to some volatility in equity. Some do not regard that volatility as a faithful representation of changes in the insurer's financial position.

* In November 2009 the IASB amended the requirements of IAS 39 relating to classification and measurement of assets within the scope of IAS 39 and relocated them to IFRS 9 *Financial Instruments*. IFRS 9 applies to all assets within the scope of IAS 39. Paragraphs BC166–BC194 discuss matters relevant when IFRS 4 was issued.

In developing ED 5, after discussing various suggestions for reducing that volatility,[*] the Board decided:

(a) not to relax the criteria in IAS 39 for classifying financial assets as 'held to maturity'. Relaxing those criteria would undermine the fundamental assertion that an entity has both the intent and ability to hold the assets until maturity. The Board noted that an insurer may be able to classify some of its fixed maturity financial assets as held to maturity if it intends not to sell them before maturity and, in addition to meeting the other conditions set out in IAS 39, concludes that an unexpected increase in lapses or claims would not compel it to sell those assets (except in the 'disaster scenario' discussed in IAS 39 paragraph AG21).

(b) not to create a new category of assets carried at amortised cost: assets held to back insurance liabilities. The creation of such a category would lead to a need for arbitrary distinctions and complex attribution procedures that would not make an insurer's financial statements more relevant and reliable, and could require insurers to develop costly systems. The Board reviewed a precedent that exists in Japan for such a category, but was not persuaded that the procedures adopted there can overcome these difficulties. Moreover, if an insurer may sell assets in response to, for example, changes in market prices or a liquidity shortage, the only appropriate measurement is fair value.

(c) not to create a new category of 'available-for-settlement' liabilities, analogous to available-for-sale assets, measured at fair value, with changes in fair value recognised in equity. The creation of such a category would make it necessary to find some basis for distinguishing between that category and the existing category of non-trading financial liabilities, or to permit a free choice of accounting treatments. The Board has identified no basis for such a distinction, nor for deciding which of these two categories would be the new residual category. Furthermore, creating such a category could require insurers to develop new systems with no certainty that those systems would be needed in phase II.

BC168 In developing ED 5, the Board concluded that the reasons given above outweigh the effects of any accounting mismatch on an insurer's reported equity. Therefore, the Board decided not to exempt insurers from these existing requirements, even temporarily.

BC169 Insurers may be particularly sensitive to equity reported in general purpose financial statements in some countries where this amount is used in assessing compliance with regulatory capital requirements. However, although insurance supervisors are important users of general purpose financial statements, those financial statements are not directed at specific needs of insurance supervisors that other users do not share. Furthermore, supervisors generally have the power

[*] The Board discussed this subject at its meeting in November 2002. It was also one of the major topics raised by insurance participants at two half-day sessions during the financial instruments round tables in March 2003. Before finalising ED 5, the Board discussed the subject again in April 2003.

 © IASCF

to obtain additional information that meets their specific needs. In the Board's view, creating new exemptions from IAS 39 in this area would not have been the best way to meet the common needs of users (including insurance supervisors) of an insurer's general purpose financial statements.

BC170 Some argued that banks enjoy an 'advantage' that is not available to insurers. Under IAS 39, a bank may measure its core banking-book assets and liabilities (loans and receivables and non-trading financial liabilities) at amortised cost, whereas an insurer would have no such option for many of the assets held to back its core insurance activities. However, as noted in paragraph BC166(d), IASC permitted amortised cost measurement for loans and receivables because it had concerns about difficulties in establishing their fair value. This factor does not apply to many assets held by insurers to back insurance liabilities.

BC171 Many of the respondents to ED 5 urged the Board to explore ways of reducing the accounting mismatch described above. The Board discussed this subject at length at all three meetings at which it discussed the responses to ED 5 before finalising the IFRS. In addition, the Board discussed it with the Standards Advisory Council. It was also raised at a meeting of the Board's Insurance Advisory Committee in September 2003, which six Board members attended together with the project staff. Individual Board members and staff also had many discussions with interested parties, including users, insurers, actuaries, auditors and regulators.

BC172 It is important to distinguish two different types of mismatch:

(a) *accounting mismatch* arises if changes in economic conditions affect assets and liabilities to the same extent, but the carrying amounts of those assets and liabilities do not respond equally to those economic changes. Specifically, accounting mismatch occurs if an entity uses different measurement bases for assets and liabilities.

(b) *economic mismatch* arises if the values of, or cash flows from, assets and liabilities respond differently to changes in economic conditions. It is worth noting that economic mismatch is not necessarily eliminated by an asset-liability management programme that involves investing in assets to provide the optimal risk-return trade-off for the package of assets and liabilities.

BC173 Ideally, a measurement model would report all the economic mismatch that exists and would not report any accounting mismatch. The Board considered various alternatives, observing that all had advantages and disadvantages. Some alternatives would have amended IAS 39 to extend the use of cost or amortised cost measurements. However, the Board noted the following:

(a) Fair value is a more relevant measurement than amortised cost for financial assets that an entity might sell in response to changing market and other conditions.

(b) In its response to ED 5, the Association for Investment Management and Research (AIMR) strongly urged the Board not to extend the use of amortised cost in IAS 39. The AIMR is a non-profit professional association of more than 67,200 financial analysts, portfolio managers, and other investment professionals in 116 countries.

(c) An accounting model that measured both assets and liabilities at amounts based on current interest rates would provide information about the degree of economic mismatch. A model that measured both at historical values, or ignored the time value of money in measuring some insurance liabilities, would not. Financial analysts often observe that information about economic mismatch is very important to them.

(d) Some suggested that insurers wish to follow a strategy that involves holding fixed maturity investments to maturity, with some flexibility to sell investments if insurance claims or lapses are unusually high. They recommended relaxing restrictions in IAS 39 so that insurers using such a strategy could use the held-to-maturity category more easily. However, in discussions with individual Board members and staff, insurers generally indicated that they also wished to keep the flexibility to make sales in the light of changing demographic and economic conditions so that they can seek the best trade-off between risk and return. That is a valid and understandable business objective, but it is difficult to argue that cost could be more relevant than fair value in such cases. Although IAS 32[*] requires disclosure of the fair value of financial assets carried at amortised cost, disclosure does not rectify inappropriate measurement.

(e) Some noted that they wished to keep the flexibility to sell corporate bonds before a major downgrade occurs. They viewed the guidance in IAS 39 as restricting their ability to do this. Moreover, because a 'tainting' requirement in IAS 39 prohibits the use of the held-to-maturity category after most sales from this category, insurers are reluctant to use this classification for corporate bonds. The application guidance in IAS 39 gives examples of cases when sales of held-to-maturity investments do not 'taint' all other such investments. For example, paragraph AG22(a) of IAS 39 refers to a sale following a significant deterioration in the issuer's creditworthiness. The Board noted that some appeared to read that guidance as limited to changes in a credit rating by an external credit rating agency, although the guidance also refers to internal ratings that meet particular criteria.

(f) The Japanese precedent mentioned in paragraph BC167(b) creates some discipline by placing restrictions on the use of amortised cost, but for systems or other reasons not all insurers in Japan adopt this approach. Furthermore, this approach permits a cost approach if the durations (ie average maturities) of insurance liabilities match those of the related assets within a specified band of 80–125 per cent. If any economic mismatch arises within that band, this approach does not recognise it. In addition, gains and losses on selling assets held at amortised cost are generally recognised immediately in profit or loss (except that some gains are deferred and amortised if sales are not compatible with the duration matching strategy).

(g) Some Board members and staff met representatives of major European insurers to explore the possibility of (i) extending the use of amortised cost

[*] In August 2005, the IASB relocated all disclosures relating to financial instruments to IFRS 7 *Financial Instruments: Disclosures*.

 © IASCF

if specified, relatively strict, criteria are met and (ii) combining that with a simplified attempt to identify 'ineffectiveness' resulting from the fact that the assets and liabilities would not respond identically to changes in interest rates. This approach would have avoided some of the practical and conceptual problems inherent in the Japanese approach discussed above. However, this untried approach had been developed at short notice and not all details had been worked through. Moreover, many insurers may not be able or willing to invest in systems that could need amendment in phase II.

(h) That a mixed measurement model can create an accounting mismatch is undeniable. Furthermore, it costs time and money for insurers to explain the effects even to sophisticated users. Insurers are very concerned that less sophisticated users may misinterpret the resulting information. If a simple, transparent and conceptually acceptable way could have been found to eliminate the accounting mismatch at an acceptable cost without also obscuring the economic mismatch, that change might have been beneficial. However, the Board could find no such way in the short term. The Board also noted that any change could have required major systems changes and that there appeared to be no consensus among insurers on a single method.

(i) Extending the use of amortised cost would have created an inconsistency with US GAAP. The accounting mismatch described in paragraphs BC167 and BC172 has existed for some years in US GAAP, which requires insurers to account for their financial assets in broadly the same way as under IAS 39. Furthermore, the US Financial Accounting Standards Board decided in January 2004 not to add to its agenda a project to reconsider US GAAP for investments held by life insurance companies.

BC174 In the light of these considerations, the Board concluded that changing the measurement requirements in IAS 39 for financial assets, even temporarily, would diminish the relevance and reliability of an insurer's financial statements. The Board observed that the accounting mismatch arose more from imperfections in existing measurement models for insurance liabilities than from deficiencies in the measurement of the assets. It would have been a retrograde step to try to mitigate the accounting mismatch by adopting a less relevant measurement of the assets—a measurement that would also have obscured some of the economic mismatch.

BC175 The Board considered whether it could mitigate the accounting mismatch by permitting improvements to the measurement of insurance liabilities. The Board noted that introducing a current market-based discount rate for insurance liabilities rather than a historical discount rate would improve the relevance and reliability of an insurer's financial statements. Therefore, such a change would have been permitted by the proposals in ED 5 and is also permitted by the IFRS. However, IAS 8 requires consistent accounting policies for similar transactions. For systems and other reasons, some insurers may not wish, or be able, in phase I to introduce a current market-based discount rate for all insurance liabilities.

BC176 The Board concluded that the increase in relevance and reliability from introducing a current discount rate could outweigh the disadvantages of permitting accounting policies that are not applied consistently to all similar liabilities. Accordingly, the Board decided to permit, but not require, an insurer

to change its accounting policies so that it remeasures designated insurance liabilities for changes in interest rates. This election permits a change in accounting policies that is applied to some liabilities, but not to all similar liabilities as IAS 8 would otherwise require. The Board noted that insurers might sometimes be able to develop simplified models that give a reasonable estimate of the effect of interest rate changes.

BC177 The Board also noted the following:

(a) No single proposal would have eliminated the accounting mismatch for a broad cross-section of insurers without also obscuring the economic mismatch.

(b) No single proposal would have been acceptable to a broad cross-section of insurers.

(c) No single proposal could have been implemented by a broad cross-section of insurers without major systems changes. In other words, no solution was available that built on common industry approaches and systems. Furthermore, the systems needed to implement successfully the approach discussed with some European insurers (see paragraph BC173(g)) would also allow the approach permitted by paragraph 24 of the IFRS (adjusting designated liabilities for changes in interest rates). Indeed, paragraph 24 imposes fewer restrictions than the approach discussed with European insurers because it does not require the assets to match the liability cash flows closely, since any mismatch in cash flows is reflected in profit or loss.

(d) Adjusting the discount rate for designated liabilities will not eliminate all the accounting mismatch described above and some, perhaps many, insurers will choose not to make that adjustment. The reasons for this are as follows:

   (i) As noted above, many insurers may not have systems to adjust liabilities for changes in interest rates and may not wish to develop such systems, even for designated liabilities as opposed to all liabilities.

   (ii) Changes in discount rates would not affect the measurement of insurance liabilities that are carried at an accumulated account value.

   (iii) Changes in discount rates would not affect the measurement of financial liabilities with a demand feature, because IAS 39 states that their fair value is not less than the amount payable on demand (discounted, if applicable, from the first date when that amount could be required to be paid). Although this last point is not strictly relevant for insurance contracts, many life insurers issue investment contracts for which it is relevant.

BC178 In summary, the Board decided not to amend existing measurement requirements in IAS 39 for financial assets because such amendments would have reduced the relevance and reliability of financial statements to an unacceptable extent. Although such amendments could have eliminated some of the

 © IASCF

accounting mismatch, they would also have obscured any economic mismatch that exists. The following points summarise amendments made to ED 5 that might mitigate the accounting mismatch in some cases, as well as relevant observations made by the Board:

(a) The Board decided to permit, but not require, an insurer to change its accounting policies so that it remeasures designated insurance liabilities for changes in interest rates (see paragraph BC176).

(b) The Board clarified the applicability of the practice sometimes known as 'shadow accounting' (paragraphs BC181–BC184).

(c) The Board amended IAS 40 *Investment Property* to permit two separate elections when an entity selects the fair value model or the cost model for investment property. One election is for investment property backing contracts (which could be either insurance contracts or financial instruments) that pay a return linked directly to the fair value of, or returns from, specified assets including that investment property. The other election is for all other investment property (see paragraph C12 of the IFRS).[*]

(d) The Board observed that some entities appeared to have misread the application guidance in IAS 39 on sales of held-to-maturity investments following a significant deterioration in the issuer's creditworthiness. Specifically, as noted in paragraph BC173(e), some appeared to have read it as limited to changes in a credit rating by an external credit rating agency, although the guidance also refers to internal ratings that meet particular criteria.

(e) The Board observed that IAS 1 and IAS 32 do not preclude a presentation identifying a separate component of equity to report a portion of the change (and cumulative change) in the carrying amount of fixed-maturity available-for-sale financial assets. An insurer could use such a presentation to highlight the effect on equity of changes in interest rates that (i) changed the carrying amount of assets but (ii) did not change the carrying amount of liabilities that respond economically to those changing interest rates.

BC179 IAS 40 permits an entity to use a fair value model for investment property, but IAS 16 does not permit this model for owner-occupied property. An entity may measure its owner-occupied property at fair value using the revaluation model in IAS 16, but changes in its fair value must be recognised in revaluation surplus rather than in profit or loss. Some insurers regard their owner-occupied property as an investment and prefer to use a fair value model for it. However, the Board decided not to make piecemeal changes to IAS 16 and IAS 40 at this stage.

BC180 The Board noted that shadow accounting (paragraphs BC181–BC184) may be relevant if there is a contractual link between payments to policyholders and the carrying amount of, or returns from, owner-occupied property. If an insurer elects to use shadow accounting, changes in the measurement of the liability resulting from revaluations of the property are recognised directly in equity, through the statement of changes in equity.

[*] The amendments contained in paragraph C12 are now incorporated as paragraphs 32A–32C of IAS 40.

Shadow accounting

BC181 In some accounting models, realised gains or losses on an insurer's assets have a direct effect on the measurement of some or all of its insurance liabilities.*

BC182 When many of those models were constructed, unrealised gains and most unrealised losses were not recognised in financial statements. Some of those models were extended later to require some financial assets to be measured at fair value, with changes in fair value recognised directly in equity (ie the same treatment as for available-for-sale financial assets under IAS 39). When this happened, a practice sometimes known as 'shadow accounting' was developed with the following two features:

(a) A recognised but unrealised gain or loss on an asset affects the measurement of the insurance liability in the same way that a realised gain or loss does.

(b) If unrealised gains or losses on an asset are recognised directly in equity, the resulting change in the carrying amount of the insurance liability is also recognised in equity.

BC183 Some respondents asked the Board to clarify whether the proposals in ED 5 permitted shadow accounting. The Board concluded the following:

(a) In principle, gains and losses on an asset should not influence the measurement of an insurance liability (unless the gains or losses on the asset alter the amounts payable to policyholders). Nevertheless, this is a feature of some existing measurement models for insurance liabilities and the Board decided that it was not feasible to eliminate this practice in phase I (see paragraph BC134 for further discussion in the context of future investment margins).

(b) Shadow accounting permits all recognised gains and losses on assets to affect the measurement of insurance liabilities in the same way, regardless of whether (i) the gains and losses are realised or unrealised and (ii) unrealised gains and losses are recognised in profit or loss or directly in equity. This is a logical application of a feature of some existing models.

(c) Because the Board does not expect that feature of existing models to survive in phase II, insurers should not be required to develop systems to apply shadow accounting.

(d) If an unrealised gain or loss on an asset triggers a shadow accounting adjustment to a liability, that adjustment should be recognised in the same way as the unrealised gain or loss.

(e) In some cases and to some extent, shadow accounting might mitigate volatility caused by differences between the measurement basis for assets and the measurement basis for insurance liabilities. However, that is a by-product of shadow accounting and not its primary purpose.

* Throughout this section, references to insurance liabilities are also relevant for (a) related deferred acquisition costs and (b) intangible assets relating to insurance contracts acquired in a business combination or portfolio transfer.

 © IASCF

BC184 Paragraph 30 of the IFRS permits, but does not require, shadow accounting. The Implementation Guidance includes an illustrative example to show how shadow accounting might become relevant in an environment where the accounting for assets changes so that unrealised gains are recognised (IG Example 4). Because the Board does not expect the feature underlying the use of shadow accounting to survive in phase II, the Board decided not to give further guidance.

Investment contracts

BC185 Many insurers issue investment contracts (ie financial instruments that do not transfer enough insurance risk to qualify as insurance contracts). Under IAS 39, the issuer measures investment contracts at either amortised cost or, with appropriate designation at inception, at fair value. Some aspects of the measurements under IAS 39 differ from the measurements that are often used at present under national accounting requirements for these contracts:

(a) The definition and treatment of transaction costs under IAS 39 may differ from the definition and treatment of acquisition costs in some national requirements.

(b) The condition in IAS 39 for treating a modification of a financial liability (or the exchange of the new liability for an old liability) as an extinguishment of the original liability may differ from equivalent national requirements.

(c) Future cash flows from assets do not affect the amortised cost or fair value of investment contract liabilities (unless the cash flows from the liabilities are contractually linked to the cash flows from the assets).

(d) The amortised cost of a financial liability is not adjusted when market interest rates change, even if the return on available assets is below the effective interest rate on the liability (unless the change in rates causes the liability cash flows to change).

(e) The fair value of a financial liability with a demand feature is not less than the amount payable on demand.

(f) The fair value of a financial instrument reflects its credit characteristics.

(g) Premiums received for an investment contract are not recognised as revenue under IAS 39, but as balance sheet movements, in the same way as a deposit received.

BC186 Some argued that the Board should not require insurers to change their accounting for investment contracts in phase I because the scope of phase I is intended to be limited and because the current treatment of such contracts is often very similar to the treatment of insurance contracts. However, the Board saw no reason to delay the application of IAS 39 to contracts that do not transfer significant insurance risk. The Board noted that some of these contracts have features, such as long maturities, recurring premiums and high initial

transaction costs, that are less common in other financial instruments. Nevertheless, applying a single set of accounting requirements to all financial instruments will make an insurer's financial statements more relevant and reliable.

BC187 Some contracts within the scope of IAS 39 grant cancellation or renewal rights to the holder. The cancellation or renewal rights are embedded derivatives and IAS 39 requires the issuer to measure them separately at fair value if they are not closely related to their host contract (unless the issuer elects to measure the entire contract at fair value).

Embedded derivatives

BC188 Some suggested that the Board should exempt insurers from the requirement to separate embedded derivatives contained in a host insurance contract and measure them at fair value under IAS 39. They argued that:

(a) separating these derivatives would require extensive and costly systems changes that might not be needed for phase II.

(b) some of these derivatives are intertwined with the host insurance contract in a way that would make separate measurement arbitrary and perhaps misleading, because the fair value of the whole contract might differ from the sum of the fair values of its components.

BC189 Some suggested that the inclusion of embedded options and guarantees in the cash flows used for a liability adequacy test could permit the Board to exempt some embedded derivatives from fair value measurement under IAS 39. Most proponents of this exemption implied that including only the intrinsic value of these items (ie without their time value) would suffice. However, because excluding the time value of these items could make an entity's financial statements much less relevant and reliable, the Board did not create such an exemption.

BC190 In the Board's view, fair value is the only relevant measurement basis for derivatives, because it is the only method that provides sufficient transparency in the financial statements. The cost of most derivatives is nil or immaterial. Hence if derivatives were measured at cost, they would not be included in the balance sheet and their success (or otherwise) in reducing risk, or their role in increasing risk, would not be visible. In addition, the value of derivatives often changes disproportionately in response to market movements (put another way, they are highly leveraged or carry a high level of risk). Fair value is the only measurement basis that can capture this leveraged nature of derivatives—information that is essential to communicate to users the nature of the rights and obligations inherent in derivatives.

BC191 IAS 39 requires entities to account separately for derivatives embedded in non-derivative contracts. This is necessary:

(a) to ensure that contractual rights and obligations that create similar risk exposures are treated in the same way whether or not they are embedded in a non-derivative contract.

 © IASCF

(b) to counter the possibility that entities might seek to avoid the requirement to measure derivatives at fair value by embedding a derivative in a non-derivative contract.

BC192 The requirement to separate embedded derivatives already applied to a host contract of any kind before the IFRS was issued. Exempting insurance contracts from that existing requirement would have been a retrograde step. Furthermore, much of the effort needed to measure embedded derivatives at fair value arises from the need to identify the derivatives and from other steps that will still be needed if the Board requires fair value measurement for phase II. In the Board's view, the incremental effort needed to identify the embedded derivatives separately in phase I is relatively small and is justified by the increased transparency that fair value measurement brings. IG Example 2 in the Implementation Guidance gives guidance on the treatment of various forms of embedded derivative.

BC193 Some embedded derivatives meet the definition of an insurance contract. It would be contradictory to require a fair value measurement in phase I of an insurance contract that is embedded in a larger contract when such measurement is not required for a stand-alone insurance contract. Therefore, the IFRS confirms that this is not required (paragraph 8). For the same reason, the Board concluded that an embedded derivative is closely related to the host insurance contract if the embedded derivative and host insurance contract are so interdependent that an entity cannot measure the embedded derivative separately (see new paragraph AG33(h) of IAS 39). Without this conclusion, paragraph 12 of IAS 39 would have required the insurer to measure the entire contract at fair value. An alternative approach would have been to retain that requirement, but require measurement at cost if an insurance contract cannot be measured reliably at fair value in its entirety, building on a similar treatment in IAS 39 for unquoted equity instruments. However, the Board did not intend to require fair value measurement for insurance contracts in phase I. Therefore, the Board decided not to require this even when it is possible to measure reliably the fair value of an insurance contract containing an embedded derivative.

BC194 The Board acknowledges that insurers need not, during phase I, recognise some potentially large exposures to items such as guaranteed annuity options and guaranteed minimum death benefits. These items create risks that many regard as predominantly financial, but if the payout is contingent on an event that creates significant insurance risk, these embedded derivatives meet the definition of an insurance contract. The IFRS requires specific disclosures about these items (paragraph 39(e)). In addition, the liability adequacy test requires an entity to consider them (see paragraphs BC94–BC104).

Elimination of internal items

BC195 Some respondents suggested that financial instruments issued by one entity to a life insurer in the same group should not be eliminated from the group's consolidated financial statements if the life insurer's assets are earmarked as security for policyholders' savings.

BC196 The Board noted that these financial instruments are not assets and liabilities from the group's perspective. The Board saw no justification for departing from the general principle that all intragroup transactions are eliminated, even if they are between components of an entity that have different stakeholders, for example policyholder funds and shareholder funds. However, although the transactions are eliminated, they may affect future cash flows. Hence, they may be relevant in measuring liabilities.

BC197 Some respondents argued that non-elimination would be consistent with the fact that financial instruments issued can (unless they are non-transferable) be plan assets in defined benefit plans under IAS 19 *Employee Benefits*. However, the Board did not view IAS 19 as a precedent in this area. IAS 19 requires a presentation net of plan assets because investment in plan assets reduces the obligation (IAS 19 Basis for Conclusions paragraph BC66). This presentation does not result in the recognition of new assets and liabilities.

Income taxes

BC198 Some respondents argued that discounting should be required, or at least permitted, for deferred tax relating to insurance contracts. The Board noted that discounting of a temporary difference is not relevant if an item's tax base and carrying amount are both determined on a present value basis.

Disclosure

BC199 The disclosure requirements are designed as a pair of high level principles, supplemented by some specified disclosures to meet those objectives. Implementation Guidance, published in a separate booklet,* discusses how an insurer might satisfy the requirements.

BC200 Although they agreed that insurers should be allowed flexibility in determining the levels of aggregation and amount of disclosure, some respondents suggested that the Board should introduce more specific and standardised disclosure requirements. Others suggested that the draft Implementation Guidance published with ED 5 was at too high a level to ensure consistency and comparability and that its non-mandatory nature might diminish its usefulness. Some were concerned that different levels of aggregation by different insurers could reduce comparability.

BC201 Nevertheless, the Board retained ED 5's approach. The Board viewed this as superior to requiring a long list of detailed and descriptive disclosures, because concentrating on the underlying principles:

(a) makes it easier for insurers to understand the rationale for the requirements, which promotes compliance.

(b) avoids 'hard-wiring' into the IFRS disclosures that may become obsolete, and encourages experimentation that will lead to improvements as techniques develop.

* but included in this volume.

 © IASCF

(c) avoids requiring specific disclosures that may not be needed to meet the underlying objectives in the circumstances of every insurer and could lead to information overload that obscures important information in a mass of detail.

(d) gives insurers flexibility to decide on an appropriate level of aggregation that enables users to see the overall picture but without combining information that has different characteristics.

BC202 Some respondents expressed the following general concerns about the proposed disclosure requirements in ED 5:

(a) The proposed volume of disclosure was excessive and some of it would duplicate extensive material included in some countries in prudential returns.

(b) Some of the proposed disclosures would be difficult and costly to prepare and audit, make it difficult to prepare timely financial statements and provide users with little value.

(c) The proposals in ED 5 would require excessive disclosure of sensitive pricing information and other confidential proprietary information.

(d) Some of the disclosures exceeded those required in other industries, which singled out insurers unfairly. Some felt that the level of disclosure would be particularly burdensome for small insurers, whereas others referred to the difficulty of aggregating information in a meaningful way for large international groups.

BC203 The two principles and most of the supporting requirements are applications of existing requirements in IFRSs, or relatively straightforward analogies with existing IFRS requirements (particularly IFRS 7 *Financial Instruments: Disclosures*).

BC203A IFRS 7 was issued in August 2005 and replaced the disclosure requirements in IAS 32, including those on which the disclosures originally in IFRS 4 were based. Accordingly, the Board amended the disclosure requirements in IFRS 4 to be consistent with IFRS 7, when possible. The Board noted that:

(a) insurers will have both insurance contracts and financial instruments. In particular, some of the investment products issued by insurers are financial instruments, not insurance contracts as defined in IFRS 4. It is more useful for users and easier for preparers if the risk disclosures for insurance contracts and financial instruments are the same.

(b) making the disclosure requirements of IFRS 4 consistent with IFRS 7 makes the disclosures easier to prepare. In particular, IFRS 7 removes the 'terms and conditions' disclosure previously in paragraph 39(b) of IFRS 4. Some commentators on ED 5 (the Exposure Draft that preceded IFRS 4) objected to this disclosure requirement, believing it to be onerous and not to provide the most useful information.

(c) the disclosures in IFRS 7 are designed to be implemented as a package, and if implemented piecemeal would result in less useful information for users. For example, the risk disclosures replace the 'terms and conditions' disclosure previously in paragraph 60(a) of IAS 32 and paragraph 39(b) of

IFRS 4. Merely updating the reference in paragraph 39(d) from IAS 32 to IFRS 7 would have resulted in some, but not all, of the risk disclosures being applicable to insurance contracts and the 'terms and conditions' disclosure being retained.

(d) as discussed in paragraph BC207, significant changes to the risk disclosures in paragraphs 38–39A are not expected as a result of phase II of the project on insurance contracts (although consequential changes may be needed to the accounting-related disclosures in paragraphs 36 and 37).

BC203B Some respondents, particularly preparers, did not agree that IFRS 4 should be amended as part of IFRS 7. In particular, some respondents argued that sensitivity analysis of market risk would be problematic for insurance contracts; they disagreed that such an analysis would be relatively easy to understand or calculate while issues relating to the measurement of fair value for insurance contracts remain unresolved. Those respondents suggested that disclosure requirements on sensitivity analysis should be considered during phase II of the project on insurance contracts, rather than in finalising IFRS 7. The Board noted that this requirement should not be unduly onerous for insurers, nor require them to provide quantitative information, because the sensitivity analysis applies only to changes in market risk variables that have an effect on profit or loss and equity in the period being reported. In addition, the Board noted that a sensitivity analysis is intended to replace the terms and conditions disclosures, which entities found onerous. The Board did not want to *require* insurers to comply with the older terms and conditions disclosures while allowing other entities to use the less onerous sensitivity analysis. However, the Board also noted that providing the sensitivity analysis would mean systems changes for some entities. Because the purpose of IFRS 4 was to minimise such changes pending the outcome of phase II, the Board did not want to require extensive systems changes for insurance contracts as a result of IFRS 7.

BC203C To address the concerns of those who do not want to make systems changes and those who want to substitute the new sensitivity analysis for the terms and conditions disclosures, the Board decided to permit a choice of sensitivity analysis disclosures for insurance risk only. Paragraph 39A of IFRS 4 has been added so that entities will be able to choose between providing:

(a) the terms and conditions disclosures, together with the qualitative sensitivity analysis currently permitted by IFRS 4; or

(b) the quantitative sensitivity analysis required by IFRS 7 (and permitted, but not required, by IFRS 4).

The Board permitted entities to choose to disclose a combination of qualitative and quantitative sensitivity analysis for insurance risk because it believes that entities should not be prevented from providing more useful information for some insurance risks, even if they do not have the ability to provide this information for all insurance risks. The Board noted that this option was a temporary solution to the problems cited in paragraph BC203B and would be eliminated in phase II.

 © IASCF

BC204 Many respondents asked the Board to clarify the status of the Implementation Guidance. In particular, some felt that the Implementation Guidance appeared to impose detailed and voluminous requirements that contradicted the Board's stated intention in paragraph BC201. In response to requests from respondents, the Board added paragraph IG12 to clarify the status of the implementation guidance on disclosure.

BC205 Some suggested that some of the disclosures, particularly those that are qualitative rather than quantitative or convey management's assertions about possible future developments, should be located outside the financial statements in a financial review by management. However, in the Board's view, the disclosure requirements are all essential and should be part of the financial statements.

BC206 Some argued that the disclosure requirements could be particularly onerous and less relevant for a subsidiary, especially if the parent guarantees the liabilities or the parent reinsures all the liabilities. However, the Board decided that no exemptions from the disclosure principles were justified. Nevertheless, the high level and flexible approach adopted by the Board enables a subsidiary to disclose the required information in a way that suits its circumstances.

BC207 Some respondents expressed concerns that the disclosure proposals in ED 5 might require extensive systems changes in phase I that might not be needed in phase II. The Board expects that both disclosure principles will remain largely unchanged for phase II, although the guidance to support them may need refinement because different information will be available and because insurers will have experience of developing systems to meet the disclosure principles in phase I.

Materiality

BC208 Some respondents expressed concerns that the IFRS (reinforced by the Implementation Guidance) might require disclosure of excessively detailed information that might not be beneficial to users. In response to these concerns, the Board included in the Implementation Guidance a discussion of materiality taken from IAS 1.

BC209 Some respondents suggested that some of the qualitative disclosures should not be subject to the normal materiality threshold, which might, in their view, lead to excessive disclosure. They proposed using different terminology, such as 'significant', to reinforce that message. However, the Board noted that not requiring disclosure of material information would be inconsistent with the definition of materiality. Thus, the Board concluded that the disclosure should, in general, rely solely on the normal definition of materiality.

BC210 In one place, the IFRS refers to a different notion. Paragraph 37(c) refers to 'the assumptions that have the greatest effect on the measurement of' assets, liabilities, income and expense arising from insurance contracts. Because many assumptions could be relevant, the Board decided to narrow the scope of the disclosure somewhat.

Explanation of recognised amounts

Assumptions

BC211 The first disclosure principle in the IFRS requires disclosure of amounts in an insurer's balance sheet[*] and income statement[†] that arise from insurance contracts (paragraph 36 of the IFRS). In support of this principle, paragraph 37(c) and (d) requires disclosure about assumptions and changes in assumptions. The disclosure of assumptions both assists users in testing reported information for sensitivity to changes in those assumptions and enhances their confidence in the transparency and comparability of the information.

BC212 Some expressed concerns that information about assumptions and changes in assumptions might be costly to prepare and of limited usefulness. There are many possible assumptions that could be disclosed: excessive aggregation would result in meaningless information, whereas excessive disaggregation could be costly, lead to information overload, and reveal commercially sensitive information. In response to these concerns, the disclosure about the assumptions focuses on the process used to derive them.

BC213 Some respondents argued that it is difficult to disclose meaningful information about changes in interdependent assumptions. As a result, an analysis by sources of change often depends on the order in which the analysis is performed. To acknowledge this difficulty, the IFRS does not specify a rigid format or contents for this analysis. This allows insurers to analyse the changes in a way that meets the objective of the disclosure and is appropriate for the risks they face and the systems that they have, or can enhance at a reasonable cost.

Changes in insurance liabilities

BC214 Paragraph 37(e) of the IFRS requires a reconciliation of changes in insurance liabilities, reinsurance assets and, if any, deferred acquisition costs. IAS 37 requires broadly comparable disclosure of changes in provisions, but the scope of IAS 37 excludes insurance contracts. Disclosure about changes in deferred acquisition costs is important because some existing methods use adjustments to deferred acquisition costs as a means of recognising some effects of remeasuring the future cash flows from an insurance contract (for example, to reflect the result of a liability adequacy test).

Nature and extent of risks arising from insurance contracts

BC215 The second disclosure principle in the IFRS requires disclosure of information that enables users to understand the nature and extent of risks arising from insurance contracts (paragraph 38 of the IFRS). The Implementation Guidance supporting this principle builds largely on existing requirements in IFRSs, particularly the disclosures for financial instruments in IFRS 7.

---

[*] IAS 1 *Presentation of Financial Statements* (as revised in 2007) replaced the term 'balance sheet' with 'statement of financial position'.

[†] IAS 1 (revised 2007) requires an entity to present all income and expense items in one statement of comprehensive income or in two statements (a separate income statement and a statement of comprehensive income).

 © IASCF

BC216 Some respondents read the draft Implementation Guidance accompanying ED 5 as implying that the IFRS would require disclosures of estimated cash flows. That was not the Board's intention because insurers cannot be expected to have systems to prepare detailed estimates of cash flows in phase I (beyond what is needed for the liability adequacy test). The Board revised the Implementation Guidance to emphasise that the second disclosure principle requires disclosure **about** cash flows (ie disclosure that helps users understand their amount, timing and uncertainty), not disclosure **of** cash flows.*

Insurance risk

BC217 For insurance risk (paragraph 39(c)), the disclosures are intended to be consistent with the spirit of the disclosures required by IAS 32.† The usefulness of particular disclosures about insurance risk depends on the circumstances of a particular insurer. Therefore, the requirements are written in general terms to allow practice in this area to evolve.

Sensitivity analysis

BC218 Paragraph 39(c)(i) requires disclosure of a sensitivity analysis. The Board decided not to include specific requirements that may not be appropriate in every case and could impede the development of more useful forms of disclosure or become obsolete.

BC219 IAS 32† requires disclosure of a sensitivity analysis only for assumptions that are not supported by observable market prices or rates. However, because the IFRS does not require a specific method of accounting for embedded options and guarantees, including some that are partly dependent on observable market prices or rates, paragraph 39(c)(i) requires a sensitivity analysis for all variables that have a material effect, including variables that are observable market prices or rates.

Claims development

BC220 Paragraph 39(c)(iii) requires disclosure about claims development. The US Securities and Exchange Commission requires property and casualty insurers to provide a table showing the development of provisions for unpaid claims and claim adjustment expenses for the previous ten years, if the provisions exceed 50 per cent of equity. The Board noted that the period of ten years is arbitrary and decided instead to set the period covered by this disclosure by reference to the length of the claims settlement cycle. Therefore, the IFRS requires that the disclosure should go back to the period when the earliest material claim arose for which there is still uncertainty about the amount and timing of the claims payments, but need not go back more than ten years (subject to transitional exemptions in paragraph 44 of the IFRS). Furthermore, the proposal applies to all insurers, not only to property and casualty insurers. However, because an insurer need not disclose this information for claims for

* IFRS 7 replaced the required disclosures about cash flows with required disclosures about the nature and extent of risks.

† In August 2005, the IASB relocated all disclosures relating to financial instruments to IFRS 7 *Financial Instruments: Disclosures*.

which uncertainty about the amount and timing of claims payments is typically resolved within one year, it is unlikely that many life insurers would need to give this disclosure.

BC221 In the US, disclosure of claims development is generally presented in management's discussion and analysis, rather than in the financial statements. However, this disclosure is important because it gives users insights into the uncertainty surrounding estimates about future claims, and also indicates whether a particular insurer has tended to overestimate or underestimate ultimate payments. Therefore, the IFRS requires it in the financial statements.

Probable maximum loss

BC222 Some suggested that an insurer—particularly a general insurer—should disclose the probable maximum loss (PML) that it would expect if a reasonably extreme event occurred. For example, an insurer might disclose the loss that it would suffer from a severe earthquake of the kind that would be expected to recur every one hundred years, on average. However, given the lack of a widely agreed definition of PML, the Board concluded that it is not feasible to require disclosure of PML or similar measures.

Exposures to interest rate risk or market risk

BC223 As discussed in paragraphs BC193 and BC194, the Board confirmed that an insurer need not account at fair value for embedded derivatives that meet the definition of an insurance contract, but also create material exposures to interest rate risk or market risk. For many insurers, these exposures can be large. Therefore, paragraph 39(e) of the IFRS specifically requires disclosures about these exposures.

Fair value of insurance liabilities and insurance assets

BC224 ED 5 proposed that an insurer should disclose the fair value of its insurance liabilities and insurance assets. This proposal was intended (a) to give useful information to users of an insurer's financial statements and (b) to encourage insurers to begin work on systems that use updated information, to minimise the transition period for phase II.

BC225 Some respondents supported the proposed disclosure of fair value, arguing that it is important information for users. Some felt that this would be particularly important given the range of measurement practices in phase I. However, many respondents (including some who supported a fair value disclosure requirement in principle) suggested that the Board should delete this requirement or suspend it until phase II is completed. They offered the following arguments:

(a) Requiring such disclosure would be premature before the Board resolves significant issues about fair value measurement and gives adequate guidance on how to determine fair value. The lack of guidance would lead to lack of comparability for users, place unreasonable demands on preparers and pose problems of auditability. Furthermore, disclosure cannot rectify that lack of comparability because it is difficult to describe the features of different models clearly and concisely.

 © IASCF

(b) Disclosure by 2006 (as proposed in ED 5) would be impracticable because insurers would not have time to create and test the necessary systems.

(c) Expecting insurers to begin work on an unknown objective would be costly and waste time. Furthermore, in the absence of agreed methods for developing fair value, the systems developed for phase I disclosures of fair value might need changes for phase II.

(d) The proposal asked for a mandate for the IASB to interpret its own requirement before explaining what it means.

BC226 The Board did not view the proposed requirement to disclose fair value as conditional on the measurement model for phase II. In the Board's view, disclosure of the fair value of insurance liabilities and insurance assets would provide relevant and reliable information for users even if phase II does not result in a fair value model. However, the Board agreed with respondents that requiring disclosure of fair value would not be appropriate at this stage.

Summary of changes from ED 5

BC227 The following is a summary of the main changes from ED 5 to the IFRS. The Board:

(a) clarified aspects of the definition of an insurance contract (paragraphs BC36 and BC37).

(b) clarified the requirement to unbundle deposit components in some (limited) circumstances (paragraphs BC40–BC54).

(c) deleted the 'sunset clause' proposed in ED 5 (paragraphs BC84 and BC85).

(d) clarified the need to consider embedded options and guarantees in a liability adequacy test (paragraph BC99) and clarified the level of aggregation for the liability adequacy test (paragraph BC100).

(e) replaced the impairment test for reinsurance assets. Instead of referring to IAS 36 (which contained no scope exclusion for reinsurance assets before the Board issued IFRS 4), the test will refer to IAS 39 (paragraphs BC107 and BC108).

(f) deleted the proposed ban on recognising a gain at inception of a reinsurance contract, and replaced this with a disclosure requirement (paragraphs BC109–BC114).

(g) clarified the treatment of acquisition costs for contracts that involve the provision of investment management services (paragraphs BC118 and BC119).

(h) changed the prohibition on introducing asset-based discount rates into a rebuttable presumption (paragraphs BC134–BC144).

(i) clarified aspects of the treatment of discretionary participation features (paragraphs BC154–BC165) and created an explicit new exemption from the requirement to separate, and measure at fair value, some options to surrender a contract with a discretionary participation feature (paragraph 9 of the IFRS).

© IASCF

(j) introduced an option for an insurer to change its accounting policies so that it remeasures designated insurance liabilities in each period for changes in interest rates. This election permits a change in accounting policies that is applied to some liabilities, but not to all similar liabilities as IAS 8 would otherwise require (paragraphs BC174–BC177).

(k) amended IAS 40 to permit two separate elections for investment property when an entity selects the fair value model or the cost model. One election is for investment property backing contracts that pay a return linked directly to the fair value of, or returns from, that investment property. The other election is for all other investment property (paragraph BC178).

(l) clarified the applicability of shadow accounting (paragraphs BC181–BC184).

(m) clarified that an embedded derivative is closely related to the host insurance contract if they are so interdependent that an entity cannot measure the embedded derivative separately (ie without considering the host contract) (paragraph BC193).

(n) clarified that the Implementation Guidance does not impose new disclosure requirements (paragraph BC204).

(o) deleted the proposed requirement to disclose the fair value of insurance contracts from 2006 (paragraphs BC224–BC226).

(p) provided an exemption from applying most disclosure requirements for insurance contracts to comparatives that relate to 2004 (paragraphs 42–44 of the IFRS).

(q) confirmed that unit-denominated payments can be measured at current unit values, for both insurance contracts and investment contracts, avoiding the apparent need to separate an ‘embedded derivative’ (paragraph AG33(g) of IAS 39, inserted by the IFRS).

Dissenting opinions

DO1 Professor Barth and Messrs Garnett, Gélard, Leisenring, Smith and Yamada dissent from the issue of IFRS 4.

Dissent of Mary E Barth, Robert P Garnett, Gilbert Gélard, James J Leisenring and John T Smith

DO2 Messrs Garnett and Gélard dissent for the reasons given in paragraphs DO3 and DO4 and Mr Garnett also dissents for the reasons given in paragraphs DO5 and DO6. Professor Barth and Messrs Leisenring and Smith dissent for the reasons given in paragraphs DO3–DO8 and Mr Smith also dissents for the reasons given in paragraphs DO9–DO13.

Temporary exemption from paragraphs 10–12 of IAS 8

DO3 Professor Barth and Messrs Garnett, Gélard, Leisenring and Smith dissent because IFRS 4 exempts an entity from applying paragraphs 10–12 of IAS 8 *Accounting Policies, Changes in Accounting Estimates and Errors* when accounting for insurance and reinsurance contracts. They believe that all entities should be required to apply these paragraphs. These Board members believe that the requirements in IAS 8 have particular relevance and applicability when an IFRS lacks specificities, as does IFRS 4, which allows the continuation of a variety of measurement bases for insurance and reinsurance contracts. Because of the failure to consider the IASB *Framework*, continuation of such practices may result in the inappropriate recognition of, or inappropriate failure to recognise, assets, liabilities, equity, income and expense. In these Board members' view, if an entity cannot meet the basic requirements of paragraphs 10–12 of IAS 8, it should not be allowed to describe its financial statements as being in accordance with International Financial Reporting Standards.

DO4 These Board members' concerns are heightened by the delay in completing phase II of the Board's project on accounting for insurance contracts. Although phase II is on the Board's active agenda, it is unlikely that the Board will be able to develop an IFRS on insurance contracts in the near term. Accordingly, it is likely that the exemption from IAS 8 will be in place for some time.

Future investment margins and shadow accounting

DO5 Professor Barth and Messrs Garnett, Leisenring and Smith dissent for the further reason that they would not permit entities to change their accounting policies for insurance and reinsurance contracts to policies that include using future investment margins in the measurement of insurance liabilities. They agree with the view expressed in paragraph BC134 that cash flows from an asset are irrelevant for the measurement of a liability (unless those cash flows affect the cash flows arising from the liability or the credit characteristics of the liability). Therefore, they believe that changing to an accounting policy for insurance

contracts that uses future investment margins to measure liabilities arising from insurance contracts reduces the relevance and reliability of an insurer's financial statements. They do not believe that other aspects of an accounting model for insurance contracts can outweigh this reduction.

DO6 These four Board members also would not permit entities to change their accounting policies for insurance and reinsurance contracts to policies that include using what is called shadow accounting. They do not believe that the changes in the carrying amount of insurance liabilities (including related deferred acquisition costs and intangible assets) under shadow accounting should be recognised directly in equity. That these changes in the measurement of the liability are calculated on the basis of changes in the measurement of assets is irrelevant. These Board members believe that these changes in insurance liabilities result in expenses that under the IASB *Framework* should be recognised in profit or loss.

Financial instruments with a discretionary participation feature*

DO7 Professor Barth and Messrs Leisenring and Smith would not permit entities to account for a financial instrument with a discretionary participation feature on a basis that differs from that required by IAS 32 *Financial Instruments: Disclosure and Presentation* and IAS 39 *Financial Instruments: Recognition and Measurement*. Those Standards require entities to separate the components of a compound financial instrument, recognise the liability component initially at fair value, and attribute any residual to the equity component. These three Board members believe that the difficulty in determining whether a discretionary participation feature is a liability or equity does not preclude applying the measurement requirements in IAS 39 to the liability and equity components once the entity makes that determination. These three Board members believe that an entity would misstate interest expense if the financial liability component is not initially measured at its fair value.

DO8 These three Board members would require entities to ensure in all cases that the liability recognised for financial instruments with a discretionary participation feature is no less than the amount that would result from applying IAS 39 to the guaranteed element. Paragraph 35 of IFRS 4 requires this if an entity classifies none or some of the feature as a liability, but not if it classifies all of the feature as a liability.

Financial instruments*

DO9 Mr Smith also dissents from IFRS 4 because he believes it defines insurance contracts too broadly and makes unnecessary exceptions to the scope of IAS 32 and IAS 39. In his view, this permits the structuring of contractual provisions to avoid the requirements of those Standards, diminishing their effectiveness and adding considerable complexity in interpreting and applying them and IFRS 4. He believes that many of the exceptions, based on the desire to avoid systems changes, are unnecessary because they generally are unrelated to the second

* In November 2009 the IASB amended the requirements of IAS 39 relating to classification and measurement of assets within the scope of IAS 39 and relocated them to IFRS 9 *Financial Instruments*. IFRS 9 applies to all assets within the scope of IAS 39.

 © IASCF

phase of the project on insurance contracts, and they create a disincentive to enhance systems before the second phase of that project is completed. Mr Smith believes that IAS 32 and IAS 39 already contain the appropriate solutions when measurements cannot be made reliably and those solutions make systems limitations transparent.

DO10 Paragraph 10 of IFRS 4 requires an insurer to unbundle a deposit component of an insurance contract if the insurer can measure the deposit component separately and the insurer's accounting policies do not otherwise require it to recognise all rights and obligations arising from the deposit component. Mr Smith notes that the deposit component consists entirely of financial liabilities or financial assets. Therefore, he believes that the deposit component of all insurance contracts should be unbundled. Mr Smith notes that IAS 32 already requires the liability component of a compound financial instrument to be separated at its fair value with any residual accounted for as equity. He believes this approach could be applied by analogy when an insurance contract contains a financial liability and would represent a superior solution.

DO11 IFRS 4 amends IAS 39 by stating that an embedded derivative and the host insurance contract are closely related if they are so interdependent that the entity cannot measure the embedded derivative separately. This creates an exemption from the requirement in IAS 39 to account for such embedded derivatives at fair value. Mr Smith disagrees with that change. In particular, if a contract permits a policyholder to obtain a derivative-based cash settlement in lieu of maintaining insurance, Mr Smith believes that the derivative-based cash settlement alternative is a financial liability and should be measured at fair value.

DO12 For the contracts discussed in the previous paragraph, Mr Smith believes that IAS 39 already provides a superior solution that will not promote structuring to take advantage of an exception to IAS 39. It requires the entire contract to be measured at fair value when an embedded derivative cannot be reliably separated from the host contract. However, Mr Smith would amend IAS 39 to require measurement at cost if a contract cannot be measured reliably at fair value in its entirety and contains a significant insurance component as well as an embedded derivative. This amendment would be consistent with similar requirements in IAS 39 for unquoted equity instruments. To make systems limitations more transparent, Mr Smith would add the disclosure required by IAS 32, including the fact that fair value cannot be measured reliably, a description of the insurance contracts in question, their carrying amounts, an explanation of why fair value cannot be measured reliably and, if possible, the range of estimates within which fair value is likely to fall.

DO13 Mr Smith would exclude from the definition of an insurance contract those contracts that are regarded as transferring significant insurance risk at inception only because they include a pricing option permitting the holder to purchase insurance at a specified price at a later date. He would also exclude from the definition those contracts in which the insurance component has expired. He believes that any remaining obligation is a financial instrument that should be accounted for under IAS 39.

Dissent of Tatsumi Yamada

DO14 Mr Yamada dissents from the issue of IFRS 4 because he believes that it does not resolve appropriately the mismatch in measurement base between financial assets of insurers and their insurance liabilities. Specifically:

(a) he disagrees with the inclusion of an option to introduce a current discount rate for designated insurance liabilities.

(b) he believes that the Board should have provided a practicable means to reduce the effect of the accounting mismatch using methods based partly on some existing practices that involve broader, but constrained, use of amortised cost.

Option to introduce a current discount rate

DO15 Mr Yamada disagrees with paragraph 24 of the IFRS, which creates an option to introduce a current market-based discount rate for designated insurance liabilities. He has sympathy for the view expressed in paragraph BC175 that introducing a current market-based discount rate for insurance liabilities rather than a historical discount rate would improve the relevance and reliability of an insurer's financial statements. However, as explained in paragraph BC126, 'the Board will not address discount rates and the basis for risk adjustments until phase II.' Therefore, Mr Yamada believes that it is not appropriate to deal with measurement of insurance liabilities in phase I of this project.

DO16 In addition, Mr Yamada believes that there should be a stringent test to assess whether changes in the carrying amount of the designated insurance liabilities mitigate the changes in carrying amount of financial assets. Without such a test, management will have a free choice to decide the extent to which it introduces remeasurement of insurance liabilities. Therefore, he does not agree with the Board's conclusion in paragraph BC176 that 'the increase in relevance and reliability from introducing a current discount rate could outweigh the disadvantages of permitting accounting policies that are not applied consistently to all similar liabilities'.

DO17 Furthermore, the option introduced by paragraph 24 is not an effective way to reduce the accounting mismatch, in Mr Yamada's view. He agrees with the Board's analysis that 'many insurers may not have systems to adjust liabilities for changes in interest rates and may not wish to develop such systems, even for designated liabilities as opposed to all liabilities', as explained in paragraph BC177(d)(i).

Assets held to back insurance liabilities*

DO18 As stated in paragraph BC171, many of the respondents to ED 5 urged the Board to explore ways of reducing the accounting mismatch. Mr Yamada notes that IFRS 4 provides some limited solutions for the accounting mismatch by clarifying that shadow accounting can be used and amending IAS 40 to permit two separate

* In November 2009 the IASB amended the requirements of IAS 39 relating to classification and measurement of assets within the scope of IAS 39 and relocated them to IFRS 9 *Financial Instruments*. IFRS 9 applies to all assets within the scope of IAS 39.

 © IASCF

elections when an entity selects the fair value model or the cost model for investment property. IFRS 4 also provides an option to introduce a current market-based discount rate for designated insurance liabilities but, for reasons given in paragraphs DO15–DO17, Mr Yamada does not support that option.

DO19 Mr Yamada believes that it would have been appropriate to provide a more broadly applicable way of mitigating the effect of the accounting mismatch. Because phase I is only a stepping stone to phase II, Mr Yamada is of the view that the only practicable solution in the short term is one based on the existing practices of insurers. He believes that if remeasurement of insurance liabilities by a current market-based discount rate is allowed as means of resolving the mismatch, a new category of assets carried at amortised cost such as the Japanese 'debt securities earmarked for policy reserve' (DSR) should also have been allowed in phase I.

DO20 Although Mr Yamada acknowledges that the DSR approach would not lead to more relevant and reliable measurements, he notes that insurers have several years' experience of using this approach, which was created in 2000 when Japan introduced an accounting standard for financial instruments that is similar to IASs 32 and 39. He believes that no perfect solution is available in phase I and together with the disclosure of fair value information required by IAS 32, the DSR approach would provide a reasonable solution for phase I. Therefore he does not agree with the Board's conclusion in paragraph BC178 that amending the existing measurement requirements in IAS 39 for financial assets 'would have reduced the relevance and reliability of financial statements to an unacceptable extent'. Indeed, Mr Yamada believes the exemption in IFRS 4 from paragraphs 10–12 of IAS 8 could impair the relevance and reliability of financial statements more than introducing the DSR approach would have done.

Guidance on implementing IFRS 4 *Insurance Contracts*

This guidance accompanies, but is not part of, IFRS 4.

Introduction

IG1 This implementation guidance:

(a) illustrates which contracts and embedded derivatives are within the scope of the IFRS (see paragraphs IG2–IG4).

(b) includes an example of an insurance contract containing a deposit component that needs to be unbundled (paragraph IG5).

(c) illustrates shadow accounting (paragraphs IG6–IG10).

(d) discusses how an insurer might satisfy the disclosure requirements in the IFRS (paragraphs IG11–IG71).

Definition of insurance contract

IG2 IG Example 1 illustrates the application of the definition of an insurance contract. The example does not illustrate all possible circumstances.

IG Example 1: Application of the definition of an insurance contract		
Contract type		***Treatment in phase I***
1.1	Insurance contract (see definition in Appendix A of the IFRS and guidance in Appendix B).	Within the scope of the IFRS, unless covered by scope exclusions in paragraph 4 of the IFRS. Some embedded derivatives and deposit components must be separated (see IG Examples 2 and 3 and paragraphs 7–12 of the IFRS).
1.2	Death benefit that could exceed amounts payable on surrender or maturity.	Insurance contract (unless contingent amount is insignificant in all scenarios that have commercial substance). Insurer could suffer a significant loss on an individual contract if the policyholder dies early. See IG Examples 1.23–27 for further discussion of surrender penalties.
1.3	A unit-linked contract that pays benefits linked to the fair value of a pool of assets. The benefit is 100 per cent of the unit value on surrender or maturity and 101 per cent of the unit value on death.	This contract contains a deposit component (100 per cent of unit value) and an insurance component (additional death benefit of 1 per cent). Paragraph 10 of the IFRS permits unbundling (but requires it only if the insurance component is material and the issuer would not otherwise recognise all obligations and rights arising under the deposit component). If the insurance component is not unbundled, the whole contract is an investment contract because the insurance component is insignificant in relation to the whole contract.
		continued…

...continued

IG Example 1: Application of the definition of an insurance contract

	Contract type	*Treatment in phase I*
1.4	Life-contingent annuity.	Insurance contract (unless contingent amount is insignificant in all scenarios that have commercial substance). Insurer could suffer a significant loss on an individual contract if the annuitant survives longer than expected.
1.5	Pure endowment. The insured person receives a payment on survival to a specified date, but beneficiaries receive nothing if the insured person dies before then.	Insurance contract (unless the transfer of insurance risk is insignificant). If a relatively homogeneous book of pure endowments is known to consist of contracts that all transfer insurance risk, the insurer may classify the entire book as insurance contracts without examining each contract to identify a few non-derivative pure endowments that transfer insignificant insurance risk (see paragraph B25).
1.6	Deferred annuity: policyholder will receive, or can elect to receive, a life-contingent annuity at rates guaranteed at inception.	Insurance contract (unless the transfer of insurance risk is insignificant). The contract transfers mortality risk to the insurer at inception, because the insurer might have to pay significant additional benefits for an individual contract if the annuitant elects to take the life-contingent annuity and survives longer than expected (unless the contingent amount is insignificant in all scenarios that have commercial substance).
1.7	Deferred annuity: policyholder will receive, or can elect to receive, a life-contingent annuity at rates prevailing when the annuity begins.	Not an insurance contract at inception, if the insurer can reprice the mortality risk without constraints. Within the scope of IAS 39 *Financial Instruments: Recognition and Measurement* unless the contract contains a discretionary participation feature. Will become an insurance contract when the annuity rate is fixed (unless the contingent amount is insignificant in all scenarios that have commercial substance).
1.8	Investment contract[(a)] that does not contain a discretionary participation feature.	Within the scope of IAS 39.
1.9	Investment contract containing a discretionary participation feature.	Paragraph 35 of the IFRS sets out requirements for these contracts, which are excluded from the scope of IAS 39.
1.10	Investment contract in which payments are contractually linked (with no discretion) to returns on a specified pool of assets held by the issuer.	Within the scope of IAS 39. Payments denominated in unit values representing the fair value of the specified assets are measured at current unit value (see paragraph AG33(g) of Appendix A of IAS 39).

continued...

 © IASCF

...continued

IG Example 1: Application of the definition of an insurance contract

	Contract type	*Treatment in phase I*
1.11	Contract that requires the issuer to make specified payments to reimburse the holder for a loss it incurs because a specified debtor fails to make payment when due under the original or modified terms of a debt instrument. The contract may have various legal forms (eg insurance contract, guarantee or letter of credit).	Insurance contract, but within the scope of IAS 39, not IFRS 4. However, if the issuer has previously asserted explicitly that it regards such contracts as insurance contracts and has used accounting applicable to insurance contracts, the issuer may elect to apply either IAS 39 and IAS 32[b] or IFRS 4 to such financial guarantee contracts. The legal form of the contract does not affect its recognition and measurement. Accounting by the holder of such a contract is excluded from the scope of IAS 39 and IFRS 4 (unless the contract is a reinsurance contract). Therefore, paragraphs 10–12 of IAS 8 *Accounting Policies, Changes in Accounting Estimates and Errors* apply. Those paragraphs specify criteria to use in developing an accounting policy if no IFRS applies specifically to an item.
1.12	A credit-related guarantee that does not, as a precondition for payment, require that the holder is exposed to, and has incurred a loss on, the failure of the debtor to make payments on the guaranteed asset when due. An example of such a guarantee is one that requires payments in response to changes in a specified credit rating or credit index.	Not an insurance contract. A derivative within the scope of IAS 39.
1.13	Guarantee fund established by contract. The contract requires all participants to pay contributions to the fund so that it can meet obligations incurred by participants (and, perhaps, others). Participants would typically be from a single industry, eg insurance, banking or travel.	The contract that establishes the guarantee fund is an insurance contract (see IG Example 1.11).
1.14	Guarantee fund established by law.	The commitment of participants to contribute to the fund is not established by a contract, so there is no insurance contract. Within the scope of IAS 37 *Provisions, Contingent Liabilities and Contingent Assets*.

continued...

...continued

IG Example 1: Application of the definition of an insurance contract

Contract type		Treatment in phase I
1.15	Residual value insurance or residual value guarantee. Guarantee by one party of the fair value at a future date of a non-financial asset held by a beneficiary of the insurance or guarantee.	Insurance contract within the scope of the IFRS (unless changes in the condition of the asset have an insignificant effect). The risk of changes in the fair value of the non-financial asset is not a financial risk because the fair value reflects not only changes in market prices for such assets (a financial variable) but also the condition of the specific asset held (a non-financial variable). However, if the contract compensates the beneficiary only for changes in market prices and not for changes in the condition of the beneficiary's asset, the contract is a derivative and within the scope of IAS 39. Residual value guarantees given by a lessee under a finance lease are within the scope of IAS 17 *Leases*.
1.16	Product warranties issued directly by a manufacturer, dealer or retailer.	Insurance contracts, but excluded from the scope of the IFRS (see IAS 18 *Revenue* and IAS 37).
1.17	Product warranties issued by a third party.	Insurance contracts, no scope exclusion. Same treatment as other insurance contracts.
1.18	Group insurance contract that gives the insurer an enforceable and non-cancellable contractual right to recover all claims paid out of future premiums, with appropriate compensation for the time value of money.	Insurance risk is insignificant. Therefore, the contract is a financial asset within the scope of IFRS 9. Servicing fees are within the scope of IAS 18 (recognise as services are provided, subject to various conditions).
1.19	Catastrophe bond: bond in which principal, interest payments or both are reduced if a specified triggering event occurs and the triggering event does not include a condition that the issuer of the bond suffered a loss.	Financial instrument with embedded derivative. Both the holder and the issuer measure the embedded derivative at fair value.

continued...

 © IASCF

...continued

IG Example 1: Application of the definition of an insurance contract

	Contract type	*Treatment in phase I*
1.20	Catastrophe bond: bond in which principal, interest payments or both are reduced significantly if a specified triggering event occurs and the triggering event includes a condition that the issuer of the bond suffered a loss.	The contract is an insurance contract, and contains an insurance component (with the issuer as policyholder and the holder as the insurer) and a deposit component. (a) If specified conditions are met, paragraph 10 of the IFRS requires the holder to unbundle the deposit component and apply IAS 39 to it. (b) The issuer accounts for the insurance component as reinsurance if it uses the bond for that purpose. If the issuer does not use the insurance component as reinsurance, it is not within the scope of the IFRS, which does not address accounting by policyholders for direct insurance contracts. (c) Under paragraph 13 of the IFRS, the holder could continue its existing accounting for the insurance component, unless that involves the practices prohibited by paragraph 14.
1.21	An insurance contract issued by an insurer to a defined benefit pension plan covering the employees of the insurer, or of another entity consolidated within the same financial statements as the insurer.	The contract will generally be eliminated from the financial statements, which will include: (a) the full amount of the pension obligation under IAS 19 *Employee Benefits*, with no deduction for the plan's rights under the contract. (b) no liability to policyholders under the contract. (c) the assets backing the contract.
1.22	An insurance contract issued to employees as a result of a defined contribution pension plan. The contractual benefits for employee service in the current and prior periods are not contingent on future service. The insurer also issues similar contracts on the same terms to third parties.	Insurance contract within the scope of the IFRS. If the employer pays part or all of the employee's premiums, the payment by the employer is an employee benefit within the scope of IAS 19. See also IAS 19, paragraphs 39–42 and 104–104D. Furthermore, a 'qualifying insurance policy' as defined in IAS 19 need not meet the definition of an insurance contract in this IFRS.

continued...

...continued

IG Example 1: Application of the definition of an insurance contract

	Contract type	***Treatment in phase I***
1.23	Loan contract containing a prepayment fee that is waived if prepayment results from the borrower's death.	Not an insurance contract. Before entering into the contract, the borrower faced no risk corresponding to the prepayment fee. Hence, although the loan contract exposes the lender to mortality risk, it does not transfer a pre-existing risk from the borrower. Thus, the risk associated with the possible waiver on death of the prepayment fee is not insurance risk (paragraphs B12 and B24(b) of Appendix B of the IFRS).
1.24	Loan contract that waives repayment of the entire loan balance if the borrower dies.	This contract contains a deposit component (the loan) and an insurance component (waiver of the loan balance on death, equivalent to a cash death benefit). If specified conditions are met, paragraph 10 of the IFRS requires or permits unbundling. If the insurance component is not unbundled, the contract is an insurance contract if the insurance component is significant in relation to the whole contract.
1.25	A contract permits the issuer to deduct a market value adjustment (MVA) from surrender values or death benefits to reflect current market prices for the underlying assets. The contract does not permit an MVA for maturity benefits.	The policyholder obtains an additional survival benefit because no MVA is applied at maturity. That benefit is a pure endowment (see IG Example 1.5). If the risk transferred by that benefit is significant, the contract is an insurance contract.
1.26	A contract permits the issuer to deduct an MVA from surrender values or maturity payments to reflect current market prices for the underlying assets. The contract does not permit an MVA for death benefits.	The policyholder obtains an additional death benefit because no MVA is applied on death. If the risk transferred by that benefit is significant, the contract is an insurance contract.
1.27	A contract permits the issuer to deduct an MVA from surrender payments to reflect current market prices for the underlying assets. The contract does not permit an MVA for death and maturity benefits. The amount payable on death or maturity is the amount originally invested plus interest.	The policyholder obtains an additional benefit because no MVA is applied on death or maturity. However, that benefit does not transfer insurance risk from the policyholder because it is certain that the policyholder will live or die and the amount payable on death or maturity is adjusted for the time value of money (see paragraph B27 of the IFRS). The contract is an investment contract. This contract combines the two features discussed in IG Examples 1.25 and 1.26. When considered separately, those two features transfer insurance risk. However, when combined, they do not transfer insurance risk. Therefore, it is not appropriate to separate this contract into two 'insurance' components.

continued...

© IASCF

...continued

IG Example 1: Application of the definition of an insurance contract

	Contract type	*Treatment in phase I*
		If the amount payable on death were not adjusted in full for the time value of money, or were adjusted in some other way, the contract might transfer insurance risk. If that insurance risk is significant, the contract is an insurance contract.
1.28	A contract meets the definition of an insurance contract. It was issued by one entity in a group (for example a captive insurer) to another entity in the same group.	If the entities present individual or separate financial statements, they treat the contract as an insurance contract in those individual or separate financial statements (see IAS 27 *Consolidated and Separate Financial Statements*). The transaction is eliminated from the group's consolidated financial statements. If the intragroup contract is reinsured with a third party that is not part of the group, the reinsurance contract is treated as a direct insurance contract in the consolidated financial statements because the intragroup contract is eliminated on consolidation.
1.29	An agreement that entity A will compensate entity B for losses on one or more contracts issued by entity B that do not transfer significant insurance risk.	The contract is an insurance contract if it transfers significant insurance risk from entity B to entity A, even if some or all of the individual contracts do not transfer significant insurance risk to entity B. The contract is a reinsurance contract if any of the contracts issued by entity B are insurance contracts. Otherwise, the contract is a direct insurance contract.

(a) The term 'investment contract' is an informal term used for ease of discussion. It refers to a financial instrument that does not meet the definition of an insurance contract.

(b) When an entity applies IFRS 7 *Financial Instruments: Disclosures*, the reference to IAS 32 is replaced by a reference to IFRS 7.

Embedded derivatives

IG3 IAS 39 requires an entity to separate embedded derivatives that meet specified conditions from the host instrument that contains them, measure the embedded derivatives at fair value and recognise changes in their fair value in profit or loss. However, an insurer need not separate an embedded derivative that itself meets the definition of an insurance contract (paragraph 7 of the IFRS). Nevertheless, separation and fair value measurement of such an embedded derivative are not prohibited if the insurer's existing accounting policies require such separation, or if an insurer changes its accounting policies and that change meets the criteria in paragraph 22 of the IFRS.

IG4 IG Example 2 illustrates the treatment of embedded derivatives contained in insurance contracts and investment contracts. The term 'investment contract' is an informal term used for ease of discussion. It refers to a financial instrument that does not meet the definition of an insurance contract. The example does not

illustrate all possible circumstances. Throughout the example, the phrase 'fair value measurement is required' indicates that the issuer of the contract is required:

(a) to measure the embedded derivative at fair value and include changes in its fair value in profit or loss.

(b) to separate the embedded derivative from the host contract, unless it measures the entire contract at fair value and includes changes in that fair value in profit or loss.

IG Example 2: Embedded derivatives

Type of embedded derivative		*Treatment if embedded in a host insurance contract*	*Treatment if embedded in a host investment contract*
2.1	Death benefit linked to equity prices or equity index, payable only on death or annuitisation and not on surrender or maturity.	The equity-index feature is an insurance contract (unless the life-contingent payments are insignificant), because the policyholder benefits from it only when the insured event occurs. Fair value measurement is not required (but not prohibited).	Not applicable. The entire contract is an insurance contract (unless the life-contingent payments are insignificant).
2.2	Death benefit that is the greater of: (a) unit value of an investment fund (equal to the amount payable on surrender or maturity); and (b) guaranteed minimum.	Excess of guaranteed minimum over unit value is a death benefit (similar to the payout on a dual trigger contract, see IG Example 2.19). This meets the definition of an insurance contract (unless the life-contingent payments are insignificant) and fair value measurement is not required (but not prohibited).	Not applicable. The entire contract is an insurance contract (unless the life-contingent payments are insignificant).
2.3	Option to take a life-contingent annuity at guaranteed rate (combined guarantee of interest rates and mortality charges).	The embedded option is an insurance contract (unless the life-contingent payments are insignificant). Fair value measurement is not required (but not prohibited).	Not applicable. The entire contract is an insurance contract (unless the life-contingent payments are insignificant).

continued...

 © IASCF

...continued

IG Example 2: Embedded derivatives

Type of embedded derivative		Treatment if embedded in a host insurance contract	Treatment if embedded in a host investment contract
2.4	Embedded guarantee of minimum interest rates in determining surrender or maturity values that is at or out of the money on issue, and not leveraged.	The embedded guarantee is not an insurance contract (unless significant payments are life-contingent[(a)]). However, it is closely related to the host contract (paragraph AG33(b) of Appendix A of IAS 39). Fair value measurement is not required (but not prohibited). If significant payments are life-contingent, the contract is an insurance contract and contains a deposit component (the guaranteed minimum). However, an insurer is not required to unbundle the contract if it recognises all obligations arising from the deposit component (paragraph 10 of the IFRS). If cancelling the deposit component requires the policyholder to cancel the insurance component, the two cancellation options may be interdependent; if the option to cancel the deposit component cannot be measured separately (ie without considering the other option), both options are regarded as part of the insurance component (paragraph AG33(h) of IAS 39).	Fair value measurement is not permitted (paragraph AG33(b) of IAS 39).
2.5	Embedded guarantee of minimum interest rates in determining surrender or maturity values: in the money on issue, or leveraged.	The embedded guarantee is not an insurance contract (unless the embedded guarantee is life-contingent to a significant extent). Fair value measurement is required (paragraph AG33(b) of IAS 39).	Fair value measurement is required (paragraph AG33(b) of IAS 39).

continued...

...continued

IG Example 2: Embedded derivatives

Type of embedded derivative		Treatment if embedded in a host insurance contract	Treatment if embedded in a host investment contract
2.6	Embedded guarantee of minimum annuity payments if the annuity payments are contractually linked to investment returns or asset prices:		
	(a) guarantee relates only to payments that are life-contingent.	The embedded guarantee is an insurance contract (unless the life-contingent payments are insignificant). Fair value measurement is not required (but not prohibited).	Not applicable. The entire contract is an insurance contract (unless the life-contingent payments are insignificant).
	(b) guarantee relates only to payments that are not life-contingent.	The embedded derivative is not an insurance contract. Fair value measurement is required (unless the guarantee is regarded as closely related to the host contract because the guarantee is an unleveraged interest floor that is at or out of the money at inception, see paragraph AG33(b) of IAS 39).	Fair value measurement is required (unless the guarantee is regarded as closely related to the host contract because the guarantee is an unleveraged interest floor that is at or out of the money at inception, see paragraph AG33(b) of IAS 39).

continued...

© IASCF

...continued

IG Example 2: Embedded derivatives

Type of embedded derivative		*Treatment if embedded in a host insurance contract*	*Treatment if embedded in a host investment contract*
	(c) policyholder can elect to receive life-contingent payments or payments that are not life-contingent, and the guarantee relates to both. When the policyholder makes its election, the issuer cannot adjust the pricing of the life-contingent payments to reflect the risk that the insurer assumes at that time (see paragraph B29 of the IFRS for discussion of contracts with separate accumulation and payout phases).	The embedded option to benefit from a guarantee of life-contingent payments is an insurance contract (unless the life-contingent payments are insignificant). Fair value measurement is not required (but not prohibited). The embedded option to receive payments that are not life-contingent ('the second option') is not an insurance contract. However, because the second option and the life-contingent option are alternatives, their fair values are interdependent. If they are so interdependent that the issuer cannot measure the second option separately (ie without considering the life-contingent option), the second option is closely related to the insurance contract. In that case, fair value measurement is not required (but not prohibited).	Not applicable. The entire contract is an insurance contract (unless the life-contingent payments are insignificant).
2.7	Embedded guarantee of minimum equity returns on surrender or maturity.	The embedded guarantee is not an insurance contract (unless the embedded guarantee is life-contingent to a significant extent) and is not closely related to the host insurance contract. Fair value measurement is required.	Fair value measurement is required.
2.8	Equity-linked return available on surrender or maturity.	The embedded derivative is not an insurance contract (unless the equity-linked return is life-contingent to a significant extent) and is not closely related to the host insurance contract. Fair value measurement is required.	Fair value measurement is required.

continued...

...continued

IG Example 2: Embedded derivatives

Type of embedded derivative		Treatment if embedded in a host insurance contract	Treatment if embedded in a host investment contract
2.9	Embedded guarantee of minimum equity returns that is available only if the policyholder elects to take a life-contingent annuity.	The embedded guarantee is an insurance contract (unless the life-contingent payments are insignificant), because the policyholder can benefit from the guarantee only by taking the annuity option (whether annuity rates are set at inception or at the date of annuitisation). Fair value measurement is not required (but not prohibited).	Not applicable. The entire contract is an insurance contract (unless the life-contingent payments are insignificant).
2.10	Embedded guarantee of minimum equity returns available to the policyholder as either (a) a cash payment, (b) a period-certain annuity or (c) a life-contingent annuity, at annuity rates prevailing at the **date of annuitisation**.	If the guaranteed payments are not contingent to a significant extent on survival, the option to take the life-contingent annuity does not transfer insurance risk until the policyholder opts to take the annuity. Therefore, the embedded guarantee is not an insurance contract and is not closely related to the host insurance contract. Fair value measurement is required. If the guaranteed payments are contingent to a significant extent on survival, the guarantee is an insurance contract (similar to a pure endowment). Fair value measurement is not required (but not prohibited).	Fair value measurement is required.

continued...

© IASCF

...continued

IG Example 2: Embedded derivatives

Type of embedded derivative		Treatment if embedded in a host insurance contract	Treatment if embedded in a host investment contract
2.11	Embedded guarantee of minimum equity returns available to the policyholder as either (a) a cash payment (b) a period-certain annuity or (c) a life-contingent annuity, at annuity rates set at **inception**.	The whole contract is an insurance contract from inception (unless the life-contingent payments are insignificant). The option to take the life-contingent annuity is an embedded insurance contract, so fair value measurement is not required (but not prohibited). The option to take the cash payment or the period-certain annuity ('the second option') is not an insurance contract (unless the option is contingent to a significant extent on survival), so it must be separated. However, because the second option and the life-contingent option are alternatives, their fair values are interdependent. If they are so interdependent that the issuer cannot measure the second option separately (ie without considering the life-contingent option), the second option is closely related to the host insurance contract. In that case, fair value measurement is not required (but not prohibited).	Not applicable.
2.12	Policyholder option to surrender a contract for a cash surrender value specified in a schedule (ie not indexed and not accumulating interest).	Fair value measurement is not required (but not prohibited: paragraph 8 of the IFRS). The surrender value may be viewed as a deposit component, but the IFRS does not require an insurer to unbundle a contract if it recognises all its obligations arising under the deposit component (paragraph 10).	The surrender option is closely related to the host contract if the surrender value is approximately equal to the amortised cost at each exercise date (paragraph AG30(g) of IAS 39). Otherwise, the surrender option is measured at fair value.

continued...

...continued

IG Example 2: Embedded derivatives

	Type of embedded derivative	*Treatment if embedded in a host insurance contract*	*Treatment if embedded in a host investment contract*
2.13	Policyholder option to surrender a contract for account value based on a principal amount and a fixed or variable interest rate (or based on the fair value of a pool of interest-bearing securities), possibly after deducting a surrender charge.	Same as for a cash surrender value (IG Example 2.12).	Same as for a cash surrender value (IG Example 2.12).
2.14	Policyholder option to surrender a contract for a surrender value based on an equity or commodity price or index.	The option is not closely related to the host contract (unless the option is life-contingent to a significant extent). Fair value measurement is required (paragraphs 8 of the IFRS and AG30(d) and (e) of IAS 39).	Fair value measurement is required (paragraph AG30(d) and (e) of IAS 39).
2.15	Policyholder option to surrender a contract for account value equal to the fair value of a pool of equity investments, possibly after deducting a surrender charge.	If the insurer measures that portion of its obligation at account value, no further adjustment is needed for the option (unless the surrender value differs significantly from account value) (see paragraph AG33(g) of IAS 39). Otherwise, fair value measurement is required.	If the insurer regards the account value as the amortised cost or fair value of that portion of its obligation, no further adjustment is needed for the option (unless the surrender value differs significantly from account value). Otherwise, fair value measurement is required.
2.16	Contractual feature that provides a return contractually linked (with no discretion) to the return on specified assets.	The embedded derivative is not an insurance contract and is not closely related to the contract (paragraph AG30(h) of IAS 39). Fair value measurement is required.	Fair value measurement is required.

continued...

 © IASCF

...continued

IG Example 2: Embedded derivatives

Type of embedded derivative		Treatment if embedded in a host insurance contract	Treatment if embedded in a host investment contract
2.17	Persistency bonus paid at maturity in cash (or as a period-certain annuity).	The embedded derivative (option to receive the persistency bonus) is not an insurance contract (unless the persistency bonus is life-contingent to a significant extent). Insurance risk does not include lapse or persistency risk (paragraph B15 of the IFRS). Fair value measurement is required.	An option or automatic provision to extend the remaining term to maturity of a debt instrument is not closely related to the host debt instrument unless there is a concurrent adjustment to the approximate current market rate of interest at the time of the extension (paragraph AG30(c) of IAS 39). If the option or provision is not closely related to the host instrument, fair value measurement is required.
2.18	Persistency bonus paid at maturity as an enhanced life-contingent annuity.	The embedded derivative is an insurance contract (unless the life-contingent payments are insignificant). Fair value measurement is not required (but not prohibited).	Not applicable. The entire contract is an insurance contract (unless the life-contingent payments are insignificant).
2.19	Dual trigger contract, eg contract requiring a payment that is contingent on a breakdown in power supply that adversely affects the holder (first trigger) and a specified level of electricity prices (second trigger). The contingent payment is made only if both triggering events occur.	The embedded derivative is an insurance contract (unless the first trigger lacks commercial substance). A contract that qualifies as an insurance contract, whether at inception or later, remains an insurance contract until all rights and obligations are extinguished or expire (paragraph B30 of the IFRS). Therefore, although the remaining exposure is similar to a financial derivative after the insured event has occurred, the embedded derivative is still an insurance contract and fair value measurement is not required (but not prohibited).	Not applicable. The entire contract is an insurance contract (unless the first trigger lacks commercial substance).

continued...

...continued

IG Example 2: Embedded derivatives

Type of embedded derivative		*Treatment if embedded in a host insurance contract*	*Treatment if embedded in a host investment contract*
2.20	Non-guaranteed participating dividend contained in a life insurance contract. The amount is contractually at the discretion of the insurer but is contractually based on the insurer's actual experience on the related block of insurance contracts.	The contract contains a discretionary participation feature, rather than an embedded derivative (paragraph 34 of the IFRS).	Not applicable. The entire contract is an insurance contract (unless the life-contingent payments are insignificant).

(a) Payments are life-contingent if they are contingent on death or contingent on survival.

 © IASCF

Unbundling a deposit component

IG5 Paragraph 10 of the IFRS requires an insurer to unbundle some insurance contracts that contain a deposit component. IG Example 3 illustrates this requirement. Although arrangements of this kind are more common in reinsurance, the same principle applies in direct insurance. However, unbundling is not required if the insurer recognises all obligations or rights arising from the deposit component.

IG Example 3: Unbundling a deposit component of a reinsurance contract

Background

A reinsurance contract has the following features:

(a) The cedant pays premiums of CU10[(a)] every year for five years.

(b) An experience account is established, equal to 90 per cent of cumulative premiums (including the additional premiums discussed in (c) below) less 90 per cent of cumulative claims.

(c) If the balance in the experience account is negative (ie cumulative claims exceed cumulative premiums), the cedant pays an additional premium equal to the experience account balance divided by the number of years left to run on the contract.

(d) At the end of the contract, if the experience account balance is positive (ie cumulative premiums exceed cumulative claims), it is refunded to the cedant; if the balance is negative, the cedant pays the balance to the reinsurer as an additional premium.

(e) Neither party can cancel the contract before maturity.

(f) The maximum loss that the reinsurer is required to pay in any period is CU200.

This contract is an insurance contract because it transfers significant insurance risk to the reinsurer. For example, in case 2 discussed below, the reinsurer is required to pay additional benefits with a present value, in year 1, of CU35, which is clearly significant in relation to the contract.

continued...

...continued

IG Example 3: Unbundling a deposit component of a reinsurance contract

The following discussion addresses the accounting by the reinsurer. Similar principles apply to the accounting by the cedant.

Application of requirements: case 1—no claims

If there are no claims, the cedant will receive CU45 in year 5 (90 per cent of the cumulative premiums of CU50). In substance, the cedant has made a loan, which the reinsurer will repay in one instalment of CU45 in year 5.

If the reinsurer's accounting policies require it to recognise its contractual liability to repay the loan to the cedant, unbundling is permitted but not required. However, if the reinsurer's accounting policies would not require it to recognise the liability to repay the loan, the reinsurer is required to unbundle the contract (paragraph 10 of the IFRS).

If the reinsurer is required, or elects, to unbundle the contract, it does so as follows. Each payment by the cedant has two components: a loan advance (deposit component) and a payment for insurance cover (insurance component). Applying IAS 39 to the deposit component, the reinsurer is required to measure it initially at fair value. Fair value could be determined by discounting the future cash flows from the deposit component. Assume that an appropriate discount rate is 10 per cent and that the insurance cover is equal in each year, so that the payment for insurance cover is the same in every year.
Each payment of CU10 by the cedant is then made up of a loan advance of CU6.7 and an insurance premium of CU3.3.

The reinsurer accounts for the insurance component in the same way that it accounts for a separate insurance contract with an annual premium of CU3.3.

The movements in the loan are shown below.

Year	Opening balance	Interest at 10 per cent	Advance (repayment)	Closing balance
	CU	CU	CU	CU
0	0.00	0.00	6.70	6.70
1	6.70	0.67	6.70	14.07
2	14.07	1.41	6.70	22.18
3	22.18	2.21	6.70	31.09
4	31.09	3.11	6.70	40.90
5	40.90	4.10	(45.00)	0.00
Total		11.50	(11.50)	

continued...

 © IASCF

...continued

IG Example 3: Unbundling a deposit component of a reinsurance contract

Application of requirements: case 2—claim of CU150 in year 1

Consider now what happens if the reinsurer pays a claim of CU150 in year 1. The changes in the experience account, and resulting additional premiums, are as follows.

Year	Premium	Additional premium	Total premium	Cumulative premium	Claims	Cumulative claims	Cumulative premiums less claims	Experience account
	CU	CU	CU	CU	CU	CU	CU	CU
0	10	0	10	10	0	0	10	9
1	10	0	10	20	(150)	(150)	(130)	(117)
2	10	39	49	69	0	(150)	(81)	(73)
3	10	36	46	115	0	(150)	(35)	(31)
4	10	31	41	156	0	(150)	6	6
		106	156		(150)			

Incremental cash flows because of the claim in year 1

The claim in year 1 leads to the following incremental cash flows, compared with case 1:

Year	Additional Premium	Claims	Refund in case 2	Refund in case 1	Net incremental cash flow	Present value at 10 per cent
	CU	CU	CU	CU	CU	CU
0	0	0			0	0
1	0	(150)			(150)	(150)
2	39	0			39	35
3	36	0			36	30
4	31	0			31	23
5	0	0	(6)	(45)	39	27
Total	106	(150)	(6)	(45)	(5)	(35)

continued...

...continued

IG Example 3: Unbundling a deposit component of a reinsurance contract

The incremental cash flows have a present value, in year 1, of CU35 (assuming a discount rate of 10 per cent is appropriate). Applying paragraphs 10–12 of the IFRS, the cedant unbundles the contract and applies IAS 39 to this deposit component (unless the cedant already recognises its contractual obligation to repay the deposit component to the reinsurer). If this were not done, the cedant might recognise the CU150 received in year 1 as income, and the incremental payments in years 2–5 as expenses. However, in substance, the reinsurer has paid a claim of CU35 and made a loan of CU115 (CU150 less CU35) that will be repaid in instalments.

The following table shows the changes in the loan balance. The table assumes that the original loan shown in case 1 and the new loan in case 2 met the criteria for offsetting in IAS 32. Amounts shown in the table are rounded.

Loan to (from) the reinsurer

Year	Opening balance	Interest at 10 per cent	Payments per original schedule	Additional payments in case 2	Closing balance
	CU	CU	CU	CU	CU
0	–	–	6	–	6
1	6	1	7	(115)	(101)
2	(101)	(10)	7	39	(65)
3	(65)	(7)	7	36	(29)
4	(29)	(3)	6	31	5
5	5	1	(45)	39	0
Total		(18)	(12)	30	

(a) In this Implementation Guidance monetary amounts are denominated in 'currency units (CU)'.

Shadow accounting

IG6 Paragraph 30 of the IFRS permits, but does not require, a practice sometimes described as 'shadow accounting'. IG Example 4 illustrates shadow accounting.

IG7 Shadow accounting is not the same as fair value hedge accounting under IAS 39 and will not usually have the same effect. Under IAS 39, a non-derivative financial asset or non-derivative financial liability may be designated as a hedging instrument only for a hedge of foreign currency risk.

© IASCF

IG8 Shadow accounting is not applicable for liabilities arising from investment contracts (ie contracts within the scope of IAS 39) because the underlying measurement of those liabilities (including the treatment of related transaction costs) does not depend on asset values or asset returns. However, shadow accounting may be applicable for a discretionary participation feature within an investment contract if the measurement of that feature depends on asset values or asset returns.

IG9 Shadow accounting is not applicable if the measurement of an insurance liability is not driven directly by realised gains and losses on assets held. For example, assume that financial assets are measured at fair value and insurance liabilities are measured using a discount rate that reflects current market rates but does not depend directly on the actual assets held. The measurements of the assets and the liability both reflect changes in interest rates, but the measurement of the liability does not depend directly on the carrying amount of the assets held. Therefore, shadow accounting is not applicable and changes in the carrying amount of the liability are recognised in profit or loss because IAS 1 *Presentation of Financial Statements* requires all items of income or expense to be recognised in profit or loss unless an IFRS requires otherwise.

IG10 Shadow accounting may be relevant if there is a contractual link between payments to policyholders and the carrying amount of, or returns from, owner-occupied property. If an entity uses the revaluation model in IAS 16 *Property, Plant and Equipment*, it recognises changes in the carrying amount of the owner-occupied property in revaluation surplus. If it also elects to use shadow accounting, the changes in the measurement of the insurance liability resulting from revaluations of the property are also recognised in revaluation surplus.

IG Example 4: Shadow accounting

Background

Under some national requirements for some insurance contracts, deferred acquisition costs (DAC) are amortised over the life of the contract as a constant proportion of estimated gross profits (EGP). EGP includes investment returns, including realised (but not unrealised) gains and losses. Interest is applied to both DAC and EGP, to preserve present value relationships. For simplicity, this example ignores interest and ignores re-estimation of EGP.

At the inception of a contract, insurer A has DAC of CU20 relating to that contract and the present value, at inception, of EGP is CU100. In other words, DAC is 20 per cent of EGP at inception. Thus, for each CU1 of realised gross profits, insurer A amortises DAC by CU0.20. For example, if insurer A sells assets and recognises a gain of CU10, insurer A amortises DAC by CU2 (20 per cent of CU10).

continued...

...continued
IG Example 4: Shadow accounting

Before adopting IFRSs for the first time in 20X5, insurer A measured financial assets on a cost basis. (Therefore, EGP under those national requirements considers only realised gains and losses.) However, under IFRSs, it classifies its financial assets as measured at fair value through profit or loss.

In 20X5 insurer A recognises unrealised gains of CU10 on the assets backing the contract and in 20X6 it sells the assets for an amount equal to their fair value at the end of 20X5.

Application of paragraph 30 of the IFRS

Paragraph 30 of the IFRS permits, but does not require, insurer A to adopt shadow accounting. If insurer A adopts shadow accounting, it amortises DAC in 20X5 by an additional CU2 (20 per cent of CU10) as a result of the change in the fair value of the assets. Insurer A recognises the additional amortisation of CU2 in profit or loss.

When insurer A sells the assets in 20X6, it makes no further adjustment to DAC.

In summary, shadow accounting treats an unrealised gain in the same way as a realised gain. If insurer A does not adopt shadow accounting, unrealised gains on assets do not affect the amortisation of DAC.

Disclosure

Purpose of this guidance

IG11 The guidance in paragraphs IG12–IG71 suggests possible ways to apply the disclosure requirements in paragraphs 36–39A of the IFRS. As explained in paragraphs 36 and 38 of the IFRS, the objective of the disclosures is:

(a) to identify and explain the amounts in an insurer's financial statements arising from insurance contracts; and

(b) to enable users of those financial statements to evaluate the nature and extent of risks arising from insurance contracts.

IG12 An insurer decides in the light of its circumstances how much detail it gives to satisfy those requirements, how much emphasis it places on different aspects of the requirements and how it aggregates information to display the overall picture without combining information that has materially different characteristics. It is necessary to strike a balance so that important information is not obscured either by the inclusion of a large amount of insignificant detail or by the aggregation of items that have materially different characteristics. For example:

(a) a large international insurance group that operates in a wide range of regulatory jurisdictions typically provides disclosures that differ in format, content and detail from those provided by a specialised niche insurer operating in one jurisdiction.

 © IASCF

(b) many insurance contracts have similar characteristics. When no single contract is individually material, a summary by classes of contracts is appropriate.

(c) information about an individual contract may be material when it is, for example, a significant contributor to an insurer's risk profile.

To satisfy the requirements, an insurer would not typically need to disclose all the information suggested in the guidance. This guidance does not create additional requirements.

IG13 IAS 1 *Presentation of Financial Statements* requires an entity to 'provide additional disclosures when compliance with the specific requirements in IFRSs is insufficient to enable users to understand the impact of particular transactions, other events and conditions on the entity's financial position and financial performance.'

IG14 For convenience, this Implementation Guidance discusses each disclosure requirement in the IFRS separately. In practice, disclosures would normally be presented as an integrated package and individual disclosures may satisfy more than one requirement. For example, information about the assumptions that have the greatest effect on the measurement of amounts arising from insurance contracts may help to convey information about insurance risk and market risk.

Materiality

IG15 IAS 1 notes that a specific disclosure requirement in an IFRS need not be satisfied if the information is not material. IAS 1 defines materiality as follows:

> Omissions or misstatements of items are material if they could, individually or collectively, influence the economic decisions that users make on the basis of the financial statements. Materiality depends on the size and nature of the omission or misstatement judged in the surrounding circumstances. The size or nature of the item, or a combination of both, could be the determining factor.

IG16 IAS 1 also explains the following:

> Assessing whether an omission or misstatement could influence economic decisions of users, and so be material, requires consideration of the characteristics of those users. The *Framework for the Preparation and Presentation of Financial Statements* states in paragraph 25 that 'users are assumed to have a reasonable knowledge of business and economic activities and accounting and a willingness to study the information with reasonable diligence.' Therefore, the assessment needs to take into account how users with such attributes could reasonably be expected to be influenced in making economic decisions.

Explanation of recognised amounts (paragraphs 36 and 37 of the IFRS)

Accounting policies

IG17 IAS 1 requires disclosure of accounting policies and paragraph 37(a) of the IFRS highlights this requirement. In developing disclosures about accounting policies for insurance contracts, an insurer might conclude that it needs to address the treatment of, for example, some or all of the following, if applicable:

(a) premiums (including the treatment of unearned premiums, renewals and lapses, premiums collected by agents and brokers but not yet passed on and premium taxes or other levies on premiums).

(b) fees or other charges made to policyholders.

(c) acquisition costs (including a description of their nature).

(d) claims incurred (both reported and not reported), claims handling costs (including a description of their nature) and liability adequacy tests (including a description of the cash flows included in the test, whether and how the cash flows are discounted and the treatment of embedded options and guarantees in those tests, see paragraphs 15–19 of the IFRS). An insurer might disclose whether insurance liabilities are discounted and, if they are discounted, explain the methodology used.

(e) the objective of methods used to adjust insurance liabilities for risk and uncertainty (for example, in terms of a level of assurance or level of sufficiency), the nature of those models, and the source of information used in the models.

(f) embedded options and guarantees (including a description of whether (i) the measurement of insurance liabilities reflects the intrinsic value and time value of these items and (ii) their measurement is consistent with observed current market prices).

(g) discretionary participation features (including a clear statement of how the insurer applies paragraphs 34 and 35 of the IFRS in classifying that feature as a liability or as a component of equity) and other features that permit policyholders to share in investment performance.

(h) salvage, subrogation or other recoveries from third parties.

(i) reinsurance held.

(j) underwriting pools, coinsurance and guarantee fund arrangements.

(k) insurance contracts acquired in business combinations and portfolio transfers, and the treatment of related intangible assets.

(l) as required by IAS 1, the judgements, apart from those involving estimations, management has made in the process of applying the accounting policies that have the most significant effect on the amounts recognised in the financial statements. The classification of discretionary participation features is an example of an accounting policy that might have a significant effect.

IG18 If the financial statements disclose supplementary information, for example embedded value information, that is not prepared on the basis used for other measurements in the financial statements, it is appropriate to explain the basis. Disclosures about embedded value methodology might include information similar to that described in paragraph IG17, as well as disclosure of whether, and how, embedded values are affected by estimated returns from assets and by locked-in capital and how those effects are estimated.

 © IASCF

Assets, liabilities, income and expense

IG19 Paragraph 37(b) of the IFRS requires an insurer to disclose the assets, liabilities, income and expenses that arise from insurance contracts. If an insurer presents its statement of cash flows using the direct method, paragraph 37(b) requires it also to disclose the cash flows that arise from insurance contracts. The IFRS does not require disclosure of specific cash flows. The following paragraphs discuss how an insurer might satisfy those general requirements.

IG20 IAS 1 requires minimum disclosures in the statement of financial position. An insurer might conclude that, to satisfy those requirements, it needs to present separately in its statement of financial position the following amounts arising from insurance contracts:

(a) liabilities under insurance contracts and reinsurance contracts issued.

(b) assets under insurance contracts and reinsurance contracts issued.

(c) assets under reinsurance ceded. Under paragraph 14(d)(i) of the IFRS, these assets are not offset against the related insurance liabilities.

IG21 Neither IAS 1 nor the IFRS prescribes the descriptions and ordering of the line items presented in the statement of financial position. An insurer could amend the descriptions and ordering to suit the nature of its transactions.

IG22 IAS 1 requires disclosure, either in the statement of financial position or in the notes, of subclassifications of the line items presented, classified in a manner appropriate to the entity's operations. Appropriate subclassifications of insurance liabilities will depend on the circumstances, but might include items such as:

(a) unearned premiums.

(b) claims reported by policyholders.

(c) claims incurred but not reported (IBNR).

(d) provisions arising from liability adequacy tests.

(e) provisions for future non-participating benefits.

(f) liabilities or components of equity relating to discretionary participation features (see paragraphs 34 and 35 of the IFRS). If an insurer classifies these features as a component of equity, disclosure is needed to comply with IAS 1, which requires an entity to disclose 'a description of the nature and purpose of each reserve within equity.'

(g) receivables and payables related to insurance contracts (amounts currently due to and from agents, brokers and policyholders related to insurance contracts).

(h) non-insurance assets acquired by exercising rights to recoveries.

IG23 Similar subclassifications may also be appropriate for reinsurance assets, depending on their materiality and other relevant circumstances. For assets under insurance contracts and reinsurance contracts issued, an insurer might conclude that it needs to distinguish:

(a) deferred acquisition costs; and

(b) intangible assets relating to insurance contracts acquired in business combinations or portfolio transfers.

IG23A Paragraph 14 of IFRS 7 *Financial Instruments: Disclosures* requires an entity to disclose the carrying amount of financial assets pledged as collateral for liabilities, the carrying amount of financial assets pledged as collateral for contingent liabilities, and any terms and conditions relating to assets pledged as collateral. In complying with this requirement, an insurer might also conclude that it needs to disclose segregation requirements that are intended to protect policyholders by restricting the use of some of the insurer's assets.

IG24 IAS 1 lists minimum line items that an entity should present in its statement of comprehensive income. It also requires the presentation of additional line items when this is necessary to present fairly the entity's financial performance. An insurer might conclude that, to satisfy these requirements, it needs to present the following amounts in its statement of comprehensive income:

(a) revenue from insurance contracts issued (without any reduction for reinsurance held).

(b) income from contracts with reinsurers.

(c) expense for policyholder claims and benefits (without any reduction for reinsurance held).

(d) expenses arising from reinsurance held.

IG25 IAS 18 requires an entity to disclose the amount of each significant category of revenue recognised during the period, and specifically requires disclosure of revenue arising from the rendering of services. Although revenue from insurance contracts is outside the scope of IAS 18, similar disclosures may be appropriate for insurance contracts. The IFRS does not prescribe a particular method for recognising revenue and various models exist:

(a) Under some models, an insurer recognises premiums earned during the period as revenue and recognises claims arising during the period (including estimates of claims incurred but not reported) as an expense.

(b) Under some other models, an insurer recognises premiums received as revenue and at the same time recognises an expense representing the resulting increase in the insurance liability.

(c) Under yet other models, an insurer recognises premiums received as deposit receipts. Its revenue includes charges for items such as mortality, and its expenses include the policyholder claims and benefits related to those charges.

IG26 IAS 1 requires additional disclosure of various items of income and expense. An insurer might conclude that, to satisfy these requirements, it needs to disclose the following additional items, either in its statement of comprehensive income or in the notes:

(a) acquisition costs (distinguishing those recognised as an expense immediately from the amortisation of deferred acquisition costs).

 © IASCF

(b) the effect of changes in estimates and assumptions.

(c) losses recognised as a result of applying liability adequacy tests.

(d) for insurance liabilities measured on a discounted basis:

  (i) accretion of interest to reflect the passage of time; and

  (ii) the effect of changes in discount rates.

(e) distributions or allocations to holders of contracts that contain discretionary participation features. The portion of profit or loss that relates to any equity component of those contracts is an allocation of profit or loss, not expense or income (paragraph 34(c) of the IFRS).

IG27 Some insurers present a detailed analysis of the sources of their earnings from insurance activities either in the statement of comprehensive income or in the notes. Such an analysis may provide useful information about both the income and expense of the current period and the risk exposures faced during the period.

IG28 The items described in paragraph IG26 are not offset against income or expense arising from reinsurance held (paragraph 14(d)(ii) of the IFRS).

IG29 Paragraph 37(b) also requires specific disclosure about gains or losses recognised on buying reinsurance. This disclosure informs users about gains or losses that may, using some measurement models, arise from imperfect measurements of the underlying direct insurance liability. Furthermore, some measurement models require a cedant to defer some of those gains and losses and amortise them over the period of the related risk exposures, or some other period. Paragraph 37(b) also requires a cedant to disclose information about such deferred gains and losses.

IG30 If an insurer does not adopt uniform accounting policies for the insurance liabilities of its subsidiaries, it might conclude that it needs to disaggregate the disclosures about amounts reported in its financial statements to give meaningful information about amounts determined using different accounting policies.

Significant assumptions and other sources of estimation uncertainty

IG31 Paragraph 37(c) of the IFRS requires an insurer to describe the process used to determine the assumptions that have the greatest effect on the measurement of assets, liabilities, income and expense arising from insurance contracts and, when practicable, give quantified disclosure of those assumptions. For some disclosures, such as discount rates or assumptions about future trends or general inflation, it may be relatively easy to disclose the assumptions used (aggregated at a reasonable but not excessive level, when necessary). For other assumptions, such as mortality tables, it may not be practicable to disclose quantified assumptions because there are too many, in which case it is more important to describe the process used to generate the assumptions.

IG32 The description of the process used to determine assumptions might include a summary of the most significant of the following:

(a) the objective of the assumptions. For example, an insurer might disclose whether the assumptions are intended to be neutral estimates of the most likely or expected outcome ('best estimates') or to provide a given level of assurance or level of sufficiency. If they are intended to provide a quantitative or qualitative level of assurance, an insurer might disclose that level.

(b) the source of data used as inputs for the assumptions that have the greatest effect. For example, an insurer might disclose whether the inputs are internal, external or a mixture of the two. For data derived from detailed studies that are not carried out annually, an insurer might disclose the criteria used to determine when the studies are updated and the date of the latest update.

(c) the extent to which the assumptions are consistent with observable market prices or other published information.

(d) a description of how past experience, current conditions and other relevant benchmarks are taken into account in developing estimates and assumptions. If a relationship would normally be expected between experience and future results, an insurer might explain the reasons for using assumptions that differ from past experience and indicate the extent of the difference.

(e) a description of how the insurer developed assumptions about future trends, such as changes in mortality, healthcare costs or litigation awards.

(f) an explanation of how the insurer identifies correlations between different assumptions.

(g) the insurer's policy in making allocations or distributions for contracts with discretionary participation features, the related assumptions that are reflected in the financial statements, the nature and extent of any significant uncertainty about the relative interests of policyholders and shareholders in the unallocated surplus associated with those contracts, and the effect on the financial statements of any changes during the period in that policy or those assumptions.

(h) the nature and extent of uncertainties affecting specific assumptions. In addition, to comply with paragraphs 125–131 of IAS 1, an insurer may need to disclose that it is reasonably possible, based on existing knowledge, that outcomes within the next financial year that are different from assumptions could require a material adjustment to the carrying amount of insurance liabilities and insurance assets. Paragraph 129 of IAS 1 gives further guidance on this disclosure.

© IASCF

IG33 The IFRS does not prescribe specific assumptions that would be disclosed, because different assumptions will be more significant for different types of contract.

Changes in assumptions

IG34 Paragraph 37(d) of the IFRS requires an insurer to disclose the effect of changes in assumptions used to measure insurance assets and insurance liabilities. This is consistent with IAS 8, which requires disclosure of the nature and amount of a change in an accounting estimate that has an effect in the current period or is expected to have an effect in future periods.

IG35 Assumptions are often interdependent. When this is the case, analysis of changes by assumption may depend on the order in which the analysis is performed and may be arbitrary to some extent. Therefore, the IFRS does not specify a rigid format or content for this analysis. This allows insurers to analyse the changes in a way that meets the objective of the disclosure and is appropriate for their particular circumstances. If practicable, an insurer might disclose separately the impact of changes in different assumptions, particularly if changes in some assumptions have an adverse effect and others have a beneficial effect. An insurer might also describe the impact of interdependencies between assumptions and the resulting limitations of any analysis of the effect of changes in assumption.

IG36 An insurer might disclose the effects of changes in assumptions both before and after reinsurance held, especially if the insurer expects a significant change in the nature or extent of its reinsurance programme or if an analysis before reinsurance is relevant for an analysis of the credit risk arising from reinsurance held.

Changes in insurance liabilities and related items

IG37 Paragraph 37(e) of the IFRS requires an insurer to disclose reconciliations of changes in insurance liabilities. It also requires disclosure of changes in reinsurance assets. An insurer need not disaggregate those changes into broad classes, but might do that if different forms of analysis are more relevant for different types of liability. The changes might include:

(a) the carrying amount at the beginning and end of the period.

(b) additional insurance liabilities arising during the period.

(c) cash paid.

(d) income and expense included in profit or loss.

(e) liabilities acquired from, or transferred to, other insurers.

(f) net exchange differences arising on the translation of the financial statements into a different presentation currency, and on the translation of a foreign operation into the presentation currency of the reporting entity.

IG38 An insurer discloses the changes in insurance liabilities and reinsurance assets in all prior periods for which it reports full comparative information.

IG39 Paragraph 37(e) of the IFRS also requires an insurer to disclose changes in deferred acquisition costs, if applicable. The reconciliation might disclose:

(a) the carrying amount at the beginning and end of the period.

(b) the amounts incurred during the period.

© IASCF

(c) the amortisation for the period.

(d) impairment losses recognised during the period.

(e) other changes categorised by cause and type.

IG40 An insurer may have recognised intangible assets related to insurance contracts acquired in a business combination or portfolio transfer. IAS 38 *Intangible Assets* contains disclosure requirements for intangible assets, including a requirement to give a reconciliation of changes in intangible assets. The IFRS does not require additional disclosures about these assets.

Nature and extent of risks arising from insurance contracts (paragraphs 38–39A of the IFRS)

IG41 The disclosures about the nature and extent of risks arising from insurance contracts are based on two foundations:

(a) There should be a balance between quantitative and qualitative disclosures, enabling users to understand the nature of risk exposures and their potential impact.

(b) Disclosures should be consistent with how management perceives its activities and risks, and the objectives, policies and processes that management uses to manage those risks. This approach is likely:

(i) to generate information that has more predictive value than information based on assumptions and methods that management does not use, for instance, in considering the insurer's ability to react to adverse situations.

(ii) to be more effective in adapting to the continuing change in risk measurement and management techniques and developments in the external environment over time.

IG42 In developing disclosures to satisfy paragraphs 38–39A of the IFRS, an insurer decides in the light of its circumstances how it would aggregate information to display the overall picture without combining information that has materially different characteristics, so that the information is useful. An insurer might group insurance contracts into broad classes appropriate for the nature of the information to be disclosed, taking into account matters such as the risks covered, the characteristics of the contracts and the measurement basis applied. The broad classes may correspond to classes established for legal or regulatory purposes, but the IFRS does not require this.

IG43 Under IFRS 8 *Operating Segments*, the identification of reportable segments reflects the way in which management allocates resources and assesses performance. An insurer might adopt a similar approach to identify broad classes of insurance contracts for disclosure purposes, although it might be appropriate to disaggregate disclosures down to the next level. For example, if an insurer identifies life insurance as a reportable segment for IFRS 8, it might be appropriate to report separate information about, say, life insurance, annuities in the accumulation phase and annuities in the payout phase.

IG44 [Deleted]

 © IASCF

IG45 In identifying broad classes for separate disclosure, an insurer might consider how best to indicate the level of uncertainty associated with the risks underwritten, to inform users whether outcomes are likely to be within a wider or a narrower range. For example, an insurer might disclose information about exposures where there are significant amounts of provisions for claims incurred but not reported (IBNR) or where outcomes and risks are unusually difficult to assess (eg asbestos).

IG46 It may be useful to disclose sufficient information about the broad classes identified to permit a reconciliation to relevant line items in the statement of financial position.

IG47 Information about the nature and extent of risks arising from insurance contracts is more useful if it highlights any relationship between classes of insurance contracts (and between insurance contracts and other items, such as financial instruments) that can affect those risks. If the effect of any relationship would not be apparent from disclosures required by the IFRS, further disclosure might be useful.

Risk management objectives and policies for mitigating risks arising from insurance contracts

IG48 Paragraph 39(a) of the IFRS requires an insurer to disclose its objectives, policies and processes for managing risks arising from insurance contracts and the methods used to manage those risks. Such discussion provides an additional perspective that complements information about contracts outstanding at a particular time. Such disclosure might include information about:

(a) the structure and organisation of the insurer's risk management function(s), including a discussion of independence and accountability.

(b) the scope and nature of the insurer's risk reporting or measurement systems, such as internal risk measurement models, sensitivity analyses, scenario analysis, and stress testing, and how the insurer integrates them into its operating activities. Useful disclosure might include a summary description of the approach used, associated assumptions and parameters (including confidence intervals, computation frequencies and historical observation periods) and strengths and limitations of the approach.

(c) the insurer's processes for accepting, measuring, monitoring and controlling insurance risks and the underwriting strategy to ensure that there are appropriate risk classification and premium levels.

(d) the extent to which insurance risks are assessed and managed on an entity-wide basis.

(e) the methods the insurer employs to limit or transfer insurance risk exposures and avoid undue concentrations of risk, such as retention limits, inclusion of options in contracts, and reinsurance.

(f) asset and liability management (ALM) techniques.

(g) the insurer's processes for managing, monitoring and controlling commitments received (or given) to accept (or contribute) additional debt or equity capital when specified events occur.

© IASCF

These disclosures might be provided both for individual types of risks insured and overall, and might include a combination of narrative descriptions and specific quantified data, as appropriate to the nature of the insurance contracts and their relative significance to the insurer.

IG49 [Deleted]

IG50 [Deleted]

Insurance risk

IG51 Paragraph 39(c) of the IFRS requires disclosures about insurance risk. Disclosures to satisfy this requirement might build on the following foundations:

(a) Information about insurance risk might be consistent with (though less detailed than) the information provided internally to the entity's key management personnel (as defined in IAS 24 *Related Party Disclosures*), so that users can assess the insurer's financial position, performance and cash flows 'through the eyes of management'.

(b) Information about risk exposures might report exposures both gross and net of reinsurance (or other risk mitigating elements, such as catastrophe bonds issued or policyholder participation features), especially if the insurer expects a significant change in the nature or extent of its reinsurance programme or if an analysis before reinsurance is relevant for an analysis of the credit risk arising from reinsurance held.

(c) In reporting quantitative information about insurance risk, an insurer might disclose the methods used, the strengths and limitations of those methods, the assumptions made, and the effect of reinsurance, policyholder participation and other mitigating elements.

(d) Insurers might classify risk along more than one dimension. For example, life insurers might classify contracts by both the level of mortality risk and the level of investment risk. It may sometimes be convenient to display this information in a matrix format.

(e) If an insurer's risk exposures at the end of the reporting period are unrepresentative of its exposures during the period, it might be useful to disclose that fact.

(f) The following disclosures required by paragraph 39 of the IFRS might also be relevant:

    (i) the sensitivity of profit or loss and equity to changes in variables that have a material effect on them.

    (ii) concentrations of insurance risk.

    (iii) the development of prior year insurance liabilities.

IG51A Disclosures about insurance risk might include:

(a) information about the nature of the risk covered, with a brief summary description of the class (such as annuities, pensions, other life insurance, motor, property and liability).

 © IASCF

(b) information about the general nature of participation features whereby policyholders share in the performance (and related risks) of individual contracts or pools of contracts or entities, including the general nature of any formula for the participation and the extent of any discretion held by the insurer.

(c) information about the terms of any obligation or contingent obligation for the insurer to contribute to government or other guarantee funds (see also IAS 37 *Provisions, Contingent Liabilities and Contingent Assets*).

Sensitivity to insurance risk

IG52 Paragraph 39(c)(i) of the IFRS requires disclosure about sensitivity to insurance risk. To permit meaningful aggregation, the sensitivity disclosures focus on summary indicators, namely profit or loss and equity. Although sensitivity tests can provide useful information, such tests have limitations. An insurer might disclose the strengths and limitations of sensitivity analyses performed.

IG52A Paragraph 39A permits two alternative approaches for this disclosure: quantitative disclosure of effects on profit or loss and equity (paragraph 39A(a)) or qualitative disclosure and disclosure about terms and conditions (paragraph 39A(b)). An insurer may provide quantitative disclosures for some insurance risks (in accordance with paragraph 39A(a)), and provide qualitative information about sensitivity and information about terms and conditions (in accordance with paragraph 39A(b)) for other insurance risks.

IG53 Informative disclosure avoids giving a misleading sensitivity analysis if there are significant non-linearities in sensitivities to variables that have a material effect. For example, if a change of 1 per cent in a variable has a negligible effect, but a change of 1.1 per cent has a material effect, it might be misleading to disclose the effect of a 1 per cent change without further explanation.

IG53A If an insurer chooses to disclose a quantitative sensitivity analysis in accordance with paragraph 39A(a), and that sensitivity analysis does not reflect significant correlations between key variables, the insurer might explain the effect of those correlations.

IG54 [Deleted]

IG54A If an insurer chooses to disclose qualitative information about sensitivity in accordance with paragraph 39A(b), it is required to disclose information about those terms and conditions of insurance contracts that have a material effect on the amount, timing and uncertainty of cash flows. To achieve this, an insurer might disclose the qualitative information suggested by paragraphs IG51–IG58 on insurance risk and paragraphs IG62–IG65G on credit risk, liquidity risk and market risk. As stated in paragraph IG12, an insurer decides in the light of its circumstances how it aggregates information to display the overall picture without combining information with different characteristics. An insurer might conclude that qualitative information needs to be more disaggregated if it is not supplemented with quantitative information.

© IASCF

Concentrations of insurance risk

IG55 Paragraph 39(c)(ii) of the IFRS refers to the need to disclose concentrations of insurance risk. Such concentration could arise from, for example:

(a) a single insurance contract, or a small number of related contracts, for instance, when an insurance contract covers low-frequency, high-severity risks such as earthquakes.

(b) single incidents that expose an insurer to risk under several different types of insurance contract. For example, a major terrorist incident could create exposure under life insurance contracts, property insurance contracts, business interruption and civil liability.

(c) exposure to unexpected changes in trends, for example, unexpected changes in human mortality or in policyholder behaviour.

(d) exposure to possible major changes in financial market conditions that could cause options held by policyholders to come into the money. For example, when interest rates decline significantly, interest rate and annuity guarantees may result in significant losses.

(e) significant litigation or legislative risks that could cause a large single loss, or have a pervasive effect on many contracts.

(f) correlations and interdependencies between different risks.

(g) significant non-linearities, such as stop-loss or excess of loss features, especially if a key variable is close to a level that triggers a material change in future cash flows.

(h) geographical and sectoral concentrations.

IG56 Disclosure of concentrations of insurance risk might include a description of the shared characteristic that identifies each concentration and an indication of the possible exposure, both before and after reinsurance held, associated with all insurance liabilities sharing that characteristic.

IG57 Disclosure about an insurer's historical performance on low-frequency, high-severity risks might be one way to help users to assess cash flow uncertainty associated with those risks. Consider an insurance contract that covers an earthquake that is expected to happen every 50 years, on average. If the insured event occurs during the current contract period, the insurer will report a large loss. If the insured event does not occur during the current period, the insurer will report a profit. Without adequate disclosure of the source of historical profits, it could be misleading for the insurer to report 49 years of reasonable profits, followed by one large loss; users may misinterpret the insurer's long-term ability to generate cash flows over the complete cycle of 50 years. Therefore, it might be useful to describe the extent of the exposure to risks of this kind and the estimated frequency of losses. If circumstances have not changed significantly, disclosure of the insurer's experience with this exposure may be one way to convey information about estimated frequencies.

 © IASCF

IG58 For regulatory or other reasons, some entities produce special purpose financial reports that show catastrophe or equalisation reserves as liabilities. However, in financial statements prepared using IFRSs, those reserves are not liabilities but are a component of equity. Therefore they are subject to the disclosure requirements in IAS 1 for equity. IAS 1 requires an entity to disclose:

(a) a description of the nature and purpose of each reserve within equity;

(b) information that enables users to understand the entity's objectives, policies and processes for managing capital; and

(c) the nature of any externally imposed capital requirements, how those requirements are incorporated into the management of capital and whether during the period it complied with any externally imposed capital requirements to which it is subject.

Claims development

IG59 Paragraph 39(c)(iii) of the IFRS requires disclosure of claims development information (subject to transitional relief in paragraph 44). Informative disclosure might reconcile this information to amounts reported in the statement of financial position. An insurer might disclose unusual claims expenses or developments separately, allowing users to identify the underlying trends in performance.

IG60 As explained in paragraph 39(c)(iii) of the IFRS, disclosures about claims development are not required for claims for which uncertainty about the amount and timing of claims payments is typically resolved within one year. Therefore, these disclosures are not normally required for most life insurance contracts. Furthermore, claims development disclosure is not normally needed for annuity contracts because each periodic payment arises, in effect, from a separate claim about which there is no uncertainty.

IG61 IG Example 5 shows one possible format for presenting claims development information. Other possible formats might, for example, present information by accident year rather than underwriting year. Although the example illustrates a format that might be useful if insurance liabilities are discounted, the IFRS does not require discounting (paragraph 25(a) of the IFRS).

IG Example 5: Disclosure of claims development

This example illustrates a possible format for a claims development table for a general insurer. The top half of the table shows how the insurer's estimates of total claims for each underwriting year develop over time. For example, at the end of 20X1, the insurer estimated that it would pay claims of CU680 for insured events relating to insurance contracts underwritten in 20X1.
By the end of 20X2, the insurer had revised the estimate of cumulative claims (both those paid and those still to be paid) to CU673.

The lower half of the table reconciles the cumulative claims to the amount appearing in the statement of financial position. First, the cumulative payments are deducted to give the cumulative unpaid claims for each year on an undiscounted basis. Second, if the claims liabilities are discounted, the effect of discounting is deducted to give the carrying amount in the statement of financial position.

Underwriting year	*20X1*	*20X2*	*20X3*	*20X4*	*20X5*	*Total*
	CU	CU	CU	CU	CU	CU
Estimate of cumulative claims:						
At end of underwriting year	680	790	823	920	968	
One year later	673	785	840	903		
Two years later	692	776	845			
Three years later	697	771				
Four years later	702					
Estimate of cumulative claims	702	771	845	903	968	
Cumulative payments	(702)	(689)	(570)	(350)	(217)	
	–	82	275	553	751	1,661
Effect of discounting	–	(14)	(68)	(175)	(285)	(542)
Present value recognised in the statement of financial position	–	68	207	378	466	1,119

 © IASCF

Credit risk, liquidity risk and market risk

IG62 Paragraph 39(d) of the IFRS requires an insurer to disclose information about credit risk, liquidity risk and market risk that paragraphs 31–42 of IFRS 7 would require if insurance contracts were within its scope. Such disclosure includes:

(a) summary quantitative data about the insurer's exposure to those risks based on information provided internally to its key management personnel (as defined in IAS 24); and

(b) to the extent not already covered by the disclosures discussed above, the information described in paragraphs 36–42 of IFRS 7.

The disclosures about credit risk, liquidity risk and market risk may be either provided in the financial statements or incorporated by cross-reference to some other statement, such as a management commentary or risk report, that is available to users of the financial statements on the same terms as the financial statements and at the same time.

IG63 [Deleted]

IG64 Informative disclosure about credit risk, liquidity risk and market risk might include:

(a) information about the extent to which features such as policyholder participation features mitigate or compound those risks.

(b) a summary of significant guarantees, and of the levels at which guarantees of market prices or interest rates are likely to alter the insurer's cash flows.

(c) the basis for determining investment returns credited to policyholders, such as whether the returns are fixed, based contractually on the return of specified assets or partly or wholly subject to the insurer's discretion.

Credit risk

IG64A Paragraphs 36–38 of IFRS 7 require disclosure about credit risk. Credit risk is defined as 'the risk that one party to a financial instrument will fail to discharge an obligation and cause the other party to incur a financial loss'. Thus, for an insurance contract, credit risk includes the risk that an insurer incurs a financial loss because a reinsurer defaults on its obligations under the reinsurance contract. Furthermore, disputes with the reinsurer could lead to an impairment of the cedant's reinsurance asset. The risk of such disputes may have an effect similar to credit risk. Thus, similar disclosure might be relevant. Balances due from agents or brokers may also be subject to credit risk.

IG64B A financial guarantee contract reimburses a loss incurred by the holder because a specified debtor fails to make payment when due. The holder is exposed to credit risk, and IFRS 7 requires the holder to provide disclosures about that credit risk. However, from the perspective of the issuer, the risk assumed by the issuer is insurance risk rather than credit risk.

IG65 [Deleted]

IG65A The issuer of a financial guarantee contract provides disclosures complying with IFRS 7 if it applies IAS 39 in recognising and measuring the contract. If the issuer elects, when permitted by paragraph 4(d) of IFRS 4, to apply IFRS 4 in recognising and measuring the contract, it provides disclosures complying with IFRS 4. The main implications are as follows:

(a) IFRS 4 requires disclosure about actual claims compared with previous estimates (claims development), but does not require disclosure of the fair value of the contract.

(b) IFRS 7 requires disclosure of the fair value of the contract, but does not require disclosure of claims development.

Liquidity risk

IG65B Paragraph 39(a) and (b) of IFRS 7 requires disclosure of a maturity analysis for financial liabilities that shows the remaining contractual maturities. For insurance contracts, the contractual maturity refers to the estimated date when contractually required cash flows will occur. This depends on factors such as when the insured event occurs and the possibility of lapse. However, IFRS 4 permits various existing accounting practices for insurance contracts to continue. As a result, an insurer may not need to make detailed estimates of cash flows to determine the amounts it recognises in the statement of financial position. To avoid requiring detailed cash flow estimates that are not required for measurement purposes, paragraph 39(d)(i) of IFRS 4 states that an insurer need not provide the maturity analyses required by paragraph 39(a) and (b) of IFRS 7 (ie that show the remaining contractual maturities of insurance contracts) if it discloses an analysis, by estimated timing, of the amounts recognised in the statement of financial position.

IG65C An insurer might also disclose a summary narrative description of how the maturity analysis (or analysis by estimated timing) flows could change if policyholders exercised lapse or surrender options in different ways. If an insurer considers that lapse behaviour is likely to be sensitive to interest rates, the insurer might disclose that fact and state whether the disclosures about market risk reflect that interdependence.

Market risk

IG65D Paragraph 40(a) of IFRS 7 requires a sensitivity analysis for each type of market risk at the end of the reporting period, showing the effect of reasonably possible changes in the relevant risk variable on profit or loss or equity. If no reasonably possible change in the relevant risk variable would affect profit or loss or equity, an entity discloses that fact to comply with paragraph 40(a) of IFRS 7. A reasonably possible change in the relevant risk variable might not affect profit or loss in the following examples:

(a) if a non-life insurance liability is not discounted, changes in market interest rates would not affect profit or loss.

(b) some insurers may use valuation factors that blend together the effect of various market and non-market assumptions that do not change unless the insurer assesses that its recognised insurance liability is not adequate. In some cases a reasonably possible change in the relevant risk variable would not affect the adequacy of the recognised insurance liability.

 © IASCF

IG65E In some accounting models, a regulator specifies discount rates or other assumptions about market risk variables that the insurer uses in measuring its insurance liabilities and the regulator does not amend those assumptions to reflect current market conditions at all times. In such cases, the insurer might comply with paragraph 40(a) of IFRS 7 by disclosing:

(a) the effect on profit or loss or equity of a reasonably possible change in the assumption set by the regulator.

(b) the fact that the assumption set by the regulator would not necessarily change at the same time, by the same amount, or in the same direction, as changes in market prices, or market rates, would imply.

IG65F An insurer might be able to take action to reduce the effect of changes in market conditions. For example, an insurer may have discretion to change surrender values or maturity benefits, or to vary the amount or timing of policyholder benefits arising from discretionary participation features. Paragraph 40(a) of IFRS 7 does not require entities to consider the potential effect of future management actions that may offset the effect of the disclosed changes in the relevant risk variable. However, paragraph 40(b) of IFRS 7 requires an entity to disclose the methods and assumptions used to prepare the sensitivity analysis. To comply with this requirement, an insurer might conclude that it needs to disclose the extent of available management actions and their effect on the sensitivity analysis.

IG65G Some insurers manage sensitivity to market conditions using a method that differs from the method described by paragraph 40(a) of IFRS 7. For example, some insurers use an analysis of the sensitivity of embedded value to changes in market risk. Paragraph 39(d)(ii) of IFRS 4 permits an insurer to use that sensitivity analysis to meet the requirement in paragraph 40(a) of IFRS 7. IFRS 4 and IFRS 7 require an insurer to provide sensitivity analyses for all classes of financial instruments and insurance contracts, but an insurer might use different approaches for different classes. IFRS 4 and IFRS 7 specify the following approaches:

(a) the sensitivity analysis described in paragraph 40(a) of IFRS 7 for financial instruments or insurance contracts;

(b) the method described in paragraph 41 of IFRS 7 for financial instruments or insurance contracts; or

(c) the method permitted by paragraph 39(d)(ii) of IFRS 4 for insurance contracts.

Exposures to market risk under embedded derivatives

IG66 Paragraph 39(e) of the IFRS requires an insurer to disclose information about exposures to market risk under embedded derivatives contained in a host insurance contract if the insurer is not required to, and does not, measure the embedded derivative at fair value (for example, guaranteed annuity options and guaranteed minimum death benefits).

© IASCF

IG67 An example of a contract containing a guaranteed annuity option is one in which the policyholder pays a fixed monthly premium for thirty years. At maturity, the policyholder can elect to take either (a) a lump sum equal to the accumulated investment value or (b) a lifetime annuity at a rate guaranteed at inception (ie when the contract started). For policyholders electing to receive the annuity, the insurer could suffer a significant loss if interest rates decline substantially or if the policyholder lives much longer than the average. The insurer is exposed to both market risk and significant insurance risk (mortality risk) and a transfer of insurance risk occurs at inception, because the insurer fixed the price for mortality risk at that date. Therefore, the contract is an insurance contract from inception. Moreover, the embedded guaranteed annuity option itself meets the definition of an insurance contract, and so separation is not required.

IG68 An example of a contract containing minimum guaranteed death benefits is one in which the policyholder pays a monthly premium for 30 years. Most of the premiums are invested in a mutual fund. The rest is used to buy life cover and to cover expenses. On maturity or surrender, the insurer pays the value of the mutual fund units at that date. On death before final maturity, the insurer pays the greater of (a) the current unit value and (b) a fixed amount. This contract could be viewed as a hybrid contract comprising (a) a mutual fund investment and (b) an embedded life insurance contract that pays a death benefit equal to the fixed amount less the current unit value (but zero if the current unit value is more than the fixed amount).

IG69 Both these embedded derivatives meet the definition of an insurance contract if the insurance risk is significant. However, in both cases market risk may be much more significant than the mortality risk. If interest rates or equity markets fall substantially, these guarantees would be well in the money. Given the long-term nature of the guarantees and the size of the exposures, an insurer might face extremely large losses. Therefore, an insurer might place particular emphasis on disclosures about such exposures.

IG70 Useful disclosures about such exposures might include:

(a) the sensitivity analysis discussed above.

(b) information about the levels where these exposures start to have a material effect on the insurer's cash flows (paragraph IG64(b)).

(c) the fair value of the embedded derivative, although neither the IFRS nor IFRS 7 requires disclosure of that fair value.

Key performance indicators

IG71 Some insurers present disclosures about what they regard as key performance indicators, such as lapse and renewal rates, total sum insured, average cost per claim, average number of claims per contract, new business volumes, claims ratio, expense ratio and combined ratio. The IFRS does not require such disclosures. However, such disclosures might be a useful way for an insurer to explain its financial performance during the period and to give an insight into the risks arising from insurance contracts.

Basis for Conclusions on IFRS 5 *Non-current Assets Held for Sale and Discontinued Operations*

This Basis for Conclusions accompanies, but is not part of, IFRS 5.

Introduction

BC1 This Basis for Conclusions summarises the International Accounting Standards Board's considerations in reaching the conclusions in IFRS 5 *Non-current Assets Held for Sale and Discontinued Operations*. Individual Board members gave greater weight to some factors than to others.

BC2 In September 2002 the Board agreed to add a short-term convergence project to its active agenda. The objective of the project is to reduce differences between IFRSs and US GAAP that are capable of resolution in a relatively short time and can be addressed outside major projects. The project is a joint project with the US Financial Accounting Standards Board (FASB).

BC3 As part of the project, the two boards agreed to review each other's deliberations on each of the selected possible convergence topics, and choose the highest quality solution as the basis for convergence. For topics recently considered by either board, there is an expectation that whichever board has more recently deliberated that topic will have the higher quality solution.

BC4 As part of the review of topics recently considered by the FASB, the Board discussed the requirements of SFAS 144 *Accounting for the Impairment or Disposal of Long-Lived Assets*, as they relate to assets held for sale and discontinued operations. The Board did not consider the requirements of SFAS 144 relating to the impairment of assets held for use. Impairment of such assets is an issue that is being addressed in the IASB research project on measurement being led by the Canadian Accounting Standards Board.

BC5 Until the issue of IFRS 5, the requirements of SFAS 144 on assets held for sale and discontinued operations differed from IFRSs in the following ways:

(a) if specified criteria are met, SFAS 144 requires non-current assets that are to be disposed of to be classified as held for sale. Such assets are remeasured at the lower of carrying amount and fair value less costs to sell and are not depreciated or amortised. IFRSs did not require non-current assets that are to be disposed of to be classified separately or measured differently from other non-current assets.

(b) the definition of discontinued operations in SFAS 144 was different from the definition of discontinuing operations in IAS 35 *Discontinuing Operations* and the presentation of such operations required by the two standards was also different.

BC6 As discussed in more detail below, the Board concluded that introducing a classification of assets that are held for sale would substantially improve the information available to users of financial statements about assets to be sold.

 © IASCF

BC7 The Board published its proposals in an Exposure Draft, ED 4 *Disposal of Non-current Assets and Presentation of Discontinued Operations*, in July 2003 with a comment deadline of 24 October 2003. The Board received over 80 comment letters on the Exposure Draft.

Scope of the IFRS

BC8 In ED 4, the Board proposed that the IFRS should apply to all non-current assets except:

(a) goodwill,

(b) financial instruments within the scope of IAS 39 *Financial Instruments: Recognition and Measurement*,*

(c) financial assets under leases, and

(d) deferred tax assets and assets arising from employee benefits.

BC9 In reconsidering the scope, the Board noted that the use of the term 'non-current' caused the following problems:

(a) assets that are acquired with the intention of resale were clearly intended to be within the scope of ED 4, but would also be within the definition of current assets and so might be thought to be excluded. The same was true for assets that had been classified as non-current but were now expected to be realised within twelve months.

(b) it was not clear how the scope would apply to assets presented in accordance with a liquidity presentation.

BC10 The Board noted that it had not intended that assets classified as non-current in accordance with IAS 1 *Presentation of Financial Statements* would be reclassified as current assets simply because of management's intention to sell or because they reached their final twelve months of expected use by the entity. The Board decided to clarify in IFRS 5 that assets classified as non-current are not reclassified as current assets until they meet the criteria to be classified as held for sale in accordance with the IFRS. Further, assets of a class that an entity would normally regard as non-current and are acquired exclusively with a view to resale are not classified as current unless they meet the criteria to be classified as held for sale in accordance with the IFRS.

BC11 In relation to assets presented in accordance with a liquidity presentation, the Board decided that non-current should be taken to mean assets that include amounts expected to be recovered more than twelve months after the balance sheet date.

BC12 These clarifications ensure that all assets of the type normally regarded by the entity as non-current will be within the scope of the IFRS.

* In November 2009 the IASB amended some of the requirements of IAS 39 and relocated them to IFRS 9 *Financial Instruments*. IFRS 9 applies to all assets within the scope of IAS 39.

© IASCF

BC13 The Board also reconsidered the exclusions from the scope proposed in ED 4. The Board noted that the classification and presentation requirements of the IFRS are applicable to all non-current assets and concluded that any exclusions should relate only to the measurement requirements. In relation to the measurement requirements, the Board decided that non-current assets should be excluded only if (i) they are already carried at fair value with changes in fair value recognised in profit or loss or (ii) there would be difficulties in determining their fair value less costs to sell. The Board therefore concluded that only the following non-current assets should be excluded from the measurement requirements of the IFRS:

Assets already carried at fair value with changes in fair value recognised in profit or loss:

(a) financial assets within the scope of IAS 39.[*]

(b) non-current assets that have been accounted for using the fair value model in IAS 40 *Investment Property*.

(c) non-current assets that have been measured at fair value less estimated point-of-sale costs in accordance with IAS 41 *Agriculture*.[†]

Assets for which there might be difficulties in determining their fair value:

(a) deferred tax assets.

(b) assets arising from employee benefits.

(c) assets arising from insurance contracts.

BC14 The Board acknowledged that the scope of the IFRS would differ from that of SFAS 144 but noted that SFAS 144 covers the impairment of non-current assets held for use as well as those held for sale. Furthermore, other requirements in US GAAP affect the scope of SFAS 144. The Board therefore concluded that convergence with the scope of SFAS 144 would not be possible.

BC14A The Board identified a need to clarify the disclosure requirements for non-current assets (or disposal groups) classified as held for sale or discontinued operations in accordance with IFRS 5. Some believed that IFRS 5 and other IFRSs that specifically refer to non-current assets (or disposal groups) classified as held for sale or discontinued operations set out all the disclosures required in respect of those assets or operations. Others believed that all disclosures required by IFRSs whose scope does not specifically exclude non-current assets (or disposal groups) classified as held for sale or discontinued operations apply to such assets (or disposal groups).[§]

---

* In November 2009 the IASB amended some of the requirements of IAS 39 and relocated them to IFRS 9 *Financial Instruments*. IFRS 9 applies to all assets within the scope of IAS 39.

† In *Improvements to IFRSs* issued in May 2008 the Board amended IAS 41: the term 'estimated point-of-sale costs' was replaced by 'costs to sell'.

§ Paragraphs BC14A–BC14E were added as a consequence of amendments to IFRS 5 by *Improvements to IFRSs* issued in April 2009.

 © IASCF

BC14B The Board noted that paragraph 30 of IFRS 5 requires an entity to 'present and disclose information that enables users of the financial statements to evaluate the financial effects of discontinued operations and disposals of non-current assets (or disposal groups).' Paragraph BC17 below states that 'the Board concluded that providing information about assets and groups of assets and liabilities to be disposed of is of benefit to users of financial statements. Such information should assist users in assessing the timing, amount and uncertainty of future cash flows.'

BC14C The Board noted that some IFRSs other than IFRS 5 require specific disclosures for non-current assets (or disposal groups) classified as held for sale or discontinued operations. For instance, paragraph 68 of IAS 33 *Earnings per Share* requires an entity to disclose the amount per share for discontinued operations. The Board also noted that the requirements of IAS 1 on fair presentation and materiality also apply to such assets (or disposal groups).

BC14D The Board also noted that when a disposal group includes assets and liabilities that are not within the scope of the measurement requirements of IFRS 5, disclosures about measurement of those assets and liabilities are normally provided in the other notes to the financial statements and do not need to be repeated, unless they better enable users of the financial statements to evaluate the financial effects of discontinued operations and disposals of non-current assets (or disposal groups).

BC14E Consequently, in *Improvements to IFRSs* issued in April 2009, the Board clarified that IFRS 5 and other IFRSs that specifically refer to non-current assets (or disposal groups) classified as held for sale or discontinued operations set out all the disclosures required in respect of those assets or operations. Additional disclosures about non-current assets (or disposal groups) classified as held for sale may be necessary to comply with the general requirements of IAS 1, in particular paragraphs 15 and 125 of that Standard.

Classification of non-current assets to be disposed of as held for sale

BC15 Under SFAS 144, long-lived assets are classified as either (i) held and used or (ii) held for sale. Before the issue of this IFRS, no distinction was made in IFRSs between non-current assets held and used and non-current assets held for sale, except in relation to financial instruments.

BC16 The Board considered whether a separate classification for non-current assets held for sale would create unnecessary complexity in IFRSs and introduce an element of management intent into the accounting. Some commentators suggested that the categorisation 'assets held for sale' is unnecessary, and that if the focus were changed to 'assets *retired* from active use' much of the complexity could be eliminated, because the latter classification would be based on actuality rather than what they perceive as management intent. They assert that it is the potential abuse of the classification that necessitates many of the detailed requirements in SFAS 144. Others suggested that, if existing IFRSs were amended to specify that assets retired from active use are measured at fair value less costs to sell and to require additional disclosure, some convergence with SFAS 144 could be achieved without creating a new IFRS.

BC17 However, the Board concluded that providing information about assets and groups of assets and liabilities to be disposed of is of benefit to users of financial statements. Such information should assist users in assessing the timing, amount and uncertainty of future cash flows. The Board understands that this was also the assessment underpinning SFAS 144. Therefore the Board concluded that introducing the notion of assets and disposal groups held for sale makes IFRSs more complete.

BC18 Furthermore, although the held for sale classification begins from an intention to sell the asset, the other criteria for this classification are tightly drawn and are significantly more objective than simply specifying an intention or commitment to sell. Some might argue that the criteria are too specific. However, the Board believes that the criteria should be specific to achieve comparability of classification between entities. The Board does not believe that a classification 'retired from active use' would necessarily require fewer criteria to support it. For example, it would be necessary to establish a distinction between assets retired from active use and those that are held as back-up spares or are temporarily idle.

BC19 Lastly, if the classification and measurement of assets held for sale in IFRSs are the same as in US GAAP, convergence will have been achieved in an area of importance to users of financial statements.

BC20 Most respondents to ED 4 agreed that a separate classification for non-current assets that are no longer held to be used is desirable. However, the proposals in ED 4 were criticised for the following reasons:

(a) the criteria were too restrictive and rules-based.

(b) a commitment to sell needs to be demonstrated, consistently with the requirements of IAS 37 *Provisions, Contingent Liabilities and Contingent Assets* relating to restructuring provisions.

(c) the classification should be for assets retired from active use.

(d) assets to be abandoned should be treated in the same way as assets to be sold.

BC21 The Board noted that a more flexible definition would be open to abuse. Further, changing the criteria for classification could cause divergence from US GAAP. The Board has, however, reordered the criteria to highlight the principles.

BC22 The Board also noted that the requirements of IAS 37 establish when a liability is incurred, whereas the requirements of the IFRS relate to the measurement and presentation of assets that are already recognised.

BC23 Finally, the Board reconfirmed the principle behind the classification proposals in ED 4, which is that the carrying amount of the assets will be recovered principally through sale. Applying this principle to assets retired from active use, the Board decided that assets retired from active use that do not meet the criteria for classification as assets held for sale should not be presented separately because the carrying amount of the asset may not be recovered principally through sale. Conversely, the Board decided that assets that meet the criteria to be classified as

 © IASCF

held for sale and are being used should not be precluded from being separately classified. This is because, if a non-current asset is available for immediate sale, the remaining use of the asset is incidental to its recovery through sale and the carrying amount of the asset will be recovered principally through sale.

BC24 Applying the same principle to assets to be abandoned, the Board noted that their carrying value will never be recovered principally through sale.

Plan to sell the controlling interest in a subsidiary*

BC24A In 2007 the Board considered situations in which an entity is committed to a plan to sell the controlling interest in a subsidiary and, after the sale, retains a non-controlling interest in its former subsidiary, taking the form of an investment in an associate, an investment in a joint venture or a financial asset. The Board considered how the classification as held for sale applies to the subsidiary in the consolidated financial statements of the entity.

BC24B The Board noted that paragraph 6 states that 'An entity shall classify a non-current asset (or disposal group) as held for sale if its carrying amount will be recovered principally through a sale transaction rather than through continuing use.' The Board also noted that IAS 27 *Consolidated and Separate Financial Statements* (as amended in January 2008) defines control and requires a parent to consolidate a subsidiary until control is lost. At the date control is lost, all the subsidiary's assets and liabilities are derecognised and any investment retained in the former subsidiary is recognised. Loss of control is a significant economic event that changes the nature of an investment. The parent-subsidiary relationship ceases to exist and an investor-investee relationship begins that differs significantly from the former parent-subsidiary relationship. Therefore, the new investor-investee relationship is recognised and measured initially at the date when control is lost.

BC24C The Board concluded that, under the sale plan described above, the controlling interest in the subsidiary is, in substance, exchanged for a non-controlling interest. Therefore, in the Board's view, being committed to a plan involving loss of control of a subsidiary should trigger classification as held for sale. The Board also noted that this conclusion is consistent with IAS 27.

BC24D The Board noted that the subsidiary's assets and liabilities meet the definition of a disposal group in accordance with paragraph 4. Therefore, the Board concluded that all the subsidiary's assets and liabilities should be classified as held for sale, not only the portion of the interest to be disposed of, regardless of whether the entity will retain a non-controlling interest.

BC24E The Board considered the comments received on the proposal set out in its exposure draft of October 2007. In response to comments from some respondents, the Board clarified in the amendment that the criteria for classification as held for sale need to be met.

* This section and paragraphs BC77A and BC79A were added as a consequence of amendments to IFRS 5 by *Improvements to IFRSs* issued in May 2008.

Assets to be exchanged for other non-current assets

BC25 Under SFAS 144, long-lived assets that are to be exchanged for similar productive assets cannot be classified as held for sale. They are regarded as disposed of only when exchanged. The Basis for Conclusions on SFAS 144 explains that this is because the exchange of such assets is accounted for at amounts based on the carrying amount of the assets, not at fair value, and that using the carrying amount is more consistent with the accounting for a long-lived asset to be held and used than for a long-lived asset to be sold.

BC26 Under IAS 16 *Property, Plant and Equipment*, as revised in 2003, an exchange of assets is normally measured at fair value. The SFAS 144 reasoning for the classification of such assets as held for sale does not, therefore, apply. Consistently with IAS 16, the IFRS treats an exchange of assets as a disposal and acquisition of assets unless the exchange has no commercial substance.

BC27 The FASB has published an exposure draft proposing to converge with the requirements in IAS 16 for an exchange of assets to be measured at fair value. The exposure draft also proposes a consequential amendment to SFAS 144 that would make exchanges of assets that have commercial substance eligible for classification as held for sale.

Measurement of non-current assets held for sale

BC28 SFAS 144 requires a long-lived asset or a disposal group classified as held for sale to be measured at the lower of its carrying amount and fair value less costs to sell. A long-lived asset classified as held for sale (or included within a disposal group) is not depreciated, but interest and other expenses attributable to the liabilities of a disposal group are recognised.

BC29 As explained in the Basis for Conclusions on SFAS 144, the remaining use in operations of an asset that is to be sold is incidental to the recovery of the carrying amount through sale. The accounting for such an asset should therefore be a process of valuation rather than allocation.

BC30 The FASB further observed that once the asset is remeasured, to depreciate the asset would reduce its carrying amount below its fair value less costs to sell. It also noted that should there be a decline in the value of the asset after initial classification as held for sale and before eventual sale, the loss would be recognised in the period of decline because the fair value less costs to sell is evaluated each period.

BC31 The counter-argument is that, although classified as held for sale, the asset is still being used in operations, and hence cessation of depreciation is inconsistent with the basic principle that the cost of an asset should be allocated over the period during which benefits are obtained from its use. Furthermore, although the decline in the value of the asset through its use would be reflected in the recognised change in fair value, it might also be masked by an increase arising from changes in the market prices of the asset.

 © IASCF

BC32 However, the Board noted that IAS 16 requires an entity to keep the expected useful life and residual values of property, plant and equipment up to date, and IAS 36 *Impairment of Assets* requires an immediate write-down to the higher of value in use and fair value less costs to sell. An entity should, therefore, often achieve a measurement effect for individual assets that are about to be sold under other IFRSs similar to that required by this IFRS as follows. Under other IFRSs, if the fair value less costs to sell is higher than carrying amount there will be no impairment and no depreciation (because the residual value will have been updated). If fair value less costs to sell is lower than carrying amount, there will be an impairment loss that reduces the carrying amount to fair value less costs to sell and then no depreciation (because the residual value will have been updated), unless value in use is higher than fair value less costs to sell. If value in use is higher than fair value less costs to sell, there would be small differences between the treatment that would arise under other IFRSs and the treatment under IFRS 5. Under other IFRSs there would be an impairment loss to the extent that the carrying amount exceeds value in use rather than to the extent that the carrying amount exceeds fair value less costs to sell. Under other IFRSs, there would also then be depreciation of the excess of value in use (the new carrying amount of the asset) over fair value less costs to sell (its residual value). However, for assets classified as held for sale, value in use will differ from fair value less costs to sell only to the extent of the net cash flows expected to arise before the sale. If the period to sale is short, this amount will usually be relatively small. The difference in impairment loss recognised and subsequent depreciation under other IFRSs compared with the impairment loss and no subsequent depreciation under IFRS 5 would, therefore, also be small.

BC33 The Board concluded that the measurement requirements of IFRS 5 for individual assets would often not involve a significant change from the requirements of other IFRSs. Furthermore, the Board agreed with the FASB that the cash flows arising from the asset's remaining use were incidental to the recovery of the asset through sale and, hence, concluded that individual assets classified as held for sale should be measured at the lower of carrying amount and fair value less costs to sell and should not be depreciated.

BC34 For disposal groups, there could be greater differences between the requirements in other IFRSs and the requirements of IFRS 5. For example, the fair value less costs to sell of a disposal group may reflect internally generated goodwill to the extent that it is higher than the carrying value of the net assets in the disposal group. The residual value of the non-current assets in the disposal group may, nonetheless, be such that, if they were accounted for in accordance with IAS 16, those assets would be depreciated.

BC35 In such a situation, some might view the requirements in IFRS 5 as allowing internally generated goodwill to stop the depreciation of non-current assets. However, the Board does not agree with that view. Rather, the Board believes that the internally generated goodwill provides a buffer against the recognition of an impairment loss on the disposal group. The same effect arises from the impairment requirements in IAS 36. The non-depreciation of the non-current assets in the disposal group is, as with individual assets, a consequence of the basic principle underlying the separate classification, that the carrying amount of the asset will be recovered principally through sale, not continuing use, and that amounts recovered through continuing use will be incidental.

BC36 In addition, it is important to emphasise that IFRS 5 permits only an asset (or disposal group) that is to be *sold* to be classified as held for sale. Assets to be abandoned are classified as held and used until disposed of, and thus are depreciated. The Board agrees with the FASB's observation that a distinction can be drawn between an asset that is to be sold and an asset that is to be abandoned, because the former will be recovered principally through sale and the latter through its continuing use. Therefore, it is logical that depreciation should cease in the former but not the latter case.

BC37 When an asset or a disposal group held for sale is part of a foreign operation with a functional currency that is different from the presentation currency of the group, an exchange difference will have been recognised in equity* arising from the translation of the asset or disposal group into the presentation currency of the group. IAS 21 *The Effects of Changes in Foreign Exchange Rates* requires the exchange difference to be 'recycled' from equity to profit or loss on disposal of the operation. The question arises whether classification as held for sale should trigger the recycling of any exchange differences. Under US GAAP (EITF 01-5 *Application of FASB Statement No. 52 to an Investment Being Evaluated for Impairment That Will Be Disposed Of*) the accumulated foreign currency translation adjustments previously recognised in other comprehensive income that are expected to be recycled in income at the time of sale are included in the carrying amount of the asset (or disposal group) being tested for impairment.

BC38 In its project on reporting comprehensive income, the Board may reconsider the issue of recycling. Therefore, it did not wish to make any interim changes to the requirements in IAS 21. Hence, the IFRS does not permit any exchange differences to be recycled on the classification of an asset or a disposal group as held for sale. The recycling will take place when the asset or disposal group is sold.

The allocation of an impairment loss to a disposal group

BC39 Under SFAS 144 and the proposals in ED 4, assets within the disposal group that are not within the scope of the IFRS are adjusted in accordance with other standards before measuring the fair value less costs to sell of the disposal group. Any loss or gain recognised on adjusting the carrying amount of the disposal group is allocated to the carrying amount of the long-lived assets of the group.

BC40 This is different from the requirements of IAS 36 for the allocation of an impairment loss arising on a cash-generating unit. IAS 36 requires an impairment loss on a cash-generating unit to be allocated first to reduce the carrying amount of goodwill and then to reduce pro rata the carrying amounts of the other assets in the unit.

BC41 The Board considered whether the allocation of an impairment loss for a disposal group should be consistent with the requirements of IAS 36 or with the requirements of SFAS 144. The Board concluded that it would be simplest to require the same allocation as is required by IAS 36 for cash-generating units. Although this is different from SFAS 144, the disposal group as a whole will be measured at the same amount.

* As a consequence of the revision of IAS 1 *Presentation of Financial Statements* (as revised in 2007) such a difference is recognised in other comprehensive income.

Newly acquired assets

BC42 SFAS 144 requires, and ED 4 proposed, newly acquired assets that meet the criteria to be classified as held for sale to be measured at fair value less costs to sell on initial recognition. So, in those instances, other than in a business combination, in which an entity acquires a non-current asset that meets the criteria to be classified as held for sale, a loss is recognised in profit or loss if the cost of the asset exceeds its fair value less costs to sell. In the more common cases in which an entity acquires, as part of a business combination, a non-current asset (or disposal group) that meets the criteria to be classified as held for sale, the difference between fair value and fair value less costs to sell is recognised in goodwill.

BC43 Some respondents to ED 4 noted that measuring newly acquired assets not part of a business combination at fair value less costs to sell was inconsistent with the general proposal that assets classified as held for sale should be measured at *the lower of carrying amount* and fair value less costs to sell. The Board agreed and amended the requirement so that it is clear that the newly acquired assets (or disposal groups) are measured on initial recognition at the lower of what their carrying amount would be were they not classified as held for sale (ie cost) and fair value less costs to sell.

BC44 In relation to business combinations, the Board noted that conceptually the assets should be recognised initially at fair value and then immediately classified as held for sale, with the result that the costs to sell are recognised in profit or loss, not goodwill. In theory, if the entity had factored the costs to sell into the purchase price, the reduced price would lead to the creation of negative goodwill, the immediate recognition of which in profit or loss would offset the loss arising from the costs to sell. Of course, in practice, the reduced price will usually result in lower net positive goodwill rather than negative goodwill to be recognised in profit or loss. For that reason, and for the sake of convergence, the Board concluded that in a business combination non-current assets that meet the criteria to be classified as held for sale on acquisition should be measured at fair value less costs to sell on initial recognition.

BC45 The Board and the FASB are considering which items should form part of the business combination transaction more generally in their joint project on the application of the purchase method. This consideration includes whether the assets and liabilities recognised in the transaction should be based on the acquirer's or the acquiree's perspective. The outcome of those deliberations may affect the decision discussed in paragraph BC44.[*]

Recognition of subsequent increases in fair value less costs to sell

BC46 The Board considered whether a subsequent increase in fair value less costs to sell should be recognised to the extent that it reversed previous impairments.

[*] In their joint project on the application of the acquisition method, the Board and the FASB clarified that the classification of assets acquired in a business combination as held for sale should be based on the acquirer's perspective. Therefore, the acquirer would have to satisfy the criteria in paragraphs 6–11 of IFRS 5 at the acquisition date in order to classify assets acquired as held for sale on initial recognition.

© IASCF

SFAS 144 requires the recognition of a subsequent increase in fair value less costs to sell, but not in excess of the cumulative loss previously recognised for a write-down to fair value less costs to sell. The Board decided that, under IFRSs, a gain should be recognised to the extent that it reverses any impairment of the asset, either in accordance with the IFRS or previously in accordance with IAS 36. Recognising a gain for the reversal of an impairment that occurred before the classification of the asset as held for sale is consistent with the requirement in IAS 36 to recognise reversals of impairment.

Recognition of impairment losses and subsequent gains for assets that, before classification as held for sale, were measured at revalued amounts in accordance with another IFRS

BC47 ED 4 proposed that impairment losses and subsequent gains for assets that, before classification as held for sale, were measured at revalued amounts in accordance with another IFRS should be treated as revaluation decreases and increases according to the standard under which the assets had previously been revalued, consistently with the requirements of IAS 36, except to the extent that the losses and gains are caused by the initial recognition of, or changes in, costs to sell. ED 4 also proposed that costs to sell should always be recognised in profit or loss.

BC48 Many respondents disagreed with these proposals, because of their complexity and because of the resulting inconsistent treatment of assets classified as held for sale. The Board considered the issues raised and decided that assets that were already carried at fair value with changes in fair value recognised in profit or loss should not be subject to the measurement requirements of the IFRS. The Board believes that, for such assets, continued measurement at fair value gives better information than measurement at the lower of carrying amount and fair value less costs to sell. The Board did not, however, believe that such treatment was appropriate for assets that had been revalued in accordance with IAS 16 and IAS 38, because those standards require depreciation to continue and the revaluation change would not necessarily be recognised in profit or loss. The Board concluded that assets that had been revalued in accordance with IAS 16 and IAS 38 should be treated in the same way as any assets that, before classification as held for sale, had not been revalued. Such an approach results in a consistent treatment for assets that are within the scope of the measurement requirements of the IFRS and, hence, a simpler standard.

Measurement of assets reclassified as held for use

BC49 Under SFAS 144, when an entity changes its plan to sell the asset and reclassifies a long-lived asset from held for sale to held and used, the asset is measured at the lower of (a) the carrying amount before the asset (or disposal group) was classified as held for sale, adjusted for any depreciation (or amortisation) that would have been recognised had the asset (or disposal group) been continuously classified as held and used and (b) its fair value at the date of the decision not to sell.

 © IASCF

BC50 The underlying principle is to restore the carrying value of the asset to what it would have been had it never been classified as held for sale, taking into account any impairments that may have occurred. In fact, SFAS 144 requires that, for held and used assets, an impairment is recognised only if the carrying amount of the asset exceeds the sum of the undiscounted cash flows expected to result from its use and eventual disposal. Thus, the carrying amount of the asset if it had never been classified as held for sale might exceed its fair value. As a result, SFAS 144 does not necessarily lead to the asset reverting to its original carrying amount. However, the Basis for Conclusions on SFAS 144 notes that the FASB concluded it would be inappropriate to write up the carrying amount of the asset to an amount greater than its fair value solely on the basis of an undiscounted cash flow test. Hence, it arrived at the requirement for measurement at the lower of (a) the asset's carrying amount had it not been classified as held for sale and (b) fair value at the date of the decision not to sell the asset.

BC51 IAS 36 has a different measurement basis for impaired assets, ie recoverable amount. The Board concluded that to be consistent with the principle of SFAS 144 and also to be consistent with the requirements of IAS 36, an asset that ceases to be classified as held for sale should be measured at the lower of (a) the carrying amount that would have been recognised had the asset not been classified as held for sale and (b) its recoverable amount at the date of reclassification. Whilst this is not full convergence, the difference arises from differences in the US GAAP and IFRS impairment models.

Removal of exemption from consolidation for subsidiaries acquired and held exclusively with a view to resale

BC52 SFAS 144 removed the exemption from consolidation in US GAAP for subsidiaries held on a temporary basis on the grounds that all assets held for sale should be treated in the same way, ie as required by SFAS 144 rather than having some assets consolidated and some not.

BC53 The Board agreed that all subsidiaries should be consolidated and that all assets (and disposal groups) that meet the criteria to be classified as held for sale should be treated in the same way. The exemption from consolidation in IAS 27 *Consolidated and Separate Financial Statements* for subsidiaries acquired and held exclusively with a view to resale prevents those assets and disposal groups within such subsidiaries that meet the criteria to be classified as held for sale from being treated consistently with other assets and disposal groups. ED 4 therefore proposed that the exemption in IAS 27 should be removed.

BC54 Some respondents disagreed with this proposal, on the grounds that the information provided by consolidation of such subsidiaries would be less useful than that provided by the current requirement to measure the investment in such subsidiaries at fair value. The Board noted that the impact of the proposals in ED 4 would be limited to the following:

(a) the measurement of a subsidiary that currently is within the scope of the exemptions would change from fair value as required by IAS 39 to the lower of cost and fair value less costs to sell.

(b) any change in fair value of the investment in the subsidiary would, in accordance with the current requirements in IAS 27, be presented as a single amount in profit or loss as a held-for-trading financial asset in accordance with IAS 39.[*] As discussed in paragraph BC72, the subsidiary would be a discontinued operation and, in accordance with the IFRS's requirements (see paragraphs BC73–BC76), any recognised change in the value of the disposal group that comprises the subsidiary would be presented as a single amount in profit or loss.

(c) the presentation in the balance sheet would change from a single amount for the investment in the subsidiary to two amounts—one for the assets and one for the liabilities of the disposal group that is the subsidiary.[†]

BC55 The Board reaffirmed its conclusion set out in paragraph BC53. However, it noted that the limited impact of the proposals apply only to the amounts required to be presented on the face of the balance sheet and the income statement. Providing the required analyses of those amounts in the notes could potentially involve the entity having to obtain significantly more information. The Board therefore decided not to require the disclosure of the analyses of the amounts presented on the face of the balance sheet and income statement for newly acquired subsidiaries and to clarify in an example the computational short cuts that could be used to arrive at the amounts to be presented on the face of the balance sheet and income statement.

Presentation of non-current assets held for sale

BC56 SFAS 144 requires an entity to present:

(a) a long-lived asset classified as held for sale separately in the balance sheet; and

(b) the assets and liabilities of a disposal group classified as held for sale separately in the asset and liability sections of the balance sheet. The major classes of those assets and liabilities are separately disclosed either on the face of the balance sheet or in the notes.

BC57 In the Basis for Conclusions on SFAS 144 the FASB noted that information about the nature of both assets and liabilities of a disposal group is useful to users. Separately presenting those items in the balance sheet provides information that is relevant. Separate presentation also distinguishes those assets that are not being depreciated from those that are being depreciated. The Board agreed with the FASB's views.

BC58 Respondents to ED 4 noted that the separate presentation within equity of amounts relating to assets and disposal groups classified as held for sale (such as, for example, unrealised gains and losses on available-for-sale assets[§] and foreign

[*] IFRS 9 *Financial Instruments*, issued in November 2009, eliminated the category of held-for-trading financial assets. Paragraph BC54 discusses matters relevant when IFRS 5 was issued.

[†] Greater disaggregation of the disposal group in the statement of financial position is permitted but not required.

© IASCF

currency translation adjustments) would also provide useful information. The Board agreed and has added such a requirement to the IFRS.

Timing of classification as, and definition of, discontinued operations

BC59 With the introduction of SFAS 144, the FASB broadened the scope of a discontinued operation from a 'segment of a business' to a 'component of an entity'. A component is widely drawn, the criterion being that it comprises 'operations and cash flows that can be clearly distinguished, operationally and for financial reporting purposes, from the rest of the entity'. SFAS 144 states that a component may be a segment, a reporting unit, a subsidiary or an asset group.

BC60 However, at the same time, the FASB specified more restrictive criteria for determining *when* the component is classified as discontinued and hence when its results are presented as discontinued. SFAS 144 requires a component to be classified as discontinued only if it has been disposed of or if it meets the criteria for classification as an asset 'held for sale'.

BC61 The definition of a discontinuing operation in IAS 35 as a 'major line of business' or 'geographical area of operations' is closer to the former, and narrower, US GAAP definition. The trigger in IAS 35 for classifying the operation as discontinuing is the earlier of (a) the entity entering into a binding sale agreement and (b) the board of directors approving and announcing a formal disposal plan. Although IAS 35 refers to IAS 37 for further guidance on what constitutes a plan, the criteria are less restrictive than those in SFAS 144.

BC62 Paragraph 12 of the *Framework* states that the objective of financial statements is to provide information about the financial position, performance and changes in financial position of an entity that is useful to a wide range of users in making economic decisions. Paragraph 15 of the *Framework* goes on to state that the economic decisions that are taken by users of financial statements require an evaluation of the ability of an entity to generate cash and cash equivalents. Separately highlighting the results of discontinued operations provides users with information that is relevant in assessing the ongoing ability of the entity to generate cash flows.

BC63 In terms of the timing of classifying an operation as discontinued, the Board considered whether more useful information is provided by making the classification conditional upon a firm decision to discontinue an operation (the current IAS 35 approach) or conditional upon the classification of an operation as held for sale.

BC64 The Board decided that, to be consistent with the presentation of assets held for disposal and in the interests of convergence, an operation should be classified as discontinued when it is disposed of or classified as held for sale.

BC65 IAS 35 also adopts a different approach from US GAAP when criteria for classification as discontinued are met after the period-end but before the financial statements are issued. SFAS 144 requires some disclosure; however, the component is *not* presented as a discontinued operation. IAS 35 requires the component to be classified as discontinuing.

BC66 The Board believes that, consistently with IAS 10 *Events after the Balance Sheet Date*,* a component should not be classified as discontinued in the financial statements unless it meets the criteria to be so classified at the balance sheet date.

BC67 In terms of the definition of a discontinued operation, ED 4 proposed adopting the SFAS 144 definition of a discontinued operation. The Board argued that under existing IAS 35 there may be disposal transactions that, although likely to have an impact on the ongoing operations of the entity, do not meet the criteria for classification as a discontinuing activity. For example, an entity might dispose of a significant portion, but not all, of its cash-generating units operating in a particular geographical area. Under IAS 35, that might not meet the definition of a discontinuing operation. Under SFAS 144, if the relevant criteria were met, it would.

BC68 However, a substantial majority of respondents to ED 4 disagreed with this proposal. They preferred instead to retain the IAS 35 criterion that a discontinued operation should be a major line of business or geographical area of operations.

BC69 The Board reconsidered the issue in the light of the comments received and concluded that the size of unit that could be classified as discontinued in accordance with SFAS 144 was too small, with the result that the information provided by separately presenting discontinued operations may not be as useful as it could be.

BC70 The Board also noted that the FASB Emerging Issues Task Force (EITF) is considering practical problems that have arisen in implementing the criteria for discontinued operations in SFAS 144. Specifically, the EITF is considering (a) the cash flows of the component that should be considered in the determination of whether cash flows have been or will be eliminated from the ongoing operations of the entity and (b) the types of continuing involvement that constitute significant continuing involvement in the operations of the disposal component. As a result of these practical problems, the Board further concluded that it was not appropriate to change the definition of a discontinued operation in a way that was likely to cause the same problems in practice as have arisen under SFAS 144.

BC71 The Board therefore decided that it would retain the requirement in IAS 35 that a discontinued operation should be a major line of business or geographical area of operations, noting that this will include operations that would have been excluded from the US definition before SFAS 144, which was based on a reporting segment. However, the Board regards this as an interim measure and intends to work with the FASB to arrive at a converged definition within a relatively short time.

BC72 Lastly, the Board considered whether newly acquired subsidiaries that meet the criteria to be classified as held for sale should always be classified as discontinued. The Board concluded that they should be so classified because they are being disposed of for one of the following reasons:

(a) the subsidiary is in a different line of business from the entity, so disposing of it is similar to disposing of a major line of business.

* In September 2007 the title of IAS 10 was amended from *Events after the Balance Sheet Date* to *Events after the Reporting Period* as a consequence of the revision of IAS 1 *Presentation of Financial Statements* in 2007.

 © IASCF

(b) the subsidiary is required to be disposed of by regulators because the entity would otherwise have too much of a particular type of operation in a particular geographical area. In such a case the subsidiary must be a significant operation.

Presentation of discontinued operations

BC73 SFAS 144 requires the results of a discontinued operation to be presented as a separate component in the income statement (net of income tax) for all periods presented.

BC74 IAS 35 did not require the results of a discontinuing operation to be presented as a net amount on the face of the income statement. Instead, specified items are disclosed either in the notes or on the face of the income statement.

BC75 In ED 4, the Board noted that it was considering the presentation of discontinued operations in the income statement in its project on reporting comprehensive income and that it did not wish to prejudge the outcome of that project by changing the requirements of IAS 35 in respect of the components to be disclosed. Given that the project on reporting comprehensive income will not be completed as soon as previously expected, the Board decided to proceed with its decisions on the presentation of discontinued operations in this IFRS.

BC76 The Board believes that discontinued operations should be shown in a section of the income statement separately from continuing operations because of the different cash flows expected to arise from the two types of operations. The Board concluded that it is sufficient to show a single net figure for discontinued operations on the face of the income statement because of the limited future cash flows expected to arise from the operations. The IFRS therefore permits an analysis of the single net amount to be presented either in the notes or in the income statement.*

BC77 A substantial majority of the respondents to ED 4 supported such a presentation.

BC77A The Board considered the comments received on the draft amendments in the 2007 exposure draft of proposed *Improvements to International Financial Reporting Standards*. Some respondents asked the Board to clarify the effects of the proposed amendment on the income statement when the disposal group meets the definition of a discontinued operation. The Board concluded that when a subsidiary is a disposal group that meets the definition of a discontinued operation in accordance with paragraph 32, an entity that is committed to a sale plan involving loss of control of the subsidiary should disclose the information required by paragraphs 33–36. The Board agreed with respondents that presentation should not differ simply because of the form of the disposal group.

* IAS 1 *Presentation of Financial Statements* (as revised in 2007) requires an entity to present all income and expense items in one statement of comprehensive income or in two statements (a separate income statement and a statement of comprehensive income).

Transitional arrangements

BC78 Some respondents to ED 4 noted that there could be difficulties in obtaining the information necessary to apply the IFRS retrospectively. The Board agreed that hindsight might be involved in determining at what date assets or disposal groups met the criteria to be classified as held for sale and their fair value at that date. Problems might also arise in separating the results of operations that would have been classified as discontinued operations in prior periods and that had been derecognised in full before the effective date of the IFRS.

BC79 The Board therefore decided to require application of the IFRS prospectively and allow retrospective application only when the necessary information had been obtained in the prior periods in question.

BC79A The Board concluded that the effective date of the amendments in paragraphs 8A and 36A for presentation purposes should be 1 July 2009 to be consistent with the effective date of the amendments to IAS 27 (as amended in January 2008) for measurement purposes. Because paragraph 45(c) of IAS 27 provides an exception to retrospective application of the amendments relating to the loss of control of a subsidiary for measurement purposes, the Board required an entity to consider the applicable transitional provisions in IAS 27 when implementing the amendments in paragraphs 8A and 36A.

Terminology

BC80 Two issues of terminology arose in developing the IFRS:

(a) the use of the term 'probable' and

(b) the use of the term 'fair value less costs to sell'.

BC81 In SFAS 144, the term *probable* is described as referring to a future sale that is 'likely to occur'. For the purposes of IFRSs, probable is defined as 'more likely than not'. To converge on the same meaning as SFAS 144 and to avoid using the term 'probable' with different meanings in IFRSs, this IFRS uses the phrase 'highly probable'. The Board regards 'highly probable' as implying a significantly higher probability than 'more likely than not' and as implying the same probability as the FASB's phrase 'likely to occur'. This is consistent with the Board's use of 'highly probable' in IAS 39.

BC82 The measurement basis 'fair value less costs to sell' used in SFAS 144 is the same as the measurement 'net selling price' used in IAS 36 (as issued in 1998). SFAS 144 defines fair value of an asset as 'the amount at which that asset could be bought or sold in a current transaction between willing parties, that is, other than in a forced or liquidation sale', and costs to sell as 'the incremental direct costs to transact a sale, that is, the costs that result directly from and are essential to a sale transaction and that would not have been incurred by the entity had the decision to sell not been made.' IAS 36 defines net selling price as the amount obtainable from the sale of an asset in an arm's length transaction between knowledgeable, willing parties, less the costs of disposal. Costs of disposal are incremental costs directly attributable to the disposal of an asset, excluding finance costs and income tax expenses.

 © IASCF

BC83 The Board considered using the phrase ‘net selling price’ to be consistent with IAS 36. However, it noted that ‘fair value’ is used in many IFRSs. The Board concluded that it would be preferable to use the same phrase as SFAS 144 so that it is clear that convergence on this point had been achieved and to amend IAS 36 so that the terminology in IAS 36 is consistent with other IFRSs. Therefore, a consequential amendment made by IFRS 5 replaces ‘net selling price’ with ‘fair value less costs to sell’ throughout IAS 36.

Summary of changes from ED 4

BC84 The major changes from the proposals in ED 4 are:

(a) clarification that assets classified as non-current are not reclassified as current until they meet the criteria to be classified as held for sale (paragraph BC10).

(b) goodwill and financial assets under leases are included in the scope of the measurement provisions of the IFRS (paragraphs BC8–BC14).

(c) non-current assets carried at fair value with changes recognised in profit or loss are excluded from the measurement provisions of the IFRS (paragraphs BC8–BC14).

(d) assets that are revalued in accordance with IAS 16 or IAS 38 are, when classified as held for sale, treated consistently with assets that had not previously been revalued (paragraphs BC47 and BC48).

(e) the allocation of an impairment loss on a disposal group is consistent with the order of allocation of impairment losses in IAS 36 (paragraphs BC39–BC41).

(f) the criterion in IAS 35 that a discontinued operation should be a major line of business or area of geographical operations has been added (paragraphs BC67–BC71).

(g) discontinued operations can be presented on the face of the income statement as a single amount (paragraphs BC73–BC77).

© IASCF

Comparison with relevant aspects of SFAS 144

BC85 The following table sets out the extent of convergence with SFAS 144:

Requirement	Extent of convergence with SFAS 144
Scope	Some differences in scope arising from other differences between IFRSs and US GAAP.
Criteria for classification as held for sale	Fully converged.
Treatment of assets to be exchanged	Fully converged if FASB proposals on exchanges of non-monetary assets are finalised.
Treatment of assets to be abandoned	Fully converged.
Measurement on initial classification	Converged, other than cumulative exchange differences recognised directly in equity[(a)] that are included in the carrying amount of the asset (or disposal group) under US GAAP but are not under IFRS 5.
Subsequent measurement	Converged on the principles, but some differences arising from different requirements on reversals of previous impairments.
Changes to a plan to sell	Converged on reclassification and on measurement, except for differences arising from different requirements on reversals of previous impairments.
Presentation of assets classified as held for sale	Fully converged.
Definition of a discontinued operation	Not converged but the Board intends to work with the FASB to arrive at a converged definition within a relatively short time.
Timing of classification of an operation as discontinued	Fully converged.
Presentation of a discontinued operation	Converged except that SFAS 144 requires the presentation of pre- and post-tax profits on the face of the income statement and IFRS 5 requires the presentation of post-tax profit only (although disaggregation is permitted).

(a) As a consequence of the revision of IAS 1 *Presentation of Financial Statements* (as revised in 2007) such differences are recognised in other comprehensive income.

 © IASCF

Dissenting opinions

Dissent of Anthony T Cope and Harry K Schmid

DO1 Messrs Cope and Schmid dissent from the issue of IFRS 5.

Dissent of Anthony T Cope

DO2 Mr Cope dissents because, in his view, the IFRS fails to meet fully the needs of users in this important area.

DO3 In deciding to undertake this project, the Board had two objectives—to improve users' ability to assess the amount, timing and uncertainty of future cash flows, and to converge with US GAAP. The ability to identify assets (or asset groups) whose value will be recovered principally through sale rather than through operations has significant implications for future cash flows. Similarly, separate presentation of discontinued operations enables users to distinguish those parts of a business that will not contribute to future cash flows.

DO4 The importance of identifying and disaggregating these components was emphasised in the 1994 report of the Special Committee on Financial Reporting of the American Institute of Certified Public Accountants (the AICPA Jenkins Committee). The Jenkins Committee report, arguably the most extensive and authoritative survey of user needs ever undertaken, recommended that:

> [The definition of discontinued operations] should be broadened to include all significant discontinued operations whose assets and results of operations and activities can be distinguished physically and operationally and for business reporting purposes.

The sections of SFAS 144 dealing with discontinued operations were the direct response of the FASB to this recommendation.

DO5 Indeed, the Board appeared to agree in its initial deliberations. In ED 4, the Board stated:

> [The Board] further concluded that the definition of discontinued operations in SFAS 144 leads to more useful information being presented and disclosed for a wider range of operations than did the existing definition in IAS 35. That information is important to users in their assessment of the amount, timing and uncertainty of future cash flows.

Mr Cope continues to agree with that statement.

DO6 However, the Board ultimately has decided to retain the definition in IAS 35, thus failing to gain convergence on an important point in a project designed to achieve such convergence, and failing to respond to the stated needs of users.

DO7 The reason given for the Board's action is that implementation problems with SFAS 144 have emerged in the US. (Most of these problems seem to be with the guidance concerning the definition in SFAS 144, rather than the definition itself.) In paragraph BC71, the Board describes its action as an interim measure, and plans to work with the FASB to arrive promptly at a converged solution. In Mr Cope's view, it would have been much preferable to have converged first, and then dealt with any implementation problems jointly with the FASB.

Dissent of Harry K Schmid

DO8 The main reasons for Mr Schmid's dissent are:

(a) depreciation/amortisation of non-current assets that are still in active use should not cease only because of a management decision to sell the assets that has not yet been fully carried out; and

(b) measurement of assets should not be based on a management decision that has not yet been fully carried out, requiring a very rule-based Standard.

DO9 Mr Schmid believes that not depreciating/amortising assets classified as held for sale but still in active use is conceptually wrong and is especially problematic for discontinued operations because such operations represent a separate major line of business or geographical area of operations. Mr Schmid does not accept that measurement at the lower of carrying amount and fair value less costs to sell acts as a proxy for depreciation because, in most such cases, the fair value less costs to sell will be higher than the carrying amount as the fair value of such disposal groups will often reflect internally generated goodwill. Therefore, non-current assets in such disposal groups will simply remain at their carrying amounts even though they are still actively used, up to one year or even longer. In addition, the net profit shown separately in the income statement for discontinued operations will not be meaningful because depreciation/amortisation charges are not deducted for the continued use of the assets and this profit cannot be compared with the information restated in comparative periods where depreciation had been charged.

DO10 The proposed classification 'held for sale' and resulting measurement of non-current assets (or disposal groups) so classified is based on a management decision that has not yet been fully carried out and demands detailed (anti-abuse) rules to define the classification and to fix the time boundaries during which these assets can remain within the classification. The final result is, in Mr Schmid's view, an excessively detailed and rule-based Standard.

DO11 Mr Schmid believes that a more simple and straightforward solution would have been possible by creating a special category of non-current assets retired from active use. The concept 'retired from active use' would have been simple to apply and management intentions would be removed from the Standard. The classification would equally apply to any form of disposal (sale, abandonment, exchange, spin-off etc); no detailed (anti-abuse) rules and no illustrations would be necessary and the Standard would be simple and based on a clear and unambiguous principle. Mr Schmid, on this point, does not agree with the conclusions in paragraph BC18 that a classification 'retired from active use' would not require fewer criteria to support it than the category 'assets held for sale'.

DO12 Mr Schmid agrees with paragraph BC17 of the Basis for Conclusions, but in order to provide information of intended sales of non-current assets, especially discontinued operations, disclosure could have been required to take effect as soon as such assets are likely to be sold, even if they are still in active use.

DO13 Mr Schmid is fully in favour of seeking, whenever possible, convergence with US GAAP, but only if the converged solution is of high quality. He is of the opinion that this is not the case for this Standard for the reasons given.

Guidance on implementing IFRS 5 *Non-current Assets Held for Sale and Discontinued Operations*

This guidance accompanies, but is not part of, IFRS 5.

Availability for immediate sale (paragraph 7)

To qualify for classification as held for sale, a non-current asset (or disposal group) must be available for immediate sale in its present condition subject only to terms that are usual and customary for sales of such assets (or disposal groups) (paragraph 7). A non-current asset (or disposal group) is available for immediate sale if an entity currently has the intention and ability to transfer the asset (or disposal group) to a buyer in its present condition. Examples 1–3 illustrate situations in which the criterion in paragraph 7 would or would not be met.

Example 1

An entity is committed to a plan to sell its headquarters building and has initiated actions to locate a buyer.

(a) The entity intends to transfer the building to a buyer after it vacates the building. The time necessary to vacate the building is usual and customary for sales of such assets. The criterion in paragraph 7 would be met at the plan commitment date.

(b) The entity will continue to use the building until construction of a new headquarters building is completed. The entity does not intend to transfer the existing building to a buyer until after construction of the new building is completed (and it vacates the existing building). The delay in the timing of the transfer of the existing building imposed by the entity (seller) demonstrates that the building is not available for immediate sale. The criterion in paragraph 7 would not be met until construction of the new building is completed, even if a firm purchase commitment for the future transfer of the existing building is obtained earlier.

Example 2

An entity is committed to a plan to sell a manufacturing facility and has initiated actions to locate a buyer. At the plan commitment date, there is a backlog of uncompleted customer orders.

(a) The entity intends to sell the manufacturing facility with its operations. Any uncompleted customer orders at the sale date will be transferred to the buyer. The transfer of uncompleted customer orders at the sale date will not affect the timing of the transfer of the facility. The criterion in paragraph 7 would be met at the plan commitment date.

(b) The entity intends to sell the manufacturing facility, but without its operations. The entity does not intend to transfer the facility to a buyer until after it ceases all operations of the facility and eliminates the backlog of uncompleted customer orders. The delay in the timing of the transfer of the facility imposed by the entity (seller) demonstrates that the facility is not available for immediate sale.

© IASCF

The criterion in paragraph 7 would not be met until the operations of the facility cease, even if a firm purchase commitment for the future transfer of the facility were obtained earlier.

Example 3

An entity acquires through foreclosure a property comprising land and buildings that it intends to sell.

(a) The entity does not intend to transfer the property to a buyer until after it completes renovations to increase the property's sales value. The delay in the timing of the transfer of the property imposed by the entity (seller) demonstrates that the property is not available for immediate sale. The criterion in paragraph 7 would not be met until the renovations are completed.

(b) After the renovations are completed and the property is classified as held for sale but before a firm purchase commitment is obtained, the entity becomes aware of environmental damage requiring remediation. The entity still intends to sell the property. However, the entity does not have the ability to transfer the property to a buyer until after the remediation is completed. The delay in the timing of the transfer of the property imposed by others before a firm purchase commitment is obtained demonstrates that the property is not available for immediate sale. The criterion in paragraph 7 would not continue to be met. The property would be reclassified as held and used in accordance with paragraph 26.

Completion of sale expected within one year (paragraph 8)

Example 4

To qualify for classification as held for sale, the sale of a non-current asset (or disposal group) must be highly probable (paragraph 7), and transfer of the asset (or disposal group) must be expected to qualify for recognition as a completed sale within one year (paragraph 8). That criterion would not be met if, for example:

(a) an entity that is a commercial leasing and finance company is holding for sale or lease equipment that has recently ceased to be leased and the ultimate form of a future transaction (sale or lease) has not yet been determined.

(b) an entity is committed to a plan to 'sell' a property that is in use, and the transfer of the property will be accounted for as a sale and finance leaseback.

Exceptions to the criterion in paragraph 8

An exception to the one-year requirement in paragraph 8 applies in limited situations in which the period required to complete the sale of a non-current asset (or disposal group) will be (or has been) extended by events or circumstances beyond an entity's control and specified conditions are met (paragraphs 9 and B1). Examples 5–7 illustrate those situations.

Example 5

An entity in the power generating industry is committed to a plan to sell a disposal group that represents a significant portion of its regulated operations. The sale requires regulatory approval, which could extend the period required to complete the sale beyond one year. Actions necessary to obtain that approval cannot be initiated until after a buyer is known and a firm purchase commitment is obtained. However, a firm purchase commitment is highly probable within one year. In that situation, the conditions in paragraph B1(a) for an exception to the one-year requirement in paragraph 8 would be met.

Example 6

An entity is committed to a plan to sell a manufacturing facility in its present condition and classifies the facility as held for sale at that date. After a firm purchase commitment is obtained, the buyer's inspection of the property identifies environmental damage not previously known to exist. The entity is required by the buyer to make good the damage, which will extend the period required to complete the sale beyond one year. However, the entity has initiated actions to make good the damage, and satisfactory rectification of the damage is highly probable. In that situation, the conditions in paragraph B1(b) for an exception to the one-year requirement in paragraph 8 would be met.

Example 7

An entity is committed to a plan to sell a non-current asset and classifies the asset as held for sale at that date.

(a) During the initial one-year period, the market conditions that existed at the date the asset was classified initially as held for sale deteriorate and, as a result, the asset is not sold by the end of that period. During that period, the entity actively solicited but did not receive any reasonable offers to purchase the asset and, in response, reduced the price. The asset continues to be actively marketed at a price that is reasonable given the change in market conditions, and the criteria in paragraphs 7 and 8 are therefore met. In that situation, the conditions in paragraph B1(c) for an exception to the one-year requirement in paragraph 8 would be met. At the end of the initial one-year period, the asset would continue to be classified as held for sale.

(b) During the following one-year period, market conditions deteriorate further, and the asset is not sold by the end of that period. The entity believes that the market conditions will improve and has not further reduced the price of the asset. The asset continues to be held for sale, but at a price in excess of its current fair value. In that situation, the absence of a price reduction demonstrates that the asset is not available for immediate sale as required by paragraph 7. In addition, paragraph 8 also requires an asset to be marketed at a price that is reasonable in relation to its current fair value. Therefore, the conditions in paragraph B1(c) for an exception to the one-year requirement in paragraph 8 would not be met. The asset would be reclassified as held and used in accordance with paragraph 26.

 © IASCF

Determining whether an asset has been abandoned

Paragraphs 13 and 14 of the IFRS specify requirements for when assets are to be treated as abandoned. Example 8 illustrates when an asset has not been abandoned.

Example 8

An entity ceases to use a manufacturing plant because demand for its product has declined. However, the plant is maintained in workable condition and it is expected that it will be brought back into use if demand picks up. The plant is not regarded as abandoned.

Presenting a discontinued operation that has been abandoned

Paragraph 13 of the IFRS prohibits assets that will be abandoned from being classified as held for sale. However, if the assets to be abandoned are a major line of business or geographical area of operations, they are reported in discontinued operations at the date at which they are abandoned. Example 9 illustrates this.

Example 9

In October 20X5 an entity decides to abandon all of its cotton mills, which constitute a major line of business. All work stops at the cotton mills during the year ended 31 December 20X6. In the financial statements for the year ended 31 December 20X5, results and cash flows of the cotton mills are treated as continuing operations. In the financial statements for the year ended 31 December 20X6, the results and cash flows of the cotton mills are treated as discontinued operations and the entity makes the disclosures required by paragraphs 33 and 34 of the IFRS.

Allocation of an impairment loss on a disposal group

Paragraph 23 of the IFRS requires an impairment loss (or any subsequent gain) recognised for a disposal group to reduce (or increase) the carrying amount of the non-current assets in the group that are within the scope of the measurement requirements of the IFRS, in the order of allocation set out in paragraphs 104 and 122 of IAS 36 (as revised in 2004). Example 10 illustrates the allocation of an impairment loss on a disposal group.

© IASCF

Example 10

An entity plans to dispose of a group of its assets (as an asset sale). The assets form a disposal group, and are measured as follows:

	Carrying amount at the end of the reporting period before classification as held for sale	Carrying amount as remeasured immediately before classification as held for sale
	CU[(a)]	CU
Goodwill	1,500	1,500
Property, plant and equipment (carried at revalued amounts)	4,600	4,000
Property, plant and equipment (carried at cost)	5,700	5,700
Inventory	2,400	2,200
AFS financial assets	1,800	1,500
Total	**16,000**	**14,900**

(a) In this guidance, monetary amounts are denominated in 'currency units (CU)'.

The entity recognises the loss of CU1,100 (CU16,000 − CU14,900) immediately before classifying the disposal group as held for sale.

The entity estimates that fair value less costs to sell of the disposal group amounts to CU13,000. Because an entity measures a disposal group classified as held for sale at the lower of its carrying amount and fair value less costs to sell, the entity recognises an impairment loss of CU1,900 (CU14,900 − CU13,000) when the group is initially classified as held for sale.

The impairment loss is allocated to non-current assets to which the measurement requirements of the IFRS are applicable. Therefore, no impairment loss is allocated to inventory and AFS financial assets. The loss is allocated to the other assets in the order of allocation set out in paragraphs 104 and 122 of IAS 36 (as revised in 2004).

 © IASCF

The allocation can be illustrated as follows:

	Carrying amount as remeasured immediately before classification as held for sale	Allocated impairment loss	Carrying amount after allocation of impairment loss
	CU	CU	CU
Goodwill	1,500	(1,500)	0
Property, plant and equipment (carried at revalued amounts)	4,000	(165)	3,835
Property, plant and equipment (carried at cost)	5,700	(235)	5,465
Inventory	2,200	–	2,200
AFS financial assets	1,500	–	1,500
Total	**14,900**	**(1,900)**	**13,000**

First, the impairment loss reduces any amount of goodwill. Then, the residual loss is allocated to other assets pro rata based on the carrying amounts of those assets.

© IASCF

Presenting discontinued operations in the statement of comprehensive income

Paragraph 33 of the IFRS requires an entity to disclose a single amount in the statement of comprehensive income for discontinued operations with an analysis in the notes or in a section of the statement of comprehensive income separate from continuing operations. Example 11 illustrates how these requirements might be met.

Example 11

XYZ GROUP – STATEMENT OF COMPREHENSIVE INCOME FOR THE YEAR ENDED 31 DECEMBER 20X2
(illustrating the classification of expenses by function)

(in thousands of currency units)	20X2	20X1
Continuing operations		
Revenue	X	X
Cost of sales	(X)	(X)
Gross profit	X	X
Other income	X	X
Distribution costs	(X)	(X)
Administrative expenses	(X)	(X)
Other expenses	(X)	(X)
Finance costs	(X)	(X)
Share of profit of associates	X	X
Profit before tax	X	X
Income tax expense	(X)	(X)
Profit for the period from continuing operations	X	X
Discontinued operations		
Profit for the period from discontinued operations[(a)]	X	X
Profit for the period	X	X
Attributable to:		
Owners of the parent		
Profit for the period from continuing operations	X	X
Profit for the period from discontinued operations	X	X
Profit for the period attributable to owners of the parent	X	X
Non-controlling interests		
Profit for the period from continuing operations	X	X
Profit for the period from discontinued operations	X	X
Profit for the period attributable to non-controlling interests	X	X
	X	X

(a) The required analysis would be given in the notes.

 © IASCF

Presenting non-current assets or disposal groups classified as held for sale

Paragraph 38 of the IFRS requires an entity to present a non-current asset classified as held for sale and the assets of a disposal group classified as held for sale separately from other assets in the statement of financial position. The liabilities of a disposal group classified as held for sale are also presented separately from other liabilities in the statement of financial position. Those assets and liabilities are not offset and presented as a single amount. Example 12 illustrates these requirements.

Example 12

At the end of 20X5, an entity decides to dispose of part of its assets (and directly associated liabilities). The disposal, which meets the criteria in paragraphs 7 and 8 to be classified as held for sale, takes the form of two disposal groups, as follows:

	Carrying amount after classification as held for sale	
	Disposal group I: CU	Disposal group II: CU
Property, plant and equipment	4,900	1,700
AFS financial asset	1,400[(a)]	–
Liabilities	(2,400)	(900)
Net carrying amount of disposal group	**3,900**	**800**

(a) An amount of CU400 relating to these assets has been recognised in other comprehensive income and accumulated in equity.

The presentation in the entity's statement of financial position of the disposal groups classified as held for sale can be shown as follows:

	20X5	**20X4**
ASSETS		
Non-current assets		
AAA	X	X
BBB	X	X
CCC	X	X
	X	X
Current assets		
DDD	X	X
EEE	X	X
	X	X
Non-current assets classified as held for sale	8,000	–
	X	X
Total assets	X	X

continued...

...continued

	20X5	20X4
EQUITY AND LIABILITIES		
Equity attributable to owners of the parent		
FFF	X	X
GGG	X	X
Amounts recognised in other comprehensive income and accumulated in equity relating to non-current assets held for sale	400	–
	X	X
Non-controlling interests	X	X
Total equity	X	X
Non-current liabilities		
HHH	X	X
III	X	X
JJJ	X	X
	X	X
Current liabilities		
KKK	X	X
LLL	X	X
MMM	X	X
Liabilities directly associated with non-current assets classified as held for sale	3,300	–
	X	X
Total liabilities	X	X
Total equity and liabilities	X	X

The presentation requirements for assets (or disposal groups) classified as held for sale at the end of the reporting period do not apply retrospectively. The comparative statements of financial position for any previous periods are therefore not re-presented.

© IASCF

Measuring and presenting subsidiaries acquired with a view to resale and classified as held for sale

A subsidiary acquired with a view to sale is not exempt from consolidation in accordance with IAS 27 *Consolidated and Separate Financial Statements*. However, if it meets the criteria in paragraph 11, it is presented as a disposal group classified as held for sale. Example 13 illustrates these requirements.

Example 13

Entity A acquires an entity H, which is a holding company with two subsidiaries, S1 and S2. S2 is acquired exclusively with a view to sale and meets the criteria to be classified as held for sale. In accordance with paragraph 32(c), S2 is also a discontinued operation.

The estimated fair value less costs to sell of S2 is CU135. A accounts for S2 as follows:

- initially, A measures the identifiable liabilities of S2 at fair value, say at CU40
- initially, A measures the acquired assets as the fair value less costs to sell of S2 (CU135) plus the fair value of the identifiable liabilities (CU40), ie at CU175
- at the end of the reporting period, A remeasures the disposal group at the lower of its cost and fair value less costs to sell, say at CU130. The liabilities are remeasured in accordance with applicable IFRSs, say at CU35. The total assets are measured at CU130 + CU35, ie at CU165
- at the end of the reporting period, A presents the assets and liabilities separately from other assets and liabilities in its consolidated financial statements as illustrated in Example 12 *Presenting non-current assets or disposal groups classified as held for sale*, and
- in the statement of comprehensive income, A presents the total of the post-tax profit or loss of S2 and the post-tax gain or loss recognised on the subsequent remeasurement of S2, which equals the remeasurement of the disposal group from CU135 to CU130.

Further analysis of the assets and liabilities or of the change in value of the disposal group is not required.

Approval by the Board of IFRS 6 issued in December 2004

International Financial Reporting Standard 6 *Exploration for and Evaluation of Mineral Resources* was approved for issue by ten of the fourteen members of the International Accounting Standards Board. Messrs Garnett, Leisenring, McGregor and Smith dissented. Their dissenting opinions are set out after the Basis for Conclusions.

Basis for Conclusions on IFRS 6 *Exploration for and Evaluation of Mineral Resources*

This Basis for Conclusions accompanies, but is not part of, IFRS 6.

Introduction

BC1 This Basis for Conclusions summarises the International Accounting Standards Board's considerations in reaching the conclusions in IFRS 6 *Exploration for and Evaluation of Mineral Resources*. Individual Board members gave greater weight to some factors than to others.

Reasons for issuing the IFRS

BC2 Paragraphs 10–12 of IAS 8 *Accounting Policies, Changes in Accounting Estimates and Errors* specify a hierarchy of criteria that an entity should use in developing an accounting policy if no IFRS applies specifically to an item. Without the exemption in IFRS 6, an entity adopting IFRSs in 2005 would have needed to assess whether its accounting policies for the exploration for and evaluation of mineral resources complied with those requirements. In the absence of guidance, there might have been uncertainty about what would be acceptable. Establishing what would be acceptable could have been costly and some entities might have made major changes in 2005 followed by further significant changes once the Board completes its comprehensive review of accounting for extractive activities.

BC3 To avoid unnecessary disruption for both users and preparers at this time, the Board proposed to limit the need for entities to change their existing accounting policies for exploration and evaluation assets. The Board did this by:

(a) creating a temporary exemption from parts of the hierarchy in IAS 8 that specify the criteria an entity uses in developing an accounting policy if no IFRS applies specifically.

(b) limiting the impact of that exemption from the hierarchy by identifying expenditures to be included in and excluded from exploration and evaluation assets and requiring all exploration and evaluation assets to be assessed for impairment.

BC4 The Board published its proposals in January 2004. ED 6 *Exploration for and Evaluation of Mineral Resources* had a comment deadline of 16 April 2004. The Board received 55 comment letters.

BC5 In April 2004 the Board approved a research project to be undertaken by staff from the national standard-setters in Australia, Canada, Norway and South Africa that will address accounting for extractive activities generally. The research project team is assisted by an advisory panel, which includes members from industry (oil and gas and mining sectors), accounting firms, users and securities regulators from around the world.

Scope

BC6 In the Board's view, even though no IFRS has addressed extractive activities directly, all IFRSs (including International Accounting Standards and Interpretations) are applicable to entities engaged in the exploration for and evaluation of mineral resources that make an unreserved statement of compliance with IFRSs in accordance with IAS 1 *Presentation of Financial Statements*. Consequently, each IFRS must be applied by all such entities.

BC7 Some respondents to ED 6 encouraged the Board to develop standards for other stages in the process of exploring for and evaluating mineral resources, including pre-exploration activities (ie activities preceding the exploration for and evaluation of mineral resources) and development activities (ie activities after the technical feasibility and commercial viability of extracting a mineral resource are demonstrable). The Board decided not to do this for two reasons. First, it did not want to prejudge the comprehensive review of the accounting for such activities. Second, the Board concluded that an appropriate accounting policy for pre-exploration activities could be developed from an application of existing IFRSs, from the *Framework*'s definitions of assets and expenses, and by applying the general principles of asset recognition in IAS 16 *Property, Plant and Equipment* and IAS 38 *Intangible Assets*.

BC8 The Board also decided not to expand the scope of IFRS 6 beyond that proposed in ED 6 because to do so would require additional due process, possibly including another exposure draft. In view of the many entities engaged in extractive activities that would be required to apply IFRSs from 1 January 2005, the Board decided that it should not delay issuing guidance by expanding the scope of the IFRS beyond the exploration for and evaluation of mineral resources.

Definition of exploration and evaluation assets

BC9 Most respondents to ED 6 agreed with the Board's proposed definition of exploration and evaluation assets, but asked for changes or clarifications to make the Board's intentions clearer:

(a) some respondents asked the Board to distinguish between exploration and pre-exploration expenditures.

(b) others asked the Board to define exploration and evaluation activities separately, reflecting the different risk profiles of such activities or the requirements of other jurisdictions.

(c) other respondents asked for further guidance on what constitute mineral resources, principally examples of what constitutes a mineral reserve.

 © IASCF

Expenditures incurred before the exploration for and evaluation of mineral resources

BC10 Respondents seemed to be concerned that the Board was extending the scope of the proposals to include expenditures incurred before the acquisition of legal rights to explore in a specific area in the definition of exploration and evaluation expenditure. Some were concerned that such an extension would open the way for the recognition of such expenditures as assets; others preferred this result. In drafting IFRS 6, the Board could not identify any reason why the *Framework* was not applicable to such expenditures.

BC11 The Board decided not to define pre-acquisition or pre-exploration expenditures. However, the IFRS clarifies that expenditures before the entity has obtained legal rights to explore in a specific area are not exploration and evaluation expenditures and are therefore outside the scope of the IFRS.

BC12 The Board noted that an appropriate application of IFRSs might require pre-acquisition expenditures related to the acquisition of an intangible asset (eg expenditures directly attributable to the acquisition of an exploration licence) to be recognised as part of the intangible asset in accordance with IAS 38. Paragraph 27(a) of IAS 38 states that the cost of a separately acquired intangible asset comprises its purchase price, including import duties and non-refundable purchase taxes, and some directly attributable costs.

BC13 Similarly, the Board understands that expenditures incurred before the exploration for and evaluation of mineral resources cannot usually be associated with any specific mineral property and thus are likely to be recognised as an expense as incurred. However, such expenditures need to be distinguished from expenditures on infrastructure—for example access roads—necessary for the exploration work to proceed. Such expenditures should be recognised as property, plant and equipment in accordance with paragraph 3 of IAS 16.

Separate definitions of ‘exploration’ and ‘evaluation’

BC14 Some respondents asked the Board to provide separate definitions of exploration and evaluation. The Board considered using the definitions provided in the Issues Paper *Extractive Industries* published by its predecessor, the Board of the International Accounting Standards Committee, in November 2000, because those definitions would be acceptable to many respondents, particularly because they are based on definitions that have been used for a number of years in both the mining and the oil and gas sectors.

BC15 The Board concluded that distinguishing between evaluation and exploration would not improve the IFRS. Exploration and evaluation are accounted for in the same way.

Mineral resources

BC16 Some respondents asked the Board to define mineral resources more precisely. The Board concluded that, for the purposes of the IFRS, elaboration was unnecessary. The items listed in the definition of exploration for and evaluation of mineral resources were sufficient to convey the Board’s intentions.

Recognition of exploration and evaluation assets

Temporary exemption from IAS 8 paragraphs 11 and 12

BC17 A variety of accounting practices are followed by entities engaged in the exploration for and evaluation of mineral resources. These practices range from deferring on the balance sheet nearly all exploration and evaluation expenditure to recognising all such expenditure in profit or loss as incurred. The IFRS permits these various accounting practices to continue. Given this diversity, some respondents to ED 6 opposed any exemption from paragraphs 11 and 12 of IAS 8. These respondents were concerned that entities could give the appearance of compliance with IFRSs while being inconsistent with the stated objectives of the IASB, ie to provide users of financial statements with financial information that was of high quality, transparent and comparable. The Board did not grant the exemption from parts of IAS 8 lightly, but took this step to minimise disruption, especially in 2006 (or 2005, for those entities that adopt the IFRS early), both for users (eg lack of continuity of trend data) and for preparers (eg systems changes).

BC18 IFRS 4 *Insurance Contracts* provides a temporary exemption from paragraphs 10–12 of IAS 8. That exemption is broader than in IFRS 6 because IFRS 4 leaves many significant aspects of accounting for insurance contracts until phase II of the Board's project on that topic. A requirement to apply paragraph 10 of IAS 8 to insurance contracts would have had much more pervasive effects and insurers would have needed to address matters such as completeness, substance over form and neutrality. In contrast, IFRS 6 leaves a relatively narrow range of issues unaddressed and the Board did not think that an exemption from paragraph 10 of IAS 8 was necessary.

BC19 ED 6 made it clear that the Board intended to suspend only paragraphs 11 and 12 of IAS 8, implying that paragraph 10 should be followed when an entity was determining its accounting policies for exploration and evaluation assets. However, it was apparent from some comments received that the Board's intention had not been understood clearly. Consequently, the IFRS contains a specific statement that complying with paragraph 10 of IAS 8 is mandatory.

BC20 Respondents who objected to the Board's proposal in ED 6 to permit some accounting practices to continue found it difficult to draw a meaningful distinction between the exploration for and evaluation of mineral resources and scientific research. Both activities can be costly and have significant risks of failure. These respondents would support bringing the exploration for and evaluation of mineral resources within the scope of IAS 16 and IAS 38. The Board is similarly concerned that existing accounting practices might result in the inappropriate recognition of exploration and evaluation assets. However, it is also concerned that accounting for exploration and evaluation expenditures in accordance with IAS 38 might result in the overstatement of expenses. In the absence of internationally accepted standards for such expenditures, the Board concluded that it could not make an informed judgement in advance of the comprehensive review of accounting for extractive activities.

© IASCF

BC21 Some suggested that the Board should require an entity to follow its national accounting requirements (ie national GAAP) in accounting for the exploration for and evaluation of mineral resources until the Board completes its comprehensive review of accounting for extractive activities, to prevent the selection of accounting policies that do not form a comprehensive basis of accounting. Consistently with its conclusions in IFRS 4, the Board concluded that defining national GAAP would have posed problems. Further definitional problems could have arisen because some entities do not apply the national GAAP of their own country. For example, some non-US entities with extractive activities in the oil and gas sector apply US GAAP. Moreover, it is unusual and, arguably, beyond the Board's mandate to impose requirements set by another body.

BC22 Therefore, the Board decided that an entity could continue to follow the accounting policies that it was using when it first applied the IFRS's requirements, provided they satisfy the requirements of paragraph 10 of IAS 8 and with some exceptions noted below. An entity could also improve those accounting policies if specified criteria are met (see paragraphs 13 and 14 of the IFRS).

BC23 The Board acknowledges that it is difficult to make piecemeal changes to recognition and measurement practices at this time because many aspects of accounting for extractive activities are interrelated with aspects that will not be considered until the Board completes its comprehensive review of accounting for extractive activities. However, not imposing the requirements in the IFRS would detract from the relevance and reliability of an entity's financial statements to an unacceptable degree.

BC23A In 2008, as part of its annual improvements project, the Board considered the guidance on the treatment in IAS 7 *Statement of Cash Flows* of some types of expenditures incurred with the objective of generating future cash flows when those expenditures are not recognised as assets in accordance with IFRSs. Some entities classify such expenditures as cash flows from operating activities and others classify them as investing activities. Examples of such expenditures are those for exploration and evaluation activities, which can be recognised according to IFRS 6 as either an asset or an expense.*

BC23B The Board noted that the exemption in IFRS 6 applies only to recognition and measurement of exploration and evaluation assets, not to the classification of related expenditures in the statement of cash flows. Consequently, the Board amended paragraph 16 of IAS 7 to state that only an expenditure that results in a recognised asset can be classified as a cash flow from investing activities.

Elements of cost of exploration and evaluation assets

BC24 ED 6 paragraph 7 listed examples of expenditures related to the exploration for and evaluation of mineral resources that might be included in the cost of an exploration and evaluation asset. ED 6 paragraph 8 listed expenditures that could not be recognised as an exploration and evaluation asset. Respondents expressed a desire for greater clarity with respect to these paragraphs and more examples of types of expenditures that would be included or excluded.

---

* Paragraphs BC23A and BC23B were added as a consequence of an amendment to IAS 7 included in *Improvements to IFRSs* issued in April 2009.

BC25 In the light of the responses, the Board decided to redraft the guidance to state that the list is not exhaustive and that the items noted are examples of expenditures that might, but need not always, satisfy the definition of exploration and evaluation expenditure. In addition, the Board noted that IFRSs require that expenditures should be treated consistently for comparable activities and between reporting periods. Any change in what is deemed to be an expenditure qualifying for recognition as an exploration and evaluation asset should be treated as a change in an accounting policy accounted for in accordance with IAS 8. Pending the comprehensive review of accounting for extractive activities, the Board does not think that it is feasible to define what expenditures should be included or excluded.

BC26 ED 6 paragraph 8 proposed to prohibit expenditure related to the development of a mineral resource from being recognised as an exploration and evaluation asset. Respondents expressed difficulty identifying expenditures on 'development'. The Board did not define 'development of a mineral resource' because this is beyond the scope of the IFRS.

BC27 However, the Board noted that development of a mineral resource once the technical feasibility and commercial viability of extracting the mineral resource had been determined was an example of the development phase of an internal project. Paragraph 57 of IAS 38 provides guidance that should be followed in developing an accounting policy for this activity.

BC28 ED 6 proposed that administration and other general overhead costs should be excluded from the initial measurement of exploration and evaluation assets. Several respondents suggested that general and administrative and overhead costs *directly attributable* to the exploration and evaluation activities should qualify for inclusion in the carrying amount of the asset. These respondents saw this treatment as consistent with the treatment of such costs with respect to inventory (paragraph 11 of IAS 2 *Inventories*) and intangible assets (paragraph 67(a) of IAS 38). However, the Board noted that such a treatment would seem to be inconsistent with paragraph 19(d) of IAS 16. The IFRS was not regarded as the appropriate Standard in which to resolve this inconsistency, and the Board decided to delete the reference in the IFRS to administrative and other general overheads. The treatment of such expenditures would be an accounting policy choice; the chosen policy should be consistent with one of the treatments available under IFRSs.

Measurement after recognition

BC29 The IFRS permits an entity recognising exploration and evaluation assets to measure such assets, after recognition, using either the cost model or the revaluation model in IAS 16 and IAS 38. The model chosen should be consistent with how the entity classifies the exploration and evaluation assets. Those revaluation models permit the revaluation of assets when specified requirements are met (see paragraphs 31–42 of IAS 16 and paragraphs 72–84 of IAS 38). The revaluation model in IAS 38 can be used only if the asset's fair value can be determined by reference to an active market; the revaluation model in IAS 16

refers only to 'market-based evidence'. The Board was troubled by this inconsistency and was concerned that entities might choose accounting policies to achieve a more advantageous measurement of exploration and evaluation assets.

BC30 A few respondents were also concerned with the option proposed in ED 6. Some did not agree that exploration and evaluation assets should be revalued, preferring an arbitrary prohibition of remeasurement. Others were concerned about the reliability of the measure. The Board concluded that no substantive reasons had been presented for reaching a conclusion different from that in ED 6. Although the revaluation of an exploration asset in accordance with IAS 16 or IAS 38 might not be widespread, it was not appropriate to prohibit remeasurement of specific types of IAS 16 or IAS 38 assets on a selective basis.

BC31 Exploration and evaluation assets may arise as a result of a business combination. The Board noted that IFRS 3 *Business Combinations* applies to all entities asserting compliance with IFRSs and that any exploration and evaluation assets acquired in a business combination should be accounted for in accordance with IFRS 3.

Presentation of exploration and evaluation assets

BC32 ED 6 noted that the Board had not yet considered whether exploration and evaluation assets are tangible or intangible. Several respondents suggested that the Board should give some direction on this issue.

BC33 Some exploration and evaluation assets are treated as intangible assets (eg drilling rights), whereas others are clearly tangible (eg vehicles and drilling rigs). A tangible asset may be used in the development of an intangible one. For example, a portable drilling rig may be used to drill test wells or take core samples, clearly part of the exploration activity. To the extent that the tangible asset is consumed in developing an intangible asset, the amount reflecting that consumption is part of the cost of the intangible asset. However, using the drilling rig to develop an intangible asset does not change a tangible asset into an intangible asset.

BC34 Pending completion of the comprehensive review of accounting practices for extractive activities, the Board did not wish to decide whether and which exploration and evaluation assets should be classified as tangible or intangible. However, the Board concluded that an entity should classify the elements of exploration and evaluation assets as tangible or intangible according to their nature and apply this classification consistently. This classification is the foundation for other accounting policy choices as described in paragraphs BC29–BC31 and for the disclosures required by the IFRS.

Impairment of exploration and evaluation assets

BC35 When it developed ED 6, the Board decided that an entity recognising exploration and evaluation assets should test those assets for impairment, and that the impairment test to be applied should be that in IAS 36 *Impairment of Assets*. Respondents accepted the general proposition that exploration and evaluation

assets should be tested for impairment. However, the Board's proposals for a special 'cash-generating unit for exploration and evaluation assets' (the special CGU) were not thought appropriate or useful.

Assessment of impairment

BC36 In some cases, and particularly in exploration-only entities, exploration and evaluation assets do not generate cash flows and there is insufficient information about the mineral resources in a specific area for an entity to make reasonable estimates of exploration and evaluation assets' recoverable amount. This is because the exploration for and evaluation of the mineral resources has not reached a stage at which information sufficient to estimate future cash flows is available to the entity. Without such information, it is not possible to estimate either fair value less costs to sell or value in use, the two measures of recoverable amount in IAS 36. Respondents noted that this would lead to an immediate write-off of exploration assets in many cases.

BC37 The Board was persuaded by respondents' arguments that recognising impairment losses on this basis was potentially inconsistent with permitting existing methods of accounting for exploration and evaluation assets to continue. Therefore, pending completion of the comprehensive review of accounting for extractive activities, the Board decided to change the approach to recognition of impairment; the assessment of impairment should be triggered by changes in facts and circumstances. However, it also confirmed that, once an entity had determined that an exploration and evaluation asset was impaired, IAS 36 should be used to measure, present and disclose that impairment in the financial statements, subject to special requirements with respect to the level at which impairment is assessed.

BC38 Paragraph 12 of ED 6 proposed that an entity that had recognised exploration and evaluation assets should assess those assets for impairment annually and recognise any resulting impairment loss in accordance with IAS 36. Paragraph 13 proposed a set of indicators of impairment that an entity would consider in addition to those in IAS 36. Respondents stated that these indicators would not achieve the Board's intended result, especially in circumstances in which the information necessary for an assessment of mineral reserves was not available.

BC39 The Board replaced the proposals in paragraphs 12 and 13 of ED 6 with an exception to the recognition requirements in IAS 36. The Board decided that, until the entity had sufficient data to determine technical feasibility and commercial viability, exploration and evaluation assets need not be assessed for impairment. However, when such information becomes available, or other facts and circumstances suggest that the asset might be impaired, the exploration and evaluation assets must be assessed for impairment. The IFRS suggests possible indicators of impairment.

The level at which impairment is assessed

BC40 When it developed ED 6, the Board decided that there was a need for consistency between the level at which costs were accumulated and the level at which impairment was assessed. Without this consistency, there was a danger that expenditures that would form part of the cost of an exploration and evaluation

 © IASCF

asset under one of the common methods of accounting for the exploration for and evaluation of mineral resources would need to be recognised in profit or loss in accordance with IAS 36. Consequently, ED 6 proposed that an entity recognising exploration and evaluation assets should make a one-time election to test those assets either at the level of the IAS 36 cash-generating unit (CGU) or at the level of a special CGU. ED 6 explained that any assets other than exploration and evaluation assets included within the special CGU should continue to be subject to separate impairment testing in accordance with IAS 36, and that impairment test should be performed before the special CGU was tested for impairment.

BC41 Respondents disagreed with the Board's proposal. In particular, and for various reasons, they did not accept that the special CGU would provide the relief it was intended to provide, because:

(a) small, start-up or exploration-only entities might not have adequate cash flows to support exploration and evaluation assets that were not cash-generating.

(b) entities applying the successful efforts method of accounting typically conduct impairment tests property by property. However, because of the way in which the special CGU was defined in ED 6 such entities would be forced to carry out impairment tests at the CGU level.

(c) the special CGU permitted management extensive discretion.

In addition, there was concern that, because the exploration and evaluation assets could be aggregated with other assets in the special CGU, there would be confusion about the appropriate measurement model to apply (fair value less costs to sell or value in use). As a result, many respondents to ED 6 did not think that the Board had achieved its intention in this respect, and said that they preferred to apply IAS 36 without the special CGU.

BC42 Although the Board disagreed with some of the arguments put forward by respondents, it acknowledged that the special CGU seemed to be more confusing than helpful. This suggested that it was not needed. Paragraph BC20 of the Basis for Conclusions on ED 6 noted the Board's reluctance to introduce a special CGU. Removing the special CGU would eliminate much of the complexity in the proposed IFRS and the confusion among constituents. It would also mean that entities with extractive activities would assess their assets for impairment at the same level as other entities—providing a higher level of comparability than might otherwise be the case.

BC43 Board members noted that paragraph 22 of IAS 36 requires impairment to be assessed at the individual asset level 'unless the asset does not generate cash inflows that are largely independent of those from other assets or groups of assets'. In addition, paragraph 70 of IAS 36 requires that 'if an active market exists for the output produced by an asset or group of assets, that asset or group of assets shall be identified as a cash-generating unit'. In some cases in which exploration and evaluation assets are recognised, eg in the petroleum sector, each well is potentially capable of producing cash inflows that are observable and capable of reliable measurement because there is an active market for crude oil.

The Board was concerned that removing the special CGU would cause entities recognising exploration and evaluation assets to test for impairment at a very low level.

BC44 The issue was highlighted in the July 2004 issue of *IASB Update*, in the project summary and in the *Effect of Redeliberations* documents available on the IASB's Website. These documents were also sent to the Board's research project team and others with a request to encourage their constituents to respond to the issues raised. The Board received 16 comment letters.

BC45 The majority of respondents continued to support the elimination of the special CGU. They also supported the notion that entities should test impairment at the level of the cost centre and suggested that the Board should consider defining an 'asset' as it applied to exploration and evaluation assets. The respondents argued that such an approach would reflect more accurately the way in which the industry manages its operations. The Board was persuaded by these arguments and decided that it should permit entities some flexibility in allocating exploration and evaluation assets to cash-generating units or groups of units, subject to an upper limit on the size of the units or groups of units.

BC46 The Board decided that its approach to the impairment of goodwill in the 2004 revisions to IAS 36 paragraphs 80–82 offered the best model available within IFRSs to accomplish its objective. It noted that entities might be able to monitor exploration and evaluation assets for internal management purposes at the level of an oilfield or a contiguous ore body. The Board did not intend to require impairment to be assessed at such a low level. Consequently, the IFRS permits CGUs to be aggregated. However, the Board decided to require the level at which impairment was assessed to be no larger than a segment, based on either the entity's primary or the entity's secondary segment reporting format in accordance with IAS 14 *Segment Reporting*. The Board concluded, consistently with the approach to goodwill in IAS 36, that this approach was necessary to ensure that entities managed on a matrix basis could test exploration and evaluation assets for impairment at the level of reporting that reflects the way they manage their operations. This requirement is no less rigorous than ED 6's requirement that the special CGU should 'be no larger than a segment'.[*]

BC47 Consequently, the Board decided to remove the proposed special CGU. In doing so, it noted that eliminating this requirement would have the following benefits:

(a) once an impairment was identified, the measurement, presentation and disclosure of impairment would be more consistent across entities recognising exploration and evaluation assets.

(b) it would remove the confusion about what practices entities recognising exploration and evaluation assets for the first time should follow.

(c) it would remove the risk noted in some comment letters that the special CGU could become the 'industry norm', limiting the Board's options when the comprehensive review of accounting for extractive activities is completed.

[*] In 2006 IAS 14 was replaced by IFRS 8 *Operating Segments*, which does not require the identification of primary and secondary segments. See paragraph BC150A of the Basis for Conclusions on IAS 36 *Impairment of Assets*.

 © IASCF

Reversal of impairment losses

BC48 The reversal of impairment losses when specified requirements (ie those set out in paragraphs 109–123 of IAS 36) are met is required of all entities for all assets (excluding goodwill and equity investments classified as available for sale). Respondents to ED 6 who commented on this issue and who disagreed with the ability to reverse impairment losses advanced no new arguments why the Board should prohibit reversal of impairment losses in the case of exploration and evaluation assets. Consequently, the Board reaffirmed its conclusion that it would not be appropriate to propose an exemption from the requirement to reverse impairment losses for exploration and evaluation assets.

Changes in accounting policies

BC49 IAS 8 prohibits a change in accounting policies that is not required by an IFRS, unless the change will result in the provision of reliable and more relevant information. Although the Board wished to avoid imposing unnecessary changes in this IFRS, it did not believe it should exempt entities from the requirement to justify changes in accounting policies. Consistently with its conclusions in IFRS 4, the Board decided to permit changes in accounting policies for exploration and evaluation assets if they make the financial statements more relevant and no less reliable, or more reliable and no less relevant judged by the criteria in IAS 8.

Disclosures

BC50 The disclosure requirements in the IFRS are based on a principle that an entity should disclose information that identifies and explains the amounts recognised in its financial statements that arise from the exploration for and evaluation of mineral resources, supplemented by specified disclosures to meet that objective.

BC51 Although respondents agreed that entities should be allowed flexibility in determining the levels of aggregation and amount of disclosure, they suggested that the Board should introduce more specific and standardised disclosure requirements. Some respondents were concerned that the variety of accounting for the exploration for and evaluation of mineral resources could reduce comparability.

BC52 The Board concluded that the ED 6 approach was superior to requiring a long list of detailed and prescriptive disclosures because concentrating on the underlying principle:

(a) makes it easier for entities to understand the rationale for the requirements, which promotes compliance.

(b) avoids requiring specific disclosures that may not be needed to meet the underlying objectives in the circumstances of every entity and could lead to information overload that obscures important information in a mass of detail.

© IASCF

(c) gives entities flexibility to decide on an appropriate level of aggregation that enables users to see the overall picture, but without combining information that has different characteristics.

(d) permits reporting exploration and evaluation expenditure by segment on either an annual basis or an accumulated basis.

BC53 Some respondents suggested that the Board should require disclosures similar to those in paragraphs 73 and 74 of IAS 16 or in paragraphs 118–125 of IAS 38. Both IAS 16 and IAS 38 contain scope exclusions for exploration and evaluation assets. Therefore, entities recognising these assets could claim that the requirements were not applicable. The Board decided that, although the scope of those standards excludes exploration and evaluation assets, their required disclosures would provide information relevant to an understanding of the financial statements and useful to users. Consequently, the Board concluded that the IFRS should confirm that the disclosures of IASs 16 and 38 are required consistently with how the entity classifies its exploration and evaluation assets (ie tangible (IAS 16) or intangible (IAS 38)).

BC54 In addition, some respondents suggested that the Board should require disclosure of non-financial information, including:

(a) commercial reserve quantities;

(b) rights to explore for, develop and produce wasting resources;

(c) disclosures about stages after exploration and evaluation; and

(d) the number of years since exploration started, and an estimation of the time remaining until a decision could be made about the technical feasibility and commercial viability of extracting the mineral resource.

Commercial reserves

BC55 The Board acknowledged that information about commercial reserve quantities is, perhaps, the most important disclosure for an entity with extractive activities. However, it noted that commercial reserves are usually determined after the exploration and evaluation stage has ended and it concluded that such disclosure was beyond the stated scope of the IFRS.

Stages after exploration and evaluation

BC56 As with commercial reserves, the Board concluded that, although information about stages after exploration and evaluation would be useful to users of financial statements, such disclosure is beyond the scope of the IFRS.

Project timing

BC57 The Board also concluded that disclosure of the number of years since exploration started and the estimated time remaining until a decision could be made about development would apply only to large scale exploration activities. It noted that if the project is significant, paragraph 112(c) of IAS 1 already requires its disclosure, ie as additional information that is necessary for an understanding of the financial statements.

 © IASCF

Effective date

BC58 ED 6 proposed that the IFRS should be effective for annual periods beginning on or after 1 January 2005. The Board decided to change the effective date to 1 January 2006 to allow entities more time to make the transition to the IFRS. It also decided to permit an entity that wishes or is required to adopt IFRSs before 1 January 2006 to adopt IFRS 6 early.

Transition

BC59 The Board did not propose any special transition in ED 6. Consequently, paragraphs 14–27 of IAS 8 would apply to any changes in accounting that are necessary as a result of the IFRS.

BC60 Some respondents expressed concern about the application of the proposals to prior periods—especially those related to impairment and the inclusion or exclusion of some expenditures from exploration and evaluation assets. In particular, respondents requested that if the Board were to require restatement, it should give transitional guidance on how to identify elements previously recognised as exploration and evaluation assets now outside the definition.

BC61 IAS 8 would require entities recognising exploration and evaluation assets to determine whether there were any facts and circumstances indicating impairment in prior periods. The Board concluded that retrospective application was not likely to involve the use of hindsight because the facts and circumstances identified in the IFRS are generally objective indicators and whether they existed at a particular date should be a question of fact. However, the Board noted that it provided transitional relief in IFRS 4 for applying the liability adequacy test to comparative periods on the basis of impracticability, principally because the liability adequacy test involves the use of current estimates of future cash flows from an entity's insurance contracts. The Board does not expect that IFRS 6's approach to impairment will involve current estimates of future cash flows and other variables to the same extent. However, it is aware that the variety of approaches to assessing recoverability means that current estimates of future cash flows and other variables are likely to be in use by some entities.

BC62 Therefore, consistently with IFRS 4, the Board concluded that if it is impracticable to apply the impairment test to comparative information that relates to annual periods beginning before 1 January 2006, an entity should disclose that fact.

BC63 Some respondents were concerned that entities would have difficulty in compiling the information necessary for 2004 comparative figures, and suggested that entities should be exempted from restating comparatives on transition, given that the IFRS would be introduced close to 1 January 2005, and could result in substantial changes.

BC64 The Board considered a similar issue when it developed ED 7 *Financial Instruments: Disclosures*, in which it concluded that entities that apply the requirements proposed in ED 7 only when they become mandatory should be required to provide comparative disclosures because such entities will have enough time to prepare the information.

BC65 In ED 7, the Board decided to propose that an entity that both (a) adopts IFRSs for the first time before 1 January 2006 and (b) applies the IFRS before that date should be exempt from the requirement to produce comparative information in the first year of application. The Board compared the concerns raised by constituents in response to ED 6 and the issues it considered in developing ED 7 and decided that its conclusions in ED 7 were also appropriate for the IFRS.

BC65A [Deleted]*

Summary of changes from ED 6

BC66 The following is a summary of the main changes from ED 6 to the IFRS. The Board:

(a) deleted the specific prohibition against including administration and other general overhead costs in the initial measurement of an exploration and evaluation asset (paragraph BC28).

(b) introduced a requirement for the entity to classify exploration and evaluation assets as either tangible or intangible according to the nature of the asset acquired and to apply this classification consistently (paragraphs BC32–BC34).

(c) amended the impairment principle so that an impairment is recognised on the basis of an assessment of facts and circumstances and measured, presented and disclosed in accordance with IAS 36, subject to the modification of the level at which the impairment is assessed (paragraphs BC36–BC39).

(d) deleted the indicators of impairment proposed in ED 6 and replaced them with examples of facts and circumstances that would suggest that an exploration and evaluation asset was impaired (paragraphs BC36–BC39).

(e) deleted the special cash-generating unit for exploration and evaluation assets and instead required that the entity determine an accounting policy for allocating exploration and evaluation assets to a cash-generating unit or units for the purpose of the impairment test (paragraphs BC40–BC47).

(f) amended the effective date of the IFRS so that the IFRS is effective for annual periods beginning on or after 1 January 2006 (paragraph BC58).

(g) provided transitional relief for entities adopting IFRSs for the first time and adopting the IFRS before 1 January 2006 (paragraphs BC59–BC65).

* Paragraph BC65A was deleted as a result of revisions to IFRS 1 *First-time Adoption of International Financial Reporting Standards* in November 2008 as it was no longer applicable.

Dissenting opinions

Dissent of Robert P Garnett, James J Leisenring, Warren J McGregor and John T Smith

DO1 Messrs Garnett, Leisenring, McGregor and Smith dissent from the issue of IFRS 6.

DO2 These four Board members dissent because they would not permit entities the alternative of continuing their existing accounting treatment for exploration and evaluation assets. In particular, they believe that all entities should be required to apply paragraphs 11 and 12 of IAS 8 *Accounting Policies, Changes in Accounting Estimates and Errors* when developing an accounting policy for exploration and evaluation assets. These Board members believe that the requirements in IAS 8 have particular relevance and applicability when an IFRS lacks specificities, as is the case for entities recognising exploration and evaluation assets. This is especially true because the IFRS allows the continuation of a variety of measurement bases for these items and, because of the failure to consider the *Framework*, may result in the inappropriate recognition of assets. In the view of these Board members, if an entity cannot meet those requirements, it should not be allowed to describe its financial statements as being in accordance with International Financial Reporting Standards.

DO3 Messrs Garnett and McGregor also disagree with the modifications to the requirements of IAS 36 for the purpose of assessing exploration and evaluation assets for impairment contained in paragraphs 18–22 of the IFRS. They think that the requirements of IAS 36 should be applied in their entirety to exploration and evaluation assets. Failure to do so could result in exploration and evaluation assets continuing to be carried forward when such assets are not known to be recoverable. This could result in the exclusion of relevant information from the financial statements because of the failure to recognise impairment losses on a timely basis and the inclusion of unreliable information because of the inclusion of assets that do not faithfully represent the transactions and other events that they purport to represent.

DO4 The four Board members' concerns are heightened by the absence as yet from the Board's main agenda of a project on accounting for exploration for and evaluation of mineral resources generally. Although a research project has begun, it is unlikely that the Board will be able to develop financial reporting standards in the medium term. Accordingly, it is likely that the concession referred to in paragraph DO2 and, in Messrs Garnett and McGregor's cases, in paragraph DO3, will remain in place for some time.

Basis for Conclusions on IFRS 7 *Financial Instruments: Disclosures*

This Basis for Conclusions accompanies, but is not part of, IFRS 7.

In this Basis for Conclusions the terminology has not been amended to reflect the changes made by IAS 1 Presentation of Financial Statements *(as revised in 2007).*

In November 2009 the requirements of IAS 39 relating to classification and measurement of assets within the scope of IAS 39 were relocated to IFRS 9 Financial Instruments*. The text of this Basis for Conclusions has been marked up to reflect those changes: new text is underlined and deleted text is struck through.*

Introduction

BC1 This Basis for Conclusions summarises the International Accounting Standards Board's considerations in reaching the conclusions in IFRS 7 *Financial Instruments: Disclosures*. Individual Board members gave greater weight to some factors than to others.

BC2 During the late 1990s, the need for a comprehensive review of IAS 30 *Disclosures in the Financial Statements of Banks and Similar Financial Institutions* became apparent. The Board's predecessor, the International Accounting Standards Committee (IASC), issued a number of Standards that addressed, more comprehensively, some of the topics previously addressed only for banks in IAS 30. Also, fundamental changes were taking place in the financial services industry and in the way in which financial institutions manage their activities and risk exposures. This made it increasingly difficult for users of banks' financial statements to assess and compare their financial position and performance, their associated risk exposures, and their processes for measuring and managing those risks.

BC3 In 1999 IASC added a project to its agenda to revise IAS 30 and in 2000 it appointed a steering committee.

BC4 In 2001 the Board added this project to its agenda. To assist and advise it, the Board retained the IAS 30 steering committee, renamed the Financial Activities Advisory Committee (FAAC), as an expert advisory group. FAAC members had experience and expertise in banks, finance companies and insurance companies and included auditors, financial analysts, preparers and regulators. The FAAC's role was:

(a) to provide input from the perspective of preparers and auditors of financial statements of entities that have significant exposures to financial instruments; and

(b) to assist the Board in developing a standard and implementation guidance for risk disclosures arising from financial instruments and for other related disclosures.

 © IASCF

BC5 The Board published its proposals in July 2004 as ED 7 *Financial Instruments: Disclosures*. The deadline for comments was 27 October 2004. The Board received 105 comment letters. After reviewing the responses, the Board issued IFRS 7 in August 2005.

BC5A In October 2008 the Board published an exposure draft *Improving Disclosures about Financial Instruments* (proposed amendments to IFRS 7). The aim of the proposed amendments was to enhance disclosures about fair value and liquidity risk. The Board received 89 comment letters. After reviewing the responses, the Board issued amendments to IFRS 7 in March 2009. The Board decided to require application of the amendments for periods beginning on or after 1 January 2009. The Board noted that, although the effective date of IFRSs and amendments to IFRSs is usually 6–18 months after issue, the urgent need for enhanced disclosures about financial instruments demanded earlier application.

Scope (paragraphs 3–5)

The entities to which the IFRS applies

BC6 Although IFRS 7 arose from a project to revise IAS 30 (a Standard that applied only to banks and similar financial institutions), it applies to all entities that have financial instruments. The Board observed that the reduction in regulatory barriers in many countries and increasing competition between banks, non-bank financial services firms, and financial conglomerates have resulted in many entities providing financial services that were traditionally provided only by entities regulated and supervised as banks. The Board concluded that this development would make it inappropriate to limit this project to banks and similar financial institutions.

BC7 The Board considered whether entities that undertake specified activities commonly undertaken by banks and other financial institutions, namely deposit-taking, lending and securities activities, face unique risks that would require a standard specific to them. However, the Board decided that the scope of this project should include disclosures about risks arising from financial instruments in all entities for the following reasons:

(a) disclosures about risks associated with financial instruments are useful to users of the financial statements of all entities.

(b) the Board found it could not satisfactorily define deposit-taking, lending, and securities activities. In particular, it could not satisfactorily differentiate an entity with securities activities from an entity holding a portfolio of financial assets for investment and liquidity management purposes.

(c) responses to the Exposure Draft of Improvements to IAS 32 *Financial Instruments: Disclosure and Presentation*, published in June 2002, indicated that IAS 32's risk disclosure requirements, applicable to all entities, could be improved.

(d) the exclusion of some financial instruments would increase the danger that risk disclosures could be incomplete and possibly misleading.

For example, a debt instrument issued by an entity could significantly affect its exposures to liquidity risk, interest rate risk and currency risk even if that instrument is not held as part of deposit-taking, lending and securities activities.

(e) users of financial statements need to be able to compare similar activities, transactions and events of different entities on a consistent basis. Hence, the disclosure principles that apply to regulated entities should not differ from those that apply to non-regulated, but otherwise similar, entities.

BC8 The Board decided that the scope of the IFRS should be the same as that of IAS 32 with one exception. The Board concluded that the IFRS should not apply to derivatives based on interests in subsidiaries, associates or joint ventures if the derivatives meet the definition of an equity instrument in IAS 32. This is because equity instruments are not remeasured and hence:

(a) they do not expose the issuer to balance sheet and income statement risk; and

(b) the disclosures about the significance of financial instruments for financial position and performance are not relevant to equity instruments.

Although these instruments are excluded from the scope of IFRS 7, they are within the scope of IAS 32 for the purpose of determining whether they meet the definition of equity instruments.

Exemptions considered by the Board

Insurers

BC9 The Board considered whether the IFRS should apply to entities that both have financial instruments and issue insurance contracts. The Board did not exempt these entities because financial instruments expose all entities to risks regardless of what other assets and liabilities they have. Accordingly, an entity that both issues insurance contracts and has financial instruments applies IFRS 4 *Insurance Contracts* to its insurance contracts and IFRS 7 to its financial assets and financial liabilities. However, many of the disclosure requirements in IFRS 4 were applications of, or relatively straightforward analogies with, existing requirements in IAS 32. Therefore, the Board also updated the disclosures required by IFRS 4 to make them consistent with IFRS 7, with modifications that reflect the interim nature of IFRS 4.

Small and medium-sized entities

BC10 The Board considered whether it should exempt small and medium-sized entities from the scope of the IFRS. The Board noted that the extent of disclosures required by the IFRS will depend on the extent to which the entity uses financial instruments and the extent to which it has assumed associated risks. The IFRS requires entities with few financial instruments and few risks to give few disclosures. Also, many of the requirements in the IFRS are based on information provided internally to the entity's key management personnel. This helps to

 © IASCF

avoid unduly onerous requirements that would not be appropriate for smaller entities. Accordingly, the Board decided not to exempt such entities from the scope of IFRS 7. However, it will keep this decision under review in its project on financial reporting for small and medium-sized entities.

Subsidiaries

BC11 Some respondents to ED 7 stated that there is little public interest in the financial statements of some entities, such as a wholly-owned subsidiary whose parent issues publicly available financial statements. These respondents stated that such subsidiaries should be exempt from some of the requirements of IFRS 7 in their individual financial statements. However, deciding whether such an entity should prepare general purpose financial statements is a matter for the entity and local legislators and regulators. If such an entity prepares financial statements in accordance with IFRSs, users of those statements should receive information of the same quality as users of any general purpose financial statements prepared in accordance with IFRSs. The Board confirmed its view that no exemptions from the general requirements of any Standard should be given for the financial statements of subsidiaries.

Disclosures about the significance of financial instruments for financial position and performance (paragraphs 7–30, B4 and B5)

BC12 The Board relocated disclosures from IAS 32 to IFRS 7, so that all disclosure requirements for financial instruments are in one Standard. Many of the disclosure requirements about the significance of financial instruments for an entity's financial position and performance were previously in IAS 32. For these disclosures, the relevant paragraphs from the Basis for Conclusions on IAS 32 have been incorporated into this Basis for Conclusions. This Basis for Conclusions does not discuss requirements that the Board did not reconsider either in revising IAS 32 in 2003 or in developing IFRS 7.

The principle (paragraph 7)

BC13 The Board decided that the disclosure requirements of IFRS 7 should result from the explicit disclosure principle in paragraph 7. The Board also decided to specify disclosures to satisfy this principle. In the Board's view, entities could not satisfy the principle in paragraph 7 unless they disclose the information required by paragraphs 8–30.

Balance sheet disclosures (paragraphs 8–19 and B4)

Categories of financial assets and financial liabilities (paragraph 8)

BC14 Paragraph 8 requires entities to disclose financial assets by the measurement categories in IFRS 9 *Financial Instruments* and financial liabilities by the measurement categories in IAS 39 *Financial Instruments: Recognition and Measurement*. The Board concluded that disclosures for each measurement category would assist users in understanding the extent to which accounting policies affect the amounts at which financial assets and financial liabilities are recognised.

BC15 The Board also concluded that separate disclosure of the carrying amounts of financial assets and financial liabilities that are ~~classified as held for trading and those~~ designated upon initial recognition as financial assets and financial liabilities at fair value through profit or loss and those mandatorily measured at fair value is useful because such designation is at the discretion of the entity.

Financial assets or financial liabilities at fair value through profit or loss (paragraphs 9–11, B4 and B5)

BC16 IAS 39 permits entities to designate a non-derivative financial liability as at fair value through profit or loss, if specified conditions are met. If entities do so, they are required to provide the disclosures in paragraphs 10 and 11. The Board's reasons for these disclosures are set out in the Basis for Conclusions on IAS 39, paragraphs BC87–BC92.

BC17 The requirements in paragraphs 9, 11 and B5(a) are related to the Amendments to IAS 39 Financial Instruments: Recognition and Measurement—*The Fair Value Option*, issued in June 2005. The reasons for those requirements are discussed in the Basis for Conclusions on those Amendments.

BC18 Paragraph 10(a) requires disclosure of the change in fair value of a financial liability designated as at fair value through profit or loss that is attributable to changes in the liability's credit risk. The Board previously considered this disclosure in its deliberations on the fair value measurement of financial liabilities in IAS 39.

BC19 Although quantifying such changes might be difficult in practice, the Board concluded that disclosure of such information would be useful to users of financial statements and would help alleviate concerns that users may misinterpret the profit or loss effects of changes in credit risk, especially in the absence of disclosures. Therefore, in finalising the revisions to IAS 32 in 2003, it decided to require disclosure of the change in fair value of the financial liability that is not attributable to changes in a benchmark interest rate. The Board believed that this is often a reasonable proxy for the change in fair value that is attributable to changes in the liability's credit risk, in particular when such changes are large, and would provide users with information with which to understand the profit or loss effect of such a change in credit risk.

BC20 However, some respondents to ED 7 stated that they did not agree that the IAS 32 disclosure provided a reasonable proxy, except for straightforward debt instruments. In particular, there could be other factors involved in the change in an instrument's fair value unrelated to the benchmark interest rate, such as the effect of an embedded derivative. Respondents also cited difficulties for unit-linked insurance contracts, for which the amount of the liability reflects the performance of a defined pool of assets. The Board noted that the proxy that was developed in IAS 32 assumed that it is not practicable for entities to determine directly the change in fair value arising from changes in credit risk. However, the Board acknowledged and shared these concerns.

BC21 As a result, the Board amended this requirement to focus directly on the objective of providing information about the effects of changes in credit risk:

 © IASCF

(a) by permitting entities to provide a more faithful representation of the amount of change in fair value that is attributable to changes in credit risk if they could do so. However, such entities are also required to disclose the methods used and provide their justification for concluding that those methods give a more faithful representation than the proxy in paragraph 10(a)(i).

(b) by amending the proxy disclosure to be the amount of change in fair value that is not attributable to changes in market conditions that give rise to market risk. For example, some entities may be able to identify part of the change in the fair value of the liability as attributable to a change in an index. In these cases, the proxy disclosure would exclude the amount of change attributable to a change in an index. Similarly, excluding the amount attributable to a change in an internal or external investment fund makes the proxy more suitable for unit-linked insurance contracts.

BC22 The Board decided that when an entity has designated a financial liability as at fair value through profit or loss, it should disclose the difference between the carrying amount and the amount the entity would contractually be required to pay at maturity to the holders of the liability (see paragraph 10(b)). The fair value may differ significantly from the settlement amount, in particular for financial liabilities with a long duration when an entity has experienced a significant deterioration in creditworthiness since their issue. The Board concluded that knowledge of this difference would be useful to users of financial statements. Also, the settlement amount is important to some financial statement users, particularly creditors.

Reclassification (paragraphs ~~12 and 12A~~ 12B–12D)

BC23 IAS 32 required disclosure of the reason for reclassification of financial assets at cost or amortised cost rather than at fair value. The Board extended this requirement to include disclosure of the reason for reclassifications and of the amount reclassified into and out of each category. As noted in paragraph BC14, the Board regards such information as useful because the categorisation of financial instruments has a significant effect on their measurement.

BC23A In October and November 2008 the Board amended IAS 39 to permit reclassification of particular financial assets in some circumstances. The Board decided to require additional disclosures about the situations in which any such reclassification is made, and the effects on the financial statements. The Board regards such information as useful because the reclassification of a financial asset can have a significant effect on the financial statements.

BC23B In November 2009 the Board revised the requirements relating to reclassification of financial assets in IFRS 9 *Financial Instruments*. Accordingly, the Board revised the disclosure requirements relating to reclassification of financial assets.

Derecognition (paragraph 13)

BC24 An entity may have transferred financial assets in such a way that part or all of them do not qualify for derecognition (see paragraphs 15–37 of IAS 39). If the entity either continues to recognise all of the assets or continues to recognise the assets to the extent of its continuing involvement, paragraph 13 requires disclosure of the nature of the financial assets, the extent of the entity's continuing involvement, and any associated liabilities. Such disclosure helps users of the financial statements evaluate the significance of the risks retained.

Collateral (paragraphs 14 and 15)

BC25 Paragraph 15 requires disclosures about collateral that the entity holds if it is permitted to sell or repledge the collateral in the absence of default by the owner. Some respondents to ED 7 argued for an exemption from this disclosure if it is impracticable to obtain the fair value of the collateral held. However, the Board concluded that it is reasonable to expect an entity to know the fair value of collateral that it holds and can sell even if there is no default.

Allowance account for credit losses (paragraph 16)

BC26 When a separate account is used to record impairment losses (such as an allowance account or similar account used to record a collective impairment of assets), paragraph 16 requires a reconciliation of that account to be disclosed. The Board was informed that analysts and other users find this information useful in assessing the adequacy of the allowance for impairment losses for such entities and when comparing one entity with another. However, the Board decided not to specify the components of the reconciliation. This allows entities flexibility in determining the most appropriate format for their needs.

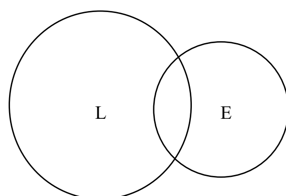
BC27 Respondents to ED 7 asked the Board to require entities to provide equivalent information if they do not use an allowance account. The Board decided not to add this disclosure in finalising the IFRS. It concluded that, for virtually all entities, IAS 39's requirement to consider impairment on a group basis would necessitate the use of an allowance or similar account. The accounting policy disclosures required by paragraph B5(d) also include information about the use of direct adjustments to carrying amounts of financial assets.

Compound financial instruments with multiple embedded derivatives (paragraph 17)

BC28 IAS 32 requires the separation of the liability and equity components of a compound financial instrument. The Board notes that this is more complicated for compound financial instruments with multiple embedded derivative features whose values are interdependent (for example, a convertible debt instrument that gives the issuer a right to call the instrument back from the holder, or the holder a right to put the instrument back to the issuer) than for those without such features. If the embedded equity and non-equity derivative features are interdependent, the sum of the separately determined values of the liability and equity components will not equal the value of the compound financial instrument as a whole.

 © IASCF

BC29 For example, the values of an embedded call option feature and an equity conversion option feature in a callable convertible debt instrument depend in part on each other if the holder's equity conversion option is extinguished when the entity exercises the call option or vice versa. The following diagram illustrates the joint value arising from the interaction between a call option and an equity conversion option in a callable convertible bond. Circle L represents the value of the liability component, ie the value of the straight debt and the embedded call option on the straight debt, and Circle E represents the value of the equity component, ie the equity conversion option on the straight debt.



The total area of the two circles represents the value of the callable convertible bond. The difference between the value of the callable convertible bond as a whole and the sum of the separately determined values for the liability and equity components is the joint value attributable to the interdependence between the call option feature and the equity conversion feature. It is represented by the intersection between the two circles.

BC30 Under the approach in IAS 32, the joint value attributable to the interdependence between multiple embedded derivative features is included in the liability component. A numerical example is set out as Illustrative Example 10 accompanying IAS 32.

BC31 Even though this approach is consistent with the definition of equity as a residual interest, the Board recognises that the allocation of the joint value to either the liability component or the equity component is arbitrary because it is, by its nature, joint. Therefore, the Board concluded that it is important to disclose the existence of issued compound financial instruments with multiple embedded derivative features that have interdependent values. Such disclosure highlights the effect of multiple embedded derivative features on the amounts recognised as liabilities and equity.

Defaults and breaches (paragraphs 18 and 19)

BC32 Paragraphs 18 and 19 require disclosures about defaults and breaches of loans payable and other loan agreements. The Board concluded that such disclosures provide relevant information about the entity's creditworthiness and its prospects of obtaining future loans.

Income statement and equity (paragraph 20)

Items of income, expenses, gains or losses (paragraph 20(a))

BC33 Paragraph 20(a) requires disclosure of income statement gains and losses by the measurement categories in IAS 39 and measurement classifications in IFRS 9 (which complement the balance sheet disclosure requirement described in paragraph BC14). The Board concluded that the disclosure is needed for users to understand the financial performance of an entity's financial instruments, given the different measurement bases in IAS 39 and IFRS 9.

BC34 Some entities include interest and dividend income in gains and losses on financial assets and financial liabilities ~~held for trading~~ measured at fair value through profit or loss and others do not. To assist users in comparing income arising from financial instruments across different entities, the Board decided that an entity should disclose how the income statement amounts are determined. For example, an entity should disclose whether net gains and losses on financial assets or financial liabilities ~~held for trading~~ measured at fair value through profit or loss include interest and dividend income (see Appendix B, paragraph B5(e)).

Fee income and expense (paragraph 20(c))

BC35 Paragraph 20(c) requires disclosure of fee income and expense (other than amounts included in determining the effective interest rate) arising from financial assets or financial liabilities and from trust and other fiduciary activities that result in the entity holding or placing assets on behalf of individuals, trusts, retirement benefit plans, and other institutions. This information indicates the level of such activities and helps users to estimate possible future income of the entity.

Other disclosures—fair value (paragraphs 25–30)

BC36 Many entities use fair value information internally in determining their overall financial position and in making decisions about individual financial instruments. It is also relevant to many decisions made by users of financial statements because, in many circumstances, it reflects the judgement of the financial markets about the present value of expected future cash flows relating to an instrument. Fair value information permits comparisons of financial instruments having substantially the same economic characteristics, regardless of why they are held and when and by whom they were issued or acquired. Fair values provide a neutral basis for assessing management's stewardship by indicating the effects of its decisions to buy, sell or hold financial assets and to incur, maintain or discharge financial liabilities. The Board decided that when an entity does not measure a financial asset or financial liability in its balance sheet at fair value, it should provide fair value information through supplementary disclosures to assist users to compare entities on a consistent basis.

BC37 Disclosure of fair value is not required for investments in unquoted equity instruments and derivatives linked to such equity instruments if their fair value cannot be measured reliably. Similarly, IFRS 4 does not specify the accounting required for contracts containing a discretionary participation feature pending

 © IASCF

phase II of the Board's project on insurance contracts. Accordingly, disclosure of fair value is not required for contracts containing a discretionary participation feature, if the fair value of that feature cannot be measured reliably. For all other financial assets and financial liabilities, it is reasonable to expect that fair value can be determined with sufficient reliability within constraints of timeliness and cost. Therefore, the Board concluded that there should be no other exception from the requirement to disclose fair value information for financial assets or financial liabilities.

BC38 To provide users of financial statements with a sense of the potential variability of fair value estimates, the Board decided that information about the use of valuation techniques should be disclosed, in particular the sensitivities of fair value estimates to the main valuation assumptions. In forming this conclusion, the Board considered the view that disclosure of sensitivities could be difficult, particularly when there are many assumptions to which the disclosure would apply and these assumptions are interdependent. However, the Board noted that a detailed quantitative disclosure of sensitivity to all assumptions is not required (only those that could result in a significantly different estimate of fair value are required) and that the disclosure does not require the entity to reflect interdependencies between assumptions when making the disclosure. Additionally, the Board considered whether this disclosure might imply that a fair value established by a valuation technique is less reliable than one established by other means. However, the Board noted that fair values estimated by valuation techniques are more subjective than those established from an observable market price, and concluded that users need information to help them assess the extent of this subjectivity.

BC39 Paragraph 28 requires disclosure about the difference that arises if the transaction price differs from the fair value of a financial instrument that is determined in accordance with paragraph AG76 of IAS 39. Those disclosures relate to matters addressed in the December 2004 amendment to IAS 39 *Transition and Initial Recognition of Financial Assets and Financial Liabilities*. That amendment does not specify how entities should account for those initial differences in subsequent periods. The disclosures required by paragraph 28 inform users about the amount of gain or loss that will be recognised in profit or loss in future periods. The Board noted that the information required to provide these disclosures would be readily available to the entities affected.

BC39A Statement of Financial Accounting Standards No. 157 *Fair Value Measurements* (SFAS 157) issued by the US Financial Accounting Standards Board requires disclosures that are based on a three-level fair value hierarchy for the inputs used in valuation techniques to measure fair value. The Board was asked by some users of financial statements to include similar disclosure requirements in IFRS 7 to provide more information about the relative reliability of the inputs to fair value measurements. The Board concluded that such a hierarchy would improve comparability between entities about the effects of fair value measurements as well as increase the convergence of IFRSs and US generally accepted accounting principles (GAAP). Therefore, the Board decided to require disclosures for financial instruments on the basis of a fair value hierarchy.

© IASCF

BC39B Because its own fair value measurement project was not yet completed, the Board decided not to propose a fair value hierarchy for measurement, but only for disclosures. The fair value hierarchy for disclosures is the same as that in SFAS 157 but uses IFRS language pending completion of the fair value measurement project. Although the implicit fair value hierarchy for measurement in IAS 39 is different from the fair value hierarchy in SFAS 157, the Board recognised the importance of using a three-level hierarchy for disclosures that is the same as that in SFAS 157.

BC39C The Board noted the following three-level measurement hierarchy implicit in IAS 39:

(a) financial instruments quoted in an active market;

(b) financial instruments whose fair value is evidenced by comparison with other observable current market transactions in the same instrument (ie without modification or repackaging) or based on a valuation technique whose variables include only data from observable markets; and

(c) financial instruments whose fair value is determined in whole or in part using a valuation technique based on assumptions that are not supported by prices from observable current market transactions in the same instrument (ie without modification or repackaging) and not based on available observable market data.

BC39D For example, the Board acknowledged that some financial instruments that for measurement purposes are considered to have an active market in accordance with paragraphs AG71–AG73 of IAS 39 might be in Level 2 for disclosure purposes. Also, the application of paragraph AG76A of IAS 39 might result in no gain or loss being recognised on the initial recognition of a financial instrument that is in Level 2 for disclosure purposes.

BC39E The introduction of the fair value disclosure hierarchy does not affect any measurement or recognition requirements of other standards. In particular, the Board noted that the recognition of gains or losses at inception of a financial instrument (as required by paragraph AG76 of IAS 39) would not change as a result of the fair value disclosure hierarchy.

BC39F The Board decided to require additional disclosures for instruments with fair value measurements that are in Level 3 of the fair value hierarchy. These disclosures inform users of financial statements about the effects of those fair value measurements that use the most subjective inputs.

BC39G After reviewing comments received on the exposure draft, the Board decided not to require disclosure by level of the fair value hierarchy for financial instruments that are not measured at fair value in the statement of financial position. The Board noted that paragraphs 25 and 27 of IFRS 7, which require the disclosure of the fair value of each class of assets and liabilities in a way that permits it to be compared with its carrying amount, and the methods and assumptions applied in determining fair values, were retained.

Disclosures about the nature and extent of risks arising from financial instruments (paragraphs 31–42 and B6–B28)

BC40 The Board was informed that users of financial statements value information about the risks arising from financial instruments, such as credit risk, liquidity risk and market risk, to which entities are exposed, and the techniques used to identify, measure, monitor and control those risks. Therefore, the Board decided to require disclosure of this information. The Board also decided to balance two objectives:

(a) consistent requirements should apply to all entities so that users receive comparable information about the risks to which entities are exposed.

(b) the disclosures provided should depend on the extent of an entity's use of financial instruments and the extent to which it assumes associated risks. Entities with many financial instruments and related risks should provide more disclosure to communicate those risks to users of financial statements. Conversely, entities with few financial instruments and related risks may provide less extensive disclosure.

BC41 The Board decided to balance these two objectives by developing an IFRS that sets out principles and minimum requirements applicable to all entities, supported by guidance on implementing the IFRS. The requirements in paragraphs 33–42 combine qualitative disclosures of the entity's exposure to risks arising from financial instruments, and the way in which management views and manages these risks, with quantitative disclosures about material risks arising from financial instruments. The extent of disclosure depends on the extent of the entity's exposure to risks arising from financial instruments. The guidance on implementing the IFRS illustrates how an entity might apply the IFRS. This guidance is consistent with the disclosure requirements for banks developed by the Basel Committee (known as Pillar 3), so that banks can prepare, and users receive, a single co-ordinated set of disclosures about financial risk.

BC42 The Board noted that because entities view and manage risk in different ways, disclosures based on how an entity manages risk are unlikely to be comparable between entities. In addition, for an entity that undertakes limited management of risks arising from financial instruments, such disclosures would convey little or no information about the risks the entity has assumed. To overcome these limitations, the Board decided to specify disclosures about risk exposures applicable to all entities. These disclosures provide a common benchmark for financial statement users when comparing risk exposures across different entities and are expected to be relatively easy for entities to prepare. Entities with more developed risk management systems would provide more detailed information.

Location of disclosures of risks arising from financial instruments (paragraph B6)

BC43 Many respondents to ED 7 argued that disclosures about risks in paragraphs 31–42 should not be part of the financial statements for the following reasons:

(a) the information would be difficult and costly to audit.

(b) the information is different from information generally included in financial statements because it is subjective, forward-looking and based on management's judgement. Thus, the information does not meet the criteria of comparability, faithful representation and completeness.

(c) inclusion of such information in a management commentary section outside the financial statements would be consistent with practice in other jurisdictions, including the US. Having this information in the financial statements would put IFRS preparers at a disadvantage relative to their US peers.

BC44 Respondents raised concerns that the disclosure of sensitivity analysis in particular should not be part of the financial statements. Respondents stated that sensitivity analysis cannot be prepared with the degree of reliability expected of information in the financial statements, and that the subjectivity in the sensitivity analysis and the hypothetical alternative values could undermine the credibility of the fair values recognised in the financial statements.

BC45 The Board considered whether the disclosures should be part of the information provided by management outside the financial statements. The Board noted that respondents generally regarded the disclosures proposed in ED 7 as useful, even if they did not agree that they should be located in the financial statements. The Board's view is that financial statements would be incomplete and potentially misleading without disclosures about risks arising from financial instruments. Hence, it concluded that such disclosures should be part of the financial statements. The Board rejected the argument that increased transparency puts an entity at a disadvantage; greater certainty on the part of investors can provide a significant advantage by lowering the entity's cost of capital.

BC46 The Board also noted that some entities might prefer to present the information required by the IFRS together with material such as a management commentary or risk report that is not part of the financial statements. Some entities might be required by regulatory authorities to provide in a separate report information similar to that required by the IFRS. Accordingly, the Board decided these disclosures should be given in the financial statements or incorporated by cross-reference from the financial statements to some other statement that is available to users of the financial statements on the same terms as the financial statements and at the same time.

Quantitative disclosures (paragraphs 34–42 and B7–B28)

Information based on how the entity manages risk (paragraphs 34 and B7)

BC47 The Board concluded that disclosures about an entity's exposure to risks arising from financial instruments should be required, and should be based on how the entity views and manages its risks, ie using the information provided to key management personnel (for example, its board of directors or chief executive officer). This approach:

(a) provides a useful insight into how the entity views and manages risk;

 © IASCF

(b) results in information that has more predictive value than information based on assumptions and methods that management does not use, for instance, in considering the entity's ability to react to adverse situations;

(c) is more effective in adapting to changes in risk measurement and management techniques and developments in the external environment;

(d) has practical advantages for preparers of financial statements, because it allows them to use the data they use in managing risk; and

(e) is consistent with the approach used in IAS 14 *Segment Reporting*.*

Information on averages

BC48 The Board considered whether it should require quantitative information about average risk exposures during the period. It noted that information about averages is more informative if the risk exposure at the reporting date is not typical of the exposure during the period. However, information about averages is also more onerous to prepare. On balance, the Board decided to require disclosure of the exposures at the reporting date in all cases and to require additional information only if the information provided at the reporting date is unrepresentative of the entity's exposure to risk during the period.

Credit risk (paragraphs 36–38, B9 and B10)

Maximum exposure to credit risk (paragraphs 36(a), B9 and B10)

BC49 Paragraph 36(a) requires disclosure of an entity's maximum exposure to credit risk at the reporting date. Some respondents to ED 7 stated that these disclosures would not provide useful information when there are no identified problems in a loan portfolio, and it is not likely that collateral would be called on. However, the Board disagreed because it believes that such information:

(a) provides users of financial statements with a consistent measure of an entity's exposure to credit risk; and

(b) takes into account the possibility that the maximum exposure to loss may differ from the amount recognised in the balance sheet.

BC50 Some respondents to ED 7 questioned whether the maximum exposure to credit risk for a derivative contract is its carrying amount because fair value does not always reflect potential future exposure to credit risk (see paragraph B10(b)). However, the Board noted that paragraph 36(a) requires disclosure of the amount that best represents the maximum exposure to credit risk *at the reporting date*, which is the carrying amount.

* In 2006 IAS 14 was replaced by IFRS 8 *Operating Segments*.

© IASCF

Collateral held as security and other credit enhancements (paragraphs 36(b) and 37(c))

BC51 ED 7 proposed that, unless impracticable, the entity should disclose the fair value of collateral held as security and other credit enhancements, to provide information about the loss the entity might incur in the event of default. However, many respondents to ED 7 disagreed with this proposal on cost/benefit grounds. Respondents indicated that fair value information might not be available for:

(a) small entities and entities other than banks, which may find it onerous to acquire information about collateral;

(b) banks that collect precise information on the value of collateral only on origination, for loans whose payments are made on time and in full (for example a mortgage portfolio secured by properties, for which valuations are not kept up to date on an asset-by-asset basis);

(c) particular types of collateral, such as a floating charge on all the assets of an entity; and

(d) insurers that hold collateral for which fair value information is not readily available.

BC52 The Board also noted respondents' concerns that an aggregate disclosure of the fair value of collateral held would be misleading when some loans in a portfolio are over-collateralised, and other loans have insufficient collateral. In these circumstances, netting the fair value of the two types of collateral would under-report the amount of credit risk. The Board agreed with respondents that the information useful to users is not the total amount of credit exposure less the total amount of collateral, but rather is the amount of credit exposure that is left after available collateral is taken into account.

BC53 Therefore, the Board decided not to require disclosure of the fair value of collateral held, but to require disclosure of only a description of collateral held as security and other credit enhancements. The Board noted that such disclosure does not require an entity to establish fair values for all its collateral (in particular when the entity has determined that the fair value of some collateral exceeds the carrying amount of the loan) and, thus, would be less onerous for entities to provide than fair values.

Credit quality of financial assets that are neither past due nor impaired (paragraph 36(c))

BC54 The Board noted that information about credit quality gives a greater insight into the credit risk of assets and helps users assess whether such assets are more or less likely to become impaired in the future. Because this information will vary between entities, the Board decided not to specify a particular method for giving this information, but rather to allow each entity to devise a method that is appropriate to its circumstances.

 © IASCF

Financial assets that are either past due or impaired (paragraph 37)

BC55 The Board decided to require separate disclosure of financial assets that are past due or impaired to provide users with information about financial assets with the greatest credit risk (paragraph 37). This includes:

(a) an analysis of the age of financial assets, including trade receivables, that are past due at the reporting date, but not impaired (paragraph 37(a)). This information provides users with information about those financial assets that are more likely to become impaired and helps users to estimate the level of future impairment losses.

(b) an analysis of financial assets that are individually determined to be impaired at the reporting date, including the factors the entity considered in determining that the financial assets are impaired (paragraph 37(b)). The Board concluded that an analysis of impaired financial assets by factors other than age (eg nature of the counterparty, or geographical analysis of impaired assets) would be useful because it helps users to understand why the impairment occurred.

Collateral and other credit enhancements obtained (paragraph 38)

BC56 Paragraph 38 requires the entity to disclose the nature and carrying amount of assets obtained by taking possession of collateral held as security or calling on other credit enhancements and its policy for disposing of such assets. The Board concluded that this information is useful because it provides information about the frequency of such activities and the entity's ability to obtain and realise the value of the collateral. ED 7 had proposed that the entity should disclose the fair value of the assets obtained less the cost of selling them, rather than the carrying amount. The Board noted that this amount might be more relevant in the case of collateral obtained that is expected to be sold. However, it also noted that such an amount would be included in the impairment calculation that is reflected in the amount recognised in the balance sheet and the purpose of the disclosure is to indicate the amount recognised in the balance sheet for such assets.

Liquidity risk (paragraphs 34(a), 39, B10A and B11A–B11F)

BC57 The Board decided to require disclosure of a maturity analysis for financial liabilities showing the remaining earliest contractual maturities (paragraph 39(a) and paragraphs B11–B16 of Appendix B).[*] Liquidity risk, ie the risk that the entity will encounter difficulty in meeting commitments associated with financial liabilities, arises because of the possibility (which may often be remote) that the entity could be required to pay its liabilities earlier than expected. The Board decided to require disclosure based on the earliest contractual maturity date because this disclosure shows a worst case scenario.

BC58 Some respondents expressed concerns that such a contractual maturity analysis does not reveal the expected maturity of liabilities, which, for some entities—eg banks with many demand deposits—may be very different. They suggested that a contractual maturity analysis alone does not provide information about the

[*] Amendments to IFRS 7 issued in March 2009 amended paragraph 39 and paragraphs B11–B16. The paragraph references in paragraph BC57 have not been amended as a result of these amendments.

conditions expected in normal circumstances or how the entity manages deviations from expected maturity. Therefore, the Board decided to require a description of how the entity manages the liquidity risk portrayed by the contractual maturity analysis.

BC58A In March 2009 the Board amended the disclosure requirements on the nature and extent of liquidity risk by:

(a) amending the definition of liquidity risk to clarify that paragraph 39 applies only to financial liabilities that will result in the outflow of cash or another financial asset. This clarifies that the disclosure requirements would not apply to financial liabilities that will be settled in the entity's own equity instruments and to liabilities within the scope of IFRS 7 that are settled with non-financial assets.

(b) emphasising that an entity must provide summary quantitative data about its exposure to liquidity risk based on information provided internally to key management personnel of the entity as required by paragraph 34(a). This reinforces the principles of IFRS 7.

(c) amending the requirement in paragraph 39 to disclose a contractual maturity analysis.

BC58B The requirements in paragraph 39(a) and (b) relate to minimum benchmark disclosures as set out in paragraph 34(b) and are expected to be relatively easy to apply. However, the Board noted that the requirement to provide disclosures based on the remaining contractual maturities was difficult to apply for some derivative financial liabilities and did not always result in information that reflects how many entities manage liquidity risk for such instruments. Hence, for some circumstances the Board eliminated the previous requirement to disclose contractual maturity information for derivative financial liabilities. However, the Board retained minimum contractual maturity disclosures for non-derivative financial liabilities (including issued financial guarantee contracts within the scope of the IFRS) and for some derivative financial liabilities.

BC58C The Board noted that for non-derivative financial liabilities (including issued financial guarantee contracts within the scope of the IFRS) and some derivative financial liabilities, contractual maturities are essential for an understanding of the timing of cash flows associated with the liabilities. Therefore, this information is useful to users of financial statements. The Board concluded that disclosures based on the remaining contractual maturities of these financial liabilities should continue to be required.

BC58D The Board also emphasised the existing requirement to disclose a maturity analysis for financial assets held for managing liquidity risk, if that information is required to enable users of its financial statements to evaluate the nature and extent of liquidity risk. The Board also emphasised that an entity must explain the relationship between qualitative and quantitative disclosures about liquidity risk so that users of financial statements can evaluate the nature and extent of liquidity risk.

 © IASCF

Market risk (paragraphs 40–42 and B17–B28)

BC59 The Board decided to require disclosure of a sensitivity analysis for each type of market risk (paragraph 40) because:

(a) users have consistently emphasised the fundamental importance of sensitivity analysis;

(b) a sensitivity analysis can be disclosed for all types of market risk and by all entities, and is relatively easy to understand and calculate; and

(c) it is suitable for all entities—including non-financial entities—that have financial instruments. It is supported by disclosures of how the entity manages the risk. Thus, it is a simpler and more suitable disclosure than other approaches, including the disclosures of terms and conditions and the gap analysis of interest rate risk previously required by IAS 32.

The Board noted that information provided by a simple sensitivity analysis would not be comparable across entities. This is because the methodologies used to prepare the sensitivity analysis and the resulting disclosures would vary according to the nature of the entity and the complexity of its risk management systems.

BC60 The Board acknowledged that a simple sensitivity analysis that shows a change in only one variable has limitations. For example, the analysis may not reveal non-linearities in sensitivities or the effects of interdependencies between variables. The Board decided to meet the first concern by requiring additional disclosure when the sensitivity analysis is unrepresentative of a risk inherent in a financial instrument (paragraph 42). The Board noted that it could meet the second concern by requiring a more complex sensitivity analysis that takes into account the interdependencies between risks. Although more informative, such an analysis is also more complex and costly to prepare. Accordingly, the Board decided not to require such an analysis, but to permit its disclosure as an alternative to the minimum requirement when it is used by management to manage risk.

BC61 Respondents to ED 7 noted that a value-at-risk amount would not show the effect on profit or loss or equity. However, entities that manage on the basis of value at risk would not want to prepare a separate sensitivity analysis solely for the purpose of this disclosure. The Board's objective was to require disclosures about sensitivity, not to mandate a particular form of sensitivity disclosure. Therefore, the Board decided not to require disclosure of the effects on profit or loss and equity if an alternative disclosure of sensitivity is made.

BC62 Respondents to ED 7 requested the Board to provide more guidance and clarification about the sensitivity analysis, in particular:

(a) what is a reasonably possible change in the relevant risk variable?

(b) what is the appropriate level of aggregation in the disclosures?

(c) what methodology should be used in preparing the sensitivity analysis?

BC63 The Board concluded that it would not be possible to provide comprehensive guidance on the methodology to be used in preparing the sensitivity analysis. The Board noted that more comparable information would be obtained if it imposed specific requirements about the inputs, process and methodology of the analysis, for example disclosure of the effects of a parallel shift of the yield curve by 100 basis points. However, the Board decided against such a specific requirement because a reasonably possible change in a relevant risk variable (such as interest rates) in one economic environment may not be reasonably possible in another (such as an economy with higher inflation). Moreover, the effect of a reasonably possible change will vary depending on the entity's risk exposures. As a result, entities are required to judge what those reasonably possible changes are.

BC64 However, the Board decided that it would provide high level application guidance about how the entity should assess what is a reasonably possible change and on the appropriate level of aggregation in the disclosures. In response to comments received on ED 7, the Board also decided to clarify that:

(a) an entity should not aggregate information about material exposures to risk from significantly different economic environments. However, if it has exposure to only one type of market risk in only one economic environment, it might not show disaggregated information.

(b) the sensitivity analysis does not require entities to determine what the profit or loss for the period would have been had the relevant risk variable been different. The sensitivity analysis shows the effect on current period profit or loss and equity if a reasonably possible change in the relevant risk variable had been applied to the risk exposures in existence at the balance sheet date.

(c) a reasonably possible change is judged relative to the economic environments in which the entity operates, and does not include remote or 'worst case' scenarios or 'stress tests'.

(d) entities are required to disclose only the effects of the changes at the limits of the reasonably possible range of the relevant risk variable, rather than all reasonably possible changes.

(e) the time frame for which entities should make an assessment about what is reasonably possible is the period until the entity next presents these disclosures, usually its next annual reporting period.

The Board also decided to add a simple example of what a sensitivity analysis might look like.

Operational risk

BC65 The Board discussed whether it should require disclosure of information about operational risk. However, the Board noted that the definition and measurement of operational risk are in their infancy and are not necessarily related to financial instruments. It also decided that such disclosures would be more appropriately located outside the financial statements. Therefore, the Board decided to defer this issue to its research project on management commentary.

 © IASCF

Effective date and transition (paragraphs 43 and 44)

BC66 The Board is committed to maintaining a 'stable platform' of substantially unchanged Standards for annual periods beginning on or before 1 January 2005, when many entities will adopt IFRSs for the first time. In addition, some preparers will need time to make the system changes necessary to comply with the IFRS. Therefore, the Board decided that the effective date of IFRS 7 should be annual periods beginning on or after 1 January 2007, with earlier application encouraged.

BC67 The Board noted that entities that apply IFRS 7 only when it becomes mandatory will have sufficient time to prepare comparative information. This conclusion does not apply to entities that apply IFRS 7 early. In particular, the time would be extremely short for those entities that would like to apply IFRS 7 when they first adopt IFRSs in 2005, to avoid changing from local GAAP to IAS 32 and IAS 30 when they adopt IFRSs and then changing again to IFRS 7 only one or two years later. Therefore, the Board gave an exemption from providing comparative disclosure in the first year of application of IFRS 7 to any entity that both (a) is a first-time adopter of IFRSs and (b) applies IFRS 7 before 1 January 2006. The Board noted that such an exemption for first-time adopters exists in IAS 32 and IFRS 4 and that the reasons for providing the exemption apply equally to IFRS 7.

BC68 The Board also considered whether it should provide an exemption from presenting all or some of the comparative information to encourage early adoption of IFRS 7 by entities that already apply IFRSs.

BC69 The Board noted that IFRS 7 contains two types of disclosures: accounting disclosures (in paragraphs 7–30) that are based on requirements previously in IAS 32 and new risk disclosures (in paragraphs 31–42). The Board concluded that existing users of IFRSs already will have complied with the requirements of IAS 32 and will not encounter difficulty in providing comparative information for the accounting disclosures.

BC70 The Board noted that most of the risk disclosures, in particular those about market risk, are based on information collected at the end of the reporting period. The Board concluded that although IFRS 7 was published in August 2005, it will still be possible for entities to collect the information that they require to comply with IFRS 7 for accounting periods beginning in 2005. However, it would not always be possible to collect the information needed to provide comparative information about accounting periods that began in 2004. As a result, the Board decided that entities that apply IFRS 7 for accounting periods beginning in 2005 (ie before 1 January 2006) need not present comparative information about the risk disclosures.

BC71 The Board also noted that comparative disclosures about risk are less relevant because these disclosures are intended to have predictive value. As a result information about risk loses relevance more quickly than other types of disclosure, and any disclosures required by previous GAAP are unlikely to be comparable with those required by IFRS 7. Accordingly, the Board decided that an entity that is not a first-time adopter and applies IFRS 7 for annual periods beginning before 1 January 2006 need not present comparative disclosures about

the nature and extent of risks arising from financial instruments. In reaching this conclusion, the Board noted that the advantages of encouraging more entities to apply IFRS 7 early outweighed the disadvantage of the reduced information provided.

BC72 The Board considered and rejected arguments that it should extend the exemption:

(a) from providing comparative information to first-time adopters that applied IFRS 7 before 1 January 2007 (rather than only those that applied IFRS 7 before 1 January 2006). The Board concluded that an entity that intends to adopt IFRSs for the first time on or after 1 January 2006 will have sufficient time to collect information for its accounting period beginning on or after 1 January 2005 and, thus, should not have difficulty in providing the comparative disclosures for accounting periods beginning on or after 1 January 2006.

(b) from providing comparative disclosures about the significance of financial instruments to all entities adopting the IFRS for annual periods beginning before 1 January 2006 (rather than only to first-time adopters). The Board concluded that only first-time adopters warranted special relief so that they would be able to adopt IFRS 7 early without first having to adopt IAS 32 and IAS 30 for only one period. Entities that are not first-time adopters already apply IAS 32 and IAS 30 and have no particular need to adopt IFRS 7 before 1 January 2007.

(c) from providing comparative disclosures about risk to periods beginning before 1 January 2007 (rather than 2006). The Board noted that entities adopting IFRS 7 after 1 January 2006 would have a full calendar year to prepare after the publication of the IFRS.

Summary of main changes from the Exposure Draft

BC73 The main changes to the proposals in ED 7 are:

(a) ED 7 proposed disclosure of the amount of change in the fair value of a financial liability designated as at fair value through profit or loss that is not attributable to changes in a benchmark interest rate as a proxy for the amount of change in fair value attributable to changes in the instrument's credit risk. The IFRS permits entities to determine the amount of change in fair value attributable to changes in the instrument's credit risk using an alternative method if the entity believes that its alternative method gives more faithful representation. The proxy disclosure has been amended to be the amount of change in fair value that is not attributable to changes in market conditions that give rise to market risk. As a result, entities may exclude factors other than a change in a benchmark interest rate when calculating the proxy.

(b) a requirement has been added for disclosures about the difference between the transaction price at initial recognition (used as fair value in accordance with paragraph AG76 of IAS 39) and the results of a valuation technique that will be used for subsequent measurement.

 © IASCF

(c) no disclosure is required of the fair value of collateral pledged as security and other credit enhancements as was proposed in ED 7.

(d) the sensitivity analysis requirements have been clarified.

(e) the exemption from presenting comparatives has been widened.

(f) the capital disclosures are a stand-alone amendment to IAS 1, rather than part of the IFRS. No disclosure is required of whether the entity has complied with capital targets set by management and of the consequences of any non-compliance with those targets.

(g) the amendments to IFRS 4 related to IFRS 7 have been modified to reduce systems changes for insurers.

Appendix
Amendments to Basis for Conclusions on other IFRSs

This appendix contains amendments to the Basis for Conclusions on other IFRSs that are necessary in order to ensure consistency with IFRS 7. In the amended paragraphs, new text is underlined and deleted text is struck through.

* * * * *

The amendments contained in this appendix when IFRS 7 was issued in 2005 have been incorporated into the text of the Basis of Conclusions on IFRS 4 and on IASs 32, 39 and 41 as issued at 18 August 2005.

Guidance on implementing IFRS 7 *Financial Instruments: Disclosures*

This guidance accompanies, but is not part of, IFRS 7.

Introduction

IG1 This guidance suggests possible ways to apply some of the disclosure requirements in IFRS 7. The guidance does not create additional requirements.

IG2 For convenience, each disclosure requirement in the IFRS is discussed separately. In practice, disclosures would normally be presented as an integrated package and individual disclosures might satisfy more than one requirement. For example, information about concentrations of risk might also convey information about exposure to credit or other risk.

Materiality

IG3 IAS 1 *Presentation of Financial Statements* notes that a specific disclosure requirement in an IFRS need not be satisfied if the information is not material. IAS 1 defines materiality as follows:

> Omissions or misstatements of items are material if they could, individually or collectively, influence the economic decisions that users make on the basis of the financial statements. Materiality depends on the size and nature of the omission or misstatement judged in the surrounding circumstances. The size or nature of the item, or a combination of both, could be the determining factor.

IG4 IAS 1 also explains that definition as follows:

> Assessing whether an omission or misstatement could influence economic decisions of users, and so be material, requires consideration of the characteristics of those users. The *Framework for the Preparation and Presentation of Financial Statements* states in paragraph 25 that 'users are assumed to have a reasonable knowledge of business and economic activities and accounting and a willingness to study the information with reasonable diligence.' Therefore, the assessment needs to take into account how users with such attributes could reasonably be expected to be influenced in making economic decisions.

Classes of financial instruments and level of disclosure (paragraphs 6 and B1–B3)

IG5 Paragraph B3 states that 'an entity decides in the light of its circumstances how much detail it provides to satisfy the requirements of this IFRS, how much emphasis it places on different aspects of the requirements and how it aggregates information to display the overall picture without combining information with different characteristics.' To satisfy the requirements, an entity may not need to disclose all the information suggested in this guidance.

IG6 Paragraph 17(c) of IAS 1 requires an entity to 'provide additional disclosures when compliance with the specific requirements in IFRSs is insufficient to enable users to understand the impact of particular transactions, other events and conditions on the entity's financial position and financial performance.'

 © IASCF

Significance of financial instruments for financial position and performance (paragraphs 7–30, B4 and B5)

Financial liabilities at fair value through profit or loss (paragraphs 10(a)(i) and B4)

IG7 The following example illustrates the calculation that an entity might perform in accordance with paragraph B4 of Appendix B of the IFRS.

IG8 On 1 January 20X1, an entity issues a 10-year bond with a par value of CU150,000* and an annual fixed coupon rate of 8 per cent, which is consistent with market rates for bonds with similar characteristics.

IG9 The entity uses LIBOR as its observable (benchmark) interest rate. At the date of inception of the bond, LIBOR is 5 per cent. At the end of the first year:

(a) LIBOR has decreased to 4.75 per cent.

(b) the fair value for the bond is CU153,811, consistent with an interest rate of 7.6 per cent.†

IG10 The entity assumes a flat yield curve, all changes in interest rates result from a parallel shift in the yield curve, and the changes in LIBOR are the only relevant changes in market conditions.

IG11 The entity estimates the amount of change in the fair value of the bond that is not attributable to changes in market conditions that give rise to market risk as follows:

[paragraph B4(a)]	
First, the entity computes the liability's internal rate of return at the start of the period using the observed market price of the liability and the liability's contractual cash flows at the start of the period. It deducts from this rate of return the observed (benchmark) interest rate at the start of the period, to arrive at an instrument-specific component of the internal rate of return.	At the start of the period of a 10-year bond with a coupon of 8 per cent, the bond's internal rate of return is 8 per cent. Because the observed (benchmark) interest rate (LIBOR) is 5 per cent, the instrument-specific component of the internal rate of return is 3 per cent.
	continued...

* In this guidance monetary amounts are denominated in 'currency units (CU)'.

† This reflects a shift in LIBOR from 5 per cent to 4.75 per cent and a movement of 0.15 per cent which, in the absence of other relevant changes in market conditions, is assumed to reflect changes in credit risk of the instrument.

...continued	
[paragraph B4(b)] Next, the entity calculates the present value of the cash flows associated with the liability using the liability's contractual cash flows at the end of the period and a discount rate equal to the sum of (i) the observed (benchmark) interest rate at the end of the period and (ii) the instrument-specific component of the internal rate of return as determined in accordance with paragraph B4(a).	The contractual cash flows of the instrument at the end of the period are: • interest: CU12,000[(a)] per year for each of years 2–10. • principal: CU150,000 in year 10. The discount rate to be used to calculate the present value of the bond is thus 7.75 per cent, which is 4.75 per cent end of period LIBOR rate, plus the 3 per cent instrument-specific component. This gives a present value of CU152,367.[(b)]
[paragraph B4(c)] The difference between the observed market price of the liability at the end of the period and the amount determined in accordance with paragraph B4(b) is the change in fair value that is not attributable to changes in the observed (benchmark) interest rate. This is the amount to be disclosed.	The market price of the liability at the end of the period is CU153,811.[(c)] Thus, the entity discloses CU1,444, which is CU153,811 – CU152,367, as the increase in fair value of the bond that is not attributable to changes in market conditions that give rise to market risk.

(a) CU150,000 × 8% = CU12,000

(b) PV = [CU12,000 × (1 – $(1 + 0.0775)^{-9}$)/0.0775] + CU150,000 × $(1 + 0.0775)^{-9}$

(c) market price = [CU12,000 × (1 – $(1 + 0.076)^{-9}$)/0.076] + CU150,000 × $(1 + 0.076)^{-9}$

Defaults and breaches (paragraphs 18 and 19)

IG12 Paragraphs 18 and 19 require disclosures when there are any defaults or breaches of loans payable. Any defaults or breaches may affect the classification of the liability as current or non-current in accordance with IAS 1.

© IASCF

Total interest expense (paragraph 20(b))*

IG13 Total interest expense disclosed in accordance with paragraph 20(b) is a component of finance costs, which paragraph 82(b) of IAS 1 requires to be presented separately in the statement of comprehensive income. The line item for finance costs may also include amounts associated with non-financial liabilities.

Fair value (paragraphs 27–28)

IG13A IFRS 7 requires disclosures about the level in the fair value hierarchy in which fair value measurements are categorised for assets and liabilities measured in the statement of financial position. A tabular format is required unless another format is more appropriate. An entity might disclose the following for assets to comply with paragraph 27B(a). (Disclosure of comparative information is also required, but is not included in the following example.)

Assets measured at fair value

		Fair value measurement at end of the reporting period using:		
		Level 1	**Level 2**	**Level 3**
Description	**31 Dec 20X2**	**CU million**	**CU million**	**CU million**
Financial assets at fair value through profit or loss				
Trading securities	100	40	55	5
Trading derivatives	39	17	20	2
Financial assets at fair value through comprehensive income				
Equity investments	75	30	40	5
Total	214	87	115	12

(Note: For liabilities, a similar table might be presented.)

* In *Improvements to IFRSs* issued in May 2008, the Board amended paragraph IG13 and removed 'total interest income' as a component of finance costs. This amendment removed an inconsistency with paragraph 32 of IAS 1 *Presentation of Financial Statements*, which precludes the offsetting of income and expenses (except when required or permitted by an IFRS).

© IASCF

IG13B IFRS 7 requires a reconciliation from beginning to ending balances for those assets and liabilities that are measured in the statement of financial position at fair value based on a valuation technique for which any significant input is not based on observable market data (Level 3). A tabular format is required unless another format is more appropriate. An entity might disclose the following for assets to comply with paragraph 27B(c). (Disclosure of comparative information is also required, but is not included in the following example.)

Assets measured at fair value based on Level 3

	Fair value measurement at the end of the reporting period			
	Financial assets at fair value			Total
	Trading securities	Trading derivatives	Equity investments	
	CU million	CU million	CU million	CU million
Opening balance	6	5	3	14
Total gains or losses				
in profit or loss	(2)	(2)	–	(4)
in other comprehensive income	–	–	1	1
Purchases	1	2	1	4
Issues	–	–	–	–
Settlements	–	(1)	–	(1)
Transfers out of Level 3	–	(2)	–	(2)
Closing balance	5	2	5	12
Total gains or losses for the period included in profit or loss for assets held at the end of the reporting period	(1)	(1)	–	(2)

Gains or losses included in profit or loss for the period (above) are presented in trading income and in other income as follows:

	Trading income
Total gains or losses included in profit or loss for the period	(4)
Total gains or losses for the period included in profit or loss for assets held at the end of the reporting period	(2)

(Note: For liabilities, a similar table might be presented.)

 © IASCF

IG14 The fair value at initial recognition of financial instruments that are not traded in active markets is determined in accordance with paragraph AG76 of IAS 39. However, when, after initial recognition, an entity will use a valuation technique that incorporates data not obtained from observable markets, there may be a difference between the transaction price at initial recognition and the amount determined at initial recognition using that valuation technique. In these circumstances, the difference will be recognised in profit or loss in subsequent periods in accordance with IAS 39 (for financial liabilities) or IFRS 9 (for financial assets) and the entity's accounting policy. Such recognition reflects changes in factors (including time) that market participants would consider in setting a price (see paragraph AG76A of IAS 39). Paragraph 28 requires disclosures in these circumstances. An entity might disclose the following to comply with paragraph 28:

Background

On 1 January 20X1 an entity purchases for CU15 million financial assets that are not traded in an active market. The entity has only one class of such financial assets.

The transaction price of CU15 million is the fair value at initial recognition.

After initial recognition, the entity will apply a valuation technique to establish the financial assets' fair value. This valuation technique includes variables other than data from observable markets.

At initial recognition, the same valuation technique would have resulted in an amount of CU14 million, which differs from fair value by CU1 million.

The entity has existing differences of CU5 million at 1 January 20X1.

Application of requirements

The entity's 20X2 disclosure would include the following:

Accounting policies

The entity uses the following valuation technique to determine the fair value of financial instruments that are not traded in an active market: [description of technique, not included in this example]. Differences may arise between the fair value at initial recognition (which, in accordance with IFRS 9, is generally the transaction price) and the amount determined at initial recognition using the valuation technique. Any such differences are [description of the entity's accounting policy].

In the notes to the financial statements

As discussed in note X, the entity uses [name of valuation technique] to measure the fair value of the following financial instruments that are not traded in an active market. However, in accordance with IFRS 9, the fair value of an instrument at inception is generally the transaction price. If the transaction price differs from the amount determined at inception using the valuation technique, that difference is [description of the entity's accounting policy].

continued...

...continued

The differences yet to be recognised in profit or loss are as follows:

	31 Dec X2	**31 Dec X1**
	CU million	CU million
Balance at beginning of year	5.3	5.0
New transactions	–	1.0
Amounts recognised in profit or loss during the year	(0.7)	(0.8)
Other increases	–	0.2
Other decreases	(0.1)	(0.1)
Balance at end of year	4.5	5.3

Nature and extent of risks arising from financial instruments (paragraphs 31–42 and B6–B28)

Qualitative disclosures (paragraph 33)

IG15 The type of qualitative information an entity might disclose to meet the requirements in paragraph 33 includes, but is not limited to, a narrative description of:

(a) the entity's exposures to risk and how they arose. Information about risk exposures might describe exposures both gross and net of risk transfer and other risk-mitigating transactions.

(b) the entity's policies and processes for accepting, measuring, monitoring and controlling risk, which might include:

(i) the structure and organisation of the entity's risk management function(s), including a discussion of independence and accountability;

(ii) the scope and nature of the entity's risk reporting or measurement systems;

(iii) the entity's policies for hedging or mitigating risk, including its policies and procedures for taking collateral; and

(iv) the entity's processes for monitoring the continuing effectiveness of such hedges or mitigating devices.

(c) the entity's policies and procedures for avoiding excessive concentrations of risk.

 © IASCF

IG16 Information about the nature and extent of risks arising from financial instruments is more useful if it highlights any relationship between financial instruments that can affect the amount, timing or uncertainty of an entity's future cash flows. The extent to which a risk exposure is altered by such relationships might be apparent to users from the disclosures required by this Standard, but in some cases further disclosures might be useful.

IG17 In accordance with paragraph 33(c), entities disclose any change in the qualitative information from the previous period and explain the reasons for the change. Such changes may result from changes in exposure to risk or from changes in the way those exposures are managed.

Quantitative disclosures (paragraphs 34–42 and B7–B28)

IG18 Paragraph 34 requires disclosure of quantitative data about concentrations of risk. For example, concentrations of credit risk may arise from:

(a) industry sectors. Thus, if an entity's counterparties are concentrated in one or more industry sectors (such as retail or wholesale), it would disclose separately exposure to risks arising from each concentration of counterparties.

(b) credit rating or other measure of credit quality. Thus, if an entity's counterparties are concentrated in one or more credit qualities (such as secured loans or unsecured loans) or in one or more credit ratings (such as investment grade or speculative grade), it would disclose separately exposure to risks arising from each concentration of counterparties.

(c) geographical distribution. Thus, if an entity's counterparties are concentrated in one or more geographical markets (such as Asia or Europe), it would disclose separately exposure to risks arising from each concentration of counterparties.

(d) a limited number of individual counterparties or groups of closely related counterparties.

Similar principles apply to identifying concentrations of other risks, including liquidity risk and market risk. For example, concentrations of liquidity risk may arise from the repayment terms of financial liabilities, sources of borrowing facilities or reliance on a particular market in which to realise liquid assets. Concentrations of foreign exchange risk may arise if an entity has a significant net open position in a single foreign currency, or aggregate net open positions in several currencies that tend to move together.

IG19 In accordance with paragraph B8, disclosure of concentrations of risk includes a description of the shared characteristic that identifies each concentration. For example, the shared characteristic may refer to geographical distribution of counterparties by groups of countries, individual countries or regions within countries.

IG20 When quantitative information at the end of the reporting period is unrepresentative of the entity's exposure to risk during the period, paragraph 35 requires further disclosure. To meet this requirement, an entity might disclose the highest, lowest and average amount of risk to which it was exposed during the

period. For example, if an entity typically has a large exposure to a particular currency, but at year-end unwinds the position, the entity might disclose a graph that shows the exposure at various times during the period, or disclose the highest, lowest and average exposures.

Credit risk (paragraphs 36–38, B9 and B10)

IG21 Paragraph 36 requires an entity to disclose information about its exposure to credit risk by class of financial instrument. Financial instruments in the same class share economic characteristics with respect to the risk being disclosed (in this case, credit risk). For example, an entity might determine that residential mortgages, unsecured consumer loans, and commercial loans each have different economic characteristics.

Collateral and other credit enhancements pledged (paragraph 36(b))

IG22 Paragraph 36(b) requires an entity to describe collateral available as security for assets it holds and other credit enhancements obtained. An entity might meet this requirement by disclosing:

(a) the policies and processes for valuing and managing collateral and other credit enhancements obtained;

(b) a description of the main types of collateral and other credit enhancements (examples of the latter being guarantees, credit derivatives, and netting agreements that do not qualify for offset in accordance with IAS 32);

(c) the main types of counterparties to collateral and other credit enhancements and their creditworthiness; and

(d) information about risk concentrations within the collateral or other credit enhancements.

Credit quality (paragraph 36(c))

IG23 Paragraph 36(c) requires an entity to disclose information about the credit quality of financial assets with credit risk that are neither past due nor impaired. In doing so, an entity might disclose the following information:

(a) an analysis of credit exposures using an external or internal credit grading system;

(b) the nature of the counterparty;

(c) historical information about counterparty default rates; and

(d) any other information used to assess credit quality.

IG24 When the entity considers external ratings when managing and monitoring credit quality, the entity might disclose information about:

(a) the amounts of credit exposures for each external credit grade;

(b) the rating agencies used;

(c) the amount of an entity's rated and unrated credit exposures; and

(d) the relationship between internal and external ratings.

 © IASCF

IG25 When the entity considers internal credit ratings when managing and monitoring credit quality, the entity might disclose information about:

(a) the internal credit ratings process;

(b) the amounts of credit exposures for each internal credit grade; and

(c) the relationship between internal and external ratings.

Financial assets that are either past due or impaired (paragraph 37)

IG26 A financial asset is past due when the counterparty has failed to make a payment when contractually due. As an example, an entity enters into a lending agreement that requires interest to be paid every month. On the first day of the next month, if interest has not been paid, the loan is past due. Past due does not mean that a counterparty will never pay, but it can trigger various actions such as renegotiation, enforcement of covenants, or legal proceedings.

IG27 When the terms and conditions of financial assets that have been classified as past due are renegotiated, the terms and conditions of the new contractual arrangement apply in determining whether the financial asset remains past due.

IG28 Paragraph 37(a) requires an analysis by class of the age of financial assets that are past due but not impaired. An entity uses its judgement to determine an appropriate number of time bands. For example, an entity might determine that the following time bands are appropriate:

(a) not more than three months;

(b) more than three months and not more than six months;

(c) more than six months and not more than one year; and

(d) more than one year.

IG29 Paragraph 37(b) requires an analysis of impaired financial assets by class. This analysis might include:

(a) the carrying amount, before deducting any impairment loss;

(b) the amount of any related impairment loss; and

(c) the nature and fair value of collateral available and other credit enhancements obtained.

IG30–IG31 [Deleted]

Market risk (paragraphs 40–42 and B17–B28)

IG32 Paragraph 40(a) requires a sensitivity analysis for each type of market risk to which the entity is exposed. There are three types of market risk: interest rate risk, currency risk and other price risk. Other price risk may include risks such as equity price risk, commodity price risk, prepayment risk (ie the risk that one party to a financial asset will incur a financial loss because the other party repays

earlier or later than expected), and residual value risk (eg a lessor of motor cars that writes residual value guarantees is exposed to residual value risk). Risk variables that are relevant to disclosing market risk include, but are not limited to:

(a) the yield curve of market interest rates. It may be necessary to consider both parallel and non-parallel shifts in the yield curve.

(b) foreign exchange rates.

(c) prices of equity instruments.

(d) market prices of commodities.

IG33 Paragraph 40(a) requires the sensitivity analysis to show the effect on profit or loss and equity of reasonably possible changes in the relevant risk variable. For example, relevant risk variables might include:

(a) prevailing market interest rates, for interest-sensitive financial instruments such as a variable-rate loan; or

(b) currency rates and interest rates, for foreign currency financial instruments such as foreign currency bonds.

IG34 For interest rate risk, the sensitivity analysis might show separately the effect of a change in market interest rates on:

(a) interest income and expense;

(b) other line items of profit or loss (such as trading gains and losses); and

(c) when applicable, equity.

An entity might disclose a sensitivity analysis for interest rate risk for each currency in which the entity has material exposures to interest rate risk.

IG35 Because the factors affecting market risk vary depending on the specific circumstances of each entity, the appropriate range to be considered in providing a sensitivity analysis of market risk varies for each entity and for each type of market risk.

 © IASCF

IG36 The following example illustrates the application of the disclosure requirement in paragraph 40(a):

> **Interest rate risk**
>
> At 31 December 20X2, if interest rates at that date had been 10 basis points lower with all other variables held constant, post-tax profit for the year would have been CU1.7 million (20X1—CU2.4 million) higher, arising mainly as a result of lower interest expense on variable borrowings. If interest rates had been 10 basis points higher, with all other variables held constant, post-tax profit would have been CU1.5 million (20X1—CU2.1 million) lower, arising mainly as a result of higher interest expense on variable borrowings. Profit is more sensitive to interest rate decreases than increases because of borrowings with capped interest rates. The sensitivity is lower in 20X2 than in 20X1 because of a reduction in outstanding borrowings that has occurred as the entity's debt has matured (see note X).[a]
>
> **Foreign currency exchange rate risk**
>
> At 31 December 20X2, if the CU had weakened 10 per cent against the US dollar with all other variables held constant, post-tax profit for the year would have been CU2.8 million (20X1—CU6.4 million) lower, and other comprehensive income would have been CU1.2 million (20X1—CU1.1 million) higher. Conversely, if the CU had strengthened 10 per cent against the US dollar with all other variables held constant, post-tax profit would have been CU2.8 million (20X1—CU6.4 million) higher, and other comprehensive income would have been CU1.2 million (20X1—CU1.1 million) lower. The lower foreign currency exchange rate sensitivity in profit in 20X2 compared with 20X1 is attributable to a reduction in foreign currency denominated debt. Equity is more sensitive in 20X2 than in 20X1 because of the increased use of hedges of foreign currency purchases, offset by the reduction in foreign currency debt.
>
> (a) Paragraph 39(a) requires disclosure of a maturity analysis of liabilities.

Other market risk disclosures (paragraph 42)

IG37 Paragraph 42 requires the disclosure of additional information when the sensitivity analysis disclosed is unrepresentative of a risk inherent in a financial instrument. For example, this can occur when:

(a) a financial instrument contains terms and conditions whose effects are not apparent from the sensitivity analysis, eg options that remain out of (or in) the money for the chosen change in the risk variable;

(b) financial assets are illiquid, eg when there is a low volume of transactions in similar assets and an entity finds it difficult to find a counterparty; or

(c) an entity has a large holding of a financial asset that, if sold in its entirety, would be sold at a discount or premium to the quoted market price for a smaller holding.

IG38 In the situation in paragraph IG37(a), additional disclosure might include:

(a) the terms and conditions of the financial instrument (eg the options);

(b) the effect on profit or loss if the term or condition were met (ie if the options were exercised); and

(c) a description of how the risk is hedged.

For example, an entity may acquire a zero-cost interest rate collar that includes an out-of-the-money leveraged written option (eg the entity pays ten times the amount of the difference between a specified interest rate floor and the current market interest rate). The entity may regard the collar as an inexpensive economic hedge against a reasonably possible increase in interest rates. However, an unexpectedly large decrease in interest rates might trigger payments under the written option that, because of the leverage, might be significantly larger than the benefit of lower interest rates. Neither the fair value of the collar nor a sensitivity analysis based on reasonably possible changes in market variables would indicate this exposure. In this case, the entity might provide the additional information described above.

IG39 In the situation described in paragraph IG37(b), additional disclosure might include the reasons for the lack of liquidity and how the entity hedges the risk.

IG40 In the situation described in paragraph IG37(c), additional disclosure might include:

(a) the nature of the security (eg entity name);

(b) the extent of holding (eg 15 per cent of the issued shares);

(c) the effect on profit or loss; and

(d) how the entity hedges the risk.

Transition (paragraph 44)

IG41 The following table summarises the effect of the exemption from presenting comparative accounting and risk disclosures for accounting periods beginning before 1 January 2006, before 1 January 2007, and on or after 1 January 2007. In this table:

(a) a **first-time adopter** is an entity preparing its first IFRS financial statements (see IFRS 1 *First-time Adoption of International Financial Reporting Standards*).

(b) an **existing IFRS user** is an entity preparing its second or subsequent IFRS financial statements.

Appendix
Amendments to guidance on other IFRSs

This appendix contains amendments to guidance on IFRSs other than IFRS 4 that are necessary in order to ensure consistency with IFRS 7. Amendments to the Guidance on Implementing IFRS 4 will be published at a later date. In the amended paragraphs, new text is underlined and deleted text is struck through.

* * * * *

The amendments contained in this appendix when IFRS 7 was issued in 2005 have been incorporated into the text of the Guidance on Implementing IAS 39 as issued at 18 August 2005. The revised Guidance on Implementing IFRS 4 was published in December 2005.

DISSENTING OPINIONS

Basis for Conclusions on IFRS 8 *Operating Segments*

This Basis for Conclusions and its appendices accompany, but are not part of, IFRS 8.

Introduction

BC1 This Basis for Conclusions summarises the International Accounting Standards Board's considerations in reaching the conclusions in IFRS 8 *Operating Segments*. Individual Board members gave greater weight to some factors than to others.

BC2 In September 2002 the Board decided to add a short-term convergence project to its active agenda. The project is being conducted jointly with the United States standard-setter, the Financial Accounting Standards Board (FASB). The objective of the project is to reduce differences between IFRSs and US generally accepted accounting principles (US GAAP) that are capable of resolution in a relatively short time and can be addressed outside major projects.

BC3 As part of the project, the Board identified differences between IAS 14 *Segment Reporting* and the US standard SFAS 131 *Disclosures about Segments of an Enterprise and Related Information*, reviewed academic research findings on segment reporting, in particular relating to the implementation of SFAS 131, and had meetings with users of financial statements.

Differences between IAS 14 and SFAS 131

BC4 The requirements of SFAS 131 are based on the way that management regards an entity, focusing on information about the components of the business that management uses to make decisions about operating matters. In contrast, IAS 14 requires the disaggregation of the entity's financial statements into segments based on related products and services, and on geographical areas.

BC5 The requirements of SFAS 14 *Financial Reporting for Segments of a Business Enterprise*, the predecessor to SFAS 131, were similar to those of IAS 14. In particular, both standards required the accounting policies underlying the disaggregated information to be the same as those underlying the entity information, since segment information was regarded as a disaggregation of the entity information. The approach to segment disclosures in SFAS 14 was criticised for not providing information about segments based on the structure of an entity's internal organisation that could enhance a user's ability to predict actions or reactions of management that could significantly affect the entity's future cash flow prospects.

Academic research findings

BC6 Most of the academic research findings on segment reporting indicated that application of SFAS 131 resulted in more useful information than its predecessor, SFAS 14. According to the research, the management approach of SFAS 131:

(a) increased the number of reported segments and provided more information;

 © IASCF

(b) enabled users to see an entity through the eyes of management;

(c) enabled an entity to provide timely segment information for external interim reporting with relatively low incremental cost;

(d) enhanced consistency with the management discussion and analysis or other annual report disclosures; and

(e) provided various measures of segment performance.

Meetings with users

BC7 The Board discussed segment reporting at several meetings with users of financial statements. Most of the users supported the management approach of SFAS 131 for the reasons mentioned in the previous paragraph. In particular, they supported an approach that would enable more segment information to be provided in interim financial reports.

BC8 Consequently the Board decided to adopt the US approach and published its proposals as an exposure draft in ED 8 *Operating Segments* in January 2006. The deadline for comments was 19 May 2006. The Board received 182 comment letters. After reviewing the responses, the Board issued IFRS 8 in November 2006.

Adoption of management approach

BC9 In the Basis for Conclusions on ED 8, the Board noted that the primary benefits of adopting the management approach in SFAS 131 are that:

(a) entities will report segments that correspond to internal management reports;

(b) entities will report segment information that will be more consistent with other parts of their annual reports;

(c) some entities will report more segments; and

(d) entities will report more segment information in interim financial reports.

In addition, the Board noted that the proposed IFRS would reduce the cost of providing disaggregated information for many entities because it uses segment information that is generated for management's use.

BC10 Most respondents to the Exposure Draft supported the adoption of the management approach. They considered the management approach appropriate, and superior to the approach of IAS 14. These respondents observed that the management approach for segment reporting allows users to review an entity's operations from the same perspective as management. They noted that although the IAS 14 approach would enhance comparability by requiring entities to report segment information that is consistent with IFRSs, the disclosures will not necessarily correspond to segment information that is reported to management and is used for making decisions.

© IASCF

BC11 Other respondents disagreed with the management approach. They argued that convergence should instead be achieved by changing SFAS 131 to IAS 14. In their view the latter approach is superior because it provides comparability of information across entities by defining measures of segment revenue, segment expense, segment result, segment assets and segment liabilities.

BC12 Yet other respondents agreed with the management approach for the identification of segment assets, but disagreed with the management approach for the measurement of the various segment disclosures. In particular, they doubted whether the publication of internally reported amounts would generate significant benefit for investors if those amounts differ from IFRS amounts.

BC13 The Board noted that if IFRS amounts could be prepared reliably and on a timely basis for segments identified using the management approach, that approach would provide the most useful information. However, the Board observed that IFRS amounts for segments cannot always be prepared on a sufficiently timely basis for interim reporting.

BC14 The Board also noted the requirements in the IFRS for an explanation of the measurements of segment profit or loss and segment assets and for reconciliations of the segment amounts to the amounts recognised in the entity's financial statements. The Board was satisfied that users would be able to understand and judge appropriately the basis on which the segment amounts were determined.

BC15 The Board concluded that the advantages of the management approach, in particular the ability of entities to prepare segment information on a sufficiently timely basis for inclusion in interim financial reports, outweighed any disadvantages arising from the potential for segments to be reported in accordance with non-IFRS accounting policies.

BC16 Given the Board's support for the principles of the management approach required by SFAS 131 and the objectives of the short-term convergence project, the Board decided that the simplest and most complete way to achieve convergence would be to use the text of SFAS 131 for the IFRS.

BC17 The FASB's thinking behind the management approach of SFAS 131 is presented in its Background Information and Basis for Conclusions. Because the Board has adopted that approach, the FASB's Background Information and Basis for Conclusions are reproduced in Appendix A to this Basis for Conclusions. The few differences from SFAS 131 that the Board has included in the IFRS are noted in paragraph BC60 below.

Scope of the standard

BC18 In ED 8, the Board proposed extending the scope of the IFRS to all entities that have public accountability rather than just entities whose securities are publicly traded. The Board noted that it was premature to adopt the proposed definition of public accountability that is being considered in a separate Board project on small and medium-sized entities (SMEs). However, the Board decided that the

 © IASCF

scope of the standard should be extended to include entities that hold assets in a fiduciary capacity for a broad group of outsiders. The Board concluded that the SMEs project is the most appropriate context in which to decide whether to extend the scope of the requirements on segment reporting to other entities.

BC19 Some respondents to ED 8 commented that the scope of the IFRS should not be extended until the Board has reached a conclusion on the definitions of 'fiduciary capacity' and 'public accountability' in the SMEs project. They argued that the terms needed clarification and definition.

BC20 The Board accepted these concerns and decided that the IFRS should not apply to entities that hold assets in a fiduciary capacity. However, the Board decided that publicly accountable entities should be within the scope of the IFRS, and that a future amendment of the scope of the IFRS should be proposed to include publicly accountable entities once the definition has been properly developed in the SMEs project. The proposed amendment will therefore be exposed at the same time as the exposure draft of the proposed IFRS for SMEs.

BC21 A number of respondents to ED 8 suggested that the scope exemption of paragraph 6 of IAS 14 should be included in the IFRS. This paragraph provided an exemption from segment reporting in the separate financial statements of the parent when a financial report contains both consolidated financial statements and the parent's separate financial statements. The Board agreed that on practical grounds such an exemption was appropriate.

BC22 In ED 8 the Board proposed that if an entity not required to apply the IFRS chooses to disclose segment information in financial statements that comply with IFRSs, that entity would be required to comply with the requirements of the IFRS. Respondents commented that this was unnecessarily restrictive. For example, they observed that requiring full compliance with the IFRS would prevent an entity outside its scope from voluntarily disclosing sales information for segments without also disclosing segment profit or loss. The Board concluded that an entity should be able to provide segment information on a voluntary basis without triggering the need to comply fully with the IFRS, so long as the disclosure is not referred to as segment information.

BC23 A respondent to ED 8 asked for clarification on whether the scope of the proposed IFRS included the consolidated financial statements of a group whose parent has no listed financial instruments, but includes a listed minority interest[*] or a subsidiary with listed debt. The Board decided that such consolidated financial statements should not be included in the scope and that the scope should be clarified accordingly. The Board also noted that the same clarification should be made to the scope of IAS 33 *Earnings per Share*.

[*] In January 2008 the IASB issued an amended IAS 27 *Consolidated and Separate Financial Statements*, which amended 'minority interest' to 'non-controlling interests'.

Aspects of the management approach

Specific measurement requirements for some items

BC24 In ED 8, the Board invited comments on whether the proposed IFRS should depart from the management approach in SFAS 131 by setting measurement requirements for specified items. Some respondents to ED 8 supported an approach that would define the measurement of the key terms such as segment revenues, segment expenses, segment results, segment assets and segment liabilities in order to enhance comparability between reporting entities. Other respondents disagreed with any departure from SFAS 131 on the grounds that defined measurements for specified items would eliminate the major benefits of the management approach.

BC25 The IFRS requires the entity to explain the measurements of segment profit or loss and segment assets and liabilities and to provide reconciliations of the total segment amounts to the amounts recognised in the entity's financial statements. The Board believes that such reconciliations will enable users to understand and judge the basis on which the segment amounts were determined. The Board also noted that to define the measurement of such amounts would be a departure from the requirements of SFAS 131 that would involve additional time and cost for entities and would be inconsistent with the management perspective on segment information.

BC26 Therefore, the Board decided not to require defined measures of segment revenues, segment expenses, segment result, segment assets and segment liabilities.

Matrix form of organisations

BC27 In ED 8 the Board proposed that when more than one set of segments could be identified, for example when entities use a matrix form of organisation, the components based on products and services should be the basis for the operating segments. Some respondents noted that matrix organisational structures are commonly used for large complex organisations and that mandating the use of components based on products and services was inconsistent with the management approach. The Board agreed with this view. Accordingly, the IFRS requires the identification of operating segments to be made by reference to the core principle of the IFRS.

Quantitative thresholds

BC28 In ED 8 the Board proposed quantitative thresholds for identifying reportable segments. Some respondents argued that such requirements represent adoption of a rule-based, rather than a principle-based, approach. In addition, some respondents commented that the inclusion of a 10 per cent threshold could create a precedent for determining materiality in other areas.

 © IASCF

BC29 The Board considered an approach whereby any material operating segment would be required to be disclosed separately. However, the Board was concerned that there might be uncertainty about the meaning of materiality in relation to disclosure. Furthermore, such a requirement would be a significant change from the wording of SFAS 131. Thus, the Board was concerned that the change would be from an easily understandable and familiar set of words that converges with SFAS 131 to a potentially confusing principle. Accordingly, the Board decided to retain the quantitative thresholds.

Interaction of aggregation criteria and quantitative thresholds

BC30 One respondent commented that the ranking of the aggregation criteria for operating segments and the quantitative thresholds for determining reportable segments was unclear in ED 8. However, the flow chart in paragraph IG7 of the implementation guidance indicates that the aggregation criteria take precedence over the quantitative thresholds. The Board also noted that the wording in SFAS 131 was clear because the paragraph on aggregation refers to aggregation into a 'single operating segment'. The quantitative thresholds then determine which operating segments are reportable segments. The term 'operating' has been inserted in paragraph 12 of the IFRS.

Inclusion of US guidance

BC31 The Board discussed the extent to which the IFRS should address the practical problems that have arisen from applying SFAS 131 in the US. The Board considered the FASB *Q&A 131 Segment Information: Guidance on Applying Statement 131* and Emerging Issues Task Force (EITF) 04-10 *Determining Whether to Aggregate Operating Segments that do not Meet the Quantitative Threshold*.

BC32 EITF 04-10 addresses the issue of whether to aggregate operating segments that do not meet the quantitative thresholds. It requires quantitative thresholds to be aggregated only if aggregation is consistent with the objective and core principles of SFAS 131, the segments have similar economic characteristics, and the segments share a majority of the aggregation criteria listed in paragraph 17(a)–(e) of SFAS 131. The Board agreed with the approach adopted in EITF 04-10 and concluded that the same requirement should be included in the IFRS.

BC33 FASB *Q&A 131—Segment Information: Guidance on Applying Statement 131* is an implementation guide that provides the views of the FASB staff on certain questions on SFAS 131. Because it was not issued by the FASB itself, the Board decided not to include this material in the IFRS.

Information about segment assets

BC34 Several respondents noted that, whilst a measure of segment profit or loss can be expected in every entity's internal reporting, a measure of segment assets is not always available, particularly in service industries or other industries with low utilisation of physical assets. Respondents suggested that in such circumstances a measure of segment assets should be disclosed only if those amounts were regularly provided to the chief operating decision maker.

BC35 ~~The Board noted that requiring disclosure of a measure of segment assets only when such a measure is reviewed by the chief operating decision maker would create divergence from SFAS 131. The Board also supported a minimum disclosure of segment profit or loss and segment assets. The Board therefore concluded that measures of segment profit or loss and total segment assets should be disclosed for all segments regardless of whether those measures are reviewed by the chief operating decision maker.~~*

BC35A After IFRS 8 was issued, the Board was informed that the reasons originally set out in paragraph BC35 contradict long-standing interpretations published in the US for the application of SFAS 131 and create an unintended difference from practice in the US under SFAS 131. After reconsideration and discussion of the interaction between the disclosure and measurement requirements in the IFRS (paragraphs 23 and 25), the Board concluded that those reasons no longer reflected its thinking. Therefore, the Board amended paragraph 23 by *Improvements to IFRSs* issued in April 2009 to clarify that a measure of segment assets should be disclosed only if that amount is regularly provided to the chief operating decision maker.

Information about segment liabilities

BC36 ED 8 did not propose disclosure of segment liabilities because there is no such requirement in SFAS 131. The reasons for this are set out in paragraph 96 of the Basis for Conclusions on SFAS 131, included as Appendix A to this Basis for Conclusions.

BC37 Some respondents proposed adding a requirement for each entity to disclose information about segment liabilities, if such information is regularly provided to the chief operating decision maker. They argued that information about segment liabilities would be helpful to users. Other respondents favoured information about net segment assets rather than gross segment assets.

BC38 The Board noted that if segment liabilities are considered in assessing the performance of, and allocating resources to, the segments of an entity, such disclosure would be consistent with the management approach. The Board also noted support for this disclosure from some commentators, particularly users of financial statements. Accordingly the Board decided to require disclosure of a measure of segment liabilities if those amounts are regularly provided to the chief operating decision maker notwithstanding that such a requirement would create divergence from SFAS 131.

Level of reconciliations

BC39 ED 8 proposed that an entity should provide reconciliations of total reportable segment amounts for specified items to amounts the entity recognised in accordance with IFRSs. It did not propose such reconciliations for individual reportable segments.

* Paragraph BC35 was deleted and paragraph BC35A added as a consequence of *Improvements to IFRSs* issued in April 2009.

 © IASCF

BC40 Several respondents expressed concern about the level of detail provided by the proposed reconciliations. They argued that if the IFRS allows segment information to be measured on the basis of management information, it should require reconciliations for individual reportable segments between the segment amounts and the equivalent amounts measured in accordance with an entity's IFRS accounting policies. They added that reconciling only total reportable segment amounts to amounts presented in the financial statements does not provide useful information.

BC41 Other respondents supported the proposed reconciliations on the grounds that more detailed reconciliations would not be more understandable to users and might be confusing. They believed that the additional costs to reporting entities were not justified.

BC42 The Board noted that a requirement to provide reconciliations at the individual reportable segment level would effectively lead to two complete segment reports—one according to internal measures and the other according to IFRSs. The Board concluded that the cost of providing two sets of segment information would outweigh the benefits.

Lack of a competitive harm exemption

BC43 The Board discussed whether entities should be exempt from aspects of the IFRS if disclosure could cause competitive damage or erosion of shareholder value. The Board considered an alternative approach whereby entities could be required to provide reasons for non-disclosure on a 'comply or explain' basis.

BC44 The Board concluded that a 'competitive harm' exemption would be inappropriate because it would provide a means for broad non-compliance with the IFRS. The Board noted that entities would be unlikely to suffer competitive harm from the required disclosures since most competitors have sources of detailed information about an entity other than its financial statements.

BC45 Respondents also commented that the requirements of the IFRS would place small listed companies at a disadvantage to non-listed companies, which are outside the scope of the IFRS. The Board noted that the relative advantage/disadvantage of an entity being publicly listed is not a matter for the Board to consider.

Adoption of the term 'impracticable'

BC46 Some respondents to ED 8 expressed concern that entities were to be allowed not to give entity-wide disclosures about products and services and geographical areas if '... the necessary information is not available and the cost to develop it would be excessive.' They argued that the test to be applied for non-disclosure should be that of impracticability as defined in IAS 1 *Presentation of Financial Statements*.

BC47 The Board noted that the wording in ED 8 ensures convergence with SFAS 131. Using the term 'impracticable' as defined in IAS 1 would change the requirement and create divergence from SFAS 131. Therefore, the Board decided to retain the wording of ED 8.

Entity-wide disclosures

Geographical information

BC48 The IFRS requires an entity to disclose geographical information about non-current assets, excluding specified items. The Board considered comments made by some respondents who advocated country-by-country disclosure, others who requested specific items of geographical information to be disclosed, and some who expressed reservations with the proposed requirement relating to disclosure of country of domicile.

BC49 A coalition of over 300 organisations from more than 50 countries known as the Publish What You Pay campaign requested that the scope of the IFRS should be extended to require additional disclosure on a country-by-country basis. The objective of such additional disclosure would be to promote greater transparency in the management of amounts paid by the oil, gas and mining industries to governments in developing or transitional countries that are resource-rich. The view of these campaigners was that publication of specific payments made by those companies to governments is in the interest of all users of financial statements.

BC50 Because the IFRS is being developed in a short-term convergence project to converge with SFAS 131, the Board decided that issues raised by the Publish What You Pay campaign relating to country-by-country disclosures should not be addressed in the IFRS. The Board was of the view that such issues merit further discussion with bodies that are currently engaged in similar issues, for example the United Nations, International Public Sector Accounting Standards Board, International Monetary Fund, World Bank, regional development banks and Financial Stability Forum.

Exemption from entity-wide disclosures

BC51 Several respondents suggested different geographical disclosures from those proposed in ED 8. For example, some preferred disclosures by geographical areas rather than by individual country. Others favoured geographical disclosure of profit or loss as well as non-current assets. Several respondents expressed the view that disclosure of total assets would be more relevant than non-current assets. Some took the view that disclosures should be made of both current and non-current assets. Other respondents recommended that financial assets should be disclosed as well as non-current assets. Some respondents expressed the view that disclosure of non-current assets should not be required if those amounts are not reviewed by the chief operating decision maker.

BC52 In developing ED 8, the Board decided to adopt the requirements in SFAS 131. Paragraphs 104–107 of the Basis for Conclusions on SFAS 131 provide the rationale for the geographical disclosures required.

BC53 None of the suggested alternative disclosures was broadly supported by the user responses. The Board noted that entities that wish to give additional information are free to do so. The Board therefore concluded that the disclosure requirement taken from SFAS 131 should not be changed.

© IASCF

Country of domicile

BC54 Some respondents asserted that disclosures relating to the country of domicile were inappropriate for many entities. They expressed the view that such information would be relevant when a large proportion of an entity's business is carried out in its country of domicile. They noted, however, that in many circumstances the country of domicile represents a small proportion of the entity's business and in these cases the information required would not be relevant. In addition, they argued that SFAS 131 had been designed for entities in the US, for whom the 'country of domicile' is in itself a significant geographical area. These respondents suggested that disclosures should instead be required about the country of principal activities.

BC55 The IFRS requires disclosures for any country that is individually material. The Board noted that identifying the country of principal activities may be difficult and subjective. Accordingly, the Board decided not to require entities to identify the country of principal activities.

Subtotal for tangible non-current assets

BC56 Paragraphs 14 and 15 of the Basis for Conclusions on ED 8 highlighted a potential difference from SFAS 131. SFAS 131 requires disclosure of 'long-lived assets' excluding intangible assets, whereas ED 8 proposed disclosure of 'non-current assets' including intangible assets. The Board reconsidered whether, in the interest of convergence, the IFRS should require disclosure of the subtotal of tangible non-current assets.

BC57 The Board concluded that a separate disclosure of a subtotal of tangible non-current assets was unnecessary on the grounds that the incremental benefit does not justify such disclosure. However, the Board noted that entities that wish to provide that information are free to do so.

Information about major customers

BC58 ED 8 proposed that, in respect of the disclosures about major customers, a group of entities known to be under common control should be treated as a single customer. Some respondents noted that this could be difficult when entities are state-controlled. The Board noted that it was considering proposals to amend IAS 24 *Related Party Disclosures* with regard to state-controlled entities, and a consequential amendment to the IFRS on reporting segments might result from those proposals. In the meantime, the Board decided to require in the IFRS that a government (whether national, state, provincial, territorial, local or foreign) and entities known to the reporting entity to be controlled by that government should be treated as a single customer. This makes the requirements relating to government-controlled entities the same as those relating to privately controlled entities.

Interim financial information

BC59 The Board decided that the changes to IAS 34 *Interim Financial Reporting* proposed in ED 8 should be amended to clarify that interim disclosure of information on segment profit or loss items is required only if the specified amounts are included

in the measure of segment profit or loss reviewed by the chief operating decision maker. The Board reached this conclusion because it noted that such disclosure is consistent with the management approach.

Differences from SFAS 131

BC60 In developing the IFRS, the Board included the following differences from SFAS 131:

(a) The FASB *Guidance on Applying Statement 131* indicates that the FASB staff believe that 'long-lived assets', as that phrase is used in paragraph 38 of SFAS 131, implies hard assets that cannot be readily removed, which would appear to exclude intangibles. Non-current assets in the IFRS include intangibles (see paragraphs BC56 and BC57).

(b) SFAS 131 does not require disclosure of a measure of segment liabilities. The IFRS requires disclosure of segment liabilities if such a measure is regularly provided to the chief operating decision maker (see paragraphs BC36–BC38).

(c) SFAS 131 requires an entity with a matrix form of organisation to determine operating segments based on products and services. The IFRS requires such an entity to determine operating segments by reference to the core principle of the IFRS (see paragraph BC27).

Transitional provisions

BC61 Under its transitional provisions, SFAS 131 was not required to be applied to interim financial statements in the initial year of its application. However, in the second year of application, comparative information relating to interim periods in the initial year of application was required. The Basis for Conclusions on SFAS 131 explained that the reason for these transitional requirements was that some of the information that is required to be reported for interim periods is based on information reported in the most recent annual financial statements. Interim segment information would not be as meaningful without a full set of annual segment information to use as a comparison and to provide an understanding of the basis on which it is provided.

BC62 The Board did not agree with the transitional provision for interim financial statements in SFAS 131. The Board noted that the IFRS is not effective until 2009, giving entities adequate time to prepare. Furthermore, the Board was aware that some entities adopting IFRSs for the first time may wish to present comparative information in accordance with the IFRS rather than IAS 14.

Background information and basis for conclusions of the US Financial Accounting Standards Board on SFAS 131

Introduction

41. This appendix summarizes considerations that were deemed significant by Board members in reaching the conclusions in this Statement. It includes reasons for accepting certain approaches and rejecting others. Individual Board members gave greater weight to some factors than to others.

Background Information

42. FASB Statement No. 14, *Financial Reporting for Segments of a Business Enterprise*, was issued in 1976. That Statement required that business enterprises report segment information on two bases: by industry and by geographic area. It also required disclosure of information about export sales and major customers.

43. The Board concluded at the time it issued Statement 14 that information about components of an enterprise, the products and services that it offers, its foreign operations, and its major customers is useful for understanding and making decisions about the enterprise as a whole. Financial statement users observe that the evaluation of the prospects for future cash flows is the central element of investment and lending decisions. The evaluation of prospects requires assessment of the uncertainty that surrounds both the timing and the amount of the expected cash flows to the enterprise, which in turn affect potential cash flows to the investor or creditor. Users also observe that uncertainty results in part from factors related to the products and services an enterprise offers and the geographic areas in which it operates.

44. In its 1993 position paper, *Financial Reporting in the 1990s and Beyond*, the Association for Investment Management and Research (AIMR) said:

> [Segment data] is vital, essential, fundamental, indispensable, and integral to the investment analysis process. Analysts need to know and understand how the various components of a multifaceted enterprise behave economically. One weak member of the group is analogous to a section of blight on a piece of fruit; it has the potential to spread rot over the entirety. Even in the absence of weakness, different segments will generate dissimilar streams of cash flows to which are attached disparate risks and which bring about unique values. Thus, without disaggregation, there is no sensible way to predict the overall amounts, timing, or risks of a complete enterprise's future cash flows. There is little dispute over the analytic usefulness of disaggregated financial data. [pages 59 and 60]

45. Over the years, financial analysts consistently requested that financial statement data be disaggregated to a much greater degree than it is in current practice. Many analysts said that they found Statement 14 helpful but inadequate. In its 1993 position paper, the AIMR emphasized that:

> There is no disagreement among AIMR members that segment information is totally vital to their work. There also is general agreement among them that the current segment reporting standard, Financial Accounting Standard No. 14, is inadequate. Recent work by a subcommittee of the [Financial Accounting Policy Committee] has confirmed that a substantial majority of analysts seek and, when it is available, use quarterly segment data. [page 5]

 © IASCF

46. The Canadian Institute of Chartered Accountants (CICA) published a Research Study, *Financial Reporting for Segments*, in August 1992. An FASB Research Report, *Reporting Disaggregated Information*, was published in February 1993. In March 1993, the FASB and the Accounting Standards Board (AcSB) of the CICA agreed to pursue their projects jointly.

47. In May 1993, the FASB and the AcSB jointly issued an Invitation to Comment, *Reporting Disaggregated Information by Business Enterprises*. That Invitation to Comment identified certain issues related to disclosure of information about segments, solicited comments on those issues, and asked readers to identify additional issues. The boards received 129 comment letters from U.S. and Canadian respondents.

48. In late 1993, the FASB and the AcSB formed the Disaggregated Disclosures Advisory Group to advise and otherwise support the two boards in their efforts to improve disaggregated disclosures. The members of the group included financial statement issuers, auditors, financial analysts, and academics from both the United States and Canada. In January 1994, the FASB and the AcSB began discussing changes to Statement 14 and *CICA Handbook* Section 1700, "Segmented Information." The two boards met with and otherwise actively solicited the views of analysts and preparers of financial statements about possible improvements to the current segment reporting requirements. FASB and AcSB members and staff also discussed disaggregated disclosures at meetings of several groups of analysts, including the AIMR's Financial Accounting Policy Committee.

49. In 1991, the AICPA formed the Special Committee on Financial Reporting (the Special Committee) to make recommendations to improve the relevance and usefulness of business reporting. The Special Committee, which comprised financial statement auditors and preparers, established focus groups of credit analysts and equity analysts to assist in formulating its recommendations. The Special Committee issued its report, *Improving Business Reporting—A Customer Focus*, in 1994. That report listed improvements in disclosures of business segment information as its first recommendation and included the following commentary:

> … for users analyzing a company involved in diverse businesses, financial information about business segments often is as important as information about the company as a whole. Users suggest that standard setters assign the highest priority to improving segment reporting because of its importance to their work and the perceived problems with current reporting of segment information. [page 68]

50. The report of the Special Committee listed the following as among the most important improvements needed:

    (a) Disclosure of segment information in interim financial reports

    (b) Greater number of segments for some enterprises

    (c) More information about segments

    (d) Segmentation that corresponds to internal management reports

    (e) Consistency of segment information with other parts of an annual report.

    Similar recommendations had been made in each of the last 20 years in evaluations of corporate reporting conducted by the AIMR.

51. The two boards reached tentative conclusions about an approach to segment reporting that was substantially different from the approach in Statement 14 and Section 1700. Key characteristics of the new approach were that (a) information would be provided about segments of the enterprise that corresponded to the structure of the enterprise's internal organization, that is, about the divisions, departments, subsidiaries, or other internal units that the chief operating decision maker uses to make operating decisions and to assess an enterprise's performance, (b) specific amounts would be allocated to segments only if they were allocated in reports used by the chief operating decision maker for evaluation of segment performance, and (c) accounting policies used to produce the disaggregated information would be the same as those used in the reports used by the chief operating decision maker in allocating resources and assessing segment performance.

52. In February 1995, the staffs of the FASB and the CICA distributed a paper, "Tentative Conclusions on Financial Reporting for Segments" (Tentative Conclusions), to selected securities analysts, the FASB Task Force on Consolidations and Related Matters, the Disaggregated Disclosures Advisory Group, the FASB's Emerging Issues Task Force, the Financial Accounting Standards Advisory Council, the AcSB's list of Associates,* and members of representative organizations that regularly work with the boards. The paper also was announced in FASB and CICA publications and was sent to anyone who requested a copy. Board and staff members discussed the Tentative Conclusions with various analyst and preparer groups. Approximately 80 comment letters were received from U.S. and Canadian respondents.

53. In January 1996, the FASB and the AcSB issued virtually identical Exposure Drafts, *Reporting Disaggregated Information about a Business Enterprise*. The FASB received 221 comment letters and the AcSB received 73 comment letters in response to the Exposure Drafts. A field test of the proposals was conducted in March 1996. A public meeting was held in Toronto in October 1996 to discuss results and concerns with field test participants. Other interested parties attended a public meeting in Norwalk in October 1996 to discuss their concerns about the proposals in the Exposure Drafts. The FASB decided that it could reach an informed decision on the project without holding a public hearing.

54. The FASB and the AcSB exchanged information during the course of redeliberating the proposals in their respective Exposure Drafts. AcSB members and CICA staff attended FASB meetings, and FASB members and staff attended AcSB meetings in late 1996 and in 1997 to discuss the issues raised by respondents. Both boards reached agreement on all of the substantive issues to achieve virtually identical standards for segment reporting in the United States and Canada. Members of the Segment Disclosures Advisory Group (formerly the Disaggregated Disclosures Advisory Group) discussed a draft of the standards section in March 1997.

* Associates are individuals and organizations with a particular interest in financial reporting issues that have volunteered to provide an outside reaction to AcSB positions at an early stage in the AcSB's deliberations.

 © IASCF

55. The International Accounting Standards Committee (IASC) issued an Exposure Draft of a proposed International Accounting Standard that would replace International Accounting Standard IAS 14, *Reporting Financial Information by Segment*, in December 1995. Although many of its provisions are similar to those of the FASB and AcSB Exposure Drafts, the IASC's proposal is based on different objectives and is different from those Exposure Drafts. A member of the IASC Segments Steering Committee participated in FASB meetings during the redeliberations of the Exposure Draft, and members of the FASB participated in meetings of the IASC Segments Steering Committee. Many of the respondents to the Exposure Drafts encouraged the FASB and the AcSB to work closely with the IASC to achieve similar standards for segment reporting. The IASC expects to issue a standard on segment reporting later in 1997. Although there likely will be differences between the IASC's requirements for segment reporting and those of this Statement, the boards expect that it will be possible to prepare one set of segment information that complies with both the IASC requirements and those of this Statement.

56. This Statement addresses the following key issues:

(a) What is the appropriate basis for defining segments?

(b) What accounting principles and allocations should be used?

(c) What specific items of information should be reported?

(d) Should segment information be reported in condensed financial statements for interim periods?

Defining Operating Segments of an Enterprise

57. The Board concluded that the *industry approach* to segment disclosures in Statement 14 was not providing the information required by financial statement users and that disclosure of disaggregated information should be based on operating segments. This Statement defines an operating segment as a component of an enterprise (a) that engages in business activities from which it may earn revenues and incur expenses, (b) whose operating results are regularly reviewed by the enterprise's chief operating decision maker to make decisions about resources to be allocated to the segment and to assess its performance, and (c) for which discrete financial information is available.

58. The AIMR's 1993 position paper and the report of the AICPA Special Committee criticized Statement 14's industry segment approach to reporting segment information. The AIMR's position paper included the following:

> FAS 14 requires disclosure of line-of-business information classified by "industry segment." Its definition of segment is necessarily imprecise, recognizing that there are numerous practical problems in applying that definition to different business entities operating under disparate circumstances. That weakness in FAS 14 has been exploited by many enterprises to suit their own financial reporting purposes. As a result, we have seen one of the ten largest firms in the country report all of its operations as being in a single, very broadly defined industry segment. [page 60]

The report of the Special Committee said that "[financial statement users] believe that many companies define industry segments too broadly for business reporting and thus report on too few industry segments" (page 69).

59. The report of the AICPA Special Committee also said that ". . . the primary means to improving industry segment reporting should be to align business reporting with internal reporting" (page 69), and the AIMR's 1993 position paper recommended that:

> ... priority should be given to the production and dissemination of financial data that reflects and reports sensibly the operations of specific enterprises. If we could obtain reports showing the details of how an individual business firm is organized and managed, we would assume more responsibility for making meaningful comparisons of those data to the unlike data of other firms that conduct their business differently. [pages 60 and 61]

Almost all of the users and many other constituents who responded to the Exposure Draft or who met with Board and staff members agreed that defining segments based on the structure of an enterprise's internal organization would result in improved information. They said that not only would enterprises be likely to report more detailed information but knowledge of the structure of an enterprise's internal organization is valuable in itself because it highlights the risks and opportunities that management believes are important.

60. Segments based on the structure of an enterprise's internal organization have at least three other significant advantages. First, an ability to see an enterprise "through the eyes of management" enhances a user's ability to predict actions or reactions of management that can significantly affect the enterprise's prospects for future cash flows. Second, because information about those segments is generated for management's use, the incremental cost of providing information for external reporting should be relatively low. Third, practice has demonstrated that the term *industry* is subjective. Segments based on an existing internal structure should be less subjective.

61. The AIMR and other users have commented that segment information is more useful if it is consistent with explanatory information provided elsewhere in the annual report. They note that the business review section and the chairman's letter in an annual report frequently discuss the enterprise's operations on a basis different from that of the segment information in the notes to the financial statements and the management's discussion and analysis section, which is required by SEC rules to correspond to the segment information provided to comply with Statement 14. That appears to occur if the enterprise is not managed in a way that corresponds to the way it defines segments under the requirements of Statement 14. Segmentation based on the structure of an enterprise's internal organization should facilitate consistent discussion of segment financial results throughout an enterprise's annual report.

62. Some respondents to the Exposure Draft opposed the Board's approach for several reasons. Segments based on the structure of an enterprise's internal organization may not be comparable between enterprises that engage in similar activities and may not be comparable from year to year for an individual enterprise. In addition, an enterprise may not be organized based on products and services or geographic areas, and thus the enterprise's segments may not be susceptible to analysis using macroeconomic models. Finally, some asserted that because enterprises are organized strategically, the information that would be reported may be competitively harmful to the reporting enterprise.

 © IASCF

63. The Board acknowledges that comparability of accounting information is important. The summary of principal conclusions in FASB Concepts Statement No. 2, *Qualitative Characteristics of Accounting Information*, says: "Comparability between enterprises and consistency in the application of methods over time increases the informational value of comparisons of relative economic opportunities or performance. The significance of information, especially quantitative information, depends to a great extent on the user's ability to relate it to some benchmark." However, Concepts Statement 2 also notes a danger:

> Improving comparability may destroy or weaken relevance or reliability if, to secure comparability between two measures, one of them has to be obtained by a method yielding less relevant or less reliable information. Historically, extreme examples of this have been provided in some European countries in which the use of standardized charts of accounts has been made mandatory in the interest of interfirm comparability but at the expense of relevance and often reliability as well. That kind of uniformity may even adversely affect comparability of information if it conceals real differences between enterprises. [paragraph 116]

64. The Board was concerned that segments defined using the approach in Statement 14 may appear to be more comparable between enterprises than they actually are. Statement 14 included the following:

> Information prepared in conformity with [Statement 14] may be of limited usefulness for comparing an industry segment of one enterprise with a similar industry segment of another enterprise (i.e., for interenterprise comparison). Interenterprise comparison of industry segments would require a fairly detailed prescription of the basis or bases of disaggregation to be followed by all enterprises, as well as specification of the basis of accounting for intersegment transfers and methods of allocating costs common to two or more segments. [paragraph 76]

65. Statement 14 explained why the Board chose not to develop a detailed prescription of the bases of disaggregation:

> ... differences among enterprises in the nature of their operations and in the extent to which components of the enterprise share common facilities, equipment, materials and supplies, or labor force make unworkable the prescription of highly detailed rules and procedures that must be followed by all enterprises. Moreover, ... differences in the accounting systems of business enterprises are a practical constraint on the degree of specificity with which standards of financial accounting and reporting for disaggregated information can be established. [paragraph 74]

Those same considerations persuaded the Board not to adopt more specific requirements in this Statement. Both relevance and comparability will not be achievable in all cases, and relevance should be the overriding concern.

66. The AICPA Special Committee, some respondents to the Exposure Draft, and other constituents recommended that the Board require that an enterprise use an alternative method of segmentation for external reporting if its internal organization is not based on differences in products and services or geography. Some specifically recommended adoption of the proposal in the IASC Exposure Draft that was commonly referred to as a "safety net." The IASC Exposure Draft approach to identifying primary and secondary operating segments calls for review of management's organization of segments, but both primary and secondary segments are required to be defined either on the basis of related

© IASCF

products and services or on the basis of geography. That is, regardless of management's organization, segments must be grouped either by related products and services or by geographic areas, and one set must be presented as primary segments and the other as secondary segments.

67. The Board recognizes that an enterprise may not be divided into components with similar products and services or geographic areas for internal purposes and that some users of financial statements have expressed a desire for information organized on those bases. However, instead of an alternative method of segmentation, which would call for multiple sets of segment information in many circumstances, the Board chose to require disclosure of additional information about products and services and about geographic areas of operations for the enterprise as a whole if the basic segment disclosures do not provide it.

68. One reason for not prescribing segmentation along bases of only related products and services or geography is that it is difficult to define clearly the circumstances in which an alternative method that differs from the management approach would be applied consistently. An enterprise with a relatively narrow product line may not consider two products to be similar, while an enterprise with a broad product line may consider those same two products to be similar. For example, a highly diversified enterprise may consider all consumer products to be similar if it has other businesses such as financial services and road construction. However, an enterprise that sells only consumer products might consider razor blades to be different from toasters.

69. A second reason for rejecting that approach is that an alternative method of segmentation would increase the cost to some enterprises to prepare the information. A management approach to defining segments allows enterprises to present the information that they use internally and facilitates consistent descriptions of the components of an enterprise from one part of the annual report to another. An enterprise could be organized by its products and services, geography, a mixture of both products and services and geography, or other bases, such as customer type, and the segment information required by this Statement would be consistent with that method of organization. Furthermore, the enterprise-wide disclosures about products and services will provide information about the total revenues from related products and services, and the enterprise-wide disclosures about geography will provide information about the revenues and assets of an enterprise both inside and outside its home country. If material, individual foreign country information also is required.

70. The Board recognizes that some enterprises organize their segments on more than one basis. Other enterprises may produce reports in which their activities are presented in a variety of ways. In those situations, reportable segments are to be determined based on a review of other factors to identify the enterprise's operating segments, including the nature of the activities of each component, the existence of managers responsible for them, and the information provided to the board of directors. In many enterprises, only one set of data is provided to the board of directors. That set of data generally is indicative of how management views the enterprise's activities.

 © IASCF

Reportable Segments

71. The Board included a notion of reportable segments, a subset of operating segments, in this Statement by defining aggregation criteria and quantitative thresholds for determining which operating segments should be reported separately in the financial statements.

72. A so-called pure management approach to segment reporting might require that an enterprise report all of the information that is reviewed by the chief operating decision maker to make decisions about resource allocations and to assess the performance of the enterprise. However, that level of detail may not be useful to readers of external financial statements, and it also may be cumbersome for an enterprise to present. Therefore, this Statement uses a modified management approach that includes both aggregation criteria and quantitative thresholds for determining reportable operating segments. However, an enterprise need not aggregate similar segments, and it may present segments that fall below the quantitative thresholds.

Aggregation of Similar Operating Segments

73. The Board believes that separate reporting of segment information will not add significantly to an investor's understanding of an enterprise if its operating segments have characteristics so similar that they can be expected to have essentially the same future prospects. The Board concluded that although information about each segment may be available, in those circumstances the benefit would be insufficient to justify its disclosure. For example, a retail chain may have 10 stores that individually meet the definition of an operating segment, but each store may be essentially the same as the others.

74. Most respondents commented on the aggregation criteria in the Exposure Draft. Many said that the criteria were unreasonably strict, to the extent that nearly identical segments might not qualify for aggregation. Some respondents linked their concerns about competitive harm and too many segments directly to the aggregation criteria, indicating that a relaxation of the criteria would significantly reduce those concerns. To better convey its intent, the Board revised the wording of the aggregation criteria and the introduction to them. However, the Board rejected recommendations that the criteria be indicators rather than tests and that the guidance require only the expectation of similar long-term performance of segments to justify aggregation because those changes might result in a level of aggregation that would cause a loss of potentially valuable information. For the same reason, the Board also rejected suggestions that segments need be similar in only a majority of the characteristics in paragraph 17 to justify aggregation. The Board recognizes that determining when two segments are sufficiently similar to justify aggregating them is difficult and subjective. However, the Board notes that one of the reasons that the information provided under Statement 14 did not satisfy financial statement users' needs is that segments with different characteristics in important areas were at times aggregated.

Quantitative Thresholds

75. In developing the Exposure Draft, the Board had concluded that quantitative criteria might interfere with the determination of operating segments and, if anything, might unnecessarily reduce the number of segments disclosed. Respondents to the Exposure Draft and others urged the Board to include quantitative criteria for determining which segments to report because they said that some enterprises would be required to report too many segments unless specific quantitative guidelines allowed them to omit small segments. Some respondents said that the Exposure Draft would have required disclosure of as many as 25 operating segments, which was not a result anticipated by the Board in its deliberations preceding the Exposure Draft. Others said that enterprises would report information that was too highly aggregated unless quantitative guidelines prevented it. The Board decided that the addition of quantitative thresholds would be a practical way to address respondents' concerns about competitive harm and proliferation of segments without fundamentally changing the management approach to segment definition.

76. Similar to the requirements in Statement 14, the Board decided to require that any operating segment that constitutes 10 percent or more of reported revenues, assets, or profit or loss be reported separately and that reportable segments account for at least 75 percent of an enterprise's external revenues. The Board decided to retain that guidance for the quantitative thresholds because it can be objectively applied and because preparers and users of financial statements already understand it.

77. Inclusion of quantitative thresholds similar to those in Statement 14 necessitates guidance on how to report operating segments that do not meet the thresholds. The Board concluded that enterprises should be permitted to aggregate information about operating segments that do not meet the thresholds with information about other operating segments that do not meet the thresholds if a majority of the aggregation criteria in paragraph 17 are met. That is a more liberal aggregation provision than that for individually material operating segments, but it prohibits aggregation of segments that are dissimilar.

78. Paragraph 125 of Concepts Statement 2 states that "... magnitude by itself, without regard to the nature of the item and the circumstances in which the judgment has to be made, will not generally be a sufficient basis for a materiality judgment." That guidance applies to segment information. An understanding of the material segments of an enterprise is important for understanding the enterprise as a whole, and individual items of segment information are important for understanding the segments. Thus, an item of segment information that, if omitted, would change a user's decision about that segment so significantly that it would change the user's decision about the enterprise as a whole is material even though an item of a similar magnitude might not be considered material if it were omitted from the consolidated financial statements. Therefore, enterprises are encouraged to report information about segments that do not meet the quantitative thresholds if management believes that it is material. Those who are familiar with the particular circumstances of each enterprise must decide what constitutes *material*.

© IASCF

Vertically Integrated Enterprises

79. The Board concluded that the definition of an operating segment should include components of an enterprise that sell primarily or exclusively to other operating segments of the enterprise if the enterprise is managed that way. Information about the components engaged in each stage of production is particularly important for understanding vertically integrated enterprises in certain businesses, for example, oil and gas enterprises. Different activities within the enterprise may have significantly different prospects for future cash flows, and users of financial statements have asserted that they need to know results of each operation.

80. Some respondents to the Exposure Draft opposed the requirement to report vertically integrated segments separately. They said that the segment results may not be comparable between enterprises and that transfer prices are not sufficiently reliable for external reporting purposes. The Board considered an approach that would have required separate reporting of vertically integrated segments only if transfer prices were based on quoted market prices and if there was no basis for combining the selling segment and the buying segment. However, that would have been a significant departure from the management approach to defining segments. The Board also was concerned that the criteria would be unworkable. Therefore, the Board decided to retain the Exposure Draft's provisions for vertically integrated segments.

Accounting Principles and Allocations

81. The Board decided that the information to be reported about each segment should be measured on the same basis as the information used by the chief operating decision maker for purposes of allocating resources to segments and assessing segments' performance. That is a management approach to measuring segment information as proposed in the Exposure Draft. The Board does not think that a separate measure of segment profit or loss or assets should have to be developed solely for the purpose of disclosing segment information. For example, an enterprise that accounts for inventory using a specialized valuation method for internal purposes should not be required to restate inventory amounts for each segment, and an enterprise that accounts for pension expense only on a consolidated basis should not be required to allocate pension expense to each operating segment.

82. The report of the AICPA Special Committee said that the Board "should allow companies to report a statistic on the same basis it is reported for internal purposes, if the statistic is reported internally. The usefulness of information prepared only for [external] reporting is questionable. Users want to understand management's perspective on the company and the implications of key statistics." It also said that "key statistics to be reported [should] be limited to statistics a company has available..." (page 72).

83. Respondents to the Exposure Draft had mixed reactions to its measurement guidance. Very few suggested that the Board require allocations solely for external reporting purposes. Most agreed that allocations are inherently arbitrary and may not be meaningful if they are not used for management purposes. No respondents suggested that intersegment transfers should be

reported on any basis other than that used internally. However, some respondents recommended that information about each segment be provided based on the accounting principles used in the enterprise's general-purpose financial statements. Some observed that unadjusted information from internal sources would not necessarily comply with generally accepted accounting principles and, for that reason, might be difficult for users to understand. Other respondents argued that comparability between enterprises would be improved if the segment information were provided on the basis of generally accepted accounting principles. Finally, a few questioned the verifiability of the information.

84. The Board decided not to require that segment information be provided in accordance with the same generally accepted accounting principles used to prepare the consolidated financial statements for several reasons. Preparing segment information in accordance with the generally accepted accounting principles used at the consolidated level would be difficult because some generally accepted accounting principles are not intended to apply at a segment level. Examples include allocation of the cost of an acquisition to individual assets and liabilities of a subsidiary using the purchase method of accounting, accounting for the cost of enterprise-wide employee benefit plans, accounting for income taxes in an enterprise that files a consolidated income tax return, and accounting for inventory on a last-in, first-out basis if the pools include items in more than one segment. In addition, there are no generally accepted accounting principles for allocating joint costs, jointly used assets, or jointly incurred liabilities to segments or for pricing intersegment transfers. As a consequence, it generally is not feasible to present segment profitability in accordance with generally accepted accounting principles.

85. The Board recognizes that segment information is subject to certain limitations and that some of that information may not be susceptible to the same degree of verifiability as some other financial information. However, verifiability is not the only important qualitative characteristic of accounting information. Verifiability is a component of reliability, which is one of two characteristics that contribute to the usefulness of accounting information. The other is relevance, which is equally important. Concepts Statement 2 states:

> Although financial information must be both relevant and reliable to be useful, information may possess both characteristics to varying degrees. It may be possible to trade relevance for reliability or vice versa, though not to the point of dispensing with one of them altogether. ... trade-offs between characteristics may be necessary or beneficial.
>
> In a particular situation, the importance attached to relevance in relation to the importance of other decision specific qualities of accounting information (for example, reliability) will be different for different information users, and their willingness to trade one quality for another will also differ. [paragraphs 42 and 45]

86. It is apparent that users are willing to trade a degree of reliability in segment information for more relevant information. The AIMR's 1993 position paper states:

> Analysts need financial statements structured so as to be consistent with how the business is organized and managed. That means that two different companies in the

 © IASCF

> same industry may have to report segment data differently because they are structured differently themselves. [page 20]

But, as previously noted, the position paper says that, under those circumstances, analysts "would assume more responsibility for making meaningful comparisons of those data to the unlike data of other firms that conduct their business differently" (page 61).

87. The Board believes that the information required by this Statement meets the objective of reliability of which both representational faithfulness and verifiability are components. An auditor can determine whether the information reported in the notes to the financial statements came from the required source by reviewing management reports or minutes from meetings of the board of directors. The information is not required to be provided on a specified basis, but the enterprise is required to explain the basis on which it is provided and to reconcile the segment information to consolidated enterprise totals. Adequate explanation and an appropriate reconciliation will enable a user to understand the information and its limitations in the context of the enterprise's financial statements. The auditor can test both the explanation of segment amounts and the reconciliations to consolidated totals. Furthermore, because management uses that information in its decision-making processes, that information is likely to be highly reliable. The information provided to comply with Statement 14 was more difficult to verify in many situations and was less reliable. Because it was prepared solely for external reporting purposes, it required allocations that may have been arbitrary, and it was based on accounting principles that may have been difficult to apply at the segment level.

88. Paragraph 29 requires amounts allocated to a segment to be allocated on a reasonable basis. However, the Board believes that the potential increased reliability that might have been achieved by requiring allocation of consolidated amounts is illusory because expenses incurred at the consolidated level could be allocated to segments in a variety of ways that could be considered "reasonable." For example, an enterprise could use either the number of employees in each segment or the segment's total salary expense in relation to the consolidated amounts as a basis for allocating pension expense to segments. Those two approaches to allocation could result in significantly different measures of segment profit or loss. However, both the number of employees and the total salary expense might be reasonable bases on which to allocate total pension expense. In contrast, it would not seem reasonable for an enterprise to allocate pension expense to a segment that had no employees eligible for the pension plan. Because of the potential for misleading information that may result from such allocations, the Board decided that it is appropriate for this Statement to require that amounts allocated to a segment be allocated on a reasonable basis.

89. The Board also considered explicitly requiring that revenues and expenses directly incurred by or directly attributable to an operating segment be reported by that segment. However, it decided that, in some cases, whether an item of revenue or expense is attributable to an operating segment is a matter of judgment. Further, such an explicit requirement would be an additional

modification of the management approach to measurement. While the Board decided not to include an explicit requirement, it believes that many items of revenue or expense clearly relate to a particular segment and that it would be unlikely that the information used by management would omit those items.

90. To assist users of financial statements in understanding segment disclosures, this Statement requires that enterprises provide sufficient explanation of the basis on which the information was prepared. That disclosure must include any differences in the basis of measurement between the consolidated amounts and the segment amounts. It also must indicate whether allocations of items were made symmetrically. An enterprise may allocate an expense to a segment without allocating the related asset; however, disclosure of that fact is required. Enterprises also are required to reconcile to the consolidated totals in the enterprise's financial statements the totals of reportable segment assets, segment revenues, segment profit or loss, and any other significant segment information that is disclosed.

91. In addition, the advantages of reporting unadjusted management information are significant. That practice is consistent with defining segments based on the structure of the enterprise's internal organization. It imposes little incremental cost on the enterprise and requires little incremental time to prepare. Thus, the enterprise can more easily report segment information in condensed financial statements for interim periods and can report more information about each segment in annual financial statements. Information used by management also highlights for a user of financial statements the risks and opportunities that management considers important.

Information to Be Disclosed about Segments

92. The items of information about each reportable operating segment that must be disclosed as described in paragraphs 25–31 represent a balance between the needs of users of financial statements who may want a complete set of financial statements for each segment and the costs to preparers who may prefer not to disclose any segment information. Statement 14 required disclosure of internal and external revenues; profit or loss; depreciation, depletion, and amortization expense; and unusual items as defined in APB Opinion No. 30, *Reporting the Results of Operations—Reporting the Effects of Disposal of a Segment of a Business, and Extraordinary, Unusual and Infrequently Occurring Events and Transactions*, for each segment. Statement 14 also required disclosure of total assets, equity in the net income of investees accounted for by the equity method, the amount of investment in equity method investees, and total expenditures for additions to long-lived assets. Some respondents to the Exposure Draft objected to disclosing any information that was not required by Statement 14, while others recommended disclosure of additional items that are not required by this Statement. This Statement calls for the following additional disclosures only if the items are included in the measure of segment profit or loss that is reviewed by the chief operating decision maker: significant noncash items, interest revenue, interest expense, and income tax expense.

 © IASCF

93. Some respondents to the Exposure Draft expressed concern that the proposals would increase the sheer volume of information compared to what was required to be reported under Statement 14. The Board considers that concern to be overstated for several reasons. Although this Statement requires disclosure of more information about an individual operating segment than Statement 14 required for an industry segment, this Statement requires disclosure of information about only one type of segment–reportable operating segments—while Statement 14 required information about two types of segments—industry segments and geographic segments. Moreover, Statement 14 required that many enterprises create information solely for external reporting, while almost all of the segment information that this Statement requires is already available in management reports. The Board recognizes, however, that some enterprises may find it necessary to create the enterprise-wide information about products and services, geographic areas, and major customers required by paragraphs 36–39.

94. The Board decided to require disclosure of significant noncash items included in the measure of segment profit or loss and information about total expenditures for additions to long-lived segment assets (other than financial instruments, long-term customer relationships of a financial institution, mortgage and other servicing rights, deferred policy acquisition costs, and deferred tax assets) if that information is reported internally because it improves financial statement users' abilities to estimate cash-generating potential and cash requirements of operating segments. As an alternative, the Board considered requiring disclosure of operating cash flow for each operating segment. However, many respondents said that disclosing operating cash flow in accordance with FASB Statement No. 95, *Statement of Cash Flows*, would require that they gather and process information solely for external reporting purposes. They said that management often evaluates cash generated or required by segments in ways other than by calculating operating cash flow in accordance with Statement 95. For that reason, the Board decided not to require disclosure of cash flow by segment.

95. Disclosure of interest revenue and interest expense included in reported segment profit or loss is intended to provide information about the financing activities of a segment. The Exposure Draft proposed that an enterprise disclose gross interest revenue and gross interest expense for all segments in which reported profit or loss includes those items. Some respondents said that financial services segments generally are managed based on net interest revenue, or the "spread," and that management looks only to that data in its decision-making process. Therefore those segments should be required to disclose only the net amount and not both gross interest revenue and expense. Those respondents noted that requiring disclosure of both gross amounts would be analogous to requiring nonfinancial services segments to disclose both sales and cost of sales. The Board decided that segments that derive a majority of revenue from interest should be permitted to disclose net interest revenue instead of gross interest revenue and gross interest expense if management finds that amount to be more relevant in managing the segment. Information about interest is most important if a single segment comprises a mix of financial and nonfinancial operations. If a segment is primarily a financial operation, interest revenue probably constitutes most of

segment revenues and interest expense will constitute most of the difference between reported segment revenues and reported segment profit or loss. If the segment has no financial operations or only immaterial financial operations, no information about interest is required.

96. The Board decided not to require the disclosure of segment liabilities. The Exposure Draft proposed that an enterprise disclose segment liabilities because the Board believed that liabilities are an important disclosure for understanding the financing activities of a segment. The Board also noted that the requirement in FASB Statement No. 94, *Consolidation of All Majority-Owned Subsidiaries*, to disclose assets, liabilities, and profit or loss about previously unconsolidated subsidiaries was continued from APB Opinion No. 18, *The Equity Method of Accounting for Investments in Common Stock*, pending completion of the project on disaggregated disclosures. However, in commenting on the disclosures that should be required by this Statement, many respondents said that liabilities are incurred centrally and that enterprises often do not allocate those amounts to segments. The Board concluded that the value of information about segment liabilities in assessing the performance of the segments of an enterprise was limited.

97. The Board decided not to require disclosure of research and development expense included in the measure of segment profit or loss. The Exposure Draft would have required that disclosure to provide financial statement users with information about the operating segments in which an enterprise is focusing its product development efforts. Disclosure of research and development expense was requested by a number of financial statement users and was specifically requested in both the report of the AICPA's Special Committee and the AIMR's 1993 position paper. However, respondents said that disclosing research and development expense by segment may result in competitive harm by providing competitors with early insight into the strategic plans of an enterprise. Other respondents observed that research and development is only one of a number of items that indicate where an enterprise is focusing its efforts and that it is much more significant in some enterprises than in others. For example, costs of employee training and advertising were cited as items that often are more important to some enterprises than research and development, calling into question the relevance of disclosing only research and development expense. Additionally, many respondents said that research and development expense often is incurred centrally and not allocated to segments. The Board therefore decided not to require the disclosure of research and development expense by segment.

Interim Period Information

98. This Statement requires disclosure of limited segment information in condensed financial statements that are included in quarterly reports to shareholders, as was proposed in the Exposure Draft. Statement 14 did not apply to those condensed financial statements because of the expense and the time required for producing segment information under Statement 14. A few respondents to the Exposure Draft said that reporting segment information in interim financial statements would be unnecessarily burdensome. However, users contended that, to be

© IASCF

timely, segment information is needed more often than annually and that the difficulties of preparing it on an interim basis could be overcome by an approach like the one in this Statement. Managers of many enterprises agree and have voluntarily provided segment information for interim periods.

99. The Board decided that the condensed financial statements in interim reports issued to shareholders should include disclosure of segment revenues from external customers, intersegment revenues, a measure of segment profit or loss, material changes in segment assets, differences in the basis of segmentation or the way segment profit or loss was measured in the previous annual period, and a reconciliation to the enterprise's total profit or loss. That decision is a compromise between the needs of users who want the same segment information for interim periods as that required in annual financial statements and the costs to preparers who must report the information. Users will have some key information on a timely basis. Enterprises should not incur significant incremental costs to provide the information because it is based on information that is used internally and therefore already available.

Restatement of Previously Reported Information

100. The Board decided to require restatement of previously reported segment information following a change in the composition of an enterprise's segments unless it is impracticable to do so. Changes in the composition of segments interrupt trends, and trend analysis is important to users of financial statements. Some financial statement issuers have said that their policy is to restate one or more prior years for internal trend analysis. Many reorganizations result in discrete profit centers' being reassigned from one segment to another and lead to relatively simple restatements. However, if an enterprise undergoes a fundamental reorganization, restatement may be very difficult and expensive. The Board concluded that in those situations restatement may be impracticable and, therefore, should not be required. However, if an enterprise does not restate its segment information, the enterprise is required to provide current-period segment information on both the old and new bases of segmentation in the year in which the change occurs unless it is impracticable to do so.

Enterprise-Wide Disclosures

101. Paragraphs 36–39 require disclosure of information about an enterprise's products and services, geographic areas, and major customers, regardless of the enterprise's organization. The required disclosures need be provided only if they are not included as part of the disclosures about segments. The Exposure Draft proposed requiring additional disclosures about products and services and geographic areas *by segment*. Many respondents said that that proposal would have resulted in disclosure of excessive amounts of information. Some enterprises providing a variety of products and services throughout many countries, for example, would have been required to present a large quantity of information that would have been time-consuming to prepare and of questionable benefit to most financial statement users. The Board decided that additional disclosures provided on an enterprise-wide basis rather than on a segment basis would be appropriate and not unduly burdensome. The Board also

agreed that those enterprise-wide disclosures are appropriate for all enterprises including those that have a single operating segment if the enterprise offers a range of products and services, derives revenues from customers in more than one country, or both.

102. Based on reviews of published information about public enterprises, discussions with constituents, and a field test of the Exposure Draft, the Board believes that most enterprises are organized by products and services or by geography and will report one or both of those types of information in their reportable operating segment disclosures. However, some enterprises will be required by paragraphs 36–39 to report additional information because the enterprise-wide disclosures are required for all enterprises, even those that have a single reportable segment.

Information about Products and Services

103. This Statement requires that enterprises report revenues from external customers for each product and service or each group of similar products and services for the enterprise as a whole. Analysts said that an analysis of trends in revenues from products and services is important in assessing both past performance and prospects for future growth. Those trends can be compared to benchmarks such as industry statistics or information reported by competitors. Information about the assets that are used to produce specific products and deliver specific services also might be useful. However, in many enterprises, assets are not dedicated to specific products and services and reporting assets by products and services would require arbitrary allocations.

Information about Geographic Areas

104. This Statement requires disclosure of information about both revenues and assets by geographic area. Analysts said that information about revenues from customers in different geographic areas assists them in understanding concentrations of risks due to negative changes in economic conditions and prospects for growth due to positive economic changes. They said that information about assets located in different areas assists them in understanding concentrations of risks (for example, political risks such as expropriation).

105. Statement 14 requires disclosure of geographic information by geographic region, whereas this Statement requires disclosure of individually material countries as well as information for the enterprise's country of domicile and all foreign countries in the aggregate. This Statement's approach has two significant benefits. First, it will reduce the burden on preparers of financial statements because most enterprises are likely to have material operations in only a few countries or perhaps only in their country of domicile. Second, and more important, it will provide information that is more useful in assessing the impact of concentrations of risk. Information disclosed by country is more useful because it is easier to interpret. Countries in contiguous areas often experience different rates of growth and other differences in economic conditions. Under the requirements of Statement 14, enterprises often reported information about broad geographic areas that included groupings such as Europe, Africa, and the Middle East. Analysts and others have questioned the usefulness of that type of broad disclosure.

 © IASCF

106. Respondents to the Exposure Draft questioned how revenues should be allocated to individual countries. For example, guidance was requested for situations in which products are shipped to one location but the customer resides in another location. The Board decided to provide flexibility concerning the basis on which enterprises attribute revenues to individual countries rather than requiring that revenues be attributed to countries according to the location of customers. The Board also decided to require that enterprises disclose the basis they have adopted for attributing revenues to countries to permit financial statement users to understand the geographic information provided.

107. As a result of its decision to require geographic information on an enterprise-wide basis, the Board decided not to require disclosure of capital expenditures on certain long-lived assets by geographic area. Such information on an enterprise-wide basis is not necessarily helpful in forecasting future cash flows of operating segments.

Information about Major Customers

108. The Board decided to retain the requirement in Statement 14, as amended by FASB Statement No. 30, *Disclosure of Information about Major Customers*, to report information about major customers because major customers of an enterprise represent a significant concentration of risk. The 10 percent threshold is arbitrary; however, it has been accepted practice since Statement 14 was issued, and few have suggested changing it.

Competitive Harm

109. A number of respondents to the Exposure Draft noted the potential for competitive harm as a result of disclosing segment information in accordance with this Statement. The Board considered adopting special provisions to reduce the potential for competitive harm from certain segment information but decided against it. In the Invitation to Comment, the Tentative Conclusions, and the Exposure Draft, the Board asked constituents for specific illustrations of competitive harm that has resulted from disclosing segment information. Some respondents said that public enterprises may be at a disadvantage to nonpublic enterprises or foreign competitors that do not have to disclose segment information. Other respondents suggested that information about narrowly defined segments may put an enterprise at a disadvantage in price negotiations with customers or in competitive bid situations.

110. Some respondents said that if a competitive disadvantage exists, it is a consequence of an obligation that enterprises have accepted to gain greater access to capital markets, which gives them certain advantages over nonpublic enterprises and many foreign enterprises. Other respondents said that enterprises are not likely to suffer competitive harm because most competitors have other sources of more detailed information about an enterprise than that disclosed in the financial statements. In addition, the information that is required to be disclosed about an operating segment is no more detailed or specific than the information typically provided by a smaller enterprise with a single operation.

111. The Board was sympathetic to specific concerns raised by certain constituents; however, it decided that a competitive-harm exemption was inappropriate because it would provide a means for broad noncompliance with this Statement. Some form of relief for single-product or single-service segments was explored; however, there are many enterprises that produce a single product or a single service that are required to issue general-purpose financial statements. Those statements would include the same information that would be reported by single-product or single-service segments of an enterprise. The Board concluded that it was not necessary to provide an exemption for single-product or single-service segments because enterprises that produce a single product or service that are required to issue general-purpose financial statements have that same exposure to competitive harm. The Board noted that concerns about competitive harm were addressed to the extent feasible by four changes made during redeliberations: (a) modifying the aggregation criteria, (b) adding quantitative materiality thresholds for identifying reportable segments, (c) eliminating the requirements to disclose research and development expense and liabilities by segment, and (d) changing the second-level disclosure requirements about products and services and geography from a segment basis to an enterprise-wide basis.

Cost-Benefit Considerations

112. One of the precepts of the Board's mission is to promulgate standards only if the expected benefits of the resulting information exceed the perceived costs. The Board strives to determine that a proposed standard will fill a significant need and that the costs incurred to satisfy that need, as compared with other alternatives, are justified in relation to the overall benefits of the resulting information. The Board concluded that the benefits that will result from this Statement will exceed the related costs.

113. The Board believes that the primary benefits of this Statement are that enterprises will report segment information in interim financial reports, some enterprises will report a greater number of segments, most enterprises will report more items of information about each segment, enterprises will report segments that correspond to internal management reports, and enterprises will report segment information that will be more consistent with other parts of their annual reports.

114. This Statement will reduce the cost of providing disaggregated information for many enterprises. Statement 14 required that enterprises define segments by both industry and by geographical area, ways that often did not match the way that information was used internally. Even if the reported segments aligned with the internal organization, the information required was often created solely for external reporting because Statement 14 required certain allocations of costs, prohibited other cost allocations, and required allocations of assets to segments. This Statement requires that information about operating segments be provided on the same basis that it is used internally. The Board believes that most of the enterprise-wide disclosures in this Statement about products and services, geography, and major customers typically are provided in current financial statements or can be prepared with minimal incremental cost.

© IASCF

Applicability to Nonpublic Enterprises and Not-for-Profit Organizations

115. The Board decided to continue to exempt nonpublic enterprises from the requirement to report segment information. Few users of nonpublic enterprises' financial statements have requested that the Board require that those enterprises provide segment information.

116. At the time the Board began considering improvements to disclosures about segment information, FASB Statement No. 117, *Financial Statements of Not-for-Profit Organizations*, had not been issued and there were no effective standards for consolidated financial statements of not-for-profit organizations. Most not-for-profit organizations provided financial information for each of their funds, which is a form of disaggregated information. The situation in Canada was similar. Thus, when the two boards agreed to pursue a joint project, they decided to limit the scope to public business enterprises.

117. The Board provided a limited form of disaggregated information in paragraph 26 of Statement 117, which requires disclosure of expense by functional classification. However, the Board acknowledges that the application of that Statement may increase the need for disaggregated information about not-for-profit organizations. A final Statement expected to result from the FASB Exposure Draft, *Consolidated Financial Statements: Policy and Procedures*, also may increase that need by requiring aggregation of information about more entities in the financial statements of not-for-profit organizations.

118. The general approach of providing information based on the structure of an enterprise's internal organization may be appropriate for not-for-profit organizations. However, the Board decided not to add not-for-profit organizations to the scope of this Statement. Users of financial statements of not-for-profit organizations have not urged the Board to include those organizations, perhaps because they have not yet seen the effects of Statement 117 and the Exposure Draft on consolidations. Furthermore, the term *not-for-profit organizations* applies to a wide variety of entities, some of which are similar to business enterprises and some of which are very different. There are likely to be unique characteristics of some of those entities or special user needs that require special provisions, which the Board has not studied. In addition, the AcSB has recently adopted standards for reporting by not-for-profit organizations that are different from Statement 117. In the interest of completing this joint project in a timely manner, the Board decided not to undertake the research and deliberations that would be necessary to adapt the requirements of this Statement to not-for-profit organizations at this time. Few respondents to the Exposure Draft disagreed with the Board's position.

Effective Date and Transition

119. The Board concluded that this Statement should be effective for financial statements issued for fiscal years beginning after December 15, 1997. In developing the Exposure Draft, the Board had decided on an effective date of December 15, 1996. The Board believed that that time frame was reasonable because almost all of the information that this Statement requires is generated by

© IASCF

systems already in place within an enterprise and a final Statement was expected to be issued before the end of 1996. However, respondents said that some enterprises may need more time to comply with the requirements of this Statement than would have been provided under the Exposure Draft.

120. The Board also decided not to require that segment information be reported in financial statements for interim periods in the initial year of application. Some of the information that is required to be reported for interim periods is based on information that would have been reported in the most recent annual financial statements. Without a full set of segment information to use as a comparison and to provide an understanding of the basis on which it is provided, interim information would not be as meaningful.

Appendix B

Amendments to Basis for Conclusions on other IFRSs

This appendix contains amendments to the Basis for Conclusions on other IFRSs that are necessary in order to note the replacement of IAS 14 by IFRS 8.

* * * * *

The amendments contained in this appendix when IFRS 8 was issued in 2006 have been incorporated into the text of the Basis for Conclusions on IFRSs 1, 6 and 7 and IASs 27 and 36 as issued at 30 November 2006.

Dissenting opinions

Dissent of Gilbert Gélard and James J Leisenring

DO1 Messrs Gélard and Leisenring dissent from the issue of the IFRS because it does not require a defined measure of segment profit or loss to be disclosed and does not require the measure of profit or loss reported to be consistent with the attribution of assets to reportable segments.

DO2 By not defining segment profit or loss, the IFRS allows the reporting of any measure of segment profit or loss as long as that measure is reviewed by the chief operating decision maker. Items of revenue and expense directly attributable to a segment need not be included in the reported profit or loss of that segment, and allocation of items not directly attributable to any given segment is not required. Messrs Gélard and Leisenring believe that the IFRS should require amounts directly incurred by or directly attributable to a segment to be included in that segment's profit or loss, and measurement of a segment's profit or loss to be consistent with the attribution of assets to the segment.

DO3 Messrs Gélard and Leisenring support the disclosure of information to enable users of financial statements to evaluate the activities of an entity and the economic environment in which it operates. However, they believe that the IFRS will not meet this objective, even with the required disclosures and reconciliation to the entity's annual financial statements, because it does not define segment profit or loss and does not require consistent attribution of assets and profit or loss to segments.

DO4 Messrs Gélard and Leisenring support the management approach for defining reportable segments and support requiring disclosure of selected segment information in interim financial reports. They believe, however, that the definitions of segment revenue, expense, result, assets and liabilities in paragraph 16 of IAS 14 *Segment Reporting* should be retained in the IFRS and applied to segments identified by the management approach. They believe that proper external reporting of segment information should not permit the use of non-GAAP measures because they might mislead users.

DO5 Messrs Gélard and Leisenring also believe that the changes from IAS 14 are not justified by the need for convergence with US GAAP. IAS 14 is a disclosure standard and therefore does not affect the reconciliation of IFRS amounts to US GAAP, though additional disclosure from what is required now by IAS 14 might be needed to comply with US GAAP.

 © IASCF

Dissent of Stephen Cooper from the amendment issued in April 2009

DO1 Mr Cooper dissents from the amendment to IFRS 8 *Operating Segments* made by *Improvements to IFRSs* issued in April 2009.

DO2 In his view the changes are unnecessary considering that the provisions in the *Framework* regarding materiality already enable a reporting entity not to disclose segment assets when those assets are small relative to segment profit and not relevant to the understanding of the business. Mr Cooper believes that allowing a reporting entity not to disclose segment assets merely because this is not reported to the chief operating decision maker weakens IFRS 8, and may result in segment assets not being disclosed even when they are important to understanding the performance and financial position of that business.

Guidance on implementing IFRS 8 *Operating Segments*

This guidance accompanies, but is not part of, IFRS 8.

Introduction

IG1 This implementation guidance provides examples that illustrate the disclosures required by IFRS 8 and a diagram to assist in identifying reportable segments. The formats in the illustrations are not requirements. The Board encourages a format that provides the information in the most understandable manner in the specific circumstances. The following illustrations are for a single hypothetical entity referred to as Diversified Company.

Descriptive information about an entity's reportable segments

IG2 The following illustrates the disclosure of descriptive information about an entity's reportable segments (the paragraph references are to the relevant requirements in the IFRS).

Description of the types of products and services from which each reportable segment derives its revenues (paragraph 22(b))

Diversified Company has five reportable segments: car parts, motor vessels, software, electronics and finance. The car parts segment produces replacement parts for sale to car parts retailers. The motor vessels segment produces small motor vessels to serve the offshore oil industry and similar businesses. The software segment produces application software for sale to computer manufacturers and retailers. The electronics segment produces integrated circuits and related products for sale to computer manufacturers. The finance segment is responsible for portions of the company's financial operations including financing customer purchases of products from other segments and property lending operations.

Measurement of operating segment profit or loss, assets and liabilities (paragraph 27)

The accounting policies of the operating segments are the same as those described in the summary of significant accounting policies except that pension expense for each operating segment is recognised and measured on the basis of cash payments to the pension plan. Diversified Company evaluates performance on the basis of profit or loss from operations before tax expense not including non-recurring gains and losses and foreign exchange gains and losses.

Diversified Company accounts for intersegment sales and transfers as if the sales or transfers were to third parties, ie at current market prices.

© IASCF

Factors that management used to identify the entity's reportable segments (paragraph 22(a))

Diversified Company's reportable segments are strategic business units that offer different products and services. They are managed separately because each business requires different technology and marketing strategies. Most of the businesses were acquired as individual units, and the management at the time of the acquisition was retained.

Information about reportable segment profit or loss, assets and liabilities

IG3 The following table illustrates a suggested format for disclosing information about reportable segment profit or loss, assets and liabilities (paragraphs 23 and 24). The same type of information is required for each year for which a statement of comprehensive income is presented. Diversified Company does not allocate tax expense (tax income) or non-recurring gains and losses to reportable segments. In addition, not all reportable segments have material non-cash items other than depreciation and amortisation in profit or loss. The amounts in this illustration, denominated as 'currency units (CU)', are assumed to be the amounts in reports used by the chief operating decision maker.

 © IASCF

	Car parts	Motor vessels	Software	Electronics	Finance	All other	Totals
	CU	CU	CU	CU	CU	CU	CU
Revenues from external customers	3,000	5,000	9,500	12,000	5,000	1,000[(a)]	35,500
Intersegment revenues	–	–	3,000	1,500	–	–	4,500
Interest revenue	450	800	1,000	1,500	–	–	3,750
Interest expense	350	600	700	1,100	–	–	2,750
Net interest revenue[(b)]	–	–	–	–	1,000	–	1,000
Depreciation and amortisation	200	100	50	1,500	1,100	–	2,950
Reportable segment profit	200	70	900	2,300	500	100	4,070
Other material non-cash items:							
Impairment of assets	–	200	–	–	–	–	200
Reportable segment assets	2,000	5,000	3,000	12,000	57,000	2,000	81,000
Expenditures for reportable segment non-current assets	300	700	500	800	600	–	2,900
Reportable segment liabilities	1,050	3,000	1,800	8,000	30,000	–	43,850

(a) Revenues from segments below the quantitative thresholds are attributable to four operating segments of Diversified Company. Those segments include a small property business, an electronics equipment rental business, a software consulting practice and a warehouse leasing operation. None of those segments has ever met any of the quantitative thresholds for determining reportable segments.

(b) The finance segment derives a majority of its revenue from interest. Management primarily relies on net interest revenue, not the gross revenue and expense amounts, in managing that segment. Therefore, as permitted by paragraph 23, only the net amount is disclosed.

Reconciliations of reportable segment revenues, profit or loss, assets and liabilities

IG4 The following illustrate reconciliations of reportable segment revenues, profit or loss, assets and liabilities to the entity's corresponding amounts (paragraph 28(a)–(d)). Reconciliations also are required to be shown for every other material item of information disclosed (paragraph 28(e)). The entity's financial statements are

assumed not to include discontinued operations. As discussed in paragraph IG2, the entity recognises and measures pension expense of its reportable segments on the basis of cash payments to the pension plan, and it does not allocate certain items to its reportable segments.

Revenues	CU
Total revenues for reportable segments	39,000
Other revenues	1,000
Elimination of intersegment revenues	(4,500)
Entity's revenues	35,500

Profit or loss	CU
Total profit or loss for reportable segments	3,970
Other profit or loss	100
Elimination of intersegment profits	(500)
Unallocated amounts:	
Litigation settlement received	500
Other corporate expenses	(750)
Adjustment to pension expense in consolidation	(250)
Income before income tax expense	3,070

Assets	CU
Total assets for reportable segments	79,000
Other assets	2,000
Elimination of receivable from corporate headquarters	(1,000)
Other unallocated amounts	1,500
Entity's assets	81,500

Liabilities	CU
Total liabilities for reportable segments	43,850
Unallocated defined benefit pension liabilities	25,000
Entity's liabilities	68,850

© IASCF

Other material items	Reportable segment totals CU	Adjustments CU	Entity totals CU
Interest revenue	3,750	75	3,825
Interest expense	2,750	(50)	2,700
Net interest revenue (finance segment only)	1,000	–	1,000
Expenditures for assets	2,900	1,000	3,900
Depreciation and amortisation	2,950	–	2,950
Impairment of assets	200	–	200

The reconciling item to adjust expenditures for assets is the amount incurred for the corporate headquarters building, which is not included in segment information. None of the other adjustments are material.

Geographical information

IG5 The following illustrates the geographical information required by paragraph 33. (Because Diversified Company's reportable segments are based on differences in products and services, no additional disclosures of revenue information about products and services are required (paragraph 32).)

Geographical information	Revenues[(a)]	Non-current assets
	CU	CU
United States	19,000	11,000
Canada	4,200	–
China	3,400	6,500
Japan	2,900	3,500
Other countries	6,000	3,000
Total	35,500	24,000

(a) Revenues are attributed to countries on the basis of the customer's location.

Information about major customers

IG6 The following illustrates the information about major customers required by paragraph 34. Neither the identity of the customer nor the amount of revenues for each operating segment is required.

> Revenues from one customer of Diversified Company's software and electronics segments represent approximately CU5,000 of the Company's total revenues.

Diagram to assist in identifying reportable segments

IG7 The following diagram illustrates how to apply the main provisions for identifying reportable segments as defined in the IFRS. The diagram is a visual supplement to the IFRS. It should not be interpreted as altering or adding to any requirements of the IFRS nor should it be regarded as a substitute for the requirements.

Diagram for identifying reportable segments

Basis for Conclusions on IFRS 9 *Financial Instruments*

This Basis for Conclusions accompanies, but is not part of, IFRS 9.

Introduction

BC1 This Basis for Conclusions summarises the International Accounting Standards Board's considerations in developing IFRS 9 *Financial Instruments*. Individual Board members gave greater weight to some factors than to others.

BC2 The Board has long acknowledged the need to improve the requirements for financial reporting of financial instruments to make it easier for users of financial statements to understand financial reporting information. To meet the heightened urgency of that need in the light of the financial crisis, the Board proposes to replace IAS 39 *Financial Instruments: Recognition and Measurement* by the end of 2010. To make progress as quickly as possible the Board has divided the project into several phases. In adopting this approach, the Board acknowledged the difficulties that might be created by differences in timing between this project and others, in particular phase II of the project on insurance contracts. (Paragraphs BC91(b), BC93 and BC113–BC117 discuss issues relating to insurance contracts.)

BC3 IFRS 9 is a new standard dealing with the accounting for financial instruments. In developing IFRS 9, the Board considered the responses to its exposure draft *Financial Instruments: Classification and Measurement*, published in July 2009. As a result, in November 2009 the Board finalised the first part of IFRS 9, dealing with classification and measurement of financial assets. In the Board's view, requirements on classification and measurement are the foundation for any financial reporting standard, and requirements on associated matters (for example, on impairment and hedge accounting) have to reflect those requirements. In addition, the Board noted that many of the application issues that have arisen in the financial crisis are related to the classification and measurement of financial assets in accordance with IAS 39.

BC4 The Board sees this first phase of the project to replace IAS 39 as a stepping stone to future improvements in the financial reporting of financial instruments and is committed to completing its project on financial instruments expeditiously. The Board is also committed to the convergence of IFRSs and US GAAP requirements for financial instruments. There are many detailed differences between them, making it impossible to achieve convergence on the basis of existing requirements. The Board will consider publishing for comment any proposals that the US Financial Accounting Standards Board (FASB) may publish, to the extent that they are different from IFRSs or proposed IFRSs.

Scope

BC5 The Board has not yet considered the scope of IFRS 9. The scope of IAS 39 and its interaction with other IFRSs have resulted in some application and interpretation issues. However, the Board believes that it should address the issue of scope comprehensively rather than only in the context of classification and

 © IASCF

measurement. The scope of IAS 39 has not been raised as a matter of concern during the financial crisis and, hence, the Board believes that the scope of IFRS 9 should be based on that of IAS 39 until it considers the scope more generally in a later phase of the project to replace IAS 39.

BC6 The exposure draft contained proposals for all items within the scope of IAS 39. However, some respondents to the exposure draft said that the Board should restrict its proposals on classification and measurement to financial assets and retain the existing requirements for financial liabilities (including the requirements for embedded derivatives and the fair value option) until the Board has more fully considered and debated the issues relating to financial liabilities. Those respondents pointed out that the Board accelerated its project on financial instruments because of the global financial crisis, which placed more emphasis on issues in the accounting for financial assets than for financial liabilities. They suggested that the Board should consider issues that arise from its projects on own credit risk and other related projects more fully before finalising the requirements for classification and measurement of financial liabilities.

BC7 The Board noted those concerns and decided that IFRS 9 should at this stage apply only to assets within the scope of IAS 39. Thus, financial liabilities, including derivative liabilities, remain within the scope of IAS 39. Accordingly, this Basis for Conclusions discusses the responses to the exposure draft as they apply to the classification and measurement of financial assets. Taking this course will enable the Board to obtain further feedback on the accounting for financial liabilities, including how best to address accounting for changes in own credit risk.

Classification

BC8 In IFRS 9 the Board aimed to improve the ability of users to understand the financial reporting of financial assets by:

(a) reducing the number of classification categories and providing a clearer rationale for measuring financial assets in a particular way that replaces the numerous categories in IAS 39, each of which has specific rules dictating how an asset can or must be classified;

(b) applying a single impairment method to all financial assets not measured at fair value, which replaces the many different impairment methods that are associated with the numerous classification categories in IAS 39; and

(c) aligning the measurement attribute of financial assets to the way the entity manages its financial assets (‘business model’) and their contractual cash flow characteristics, thus providing relevant and useful information to users for their assessment of the amounts, timing and uncertainty of the entity’s future cash flows.

BC9 The Board believes that IFRS 9 both improves the ability of users to understand and use the financial reporting of financial assets and eliminates much of the complexity in IAS 39. The Board disagrees with the assertion made by a dissenting Board member that IFRS 9 does not meet the objective of reducing the number of classification categories for financial assets and eliminating the specific rules associated with those categories. Unlike IAS 39, IFRS 9 provides a clear rationale for

measuring a financial asset at either amortised cost or fair value, and hence improves the ability of users to understand the financial reporting of financial assets. IFRS 9 aligns the measurement attribute of financial assets to the way the entity manages its financial assets ('business model') and their contractual cash flow characteristics. In so doing, IFRS 9 significantly reduces complexity by eliminating the numerous rules associated with each classification category in IAS 39. Consistently with all other financial assets, hybrid contracts with financial asset hosts are classified and measured in their entirety, thereby eliminating the complex and rule-based requirements in IAS 39 for embedded derivatives. Furthermore, IFRS 9 requires a single impairment method, which replaces the different impairment methods associated with the many classification categories in IAS 39. The Board believes that these changes will improve the ability of users to understand the financial reporting of financial assets and to better assess the amounts, timing and uncertainty of future cash flows.

Measurement categories

BC10 Some users of financial statements support a single measurement method—fair value—for all financial assets. They view fair value as more relevant than other measurements in helping them to assess the effect of current economic events on an entity. They assert that having one measurement attribute for all financial assets promotes consistency in valuation, presentation and disclosure and improves the usefulness of financial statements.

BC11 However, many users and others, including many preparers and auditors of financial statements and regulators, do not support the recognition in the statement of comprehensive income of changes in fair value for financial assets that are not held for trading or are not managed on a fair value basis. Some users say that they often value an entity on the basis of its business model and that in some circumstances cost-based information provides relevant information that can be used to predict likely actual cash flows.

BC12 Some, including some of those who generally support the broad application of fair value for financial assets, raise concerns about the use of fair value when fair value cannot be determined within a narrow range. Those views were consistent with the general concerns raised during the financial crisis. Many also believe that other issues, including financial statement presentation, need to be addressed before a comprehensive fair value measurement requirement would be feasible.

BC13 In response to those views, the Board decided that measuring all financial assets at fair value is not the most appropriate approach to improving the financial reporting for financial instruments. Accordingly, the exposure draft proposed that entities should classify financial assets into two primary measurement categories: amortised cost and fair value (the 'mixed attribute approach'). The Board noted that both of those measurement methods can provide useful information to users of financial statements for particular types of financial assets in particular circumstances.

BC14 Almost all respondents to the exposure draft supported the mixed attribute approach, stating that amortised cost provides relevant and useful information about particular financial assets in particular circumstances because it provides information about the entity's likely actual cash flows. Some respondents said

 © IASCF

that fair value does not provide such information because it assumes that the financial asset is sold or transferred on the measurement date.

BC15 Accordingly, IFRS 9 requires some financial assets to be measured at amortised cost if particular conditions are met.

Fair value information in the statements of financial position and financial performance

BC16 Some respondents to the exposure draft proposed that fair value information should be presented in the statement of financial position for financial assets measured at amortised cost. Some of those supporting such presentation said that the information provided would be more reliable and timely if it were required to be presented in the statement of financial position rather than in the notes.

BC17 The Board also considered whether the total gains and losses for the period related to fair value measurements in Level 3 of the fair value measurement hierarchy (paragraph 27A of IFRS 7 *Financial Instruments: Disclosures* describes the levels in the fair value hierarchy) should be presented separately in the statement of comprehensive income. Those supporting such presentation said that its prominence would draw attention to how much of the total fair value gain or loss for the period was attributable to fair value measurements that are subject to more measurement uncertainty.

BC18 The Board decided that it would reconsider both issues at a future date. The Board noted that the Level 3 gains or losses for the period are required to be disclosed in the notes to the financial statements in accordance with IFRS 7. The Board also noted that neither proposal had been exposed for public comment and further consultation was required. The Board decided that these two issues should form part of convergence discussions with the FASB.

Approach to classification

BC19 The exposure draft proposed that an entity should classify its financial assets into two primary measurement categories on the basis of the financial assets' characteristics and the entity's business model for managing them. Thus, a financial asset would be measured at amortised cost if two conditions were met:

(a) the financial asset has only basic loan features; and

(b) the financial asset is managed on a contractual yield basis.

A financial asset that did not meet both conditions would be measured at fair value.

BC20 Most respondents supported classification based on the contractual terms of the financial asset and how an entity manages groups of financial assets. Although they agreed with the principles proposed in the exposure draft, some did not agree with the way the approach was described and said that more application guidance was needed, in particular to address the following issues:

(a) the order in which the two conditions are considered;

(b) how the 'managed on a contractual yield basis' condition should be applied; and

(c) how the 'basic loan features' condition should be applied.

BC21 Most respondents agreed that the two conditions for determining how financial assets are measured were necessary. However, many questioned the order in which the two conditions should be considered. The Board agreed with those comment letters that stated that it would be more efficient for an entity to consider the business model condition first. Therefore, the Board clarified that entities would consider the business model first. However, the Board noted that the contractual cash flow characteristics of any financial asset within a business model that has the objective of collecting contractual cash flows must also be assessed to ensure that amortised cost provides relevant information to users.

The entity's business model

BC22 The Board concluded that an entity's business model affects the predictive quality of contractual cash flows—ie whether the likely actual cash flows will result primarily from the collection of contractual cash flows. Accordingly, the exposure draft proposed that a financial asset should be measured at amortised cost only if it is 'managed on a contractual yield basis'. This condition was intended to ensure that the measurement of a financial asset provides information that is useful to users of financial statements in predicting likely actual cash flows.

BC23 Almost all respondents to the exposure draft agreed that classification and measurement should reflect how an entity manages its financial assets. However, most expressed concern that the term 'managed on a contractual yield basis' would not adequately describe that principle and that more guidance was needed.

BC24 In August 2009 the FASB posted on its website a description of its tentative approach to classification and measurement of financial instruments. That approach also considers the entity's business model. Under that approach, financial instruments would be measured at fair value through profit or loss unless:

> ... an entity's business strategy is to hold debt instruments with principal amounts for collection or payment(s) of contractual cash flows rather than to sell or settle the financial instruments with a third party ...

The FASB also provided explanatory text:

> ... an entity's business strategy for a financial instrument would be evaluated based on how the entity manages its financial instruments rather than based on the entity's intent for an individual financial instrument. The entity also would demonstrate that it holds a high proportion of similar instruments for long periods of time relative to their contractual terms.

BC25 The Board had intended 'managed on a contractual yield basis' to describe a similar condition. However, it decided not to use the FASB's proposed guidance because the additional guidance included would still necessitate significant judgement. In addition, the Board noted that the FASB's proposed approach might be viewed as very similar to the notion of 'held to maturity' in IAS 39, which could result in 'bright line' guidance on how to apply it. Most respondents believed the Board should avoid such bright lines and that an entity should be required to exercise judgement.

 © IASCF

BC26 Therefore, in response to the concerns noted in paragraph BC23, the Board clarified the condition by requiring an entity to measure a financial asset at amortised cost only if the objective of the entity's business model is to hold the financial asset to collect the contractual cash flows. The Board also clarified in the application guidance that:

(a) it is expected that an entity may sell some financial assets that it holds with an objective of collecting the contractual cash flows. Very few business models entail holding all instruments until maturity. However, frequent buying and selling of financial assets is not consistent with a business model of holding financial assets to collect contractual cash flows.

(b) an entity needs to use judgement to determine at what level this condition should be applied. That determination is made on the basis of how an entity manages its business. It is not made at the level of an individual financial asset.

BC27 The Board noted that an entity's business model does not relate to a choice (ie it is not a voluntary designation) but rather it is a matter of fact that can be observed by the way an entity is managed and information is provided to its management.

BC28 For example, if an investment bank uses a trading business model, it could not easily become a savings bank that uses an 'originate and hold' business model. Therefore, a business model is very different from 'management intentions' which can relate to a single instrument. The Board concluded that sales or transfers of financial instruments before maturity would not be inconsistent with a business model with an objective of collecting contractual cash flows, as long as such transactions were consistent with that business model, rather than with a business model that has the objective of realising changes in fair values.

Contractual cash flow characteristics

BC29 The exposure draft proposed that only financial instruments with basic loan features could be measured at amortised cost. It specified that a financial instrument has basic loan features if its contractual terms give rise on specified dates to cash flows that are solely payments of principal and interest on the principal amount outstanding. For the purposes of this condition, interest is consideration for the time value of money and the credit risk associated with the principal amount outstanding during a particular period of time, which may include a premium for liquidity risk.

BC30 The objective of the effective interest method for financial instruments measured at amortised cost is to allocate interest revenue or expense to the relevant period. Cash flows that are interest always have a close relation to the amount advanced to the debtor (the 'funded' amount) because interest is consideration for the time value of money and the credit risk associated with the issuer of the instrument and with the instrument itself. The Board noted that the effective interest method is not an appropriate method to allocate cash flows that are not principal or interest on the principal amount outstanding. The Board concluded that if a financial asset contains contractual cash flows that are not principal or interest on the principal amount outstanding then a valuation overlay to contractual cash flows (fair value) is required to ensure that the reported financial information provides useful information.

© IASCF

BC31 Most respondents to the exposure draft agreed with the principle that classification should reflect the contractual terms of the financial asset. However, many objected to the label 'basic loan features' and requested more guidance to apply the principle to particular financial assets. Respondents were also concerned that the exposure draft did not discuss 'immaterial' or 'insignificant' features that they believed ought not to affect classification.

BC32 The Board decided to clarify how contractual cash flow characteristics should affect classification and improve the examples that illustrate how the condition should be applied. It decided not to add application guidance clarifying that the notion of materiality applies to this condition, because that notion applies to every item in the financial statements. However, it did add application guidance that a contractual cash flow characteristic does not affect the classification of a financial asset if it is 'not genuine'.

Application of the two classification conditions to particular financial assets

Investments in contractually linked instruments (tranches)

BC33 A structured investment vehicle may issue different tranches to create a 'waterfall' structure that prioritises the payments by the issuer to the holders of the different tranches. In typical waterfall structures, multiple contractually linked instruments effect concentrations of credit risk in which payments to holders are prioritised. Such structures specify the order in which any losses that the issuer incurs are allocated to the tranches. The exposure draft concluded that tranches providing credit protection (albeit on a contingent basis) to other tranches are leveraged because they expose themselves to higher credit risk by writing credit protection to other tranches. Hence their cash flows do not represent solely payments of principal and interest on the principal amount outstanding. Thus, only the most senior tranche could have basic loan features and might qualify for measurement at amortised cost, because only the most senior tranche would receive credit protection in all situations.

BC34 The exposure draft proposed that the classification principle should be based on whether a tranche could provide credit protection to any other tranches in *any* possible scenario. In the Board's view, a contract that contains credit concentration features that create ongoing subordination (not only in a liquidation scenario) would include contractual cash flows that represent a premium for providing credit protection to other tranches. Only the most senior tranche does not receive such a premium.

BC35 In proposing this approach, the Board concluded that subordination in itself should not preclude amortised cost measurement. The ranking of an entity's instruments is a common form of subordination that affects almost all lending transactions. Commercial law (including bankruptcy law) typically sets out a basic ranking for creditors. This is required because not all creditors' claims are contractual (eg claims regarding damages for unlawful behaviour and for tax liabilities or social insurance contributions). Although it is often difficult to determine exactly the degree of leverage resulting from this subordination, the Board believes that it is reasonable to assume that commercial law does not intend to create leveraged credit exposure for general creditors such as trade

 © IASCF

creditors. Thus, the Board believes that the credit risk associated with general creditors does not preclude the contractual cash flows representing the payments of principal and interest on the principal amount outstanding. Consequently, the credit risk associated with any secured or senior liabilities ranking above general creditors should also not preclude the contractual cash flows from representing payments of principal and interest on the principal amount outstanding.

BC36 Almost all respondents disagreed with the approach in the exposure draft for investments in contractually linked instruments for the following reasons:

(a) It focused on form and legal structure rather than the economic characteristics of the financial instruments.

(b) It would create structuring opportunities because of the focus on the existence of a waterfall structure, without consideration of the characteristics of the underlying instruments.

(c) It would be an exception to the overall classification model, driven by anti-abuse considerations.

BC37 In particular, respondents argued that the proposals in the exposure draft would conclude that some tranches provide credit protection and therefore were ineligible for measurement at amortised cost, even though that tranche might have a lower credit risk than the underlying pool of instruments that would themselves be eligible for measurement at amortised cost.

BC38 The Board did not agree that the proposals in the exposure draft were an exception to the overall classification model. In the Board's view, those proposals were consistent with many respondents' view that any financial instrument that creates contractual subordination should be subject to the proposed classification criteria and no specific guidance should be required to apply the classification approach to these instruments. However, it noted that, for contractually linked instruments that effect concentrations of credit risk, many respondents did not agree that the contractual cash flow characteristics determined by the terms and conditions of the financial asset in isolation best reflected the economic characteristics of that financial asset.

BC39 Respondents proposed other approaches in which an investor 'looks through' to the underlying pool of instruments of a waterfall structure and measures the instruments at fair value if looking through is not possible. They made the following points:

(a) *Practicability:* The securitisation transactions intended to be addressed were generally over-the-counter transactions in which the parties involved had sufficient information about the assets to perform an analysis of the underlying pool of instruments.

(b) *Complexity:* Complex accounting judgement was appropriate to reflect the complex economic characteristics of the instrument. In particular, in order to obtain an understanding of the effects of the contractual terms and conditions, an investor would have to understand the underlying pool of instruments. Also, requiring fair value measurement if it were not practicable to look through to the underlying pool of instruments would allow an entity to avoid such complexity.

(c) *Mechanics:* Amortised cost measurement should be available only if all of the instruments in the underlying pool of instruments had contractual cash flows that represented payments of principal and interest on the principal amount outstanding. Some also suggested that instruments that change the cash flow variability of the underlying pool of instruments in a way that is consistent with representing solely payments of principal and interest on the principal amount outstanding, or aligned currency/interest rates with the issued notes, should not preclude amortised cost measurement.

(d) *Relative exposure to credit risk:* Many favoured use of a probability-weighted approach to assess whether an instrument has a lower or higher exposure to credit risk than the average credit risk of the underlying pool of instruments.

BC40 The Board was persuaded that classification based solely on the contractual features of the financial asset being assessed for classification would not capture the economic characteristics of the instruments when a concentrated credit risk arises through contractual linkage. Therefore, the Board decided that, unless it is impracticable, an entity should 'look through' to assess the underlying cash flow characteristics of the financial assets and to assess the exposure to credit risk of those financial assets relative to the underlying pool of instruments.

BC41 The Board concluded that the nature of contractually linked instruments that effect concentrations of credit risk justifies this approach because the variability of cash flows from the underlying pool of instruments is a reference point, and tranching only reallocates credit risk. Thus, if the contractual cash flows of the assets in the underlying pool represent payments of principal and interest on the principal amount outstanding, any tranche that is exposed to the same or lower credit risk (as evidenced by the cash flow variability of the tranche relative to the overall cash flow variability of the underlying instrument pool) would also be deemed to represent payments of principal and interest on the principal amount outstanding. The Board also took the view that such an approach would address many of the concerns raised in the comment letters with regard to structuring opportunities and the focus on the contractual form of the financial asset, rather than its underlying economic characteristics. The Board also noted that in order to understand and make the judgement about whether particular types of financial assets have the required cash flow characteristics, an entity would have to understand the characteristics of the underlying issuer to ensure that the instrument's cash flows are solely payments of principal and interest on the principal amount outstanding.

BC42 To apply this approach, the Board decided that an entity should:

(a) determine whether the contractual terms of the issued instrument (the financial asset being classified) give rise to cash flows that are solely payments of principal and interest on the principal amount outstanding. The Board concluded that the issued instrument must have contractual cash flows that are solely payments of principal and interest on the principal amount outstanding.

 © IASCF

(b) look through to the underlying pool of instruments until it can identify the instruments that are creating (rather than simply passing through) the cash flows.

(c) determine whether one or more of the instruments in the underlying pool has contractual cash flows that are solely payments of principal and interest on the principal amount outstanding. The Board concluded the underlying pool must contain one or more instruments that have contractual cash flows that are solely payments of principal and interest on the principal amount outstanding.

(d) assess whether any other instruments in the underlying pool only:

  (i) reduce the cash flow variability of the underlying pool of instruments in a way that is consistent with representing solely payments of principal and interest on the principal amount outstanding, or

  (ii) align the cash flows of the issued financial assets with the underlying pool of financial instruments.

  The Board concluded that the existence of such instruments does not preclude the cash flows from representing solely payments of principal and interest on the principal amount outstanding. The Board determined that the existence of other instruments in the pool would, however, preclude the cash flows representing solely payments of principal and interest on the principal amount outstanding. For example, an underlying pool that contains government bonds and an instrument that swaps government credit risk for (riskier) corporate credit risk would not have cash flows that represent solely principal and interest on the principal amount outstanding.

(e) measure at fair value any issued instrument in which any of the financial instruments in the underlying pool:

  (i) have cash flows that do not represent solely payments of principal and interest on the principal amount outstanding; or

  (ii) could change so that cash flows may not represent solely payments of principal and interest on the principal amount outstanding at any point in the future.

(f) measure at fair value any issued instrument whose exposure to credit risk in the underlying pool of financial instruments is greater than the exposure to credit risk of the underlying pool of financial instruments. The Board decided that if the range of expected losses on the issued instrument is greater than the weighted average range of expected losses on the underlying pool of financial instruments, then the issued instrument should be measured at fair value.

BC43 The Board also decided that if it were not practicable to look through to the underlying pool of financial instruments, entities should measure the issued instrument at fair value.

Financial assets acquired at a discount that reflects incurred credit losses

BC44 The exposure draft proposed that if a financial asset is acquired at a discount that reflects incurred credit losses, it cannot be measured at amortised cost because:

(a) the entity does not hold such financial assets to collect the cash flows arising from those assets' contractual terms; and

(b) an investor acquiring a financial asset at such a discount believes that the actual losses will be less than the losses that are reflected in the purchase price. Thus, that asset creates exposure to significant variability in actual cash flows and such variability is not interest.

BC45 Almost all respondents disagreed with the Board's conclusion that these assets cannot be held to collect the contractual cash flows. They regarded that conclusion as an exception to a classification approach based on the entity's business model for managing the financial assets. In particular, they noted that entities could acquire and subsequently manage such assets as part of an otherwise performing asset portfolio for which the objective of the entity's business model is to hold the assets to collect contractual cash flows.

BC46 Respondents also noted that an entity's expectations about actual future cash flows are not the same as the contractual cash flows of the financial asset. Those expectations are irrelevant to an assessment of the financial asset's contractual cash flow characteristics.

BC47 The Board agreed that the general classification approach in IFRS 9 should apply to financial assets acquired at a discount that reflects incurred credit losses. Thus, when such assets meet the conditions in paragraph 4.2, they are measured at amortised cost.

Alternative approaches to classification

BC48 In its deliberations leading to the exposure draft, the Board discussed alternative approaches to classification and measurement. In particular, it considered an approach in which financial assets that have basic loan features, are managed on a contractual yield basis and meet the definition of loans and receivables in IAS 39 would be measured at amortised cost. All other financial assets would be measured at fair value. The fair value changes for each period for those financial assets with basic loan features that are managed on a contractual yield basis would be disaggregated and presented as follows:

(a) changes in recognised value determined on an amortised cost basis (including impairments determined using the incurred loss impairment requirements in IAS 39) would be presented in profit or loss; and

(b) any difference between the amortised cost measure in (a) and the fair value change for the period would be presented in other comprehensive income.

BC49 The Board also considered variants in which all financial assets and financial liabilities would be measured at fair value. One variant would be to present both the amounts in paragraph BC48(a) and (b) in profit or loss, but separately. Another variant would be to measure all financial instruments (including financial assets that meet the two conditions specified in the exposure draft and meet the

© IASCF

definition of loans and receivables in IAS 39) at fair value in the statement of financial position. All financial instruments (including financial liabilities) with basic loan features that are managed on a contractual yield basis would be disaggregated and presented as described in paragraph BC48(a) and (b).

BC50 Respondents noted that the alternative approach described in paragraph BC48 and both variants described in paragraph BC49 would result in more financial assets and financial liabilities being measured at fair value. Respondents also noted that the alternative approach would apply only to financial assets. Lastly, almost all respondents noted that splitting gains and losses between profit or loss and other comprehensive income would increase complexity and reduce understandability. The Board concluded that those approaches would not result in more useful information than the approach in IFRS 9 and did not consider them further.

BC51 The Board also considered and rejected the following approaches to classification:

(a) *Classification based on the definition of held for trading:* A few respondents suggested that all financial assets and financial liabilities that are not 'held for trading' should be eligible for measurement at amortised cost. However, in the Board's view, the notion of 'held for trading' is too narrow and cannot appropriately reflect all situations in which amortised cost does not provide useful information.

(b) *Three-category approach:* Some respondents suggested retaining a three-category approach, ie including a third category similar to the available-for-sale category in IAS 39. However, in the Board's view, such an approach would neither significantly improve nor reduce the complexity of the reporting for financial instruments.

(c) *Classification based only on the business model:* A small number of respondents thought the contractual terms of the instrument condition was unnecessary and that classification should depend solely on the entity's business model for managing financial instruments. However, in the Board's view, determining classification solely on the basis of how an entity manages its financial instruments would result in misleading information that is not useful to a user in understanding the risks associated with complex or risky instruments. The Board concluded, as had almost all respondents, that the contractual cash flow characteristics condition is required to ensure that amortised cost is used only when it provides information that is useful in predicting the entity's future cash flows.

(d) *Amortised cost as the default option:* The Board considered developing conditions that specified when a financial asset must be measured at fair value, with the requirement that all other financial instruments would be measured at amortised cost. The Board rejected that approach because it believes that new conditions would have to be developed in the future to address innovative financial products. In addition, the Board noted that such an approach would not be practical because an entity can apply amortised cost only to some types of financial instruments.

(e) *Originated loan approach:* In developing an approach to distinguish between financial assets measured at fair value and amortised cost the Board considered a model in which only loans originated by the entity would qualify for amortised cost measurement. The Board acknowledged that for originated instruments the entity potentially has better information about the future contractual cash flows and credit risk than for purchased loans. However, the Board decided not to pursue that approach, mainly because some entities manage originated and purchased loans in the same portfolio. Distinguishing between originated and purchased loans, which would be done mainly for accounting purposes, would involve systems changes. In addition, the Board noted that 'originated loans' might easily be created by placing purchased loans into an investment vehicle. The Board also noted that the definition of loans and receivables in IAS 39 had created application problems in practice.

Tainting

BC52 The Board considered whether it should prohibit an entity from classifying a financial asset as measured at amortised cost if the entity had previously sold or reclassified financial assets rather than holding them to collect the contractual cash flows. A restriction of this kind is often called 'tainting'. However, the Board believes that classification based on the entity's business model for managing financial assets and the contractual cash flow characteristics of those financial assets provides a clear rationale for measurement. A tainting provision would increase the complexity of application, be unduly prohibitive in the context of that approach and could give rise to classification inconsistent with the classification approach. However, the Board amended IAS 1 *Presentation of Financial Statements* to require an entity to present separately in the statement of comprehensive income all gains and losses arising from the derecognition of financial assets measured at amortised cost. The Board also amended IFRS 7 to require an entity to disclose an analysis of those gains and losses, including the reasons for derecognising those financial assets. Those requirements enable users of financial statements to understand the effects of derecognising before maturity instruments measured at amortised cost and also provides transparency in situations where an entity has measured financial assets at amortised cost on the basis of having an objective of managing those assets in order to collect the contractual cash flows but regularly sells them.

Embedded derivatives

BC53 An embedded derivative is a derivative component of a hybrid (combined) contract that also includes a non-derivative host, with the effect that some of the cash flows of the combined contract vary like the cash flows of a stand-alone derivative contract. IAS 39 requires an entity to assess all contracts to determine whether they contain one or more embedded derivatives that are required to be separated from the host and accounted for as stand-alone derivatives.

 © IASCF

BC54 Many respondents to the discussion paper *Reducing Complexity in Reporting Financial Instruments* commented that the requirements and guidance in IAS 39 are complex, rule-based and internally inconsistent. Respondents, and others, also noted the many application problems that arise from requirements to assess all non-derivative contracts for embedded derivatives and, if required, to account for and measure those embedded derivatives separately as stand-alone derivatives.

BC55 The Board discussed three approaches for accounting for embedded derivatives:

(a) to maintain the requirements in IAS 39;

(b) to use 'closely related' (used in IAS 39 to determine whether an embedded derivative is required to be separated from the host) to determine the classification for the contract in its entirety; and

(c) to use the same classification approach for all financial assets (including hybrid contracts).

BC56 The Board rejected the first two approaches. The Board noted that both would rely on the assessment of whether an embedded derivative is 'closely related' to the host. The 'closely related' assessment in IAS 39 is based on a list of examples that are inconsistent and unclear. That assessment is also a significant source of complexity. Both approaches would result in hybrid contracts being classified using conditions different from those that would be applied to all non-hybrid financial instruments. Consequently, some hybrid contracts whose contractual cash flows do not solely represent payments of principal and interest on the principal amount outstanding might be measured at amortised cost. Similarly, some hybrid contracts whose contractual cash flows do meet the conditions for measurement at amortised cost might be measured at fair value. The Board also believes that neither approach would make it easier for users of financial statements to understand the information that financial statements present about financial instruments.

BC57 Therefore, the exposure draft proposed that entities should use the same classification approach for all financial instruments, including hybrid contracts with hosts within the scope of the proposed IFRS ('financial hosts'). The Board concluded that a single classification approach for all financial instruments and hybrid contracts with financial hosts was the only approach that responded adequately to the criticisms described above. The Board noted that using a single classification approach improves comparability by ensuring consistency in classification, and hence makes it easier for users to understand the information that financial statements present about financial instruments.

BC58 In the responses to the exposure draft, some respondents, mainly preparers, stated their preference for keeping or modifying the bifurcation model that was in IAS 39. They noted that:

(a) eliminating the requirement to account for embedded derivatives as stand-alone derivatives would lead to increased volatility in profit or loss and result in accounting that did not reflect the underlying economics and risk management or business model considerations in a transaction. For example, the components of some hybrid financial instruments may be managed separately.

(b) structuring opportunities would be created, for example if an entity entered into two transactions that have the same economic effect as entering into a single hybrid contract.

BC59 However, the Board confirmed the proposals in the exposure draft for the following reasons:

(a) The elimination of the embedded derivatives guidance for hybrid contracts with financial hosts reduces the complexity in financial reporting of financial assets by eliminating another classification approach and improves the reporting for financial instruments. Many constituents agreed with this conclusion.

(b) In the Board's view, the underlying rationale for separate accounting for embedded derivatives is not to reflect risk management activities, but to avoid entities circumventing the recognition and measurement requirements for derivatives. Accordingly it is an exception to the definition of the unit of account (the contract) motivated by a wish to avoid abuse. It would reduce complexity to eliminate an anti-abuse exception.

(c) The Board noted the concerns about structuring opportunities referred to in paragraph BC58(b). However, two contracts represent two units of account. Reconsideration of the unit of account forms part of a far broader issue for financial reporting that is outside the scope of the Board's considerations in IFRS 9. In addition, embedded derivative features often do not have contractual cash flows that represent payments of principal and interest on the principal amount outstanding and thus the entire hybrid contract would not be eligible to be measured at amortised cost. However, the Board noted that this would provide more relevant information because the embedded derivative feature affects the cash flows ultimately arising from the hybrid contract. Thus, applying the classification approach to the hybrid contract in its entirety would depict more faithfully the amount, timing and uncertainty of future cash flows.

(d) In the Board's view, accounting for the hybrid contract as one unit of account is consistent with the project's objective—to improve the usefulness for users in their assessment of the timing, amount and uncertainty of future cash flows of financial instruments and to reduce the complexity in reporting financial instruments.

Because the Board decided that the scope of IFRS 9 at this stage should be assets within the scope of IAS 39, this decision applies only to hybrid contracts with financial asset hosts.

BC60 The Board decided not to consider at this time changes to the requirements in IAS 39 for embedded derivatives in hybrid contracts with non-financial hosts. The Board acknowledged that those requirements are also complex and have resulted in some application problems, including the question of whether particular types of non-financial contracts are within the scope of IAS 39. The Board accepted the importance of ensuring that any proposals for hybrid contracts with non-financial hosts should also address which non-financial contracts should be within the scope of IFRS 9. The Board also noted the importance for many non-financial entities of hedge accounting for non-financial

© IASCF

items, and the relationship to both scope and embedded derivative requirements. Therefore, the Board concluded that the requirements for hybrid contracts with non-financial hosts should be addressed in a later phase of the project to replace IAS 39.

Option to designate a financial asset at fair value

BC61 IAS 39 allows entities an option to designate on initial recognition any financial asset or financial liability as measured at fair value through profit or loss if one (or more) of the following three conditions is met:

(a) Doing so eliminates or significantly reduces a measurement or recognition inconsistency (sometimes referred to as an 'accounting mismatch') that would otherwise arise from measuring assets or liabilities on different bases or recognising the gains and losses on them on different bases.

(b) A group of financial assets, financial liabilities or both is managed and its performance is evaluated on a fair value basis, in accordance with a documented risk management or investment strategy, and information about the group is provided internally on that basis to the entity's key management personnel.

(c) The financial asset or financial liability contains one or more embedded derivatives (and particular other conditions described in paragraph 11A of IAS 39 are met) and the entity elects to account for the hybrid (combined) contract in its entirety.

BC62 However, in contrast to IAS 39, IFRS 9 requires:

(a) any financial asset that is not managed within a business model that has the objective of collecting contractual cash flows to be measured at fair value; and

(b) hybrid contracts with financial asset hosts to be classified in their entirety, hence eliminating the requirement to identify and account for embedded derivatives separately.

Accordingly, the Board concluded that the conditions described in paragraph BC61(b) and (c) are unnecessary for financial assets.

BC63 The Board retained the eligibility condition described in paragraph BC61(a) because it mitigates some anomalies that result from the different measurement attributes used for financial instruments. In particular, it eliminates the need for fair value hedge accounting of fair value exposures when there are natural offsets. It also avoids problems arising from a mixed measurement model when some financial assets are measured at amortised cost and related financial liabilities are measured at fair value. A separate phase of the project is considering hedge accounting, and the fair value option will be better considered in that context. The Board also noted that particular industry sectors believe it is important to be able to mitigate such anomalies until other IASB projects are completed (eg insurance contracts). The Board decided to defer consideration of changes to the eligibility condition set out in paragraph BC61(a) as part of the future exposure draft on hedge accounting.

BC64 Almost all the respondents to the exposure draft supported the proposal to retain the fair value option if such designation eliminates or significantly reduces an accounting mismatch. Although some respondents would prefer an unrestricted fair value option, they acknowledged that an unrestricted fair value option has been opposed by many in the past and it is not appropriate to pursue it now.

Reclassification between fair value and amortised cost categories

BC65 The exposure draft proposed to prohibit reclassification of financial assets between the amortised cost and fair value categories. The Board's rationale for that proposal was as follows:

(a) Requiring (or permitting) reclassifications would not make it easier for users of financial statements to understand the information that financial statements provide about financial instruments.

(b) Requiring (or permitting) reclassifications would increase complexity because detailed guidance would be required to specify when reclassifications would be required (or permitted) and the subsequent accounting for reclassified financial instruments.

(c) Reclassification should not be necessary because classification is based on the entity's business model and that business model is not expected to change.

BC66 In their responses, some users questioned the usefulness of reclassified information, noting concerns about the consistency and rigour with which any requirements would be applied. Some were also concerned that opportunistic reclassifications would be possible.

BC67 However, almost all respondents (including most users) argued that prohibiting reclassification is inconsistent with a classification approach based on how an entity manages its financial assets. They noted that in an approach based on an entity's business model for managing financial assets, reclassifications would provide useful, relevant and comparable information to users because it would ensure that financial statements faithfully represent how those financial assets are managed at the reporting date. In particular, most users stated that, conceptually, reclassifications should not be prohibited when the classification no longer reflects how the instruments would be classified if the items were newly acquired. If reclassification were prohibited, the reported information would not reflect the amounts, timing and uncertainty of future cash flows.

BC68 The Board was persuaded by these arguments and decided that reclassification should not be prohibited. The Board noted that prohibiting reclassification decreases comparability for like instruments managed in the same way.

BC69 Some respondents contended that reclassifications should be permitted, rather than required, but did not explain their justification. However, the Board noted that permitting reclassification would decrease comparability, both between different entities and for instruments held by a single entity, and would enable an entity to manage its profit or loss by selecting the timing of when future gains or losses are recognised. Therefore, the Board decided that reclassification should be required when the entity's business model for managing those financial assets changes.

 © IASCF

BC70 The Board noted that, as highlighted by many respondents, such changes in business model would be very infrequent, significant and demonstrable and determined by the entity's senior management as a result of external or internal change.

BC71 The Board considered arguments that reclassification should also be permitted or required when contractual cash flow characteristics of a financial asset vary (or may vary) over that asset's life based on its original contractual terms. However, the Board noted that, unlike a change in business model, the contractual terms of a financial asset are known at initial recognition. An entity classifies the financial asset at initial recognition on the basis of the contractual terms over the life of the instrument. Therefore the Board decided that reclassification on the basis of a financial asset's contractual cash flows should not be permitted.

BC72 The Board considered how reclassifications should be accounted for. Almost all respondents said that reclassifications should be accounted for prospectively and should be accompanied by robust disclosures. The Board reasoned that if classification and reclassification are based on the business model within which they are managed, classification should always reflect the business model within which the financial asset was managed at the reporting date. To apply the reclassification retrospectively would not reflect how the financial assets were managed at the prior reporting dates.

BC73 The Board also considered the date at which reclassifications could take effect. Some respondents stated that reclassifications should be reflected in the entity's financial statements as soon as the entity's business model for the relevant instruments changes. To do otherwise would be contradictory to the objective of reclassification—ie to reflect how the instruments are managed. However, the Board decided that reclassifications should take effect from the beginning of the following reporting period. In the Board's view, entities should be prevented from choosing a reclassification date to achieve an accounting result. The Board also noted that a change in an entity's business model is a significant and demonstrable event; therefore, an entity will most likely disclose such an event in its financial statements in the reporting period in which the change in business model takes place.

BC74 The Board also considered and rejected the following approaches:

(a) *Disclosure approach:* Quantitative and qualitative disclosure (instead of reclassification) could be used to address when the classification no longer reflects how the financial assets would be classified if they were newly acquired. However, in the Board's view, disclosure is not an adequate substitute for recognition.

(b) *One-way reclassification:* Reclassification would be required only to fair value measurement, ie reclassification to amortised cost measurement would be prohibited. Proponents of this approach indicated that such an approach might minimise abuse of the reclassification requirements and result in more instruments being measured at fair value. However, in the Board's view, there is no conceptual reason to require reclassification in one direction but not the other.

Measurement

Exception in IAS 39 from fair value measurement for some unquoted equity instruments (and some derivatives linked to those instruments)

BC75 The Board believes that measurement at amortised cost is not applicable to equity investments because such financial assets have no contractual cash flows and hence there are no contractual cash flows to amortise. IAS 39 contains an exception from fair value measurement for investments in equity instruments (and some derivatives linked to those investments) that do not have a quoted price in an active market and whose fair value cannot be reliably measured. Those equity investments are required to be measured at cost less impairment, if any. Impairment losses are measured as the difference between the carrying amount of the financial asset and the present value of estimated future cash flows discounted at the current market rate of return for a similar financial asset.

BC76 The exposure draft proposed that all investments in equity instruments (and derivatives linked to those investments) should be measured at fair value for the following reasons:

(a) For investments in equity instruments and derivatives, fair value provides the most relevant information. Cost provides little, if any, information with predictive value about the timing, amount and uncertainty of the future cash flows arising from the instrument. In many cases, fair value will differ significantly from historical cost (this is particularly true for derivatives measured at cost under the exception).

(b) To ensure that a financial asset accounted for under the cost exception is not carried above its recoverable amount, IAS 39 requires an entity to monitor instruments measured at cost for any impairment. Calculating any impairment loss is similar to determining fair value (ie the estimated future cash flows are discounted using the current market rate of return for a similar financial asset and compared with the carrying amount).

(c) Removing the exception would reduce complexity because the classification model for financial assets would not have a third measurement attribute and would not require an additional impairment methodology. Although there might be an increase in the complexity of determining fair values on a recurring basis that complexity would be offset (at least partially) by the fact that all equity instruments and derivatives have one common measurement attribute; thus the impairment requirements would be eliminated.

BC77 Many respondents agreed that cost does not provide useful information about future cash flows arising from equity instruments and that conceptually such equity instruments should be measured using a current measurement attribute such as fair value. Some of those respondents generally agreed with the removal of the exception, but suggested that disclosures would have to include information about the uncertainties surrounding measurement.

 © IASCF

BC78 However, many respondents (mainly preparers from non-financial entities and some auditors) disagreed with the proposal to eliminate the current cost exception on the grounds of the reliability and usefulness of fair value measurement and the cost and difficulty involved in determining fair value on a recurring basis. They generally preferred to keep a cost exception, similar to that in IAS 39. Some noted that the proposals would not reduce complexity, because they would increase complexity in measurement. Furthermore, a few believed that cost could provide useful information if the financial asset is held for the long term.

BC79 The Board considered those arguments as follows:

(a) *Reliability and usefulness of fair value measurement*

Respondents noted that IAS 39 included a cost exception because of the lack of reliability of fair value measurement for particular equity instruments and contended that this rationale is still valid. They believe that, given the lack of available reliable information, any fair value measurement would require significant management judgement or might be impossible. They also believe that comparability would be impaired by the requirement to measure such equity instruments at fair value. However, those respondents had considered the question of reliability of fair value for the instruments concerned in isolation. In the Board's view, the usefulness of information must be assessed against all four of the qualitative characteristics in the *Framework*: reliability, understandability, relevance and comparability. Thus, cost is a reliable (and objective) amount, but has little, if any, relevance. In the Board's view measuring all equity instruments at fair value, including those that are currently measured using the cost exception in IAS 39, meets the criteria in the *Framework* for information to be reliable if appropriate measurement techniques and inputs are employed. The Board noted that its project on fair value measurement will provide guidance on how to meet that objective.

(b) *Cost and difficulty involved in determining fair value on a recurring basis*

Many respondents, particularly in emerging economies, said that they faced difficulty in obtaining information that might be relied on to use in valuation. Others said that they would inevitably rely heavily on external experts at significant cost. Many questioned whether the requirement to determine fair value on a recurring basis would involve significant costs and efforts that are not offset by the incremental benefit to usefulness from fair value. The Board considered the costs of requiring such equity investments to be measured at fair value from the perspectives of valuation methodology and expertise, as well as the ability to obtain the information required for a fair value measurement. The Board noted that valuation methods for equity investments are well-developed and are often far less complex than those required for other financial instruments that are required to be measured at fair value, including many complex derivative products. Although some expressed concern that smaller entities applying IFRSs might not have internal systems or expertise to determine easily the fair value of equity investments held, the Board noted that basic shareholder rights generally enable an entity to obtain the necessary information to perform a valuation. The Board acknowledged that there

are circumstances in which the cost of determining fair value could outweigh the benefits from fair value measurement. In particular, the Board noted that, in some jurisdictions, entities hold high numbers of unquoted equity instruments that are currently accounted for under the cost exception and the value of a single investment is considered low. However, the Board concluded that if the volume of the investments individually or aggregated is material the incremental benefit of fair value generally outweighs the additional cost because of the impact of the investments on the financial performance and position of the entity.

BC80 The Board noted that there are some circumstances in which cost might be representative of fair value and decided to provide additional application guidance on those circumstances to alleviate some of the concerns expressed. However, the Board also noted that those circumstances would never apply to equity investments held by particular entities such as financial institutions and investment funds.

BC81 The Board considered whether a simplified approach to measurement should be provided for equity instruments when fair value measurement was impracticable. The Board also discussed possible simplified measurement approaches, including management's best estimate of the price it would accept to sell or buy the instrument, or changes in the share of net assets. However, the Board concluded that a simplified measurement approach would add complexity to the classification approach and reduce the usefulness of information to users of financial statements. Those disadvantages would not be offset by the benefit of reduced cost to preparers of financial statements.

Gains and losses

Investments in equity instruments

BC82 IFRS 9 permits an entity to make an irrevocable election to present in other comprehensive income changes in the value of any investment in equity instruments that is not held for trading. The term 'equity instrument' is defined in IAS 32 *Financial Instruments: Presentation*. The Board noted that in particular circumstances a puttable instrument (or an instrument that imposes on the entity an obligation to deliver to another party a pro rata share of the net assets of the entity only on liquidation) is classified as equity. However, the Board noted that such instruments do not meet the definition of an equity instrument.

BC83 In the Board's view, fair value provides the most useful information about investments in equity instruments to users of financial statements. However, the Board noted arguments that presenting fair value gains and losses in profit or loss for some equity investments may not be indicative of the performance of the entity, particularly if the entity holds those equity instruments for non-contractual benefits, rather than primarily for increases in the value of the investment. An example could be a requirement to hold such an investment if an entity sells its products in a particular country.

BC84 The Board also noted that, in their valuation of an entity, users of financial statements often differentiate between fair value changes arising from equity investments held for purposes other than generating investment returns and

 © IASCF

equity investments held for trading. Thus, the Board believes that separate presentation in other comprehensive income of gains and losses for some investments could provide useful information to users of financial statements because it would allow them to identify easily, and value accordingly, the associated fair value changes.

BC85 Almost all respondents to the exposure draft supported recognition of fair value gains and losses in other comprehensive income for particular equity investments. They agreed that an entity should make an irrevocable election to identify those equity instruments. However, some users did not support these proposals in the exposure draft.

BC86 The concerns expressed in the comment letters were as follows:

(a) *Dividends:* The exposure draft proposed that dividends on equity instruments measured at fair value with changes recognised in other comprehensive income would also be recognised in other comprehensive income. Nearly all respondents objected to that proposal. They argued that dividends are a form of income that should be presented in profit or loss in accordance with IAS 18 *Revenue* and noted that those equity investments are sometimes funded with debt instruments whose interest expense is recognised in profit or loss. As a result, presenting dividends in other comprehensive income would create a 'mismatch'. Some listed investment funds stated that without recognising dividend income in profit or loss their financial statements would become meaningless to their investors. The Board agreed with those arguments. The Board noted that structuring opportunities may remain because dividends could represent a return of investment, rather than a return on investment. Therefore, the Board decided that dividends that clearly represent a recovery of part of the cost of the investment are not recognised in profit or loss. However, in the Board's view, those structuring opportunities would be limited because an entity with the ability to control or significantly influence the dividend policy of the investment would not account for those investments in accordance with IFRS 9. Furthermore, the Board decided to require disclosures that would allow a user to compare easily the dividends recognised in profit or loss and the other fair value changes.

(b) *Recycling:* Many respondents, including many users, did not support the proposal to prohibit subsequent transfer ('recycling') of fair value changes to profit or loss (on derecognition of the investments in an equity instrument). Those respondents supported an approach that maintains a distinction between realised and unrealised gains and losses and said that an entity's performance should include all realised gains and losses. However, the Board concluded that a gain or loss on those investments should be recognised once only; therefore, recognising a gain or loss in other comprehensive income and subsequently transferring it to profit or loss is inappropriate. In addition, the Board noted that recycling of gains and losses to profit or loss would create something similar to the available-for-sale category in IAS 39 and would create the requirement to assess the equity instrument for impairment, which had created application problems. That would not significantly improve or reduce the

complexity of the financial reporting for financial assets. Accordingly, the Board decided to prohibit recycling of gains and losses into profit or loss when an equity instrument is derecognised.

(c) *Scope of exception:* Some respondents asked the Board to identify a principle that defined the equity instruments to which the exception should apply. However, they did not specify what that principle should be. The Board previously considered developing a principle to identify other equity investments whose fair value changes should be presented in profit or loss (or other comprehensive income), including a distinction based on whether the equity instruments represented a 'strategic investment'. However, the Board decided that it would be difficult, and perhaps impossible, to develop a clear and robust principle that would identify investments that are different enough to justify a different presentation requirement. The Board considered whether a list of indicators could be used to support the principle, but decided that such a list would inevitably be rule-based and could not be comprehensive enough to address all possible situations and factors. Moreover, the Board noted that such an approach would create complexity in application without necessarily increasing the usefulness of information to users of financial statements.

(d) *Irrevocability of the exception:* A small number of respondents believed that an entity should be able to reclassify equity instruments into and out of the fair value through other comprehensive income category if an entity starts or ceases to hold the investments for trading purposes. However, the Board decided that the option must be irrevocable to provide discipline to its application. The Board also noted that the option to designate a financial asset as measured at fair value is also irrevocable.

BC87 An entity may transfer the cumulative gain or loss within equity. In the light of jurisdiction-specific restrictions on components of equity, the Board decided not to provide specific requirements related to that transfer.

BC88 IFRS 9 amends IFRS 7 to require additional disclosures about investments in equity instruments that are measured at fair value through other comprehensive income. The Board believes those disclosures will provide useful information to users of financial statements about instruments presented in that manner and the effect of that presentation.

BC89 The Board noted that permitting an option for entities to present some gains and losses in other comprehensive income is an exception to the overall classification and measurement approach and adds complexity. However, the Board believes that the requirement that the election is irrevocable, together with the additional disclosures required, addresses many of those concerns.

Effective date

BC90 The Board recognises that many countries require time for translation and for introducing the mandatory requirements into law. In addition, entities require time to implement new standards. The Board usually sets an effective date of between six and eighteen months after issuing an IFRS. However, the Board has adopted a phased approach to publishing IFRS 9, so this is not possible.

 © IASCF

BC91 In the response to the exposure draft, respondents urged that:

(a) it would be helpful to preparers if the Board were to permit all phases of the project to replace IAS 39 to be adopted at the same time.

(b) it would be helpful to entities that issue insurance contracts if the effective date of IFRS 9 were aligned to the forthcoming IFRS on accounting for insurance contracts. Most of an insurer's assets are financial assets and most of its liabilities are insurance liabilities or financial liabilities. Thus, if an insurer applies IFRS 9 before it applies any new IFRS on insurance, it might face two rounds of major change in a short period. This would be disruptive for both users and preparers.

(c) because a number of countries will adopt IFRSs in the next few years, it would be helpful to entities in those countries if the Board did not require them to make two changes in a short period of time.

BC92 With these factors in mind, the Board decided it should require entities to apply the requirements of IFRS 9 for annual periods beginning on or after 1 January 2013. The Board intends that this date will allow entities to adopt at the same time the guidance from all phases of the project to replace IAS 39.

BC93 The Board will consider delaying the effective date of IFRS 9 if the impairment phase of the project to replace IAS 39 makes such a delay necessary, or if the new IFRS on insurance contracts has a mandatory effective date later than 2013, to avoid an insurer having to face two rounds of changes in a short period.

BC94 The Board decided to permit earlier application of IFRS 9 to allow an entity to apply the new requirements on classification and measurement of financial assets. This enables entities to use IFRS 9 in their 2009 annual financial statements and meets one of the objectives of the phased approach, ie to have improved classification and measurement requirements for financial assets in place for 2009 year-ends.

BC95 The effect of transition will be significant for some entities. As a result, there will be less comparability between entities that apply IFRS 9 and those that do not. Accordingly, IFRS 9 includes additional disclosures about the transition to IFRS 9.

Transition

BC96 IAS 8 *Accounting Policies, Changes in Accounting Estimates and Errors* states that retrospective application results in the most useful information to users because the information presented for all periods is comparable. Therefore, the exposure draft proposed retrospective application subject to some transition relief in particular circumstances. The Board considered the difficulties and associated costs of full retrospective application of the proposals in the exposure draft.

BC97 Most respondents agreed, in principle, with requiring retrospective application, but many questioned the practicability of the approach. In particular, many noted that the extensive exceptions to retrospective application that would be required to make such transition practicable significantly reduced (and possibly eliminated) any benefit that users might obtain from requiring comparative information to be restated.

© IASCF

BC98 The Board considered whether to require prospective application, but noted that such an approach does not provide comparable information for users of financial statements. In addition, the Board noted that any transition approach (such as prospective application) that requires resetting the effective interest rate for financial assets measured at amortised cost reduces the usefulness of information about interest income.

BC99 The Board decided to require retrospective application but provide transition relief to address particular difficulties that might arise from retrospective application. The Board also noted that IAS 8 sets out transition requirements that apply if retrospective application is impracticable and prohibits the use of hindsight when applying a new accounting policy to a prior period.

Transition relief

Impracticability exceptions

BC100 The Board acknowledged that it may be impracticable for an entity to apply the effective interest method or impairment requirements in IAS 39 retrospectively in some situations. The process would be cumbersome, in particular for an entity with a large number of financial assets that were previously measured at fair value but are measured at amortised cost in accordance with the approach in IFRS 9. Several loss events and reversals might have occurred between the date when the asset was initially recognised and the date of initial application of the IFRS. IFRS 9 requires that if applying the impairment requirements is impracticable or requires the use of hindsight, an entity should use previously determined fair value information to determine whether a financial asset was impaired in comparative periods. IFRS 9 also requires that the fair value at the date of initial application of the new requirements should be treated as the new amortised cost carrying amount of that financial asset in that case. The Board rejected proposals that entities should be permitted, but not required, to treat the fair value at the date of initial application as amortised cost because it would impair comparability and require significant guidance about when such an option should be permitted.

BC101 The Board noted that an entity would not have determined the fair value of an investment in an unquoted equity instrument (or a derivative on such an investment) that was previously accounted for in accordance with paragraphs 46(c) and 66 of IAS 39. Moreover, an entity will not have the necessary information to determine fair value retrospectively without using hindsight. Accordingly, IFRS 9 requires such instruments to be measured at fair value at the date of initial application.

Hybrid contracts

BC102 An entity may not have previously determined the fair value of a hybrid contract in its entirety. Moreover, an entity will not have the necessary information to determine fair value retrospectively without using hindsight. However, an entity would have been required to measure both the embedded derivative and host separately at fair value to apply the disclosure requirements in IFRS 7. Therefore, in comparative periods, IFRS 9 requires the sum of the fair value of the embedded derivative and the host to be used as an approximation of the fair value of the entire hybrid contract.

 © IASCF

BC103 The proposals in the exposure draft would have resulted in fair value measurement for many hybrid contracts for which the embedded derivative was accounted for separately in accordance with IAS 39. Some respondents asked for such treatment under IAS 39 to be 'grandfathered'. The Board noted that many such requests had been related to the proposed treatment of hybrid contracts with financial liability hosts, which are not included in the IFRS. Therefore the Board decided not to permit an option to grandfather hybrid contracts with financial hosts that were bifurcated in accordance with IAS 39 as an accounting policy choice because it would impair comparability, and because some such contracts may still have a significant remaining maturity.

Assessment of the objective of the entity's business model for managing financial assets

BC104 IFRS 9 requires an entity to assess whether the objective of an entity's business model is to manage financial assets to collect the contractual cash flows on the basis of circumstances at the date of initial application. The Board believes it would be difficult, and perhaps impossible, to assess that condition on the basis of circumstances when the instrument first satisfied the recognition criterion in IAS 39.

Assessment of qualifying criteria for fair value option

BC105 The Board decided that the assessment of whether a financial asset or financial liability meets the eligibility criterion for designation under the fair value option should be based on the circumstances at the date of initial application. IFRS 9 changes the classification of some financial assets, including eliminating two of the three eligibility criteria in IAS 39 for the fair value option for financial assets. Therefore, the Board believes that an entity should reconsider at transition its original assessment of whether to designate a financial asset or financial liability as at fair value through profit or loss.

Comparative information

BC106 As noted above, many respondents were concerned that the inevitable exceptions to full retrospective application would result in restated information that is incomplete. They proposed an approach similar to that used on first-time adoption of IFRSs and when entities adopted IAS 39 in 2005, in which the requirement to provide comparative information was waived. Some respondents believe that such an approach would address the concerns that, although IAS 1 requires only one year of comparative information, the legal and regulatory frameworks in many jurisdictions require further comparative periods to be presented. In those situations, the restatement of comparatives would be virtually impossible for an entity wishing to adopt IFRS 9 early.

BC107 In the Board's view, waiving the requirement to restate comparatives strikes a balance between the conceptually preferable method of full retrospective application (as stated in IAS 8) and the practicability of adopting the new classification model within a short time frame. Accordingly, the Board decided that it would permit, but not require, restatement of comparative periods by entities

that implement IFRS 9 for reporting periods beginning before 1 January 2012. However, those considerations would be less applicable for entities that adopted outside a short time frame. Therefore, restated comparative information is required if an entity adopts IFRS 9 for reporting periods beginning after 1 January 2012.

Date of initial application

BC108 The exposure draft stated that the date of initial application would be the date when an entity first applies the requirements in the IFRS. Many respondents questioned whether the date of initial application could be an arbitrary date between the date of issue of the IFRS (or even earlier) and the mandatory effective date, resulting in a loss of comparability over a long period of time. The Board agreed that a free choice would impair comparability, but noted it intended that entities should be able to apply the IFRS in 2009 or 2010 financial statements. Accordingly, the IFRS requires the date of initial application to be the beginning of a reporting period, but provides relief from this requirement for entities applying the IFRS for reporting periods beginning on or before 1 January 2011.

Hedge accounting

BC109 The Board decided not to carry forward the specific transition provisions on hedge accounting proposed in the exposure draft because they are not necessary.

Transitional disclosures

BC110 The exposure draft proposed disclosures for entities that apply the new IFRS 9 early. However, many noted that such disclosures would be useful for all entities applying IFRS 9 for the first time, and not only early adopters. The Board noted that the information necessary to make those disclosures would be readily available to the entity to make the necessary journal entries on transition and to account for the financial assets in the future. Accordingly, IFRS 9 requires all entities to supply additional disclosures on transition.

BC111 The Board rejected a proposal in the comment letters that entities should apply disclosures similar to those based on IFRS 1 *First-time Adoption of International Financial Reporting Standards* explaining the transition to the new IFRS. The Board noted that the disclosures in IFRS 1 relate to first-time adoption and not to changes in accounting policies. Disclosures about changes in an accounting policy are required by IAS 8.

Transition for future phases

BC112 The Board does not intend to require entities that apply IFRS 9 early also to apply early any future requirements arising from the project to improve IAS 39. However, to reduce the number of versions of IFRSs that can be applied, the Board intends that any future additions to IFRS 9 can be applied only if the entity also applies requirements published before them.

 © IASCF

Transitional insurance issues

BC113 The Board noted that insurers may face particular problems if they apply IFRS 9 before they apply the phase II standard on insurance contracts ('the new IFRS 4'). To avoid accounting mismatches in profit or loss, many insurers classify many of their financial assets as available for sale. If those insurers apply IFRS 9 before the new IFRS 4, they might decide to classify many of their financial assets at amortised cost (assuming they meet the relevant conditions in IFRS 9). When those insurers later apply the new IFRS 4, they may wish to reclassify those assets from amortised cost to fair value through profit or loss, but that may not generally be possible in accordance with IFRS 9. Thus, those insurers might have either to classify those assets at fair value through profit or loss during the intervening period or to continue to classify them at amortised cost when they apply the new IFRS 4. Either choice might lead to an accounting mismatch.

BC114 The Board considered whether it could reduce such mismatches by maintaining the available-for-sale category for insurers until they can apply the new IFRS 4. However, if the Board did so, it would have to create detailed and arbitrary descriptions of the entities and instruments to which that approach would apply. The Board concluded that permitting the continuation of that category would not provide more useful information for users.

BC115 The Board will consider in developing the new IFRS 4 whether to provide an option for insurers to reclassify some or all financial assets when they first apply the new IFRS 4. This would be similar to the option in paragraph 45 of IFRS 4 *Insurance Contracts* and paragraph D4 of IFRS 1. The Board included such an option in IFRS 4 for reasons that may be equally valid for phase II.

Shadow accounting for participating contracts

BC116 Some insurers expressed concerns that an accounting mismatch will arise if the assets backing participating insurance liabilities include equity investments and the insurer elects to present gains and losses on those investments in other comprehensive income. That accounting mismatch would arise because paragraph 30 of IFRS 4 does not give explicit authority to apply 'shadow accounting' in such cases.

BC117 The Board acknowledges that this accounting mismatch is undesirable. However, for the following reasons, the Board did not amend paragraph 30 of IFRS 4:

(a) This accounting mismatch will arise only if an insurer elects to present gains and losses on equity investments in other comprehensive income.

(b) As described in paragraph BC84, in creating the option to present gains and losses on equity investments in other comprehensive income, the Board's intention was to provide a presentation alternative for some equity investments in which presenting fair value gains and losses in profit or loss may not be indicative of the performance of the entity, particularly if the entity holds those equity instruments for non-contractual benefits, rather than primarily to generate increases in the value of the investment. The Board did not intend to provide an alternative for investments in any other circumstances, including if an entity intends to hold an equity investment over a long time frame. In the Board's view, if an insurer holds

investments with the primary objective of realising a profit from increases in their value, for the benefit of either the insurer itself or its policyholders, the most transparent place to present those value changes is in profit or loss.

Summary of main changes from the exposure draft

BC118 The main changes from the exposure draft are:

(a) At this stage, IFRS 9 deals with the classification and measurement of financial assets only, rather than financial assets and financial liabilities as proposed in the exposure draft.

(b) IFRS 9 requires entities to classify financial assets on the basis of the objective of the entity's business model for managing the financial assets and the characteristics of the contractual cash flows. It points out that the entity's business model should be considered first, and that the contractual cash flow characteristics should be considered only for financial assets that are eligible to be measured at amortised cost because of the business model. It states that both classification conditions are essential to ensure that amortised cost provides useful information.

(c) Additional application guidance has been added on how to apply the conditions necessary for amortised cost measurement.

(d) IFRS 9 requires a 'look through' approach for investments in contractually linked instruments that effect concentrations of credit risk. The exposure draft had proposed that only the most senior tranche could have cash flows that represented payments of principal and interest on the principal amount outstanding.

(e) IFRS 9 requires (unless the fair value option is elected) financial assets purchased in the secondary market to be recognised at amortised cost if the instruments are managed within a business model that has an objective of collecting contractual cash flows and the financial asset has only contractual cash flows representing principal and interest on the principal amount outstanding even if such assets are acquired at a discount that reflects incurred credit losses.

(f) IFRS 9 requires that when an entity elects to present gains and losses on equity instruments measured at fair value in other comprehensive income, dividends are to be recognised in profit or loss. The exposure draft had proposed that those dividends would be recognised in other comprehensive income.

(g) IFRS 9 requires reclassifications between amortised cost and fair value classifications when the entity's business model changes. The exposure draft had proposed prohibiting reclassification.

(h) For entities that adopt IFRS 9 for reporting periods before 1 January 2012 IFRS 9 provides transition relief from restating comparative information.

(i) IFRS 9 requires additional disclosures for all entities when they first apply the IFRS.

 © IASCF

Cost-benefit considerations

BC119 The objective of financial statements is to provide information about the financial position, performance and changes in financial position of an entity that is useful to a wide range of users in making economic decisions. To attain this objective, the Board endeavours to ensure that an IFRS will meet a significant need and that the overall benefits of the resulting information justify the costs of providing it. Although the costs to implement a new IFRS might not be borne evenly, users of financial statements benefit from improvements in financial reporting, thereby facilitating the functioning of markets for capital and credit and the efficient allocation of resources in the economy.

BC120 The evaluation of costs and benefits is necessarily subjective. In making its judgement, the Board considered the following:

(a) the costs incurred by preparers of financial statements;

(b) the costs incurred by users of financial statements when information is not available;

(c) the comparative advantage that preparers have in developing information, compared with the costs that users would incur to develop surrogate information;

(d) the benefit of better economic decision-making as result of improved financial reporting; and

(e) the costs of transition for users, preparers and others.

BC121 The objective of IFRS 9 is to present information that is useful to users for their assessment of the amounts, timing and uncertainty of future cash flows of financial assets. However, the Board also considered the cost of implementing IFRS 9 and applying it on a continuous basis. During the development of IFRS 9 the Board conducted an extensive outreach programme to consult users, preparers, auditors, regulators and others. Those activities helped the Board evaluate the relative costs and benefits of IFRS 9.

BC122 IFRS 9 should improve the ability of users to understand the financial reporting for financial assets by:

(a) reducing the number of classification categories. All financial assets will be subsequently measured at either amortised cost or fair value. Hybrid contracts with financial asset hosts will be classified and measured in their entirety thereby eliminating the complex and rule-based requirements in IAS 39.

(b) having a single impairment methodology that is applied to all financial assets that are not measured at fair value. Many constituents criticised the multitude of impairment methodologies in IAS 39.

(c) providing a clear rationale for why financial assets are measured in a particular way, which aligns the measurement attribute to the way that an entity manages its financial assets and their contractual cash flow characteristics.

© IASCF

BC123 There are costs involved in the adoption and ongoing application of IFRS 9. Those costs will depend on an entity's volume and complexity of financial instruments as well the industry and jurisdiction in which the entity operates. However, those costs should be minimised because IFRS 9 is less complex and rule-based than the equivalent requirements in IAS 39. Consequently, the Board believes that the benefits of IFRS 9 outweigh the costs.

Dissenting opinions

Dissenting opinion of James J Leisenring

DO1 Mr Leisenring supports efforts to reduce the complexity of accounting for financial instruments. In that regard, he supports requiring all financial instruments to be measured at fair value, with that measurement being recognised in profit or loss. He finds no compelling reason related to improving financial reporting to reject that approach. It is an approach that maximises comparability and minimises complexity.

DO2 It maximises comparability because all financial instruments would be measured at one attribute within an entity and across entities. No measurement or presentation would change to reflect either arbitrary distinctions or management behaviour or intentions. IFRS 9 emphasises management intentions and behaviour, which substantially undermines comparability.

DO3 Complexity of accounting would be drastically reduced if all financial instruments were measured at fair value. The approach favoured by Mr Leisenring provides at least the following simplifications:

(a) no impairment model is necessary.

(b) criteria for when a given instrument must or can be measured with a given attribute are unnecessary.

(c) there is no need to bifurcate embedded derivatives or to identify financial derivatives.

(d) it eliminates the need for fair value hedge accounting for financial instruments.

(e) it eliminates the disparity in the measurement of derivatives within and outside the scope of IAS 39.

(f) it minimises the incentives for structuring transactions to achieve a particular accounting outcome.

(g) no fair value option would be needed to eliminate accounting mismatches.

(h) it provides a superior foundation for developing a comprehensive standard for the derecognition of financial instruments that is not present in a mixed attribute model.

DO4 Mr Leisenring accepts that measuring more instruments at fair value increases measurement complexity, but this increase is minimal compared with the reductions in complexity that would be otherwise achieved. There is no disagreement that derivatives must be measured at fair value. Those instruments raise the most difficult measurement issues, as cash instruments have many fewer problems. Indeed, some suggestions for an impairment model would measure at fair value the credit loss component of cash instruments. If that were to be the conclusion on impairment (an expected loss approach), it would minimise the incremental fair value measurement complexity of recording at fair value instruments now at amortised cost.

 © IASCF

DO5 Mr Leisenring recognises that measuring all instruments at fair value through profit or loss raises presentation issues about disaggregation of fair value changes. However, he does not believe that these issues are insurmountable.

DO6 Investors have often told both the IASB and the FASB that fair value of financial instruments recognised in profit or loss provides the most useful information for their purposes. There is a worldwide demand for an improved and common solution to the accounting for financial instruments. Investors are disappointed that the Board will not take this opportunity to make, with other standard-setters, truly substantive changes rather than these minimal changes that perpetuate all the legitimate concerns that have been expressed about the mixed attribute model.

DO7 IFRS 9 does to some extent reduce complexity but that reduction is minimal. Certain measurement classifications are eliminated but others have been added. Mr Leisenring does not think that, on balance, this is an improvement over IAS 39.

DO8 Fundamental to IFRS 9 is the distinction between financial instruments measured at amortised cost and those at fair value. Mr Leisenring is concerned that neither of the two conditions necessary for that determination is operational. Paragraph BC56 criticises IAS 39 because the embedded derivative requirement of that standard is based on a list of examples. However, the basic classification model of IFRS 9 is based on lists of examples in paragraphs B4.4, B4.13 and B4.14. The examples are helpful but are far from exhaustive of the issues that will be problematic in applying the two criteria for classification at amortised cost.

DO9 Mr Leisenring also thinks that the two criteria are inconsistently applied. When the objective of the entity's business model is to hold the assets to collect the contracted cash flows of an instrument there is no requirement that the entity must actually do so. The cash flow characteristics of the instrument are also ignored when the guidance is applied to investments in contractually linked instruments (tranches). In those circumstances the contractual cash flows of the instrument are ignored and one is required to look through to the composition of assets and liabilities of the issuing entity. This 'look through' requirement is also potentially complex and in Mr Leisenring's opinion is likely to be not very operational. Mr Leisenring also objects to eliminating the requirement to bifurcate derivatives embedded in cash instruments. This objection is primarily because of concern that the two criteria to qualify for amortised cost will not be operational. The pressure on those two conditions will be enormous because there will be an incentive to embed derivatives in a cash instrument in anticipation that the instrument might qualify for amortised cost. Derivatives should be at fair value whether embedded or standing alone and a bifurcation requirement would achieve that accounting. If Mr Leisenring were confident that the criteria for amortised cost could be applied as intended he would not be as concerned because instruments with embedded derivatives would be at fair value in their entirety.

DO10 Mr Leisenring is concerned that, in the current crisis, instruments that have provided some of the most significant losses when measured at fair value would be eligible for amortised cost. That conclusion is not responsive to the present environment. The approach also allows actively traded debt instruments, including treasury securities, to be at amortised cost. These results are unacceptable and reduce the usefulness of reported information for investors.

DO11 The Board is required by its *Framework* to be neutral in its decision-making and to strive to produce neutral information to maximise the usefulness of financial information. IFRS 9 fails in that regard because it produces information based on free choice, management intention and management behaviour. Reporting that will result from this approach will not produce neutral information and diminishes the usefulness of financial reporting.

DO12 The Board is insistent in paragraph BC27 that accounting based on a business model is not free choice but never explains why selection of a business model is not a management choice. The existence of a trading account, a fair value option and the objective of a business model are all free choices.

DO13 The classification of selected equity instruments at fair value with the result of the remeasurement reported outside profit or loss is also a free choice. The Board concludes that reporting fair value changes in profit or loss may not reflect the operating performance of an entity. Mr Leisenring could accept accounting for changes in fair value of some instruments outside profit or loss in other comprehensive income. That accounting, however, should not be a free choice and why that presentation is superior in defined circumstances should be developed. In addition, when these securities are sold any realised gains and losses are not 'recycled' to profit or loss. That conclusion is inconsistent with the Board's conclusion that dividends received on these instruments should be reported in profit or loss. Such dividends would represent a return on investment or a form of 'recycling' of changes in the value of the instruments.

DO14 Mr Leisenring believes that a business model is rarely relevant in writing accounting standards. Identical transactions, rights and obligations should be accounted for in the same way if comparability of financial information is to be achieved. The result of applying IFRS 9 ignores any concern for comparability of financial information.

DO15 The credit crisis has provided confirmation that a drastic change in accounting for financial instruments is desirable. However, many have said that while they agree that the approach suggested by Mr Leisenring would be superior, and a significant improvement, the world is not ready to embrace such change. It is unclear to Mr Leisenring what factors need to be present for the optimal solution to be acceptable. He has concluded that it is hard to envisage circumstances that would make the case any more compelling for fundamental change and improvement than the present circumstances. Therefore, IFRS 9 will inevitably preserve a mixed attribute model and the resulting complexity for a significant period of time.

DO16 An objective of replacing IAS 39 was to provide a basis for convergence with accounting standards issued by the FASB. Mr Leisenring is concerned that IFRS 9 does not provide such a basis. As a consequence, allowing early adoption of the IFRS is undesirable. For convergence to be achieved significant changes in the IFRS are inevitable. Early adoption of the IFRS will therefore necessitate another costly accounting change when convergence is achieved. Permitting early adoption of this IFRS is also undesirable as it permits a lack of comparability in accounting for many years due to the deferred required effective date.

 © IASCF

DO17 Mr Leisenring would accept that if, for reasons other than the desire to provide useful information to investors, his approach is politically unattainable, an alternative could be developed that would be operational. That approach would require all financial assets and financial liabilities to be recorded at fair value through profit or loss except originated loans retained by the originator, trade receivables and accounts payable. If certain derivatives were embedded in an instrument to be accounted for at amortised cost the derivative would be either bifurcated and accounted for at fair value or the entire instrument would be measured at fair value. Either approach would be acceptable.

Dissenting opinion of Patricia McConnell

DO18 Ms McConnell believes that fair value is the most relevant and useful measurement attribute for financial assets. However, she acknowledges that many investors prefer not to measure all financial assets at fair value. Those investors believe that both amortised cost and fair value can provide useful information for particular kinds of financial assets in particular circumstances. Therefore, in order to meet the objective of developing high quality, global accounting standards that serve the interests of all investors, Ms McConnell believes that no single measurement attribute should have primacy over another. Thus any new IFRS setting classification and measurement principles for financial assets should require disclosure of sufficient information in the primary financial statements to permit determination of profit or loss and financial position using both amortised cost and fair value. For example, when a measurement attribute other than fair value is used for financial assets, information about fair value should be displayed prominently in the statement of financial position. The Board did not adopt such disclosure in IFRS 9, as discussed in paragraphs BC16–BC18 of the Board's Basis for Conclusions.

DO19 As stated in paragraph BC8, an objective of the Board in developing IFRS 9 was to reduce the number of classification categories for financial instruments. However, Ms McConnell believes that IFRS 9 has not accomplished that objective. IFRS 9 would permit or require the following categories: (1) amortised cost, (2) a fair value option through profit or loss for financial assets that qualify for amortised cost but for which amortised cost would create an accounting mismatch, (3) fair value through profit or loss for debt instruments that fail to qualify for amortised cost, (4) fair value though profit or loss for trading securities, (5) fair value through profit or loss for equity securities not held for trading and (6) fair value through other comprehensive income for equity investments not held for trading. Ms McConnell does not view those six categories as a significant improvement over the six categories in IAS 39; like the categories in IAS 39, they will hinder investors' understanding of an already complex area of financial reporting.

DO20 IFRS 9 sets out two criteria for measuring financial assets at amortised cost: (1) the way the entity manages its financial assets ('business model') and (2) the contractual cash flow characteristics of its financial assets. On the surface, this appears to be an improvement over IAS 39's criterion that was based on management's intention to trade, hold available for sale, hold to maturity, or hold for the foreseeable future. However, Ms McConnell finds it difficult to see how IFRS 9's criterion based on the objective of the entity's business model differs

significantly from management's intention. In her opinion selection of a business model is a management choice, as is the decision to have a trading account, use the fair value option for debt instruments or the fair value option for equity instruments with gains and losses reported in other comprehensive income. In paragraphs BC27 and BC28 the Board argues that selection of a measurement method based on an entity's business model is not a free choice. Ms McConnell does not find the arguments persuasive.

DO21 IFRS 9 permits an entity to make an irrevocable election to present in other comprehensive income changes in the value of any investment in equity instruments that is not held for trading. Ms McConnell could accept accounting for changes in fair value of some instruments outside profit or loss in other comprehensive income. However, that treatment should not be a free choice; criteria for that presentation should be developed. In addition, the Board decided that when those securities are sold any realised gains and losses are not 'reclassified' to profit or loss. That conclusion is inconsistent with the Board's decision to report dividends received on these investments in profit or loss. Such dividends represent a return on investment or a form of 'reclassifying' changes in the value of the instruments.

DO22 In addition, Ms McConnell believes the 'look through' guidance for contractually linked investments (tranches) is an exception to one of the criteria necessary for applying amortised cost, namely the contractual cash flow characteristics of the instrument. In those circumstances the contractual cash flows of the instrument are ignored. Instead an entity is required to 'look through' to the underlying pool of instruments and access their cash flow characteristics and credit risk relative to a direct investment in the underlying instruments. Ms McConnell believes that this provision adds complexity to the IFRS and reduces the usefulness of the reporting for financial assets. Moreover, since an entity is required to 'look through' only upon initial recognition of the financial asset, subsequent changes in the relative exposure to credit risk over the life of a structured investment vehicle would be ignored. Consequently, Ms McConnell believes it is possible that highly volatile investments, such as those owning sub-prime residential mortgage loans, would be reported at amortised cost.

Basis for Conclusions on IAS 1 *Presentation of Financial Statements*

The International Accounting Standards Board revised IAS 1 Presentation of Financial Statements *in 2007 as part of its project on financial statement presentation. It was not the Board's intention to reconsider as part of that project all the requirements in IAS 1.*

For convenience, the Board has incorporated into this Basis for Conclusions relevant material from the Basis for Conclusions on the revision of IAS 1 in 2003 and its amendment in 2005. Paragraphs have been renumbered and reorganised as necessary to reflect the new structure of the Standard.

This Basis for Conclusions accompanies, but is not part of, IAS 1.

Introduction

BC1 The International Accounting Standards Committee (IASC) issued the first version of IAS 1 *Disclosure of Accounting Policies* in 1975. It was reformatted in 1994 and superseded in 1997 by IAS 1 *Presentation of Financial Statements*.* In 2003 the International Accounting Standards Board revised IAS 1 as part of the Improvements project and in 2005 the Board amended it as a consequence of issuing IFRS 7 *Financial Instruments: Disclosures*. In 2007 the Board revised IAS 1 again as part of its project on financial statement presentation. This Basis for Conclusions summarises the Board's considerations in reaching its conclusions on revising IAS 1 in 2003, on amending it in 2005 and revising it in 2007. It includes reasons for accepting some approaches and rejecting others. Individual Board members gave greater weight to some factors than to others.

The Improvements project—revision of IAS 1 (2003)

BC2 In July 2001 the Board announced that, as part of its initial agenda of technical projects, it would undertake a project to improve a number of standards, including IAS 1. The project was undertaken in the light of queries and criticisms raised in relation to the standards by securities regulators, professional accountants and other interested parties. The objectives of the Improvements project were to reduce or eliminate alternatives, redundancies and conflicts within standards, to deal with some convergence issues and to make other improvements. The Board's intention was not to reconsider the fundamental approach to the presentation of financial statements established by IAS 1 in 1997.

BC3 In May 2002 the Board published an exposure draft of proposed *Improvements to International Accounting Standards*, which contained proposals to revise IAS 1. The Board received more than 160 comment letters. After considering the responses the Board issued in 2003 a revised version of IAS 1. In its revision the Board's main objectives were:

(a) to provide a framework within which an entity assesses how to present fairly the effects of transactions and other events, and assesses whether the result of complying with a requirement in an IFRS would be so misleading that it would not give a fair presentation;

* IASC did not publish a Basis for Conclusions.

 © IASCF

(b) to base the criteria for classifying liabilities as current or non-current solely on the conditions existing at the balance sheet date;

(c) to prohibit the presentation of items of income and expense as 'extraordinary items';

(d) to specify disclosures about the judgements that management has made in the process of applying the entity's accounting policies, apart from those involving estimations, and that have the most significant effect on the amounts recognised in the financial statements; and

(e) to specify disclosures about sources of estimation uncertainty at the balance sheet date that have a significant risk of causing a material adjustment to the carrying amounts of assets and liabilities within the next financial year.

BC4 The following sections summarise the Board's considerations in reaching its conclusions as part of its Improvements project in 2003:

(a) departures from IFRSs (paragraphs BC23–BC30)

(b) criterion for exemption from requirements (paragraphs BC34–BC36)

(c) effect of events after the reporting period on the classification of liabilities (paragraphs BC39–BC48)

(d) results of operating activities (paragraphs BC55 and BC56)

(e) minority interest (paragraph BC59)*

(f) extraordinary items (paragraphs BC60–BC64)

(g) disclosure of the judgements management has made in the process of applying the entity's accounting policies (paragraphs BC77 and BC78)

(h) disclosure of major sources of estimation uncertainty (paragraphs BC79–BC84).

Amendment to IAS 1—*Capital Disclosures* (2005)

BC5 In August 2005 the Board issued an Amendment to IAS 1—*Capital Disclosures*. The amendment added to IAS 1 requirements for disclosure of:

(a) the entity's objectives, policies and processes for managing capital.

(b) quantitative data about what the entity regards as capital.

(c) whether the entity has complied with any capital requirements; and if it has not complied, the consequences of such non-compliance.

BC6 The following sections summarise the Board's considerations in reaching its conclusions as part of its amendment to IAS 1 in 2005:

(a) disclosures about capital (paragraphs BC85–BC89)

(b) objectives, policies and processes for managing capital (paragraphs BC90 and BC91)

* In January 2008 the IASB issued an amended IAS 27 *Consolidated and Separate Financial Statements*, which amended 'minority interest' to 'non-controlling interests'.

(c) externally imposed capital requirements (paragraphs BC92–BC97)

(d) internal capital targets (paragraphs BC98–BC100).

Amendments to IAS 32 and IAS 1—*Puttable Financial Instruments and Obligations Arising on Liquidation* (2008)

BC6A In July 2006 the Board published an exposure draft of proposed amendments to IAS 32 and IAS 1 relating to the classification of puttable instruments and instruments with obligations arising only on liquidation. The Board subsequently confirmed the proposals and in February 2008 issued an amendment that now forms part of IAS 1.

Financial statement presentation—Joint project

BC7 In September 2001 the Board added to its agenda the performance reporting project (in March 2006 renamed the 'financial statement presentation project'). The objective of the project was to enhance the usefulness of information presented in the income statement. The Board developed a possible new model for reporting income and expenses and conducted preliminary testing. Similarly, in the United States, the Financial Accounting Standards Board (FASB) added a project on performance reporting to its agenda in October 2001, developed its model and conducted preliminary testing. Constituents raised concerns about both models and about the fact that they were different.

BC8 In April 2004 the Board and the FASB decided to work on financial statement presentation as a joint project. They agreed that the project should address presentation and display not only in the income statement, but also in the other statements that, together with the income statement, would constitute a complete set of financial statements—the balance sheet, the statement of changes in equity, and the cash flow statement. The Board decided to approach the project in two phases. Phase A would address the statements that constitute a complete set of financial statements and the periods for which they are required to be presented. Phase B would be undertaken jointly with the FASB and would address more fundamental issues relating to presentation and display of information in the financial statements, including:

(a) consistent principles for aggregating information in each financial statement.

(b) the totals and subtotals that should be reported in each financial statement.

(c) whether components of other comprehensive income should be reclassified to profit or loss and, if so, the characteristics of the transactions and events that should be reclassified and when reclassification should be made.

(d) whether the direct or the indirect method of presenting operating cash flows provides more useful information.

 © IASCF

BC9 In March 2006, as a result of its work in phase A, the Board published an exposure draft of proposed amendments to IAS 1—*A Revised Presentation*. The Board received more than 130 comment letters. The exposure draft proposed amendments that affected the presentation of owner changes in equity and the presentation of comprehensive income, but did not propose to change the recognition, measurement or disclosure of specific transactions and other events required by other IFRSs. It also proposed to bring IAS 1 largely into line with the US standard—SFAS 130 *Reporting Comprehensive Income*. After considering the responses to the exposure draft the Board issued a revised version of IAS 1. The FASB decided to consider phases A and B issues together, and therefore did not publish an exposure draft on phase A.

BC10 The following sections summarise the Board's considerations in reaching its conclusions as part of its revision in 2007:

(a) general purpose financial statements (paragraphs BC11–BC13)

(b) titles of financial statements (paragraphs BC14–BC21)

(c) equal prominence (paragraph BC22)

(d) a statement of financial position as at the beginning of the earliest comparative period (paragraphs BC31 and BC32)

(e) IAS 34 *Interim Financial Reporting* (paragraph BC33)

(f) reporting owner and non-owner changes in equity (paragraphs BC37 and BC38)

(g) reporting comprehensive income (paragraphs BC49–BC54)

(h) subtotal for profit or loss (paragraphs BC57 and BC58)

(i) other comprehensive income-related tax effects (paragraphs BC65–BC68)

(j) reclassification adjustments (paragraphs BC69–BC73)

(k) effects of retrospective application or retrospective restatement (paragraph BC74)

(l) presentation of dividends (paragraph BC75)

(m) IAS 7 *Cash Flow Statements* (paragraph BC76)

(n) presentation of measures per share (paragraphs BC101–BC104)

(o) effective date and transition (paragraph BC105)

(p) differences from SFAS 130 (paragraph BC106).

Definitions

General purpose financial statements (paragraph 7)

BC11 The exposure draft of 2006 proposed a change to the explanatory paragraph of what 'general purpose financial statements' include, in order to produce a more generic definition of a set of financial statements. Paragraph 7 of the exposure draft stated:

> General purpose financial statements include those that are presented separately or within other *public* documents such as a *regulatory filing* or report to shareholders. [emphasis added]

BC12 Respondents expressed concern about the proposed change. They argued that it could be understood as defining as general purpose financial statements any financial statement or set of financial statements filed with a regulator and could capture documents other than annual reports and prospectuses. They saw this change as expanding the scope of IAS 1 to documents that previously would not have contained all of the disclosures required by IAS 1. Respondents pointed out that the change would particularly affect some entities (such as small private companies and subsidiaries of public companies with no external users of financial reports) that are required by law to place their financial statements on a public file.

BC13 The Board acknowledged that in some countries the law requires entities, whether public or private, to report to regulatory authorities and include information in those reports that could be beyond the scope of IAS 1. Because the Board did not intend to extend the definition of general purpose financial statements, it decided to eliminate the explanatory paragraph of what 'general purpose financial statements' include, while retaining the definition of 'general purpose financial statements'.

Financial statements

Complete set of financial statements

Titles of financial statements (paragraph 10)

BC14 The exposure draft of 2006 proposed changes to the titles of some of the financial statements—from 'balance sheet' to 'statement of financial position', from 'income statement' to 'statement of profit or loss' and from 'cash flow statement' to 'statement of cash flows'. In addition, the exposure draft proposed a 'statement of recognised income and expense' and that all owner changes in equity should be included in a 'statement of changes in equity'. The Board did not propose to make any of these changes of nomenclature mandatory.

BC15 Many respondents opposed the proposed changes, pointing out that the existing titles had a long tradition and were well understood. However, the Board reaffirmed its view that the proposed new titles better reflect the function of each financial statement, and pointed out that an entity could choose to use other titles in its financial report.

 © IASCF

BC16 The Board reaffirmed its conclusion that the title 'statement of financial position' not only better reflects the function of the statement but is consistent with the *Framework for the Preparation and Presentation of Financial Statements*, which contains several references to 'financial position'. Paragraph 12 of the *Framework* states that the objective of financial statements is to provide information about the financial position, performance and changes in financial position of an entity; paragraph 19 of the *Framework* states that information about financial position is primarily provided in a balance sheet. In the Board's view, the title 'balance sheet' simply reflects that double entry bookkeeping requires debits to equal credits. It does not identify the content or purpose of the statement. The Board also noted that 'financial position' is a well-known and accepted term, as it has been used in auditors' opinions internationally for more than 20 years to describe what the 'balance sheet' presents. The Board decided that aligning the statement's title with its content and the opinion rendered by the auditor would help the users of financial statements.

BC17 As to the other statements, respondents suggested that renaming the balance sheet the 'statement of financial position' implied that the 'cash flow statement' and the 'statement of recognised income and expense' do not also reflect an entity's financial position. The Board observed that although the latter statements reflect changes in an entity's financial position, neither can be called a 'statement of changes in financial position', as this would not depict their true function and objective (ie to present cash flows and performance, respectively). The Board acknowledged that the titles 'income statement' and 'statement of profit or loss' are similar in meaning and could be used interchangeably, and decided to retain the title 'income statement' as this is more commonly used.

BC18 The title of the proposed new statement, the 'statement of recognised income and expense', reflects a broader content than the former 'income statement'. The statement encompasses both income and expenses recognised in profit or loss and income and expenses recognised outside profit or loss.

BC19 Many respondents opposed the title 'statement of recognised income and expense', objecting particularly to the use of the term 'recognised'. The Board acknowledged that the term 'recognised' could also be used to describe the content of other primary statements as 'recognition', explained in paragraph 82 of the *Framework*, is 'the process of incorporating in the balance sheet or income statement an item that meets the definition of an element and satisfies the criteria for recognition set out in paragraph 83.' Many respondents suggested the term 'statement of comprehensive income' instead.

BC20 In response to respondents' concerns and to converge with SFAS 130, the Board decided to rename the new statement a 'statement of comprehensive income'. The term 'comprehensive income' is not defined in the *Framework* but is used in IAS 1 to describe the change in equity of an entity during a period from transactions, events and circumstances other than those resulting from transactions with owners in their capacity as owners. Although the term 'comprehensive income' is used to describe the aggregate of all components of comprehensive income, including profit or loss, the term 'other comprehensive income' refers to income and expenses that under IFRSs are included in comprehensive income but excluded from profit or loss.

© IASCF

BC21 In finalising its revision, the Board confirmed that the titles of financial statements used in this Standard would not be mandatory. The titles will be used in future IFRSs but are not required to be used by entities in their financial statements. Some respondents to the exposure draft expressed concern that non-mandatory titles will result in confusion. However, the Board believes that making use of the titles non-mandatory will allow time for entities to implement changes gradually as the new titles become more familiar.

Equal prominence (paragraphs 11 and 12)

BC22 The Board noted that the financial performance of an entity is not assessed by reference to a single financial statement or a single measure within a financial statement. The Board believes that the financial performance of an entity can be assessed only after all aspects of the financial statements are taken into account and understood in their entirety. Accordingly, the Board decided that in order to help users of the financial statements to understand the financial performance of an entity comprehensively, all financial statements within the complete set of financial statements should be presented with equal prominence.

Departures from IFRSs (paragraphs 19–24)

BC23 IAS 1 (as issued in 1997) permitted an entity to depart from a requirement in a Standard 'in the extremely rare circumstances when management concludes that compliance with a requirement in a Standard would be misleading, and therefore that departure from a requirement is necessary to achieve a fair presentation' (paragraph 17, now paragraph 19). When such a departure occurred, paragraph 18 (now paragraph 20) required extensive disclosure of the facts and circumstances surrounding the departure and the treatment adopted.

BC24 The Board decided to clarify in paragraph 15 of the Standard that for financial statements to present fairly the financial position, financial performance and cash flows of an entity, they must represent faithfully the effects of transactions and other events in accordance with the definitions and recognition criteria for assets, liabilities, income and expenses set out in the *Framework*.

BC25 The Board decided to limit the occasions on which an entity should depart from a requirement in an IFRS to the extremely rare circumstances in which management concludes that compliance with the requirement would be so misleading that it would conflict with the objective of financial statements set out in the *Framework*. Guidance on this criterion states that an item of information would conflict with the objective of financial statements when it does not represent faithfully the transactions, other events or conditions that it either purports to represent or could reasonably be expected to represent and, consequently, it would be likely to influence economic decisions made by users of financial statements.

BC26 These amendments provide a framework within which an entity assesses how to present fairly the effects of transactions, other events and conditions, and whether the result of complying with a requirement in an IFRS would be so misleading that it would not give a fair presentation.

 © IASCF

BC27 The Board considered whether IAS 1 should be silent on departures from IFRSs. The Board decided against making that change, because it would remove the Board's capability to specify the criteria under which departures from IFRSs should occur.

BC28 Departing from a requirement in an IFRS when considered necessary to achieve a fair presentation would conflict with the regulatory framework in some jurisdictions. The revised IAS 1 takes into account the existence of different regulatory requirements. It requires that when an entity's circumstances satisfy the criterion described in paragraph BC25 for departure from a requirement in an IFRS, the entity should proceed as follows:

(a) When the relevant regulatory framework requires—or otherwise does not prohibit—a departure from the requirement, the entity should make that departure and the disclosures set out in paragraph 20.

(b) When the relevant regulatory framework prohibits departure from the requirement, the entity should, to the maximum extent possible, reduce the perceived misleading aspects of compliance by making the disclosures set out in paragraph 23.

This amendment enables entities to comply with the requirements of IAS 1 when the relevant regulatory framework prohibits departures from accounting standards, while retaining the principle that entities should, to the maximum extent possible, ensure that financial statements provide a fair presentation.

BC29 After considering the comments received on the exposure draft of 2002, the Board added to IAS 1 a requirement in paragraph 21 to disclose the effect of a departure from a requirement of an IFRS in a prior period on the current period's financial statements. Without this disclosure, users of the entity's financial statements could be unaware of the continuing effects of prior period departures.

BC30 In view of the strict criteria for departure from a requirement in an IFRS, IAS 1 includes a rebuttable presumption that if other entities in similar circumstances comply with the requirement, the entity's compliance with the requirement would not be so misleading that it would conflict with the objective of financial statements set out in the *Framework*.

Comparative information

A statement of financial position as at the beginning of the earliest comparative period (paragraph 39)

BC31 The exposure draft of 2006 proposed that a statement of financial position as at the beginning of the earliest comparative period should be presented as part of a complete set of financial statements. This statement would provide a basis for investors and creditors to evaluate information about the entity's performance during the period. However, many respondents expressed concern that the requirement would unnecessarily increase disclosures in financial statements, or would be impracticable, excessive and costly.

BC32 By adding a statement of financial position as at the beginning of the earliest comparative period, the exposure draft proposed that an entity should present three statements of financial position and two of each of the other statements. Considering that financial statements from prior years are readily available for financial analysis, the Board decided to require only two statements of financial position, except when the financial statements have been affected by retrospective application or retrospective restatement, as defined in IAS 8 *Accounting Policies, Changes in Accounting Estimates and Errors*, or when a reclassification has been made. In those circumstances three statements of financial position are required.

IAS 34 *Interim Financial Reporting*

BC33 The Board decided not to reflect in paragraph 8 of IAS 34 (ie the minimum components of an interim financial report) its decision to require the inclusion of a statement of financial position as at the beginning of the earliest comparative period in a complete set of financial statements. IAS 34 has a year-to-date approach to interim reporting and does not replicate the requirements of IAS 1 in terms of comparative information.

Criterion for exemption from requirements (paragraphs 41–44)

BC34 IAS 1 as issued in 1997 specified that when the presentation or classification of items in the financial statements is amended, comparative amounts should be reclassified unless it is impracticable to do so. Applying a requirement is impracticable when the entity cannot apply it after making every reasonable effort to do so.

BC35 The exposure draft of 2002 proposed a different criterion for exemption from particular requirements. For the reclassification of comparative amounts, and its proposed new requirement to disclose key assumptions and other sources of estimation uncertainty at the end of the reporting period (discussed in paragraphs BC79–BC84), the exposure draft proposed that the criterion for exemption should be that applying the requirements would require undue cost or effort.

BC36 In the light of respondents' comments on the exposure draft, the Board decided that an exemption based on management's assessment of undue cost or effort was too subjective to be applied consistently by different entities. Moreover, balancing costs and benefits was a task for the Board when it sets accounting requirements rather than for entities when they apply them. Therefore, the Board retained the 'impracticability' criterion for exemption. This affects the exemptions now set out in paragraphs 41–43 and 131 of IAS 1. Impracticability is the only basis on which IFRSs allow specific exemptions from applying particular requirements when the effect of applying them is material.*

* In 2006 the IASB issued IFRS 8 *Operating Segments*. As explained in paragraphs BC46 and BC47 of the Basis for Conclusions on IFRS 8, that IFRS includes an exemption from some requirements if the necessary information is not available and the cost to develop it would be excessive.

 © IASCF

Reporting owner and non-owner changes in equity

BC37 The exposure draft of 2006 proposed to separate changes in equity of an entity during a period arising from transactions with owners in their capacity as owners (ie all owner changes in equity) from other changes in equity (ie non-owner changes in equity). All owner changes in equity would be presented in the statement of changes in equity, separately from non-owner changes in equity.

BC38 Most respondents welcomed this proposal and saw this change as an improvement of financial reporting, by increasing the transparency of those items recognised in equity that are not reported as part of profit or loss. However, some respondents pointed out that the terms 'owner' and 'non-owner' were not defined in the exposure draft, the *Framework* or elsewhere in IFRSs, although they are extensively used in national accounting standards. They also noted that the terms 'owner' and 'equity holder' were used interchangeably in the exposure draft. The Board decided to adopt the term 'owner' and use it throughout IAS 1 to converge with SFAS 130, which uses the term in the definition of 'comprehensive income'.

Statement of financial position

Current assets and current liabilities (paragraphs 68 and 71)

BC38A As part of its improvements project in 2007, the Board identified inconsistent guidance regarding the current/non-current classification of derivatives. Some might read the guidance included in paragraph 71 as implying that financial liabilities classified as held for trading in accordance with IAS 39 *Financial Instruments: Recognition and Measurement*[*] are always required to be presented as current.

BC38B The Board expects the criteria set out in paragraph 69 to be used to assess whether a financial liability should be presented as current or non-current. The 'held for trading' category in paragraph 9 of IAS 39[*] is for measurement purposes and includes financial assets and liabilities that may not be held primarily for trading purposes.

BC38C The Board reaffirmed that if a financial liability is held primarily for trading purposes it should be presented as current regardless of its maturity date. However, a financial liability that is not held for trading purposes, such as a derivative that is not a financial guarantee contract or a designated hedging instrument, should be presented as current or non-current on the basis of its settlement date. For example, derivatives that have a maturity of more than twelve months and are expected to be held for more than twelve months after the reporting period should be presented as non-current assets or liabilities.

* In November 2009 the IASB amended the requirements of IAS 39 relating to classification and measurement of assets within the scope of IAS 39 and relocated them to IFRS 9 *Financial Instruments*. IFRS 9 applies to all assets within the scope of IAS 39. Paragraphs BC38A–BC38D discuss matters relevant when IAS 1 was issued.

BC38D Therefore, the Board decided to remove the identified inconsistency by amending the examples of current liabilities in paragraph 71. The Board also amended paragraph 68 in respect of current assets to remove a similar inconsistency.

Classification of the liability component of a convertible instrument (paragraph 69)

BC38E As part of its improvements project in 2007, the Board considered the classification of the liability component of a convertible instrument as current or non-current. Paragraph 69(d) of IAS 1 states that when an entity does not have an unconditional right to defer settlement of a liability for at least twelve months after the reporting period, the liability should be classified as current. According to the *Framework*, conversion of a liability into equity is a form of settlement.

BC38F The application of these requirements means that if the conversion option can be exercised by the holder at any time, the liability component would be classified as current. This classification would be required even if the entity would not be required to settle unconverted instruments with cash or other assets for more than twelve months after the reporting period.

BC38G IAS 1 and the *Framework* state that information about the liquidity and solvency positions of an entity is useful to users. The terms 'liquidity' and 'solvency' are associated with the availability of cash to an entity. Issuing equity does not result in an outflow of cash or other assets of the entity.

BC38H The Board concluded that classifying the liability on the basis of the requirements to transfer cash or other assets rather than on settlement better reflects the liquidity and solvency position of an entity, and therefore it decided to amend IAS 1 accordingly.

BC38I The Board discussed the comments received in response to its exposure draft of proposed *Improvements to IFRSs* published in 2007 and noted that some respondents were concerned that the proposal in the exposure draft would apply to all liabilities, not just those that are components of convertible instruments as originally contemplated in the exposure draft. Consequently, in *Improvements to IFRSs* issued in April 2009, the Board amended the proposed wording to clarify that the amendment applies only to the classification of a liability that can, at the option of the counterparty, be settled by the issue of the entity's equity instruments.

Effect of events after the reporting period on the classification of liabilities (paragraphs 69–76)

BC39 Paragraph 63 of IAS 1 (as issued in 1997) included the following:

> An enterprise should continue to classify its long-term interest-bearing liabilities as non-current, even when they are due to be settled within twelve months of the balance sheet date if:
>
> (a) the original term was for a period of more than twelve months;
>
> (b) the enterprise intends to refinance the obligation on a long-term basis; and
>
> (c) that intention is supported by an agreement to refinance, or to reschedule payments, which is completed before the financial statements are authorised for issue.

 © IASCF

BC40 Paragraph 65 stated:

> Some borrowing agreements incorporate undertakings by the borrower (covenants) which have the effect that the liability becomes payable on demand if certain conditions related to the borrower's financial position are breached. In these circumstances, the liability is classified as non-current only when:
>
> (a) the lender has agreed, prior to the authorisation of the financial statements for issue, not to demand payment as a consequence of the breach; and
>
> (b) it is not probable that further breaches will occur within twelve months of the balance sheet date.

BC41 The Board considered these requirements and concluded that refinancing, or the receipt of a waiver of the lender's right to demand payment, that occurs after the reporting period should not be taken into account in the classification of a liability.

BC42 Therefore, the exposure draft of 2002 proposed:

(a) to amend paragraph 63 to specify that a long-term financial liability due to be settled within twelve months of the balance sheet date should not be classified as a non-current liability because an agreement to refinance, or to reschedule payments, on a long-term basis is completed after the balance sheet date and before the financial statements are authorised for issue. This amendment would not affect the classification of a liability as non-current when the entity has, under the terms of an existing loan facility, the discretion to refinance or roll over its obligations for at least twelve months after the balance sheet date.

(b) to amend paragraph 65 to specify that a long-term financial liability that is payable on demand because the entity breached a condition of its loan agreement should be classified as current at the balance sheet date even if the lender has agreed after the balance sheet date, and before the financial statements are authorised for issue, not to demand payment as a consequence of the breach. However, if the lender has agreed by the balance sheet date to provide a period of grace within which the entity can rectify the breach and during which the lender cannot demand immediate repayment, the liability is classified as non-current if it is due for settlement, without that breach of the loan agreement, at least twelve months after the balance sheet date and:

    (i) the entity rectifies the breach within the period of grace; or

    (ii) when the financial statements are authorised for issue, the period of grace is incomplete and it is probable that the breach will be rectified.

BC43 Some respondents disagreed with these proposals. They advocated classifying a liability as current or non-current according to whether it is expected to use current assets of the entity, rather than strictly on the basis of its date of maturity and whether it is callable at the end of the reporting period. In their view, this would provide more relevant information about the liability's future effect on the timing of the entity's resource flows.

BC44 However, the Board decided that the following arguments for changing paragraphs 63 and 65 were more persuasive:

(a) refinancing a liability after the balance sheet date does not affect the entity's liquidity and solvency *at the balance sheet date*, the reporting of which should reflect contractual arrangements in force on that date. Therefore, it is a non-adjusting event in accordance with IAS 10 *Events after the Balance Sheet Date* and should not affect the presentation of the entity's balance sheet.

(b) it is illogical to adopt a criterion that 'non-current' classification of short-term obligations expected to be rolled over for at least twelve months after the balance sheet date depends on whether the roll-over is at the discretion of the entity, and then to provide an exception based on refinancing occurring after the balance sheet date.

(c) in the circumstances set out in paragraph 65, unless the lender has waived its right to demand immediate repayment or granted a period of grace within which the entity may rectify the breach of the loan agreement, the financial condition of the entity at the balance sheet date was that the entity did not hold an absolute right to defer repayment, based on the terms of the loan agreement. The granting of a waiver or a period of grace changes the terms of the loan agreement. Therefore, an entity's receipt from the lender, after the balance sheet date, of a waiver or a period of grace of at least twelve months does not change the nature of the liability to non-current until it occurs.

BC45 IAS 1 now includes the amendments proposed in 2002, with one change. The change relates to the classification of a long-term loan when, at the end of the reporting period, the lender has provided a period of grace within which a breach of the loan agreement can be rectified, and during which period the lender cannot demand immediate repayment of the loan.

BC46 The exposure draft proposed that such a loan should be classified as non-current if it is due for settlement, without the breach, at least twelve months after the balance sheet date and:

(a) the entity rectifies the breach within the period of grace; or

(b) when the financial statements are authorised for issue, the period of grace is incomplete and it is probable that the breach will be rectified.

BC47 After considering respondents' comments, the Board decided that the occurrence or probability of a rectification of a breach after the reporting period is irrelevant to the conditions existing at the end of the reporting period. The revised IAS 1 requires that, for the loan to be classified as non-current, the period of grace must end at least twelve months after the reporting period (see paragraph 75). Therefore, the conditions (a) and (b) in paragraph BC46 are redundant.

BC48 The Board considered arguments that if a period of grace to remedy a breach of a long-term loan agreement is provided before the end of the reporting period, the loan should be classified as non-current regardless of the length of the period of grace. These arguments are based on the view that, at the end of the reporting period, the lender does not have an unconditional legal right to demand

 © IASCF

repayment before the original maturity date (ie if the entity remedies the breach during the period of grace, it is entitled to repay the loan on the original maturity date). However, the Board concluded that an entity should classify a loan as non-current only if it has an unconditional right to defer settlement of the loan for at least twelve months after the reporting period. This criterion focuses on the legal rights of the entity, rather than those of the lender.

Statement of comprehensive income

Reporting comprehensive income (paragraph 81)

BC49 The exposure draft of 2006 proposed that all non-owner changes in equity should be presented in a single statement or in two statements. In a single-statement presentation, all items of income and expense are presented together. In a two-statement presentation, the first statement ('income statement') presents income and expenses recognised in profit or loss and the second statement ('statement of comprehensive income') begins with profit or loss and presents, in addition, items of income and expense that IFRSs require or permit to be recognised outside profit or loss. Such items include, for example, translation differences related to foreign operations and gains or losses on available-for-sale[*] financial assets. The statement of comprehensive income does not include transactions with owners in their capacity as owners. Such transactions are presented in the statement of changes in equity.

BC50 Respondents to the exposure draft had mixed views about whether the Board should permit a choice of displaying non-owner changes in equity in one statement or two statements. Many respondents agreed with the Board's proposal to maintain the two-statement approach and the single-statement approach as alternatives and a few urged the Board to mandate one of them. However, most respondents preferred the two-statement approach because it distinguishes profit or loss and total comprehensive income; they believe that with the two-statement approach, the 'income statement' remains a primary financial statement. Respondents supported the presentation of two separate statements as a transition measure until the Board develops principles to determine the criteria for inclusion of items in profit or loss or in other comprehensive income.

BC51 The exposure draft of 2006 expressed the Board's preference for a single statement of all non-owner changes in equity. The Board provided several reasons for this preference. All items of non-owner changes in equity meet the definitions of income and expenses in the *Framework*. The *Framework* does not define profit or loss, nor does it provide criteria for distinguishing the characteristics of items that should be included in profit or loss from those items that should be excluded from profit or loss. Therefore, the Board decided that it was conceptually correct for an entity to present all non-owner changes in equity (ie all income and expenses recognised in a period) in a single statement because there are no clear principles or common characteristics that can be used to separate income and expenses into two statements.

[*] IFRS 9 *Financial Instruments*, issued in November 2009, eliminated the category of available-for-sale financial assets. This paragraph discusses matters relevant when IAS 1 was issued.

© IASCF

BC52 However, in the Board's discussions with interested parties, it was clear that many were strongly opposed to the concept of a single statement. They argued that there would be undue focus on the bottom line of the single statement. In addition, many argued that it was premature for the Board to conclude that presentation of income and expense in a single statement was an improvement in financial reporting without also addressing the other aspects of presentation and display, namely deciding what categories and line items should be presented in a statement of recognised income and expense.

BC53 In the light of these views, although it preferred a single statement, the Board decided that an entity should have the choice of presenting all income and expenses recognised in a period in one statement or in two statements. An entity is prohibited from presenting components of income and expense (ie non-owner changes in equity) in the statement of changes in equity.

BC54 Many respondents disagreed with the Board's preference and thought that a decision at this stage would be premature. In their view the decision about a single-statement or two-statement approach should be subject to further consideration. They urged the Board to address other aspects of presentation and display, namely deciding which categories and line items should be presented in a 'statement of comprehensive income'. The Board reaffirmed its reasons for preferring a single-statement approach and agreed to address other aspects of display and presentation in the next stage of the project.

Results of operating activities

BC55 IAS 1 omits the requirement in the 1997 version to disclose the results of operating activities as a line item in the income statement. 'Operating activities' are not defined in IAS 1, and the Board decided not to require disclosure of an undefined item.

BC56 The Board recognises that an entity may elect to disclose the results of operating activities, or a similar line item, even though this term is not defined. In such cases, the Board notes that the entity should ensure that the amount disclosed is representative of activities that would normally be regarded as 'operating'. In the Board's view, it would be misleading and would impair the comparability of financial statements if items of an operating nature were excluded from the results of operating activities, even if that had been industry practice. For example, it would be inappropriate to exclude items clearly related to operations (such as inventory write-downs and restructuring and relocation expenses) because they occur irregularly or infrequently or are unusual in amount. Similarly, it would be inappropriate to exclude items on the grounds that they do not involve cash flows, such as depreciation and amortisation expenses.

Subtotal for profit or loss (paragraph 82)

BC57 As revised, IAS 1 requires a subtotal for profit or loss in the statement of comprehensive income. If an entity chooses to present comprehensive income by using two statements, it should begin the second statement with profit or loss—the bottom line of the first statement (the 'income statement')—and display the components of other comprehensive income immediately after that. The Board

 © IASCF

concluded that this is the best way to achieve the objective of equal prominence (see paragraph BC22) for the presentation of income and expenses. An entity that chooses to display comprehensive income in one statement should include profit or loss as a subtotal within that statement.

BC58 The Board acknowledged that the items included in profit or loss do not possess any unique characteristics that allow them to be distinguished from items that are included in other comprehensive income. However, the Board and its predecessor have required some items to be recognised outside profit or loss. The Board will deliberate in the next stage of the project how items of income and expense should be presented in the statement of comprehensive income.

Minority interest (paragraph 83)*

BC59 IAS 1 requires the 'profit or loss attributable to minority interest' and 'profit or loss attributable to owners of the parent' each to be presented in the income statement in accordance with paragraph 83. These amounts are to be presented as allocations of profit or loss, not as items of income or expense. A similar requirement has been added for the statement of changes in equity, in paragraph 106(a). These changes are consistent with IAS 27 *Consolidated and Separate Financial Statements*, which requires that in a consolidated balance sheet (now called 'statement of financial position'), minority interest is presented within equity because it does not meet the definition of a liability in the *Framework*.

Extraordinary items (paragraph 87)

BC60 IAS 8 *Net Profit or Loss for the Period, Fundamental Errors and Changes in Accounting Policies* (issued in 1993) required extraordinary items to be disclosed in the income statement separately from the profit or loss from ordinary activities. That standard defined 'extraordinary items' as 'income or expenses that arise from events or transactions that are clearly distinct from the ordinary activities of the enterprise and therefore are not expected to recur frequently or regularly'.

BC61 In 2002, the Board decided to eliminate the concept of extraordinary items from IAS 8 and to prohibit the presentation of items of income and expense as 'extraordinary items' in the income statement and the notes. Therefore, in accordance with IAS 1, no items of income and expense are to be presented as arising from outside the entity's ordinary activities.

BC62 Some respondents to the exposure draft of 2002 argued that extraordinary items should be presented in a separate component of the income statement because they are clearly distinct from all of the other items of income and expense, and because such presentation highlights to users of financial statements the items of income and expense to which the least attention should be given when predicting an entity's future performance.

* In January 2008 the IASB issued an amended IAS 27 *Consolidated and Separate Financial Statements*, which amended 'minority interest' to 'non-controlling interests'.

BC63 The Board decided that items treated as extraordinary result from the normal business risks faced by an entity and do not warrant presentation in a separate component of the income statement. The nature or function of a transaction or other event, rather than its frequency, should determine its presentation within the income statement. Items currently classified as 'extraordinary' are only a subset of the items of income and expense that may warrant disclosure to assist users in predicting an entity's future performance.

BC64 Eliminating the category of extraordinary items eliminates the need for arbitrary segregation of the effects of related external events—some recurring and others not—on the profit or loss of an entity for a period. For example, arbitrary allocations would have been necessary to estimate the financial effect of an earthquake on an entity's profit or loss if it occurs during a major cyclical downturn in economic activity. In addition, paragraph 97 of IAS 1 requires disclosure of the nature and amount of material items of income and expense.

Other comprehensive income—related tax effects (paragraphs 90 and 91)

BC65 The exposure draft of 2006 proposed to allow components of 'other recognised income and expense' (now 'other comprehensive income') to be presented before tax effects ('gross presentation') or after their related tax effects ('net presentation'). The 'gross presentation' facilitated the traceability of other comprehensive income items to profit or loss, because items of profit or loss are generally displayed before tax. The 'net presentation' facilitated the identification of other comprehensive income items in the equity section of the statement of financial position. A majority of respondents supported allowing both approaches. The Board reaffirmed its conclusion that components of other comprehensive income could be displayed either (a) net of related tax effects or (b) before related tax effects.

BC66 Regardless of whether a pre-tax or post-tax display was used, the exposure draft proposed to require disclosure of the amount of income tax expense or benefit allocated separately to individual components of other comprehensive income, in line with SFAS 130. Many respondents agreed in principle with this disclosure, because they agreed that it helped to improve the clarity and transparency of such information, particularly when components of other comprehensive income are taxed at rates different from those applied to profit or loss.

BC67 However, most respondents expressed concern about having to trace the tax effect for each one of the components of other comprehensive income. Several observed that the tax allocation process is arbitrary (eg it may involve the application of subjectively determined tax rates) and some pointed out that this information is not readily available for some industries (eg the insurance sector), where components of other comprehensive income are multiple and tax allocation involves a high degree of subjectivity. Others commented that they did not understand why tax should be attributed to components of comprehensive income line by line, when this is not a requirement for items in profit or loss.

 © IASCF

BC68 The Board decided to maintain the disclosure of income tax expense or benefit allocated to each component of other comprehensive income. Users of financial statements often requested further information on tax amounts relating to components of other comprehensive income, because tax rates often differed from those applied to profit or loss. The Board also observed that an entity should have such tax information available and that a disclosure requirement would therefore not involve additional cost for preparers of financial statements.

Reclassification adjustments (paragraphs 92–96)

BC69 In the exposure draft of 2006, the Board proposed that an entity should separately present reclassification adjustments. These adjustments are the amounts reclassified to profit or loss in the current period that were previously recognised in other comprehensive income. The Board decided that adjustments necessary to avoid double-counting items in total comprehensive income when those items are reclassified to profit or loss in accordance with IFRSs. The Board's view was that separate presentation of reclassification adjustments is essential to inform users of those amounts that are included as income and expenses in different periods—as income or expenses in other comprehensive income in previous periods and as income or expenses in profit or loss in the current period. Without such information, users may find it difficult to assess the effect of reclassifications on profit or loss and to calculate the overall gain or loss associated with available-for-sale[*] financial assets, cash flow hedges and on translation or disposal of foreign operations.

BC70 Most respondents agreed with the Board's decision and believe that the disclosure of reclassification adjustments is important to understanding how components recognised in profit or loss are related to other items recognised in equity in two different periods. However, some respondents suggested that the Board should use the term 'recycling', rather than 'reclassification' as the former term is more common. The Board concluded that both terms are similar in meaning, but decided to use the term 'reclassification adjustment' to converge with the terminology used in SFAS 130.

BC71 The exposure draft proposed to allow the presentation of reclassification adjustments in the statement of recognised income and expense (now 'statement of comprehensive income') or in the notes. Most respondents supported this approach.

BC72 Some respondents noted some inconsistencies in the definition of 'reclassification adjustments' in the exposure draft (now paragraphs 7 and 93 of IAS 1). Respondents suggested that the Board should expand the definition in paragraph 7 to include gains and losses recognised in current periods in addition to those recognised in earlier periods, to make the definition consistent with paragraph 93. They commented that, without clarification, there could be differences between interim and annual reporting, for reclassifications of items that arise in one interim period and reverse out in a different interim period within the same annual period.

[*] IFRS 9 *Financial Instruments*, issued in November 2009, eliminated the category of available-for-sale financial assets. This paragraph discusses matters relevant when IAS 1 was issued.

BC73 The Board decided to align the definition of reclassification adjustments with SFAS 130 and include an additional reference to 'current periods' in paragraph 7.

Statement of changes in equity

Effects of retrospective application or retrospective restatement (paragraph 106(b))

BC74 Some respondents to the exposure draft of 2006 asked the Board to clarify whether the effects of retrospective application or retrospective restatement, as defined in IAS 8, should be regarded as non-owner changes in equity. The Board noted that IAS 1 specifies that these effects are included in the statement of changes in equity. However, the Board decided to clarify that the effects of retrospective application or retrospective restatement are not changes in equity in the period, but provide a reconciliation between the previous period's closing balance and the opening balance in the statement of changes in equity.

Presentation of dividends (paragraph 107)

BC75 The Board reaffirmed its conclusion to require the presentation of dividends in the statement of changes in equity or in the notes, because dividends are distributions to owners in their capacity as owners and the statement of changes in equity presents all owner changes in equity. The Board concluded that an entity should not present dividends in the statement of comprehensive income because that statement presents non-owner changes in equity.

Statement of cash flows

IAS 7 *Cash Flow Statements* (paragraph 111)

BC76 The Board considered whether the operating section of an indirect method statement of cash flows should begin with total comprehensive income instead of profit or loss as is required by IAS 7 *Cash Flow Statements*. When components of other comprehensive income are non-cash items, they would become reconciling items in arriving at cash flows from operating activities and would add items to the statement of cash flows without adding information content. The Board concluded that an amendment to IAS 7 is not required; however, as mentioned in paragraph BC14 the Board decided to relabel this financial statement as 'statement of cash flows'.

Notes

Disclosure of the judgements that management has made in the process of applying the entity's accounting policies (paragraphs 122–124)

BC77 The revised IAS 1 requires disclosure of the judgements, apart from those involving estimations, that management has made in the process of applying the entity's accounting policies and that have the most significant effect on the

 © IASCF

amounts recognised in the financial statements (see paragraph 122). An example of these judgements is how management determines whether financial assets are held-to-maturity investments. The Board decided that disclosure of the most important of these judgements would enable users of financial statements to understand better how the accounting policies are applied and to make comparisons between entities regarding the basis on which managements make these judgements.

BC78 Comments received on the exposure draft of 2002 indicated that the purpose of the proposed disclosure was unclear. Accordingly, the Board amended the disclosure explicitly to exclude judgements involving estimations (which are the subject of the disclosure in paragraph 125) and added another four examples of the types of judgements disclosed (see paragraphs 123 and 124).

Disclosure of major sources of estimation uncertainty (paragraphs 125–133)

BC79 IAS 1 requires disclosure of the assumptions concerning the future, and other major sources of estimation uncertainty at the end of the reporting period, that have a significant risk of causing a material adjustment to the carrying amounts of assets and liabilities within the next financial year. For those assets and liabilities, the proposed disclosures include details of:

(a) their nature; and

(b) their carrying amount as at the end of the reporting period (see paragraph 125).

BC80 Determining the carrying amounts of some assets and liabilities requires estimation of the effects of uncertain future events on those assets and liabilities at the end of the reporting period. For example, in the absence of recently observed market prices used to measure the following assets and liabilities, future-oriented estimates are necessary to measure the recoverable amount of classes of property, plant and equipment, the effect of technological obsolescence of inventories, provisions subject to the future outcome of litigation in progress, and long-term employee benefit liabilities such as pension obligations. These estimates involve assumptions about items such as the risk adjustment to cash flows or discount rates used, future changes in salaries and future changes in prices affecting other costs. No matter how diligently an entity estimates the carrying amounts of assets and liabilities subject to significant estimation uncertainty at the end of the reporting period, the reporting of point estimates in the statement of financial position cannot provide information about the estimation uncertainties involved in measuring those assets and liabilities and the implications of those uncertainties for the period's profit or loss.

BC81 The *Framework* states that 'The economic decisions that are made by users of financial statements require an evaluation of the ability of an entity to generate cash and cash equivalents and of the timing and certainty of their generation.' The Board decided that disclosure of information about assumptions and other major sources of estimation uncertainty at the end of the reporting period enhances the relevance, reliability and understandability of the information reported in financial statements. These assumptions and other sources of estimation uncertainty relate to estimates that require management's most

© IASCF

difficult, subjective or complex judgements. Therefore, disclosure in accordance with paragraph 125 of the revised IAS 1 would be made in respect of relatively few assets or liabilities (or classes of them).

BC82 The exposure draft of 2002 proposed the disclosure of some 'sources of measurement uncertainty'. In the light of comments received that the purpose of this disclosure was unclear, the Board decided:

(a) to amend the subject of that disclosure to 'sources of estimation uncertainty at the end of the reporting period'; and

(b) to clarify in the revised Standard that the disclosure does not apply to assets and liabilities measured at fair value based on recently observed market prices (see paragraph 128 of IAS 1).

BC83 When assets and liabilities are measured at fair value on the basis of recently observed market prices, future changes in carrying amounts would not result from using estimates to measure the assets and liabilities at the end of the reporting period. Using observed market prices to measure assets or liabilities obviates the need for estimates at the end of the reporting period. The market prices properly reflect the fair values at the end of the reporting period, even though future market prices could be different. The objective of fair value measurement is to reflect fair value at the measurement date, not to predict a future value.

BC84 IAS 1 does not prescribe the particular form or detail of the disclosures. Circumstances differ from entity to entity, and the nature of estimation uncertainty at the end of the reporting period has many facets. IAS 1 limits the scope of the disclosures to items that have a significant risk of causing a material adjustment to the carrying amounts of assets and liabilities within the next financial year. The longer the future period to which the disclosures relate, the greater the range of items that would qualify for disclosure, and the less specific are the disclosures that could be made about particular assets or liabilities. A period longer than the next financial year might obscure the most relevant information with other disclosures.

Disclosures about capital (paragraphs 134 and 135)

BC85 In July 2004 the Board published an exposure draft—ED 7 *Financial Instruments: Disclosures*. As part of that project, the Board considered whether it should require disclosures about capital.

BC86 The level of an entity's capital and how it manages capital are important factors for users to consider in assessing the risk profile of an entity and its ability to withstand unexpected adverse events. The level of capital might also affect the entity's ability to pay dividends. Consequently, ED 7 proposed disclosures about capital.

BC87 In ED 7 the Board decided that it should not limit the requirements for disclosures about capital to entities that are subject to external capital requirements (eg regulatory capital requirements established by legislation or other regulation). The Board believes that information about capital is useful for all entities, as is evidenced by the fact that some entities set internal capital requirements and norms have been established for some industries. The Board noted that the

 © IASCF

capital disclosures are not intended to replace disclosures required by regulators. The Board also noted that the financial statements should not be regarded as a substitute for disclosures to regulators (which may not be available to all users) because the function of disclosures made to regulators may differ from the function of those to other users. Therefore, the Board decided that information about capital should be required of all entities because it is useful to users of general purpose financial statements. Accordingly, the Board did not distinguish between the requirements for regulated and non-regulated entities.

BC88 Some respondents to ED 7 questioned the relevance of the capital disclosures in an IFRS dealing with disclosures relating to financial instruments. The Board noted that an entity's capital does not relate solely to financial instruments and, thus, capital disclosures have more general relevance. Accordingly, the Board included these disclosures in IAS 1, rather than IFRS 7 *Financial Instruments: Disclosures*, the IFRS resulting from ED 7.

BC89 The Board also decided that an entity's decision to adopt the amendments to IAS 1 should be independent of the entity's decision to adopt IFRS 7. The Board noted that issuing a separate amendment facilitates separate adoption decisions.

Objectives, policies and processes for managing capital (paragraph 136)

BC90 The Board decided that disclosure about capital should be placed in the context of a discussion of the entity's objectives, policies and processes for managing capital. This is because the Board believes that such a discussion both communicates important information about the entity's capital strategy and provides the context for other disclosures.

BC91 The Board considered whether an entity can have a view of capital that differs from what IFRSs define as equity. The Board noted that, although for the purposes of this disclosure capital would often equate with equity as defined in IFRSs, it might also include or exclude some components. The Board also noted that this disclosure is intended to give entities the opportunity to describe how they view the components of capital they manage, if this is different from what IFRSs define as equity.

Externally imposed capital requirements (paragraph 136)

BC92 The Board considered whether it should require disclosure of any externally imposed capital requirements. Such a capital requirement could be:

(a) an industry-wide requirement with which all entities in the industry must comply; or

(b) an entity-specific requirement imposed on a particular entity by its prudential supervisor or other regulator.

BC93 The Board noted that some industries and countries have industry-wide capital requirements, and others do not. Thus, the Board concluded that it should not require disclosure of industry-wide requirements, or compliance with such requirements, because such disclosure would not lead to comparability between different entities or between similar entities in different countries.

BC94 The Board concluded that disclosure of the existence and level of entity-specific capital requirements is important information for users, because it informs them about the risk assessment of the regulator. Such disclosure improves transparency and market discipline.

BC95 However, the Board noted the following arguments against requiring disclosure of externally imposed entity-specific capital requirements.

(a) Users of financial statements might rely primarily on the regulator's assessment of solvency risk without making their own risk assessment.

(b) The focus of a regulator's risk assessment is for those whose interests the regulations are intended to protect (eg depositors or policyholders). This emphasis is different from that of a shareholder. Thus, it could be misleading to suggest that the regulator's risk assessment could, or should, be a substitute for independent analysis by investors.

(c) The disclosure of entity-specific capital requirements imposed by a regulator might undermine that regulator's ability to impose such requirements. For example, the information could cause depositors to withdraw funds, a prospect that might discourage regulators from imposing requirements. Furthermore, an entity's regulatory dialogue would become public, which might not be appropriate in all circumstances.

(d) Because different regulators have different tools available, for example formal requirements and moral suasion, a requirement to disclose entity-specific capital requirements could not be framed in a way that would lead to the provision of information that is comparable across entities.

(e) Disclosure of capital requirements (and hence, regulatory judgements) could hamper clear communication to the entity of the regulator's assessment by creating incentives to use moral suasion and other informal mechanisms.

(f) Disclosure requirements should not focus on entity-specific capital requirements in isolation, but should focus on how entity-specific capital requirements affect how an entity manages and determines the adequacy of its capital resources.

(g) A requirement to disclose entity-specific capital requirements imposed by a regulator is not part of Pillar 3 of the Basel II Framework developed by the Basel Committee on Banking Supervision.

BC96 Taking into account all of the above arguments, the Board decided not to require quantitative disclosure of externally imposed capital requirements. Rather, it decided to require disclosures about whether the entity complied with any externally imposed capital requirements during the period and, if not, the consequences of non-compliance. This retains confidentiality between regulators and the entity, but alerts users to breaches of capital requirements and their consequences.

BC97 Some respondents to ED 7 did not agree that breaches of externally imposed capital requirements should be disclosed. They argued that disclosure about breaches of externally imposed capital requirements and the associated regulatory measures subsequently imposed could be disproportionately

 © IASCF

damaging to entities. The Board was not persuaded by these arguments because it believes that such concerns indicate that information about breaches of externally imposed capital requirements may often be material by its nature. The *Framework* states that 'Information is material if its omission or misstatement could influence the economic decisions of users taken on the basis of the financial statements.' Similarly, the Board decided not to provide an exemption for temporary non-compliance with regulatory requirements during the year. Information that an entity is sufficiently close to its limits to breach them, even on a temporary basis, is useful for users.

Internal capital targets

BC98 The Board proposed in ED 7 that the requirement to disclose information about breaches of capital requirements should apply equally to breaches of internally imposed requirements, because it believed the information is also useful to a user of the financial statements.

BC99 However, this proposal was criticised by respondents to ED 7 for the following reasons:

(a) The information is subjective and, thus, not comparable between entities. In particular, different entities will set internal targets for different reasons, so a breach of a requirement might signify different things for different entities. In contrast, a breach of an external requirement has similar implications for all entities required to comply with similar requirements.

(b) Capital targets are not more important than other internally set financial targets, and to require disclosure only of capital targets would provide users with incomplete, and perhaps misleading, information.

(c) Internal targets are estimates that are subject to change by the entity. It is not appropriate to require the entity's performance against this benchmark to be disclosed.

(d) An internally set capital target can be manipulated by management. The disclosure requirement could cause management to set the target so that it would always be achieved, providing little useful information to users and potentially reducing the effectiveness of the entity's capital management.

BC100 As a result, the Board decided not to require disclosure of the capital targets set by management, whether the entity has complied with those targets, or the consequences of any non-compliance. However, the Board confirmed its view that when an entity has policies and processes for managing capital, qualitative disclosures about these policies and processes are useful. The Board also concluded that these disclosures, together with disclosure of the components of equity and their changes during the year (required by paragraphs 106–110), would give sufficient information about entities that are not regulated or subject to externally imposed capital requirements.

Puttable financial instruments and obligations arising on liquidation

BC100A The Board decided to require disclosure of information about puttable instruments and instruments that impose on the entity an obligation to deliver to another party a pro rata share of the net assets of the entity only on liquidation that are reclassified in accordance with paragraphs 16E and 16F of IAS 32. This is because the Board concluded that this disclosure allows users of financial statements to understand the effects of any reclassifications.

BC100B The Board also concluded that entities with puttable financial instruments classified as equity should be required to disclose additional information to allow users to assess any effect on the entity's liquidity arising from the ability of the holder to put the instruments to the issuer. Financial instruments classified as equity usually do not include any obligation for the entity to deliver a financial asset to another party. Therefore, the Board concluded that additional disclosures are needed in these circumstances. In particular, the Board concluded that entities should disclose the expected cash outflow on redemption or repurchase of those financial instruments that are classified as equity and information about how that amount was determined. That information allows liquidity risk associated with the put obligation and future cash flows to be evaluated.

Presentation of measures per share

BC101 The exposure draft of 2006 did not propose to change the requirements of IAS 33 *Earnings per Share* on the presentation of basic and diluted earnings per share. A majority of respondents agreed with this decision. In their opinion, earnings per share should be the only measure per share permitted or required in the statement of comprehensive income and changing those requirements was beyond the scope of this stage of the financial statement presentation project.

BC102 However, some respondents would like to see alternative measures per share whenever earnings per share is not viewed as the most relevant measure for financial analysts (ie credit rating agencies that focus on other measures). A few respondents proposed that an entity should also display an amount per share for total comprehensive income, because this was considered a useful measure. The Board did not support including alternative measures per share in the financial statements, until totals and subtotals, and principles for aggregating and disaggregating items, are addressed and discussed as part of the next stage of the financial statement presentation project.

BC103 Some respondents also interpreted the current provisions in IAS 33 as allowing de facto a display of alternative measures in the income statement. In its deliberations, the Board was clear that paragraph 73 of IAS 33 did not leave room for confusion. However, it decided that the wording in paragraph 73 could be improved to clarify that alternative measures should be shown 'only in the notes'. This will be done when IAS 33 is revisited or as part of the annual improvements process.

 © IASCF

BC104 One respondent commented that the use of the word 'earnings' was inappropriate in the light of changes proposed in the exposure draft and that the measure should be denominated 'profit or loss per share', instead. The Board considered that this particular change in terminology was beyond the scope of IAS 1.

Transition and effective date

BC105 The Board is committed to maintaining a 'stable platform' of substantially unchanged standards for annual periods beginning between 1 January 2006 and 31 December 2008. In addition, some preparers will need time to make the system changes necessary to comply with the revisions to IAS 1. Therefore, the Board decided that the effective date of IAS 1 should be annual periods beginning on or after 1 January 2009, with earlier application permitted.

Differences from SFAS 130

BC106 In developing IAS 1, the Board identified the following differences from SFAS 130:

(a) **Reporting and display of comprehensive income** Paragraph 22 of SFAS 130 permits a choice of displaying comprehensive income and its components, in one or two statements of financial performance or in a statement of changes in equity. IAS 1 (as revised in 2007) does not permit display in a statement of changes in equity.

(b) **Reporting other comprehensive income in the equity section of a statement of financial position** Paragraph 26 of SFAS 130 specifically states that the *total of other comprehensive income* is reported separately from retained earnings and additional paid-in capital in a statement of financial position at the end of the period. A descriptive title such as *accumulated other comprehensive income* is used for that component of equity. An entity discloses accumulated balances for each classification in that separate component of equity in a statement of financial position, in a statement of changes in equity, or in notes to the financial statements. IAS 1 (as revised in 2007) does not specifically require the display of a total of accumulated other comprehensive income in the statement of financial position.

(c) **Display of the share of other comprehensive income items of associates and joint ventures accounted for using the equity method** Paragraph 82 of IAS 1 (as revised in 2007) requires the display in the statement of comprehensive income of the investor's share of the investee's other comprehensive income. Paragraph 122 of SFAS 130 does not specify how that information should be displayed. An investor is permitted to combine its proportionate share of other comprehensive income amounts with its own other comprehensive income items and display the aggregate of those amounts in an income statement type format or in a statement of changes in equity.

Appendix
Amendments to the Basis for Conclusions on other IFRSs

This appendix contains amendments to the Basis for Conclusions on other IFRSs that are necessary in order to ensure consistency with the revised IAS 1. Amended paragraphs are shown with the new text underlined and deleted text struck through.

* * * * *

The amendments contained in this appendix when this Standard was revised in 2007 have been incorporated into the relevant pronouncements published in this volume.

Dissenting opinions

Dissent of Mary E Barth, Anthony T Cope, Robert P Garnett and James J Leisenring from IAS 1 (as revised in September 2007)

DO1 Professor Barth and Messrs Cope, Garnett and Leisenring voted against the issue of IAS 1 *Presentation of Financial Statements* in 2007. The reasons for their dissent are set out below.

DO2 Those Board members agree with the requirement to report all items of income and expense separately from changes in net assets that arise from transactions with owners in their capacity as owners. Making that distinction clearly is a significant improvement in financial reporting.

DO3 However, they believe that the decision to permit entities to divide the statement of comprehensive income into two separate statements is both conceptually unsound and unwise.

DO4 As noted in paragraph BC51, the *Framework* does not define profit or loss, or net income. It also does not indicate what criteria should be used to distinguish between those items of recognised income and expense that should be included in profit or loss and those items that should not. In some cases, it is even possible for identical transactions to be reported inside or outside profit or loss. Indeed, in that same paragraph, the Board acknowledges these facts, and indicates that it had a preference for reporting all items of income and expense in a single statement, believing that a single statement is the conceptually correct approach. Those Board members believe that some items of income and expense that will potentially bypass the statement of profit and loss can be as significant to the assessment of an entity's performance as items that will be included. Until a conceptual distinction can be developed to determine whether any items should be reported in profit or loss or elsewhere, financial statements will lack neutrality and comparability unless all items are reported in a single statement. In such a statement, profit or loss can be shown as a subtotal, reflecting current conventions.

DO5 In the light of those considerations, it is puzzling that most respondents to the exposure draft that proposed these amendments favoured permitting a two-statement approach, reasoning that it 'distinguishes between profit and loss and total comprehensive income' (paragraph BC50). Distinguishing between those items reported in profit or loss and those reported elsewhere is accomplished by the requirement for relevant subtotals to be included in a statement of comprehensive income. Respondents also stated that a two-statement approach gives primacy to the 'income statement'; that conflicts with the Board's requirement in paragraph 11 of IAS 1 to give equal prominence to all financial statements within a set of financial statements.

DO6 Those Board members also believe that the amendments are flawed by offering entities a choice of presentation methods. The Board has expressed a desire to reduce alternatives in IFRSs. The *Preface to International Financial Reporting Standards*, in paragraph 13, states: 'the IASB intends not to permit choices in accounting treatment ... and will continue to reconsider ... those transactions and events for

which IASs permit a choice of accounting treatment, with the objective of reducing the number of those choices.' The *Preface* extends this objective to both accounting and reporting. The same paragraph states: 'The IASB's objective is to require like transactions and events to be accounted for *and reported* in a like way and unlike transactions and events to be accounted for *and reported* differently' (emphasis added). By permitting a choice in this instance, the IASB has abandoned that principle.

DO7 Finally, the four Board members believe that allowing a choice of presentation at this time will ingrain practice, and make achievement of the conceptually correct presentation more difficult as the long-term project on financial statement presentation proceeds.

 © IASCF

Guidance on implementing IAS 1 *Presentation of Financial Statements*

This guidance accompanies, but is not part of, IAS 1.

Illustrative financial statement structure

IG1 IAS 1 sets out the components of financial statements and minimum requirements for disclosure in the statements of financial position, comprehensive income and changes in equity. It also describes further items that may be presented either in the relevant financial statement or in the notes. This guidance provides simple examples of ways in which the requirements of IAS 1 for the presentation of the statements of financial position, comprehensive income and changes in equity might be met. An entity should change the order of presentation, the titles of the statements and the descriptions used for line items when necessary to suit its particular circumstances.

IG2 The guidance is in two sections. Paragraphs IG3–IG6 provide examples of the presentation of financial statements. Paragraphs IG7–IG9 have been deleted. Paragraphs IG10 and IG11 provide examples of capital disclosures.

IG3 The illustrative statement of financial position shows one way in which an entity may present a statement of financial position distinguishing between current and non-current items. Other formats may be equally appropriate, provided the distinction is clear.

IG4 The illustrations use the term 'comprehensive income' to label the total of all components of comprehensive income, including profit or loss. The illustrations use the term 'other comprehensive income' to label income and expenses that are included in comprehensive income but excluded from profit or loss. IAS 1 does not require an entity to use those terms in its financial statements.

IG5 Two statements of comprehensive income are provided, to illustrate the alternative presentations of income and expenses in a single statement or in two statements. The single statement of comprehensive income illustrates the classification of income and expenses within profit or loss by function. The separate statement (in this example, 'the income statement') illustrates the classification of income and expenses within profit by nature.

IG6 The examples are not intended to illustrate all aspects of IFRSs, nor do they constitute a complete set of financial statements, which would also include a statement of cash flows, a summary of significant accounting policies and other explanatory information.

XYZ Group – Statement of comprehensive income for the year ended 31 December 20X7

(illustrating the presentation of comprehensive income in one statement and the classification of expenses within profit by function)

(in thousands of currency units)

	20X7	20X6
Profit attributable to:		
Owners of the parent	97,000	52,400
Non-controlling interests	24,250	13,100
	121,250	65,500
Total comprehensive income attributable to:		
Owners of the parent	85,800	74,800
Non-controlling interests	21,450	18,700
	107,250	93,500
Earnings per share (in currency units):		
Basic and diluted	0.46	0.30

Alternatively, components of other comprehensive income could be presented in the statement of comprehensive income net of tax:

Other comprehensive income for the year, after tax:	**20X7**	**20X7**
Exchange differences on translating foreign operations	4,000	8,000
Investments in equity instruments	(18,000)	20,000
Cash flow hedges	(500)	(3000)
Gains on property revaluation	600	2,700
Actuarial gains (losses) on defined benefit pension plans	(500)	1,000
Share of other comprehensive income of associates	400	(700)
Other comprehensive income for the year, net of tax[d]	(14,000)	28,000

(a) This means the share of associates' other comprehensive income attributable to owners of the associates, ie it is after tax and non-controlling interests in the associates.

(b) This illustrates the aggregated presentation, with disclosure of the current year gain or loss and reclassification adjustment presented in the notes. Alternatively, a gross presentation can be used.

(c) This means the share of associates' other comprehensive income attributable to owners of the associates, ie it is after tax and non-controlling interests in the associates.

(d) The income tax relating to each component of other comprehensive income is disclosed in the notes.

XYZ Group – Income statement for the year ended 31 December 20X7

XYZ Group – Statement of changes in equity for the year ended 31 December 20X7

(in thousands of currency units)

	Share capital	Retained earnings	Translation of foreign operations	Available-for-sale financial assets	Cash flow hedges	Revaluation surplus	Total	Non-controlling interests	Total equity
Balance at 1 January 20X6	600,000	118,100	(4,000)	1,600	2,000	–	717,700	29,800	747,500
Changes in accounting policy	–	400	–	–	–	–	400	100	500
Restated balance	600,000	118,500	(4,000)	1,600	2,000	–	718,100	29,900	748,000
Changes in equity for 20X6									
Dividends	–	(10,000)	–	–	–	–	(10,000)	–	(10,000)
Total comprehensive income for the year[(k)]	–	53,200	6,400	16,000	(2,400)	1,600	74,800	18,700	93,500
Balance at 31 December 20X6	600,000	161,700	2,400	17,600	(400)	1,600	782,900	48,600	831,500
Changes in equity for 20X7									
Issue of share capital	50,000	–	–	–	–	–	50,000	–	50,000
Dividends	–	(15,000)	–	–	–	–	(15,000)	–	(15,000)
Total comprehensive income for the year[(l)]	–	96,600	3,200	(14,400)	(400)	800	85,800	21,450	107,250
Transfer to retained earnings	–	200	–	–	–	200	–	–	–
Balance at 31 December 20X7	650,000	243,500	5,600	3,200	(800)	2,200	903,700	70,050	973,750

(k) The amount included in retained earnings for 20X6 of 53,200 represents profit attributable to owners of the parent of 52,400 plus actuarial gains on defined benefit pension plans of 800 (1,333, less tax 333, less non-controlling interests 200).

The amount included in the translation, investments in equity instruments and cash flow hedge reserves represent other comprehensive income for each component, net of tax and non-controlling interests, eg other comprehensive income related to investments in equity instruments for 20X6 of 16,000 is 26,667, less tax 6,667, less non-controlling interests 4,000.

The amount included in the revaluation surplus of 1,600 represents the share of other comprehensive income of associates of (700) plus gains on property revaluation of 2,300 (3,367, less tax 667, less non-controlling interests 400). Other comprehensive income of associates relates solely to gains or losses on property revaluation.

(l) The amount included in retained earnings for 20X7 of 96,600 represents profit attributable to owners of the parent of 97,000 plus actuarial losses on defined benefit pension plans of 400 (667, less tax 167, less non-controlling interests 100).

The amount included in the translation, investments in equity instruments and cash flow hedge reserves represent other comprehensive income for each component, net of tax and non-controlling interests, eg other comprehensive income related to the translation of foreign operations for 20X7 of 3,200 is 5,334, less tax 1,334, less non-controlling interests 800.

The amount included in the revaluation surplus of 800 represents the share of other comprehensive income of associates of 400 plus gains on property revaluation of 400 (933, less tax 333, less non-controlling interests 200). Other comprehensive income of associates relates solely to gains or losses on property revaluation.

IG7–IG9 [Deleted]

Part III: Illustrative examples of capital disclosures (paragraphs 134–136)
An entity that is not a regulated financial institution

IG10 The following example illustrates the application of paragraphs 134 and 135 for an entity that is not a financial institution and is not subject to an externally imposed capital requirement. In this example, the entity monitors capital using a debt-to-adjusted capital ratio. Other entities may use different methods to monitor capital. The example is also relatively simple. An entity decides, in the light of its circumstances, how much detail it provides to satisfy the requirements of paragraphs 134 and 135.

Facts

Group A manufactures and sells cars. Group A includes a finance subsidiary that provides finance to customers, primarily in the form of leases. Group A is not subject to any externally imposed capital requirements.

Example disclosure

The Group's objectives when managing capital are:

- to safeguard the entity's ability to continue as a going concern, so that it can continue to provide returns for shareholders and benefits for other stakeholders, and
- to provide an adequate return to shareholders by pricing products and services commensurately with the level of risk.

The Group sets the amount of capital in proportion to risk. The Group manages the capital structure and makes adjustments to it in the light of changes in economic conditions and the risk characteristics of the underlying assets. In order to maintain or adjust the capital structure, the Group may adjust the amount of dividends paid to shareholders, return capital to shareholders, issue new shares, or sell assets to reduce debt.

Consistently with others in the industry, the Group monitors capital on the basis of the debt-to-adjusted capital ratio. This ratio is calculated as net debt ÷ adjusted capital. Net debt is calculated as total debt (as shown in the statement of financial position) less cash and cash equivalents. Adjusted capital comprises all components of equity (ie share capital, share premium, non-controlling interests, retained earnings, and revaluation surplus) other than amounts accumulated in equity relating to cash flow hedges, and includes some forms of subordinated debt.

continued...

...continued

During 20X4, the Group's strategy, which was unchanged from 20X3, was to maintain the debt-to-adjusted capital ratio at the lower end of the range 6:1 to 7:1, in order to secure access to finance at a reasonable cost by maintaining a BB credit rating. The debt-to-adjusted capital ratios at 31 December 20X4 and at 31 December 20X3 were as follows:

	31 Dec 20X4	31 Dec 20X3
	CU million	CU million
Total debt	1,000	1,100
Less: cash and cash equivalents	(90)	(150)
Net debt	910	950
Total equity	110	105
Add: subordinated debt instruments	38	38
Less: amounts accumulated in equity relating to cash flow hedges	(10)	(5)
Adjusted capital	138	138
Debt-to-adjusted capital ratio	6.6	6.9

The decrease in the debt-to-adjusted capital ratio during 20X4 resulted primarily from the reduction in net debt that occurred on the sale of subsidiary Z. As a result of this reduction in net debt, improved profitability and lower levels of managed receivables, the dividend payment was increased to CU2.8 million for 20X4 (from CU2.5 million for 20X3).

 © IASCF

An entity that has not complied with externally imposed capital requirements

IG11 The following example illustrates the application of paragraph 135(e) when an entity has not complied with externally imposed capital requirements during the period. Other disclosures would be provided to comply with the other requirements of paragraphs 134 and 135.

Facts

Entity A provides financial services to its customers and is subject to capital requirements imposed by Regulator B. During the year ended 31 December 20X7, Entity A did not comply with the capital requirements imposed by Regulator B. In its financial statements for the year ended 31 December 20X7, Entity A provides the following disclosure relating to its non-compliance.

Example disclosure

Entity A filed its quarterly regulatory capital return for 30 September 20X7 on 20 October 20X7. At that date, Entity A's regulatory capital was below the capital requirement imposed by Regulator B by CU1 million. As a result, Entity A was required to submit a plan to the regulator indicating how it would increase its regulatory capital to the amount required. Entity A submitted a plan that entailed selling part of its unquoted equities portfolio with a carrying amount of CU11.5 million in the fourth quarter of 20X7. In the fourth quarter of 20X7, Entity A sold its fixed interest investment portfolio for CU12.6 million and met its regulatory capital requirement.

Appendix
Amendments to guidance on other IFRSs

The following amendments to guidance on other IFRSs are necessary in order to ensure consistency with the revised IAS 1. In the amended paragraphs, new text is underlined and deleted text is struck through.

* * * * *

The amendments contained in this appendix when IAS 1 was revised in 2007 have been incorporated into the guidance on the relevant IFRSs, published in this volume.

Basis for Conclusions on IAS 2 *Inventories*

This Basis for Conclusions accompanies, but is not part of, IAS 2.

Introduction

BC1 This Basis for Conclusions summarises the International Accounting Standards Board's considerations in reaching its conclusions on revising IAS 2 *Inventories* in 2003. Individual Board members gave greater weight to some factors than to others.

BC2 In July 2001 the Board announced that, as part of its initial agenda of technical projects, it would undertake a project to improve a number of Standards, including IAS 2. The project was undertaken in the light of queries and criticisms raised in relation to the Standards by securities regulators, professional accountants and other interested parties. The objectives of the Improvements project were to reduce or eliminate alternatives, redundancies and conflicts within Standards, to deal with some convergence issues and to make other improvements. In May 2002 the Board published its proposals in an Exposure Draft of *Improvements to International Accounting Standards*, with a comment deadline of 16 September 2002. The Board received over 160 comment letters on the Exposure Draft.

BC3 Because the Board's intention was not to reconsider the fundamental approach to the accounting for inventories established by IAS 2, this Basis for Conclusions does not discuss requirements in IAS 2 that the Board has not reconsidered.

Scope

Reference to historical cost system

BC4 Both the objective and the scope of the previous version of IAS 2 referred to 'the accounting treatment for inventories under the historical cost system.' Some had interpreted those words as meaning that the Standard applied only under a historical cost system and permitted entities the choice of applying other measurement bases, for example fair value.

BC5 The Board agreed that those words could be seen as permitting a choice, resulting in inconsistent application of the Standard. Accordingly, it deleted the words 'in the context of the historical cost system in accounting for inventories' to clarify that the Standard applies to all inventories that are not specifically exempted from its scope.

Inventories of broker-traders

BC6 The Exposure Draft proposed excluding from the scope of the Standard inventories of non-producers of agricultural and forest products and mineral ores to the extent that these inventories are measured at net realisable value in

accordance with well-established industry practices. However, some respondents disagreed with this scope exemption for the following reasons:

(a) the scope exemption should apply to all types of inventories of broker-traders;

(b) established practice is for broker-traders to follow a mark-to-market approach rather than to value these inventories at net realisable value;

(c) the guidance on net realisable value in IAS 2 is not appropriate for the valuation of inventories of broker-traders.

BC7 The Board found these comments persuasive. Therefore it decided that the Standard should not apply to the measurement of inventories of:

(a) producers of agricultural and forest products, agricultural produce after harvest, and minerals and mineral products, to the extent that they are measured at net realisable value (as in the previous version of IAS 2), or

(b) commodity broker-traders when their inventories are measured at fair value less costs to sell.

BC8 The Board further decided that the measurement of the effect of inventories on profit or loss for the period needed to be consistent with the measurement attribute of inventories for which such exemption is allowed. Accordingly, to qualify under (a) or (b), the Standard requires changes in the recognised amount of inventories to be included in profit or loss for the period. The Board believes this is particularly appropriate in the case of commodity broker-traders because they seek to profit from fluctuations in prices and trade margins.

Cost formulas

BC9 The combination of the previous version of IAS 2 and SIC-1 *Consistency—Different Cost Formulas for Inventories* allowed some choice between first-in, first-out (FIFO) or weighted average cost formulas (benchmark treatment) and the last-in, first-out (LIFO) method (allowed alternative treatment). The Board decided to eliminate the allowed alternative of using the LIFO method.

BC10 The LIFO method treats the newest items of inventory as being sold first, and consequently the items remaining in inventory are recognised as if they were the oldest. This is generally not a reliable representation of actual inventory flows.

BC11 The LIFO method is an attempt to meet a perceived deficiency of the conventional accounting model (the measurement of cost of goods sold expense by reference to outdated prices for the inventories sold, whereas sales revenue is measured at current prices). It does so by imposing an unrealistic cost flow assumption.

BC12 The use of LIFO in financial reporting is often tax-driven, because it results in cost of goods sold expense calculated using the most recent prices being deducted from revenue in the determination of the gross margin. The LIFO method reduces (increases) profits in a manner that tends to reflect the effect that increased (decreased) prices would have on the cost of replacing inventories sold. However,

 © IASCF

this effect depends on the relationship between the prices of the most recent inventory acquisitions and the replacement cost at the end of the period. Thus, it is not a truly systematic method for determining the effect of changing prices on profits.

BC13 The use of LIFO results in inventories being recognised in the balance sheet at amounts that bear little relationship to recent cost levels of inventories. However, LIFO can distort profit or loss, especially when 'preserved' older 'layers' of inventory are presumed to have been used when inventories are substantially reduced. It is more likely in these circumstances that relatively new inventories will have been used to meet the increased demands on inventory.

BC14 Some respondents argued that the use of LIFO has merit in certain circumstances because it partially adjusts profit or loss for the effects of price changes. The Board concluded that it is not appropriate to allow an approach that results in a measurement of profit or loss for the period that is inconsistent with the measurement of inventories for balance sheet purposes.

BC15 Other respondents argued that in some industries, such as the oil and gas industry, inventory levels are driven by security considerations and often represent a minimum of 90 days of sales. They argue that, in these industries, the use of LIFO better reflects an entity's performance because inventories held as security stocks are closer to long-term assets than to working capital.

BC16 The Board was not convinced by these arguments because these security stocks do not match historical layers under a LIFO computation.

BC17 Other respondents argued that in some cases, for example, when measuring coal dumps, piles of iron or metal scraps (when stock bins are replenished by 'topping up'), the LIFO method reflects the actual physical flow of inventories.

BC18 The Board concluded that valuation of these inventories follows a direct costing approach where actual physical flows are matched with direct costs, which is a method different from LIFO.

BC19 The Board decided to eliminate the LIFO method because of its lack of representational faithfulness of inventory flows. This decision does not rule out specific cost methods that reflect inventory flows that are similar to LIFO.

BC20 The Board recognised that, in some jurisdictions, use of the LIFO method for tax purposes is possible only if that method is also used for accounting purposes. It concluded, however, that tax considerations do not provide an adequate conceptual basis for selecting an appropriate accounting treatment and that it is not acceptable to allow an inferior accounting treatment purely because of tax regulations and advantages in particular jurisdictions. This may be an issue for local taxation authorities.

BC21 IAS 2 continues to allow the use of both the FIFO and the weighted average methods for interchangeable inventories.

© IASCF

Cost of inventories recognised as an expense in the period

BC22 The Exposure Draft proposed deleting paragraphs in the previous version of IAS 2 that required disclosure of the cost of inventories recognised as an expense in the period, because this disclosure is required in IAS 1 *Presentation of Financial Statements*.

BC23 Some respondents observed that IAS 1 does not specifically require disclosure of the cost of inventories recognised as an expense in the period when presenting an analysis of expenses using a classification based on their function. They argued that this information is important to understand the financial statements. Therefore the Board decided to require this disclosure specifically in IAS 2.

Statement of Cash Flows

This version includes amendments resulting from IFRSs issued up to 31 December 2009.

The text of the unaccompanied IAS 7 is contained in Part A of this edition. Its effective date when issued was 1 January 1994. The effective date of the most recent amendments is 1 January 2010. This part presents the following accompanying documents:

Basis for Conclusions on IAS 7 *Statement of Cash Flows*

This Basis for Conclusions accompanies, but is not part of, IAS 7.

BC1 This Basis for Conclusions summarises the considerations of the International Accounting Standards Board in reaching its conclusions on amending IAS 7 *Statement of Cash Flows* as part of *Improvements to IFRSs* issued in April 2009. Individual Board members gave greater weight to some factors than to others.

BC2 IAS 7 was developed by the International Accounting Standards Committee in 1992 and was not accompanied by a Basis for Conclusions. This Basis refers to clarification of guidance on classification of cash flows from investing activities.

Classification of expenditures on unrecognised assets

BC3 In 2008 the International Financial Reporting Interpretations Committee (IFRIC) reported to the Board that practice differed for the classification of cash flows for expenditures incurred with the objective of generating future cash flows when those expenditures are not recognised as assets in accordance with IFRSs. Some entities classified such expenditures as cash flows from operating activities and others classified them as investing activities. Examples of such expenditures are those for exploration and evaluation activities, which IFRS 6 *Exploration for and Evaluation of Mineral Resources* permits to be recognised as either an asset or an expense depending on the entity's previous accounting policies for those expenditures. Expenditures on advertising and promotional activities, staff training, and research and development could also raise the same issue.

BC4 The IFRIC decided not to add this issue to its agenda but recommended that the Board should amend IAS 7 to state explicitly that only an expenditure that results in a recognised asset can be classified as a cash flow from investing activity.

BC5 In 2008, as part of its annual improvements project, the Board considered the principles in IAS 7, specifically guidance on the treatment of such expenditures in the statement of cash flows. The Board noted that even though paragraphs 14 and 16 of IAS 7 appear to be clear that only expenditure that results in the recognition of an asset should be classified as cash flows from investing activities, the wording is not definitive in this respect. Some might have misinterpreted the reference in paragraph 11 of IAS 7 for an entity to assess classification by activity that is most appropriate to its business to imply that the assessment is an accounting policy choice.

BC6 Consequently, in *Improvements to IFRSs* issued in April 2009, the Board removed the potential misinterpretation by amending paragraph 16 of IAS 7 to state explicitly that only an expenditure that results in a recognised asset can be classified as a cash flow from investing activities.

 © IASCF

BC7 The Board concluded that this amendment better aligns the classification of cash flows from investing activities in the statement of cash flows and the presentation of recognised assets in the statement of financial position, reduces divergence in practice and, therefore, results in financial statements that are easier for users to understand.

BC8 The Board also amended the Basis for Conclusions on IFRS 6 to clarify the Board's view that the exemption in IFRS 6 applies only to recognition and measurement of exploration and evaluation assets, not to the classification of related expenditures in the statement of cash flows, for the same reasons set out in paragraph BC7.

Illustrative examples

These illustrative examples accompany, but are not part of, IAS 7.

A Statement of cash flows for an entity other than a financial institution

1 The examples show only current period amounts. Corresponding amounts for the preceding period are required to be presented in accordance with IAS 1 *Presentation of Financial Statements*.

2 Information from the statement of comprehensive income and statement of financial position is provided to show how the statements of cash flows under the direct method and indirect method have been derived. Neither the statement of comprehensive income nor the statement of financial position is presented in conformity with the disclosure and presentation requirements of other Standards.

3 The following additional information is also relevant for the preparation of the statements of cash flows:

- all of the shares of a subsidiary were acquired for 590. The fair values of assets acquired and liabilities assumed were as follows:

Inventories	100
Accounts receivable	100
Cash	40
Property, plant and equipment	650
Trade payables	100
Long-term debt	200

- 250 was raised from the issue of share capital and a further 250 was raised from long-term borrowings.
- interest expense was 400, of which 170 was paid during the period. Also, 100 relating to interest expense of the prior period was paid during the period.
- dividends paid were 1,200.
- the liability for tax at the beginning and end of the period was 1,000 and 400 respectively. During the period, a further 200 tax was provided for. Withholding tax on dividends received amounted to 100.
- during the period, the group acquired property, plant and equipment with an aggregate cost of 1,250 of which 900 was acquired by means of finance leases. Cash payments of 350 were made to purchase property, plant and equipment.
- plant with original cost of 80 and accumulated depreciation of 60 was sold for 20.
- accounts receivable as at the end of 20X2 include 100 of interest receivable.

Cash and cash equivalents at end of period (Note C)		230

(a) This could also be shown as an operating cash flow.

Notes to the statement of cash flows (direct method and indirect method)

A. Obtaining control of subsidiary

During the period the Group obtained control of subsidiary X. The fair values of assets acquired and liabilities assumed were as follows:

Cash	40
Inventories	100
Accounts receivable	100
Property, plant and equipment	650
Trade payables	(100)
Long-term debt	(200)
Total purchase price paid in cash	590
Less: Cash of subsidiary X acquired	(40)
Cash paid to obtain control net of cash acquired	550

B. Property, plant and equipment

During the period, the Group acquired property, plant and equipment with an aggregate cost of 1,250 of which 900 was acquired by means of finance leases. Cash payments of 350 were made to purchase property, plant and equipment.

C. Cash and cash equivalents

Cash and cash equivalents consist of cash on hand and balances with banks, and investments in money market instruments. Cash and cash equivalents included in the statement of cash flows comprise the following amounts in the statement of financial position:

	20X2	**20X1**
Cash on hand and balances with banks	40	25
Short-term investments	190	135
Cash and cash equivalents as previously reported	230	160
Effect of exchange rate changes	–	(40)
Cash and cash equivalents as restated	230	120

Cash and cash equivalents at the end of the period include deposits with banks of 100 held by a subsidiary which are not freely remissible to the holding company because of currency exchange restrictions.

The Group has undrawn borrowing facilities of 2,000 of which 700 may be used only for future expansion.

 © IASCF

D. Segment information

	Segment A	Segment B	Total
Cash flows from:			
Operating activities	1,520	(140)	1,380
Investing activities	(640)	160	(480)
Financing activities	(570)	(220)	(790)
	310	(200)	110

Alternative presentation (indirect method)

As an alternative, in an indirect method statement of cash flows, operating profit before working capital changes is sometimes presented as follows:

Revenues excluding investment income	30,650	
Operating expense excluding depreciation	(26,910)	
Operating profit before working capital changes		3,740

B Statement of cash flows for a financial institution

1 The example shows only current period amounts. Comparative amounts for the preceding period are required to be presented in accordance with IAS 1 *Presentation of Financial Statements*.

2 The example is presented using the direct method.

		20X2
Cash flows from operating activities		
Interest and commission receipts	28,447	
Interest payments	(23,463)	
Recoveries on loans previously written off	237	
Cash payments to employees and suppliers	(997)	
	4,224	
(Increase) decrease in operating assets:		
Short-term funds	(650)	
Deposits held for regulatory or monetary control purposes	234	
Funds advanced to customers	(288)	
Net increase in credit card receivables	(360)	
Other short-term negotiable securities	(120)	
Increase (decrease) in operating liabilities:		
Deposits from customers	600	
Negotiable certificates of deposit	(200)	
Net cash from operating activities before income tax	3,440	
Income taxes paid	(100)	
Net cash from operating activities		3,340
Cash flows from investing activities		
Disposal of subsidiary Y	50	
Dividends received	200	
Interest received	300	
Proceeds from sales of non-dealing securities	1,200	
Purchase of non-dealing securities	(600)	
Purchase of property, plant and equipment	(500)	
Net cash from investing activities		650

continued...

Basis for Conclusions on IAS 8 *Accounting Policies, Changes in Accounting Estimates and Errors*

This Basis for Conclusions accompanies, but is not part of, IAS 8.

Introduction

BC1 This Basis for Conclusions summarises the International Accounting Standards Board's considerations in reaching its conclusions on revising IAS 8 *Net Profit or Loss for the Period, Fundamental Errors and Changes in Accounting Policies* in 2003. Individual Board members gave greater weight to some factors than to others.

BC2 In July 2001 the Board announced that, as part of its initial agenda of technical projects, it would undertake a project to improve a number of Standards, including IAS 8. The project was undertaken in the light of queries and criticisms raised in relation to the Standards by securities regulators, professional accountants and other interested parties. The objectives of the Improvements project were to reduce or eliminate alternatives, redundancies and conflicts within Standards, to deal with some convergence issues and to make other improvements. In May 2002 the Board published its proposals in an Exposure Draft of *Improvements to International Accounting Standards*, with a comment deadline of 16 September 2002. The Board received over 160 comment letters on the Exposure Draft.

BC3 The Standard includes extensive changes to the previous version of IAS 8. The Board's intention was not to reconsider all of the previous Standard's requirements for selecting and applying accounting policies, and accounting for changes in accounting policies, changes in accounting estimates and corrections of errors. Accordingly, this Basis for Conclusions does not discuss requirements in IAS 8 that the Board did not reconsider.

Removing allowed alternative treatments

BC4 The previous version of IAS 8 included allowed alternative treatments of voluntary changes in accounting policies (paragraphs 54–57) and corrections of fundamental errors (paragraphs 38–40). Under those allowed alternatives:

(a) the adjustment resulting from retrospective application of a change in an accounting policy was included in profit or loss for the current period; and

(b) the amount of the correction of a fundamental error was included in profit or loss for the current period.

BC5 In both circumstances, comparative information was presented as it was presented in the financial statements of prior periods.

BC6 The Board identified the removal of optional treatments for changes in accounting policies and corrections of errors as an important improvement to the previous version of IAS 8. The Standard removes the allowed alternative treatments and requires changes in accounting policies and corrections of prior period errors to be accounted for retrospectively.

BC7 The Board concluded that retrospective application made by amending the comparative information presented for prior periods is preferable to the previously allowed alternative treatments because, under the now required method of retrospective application:

(a) profit or loss for the period of the change does not include the effects of changes in accounting policies or errors relating to prior periods.

(b) information presented about prior periods is prepared on the same basis as information about the current period, and is therefore comparable. This information possesses a qualitative characteristic identified in the *Framework for the Preparation and Presentation of Financial Statements*, and provides the most useful information for trend analysis of income and expenses.

(c) prior period errors are not repeated in comparative information presented for prior periods.

BC8 Some respondents to the Exposure Draft argued that the previously allowed alternative treatments are preferable because:

(a) correcting prior period errors by restating prior period information involves an unjustifiable use of hindsight;

(b) recognising the effects of changes in accounting policies and corrections of errors in current period profit or loss makes them more prominent to users of financial statements; and

(c) each amount credited or debited to retained earnings as a result of an entity's activities has been recognised in profit or loss in some period.

BC9 The Board concluded that restating prior period information to correct a prior period error does not involve an unjustifiable use of hindsight because prior period errors are defined in terms of a failure to use, or misuse of, reliable information that was available when the prior period financial statements were authorised for issue and could reasonably be expected to have been obtained and taken into account in the preparation and presentation of those financial statements.

BC10 The Board also concluded that the disclosures about changes in accounting policies and corrections of prior period errors in paragraphs 28, 29 and 49 of the Standard should ensure that their effects are sufficiently prominent to users of financial statements.

BC11 The Board further concluded that it is less important for each amount credited or debited to retained earnings as a result of an entity's activities to be recognised in profit or loss in some period than for the profit or loss for each period presented to represent faithfully the effects of transactions and other events occurring in that period.

 © IASCF

Eliminating the distinction between fundamental errors and other material prior period errors

BC12 The Standard eliminates the distinction between fundamental errors and other material prior period errors. As a result, all material prior period errors are accounted for in the same way as a fundamental error was accounted for under the retrospective treatment in the previous version of IAS 8. The Board concluded that the definition of 'fundamental errors' in the previous version was difficult to interpret consistently because the main feature of the definition—that the error causes the financial statements of one or more prior periods no longer to be considered to have been reliable—was also a feature of all material prior period errors.

Applying a Standard or an Interpretation that specifically applies to an item

BC13 The Exposure Draft proposed that when a Standard or an Interpretation applies to an item in the financial statements, the accounting policy (or policies) applied to that item is (are) determined by considering the following in descending order:

(a) the Standard (including any Appendices that form part of the Standard);

(b) the Interpretation;

(c) Appendices to the Standard that do not form a part of the Standard; and

(d) Implementation Guidance issued in respect of the Standard.

BC14 The Board decided not to set out a hierarchy of requirements for these circumstances. The Standard requires only applicable IFRSs to be applied. In addition, it does not mention Appendices.

BC15 The Board decided not to rank Standards above Interpretations because the definition of International Financial Reporting Standards (IFRSs) includes Interpretations, which are equal in status to Standards. The rubric to each Standard clarifies what material constitutes the requirements of an IFRS and what is Implementation Guidance.* The term 'Appendix' is retained only for material that is part of an IFRS.

Pronouncements of other standard-setting bodies

BC16 The Exposure Draft proposed that in the absence of a Standard or an Interpretation specifically applying to an item, management should develop and apply an accounting policy by considering, among other guidance, pronouncements of other standard-setting bodies that use a similar conceptual framework to develop accounting standards. Respondents to the Exposure Draft commented that this could *require* entities to consider the pronouncements of

* In 2007 the Board was advised that paragraphs 7 and 9 may appear to conflict, and may be misinterpreted to require mandatory consideration of Implementation Guidance. The Board amended paragraphs 7, 9 and 11 by *Improvements to IFRSs* issued in May 2008 to state that only guidance that is identified as an integral part of IFRSs is mandatory.

various other standard-setting bodies when IASB guidance does not exist. Some commentators argued that, for example, it could require consideration of all components of US GAAP on some topics. After considering these comments, the Board decided that the Standard should indicate that considering such pronouncements is voluntary (see paragraph 12 of the Standard).

BC17 As proposed in the Exposure Draft, the Standard states that pronouncements of other standard-setting bodies are used only if they do not conflict with:

(a) the requirements and guidance in IFRSs dealing with similar and related issues; and

(b) the definitions, recognition criteria and measurement concepts for assets, liabilities, income and expenses in the *Framework*.

BC18 The Standard refers to the most recent pronouncements of other standard-setting bodies because if pronouncements are withdrawn or superseded, the relevant standard-setting body no longer thinks they include the best accounting policies to apply.

BC19 Comments received indicated that it was unclear from the Exposure Draft whether a change in accounting policy following a change in a pronouncement of another standard-setting body should be accounted for under the transitional provisions in that pronouncement. As noted above, the Standard does not mandate using pronouncements of other standard-setting bodies in any circumstances. Accordingly, the Board decided to clarify that such a change in accounting policy is accounted for and disclosed as a voluntary change in accounting policy (see paragraph 21 of the Standard). Thus, an entity is precluded from applying transitional provisions specified by the other standard-setting body if they are inconsistent with the treatment of voluntary changes in accounting policies specified by the Standard.

Materiality

BC20 The Standard states that accounting policies specified by IFRSs need not be applied when the effect of applying them is immaterial. It also states that financial statements do not comply with IFRSs if they contain material errors, and that material prior period errors are to be corrected in the first set of financial statements authorised for issue after their discovery. The Standard includes a definition of material omissions or misstatements, which is based on the description of materiality in IAS 1 *Presentation of Financial Statements* (as issued in 1997) and in the *Framework*.

BC21 The former *Preface to Statements of International Accounting Standards* stated that International Accounting Standards were not intended to apply to immaterial items. There is no equivalent statement in the *Preface to International Financial Reporting Standards*. The Board received comments that the absence of such a statement from the *Preface* could be interpreted as requiring an entity to apply accounting policies (including measurement requirements) specified by IFRSs to immaterial items. However, the Board decided that the application of the concept of materiality should be in Standards rather than in the *Preface*.

 © IASCF

BC22 The application of the concept of materiality is set out in two Standards. IAS 1 (as revised in 2007) continues to specify its application to disclosures. IAS 8 specifies the application of materiality in applying accounting policies and correcting errors (including errors in measuring items).

Criterion for exemption from requirements

BC23 The previous version of IAS 8 included an impracticability criterion for exemption from retrospective application of voluntary changes in accounting policies and retrospective restatement for fundamental errors, and from making related disclosures, when the allowed alternative treatment of those items was not applied. The Exposure Draft proposed instead an exemption from retrospective application and retrospective restatement when it gives rise to undue cost or effort.

BC24 In the light of comments received on the Exposure Draft, the Board decided that an exemption based on management's assessment of undue cost or effort is too subjective to be applied consistently by different entities. Moreover, the Board decided that balancing costs and benefits is a task for the Board when it sets accounting requirements rather than for entities when they apply those requirements. Therefore, the Board decided to retain the impracticability criterion for exemption in the previous version of IAS 8. This affects the exemptions in paragraphs 23–25, 39 and 43–45 of the Standard. Impracticability is the only basis on which specific exemptions are provided in IFRSs from applying particular requirements when the effect of applying them is material.*

Definition of 'impracticable'

BC25 The Board decided to clarify the meaning of 'impracticable' in relation to retrospective application of a change in accounting policy and retrospective restatement to correct a prior period error.

BC26 Some commentators suggested that retrospective application of a change in accounting policy and retrospective restatement to correct a prior period error are impracticable for a particular prior period whenever significant estimates are required as of a date in that period. However, the Board decided to specify a narrower definition of impracticable because the fact that significant estimates are frequently required when amending comparative information presented for prior periods does not prevent reliable adjustment or correction of the comparative information. Thus, the Board decided that an inability to distinguish objectively information that both provides evidence of circumstances that existed on the date(s) as at which those amounts are to be recognised, measured or disclosed and would have been available when the financial statements for that prior period were authorised for issue from other information is the factor that prevents reliable adjustment or correction of comparative information for prior periods (see part (c) of the definition of 'impracticable' and paragraphs 51 and 52 of the Standard).

* In 2006 the IASB issued IFRS 8 *Operating Segments*. As explained in paragraphs BC46 and BC47 of the Basis for Conclusions on IFRS 8, that IFRS includes an exemption from some requirements if the necessary information is not available and the cost to develop it would be excessive.

© IASCF

BC27 The Standard specifies that hindsight should not be used when applying a new accounting policy to, or correcting amounts for, a prior period, either in making assumptions about what management's intentions would have been in a prior period or estimating the amounts in a prior period. This is because management's intentions in a prior period cannot be objectively established in a later period, and using information that would have been unavailable when the financial statements for the prior period(s) affected were authorised for issue is inconsistent with the definitions of retrospective application and retrospective restatement.

Applying the impracticability exemption

BC28 The Standard specifies that when it is impracticable to determine the cumulative effect of applying a new accounting policy to all prior periods, or the cumulative effect of an error on all prior periods, the entity changes the comparative information as if the new accounting policy had been applied, or the error had been corrected, prospectively from the earliest date practicable (see paragraphs 25 and 45 of the Standard). This is similar to paragraph 52 of the previous version of IAS 8, but it is no longer restricted to changes in accounting policies. The Board decided to include such provisions in the Standard because it agrees with comments received that it is preferable to require prospective application from the start of the earliest period practicable than to permit a change in accounting policy only when the entity can determine the cumulative effect of the change for all prior periods at the beginning of the current period.

BC29 Consistently with the Exposure Draft's proposals, the Standard provides an impracticability exemption from retrospective application of changes in accounting policies, including retrospective application of changes made in accordance with the transitional provisions in an IFRS. The previous version of IAS 8 specified the impracticability exemption for retrospective application of only *voluntary* changes in accounting policies. Thus, the applicability of the exemption to changes made in accordance with the transitional provisions in an IFRS depended on the text of that IFRS. The Board extended the applicability of the exemption because it decided that the need for the exemption applies equally to all changes in accounting policies applied retrospectively.

Disclosures about impending application of newly issued IFRSs

BC30 The Standard requires an entity to provide disclosures when it has not yet applied a new IFRS that has been issued but is not yet effective. The entity is required to disclose that it has not yet applied the IFRS, and known or reasonably estimable information relevant to assessing the possible impact that initial application of the new IFRS will have on the entity's financial statements in the period of initial application (paragraph 30). The Standard also includes guidance on specific disclosures the entity should consider when applying this requirement (paragraph 31).

 © IASCF

BC31 Paragraphs 30 and 31 of the Standard differ from the proposals in the Exposure Draft in the following respects:

(a) they specify that an entity needs to disclose information only if it is known or reasonably estimable. This clarification responds to comments on the Exposure Draft that the proposed disclosures would sometimes be impracticable.

(b) whereas the Exposure Draft proposed to mandate the disclosures now in paragraph 31, the Standard sets out these disclosures as items an entity should consider disclosing to meet the general requirement in paragraph 30. This amendment focuses the requirement on the objective of the disclosure, and, in response to comments on the Exposure Draft that the proposed disclosures were more onerous than the disclosures in US GAAP, clarifies that the Board's intention was to converge with US requirements, rather than to be more onerous.

Recognising the effects of changes in accounting estimates

BC32 The Exposure Draft proposed to retain without exception the requirement in the previous version of IAS 8 that the effect of a change in accounting estimate is *recognised in profit or loss* in:

(a) the period of the change, if the change affects that period only; or

(b) the period of the change and future periods, if the change affects both.

BC33 Some respondents to the Exposure Draft disagreed with requiring the effects of all changes in accounting estimates to be recognised in profit or loss. They argued that this is inappropriate to the extent that a change in an accounting estimate gives rise to changes in assets and liabilities, because the entity's equity does not change as a result. These commentators also argued that it is inappropriate to preclude recognising the effects of changes in accounting estimates directly in equity when that is required or permitted by a Standard or an Interpretation. The Board concurs, and decided to provide an exception to the requirement described in paragraph BC32 for these circumstances.

Guidance on implementing IAS 8 *Accounting Policies, Changes in Accounting Estimates and Errors*

This guidance accompanies, but is not part of, IAS 8.

Example 1 – Retrospective restatement of errors

1.1 During 20X2, Beta Co discovered that some products that had been sold during 20X1 were incorrectly included in inventory at 31 December 20X1 at CU6,500.*

1.2 Beta's accounting records for 20X2 show sales of CU104,000, cost of goods sold of CU86,500 (including CU6,500 for the error in opening inventory), and income taxes of CU5,250.

1.3 In 20X1, Beta reported:

	CU
Sales	73,500
Cost of goods sold	(53,500)
Profit before income taxes	20,000
Income taxes	(6,000)
Profit	14,000

1.4 20X1 opening retained earnings was CU20,000 and closing retained earnings was CU34,000.

1.5 Beta's income tax rate was 30 per cent for 20X2 and 20X1. It had no other income or expenses.

1.6 Beta had CU5,000 of share capital throughout, and no other components of equity except for retained earnings. Its shares are not publicly traded and it does not disclose earnings per share.

Beta Co
Extract from the statement of comprehensive income

	20X2	(restated) 20X1
	CU	CU
Sales	104,000	73,500
Cost of goods sold	(80,000)	(60,000)
Profit before income taxes	24,000	13,500
Income taxes	(7,200)	(4,050)
Profit	16,800	9,450

* In these examples, monetary amounts are denominated in 'currency units (CU)'.

Beta Co
Statement of changes in equity

	Share capital	Retained earnings	Total
	CU	CU	CU
Balance at 31 December 20X0	5,000	20,000	25,000
Profit for the year ended 31 December 20X1 as restated		9,450	9,450
Balance at 31 December 20X1	5,000	29,450	34,450
Profit for the year ended 31 December 20X2		16,800	16,800
Balance at 31 December 20X2	5,000	46,250	51,250

Extracts from the notes

1 Some products that had been sold in 20X1 were incorrectly included in inventory at 31 December 20X1 at CU6,500. The financial statements of 20X1 have been restated to correct this error. The effect of the restatement on those financial statements is summarised below. There is no effect in 20X2.

	Effect on 20X1
	CU
(Increase) in cost of goods sold	(6,500)
Decrease in income tax expense	1,950
(Decrease) in profit	(4,550)
(Decrease) in inventory	(6,500)
Decrease in income tax payable	1,950
(Decrease) in equity	(4,550)

Example 2 – Change in accounting policy with retrospective application

[Deleted]

© IASCF

Example 3 – Prospective application of a change in accounting policy when retrospective application is not practicable

3.1 During 20X2, Delta Co changed its accounting policy for depreciating property, plant and equipment, so as to apply much more fully a components approach, whilst at the same time adopting the revaluation model.

3.2 In years before 20X2, Delta's asset records were not sufficiently detailed to apply a components approach fully. At the end of 20X1, management commissioned an engineering survey, which provided information on the components held and their fair values, useful lives, estimated residual values and depreciable amounts at the beginning of 20X2. However, the survey did not provide a sufficient basis for reliably estimating the cost of those components that had not previously been accounted for separately, and the existing records before the survey did not permit this information to be reconstructed.

3.3 Delta's management considered how to account for each of the two aspects of the accounting change. They determined that it was not practicable to account for the change to a fuller components approach retrospectively, or to account for that change prospectively from any earlier date than the start of 20X2. Also, the change from a cost model to a revaluation model is required to be accounted for prospectively. Therefore, management concluded that it should apply Delta's new policy prospectively from the start of 20X2.

3.4 Additional information:

Delta's tax rate is 30 per cent.

	CU
Property, plant and equipment at the end of 20X1:	
Cost	25,000
Depreciation	(14,000)
Net book value	11,000
Prospective depreciation expense for 20X2 (old basis)	1,500
Some results of the engineering survey:	
Valuation	17,000
Estimated residual value	3,000
Average remaining asset life (years)	7
Depreciation expense on existing property, plant and equipment for 20X2 (new basis)	2,000

continued...

 © IASCF

...continued

Extract from the notes

1 From the start of 20X2, Delta changed its accounting policy for depreciating property, plant and equipment, so as to apply much more fully a components approach, whilst at the same time adopting the revaluation model. Management takes the view that this policy provides reliable and more relevant information because it deals more accurately with the components of property, plant and equipment and is based on up-to-date values. The policy has been applied prospectively from the start of 20X2 because it was not practicable to estimate the effects of applying the policy either retrospectively, or prospectively from any earlier date. Accordingly, the adoption of the new policy has no effect on prior years. The effect on the current year is to increase the carrying amount of property, plant and equipment at the start of the year by CU6,000; increase the opening deferred tax provision by CU1,800; create a revaluation surplus at the start of the year of CU4,200; increase depreciation expense by CU500; and reduce tax expense by CU150.

Basis for Conclusions on IAS 10 *Events after the Reporting Period*[*]

This Basis for Conclusions accompanies, but is not part of, IAS 10.

Introduction

BC1 This Basis for Conclusions summarises the International Accounting Standards Board's considerations in reaching its conclusions on revising IAS 10 *Events After the Balance Sheet Date* in 2003. Individual Board members gave greater weight to some factors than to others.

BC2 In July 2001 the Board announced that, as part of its initial agenda of technical projects, it would undertake a project to improve a number of Standards, including IAS 10. The project was undertaken in the light of queries and criticisms raised in relation to the Standards by securities regulators, professional accountants and other interested parties. The objectives of the Improvements project were to reduce or eliminate alternatives, redundancies and conflicts within Standards, to deal with some convergence issues and to make other improvements. In May 2002 the Board published its proposals in an Exposure Draft of *Improvements to International Accounting Standards*, with a comment deadline of 16 September 2002. The Board received over 160 comment letters on the Exposure Draft.

BC3 Because the Board's intention was not to reconsider the fundamental approach to the accounting for events after the balance sheet date established by IAS 10, this Basis for Conclusions does not discuss requirements in IAS 10 that the Board has not reconsidered.

Limited clarification

BC4 For this limited clarification of IAS 10 the main change made is in paragraphs 12 and 13 (paragraphs 11 and 12 of the previous version of IAS 10). As revised, those paragraphs state that if dividends are declared after the balance sheet date,[†] an entity shall not recognise those dividends as a liability at the balance sheet date. This is because undeclared dividends do not meet the criteria of a present obligation in IAS 37 *Provisions, Contingent Liabilities and Contingent Assets*. The Board discussed whether or not an entity's past practice of paying dividends could be considered a constructive obligation. The Board concluded that such practices do not give rise to a liability to pay dividends.[§]

---

* In September 2007 the IASB amended the title of IAS 10 from *Events after the Balance Sheet Date* to *Events after the Reporting Period* as a consequence of the amendments in IAS 1 *Presentation of Financial Statements* (as revised in 2007).

† IAS 1 *Presentation of Financial Statements* (as revised in 2007) replaced the term 'balance sheet date' with 'end of the reporting period'.

§ In 2007 the Board was advised that paragraph 13, taken in isolation, could be read to imply that a liability should be recognised in some circumstances on the basis that a constructive obligation exists, such as when there is an established pattern of paying a dividend. Therefore, the Board amended paragraph 13 by *Improvements to IFRSs* issued in May 2008 to state that no such obligation exists.

ILLUSTRATIVE EXAMPLES

Disclosure of accounting policies B732

The determination of contract revenue and expenses B732

Contract disclosures B733

© IASCF

Illustrative examples

These illustrative examples accompany, but are not part of, IAS 11.

Disclosure of accounting policies

The following are examples of accounting policy disclosures:

Revenue from fixed price construction contracts is recognised on the percentage of completion method, measured by reference to the percentage of labour hours incurred to date to estimated total labour hours for each contract.

Revenue from cost plus contracts is recognised by reference to the recoverable costs incurred during the period plus the fee earned, measured by the proportion that costs incurred to date bear to the estimated total costs of the contract.

The determination of contract revenue and expenses

The following example illustrates one method of determining the stage of completion of a contract and the timing of the recognition of contract revenue and expenses (see paragraphs 22–35 of the Standard).

A construction contractor has a fixed price contract for 9,000 to build a bridge. The initial amount of revenue agreed in the contract is 9,000. The contractor's initial estimate of contract costs is 8,000. It will take 3 years to build the bridge.

By the end of year 1, the contractor's estimate of contract costs has increased to 8,050.

In year 2, the customer approves a variation resulting in an increase in contract revenue of 200 and estimated additional contract costs of 150. At the end of year 2, costs incurred include 100 for standard materials stored at the site to be used in year 3 to complete the project.

The contractor determines the stage of completion of the contract by calculating the proportion that contract costs incurred for work performed to date bear to the latest estimated total contract costs. A summary of the financial data during the construction period is as follows:

	Year 1	Year 2	Year 3
Initial amount of revenue agreed in contract	9,000	9,000	9,000
Variation	–	200	200
Total contract revenue	9,000	9,200	9,200
Contract costs incurred to date	2,093	6,168	8,200
Contract costs to complete	5,957	2,032	–
Total estimated contract costs	8,050	8,200	8,200
Estimated profit	950	1,000	1,000
Stage of completion	26%	74%	100%

 © IASCF

The stage of completion for year 2 (74%) is determined by excluding from contract costs incurred for work performed to date the 100 of standard materials stored at the site for use in year 3.

The amounts of revenue, expenses and profit recognised in the statement of comprehensive income in the three years are as follows:

	To date	Recognised in prior years	Recognised in current year
Year 1			
Revenue (9,000 × .26)	2,340	–	2,340
Expenses (8,050 × .26)	2,093	–	2,093
Profit	247	–	247
Year 2			
Revenue (9,200 × .74)	6,808	2,340	4,468
Expenses (8,200 × .74)	6,068	2,093	3,975
Profit	740	247	493
Year 3			
Revenue (9,200 × 1.00)	9,200	6,808	2,392
Expenses	8,200	6,068	2,132
Profit	1,000	740	260

Contract disclosures

A contractor has reached the end of its first year of operations. All its contract costs incurred have been paid for in cash and all its progress billings and advances have been received in cash. Contract costs incurred for contracts B, C and E include the cost of materials that have been purchased for the contract but which have not been used in contract performance to date. For contracts B, C and E, the customers have made advances to the contractor for work not yet performed.

The status of its five contracts in progress at the end of year 1 is as follows:

	A	B	C	D	E	Total
Contract revenue recognised in accordance with paragraph 22	145	520	380	200	55	1,300
Contract expenses recognised in accordance with paragraph 22	110	450	350	250	55	1,215
Expected losses recognised in accordance with paragraph 36	–	–	–	40	30	70
Recognised profits less recognised losses	35	70	30	(90)	(30)	15
Contract costs incurred in the period	110	510	450	250	100	1,420
Contract costs incurred recognised as contract expenses in the period in accordance with paragraph 22	110	450	350	250	55	1,215
Contract costs that relate to future activity recognised as an asset in accordance with paragraph 27	–	60	100	–	45	205
Contract revenue (see above)	145	520	380	200	55	1,300
Progress billings (paragraph 41)	100	520	380	180	55	1,235
Unbilled contract revenue	45	–	–	20	–	65
Advances (paragraph 41)	–	80	20	–	25	125

The amounts to be disclosed in accordance with the Standard are as follows:

Contract revenue recognised as revenue in the period (paragraph 39(a))	1,300
Contract costs incurred and recognised profits (less recognised losses) to date (paragraph 40(a))	1,435
Advances received (paragraph 40(b))	125
Gross amount due from customers for contract work – presented as an asset in accordance with paragraph 42(a)	220
Gross amount due to customers for contract work – presented as a liability in accordance with paragraph 42(b)	(20)

 © IASCF

The amounts to be disclosed in accordance with paragraphs 40(a), 42(a) and 42(b) are calculated as follows:

	Contract					
	A	B	C	D	E	Total
Contract costs incurred	110	510	450	250	100	1,420
Recognised profits less recognised losses	35	70	30	(90)	(30)	15
	145	580	480	160	70	1,435
Progress billings	100	520	380	180	55	1,235
Due from customers	45	60	100	–	15	220
Due to customers	–	–	–	(20)	–	(20)

The amount disclosed in accordance with paragraph 40(a) is the same as the amount for the current period because the disclosures relate to the first year of operation.

Income Taxes

This version includes amendments resulting from IFRSs issued up to 31 December 2009.

The text of the unaccompanied IAS 12 is contained in Part A of this edition. Its effective date when issued was 1 January 1998. The effective date of the most recent amendments is 1 January 2013. This part presents the following accompanying documents:

	page
ILLUSTRATIVE EXAMPLES	
Examples of temporary differences	**B738**
Illustrative computations and presentation	**B742**

Illustrative examples

These illustrative examples accompany, but are not part of, IAS 12.

Examples of temporary differences

A. Examples of circumstances that give rise to taxable temporary differences

All taxable temporary differences give rise to a deferred tax liability.

Transactions that affect profit or loss

1 Interest revenue is received in arrears and is included in accounting profit on a time apportionment basis but is included in taxable profit on a cash basis.

2 Revenue from the sale of goods is included in accounting profit when goods are delivered but is included in taxable profit when cash is collected. (*note: as explained in B3 below, there is also a **deductible** temporary difference associated with any related inventory*).

3 Depreciation of an asset is accelerated for tax purposes.

4 Development costs have been capitalised and will be amortised to the statement of comprehensive income but were deducted in determining taxable profit in the period in which they were incurred.

5 Prepaid expenses have already been deducted on a cash basis in determining the taxable profit of the current or previous periods.

Transactions that affect the statement of financial position

6 Depreciation of an asset is not deductible for tax purposes and no deduction will be available for tax purposes when the asset is sold or scrapped. *(note: paragraph 15(b) of the Standard prohibits recognition of the resulting deferred tax liability unless the asset was acquired in a business combination, see also paragraph 22 of the Standard.)*

7 A borrower records a loan at the proceeds received (which equal the amount due at maturity), less transaction costs. Subsequently, the carrying amount of the loan is increased by amortisation of the transaction costs to accounting profit. The transaction costs were deducted for tax purposes in the period when the loan was first recognised. *(notes: (1) the taxable temporary difference is the amount of transaction costs already deducted in determining the taxable profit of current or prior periods, less the cumulative amount amortised to accounting profit; and (2) as the initial recognition of the loan affects taxable profit, the exception in paragraph 15(b) of the Standard does not apply. Therefore, the borrower recognises the deferred tax liability.)*

8 A loan payable was measured on initial recognition at the amount of the net proceeds, net of transaction costs. The transaction costs are amortised to accounting profit over the life of the loan. Those transaction costs are not deductible in determining the taxable profit of future, current or prior periods. *(notes: (1) the taxable temporary difference is the amount of unamortised transaction costs; and (2) paragraph 15(b) of the Standard prohibits recognition of the resulting deferred tax liability.)*

 © IASCF

9 The liability component of a compound financial instrument (for example a convertible bond) is measured at a discount to the amount repayable on maturity (see IAS 32 *Financial Instruments: Presentation*). The discount is not deductible in determining taxable profit (tax loss).

Fair value adjustments and revaluations

10 Financial assets or investment property are carried at fair value which exceeds cost but no equivalent adjustment is made for tax purposes.

11 An entity revalues property, plant and equipment (under the revaluation model treatment in IAS 16 *Property, Plant and Equipment*) but no equivalent adjustment is made for tax purposes. (*note: paragraph 61A of the Standard requires the related deferred tax to be recognised in other comprehensive income*.)

Business combinations and consolidation

12 The carrying amount of an asset is increased to fair value in a business combination and no equivalent adjustment is made for tax purposes. (*Note that on initial recognition, the resulting deferred tax liability increases goodwill or decreases the amount of any bargain purchase gain recognised. See paragraph 66 of the Standard*.)

13 Reductions in the carrying amount of goodwill are not deductible in determining taxable profit and the cost of the goodwill would not be deductible on disposal of the business. (*Note that paragraph 15(a) of the Standard prohibits recognition of the resulting deferred tax liability*.)

14 Unrealised losses resulting from intragroup transactions are eliminated by inclusion in the carrying amount of inventory or property, plant and equipment.

15 Retained earnings of subsidiaries, branches, associates and joint ventures are included in consolidated retained earnings, but income taxes will be payable if the profits are distributed to the reporting parent. (*note: paragraph 39 of the Standard prohibits recognition of the resulting deferred tax liability if the parent, investor or venturer is able to control the timing of the reversal of the temporary difference and it is probable that the temporary difference will not reverse in the foreseeable future*.)

16 Investments in foreign subsidiaries, branches or associates or interests in foreign joint ventures are affected by changes in foreign exchange rates. (*notes: (1) there may be either a taxable temporary difference or a deductible temporary difference; and (2) paragraph 39 of the Standard prohibits recognition of the resulting deferred tax liability if the parent, investor or venturer is able to control the timing of the reversal of the temporary difference and it is probable that the temporary difference will not reverse in the foreseeable future*.)

17 The non-monetary assets and liabilities of an entity are measured in its functional currency but the taxable profit or tax loss is determined in a different currency. (*notes: (1) there may be either a taxable temporary difference or a deductible temporary difference; (2) where there is a taxable temporary difference, the resulting deferred tax liability is recognised (paragraph 41 of the Standard); and (3) the deferred tax is recognised in profit or loss, see paragraph 58 of the Standard*.)

© IASCF

Hyperinflation

18 Non-monetary assets are restated in terms of the measuring unit current at the end of the reporting period (see IAS 29 *Financial Reporting in Hyperinflationary Economies*) and no equivalent adjustment is made for tax purposes. (*notes: (1) the deferred tax is recognised in profit or loss; and (2) if, in addition to the restatement, the non-monetary assets are also revalued, the deferred tax relating to the revaluation is recognised in other comprehensive income and the deferred tax relating to the restatement is recognised in profit or loss*.)

B. Examples of circumstances that give rise to deductible temporary differences

All deductible temporary differences give rise to a deferred tax asset. However, some deferred tax assets may not satisfy the recognition criteria in paragraph 24 of the Standard.

Transactions that affect profit or loss

1 Retirement benefit costs are deducted in determining accounting profit as service is provided by the employee, but are not deducted in determining taxable profit until the entity pays either retirement benefits or contributions to a fund. *(note: similar deductible temporary differences arise where other expenses, such as product warranty costs or interest, are deductible on a cash basis in determining taxable profit.)*

2 Accumulated depreciation of an asset in the financial statements is greater than the cumulative depreciation allowed up to the end of the reporting period for tax purposes.

3 The cost of inventories sold before the end of the reporting period is deducted in determining accounting profit when goods or services are delivered but is deducted in determining taxable profit when cash is collected. *(note: as explained in A2 above, there is also a* ***taxable*** *temporary difference associated with the related trade receivable.)*

4 The net realisable value of an item of inventory, or the recoverable amount of an item of property, plant or equipment, is less than the previous carrying amount and an entity therefore reduces the carrying amount of the asset, but that reduction is ignored for tax purposes until the asset is sold.

5 Research costs (or organisation or other start up costs) are recognised as an expense in determining accounting profit but are not permitted as a deduction in determining taxable profit until a later period.

6 Income is deferred in the statement of financial position but has already been included in taxable profit in current or prior periods.

7 A government grant which is included in the statement of financial position as deferred income will not be taxable in future periods. *(note: paragraph 24 of the Standard prohibits the recognition of the resulting deferred tax asset, see also paragraph 33 of the Standard.)*

© IASCF

Fair value adjustments and revaluations

8 Financial assets or investment property are carried at fair value which is less than cost, but no equivalent adjustment is made for tax purposes.

Business combinations and consolidation

9 A liability is recognised at its fair value in a business combination, but none of the related expense is deducted in determining taxable profit until a later period. *(Note that the resulting deferred tax asset decreases goodwill or increases the amount of any bargain purchase gain recognised. See paragraph 66 of the Standard.)*

10 [Deleted]

11 Unrealised profits resulting from intragroup transactions are eliminated from the carrying amount of assets, such as inventory or property, plant or equipment, but no equivalent adjustment is made for tax purposes.

12 Investments in foreign subsidiaries, branches or associates or interests in foreign joint ventures are affected by changes in foreign exchange rates. (*notes: (1) there may be a taxable temporary difference or a deductible temporary difference; and (2) paragraph 44 of the Standard requires recognition of the resulting deferred tax asset to the extent, and only to the extent, that it is probable that: (a) the temporary difference will reverse in the foreseeable future; and (b) taxable profit will be available against which the temporary difference can be utilised).*

13 The non-monetary assets and liabilities of an entity are measured in its functional currency but the taxable profit or tax loss is determined in a different currency. *(notes: (1) there may be either a taxable temporary difference or a deductible temporary difference; (2) where there is a deductible temporary difference, the resulting deferred tax asset is recognised to the extent that it is probable that sufficient taxable profit will be available (paragraph 41 of the Standard); and (3) the deferred tax is recognised in profit or loss, see paragraph 58 of the Standard.)*

C. Examples of circumstances where the carrying amount of an asset or liability is equal to its tax base

1 Accrued expenses have already been deducted in determining an entity's current tax liability for the current or earlier periods.

2 A loan payable is measured at the amount originally received and this amount is the same as the amount repayable on final maturity of the loan.

3 Accrued expenses will never be deductible for tax purposes.

4 Accrued income will never be taxable.

Illustrative computations and presentation

Extracts from statements of financial position and statements of comprehensive income are provided to show the effects on these financial statements of the transactions described below. These extracts do not necessarily conform with all the disclosure and presentation requirements of other Standards.

All the examples below assume that the entities concerned have no transaction other than those described.

Example 1 – Depreciable assets

An entity buys equipment for 10,000 and depreciates it on a straight-line basis over its expected useful life of five years. For tax purposes, the equipment is depreciated at 25% a year on a straight-line basis. Tax losses may be carried back against taxable profit of the previous five years. In year 0, the entity's taxable profit was 5,000. The tax rate is 40%.

The entity will recover the carrying amount of the equipment by using it to manufacture goods for resale. Therefore, the entity's current tax computation is as follows:

	Year				
	1	*2*	*3*	*4*	*5*
Taxable income	2,000	2,000	2,000	2,000	2,000
Depreciation for tax purposes	2,500	2,500	2,500	2,500	0
Taxable profit (tax loss)	(500)	(500)	(500)	(500)	2,000
Current tax expense (income) at 40%	(200)	(200)	(200)	(200)	800

The entity recognises a current tax asset at the end of years 1 to 4 because it recovers the benefit of the tax loss against the taxable profit of year 0.

The temporary differences associated with the equipment and the resulting deferred tax asset and liability and deferred tax expense and income are as follows:

	Year				
	1	*2*	*3*	*4*	*5*
Carrying amount	8,000	6,000	4,000	2,000	0
Tax base	7,500	5,000	2,500	0	0
Taxable temporary difference	500	1,000	1,500	2,000	0
Opening deferred tax liability	0	200	400	600	800
Deferred tax expense (income)	200	200	200	200	(800)
Closing deferred tax liability	200	400	600	800	0

 © IASCF

The entity recognises the deferred tax liability in years 1 to 4 because the reversal of the taxable temporary difference will create taxable income in subsequent years. The entity's statement of comprehensive income includes the following:

	Year				
	1	*2*	*3*	*4*	*5*
Income	2,000	2,000	2,000	2,000	2,000
Depreciation	2,000	2,000	2,000	2,000	2,000
Profit before tax	0	0	0	0	0
Current tax expense (income)	(200)	(200)	(200)	(200)	800
Deferred tax expense (income)	200	200	200	200	(800)
Total tax expense (income)	0	0	0	0	0
Profit for the period	0	0	0	0	0

Example 2 – Deferred tax assets and liabilities

The example deals with an entity over the two-year period, X5 and X6. In X5 the enacted income tax rate was 40% of taxable profit. In X6 the enacted income tax rate was 35% of taxable profit.

Charitable donations are recognised as an expense when they are paid and are not deductible for tax purposes.

In X5, the entity was notified by the relevant authorities that they intend to pursue an action against the entity with respect to sulphur emissions. Although as at December X6 the action had not yet come to court the entity recognised a liability of 700 in X5 being its best estimate of the fine arising from the action. Fines are not deductible for tax purposes.

In X2, the entity incurred 1,250 of costs in relation to the development of a new product. These costs were deducted for tax purposes in X2. For accounting purposes, the entity capitalised this expenditure and amortised it on the straight-line basis over five years. At 31/12/X4, the unamortised balance of these product development costs was 500.

In X5, the entity entered into an agreement with its existing employees to provide healthcare benefits to retirees. The entity recognises as an expense the cost of this plan as employees provide service. No payments to retirees were made for such benefits in X5 or X6. Healthcare costs are deductible for tax purposes when payments are made to retirees. The entity has determined that it is probable that taxable profit will be available against which any resulting deferred tax asset can be utilised.

Buildings are depreciated for accounting purposes at 5% a year on a straight-line basis and at 10% a year on a straight-line basis for tax purposes. Motor vehicles are depreciated for accounting purposes at 20% a year on a straight-line basis and at 25% a year on a straight-line basis for tax purposes. A full year's depreciation is charged for accounting purposes in the year that an asset is acquired.

© IASCF

At 1/1/X6, the building was revalued to 65,000 and the entity estimated that the remaining useful life of the building was 20 years from the date of the revaluation. The revaluation did not affect taxable profit in X6 and the taxation authorities did not adjust the tax base of the building to reflect the revaluation. In X6, the entity transferred 1,033 from revaluation surplus to retained earnings. This represents the difference of 1,590 between the actual depreciation on the building (3,250) and equivalent depreciation based on the cost of the building (1,660, which is the book value at 1/1/X6 of 33,200 divided by the remaining useful life of 20 years), less the related deferred tax of 557 (see paragraph 64 of the Standard).

Current tax expense

	X5	*X6*
Accounting profit	8,775	8,740
Add		
Depreciation for accounting purposes	4,800	8,250
Charitable donations	500	350
Fine for environmental pollution	700	–
Product development costs	250	250
Healthcare benefits	2,000	1,000
	17,025	18,590
Deduct		
Depreciation for tax purposes	(8,100)	(11,850)
Taxable profit	8,925	6,740
Current tax expense at 40%	3,570	
Current tax expense at 35%		2,359

Carrying amounts of property, plant and equipment

Illustrative disclosure

The amounts to be disclosed in accordance with the Standard are as follows:

Major components of tax expense (income) (paragraph 79)

	X5	*X6*
Current tax expense	3,570	2,359
Deferred tax expense relating to the origination and reversal of temporary differences:	420	822
Deferred tax expense (income) resulting from reduction in tax rate	–	(1,127)
Tax expense	3,990	2,054

Income tax relating to the components of other comprehensive income (paragraph 81(ab))

Deferred tax relating to revaluation of building	–	(11,130)

In addition, deferred tax of 557 was transferred in X6 from retained earnings to revaluation surplus. This relates to the difference between the actual depreciation on the building and equivalent depreciation based on the cost of the building.

Explanation of the relationship between tax expense and accounting profit (paragraph 81(c))

The Standard permits two alternative methods of explaining the relationship between tax expense (income) and accounting profit. Both of these formats are illustrated below.

(i) a numerical reconciliation between tax expense (income) and the product of accounting profit multiplied by the applicable tax rate(s), disclosing also the basis on which the applicable tax rate(s) is (are) computed

	X5	*X6*
Accounting profit	8,775	8,740
Tax at the applicable tax rate of 35% (X5: 40%)	3,510	3,059
Tax effect of expenses that are not deductible in determining taxable profit:		
Charitable donations	200	122
Fines for environmental pollution	280	–
Reduction in opening deferred taxes resulting from reduction in tax rate	–	(1,127)
Tax expense	3,990	2,054

The applicable tax rate is the aggregate of the national income tax rate of 30% (X5: 35%) and the local income tax rate of 5%.

© IASCF

(ii) a numerical reconciliation between the average effective tax rate and the applicable tax rate, disclosing also the basis on which the applicable tax rate is computed

	X5	*X6*
	%	%
Applicable tax rate	40.0	35.0
Tax effect of expenses that are not deductible for tax purposes:		
Charitable donations	2.3	1.4
Fines for environmental pollution	3.2	–
Effect on opening deferred taxes of reduction in tax rate	–	(12.9)
Average effective tax rate (tax expense divided by profit before tax)	45.5	23.5

The applicable tax rate is the aggregate of the national income tax rate of 30% (X5: 35%) and the local income tax rate of 5%.

An explanation of changes in the applicable tax rate(s) compared to the previous accounting period (paragraph 81(d))

In X6, the government enacted a change in the national income tax rate from 35% to 30%.

In respect of each type of temporary difference, and in respect of each type of unused tax losses and unused tax credits:

(i) the amount of the deferred tax assets and liabilities recognised in the statement of financial position for each period presented;

(ii) the amount of the deferred tax income or expense recognised in profit or loss for each period presented, if this is not apparent from the changes in the amounts recognised in the statement of financial position (paragraph 81(g))

	X5	*X6*
Accelerated depreciation for tax purposes	9,720	10,322
Liabilities for healthcare benefits that are deducted for tax purposes only when paid	(800)	(1,050)
Product development costs deducted from taxable profit in earlier years	100	–
Revaluation, net of related depreciation	–	10,573
Deferred tax liability	9,020	19,845

(note: the amount of the deferred tax income or expense recognised in profit or loss for the current year is apparent from the changes in the amounts recognised in the statement of financial position)

 © IASCF

Example 3 – Business combinations

On 1 January X5 entity A acquired 100 per cent of the shares of entity B at a cost of 600. At the acquisition date, the tax base in A's tax jurisdiction of A's investment in B is 600. Reductions in the carrying amount of goodwill are not deductible for tax purposes, and the cost of the goodwill would also not be deductible if B were to dispose of its underlying business. The tax rate in A's tax jurisdiction is 30 per cent and the tax rate in B's tax jurisdiction is 40 per cent.

The fair value of the identifiable assets acquired and liabilities assumed (excluding deferred tax assets and liabilities) by A is set out in the following table, together with their tax bases in B's tax jurisdiction and the resulting temporary differences.

	Amount recognised at acquisition	*Tax base*	*Temporary differences*
Property, plant and equipment	270	155	115
Accounts receivable	210	210	–
Inventory	174	124	50
Retirement benefit obligations	(30)	–	(30)
Accounts payable	(120)	(120)	–
Identifiable assets acquired and liabilities assumed, excluding deferred tax	504	369	135

The deferred tax asset arising from the retirement benefit obligations is offset against the deferred tax liabilities arising from the property, plant and equipment and inventory (see paragraph 74 of the Standard).

No deduction is available in B's tax jurisdiction for the cost of the goodwill. Therefore, the tax base of the goodwill in B's jurisdiction is nil. However, in accordance with paragraph 15(a) of the Standard, A recognises no deferred tax liability for the taxable temporary difference associated with the goodwill in B's tax jurisdiction.

The carrying amount, in A's consolidated financial statements, of its investment in B is made up as follows:

Fair value of identifiable assets acquired and liabilities assumed, excluding deferred tax	504
Deferred tax liability (135 at 40%)	(54)
Fair value of identifiable assets acquired and liabilities assumed	450
Goodwill	150
Carrying amount	600

Because, at the acquisition date, the tax base in A's tax jurisdiction, of A's investment in B is 600, no temporary difference is associated in A's tax jurisdiction with the investment.

During X5, B's equity (incorporating the fair value adjustments made as a result of the business combination) changed as follows:

At 1 January X5	450
Retained profit for X5 (net profit of 150, less dividend payable of 80)	70
At 31 December X5	520

A recognises a liability for any withholding tax or other taxes that it will incur on the accrued dividend receivable of 80.

At 31 December X5, the carrying amount of A's underlying investment in B, excluding the accrued dividend receivable, is as follows:

Net assets of B	520
Goodwill	150
Carrying amount	670

The temporary difference associated with A's underlying investment is 70. This amount is equal to the cumulative retained profit since the acquisition date.

If A has determined that it will not sell the investment in the foreseeable future and that B will not distribute its retained profits in the foreseeable future, no deferred tax liability is recognised in relation to A's investment in B (see paragraphs 39 and 40 of the Standard). Note that this exception would apply for an investment in an associate only if there is an agreement requiring that the profits of the associate will not be distributed in the foreseeable future (see paragraph 42 of the Standard). A discloses the amount of the temporary difference for which no deferred tax is recognised, ie 70 (see paragraph 81(f) of the Standard).

If A expects to sell the investment in B, or that B will distribute its retained profits in the foreseeable future, A recognises a deferred tax liability to the extent that the temporary difference is expected to reverse. The tax rate reflects the manner in which A expects to recover the carrying amount of its investment (see paragraph 51 of the Standard). A recognises the deferred tax in other comprehensive income to the extent that the deferred tax results from foreign exchange translation differences that have been recognised in other comprehensive income (paragraph 61A of the Standard). A discloses separately:

(a) the amount of deferred tax that has been recognised in other comprehensive income (paragraph 81(ab) of the Standard); and

(b) the amount of any remaining temporary difference which is not expected to reverse in the foreseeable future and for which, therefore, no deferred tax is recognised (see paragraph 81(f) of the Standard).

 © IASCF

Example 4 – Compound financial instruments

An entity receives a non-interest-bearing convertible loan of 1,000 on 31 December X4 repayable at par on 1 January X8. In accordance with IAS 32 *Financial Instruments: Presentation* the entity classifies the instrument's liability component as a liability and the equity component as equity. The entity assigns an initial carrying amount of 751 to the liability component of the convertible loan and 249 to the equity component. Subsequently, the entity recognises imputed discount as interest expense at an annual rate of 10% on the carrying amount of the liability component at the beginning of the year. The tax authorities do not allow the entity to claim any deduction for the imputed discount on the liability component of the convertible loan. The tax rate is 40%.

The temporary differences associated with the liability component and the resulting deferred tax liability and deferred tax expense and income are as follows:

	Year			
	X4	*X5*	*X6*	*X7*
Carrying amount of liability component	751	826	909	1,000
Tax base	1,000	1,000	1,000	1,000
Taxable temporary difference	249	174	91	–
Opening deferred tax liability at 40%	0	100	70	37
Deferred tax charged to equity	100	–	–	–
Deferred tax expense (income)	–	(30)	(33)	(37)
Closing deferred tax liability at 40%	100	70	37	–

As explained in paragraph 23 of the Standard, at 31 December X4, the entity recognises the resulting deferred tax liability by adjusting the initial carrying amount of the equity component of the convertible liability. Therefore, the amounts recognised at that date are as follows:

Liability component	751
Deferred tax liability	100
Equity component (249 less 100)	149
	1,000

Subsequent changes in the deferred tax liability are recognised in profit or loss as tax income (see paragraph 23 of the Standard). Therefore, the entity's profit or loss includes the following:

	Year			
	X4	*X5*	*X6*	*X7*
Interest expense (imputed discount)	–	75	83	91
Deferred tax expense (income)	–	(30)	(33)	(37)
	–	45	50	54

Example 5 – Share-based payment transactions

In accordance with IFRS 2 *Share-based Payment*, an entity has recognised an expense for the consumption of employee services received as consideration for share options granted. A tax deduction will not arise until the options are exercised, and the deduction is based on the options' intrinsic value at exercise date.

As explained in paragraph 68B of the Standard, the difference between the tax base of the employee services received to date (being the amount the taxation authorities will permit as a deduction in future periods in respect of those services), and the carrying amount of nil, is a deductible temporary difference that results in a deferred tax asset. Paragraph 68B requires that, if the amount the taxation authorities will permit as a deduction in future periods is not known at the end of the period, it should be estimated, based on information available at the end of the period. If the amount that the taxation authorities will permit as a deduction in future periods is dependent upon the entity's share price at a future date, the measurement of the deductible temporary difference should be based on the entity's share price at the end of the period. Therefore, in this example, the estimated future tax deduction (and hence the measurement of the deferred tax asset) should be based on the options' intrinsic value at the end of the period.

As explained in paragraph 68C of the Standard, if the tax deduction (or estimated future tax deduction) exceeds the amount of the related cumulative remuneration expense, this indicates that the tax deduction relates not only to remuneration expense but also to an equity item. In this situation, paragraph 68C requires that the excess of the associated current or deferred tax should be recognised directly in equity.

The entity's tax rate is 40 per cent. The options were granted at the start of year 1, vested at the end of year 3 and were exercised at the end of year 5. Details of the expense recognised for employee services received and consumed in each accounting period, the number of options outstanding at each year-end, and the intrinsic value of the options at each year-end, are as follows:

	Employee services expense	Number of options at year-end	Intrinsic value per option
Year 1	188,000	50,000	5
Year 2	185,000	45,000	8
Year 3	190,000	40,000	13
Year 4	0	40,000	17
Year 5	0	40,000	20

The entity recognises a deferred tax asset and deferred tax income in years 1–4 and current tax income in year 5 as follows. In years 4 and 5, some of the deferred and current tax income is recognised directly in equity, because the estimated (and actual) tax deduction exceeds the cumulative remuneration expense.

 © IASCF

Year 1

Deferred tax asset and deferred tax income:

(50,000 × 5 × ⅓ [(a)] × 0.40) =	33,333

(a) The tax base of the employee services received is based on the intrinsic value of the options, and those options were granted for three years' services. Because only one year's services have been received to date, it is necessary to multiply the option's intrinsic value by one-third to arrive at the tax base of the employee services received in year 1.

The deferred tax income is all recognised in profit or loss, because the estimated future tax deduction of 83,333 (50,000 × 5 × ⅓) is less than the cumulative remuneration expense of 188,000.

Year 2

Deferred tax asset at year-end:		
(45,000 × 8 × ⅔ × 0.40) =	96,000	
Less deferred tax asset at start of year	(33,333)	
Deferred tax income for year		62,667*
* This amount consists of the following:		
Deferred tax income for the temporary difference between the tax base of the employee services received during the year and their carrying amount of nil:		
(45,000 × 8 × ⅓ × 0.40)	48,000	
Tax income resulting from an adjustment to the tax base of employee services received in previous years:		
(a) increase in intrinsic value: (45,000 × 3 × ⅓ × 0.40)	18,000	
(b) decrease in number of options: (5,000 × 5 × ⅓ × 0.40)	(3,333)	
Deferred tax income for year		62,667

The deferred tax income is all recognised in profit or loss, because the estimated future tax deduction of 240,000 (45,000 × 8 × ⅔) is less than the cumulative remuneration expense of 373,000 (188,000 + 185,000).

Year 3

Deferred tax asset at year-end:	
(40,000 × 13 × 0.40) =	208,000
Less deferred tax asset at start of year	(96,000)
Deferred tax income for year	112,000

The deferred tax income is all recognised in profit or loss, because the estimated future tax deduction of 520,000 (40,000 × 13) is less than the cumulative remuneration expense of 563,000 (188,000 + 185,000 + 190,000).

© IASCF

Year 4

Deferred tax asset at year-end:		
(40,000 × 17 × 0.40) =	272,000	
Less deferred tax asset at start of year	(208,000)	
Deferred tax income for year		64,000

The deferred tax income is recognised partly in profit or loss and partly directly in equity as follows:

Estimated future tax deduction (40,000 × 17) =	680,000	
Cumulative remuneration expense	563,000	
Excess tax deduction		117,000
Deferred tax income for year	64,000	
Excess recognised directly in equity (117,000 × 0.40) =	46,800	
Recognised in profit or loss		17,200

Year 5

Deferred tax expense (reversal of deferred tax asset)	272,000	
Amount recognised directly in equity (reversal of cumulative deferred tax income recognised directly in equity)	46,800	
Amount recognised in profit or loss		225,200
Current tax income based on intrinsic value of options at exercise date (40,000 × 20 × 0.40) =	320,000	
Amount recognised in profit or loss (563,000 × 0.40) =	225,200	
Amount recognised directly in equity		94,800

Summary

	Statement of comprehensive income				Statement of financial position	
	Employee services expense	Current tax expense (income)	Deferred tax expense (income)	Total tax expense (income)	Equity	Deferred tax asset
Year 1	188,000	0	(33,333)	(33,333)	0	33,333

Example 6 – Replacement awards in a business combination

On 1 January 20X1 Entity A acquired 100 per cent of Entity B. Entity A pays cash consideration of CU400 to the former owners of Entity B.

At the acquisition date Entity B had outstanding employee share options with a market-based measure of CU100. The share options were fully vested. As part of the business combination Entity B's outstanding share options are replaced by share options of Entity A (replacement awards) with a market-based measure of CU100 and an intrinsic value of CU80. The replacement awards are fully vested. In accordance with paragraphs B56–B62 of IFRS 3 *Business Combinations* (as revised in 2008), the replacement awards are part of the consideration transferred for Entity B. A tax deduction for the replacement awards will not arise until the options are exercised. The tax deduction will be based on the share options' intrinsic value at that date. Entity A's tax rate is 40 per cent. Entity A recognises a deferred tax asset of CU32 (CU80 intrinsic value × 40%) on the replacement awards at the acquisition date.

Entity A measures the identifiable net assets obtained in the business combination (excluding deferred tax assets and liabilities) at CU450. The tax base of the identifiable net assets obtained is CU300. Entity A recognises a deferred tax liability of CU60 ((CU450 – CU300) × 40%) on the identifiable net assets at the acquisition date.

Goodwill is calculated as follows:

	CU
Cash consideration	400
Market-based measure of replacement awards	100
Total consideration transferred	500
Identifiable net assets, excluding deferred tax assets and liabilities	(450)
Deferred tax asset	32
Deferred tax liability	60
Goodwill	**78**

Reductions in the carrying amount of goodwill are not deductible for tax purposes. In accordance with paragraph 15(a) of the Standard, Entity A recognises no deferred tax liability for the taxable temporary difference associated with the goodwill recognised in the business combination.

The accounting entry for the business combination is as follows:

			CU	CU
Dr	Goodwill		78	
Dr	Identifiable net assets		450	
Dr	Deferred tax asset		32	
	Cr	Cash		400
	Cr	Equity (replacement awards)		100
	Cr	Deferred tax liability		60

On 31 December 20X1 the intrinsic value of the replacement awards is CU120. Entity A recognises a deferred tax asset of CU48 (CU120 × 40%). Entity A recognises deferred tax income of CU16 (CU48 – CU32) from the increase in the intrinsic value of the replacement awards. The accounting entry is as follows:

		CU	CU
Dr	Deferred tax asset	16	
	Cr Deferred tax income		16

If the replacement awards had not been tax-deductible under current tax law, Entity A would not have recognised a deferred tax asset on the acquisition date. Entity A would have accounted for any subsequent events that result in a tax deduction related to the replacement award in the deferred tax income or expense of the period in which the subsequent event occurred.

Paragraphs B56–B62 of IFRS 3 provide guidance on determining which portion of a replacement award is part of the consideration transferred in a business combination and which portion is attributable to future service and thus a post-combination remuneration expense. Deferred tax assets and liabilities on replacement awards that are post-combination expenses are accounted for in accordance with the general principles as illustrated in Example 5.

Basis for Conclusions on IAS 16 *Property, Plant and Equipment*

This Basis for Conclusions accompanies, but is not part of, IAS 16.

Introduction

BC1 This Basis for Conclusions summarises the International Accounting Standards Board's considerations in reaching its conclusions on revising IAS 16 *Property, Plant and Equipment* in 2003. Individual Board members gave greater weight to some factors than to others.

BC2 In July 2001 the Board announced that, as part of its initial agenda of technical projects, it would undertake a project to improve a number of Standards, including IAS 16. The project was undertaken in the light of queries and criticisms raised in relation to the Standards by securities regulators, professional accountants and other interested parties. The objectives of the Improvements project were to reduce or eliminate alternatives, redundancies and conflicts within Standards, to deal with some convergence issues and to make other improvements. In May 2002 the Board published its proposals in an Exposure Draft of *Improvements to International Accounting Standards*, with a comment deadline of 16 September 2002. The Board received over 160 comment letters on the Exposure Draft.

BC3 Because the Board's intention was not to reconsider the fundamental approach to the accounting for property, plant and equipment that was established by IAS 16, this Basis for Conclusions does not discuss requirements in IAS 16 that the Board has not reconsidered.

Scope

BC4 The Board clarified that the requirements of IAS 16 apply to items of property, plant and equipment that an entity uses to develop or maintain (a) biological assets and (b) mineral rights and mineral reserves such as oil, natural gas and similar non-regenerative resources. The Board noted that items of property, plant and equipment that an entity uses for these purposes possess the same characteristics as other items of property, plant and equipment.

Recognition

BC5 In considering potential improvements to the previous version of IAS 16, the Board reviewed its subsequent expenditure recognition principle for two reasons. First, the existing subsequent expenditure recognition principle did not align with the asset recognition principle in the *Framework*. Second, the Board noted difficulties in practice in making the distinction it required between expenditures that maintain, and those that enhance, an item of property, plant and equipment. Some expenditures seem to do both.

 © IASCF

BC6 The Board ultimately decided that the separate recognition principle for subsequent expenditure was not needed. As a result, an entity will evaluate all its property, plant and equipment costs under IAS 16's general recognition principle. Also, if the cost of a replacement for part of an item of property, plant and equipment is recognised in the carrying amount of an asset, then an entity will derecognise the carrying amount of what was replaced to avoid carrying both the replacement and the replaced portion as assets. This derecognition occurs whether or not what is replaced is a part of an item that the entity depreciates separately.

BC7 The Board's decision on how to handle the recognition principles was not reached easily. In the Exposure Draft (ED), the Board proposed to include within IAS 16's general recognition principle only the recognition of subsequent expenditures that are replacements of a part of an item of property, plant and equipment. Also in the ED, the Board proposed to modify the subsequent expenditure recognition principle to distinguish more clearly the expenditures to which it would continue to apply.

BC8 Respondents to the ED agreed that it was appropriate for subsequent expenditures that were replacements of a part of an item of property, plant and equipment that an entity depreciated separately to be covered by the general recognition principle. However, the respondents argued, and the Board agreed, that the modified second principle was not clearer because it would result in an entity recognising in the carrying amount of an asset and then depreciating subsequent expenditures that were for the day-to-day servicing of items of property, plant and equipment, those that might commonly be regarded as for 'repairs and maintenance'. That result was not the Board's intention.

BC9 In its redeliberation of the ED, the Board concluded it could not retain the proposed modified subsequent expenditure recognition principle. It also concluded that it could not revert to the subsequent expenditure principle in the previous version of IAS 16 because, if it did, nothing was improved; the *Framework* conflict was not resolved and the practice issues were not addressed.

BC10 The Board concluded that it was best for all subsequent expenditures to be covered by IAS 16's general recognition principle. This solution had the following advantages:

(a) use of IAS 16's general recognition principle fits the *Framework.*

(b) use of a single recognition principle is a straightforward approach.

(c) retaining IAS 16's general recognition principle and combining it with the derecognition principle will result in financial statements that reflect what is occurring, ie both the flow of property, plant and equipment through an entity and the economics of the acquisition and disposal process.

(d) use of one recognition principle fosters consistency. With two principles, consistency is not achieved unless it is clear when each should apply. Because IAS 16 does not address what constitutes an 'item' of property, plant and equipment, this clarity was not assured because some might characterise a particular cost as the initial cost of a new item of property, plant and equipment and others might regard it as a subsequent cost of an existing item of property, plant and equipment.

BC11 As a consequence of placing all subsequent expenditures under IAS 16's general recognition principle, the Board also included those expenditures under IAS 16's derecognition principle. In the ED, the Board proposed the derecognition of the carrying amount of a part of an item that was depreciated separately and was replaced by a subsequent expenditure that an entity recognised in the carrying amount of the asset under the general recognition principle. With this change, replacements of a part of an item that are not depreciated separately are subject to the same approach.

BC12 The Board noted that some subsequent expenditures on property, plant and equipment, although arguably incurred in the pursuit of future economic benefits, are not sufficiently certain to be recognised in the carrying amount of an asset under the general recognition principle. Thus, the Board decided to state in the Standard that an entity recognises in profit or loss as incurred the costs of the day-to-day servicing of property, plant and equipment.

Measurement at recognition

Asset dismantlement, removal and restoration costs

BC13 The previous version of IAS 16 provided that in initially measuring an item of property, plant and equipment at its cost, an entity would include the cost of dismantling and removing that item and restoring the site on which it is located to the extent it had recognised an obligation for that cost. As part of its deliberations, the Board evaluated whether it could improve this guidance by addressing associated issues that have arisen in practice.

BC14 The Board concluded that the relatively limited scope of the Improvements project warranted addressing only one matter. That matter was whether the cost of an item of property, plant and equipment should include the initial estimate of the cost of dismantlement, removal and restoration that an entity incurs as a consequence of using the item (instead of as a consequence of acquiring it). Therefore, the Board did not address how an entity should account for (a) changes in the amount of the initial estimate of a recognised obligation, (b) the effects of accretion of, or changes in interest rates on, a recognised obligation or (c) the cost of obligations an entity did not face when it acquired the item, such as an obligation triggered by a law change enacted after the asset was acquired.

BC15 The Board observed that whether the obligation is incurred upon acquisition of the item or while it is being used, its underlying nature and its association with the asset are the same. Therefore, the Board decided that the cost of an item should include the costs of dismantlement, removal or restoration, the obligation for which an entity has incurred as a consequence of having used the item during a particular period other than to produce inventories during that period. An entity applies IAS 2 *Inventories* to the costs of these obligations that are incurred as a consequence of having used the item during a particular period to produce inventories during that period. The Board observed that accounting for these costs initially in accordance with IAS 2 acknowledges their nature. Furthermore, doing so achieves the same result as including these costs as an element of the

 © IASCF

cost of an item of property, plant and equipment, depreciating them over the production period just completed and identifying the depreciation charge as a cost to produce another asset (inventory), in which case the depreciation charge constitutes part of the cost of that other asset.

BC16 The Board noted that because IAS 16's initial measurement provisions are not affected by an entity's subsequent decision to carry an item under the cost model or the revaluation model, the Board's decision applies to assets that an entity carries under either treatment.

Asset exchange transactions

BC17 Paragraph 22 of the previous version of IAS 16 indicated that if (a) an item of property, plant and equipment is acquired in exchange for a similar asset that has a similar use in the same line of business and has a similar fair value or (b) an item of property, plant and equipment is sold in exchange for an equity interest in a similar asset, then no gain or loss is recognised on the transaction. The cost of the new asset is the carrying amount of the asset given up (rather than the fair value of the purchase consideration given for the new asset).

BC18 This requirement in the previous version of IAS 16 was consistent with views that:

(a) gains should not be recognised on exchanges of assets unless the exchanges represent the culmination of an earning process;

(b) exchanges of assets of a similar nature and value are not a substantive event warranting the recognition of gains; and

(c) requiring or permitting the recognition of gains from such exchanges enables entities to 'manufacture' gains by attributing inflated values to the assets exchanged, if the assets do not have observable market prices in active markets.

BC19 The approach described above raised issues about how to identify whether assets exchanged are similar in nature and value. The Board reviewed this topic, and noted views that:

(a) under the *Framework*, the recognition of income from an exchange of assets does not depend on whether the assets exchanged are dissimilar;

(b) income is not necessarily earned only at the culmination of an earning process, and in some cases it is arbitrary to determine when an earning process culminates;

(c) generally, under both measurement bases after recognition that are permitted under IAS 16, gain recognition is not deferred beyond the date at which assets are exchanged; and

(d) removing 'existing carrying amount' measurement of property, plant and equipment acquired in exchange for similar assets would increase the consistency of measurement of acquisitions of assets.

BC20 The Board decided to require in IAS 16 that all items of property, plant and equipment acquired in exchange for non-monetary assets or a combination of monetary and non-monetary assets should be measured at fair value, except that, if the exchange transaction lacks commercial substance or the fair value of neither of the assets exchanged can be determined reliably, then the cost of the asset acquired in the exchange should be measured at the carrying amount of the asset given up.

BC21 The Board added the 'commercial substance' test in response to a concern raised in the comments it received on the ED. This concern was that, under the Board's proposal, an entity would measure at fair value an asset acquired in a transaction that did not have commercial substance, ie the transaction did not have a discernible effect on an entity's economics. The Board agreed that requiring an evaluation of commercial substance would help to give users of the financial statements assurance that the substance of a transaction in which the acquired asset is measured at fair value (and often, consequentially, a gain on the disposal of the transferred asset is recognised in income) is the same as its legal form.

BC22 The Board concluded that in evaluating whether a transaction has commercial substance, an entity should calculate the present value of the post-tax cash flows that it can reasonably expect to derive from the portion of its operations affected by the transaction. The discount rate should reflect the entity's current assessment of the time value of money and the risks specific to those operations rather than those that marketplace participants would make.

BC23 The Board included the 'reliable measurement' test for using fair value to measure these exchanges to minimise the risk that entities could 'manufacture' gains by attributing inflated values to the assets exchanged. Taking into consideration its project for the convergence of IFRSs and US GAAP, the Board discussed whether to change the manner in which its 'reliable measurement' test is described. The Board observed this was unnecessary because it believes that its guidance and that contained in US GAAP are intended to have the same meaning.

BC24 The Board decided to retain, in IAS 18 *Revenue*, its prohibition on recognising revenue from exchanges or swaps of goods or services of a similar nature and value. The Board has on its agenda a project on revenue recognition and does not propose to make any significant amendments to IAS 18 until that project is completed.

Measurement after recognition

Revaluation model

BC25 The Board is taking part in research activities with national standard-setters on revaluations of property, plant and equipment. This research is intended to promote international convergence of standards. One of the most important issues is identifying the preferred measurement attribute for revaluations. This research could lead to proposals to amend IAS 16.

 © IASCF

Depreciation: unit of measure

BC26 The Board's discussions about the potential improvements to the depreciation principle in the previous version of IAS 16 included consideration of the unit of measure an entity uses to depreciate its items of property, plant and equipment. Of particular concern to the Board were situations in which the unit of measure is the 'item as a whole' even though that item may be composed of significant parts with individually varying useful lives or consumption patterns. The Board did not believe that, in these situations, an entity's use of approximation techniques, such as a weighted average useful life for the item as a whole, resulted in depreciation that faithfully represents an entity's varying expectations for the significant parts.

BC27 The Board sought to improve the previous version of IAS 16 by proposing in the ED revisions to existing guidance on separating an item into its parts and then further clarifying in the Standard the need for an entity to depreciate separately any significant parts of an item of property, plant and equipment. By doing so an entity will also separately depreciate the item's remainder.

Depreciation: depreciable amount

BC28 During its discussion of depreciation principles, the Board noted the concern that, under the cost model, the previous version of IAS 16 does not state clearly why an entity deducts an asset's residual value from its cost to determine the asset's depreciable amount. Some argue that the objective is one of precision, ie reducing the amount of depreciation so that it reflects the item's net cost. Others argue that the objective is one of economics, ie stopping depreciation if, because of inflation or otherwise, an entity expects that during its useful life an asset will increase in value by an amount greater than it will diminish.

BC29 The Board decided to improve the previous version of IAS 16 by making clear the objective of deducting a residual value in determining an asset's depreciable amount. In doing so, the Board did not adopt completely either the 'net cost' or the 'economics' objective. Given the concept of depreciation as a cost allocation technique, the Board concluded that an entity's expectation of increases in an asset's value, because of inflation or otherwise, does not override the need to depreciate it. Thus, the Board changed the definition of residual value to the amount an entity could receive for the asset currently (at the financial reporting date) if the asset were already as old and worn as it will be when the entity expects to dispose of it. Thus, an increase in the expected residual value of an asset because of past events will affect the depreciable amount; expectations of future changes in residual value other than the effects of expected wear and tear will not.

Depreciation: depreciation period

BC30 The Board decided that the useful life of an asset should encompass the entire time it is available for use, regardless of whether during that time it is in use or is idle. Idle periods most commonly occur just after an asset is acquired and just before it is disposed of, the latter while the asset is held either for sale or for another form of disposal.

BC31 The Board concluded that, whether idle or not, it is appropriate to depreciate an asset with a limited useful life so that the financial statements reflect the consumption of the asset's service potential that occurs while the asset is held. The Board also discussed but decided not to address the measurement of assets held for sale. The Board concluded that whether to apply a different measurement model to assets held for sale—which may or may not be idle—was a different question and was beyond the scope of the Improvements project.

BC32 In July 2003 the Board published ED 4 *Disposal of Non-current Assets and Presentation of Discontinued Operations*. ED 4 was published as part of the Board's short-term convergence project, the scope of which was broader than that of the Improvements project. In ED 4, the Board proposed that an entity should classify some of its assets as 'assets held for sale' if specified criteria are met. Among other things, the Board proposed that an entity should cease depreciating an asset classified in this manner, irrespective of whether the asset is idle. The basis for this proposal was that the carrying amount of an asset held for sale will be recovered principally through sale rather than future operations, and therefore accounting for the asset should be a process of valuation rather than allocation. The Board will amend IAS 16 accordingly when ED 4 is finalised.

Depreciation: depreciation method

BC33 The Board considered how an entity should account for a change in a depreciation method. The Board concluded that a change in a depreciation method is a change in the technique used to apply the entity's accounting policy to recognise depreciation as an asset's future economic benefits are consumed. Therefore, it is a change in an accounting estimate.

Derecognition

Derecognition date

BC34 The Board decided that an entity should apply the revenue recognition principle in IAS 18 for sales of goods to its gains from the sales of items of property, plant and equipment. The requirements in that principle ensure the representational faithfulness of an entity's recognised revenue. Representational faithfulness is also the appropriate objective for an entity's recognised gains. However, in IAS 16, the revenue recognition principle's criteria drive derecognition of the asset disposed of rather than recognition of the proceeds received. Applying the principle instead to the recognition of the proceeds might lead to the conclusion that an entity will recognise a deferred gain. Deferred gains do not meet the definition of a liability under the *Framework*. Thus, the Board decided that an entity does not derecognise an item of property, plant and equipment until the requirements in IAS 18 to recognise revenue on the sale of goods are met.

 © IASCF

Gain classification

BC35 Although the Board concluded that an entity should apply the recognition principle for revenue from sales of goods to its recognition of gains on disposals of items of property, plant and equipment, the Board concluded that the respective approaches to income statement display should differ. The Board concluded that users of financial statements would consider these gains and the proceeds from an entity's sale of goods in the course of its ordinary activities differently in their evaluation of an entity's past results and their projections of future cash flows. This is because revenue from the sale of goods is typically more likely to recur in comparable amounts than are gains from sales of items of property, plant and equipment. Accordingly, the Board concluded that an entity should not classify as revenue gains on disposals of items of property, plant and equipment.

Assets held for rental to others*

BC35A The Board identified that, in some industries, entities are in the business of renting and subsequently selling the same assets.

BC35B The Board noted that the Standard prohibits classification as revenue of gains arising from derecognition of items of property, plant and equipment. The Board also noted that paragraph BC35 states the reason for this is 'users of financial statements would consider these gains and the proceeds from an entity's sale of goods in the course of its ordinary activities differently in their evaluation of an entity's past results and their projections of future cash flows.'

BC35C Consistently with that reason, the Board concluded that entities whose ordinary activities include renting and subsequently selling the same assets should recognise revenue from both renting and selling the assets. In the Board's view, the presentation of gross selling revenue, rather than a net gain or loss on the sale of the assets, would better reflect the ordinary activities of such entities.

BC35D The Board concluded that the disclosure requirements of IAS 16, IAS 2 and IAS 18 would lead an entity to disclose relevant information for users.

BC35E The Board also concluded that paragraph 14 of IAS 7 *Statement of Cash Flows* should be amended to present within operating activities cash payments to manufacture or acquire such assets and cash receipts from rents and sales of such assets.

BC35F The Board discussed the comments received in response to its exposure draft of proposed *Improvements to International Financial Reporting Standards* published in 2007 and noted that a few respondents would prefer the issue to be included in one of the Board's major projects such as the revenue recognition project or the financial statement presentation project. However, the Board noted that the proposed amendment would improve financial statement presentation before

* Paragraphs BC35A–BC35F were added as a consequence of amendments to IAS 16 by *Improvements to IFRSs* issued in May 2008. At the same time, the Board also amended paragraph 6 by replacing the term 'net selling price' in the definition of 'recoverable amount' with 'fair value less costs to sell' for consistency with the wording used in IFRS 5 *Non-current Assets Held for Sale and Discontinued Operations* and IAS 36 *Impairment of Assets*.

© IASCF

those projects could be completed and decided to add paragraph 68A as previously exposed. A few respondents raised the concern that the term 'held for sale' in the amendment could be confused with the notion of held for sale in accordance with IFRS 5 *Non-current Assets Held for Sale and Discontinued Operations*. Consequently, the Board clarified in the amendment that IFRS 5 should not be applied in those circumstances.

Transitional provisions

BC36 The Board concluded that it would be impracticable for an entity to determine retrospectively whether a previous transaction involving an exchange of non-monetary assets had commercial substance. This is because it would not be possible for management to avoid using hindsight in making the necessary estimates as of earlier dates. Accordingly, the Board decided that in accordance with the provisions of IAS 8 an entity should consider commercial substance only in evaluating the initial measurement of future transactions involving an exchange of non-monetary assets.

Summary of changes from the Exposure Draft

BC37 The main changes from the ED proposals to the revised Standard are as follows:

(a) The ED contained two recognition principles, one applying to subsequent expenditures on existing items of property, plant and equipment. The Standard contains a single recognition principle that applies to costs incurred initially to acquire an item and costs incurred subsequently to add to, replace part of or service an item. An entity applies the recognition principle to the latter costs at the time it incurs them.

(b) Under the approach proposed in the ED, an entity measured an item of property, plant and equipment acquired in exchange for a non-monetary asset at fair value irrespective of whether the exchange transaction in which it was acquired had commercial substance. Under the Standard, a lack of commercial substance is cause for an entity to measure the acquired asset at the carrying amount of the asset given up.

(c) Compared with the Standard, the ED did not as clearly set out the principle that an entity separately depreciates at least the parts of an item of property, plant and equipment that are of significant cost.

(d) Under the approach proposed in the ED, an entity derecognised the carrying amount of a replaced part of an item of property, plant and equipment if it recognised in the carrying amount of the asset the cost of the replacement under the general recognition principle. In the Standard, an entity also applies this approach to a replacement of a part of an item that is not depreciated separately.

(e) In finalising the Standard, the Board identified further necessary consequential amendments to IFRS 1, IAS 14, IAS 34, IAS 36, IAS 37, IAS 38, IAS 40, SIC-13, SIC-21, SIC-22 and SIC-32.

Basis for Conclusions on IAS 17 *Leases*

This Basis for Conclusions accompanies, but is not part of, IAS 17.

Introduction

BC1 This Basis for Conclusions summarises the International Accounting Standards Board's considerations in reaching its conclusions on revising IAS 17 *Leases* in 2003. Individual Board members gave greater weight to some factors than to others.

BC2 In July 2001 the Board announced that, as part of its initial agenda of technical projects, it would undertake a project to improve a number of Standards, including IAS 17. The project was undertaken in the light of queries and criticisms raised in relation to the Standards by securities regulators, professional accountants and other interested parties. The objectives of the Improvements project were to reduce or eliminate alternatives, redundancies and conflicts within existing Standards, to deal with some convergence issues and to make other improvements. In May 2002 the Board published its proposals in an Exposure Draft of *Improvements to International Accounting Standards*, with a comment deadline of 16 September 2002. The Board received over 160 comment letters on the Exposure Draft.

BC3 Because the Board's intention was not to reconsider the fundamental approach to the accounting for leases established by IAS 17, this Basis for Conclusions does not discuss requirements in IAS 17 that the Board has not reconsidered.

Classification of leases—leases of land and buildings (2003 amendment)

BC4 Paragraph 14 of the Standard requires a lease of land with an indefinite economic life to be normally classified as an operating lease, unless title is expected to pass to the lessee by the end of the lease term. The previous version of IAS 17 (as amended in 2000) was not explicit about how to classify a lease of land and buildings.

BC5 This is a matter of concern in countries where property rights are obtained under long-term leases and the substance of those leases differs little from buying a property. Therefore, the Board decided to deal with this matter in its Improvements project in 2001 and not to defer its resolution until the more fundamental project on leases was completed.

BC6 The Board noted that two approaches are applied in practice. The first is to treat such a lease as a single unit and to classify it as an operating lease in its entirety. The second is to split the lease into two elements—a lease of land and a lease of buildings. The Board decided that the first approach does not adequately reflect the assets controlled by the entity or their usage and financing. It is also inconsistent with the classification and the measurement of other leases. Therefore, the Board rejected the first approach of classifying a lease of land and buildings as an operating lease in its entirety.

BC7 The Board agreed on the second approach of splitting the lease into two elements—a lease of land and a lease of buildings. The land element would normally be classified as an operating lease in accordance with paragraph 14 of the revised Standard and the buildings element classified as an operating or finance lease by applying the conditions in paragraphs 7–13. The Board noted that generally accepted accounting principles in Australia, Canada and the United States all explicitly require a lease of land and buildings to be split into two elements.

BC8 The Board also discussed a third approach, namely whether to delete the requirement (in paragraph 14 of the Standard) normally to classify a lease of land as an operating lease when title does not pass at the end of the lease and to require such a lease to be classified as a finance lease when all other conditions for finance lease classification in the Standard are met. The Board noted that such an accounting treatment would conflict with the criteria for lease classification in the Standard, which are based on the extent to which the risks and rewards incidental to ownership of a leased asset lie with the lessor or the lessee. Indeed, land normally has an indefinite economic life and hence there are significant risks and rewards associated with the land at the end of the lease term, which do not pass to the lessee. Therefore, the Board rejected this approach when issuing the amendments to IAS 17 in December 2003.

Land element in long-term leases (2009 amendment)*

BC8A As part of its annual improvements project in 2007, the Board reconsidered the decisions it made in 2003, specifically the perceived inconsistency between the general lease classification guidance in paragraphs 7–13 and the specific lease classification guidance in paragraphs 14 and 15 related to long-term leases of land and buildings. The Board concluded that the guidance in paragraphs 14 and 15 might lead to a conclusion on the classification of land leases that does not reflect the substance of the transaction.

BC8B For example, consider a 999-year lease of land and buildings. In this situation, significant risks and rewards associated with the land during the lease term would have been transferred to the lessee despite there being no transfer of title.

BC8C The Board noted that the lessee in leases of this type will typically be in a position economically similar to an entity that purchased the land and buildings. The present value of the residual value of the property in a lease with a term of several decades would be negligible. The Board concluded that the accounting for the land element as a finance lease in such circumstances would be consistent with the economic position of the lessee.

BC8D The Board noted that this amendment reversed the decision it made in amending IAS 17 in December 2003. The Board also noted that the amendment differed from the International Financial Reporting Interpretations Committee's agenda decision in March 2006 based on the IAS 17 guidance that such long-term leases of land would be classified as an operating lease unless title or significant risks and rewards of ownership passed to the lessee, irrespective of the term of the

* Paragraphs BC8A–BC8F were added as a consequence of amendments to IAS 17 made by *Improvements to IFRSs* issued in April 2009.

 © IASCF

lease. However, the Board believed that this change improves the accounting for leases by removing a rule and an exception to the general principles applicable to the classification of leases.

BC8E Some respondents to the exposure draft proposing this amendment agreed with the direction of this proposal but suggested that it should be incorporated into the Board's project on leases. The Board acknowledged that the project on leases is expected to produce a standard in 2011. However, the Board decided to issue the amendment now because of the improvement in accounting for leases that would result and the significance of this issue in countries in which property rights are obtained under long-term leases. Therefore, the Board decided to remove this potential inconsistency by deleting the guidance in paragraphs 14 and 15.

BC8F Some respondents raised concerns about the proposed requirement to apply the amendment retrospectively. The land and buildings elements of a long-term finance lease may have different amortisation bases. Accordingly, entities must obtain relative fair values even when both elements are classified as finance leases. The Board noted that this information should already be available because entities would have had to obtain it to adopt the 2003 amendment to IAS 17 that required the split between land and buildings elements for the purposes of lease classification. However, the Board acknowledged that the fair values at the inception of the leases might not be available in some situations. The Board noted that determining the fair value of the land element at the inception of long-term leases in these instances would require the use of hindsight and might not achieve comparability. Accordingly, the Board decided not to require retrospective application when the necessary information is not available. The Board also rejected prospective application of the amendment because the land element in existing long-term leases would be accounted for inconsistently. Therefore, the Board decided to adopt the modified retrospective transition requirement in paragraph 68A of IAS 17.

Allocation of minimum lease payments between land and buildings

BC9 The Exposure Draft proposed that the allocation of the minimum lease payments between land and buildings should be made in proportion to their relative fair values at the inception of the lease. Respondents to the Exposure Draft questioned whether the allocation basis referred to the land and buildings components of the fair value of the property or the fair value of those components to the extent they were the subject of the lease.

BC10 The Board noted that an allocation of the minimum lease payments by reference to the relative fair values of the land and buildings would not reflect the fact that land often has an indefinite economic life, and therefore would be expected to maintain its value beyond the lease term. In contrast, the future economic benefits of a building are likely to be used up, at the least to some extent, over the lease term. Therefore, it would be reasonable to expect that the lease payments relating to the building would be set at a level that enabled the lessor not only to make a return on initial investment, but also to recoup the value of the building used up over the term of the lease. In the case of land, the lessor would not normally need compensation for using up the land.

BC11 Therefore, the Board decided to clarify in the Standard that the allocation of the minimum lease payments is weighted to reflect their role in compensating the lessor, and not by reference to the relative fair values of the land and buildings. In other words, the weighting should reflect the lessee's leasehold interest in the land and the buildings. In the extreme case that a building is fully depreciated over the lease term, the minimum lease payments would need to be weighted to provide a return plus the full depreciation of the building's value at the inception of the lease. The leasehold interest in the land would, assuming a residual value that equals its value at the inception of the lease, have a weighting that reflects only a return on the initial investment.

Impracticability of split between land and buildings

BC12 A question that arises is how to treat leases for which it is not possible to measure the two elements reliably (eg because similar land and buildings are not sold or leased separately). One possibility would be to classify the entire lease as a finance lease. This would prevent a lessee from avoiding finance lease treatment for the buildings by asserting that it cannot separately measure the two elements. However, it may be apparent from the circumstances that classifying the entire lease as a finance lease is not representationally faithful. In view of this, the Board decided that when it is not possible to measure the two elements reliably, the entire lease should be classified as a finance lease unless it is clear that both elements should be classified as an operating lease.

Exception to the requirement to separate the land and buildings elements

BC13 The Board discussed whether to allow or require an exception from the requirement to separate the land and buildings elements in cases in which the present value of the land element at the inception of the lease is small in relation to the value of the entire lease. In such cases the benefits of separating the lease into two elements and accounting for each separately may not outweigh the costs. The Board noted that generally accepted accounting principles in Australia, Canada and the United States allow or require such leases to be classified and accounted for as a single unit, with finance lease treatment being used when the relevant criteria are met. The Board decided to allow land and buildings to be treated as a single unit when the land element is immaterial.

BC14 Some respondents to the Exposure Draft requested guidance on how small the relative value of the land element needs to be in relation to the total value of the lease. The Board decided not to introduce a bright line such as a specific percentage threshold. The Board decided that the normal provisions on materiality should apply.

Transitional provisions

BC15 The Board decided that the requirement to separate the land and buildings elements in a lease of land and buildings should be applied retrospectively. It noted that there will be cases when it will be impracticable to reassess the treatment of these leases retrospectively, because doing so requires estimating

 © IASCF

what the fair value of the two elements was at the inception of the lease, which may have been many years before. The Board also noted that IAS 8 *Accounting Policies, Changes in Accounting Estimates and Errors* contains guidance on when it is impracticable to apply retrospectively a change in accounting policy and therefore decided not to provide specific transitional provisions for the implementation of this revision to IAS 17.

Inception of the lease and commencement of the lease term

BC16 The previous version of IAS 17 did not define the commencement of the lease term. It implicitly assumed that commencement (when the lease begins) and inception (when the agreement is entered into) are simultaneous. Some respondents questioned what should happen if there is a time lag between the two dates, particularly if the amounts change—for example, because the asset is under construction and the final cost is not known at inception. The Standard now specifies that recognition takes place at commencement, based on values measured at inception. However, if the lease is adjusted for changes in the lessor's costs between the inception of the lease and the commencement of the lease term, the effect of any such changes is deemed to have taken place at inception. These revisions are consistent with generally accepted accounting principles in Australia, Canada and the United States, and are consistent with the present accounting treatment of most ordinary purchases and sales.

BC17 In agreeing on this treatment, the Board noted that measurement at commencement would have been more satisfactory in principle. However, this cannot be done properly within the framework of IAS 17 because the Standard generally requires a finance lease receivable or payable to be recognised at an amount based on the fair value of the asset, which is inappropriate at any date after inception.

Leases in the financial statements of lessors other than manufacturers and dealers

BC18 Lessors may incur direct costs in negotiating a lease, such as commissions, brokers' fees and legal fees. The previous version of IAS 17 contained a choice on how to account for such costs—they might be either charged as an expense as incurred or allocated over the lease term. The choice of treatment applied to operating and finance leases. In the case of a finance lease, paragraph 33 of the previous version of IAS 17 stated that allocation over the lease term might be achieved by recognising the cost as an expense and, in the same period, recognising an equal amount of unearned finance income.

BC19 The Board decided that this treatment was not in accordance with the *Framework for the Preparation and Presentation of Financial Statements*. Its effect was to recognise some future finance income as income and an asset at the commencement of the lease term. However, at that date, the *Framework*'s definitions of income and assets are not met. Therefore, the Board decided that if direct costs incurred by lessors are to be allocated over the lease term, this should be achieved by including them in the carrying amount of the lease asset.

© IASCF

BC20 The Board noted that standard-setters in Australia, Canada, France, Japan, the United Kingdom and the United States either permit or require initial direct costs to be allocated over the lease term. The Board also noted that other Standards permit or require the recognition of a range of similar costs in the carrying amount of assets, generally subject to those costs being directly attributable to the acquisition of the asset in question. Hence, for reasons of convergence and comparability with other Standards, the Board decided to require initial direct costs to be included in the carrying amount of the lease asset.

BC21 For consistency with other Standards, in particular IAS 39 *Financial Instruments: Recognition and Measurement*,[*] the Board decided that recognition in the carrying amount of assets should be restricted to costs that are incremental and directly attributable to negotiating and arranging a lease.

[*] In November 2009 the IASB amended some of the requirements of IAS 39 and relocated them to IFRS 9 *Financial Instruments*.

Dissenting opinion

Dissent of James J Leisenring from the amendment issued in April 2009

DO1 Mr Leisenring dissents from the amendment to IAS 17 *Leases* made by *Improvements to IFRSs* issued in April 2009.

DO2 Mr Leisenring believes that the amendment inappropriately permits an accounting that does not reflect the economic position of the lessee. In his view, land normally has an indefinite economic life, unlike other properties with finite useful lives. Therefore, it is not the lessee's land at the end of the lease even if the lease term is 999 years. He does not believe that a lessee is in a position economically similar to the purchaser of the land. Any appreciation in the land value does not accrue to the lessee at the termination of the lease. Furthermore, it is unclear how long the lease term must be for the Board to conclude that a lessee and a purchaser are in the same economic position.

DO3 This amendment also reverses the decision the Board made in amending IAS 17 in December 2003 and creates a divergence from US generally accepted accounting principles. Mr Leisenring agrees with some respondents that it is best to incorporate this amendment into the Board's broader project on lease accounting.

Guidance on implementing IAS 17 *Leases*

This guidance accompanies, but is not part of, IAS 17.

Illustrative examples of sale and leaseback transactions that result in operating leases

A sale and leaseback transaction that results in an operating lease may give rise to profit or a loss, the determination and treatment of which depends on the leased asset's carrying amount, fair value and selling price. The table below shows the requirements of the Standard in various circumstances.

Sale price at fair value (paragraph 61)	**Carrying amount equal to fair value**	**Carrying amount less than fair value**	**Carrying amount above fair value**
Profit	no profit	recognise profit immediately	not applicable
Loss	no loss	not applicable	recognise loss immediately

Sale price below fair value (paragraph 61)			
Profit	no profit	recognise profit immediately	no profit (note 1)
Loss <u>not</u> compensated for by future lease payments at below market price	recognise loss immediately	recognise loss immediately	(note 1)
Loss compensated for by future lease payments at below market price	defer and amortise loss	defer and amortise loss	(note 1)

Sale price above fair value (paragraph 61)			
Profit	defer and amortise profit	defer and amortise excess profit (note 3)	defer and amortise profit (note 2)
Loss	no loss	no loss	(note 1)

 © IASCF

Note 1 These parts of the table represent circumstances dealt with in paragraph 63 of the Standard. Paragraph 63 requires the carrying amount of an asset to be written down to fair value where it is subject to a sale and leaseback.

Note 2 Profit is the difference between fair value and sale price because the carrying amount would have been written down to fair value in accordance with paragraph 63.

Note 3 The excess profit (the excess of sale price over fair value) is deferred and amortised over the period for which the asset is expected to be used. Any excess of fair value over carrying amount is recognised immediately.

IASB document published to accompany

International Accounting Standard 18

Revenue

This version includes amendments resulting from IFRSs issued up to 31 December 2009.

The text of the unaccompanied IAS 18 is contained in Part A of this edition. Its effective date when issued was 1 January 1995. The effective date of the latest amendments is 1 January 2013. This part presents the following accompanying document:

page

ILLUSTRATIVE EXAMPLES
Sale of goods **B784**
Rendering of services **B786**
Interest, royalties and dividends **B790**
Recognition and measurement **B791**

Illustrative examples

These illustrative examples accompany, but are not part of, IAS 18. The examples focus on particular aspects of a transaction and are not a comprehensive discussion of all the relevant factors that might influence the recognition of revenue. The examples generally assume that the amount of revenue can be measured reliably, it is probable that the economic benefits will flow to the entity and the costs incurred or to be incurred can be measured reliably.

Sale of goods

The law in different countries may mean the recognition criteria in this Standard are met at different times. In particular, the law may determine the point in time at which the entity transfers the significant risks and rewards of ownership. Therefore, the examples in this section of the appendix need to be read in the context of the laws relating to the sale of goods in the country in which the transaction takes place.

1 *'Bill and hold' sales, in which delivery is delayed at the buyer's request but the buyer takes title and accepts billing.*

Revenue is recognised when the buyer takes title, provided:

(a) it is probable that delivery will be made;

(b) the item is on hand, identified and ready for delivery to the buyer at the time the sale is recognised;

(c) the buyer specifically acknowledges the deferred delivery instructions; and

(d) the usual payment terms apply.

Revenue is not recognised when there is simply an intention to acquire or manufacture the goods in time for delivery.

2 *Goods shipped subject to conditions.*

(a) *installation and inspection.*

Revenue is normally recognised when the buyer accepts delivery, and installation and inspection are complete. However, revenue is recognised immediately upon the buyer's acceptance of delivery when:

(i) the installation process is simple in nature, for example the installation of a factory tested television receiver which only requires unpacking and connection of power and antennae; or

(ii) the inspection is performed only for purposes of final determination of contract prices, for example, shipments of iron ore, sugar or soya beans.

(b) *on approval when the buyer has negotiated a limited right of return.*

If there is uncertainty about the possibility of return, revenue is recognised when the shipment has been formally accepted by the buyer or the goods have been delivered and the time period for rejection has elapsed.

 © IASCF

(c) *consignment sales under which the recipient (buyer) undertakes to sell the goods on behalf of the shipper (seller).*

Revenue is recognised by the shipper when the goods are sold by the recipient to a third party.

(d) *cash on delivery sales.*

Revenue is recognised when delivery is made and cash is received by the seller or its agent.

3 *Lay away sales under which the goods are delivered only when the buyer makes the final payment in a series of instalments.*

Revenue from such sales is recognised when the goods are delivered. However, when experience indicates that most such sales are consummated, revenue may be recognised when a significant deposit is received provided the goods are on hand, identified and ready for delivery to the buyer.

4 *Orders when payment (or partial payment) is received in advance of delivery for goods not presently held in inventory, for example, the goods are still to be manufactured or will be delivered directly to the customer from a third party.*

Revenue is recognised when the goods are delivered to the buyer.

5 *Sale and repurchase agreements (other than swap transactions) under which the seller concurrently agrees to repurchase the same goods at a later date, or when the seller has a call option to repurchase, or the buyer has a put option to require the repurchase, by the seller, of the goods.*

For a sale and repurchase agreement on an asset other than a financial asset, the terms of the agreement need to be analysed to ascertain whether, in substance, the seller has transferred the risks and rewards of ownership to the buyer and hence revenue is recognised. When the seller has retained the risks and rewards of ownership, even though legal title has been transferred, the transaction is a financing arrangement and does not give rise to revenue. For a sale and repurchase agreement on a financial asset, IFRS 9 *Financial Instruments* and IAS 39 *Financial Instruments: Recognition and Measurement* apply.

6 *Sales to intermediate parties, such as distributors, dealers or others for resale.*

Revenue from such sales is generally recognised when the risks and rewards of ownership have passed. However, when the buyer is acting, in substance, as an agent, the sale is treated as a consignment sale.

7 *Subscriptions to publications and similar items.*

When the items involved are of similar value in each time period, revenue is recognised on a straight-line basis over the period in which the items are despatched. When the items vary in value from period to period, revenue is recognised on the basis of the sales value of the item despatched in relation to the total estimated sales value of all items covered by the subscription.

© IASCF

8 *Instalment sales, under which the consideration is receivable in instalments.*

Revenue attributable to the sales price, exclusive of interest, is recognised at the date of sale. The sale price is the present value of the consideration, determined by discounting the instalments receivable at the imputed rate of interest. The interest element is recognised as revenue as it is earned, using the effective interest method.

9 *Real estate sales.*

This example has been superseded by IFRIC Interpretation 15 *Agreements for the Construction of Real Estate*.

Rendering of services

10 *Installation fees.*

Installation fees are recognised as revenue by reference to the stage of completion of the installation, unless they are incidental to the sale of a product, in which case they are recognised when the goods are sold.

11 *Servicing fees included in the price of the product.*

When the selling price of a product includes an identifiable amount for subsequent servicing (for example, after sales support and product enhancement on the sale of software), that amount is deferred and recognised as revenue over the period during which the service is performed. The amount deferred is that which will cover the expected costs of the services under the agreement, together with a reasonable profit on those services.

12 *Advertising commissions.*

Media commissions are recognised when the related advertisement or commercial appears before the public. Production commissions are recognised by reference to the stage of completion of the project.

13 *Insurance agency commissions.*

Insurance agency commissions received or receivable which do not require the agent to render further service are recognised as revenue by the agent on the effective commencement or renewal dates of the related policies. However, when it is probable that the agent will be required to render further services during the life of the policy, the commission, or part thereof, is deferred and recognised as revenue over the period during which the policy is in force.

14 *Financial service fees.*

The recognition of revenue for financial service fees depends on the purposes for which the fees are assessed and the basis of accounting for any associated financial instrument. The description of fees for financial services may not be indicative of the nature and substance of the services provided. Therefore, it is necessary to distinguish between fees that are an integral part of the effective interest rate of a financial instrument, fees that are earned as services are provided, and fees that are earned on the execution of a significant act.

 © IASCF

(a) *Fees that are an integral part of the effective interest rate of a financial instrument.*

Such fees are generally treated as an adjustment to the effective interest rate. However, when the financial instrument is measured at fair value with the change in fair value recognised in profit or loss, the fees are recognised as revenue when the instrument is initially recognised.

(i) *Origination fees received by the entity relating to the creation or acquisition of a financial asset other than one that under IFRS 9 is measured at fair value through profit or loss.*

Such fees may include compensation for activities such as evaluating the borrower's financial condition, evaluating and recording guarantees, collateral and other security arrangements, negotiating the terms of the instrument, preparing and processing documents and closing the transaction. These fees are an integral part of generating an involvement with the resulting financial instrument and, together with the related transaction costs[*] (as defined in IAS 39), are deferred and recognised as an adjustment to the effective interest rate.

(ii) *Commitment fees received by the entity to originate a loan when the loan commitment is outside the scope of IAS 39.*

If it is probable that the entity will enter into a specific lending arrangement and the loan commitment is not within the scope of IAS 39, the commitment fee received is regarded as compensation for an ongoing involvement with the acquisition of a financial instrument and, together with the related transaction costs (as defined in IAS 39), is deferred and recognised as an adjustment to the effective interest rate. If the commitment expires without the entity making the loan, the fee is recognised as revenue on expiry. Loan commitments that are within the scope of IAS 39 are accounted for as derivatives and measured at fair value.

(iii) *Origination fees received on issuing financial liabilities measured at amortised cost.*

These fees are an integral part of generating an involvement with a financial liability. When a financial liability is not classified as 'at fair value through profit or loss', the origination fees received are included, with the related transaction costs (as defined in IAS 39) incurred, in the initial carrying amount of the financial liability and recognised as an adjustment to the effective interest rate. An entity distinguishes fees and costs that are an integral part of the effective interest rate for the financial liability from origination fees and transaction costs relating to the right to provide services, such as investment management services.

[*] In *Improvements to IFRSs* issued in May 2008, the Board replaced the term 'direct costs' with 'transaction costs' as defined in paragraph 9 of IAS 39. This amendment removed an inconsistency for costs incurred in originating financial assets and liabilities that should be deferred and recognised as an adjustment to the underlying effective interest rate. 'Direct costs', as previously defined, did not require such costs to be incremental.

(b) *Fees earned as services are provided.*

(i) *Fees charged for servicing a loan.*

Fees charged by an entity for servicing a loan are recognised as revenue as the services are provided.

(ii) *Commitment fees to originate a loan when the loan commitment is outside the scope of IAS 39.*

If it is unlikely that a specific lending arrangement will be entered into and the loan commitment is outside the scope of IAS 39, the commitment fee is recognised as revenue on a time proportion basis over the commitment period. Loan commitments that are within the scope of IAS 39 are accounted for as derivatives and measured at fair value.

(iii) *Investment management fees.*

Fees charged for managing investments are recognised as revenue as the services are provided.

Incremental costs that are directly attributable to securing an investment management contract are recognised as an asset if they can be identified separately and measured reliably and if it is probable that they will be recovered. As in IAS 39, an incremental cost is one that would not have been incurred if the entity had not secured the investment management contract. The asset represents the entity's contractual right to benefit from providing investment management services, and is amortised as the entity recognises the related revenue. If the entity has a portfolio of investment management contracts, it may assess their recoverability on a portfolio basis.

Some financial services contracts involve both the origination of one or more financial instruments and the provision of investment management services. An example is a long-term monthly saving contract linked to the management of a pool of equity securities. The provider of the contract distinguishes the transaction costs relating to the origination of the financial instrument from the costs of securing the right to provide investment management services.

(c) *Fees that are earned on the execution of a significant act.*

The fees are recognised as revenue when the significant act has been completed, as in the examples below.

(i) *Commission on the allotment of shares to a client.*

The commission is recognised as revenue when the shares have been allotted.

(ii) *Placement fees for arranging a loan between a borrower and an investor.*

The fee is recognised as revenue when the loan has been arranged.

 © IASCF

(iii) *Loan syndication fees.*

A syndication fee received by an entity that arranges a loan and retains no part of the loan package for itself (or retains a part at the same effective interest rate for comparable risk as other participants) is compensation for the service of syndication. Such a fee is recognised as revenue when the syndication has been completed.

15 *Admission fees.*

Revenue from artistic performances, banquets and other special events is recognised when the event takes place. When a subscription to a number of events is sold, the fee is allocated to each event on a basis which reflects the extent to which services are performed at each event.

16 *Tuition fees.*

Revenue is recognised over the period of instruction.

17 *Initiation, entrance and membership fees.*
